Implement OnAfterExecuteAction to do something after the action has executed. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request.

See Also

OnAfterExecute (see page 24075)

OnBeforeExecuteAction (see page 24186)

41.1.10.3.2 TDataSetAdapter.OnAfterGetActionResponse Event

Occurs after the adapter action response is generated.

Pascal

```
property OnAfterGetActionResponse: TAdapterActionExecuteEvent;
```

C++

```
__property TAdapterActionExecuteEvent OnAfterGetActionResponse;
```

Description

Implement OnAfterGetActionResponse to do something after the action response is generated. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request.

See Also

OnAfterGetResponse (see page 24075)

OnBeforeGetActionResponse (see page 24186)

41.1.10.3.3 TDataSetAdapter.OnAfterUpdateFields Event

Occurs after values in the HTTP request are used to update adapter fields.

Pascal

```
property OnAfterUpdateFields: TActionRequestFieldsEvent;
```

C++

```
__property TActionRequestFieldsEvent OnAfterUpdateFields;
```

Description

Implement this event handler to perform custom updates. The AdapterFields parameter lists all of the adapter fields that have corresponding values in the HTTP request. The adapter's errors object is used to record update errors.

See Also

UpdateFieldsUpdateValues (see page 24178)

OnBeforeUpdateFields (see page 24187)

Errors (see page 24182)

41.1.10.3.4 TDataSetAdapter.OnAfterValidateFields Event

Occurs after values in the HTTP request are validated by the adapter's fields.

Pascal

```
property OnAfterValidateFields: TActionRequestFieldsEvent;
```

C++

```
__property TActionRequestFieldsEvent OnAfterValidateFields;
```

Description

Implement this event handler to perform custom validation of the HTTP request. The AdapterFields parameter lists all of the adapter fields that have corresponding values in the HTTP request. The adapter's errors object is used to record validation errors.

See Also

UpdateFieldsValidateValues (see page 24178)

OnBeforeValidateFields (see page 24187)

Errors (see page 24182)

41.1.10.3.5 TDataSetAdapter.OnBeforeExecuteAction Event

Occurs before an adapter action is executed.

Pascal

```
property OnBeforeExecuteAction: TAdapterActionExecuteHandledEvent;
```

C++

```
__property TAdapterActionExecuteHandledEvent OnBeforeExecuteAction;
```

Description

Implement OnBeforeExecuteAction to do something before the action is executed. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. Set the Handled flag to prevent the action from

being executed.

See Also

OnBeforeExecute (see page 24076)

OnAfterExecuteAction (see page 24184)

41.1.10.3.6 TDataSetAdapter.OnBeforeGetActionResponse Event

Occurs before the adapter action response is generated.

Pascal

```
property OnBeforeGetActionResponse: TAdapterActionExecuteHandledEvent;
```

C++

```
__property TAdapterActionExecuteHandledEvent OnBeforeGetActionResponse;
```

Description

Implement OnBeforeGetActionResponse to do something before the action response is generated. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. Set the Handled flag to indicate that the response has been generated and no further processing is needed.

See Also

OnBeforeGetResponse (see page 24076)

OnAfterGetActionResponse (see page 24185)

41.1.10.3.7 TDataSetAdapter.OnBeforeUpdateFields Event

Occurs before values in the HTTP request are used to update adapter fields.

Pascal

```
property OnBeforeUpdateFields: TActionRequestFieldsHandledEvent;
```

C++

```
__property TActionRequestFieldsHandledEvent OnBeforeUpdateFields;
```

Description

Implement this event handler to perform custom updates of adapter fields. The AdapterFields parameter lists all of the adapter fields that have corresponding values in the HTTP request. Set the Handled flag to prevent any further updates. Add update errors to the adapter's errors object.

See Also

UpdateFieldsUpdateValues (see page 24178)

OnAfterUpdateFields (see page 24185)

Errors (see page 24182)

41.1.10.3.8 TDataSetAdapter.OnBeforeValidateFields Event

Occurs before values in the HTTP request are validated by the adapter's fields.

Pascal

```
property OnBeforeValidateFields: TActionRequestFieldsHandledEvent;
```

C++

```
__property TActionRequestFieldsHandledEvent OnBeforeValidateFields;
```

Description

Implement this event handler to perform custom validation of the HTTP request. The AdapterFields parameter lists all of the adapter fields that have corresponding values in the HTTP request. Set the Handled flag to prevent any further validation. Add validation errors to the adapter's errors object.

See Also

UpdateFieldsValidateValues (see page 24178)

OnAfterValidateFields (see page 24186)

Errors (see page 24182)

41.1.10.3.9 TDataSetAdapter.OnGetActionParams Event

Supplies name/value pairs needed to execute an adapter action.

Pascal

```
property OnGetActionParams: TAdapterActionGetParamsEvent;
```

C++

```
__property TAdapterActionGetParamsEvent OnGetActionParams;
```

Description

Implement this event handler to specify the name/value pairs needed to execute an action.

See Also

OnGetParams (see page 24077)

41.1.10.3.10 TDataSetAdapter.OnGetRecordCount Event

Implement this event to identify the total number of records that can be iterated.

Pascal

```
property OnGetRecordCount: TGetRecordCountEvent;
```

C++

```
__property TGetRecordCountEvent OnGetRecordCount;
```

Description

OnGetRecordCount is called to calculate the number of pages.

41.1.10.3.11 TDataSetAdapter.OnPrepareDataSet Event

Occurs before the dataset adapter uses any information from its associated dataset.

Pascal

```
property OnPrepareDataSet: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnPrepareDataSet;
```

Description

Write an OnPrepareDataSet event handler to set up the associated dataset before the WebSnap application uses this adapter. For example, you can use an OnPrepareDataSet event handler to dynamically generate and execute a query.

This event occurs when the Web module containing the dataset adapter is first activated, and whenever the WebSnap application changes the value of the Mode property.

Note: Do not confuse the this event with the Prepared property of many dataset components. This event allows the adapter to perform any tasks it requires to accurately represent its corresponding dataset. The Prepared property of a dataset component indicates whether the underlying database engine has initialized itself to represent a database query.

See Also

PrepareDataSet (see page 7799)

DataSet (see page 7807)

Mode (see page 7810)

41.1.11 TDataSetAdapterApplyRowAction Class

TDataSetAdapterApplyRowAction applies the updates from an HTTP request to a single record of an adapter's dataset.

Class Hierarchy

Pascal

```
TDataSetAdapterApplyRowAction = class(TCustomDataSetAdapterRowAction);
```

C++

```
class TDataSetAdapterApplyRowAction : public TCustomDataSetAdapterRowAction;
```

File

DBAdapt

Description

Add TDataSetAdapterApplyRowAction to a dataset adapter (TDataSetAdapter (see page 7872)) to support HTML forms that update a set of field values in the record of a dataset. When this action is executed, it positions the parent dataset on the record specified by the current request object and updates any fields for which new values are included in the current request.

Server-side script addresses this action as the 'Apply' action of the parent adapter. By default, this action is visible (included in HTML forms) only when the parent adapter is in insert or edit mode. You can, however, cause this action to be included when the dataset is in other modes by changing the value of its ActionModes (see page 7899) property. If the action is visible when the dataset is in browse mode, the control for this action appears disabled.

This action is included by default when the adapter is used to build forms that represent a single database record that is in edit or insert mode.

See Also

TDataSetAdapterBrowseRowAction (see page 7903)

TDataSetAdapterCancelRowAction (see page 7916)

TDataSetAdapterDeleteRowAction (see page 7934)

TDataSetAdapterEditRowAction (see page 7947)

TDataSetAdapterFirstRowAction (see page 7972)

TDataSetAdapterLastRowAction (see page 7984)

TDataSetAdapterNextRowAction (see page 8030)

TDataSetAdapterPrevRowAction (see page 8042)

TDataSetAdapterRefreshRowAction (see page 8054)

TDataSetAdapterNewRowAction (see page 8016)

TDataSetAdapter (see page 7872)

TCustomDataSetAdapter (see page 7766)

41.1.11.1 TDataSetAdapterApplyRowAction Members

The following tables list the members exposed by TDataSetAdapterApplyRowAction.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.

	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	CheckExecuteAccess (see page 24050)	Checks end-user rights to execute this adapter action.
	CreateRequestContext (see page 24050)	Creates an object that describes the adapter action parameters and adapter field values.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DoAfterExecuteActionRequest (see page 24051)	Calls event handlers after the adapter action is executed.
V	DoAfterGetExecuteActionResponse (see page 24051)	Calls event handlers after the adapter action response is formulated.
V	DoBeforeExecuteActionRequest (see page 24052)	Calls event handlers before the adapter action is executed.
V	DoBeforeGetExecuteActionResponse (see page 24052)	Calls event handlers before the adapter action response is formulated.
	EndIterator (see page 24053)	Implements IIteratorSupport's EndIterator method.
	ExecuteActionRequest (see page 24053)	Executes the adapter action using parameters passed in the HTTP request.
	GetActionName (see page 24054)	Gets the name used to reference this adapter action with server-side script.
	GetAdapter (see page 7819)	Returns the value of the Adapter (see page 7822) property.
	GetAdapter (see page 24054)	GetAdapter returns the parent adapter component.
	GetAdapterItemRequestParams (see page 24055)	Provides the name/value pairs needed to execute this adapter action.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetContainerList (see page 24727)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
	GetDataSet (see page 7819)	Returns the value of the DataSet (see page 7822) property.
V	GetDefaultActionName (see page 7898)	Gets the default name used to reference this adapter action with server-side script.
V	GetDefaultDisplayLabel (see page 24055)	Provides the default display label for this adapter action.
	GetDisplayLabel (see page 24055)	Returns the suggested display label for this adapter action.
	GetDisplayStyle (see page 24056)	Returns a string value to suggest an HTML display style for this adapter action.
V	GetDisplayStyleType (see page 24056)	Suggests an HTML display type for this adapter action.
	GetErrors (see page 24057)	This is GetErrors, a member of class TBaseAdapterAction.
	GetExecuteActionResponse (see page 24057)	Generates a response after the adapter action has been executed.
	GetFailureOptions (see page 24057)	Indicates whether to perform an HTTP redirect after execution of this adapter action fails.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetInputStyle (see page 24058)	Returns a string value to suggest an HTML display style for this adapter action.
	GetIsAdapterActionList (see page 24058)	Indicates whether this adapter action may have multiple commands.
V	GetItemCount (see page 24058)	Returns the number of commands defined by this adapter action.
	GetIteratorIndex (see page 24059)	Implements IIteratorIndex's GetIteratorIndex method.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetSuccessOptions (see page 24059)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetVariableName (see page 24060)	Gets the name used to reference this adapter action with server-side script.
	GetViewMode (see page 24060)	Returns a string value to suggest a view mode for this adapter action.
V	GetViewModeType (see page 24060)	Suggests a view mode for this adapter action.
	GetVisible (see page 24061)	Indicates whether a button or hyperlink for this adapter action should be displayed on the HTML page.
V	GetWebSnapObjClass (see page 24061)	Returns the class type for this adapter field.
	HandleRequest (see page 24061)	Executes the adapter action and generates a response.
	HasExecuteAccess (see page 24062)	Checks the end-user's right to execute this adapter action.
	ImplCreateRequestContext (see page 24062)	Creates an object that describes the action parameters and field values.

	ImplEndIterator (see page 24062)	Implements IIteratorSupport's EndIterator (see page 24053) method.
V	ImplExecuteActionRequest (see page 7898)	Executes the adapter action using parameters passed in the HTTP request.
V	ImplGetActionName (see page 24063)	Gets the name used to reference this adapter action with server-side script.
V	ImplGetActionName (see page 24195)	Gets the name used to reference this adapter action with server-side script.
V	ImplGetAdapterItemRequestParams (see page 7854)	Provides the underlying implementation for the GetAdapterItemRequestParams method.
V	ImplGetAdapterItemRequestParams (see page 24063)	Provides the name/value pairs needed to execute this adapter action.
V	ImplGetAdapterItemRequestParams (see page 24196)	Provides the name/value pairs needed to execute this adapter action.
V	ImplGetDisplayLabel (see page 24064)	Returns the suggested display label for this adapter action.
V	ImplGetExecuteActionResponse (see page 24064)	Generates a response after the adapter action has been executed.
V	ImplGetFailureOptions (see page 24065)	Indicates whether to perform an HTTP redirect after execution of this adapter action fails.
V	ImplGetIsAdapterActionList (see page 24065)	Indicates whether this adapter action may have multiple commands.
V	ImplGetIteratorIndex (see page 24065)	Implements IIteratorIndex's GetIteratorIndex (see page 24059) method.
V	ImplGetSuccessOptions (see page 24066)	Indicates whether to perform an HTTP redirect after successfully executing this action.
V	ImplGetSuccessOptions (see page 24196)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	ImplGetVariableName (see page 24066)	Gets the name used to reference this adapter action with server-side script.
V	ImplGetVisible (see page 7819)	Provides the underlying implementation for the GetVisible method.
V	ImplGetVisible (see page 24066)	Indicates whether a button or hyperlink for this adapter action should be displayed on the HTML page.
V	ImplHandleRequest (see page 24067)	Executes the adapter action and generates a response.
V	ImplHasExecuteAccess (see page 24067)	Checks the end-user's right to execute this adapter action.
V	ImplInIterator (see page 24067)	Implements IIteratorIndex's InIterator (see page 24069) method.
V	ImplIsDefaultAction (see page 7898)	Indicates whether this adapter action should be added, by default, to the parent adapter.
	ImplNextIteration (see page 24068)	Implements IIteratorSupport's NextIteration (see page 24070) method.
	ImplSetActionName (see page 24197)	Sets the name that is used to reference this adapter action with server-side script.
	ImplStartIterator (see page 24068)	Implements IIteratorSupport's StartIterator (see page 24071) method.
V	ImplWebEnabled (see page 7899)	Provides the underlying implementation for the WebEnabled method.
	InIterator (see page 24069)	Implements IIteratorIndex's InIterator method.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsDefaultAction (see page 24070)	Indicates whether this adapter action should be added, by default, to the parent adapter.
V	IsDefaultField (see page 24728)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	NextIteration (see page 24070)	Implements IIteratorSupport's NextIteration method.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	ParentChanged (see page 24070)	Handles movement of the component to a different parent.
V	ParentChanged (see page 24728)	Responds when the WebParent (see page 24731) property changes.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 24729)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetActionName (see page 24197)	Sets the name that is used to reference this adapter action with server-side script.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDisplayLabel (see page 24071)	Set the value of the DisplayLabel (see page 24073) property.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.

V	SetParentComponent (see page 24729)	Sets the WebParent (see page 24731) property to be the same as this component's parent.
	SetWebParent (see page 24730)	Sets the value of the WebParent (see page 24731) property.
	StartIterator (see page 24071)	Implements IIteratorSupport's StartIterator method.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WebEnabled (see page 24071)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	Adapter (see page 7822)	Indicates the dataset adapter that uses this object to represent one of its actions.
R	Adapter (see page 24072)	Provides access to the parent adapter component.
R	Errors (see page 24073)	This is Errors, a member of class TBaseAdapterAction.
R	WebContainedComponentHelper (see page 24730)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.
R	WebParent (see page 24731)	Indicates the component that uses this TWebContainedComponent (see page 24722) as one of its Web items.

Public Events

	Name	Description
	OnExecute (see page 7822)	Occurs when server-side script executes this action.
	OnExecute (see page 24200)	Called to execute this action using parameters passed in the HTTP request.
	OnGetEnabled (see page 7823)	Occurs when the WebSnap application to determine whether a control or hyperlink for this action should be enabled.
	OnGetEnabled (see page 24200)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	CreateRequestContext (see page 19681)	Creates an object that describes the adapter action parameters and adapter field values.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.

	Destroy (see page 22287)	Disposes of an object instance.
	Destroy (see page 24726)	Frees an instance of TWebContainedComponent (see page 24722).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	EndIterator (see page 19723)	This is EndIterator, a member of class IIteratorSupport.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetActionName (see page 19755)	This is GetActionName, a member of class IWebGetActionName.
	GetAdapterItemRequestParams (see page 19692)	This is GetAdapterItemRequestParams, a member of class IGetAdapterItemRequestParams.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.
	GetDisplayLabel (see page 19756)	This is GetDisplayLabel, a member of class IWebGetDisplayLabel.
	GetDisplayStyle (see page 19700)	Returns the preferred display style for an adapter field or adapter action.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetFailureOptions (see page 964)	This is GetFailureOptions, a member of class IGetAdapterActionRedirectOptions.
	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	GetInputStyle (see page 19700)	Returns the preferred editing style for an adapter field.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIsAdapterActionList (see page 19717)	This is GetIsAdapterActionList, a member of class IIsAdapterActionList.
	GetIteratorIndex (see page 19721)	Returns the value of the IteratorIndex (see page 19721) property.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetParentComponent (see page 24727)	Returns the object that uses this component to generate HTML.
	GetSuccessOptions (see page 964)	This is GetSuccessOptions, a member of class IGetAdapterActionRedirectOptions.
	GetVariableName (see page 15329)	This is GetVariableName, a member of class IWebVariableName.
	GetViewMode (see page 19701)	Returns the preferred mode of an adapter field.
	GetVisible (see page 19652)	This is GetVisible, a member of class IAdapterActionAttributes.
	HandleRequest (see page 19681)	Executes the adapter action and generates a response.
	HasExecuteAccess (see page 19651)	This is HasExecuteAccess, a member of class IAdapterActionAccess.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	HasParent (see page 24727)	Indicates whether this component appears in another component's list of Web items.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InIterator (see page 19721)	Indicates whether the object is iterating over its items.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsDefaultAction (see page 19768)	This is IsDefaultAction, a member of class IWebIsDefaultAction.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.

	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NextIteration (see page 19723)	Advances to the objects next item.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetActionName (see page 19783)	This is SetActionName, a member of class IWebSetActionName.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.
	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	StartIterator (see page 19724)	This is StartIterator, a member of class IIteratorSupport.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	WebEnabled (see page 19752)	This is WebEnabled, a member of class IWebEnabled.

Public Properties

	Name	Description
	ActionName (see page 7821)	Identifies the name of this action when using server-side script.
R	ActionName (see page 19755)	This is ActionName, a member of class IWebGetActionName.
R	ActionName (see page 24072)	Identifies the name of this action when using server-side script.
	ActionName (see page 24198)	Identifies the name of this action when using server-side script.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
R	DataSet (see page 7822)	Indicates the dataset on which this action operates.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	FailureOptions (see page 965)	This is FailureOptions, a member of class IGetAdapterActionRedirectOptions.
	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.
R	IsAdapterActionList (see page 19717)	This is IsAdapterActionList, a member of class IIsAdapterActionList.
R	ItemCount (see page 24074)	Returns the number of items defined by an adapter action.
R	ItemIndex (see page 24074)	Returns the index of the current item of an adapter action.
R	IteratorIndex (see page 19721)	Indicates the index of the current item.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
R	SuccessOptions (see page 965)	This is SuccessOptions, a member of class IGetAdapterActionRedirectOptions.
R	VariableName (see page 15329)	This is VariableName, a member of class IWebVariableName.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
R	Visible (see page 19652)	This is Visible, a member of class IAdapterActionAttributes.

Published Events

	Name	Description
	OnAfterExecute (see page 7901)	Called after the adapter action has executed.

	OnAfterGetResponse (see page 7902)	Called after the adapter action response is generated.
	OnBeforeExecute (see page 7902)	Called before the adapter action is executed.
	OnBeforeGetResponse (see page 7902)	Called before the adapter action response is generated.
	OnGetParams (see page 7903)	Specifies name/value pairs needed to execute this adapter action.

Published Methods

	Name	Description
	Create (see page 7897)	Creates and initializes an instance of TDataSetAdapterApplyRowAction (see page 7890).

Published Properties

	Name	Description
	ActionModes (see page 7899)	Indicates what dataset adapter modes this field supports.
	DisplayLabel (see page 7900)	Suggests a display label for this adapter action.
	ExecuteAccess (see page 7900)	Defines the rights required to execute this action.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	RedirectOptions (see page 7901)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	Tag (see page 2808)	Stores an integer value as part of a component.

41.1.11.2 TDataSetAdapterApplyRowAction.Create Constructor

Creates and initializes an instance of TDataSetAdapterApplyRowAction (see page 7890).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TDataSetAdapterApplyRowAction(TComponent * AOwner);
```

Description

The TDataSetAdapterApplyRowAction (see page 7890) constructor allocates memory for the adapter action object and initializes its properties.

AOwner is the component that is responsible for starting the streaming process when a module containing the adapter action is loaded or saved. It becomes the value of the Owner property. Typically, AOwner is the Web module.

See Also

Owner (see page 2807)

41.1.11.3 TDataSetAdapterApplyRowAction Methods

The methods of the TDataSetAdapterApplyRowAction class are listed here.

Protected Methods

	Name	Description
	GetDefaultActionName (see page 7898)	Gets the default name used to reference this adapter action with server-side script.
	ImplExecuteActionRequest (see page 7898)	Executes the adapter action using parameters passed in the HTTP request.
	ImplIsDefaultAction (see page 7898)	Indicates whether this adapter action should be added, by default, to the parent adapter.
	ImplWebEnabled (see page 7899)	Provides the underlying implementation for the WebEnabled method.

41.1.11.3.1 TDataSetAdapterApplyRowAction.GetDefaultActionName Method

Gets the default name used to reference this adapter action with server-side script.

Pascal

```
function GetDefaultActionName: string; override;
```

C++

```
virtual __fastcall AnsiString GetDefaultActionName();
```

Description

GetDefaultActionName returns the name of the adapter action component. Descendants may override this function.

See Also

ImplGetActionName (see page 24063)

41.1.11.3.2 TDataSetAdapterApplyRowAction.ImplExecuteActionRequest Method

Executes the adapter action using parameters passed in the HTTP request.

Pascal

```
procedure ImplExecuteActionRequest(AActionRequest: IActionRequest; AActionResponse:
IActionResponse); override;
```

C++

```
virtual __fastcall ImplExecuteActionRequest(IActionRequest AActionRequest, IActionResponse
AActionResponse);
```

Description

ImplExecuteActionRequest create a TStrings containing the name/value pairs in AActionRequest and calls the OnExecute event handler.

See Also

ImplExecuteActionRequest (see page 24063)

OnExecute (see page 24200)

41.1.11.3.3 TDataSetAdapterApplyRowAction.ImplIsDefaultAction Method

Indicates whether this adapter action should be added, by default, to the parent adapter.

Pascal

```
function ImplIsDefaultAction(ADisplay: TObject): Boolean; override;
```

C++

```
virtual __fastcall Boolean ImplIsDefaultAction(TObject * ADisplay);
```

Description

ImplIsDefaultAction is called by IsDefaultAction. ImplIsDefaultAction returns true. ImplIsDefaultAction may be overridden by a descendant class.

See Also

IsDefaultAction (see page 24070)

ImplIsDefaultAction (see page 24243)

41.1.11.3.4 TDataSetAdapterApplyRowAction.ImplWebEnabled Method

Provides the underlying implementation for the WebEnabled method.

Pascal

```
function ImplWebEnabled: Boolean; override;
```

C++

```
virtual __fastcall Boolean ImplWebEnabled();
```

Description

The WebEnabled method calls ImplWebEnabled to determine whether the control or hyperlink for this action should appear enabled in the HTML form. WebEnabled returns true if controls should be enabled, false otherwise.

ImplWebEnabled generates an OnGetEnabled event so that you can specify whether controls for this action are enabled. If there is no OnGetEnabled event handler, ImplWebEnabled returns true if the parent adapter's GetKeyFields method returns a set of fields that can locate records in the associated dataset.

See Also

WebEnabled (see page 24071)

OnGetEnabled (see page 7823)

GetKeyFields (see page 7786)

41.1.11.4 TDataSetAdapterApplyRowAction Properties

The properties of the TDataSetAdapterApplyRowAction class are listed here.

Published Properties

	Name	Description
	ActionModes (see page 7899)	Indicates what dataset adapter modes this field supports.
	DisplayLabel (see page 7900)	Suggests a display label for this adapter action.
	ExecuteAccess (see page 7900)	Defines the rights required to execute this action.
	RedirectOptions (see page 7901)	Indicates whether to perform an HTTP redirect after successfully executing this action.

41.1.11.4.1 TDataSetAdapterApplyRowAction.ActionModes Property

Indicates what dataset adapter modes this field supports.

Pascal

```
property ActionModes: TDataSetAdapterModes;
```

C++

```
__property TDataSetAdapterModes ActionModes;
```

Description

ActionModes is a set of all the modes in which this adapter action can be used. If the parent dataset adapter is in a mode that is not included in this set, any forms generated using that adapter do not include a control for executing this action. Thus, for example, there is no sense in adding a control that applies edits to a form that presents a read-only view of the data. An apply action, then, should not include amBrowse in its action modes.

See Also

CanModify (see page 7154)

Adapter (see page 7752)

Mode (see page 7810)

GetDisplayStyle (see page 7739)

GetInputStyle (see page 7741)

GetViewMode (see page 7744)

41.1.11.4.2 TDataSetAdapterApplyRowAction.DisplayLabel Property

Suggests a display label for this adapter action.

Pascal

```
property DisplayLabel: string;
```

C++

```
__property AnsiString DisplayLabel;
```

Description

Use this property to suggest a display label to use when generating HTML to display the a button or hyperlink to execute this adapter action. Typically the adapter action is displayed using server-side script, either generated or custom written. Server-side script uses the DisplayLabel property to access this value.

See Also

ImplGetDisplayLabel (see page 24064)

SetDisplayLabel (see page 24071)

41.1.11.4.3 TDataSetAdapterApplyRowAction.ExecuteAccess Property

Defines the rights required to execute this action.

Pascal

```
property ExecuteAccess: string;
```

C++

```
__property AnsiString ExecuteAccess;
```

Description

The ExecuteAccess property defines the access rights required to execute this action. When server-side script accesses the CanExecute property, this value is checked against the end user's rights. Typically, an exception is raised when an end-user attempts to execute an adapter action that does not allow access.

See Also

TWebUserList (see page 25625)

hasexecuteaccess (see page 24162)

41.1.11.4.4 TDataSetAdapterApplyRowAction.RedirectOptions Property

Indicates whether to perform an HTTP redirect after successfully executing this action.

Pascal

```
property RedirectOptions: TAdapterActionRedirectOptions;
```

C++

```
__property TAdapterActionRedirectOptions RedirectOptions;
```

Description

Set RedirectOptions to indicate that HTTP redirect should be performed after executing this adapter action. An HTTP redirect causes the browser to "forget" about the parameters passed when executing the adapter action. Without a redirect, the browser's Refresh or Reload command cause the last HTTP request to be resent, resulting in re-execution of the adapter action.

See Also

SendRedirect (see page 15201)

41.1.11.5 TDataSetAdapterApplyRowAction Events

The events of the TDataSetAdapterApplyRowAction class are listed here.

Published Events

	Name	Description
	OnAfterExecute (see page 7901)	Called after the adapter action has executed.
	OnAfterGetResponse (see page 7902)	Called after the adapter action response is generated.
	OnBeforeExecute (see page 7902)	Called before the adapter action is executed.
	OnBeforeGetResponse (see page 7902)	Called before the adapter action response is generated.
	OnGetParams (see page 7903)	Specifies name/value pairs needed to execute this adapter action.

41.1.11.5.1 TDataSetAdapterApplyRowAction.OnAfterExecute Event

Called after the adapter action has executed.

Pascal

```
property OnAfterExecute: TActionExecuteEvent;
```

C++

```
__property TActionExecuteEvent OnAfterExecute;
```

Description

Implement OnAfterExecute to do something after the action has executed. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. OnAfterExecute is called by DoAfterExecuteActionRequest.

See Also

DoAfterExecuteActionRequest (see page 24051)

OnAfterExecuteAction (see page 24184)

OnBeforeExecute (see page 24076)

41.1.11.5.2 TDataSetAdapterApplyRowAction.OnAfterGetResponse Event

Called after the adapter action response is generated.

Pascal

```
property OnAfterGetResponse: TActionExecuteEvent;
```

C++

```
__property TActionExecuteEvent OnAfterGetResponse;
```

Description

Implement OnAfterGetResponse to do something after the action response is generated. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. OnAfterGetResponse is called by DoAfterGetExecuteActionReponse.

See Also

DoBeforeGetExecuteActionResponse (see page 24052)

OnAfterGetResponse (see page 24075)

OnBeforeGetActionResponse (see page 24186)

41.1.11.5.3 TDataSetAdapterApplyRowAction.OnBeforeExecute Event

Called before the adapter action is executed.

Pascal

```
property OnBeforeExecute: TActionExecuteHandledEvent;
```

C++

```
__property TActionExecuteHandledEvent OnBeforeExecute;
```

Description

Implement OnBeforeExecute to do something before the action is executed. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. Set the Handled flag to prevent the action from being executed. OnBeforeExecute is called by DoBeforeExecuteActionRequest.

See Also

DoBeforeExecuteActionRequest (see page 24052)

OnAfterExecute (see page 24075)

OnBeforeExecuteAction (see page 24186)

41.1.11.5.4 TDataSetAdapterApplyRowAction.OnBeforeGetResponse Event

Called before the adapter action response is generated.

Pascal

```
property OnBeforeGetResponse: TActionExecuteHandledEvent;
```

C++

```
__property TActionExecuteHandledEvent OnBeforeGetResponse;
```

Description

Implement OnBeforeGetResponse to do something before the action response is generated. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. Set the Handled flag to indicate that the response has been generated and no further processing is needed. OnBeforeGetResponse is called by DoBeforeGetExecuteActionReponse.

See Also

DoBeforeGetExecuteActionResponse (see page 24052)

OnAfterGetResponse (see page 24075)

OnBeforeGetActionResponse (see page 24186)

41.1.11.5.5 TDataSetAdapterApplyRowAction.OnGetParams Event

Specifies name/value pairs needed to execute this adapter action.

Pascal

```
property OnGetParams: TActionGetParamsEvent;
```

C++

```
__property TActionGetParamsEvent OnGetParams;
```

Description

Implement this event handler to specify the name/value needed to execute this action. For example, an action that deletes a row in a table will need a name/value pair that identifies the row to be deleted such as "Key=123".

See Also

ImplGetAdapterItemRequestParams (see page 24063)

41.1.12 TDataSetAdapterBrowseRowAction Class

TDataSetAdapterBrowseRowAction applies the updates from an HTTP request to a single record of an adapter's dataset and changes the dataset adapter to browse mode.

Class Hierarchy

Pascal

```
TDataSetAdapterBrowseRowAction = class(TCustomDataSetAdapterRowAction);
```

C++

```
class TDataSetAdapterBrowseRowAction : public TCustomDataSetAdapterRowAction;
```

File

DBAdapt

Description

Add TDataSetAdapterBrowseRowAction to a dataset adapter (TDataSetAdapter (see page 7872)) to support HTML forms that can change from editing or inserting database information to read-only viewing of the data. When this action is executed, it positions the parent dataset on the record specified by the current request object and updates any fields for which new values are included in the current request. It then changes the parent dataset's mode to browse mode.

Server-side script addresses this action as the 'BrowseRow' action of the parent adapter. This action is included by default when the adapter is used to build forms that represent a multiple database records.

See Also

TDataSetAdapterApplyRowAction (see page 7890)

TDataSetAdapterCancelRowAction (see page 7916)

TDataSetAdapterDeleteRowAction (see page 7934)

TDataSetAdapterEditRowAction (see page 7947)

TDataSetAdapterFirstRowAction (see page 7972)

TDataSetAdapterLastRowAction (see page 7984)

TDataSetAdapterNextRowAction (see page 8030)

TDataSetAdapterPrevRowAction (see page 8042)

TDataSetAdapterRefreshRowAction (see page 8054)

TDataSetAdapterNewRowAction (see page 8016)

TDataSetAdapter (see page 7872)

TCustomDataSetAdapter (see page 7766)

TCustomDataSetAdapter (see page 7766)

41.1.12.1 TDataSetAdapterBrowseRowAction Members

The following tables list the members exposed by TDataSetAdapterBrowseRowAction.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	CheckExecuteAccess (see page 24050)	Checks end-user rights to execute this adapter action.
	CreateRequestContext (see page 24050)	Creates an object that describes the adapter action parameters and adapter field values.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DoAfterExecuteActionRequest (see page 24051)	Calls event handlers after the adapter action is executed.
V	DoAfterGetExecuteActionResponse (see page 24051)	Calls event handlers after the adapter action response is formulated.
V	DoBeforeExecuteActionRequest (see page 24052)	Calls event handlers before the adapter action is executed.
V	DoBeforeGetExecuteActionResponse (see page 24052)	Calls event handlers before the adapter action response is formulated.
	EndIterator (see page 24053)	Implements IIteratorSupport's EndIterator method.
	ExecuteActionRequest (see page 24053)	Executes the adapter action using parameters passed in the HTTP request.
	GetActionName (see page 24054)	Gets the name used to reference this adapter action with server-side script.
	GetAdapter (see page 7819)	Returns the value of the Adapter (see page 7822) property.
	GetAdapter (see page 24054)	GetAdapter returns the parent adapter component.
	GetAdapterItemRequestParams (see page 24055)	Provides the name/value pairs needed to execute this adapter action.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetContainerList (see page 24727)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
	GetDataSet (see page 7819)	Returns the value of the DataSet (see page 7822) property.
V	GetDefaultActionName (see page 7911)	Gets the default name used to reference this adapter action with server-side script.

	GetDefaultDisplayLabel (see page 24055)	Provides the default display label for this adapter action.
	GetDisplayLabel (see page 24055)	Returns the suggested display label for this adapter action.
	GetDisplayStyle (see page 24056)	Returns a string value to suggest an HTML display style for this adapter action.
	GetDisplayStyleType (see page 24056)	Suggests an HTML display type for this adapter action.
	GetErrors (see page 24057)	This is GetErrors, a member of class TBaseAdapterAction.
	GetExecuteActionResponse (see page 24057)	Generates a response after the adapter action has been executed.
	GetFailureOptions (see page 24057)	Indicates whether to perform an HTTP redirect after execution of this adapter action fails.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
	GetInputStyle (see page 24058)	Returns a string value to suggest an HTML display style for this adapter action.
	GetIsAdapterActionList (see page 24058)	Indicates whether this adapter action may have multiple commands.
	GetItemCount (see page 24058)	Returns the number of commands defined by this adapter action.
	GetIteratorIndex (see page 24059)	Implements IIteratorIndex's GetIteratorIndex method.
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetSuccessOptions (see page 24059)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetVariableName (see page 24060)	Gets the name used to reference this adapter action with server-side script.
	GetViewMode (see page 24060)	Returns a string value to suggest a view mode for this adapter action.
	GetViewModeType (see page 24060)	Suggests a view mode for this adapter action.
	GetVisible (see page 24061)	Indicates whether a button or hyperlink for this adapter action should be displayed on the HTML page.
	GetWebSnapObjClass (see page 24061)	Returns the class type for this adapter field.
	HandleRequest (see page 24061)	Executes the adapter action and generates a response.
	HasExecuteAccess (see page 24062)	Checks the end-user's right to execute this adapter action.
	ImplCreateRequestContext (see page 24062)	Creates an object that describes the action parameters and field values.
	ImplEndIterator (see page 24062)	Implements IIteratorSupport's EndIterator (see page 24053) method.
	ImplExecuteActionRequest (see page 7911)	Executes the adapter action using parameters passed in the HTTP request.
	ImplGetActionName (see page 24063)	Gets the name used to reference this adapter action with server-side script.
	ImplGetActionName (see page 24195)	Gets the name used to reference this adapter action with server-side script.
	ImplGetAdapterItemRequestParams (see page 7854)	Provides the underlying implementation for the GetAdapterItemRequestParams method.
	ImplGetAdapterItemRequestParams (see page 24063)	Provides the name/value pairs needed to execute this adapter action.
	ImplGetAdapterItemRequestParams (see page 24196)	Provides the name/value pairs needed to execute this adapter action.
	ImplGetDisplayLabel (see page 24064)	Returns the suggested display label for this adapter action.
	ImplGetExecuteActionResponse (see page 24064)	Generates a response after the adapter action has been executed.
	ImplGetFailureOptions (see page 24065)	Indicates whether to perform an HTTP redirect after execution of this adapter action fails.
	ImplGetIsAdapterActionList (see page 24065)	Indicates whether this adapter action may have multiple commands.
	ImplGetIteratorIndex (see page 24065)	Implements IIteratorIndex's GetIteratorIndex (see page 24059) method.
	ImplGetSuccessOptions (see page 24066)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	ImplGetSuccessOptions (see page 24196)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	ImplGetVariableName (see page 24066)	Gets the name used to reference this adapter action with server-side script.
	ImplGetVisible (see page 7819)	Provides the underlying implementation for the GetVisible method.
	ImplGetVisible (see page 24066)	Indicates whether a button or hyperlink for this adapter action should be displayed on the HTML page.
	ImplHandleRequest (see page 24067)	Executes the adapter action and generates a response.
	ImplHasExecuteAccess (see page 24067)	Checks the end-user's right to execute this adapter action.
	ImplInIterator (see page 24067)	Implements IIteratorIndex's InIterator (see page 24069) method.
	ImplIsDefaultAction (see page 7912)	Indicates whether this adapter action should be added, by default, to the parent adapter.
	ImplNextIteration (see page 24068)	Implements IIteratorSupport's NextIteration (see page 24070) method.

	ImplSetActionName (see page 24197)	Sets the name that is used to reference this adapter action with server-side script.
	ImplStartIterator (see page 24068)	Implements IIteratorSupport's StartIterator (see page 24071) method.
V	ImplWebEnabled (see page 7912)	Provides the underlying implementation for the WebEnabled method.
	InIterator (see page 24069)	Implements IIteratorIndex's InIterator method.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsDefaultAction (see page 24070)	Indicates whether this adapter action should be added, by default, to the parent adapter.
V	IsDefaultField (see page 24728)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	NextIteration (see page 24070)	Implements IIteratorSupport's NextIteration method.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	ParentChanged (see page 24070)	Handles movement of the component to a different parent.
V	ParentChanged (see page 24728)	Responds when the WebParent (see page 24731) property changes.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 24729)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetActionName (see page 24197)	Sets the name that is used to reference this adapter action with server-side script.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDisplayLabel (see page 24071)	Set the value of the DisplayLabel (see page 24073) property.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 24729)	Sets the WebParent (see page 24731) property to be the same as this component's parent.
	SetWebParent (see page 24730)	Sets the value of the WebParent (see page 24731) property.
	StartIterator (see page 24071)	Implements IIteratorSupport's StartIterator method.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WebEnabled (see page 24071)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	Adapter (see page 7822)	Indicates the dataset adapter that uses this object to represent one of its actions.
R	Adapter (see page 24072)	Provides access to the parent adapter component.
R	Errors (see page 24073)	This is Errors, a member of class TBaseAdapterAction.
R	WebContainedComponentHelper (see page 24730)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.
R	WebParent (see page 24731)	Indicates the component that uses this TWebContainedComponent (see page 24722) as one of its Web items.

Public Events

	Name	Description
	OnExecute (see page 7822)	Occurs when server-side script executes this action.
	OnExecute (see page 24200)	Called to execute this action using parameters passed in the HTTP request.
	OnGetEnabled (see page 7823)	Occurs when the WebSnap application to determine whether a control or hyperlink for this action should be enabled.
	OnGetEnabled (see page 24200)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	CreateRequestContext (see page 19681)	Creates an object that describes the adapter action parameters and adapter field values.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Destroy (see page 24726)	Frees an instance of TWebContainedComponent (see page 24722).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	EndIterator (see page 19723)	This is EndIterator, a member of class IIteratorSupport.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetActionName (see page 19755)	This is GetActionName, a member of class IWebGetActionName.
	GetAdapterItemRequestParams (see page 19692)	This is GetAdapterItemRequestParams, a member of class IGetAdapterItemRequestParams.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.
	GetDisplayLabel (see page 19756)	This is GetDisplayLabel, a member of class IWebGetDisplayLabel.
	GetDisplayStyle (see page 19700)	Returns the preferred display style for an adapter field or adapter action.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetFailureOptions (see page 964)	This is GetFailureOptions, a member of class IGetAdapterActionRedirectOptions.
	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.

	GetInputStyle (see page 19700)	Returns the preferred editing style for an adapter field.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIsAdapterActionList (see page 19717)	This is GetIsAdapterActionList, a member of class IIsAdapterActionList.
	GetIteratorIndex (see page 19721)	Returns the value of the IteratorIndex (see page 19721) property.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 24727)	Returns the object that uses this component to generate HTML.
	GetSuccessOptions (see page 964)	This is GetSuccessOptions, a member of class IGetAdapterActionRedirectOptions.
	GetVariableName (see page 15329)	This is GetVariableName, a member of class IWebVariableName.
	GetViewMode (see page 19701)	Returns the preferred mode of an adapter field.
	GetVisible (see page 19652)	This is GetVisible, a member of class IAdapterActionAttributes.
	HandleRequest (see page 19681)	Executes the adapter action and generates a response.
	HasExecuteAccess (see page 19651)	This is HasExecuteAccess, a member of class IAdapterActionAccess.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 24727)	Indicates whether this component appears in another component's list of Web items.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InIterator (see page 19721)	Indicates whether the object is iterating over its items.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsDefaultAction (see page 19768)	This is IsDefaultAction, a member of class IWebIsDefaultAction.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NextIteration (see page 19723)	Advances to the objects next item.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetActionName (see page 19783)	This is SetActionName, a member of class IWebSetActionName.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.
	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	StartIterator (see page 19724)	This is StartIterator, a member of class IIteratorSupport.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	WebEnabled (see page 19752)	This is WebEnabled, a member of class IWebEnabled.

Public Properties

	Name	Description
	ActionName (see page 7821)	Identifies the name of this action when using server-side script.
R	ActionName (see page 19755)	This is ActionName, a member of class IWebGetActionName.
R	ActionName (see page 24072)	Identifies the name of this action when using server-side script.

	ActionName (see page 24198)	Identifies the name of this action when using server-side script.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
R	DataSet (see page 7822)	Indicates the dataset on which this action operates.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	FailureOptions (see page 965)	This is FailureOptions, a member of class IGetAdapterActionRedirectOptions.
	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.
R	IsAdapterActionList (see page 19717)	This is IsAdapterActionList, a member of class IIsAdapterActionList.
R	ItemCount (see page 24074)	Returns the number of items defined by an adapter action.
R	ItemIndex (see page 24074)	Returns the index of the current item of an adapter action.
R	IteratorIndex (see page 19721)	Indicates the index of the current item.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	RedirectOptions (see page 24074)	Indicates whether to perform an HTTP redirect after successfully executing this action.
R	SuccessOptions (see page 965)	This is SuccessOptions, a member of class IGetAdapterActionRedirectOptions.
R	VariableName (see page 15329)	This is VariableName, a member of class IWebVariableName.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
R	Visible (see page 19652)	This is Visible, a member of class IAdapterActionAttributes.

Published Events

	Name	Description
	OnAfterExecute (see page 7914)	Called after the adapter action has executed.
	OnAfterGetResponse (see page 7915)	Called after the adapter action response is generated.
	OnBeforeExecute (see page 7915)	Called before the adapter action is executed.
	OnBeforeGetResponse (see page 7915)	Called before the adapter action response is generated.
	OnGetParams (see page 7916)	Specifies name/value pairs needed to execute this adapter action.

Published Methods

	Name	Description
V	Create (see page 7910)	Creates and initializes an instance of TDataSetAdapterBrowseRowAction (see page 7903).

Published Properties

	Name	Description
	ActionModes (see page 7913)	Indicates what dataset adapter modes this field supports.
	DisplayLabel (see page 7913)	Suggests a display label for this adapter action.
	ExecuteAccess (see page 7914)	Defines the rights required to execute this action.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

41.1.12.2 TDataSetAdapterBrowseRowAction.Create Constructor

Creates and initializes an instance of TDataSetAdapterBrowseRowAction (see page 7903).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TDataSetAdapterBrowseRowAction(TComponent * AOwner);
```

Description

The TDataSetAdapterBrowseRowAction (see page 7903) constructor allocates memory for the adapter action object and initializes its properties.

AOwner is the component that is responsible for starting the streaming process when a module containing the adapter action is loaded or saved. It becomes the value of the Owner property. Typically, AOwner is the Web module.

See Also

Owner (see page 2807)

41.1.12.3 TDataSetAdapterBrowseRowAction Methods

The methods of the TDataSetAdapterBrowseRowAction class are listed here.

Protected Methods

	Name	Description
	GetDefaultActionName (see page 7911)	Gets the default name used to reference this adapter action with server-side script.
	ImplExecuteActionRequest (see page 7911)	Executes the adapter action using parameters passed in the HTTP request.
	ImplIsDefaultAction (see page 7912)	Indicates whether this adapter action should be added, by default, to the parent adapter.
	ImplWebEnabled (see page 7912)	Provides the underlying implementation for the WebEnabled method.

41.1.12.3.1 TDataSetAdapterBrowseRowAction.GetDefaultActionName Method

Gets the default name used to reference this adapter action with server-side script.

Pascal

```
function GetDefaultActionName: string; override;
```

C++

```
virtual __fastcall AnsiString GetDefaultActionName();
```

Description

GetDefaultActionName returns the name of the adapter action component. Descendants may override this function.

See Also

ImplGetActionName (see page 24063)

41.1.12.3.2 TDataSetAdapterBrowseRowAction.ImplExecuteActionRequest Method

Executes the adapter action using parameters passed in the HTTP request.

Pascal

```
procedure ImplExecuteActionRequest(AActionRequest: IActionRequest; AActionResponse:
IActionResponse); override;
```

C++

```
virtual __fastcall ImplExecuteActionRequest(IActionRequest AActionRequest, IActionResponse
AActionResponse);
```

Description

ImplExecuteActionRequest create a TStrings containing the name/value pairs in AActionRequest and calls the OnExecute event handler.

See Also

ImplExecuteActionRequest (see page 24063)

OnExecute (see page 24200)

41.1.12.3.3 TDataSetAdapterBrowseRowAction.ImplIsDefaultAction Method

Indicates whether this adapter action should be added, by default, to the parent adapter.

Pascal

```
function ImplIsDefaultAction(ADisplay: TObject): Boolean; override;
```

C++

```
virtual __fastcall Boolean ImplIsDefaultAction(TObject * ADisplay);
```

Description

ImplIsDefaultAction is called by IsDefaultAction. ImplIsDefaultAction returns true. ImplIsDefaultAction may be overridden by a descendant class.

See Also

IsDefaultAction (see page 24070)

ImplIsDefaultAction (see page 24243)

41.1.12.3.4 TDataSetAdapterBrowseRowAction.ImplWebEnabled Method

Provides the underlying implementation for the WebEnabled method.

Pascal

```
function ImplWebEnabled: Boolean; override;
```

C++

```
virtual __fastcall Boolean ImplWebEnabled();
```

Description

The WebEnabled method calls ImplWebEnabled to determine whether the control or hyperlink for this action should appear enabled in the HTML form. WebEnabled returns true if controls should be enabled, false otherwise.

ImplWebEnabled generates an OnGetEnabled event so that you can specify whether controls for this action are enabled. If there is no OnGetEnabled event handler, ImplWebEnabled returns true if the parent adapter's GetKeyFields method returns a set of fields that can locate records in the associated dataset.

See Also

WebEnabled (see page 24071)

OnGetEnabled (see page 7823)

GetKeyFields (see page 7786)

41.1.12.4 TDataSetAdapterBrowseRowAction Properties

The properties of the TDataSetAdapterBrowseRowAction class are listed here.

Published Properties

	Name	Description
	ActionModes (see page 7913)	Indicates what dataset adapter modes this field supports.
	DisplayLabel (see page 7913)	Suggests a display label for this adapter action.
	ExecuteAccess (see page 7914)	Defines the rights required to execute this action.

41.1.12.4.1 TDataSetAdapterBrowseRowAction.ActionModes Property

Indicates what dataset adapter modes this field supports.

Pascal

```
property ActionModes: TDataSetAdapterModes;
```

C++

```
__property TDataSetAdapterModes ActionModes;
```

Description

ActionModes is a set of all the modes in which this adapter action can be used. If the parent dataset adapter is in a mode that is not included in this set, any forms generated using that adapter do not include a control for executing this action. Thus, for example, there is no sense in adding a control that applies edits to a form that presents a read-only view of the data. An apply action, then, should not include amBrowse in its action modes.

See Also

CanModify (see page 7154)

Adapter (see page 7752)

Mode (see page 7810)

GetDisplayStyle (see page 7739)

GetInputStyle (see page 7741)

GetViewMode (see page 7744)

41.1.12.4.2 TDataSetAdapterBrowseRowAction.DisplayLabel Property

Suggests a display label for this adapter action.

Pascal

```
property DisplayLabel: string;
```

C++

```
__property AnsiString DisplayLabel;
```

Description

Use this property to suggest a display label to use when generating HTML to display the a button or hyperlink to execute this adapter action. Typically the adapter action is displayed using server-side script, either generated or custom written. Server-side script uses the DisplayLabel property to access this value.

See Also

ImplGetDisplayLabel (see page 24064)

SetDisplayLabel (see page 24071)

41.1.12.4.3 TDataSetAdapterBrowseRowAction.ExecuteAccess Property

Defines the rights required to execute this action.

Pascal

```
property ExecuteAccess: string;
```

C++

```
__property AnsiString ExecuteAccess;
```

Description

The ExecuteAccess property defines the access rights required to execute this action. When server-side script accesses the CanExecute property, this value is checked against the end user's rights. Typically, an exception is raised when an end-user attempts to execute an adapter action that does not allow access.

See Also

TWebUserList (see page 25625)

hasexecuteaccess (see page 24162)

41.1.12.5 TDataSetAdapterBrowseRowAction Events

The events of the TDataSetAdapterBrowseRowAction class are listed here.

Published Events

	Name	Description
	OnAfterExecute (see page 7914)	Called after the adapter action has executed.
	OnAfterGetResponse (see page 7915)	Called after the adapter action response is generated.
	OnBeforeExecute (see page 7915)	Called before the adapter action is executed.
	OnBeforeGetResponse (see page 7915)	Called before the adapter action response is generated.
	OnGetParams (see page 7916)	Specifies name/value pairs needed to execute this adapter action.

41.1.12.5.1 TDataSetAdapterBrowseRowAction.OnAfterExecute Event

Called after the adapter action has executed.

Pascal

```
property OnAfterExecute: TActionExecuteEvent;
```

C++

```
__property TActionExecuteEvent OnAfterExecute;
```

Description

Implement OnAfterExecute to do something after the action has executed. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. OnAfterExecute is called by DoAfterExecuteActionRequest.

See Also

DoAfterExecuteActionRequest (see page 24051)

OnAfterExecuteAction (see page 24184)

OnBeforeExecute (see page 24076)

41.1.12.5.2 TDataSetAdapterBrowseRowAction.OnAfterGetResponse Event

Called after the adapter action response is generated.

Pascal

```
property OnAfterGetResponse: TActionExecuteEvent;
```

C++

```
__property TActionExecuteEvent OnAfterGetResponse;
```

Description

Implement OnAfterGetResponse to do something after the action response is generated. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. OnAfterGetResponse is called by DoAfterGetExecuteActionReponse.

See Also

DoBeforeGetExecuteActionResponse (see page 24052)

OnAfterGetResponse (see page 24075)

OnBeforeGetActionResponse (see page 24186)

41.1.12.5.3 TDataSetAdapterBrowseRowAction.OnBeforeExecute Event

Called before the adapter action is executed.

Pascal

```
property OnBeforeExecute: TActionExecuteHandledEvent;
```

C++

```
__property TActionExecuteHandledEvent OnBeforeExecute;
```

Description

Implement OnBeforeExecute to do something before the action is executed. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. Set the Handled flag to prevent the action from being executed. OnBeforeExecute is called by DoBeforeExecuteActionRequest.

See Also

DoBeforeExecuteActionRequest (see page 24052)

OnAfterExecute (see page 24075)

OnBeforeExecuteAction (see page 24186)

41.1.12.5.4 TDataSetAdapterBrowseRowAction.OnBeforeGetResponse Event

Called before the adapter action response is generated.

Pascal

```
property OnBeforeGetResponse: TActionExecuteHandledEvent;
```

C++

```
__property TActionExecuteHandledEvent OnBeforeGetResponse;
```

Description

Implement OnBeforeGetResponse to do something before the action response is generated. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. Set the Handled flag to indicate that the response has been generated and no further processing is needed. OnBeforeGetResponse is called by DoBeforeGetExecuteActionReponse.

See Also

DoBeforeGetExecuteActionResponse (see page 24052)

OnAfterGetResponse (see page 24075)

OnBeforeGetActionResponse (see page 24186)

41.1.12.5.5 TDataSetAdapterBrowseRowAction.OnGetParams Event

Specifies name/value pairs needed to execute this adapter action.

Pascal

```
property OnGetParams: TActionGetParamsEvent;
```

C++

```
__property TActionGetParamsEvent OnGetParams;
```

Description

Implement this event handler to specify the name/value needed to execute this action. For example, an action that deletes a row in a table will need a name/value pair that identifies the row to be deleted such as "Key=123".

See Also

ImplGetAdapterItemRequestParams (see page 24063)

41.1.13 TDataSetAdapterCancelRowAction Class

TDataSetAdapterBrowseRowAction (see page 7903) cancels edits made in an HTML form and changes the dataset adapter to browse mode.

Class Hierarchy

Pascal

```
TDataSetAdapterCancelRowAction = class(TCustomDataSetAdapterRowAction);
```

C++

```
class TDataSetAdapterCancelRowAction : public TCustomDataSetAdapterRowAction;
```

File

DBAdapt

Description

Add TDataSetAdapterBrowseRowAction (see page 7903) to a dataset adapter (TDataSetAdapter (see page 7872)) to support HTML forms that let users cancel the edits that they make and change to read-only viewing of database data. When this action is executed, it ignores any new field values and returns the parent dataset adapter to its default mode. It then positions the dataset on the record specified by the current request object.

Server-side script addresses this action as the 'Cancel' action of the parent adapter. By default, this action is visible (included in HTML forms) only when the parent adapter is in insert or edit mode. You can, however, cause this action to be included when the dataset is in other modes by changing the value of its ActionModes (see page 7926) property. If the action is visible when the dataset is in browse mode, the control for this action appears disabled.

This action is included by default when the adapter is used to build forms that represent a single database record.

See Also

TDataSetAdapterApplyRowAction (see page 7890)

TDataSetAdapterBrowseRowAction (see page 7903)

TDataSetAdapterDeleteRowAction (see page 7934)

TDataSetAdapterEditRowAction (see page 7947)

TDataSetAdapterFirstRowAction (see page 7972)

TDataSetAdapterLastRowAction (see page 7984)

TDataSetAdapterNextRowAction (see page 8030)

TDataSetAdapterPrevRowAction (see page 8042)

TDataSetAdapterRefreshRowAction (see page 8054)

TDataSetAdapterNewRowAction (see page 8016)

TDataSetAdapter (see page 7872)

TCustomDataSetAdapter (see page 7766)

TCustomDataSetAdapter (see page 7766)

41.1.13.1 TDataSetAdapterCancelRowAction Members

The following tables list the members exposed by TDataSetAdapterCancelRowAction.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	CheckExecuteAccess (see page 24050)	Checks end-user rights to execute this adapter action.
	CreateRequestContext (see page 24050)	Creates an object that describes the adapter action parameters and adapter field values.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DoAfterExecuteActionRequest (see page 24051)	Calls event handlers after the adapter action is executed.
V	DoAfterGetExecuteActionResponse (see page 24051)	Calls event handlers after the adapter action response is formulated.
V	DoBeforeExecuteActionRequest (see page 24052)	Calls event handlers before the adapter action is executed.
V	DoBeforeGetExecuteActionResponse (see page 24052)	Calls event handlers before the adapter action response is formulated.
	EndIterator (see page 24053)	Implements IIteratorSupport's EndIterator method.
	ExecuteActionRequest (see page 24053)	Executes the adapter action using parameters passed in the HTTP request.
	GetActionName (see page 24054)	Gets the name used to reference this adapter action with server-side script.
	GetAdapter (see page 7819)	Returns the value of the Adapter (see page 7822) property.
	GetAdapter (see page 24054)	GetAdapter returns the parent adapter component.
	GetAdapterItemRequestParams (see page 24055)	Provides the name/value pairs needed to execute this adapter action.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.

	GetContainerList (see page 24727)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
	GetDataSet (see page 7819)	Returns the value of the DataSet (see page 7822) property.
V	GetDefaultActionName (see page 7924)	Gets the default name used to reference this adapter action with server-side script.
V	GetDefaultDisplayLabel (see page 24055)	Provides the default display label for this adapter action.
	GetDisplayLabel (see page 24055)	Returns the suggested display label for this adapter action.
	GetDisplayStyle (see page 24056)	Returns a string value to suggest an HTML display style for this adapter action.
V	GetDisplayStyleType (see page 24056)	Suggests an HTML display type for this adapter action.
	GetErrors (see page 24057)	This is GetErrors, a member of class TBaseAdapterAction.
	GetExecuteActionResponse (see page 24057)	Generates a response after the adapter action has been executed.
	GetFailureOptions (see page 24057)	Indicates whether to perform an HTTP redirect after execution of this adapter action fails.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetInputStyle (see page 24058)	Returns a string value to suggest an HTML display style for this adapter action.
	GetIsAdapterActionList (see page 24058)	Indicates whether this adapter action may have multiple commands.
V	GetItemCount (see page 24058)	Returns the number of commands defined by this adapter action.
	GetIteratorIndex (see page 24059)	Implements IIteratorIndex's GetIteratorIndex method.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetSuccessOptions (see page 24059)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetVariableName (see page 24060)	Gets the name used to reference this adapter action with server-side script.
	GetViewMode (see page 24060)	Returns a string value to suggest a view mode for this adapter action.
V	GetViewModeType (see page 24060)	Suggests a view mode for this adapter action.
	GetVisible (see page 24061)	Indicates whether a button or hyperlink for this adapter action should be displayed on the HTML page.
V	GetWebSnapObjClass (see page 24061)	Returns the class type for this adapter field.
	HandleRequest (see page 24061)	Executes the adapter action and generates a response.
	HasExecuteAccess (see page 24062)	Checks the end-user's right to execute this adapter action.
	ImplCreateRequestContext (see page 24062)	Creates an object that describes the action parameters and field values.
	ImplEndIterator (see page 24062)	Implements IIteratorSupport's EndIterator (see page 24053) method.
V	ImplExecuteActionRequest (see page 7925)	Executes the adapter action using parameters passed in the HTTP request.
V	ImplGetActionName (see page 24063)	Gets the name used to reference this adapter action with server-side script.
V	ImplGetActionName (see page 24195)	Gets the name used to reference this adapter action with server-side script.
V	ImplGetAdapterItemRequestParams (see page 7854)	Provides the underlying implementation for the GetAdapterItemRequestParams method.
V	ImplGetAdapterItemRequestParams (see page 24063)	Provides the name/value pairs needed to execute this adapter action.
V	ImplGetAdapterItemRequestParams (see page 24196)	Provides the name/value pairs needed to execute this adapter action.
V	ImplGetDisplayLabel (see page 24064)	Returns the suggested display label for this adapter action.
V	ImplGetExecuteActionResponse (see page 24064)	Generates a response after the adapter action has been executed.
V	ImplGetFailureOptions (see page 24065)	Indicates whether to perform an HTTP redirect after execution of this adapter action fails.
V	ImplGetIsAdapterActionList (see page 24065)	Indicates whether this adapter action may have multiple commands.
V	ImplGetIteratorIndex (see page 24065)	Implements IIteratorIndex's GetIteratorIndex (see page 24059) method.
V	ImplGetSuccessOptions (see page 24066)	Indicates whether to perform an HTTP redirect after successfully executing this action.
V	ImplGetSuccessOptions (see page 24196)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	ImplGetVariableName (see page 24066)	Gets the name used to reference this adapter action with server-side script.
V	ImplGetVisible (see page 7819)	Provides the underlying implementation for the GetVisible method.
V	ImplGetVisible (see page 24066)	Indicates whether a button or hyperlink for this adapter action should be displayed on the HTML page.
V	ImplHandleRequest (see page 24067)	Executes the adapter action and generates a response.

V	ImplHasExecuteAccess (see page 24067)	Checks the end-user's right to execute this adapter action.
V	ImplInIterator (see page 24067)	Implements IIteratorIndex's InIterator (see page 24069) method.
V	ImplIsDefaultAction (see page 7925)	Indicates whether this adapter action should be added, by default, to the parent adapter.
	ImplNextIteration (see page 24068)	Implements IIteratorSupport's NextIteration (see page 24070) method.
	ImplSetActionName (see page 24197)	Sets the name that is used to reference this adapter action with server-side script.
	ImplStartIterator (see page 24068)	Implements IIteratorSupport's StartIterator (see page 24071) method.
V	ImplWebEnabled (see page 7925)	Provides the underlying implementation for the WebEnabled method.
	InIterator (see page 24069)	Implements IIteratorIndex's InIterator method.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsDefaultAction (see page 24070)	Indicates whether this adapter action should be added, by default, to the parent adapter.
V	IsDefaultField (see page 24728)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	NextIteration (see page 24070)	Implements IIteratorSupport's NextIteration method.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	ParentChanged (see page 24070)	Handles movement of the component to a different parent.
V	ParentChanged (see page 24728)	Responds when the WebParent (see page 24731) property changes.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 24729)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetActionName (see page 24197)	Sets the name that is used to reference this adapter action with server-side script.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDisplayLabel (see page 24071)	Set the value of the DisplayLabel (see page 24073) property.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 24729)	Sets the WebParent (see page 24731) property to be the same as this component's parent.
	SetWebParent (see page 24730)	Sets the value of the WebParent (see page 24731) property.
	StartIterator (see page 24071)	Implements IIteratorSupport's StartIterator method.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WebEnabled (see page 24071)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	Adapter (see page 7822)	Indicates the dataset adapter that uses this object to represent one of its actions.
R	Adapter (see page 24072)	Provides access to the parent adapter component.

R	Errors (see page 24073)	This is Errors, a member of class TBaseAdapterAction.
R	WebContainedComponentHelper (see page 24730)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.
R	WebParent (see page 24731)	Indicates the component that uses this TWebContainedComponent (see page 24722) as one of its Web items.

Public Events

	Name	Description
	OnExecute (see page 7822)	Occurs when server-side script executes this action.
	OnExecute (see page 24200)	Called to execute this action using parameters passed in the HTTP request.
	OnGetEnabled (see page 7823)	Occurs when the WebSnap application to determine whether a control or hyperlink for this action should be enabled.
	OnGetEnabled (see page 24200)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	CreateRequestContext (see page 19681)	Creates an object that describes the adapter action parameters and adapter field values.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Destroy (see page 24726)	Frees an instance of TWebContainedComponent (see page 24722).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	EndIterator (see page 19723)	This is EndIterator, a member of class IIteratorSupport.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetActionName (see page 19755)	This is GetActionName, a member of class IWebGetActionName.
	GetAdapterItemRequestParams (see page 19692)	This is GetAdapterItemRequestParams, a member of class IGetAdapterItemRequestParams.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.

	GetDisplayLabel (see page 19756)	This is GetDisplayLabel, a member of class IWebGetDisplayLabel.
	GetDisplayStyle (see page 19700)	Returns the preferred display style for an adapter field or adapter action.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetFailureOptions (see page 964)	This is GetFailureOptions, a member of class IGetAdapterActionRedirectOptions.
	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	GetInputStyle (see page 19700)	Returns the preferred editing style for an adapter field.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIsAdapterActionList (see page 19717)	This is GetIsAdapterActionList, a member of class IIsAdapterActionList.
	GetIteratorIndex (see page 19721)	Returns the value of the IteratorIndex (see page 19721) property.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 24727)	Returns the object that uses this component to generate HTML.
	GetSuccessOptions (see page 964)	This is GetSuccessOptions, a member of class IGetAdapterActionRedirectOptions.
	GetVariableName (see page 15329)	This is GetVariableName, a member of class IWebVariableName.
	GetViewMode (see page 19701)	Returns the preferred mode of an adapter field.
	GetVisible (see page 19652)	This is GetVisible, a member of class IAdapterActionAttributes.
	HandleRequest (see page 19681)	Executes the adapter action and generates a response.
	HasExecuteAccess (see page 19651)	This is HasExecuteAccess, a member of class IAdapterActionAccess.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 24727)	Indicates whether this component appears in another component's list of Web items.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InIterator (see page 19721)	Indicates whether the object is iterating over its items.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsDefaultAction (see page 19768)	This is IsDefaultAction, a member of class IWebIsDefaultAction.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NextIteration (see page 19723)	Advances to the objects next item.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetActionName (see page 19783)	This is SetActionName, a member of class IWebSetActionName.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.
	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	StartIterator (see page 19724)	This is StartIterator, a member of class IIteratorSupport.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	WebEnabled (see page 19752)	This is WebEnabled, a member of class IWebEnabled.

Public Properties

	Name	Description
	ActionName (see page 7821)	Identifies the name of this action when using server-side script.
R	ActionName (see page 19755)	This is ActionName, a member of class IWebGetActionName.
R	ActionName (see page 24072)	Identifies the name of this action when using server-side script.
	ActionName (see page 24198)	Identifies the name of this action when using server-side script.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
R	DataSet (see page 7822)	Indicates the dataset on which this action operates.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	FailureOptions (see page 965)	This is FailureOptions, a member of class IGetAdapterActionRedirectOptions.
	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.
R	IsAdapterActionList (see page 19717)	This is IsAdapterActionList, a member of class IIsAdapterActionList.
R	ItemCount (see page 24074)	Returns the number of items defined by an adapter action.
R	ItemIndex (see page 24074)	Returns the index of the current item of an adapter action.
R	IteratorIndex (see page 19721)	Indicates the index of the current item.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
R	SuccessOptions (see page 965)	This is SuccessOptions, a member of class IGetAdapterActionRedirectOptions.
R	VariableName (see page 15329)	This is VariableName, a member of class IWebVariableName.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
R	Visible (see page 19652)	This is Visible, a member of class IAdapterActionAttributes.

Published Events

	Name	Description
	OnAfterExecute (see page 7928)	Called after the adapter action has executed.
	OnAfterGetResponse (see page 7928)	Called after the adapter action response is generated.
	OnBeforeExecute (see page 7929)	Called before the adapter action is executed.
	OnBeforeGetResponse (see page 7929)	Called before the adapter action response is generated.
	OnGetParams (see page 7929)	Specifies name/value pairs needed to execute this adapter action.

Published Methods

	Name	Description
V	Create (see page 7924)	Creates and initializes an instance of TDataSetAdapterCancelRowAction (see page 7916).

Published Properties

	Name	Description
	ActionModes (see page 7926)	Indicates what dataset adapter modes this field supports.
	DisplayLabel (see page 7926)	Suggests a display label for this adapter action.
	ExecuteAccess (see page 7927)	Defines the rights required to execute this action.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	RedirectOptions (see page 7927)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	Tag (see page 2808)	Stores an integer value as part of a component.

41.1.13.2 TDataSetAdapterCancelRowAction.Create Constructor

Creates and initializes an instance of TDataSetAdapterCancelRowAction (see page 7916).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TDataSetAdapterCancelRowAction(TComponent * AOwner);
```

Description

The TDataSetAdapterCancelRowAction (see page 7916) constructor allocates memory for the adapter action object and initializes its properties.

AOwner is the component that is responsible for starting the streaming process when a module containing the adapter action is loaded or saved. It becomes the value of the Owner property. Typically, AOwner is the Web module.

See Also

Owner (see page 2807)

41.1.13.3 TDataSetAdapterCancelRowAction Methods

The methods of the TDataSetAdapterCancelRowAction class are listed here.

Protected Methods

	Name	Description
	GetDefaultActionName (see page 7924)	Gets the default name used to reference this adapter action with server-side script.
	ImplExecuteActionRequest (see page 7925)	Executes the adapter action using parameters passed in the HTTP request.
	ImplIsDefaultAction (see page 7925)	Indicates whether this adapter action should be added, by default, to the parent adapter.
	ImplWebEnabled (see page 7925)	Provides the underlying implementation for the WebEnabled method.

41.1.13.3.1 TDataSetAdapterCancelRowAction.GetDefaultActionName Method

Gets the default name used to reference this adapter action with server-side script.

Pascal

```
function GetDefaultActionName: string; override;
```

C++

```
virtual __fastcall AnsiString GetDefaultActionName();
```

Description

GetDefaultActionName returns the name of the adapter action component. Descendants may override this function.

See Also

ImplGetActionName (see page 24063)

41.1.13.3.2 TDataSetAdapterCancelRowAction.ImplExecuteActionRequest Method

Executes the adapter action using parameters passed in the HTTP request.

Pascal

```
procedure ImplExecuteActionRequest(AActionRequest: IActionRequest; AActionResponse:
IActionResponse); override;
```

C++

```
virtual __fastcall ImplExecuteActionRequest(IActionRequest AActionRequest, IActionResponse
AActionResponse);
```

Description

ImplExecuteActionRequest create a TStrings containing the name/value pairs in AActionRequest and calls the OnExecute event handler.

See Also

ImplExecuteActionRequest (see page 24063)

OnExecute (see page 24200)

41.1.13.3.3 TDataSetAdapterCancelRowAction.ImplIsDefaultAction Method

Indicates whether this adapter action should be added, by default, to the parent adapter.

Pascal

```
function ImplIsDefaultAction(ADisplay: TObject): Boolean; override;
```

C++

```
virtual __fastcall Boolean ImplIsDefaultAction(TObject * ADisplay);
```

Description

ImplIsDefaultAction is called by IsDefaultAction. ImplIsDefaultAction returns true. ImplIsDefaultAction may be overridden by a descendant class.

See Also

IsDefaultAction (see page 24070)

ImplIsDefaultAction (see page 24243)

41.1.13.3.4 TDataSetAdapterCancelRowAction.ImplWebEnabled Method

Provides the underlying implementation for the WebEnabled method.

Pascal

```
function ImplWebEnabled: Boolean; override;
```

C++

```
virtual __fastcall Boolean ImplWebEnabled();
```

Description

The WebEnabled method calls ImplWebEnabled to determine whether the control or hyperlink for this action should appear enabled in the HTML form. WebEnabled returns true if controls should be enabled, false otherwise.

ImplWebEnabled generates an OnGetEnabled event so that you can specify whether controls for this action are enabled. If there is no OnGetEnabled event handler, ImplWebEnabled returns true if the parent adapter's GetKeyFields method returns a set of fields that can locate records in the associated dataset.

See Also

WebEnabled (see page 24071)

OnGetEnabled (see page 7823)

GetKeyFields (see page 7786)

41.1.13.4 TDataSetAdapterCancelRowAction Properties

The properties of the TDataSetAdapterCancelRowAction class are listed here.

Published Properties

	Name	Description
	ActionModes (see page 7926)	Indicates what dataset adapter modes this field supports.
	DisplayLabel (see page 7926)	Suggests a display label for this adapter action.
	ExecuteAccess (see page 7927)	Defines the rights required to execute this action.
	RedirectOptions (see page 7927)	Indicates whether to perform an HTTP redirect after successfully executing this action.

41.1.13.4.1 TDataSetAdapterCancelRowAction.ActionModes Property

Indicates what dataset adapter modes this field supports.

Pascal

```
property ActionModes: TDataSetAdapterModes;
```

C++

```
__property TDataSetAdapterModes ActionModes;
```

Description

ActionModes is a set of all the modes in which this adapter action can be used. If the parent dataset adapter is in a mode that is not included in this set, any forms generated using that adapter do not include a control for executing this action. Thus, for example, there is no sense in adding a control that applies edits to a form that presents a read-only view of the data. An apply action, then, should not include amBrowse in its action modes.

See Also

CanModify (see page 7154)

Adapter (see page 7752)

Mode (see page 7810)

GetDisplayStyle (see page 7739)

GetInputStyle (see page 7741)

GetViewMode (see page 7744)

41.1.13.4.2 TDataSetAdapterCancelRowAction.DisplayLabel Property

Suggests a display label for this adapter action.

Pascal

```
property DisplayLabel: string;
```

C++

```
__property AnsiString DisplayLabel;
```

Description

Use this property to suggest a display label to use when generating HTML to display the a button or hyperlink to execute this adapter action. Typically the adapter action is displayed using server-side script, either generated or custom written. Server-side script uses the DisplayLabel property to access this value.

See Also

ImplGetDisplayLabel (see page 24064)

SetDisplayLabel (see page 24071)

41.1.13.4.3 TDataSetAdapterCancelRowAction.ExecuteAccess Property

Defines the rights required to execute this action.

Pascal

```
property ExecuteAccess: string;
```

C++

```
__property AnsiString ExecuteAccess;
```

Description

The ExecuteAccess property defines the access rights required to execute this action. When server-side script accesses the CanExecute property, this value is checked against the end user's rights. Typically, an exception is raised when an end-user attempts to execute an adapter action that does not allow access.

See Also

TWebUserList (see page 25625)

hasexecuteaccess (see page 24162)

41.1.13.4.4 TDataSetAdapterCancelRowAction.RedirectOptions Property

Indicates whether to perform an HTTP redirect after successfully executing this action.

Pascal

```
property RedirectOptions: TAdapterActionRedirectOptions;
```

C++

```
__property TAdapterActionRedirectOptions RedirectOptions;
```

Description

Set RedirectOptions to indicate that HTTP redirect should be performed after executing this adapter action. An HTTP redirect causes the browser to "forget" about the parameters passed when executing the adapter action. Without a redirect, the browser's Refresh or Reload command cause the last HTTP request to be resent, resulting in re-execution of the adapter action.

See Also

SendRedirect (see page 15201)

41.1.13.5 TDataSetAdapterCancelRowAction Events

The events of the TDataSetAdapterCancelRowAction class are listed here.

Published Events

	Name	Description
	OnAfterExecute (see page 7928)	Called after the adapter action has executed.
	OnAfterGetResponse (see page 7928)	Called after the adapter action response is generated.
	OnBeforeExecute (see page 7929)	Called before the adapter action is executed.
	OnBeforeGetResponse (see page 7929)	Called before the adapter action response is generated.
	OnGetParams (see page 7929)	Specifies name/value pairs needed to execute this adapter action.

41.1.13.5.1 TDataSetAdapterCancelRowAction.OnAfterExecute Event

Called after the adapter action has executed.

Pascal

```
property OnAfterExecute: TActionExecuteEvent;
```

C++

```
__property TActionExecuteEvent OnAfterExecute;
```

Description

Implement OnAfterExecute to do something after the action has executed. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. OnAfterExecute is called by DoAfterExecuteActionRequest.

See Also

DoAfterExecuteActionRequest (see page 24051)

OnAfterExecuteAction (see page 24184)

OnBeforeExecute (see page 24076)

41.1.13.5.2 TDataSetAdapterCancelRowAction.OnAfterGetResponse Event

Called after the adapter action response is generated.

Pascal

```
property OnAfterGetResponse: TActionExecuteEvent;
```

C++

```
__property TActionExecuteEvent OnAfterGetResponse;
```

Description

Implement OnAfterGetResponse to do something after the action response is generated. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. OnAfterGetResponse is called by DoAfterGetExecuteActionReponse.

See Also

DoBeforeGetExecuteActionResponse (see page 24052)

OnAfterGetResponse (see page 24075)

OnBeforeGetActionResponse (see page 24186)

41.1.13.5.3 TDataSetAdapterCancelRowAction.OnBeforeExecute Event

Called before the adapter action is executed.

Pascal

```
property OnBeforeExecute: TActionExecuteHandledEvent;
```

C++

```
__property TActionExecuteHandledEvent OnBeforeExecute;
```

Description

Implement OnBeforeExecute to do something before the action is executed. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. Set the Handled flag to prevent the action from being executed. OnBeforeExecute is called by DoBeforeExecuteActionRequest.

See Also

DoBeforeExecuteActionRequest (see page 24052)

OnAfterExecute (see page 24075)

OnBeforeExecuteAction (see page 24186)

41.1.13.5.4 TDataSetAdapterCancelRowAction.OnBeforeGetResponse Event

Called before the adapter action response is generated.

Pascal

```
property OnBeforeGetResponse: TActionExecuteHandledEvent;
```

C++

```
__property TActionExecuteHandledEvent OnBeforeGetResponse;
```

Description

Implement OnBeforeGetResponse to do something before the action response is generated. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. Set the Handled flag to indicate that the response has been generated and no further processing is needed. OnBeforeGetResponse is called by DoBeforeGetExecuteActionReponse.

See Also

DoBeforeGetExecuteActionResponse (see page 24052)

OnAfterGetResponse (see page 24075)

OnBeforeGetActionResponse (see page 24186)

41.1.13.5.5 TDataSetAdapterCancelRowAction.OnGetParams Event

Specifies name/value pairs needed to execute this adapter action.

Pascal

```
property OnGetParams: TActionGetParamsEvent;
```

C++

```
__property TActionGetParamsEvent OnGetParams;
```

Description

Implement this event handler to specify the name/value needed to execute this action. For example, an action that deletes a row in a table will need a name/value pair that identifies the row to be deleted such as "Key=123".

See Also

ImplGetAdapterItemRequestParams (see page 24063)

41.1.14 TDataSetAdapterDataLink Class

<insert text here>

Class Hierarchy

Pascal

```
TDataSetAdapterDataLink = class(TDataLink);
```

C++

```
class TDataSetAdapterDataLink : public TDataLink;
```

File

DBAdapt

Description

<insert text here>

41.1.14.1 TDataSetAdapterDataLink Members

The following tables list the members exposed by TDataSetAdapterDataLink.

Protected Methods

	Name	Description
	ActiveChanged (see page 6880)	Responds to changes in the Active (see page 6888) property.
	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	CheckBrowseMode (see page 6880)	Allows the data-aware object to respond just before an event that changes the dataset state.
	DataEvent (see page 7932)	Responds to various events that occur while working with data.
	DataSetChanged (see page 6881)	Responds to changes in the dataset.
	DataSetScrolled (see page 6882)	Allows a response to scrolling the representation of the dataset within the data-aware object.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	EditingChanged (see page 6883)	Responds to changes in the editing state of the data source.
	FocusControl (see page 6884)	Provides the interface for a method to force focus to the data-aware component associated with the TDataLink (see page 6876).
	GetActiveRecord (see page 6884)	This is GetActiveRecord, a member of class TDataLink.
	GetBOF (see page 6884)	This is GetBOF, a member of class TDataLink.
	GetBufferCount (see page 6884)	This is GetBufferCount, a member of class TDataLink.

	GetEOF (see page 6885)	This is GetEOF, a member of class TDataLink.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetRecordCount (see page 6885)	This is GetRecordCount, a member of class TDataLink.
	LayoutChanged (see page 6885)	Responds to changes in the representation of the data by the data-aware object.
	MoveBy (see page 6885)	Repositions the dataset to another record relative to its active record.
	RecordChanged (see page 7933)	Responds to changes in the contents of the current record or field of the dataset.
	SetActiveRecord (see page 6886)	This is SetActiveRecord, a member of class TDataLink.
	SetBufferCount (see page 6887)	This is SetBufferCount, a member of class TDataLink.
	UpdateData (see page 6887)	Provides an interface for writing edits to a record in the dataset.

Protected Properties

	Name	Description
	VisualControl (see page 6894)	Indicates whether a visual control uses the datalink.

Public Events

	Name	Description
	OnDataSetStateChange (see page 7934)	This is OnDataSetStateChange, a member of class TDataSetAdapterDataLink.

Public Methods

	Name	Description
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 7932)	<insert text here>
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 6879)	Destroys an instance of TDataLink (see page 6876).
	Destroy (see page 22287)	Disposes of an object instance.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Edit (see page 6882)	Attempts to drive the data source into an editing state if it is not already in one.
	ExecuteAction (see page 6883)	Invokes an action with the datasource as its target.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.

V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	UpdateAction (see page 6887)	Updates an action to reflect the current state of the TDataLink (see page 6876).
	UpdateRecord (see page 6888)	Responds to notifications that edits should be posted to the dataset.

Public Properties

	Name	Description
R	Active (see page 6888)	Specifies whether the dataset that TDataLink (see page 6876) manages is active.
	ActiveRecord (see page 6889)	Specifies the index of the current record within the internal record buffer maintained by the dataset for the Owner of the TDataLink (see page 6876) object.
R	BOF (see page 6889)	Indicates whether the first record in a dataset is active.
	BufferCount (see page 6890)	Specifies the number of records cached by the dataset for the Owner of the TDataLink (see page 6876) object.
R	DataSet (see page 6890)	Specifies the TDataSet (see page 6894) object that represents the data that this TDataLink (see page 6876) is tracking.
	DataSource (see page 6891)	Specifies the TDataSource (see page 7070) object that the Owner of the TDataLink (see page 6876) uses to connect to the dataset.
	DataSourceFixed (see page 6891)	Indicates whether the DataSource (see page 6891) property can be set.
R	Editing (see page 6892)	Indicates whether the DataSource (see page 6891) is in edit mode.
R	Eof (see page 6892)	Indicates whether the last record in a dataset is active.
	ReadOnly (see page 6893)	Indicates whether the dataset for this TDataLink (see page 6876) can be modified.
R	RecordCount (see page 6893)	Indicates the number of records in the internal record buffer maintained by the dataset.

41.1.14.2 TDataSetAdapterDataLink.Create Constructor

<insert text here>

Pascal

```
constructor Create(AAdapter: TComponent);
```

C++

```
__fastcall TDataSetAdapterDataLink(TComponent * AAdapter);
```

Description

<insert text here>

41.1.14.3 TDataSetAdapterDataLink Methods

The methods of the TDataSetAdapterDataLink class are listed here.

Protected Methods

	Name	Description
V	DataEvent (see page 7932)	Responds to various events that occur while working with data.
V	RecordChanged (see page 7933)	Responds to changes in the contents of the current record or field of the dataset.

41.1.14.3.1 TDataSetAdapterDataLink.DataEvent Method

Responds to various events that occur while working with data.

Pascal

```
procedure DataEvent(Event: TDataEvent; Info: Longint); override;
```

C++

```
virtual __fastcall DataEvent(TDataEvent Event, Longint Info);
```

Description

DataEvent is called automatically when various data events occur. Event indicates the event that just occurred. Info provides additional context information for some events.

DataEvent dispatches these events by calling the appropriate methods, as indicated in the following table.

Data event	Info	Method called
deFieldChange | deRecordChange	The field that changed	RecordChanged
deDataSetChange	Current index into the record buffer	DataSetChanged
deDataSetScroll	Current index into the record buffer	DataSetScrolled
deLayoutChange	Current index into the record buffer	LayoutChanged
deUpdateRecord	UpdateRecord	
deUpdateState	EditingChanged or ActiveChanged	
deCheckBrowseMode	CheckBrowseMode	
deFocusControl	FocusControl	

See Also

DataSetScrolled (see page 6882)

LayoutChanged (see page 6885)

RecordChanged (see page 6886)

DataSetChanged (see page 6881)

UpdateRecord (see page 6888)

CheckBrowseMode (see page 6880)

FocusControl (see page 6884)

ActiveChanged (see page 6880)

EditingChanged (see page 6883)

41.1.14.3.2 TDataSetAdapterDataLink.RecordChanged Method

Responds to changes in the contents of the current record or field of the dataset.

Pascal

```
procedure RecordChanged(Field: TField); override;
```

C++

```
virtual __fastcall RecordChanged(TField Field);
```

Description

The RecordChanged method defined by TDataLink merely provides an interface for a method that can respond to changes to the contents of the current record. RecordChanged is called after changes have been posted to the current record in the dataset, and from DataSetChanged.

The Field parameter indicates which field of the current record has changed in value. If Field is nil (Delphi) or NULL (C++), any

number of fields within the current record may have changed.

Derived objects that do not need to respond to such changes can allow the inherited method to ignore them.

See Also

ActiveRecord (see page 6889)

DataSetChanged (see page 6881)

OnDataChange (see page 7080)

OnChange (see page 7181)

41.1.14.4 TDataSetAdapterDataLink Events

The events of the TDataSetAdapterDataLink class are listed here.

Public Events

	Name	Description
	OnDataSetStateChange (see page 7934)	This is OnDataSetStateChange, a member of class TDataSetAdapterDataLink.

41.1.14.4.1 TDataSetAdapterDataLink.OnDataSetStateChange Event

Pascal

```
property OnDataSetStateChange: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnDataSetStateChange;
```

Description

This is OnDataSetStateChange, a member of class TDataSetAdapterDataLink.

41.1.15 TDataSetAdapterDeleteRowAction Class

TDataSetAdapterDeleteRowAction deletes the current row from a dataset, as specified in an HTTP request.

Class Hierarchy

Pascal

```
TDataSetAdapterDeleteRowAction = class(TCustomDataSetAdapterRowAction);
```

C++

```
class TDataSetAdapterDeleteRowAction : public TCustomDataSetAdapterRowAction;
```

File

DBAdapt

Description

Add TDataSetAdapterDeleteRowAction to a dataset adapter (TDataSetAdapter (see page 7872)) to support HTML forms that let users delete database records. When this action is executed, it positions the dataset on the record specified in the current request and deletes it (or fails to post edits if the dataset adapter is in insert mode).

Server-side script addresses this action as the 'DeleteRow' action of the parent adapter. By default, this action is visible (included in HTML forms) only when the parent adapter is in insert or edit mode. You can, however, cause this action to be included when the dataset is in other modes by changing the value of its ActionModes (see page 7821) property.

See Also

TDataSetAdapterApplyRowAction (see page 7890)

TDataSetAdapterBrowseRowAction (see page 7903)

TDataSetAdapterCancelRowAction (see page 7916)

TDataSetAdapterFirstRowAction (see page 7972)

TDataSetAdapterLastRowAction (see page 7984)

TDataSetAdapterNextRowAction (see page 8030)

TDataSetAdapterPrevRowAction (see page 8042)

TDataSetAdapterRefreshRowAction (see page 8054)

TDataSetAdapterNewRowAction (see page 8016)

TDataSetAdapter (see page 7872)

TCustomDataSetAdapter (see page 7766)

TDataSet (see page 6894)

TDataSEtAdapterRowAction

41.1.15.1 TDataSetAdapterDeleteRowAction Members

The following tables list the members exposed by TDataSetAdapterDeleteRowAction.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	CheckExecuteAccess (see page 24050)	Checks end-user rights to execute this adapter action.
	CreateRequestContext (see page 24050)	Creates an object that describes the adapter action parameters and adapter field values.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DoAfterExecuteActionRequest (see page 24051)	Calls event handlers after the adapter action is executed.
V	DoAfterGetExecuteActionResponse (see page 24051)	Calls event handlers after the adapter action response is formulated.
V	DoBeforeExecuteActionRequest (see page 24052)	Calls event handlers before the adapter action is executed.
V	DoBeforeGetExecuteActionResponse (see page 24052)	Calls event handlers before the adapter action response is formulated.
	EndIterator (see page 24053)	Implements IIteratorSupport's EndIterator method.
	ExecuteActionRequest (see page 24053)	Executes the adapter action using parameters passed in the HTTP request.
	GetActionName (see page 24054)	Gets the name used to reference this adapter action with server-side script.
	GetAdapter (see page 7819)	Returns the value of the Adapter (see page 7822) property.
	GetAdapter (see page 24054)	GetAdapter returns the parent adapter component.
	GetAdapterItemRequestParams (see page 24055)	Provides the name/value pairs needed to execute this adapter action.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetContainerList (see page 24727)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
	GetDataSet (see page 7819)	Returns the value of the DataSet (see page 7822) property.

	GetDefaultActionName (see page 7942)	Gets the default name used to reference this adapter action with server-side script.
	GetDefaultDisplayLabel (see page 24055)	Provides the default display label for this adapter action.
	GetDisplayLabel (see page 24055)	Returns the suggested display label for this adapter action.
	GetDisplayStyle (see page 24056)	Returns a string value to suggest an HTML display style for this adapter action.
	GetDisplayStyleType (see page 24056)	Suggests an HTML display type for this adapter action.
	GetErrors (see page 24057)	This is GetErrors, a member of class TBaseAdapterAction.
	GetExecuteActionResponse (see page 24057)	Generates a response after the adapter action has been executed.
	GetFailureOptions (see page 24057)	Indicates whether to perform an HTTP redirect after execution of this adapter action fails.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetInputStyle (see page 24058)	Returns a string value to suggest an HTML display style for this adapter action.
	GetIsAdapterActionList (see page 24058)	Indicates whether this adapter action may have multiple commands.
	GetItemCount (see page 24058)	Returns the number of commands defined by this adapter action.
	GetIteratorIndex (see page 24059)	Implements IIteratorIndex's GetIteratorIndex method.
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetSuccessOptions (see page 24059)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetVariableName (see page 24060)	Gets the name used to reference this adapter action with server-side script.
	GetViewMode (see page 24060)	Returns a string value to suggest a view mode for this adapter action.
	GetViewModeType (see page 24060)	Suggests a view mode for this adapter action.
	GetVisible (see page 24061)	Indicates whether a button or hyperlink for this adapter action should be displayed on the HTML page.
	GetWebSnapObjClass (see page 24061)	Returns the class type for this adapter field.
	HandleRequest (see page 24061)	Executes the adapter action and generates a response.
	HasExecuteAccess (see page 24062)	Checks the end-user's right to execute this adapter action.
	ImplCreateRequestContext (see page 24062)	Creates an object that describes the action parameters and field values.
	ImplEndIterator (see page 24062)	Implements IIteratorSupport's EndIterator (see page 24053) method.
	ImplExecuteActionRequest (see page 7942)	Executes the adapter action using parameters passed in the HTTP request.
	ImplGetActionName (see page 24063)	Gets the name used to reference this adapter action with server-side script.
	ImplGetActionName (see page 24195)	Gets the name used to reference this adapter action with server-side script.
	ImplGetAdapterItemRequestParams (see page 7854)	Provides the underlying implementation for the GetAdapterItemRequestParams method.
	ImplGetAdapterItemRequestParams (see page 24063)	Provides the name/value pairs needed to execute this adapter action.
	ImplGetAdapterItemRequestParams (see page 24196)	Provides the name/value pairs needed to execute this adapter action.
	ImplGetDisplayLabel (see page 24064)	Returns the suggested display label for this adapter action.
	ImplGetExecuteActionResponse (see page 24064)	Generates a response after the adapter action has been executed.
	ImplGetFailureOptions (see page 24065)	Indicates whether to perform an HTTP redirect after execution of this adapter action fails.
	ImplGetIsAdapterActionList (see page 24065)	Indicates whether this adapter action may have multiple commands.
	ImplGetIteratorIndex (see page 24065)	Implements IIteratorIndex's GetIteratorIndex (see page 24059) method.
	ImplGetSuccessOptions (see page 24066)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	ImplGetSuccessOptions (see page 24196)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	ImplGetVariableName (see page 24066)	Gets the name used to reference this adapter action with server-side script.
	ImplGetVisible (see page 7819)	Provides the underlying implementation for the GetVisible method.
	ImplGetVisible (see page 24066)	Indicates whether a button or hyperlink for this adapter action should be displayed on the HTML page.
	ImplHandleRequest (see page 24067)	Executes the adapter action and generates a response.
	ImplHasExecuteAccess (see page 24067)	Checks the end-user's right to execute this adapter action.
	ImplInIterator (see page 24067)	Implements IIteratorIndex's InIterator (see page 24069) method.

	ImplIsDefaultAction (see page 7943)	Indicates whether this adapter action should be added, by default, to the parent adapter.
	ImplNextIteration (see page 24068)	Implements IIteratorSupport's NextIteration (see page 24070) method.
	ImplSetActionName (see page 24197)	Sets the name that is used to reference this adapter action with server-side script.
	ImplStartIterator (see page 24068)	Implements IIteratorSupport's StartIterator (see page 24071) method.
	ImplWebEnabled (see page 7820)	Provides the underlying implementation for the WebEnabled method.
	ImplWebEnabled (see page 7855)	Provides the underlying implementation for the WebEnabled method.
	ImplWebEnabled (see page 24069)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.
	ImplWebEnabled (see page 24197)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.
	InIterator (see page 24069)	Implements IIteratorIndex's InIterator method.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsDefaultAction (see page 24070)	Indicates whether this adapter action should be added, by default, to the parent adapter.
	IsDefaultField (see page 24728)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	NextIteration (see page 24070)	Implements IIteratorSupport's NextIteration method.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	ParentChanged (see page 24070)	Handles movement of the component to a different parent.
	ParentChanged (see page 24728)	Responds when the WebParent (see page 24731) property changes.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	ReadState (see page 24729)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetActionName (see page 24197)	Sets the name that is used to reference this adapter action with server-side script.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDisplayLabel (see page 24071)	Set the value of the DisplayLabel (see page 24073) property.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	SetParentComponent (see page 24729)	Sets the WebParent (see page 24731) property to be the same as this component's parent.
	SetWebParent (see page 24730)	Sets the value of the WebParent (see page 24731) property.
	StartIterator (see page 24071)	Implements IIteratorSupport's StartIterator method.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WebEnabled (see page 24071)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	Adapter (see page 7822)	Indicates the dataset adapter that uses this object to represent one of its actions.
R	Adapter (see page 24072)	Provides access to the parent adapter component.
R	Errors (see page 24073)	This is Errors, a member of class TBaseAdapterAction.
R	WebContainedComponentHelper (see page 24730)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.
R	WebParent (see page 24731)	Indicates the component that uses this TWebContainedComponent (see page 24722) as one of its Web items.

Public Events

	Name	Description
	OnExecute (see page 7822)	Occurs when server-side script executes this action.
	OnExecute (see page 24200)	Called to execute this action using parameters passed in the HTTP request.
	OnGetEnabled (see page 7823)	Occurs when the WebSnap application to determine whether a control or hyperlink for this action should be enabled.
	OnGetEnabled (see page 24200)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
V	Create (see page 7818)	Creates and initializes an instance of TCustomDataSetAdapterAction (see page 7811).
V	Create (see page 7853)	Creates and initializes an instance of TCustomDataSetAdapterRowAction (see page 7846).
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	Create (see page 24726)	Creates and initializes an instance of TWebContainedComponent (see page 24722).
	CreateRequestContext (see page 19681)	Creates an object that describes the adapter action parameters and adapter field values.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Destroy (see page 24726)	Frees an instance of TWebContainedComponent (see page 24722).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	EndIterator (see page 19723)	This is EndIterator, a member of class IIteratorSupport.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.

	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetActionName (see page 19755)	This is GetActionName, a member of class IWebGetActionName.
	GetAdapterItemRequestParams (see page 19692)	This is GetAdapterItemRequestParams, a member of class IGetAdapterItemRequestParams.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.
	GetDisplayLabel (see page 19756)	This is GetDisplayLabel, a member of class IWebGetDisplayLabel.
	GetDisplayStyle (see page 19700)	Returns the preferred display style for an adapter field or adapter action.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetFailureOptions (see page 964)	This is GetFailureOptions, a member of class IGetAdapterActionRedirectOptions.
	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	GetInputStyle (see page 19700)	Returns the preferred editing style for an adapter field.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIsAdapterActionList (see page 19717)	This is GetIsAdapterActionList, a member of class IIsAdapterActionList.
	GetIteratorIndex (see page 19721)	Returns the value of the IteratorIndex (see page 19721) property.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 24727)	Returns the object that uses this component to generate HTML.
	GetSuccessOptions (see page 964)	This is GetSuccessOptions, a member of class IGetAdapterActionRedirectOptions.
	GetVariableName (see page 15329)	This is GetVariableName, a member of class IWebVariableName.
	GetViewMode (see page 19701)	Returns the preferred mode of an adapter field.
	GetVisible (see page 19652)	This is GetVisible, a member of class IAdapterActionAttributes.
	HandleRequest (see page 19681)	Executes the adapter action and generates a response.
	HasExecuteAccess (see page 19651)	This is HasExecuteAccess, a member of class IAdapterActionAccess.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 24727)	Indicates whether this component appears in another component's list of Web items.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InIterator (see page 19721)	Indicates whether the object is iterating over its items.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsDefaultAction (see page 19768)	This is IsDefaultAction, a member of class IWebIsDefaultAction.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NextIteration (see page 19723)	Advances to the objects next item.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.

	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetActionName (see page 19783)	This is SetActionName, a member of class IWebSetActionName.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.
	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	StartIterator (see page 19724)	This is StartIterator, a member of class IIteratorSupport.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	WebEnabled (see page 19752)	This is WebEnabled, a member of class IWebEnabled.

Public Properties

	Name	Description
	ActionModes (see page 7821)	Indicates what dataset adapter modes this field supports.
	ActionName (see page 7821)	Identifies the name of this action when using server-side script.
R	ActionName (see page 19755)	This is ActionName, a member of class IWebGetActionName.
R	ActionName (see page 24072)	Identifies the name of this action when using server-side script.
	ActionName (see page 24198)	Identifies the name of this action when using server-side script.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
R	DataSet (see page 7822)	Indicates the dataset on which this action operates.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	FailureOptions (see page 965)	This is FailureOptions, a member of class IGetAdapterActionRedirectOptions.
	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.
R	IsAdapterActionList (see page 19717)	This is IsAdapterActionList, a member of class IIsAdapterActionList.
R	ItemCount (see page 24074)	Returns the number of items defined by an adapter action.
R	ItemIndex (see page 24074)	Returns the index of the current item of an adapter action.
R	IteratorIndex (see page 19721)	Indicates the index of the current item.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
R	SuccessOptions (see page 965)	This is SuccessOptions, a member of class IGetAdapterActionRedirectOptions.
R	VariableName (see page 15329)	This is VariableName, a member of class IWebVariableName.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
R	Visible (see page 19652)	This is Visible, a member of class IAdapterActionAttributes.

Published Events

	Name	Description
	OnAfterExecute (see page 7945)	Called after the adapter action has executed.
	OnAfterGetResponse (see page 7945)	Called after the adapter action response is generated.
	OnBeforeExecute (see page 7945)	Called before the adapter action is executed.
	OnBeforeGetResponse (see page 7946)	Called before the adapter action response is generated.
	OnGetParams (see page 7946)	Specifies name/value pairs needed to execute this adapter action.

Published Properties

	Name	Description
	DisplayLabel (see page 7943)	Suggests a display label for this adapter action.
	ExecuteAccess (see page 7944)	Defines the rights required to execute this action.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	RedirectOptions (see page 7944)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	Tag (see page 2808)	Stores an integer value as part of a component.

41.1.15.2 TDataSetAdapterDeleteRowAction Methods

The methods of the TDataSetAdapterDeleteRowAction class are listed here.

Protected Methods

	Name	Description
	GetDefaultActionName (see page 7942)	Gets the default name used to reference this adapter action with server-side script.
	ImplExecuteActionRequest (see page 7942)	Executes the adapter action using parameters passed in the HTTP request.
	ImplIsDefaultAction (see page 7943)	Indicates whether this adapter action should be added, by default, to the parent adapter.

41.1.15.2.1 TDataSetAdapterDeleteRowAction.GetDefaultActionName Method

Gets the default name used to reference this adapter action with server-side script.

Pascal

```
function GetDefaultActionName: string; override;
```

C++

```
virtual __fastcall AnsiString GetDefaultActionName();
```

Description

GetDefaultActionName returns the name of the adapter action component. Descendants may override this function.

See Also

ImplGetActionName (see page 24063)

41.1.15.2.2 TDataSetAdapterDeleteRowAction.ImplExecuteActionRequest Method

Executes the adapter action using parameters passed in the HTTP request.

Pascal

```
procedure ImplExecuteActionRequest(AActionRequest: IActionRequest; AActionResponse:
IActionResponse); override;
```

C++

```
virtual __fastcall ImplExecuteActionRequest(IActionRequest AActionRequest, IActionResponse
AActionResponse);
```

Description

ImplExecuteActionRequest create a TStrings containing the name/value pairs in AActionRequest and calls the OnExecute event handler.

See Also

ImplExecuteActionRequest (see page 24063)

OnExecute (see page 24200)

41.1.15.2.3 TDataSetAdapterDeleteRowAction.ImplIsDefaultAction Method

Indicates whether this adapter action should be added, by default, to the parent adapter.

Pascal

```
function ImplIsDefaultAction(ADisplay: TObject): Boolean; override;
```

C++

```
virtual __fastcall Boolean ImplIsDefaultAction(TObject * ADisplay);
```

Description

ImplIsDefaultAction is called by IsDefaultAction. ImplIsDefaultAction returns true. ImplIsDefaultAction may be overridden by a descendant class.

See Also

IsDefaultAction (see page 24070)

ImplIsDefaultAction (see page 24243)

41.1.15.3 TDataSetAdapterDeleteRowAction Properties

The properties of the TDataSetAdapterDeleteRowAction class are listed here.

Published Properties

	Name	Description
	DisplayLabel (see page 7943)	Suggests a display label for this adapter action.
	ExecuteAccess (see page 7944)	Defines the rights required to execute this action.
	RedirectOptions (see page 7944)	Indicates whether to perform an HTTP redirect after successfully executing this action.

41.1.15.3.1 TDataSetAdapterDeleteRowAction.DisplayLabel Property

Suggests a display label for this adapter action.

Pascal

```
property DisplayLabel: string;
```

C++

```
__property AnsiString DisplayLabel;
```

Description

Use this property to suggest a display label to use when generating HTML to display the a button or hyperlink to execute this adapter action. Typically the adapter action is displayed using server-side script, either generated or custom written. Server-side script uses the DisplayLabel property to access this value.

See Also

ImplGetDisplayLabel (see page 24064)

SetDisplayLabel (see page 24071)

41.1.15.3.2 TDataSetAdapterDeleteRowAction.ExecuteAccess Property

Defines the rights required to execute this action.

Pascal

```
property ExecuteAccess: string;
```

C++

```
__property AnsiString ExecuteAccess;
```

Description

The ExecuteAccess property defines the access rights required to execute this action. When server-side script accesses the CanExecute property, this value is checked against the end user's rights. Typically, an exception is raised when an end-user attempts to execute an adapter action that does not allow access.

See Also

TWebUserList (see page 25625)

hasexecuteaccess (see page 24162)

41.1.15.3.3 TDataSetAdapterDeleteRowAction.RedirectOptions Property

Indicates whether to perform an HTTP redirect after successfully executing this action.

Pascal

```
property RedirectOptions: TAdapterActionRedirectOptions;
```

C++

```
__property TAdapterActionRedirectOptions RedirectOptions;
```

Description

Set RedirectOptions to indicate that HTTP redirect should be performed after executing this adapter action. An HTTP redirect causes the browser to "forget" about the parameters passed when executing the adapter action. Without a redirect, the browser's Refresh or Reload command cause the last HTTP request to be resent, resulting in re-execution of the adapter action.

See Also

SendRedirect (see page 15201)

41.1.15.4 TDataSetAdapterDeleteRowAction Events

The events of the TDataSetAdapterDeleteRowAction class are listed here.

Published Events

	Name	Description
	OnAfterExecute (see page 7945)	Called after the adapter action has executed.
	OnAfterGetResponse (see page 7945)	Called after the adapter action response is generated.
	OnBeforeExecute (see page 7945)	Called before the adapter action is executed.
	OnBeforeGetResponse (see page 7946)	Called before the adapter action response is generated.
	OnGetParams (see page 7946)	Specifies name/value pairs needed to execute this adapter action.

41.1.15.4.1 TDataSetAdapterDeleteRowAction.OnAfterExecute Event

Called after the adapter action has executed.

Pascal

```
property OnAfterExecute: TActionExecuteEvent;
```

C++

```
__property TActionExecuteEvent OnAfterExecute;
```

Description

Implement OnAfterExecute to do something after the action has executed. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. OnAfterExecute is called by DoAfterExecuteActionRequest.

See Also

DoAfterExecuteActionRequest (see page 24051)

OnAfterExecuteAction (see page 24184)

OnBeforeExecute (see page 24076)

41.1.15.4.2 TDataSetAdapterDeleteRowAction.OnAfterGetResponse Event

Called after the adapter action response is generated.

Pascal

```
property OnAfterGetResponse: TActionExecuteEvent;
```

C++

```
__property TActionExecuteEvent OnAfterGetResponse;
```

Description

Implement OnAfterGetResponse to do something after the action response is generated. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. OnAfterGetResponse is called by DoAfterGetExecuteActionReponse.

See Also

DoBeforeGetExecuteActionResponse (see page 24052)

OnAfterGetResponse (see page 24075)

OnBeforeGetActionResponse (see page 24186)

41.1.15.4.3 TDataSetAdapterDeleteRowAction.OnBeforeExecute Event

Called before the adapter action is executed.

Pascal

```
property OnBeforeExecute: TActionExecuteHandledEvent;
```

C++

```
__property TActionExecuteHandledEvent OnBeforeExecute;
```

Description

Implement OnBeforeExecute to do something before the action is executed. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. Set the Handled flag to prevent the action from being executed. OnBeforeExecute is called by DoBeforeExecuteActionRequest.

See Also

DoBeforeExecuteActionRequest (see page 24052)

OnAfterExecute (see page 24075)

OnBeforeExecuteAction (see page 24186)

41.1.15.4.4 TDataSetAdapterDeleteRowAction.OnBeforeGetResponse Event

Called before the adapter action response is generated.

Pascal

```
property OnBeforeGetResponse: TActionExecuteHandledEvent;
```

C++

```
__property TActionExecuteHandledEvent OnBeforeGetResponse;
```

Description

Implement OnBeforeGetResponse to do something before the action response is generated. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. Set the Handled flag to indicate that the response has been generated and no further processing is needed. OnBeforeGetResponse is called by DoBeforeGetExecuteActionReponse.

DoBeforeGetExecuteActionResponse (see page 24052)

OnAfterGetResponse (see page 24075)

OnBeforeGetActionResponse (see page 24186)

41.1.15.4.5 TDataSetAdapterDeleteRowAction.OnGetParams Event

Specifies name/value pairs needed to execute this adapter action.

Pascal

```
property OnGetParams: TActionGetParamsEvent;
```

C++

```
__property TActionGetParamsEvent OnGetParams;
```

Description

Implement this event handler to specify the name/value needed to execute this action. For example, an action that deletes a row in a table will need a name/value pair that identifies the row to be deleted such as "Key=123".

41.1.16 TDataSetAdapterEditRowAction Class

TDataSetAdapterDeleteRowAction (see page 7934) puts the parent dataset adapter into edit mode.

Class Hierarchy

Pascal

```
TDataSetAdapterEditRowAction = class(TCustomDataSetAdapterRowAction);
```

C++

```
class TDataSetAdapterEditRowAction : public TCustomDataSetAdapterRowAction;
```

File

DBAdapt

Description

Add TDataSetAdapterEditRowAction to a dataset adapter (TDataSetAdapter (see page 7872)) to support HTML forms that let users start a new edit to the current database record. When this action is executed, it positions the dataset on the record specified in the current request, applies any edits contained in the current request, and puts the parent dataset adapter in edit mode.

Server-side script addresses this action as the 'EditRow' action of the parent adapter. By default, this action is visible (included in HTML forms) regardless of the mode of the parent adapter. This action is included by default when the adapter is used to build forms that represent multiple database records.

41.1.16.1 TDataSetAdapterEditRowAction Members

The following tables list the members exposed by TDataSetAdapterEditRowAction.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	CheckExecuteAccess (see page 24050)	Checks end-user rights to execute this adapter action.
	CreateRequestContext (see page 24050)	Creates an object that describes the adapter action parameters and adapter field values.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DoAfterExecuteActionRequest (see page 24051)	Calls event handlers after the adapter action is executed.
V	DoAfterGetExecuteActionResponse (see page 24051)	Calls event handlers after the adapter action response is formulated.
V	DoBeforeExecuteActionRequest (see page 24052)	Calls event handlers before the adapter action is executed.
V	DoBeforeGetExecuteActionResponse (see page 24052)	Calls event handlers before the adapter action response is formulated.
	EndIterator (see page 24053)	Implements IIteratorSupport's EndIterator method.
	ExecuteActionRequest (see page 24053)	Executes the adapter action using parameters passed in the HTTP request.
	GetActionName (see page 24054)	Gets the name used to reference this adapter action with server-side script.
	GetAdapter (see page 7819)	Returns the value of the Adapter (see page 7822) property.

	GetAdapter (see page 24054)	GetAdapter returns the parent adapter component.
	GetAdapterItemRequestParams (see page 24055)	Provides the name/value pairs needed to execute this adapter action.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetContainerList (see page 24727)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
	GetDataSet (see page 7819)	Returns the value of the DataSet (see page 7822) property.
	GetDefaultActionName (see page 7954)	Gets the default name used to reference this adapter action with server-side script.
	GetDefaultDisplayLabel (see page 24055)	Provides the default display label for this adapter action.
	GetDisplayLabel (see page 24055)	Returns the suggested display label for this adapter action.
	GetDisplayStyle (see page 24056)	Returns a string value to suggest an HTML display style for this adapter action.
	GetDisplayStyleType (see page 24056)	Suggests an HTML display type for this adapter action.
	GetErrors (see page 24057)	This is GetErrors, a member of class TBaseAdapterAction.
	GetExecuteActionResponse (see page 24057)	Generates a response after the adapter action has been executed.
	GetFailureOptions (see page 24057)	Indicates whether to perform an HTTP redirect after execution of this adapter action fails.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
	GetInputStyle (see page 24058)	Returns a string value to suggest an HTML display style for this adapter action.
	GetIsAdapterActionList (see page 24058)	Indicates whether this adapter action may have multiple commands.
	GetItemCount (see page 24058)	Returns the number of commands defined by this adapter action.
	GetIteratorIndex (see page 24059)	Implements IIteratorIndex's GetIteratorIndex method.
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetSuccessOptions (see page 24059)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetVariableName (see page 24060)	Gets the name used to reference this adapter action with server-side script.
	GetViewMode (see page 24060)	Returns a string value to suggest a view mode for this adapter action.
	GetViewModeType (see page 24060)	Suggests a view mode for this adapter action.
	GetVisible (see page 24061)	Indicates whether a button or hyperlink for this adapter action should be displayed on the HTML page.
	GetWebSnapObjClass (see page 24061)	Returns the class type for this adapter field.
	HandleRequest (see page 24061)	Executes the adapter action and generates a response.
	HasExecuteAccess (see page 24062)	Checks the end-user's right to execute this adapter action.
	ImplCreateRequestContext (see page 24062)	Creates an object that describes the action parameters and field values.
	ImplEndIterator (see page 24062)	Implements IIteratorSupport's EndIterator (see page 24053) method.
	ImplExecuteActionRequest (see page 7955)	Executes the adapter action using parameters passed in the HTTP request.
	ImplGetActionName (see page 24063)	Gets the name used to reference this adapter action with server-side script.
	ImplGetActionName (see page 24195)	Gets the name used to reference this adapter action with server-side script.
	ImplGetAdapterItemRequestParams (see page 7854)	Provides the underlying implementation for the GetAdapterItemRequestParams method.
	ImplGetAdapterItemRequestParams (see page 24063)	Provides the name/value pairs needed to execute this adapter action.
	ImplGetAdapterItemRequestParams (see page 24196)	Provides the name/value pairs needed to execute this adapter action.
	ImplGetDisplayLabel (see page 24064)	Returns the suggested display label for this adapter action.
	ImplGetExecuteActionResponse (see page 24064)	Generates a response after the adapter action has been executed.
	ImplGetFailureOptions (see page 24065)	Indicates whether to perform an HTTP redirect after execution of this adapter action fails.
	ImplGetIsAdapterActionList (see page 24065)	Indicates whether this adapter action may have multiple commands.
	ImplGetIteratorIndex (see page 24065)	Implements IIteratorIndex's GetIteratorIndex (see page 24059) method.
	ImplGetSuccessOptions (see page 24066)	Indicates whether to perform an HTTP redirect after successfully executing this action.

	ImplGetSuccessOptions (see page 24196)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	ImplGetVariableName (see page 24066)	Gets the name used to reference this adapter action with server-side script.
	ImplGetVisible (see page 7819)	Provides the underlying implementation for the GetVisible method.
	ImplGetVisible (see page 24066)	Indicates whether a button or hyperlink for this adapter action should be displayed on the HTML page.
	ImplHandleRequest (see page 24067)	Executes the adapter action and generates a response.
	ImplHasExecuteAccess (see page 24067)	Checks the end-user's right to execute this adapter action.
	ImplInIterator (see page 24067)	Implements IIteratorIndex's InIterator (see page 24069) method.
	ImplIsDefaultAction (see page 7955)	Indicates whether this adapter action should be added, by default, to the parent adapter.
	ImplNextIteration (see page 24068)	Implements IIteratorSupport's NextIteration (see page 24070) method.
	ImplSetActionName (see page 24197)	Sets the name that is used to reference this adapter action with server-side script.
	ImplStartIterator (see page 24068)	Implements IIteratorSupport's StartIterator (see page 24071) method.
	ImplWebEnabled (see page 7955)	Provides the underlying implementation for the WebEnabled method.
	InIterator (see page 24069)	Implements IIteratorIndex's InIterator method.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsDefaultAction (see page 24070)	Indicates whether this adapter action should be added, by default, to the parent adapter.
	IsDefaultField (see page 24728)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	NextIteration (see page 24070)	Implements IIteratorSupport's NextIteration method.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	ParentChanged (see page 24070)	Handles movement of the component to a different parent.
	ParentChanged (see page 24728)	Responds when the WebParent (see page 24731) property changes.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	ReadState (see page 24729)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetActionName (see page 24197)	Sets the name that is used to reference this adapter action with server-side script.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDisplayLabel (see page 24071)	Set the value of the DisplayLabel (see page 24073) property.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	SetParentComponent (see page 24729)	Sets the WebParent (see page 24731) property to be the same as this component's parent.
	SetWebParent (see page 24730)	Sets the value of the WebParent (see page 24731) property.
	StartIterator (see page 24071)	Implements IIteratorSupport's StartIterator method.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WebEnabled (see page 24071)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.

	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	Adapter (see page 7822)	Indicates the dataset adapter that uses this object to represent one of its actions.
	Adapter (see page 24072)	Provides access to the parent adapter component.
	Errors (see page 24073)	This is Errors, a member of class TBaseAdapterAction.
	WebContainedComponentHelper (see page 24730)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.
	WebParent (see page 24731)	Indicates the component that uses this TWebContainedComponent (see page 24722) as one of its Web items.

Public Events

	Name	Description
	OnExecute (see page 7822)	Occurs when server-side script executes this action.
	OnExecute (see page 24200)	Called to execute this action using parameters passed in the HTTP request.
	OnGetEnabled (see page 7823)	Occurs when the WebSnap application to determine whether a control or hyperlink for this action should be enabled.
	OnGetEnabled (see page 24200)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	CreateRequestContext (see page 19681)	Creates an object that describes the adapter action parameters and adapter field values.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 2766)	Disposes of the component and its owned components.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 22287)	Disposes of an object instance.
	Destroy (see page 24726)	Frees an instance of TWebContainedComponent (see page 24722).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	EndIterator (see page 19723)	This is EndIterator, a member of class IIteratorSupport.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.

	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetActionName (see page 19755)	This is GetActionName, a member of class IWebGetActionName.
	GetAdapterItemRequestParams (see page 19692)	This is GetAdapterItemRequestParams, a member of class IGetAdapterItemRequestParams.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.
	GetDisplayLabel (see page 19756)	This is GetDisplayLabel, a member of class IWebGetDisplayLabel.
	GetDisplayStyle (see page 19700)	Returns the preferred display style for an adapter field or adapter action.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetFailureOptions (see page 964)	This is GetFailureOptions, a member of class IGetAdapterActionRedirectOptions.
	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	GetInputStyle (see page 19700)	Returns the preferred editing style for an adapter field.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIsAdapterActionList (see page 19717)	This is GetIsAdapterActionList, a member of class IIsAdapterActionList.
	GetIteratorIndex (see page 19721)	Returns the value of the IteratorIndex (see page 19721) property.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 24727)	Returns the object that uses this component to generate HTML.
	GetSuccessOptions (see page 964)	This is GetSuccessOptions, a member of class IGetAdapterActionRedirectOptions.
	GetVariableName (see page 15329)	This is GetVariableName, a member of class IWebVariableName.
	GetViewMode (see page 19701)	Returns the preferred mode of an adapter field.
	GetVisible (see page 19652)	This is GetVisible, a member of class IAdapterActionAttributes.
	HandleRequest (see page 19681)	Executes the adapter action and generates a response.
	HasExecuteAccess (see page 19651)	This is HasExecuteAccess, a member of class IAdapterActionAccess.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 24727)	Indicates whether this component appears in another component's list of Web items.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InIterator (see page 19721)	Indicates whether the object is iterating over its items.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsDefaultAction (see page 19768)	This is IsDefaultAction, a member of class IWebIsDefaultAction.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NextIteration (see page 19723)	Advances to the objects next item.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetActionName (see page 19783)	This is SetActionName, a member of class IWebSetActionName.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.

	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	StartIterator (see page 19724)	This is StartIterator, a member of class IIteratorSupport.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	WebEnabled (see page 19752)	This is WebEnabled, a member of class IWebEnabled.

Public Properties

	Name	Description
	ActionName (see page 7821)	Identifies the name of this action when using server-side script.
R	ActionName (see page 19755)	This is ActionName, a member of class IWebGetActionName.
R	ActionName (see page 24072)	Identifies the name of this action when using server-side script.
	ActionName (see page 24198)	Identifies the name of this action when using server-side script.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
R	DataSet (see page 7822)	Indicates the dataset on which this action operates.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	FailureOptions (see page 965)	This is FailureOptions, a member of class IGetAdapterActionRedirectOptions.
	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.
R	IsAdapterActionList (see page 19717)	This is IsAdapterActionList, a member of class IIsAdapterActionList.
R	ItemCount (see page 24074)	Returns the number of items defined by an adapter action.
R	ItemIndex (see page 24074)	Returns the index of the current item of an adapter action.
R	IteratorIndex (see page 19721)	Indicates the index of the current item.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	RedirectOptions (see page 24074)	Indicates whether to perform an HTTP redirect after successfully executing this action.
R	SuccessOptions (see page 965)	This is SuccessOptions, a member of class IGetAdapterActionRedirectOptions.
R	VariableName (see page 15329)	This is VariableName, a member of class IWebVariableName.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
R	Visible (see page 19652)	This is Visible, a member of class IAdapterActionAttributes.

Published Events

	Name	Description
	OnAfterExecute (see page 7958)	Called after the adapter action has executed.
	OnAfterGetResponse (see page 7958)	Called after the adapter action response is generated.
	OnBeforeExecute (see page 7958)	Called before the adapter action is executed.
	OnBeforeGetResponse (see page 7959)	Called before the adapter action response is generated.
	OnGetParams (see page 7959)	Specifies name/value pairs needed to execute this adapter action.

Published Methods

	Name	Description
V	Create (see page 7954)	Creates and initializes an instance of TDataSetAdapterEditRowAction (see page 7947).

Published Properties

	Name	Description
	ActionModes (see page 7956)	Indicates what dataset adapter modes this field supports.
	DisplayLabel (see page 7957)	Suggests a display label for this adapter action.
	ExecuteAccess (see page 7957)	Defines the rights required to execute this action.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

41.1.16.2 TDataSetAdapterEditRowAction.Create Constructor

Creates and initializes an instance of TDataSetAdapterEditRowAction (see page 7947).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TDataSetAdapterEditRowAction(TComponent * AOwner);
```

Description

The TDataSetAdapterEditRowAction (see page 7947) constructor allocates memory for the adapter action object and initializes its properties.

AOwner is the component that is responsible for starting the streaming process when a module containing the adapter action is loaded or saved. It becomes the value of the Owner property. Typically, AOwner is the Web module.

See Also

Owner (see page 2807)

41.1.16.3 TDataSetAdapterEditRowAction Methods

The methods of the TDataSetAdapterEditRowAction class are listed here.

Protected Methods

	Name	Description
	GetDefaultActionName (see page 7954)	Gets the default name used to reference this adapter action with server-side script.
	ImplExecuteActionRequest (see page 7955)	Executes the adapter action using parameters passed in the HTTP request.
	ImplIsDefaultAction (see page 7955)	Indicates whether this adapter action should be added, by default, to the parent adapter.
	ImplWebEnabled (see page 7955)	Provides the underlying implementation for the WebEnabled method.

41.1.16.3.1 TDataSetAdapterEditRowAction.GetDefaultActionName Method

Gets the default name used to reference this adapter action with server-side script.

Pascal

```
function GetDefaultActionName: string; override;
```

C++

```
virtual __fastcall AnsiString GetDefaultActionName();
```

Description

GetDefaultActionName returns the name of the adapter action component. Descendants may override this function.

See Also

ImplGetActionName (see page 24063)

41.1.16.3.2 TDataSetAdapterEditRowAction.ImplExecuteActionRequest Method

Executes the adapter action using parameters passed in the HTTP request.

Pascal

```
procedure ImplExecuteActionRequest(AActionRequest: IActionRequest; AActionResponse:
IActionResponse); override;
```

C++

```
virtual __fastcall ImplExecuteActionRequest(IActionRequest AActionRequest, IActionResponse
AActionResponse);
```

Description

ImplExecuteActionRequest create a TStrings containing the name/value pairs in AActionRequest and calls the OnExecute event handler.

See Also

ImplExecuteActionRequest (see page 24063)

OnExecute (see page 24200)

41.1.16.3.3 TDataSetAdapterEditRowAction.ImplIsDefaultAction Method

Indicates whether this adapter action should be added, by default, to the parent adapter.

Pascal

```
function ImplIsDefaultAction(ADisplay: TObject): Boolean; override;
```

C++

```
virtual __fastcall Boolean ImplIsDefaultAction(TObject * ADisplay);
```

Description

ImplIsDefaultAction is called by IsDefaultAction. ImplIsDefaultAction returns true. ImplIsDefaultAction may be overridden by a descendant class.

See Also

IsDefaultAction (see page 24070)

ImplIsDefaultAction (see page 24243)

41.1.16.3.4 TDataSetAdapterEditRowAction.ImplWebEnabled Method

Provides the underlying implementation for the WebEnabled method.

Pascal

```
function ImplWebEnabled: Boolean; override;
```

C++

```
virtual __fastcall Boolean ImplWebEnabled();
```

Description

The WebEnabled method calls ImplWebEnabled to determine whether the control or hyperlink for this action should appear enabled in the HTML form. WebEnabled returns true if controls should be enabled, false otherwise.

ImplWebEnabled generates an OnGetEnabled event so that you can specify whether controls for this action are enabled. If there is no OnGetEnabled event handler, ImplWebEnabled returns true if the parent adapter's GetKeyFields method returns a set of fields that can locate records in the associated dataset.

See Also

WebEnabled (see page 24071)

OnGetEnabled (see page 7823)

GetKeyFields (see page 7786)

41.1.16.4 TDataSetAdapterEditRowAction Properties

The properties of the TDataSetAdapterEditRowAction class are listed here.

Published Properties

	Name	Description
	ActionModes (see page 7956)	Indicates what dataset adapter modes this field supports.
	DisplayLabel (see page 7957)	Suggests a display label for this adapter action.
	ExecuteAccess (see page 7957)	Defines the rights required to execute this action.

41.1.16.4.1 TDataSetAdapterEditRowAction.ActionModes Property

Indicates what dataset adapter modes this field supports.

Pascal

```
property ActionModes: TDataSetAdapterModes;
```

C++

```
__property TDataSetAdapterModes ActionModes;
```

Description

ActionModes is a set of all the modes in which this adapter action can be used. If the parent dataset adapter is in a mode that is not included in this set, any forms generated using that adapter do not include a control for executing this action. Thus, for example, there is no sense in adding a control that applies edits to a form that presents a read-only view of the data. An apply action, then, should not include amBrowse in its action modes.

See Also

CanModify (see page 7154)

Adapter (see page 7752)

Mode (see page 7810)

GetDisplayStyle (see page 7739)

GetInputStyle (see page 7741)

GetViewMode (see page 7744)

41.1.16.4.2 TDataSetAdapterEditRowAction.DisplayLabel Property

Suggests a display label for this adapter action.

Pascal

```
property DisplayLabel: string;
```

C++

```
__property AnsiString DisplayLabel;
```

Description

Use this property to suggest a display label to use when generating HTML to display the a button or hyperlink to execute this adapter action. Typically the adapter action is displayed using server-side script, either generated or custom written. Server-side script uses the DisplayLabel property to access this value.

See Also

ImplGetDisplayLabel (see page 24064)

SetDisplayLabel (see page 24071)

41.1.16.4.3 TDataSetAdapterEditRowAction.ExecuteAccess Property

Defines the rights required to execute this action.

Pascal

```
property ExecuteAccess: string;
```

C++

```
__property AnsiString ExecuteAccess;
```

Description

The ExecuteAccess property defines the access rights required to execute this action. When server-side script accesses the CanExecute property, this value is checked against the end user's rights. Typically, an exception is raised when an end-user attempts to execute an adapter action that does not allow access.

See Also

TWebUserList (see page 25625)

hasexecuteaccess (see page 24162)

41.1.16.5 TDataSetAdapterEditRowAction Events

The events of the TDataSetAdapterEditRowAction class are listed here.

Published Events

	Name	Description
	OnAfterExecute (see page 7958)	Called after the adapter action has executed.
	OnAfterGetResponse (see page 7958)	Called after the adapter action response is generated.
	OnBeforeExecute (see page 7958)	Called before the adapter action is executed.
	OnBeforeGetResponse (see page 7959)	Called before the adapter action response is generated.
	OnGetParams (see page 7959)	Specifies name/value pairs needed to execute this adapter action.

41.1.16.5.1 TDataSetAdapterEditRowAction.OnAfterExecute Event

Called after the adapter action has executed.

Pascal

```
property OnAfterExecute: TActionExecuteEvent;
```

C++

```
__property TActionExecuteEvent OnAfterExecute;
```

Description

Implement OnAfterExecute to do something after the action has executed. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. OnAfterExecute is called by DoAfterExecuteActionRequest.

See Also

DoAfterExecuteActionRequest (see page 24051)

OnAfterExecuteAction (see page 24184)

OnBeforeExecute (see page 24076)

41.1.16.5.2 TDataSetAdapterEditRowAction.OnAfterGetResponse Event

Called after the adapter action response is generated.

Pascal

```
property OnAfterGetResponse: TActionExecuteEvent;
```

C++

```
__property TActionExecuteEvent OnAfterGetResponse;
```

Description

Implement OnAfterGetResponse to do something after the action response is generated. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. OnAfterGetResponse is called by DoAfterGetExecuteActionReponse.

See Also

DoBeforeGetExecuteActionResponse (see page 24052)

OnAfterGetResponse (see page 24075)

OnBeforeGetActionResponse (see page 24186)

41.1.16.5.3 TDataSetAdapterEditRowAction.OnBeforeExecute Event

Called before the adapter action is executed.

Pascal

```
property OnBeforeExecute: TActionExecuteHandledEvent;
```

C++

```
__property TActionExecuteHandledEvent OnBeforeExecute;
```

Description

Implement OnBeforeExecute to do something before the action is executed. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. Set the Handled flag to prevent the action from being executed. OnBeforeExecute is called by DoBeforeExecuteActionRequest.

See Also

DoBeforeExecuteActionRequest (see page 24052)

OnAfterExecute (see page 24075)

OnBeforeExecuteAction (see page 24186)

41.1.16.5.4 TDataSetAdapterEditRowAction.OnBeforeGetResponse Event

Called before the adapter action response is generated.

Pascal

```
property OnBeforeGetResponse: TActionExecuteHandledEvent;
```

C++

```
__property TActionExecuteHandledEvent OnBeforeGetResponse;
```

Description

Implement OnBeforeGetResponse to do something before the action response is generated. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. Set the Handled flag to indicate that the response has been generated and no further processing is needed. OnBeforeGetResponse is called by DoBeforeGetExecuteActionReponse.

See Also

DoBeforeGetExecuteActionResponse (see page 24052)

OnAfterGetResponse (see page 24075)

OnBeforeGetActionResponse (see page 24186)

41.1.16.5.5 TDataSetAdapterEditRowAction.OnGetParams Event

Specifies name/value pairs needed to execute this adapter action.

Pascal

```
property OnGetParams: TActionGetParamsEvent;
```

C++

```
__property TActionGetParamsEvent OnGetParams;
```

Description

Implement this event handler to specify the name/value needed to execute this action. For example, an action that deletes a row in a table will need a name/value pair that identifies the row to be deleted such as "Key=123".

See Also

ImplGetAdapterItemRequestParams (see page 24063)

41.1.17 TDataSetAdapterField Class

TDataSetAdapterField is the an adapter field object that represents a database field whose value can be displayed as a simple text element.

Class Hierarchy

Pascal

```
TDataSetAdapterField = class(TCustomDataSetAdapterField);
```

C++

```
class TDataSetAdapterField : public TCustomDataSetAdapterField;
```

File

DBAdapt

Description

Add TDataSetAdapterField as a child of a TDataSetAdapter (see page 7872) component to represent a simple field in the dataset associated with the dataset adapter. TDataSetAdapterField represents simple field types that can appear in a single-line edit control. TDataSetAdapterField represents a single field from a database table, and enables server-side script to refer to or update that field's value.

TDataSetAdapterField supports several properties that can be used in server-side script. These include:

ValuesList (see page 7970), which is an object that lists the possible values for this field.

Value, which is the current value of the field.

DisplayText, which represents the current value of the field as a text string.

DisplayStyle and InputStyle, which indicate the type of control that should represent the field value in HTML forms.

DisplayLabel, which provides a text label that can be used to label HTML controls that represent the field.

Required, which indicates whether the field requires a value.

Visible, which indicates whether HTML forms should include a control for this field.

TDataSetAdapterMemoField (see page 7996)

TDataSetAdapterImageField (see page 8138)

TDataSetAdapter (see page 7872)

TField (see page 7115)

TAdapterDisplayField (see page 25109)

TAdapterDisplayColumn (see page 25099)

TAdapterEditColumn (see page 25132)

41.1.17.1 TDataSetAdapterField Members

The following tables list the members exposed by TDataSetAdapterField.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	AsFormatted (see page 23931)	Returns text used to generate a representation of the adapter field value.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	CheckModifyAccess (see page 23931)	Checks end-user rights to modify the adapter field value.
	CheckOrigValue (see page 7736)	Ensures that the current value of this field is the same as the original value.
	CheckValueChange (see page 7737)	Indicates whether the current value of this field is the same as the original value.
	CheckViewAccess (see page 23931)	Checks end-user rights to view the adapter field value.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.

	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	FullyQualifyInputName (see page 7738)	Indicates whether references to this field in HTML forms must be qualified with the name of the parent adapter.
	FullyQualifyInputName (see page 23932)	Indicates whether the HTML input names must be qualified with the name of the adapter.
	GetAdapter (see page 7738)	Returns the value of the Adapter (see page 7752) property.
	GetAdapter (see page 23932)	GetAdapter returns the parent adapter component.
	GetAdapterValuesList (see page 7831)	Returns the value of the ValuesList (see page 7837) property.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetContainerList (see page 24727)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
	GetDataSet (see page 7738)	Returns the dataset associated with this field's parent adapter.
	GetDataSetFieldValue (see page 7739)	Returns the value of the associated dataset field.
	GetDefaultDisplayLabel (see page 23932)	Provides the default display label for this adapter field.
	GetDefaultFieldName (see page 23932)	Gets the default name used to reference this adapter field with server-side script.
	GetDisplayLabel (see page 23933)	Returns the suggested display label for this adapter field.
	GetDisplayStyle (see page 7739)	Returns a string value that suggests an HTML display style for this adapter field.
	GetDisplayStyleType (see page 7740)	Returns the HTML display style type for this adapter field.
	GetDisplayWidth (see page 23933)	Returns the suggested display width for this adapter field.
	GetEchoActionFieldValue (see page 23933)	Returns the value of the echo flag.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetInputName (see page 23934)	Identifies the name to use when generating an HTML input for this adapter field.
	GetInputStyle (see page 7741)	Returns a string value that suggests an HTML editing style for this adapter field.
	GetInputStyleType (see page 7742)	Returns the style of the HTML control to use for editing this adapter field.
	GetInputStyleType (see page 7831)	Returns the default style of the HTML control to use for editing this adapter field.
	GetKeyName (see page 7742)	Returns the name of the associated dataset field if it appears in the index (key) that the parent dataset adapter uses.
	GetKeyParams (see page 7743)	Returns a list of fields that the parent dataset adapter uses to locate records, along with their current values in that adapter's dataset.
	GetMaxLength (see page 23934)	Returns the maximum length, in characters, that the user should be allowed to enter when entering a value for this adapter field.
	GetNeedPrevValue (see page 7832)	Indicates whether an HTML form should include a hidden field that stores this field's value so that generated requests include the previous field value.
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetPrevValue (see page 7832)	Returns the value of this field, as it should appear in a hidden field in an HTML form.
	GetReadOnly (see page 7743)	Indicates whether the adapter field represents a read-only database field.
	GetRequired (see page 23934)	Indicates whether the end-user must enter a value for this adapter field.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetValue (see page 23935)	Gets the value of this adapter field as a Variant.
	GetVariableName (see page 23935)	Gets the name used to reference this adapter field with server-side script.
	GetViewMode (see page 7744)	Returns a string value that indicates what function a control that represents this field should perform.
	GetViewModeType (see page 7744)	Returns the view mode for the function a control that represents this field should perform.
	GetVisible (see page 23935)	Indicates whether the value of this adapter field should be displayed to the end-user.
	GetWebSnapObjClass (see page 23936)	Returns the class type for this adapter field.
	HasModifyAccess (see page 23936)	Checks the end-user's right to modify this adapter field.
	HasViewAccess (see page 23936)	Checks the end-user's right to view this adapter field.
	ImplAsFormatted (see page 7745)	Provides the underlying implementation for the AsFormatted method.

	ImplAsFormatted (see page 23937)	Returns text used to generate a representation of the adapter field value.
	ImplCheckOrigValue (see page 7745)	Provides the underlying implementation for the CheckOrigValue (see page 7736) method.
	ImplCheckOrigValue (see page 7833)	Provides the underlying implementation for the CheckOrigValue (see page 7736) method.
	ImplCheckValueChange (see page 7746)	Provides the underlying implementation for the CheckValueChange (see page 7737) method.
	ImplCheckValueChange (see page 7833)	Provides the underlying implementation for the CheckValueChange (see page 7737) method.
	ImplGetDisplayLabel (see page 7747)	Provides the underlying implementation for the GetDisplayLabel method.
	ImplGetDisplayLabel (see page 23937)	Returns the suggested display label for this adapter field.
	ImplGetDisplayWidth (see page 7747)	Provides the underlying implementation for the GetDisplayWidth method.
	ImplGetDisplayWidth (see page 23937)	Returns the suggested display width for this adapter field.
	ImplGetEchoActionFieldValue (see page 7763)	Provides the underlying implementation for the GetEchoActionFieldValue method.
	ImplGetEchoActionFieldValue (see page 23938)	Returns the value of the echo flag.
	ImplGetInputName (see page 23938)	Identifies the name to use when generating the HTML input for this adapter field.
	ImplGetMaxLength (see page 23938)	Returns the maximum length, in characters, that the user should be allowed to enter when entering a value for this adapter field.
	ImplGetNeedPrevValue (see page 7834)	Provides the underlying implementation for the GetNeedPrevValue (see page 7832) method.
	ImplGetPrevValue (see page 7835)	Provides the underlying implementation of the GetPrevValue (see page 7832) method.
	ImplGetRequired (see page 7747)	Provides the underlying implementation for the GetRequired method.
	ImplGetRequired (see page 23939)	Indicates whether the end-user must enter a value for this adapter field.
	ImplGetValue (see page 7748)	Provides the underlying implementation for the GetValue method.
	ImplGetValue (see page 7835)	Provides the underlying implementation for the GetValue method.
	ImplGetValue (see page 23939)	Gets the value of this adapter field as a Variant.
	ImplGetVariableName (see page 23939)	Gets the name used to reference this adapter field with server-side script.
	ImplGetVisible (see page 7748)	Provides the underlying implementation for the GetVisible method.
	ImplGetVisible (see page 23940)	Indicates whether the value of this adapter field should be displayed to the end-user.
	ImplHasModifyAccess (see page 23940)	Checks the end-user's right to modify this adapter field.
	ImplHasViewAccess (see page 23940)	Checks the end-user's right to view this adapter field.
	ImplSetEchoActionFieldValue (see page 7763)	Provides the underlying implementation for the SetEchoActionFieldValue method.
	ImplSetEchoActionFieldValue (see page 23941)	Sets the echo flag for this adapter field.
	ImplSetFieldName (see page 7749)	Provides the underlying implementation for the SetFieldName method.
	ImplSetFieldName (see page 23941)	Sets the name that is used to reference this adapter field with server-side script.
	ImplUpdateValue (see page 7749)	Provides the underlying implementation for the UpdateValue (see page 7751) method.
	ImplUpdateValue (see page 7836)	Provides the underlying implementation for the UpdateValue (see page 7751) method.
	ImplValidateValue (see page 7764)	Provides the underlying implementation for the ValidateValue (see page 7765) method.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsDefaultField (see page 24728)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	Notification (see page 7750)	Forwards notification messages to all owned components.
	Notification (see page 7836)	Responds when components are added to or deleted from the WebSnap application.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	ParentChanged (see page 23941)	Handles movement of the component to a different parent.
	ParentChanged (see page 24728)	Responds when the WebParent (see page 24731) property changes.
	PrepareDataSet (see page 7750)	Responds when the parent dataset adapter prepares its dataset.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.

V	ReadState (see page 24729)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDataSetField (see page 7751)	Sets the value of the DataSetField (see page 7752) property.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetEchoActionFieldValue (see page 23942)	Sets the echo flag for this adapter field.
	SetFieldName (see page 23942)	Sets the name that is used to reference this adapter field with server-side script.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 24729)	Sets the WebParent (see page 24731) property to be the same as this component's parent.
	SetWebParent (see page 24730)	Sets the value of the WebParent (see page 24731) property.
	TestValueChange (see page 7764)	Checks whether a new value matches the current value of this field.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	UpdateValue (see page 7751)	Updates the adapter field when the user assigns a new value.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	ValidateValue (see page 7765)	Validates a new value for this field that appears in the current request.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	Adapter (see page 7752)	Indicates the dataset adapter that uses this object to represent one of its fields.
R	Adapter (see page 23943)	Returns the parent adapter component.
R	WebContainedComponentHelper (see page 24730)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.
R	WebParent (see page 24731)	Indicates the component that uses this TWebContainedComponent (see page 24722) as one of its Web items.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	AsFormatted (see page 19682)	This is AsFormatted, a member of class IAsFormatted.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	CheckOrigValue (see page 24569)	This is CheckOrigValue, a member of class ICheckOrigValue.
	CheckValueChange (see page 24570)	This is CheckValueChange, a member of class ICheckValueChange.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.

	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
V	Create (see page 7735)	Creates and initializes an instance of TBaseDataSetAdapterField (see page 7729).
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	Create (see page 24726)	Creates and initializes an instance of TWebContainedComponent (see page 24722).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Destroy (see page 24726)	Frees an instance of TWebContainedComponent (see page 24722).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FindField (see page 7737)	Returns the dataset field whose value this adapter field represents.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetAdapterValuesList (see page 19695)	This is GetAdapterValuesList, a member of class IGetAdapterValuesList.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.
	GetDisplayLabel (see page 19756)	This is GetDisplayLabel, a member of class IWebGetDisplayLabel.
	GetDisplayStyle (see page 19700)	Returns the preferred display style for an adapter field or adapter action.
	GetDisplayWidth (see page 19757)	This is GetDisplayWidth, a member of class IWebGetDisplayWidth.
	GetEchoActionFieldValue (see page 24573)	This is GetEchoActionFieldValue, a member of class IEchoActionFieldValue.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetFieldName (see page 19758)	This is GetFieldName, a member of class IWebGetFieldName.
	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	GetInputName (see page 19767)	This is GetInputName, a member of class IWebInputName.
	GetInputStyle (see page 19700)	Returns the preferred editing style for an adapter field.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetKeyName (see page 8105)	This is GetKeyName, a member of class IGetDataSetKeyName.
	GetMaxLength (see page 19763)	This is GetMaxLength, a member of class IWebGetMaxLength.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetNeedPrevValue (see page 24587)	This is GetNeedPrevValue, a member of class IWebGetFieldPrevValue.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 24727)	Returns the object that uses this component to generate HTML.
	GetPrevValue (see page 24587)	This is GetPrevValue, a member of class IWebGetFieldPrevValue.
	GetRequired (see page 19668)	This is GetRequired, a member of class IAdapterFieldAttributes.
	GetValue (see page 19759)	This is GetValue, a member of class IWebGetFieldValue.
	GetVariableName (see page 15329)	This is GetVariableName, a member of class IWebVariableName.
	GetViewMode (see page 19701)	Returns the preferred mode of an adapter field.
	GetVisible (see page 19668)	This is GetVisible, a member of class IAdapterFieldAttributes.

	HasModifyAccess (see page 19667)	This is HasModifyAccess, a member of class IAdapterFieldAccess.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 24727)	Indicates whether this component appears in another component's list of Web items.
	HasViewAccess (see page 19667)	This is HasViewAccess, a member of class IAdapterFieldAccess.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	PrepareDataSet (see page 8109)	This is PrepareDataSet, a member of class IPrepareDataSet.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.
	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.
	SetEchoActionFieldValue (see page 24573)	This is SetEchoActionFieldValue, a member of class IEchoActionFieldValue.
	SetFieldName (see page 19784)	This is SetFieldName, a member of class IWebSetFieldName.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	UpdateValue (see page 24584)	This is UpdateValue, a member of class IUpdateValue.
	ValidateValue (see page 24585)	This is ValidateValue, a member of class IValidateValue.

Public Properties

	Name	Description
R	ActionOrigValue (see page 23943)	Retrieve the original value of this adapter field.
R	ActionValue (see page 23943)	Retrieve the value for this adapter field entered by the end-user.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	EchoActionFieldValue (see page 24574)	This is EchoActionFieldValue, a member of class IEchoActionFieldValue.
	EchoActionFieldValue (see page 23944)	Used to echo the value(s) entered by the end-user when generating an HTML form.
R	FieldName (see page 19758)	This is FieldName, a member of class IWebGetFieldName.
	FieldName (see page 23944)	Identifies the name of this field when using server-side script.
	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.

R	InputName (see page 19767)	This is InputName, a member of class IWebInputName.
R	KeyName (see page 8105)	This is KeyName, a member of class IGetDataSetKeyName.
R	NeedPrevValue (see page 24587)	This is NeedPrevValue, a member of class IWebGetFieldPrevValue.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
R	PrevValue (see page 24587)	This is PrevValue, a member of class IWebGetFieldPrevValue.
R	Required (see page 19669)	This is Required, a member of class IAdapterFieldAttributes.
R	Value (see page 19760)	This is Value, a member of class IWebGetFieldValue.
R	Value (see page 23945)	Provides the value of an adapter field as a variant.
R	VariableName (see page 15329)	This is VariableName, a member of class IWebVariableName.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
R	Visible (see page 19669)	This is Visible, a member of class IAdapterFieldAttributes.

Published Events

	Name	Description
	OnGetDisplayText (see page 7971)	Occurs when the adapter field needs to supply its formatted value as a string that can appear in HTML forms.
	OnGetValue (see page 7971)	Occurs when the adapter field needs to supply its value as a Variant.
	OnValidateValue (see page 7972)	Occurs when the parent adapter wants to validate the new value for this field.

Published Properties

	Name	Description
	DataSetField (see page 7967)	Specifies the name of the dataset field that this adapter field represents.
	FieldFlags (see page 7968)	Indicates various attributes of the adapter field.
	FieldModes (see page 7968)	Indicates what dataset adapter modes this field supports.
	ModifyAccess (see page 7969)	Identifies the rights required to update this field.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	OnUpdateValue (see page 7969)	Occurs when the WebSnap application updates this adapter field's value based on in incoming request.
	Tag (see page 2808)	Stores an integer value as part of a component.
	ValuesList (see page 7970)	Specifies the interface of an object that lists the possible values for this field.
	ViewAccess (see page 7970)	Identifies the rights required to view this field.

41.1.17.2 TDataSetAdapterField Properties

The properties of the TDataSetAdapterField class are listed here.

Published Properties

	Name	Description
	DataSetField (see page 7967)	Specifies the name of the dataset field that this adapter field represents.
	FieldFlags (see page 7968)	Indicates various attributes of the adapter field.
	FieldModes (see page 7968)	Indicates what dataset adapter modes this field supports.
	ModifyAccess (see page 7969)	Identifies the rights required to update this field.
	OnUpdateValue (see page 7969)	Occurs when the WebSnap application updates this adapter field's value based on in incoming request.
	ValuesList (see page 7970)	Specifies the interface of an object that lists the possible values for this field.
	ViewAccess (see page 7970)	Identifies the rights required to view this field.

41.1.17.2.1 TDataSetAdapterField.DataSetField Property

Specifies the name of the dataset field that this adapter field represents.

Pascal

```
property DataSetField: string;
```

C++

```
__property AnsiString DataSetField;
```

Description

DataSetField is the FieldName of the TField object whose value this adapter field represents. DataSetField can be the name of a simple field in a database table, the name of a subfield of an object field that has been qualified by the parent field's name, or the name of an aggregated field.

DataSetField is the same as the name of this adapter field in server-side script, except that the name of the adapter field omits any illegal characters (the only legal characters are the letters between a and z (or A and Z), digits, and the underline character).

If DataSetField is an empty string, this adapter field does not have a value, and the FindField method returns nil (Delphi) or NULL (C++).

See Also

FieldName (see page 7164)

FindField (see page 7737)

41.1.17.2.2 TDataSetAdapterField.FieldFlags Property

Indicates various attributes of the adapter field.

Pascal

```
property FieldFlags: TDataSetAdapterFieldFlags;
```

C++

```
__property TDataSetAdapterFieldFlags FieldFlags;
```

Description

FieldFlags indicates special uses of the value of this adapter field. This is a set that can indicate whether the value corresponds to a key field in the database (used to locate database records) and whether HTML forms store the original value of the field as a hidden field so that the application can detect changes to the field value.

See Also

IsIndexField (see page 7168)

DataSetField (see page 7752)

GetKeyName (see page 7742)

GetKeyFields (see page 7786)

41.1.17.2.3 TDataSetAdapterField.FieldModes Property

Indicates what dataset adapter modes this field supports.

Pascal

```
property FieldModes: TDataSetAdapterModes;
```

C++

```
__property TDataSetAdapterModes FieldModes;
```

Description

FieldModes is a set of all the modes in which this adapter field can be used. If the parent dataset adapter is in a mode that is not

included in this set, any forms generated using that adapter do not include a control to represent this field. Thus, for example, to make a field read-only, you can exclude amInsert and amEdit from FieldModes. Then, the field appears when the user is viewing or querying the dataset, but not when the user is editing or inserting a record.

CanModify (see page 7154)

Adapter (see page 7752)

Mode (see page 7810)

GetDisplayStyle (see page 7739)

GetInputStyle (see page 7741)

GetViewMode (see page 7744)

41.1.17.2.4 TDataSetAdapterField.ModifyAccess Property

Identifies the rights required to update this field.

Pascal

```
property ModifyAccess: string;
```

C++

```
__property AnsiString ModifyAccess;
```

Description

The ModifyAccess property defines the access rights required to modify this field. When server-side script accesses the CanModify property, this value is checked against the end user's rights. Typically, an exception is raised when an end-user attempts to updates an adapter field that does not allow access.

See Also

TWebUserList (see page 25625)

hasmodifyaccess (see page 24162)

41.1.17.2.5 TDataSetAdapterField.OnUpdateValue Property

Occurs when the WebSnap application updates this adapter field's value based on in incoming request.

Pascal

```
property OnUpdateValue: TDatasetAdapterFieldValueEvent;
```

C++

```
__property TDatasetAdapterFieldValueEvent OnUpdateValue;
```

Description

Write an OnUpdateValue event handler to provide your own mechanism for updating the corresponding database field when the WebSnap application updates this adapter field's value. If you supply an OnUpdateValue event handler, the dataset adapter field assumes you have handled the update and does not write the new value to the associated dataset field. If there is no OnUpdateValue event handler, the dataset adapter field writes the field value to the associated dataset field.

Note: TBaseDataSetAdapterInputField defines but does not generate this event. Instead, descendant classes generate this event when updating the adapter field value. If you create your own TBaseDataSetAdapterInputField descendant, you must generate this event from your implementation of the UpdateValue method.

See Also

Value (see page 7180)

Value (see page 23945)

OnGetValue (see page 7754)

ImplUpdateValue (see page 7749)

41.1.17.2.6 TDataSetAdapterField.ValuesList Property

Specifies the interface of an object that lists the possible values for this field.

Pascal

```
property ValuesList: IValuesListAdapter;
```

C++

```
__property IValuesListAdapter ValuesList;
```

Description

ValuesList is the interface of an adapter that lists a set of values. It can be the interface of any object that supports the IValuesListAdapter interface, such as TStringsValuesList or TDataSetValuesList. Each value in the list that this adapter maintains represents a possible value for this field. This is useful when you want to restrict the possible values a user can assign to the associated database field.

When you assign a value to the ValuesList property, the default control for editing this fields value changes to a single selection list box.

See Also

TStringsValuesList (see page 24540)

TDataSetValuesList (see page 8079)

GetInputStyleType (see page 7831)

41.1.17.2.7 TDataSetAdapterField.ViewAccess Property

Identifies the rights required to view this field.

Pascal

```
property ViewAccess: string;
```

C++

```
__property AnsiString ViewAccess;
```

Description

The ViewAccess property identifies the access rights required to view this field. When server-side script accesses the CanView property, this value is checked against the end user's rights. Typically, an exception is raised when an end-user attempts to view an adapter field that does not allow access.

See Also

TWebUserList (see page 25625)

HasViewAccess (see page 24162)

41.1.17.3 TDataSetAdapterField Events

The events of the TDataSetAdapterField class are listed here.

Published Events

	Name	Description
	OnGetDisplayText (see page 7971)	Occurs when the adapter field needs to supply its formatted value as a string that can appear in HTML forms.
	OnGetValue (see page 7971)	Occurs when the adapter field needs to supply its value as a Variant.
	OnValidateValue (see page 7972)	Occurs when the parent adapter wants to validate the new value for this field.

41.1.17.3.1 TDataSetAdapterField.OnGetDisplayText Event

Occurs when the adapter field needs to supply its formatted value as a string that can appear in HTML forms.

Pascal

```
property OnGetDisplayText: TDataSetAdapterFieldGetStringEvent;
```

C++

```
__property TDataSetAdapterFieldGetStringEvent OnGetDisplayText;
```

Description

TBaseDataSetAdapterField generates this event when supplying the read-only text representation of the field's value. This allows the WebSnap application to dynamically supply the formatted value of the field. Server-side script can access the resulting string using the DisplayText property.

Note: If you do not supply an OnGetDisplayText event handler, TBaseDataSetAdapterField uses the field component's DisplayText property.

See Also

DisplayText (see page 7162)

Value (see page 23945)

OnGetValue (see page 7754)

41.1.17.3.2 TDataSetAdapterField.OnGetValue Event

Occurs when the adapter field needs to supply its value as a Variant.

Pascal

```
property OnGetValue: TDataSetAdapterFieldGetValueEvent;
```

C++

```
__property TDataSetAdapterFieldGetValueEvent OnGetValue;
```

Description

TBaseDataSetAdapterField generates an OnGetValue event when the WebSnap application reads its Value property. This allows the adapter field to dynamically supply the value for the field. For example, you can use this event to decrypt values that are stored in the database in an encrypted form.

Note: If you do not supply an OnGetValue event handler, TBaseDataSetAdapterField uses the field component's Value property.

See Also

Value (see page 7180)

Value (see page 23945)

OnGetDisplayText (see page 7754)

41.1.17.3.3 TDataSetAdapterField.OnValidateValue Event

Occurs when the parent adapter wants to validate the new value for this field.

Pascal

```
property OnValidateValue: TDataAdapterFieldValidateValueEvent;
```

C++

```
__property TDataAdapterFieldValidateValueEvent OnValidateValue;
```

Description

Write an OnValidateValue event handler to provide your own validation of new field values before the WebSnap application attempts to update this field's value. If the new Value is not valid, the OnValidateValue event handler should raise an exception.

The parent dataset adapter generates this event when it receives new field values from an update request message.

See Also

Adapter (see page 7752)

Value (see page 23945)

OnGetValue (see page 7754)

OnValidate (see page 7183)

41.1.18 TDataSetAdapterFirstRowAction Class

TDataSetAdapterNextRowAction (see page 8030) posts any edits made in an HTML form and moves the dataset adapter to the first record.

Class Hierarchy

Pascal

```
TDataSetAdapterFirstRowAction = class(TDataSetAdapterMoveRowAction);
```

C++

```
class TDataSetAdapterFirstRowAction : public TDataSetAdapterMoveRowAction;
```

File

DBAdapt

Description

Add TDataSetAdapterBrowseRowAction (see page 7903) to a dataset adapter (TDataSetAdapter (see page 7872)) to support HTML forms that let users navigate to the first record in a dataset. When this action is executed, it locates the parent adapter's dataset on the record specified by the current request object, posts any edits included in the current request, and then moves the dataset to the first record.

Server-side script addresses this action as the 'FirstRow' action of the parent adapter. If the current request identifies the first record of the dataset as current, the control for this action appears disabled.

See Also

TDataSetAdapterApplyRowAction (see page 7890)

TDataSetAdapterBrowseRowAction (see page 7903)

TDataSetAdapterDeleteRowAction (see page 7934)

TDataSetAdapterEditRowAction (see page 7947)

TDataSetAdapterNextRowAction (see page 8030)

TDataSetAdapterLastRowAction (see page 7984)

TDataSetAdapterCancelRowAction (see page 7916)

TDataSetAdapterPrevRowAction (see page 8042)

TDataSetAdapterRefreshRowAction (see page 8054)

TDataSetAdapterNewRowAction (see page 8016)

TDataSetAdapter (see page 7872)

TCustomDataSetAdapter (see page 7766)

TDataSet (see page 6894)

41.1.18.1 TDataSetAdapterFirstRowAction Members

The following tables list the members exposed by TDataSetAdapterFirstRowAction.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	CheckExecuteAccess (see page 24050)	Checks end-user rights to execute this adapter action.
	CreateRequestContext (see page 24050)	Creates an object that describes the adapter action parameters and adapter field values.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DoAfterExecuteActionRequest (see page 24051)	Calls event handlers after the adapter action is executed.
V	DoAfterGetExecuteActionResponse (see page 24051)	Calls event handlers after the adapter action response is formulated.
V	DoBeforeExecuteActionRequest (see page 24052)	Calls event handlers before the adapter action is executed.
V	DoBeforeGetExecuteActionResponse (see page 24052)	Calls event handlers before the adapter action response is formulated.
	EndIterator (see page 24053)	Implements IIteratorSupport's EndIterator method.
	ExecuteActionRequest (see page 24053)	Executes the adapter action using parameters passed in the HTTP request.
	GetActionName (see page 24054)	Gets the name used to reference this adapter action with server-side script.
	GetAdapter (see page 7819)	Returns the value of the Adapter (see page 7822) property.
	GetAdapter (see page 24054)	GetAdapter returns the parent adapter component.
	GetAdapterItemRequestParams (see page 24055)	Provides the name/value pairs needed to execute this adapter action.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetContainerList (see page 24727)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
	GetDataSet (see page 7819)	Returns the value of the DataSet (see page 7822) property.
V	GetDefaultActionName (see page 7980)	Gets the default name used to reference this adapter action with server-side script.

	GetDefaultDisplayLabel (see page 24055)	Provides the default display label for this adapter action.
	GetDisplayLabel (see page 24055)	Returns the suggested display label for this adapter action.
	GetDisplayStyle (see page 24056)	Returns a string value to suggest an HTML display style for this adapter action.
	GetDisplayStyleType (see page 24056)	Suggests an HTML display type for this adapter action.
	GetErrors (see page 24057)	This is GetErrors, a member of class TBaseAdapterAction.
	GetExecuteActionResponse (see page 24057)	Generates a response after the adapter action has been executed.
	GetFailureOptions (see page 24057)	Indicates whether to perform an HTTP redirect after execution of this adapter action fails.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
	GetInputStyle (see page 24058)	Returns a string value to suggest an HTML display style for this adapter action.
	GetIsAdapterActionList (see page 24058)	Indicates whether this adapter action may have multiple commands.
	GetItemCount (see page 24058)	Returns the number of commands defined by this adapter action.
	GetIteratorIndex (see page 24059)	Implements IIteratorIndex's GetIteratorIndex method.
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetSuccessOptions (see page 24059)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetVariableName (see page 24060)	Gets the name used to reference this adapter action with server-side script.
	GetViewMode (see page 24060)	Returns a string value to suggest a view mode for this adapter action.
	GetViewModeType (see page 24060)	Suggests a view mode for this adapter action.
	GetVisible (see page 24061)	Indicates whether a button or hyperlink for this adapter action should be displayed on the HTML page.
	GetWebSnapObjClass (see page 24061)	Returns the class type for this adapter field.
	HandleRequest (see page 24061)	Executes the adapter action and generates a response.
	HasExecuteAccess (see page 24062)	Checks the end-user's right to execute this adapter action.
	ImplCreateRequestContext (see page 24062)	Creates an object that describes the action parameters and field values.
	ImplEndIterator (see page 24062)	Implements IIteratorSupport's EndIterator (see page 24053) method.
	ImplExecuteActionRequest (see page 7980)	Executes the adapter action using parameters passed in the HTTP request.
	ImplGetActionName (see page 24063)	Gets the name used to reference this adapter action with server-side script.
	ImplGetActionName (see page 24195)	Gets the name used to reference this adapter action with server-side script.
	ImplGetAdapterItemRequestParams (see page 7854)	Provides the underlying implementation for the GetAdapterItemRequestParams method.
	ImplGetAdapterItemRequestParams (see page 24063)	Provides the name/value pairs needed to execute this adapter action.
	ImplGetAdapterItemRequestParams (see page 24196)	Provides the name/value pairs needed to execute this adapter action.
	ImplGetDisplayLabel (see page 24064)	Returns the suggested display label for this adapter action.
	ImplGetExecuteActionResponse (see page 24064)	Generates a response after the adapter action has been executed.
	ImplGetFailureOptions (see page 24065)	Indicates whether to perform an HTTP redirect after execution of this adapter action fails.
	ImplGetIsAdapterActionList (see page 24065)	Indicates whether this adapter action may have multiple commands.
	ImplGetIteratorIndex (see page 24065)	Implements IIteratorIndex's GetIteratorIndex (see page 24059) method.
	ImplGetSuccessOptions (see page 24066)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	ImplGetSuccessOptions (see page 24196)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	ImplGetVariableName (see page 24066)	Gets the name used to reference this adapter action with server-side script.
	ImplGetVisible (see page 7819)	Provides the underlying implementation for the GetVisible method.
	ImplGetVisible (see page 24066)	Indicates whether a button or hyperlink for this adapter action should be displayed on the HTML page.
	ImplHandleRequest (see page 24067)	Executes the adapter action and generates a response.
	ImplHasExecuteAccess (see page 24067)	Checks the end-user's right to execute this adapter action.
	ImplInIterator (see page 24067)	Implements IIteratorIndex's InIterator (see page 24069) method.
	ImplIsDefaultAction (see page 8016)	Provides the underlying implementation for the IsDefaultAction method.
	ImplIsDefaultAction (see page 24068)	Indicates whether this adapter action should be added, by default, to the parent adapter.

	ImplNextIteration (see page 24068)	Implements IIteratorSupport's NextIteration (see page 24070) method.
	ImplSetActionName (see page 24197)	Sets the name that is used to reference this adapter action with server-side script.
	ImplStartIterator (see page 24068)	Implements IIteratorSupport's StartIterator (see page 24071) method.
V	ImplWebEnabled (see page 7980)	Provides the underlying implementation for the WebEnabled method.
	InIterator (see page 24069)	Implements IIteratorIndex's InIterator method.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsDefaultAction (see page 24070)	Indicates whether this adapter action should be added, by default, to the parent adapter.
V	IsDefaultField (see page 24728)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	NextIteration (see page 24070)	Implements IIteratorSupport's NextIteration method.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	ParentChanged (see page 24070)	Handles movement of the component to a different parent.
V	ParentChanged (see page 24728)	Responds when the WebParent (see page 24731) property changes.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 24729)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetActionName (see page 24197)	Sets the name that is used to reference this adapter action with server-side script.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDisplayLabel (see page 24071)	Set the value of the DisplayLabel (see page 24073) property.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 24729)	Sets the WebParent (see page 24731) property to be the same as this component's parent.
	SetWebParent (see page 24730)	Sets the value of the WebParent (see page 24731) property.
	StartIterator (see page 24071)	Implements IIteratorSupport's StartIterator method.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WebEnabled (see page 24071)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	Adapter (see page 7822)	Indicates the dataset adapter that uses this object to represent one of its actions.
R	Adapter (see page 24072)	Provides access to the parent adapter component.
R	Errors (see page 24073)	This is Errors, a member of class TBaseAdapterAction.
R	WebContainedComponentHelper (see page 24730)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.
R	WebParent (see page 24731)	Indicates the component that uses this TWebContainedComponent (see page 24722) as one of its Web items.

Public Events

	Name	Description
	OnExecute (see page 7822)	Occurs when server-side script executes this action.
	OnExecute (see page 24200)	Called to execute this action using parameters passed in the HTTP request.
	OnGetEnabled (see page 7823)	Occurs when the WebSnap application to determine whether a control or hyperlink for this action should be enabled.
	OnGetEnabled (see page 24200)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
V	Create (see page 7818)	Creates and initializes an instance of TCustomDataSetAdapterAction (see page 7811).
V	Create (see page 7853)	Creates and initializes an instance of TCustomDataSetAdapterRowAction (see page 7846).
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	Create (see page 24726)	Creates and initializes an instance of TWebContainedComponent (see page 24722).
	CreateRequestContext (see page 19681)	Creates an object that describes the adapter action parameters and adapter field values.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Destroy (see page 24726)	Frees an instance of TWebContainedComponent (see page 24722).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	EndIterator (see page 19723)	This is EndIterator, a member of class IIteratorSupport.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetActionName (see page 19755)	This is GetActionName, a member of class IWebGetActionName.
	GetAdapterItemRequestParams (see page 19692)	This is GetAdapterItemRequestParams, a member of class IGetAdapterItemRequestParams.

	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.
	GetDisplayLabel (see page 19756)	This is GetDisplayLabel, a member of class IWebGetDisplayLabel.
	GetDisplayStyle (see page 19700)	Returns the preferred display style for an adapter field or adapter action.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetFailureOptions (see page 964)	This is GetFailureOptions, a member of class IGetAdapterActionRedirectOptions.
	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	GetInputStyle (see page 19700)	Returns the preferred editing style for an adapter field.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIsAdapterActionList (see page 19717)	This is GetIsAdapterActionList, a member of class IIsAdapterActionList.
	GetIteratorIndex (see page 19721)	Returns the value of the IteratorIndex (see page 19721) property.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 24727)	Returns the object that uses this component to generate HTML.
	GetSuccessOptions (see page 964)	This is GetSuccessOptions, a member of class IGetAdapterActionRedirectOptions.
	GetVariableName (see page 15329)	This is GetVariableName, a member of class IWebVariableName.
	GetViewMode (see page 19701)	Returns the preferred mode of an adapter field.
	GetVisible (see page 19652)	This is GetVisible, a member of class IAdapterActionAttributes.
	HandleRequest (see page 19681)	Executes the adapter action and generates a response.
	HasExecuteAccess (see page 19651)	This is HasExecuteAccess, a member of class IAdapterActionAccess.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 24727)	Indicates whether this component appears in another component's list of Web items.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InIterator (see page 19721)	Indicates whether the object is iterating over its items.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsDefaultAction (see page 19768)	This is IsDefaultAction, a member of class IWebIsDefaultAction.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NextIteration (see page 19723)	Advances to the objects next item.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetActionName (see page 19783)	This is SetActionName, a member of class IWebSetActionName.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.
	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	StartIterator (see page 19724)	This is StartIterator, a member of class IIteratorSupport.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

	WebEnabled (see page 19752)	This is WebEnabled, a member of class IWebEnabled.

Public Properties

	Name	Description
	ActionModes (see page 7821)	Indicates what dataset adapter modes this field supports.
	ActionName (see page 7821)	Identifies the name of this action when using server-side script.
R	ActionName (see page 19755)	This is ActionName, a member of class IWebGetActionName.
R	ActionName (see page 24072)	Identifies the name of this action when using server-side script.
	ActionName (see page 24198)	Identifies the name of this action when using server-side script.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
R	DataSet (see page 7822)	Indicates the dataset on which this action operates.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	FailureOptions (see page 965)	This is FailureOptions, a member of class IGetAdapterActionRedirectOptions.
	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.
R	IsAdapterActionList (see page 19717)	This is IsAdapterActionList, a member of class IIsAdapterActionList.
R	ItemCount (see page 24074)	Returns the number of items defined by an adapter action.
R	ItemIndex (see page 24074)	Returns the index of the current item of an adapter action.
R	IteratorIndex (see page 19721)	Indicates the index of the current item.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
R	SuccessOptions (see page 965)	This is SuccessOptions, a member of class IGetAdapterActionRedirectOptions.
R	VariableName (see page 15329)	This is VariableName, a member of class IWebVariableName.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
R	Visible (see page 19652)	This is Visible, a member of class IAdapterActionAttributes.

Published Events

	Name	Description
	OnAfterExecute (see page 7982)	Called after the adapter action has executed.
	OnAfterGetResponse (see page 7983)	Called after the adapter action response is generated.
	OnBeforeExecute (see page 7983)	Called before the adapter action is executed.
	OnBeforeGetResponse (see page 7984)	Called before the adapter action response is generated.
	OnGetParams (see page 7984)	Specifies name/value pairs needed to execute this adapter action.

Published Properties

	Name	Description
	DisplayLabel (see page 7981)	Suggests a display label for this adapter action.
	ExecuteAccess (see page 7981)	Defines the rights required to execute this action.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	RedirectOptions (see page 7982)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	Tag (see page 2808)	Stores an integer value as part of a component.

41.1.18.2 TDataSetAdapterFirstRowAction Methods

The methods of the TDataSetAdapterFirstRowAction class are listed here.

Protected Methods

	Name	Description
	GetDefaultActionName (see page 7980)	Gets the default name used to reference this adapter action with server-side script.
	ImplExecuteActionRequest (see page 7980)	Executes the adapter action using parameters passed in the HTTP request.
	ImplWebEnabled (see page 7980)	Provides the underlying implementation for the WebEnabled method.

41.1.18.2.1 TDataSetAdapterFirstRowAction.GetDefaultActionName Method

Gets the default name used to reference this adapter action with server-side script.

Pascal

```
function GetDefaultActionName: string; override;
```

C++

```
virtual __fastcall AnsiString GetDefaultActionName();
```

Description

GetDefaultActionName returns the name of the adapter action component. Descendants may override this function.

See Also

ImplGetActionName (see page 24063)

41.1.18.2.2 TDataSetAdapterFirstRowAction.ImplExecuteActionRequest Method

Executes the adapter action using parameters passed in the HTTP request.

Pascal

```
procedure ImplExecuteActionRequest(AActionRequest: IActionRequest; AActionResponse:
IActionResponse); override;
```

C++

```
virtual __fastcall ImplExecuteActionRequest(IActionRequest AActionRequest, IActionResponse
AActionResponse);
```

Description

ImplExecuteActionRequest create a TStrings containing the name/value pairs in AActionRequest and calls the OnExecute event handler.

See Also

ImplExecuteActionRequest (see page 24063)

OnExecute (see page 24200)

41.1.18.2.3 TDataSetAdapterFirstRowAction.ImplWebEnabled Method

Provides the underlying implementation for the WebEnabled method.

Pascal

```
function ImplWebEnabled: Boolean; override;
```

C++

```
virtual __fastcall Boolean ImplWebEnabled();
```

Description

The WebEnabled method calls ImplWebEnabled to determine whether the control or hyperlink for this action should appear enabled in the HTML form. WebEnabled returns true if controls should be enabled, false otherwise.

ImplWebEnabled generates an OnGetEnabled event so that you can specify whether controls for this action are enabled. If there is no OnGetEnabled event handler, ImplWebEnabled returns true if the parent adapter's GetKeyFields method returns a set of fields that can locate records in the associated dataset.

See Also

WebEnabled (see page 24071)

OnGetEnabled (see page 7823)

GetKeyFields (see page 7786)

41.1.18.3 TDataSetAdapterFirstRowAction Properties

The properties of the TDataSetAdapterFirstRowAction class are listed here.

Published Properties

	Name	Description
	DisplayLabel (see page 7981)	Suggests a display label for this adapter action.
	ExecuteAccess (see page 7981)	Defines the rights required to execute this action.
	RedirectOptions (see page 7982)	Indicates whether to perform an HTTP redirect after successfully executing this action.

41.1.18.3.1 TDataSetAdapterFirstRowAction.DisplayLabel Property

Suggests a display label for this adapter action.

Pascal

```
property DisplayLabel: string;
```

C++

```
__property AnsiString DisplayLabel;
```

Description

Use this property to suggest a display label to use when generating HTML to display the a button or hyperlink to execute this adapter action. Typically the adapter action is displayed using server-side script, either generated or custom written. Server-side script uses the DisplayLabel property to access this value.

See Also

ImplGetDisplayLabel (see page 24064)

SetDisplayLabel (see page 24071)

41.1.18.3.2 TDataSetAdapterFirstRowAction.ExecuteAccess Property

Defines the rights required to execute this action.

Pascal

```
property ExecuteAccess: string;
```

C++

```
__property AnsiString ExecuteAccess;
```

Description

The ExecuteAccess property defines the access rights required to execute this action. When server-side script accesses the CanExecute property, this value is checked against the end user's rights. Typically, an exception is raised when an end-user attempts to execute an adapter action that does not allow access.

See Also

TWebUserList (see page 25625)

hasexecuteaccess (see page 24162)

41.1.18.3.3 TDataSetAdapterFirstRowAction.RedirectOptions Property

Indicates whether to perform an HTTP redirect after successfully executing this action.

Pascal

```
property RedirectOptions: TAdapterActionRedirectOptions;
```

C++

```
__property TAdapterActionRedirectOptions RedirectOptions;
```

Description

Set RedirectOptions to indicate that HTTP redirect should be performed after executing this adapter action. An HTTP redirect causes the browser to "forget" about the parameters passed when executing the adapter action. Without a redirect, the browser's Refresh or Reload command cause the last HTTP request to be resent, resulting in re-execution of the adapter action.

See Also

SendRedirect (see page 15201)

41.1.18.4 TDataSetAdapterFirstRowAction Events

The events of the TDataSetAdapterFirstRowAction class are listed here.

Published Events

	Name	Description
	OnAfterExecute (see page 7982)	Called after the adapter action has executed.
	OnAfterGetResponse (see page 7983)	Called after the adapter action response is generated.
	OnBeforeExecute (see page 7983)	Called before the adapter action is executed.
	OnBeforeGetResponse (see page 7984)	Called before the adapter action response is generated.
	OnGetParams (see page 7984)	Specifies name/value pairs needed to execute this adapter action.

41.1.18.4.1 TDataSetAdapterFirstRowAction.OnAfterExecute Event

Called after the adapter action has executed.

Pascal

```
property OnAfterExecute: TActionExecuteEvent;
```

C++

```
__property TActionExecuteEvent OnAfterExecute;
```

Description

Implement OnAfterExecute to do something after the action has executed. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. OnAfterExecute is called by DoAfterExecuteActionRequest.

See Also

DoAfterExecuteActionRequest (see page 24051)

OnAfterExecuteAction (see page 24184)

OnBeforeExecute (see page 24076)

41.1.18.4.2 TDataSetAdapterFirstRowAction.OnAfterGetResponse Event

Called after the adapter action response is generated.

Pascal

```
property OnAfterGetResponse: TActionExecuteEvent;
```

C++

```
__property TActionExecuteEvent OnAfterGetResponse;
```

Description

Implement OnAfterGetResponse to do something after the action response is generated. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. OnAfterGetResponse is called by DoAfterGetExecuteActionReponse.

See Also

DoBeforeGetExecuteActionResponse (see page 24052)

OnAfterGetResponse (see page 24075)

OnBeforeGetActionResponse (see page 24186)

41.1.18.4.3 TDataSetAdapterFirstRowAction.OnBeforeExecute Event

Called before the adapter action is executed.

Pascal

```
property OnBeforeExecute: TActionExecuteHandledEvent;
```

C++

```
__property TActionExecuteHandledEvent OnBeforeExecute;
```

Description

Implement OnBeforeExecute to do something before the action is executed. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. Set the Handled flag to prevent the action from being executed. OnBeforeExecute is called by DoBeforeExecuteActionRequest.

See Also

DoBeforeExecuteActionRequest (see page 24052)

OnAfterExecute (see page 24075)

OnBeforeExecuteAction (see page 24186)

41.1.18.4.4 TDataSetAdapterFirstRowAction.OnBeforeGetResponse Event

Called before the adapter action response is generated.

Pascal

```
property OnBeforeGetResponse: TActionExecuteHandledEvent;
```

C++

```
__property TActionExecuteHandledEvent OnBeforeGetResponse;
```

Description

Implement OnBeforeGetResponse to do something before the action response is generated. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. Set the Handled flag to indicate that the response has been generated and no further processing is needed. OnBeforeGetResponse is called by DoBeforeGetExecuteActionReponse.

See Also

DoBeforeGetExecuteActionResponse (see page 24052)

OnAfterGetResponse (see page 24075)

OnBeforeGetActionResponse (see page 24186)

41.1.18.4.5 TDataSetAdapterFirstRowAction.OnGetParams Event

Specifies name/value pairs needed to execute this adapter action.

Pascal

```
property OnGetParams: TActionGetParamsEvent;
```

C++

```
__property TActionGetParamsEvent OnGetParams;
```

Description

Implement this event handler to specify the name/value needed to execute this action. For example, an action that deletes a row in a table will need a name/value pair that identifies the row to be deleted such as "Key=123".

ImplGetAdapterItemRequestParams (see page 24063)

41.1.19 TDataSetAdapterLastRowAction Class

TDataSetAdapterLastRowAction posts any edits made in an HTML form and moves the dataset adapter to the last record.

Class Hierarchy

Pascal

```
TDataSetAdapterLastRowAction = class(TDataSetAdapterMoveRowAction);
```

C++

```
class TDataSetAdapterLastRowAction : public TDataSetAdapterMoveRowAction;
```

File

DBAdapt

Description

Add TDataSetAdapterLastRowAction to a dataset adapter (TDataSetAdapter (see page 7872)) to support HTML forms that let users jump to the last record in a dataset. When this action is executed, it locates the parent adapter's dataset on the record specified by the current request object, posts any edits included in the current request, and then moves the dataset to its last record.

Server-side script addresses this action as the 'LastRow' action of the parent adapter. If the current request identifies the last record of the dataset as current, the control for this action appears disabled.

41.1.19.1 TDataSetAdapterLastRowAction Members

The following tables list the members exposed by TDataSetAdapterLastRowAction.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	CheckExecuteAccess (see page 24050)	Checks end-user rights to execute this adapter action.
	CreateRequestContext (see page 24050)	Creates an object that describes the adapter action parameters and adapter field values.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DoAfterExecuteActionRequest (see page 24051)	Calls event handlers after the adapter action is executed.
V	DoAfterGetExecuteActionResponse (see page 24051)	Calls event handlers after the adapter action response is formulated.
V	DoBeforeExecuteActionRequest (see page 24052)	Calls event handlers before the adapter action is executed.
V	DoBeforeGetExecuteActionResponse (see page 24052)	Calls event handlers before the adapter action response is formulated.
	EndIterator (see page 24053)	Implements IIteratorSupport's EndIterator method.
	ExecuteActionRequest (see page 24053)	Executes the adapter action using parameters passed in the HTTP request.
	GetActionName (see page 24054)	Gets the name used to reference this adapter action with server-side script.
	GetAdapter (see page 7819)	Returns the value of the Adapter (see page 7822) property.
	GetAdapter (see page 24054)	GetAdapter returns the parent adapter component.
	GetAdapterItemRequestParams (see page 24055)	Provides the name/value pairs needed to execute this adapter action.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetContainerList (see page 24727)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
	GetDataSet (see page 7819)	Returns the value of the DataSet (see page 7822) property.
V	GetDefaultActionName (see page 7992)	Gets the default name used to reference this adapter action with server-side script.

	GetDefaultDisplayLabel (see page 24055)	Provides the default display label for this adapter action.
	GetDisplayLabel (see page 24055)	Returns the suggested display label for this adapter action.
	GetDisplayStyle (see page 24056)	Returns a string value to suggest an HTML display style for this adapter action.
	GetDisplayStyleType (see page 24056)	Suggests an HTML display type for this adapter action.
	GetErrors (see page 24057)	This is GetErrors, a member of class TBaseAdapterAction.
	GetExecuteActionResponse (see page 24057)	Generates a response after the adapter action has been executed.
	GetFailureOptions (see page 24057)	Indicates whether to perform an HTTP redirect after execution of this adapter action fails.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
	GetInputStyle (see page 24058)	Returns a string value to suggest an HTML display style for this adapter action.
	GetIsAdapterActionList (see page 24058)	Indicates whether this adapter action may have multiple commands.
	GetItemCount (see page 24058)	Returns the number of commands defined by this adapter action.
	GetIteratorIndex (see page 24059)	Implements IIteratorIndex's GetIteratorIndex method.
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetSuccessOptions (see page 24059)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetVariableName (see page 24060)	Gets the name used to reference this adapter action with server-side script.
	GetViewMode (see page 24060)	Returns a string value to suggest a view mode for this adapter action.
	GetViewModeType (see page 24060)	Suggests a view mode for this adapter action.
	GetVisible (see page 24061)	Indicates whether a button or hyperlink for this adapter action should be displayed on the HTML page.
	GetWebSnapObjClass (see page 24061)	Returns the class type for this adapter field.
	HandleRequest (see page 24061)	Executes the adapter action and generates a response.
	HasExecuteAccess (see page 24062)	Checks the end-user's right to execute this adapter action.
	ImplCreateRequestContext (see page 24062)	Creates an object that describes the action parameters and field values.
	ImplEndIterator (see page 24062)	Implements IIteratorSupport's EndIterator (see page 24053) method.
	ImplExecuteActionRequest (see page 7992)	Executes the adapter action using parameters passed in the HTTP request.
	ImplGetActionName (see page 24063)	Gets the name used to reference this adapter action with server-side script.
	ImplGetActionName (see page 24195)	Gets the name used to reference this adapter action with server-side script.
	ImplGetAdapterItemRequestParams (see page 7854)	Provides the underlying implementation for the GetAdapterItemRequestParams method.
	ImplGetAdapterItemRequestParams (see page 24063)	Provides the name/value pairs needed to execute this adapter action.
	ImplGetAdapterItemRequestParams (see page 24196)	Provides the name/value pairs needed to execute this adapter action.
	ImplGetDisplayLabel (see page 24064)	Returns the suggested display label for this adapter action.
	ImplGetExecuteActionResponse (see page 24064)	Generates a response after the adapter action has been executed.
	ImplGetFailureOptions (see page 24065)	Indicates whether to perform an HTTP redirect after execution of this adapter action fails.
	ImplGetIsAdapterActionList (see page 24065)	Indicates whether this adapter action may have multiple commands.
	ImplGetIteratorIndex (see page 24065)	Implements IIteratorIndex's GetIteratorIndex (see page 24059) method.
	ImplGetSuccessOptions (see page 24066)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	ImplGetSuccessOptions (see page 24196)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	ImplGetVariableName (see page 24066)	Gets the name used to reference this adapter action with server-side script.
	ImplGetVisible (see page 7819)	Provides the underlying implementation for the GetVisible method.
	ImplGetVisible (see page 24066)	Indicates whether a button or hyperlink for this adapter action should be displayed on the HTML page.
	ImplHandleRequest (see page 24067)	Executes the adapter action and generates a response.
	ImplHasExecuteAccess (see page 24067)	Checks the end-user's right to execute this adapter action.
	ImplInIterator (see page 24067)	Implements IIteratorIndex's InIterator (see page 24069) method.
	ImplIsDefaultAction (see page 8016)	Provides the underlying implementation for the IsDefaultAction method.
	ImplIsDefaultAction (see page 24068)	Indicates whether this adapter action should be added, by default, to the parent adapter.

	ImplNextIteration (see page 24068)	Implements IIteratorSupport's NextIteration (see page 24070) method.
	ImplSetActionName (see page 24197)	Sets the name that is used to reference this adapter action with server-side script.
	ImplStartIterator (see page 24068)	Implements IIteratorSupport's StartIterator (see page 24071) method.
V	ImplWebEnabled (see page 7992)	Provides the underlying implementation for the WebEnabled method.
	InIterator (see page 24069)	Implements IIteratorIndex's InIterator method.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsDefaultAction (see page 24070)	Indicates whether this adapter action should be added, by default, to the parent adapter.
V	IsDefaultField (see page 24728)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	NextIteration (see page 24070)	Implements IIteratorSupport's NextIteration method.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	ParentChanged (see page 24070)	Handles movement of the component to a different parent.
V	ParentChanged (see page 24728)	Responds when the WebParent (see page 24731) property changes.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 24729)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetActionName (see page 24197)	Sets the name that is used to reference this adapter action with server-side script.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDisplayLabel (see page 24071)	Set the value of the DisplayLabel (see page 24073) property.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 24729)	Sets the WebParent (see page 24731) property to be the same as this component's parent.
	SetWebParent (see page 24730)	Sets the value of the WebParent (see page 24731) property.
	StartIterator (see page 24071)	Implements IIteratorSupport's StartIterator method.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WebEnabled (see page 24071)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	Adapter (see page 7822)	Indicates the dataset adapter that uses this object to represent one of its actions.
R	Adapter (see page 24072)	Provides access to the parent adapter component.
R	Errors (see page 24073)	This is Errors, a member of class TBaseAdapterAction.
R	WebContainedComponentHelper (see page 24730)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.
R	WebParent (see page 24731)	Indicates the component that uses this TWebContainedComponent (see page 24722) as one of its Web items.

Public Events

	Name	Description
	OnExecute (see page 7822)	Occurs when server-side script executes this action.
	OnExecute (see page 24200)	Called to execute this action using parameters passed in the HTTP request.
	OnGetEnabled (see page 7823)	Occurs when the WebSnap application to determine whether a control or hyperlink for this action should be enabled.
	OnGetEnabled (see page 24200)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
V	Create (see page 7818)	Creates and initializes an instance of TCustomDataSetAdapterAction (see page 7811).
V	Create (see page 7853)	Creates and initializes an instance of TCustomDataSetAdapterRowAction (see page 7846).
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	Create (see page 24726)	Creates and initializes an instance of TWebContainedComponent (see page 24722).
	CreateRequestContext (see page 19681)	Creates an object that describes the adapter action parameters and adapter field values.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Destroy (see page 24726)	Frees an instance of TWebContainedComponent (see page 24722).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	EndIterator (see page 19723)	This is EndIterator, a member of class IIteratorSupport.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetActionName (see page 19755)	This is GetActionName, a member of class IWebGetActionName.
	GetAdapterItemRequestParams (see page 19692)	This is GetAdapterItemRequestParams, a member of class IGetAdapterItemRequestParams.

	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.
	GetDisplayLabel (see page 19756)	This is GetDisplayLabel, a member of class IWebGetDisplayLabel.
	GetDisplayStyle (see page 19700)	Returns the preferred display style for an adapter field or adapter action.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetFailureOptions (see page 964)	This is GetFailureOptions, a member of class IGetAdapterActionRedirectOptions.
	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	GetInputStyle (see page 19700)	Returns the preferred editing style for an adapter field.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIsAdapterActionList (see page 19717)	This is GetIsAdapterActionList, a member of class IIsAdapterActionList.
	GetIteratorIndex (see page 19721)	Returns the value of the IteratorIndex (see page 19721) property.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 24727)	Returns the object that uses this component to generate HTML.
	GetSuccessOptions (see page 964)	This is GetSuccessOptions, a member of class IGetAdapterActionRedirectOptions.
	GetVariableName (see page 15329)	This is GetVariableName, a member of class IWebVariableName.
	GetViewMode (see page 19701)	Returns the preferred mode of an adapter field.
	GetVisible (see page 19652)	This is GetVisible, a member of class IAdapterActionAttributes.
	HandleRequest (see page 19681)	Executes the adapter action and generates a response.
	HasExecuteAccess (see page 19651)	This is HasExecuteAccess, a member of class IAdapterActionAccess.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 24727)	Indicates whether this component appears in another component's list of Web items.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InIterator (see page 19721)	Indicates whether the object is iterating over its items.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsDefaultAction (see page 19768)	This is IsDefaultAction, a member of class IWebIsDefaultAction.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NextIteration (see page 19723)	Advances to the objects next item.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetActionName (see page 19783)	This is SetActionName, a member of class IWebSetActionName.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.
	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	StartIterator (see page 19724)	This is StartIterator, a member of class IIteratorSupport.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

	WebEnabled (see page 19752)	This is WebEnabled, a member of class IWebEnabled.

Public Properties

	Name	Description
	ActionModes (see page 7821)	Indicates what dataset adapter modes this field supports.
	ActionName (see page 7821)	Identifies the name of this action when using server-side script.
R	ActionName (see page 19755)	This is ActionName, a member of class IWebGetActionName.
R	ActionName (see page 24072)	Identifies the name of this action when using server-side script.
	ActionName (see page 24198)	Identifies the name of this action when using server-side script.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
R	DataSet (see page 7822)	Indicates the dataset on which this action operates.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	FailureOptions (see page 965)	This is FailureOptions, a member of class IGetAdapterActionRedirectOptions.
	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.
R	IsAdapterActionList (see page 19717)	This is IsAdapterActionList, a member of class IIsAdapterActionList.
R	ItemCount (see page 24074)	Returns the number of items defined by an adapter action.
R	ItemIndex (see page 24074)	Returns the index of the current item of an adapter action.
R	IteratorIndex (see page 19721)	Indicates the index of the current item.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
R	SuccessOptions (see page 965)	This is SuccessOptions, a member of class IGetAdapterActionRedirectOptions.
R	VariableName (see page 15329)	This is VariableName, a member of class IWebVariableName.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
R	Visible (see page 19652)	This is Visible, a member of class IAdapterActionAttributes.

Published Events

	Name	Description
	OnAfterExecute (see page 7994)	Called after the adapter action has executed.
	OnAfterGetResponse (see page 7995)	Called after the adapter action response is generated.
	OnBeforeExecute (see page 7995)	Called before the adapter action is executed.
	OnBeforeGetResponse (see page 7996)	Called before the adapter action response is generated.
	OnGetParams (see page 7996)	Specifies name/value pairs needed to execute this adapter action.

Published Properties

	Name	Description
	DisplayLabel (see page 7993)	Suggests a display label for this adapter action.
	ExecuteAccess (see page 7993)	Defines the rights required to execute this action.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	RedirectOptions (see page 7994)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	Tag (see page 2808)	Stores an integer value as part of a component.

41.1.19.2 TDataSetAdapterLastRowAction Methods

The methods of the TDataSetAdapterLastRowAction class are listed here.

Protected Methods

	Name	Description
	GetDefaultActionName (see page 7992)	Gets the default name used to reference this adapter action with server-side script.
	ImplExecuteActionRequest (see page 7992)	Executes the adapter action using parameters passed in the HTTP request.
	ImplWebEnabled (see page 7992)	Provides the underlying implementation for the WebEnabled method.

41.1.19.2.1 TDataSetAdapterLastRowAction.GetDefaultActionName Method

Gets the default name used to reference this adapter action with server-side script.

Pascal

```
function GetDefaultActionName: string; override;
```

C++

```
virtual __fastcall AnsiString GetDefaultActionName();
```

Description

GetDefaultActionName returns the name of the adapter action component. Descendants may override this function.

See Also

ImplGetActionName (see page 24063)

41.1.19.2.2 TDataSetAdapterLastRowAction.ImplExecuteActionRequest Method

Executes the adapter action using parameters passed in the HTTP request.

Pascal

```
procedure ImplExecuteActionRequest(AActionRequest: IActionRequest; AActionResponse:
IActionResponse); override;
```

C++

```
virtual __fastcall ImplExecuteActionRequest(IActionRequest AActionRequest, IActionResponse
AActionResponse);
```

Description

ImplExecuteActionRequest create a TStrings containing the name/value pairs in AActionRequest and calls the OnExecute event handler.

See Also

ImplExecuteActionRequest (see page 24063)

OnExecute (see page 24200)

41.1.19.2.3 TDataSetAdapterLastRowAction.ImplWebEnabled Method

Provides the underlying implementation for the WebEnabled method.

Pascal

```
function ImplWebEnabled: Boolean; override;
```

C++

```
virtual __fastcall Boolean ImplWebEnabled();
```

Description

The WebEnabled method calls ImplWebEnabled to determine whether the control or hyperlink for this action should appear enabled in the HTML form. WebEnabled returns true if controls should be enabled, false otherwise.

ImplWebEnabled generates an OnGetEnabled event so that you can specify whether controls for this action are enabled. If there is no OnGetEnabled event handler, ImplWebEnabled returns true if the parent adapter's GetKeyFields method returns a set of fields that can locate records in the associated dataset.

See Also

WebEnabled (see page 24071)

OnGetEnabled (see page 7823)

GetKeyFields (see page 7786)

41.1.19.3 TDataSetAdapterLastRowAction Properties

The properties of the TDataSetAdapterLastRowAction class are listed here.

Published Properties

	Name	Description
	DisplayLabel (see page 7993)	Suggests a display label for this adapter action.
	ExecuteAccess (see page 7993)	Defines the rights required to execute this action.
	RedirectOptions (see page 7994)	Indicates whether to perform an HTTP redirect after successfully executing this action.

41.1.19.3.1 TDataSetAdapterLastRowAction.DisplayLabel Property

Suggests a display label for this adapter action.

Pascal

```
property DisplayLabel: string;
```

C++

```
__property AnsiString DisplayLabel;
```

Description

Use this property to suggest a display label to use when generating HTML to display the a button or hyperlink to execute this adapter action. Typically the adapter action is displayed using server-side script, either generated or custom written. Server-side script uses the DisplayLabel property to access this value.

See Also

ImplGetDisplayLabel (see page 24064)

SetDisplayLabel (see page 24071)

41.1.19.3.2 TDataSetAdapterLastRowAction.ExecuteAccess Property

Defines the rights required to execute this action.

Pascal

```
property ExecuteAccess: string;
```

C++

```
__property AnsiString ExecuteAccess;
```

Description

The ExecuteAccess property defines the access rights required to execute this action. When server-side script accesses the CanExecute property, this value is checked against the end user's rights. Typically, an exception is raised when an end-user attempts to execute an adapter action that does not allow access.

See Also

TWebUserList (see page 25625)

hasexecuteaccess (see page 24162)

41.1.19.3.3 TDataSetAdapterLastRowAction.RedirectOptions Property

Indicates whether to perform an HTTP redirect after successfully executing this action.

Pascal

```
property RedirectOptions: TAdapterActionRedirectOptions;
```

C++

```
__property TAdapterActionRedirectOptions RedirectOptions;
```

Description

Set RedirectOptions to indicate that HTTP redirect should be performed after executing this adapter action. An HTTP redirect causes the browser to "forget" about the parameters passed when executing the adapter action. Without a redirect, the browser's Refresh or Reload command cause the last HTTP request to be resent, resulting in re-execution of the adapter action.

See Also

SendRedirect (see page 15201)

41.1.19.4 TDataSetAdapterLastRowAction Events

The events of the TDataSetAdapterLastRowAction class are listed here.

Published Events

	Name	Description
	OnAfterExecute (see page 7994)	Called after the adapter action has executed.
	OnAfterGetResponse (see page 7995)	Called after the adapter action response is generated.
	OnBeforeExecute (see page 7995)	Called before the adapter action is executed.
	OnBeforeGetResponse (see page 7996)	Called before the adapter action response is generated.
	OnGetParams (see page 7996)	Specifies name/value pairs needed to execute this adapter action.

41.1.19.4.1 TDataSetAdapterLastRowAction.OnAfterExecute Event

Called after the adapter action has executed.

Pascal

```
property OnAfterExecute: TActionExecuteEvent;
```

C++

```
__property TActionExecuteEvent OnAfterExecute;
```

Description

Implement OnAfterExecute to do something after the action has executed. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. OnAfterExecute is called by DoAfterExecuteActionRequest.

See Also

DoAfterExecuteActionRequest (see page 24051)

OnAfterExecuteAction (see page 24184)

OnBeforeExecute (see page 24076)

41.1.19.4.2 TDataSetAdapterLastRowAction.OnAfterGetResponse Event

Called after the adapter action response is generated.

Pascal

```
property OnAfterGetResponse: TActionExecuteEvent;
```

C++

```
__property TActionExecuteEvent OnAfterGetResponse;
```

Description

Implement OnAfterGetResponse to do something after the action response is generated. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. OnAfterGetResponse is called by DoAfterGetExecuteActionReponse.

See Also

DoBeforeGetExecuteActionResponse (see page 24052)

OnAfterGetResponse (see page 24075)

OnBeforeGetActionResponse (see page 24186)

41.1.19.4.3 TDataSetAdapterLastRowAction.OnBeforeExecute Event

Called before the adapter action is executed.

Pascal

```
property OnBeforeExecute: TActionExecuteHandledEvent;
```

C++

```
__property TActionExecuteHandledEvent OnBeforeExecute;
```

Description

Implement OnBeforeExecute to do something before the action is executed. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. Set the Handled flag to prevent the action from being executed. OnBeforeExecute is called by DoBeforeExecuteActionRequest.

See Also

DoBeforeExecuteActionRequest (see page 24052)

OnAfterExecute (see page 24075)

OnBeforeExecuteAction (see page 24186)

41.1.19.4.4 TDataSetAdapterLastRowAction.OnBeforeGetResponse Event

Called before the adapter action response is generated.

Pascal

```
property OnBeforeGetResponse: TActionExecuteHandledEvent;
```

C++

```
__property TActionExecuteHandledEvent OnBeforeGetResponse;
```

Description

Implement OnBeforeGetResponse to do something before the action response is generated. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. Set the Handled flag to indicate that the response has been generated and no further processing is needed. OnBeforeGetResponse is called by DoBeforeGetExecuteActionReponse.

See Also

DoBeforeGetExecuteActionResponse (see page 24052)

OnAfterGetResponse (see page 24075)

OnBeforeGetActionResponse (see page 24186)

41.1.19.4.5 TDataSetAdapterLastRowAction.OnGetParams Event

Specifies name/value pairs needed to execute this adapter action.

Pascal

```
property OnGetParams: TActionGetParamsEvent;
```

C++

```
__property TActionGetParamsEvent OnGetParams;
```

Description

Implement this event handler to specify the name/value needed to execute this action. For example, an action that deletes a row in a table will need a name/value pair that identifies the row to be deleted such as "Key=123".

See Also

ImplGetAdapterItemRequestParams (see page 24063)

41.1.20 TDataSetAdapterMemoField Class

The TDataSetAdapterMemoField represents a memo field in a dataset.

Class Hierarchy

Pascal

```
TDataSetAdapterMemoField = class(TCustomDataSetAdapterMemoField);
```

C++

```
class TDataSetAdapterMemoField : public TCustomDataSetAdapterMemoField;
```

File

DBAdapt

Description

Add TDataSetAdapterMemoField as a child of a TDataSetAdapter (see page 7872) component to represent a memo field in the dataset associated with the dataset adapter. TDataSetAdapterMemoField represents a single field from a database table, and enables server-side script to refer to or update that field's value. When generating an HTML form or grid displaying dataset fields, server-side script calls the TDataSetAdapterMemoField to retrieve the value of the dataset field and write the value to the HTML content. When executing a TDataSetAdapter (see page 7872) action, the TDataSetAdapterMemoField is responsible for validating and updating the dataset field.

TDataSetAdapterField (see page 7960) supports several properties that can be used in server-side script. These include:

Value, which is the current value of the field.

DisplayText, which represents the current value of the field as a text string.

DisplayStyle and InputStyle, which indicate the type of control that should represent the field value in HTML forms.

DisplayLabel, which provides a text label that can be used to label HTML controls that represent the field.

Required, which indicates whether the field requires a value.

Visible, which indicates whether HTML forms should include a control for this field.

See Also

TMemoField (see page 7348)

TDataSetAdapter (see page 7872)

TAdapterDisplayField (see page 25109)

TAdapterDisplayColumn (see page 25099)

TDataSetAdapterField (see page 7960)

TDataSetAdapterImageField (see page 8138)

41.1.20.1 TDataSetAdapterMemoField Members

The following tables list the members exposed by TDataSetAdapterMemoField.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	AsFormatted (see page 23931)	Returns text used to generate a representation of the adapter field value.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	CheckModifyAccess (see page 23931)	Checks end-user rights to modify the adapter field value.
	CheckOrigValue (see page 7736)	Ensures that the current value of this field is the same as the original value.
	CheckOrUpdateValue (see page 7845)	Called by ImplUpdateValue (see page 7846) and by ImplCheckValueChange (see page 7845).
	CheckValueChange (see page 7737)	Indicates whether the current value of this field is the same as the original value.
	CheckViewAccess (see page 23931)	Checks end-user rights to view the adapter field value.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	FullyQualifyInputName (see page 7738)	Indicates whether references to this field in HTML forms must be qualified with the name of the parent adapter.
V	FullyQualifyInputName (see page 23932)	Indicates whether the HTML input names must be qualified with the name of the adapter.
	GetAdapter (see page 7738)	Returns the value of the Adapter (see page 7752) property.
	GetAdapter (see page 23932)	GetAdapter returns the parent adapter component.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.

	GetContainerList (see page 24727)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
	GetDataSet (see page 7738)	Returns the dataset associated with this field's parent adapter.
V	GetDataSetFieldValue (see page 7739)	Returns the value of the associated dataset field.
V	GetDefaultDisplayLabel (see page 23932)	Provides the default display label for this adapter field.
V	GetDefaultFieldName (see page 23932)	Gets the default name used to reference this adapter field with server-side script.
	GetDisplayLabel (see page 23933)	Returns the suggested display label for this adapter field.
	GetDisplayStyle (see page 7739)	Returns a string value that suggests an HTML display style for this adapter field.
V	GetDisplayStyleType (see page 7740)	Returns the HTML display style type for this adapter field.
	GetDisplayWidth (see page 23933)	Returns the suggested display width for this adapter field.
	GetEchoActionFieldValue (see page 23933)	Returns the value of the echo flag.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetInputName (see page 23934)	Identifies the name to use when generating an HTML input for this adapter field.
	GetInputStyle (see page 7741)	Returns a string value that suggests an HTML editing style for this adapter field.
V	GetInputStyleType (see page 7742)	Returns the style of the HTML control to use for editing this adapter field.
V	GetInputStyleType (see page 7845)	Returns htmliTextArea to indicate that this field should be represented by an HTML TextArea.
	GetKeyName (see page 7742)	Returns the name of the associated dataset field if it appears in the index (key) that the parent dataset adapter uses.
	GetKeyParams (see page 7743)	Returns a list of fields that the parent dataset adapter uses to locate records, along with their current values in that adapter's dataset.
	GetMaxLength (see page 23934)	Returns the maximum length, in characters, that the user should be allowed to enter when entering a value for this adapter field.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetReadOnly (see page 7743)	Indicates whether the adapter field represents a read-only database field.
	GetRequired (see page 23934)	Indicates whether the end-user must enter a value for this adapter field.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetValue (see page 23935)	Gets the value of this adapter field as a Variant.
	GetVariableName (see page 23935)	Gets the name used to reference this adapter field with server-side script.
	GetViewMode (see page 7744)	Returns a string value that indicates what function a control that represents this field should perform.
V	GetViewModeType (see page 7744)	Returns the view mode for the function a control that represents this field should perform.
	GetVisible (see page 23935)	Indicates whether the value of this adapter field should be displayed to the end-user.
V	GetWebSnapObjClass (see page 23936)	Returns the class type for this adapter field.
	HasModifyAccess (see page 23936)	Checks the end-user's right to modify this adapter field.
	HasViewAccess (see page 23936)	Checks the end-user's right to view this adapter field.
V	ImplAsFormatted (see page 7745)	Provides the underlying implementation for the AsFormatted method.
V	ImplAsFormatted (see page 7845)	Returns the text that is used to display a read only representation of the dataset field.
V	ImplAsFormatted (see page 23937)	Returns text used to generate a representation of the adapter field value.
V	ImplCheckOrigValue (see page 7745)	Provides the underlying implementation for the CheckOrigValue (see page 7736) method.
V	ImplCheckValueChange (see page 7746)	Provides the underlying implementation for the CheckValueChange (see page 7737) method.
V	ImplCheckValueChange (see page 7845)	Indicates whether the data was changed by the user.
V	ImplGetDisplayLabel (see page 7747)	Provides the underlying implementation for the GetDisplayLabel method.
V	ImplGetDisplayLabel (see page 23937)	Returns the suggested display label for this adapter field.
V	ImplGetDisplayWidth (see page 7747)	Provides the underlying implementation for the GetDisplayWidth method.
V	ImplGetDisplayWidth (see page 23937)	Returns the suggested display width for this adapter field.
V	ImplGetEchoActionFieldValue (see page 7763)	Provides the underlying implementation for the GetEchoActionFieldValue method.
V	ImplGetEchoActionFieldValue (see page 23938)	Returns the value of the echo flag.
V	ImplGetInputName (see page 23938)	Identifies the name to use when generating the HTML input for this adapter field.

	ImplGetMaxLength (see page 23938)	Returns the maximum length, in characters, that the user should be allowed to enter when entering a value for this adapter field.
	ImplGetRequired (see page 7747)	Provides the underlying implementation for the GetRequired method.
	ImplGetRequired (see page 23939)	Indicates whether the end-user must enter a value for this adapter field.
	ImplGetValue (see page 7748)	Provides the underlying implementation for the GetValue method.
	ImplGetValue (see page 7846)	Returns either the value of the associated dataset field as a Variant, or the last value entered by the end user.
	ImplGetValue (see page 23939)	Gets the value of this adapter field as a Variant.
	ImplGetVariableName (see page 23939)	Gets the name used to reference this adapter field with server-side script.
	ImplGetVisible (see page 7748)	Provides the underlying implementation for the GetVisible method.
	ImplGetVisible (see page 23940)	Indicates whether the value of this adapter field should be displayed to the end-user.
	ImplHasModifyAccess (see page 23940)	Checks the end-user's right to modify this adapter field.
	ImplHasViewAccess (see page 23940)	Checks the end-user's right to view this adapter field.
	ImplSetEchoActionFieldValue (see page 7763)	Provides the underlying implementation for the SetEchoActionFieldValue method.
	ImplSetEchoActionFieldValue (see page 23941)	Sets the echo flag for this adapter field.
	ImplSetFieldName (see page 7749)	Provides the underlying implementation for the SetFieldName method.
	ImplSetFieldName (see page 23941)	Sets the name that is used to reference this adapter field with server-side script.
	ImplUpdateValue (see page 7749)	Provides the underlying implementation for the UpdateValue (see page 7751) method.
	ImplUpdateValue (see page 7846)	Verifies that the field has modify access rights, and if so updates the value for this TCustomDataSetAdapterMemoField (see page 7837).
	ImplValidateValue (see page 7764)	Provides the underlying implementation for the ValidateValue (see page 7765) method.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsDefaultField (see page 24728)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	Notification (see page 7750)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	ParentChanged (see page 23941)	Handles movement of the component to a different parent.
	ParentChanged (see page 24728)	Responds when the WebParent (see page 24731) property changes.
	PrepareDataSet (see page 7750)	Responds when the parent dataset adapter prepares its dataset.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	ReadState (see page 24729)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDataSetField (see page 7751)	Sets the value of the DataSetField (see page 7752) property.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetEchoActionFieldValue (see page 23942)	Sets the echo flag for this adapter field.
	SetFieldName (see page 23942)	Sets the name that is used to reference this adapter field with server-side script.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	SetParentComponent (see page 24729)	Sets the WebParent (see page 24731) property to be the same as this component's parent.
	SetWebParent (see page 24730)	Sets the value of the WebParent (see page 24731) property.
	TestValueChange (see page 7764)	Checks whether a new value matches the current value of this field.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.

	UpdateValue (see page 7751)	Updates the adapter field when the user assigns a new value.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	ValidateValue (see page 7765)	Validates a new value for this field that appears in the current request.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	Adapter (see page 7752)	Indicates the dataset adapter that uses this object to represent one of its fields.
R	Adapter (see page 23943)	Returns the parent adapter component.
R	WebContainedComponentHelper (see page 24730)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.
R	WebParent (see page 24731)	Indicates the component that uses this TWebContainedComponent (see page 24722) as one of its Web items.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	AsFormatted (see page 19682)	This is AsFormatted, a member of class IAsFormatted.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	CheckValueChange (see page 24570)	This is CheckValueChange, a member of class ICheckValueChange.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
V	Create (see page 7735)	Creates and initializes an instance of TBaseDataSetAdapterField (see page 7729).
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	Create (see page 24726)	Creates and initializes an instance of TWebContainedComponent (see page 24722).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Destroy (see page 24726)	Frees an instance of TWebContainedComponent (see page 24722).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FindField (see page 7737)	Returns the dataset field whose value this adapter field represents.

	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.
	GetDisplayLabel (see page 19756)	This is GetDisplayLabel, a member of class IWebGetDisplayLabel.
	GetDisplayStyle (see page 19700)	Returns the preferred display style for an adapter field or adapter action.
	GetDisplayWidth (see page 19757)	This is GetDisplayWidth, a member of class IWebGetDisplayWidth.
	GetEchoActionFieldValue (see page 24573)	This is GetEchoActionFieldValue, a member of class IEchoActionFieldValue.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetFieldName (see page 19758)	This is GetFieldName, a member of class IWebGetFieldName.
	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	GetInputName (see page 19767)	This is GetInputName, a member of class IWebInputName.
	GetInputStyle (see page 19700)	Returns the preferred editing style for an adapter field.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetKeyName (see page 8105)	This is GetKeyName, a member of class IGetDataSetKeyName.
	GetMaxLength (see page 19763)	This is GetMaxLength, a member of class IWebGetMaxLength.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 24727)	Returns the object that uses this component to generate HTML.
	GetRequired (see page 19668)	This is GetRequired, a member of class IAdapterFieldAttributes.
	GetValue (see page 19759)	This is GetValue, a member of class IWebGetFieldValue.
	GetVariableName (see page 15329)	This is GetVariableName, a member of class IWebVariableName.
	GetViewMode (see page 19701)	Returns the preferred mode of an adapter field.
	GetVisible (see page 19668)	This is GetVisible, a member of class IAdapterFieldAttributes.
	HasModifyAccess (see page 19667)	This is HasModifyAccess, a member of class IAdapterFieldAccess.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 24727)	Indicates whether this component appears in another component's list of Web items.
	HasViewAccess (see page 19667)	This is HasViewAccess, a member of class IAdapterFieldAccess.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	PrepareDataSet (see page 8109)	This is PrepareDataSet, a member of class IPrepareDataSet.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.
	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.
	SetEchoActionFieldValue (see page 24573)	This is SetEchoActionFieldValue, a member of class IEchoActionFieldValue.
	SetFieldName (see page 19784)	This is SetFieldName, a member of class IWebSetFieldName.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	UpdateValue (see page 24584)	This is UpdateValue, a member of class IUpdateValue.
	ValidateValue (see page 24585)	This is ValidateValue, a member of class IValidateValue.

Public Properties

	Name	Description
R	ActionOrigValue (see page 23943)	Retrieve the original value of this adapter field.
R	ActionValue (see page 23943)	Retrieve the value for this adapter field entered by the end-user.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	EchoActionFieldValue (see page 24574)	This is EchoActionFieldValue, a member of class IEchoActionFieldValue.
	EchoActionFieldValue (see page 23944)	Used to echo the value(s) entered by the end-user when generating an HTML form.
R	FieldName (see page 19758)	This is FieldName, a member of class IWebGetFieldName.
	FieldName (see page 23944)	Identifies the name of this field when using server-side script.
	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.
R	InputName (see page 19767)	This is InputName, a member of class IWebInputName.
R	KeyName (see page 8105)	This is KeyName, a member of class IGetDataSetKeyName.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
R	Required (see page 19669)	This is Required, a member of class IAdapterFieldAttributes.
R	Value (see page 19760)	This is Value, a member of class IWebGetFieldValue.
R	Value (see page 23945)	Provides the value of an adapter field as a variant.
R	VariableName (see page 15329)	This is VariableName, a member of class IWebVariableName.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
R	Visible (see page 19669)	This is Visible, a member of class IAdapterFieldAttributes.

Published Events

	Name	Description
	OnGetDisplayText (see page 8007)	Occurs when the adapter field needs to supply its formatted value as a string that can appear in HTML forms.
	OnGetValue (see page 8007)	Occurs when the adapter field needs to supply its value as a Variant.
	OnValidateValue (see page 8008)	Occurs when the parent adapter wants to validate the new value for this field.

Published Properties

	Name	Description
	DataSetField (see page 8004)	Specifies the name of the dataset field that this adapter field represents.
	FieldFlags (see page 8004)	Indicates various attributes of the adapter field.
	FieldModes (see page 8005)	Indicates what dataset adapter modes this field supports.
	ModifyAccess (see page 8005)	Identifies the rights required to update this field.

	Name (see page 2805)	Specifies the name of the component as referenced in code.
	OnUpdateValue (see page 8006)	Occurs when the WebSnap application updates this adapter field's value based on in incoming request.
	Tag (see page 2808)	Stores an integer value as part of a component.
	ViewAccess (see page 8006)	Identifies the rights required to view this field.

41.1.20.2 TDataSetAdapterMemoField Properties

The properties of the TDataSetAdapterMemoField class are listed here.

Published Properties

	Name	Description
	DataSetField (see page 8004)	Specifies the name of the dataset field that this adapter field represents.
	FieldFlags (see page 8004)	Indicates various attributes of the adapter field.
	FieldModes (see page 8005)	Indicates what dataset adapter modes this field supports.
	ModifyAccess (see page 8005)	Identifies the rights required to update this field.
	OnUpdateValue (see page 8006)	Occurs when the WebSnap application updates this adapter field's value based on in incoming request.
	ViewAccess (see page 8006)	Identifies the rights required to view this field.

41.1.20.2.1 TDataSetAdapterMemoField.DataSetField Property

Specifies the name of the dataset field that this adapter field represents.

Pascal

```
property DataSetField: string;
```

C++

```
__property AnsiString DataSetField;
```

Description

DataSetField is the FieldName of the TField object whose value this adapter field represents. DataSetField can be the name of a simple field in a database table, the name of a subfield of an object field that has been qualified by the parent field's name, or the name of an aggregated field.

DataSetField is the same as the name of this adapter field in server-side script, except that the name of the adapter field omits any illegal characters (the only legal characters are the letters between a and z (or A and Z), digits, and the underline character).

If DataSetField is an empty string, this adapter field does not have a value, and the FindField method returns nil (Delphi) or NULL (C++).

See Also

FieldName (see page 7164)

FindField (see page 7737)

41.1.20.2.2 TDataSetAdapterMemoField.FieldFlags Property

Indicates various attributes of the adapter field.

Pascal

```
property FieldFlags: TDataSetAdapterFieldFlags;
```

C++

```
__property TDataSetAdapterFieldFlags FieldFlags;
```

Description

FieldFlags indicates special uses of the value of this adapter field. This is a set that can indicate whether the value corresponds to a key field in the database (used to locate database records) and whether HTML forms store the original value of the field as a hidden field so that the application can detect changes to the field value.

See Also

IsIndexField (see page 7168)

DataSetField (see page 7752)

GetKeyName (see page 7742)

GetKeyFields (see page 7786)

41.1.20.2.3 TDataSetAdapterMemoField.FieldModes Property

Indicates what dataset adapter modes this field supports.

Pascal

```
property FieldModes: TDataSetAdapterModes;
```

C++

```
__property TDataSetAdapterModes FieldModes;
```

Description

FieldModes is a set of all the modes in which this adapter field can be used. If the parent dataset adapter is in a mode that is not included in this set, any forms generated using that adapter do not include a control to represent this field. Thus, for example, to make a field read-only, you can exclude amInsert and amEdit from FieldModes. Then, the field appears when the user is viewing or querying the dataset, but not when the user is editing or inserting a record.

CanModify (see page 7154)

Adapter (see page 7752)

Mode (see page 7810)

GetDisplayStyle (see page 7739)

GetInputStyle (see page 7741)

GetViewMode (see page 7744)

41.1.20.2.4 TDataSetAdapterMemoField.ModifyAccess Property

Identifies the rights required to update this field.

Pascal

```
property ModifyAccess: string;
```

C++

```
__property AnsiString ModifyAccess;
```

Description

The ModifyAccess property defines the access rights required to modify this field. When server-side script accesses the CanModify property, this value is checked against the end user's rights. Typically, an exception is raised when an end-user

attempts to updates an adapter field that does not allow access.

See Also

TWebUserList (see page 25625)

hasmodifyaccess (see page 24162)

41.1.20.2.5 TDataSetAdapterMemoField.OnUpdateValue Property

Occurs when the WebSnap application updates this adapter field's value based on in incoming request.

Pascal

```
property OnUpdateValue: TDatasetAdapterFieldValueEvent;
```

C++

```
__property TDatasetAdapterFieldValueEvent OnUpdateValue;
```

Description

Write an OnUpdateValue event handler to provide your own mechanism for updating the corresponding database field when the WebSnap application updates this adapter field's value. If you supply an OnUpdateValue event handler, the dataset adapter field assumes you have handled the update and does not write the new value to the associated dataset field. If there is no OnUpdateValue event handler, the dataset adapter field writes the field value to the associated dataset field.

Note: TBaseDataSetAdapterInputField defines but does not generate this event. Instead, descendant classes generate this event when updating the adapter field value. If you create your own TBaseDataSetAdapterInputField descendant, you must generate this event from your implementation of the UpdateValue method.

See Also

Value (see page 7180)

Value (see page 23945)

OnGetValue (see page 7754)

ImplUpdateValue (see page 7749)

41.1.20.2.6 TDataSetAdapterMemoField.ViewAccess Property

Identifies the rights required to view this field.

Pascal

```
property ViewAccess: string;
```

C++

```
__property AnsiString ViewAccess;
```

Description

The ViewAccess property identifies the access rights required to view this field. When server-side script accesses the CanView property, this value is checked against the end user's rights. Typically, an exception is raised when an end-user attempts to view an adapter field that does not allow access.

See Also

TWebUserList (see page 25625)

HasViewAccess (see page 24162)

41.1.20.3 TDataSetAdapterMemoField Events

The events of the TDataSetAdapterMemoField class are listed here.

Published Events

	Name	Description
	OnGetDisplayText (see page 8007)	Occurs when the adapter field needs to supply its formatted value as a string that can appear in HTML forms.
	OnGetValue (see page 8007)	Occurs when the adapter field needs to supply its value as a Variant.
	OnValidateValue (see page 8008)	Occurs when the parent adapter wants to validate the new value for this field.

41.1.20.3.1 TDataSetAdapterMemoField.OnGetDisplayText Event

Occurs when the adapter field needs to supply its formatted value as a string that can appear in HTML forms.

Pascal

```
property OnGetDisplayText: TDataSetAdapterFieldGetStringEvent;
```

C++

```
__property TDataSetAdapterFieldGetStringEvent OnGetDisplayText;
```

Description

TBaseDataSetAdapterField generates this event when supplying the read-only text representation of the field's value. This allows the WebSnap application to dynamically supply the formatted value of the field. Server-side script can access the resulting string using the DisplayText property.

Note: If you do not supply an OnGetDisplayText event handler, TBaseDataSetAdapterField uses the field component's DisplayText property.

See Also

DisplayText (see page 7162)

Value (see page 23945)

OnGetValue (see page 7754)

41.1.20.3.2 TDataSetAdapterMemoField.OnGetValue Event

Occurs when the adapter field needs to supply its value as a Variant.

Pascal

```
property OnGetValue: TDataSetAdapterFieldGetValueEvent;
```

C++

```
__property TDataSetAdapterFieldGetValueEvent OnGetValue;
```

Description

TBaseDataSetAdapterField generates an OnGetValue event when the WebSnap application reads its Value property. This allows the adapter field to dynamically supply the value for the field. For example, you can use this event to decrypt values that are stored in the database in an encrypted form.

Note: If you do not supply an OnGetValue event handler, TBaseDataSetAdapterField uses the field component's Value property.

See Also

Value (see page 7180)

Value (see page 23945)

OnGetDisplayText (see page 7754)

41.1.20.3.3 TDataSetAdapterMemoField.OnValidateValue Event

Occurs when the parent adapter wants to validate the new value for this field.

Pascal

```
property OnValidateValue: TDataAdapterFieldValidateValueEvent;
```

C++

```
__property TDataAdapterFieldValidateValueEvent OnValidateValue;
```

Description

Write an OnValidateValue event handler to provide your own validation of new field values before the WebSnap application attempts to update this field's value. If the new Value is not valid, the OnValidateValue event handler should raise an exception.

The parent dataset adapter generates this event when it receives new field values from an update request message.

See Also

Adapter (see page 7752)

Value (see page 23945)

OnGetValue (see page 7754)

OnValidate (see page 7183)

41.1.21 TDataSetAdapterMoveRowAction Class

TDataSetAdapterMoveRowAction is the base class for adapter actions that change the current record of a dataset.

Class Hierarchy

Pascal

```
TDataSetAdapterMoveRowAction = class(TCustomDataSetAdapterRowAction);
```

C++

```
class TDataSetAdapterMoveRowAction : public TCustomDataSetAdapterRowAction;
```

File

DBAdapt

Description

TDataSetAdapterMoveRowAction is the base class for all adapter action objects that change the current record of the dataset associated with a dataset adapter. TDataSetAdapterMoveRowAction descendants are included as the actions of a dataset adapter (TDataSetAdapter (see page 7872)). Each TDataSetAdapterMoveRowAction descendant can be executed to change the current record of the parent adapter's dataset.

Do not use TDataSetAdapterMoveRowAction directly. It is intended only as a base class. Instead, use a TDataSetAdapterMoveRowAction descendant such as TDataSetAdapterFirstRowAction (see page 7972), TDataSetAdapterLastRowAction (see page 7984), TDataSetAdapterNextRowAction (see page 8030), or TDataSetAdapterPrevRowAction (see page 8042).

See Also

TDataSetAdapterFirstRowAction (see page 7972)

TDataSetAdapterLastRowAction (see page 7984)

TDataSetAdapterNextRowAction (see page 8030)

TDataSetAdapterPrevRowAction (see page 8042)

TDataSetAdapter (see page 7872)

41.1.21.1 TDataSetAdapterMoveRowAction Members

The following tables list the members exposed by TDataSetAdapterMoveRowAction.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	CheckExecuteAccess (see page 24050)	Checks end-user rights to execute this adapter action.
	CreateRequestContext (see page 24050)	Creates an object that describes the adapter action parameters and adapter field values.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DoAfterExecuteActionRequest (see page 24051)	Calls event handlers after the adapter action is executed.
V	DoAfterGetExecuteActionResponse (see page 24051)	Calls event handlers after the adapter action response is formulated.
V	DoBeforeExecuteActionRequest (see page 24052)	Calls event handlers before the adapter action is executed.
V	DoBeforeGetExecuteActionResponse (see page 24052)	Calls event handlers before the adapter action response is formulated.
	EndIterator (see page 24053)	Implements IIteratorSupport's EndIterator method.
	ExecuteActionRequest (see page 24053)	Executes the adapter action using parameters passed in the HTTP request.
	GetActionName (see page 24054)	Gets the name used to reference this adapter action with server-side script.
	GetAdapter (see page 7819)	Returns the value of the Adapter (see page 7822) property.
	GetAdapter (see page 24054)	GetAdapter returns the parent adapter component.
	GetAdapterItemRequestParams (see page 24055)	Provides the name/value pairs needed to execute this adapter action.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetContainerList (see page 24727)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
	GetDataSet (see page 7819)	Returns the value of the DataSet (see page 7822) property.
V	GetDefaultActionName (see page 24055)	Gets the default name used to reference this adapter action with server-side script.
V	GetDefaultDisplayLabel (see page 24055)	Provides the default display label for this adapter action.
	GetDisplayLabel (see page 24055)	Returns the suggested display label for this adapter action.
	GetDisplayStyle (see page 24056)	Returns a string value to suggest an HTML display style for this adapter action.
V	GetDisplayStyleType (see page 24056)	Suggests an HTML display type for this adapter action.
	GetErrors (see page 24057)	This is GetErrors, a member of class TBaseAdapterAction.
	GetExecuteActionResponse (see page 24057)	Generates a response after the adapter action has been executed.
	GetFailureOptions (see page 24057)	Indicates whether to perform an HTTP redirect after execution of this adapter action fails.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetInputStyle (see page 24058)	Returns a string value to suggest an HTML display style for this adapter action.

	GetIsAdapterActionList (see page 24058)	Indicates whether this adapter action may have multiple commands.
	GetItemCount (see page 24058)	Returns the number of commands defined by this adapter action.
	GetIteratorIndex (see page 24059)	Implements IIteratorIndex's GetIteratorIndex method.
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetSuccessOptions (see page 24059)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetVariableName (see page 24060)	Gets the name used to reference this adapter action with server-side script.
	GetViewMode (see page 24060)	Returns a string value to suggest a view mode for this adapter action.
	GetViewModeType (see page 24060)	Suggests a view mode for this adapter action.
	GetVisible (see page 24061)	Indicates whether a button or hyperlink for this adapter action should be displayed on the HTML page.
	GetWebSnapObjClass (see page 24061)	Returns the class type for this adapter field.
	HandleRequest (see page 24061)	Executes the adapter action and generates a response.
	HasExecuteAccess (see page 24062)	Checks the end-user's right to execute this adapter action.
	ImplCreateRequestContext (see page 24062)	Creates an object that describes the action parameters and field values.
	ImplEndIterator (see page 24062)	Implements IIteratorSupport's EndIterator (see page 24053) method.
	ImplExecuteActionRequest (see page 24063)	Executes the adapter action using parameters passed in the HTTP request.
	ImplExecuteActionRequest (see page 24195)	Executes the adapter action using parameters passed in the HTTP request.
	ImplGetActionName (see page 24063)	Gets the name used to reference this adapter action with server-side script.
	ImplGetActionName (see page 24195)	Gets the name used to reference this adapter action with server-side script.
	ImplGetAdapterItemRequestParams (see page 7854)	Provides the underlying implementation for the GetAdapterItemRequestParams method.
	ImplGetAdapterItemRequestParams (see page 24063)	Provides the name/value pairs needed to execute this adapter action.
	ImplGetAdapterItemRequestParams (see page 24196)	Provides the name/value pairs needed to execute this adapter action.
	ImplGetDisplayLabel (see page 24064)	Returns the suggested display label for this adapter action.
	ImplGetExecuteActionResponse (see page 24064)	Generates a response after the adapter action has been executed.
	ImplGetFailureOptions (see page 24065)	Indicates whether to perform an HTTP redirect after execution of this adapter action fails.
	ImplGetIsAdapterActionList (see page 24065)	Indicates whether this adapter action may have multiple commands.
	ImplGetIteratorIndex (see page 24065)	Implements IIteratorIndex's GetIteratorIndex (see page 24059) method.
	ImplGetSuccessOptions (see page 24066)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	ImplGetSuccessOptions (see page 24196)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	ImplGetVariableName (see page 24066)	Gets the name used to reference this adapter action with server-side script.
	ImplGetVisible (see page 7819)	Provides the underlying implementation for the GetVisible method.
	ImplGetVisible (see page 24066)	Indicates whether a button or hyperlink for this adapter action should be displayed on the HTML page.
	ImplHandleRequest (see page 24067)	Executes the adapter action and generates a response.
	ImplHasExecuteAccess (see page 24067)	Checks the end-user's right to execute this adapter action.
	ImplInIterator (see page 24067)	Implements IIteratorIndex's InIterator (see page 24069) method.
	ImplIsDefaultAction (see page 8016)	Provides the underlying implementation for the IsDefaultAction method.
	ImplNextIteration (see page 24068)	Implements IIteratorSupport's NextIteration (see page 24070) method.
	ImplSetActionName (see page 24197)	Sets the name that is used to reference this adapter action with server-side script.
	ImplStartIterator (see page 24068)	Implements IIteratorSupport's StartIterator (see page 24071) method.
	ImplWebEnabled (see page 7820)	Provides the underlying implementation for the WebEnabled method.
	ImplWebEnabled (see page 7855)	Provides the underlying implementation for the WebEnabled method.
	ImplWebEnabled (see page 24069)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.
	ImplWebEnabled (see page 24197)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.
	InIterator (see page 24069)	Implements IIteratorIndex's InIterator method.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.

	IsDefaultAction (see page 24070)	Indicates whether this adapter action should be added, by default, to the parent adapter.
V	IsDefaultField (see page 24728)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	NextIteration (see page 24070)	Implements IIteratorSupport's NextIteration method.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	ParentChanged (see page 24070)	Handles movement of the component to a different parent.
V	ParentChanged (see page 24728)	Responds when the WebParent (see page 24731) property changes.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 24729)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetActionName (see page 24197)	Sets the name that is used to reference this adapter action with server-side script.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDisplayLabel (see page 24071)	Set the value of the DisplayLabel (see page 24073) property.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 24729)	Sets the WebParent (see page 24731) property to be the same as this component's parent.
	SetWebParent (see page 24730)	Sets the value of the WebParent (see page 24731) property.
	StartIterator (see page 24071)	Implements IIteratorSupport's StartIterator method.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WebEnabled (see page 24071)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	Adapter (see page 7822)	Indicates the dataset adapter that uses this object to represent one of its actions.
R	Adapter (see page 24072)	Provides access to the parent adapter component.
R	Errors (see page 24073)	This is Errors, a member of class TBaseAdapterAction.
R	WebContainedComponentHelper (see page 24730)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.
R	WebParent (see page 24731)	Indicates the component that uses this TWebContainedComponent (see page 24722) as one of its Web items.

Public Events

	Name	Description
	OnAfterExecute (see page 24075)	Called after the adapter action has executed.
	OnAfterExecute (see page 24198)	Called after the adapter action has executed.
	OnAfterGetResponse (see page 24075)	Called after the adapter action response is generated.

	OnAfterGetResponse (see page 24199)	Called after the adapter action response is generated.
	OnBeforeExecute (see page 24076)	Called before the adapter action is executed.
	OnBeforeExecute (see page 24199)	Called before the adapter action is executed.
	OnBeforeGetResponse (see page 24076)	Called before the adapter action response is generated.
	OnBeforeGetResponse (see page 24200)	Called before the adapter action response is generated.
	OnExecute (see page 7822)	Occurs when server-side script executes this action.
	OnExecute (see page 24200)	Called to execute this action using parameters passed in the HTTP request.
	OnGetEnabled (see page 7823)	Occurs when the WebSnap application to determine whether a control or hyperlink for this action should be enabled.
	OnGetEnabled (see page 24200)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.
	OnGetParams (see page 24077)	Specifies name/value pairs needed to execute this adapter action.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
V	Create (see page 7818)	Creates and initializes an instance of TCustomDataSetAdapterAction (see page 7811).
V	Create (see page 7853)	Creates and initializes an instance of TCustomDataSetAdapterRowAction (see page 7846).
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	Create (see page 24726)	Creates and initializes an instance of TWebContainedComponent (see page 24722).
	CreateRequestContext (see page 19681)	Creates an object that describes the adapter action parameters and adapter field values.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Destroy (see page 24726)	Frees an instance of TWebContainedComponent (see page 24722).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	EndIterator (see page 19723)	This is EndIterator, a member of class IIteratorSupport.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.

	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetActionName (see page 19755)	This is GetActionName, a member of class IWebGetActionName.
	GetAdapterItemRequestParams (see page 19692)	This is GetAdapterItemRequestParams, a member of class IGetAdapterItemRequestParams.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.
	GetDisplayLabel (see page 19756)	This is GetDisplayLabel, a member of class IWebGetDisplayLabel.
	GetDisplayStyle (see page 19700)	Returns the preferred display style for an adapter field or adapter action.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetFailureOptions (see page 964)	This is GetFailureOptions, a member of class IGetAdapterActionRedirectOptions.
	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	GetInputStyle (see page 19700)	Returns the preferred editing style for an adapter field.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIsAdapterActionList (see page 19717)	This is GetIsAdapterActionList, a member of class IIsAdapterActionList.
	GetIteratorIndex (see page 19721)	Returns the value of the IteratorIndex (see page 19721) property.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 24727)	Returns the object that uses this component to generate HTML.
	GetSuccessOptions (see page 964)	This is GetSuccessOptions, a member of class IGetAdapterActionRedirectOptions.
	GetVariableName (see page 15329)	This is GetVariableName, a member of class IWebVariableName.
	GetViewMode (see page 19701)	Returns the preferred mode of an adapter field.
	GetVisible (see page 19652)	This is GetVisible, a member of class IAdapterActionAttributes.
	HandleRequest (see page 19681)	Executes the adapter action and generates a response.
	HasExecuteAccess (see page 19651)	This is HasExecuteAccess, a member of class IAdapterActionAccess.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 24727)	Indicates whether this component appears in another component's list of Web items.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InIterator (see page 19721)	Indicates whether the object is iterating over its items.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsDefaultAction (see page 19768)	This is IsDefaultAction, a member of class IWebIsDefaultAction.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NextIteration (see page 19723)	Advances to the objects next item.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetActionName (see page 19783)	This is SetActionName, a member of class IWebSetActionName.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.

	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	StartIterator (see page 19724)	This is StartIterator, a member of class IIteratorSupport.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	WebEnabled (see page 19752)	This is WebEnabled, a member of class IWebEnabled.

Public Properties

	Name	Description
	ActionModes (see page 7821)	Indicates what dataset adapter modes this field supports.
	ActionName (see page 7821)	Identifies the name of this action when using server-side script.
R	ActionName (see page 19755)	This is ActionName, a member of class IWebGetActionName.
R	ActionName (see page 24072)	Identifies the name of this action when using server-side script.
	ActionName (see page 24198)	Identifies the name of this action when using server-side script.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
R	DataSet (see page 7822)	Indicates the dataset on which this action operates.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DisplayLabel (see page 24073)	Suggests a display label for this adapter action.
	ExecuteAccess (see page 24073)	Defines the rights required to execute this action.
R	FailureOptions (see page 965)	This is FailureOptions, a member of class IGetAdapterActionRedirectOptions.
	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.
R	IsAdapterActionList (see page 19717)	This is IsAdapterActionList, a member of class IIsAdapterActionList.
R	ItemCount (see page 24074)	Returns the number of items defined by an adapter action.
R	ItemIndex (see page 24074)	Returns the index of the current item of an adapter action.
R	IteratorIndex (see page 19721)	Indicates the index of the current item.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	RedirectOptions (see page 24074)	Indicates whether to perform an HTTP redirect after successfully executing this action.
R	SuccessOptions (see page 965)	This is SuccessOptions, a member of class IGetAdapterActionRedirectOptions.
R	VariableName (see page 15329)	This is VariableName, a member of class IWebVariableName.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
R	Visible (see page 19652)	This is Visible, a member of class IAdapterActionAttributes.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

41.1.21.2 TDataSetAdapterMoveRowAction Methods

The methods of the TDataSetAdapterMoveRowAction class are listed here.

Protected Methods

	Name	Description
	ImplIsDefaultAction (see page 8016)	Provides the underlying implementation for the IsDefaultAction method.

41.1.21.2.1 TDataSetAdapterMoveRowAction.ImplIsDefaultAction Method

Provides the underlying implementation for the IsDefaultAction method.

Pascal

```
function ImplIsDefaultAction(ADisplay: TObject): Boolean; override;
```

C++

```
virtual __fastcall Boolean ImplIsDefaultAction(TObject * ADisplay);
```

Description

The IsDefaultAction calls ImplIsDefaultAction to determine whether this action should be added, by default, to the parent adapter. Default actions are added to the adapter unless you explicitly specify the actions of the parent adapter.

ADisplay is the Web item associated with the parent adapter that generates HTML content to represent the adapter's fields and actions. This item is a member of the hierarchy of Web items rooted by a TAdapterForm object.

ImplIsDefaultAction returns true if this action should be included among the adapter's default actions, false if it should only be included when explicitly added to the parent adapter.

ImplIsDefaultAction always returns false when the parent adapter is in query mode. When the parent adapter is in any other mode, ImplIsDefaultAction checks whether ADisplay has a GetAdapterDisplayCharacteristics method. If ADisplay can provide display characteristics, ImplIsDefaultAction returns true only if those characteristics indicate an ability to change the current record. If ADisplay can't provide displaycharacteristics, ImplIsDefaultAction returns true.

IsDefaultAction (see page 24070)

Mode (see page 7810)

GetAdapterDisplayCharacteristics (see page 25129)

TAdapterForm (see page 25159)

41.1.22 TDataSetAdapterNewRowAction Class

TDataSetAdapterNewRowAction places the parent dataset adapter in insert mode.

Class Hierarchy

Pascal

```
TDataSetAdapterNewRowAction = class(TDataSetAdapterRowAction);
```

C++

```
class TDataSetAdapterNewRowAction : public TDataSetAdapterRowAction;
```

File

DBAdapt

Description

Add TDataSetAdapterDeleteRowAction (see page 7934) to a dataset adapter (TDataSetAdapter (see page 7872)) to support HTML forms that let users insert new database records. When this action is executed, it positions the dataset on the record specified in the current request, applies any updates in that request, and then puts the parent dataset adapter into insert mode.

Server-side script addresses this action as the 'NewRow' action of the parent adapter.

41.1.22.1 TDataSetAdapterNewRowAction Members

The following tables list the members exposed by TDataSetAdapterNewRowAction.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	CheckExecuteAccess (see page 24050)	Checks end-user rights to execute this adapter action.
	CreateRequestContext (see page 24050)	Creates an object that describes the adapter action parameters and adapter field values.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DoAfterExecuteActionRequest (see page 24051)	Calls event handlers after the adapter action is executed.
V	DoAfterGetExecuteActionResponse (see page 24051)	Calls event handlers after the adapter action response is formulated.
V	DoBeforeExecuteActionRequest (see page 24052)	Calls event handlers before the adapter action is executed.
V	DoBeforeGetExecuteActionResponse (see page 24052)	Calls event handlers before the adapter action response is formulated.
	EndIterator (see page 24053)	Implements IIteratorSupport's EndIterator method.
	ExecuteActionRequest (see page 24053)	Executes the adapter action using parameters passed in the HTTP request.
	GetActionName (see page 24054)	Gets the name used to reference this adapter action with server-side script.
	GetAdapter (see page 7819)	Returns the value of the Adapter (see page 7822) property.
	GetAdapter (see page 24054)	GetAdapter returns the parent adapter component.
	GetAdapterItemRequestParams (see page 24055)	Provides the name/value pairs needed to execute this adapter action.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetContainerList (see page 24727)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
	GetDataSet (see page 7819)	Returns the value of the DataSet (see page 7822) property.
V	GetDefaultActionName (see page 8024)	Gets the default name used to reference this adapter action with server-side script.

	GetDefaultDisplayLabel (see page 24055)	Provides the default display label for this adapter action.
	GetDisplayLabel (see page 24055)	Returns the suggested display label for this adapter action.
	GetDisplayStyle (see page 24056)	Returns a string value to suggest an HTML display style for this adapter action.
	GetDisplayStyleType (see page 24056)	Suggests an HTML display type for this adapter action.
	GetErrors (see page 24057)	This is GetErrors, a member of class TBaseAdapterAction.
	GetExecuteActionResponse (see page 24057)	Generates a response after the adapter action has been executed.
	GetFailureOptions (see page 24057)	Indicates whether to perform an HTTP redirect after execution of this adapter action fails.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
	GetInputStyle (see page 24058)	Returns a string value to suggest an HTML display style for this adapter action.
	GetIsAdapterActionList (see page 24058)	Indicates whether this adapter action may have multiple commands.
	GetItemCount (see page 24058)	Returns the number of commands defined by this adapter action.
	GetIteratorIndex (see page 24059)	Implements IIteratorIndex's GetIteratorIndex method.
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetSuccessOptions (see page 24059)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetVariableName (see page 24060)	Gets the name used to reference this adapter action with server-side script.
	GetViewMode (see page 24060)	Returns a string value to suggest a view mode for this adapter action.
	GetViewModeType (see page 24060)	Suggests a view mode for this adapter action.
	GetVisible (see page 24061)	Indicates whether a button or hyperlink for this adapter action should be displayed on the HTML page.
	GetWebSnapObjClass (see page 24061)	Returns the class type for this adapter field.
	HandleRequest (see page 24061)	Executes the adapter action and generates a response.
	HasExecuteAccess (see page 24062)	Checks the end-user's right to execute this adapter action.
	ImplCreateRequestContext (see page 24062)	Creates an object that describes the action parameters and field values.
	ImplEndIterator (see page 24062)	Implements IIteratorSupport's EndIterator (see page 24053) method.
	ImplExecuteActionRequest (see page 8025)	Provides the underlying implementation for the ExecuteActionRequest method.
	ImplGetActionName (see page 24063)	Gets the name used to reference this adapter action with server-side script.
	ImplGetActionName (see page 24195)	Gets the name used to reference this adapter action with server-side script.
	ImplGetAdapterItemRequestParams (see page 7854)	Provides the underlying implementation for the GetAdapterItemRequestParams method.
	ImplGetAdapterItemRequestParams (see page 8074)	Provides the underlying implementation for the GetAdapterItemRequestParams method.
	ImplGetAdapterItemRequestParams (see page 24063)	Provides the name/value pairs needed to execute this adapter action.
	ImplGetAdapterItemRequestParams (see page 24196)	Provides the name/value pairs needed to execute this adapter action.
	ImplGetDisplayLabel (see page 24064)	Returns the suggested display label for this adapter action.
	ImplGetExecuteActionResponse (see page 24064)	Generates a response after the adapter action has been executed.
	ImplGetFailureOptions (see page 24065)	Indicates whether to perform an HTTP redirect after execution of this adapter action fails.
	ImplGetIsAdapterActionList (see page 24065)	Indicates whether this adapter action may have multiple commands.
	ImplGetIteratorIndex (see page 24065)	Implements IIteratorIndex's GetIteratorIndex (see page 24059) method.
	ImplGetSuccessOptions (see page 24066)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	ImplGetSuccessOptions (see page 24196)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	ImplGetVariableName (see page 24066)	Gets the name used to reference this adapter action with server-side script.
	ImplGetVisible (see page 7819)	Provides the underlying implementation for the GetVisible method.
	ImplGetVisible (see page 24066)	Indicates whether a button or hyperlink for this adapter action should be displayed on the HTML page.
	ImplHandleRequest (see page 24067)	Executes the adapter action and generates a response.
	ImplHasExecuteAccess (see page 24067)	Checks the end-user's right to execute this adapter action.
	ImplInIterator (see page 24067)	Implements IIteratorIndex's InIterator (see page 24069) method.

V	ImplIsDefaultAction (see page 8025)	Indicates whether this adapter action should be added, by default, to the parent adapter.
	ImplNextIteration (see page 24068)	Implements IIteratorSupport's NextIteration (see page 24070) method.
	ImplSetActionName (see page 24197)	Sets the name that is used to reference this adapter action with server-side script.
	ImplStartIterator (see page 24068)	Implements IIteratorSupport's StartIterator (see page 24071) method.
V	ImplWebEnabled (see page 8026)	Provides the underlying implementation for the WebEnabled method.
	InIterator (see page 24069)	Implements IIteratorIndex's InIterator method.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsDefaultAction (see page 24070)	Indicates whether this adapter action should be added, by default, to the parent adapter.
V	IsDefaultField (see page 24728)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	NextIteration (see page 24070)	Implements IIteratorSupport's NextIteration method.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	ParentChanged (see page 24070)	Handles movement of the component to a different parent.
V	ParentChanged (see page 24728)	Responds when the WebParent (see page 24731) property changes.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 24729)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetActionName (see page 24197)	Sets the name that is used to reference this adapter action with server-side script.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDisplayLabel (see page 24071)	Set the value of the DisplayLabel (see page 24073) property.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 24729)	Sets the WebParent (see page 24731) property to be the same as this component's parent.
	SetWebParent (see page 24730)	Sets the value of the WebParent (see page 24731) property.
	StartIterator (see page 24071)	Implements IIteratorSupport's StartIterator method.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WebEnabled (see page 24071)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	Adapter (see page 7822)	Indicates the dataset adapter that uses this object to represent one of its actions.
R	Adapter (see page 24072)	Provides access to the parent adapter component.
R	Errors (see page 24073)	This is Errors, a member of class TBaseAdapterAction.
R	WebContainedComponentHelper (see page 24730)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.

R	WebParent (see page 24731)	Indicates the component that uses this TWebContainedComponent (see page 24722) as one of its Web items.

Public Events

	Name	Description
	OnExecute (see page 7822)	Occurs when server-side script executes this action.
	OnExecute (see page 24200)	Called to execute this action using parameters passed in the HTTP request.
	OnGetEnabled (see page 7823)	Occurs when the WebSnap application to determine whether a control or hyperlink for this action should be enabled.
	OnGetEnabled (see page 24200)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	CreateRequestContext (see page 19681)	Creates an object that describes the adapter action parameters and adapter field values.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Destroy (see page 24726)	Frees an instance of TWebContainedComponent (see page 24722).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	EndIterator (see page 19723)	This is EndIterator, a member of class IIteratorSupport.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetActionName (see page 19755)	This is GetActionName, a member of class IWebGetActionName.
	GetAdapterItemRequestParams (see page 19692)	This is GetAdapterItemRequestParams, a member of class IGetAdapterItemRequestParams.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.
	GetDisplayLabel (see page 19756)	This is GetDisplayLabel, a member of class IWebGetDisplayLabel.
	GetDisplayStyle (see page 19700)	Returns the preferred display style for an adapter field or adapter action.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.

	GetFailureOptions (see page 964)	This is GetFailureOptions, a member of class IGetAdapterActionRedirectOptions.
	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	GetInputStyle (see page 19700)	Returns the preferred editing style for an adapter field.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIsAdapterActionList (see page 19717)	This is GetIsAdapterActionList, a member of class IIsAdapterActionList.
	GetIteratorIndex (see page 19721)	Returns the value of the IteratorIndex (see page 19721) property.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 24727)	Returns the object that uses this component to generate HTML.
	GetSuccessOptions (see page 964)	This is GetSuccessOptions, a member of class IGetAdapterActionRedirectOptions.
	GetVariableName (see page 15329)	This is GetVariableName, a member of class IWebVariableName.
	GetViewMode (see page 19701)	Returns the preferred mode of an adapter field.
	GetVisible (see page 19652)	This is GetVisible, a member of class IAdapterActionAttributes.
	HandleRequest (see page 19681)	Executes the adapter action and generates a response.
	HasExecuteAccess (see page 19651)	This is HasExecuteAccess, a member of class IAdapterActionAccess.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 24727)	Indicates whether this component appears in another component's list of Web items.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InIterator (see page 19721)	Indicates whether the object is iterating over its items.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsDefaultAction (see page 19768)	This is IsDefaultAction, a member of class IWebIsDefaultAction.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NextIteration (see page 19723)	Advances to the objects next item.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetActionName (see page 19783)	This is SetActionName, a member of class IWebSetActionName.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.
	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	StartIterator (see page 19724)	This is StartIterator, a member of class IIteratorSupport.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	WebEnabled (see page 19752)	This is WebEnabled, a member of class IWebEnabled.

Public Properties

	Name	Description
	ActionName (see page 7821)	Identifies the name of this action when using server-side script.

R	ActionName (see page 19755)	This is ActionName, a member of class IWebGetActionName.
R	ActionName (see page 24072)	Identifies the name of this action when using server-side script.
	ActionName (see page 24198)	Identifies the name of this action when using server-side script.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
R	DataSet (see page 7822)	Indicates the dataset on which this action operates.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	FailureOptions (see page 965)	This is FailureOptions, a member of class IGetAdapterActionRedirectOptions.
	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.
R	IsAdapterActionList (see page 19717)	This is IsAdapterActionList, a member of class IIsAdapterActionList.
R	ItemCount (see page 24074)	Returns the number of items defined by an adapter action.
R	ItemIndex (see page 24074)	Returns the index of the current item of an adapter action.
R	IteratorIndex (see page 19721)	Indicates the index of the current item.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	RedirectOptions (see page 24074)	Indicates whether to perform an HTTP redirect after successfully executing this action.
R	SuccessOptions (see page 965)	This is SuccessOptions, a member of class IGetAdapterActionRedirectOptions.
R	VariableName (see page 15329)	This is VariableName, a member of class IWebVariableName.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
R	Visible (see page 19652)	This is Visible, a member of class IAdapterActionAttributes.

Published Events

	Name	Description
	OnAfterExecute (see page 8028)	Called after the adapter action has executed.
	OnAfterGetResponse (see page 8028)	Called after the adapter action response is generated.
	OnBeforeExecute (see page 8029)	Called before the adapter action is executed.
	OnBeforeGetResponse (see page 8029)	Called before the adapter action response is generated.
	OnGetParams (see page 8029)	Specifies name/value pairs needed to execute this adapter action.

Published Methods

	Name	Description
V	Create (see page 8024)	Creates and initializes an instance of TDataSetAdapterNewRowAction (see page 8016).

Published Properties

	Name	Description
	ActionModes (see page 8026)	Indicates what dataset adapter modes this field supports.
	DisplayLabel (see page 8027)	Suggests a display label for this adapter action.
	ExecuteAccess (see page 8027)	Defines the rights required to execute this action.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	RedirectOptions (see page 8076)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	Tag (see page 2808)	Stores an integer value as part of a component.

41.1.22.2 TDataSetAdapterNewRowAction.Create Constructor

Creates and initializes an instance of TDataSetAdapterNewRowAction (see page 8016).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TDataSetAdapterNewRowAction(TComponent * AOwner);
```

Description

The TDataSetAdapterNewRowAction (see page 8016) constructor allocates memory for the adapter action object and initializes its properties.

AOwner is the component that is responsible for starting the streaming process when a module containing the adapter action is loaded or saved. It becomes the value of the Owner property. Typically, AOwner is the Web module.

See Also

Owner (see page 2807)

41.1.22.3 TDataSetAdapterNewRowAction Methods

The methods of the TDataSetAdapterNewRowAction class are listed here.

Protected Methods

	Name	Description
	GetDefaultActionName (see page 8024)	Gets the default name used to reference this adapter action with server-side script.
	ImplExecuteActionRequest (see page 8025)	Provides the underlying implementation for the ExecuteActionRequest method.
	ImplIsDefaultAction (see page 8025)	Indicates whether this adapter action should be added, by default, to the parent adapter.
	ImplWebEnabled (see page 8026)	Provides the underlying implementation for the WebEnabled method.

41.1.22.3.1 TDataSetAdapterNewRowAction.GetDefaultActionName Method

Gets the default name used to reference this adapter action with server-side script.

Pascal

```
function GetDefaultActionName: string; override;
```

C++

```
virtual __fastcall AnsiString GetDefaultActionName();
```

Description

GetDefaultActionName returns the name of the adapter action component. Descendants may override this function.

See Also

ImplGetActionName (see page 24063)

41.1.22.3.2 TDataSetAdapterNewRowAction.ImplExecuteActionRequest Method

Provides the underlying implementation for the ExecuteActionRequest method.

Pascal

```
procedure ImplExecuteActionRequest(AActionRequest: IActionRequest; AActionResponse:
IActionResponse); override;
```

C++

```
virtual __fastcall ImplExecuteActionRequest(IActionRequest AActionRequest, IActionResponse
AActionResponse);
```

Description

The ExecuteActionRequest method calls ImplExecuteActionRequest to execute this action in response to server-side script.

AActionRequest is an interface to the current request object. ImplExecuteActionRequest uses this to obtain information about the current request (such as the values of request parameters).

AActionResponse is an interface to the current response object. ImplExecuteActionRequest uses this to indicate the status of the emerging HTTP response.

ImplExecuteActionRequest generates an OnExecute event, allowing you to provide the implementation for this action in an OnExecute event handler. If you do not supply an OnExecute event handler, ImplExecuteActionRequest calls the parent adapter's LocateAndApply method, to position the adapter's dataset on the record indicated by the current request and apply any updates that the request contains.

See Also

ExecuteActionRequest (see page 24053)

OnExecute (see page 7822)

LocateAndApply (see page 7796)

41.1.22.3.3 TDataSetAdapterNewRowAction.ImplIsDefaultAction Method

Indicates whether this adapter action should be added, by default, to the parent adapter.

Pascal

```
function ImplIsDefaultAction(ADisplay: TObject): Boolean; override;
```

C++

```
virtual __fastcall Boolean ImplIsDefaultAction(TObject * ADisplay);
```

Description

ImplIsDefaultAction is called by IsDefaultAction. ImplIsDefaultAction returns true. ImplIsDefaultAction may be overridden by a descendant class.

See Also

IsDefaultAction (see page 24070)

ImplIsDefaultAction (see page 24243)

41.1.22.3.4 TDataSetAdapterNewRowAction.ImplWebEnabled Method

Provides the underlying implementation for the WebEnabled method.

Pascal

```
function ImplWebEnabled: Boolean; override;
```

C++

```
virtual __fastcall Boolean ImplWebEnabled();
```

Description

The WebEnabled method calls ImplWebEnabled to determine whether the control or hyperlink for this action should appear enabled in the HTML form. WebEnabled returns true if controls should be enabled, false otherwise.

ImplWebEnabled generates an OnGetEnabled event so that you can specify whether controls for this action are enabled. If there is no OnGetEnabled event handler, ImplWebEnabled returns true if the parent adapter's GetKeyFields method returns a set of fields that can locate records in the associated dataset.

See Also

WebEnabled (see page 24071)

OnGetEnabled (see page 7823)

GetKeyFields (see page 7786)

41.1.22.4 TDataSetAdapterNewRowAction Properties

The properties of the TDataSetAdapterNewRowAction class are listed here.

Published Properties

	Name	Description
	ActionModes (see page 8026)	Indicates what dataset adapter modes this field supports.
	DisplayLabel (see page 8027)	Suggests a display label for this adapter action.
	ExecuteAccess (see page 8027)	Defines the rights required to execute this action.

41.1.22.4.1 TDataSetAdapterNewRowAction.ActionModes Property

Indicates what dataset adapter modes this field supports.

Pascal

```
property ActionModes: TDataSetAdapterModes;
```

C++

```
__property TDataSetAdapterModes ActionModes;
```

Description

ActionModes is a set of all the modes in which this adapter action can be used. If the parent dataset adapter is in a mode that is not included in this set, any forms generated using that adapter do not include a control for executing this action. Thus, for example, there is no sense in adding a control that applies edits to a form that presents a read-only view of the data. An apply action, then, should not include amBrowse in its action modes.

See Also

CanModify (see page 7154)

Adapter (see page 7752)

Mode (see page 7810)

GetDisplayStyle (see page 7739)

GetInputStyle (see page 7741)

GetViewMode (see page 7744)

41.1.22.4.2 TDataSetAdapterNewRowAction.DisplayLabel Property

Suggests a display label for this adapter action.

Pascal

```
property DisplayLabel: string;
```

C++

```
__property AnsiString DisplayLabel;
```

Description

Use this property to suggest a display label to use when generating HTML to display the a button or hyperlink to execute this adapter action. Typically the adapter action is displayed using server-side script, either generated or custom written. Server-side script uses the DisplayLabel property to access this value.

See Also

ImplGetDisplayLabel (see page 24064)

SetDisplayLabel (see page 24071)

41.1.22.4.3 TDataSetAdapterNewRowAction.ExecuteAccess Property

Defines the rights required to execute this action.

Pascal

```
property ExecuteAccess: string;
```

C++

```
__property AnsiString ExecuteAccess;
```

Description

The ExecuteAccess property defines the access rights required to execute this action. When server-side script accesses the CanExecute property, this value is checked against the end user's rights. Typically, an exception is raised when an end-user attempts to execute an adapter action that does not allow access.

See Also

TWebUserList (see page 25625)

hasexecuteaccess (see page 24162)

41.1.22.5 TDataSetAdapterNewRowAction Events

The events of the TDataSetAdapterNewRowAction class are listed here.

Published Events

	Name	Description
	OnAfterExecute (see page 8028)	Called after the adapter action has executed.
	OnAfterGetResponse (see page 8028)	Called after the adapter action response is generated.
	OnBeforeExecute (see page 8029)	Called before the adapter action is executed.
	OnBeforeGetResponse (see page 8029)	Called before the adapter action response is generated.
	OnGetParams (see page 8029)	Specifies name/value pairs needed to execute this adapter action.

41.1.22.5.1 TDataSetAdapterNewRowAction.OnAfterExecute Event

Called after the adapter action has executed.

Pascal

```
property OnAfterExecute: TActionExecuteEvent;
```

C++

```
__property TActionExecuteEvent OnAfterExecute;
```

Description

Implement OnAfterExecute to do something after the action has executed. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. OnAfterExecute is called by DoAfterExecuteActionRequest.

See Also

DoAfterExecuteActionRequest (see page 24051)

OnAfterExecuteAction (see page 24184)

OnBeforeExecute (see page 24076)

41.1.22.5.2 TDataSetAdapterNewRowAction.OnAfterGetResponse Event

Called after the adapter action response is generated.

Pascal

```
property OnAfterGetResponse: TActionExecuteEvent;
```

C++

```
__property TActionExecuteEvent OnAfterGetResponse;
```

Description

Implement OnAfterGetResponse to do something after the action response is generated. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. OnAfterGetResponse is called by DoAfterGetExecuteActionReponse.

See Also

DoBeforeGetExecuteActionResponse (see page 24052)

OnAfterGetResponse (see page 24075)

OnBeforeGetActionResponse (see page 24186)

41.1.22.5.3 TDataSetAdapterNewRowAction.OnBeforeExecute Event

Called before the adapter action is executed.

Pascal

```
property OnBeforeExecute: TActionExecuteHandledEvent;
```

C++

```
__property TActionExecuteHandledEvent OnBeforeExecute;
```

Description

Implement OnBeforeExecute to do something before the action is executed. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. Set the Handled flag to prevent the action from being executed. OnBeforeExecute is called by DoBeforeExecuteActionRequest.

See Also

DoBeforeExecuteActionRequest (see page 24052)

OnAfterExecute (see page 24075)

OnBeforeExecuteAction (see page 24186)

41.1.22.5.4 TDataSetAdapterNewRowAction.OnBeforeGetResponse Event

Called before the adapter action response is generated.

Pascal

```
property OnBeforeGetResponse: TActionExecuteHandledEvent;
```

C++

```
__property TActionExecuteHandledEvent OnBeforeGetResponse;
```

Description

Implement OnBeforeGetResponse to do something before the action response is generated. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. Set the Handled flag to indicate that the response has been generated and no further processing is needed. OnBeforeGetResponse is called by DoBeforeGetExecuteActionReponse.

See Also

DoBeforeGetExecuteActionResponse (see page 24052)

OnAfterGetResponse (see page 24075)

OnBeforeGetActionResponse (see page 24186)

41.1.22.5.5 TDataSetAdapterNewRowAction.OnGetParams Event

Specifies name/value pairs needed to execute this adapter action.

Pascal

```
property OnGetParams: TActionGetParamsEvent;
```

C++

```
__property TActionGetParamsEvent OnGetParams;
```

Description

Implement this event handler to specify the name/value needed to execute this action. For example, an action that deletes a row in a table will need a name/value pair that identifies the row to be deleted such as "Key=123".

See Also

ImplGetAdapterItemRequestParams (see page 24063)

41.1.23 TDataSetAdapterNextRowAction Class

TDataSetAdapterNextRowAction posts any edits made in an HTML form and moves the dataset adapter to the next record.

Class Hierarchy

Pascal

```
TDataSetAdapterNextRowAction = class(TDataSetAdapterMoveRowAction);
```

C++

```
class TDataSetAdapterNextRowAction : public TDataSetAdapterMoveRowAction;
```

File

DBAdapt

Description

Add TDataSetAdapterNextRowAction to a dataset adapter (TDataSetAdapter (see page 7872)) to support HTML forms that let users progress to the next dataset record. When this action is executed, it locates the parent adapter's dataset on the record

specified by the current request object, posts any edits included in the current request, and then advances the dataset to the next record.

Server-side script addresses this action as the 'NextRow' action of the parent adapter. If the current request identifies the last record of the dataset as current, the control for this action appears disabled.

See Also

TDataSetAdapterApplyRowAction (see page 7890)

TDataSetAdapterBrowseRowAction (see page 7903)

TDataSetAdapterDeleteRowAction (see page 7934)

TDataSetAdapterEditRowAction (see page 7947)

TDataSetAdapterFirstRowAction (see page 7972)

TDataSetAdapterLastRowAction (see page 7984)

TDataSetAdapterCancelRowAction (see page 7916)

TDataSetAdapterPrevRowAction (see page 8042)

TDataSetAdapterRefreshRowAction (see page 8054)

TDataSetAdapterNewRowAction (see page 8016)

TDataSet (see page 6894)

41.1.23.1 TDataSetAdapterNextRowAction Members

The following tables list the members exposed by TDataSetAdapterNextRowAction.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	CheckExecuteAccess (see page 24050)	Checks end-user rights to execute this adapter action.
	CreateRequestContext (see page 24050)	Creates an object that describes the adapter action parameters and adapter field values.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DoAfterExecuteActionRequest (see page 24051)	Calls event handlers after the adapter action is executed.
V	DoAfterGetExecuteActionResponse (see page 24051)	Calls event handlers after the adapter action response is formulated.
V	DoBeforeExecuteActionRequest (see page 24052)	Calls event handlers before the adapter action is executed.
V	DoBeforeGetExecuteActionResponse (see page 24052)	Calls event handlers before the adapter action response is formulated.
	EndIterator (see page 24053)	Implements IIteratorSupport's EndIterator method.

	ExecuteActionRequest (see page 24053)	Executes the adapter action using parameters passed in the HTTP request.
	GetActionName (see page 24054)	Gets the name used to reference this adapter action with server-side script.
	GetAdapter (see page 7819)	Returns the value of the Adapter (see page 7822) property.
	GetAdapter (see page 24054)	GetAdapter returns the parent adapter component.
	GetAdapterItemRequestParams (see page 24055)	Provides the name/value pairs needed to execute this adapter action.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetContainerList (see page 24727)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
	GetDataSet (see page 7819)	Returns the value of the DataSet (see page 7822) property.
	GetDefaultActionName (see page 8037)	Gets the default name used to reference this adapter action with server-side script.
	GetDefaultDisplayLabel (see page 24055)	Provides the default display label for this adapter action.
	GetDisplayLabel (see page 24055)	Returns the suggested display label for this adapter action.
	GetDisplayStyle (see page 24056)	Returns a string value to suggest an HTML display style for this adapter action.
	GetDisplayStyleType (see page 24056)	Suggests an HTML display type for this adapter action.
	GetErrors (see page 24057)	This is GetErrors, a member of class TBaseAdapterAction.
	GetExecuteActionResponse (see page 24057)	Generates a response after the adapter action has been executed.
	GetFailureOptions (see page 24057)	Indicates whether to perform an HTTP redirect after execution of this adapter action fails.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetInputStyle (see page 24058)	Returns a string value to suggest an HTML display style for this adapter action.
	GetIsAdapterActionList (see page 24058)	Indicates whether this adapter action may have multiple commands.
	GetItemCount (see page 24058)	Returns the number of commands defined by this adapter action.
	GetIteratorIndex (see page 24059)	Implements IIteratorIndex's GetIteratorIndex method.
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetSuccessOptions (see page 24059)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetVariableName (see page 24060)	Gets the name used to reference this adapter action with server-side script.
	GetViewMode (see page 24060)	Returns a string value to suggest a view mode for this adapter action.
	GetViewModeType (see page 24060)	Suggests a view mode for this adapter action.
	GetVisible (see page 24061)	Indicates whether a button or hyperlink for this adapter action should be displayed on the HTML page.
	GetWebSnapObjClass (see page 24061)	Returns the class type for this adapter field.
	HandleRequest (see page 24061)	Executes the adapter action and generates a response.
	HasExecuteAccess (see page 24062)	Checks the end-user's right to execute this adapter action.
	ImplCreateRequestContext (see page 24062)	Creates an object that describes the action parameters and field values.
	ImplEndIterator (see page 24062)	Implements IIteratorSupport's EndIterator (see page 24053) method.
	ImplExecuteActionRequest (see page 8037)	Executes the adapter action using parameters passed in the HTTP request.
	ImplGetActionName (see page 24063)	Gets the name used to reference this adapter action with server-side script.
	ImplGetActionName (see page 24195)	Gets the name used to reference this adapter action with server-side script.
	ImplGetAdapterItemRequestParams (see page 7854)	Provides the underlying implementation for the GetAdapterItemRequestParams method.
	ImplGetAdapterItemRequestParams (see page 24063)	Provides the name/value pairs needed to execute this adapter action.
	ImplGetAdapterItemRequestParams (see page 24196)	Provides the name/value pairs needed to execute this adapter action.
	ImplGetDisplayLabel (see page 24064)	Returns the suggested display label for this adapter action.
	ImplGetExecuteActionResponse (see page 24064)	Generates a response after the adapter action has been executed.
	ImplGetFailureOptions (see page 24065)	Indicates whether to perform an HTTP redirect after execution of this adapter action fails.
	ImplGetIsAdapterActionList (see page 24065)	Indicates whether this adapter action may have multiple commands.

	ImplGetIteratorIndex (see page 24065)	Implements IIteratorIndex's GetIteratorIndex (see page 24059) method.
	ImplGetSuccessOptions (see page 24066)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	ImplGetSuccessOptions (see page 24196)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	ImplGetVariableName (see page 24066)	Gets the name used to reference this adapter action with server-side script.
	ImplGetVisible (see page 7819)	Provides the underlying implementation for the GetVisible method.
	ImplGetVisible (see page 24066)	Indicates whether a button or hyperlink for this adapter action should be displayed on the HTML page.
	ImplHandleRequest (see page 24067)	Executes the adapter action and generates a response.
	ImplHasExecuteAccess (see page 24067)	Checks the end-user's right to execute this adapter action.
	ImplInIterator (see page 24067)	Implements IIteratorIndex's InIterator (see page 24069) method.
	ImplIsDefaultAction (see page 8016)	Provides the underlying implementation for the IsDefaultAction method.
	ImplIsDefaultAction (see page 24068)	Indicates whether this adapter action should be added, by default, to the parent adapter.
	ImplNextIteration (see page 24068)	Implements IIteratorSupport's NextIteration (see page 24070) method.
	ImplSetActionName (see page 24197)	Sets the name that is used to reference this adapter action with server-side script.
	ImplStartIterator (see page 24068)	Implements IIteratorSupport's StartIterator (see page 24071) method.
	ImplWebEnabled (see page 8038)	Provides the underlying implementation for the WebEnabled method.
	InIterator (see page 24069)	Implements IIteratorIndex's InIterator method.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsDefaultAction (see page 24070)	Indicates whether this adapter action should be added, by default, to the parent adapter.
	IsDefaultField (see page 24728)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	NextIteration (see page 24070)	Implements IIteratorSupport's NextIteration method.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	ParentChanged (see page 24070)	Handles movement of the component to a different parent.
	ParentChanged (see page 24728)	Responds when the WebParent (see page 24731) property changes.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	ReadState (see page 24729)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetActionName (see page 24197)	Sets the name that is used to reference this adapter action with server-side script.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDisplayLabel (see page 24071)	Set the value of the DisplayLabel (see page 24073) property.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	SetParentComponent (see page 24729)	Sets the WebParent (see page 24731) property to be the same as this component's parent.
	SetWebParent (see page 24730)	Sets the value of the WebParent (see page 24731) property.
	StartIterator (see page 24071)	Implements IIteratorSupport's StartIterator method.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.

	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WebEnabled (see page 24071)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	Adapter (see page 7822)	Indicates the dataset adapter that uses this object to represent one of its actions.
R	Adapter (see page 24072)	Provides access to the parent adapter component.
R	Errors (see page 24073)	This is Errors, a member of class TBaseAdapterAction.
R	WebContainedComponentHelper (see page 24730)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.
R	WebParent (see page 24731)	Indicates the component that uses this TWebContainedComponent (see page 24722) as one of its Web items.

Public Events

	Name	Description
	OnExecute (see page 7822)	Occurs when server-side script executes this action.
	OnExecute (see page 24200)	Called to execute this action using parameters passed in the HTTP request.
	OnGetEnabled (see page 7823)	Occurs when the WebSnap application to determine whether a control or hyperlink for this action should be enabled.
	OnGetEnabled (see page 24200)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
V	Create (see page 7818)	Creates and initializes an instance of TCustomDataSetAdapterAction (see page 7811).
V	Create (see page 7853)	Creates and initializes an instance of TCustomDataSetAdapterRowAction (see page 7846).
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	Create (see page 24726)	Creates and initializes an instance of TWebContainedComponent (see page 24722).
	CreateRequestContext (see page 19681)	Creates an object that describes the adapter action parameters and adapter field values.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Destroy (see page 24726)	Frees an instance of TWebContainedComponent (see page 24722).
	DestroyComponents (see page 2771)	Destroys all owned components.

	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	EndIterator (see page 19723)	This is EndIterator, a member of class IIteratorSupport.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetActionName (see page 19755)	This is GetActionName, a member of class IWebGetActionName.
	GetAdapterItemRequestParams (see page 19692)	This is GetAdapterItemRequestParams, a member of class IGetAdapterItemRequestParams.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.
	GetDisplayLabel (see page 19756)	This is GetDisplayLabel, a member of class IWebGetDisplayLabel.
	GetDisplayStyle (see page 19700)	Returns the preferred display style for an adapter field or adapter action.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetFailureOptions (see page 964)	This is GetFailureOptions, a member of class IGetAdapterActionRedirectOptions.
	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	GetInputStyle (see page 19700)	Returns the preferred editing style for an adapter field.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIsAdapterActionList (see page 19717)	This is GetIsAdapterActionList, a member of class IIsAdapterActionList.
	GetIteratorIndex (see page 19721)	Returns the value of the IteratorIndex (see page 19721) property.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 24727)	Returns the object that uses this component to generate HTML.
	GetSuccessOptions (see page 964)	This is GetSuccessOptions, a member of class IGetAdapterActionRedirectOptions.
	GetVariableName (see page 15329)	This is GetVariableName, a member of class IWebVariableName.
	GetViewMode (see page 19701)	Returns the preferred mode of an adapter field.
	GetVisible (see page 19652)	This is GetVisible, a member of class IAdapterActionAttributes.
	HandleRequest (see page 19681)	Executes the adapter action and generates a response.
	HasExecuteAccess (see page 19651)	This is HasExecuteAccess, a member of class IAdapterActionAccess.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 24727)	Indicates whether this component appears in another component's list of Web items.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InIterator (see page 19721)	Indicates whether the object is iterating over its items.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsDefaultAction (see page 19768)	This is IsDefaultAction, a member of class IWebIsDefaultAction.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.

	NextIteration (see page 19723)	Advances to the objects next item.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetActionName (see page 19783)	This is SetActionName, a member of class IWebSetActionName.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.
	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	StartIterator (see page 19724)	This is StartIterator, a member of class IIteratorSupport.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	WebEnabled (see page 19752)	This is WebEnabled, a member of class IWebEnabled.

Public Properties

	Name	Description
	ActionModes (see page 7821)	Indicates what dataset adapter modes this field supports.
	ActionName (see page 7821)	Identifies the name of this action when using server-side script.
R	ActionName (see page 19755)	This is ActionName, a member of class IWebGetActionName.
R	ActionName (see page 24072)	Identifies the name of this action when using server-side script.
	ActionName (see page 24198)	Identifies the name of this action when using server-side script.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
R	DataSet (see page 7822)	Indicates the dataset on which this action operates.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	FailureOptions (see page 965)	This is FailureOptions, a member of class IGetAdapterActionRedirectOptions.
	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.
R	IsAdapterActionList (see page 19717)	This is IsAdapterActionList, a member of class IIsAdapterActionList.
R	ItemCount (see page 24074)	Returns the number of items defined by an adapter action.
R	ItemIndex (see page 24074)	Returns the index of the current item of an adapter action.
R	IteratorIndex (see page 19721)	Indicates the index of the current item.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
R	SuccessOptions (see page 965)	This is SuccessOptions, a member of class IGetAdapterActionRedirectOptions.
R	VariableName (see page 15329)	This is VariableName, a member of class IWebVariableName.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
R	Visible (see page 19652)	This is Visible, a member of class IAdapterActionAttributes.

Published Events

	Name	Description
	OnAfterExecute (see page 8040)	Called after the adapter action has executed.
	OnAfterGetResponse (see page 8040)	Called after the adapter action response is generated.
	OnBeforeExecute (see page 8040)	Called before the adapter action is executed.

	OnBeforeGetResponse (see page 8041)	Called before the adapter action response is generated.
	OnGetParams (see page 8041)	Specifies name/value pairs needed to execute this adapter action.

Published Properties

	Name	Description
	DisplayLabel (see page 8038)	Suggests a display label for this adapter action.
	ExecuteAccess (see page 8039)	Defines the rights required to execute this action.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	RedirectOptions (see page 8039)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	Tag (see page 2808)	Stores an integer value as part of a component.

41.1.23.2 TDataSetAdapterNextRowAction Methods

The methods of the TDataSetAdapterNextRowAction class are listed here.

Protected Methods

	Name	Description
	GetDefaultActionName (see page 8037)	Gets the default name used to reference this adapter action with server-side script.
	ImplExecuteActionRequest (see page 8037)	Executes the adapter action using parameters passed in the HTTP request.
	ImplWebEnabled (see page 8038)	Provides the underlying implementation for the WebEnabled method.

41.1.23.2.1 TDataSetAdapterNextRowAction.GetDefaultActionName Method

Gets the default name used to reference this adapter action with server-side script.

Pascal

```
function GetDefaultActionName: string; override;
```

C++

```
virtual __fastcall AnsiString GetDefaultActionName();
```

Description

GetDefaultActionName returns the name of the adapter action component. Descendants may override this function.

See Also

ImplGetActionName (see page 24063)

41.1.23.2.2 TDataSetAdapterNextRowAction.ImplExecuteActionRequest Method

Executes the adapter action using parameters passed in the HTTP request.

Pascal

```
procedure ImplExecuteActionRequest(AActionRequest: IActionRequest; AActionResponse:
IActionResponse); override;
```

C++

```
virtual __fastcall ImplExecuteActionRequest(IActionRequest AActionRequest, IActionResponse
AActionResponse);
```

Description

ImplExecuteActionRequest create a TStrings containing the name/value pairs in AActionRequest and calls the OnExecute event

handler.

See Also

ImplExecuteActionRequest (see page 24063)

OnExecute (see page 24200)

41.1.23.2.3 TDataSetAdapterNextRowAction.ImplWebEnabled Method

Provides the underlying implementation for the WebEnabled method.

Pascal

```
function ImplWebEnabled: Boolean; override;
```

C++

```
virtual __fastcall Boolean ImplWebEnabled();
```

Description

The WebEnabled method calls ImplWebEnabled to determine whether the control or hyperlink for this action should appear enabled in the HTML form. WebEnabled returns true if controls should be enabled, false otherwise.

ImplWebEnabled generates an OnGetEnabled event so that you can specify whether controls for this action are enabled. If there is no OnGetEnabled event handler, ImplWebEnabled returns true if the parent adapter's GetKeyFields method returns a set of fields that can locate records in the associated dataset.

See Also

WebEnabled (see page 24071)

OnGetEnabled (see page 7823)

GetKeyFields (see page 7786)

41.1.23.3 TDataSetAdapterNextRowAction Properties

The properties of the TDataSetAdapterNextRowAction class are listed here.

Published Properties

	Name	Description
	DisplayLabel (see page 8038)	Suggests a display label for this adapter action.
	ExecuteAccess (see page 8039)	Defines the rights required to execute this action.
	RedirectOptions (see page 8039)	Indicates whether to perform an HTTP redirect after successfully executing this action.

41.1.23.3.1 TDataSetAdapterNextRowAction.DisplayLabel Property

Suggests a display label for this adapter action.

Pascal

```
property DisplayLabel: string;
```

C++

```
__property AnsiString DisplayLabel;
```

Description

Use this property to suggest a display label to use when generating HTML to display the a button or hyperlink to execute this

adapter action. Typically the adapter action is displayed using server-side script, either generated or custom written. Server-side script uses the DisplayLabel property to access this value.

See Also

ImplGetDisplayLabel (see page 24064)

SetDisplayLabel (see page 24071)

41.1.23.3.2 TDataSetAdapterNextRowAction.ExecuteAccess Property

Defines the rights required to execute this action.

Pascal

```
property ExecuteAccess: string;
```

C++

```
__property AnsiString ExecuteAccess;
```

Description

The ExecuteAccess property defines the access rights required to execute this action. When server-side script accesses the CanExecute property, this value is checked against the end user's rights. Typically, an exception is raised when an end-user attempts to execute an adapter action that does not allow access.

See Also

TWebUserList (see page 25625)

hasexecuteaccess (see page 24162)

41.1.23.3.3 TDataSetAdapterNextRowAction.RedirectOptions Property

Indicates whether to perform an HTTP redirect after successfully executing this action.

Pascal

```
property RedirectOptions: TAdapterActionRedirectOptions;
```

C++

```
__property TAdapterActionRedirectOptions RedirectOptions;
```

Description

Set RedirectOptions to indicate that HTTP redirect should be performed after executing this adapter action. An HTTP redirect causes the browser to "forget" about the parameters passed when executing the adapter action. Without a redirect, the browser's Refresh or Reload command cause the last HTTP request to be resent, resulting in re-execution of the adapter action.

See Also

SendRedirect (see page 15201)

41.1.23.4 TDataSetAdapterNextRowAction Events

The events of the TDataSetAdapterNextRowAction class are listed here.

Published Events

	Name	Description
	OnAfterExecute (see page 8040)	Called after the adapter action has executed.

	OnAfterGetResponse (see page 8040)	Called after the adapter action response is generated.
	OnBeforeExecute (see page 8040)	Called before the adapter action is executed.
	OnBeforeGetResponse (see page 8041)	Called before the adapter action response is generated.
	OnGetParams (see page 8041)	Specifies name/value pairs needed to execute this adapter action.

41.1.23.4.1 TDataSetAdapterNextRowAction.OnAfterExecute Event

Called after the adapter action has executed.

Pascal

```
property OnAfterExecute: TActionExecuteEvent;
```

C++

```
__property TActionExecuteEvent OnAfterExecute;
```

Description

Implement OnAfterExecute to do something after the action has executed. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. OnAfterExecute is called by DoAfterExecuteActionRequest.

See Also

DoAfterExecuteActionRequest (see page 24051)

OnAfterExecuteAction (see page 24184)

OnBeforeExecute (see page 24076)

41.1.23.4.2 TDataSetAdapterNextRowAction.OnAfterGetResponse Event

Called after the adapter action response is generated.

Pascal

```
property OnAfterGetResponse: TActionExecuteEvent;
```

C++

```
__property TActionExecuteEvent OnAfterGetResponse;
```

Description

Implement OnAfterGetResponse to do something after the action response is generated. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. OnAfterGetResponse is called by DoAfterGetExecuteActionReponse.

See Also

DoBeforeGetExecuteActionResponse (see page 24052)

OnAfterGetResponse (see page 24075)

OnBeforeGetActionResponse (see page 24186)

41.1.23.4.3 TDataSetAdapterNextRowAction.OnBeforeExecute Event

Called before the adapter action is executed.

Pascal

```
property OnBeforeExecute: TActionExecuteHandledEvent;
```

C++

```
__property TActionExecuteHandledEvent OnBeforeExecute;
```

Description

Implement OnBeforeExecute to do something before the action is executed. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. Set the Handled flag to prevent the action from being executed. OnBeforeExecute is called by DoBeforeExecuteActionRequest.

See Also

DoBeforeExecuteActionRequest (see page 24052)

OnAfterExecute (see page 24075)

OnBeforeExecuteAction (see page 24186)

41.1.23.4.4 TDataSetAdapterNextRowAction.OnBeforeGetResponse Event

Called before the adapter action response is generated.

Pascal

```
property OnBeforeGetResponse: TActionExecuteHandledEvent;
```

C++

```
__property TActionExecuteHandledEvent OnBeforeGetResponse;
```

Description

Implement OnBeforeGetResponse to do something before the action response is generated. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. Set the Handled flag to indicate that the response has been generated and no further processing is needed. OnBeforeGetResponse is called by DoBeforeGetExecuteActionReponse.

See Also

DoBeforeGetExecuteActionResponse (see page 24052)

OnAfterGetResponse (see page 24075)

OnBeforeGetActionResponse (see page 24186)

41.1.23.4.5 TDataSetAdapterNextRowAction.OnGetParams Event

Specifies name/value pairs needed to execute this adapter action.

Pascal

```
property OnGetParams: TActionGetParamsEvent;
```

C++

```
__property TActionGetParamsEvent OnGetParams;
```

Description

Implement this event handler to specify the name/value needed to execute this action. For example, an action that deletes a row in a table will need a name/value pair that identifies the row to be deleted such as "Key=123".

See Also

ImplGetAdapterItemRequestParams (see page 24063)

41.1.24 TDataSetAdapterPrevRowAction Class

TDataSetAdapterPrevRowAction posts any edits made in an HTML form and moves the dataset adapter to the prior record.

Class Hierarchy

Pascal

```
TDataSetAdapterPrevRowAction = class(TDataSetAdapterMoveRowAction);
```

C++

```
class TDataSetAdapterPrevRowAction : public TDataSetAdapterMoveRowAction;
```

File

DBAdapt

Description

Add TDataSetAdapterPrevRowAction to a dataset adapter (TDataSetAdapter (see page 7872)) to support HTML forms that let users move to the previous dataset record. When this action is executed, it locates the parent adapter's dataset on the record specified by the current request object, posts any edits included in the current request, and then moves the dataset to the prior record.

Server-side script addresses this action as the 'PrevRow' action of the parent adapter. If the current request identifies the first record of the dataset as current, the control for this action appears disabled.

See Also

TDataSetAdapterApplyRowAction (see page 7890)

TDataSetAdapterBrowseRowAction (see page 7903)

TDataSetAdapterDeleteRowAction (see page 7934)

TDataSetAdapterEditRowAction (see page 7947)

TDataSetAdapterFirstRowAction (see page 7972)

TDataSetAdapterLastRowAction (see page 7984)

TDataSetAdapterCancelRowAction (see page 7916)

TDataSetAdapterNextRowAction (see page 8030)

TDataSetAdapterRefreshRowAction (see page 8054)

TDataSetAdapterNewRowAction (see page 8016)

TDataSetAdapter (see page 7872)

TCustomDataSetAdapter (see page 7766)

TDataSet (see page 6894)

41.1.24.1 TDataSetAdapterPrevRowAction Members

The following tables list the members exposed by TDataSetAdapterPrevRowAction.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	CheckExecuteAccess (see page 24050)	Checks end-user rights to execute this adapter action.
	CreateRequestContext (see page 24050)	Creates an object that describes the adapter action parameters and adapter field values.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DoAfterExecuteActionRequest (see page 24051)	Calls event handlers after the adapter action is executed.
V	DoAfterGetExecuteActionResponse (see page 24051)	Calls event handlers after the adapter action response is formulated.
V	DoBeforeExecuteActionRequest (see page 24052)	Calls event handlers before the adapter action is executed.
V	DoBeforeGetExecuteActionResponse (see page 24052)	Calls event handlers before the adapter action response is formulated.
	EndIterator (see page 24053)	Implements IIteratorSupport's EndIterator method.
	ExecuteActionRequest (see page 24053)	Executes the adapter action using parameters passed in the HTTP request.
	GetActionName (see page 24054)	Gets the name used to reference this adapter action with server-side script.
	GetAdapter (see page 7819)	Returns the value of the Adapter (see page 7822) property.
	GetAdapter (see page 24054)	GetAdapter returns the parent adapter component.
	GetAdapterItemRequestParams (see page 24055)	Provides the name/value pairs needed to execute this adapter action.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.

	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetContainerList (see page 24727)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
	GetDataSet (see page 7819)	Returns the value of the DataSet (see page 7822) property.
V	GetDefaultActionName (see page 8049)	Gets the default name used to reference this adapter action with server-side script.
V	GetDefaultDisplayLabel (see page 24055)	Provides the default display label for this adapter action.
	GetDisplayLabel (see page 24055)	Returns the suggested display label for this adapter action.
	GetDisplayStyle (see page 24056)	Returns a string value to suggest an HTML display style for this adapter action.
V	GetDisplayStyleType (see page 24056)	Suggests an HTML display type for this adapter action.
	GetErrors (see page 24057)	This is GetErrors, a member of class TBaseAdapterAction.
	GetExecuteActionResponse (see page 24057)	Generates a response after the adapter action has been executed.
	GetFailureOptions (see page 24057)	Indicates whether to perform an HTTP redirect after execution of this adapter action fails.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
	GetInputStyle (see page 24058)	Returns a string value to suggest an HTML display style for this adapter action.
	GetIsAdapterActionList (see page 24058)	Indicates whether this adapter action may have multiple commands.
V	GetItemCount (see page 24058)	Returns the number of commands defined by this adapter action.
	GetIteratorIndex (see page 24059)	Implements IIteratorIndex's GetIteratorIndex method.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetSuccessOptions (see page 24059)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetVariableName (see page 24060)	Gets the name used to reference this adapter action with server-side script.
	GetViewMode (see page 24060)	Returns a string value to suggest a view mode for this adapter action.
V	GetViewModeType (see page 24060)	Suggests a view mode for this adapter action.
	GetVisible (see page 24061)	Indicates whether a button or hyperlink for this adapter action should be displayed on the HTML page.
V	GetWebSnapObjClass (see page 24061)	Returns the class type for this adapter field.
	HandleRequest (see page 24061)	Executes the adapter action and generates a response.
	HasExecuteAccess (see page 24062)	Checks the end-user's right to execute this adapter action.
	ImplCreateRequestContext (see page 24062)	Creates an object that describes the action parameters and field values.
	ImplEndIterator (see page 24062)	Implements IIteratorSupport's EndIterator (see page 24053) method.
V	ImplExecuteActionRequest (see page 8049)	Executes the adapter action using parameters passed in the HTTP request.
V	ImplGetActionName (see page 24063)	Gets the name used to reference this adapter action with server-side script.
V	ImplGetActionName (see page 24195)	Gets the name used to reference this adapter action with server-side script.
V	ImplGetAdapterItemRequestParams (see page 7854)	Provides the underlying implementation for the GetAdapterItemRequestParams method.
V	ImplGetAdapterItemRequestParams (see page 24063)	Provides the name/value pairs needed to execute this adapter action.
V	ImplGetAdapterItemRequestParams (see page 24196)	Provides the name/value pairs needed to execute this adapter action.
V	ImplGetDisplayLabel (see page 24064)	Returns the suggested display label for this adapter action.
V	ImplGetExecuteActionResponse (see page 24064)	Generates a response after the adapter action has been executed.
V	ImplGetFailureOptions (see page 24065)	Indicates whether to perform an HTTP redirect after execution of this adapter action fails.
V	ImplGetIsAdapterActionList (see page 24065)	Indicates whether this adapter action may have multiple commands.
V	ImplGetIteratorIndex (see page 24065)	Implements IIteratorIndex's GetIteratorIndex (see page 24059) method.
V	ImplGetSuccessOptions (see page 24066)	Indicates whether to perform an HTTP redirect after successfully executing this action.
V	ImplGetSuccessOptions (see page 24196)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	ImplGetVariableName (see page 24066)	Gets the name used to reference this adapter action with server-side script.
V	ImplGetVisible (see page 7819)	Provides the underlying implementation for the GetVisible method.
V	ImplGetVisible (see page 24066)	Indicates whether a button or hyperlink for this adapter action should be displayed on the HTML page.

	ImplHandleRequest (see page 24067)	Executes the adapter action and generates a response.
	ImplHasExecuteAccess (see page 24067)	Checks the end-user's right to execute this adapter action.
	ImplInIterator (see page 24067)	Implements IIteratorIndex's InIterator (see page 24069) method.
	ImplIsDefaultAction (see page 8016)	Provides the underlying implementation for the IsDefaultAction method.
	ImplIsDefaultAction (see page 24068)	Indicates whether this adapter action should be added, by default, to the parent adapter.
	ImplNextIteration (see page 24068)	Implements IIteratorSupport's NextIteration (see page 24070) method.
	ImplSetActionName (see page 24197)	Sets the name that is used to reference this adapter action with server-side script.
	ImplStartIterator (see page 24068)	Implements IIteratorSupport's StartIterator (see page 24071) method.
	ImplWebEnabled (see page 8050)	Provides the underlying implementation for the WebEnabled method.
	InIterator (see page 24069)	Implements IIteratorIndex's InIterator method.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsDefaultAction (see page 24070)	Indicates whether this adapter action should be added, by default, to the parent adapter.
	IsDefaultField (see page 24728)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	NextIteration (see page 24070)	Implements IIteratorSupport's NextIteration method.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	ParentChanged (see page 24070)	Handles movement of the component to a different parent.
	ParentChanged (see page 24728)	Responds when the WebParent (see page 24731) property changes.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	ReadState (see page 24729)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetActionName (see page 24197)	Sets the name that is used to reference this adapter action with server-side script.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDisplayLabel (see page 24071)	Set the value of the DisplayLabel (see page 24073) property.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	SetParentComponent (see page 24729)	Sets the WebParent (see page 24731) property to be the same as this component's parent.
	SetWebParent (see page 24730)	Sets the value of the WebParent (see page 24731) property.
	StartIterator (see page 24071)	Implements IIteratorSupport's StartIterator method.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WebEnabled (see page 24071)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	Adapter (see page 7822)	Indicates the dataset adapter that uses this object to represent one of its actions.
R	Adapter (see page 24072)	Provides access to the parent adapter component.
R	Errors (see page 24073)	This is Errors, a member of class TBaseAdapterAction.
R	WebContainedComponentHelper (see page 24730)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.
R	WebParent (see page 24731)	Indicates the component that uses this TWebContainedComponent (see page 24722) as one of its Web items.

Public Events

	Name	Description
	OnExecute (see page 7822)	Occurs when server-side script executes this action.
	OnExecute (see page 24200)	Called to execute this action using parameters passed in the HTTP request.
	OnGetEnabled (see page 7823)	Occurs when the WebSnap application to determine whether a control or hyperlink for this action should be enabled.
	OnGetEnabled (see page 24200)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
V	Create (see page 7818)	Creates and initializes an instance of TCustomDataSetAdapterAction (see page 7811).
V	Create (see page 7853)	Creates and initializes an instance of TCustomDataSetAdapterRowAction (see page 7846).
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	Create (see page 24726)	Creates and initializes an instance of TWebContainedComponent (see page 24722).
	CreateRequestContext (see page 19681)	Creates an object that describes the adapter action parameters and adapter field values.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Destroy (see page 24726)	Frees an instance of TWebContainedComponent (see page 24722).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	EndIterator (see page 19723)	This is EndIterator, a member of class IIteratorSupport.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.

	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetActionName (see page 19755)	This is GetActionName, a member of class IWebGetActionName.
	GetAdapterItemRequestParams (see page 19692)	This is GetAdapterItemRequestParams, a member of class IGetAdapterItemRequestParams.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.
	GetDisplayLabel (see page 19756)	This is GetDisplayLabel, a member of class IWebGetDisplayLabel.
	GetDisplayStyle (see page 19700)	Returns the preferred display style for an adapter field or adapter action.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetFailureOptions (see page 964)	This is GetFailureOptions, a member of class IGetAdapterActionRedirectOptions.
	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	GetInputStyle (see page 19700)	Returns the preferred editing style for an adapter field.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIsAdapterActionList (see page 19717)	This is GetIsAdapterActionList, a member of class IIsAdapterActionList.
	GetIteratorIndex (see page 19721)	Returns the value of the IteratorIndex (see page 19721) property.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 24727)	Returns the object that uses this component to generate HTML.
	GetSuccessOptions (see page 964)	This is GetSuccessOptions, a member of class IGetAdapterActionRedirectOptions.
	GetVariableName (see page 15329)	This is GetVariableName, a member of class IWebVariableName.
	GetViewMode (see page 19701)	Returns the preferred mode of an adapter field.
	GetVisible (see page 19652)	This is GetVisible, a member of class IAdapterActionAttributes.
	HandleRequest (see page 19681)	Executes the adapter action and generates a response.
	HasExecuteAccess (see page 19651)	This is HasExecuteAccess, a member of class IAdapterActionAccess.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 24727)	Indicates whether this component appears in another component's list of Web items.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InIterator (see page 19721)	Indicates whether the object is iterating over its items.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsDefaultAction (see page 19768)	This is IsDefaultAction, a member of class IWebIsDefaultAction.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NextIteration (see page 19723)	Advances to the objects next item.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.

	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetActionName (see page 19783)	This is SetActionName, a member of class IWebSetActionName.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.
	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	StartIterator (see page 19724)	This is StartIterator, a member of class IIteratorSupport.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	WebEnabled (see page 19752)	This is WebEnabled, a member of class IWebEnabled.

Public Properties

	Name	Description
	ActionModes (see page 7821)	Indicates what dataset adapter modes this field supports.
	ActionName (see page 7821)	Identifies the name of this action when using server-side script.
R	ActionName (see page 19755)	This is ActionName, a member of class IWebGetActionName.
R	ActionName (see page 24072)	Identifies the name of this action when using server-side script.
	ActionName (see page 24198)	Identifies the name of this action when using server-side script.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
R	DataSet (see page 7822)	Indicates the dataset on which this action operates.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	FailureOptions (see page 965)	This is FailureOptions, a member of class IGetAdapterActionRedirectOptions.
	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.
R	IsAdapterActionList (see page 19717)	This is IsAdapterActionList, a member of class IIsAdapterActionList.
R	ItemCount (see page 24074)	Returns the number of items defined by an adapter action.
R	ItemIndex (see page 24074)	Returns the index of the current item of an adapter action.
R	IteratorIndex (see page 19721)	Indicates the index of the current item.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
R	SuccessOptions (see page 965)	This is SuccessOptions, a member of class IGetAdapterActionRedirectOptions.
R	VariableName (see page 15329)	This is VariableName, a member of class IWebVariableName.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
R	Visible (see page 19652)	This is Visible, a member of class IAdapterActionAttributes.

Published Events

	Name	Description
	OnAfterExecute (see page 8052)	Called after the adapter action has executed.
	OnAfterGetResponse (see page 8052)	Called after the adapter action response is generated.
	OnBeforeExecute (see page 8052)	Called before the adapter action is executed.
	OnBeforeGetResponse (see page 8053)	Called before the adapter action response is generated.
	OnGetParams (see page 8053)	Specifies name/value pairs needed to execute this adapter action.

Published Properties

	Name	Description
	DisplayLabel (see page 8050)	Suggests a display label for this adapter action.
	ExecuteAccess (see page 8051)	Defines the rights required to execute this action.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	RedirectOptions (see page 8051)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	Tag (see page 2808)	Stores an integer value as part of a component.

41.1.24.2 TDataSetAdapterPrevRowAction Methods

The methods of the TDataSetAdapterPrevRowAction class are listed here.

Protected Methods

	Name	Description
	GetDefaultActionName (see page 8049)	Gets the default name used to reference this adapter action with server-side script.
	ImplExecuteActionRequest (see page 8049)	Executes the adapter action using parameters passed in the HTTP request.
	ImplWebEnabled (see page 8050)	Provides the underlying implementation for the WebEnabled method.

41.1.24.2.1 TDataSetAdapterPrevRowAction.GetDefaultActionName Method

Gets the default name used to reference this adapter action with server-side script.

Pascal

```
function GetDefaultActionName: string; override;
```

C++

```
virtual __fastcall AnsiString GetDefaultActionName();
```

Description

GetDefaultActionName returns the name of the adapter action component. Descendants may override this function.

See Also

ImplGetActionName (see page 24063)

41.1.24.2.2 TDataSetAdapterPrevRowAction.ImplExecuteActionRequest Method

Executes the adapter action using parameters passed in the HTTP request.

Pascal

```
procedure ImplExecuteActionRequest(AActionRequest: IActionRequest; AActionResponse:
IActionResponse); override;
```

C++

```
virtual __fastcall ImplExecuteActionRequest(IActionRequest AActionRequest, IActionResponse
AActionResponse);
```

Description

ImplExecuteActionRequest create a TStrings containing the name/value pairs in AActionRequest and calls the OnExecute event handler.

See Also

ImplExecuteActionRequest (see page 24063)

OnExecute (see page 24200)

41.1.24.2.3 TDataSetAdapterPrevRowAction.ImplWebEnabled Method

Provides the underlying implementation for the WebEnabled method.

Pascal

```
function ImplWebEnabled: Boolean; override;
```

C++

```
virtual __fastcall Boolean ImplWebEnabled();
```

Description

The WebEnabled method calls ImplWebEnabled to determine whether the control or hyperlink for this action should appear enabled in the HTML form. WebEnabled returns true if controls should be enabled, false otherwise.

ImplWebEnabled generates an OnGetEnabled event so that you can specify whether controls for this action are enabled. If there is no OnGetEnabled event handler, ImplWebEnabled returns true if the parent adapter's GetKeyFields method returns a set of fields that can locate records in the associated dataset.

See Also

WebEnabled (see page 24071)

OnGetEnabled (see page 7823)

GetKeyFields (see page 7786)

41.1.24.3 TDataSetAdapterPrevRowAction Properties

The properties of the TDataSetAdapterPrevRowAction class are listed here.

Published Properties

	Name	Description
	DisplayLabel (see page 8050)	Suggests a display label for this adapter action.
	ExecuteAccess (see page 8051)	Defines the rights required to execute this action.
	RedirectOptions (see page 8051)	Indicates whether to perform an HTTP redirect after successfully executing this action.

41.1.24.3.1 TDataSetAdapterPrevRowAction.DisplayLabel Property

Suggests a display label for this adapter action.

Pascal

```
property DisplayLabel: string;
```

C++

```
__property AnsiString DisplayLabel;
```

Description

Use this property to suggest a display label to use when generating HTML to display the a button or hyperlink to execute this adapter action. Typically the adapter action is displayed using server-side script, either generated or custom written. Server-side

script uses the DisplayLabel property to access this value.

See Also

ImplGetDisplayLabel (see page 24064)

SetDisplayLabel (see page 24071)

41.1.24.3.2 TDataSetAdapterPrevRowAction.ExecuteAccess Property

Defines the rights required to execute this action.

Pascal

```
property ExecuteAccess: string;
```

C++

```
__property AnsiString ExecuteAccess;
```

Description

The ExecuteAccess property defines the access rights required to execute this action. When server-side script accesses the CanExecute property, this value is checked against the end user's rights. Typically, an exception is raised when an end-user attempts to execute an adapter action that does not allow access.

See Also

TWebUserList (see page 25625)

hasexecuteaccess (see page 24162)

41.1.24.3.3 TDataSetAdapterPrevRowAction.RedirectOptions Property

Indicates whether to perform an HTTP redirect after successfully executing this action.

Pascal

```
property RedirectOptions: TAdapterActionRedirectOptions;
```

C++

```
__property TAdapterActionRedirectOptions RedirectOptions;
```

Description

Set RedirectOptions to indicate that HTTP redirect should be performed after executing this adapter action. An HTTP redirect causes the browser to "forget" about the parameters passed when executing the adapter action. Without a redirect, the browser's Refresh or Reload command cause the last HTTP request to be resent, resulting in re-execution of the adapter action.

See Also

SendRedirect (see page 15201)

41.1.24.4 TDataSetAdapterPrevRowAction Events

The events of the TDataSetAdapterPrevRowAction class are listed here.

Published Events

	Name	Description
	OnAfterExecute (see page 8052)	Called after the adapter action has executed.
	OnAfterGetResponse (see page 8052)	Called after the adapter action response is generated.

	OnBeforeExecute (see page 8052)	Called before the adapter action is executed.
	OnBeforeGetResponse (see page 8053)	Called before the adapter action response is generated.
	OnGetParams (see page 8053)	Specifies name/value pairs needed to execute this adapter action.

41.1.24.4.1 TDataSetAdapterPrevRowAction.OnAfterExecute Event

Called after the adapter action has executed.

Pascal

```
property OnAfterExecute: TActionExecuteEvent;
```

C++

```
__property TActionExecuteEvent OnAfterExecute;
```

Description

Implement OnAfterExecute to do something after the action has executed. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. OnAfterExecute is called by DoAfterExecuteActionRequest.

See Also

DoAfterExecuteActionRequest (see page 24051)

OnAfterExecuteAction (see page 24184)

OnBeforeExecute (see page 24076)

41.1.24.4.2 TDataSetAdapterPrevRowAction.OnAfterGetResponse Event

Called after the adapter action response is generated.

Pascal

```
property OnAfterGetResponse: TActionExecuteEvent;
```

C++

```
__property TActionExecuteEvent OnAfterGetResponse;
```

Description

Implement OnAfterGetResponse to do something after the action response is generated. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. OnAfterGetResponse is called by DoAfterGetExecuteActionReponse.

See Also

DoBeforeGetExecuteActionResponse (see page 24052)

OnAfterGetResponse (see page 24075)

OnBeforeGetActionResponse (see page 24186)

41.1.24.4.3 TDataSetAdapterPrevRowAction.OnBeforeExecute Event

Called before the adapter action is executed.

Pascal

```
property OnBeforeExecute: TActionExecuteHandledEvent;
```

C++

```
__property TActionExecuteHandledEvent OnBeforeExecute;
```

Description

Implement OnBeforeExecute to do something before the action is executed. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. Set the Handled flag to prevent the action from being executed. OnBeforeExecute is called by DoBeforeExecuteActionRequest.

See Also

DoBeforeExecuteActionRequest (see page 24052)

OnAfterExecute (see page 24075)

OnBeforeExecuteAction (see page 24186)

41.1.24.4.4 TDataSetAdapterPrevRowAction.OnBeforeGetResponse Event

Called before the adapter action response is generated.

Pascal

```
property OnBeforeGetResponse: TActionExecuteHandledEvent;
```

C++

```
__property TActionExecuteHandledEvent OnBeforeGetResponse;
```

Description

Implement OnBeforeGetResponse to do something before the action response is generated. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. Set the Handled flag to indicate that the response has been generated and no further processing is needed. OnBeforeGetResponse is called by DoBeforeGetExecuteActionReponse.

See Also

DoBeforeGetExecuteActionResponse (see page 24052)

OnAfterGetResponse (see page 24075)

OnBeforeGetActionResponse (see page 24186)

41.1.24.4.5 TDataSetAdapterPrevRowAction.OnGetParams Event

Specifies name/value pairs needed to execute this adapter action.

Pascal

```
property OnGetParams: TActionGetParamsEvent;
```

C++

```
__property TActionGetParamsEvent OnGetParams;
```

Description

Implement this event handler to specify the name/value needed to execute this action. For example, an action that deletes a row in a table will need a name/value pair that identifies the row to be deleted such as "Key=123".

See Also

ImplGetAdapterItemRequestParams (see page 24063)

41.1.25 TDataSetAdapterRefreshRowAction Class

TDataSetAdapterRefreshRowAction refetches the current field values for the dataset record specified in the current HTTP request.

Class Hierarchy

Pascal

```
TDataSetAdapterRefreshRowAction = class(TCustomDataSetAdapterRowAction);
```

C++

```
class TDataSetAdapterRefreshRowAction : public TCustomDataSetAdapterRowAction;
```

File

DBAdapt

Description

Add TDataSetAdapterRefreshRowAction to a dataset adapter (TDataSetAdapter (see page 7872)) to support HTML forms that let users re-fetch database information to reflect the current value in the associated dataset. When this action is executed, it sets the mode of the parent adapter from the value specified in the current request and positions the dataset on the record specified in the current request. This allows forms that include the adapter to represent the current values of the fields in the dataset. If the request specifies insert mode, this action first posts the new record to the dataset.

Server-side script addresses this action as the 'RefreshRow' action of the parent adapter. By default, this action is visible (included in HTML forms) regardless of the mode of the parent adapter. This action is included by default when the adapter is used to build forms that represent a single database record.

See Also

TDataSetAdapterApplyRowAction (see page 7890)

TDataSetAdapterBrowseRowAction (see page 7903)

TDataSetAdapterCancelRowAction (see page 7916)

TDataSetAdapterDeleteRowAction (see page 7934)

TDataSetAdapterFirstRowAction (see page 7972)

TDataSetAdapterLastRowAction (see page 7984)

TDataSetAdapterNextRowAction (see page 8030)

TDataSetAdapterPrevRowAction (see page 8042)

TDataSetAdapterEditRowAction (see page 7947)

TDataSetAdapterNewRowAction (see page 8016)

TDataSetAdapter (see page 7872)

TCustomDataSetAdapter (see page 7766)

TCustomDataSetAdapter (see page 7766)

41.1.25.1 TDataSetAdapterRefreshRowAction Members

The following tables list the members exposed by TDataSetAdapterRefreshRowAction.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	CheckExecuteAccess (see page 24050)	Checks end-user rights to execute this adapter action.
	CreateRequestContext (see page 24050)	Creates an object that describes the adapter action parameters and adapter field values.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DoAfterExecuteActionRequest (see page 24051)	Calls event handlers after the adapter action is executed.
V	DoAfterGetExecuteActionResponse (see page 24051)	Calls event handlers after the adapter action response is formulated.
V	DoBeforeExecuteActionRequest (see page 24052)	Calls event handlers before the adapter action is executed.
V	DoBeforeGetExecuteActionResponse (see page 24052)	Calls event handlers before the adapter action response is formulated.
	EndIterator (see page 24053)	Implements IIteratorSupport's EndIterator method.
	ExecuteActionRequest (see page 24053)	Executes the adapter action using parameters passed in the HTTP request.
	GetActionName (see page 24054)	Gets the name used to reference this adapter action with server-side script.
	GetAdapter (see page 7819)	Returns the value of the Adapter (see page 7822) property.
	GetAdapter (see page 24054)	GetAdapter returns the parent adapter component.
	GetAdapterItemRequestParams (see page 24055)	Provides the name/value pairs needed to execute this adapter action.

	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetContainerList (see page 24727)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
	GetDataSet (see page 7819)	Returns the value of the DataSet (see page 7822) property.
V	GetDefaultActionName (see page 8061)	Gets the default name used to reference this adapter action with server-side script.
V	GetDefaultDisplayLabel (see page 24055)	Provides the default display label for this adapter action.
	GetDisplayLabel (see page 24055)	Returns the suggested display label for this adapter action.
	GetDisplayStyle (see page 24056)	Returns a string value to suggest an HTML display style for this adapter action.
V	GetDisplayStyleType (see page 24056)	Suggests an HTML display type for this adapter action.
	GetErrors (see page 24057)	This is GetErrors, a member of class TBaseAdapterAction.
	GetExecuteActionResponse (see page 24057)	Generates a response after the adapter action has been executed.
	GetFailureOptions (see page 24057)	Indicates whether to perform an HTTP redirect after execution of this adapter action fails.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetInputStyle (see page 24058)	Returns a string value to suggest an HTML display style for this adapter action.
	GetIsAdapterActionList (see page 24058)	Indicates whether this adapter action may have multiple commands.
V	GetItemCount (see page 24058)	Returns the number of commands defined by this adapter action.
	GetIteratorIndex (see page 24059)	Implements IIteratorIndex's GetIteratorIndex method.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetSuccessOptions (see page 24059)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetVariableName (see page 24060)	Gets the name used to reference this adapter action with server-side script.
	GetViewMode (see page 24060)	Returns a string value to suggest a view mode for this adapter action.
V	GetViewModeType (see page 24060)	Suggests a view mode for this adapter action.
	GetVisible (see page 24061)	Indicates whether a button or hyperlink for this adapter action should be displayed on the HTML page.
V	GetWebSnapObjClass (see page 24061)	Returns the class type for this adapter field.
	HandleRequest (see page 24061)	Executes the adapter action and generates a response.
	HasExecuteAccess (see page 24062)	Checks the end-user's right to execute this adapter action.
	ImplCreateRequestContext (see page 24062)	Creates an object that describes the action parameters and field values.
	ImplEndIterator (see page 24062)	Implements IIteratorSupport's EndIterator (see page 24053) method.
V	ImplExecuteActionRequest (see page 8061)	Executes the adapter action using parameters passed in the HTTP request.
V	ImplGetActionName (see page 24063)	Gets the name used to reference this adapter action with server-side script.
V	ImplGetActionName (see page 24195)	Gets the name used to reference this adapter action with server-side script.
V	ImplGetAdapterItemRequestParams (see page 7854)	Provides the underlying implementation for the GetAdapterItemRequestParams method.
V	ImplGetAdapterItemRequestParams (see page 24063)	Provides the name/value pairs needed to execute this adapter action.
V	ImplGetAdapterItemRequestParams (see page 24196)	Provides the name/value pairs needed to execute this adapter action.
V	ImplGetDisplayLabel (see page 24064)	Returns the suggested display label for this adapter action.
V	ImplGetExecuteActionResponse (see page 24064)	Generates a response after the adapter action has been executed.
V	ImplGetFailureOptions (see page 24065)	Indicates whether to perform an HTTP redirect after execution of this adapter action fails.
V	ImplGetIsAdapterActionList (see page 24065)	Indicates whether this adapter action may have multiple commands.
V	ImplGetIteratorIndex (see page 24065)	Implements IIteratorIndex's GetIteratorIndex (see page 24059) method.
V	ImplGetSuccessOptions (see page 24066)	Indicates whether to perform an HTTP redirect after successfully executing this action.
V	ImplGetSuccessOptions (see page 24196)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	ImplGetVariableName (see page 24066)	Gets the name used to reference this adapter action with server-side script.

	ImplGetVisible (see page 7819)	Provides the underlying implementation for the GetVisible method.
	ImplGetVisible (see page 24066)	Indicates whether a button or hyperlink for this adapter action should be displayed on the HTML page.
	ImplHandleRequest (see page 24067)	Executes the adapter action and generates a response.
	ImplHasExecuteAccess (see page 24067)	Checks the end-user's right to execute this adapter action.
	ImplInIterator (see page 24067)	Implements IIteratorIndex's InIterator (see page 24069) method.
	ImplIsDefaultAction (see page 8062)	Indicates whether this adapter action should be added, by default, to the parent adapter.
	ImplNextIteration (see page 24068)	Implements IIteratorSupport's NextIteration (see page 24070) method.
	ImplSetActionName (see page 24197)	Sets the name that is used to reference this adapter action with server-side script.
	ImplStartIterator (see page 24068)	Implements IIteratorSupport's StartIterator (see page 24071) method.
	ImplWebEnabled (see page 8062)	Provides the underlying implementation for the WebEnabled method.
	InIterator (see page 24069)	Implements IIteratorIndex's InIterator method.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsDefaultAction (see page 24070)	Indicates whether this adapter action should be added, by default, to the parent adapter.
	IsDefaultField (see page 24728)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	NextIteration (see page 24070)	Implements IIteratorSupport's NextIteration method.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	ParentChanged (see page 24070)	Handles movement of the component to a different parent.
	ParentChanged (see page 24728)	Responds when the WebParent (see page 24731) property changes.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	ReadState (see page 24729)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetActionName (see page 24197)	Sets the name that is used to reference this adapter action with server-side script.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDisplayLabel (see page 24071)	Set the value of the DisplayLabel (see page 24073) property.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	SetParentComponent (see page 24729)	Sets the WebParent (see page 24731) property to be the same as this component's parent.
	SetWebParent (see page 24730)	Sets the value of the WebParent (see page 24731) property.
	StartIterator (see page 24071)	Implements IIteratorSupport's StartIterator method.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WebEnabled (see page 24071)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	Adapter (see page 7822)	Indicates the dataset adapter that uses this object to represent one of its actions.
R	Adapter (see page 24072)	Provides access to the parent adapter component.
R	Errors (see page 24073)	This is Errors, a member of class TBaseAdapterAction.
R	WebContainedComponentHelper (see page 24730)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.
R	WebParent (see page 24731)	Indicates the component that uses this TWebContainedComponent (see page 24722) as one of its Web items.

Public Events

	Name	Description
	OnExecute (see page 7822)	Occurs when server-side script executes this action.
	OnExecute (see page 24200)	Called to execute this action using parameters passed in the HTTP request.
	OnGetEnabled (see page 7823)	Occurs when the WebSnap application to determine whether a control or hyperlink for this action should be enabled.
	OnGetEnabled (see page 24200)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
V	Create (see page 7818)	Creates and initializes an instance of TCustomDataSetAdapterAction (see page 7811).
V	Create (see page 7853)	Creates and initializes an instance of TCustomDataSetAdapterRowAction (see page 7846).
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	Create (see page 24726)	Creates and initializes an instance of TWebContainedComponent (see page 24722).
	CreateRequestContext (see page 19681)	Creates an object that describes the adapter action parameters and adapter field values.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Destroy (see page 24726)	Frees an instance of TWebContainedComponent (see page 24722).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	EndIterator (see page 19723)	This is EndIterator, a member of class IIteratorSupport.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.

	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetActionName (see page 19755)	This is GetActionName, a member of class IWebGetActionName.
	GetAdapterItemRequestParams (see page 19692)	This is GetAdapterItemRequestParams, a member of class IGetAdapterItemRequestParams.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.
	GetDisplayLabel (see page 19756)	This is GetDisplayLabel, a member of class IWebGetDisplayLabel.
	GetDisplayStyle (see page 19700)	Returns the preferred display style for an adapter field or adapter action.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetFailureOptions (see page 964)	This is GetFailureOptions, a member of class IGetAdapterActionRedirectOptions.
	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	GetInputStyle (see page 19700)	Returns the preferred editing style for an adapter field.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIsAdapterActionList (see page 19717)	This is GetIsAdapterActionList, a member of class IIsAdapterActionList.
	GetIteratorIndex (see page 19721)	Returns the value of the IteratorIndex (see page 19721) property.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 24727)	Returns the object that uses this component to generate HTML.
	GetSuccessOptions (see page 964)	This is GetSuccessOptions, a member of class IGetAdapterActionRedirectOptions.
	GetVariableName (see page 15329)	This is GetVariableName, a member of class IWebVariableName.
	GetViewMode (see page 19701)	Returns the preferred mode of an adapter field.
	GetVisible (see page 19652)	This is GetVisible, a member of class IAdapterActionAttributes.
	HandleRequest (see page 19681)	Executes the adapter action and generates a response.
	HasExecuteAccess (see page 19651)	This is HasExecuteAccess, a member of class IAdapterActionAccess.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 24727)	Indicates whether this component appears in another component's list of Web items.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InIterator (see page 19721)	Indicates whether the object is iterating over its items.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsDefaultAction (see page 19768)	This is IsDefaultAction, a member of class IWebIsDefaultAction.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NextIteration (see page 19723)	Advances to the objects next item.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.

	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetActionName (see page 19783)	This is SetActionName, a member of class IWebSetActionName.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.
	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	StartIterator (see page 19724)	This is StartIterator, a member of class IIteratorSupport.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	WebEnabled (see page 19752)	This is WebEnabled, a member of class IWebEnabled.

Public Properties

	Name	Description
	ActionModes (see page 7821)	Indicates what dataset adapter modes this field supports.
	ActionName (see page 7821)	Identifies the name of this action when using server-side script.
R	ActionName (see page 19755)	This is ActionName, a member of class IWebGetActionName.
R	ActionName (see page 24072)	Identifies the name of this action when using server-side script.
	ActionName (see page 24198)	Identifies the name of this action when using server-side script.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
R	DataSet (see page 7822)	Indicates the dataset on which this action operates.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	FailureOptions (see page 965)	This is FailureOptions, a member of class IGetAdapterActionRedirectOptions.
	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.
R	IsAdapterActionList (see page 19717)	This is IsAdapterActionList, a member of class IIsAdapterActionList.
R	ItemCount (see page 24074)	Returns the number of items defined by an adapter action.
R	ItemIndex (see page 24074)	Returns the index of the current item of an adapter action.
R	IteratorIndex (see page 19721)	Indicates the index of the current item.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
R	SuccessOptions (see page 965)	This is SuccessOptions, a member of class IGetAdapterActionRedirectOptions.
R	VariableName (see page 15329)	This is VariableName, a member of class IWebVariableName.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
R	Visible (see page 19652)	This is Visible, a member of class IAdapterActionAttributes.

Published Events

	Name	Description
	OnAfterExecute (see page 8064)	Called after the adapter action has executed.
	OnAfterGetResponse (see page 8064)	Called after the adapter action response is generated.
	OnBeforeExecute (see page 8065)	Called before the adapter action is executed.
	OnBeforeGetResponse (see page 8065)	Called before the adapter action response is generated.
	OnGetParams (see page 8066)	Specifies name/value pairs needed to execute this adapter action.

Published Properties

	Name	Description
	DisplayLabel (see page 8063)	Suggests a display label for this adapter action.
	ExecuteAccess (see page 8063)	Defines the rights required to execute this action.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	RedirectOptions (see page 8063)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	Tag (see page 2808)	Stores an integer value as part of a component.

41.1.25.2 TDataSetAdapterRefreshRowAction Methods

The methods of the TDataSetAdapterRefreshRowAction class are listed here.

Protected Methods

	Name	Description
	GetDefaultActionName (see page 8061)	Gets the default name used to reference this adapter action with server-side script.
	ImplExecuteActionRequest (see page 8061)	Executes the adapter action using parameters passed in the HTTP request.
	ImplIsDefaultAction (see page 8062)	Indicates whether this adapter action should be added, by default, to the parent adapter.
	ImplWebEnabled (see page 8062)	Provides the underlying implementation for the WebEnabled method.

41.1.25.2.1 TDataSetAdapterRefreshRowAction.GetDefaultActionName Method

Gets the default name used to reference this adapter action with server-side script.

Pascal

```
function GetDefaultActionName: string; override;
```

C++

```
virtual __fastcall AnsiString GetDefaultActionName();
```

Description

GetDefaultActionName returns the name of the adapter action component. Descendants may override this function.

See Also

ImplGetActionName (see page 24063)

41.1.25.2.2 TDataSetAdapterRefreshRowAction.ImplExecuteActionRequest Method

Executes the adapter action using parameters passed in the HTTP request.

Pascal

```
procedure ImplExecuteActionRequest(AActionRequest: IActionRequest; AActionResponse:
IActionResponse); override;
```

C++

```
virtual __fastcall ImplExecuteActionRequest(IActionRequest AActionRequest, IActionResponse
AActionResponse);
```

Description

ImplExecuteActionRequest create a TStrings containing the name/value pairs in AActionRequest and calls the OnExecute event

handler.

See Also

ImplExecuteActionRequest (see page 24063)

OnExecute (see page 24200)

41.1.25.2.3 TDataSetAdapterRefreshRowAction.ImplIsDefaultAction Method

Indicates whether this adapter action should be added, by default, to the parent adapter.

Pascal

```
function ImplIsDefaultAction(ADisplay: TObject): Boolean; override;
```

C++

```
virtual __fastcall Boolean ImplIsDefaultAction(TObject * ADisplay);
```

Description

ImplIsDefaultAction is called by IsDefaultAction. ImplIsDefaultAction returns true. ImplIsDefaultAction may be overridden by a descendant class.

See Also

IsDefaultAction (see page 24070)

ImplIsDefaultAction (see page 24243)

41.1.25.2.4 TDataSetAdapterRefreshRowAction.ImplWebEnabled Method

Provides the underlying implementation for the WebEnabled method.

Pascal

```
function ImplWebEnabled: Boolean; override;
```

C++

```
virtual __fastcall Boolean ImplWebEnabled();
```

Description

The WebEnabled method calls ImplWebEnabled to determine whether the control or hyperlink for this action should appear enabled in the HTML form. WebEnabled returns true if controls should be enabled, false otherwise.

ImplWebEnabled generates an OnGetEnabled event so that you can specify whether controls for this action are enabled. If there is no OnGetEnabled event handler, ImplWebEnabled returns true if the parent adapter's GetKeyFields method returns a set of fields that can locate records in the associated dataset.

See Also

WebEnabled (see page 24071)

OnGetEnabled (see page 7823)

GetKeyFields (see page 7786)

41.1.25.3 TDataSetAdapterRefreshRowAction Properties

The properties of the TDataSetAdapterRefreshRowAction class are listed here.

Published Properties

	Name	Description
	DisplayLabel (see page 8063)	Suggests a display label for this adapter action.
	ExecuteAccess (see page 8063)	Defines the rights required to execute this action.
	RedirectOptions (see page 8063)	Indicates whether to perform an HTTP redirect after successfully executing this action.

41.1.25.3.1 TDataSetAdapterRefreshRowAction.DisplayLabel Property

Suggests a display label for this adapter action.

Pascal

```
property DisplayLabel: string;
```

C++

```
__property AnsiString DisplayLabel;
```

Description

Use this property to suggest a display label to use when generating HTML to display the a button or hyperlink to execute this adapter action. Typically the adapter action is displayed using server-side script, either generated or custom written. Server-side script uses the DisplayLabel property to access this value.

See Also

ImplGetDisplayLabel (see page 24064)

SetDisplayLabel (see page 24071)

41.1.25.3.2 TDataSetAdapterRefreshRowAction.ExecuteAccess Property

Defines the rights required to execute this action.

Pascal

```
property ExecuteAccess: string;
```

C++

```
__property AnsiString ExecuteAccess;
```

Description

The ExecuteAccess property defines the access rights required to execute this action. When server-side script accesses the CanExecute property, this value is checked against the end user's rights. Typically, an exception is raised when an end-user attempts to execute an adapter action that does not allow access.

See Also

TWebUserList (see page 25625)

hasexecuteaccess (see page 24162)

41.1.25.3.3 TDataSetAdapterRefreshRowAction.RedirectOptions Property

Indicates whether to perform an HTTP redirect after successfully executing this action.

Pascal

```
property RedirectOptions: TAdapterActionRedirectOptions;
```

C++

```
__property TAdapterActionRedirectOptions RedirectOptions;
```

Description

Set RedirectOptions to indicate that HTTP redirect should be performed after executing this adapter action. An HTTP redirect causes the browser to "forget" about the parameters passed when executing the adapter action. Without a redirect, the browser's Refresh or Reload command cause the last HTTP request to be resent, resulting in re-execution of the adapter action.

See Also

SendRedirect (see page 15201)

41.1.25.4 TDataSetAdapterRefreshRowAction Events

The events of the TDataSetAdapterRefreshRowAction class are listed here.

Published Events

	Name	Description
	OnAfterExecute (see page 8064)	Called after the adapter action has executed.
	OnAfterGetResponse (see page 8064)	Called after the adapter action response is generated.
	OnBeforeExecute (see page 8065)	Called before the adapter action is executed.
	OnBeforeGetResponse (see page 8065)	Called before the adapter action response is generated.
	OnGetParams (see page 8066)	Specifies name/value pairs needed to execute this adapter action.

41.1.25.4.1 TDataSetAdapterRefreshRowAction.OnAfterExecute Event

Called after the adapter action has executed.

Pascal

```
property OnAfterExecute: TActionExecuteEvent;
```

C++

```
__property TActionExecuteEvent OnAfterExecute;
```

Description

Implement OnAfterExecute to do something after the action has executed. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. OnAfterExecute is called by DoAfterExecuteActionRequest.

See Also

DoAfterExecuteActionRequest (see page 24051)

OnAfterExecuteAction (see page 24184)

OnBeforeExecute (see page 24076)

41.1.25.4.2 TDataSetAdapterRefreshRowAction.OnAfterGetResponse Event

Called after the adapter action response is generated.

Pascal

```
property OnAfterGetResponse: TActionExecuteEvent;
```

C++

```
__property TActionExecuteEvent OnAfterGetResponse;
```

Description

Implement OnAfterGetResponse to do something after the action response is generated. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. OnAfterGetResponse is called by DoAfterGetExecuteActionReponse.

See Also

DoBeforeGetExecuteActionResponse (see page 24052)

OnAfterGetResponse (see page 24075)

OnBeforeGetActionResponse (see page 24186)

41.1.25.4.3 TDataSetAdapterRefreshRowAction.OnBeforeExecute Event

Called before the adapter action is executed.

Pascal

```
property OnBeforeExecute: TActionExecuteHandledEvent;
```

C++

```
__property TActionExecuteHandledEvent OnBeforeExecute;
```

Description

Implement OnBeforeExecute to do something before the action is executed. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. Set the Handled flag to prevent the action from being executed. OnBeforeExecute is called by DoBeforeExecuteActionRequest.

See Also

DoBeforeExecuteActionRequest (see page 24052)

OnAfterExecute (see page 24075)

OnBeforeExecuteAction (see page 24186)

41.1.25.4.4 TDataSetAdapterRefreshRowAction.OnBeforeGetResponse Event

Called before the adapter action response is generated.

Pascal

```
property OnBeforeGetResponse: TActionExecuteHandledEvent;
```

C++

```
__property TActionExecuteHandledEvent OnBeforeGetResponse;
```

Description

Implement OnBeforeGetResponse to do something before the action response is generated. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. Set the Handled flag to indicate that the response has been generated and no further processing is needed. OnBeforeGetResponse is called by DoBeforeGetExecuteActionReponse.

See Also

DoBeforeGetExecuteActionResponse (see page 24052)

OnAfterGetResponse (see page 24075)

OnBeforeGetActionResponse (see page 24186)

41.1.25.4.5 TDataSetAdapterRefreshRowAction.OnGetParams Event

Specifies name/value pairs needed to execute this adapter action.

Pascal

```
property OnGetParams: TActionGetParamsEvent;
```

C++

```
__property TActionGetParamsEvent OnGetParams;
```

Description

Implement this event handler to specify the name/value needed to execute this action. For example, an action that deletes a row in a table will need a name/value pair that identifies the row to be deleted such as "Key=123".

ImplGetAdapterItemRequestParams (see page 24063)

41.1.26 TDataSetAdapterRowAction Class

TDataSetAdapterRowAction is a general-purpose action for dataset adapters.

Class Hierarchy

Pascal

```
TDataSetAdapterRowAction = class(TCustomDataSetAdapterRowAction);
```

C++

```
class TDataSetAdapterRowAction : public TCustomDataSetAdapterRowAction;
```

File

DBAdapt

Description

Add TDataSetAdapterRowAction to a dataset adapter (TDataSetAdapter (see page 7872)) to support your own custom actions that operate on the adapter's dataset. When this action is executed, it generates an OnExecute (see page 7822) event. You can supply an event handler that provides the implementation for this action.

By default, this action is visible (included in HTML forms) unless the parent adapter is in query mode. You can change when the action is visible by setting the ActionModes (see page 8075) property.

See Also

TDataSetAdapterApplyRowAction (see page 7890)

TDataSetAdapterBrowseRowAction (see page 7903)

TDataSetAdapterCancelRowAction (see page 7916)

TDataSetAdapterDeleteRowAction (see page 7934)

TDataSetAdapterFirstRowAction (see page 7972)

TDataSetAdapterLastRowAction (see page 7984)

TDataSetAdapterNextRowAction (see page 8030)

TDataSetAdapterPrevRowAction (see page 8042)

TDataSetAdapterEditRowAction (see page 7947)

TDataSetAdapterNewRowAction (see page 8016)

TDataSetAdapter (see page 7872)

TDataSetAdapterRefreshRowAction (see page 8054)

41.1.26.1 TDataSetAdapterRowAction Members

The following tables list the members exposed by TDataSetAdapterRowAction.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	CheckExecuteAccess (see page 24050)	Checks end-user rights to execute this adapter action.
	CreateRequestContext (see page 24050)	Creates an object that describes the adapter action parameters and adapter field values.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DoAfterExecuteActionRequest (see page 24051)	Calls event handlers after the adapter action is executed.
V	DoAfterGetExecuteActionResponse (see page 24051)	Calls event handlers after the adapter action response is formulated.
V	DoBeforeExecuteActionRequest (see page 24052)	Calls event handlers before the adapter action is executed.
V	DoBeforeGetExecuteActionResponse (see page 24052)	Calls event handlers before the adapter action response is formulated.
	EndIterator (see page 24053)	Implements IIteratorSupport's EndIterator method.
	ExecuteActionRequest (see page 24053)	Executes the adapter action using parameters passed in the HTTP request.
	GetActionName (see page 24054)	Gets the name used to reference this adapter action with server-side script.
	GetAdapter (see page 7819)	Returns the value of the Adapter (see page 7822) property.
	GetAdapter (see page 24054)	GetAdapter returns the parent adapter component.
	GetAdapterItemRequestParams (see page 24055)	Provides the name/value pairs needed to execute this adapter action.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetContainerList (see page 24727)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
	GetDataSet (see page 7819)	Returns the value of the DataSet (see page 7822) property.
V	GetDefaultActionName (see page 24055)	Gets the default name used to reference this adapter action with server-side script.
V	GetDefaultDisplayLabel (see page 24055)	Provides the default display label for this adapter action.
	GetDisplayLabel (see page 24055)	Returns the suggested display label for this adapter action.
	GetDisplayStyle (see page 24056)	Returns a string value to suggest an HTML display style for this adapter action.
V	GetDisplayStyleType (see page 24056)	Suggests an HTML display type for this adapter action.

	GetErrors (see page 24057)	This is GetErrors, a member of class TBaseAdapterAction.
	GetExecuteActionResponse (see page 24057)	Generates a response after the adapter action has been executed.
	GetFailureOptions (see page 24057)	Indicates whether to perform an HTTP redirect after execution of this adapter action fails.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
	GetInputStyle (see page 24058)	Returns a string value to suggest an HTML display style for this adapter action.
	GetIsAdapterActionList (see page 24058)	Indicates whether this adapter action may have multiple commands.
	GetItemCount (see page 24058)	Returns the number of commands defined by this adapter action.
	GetIteratorIndex (see page 24059)	Implements IIteratorIndex's GetIteratorIndex method.
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetSuccessOptions (see page 24059)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetVariableName (see page 24060)	Gets the name used to reference this adapter action with server-side script.
	GetViewMode (see page 24060)	Returns a string value to suggest a view mode for this adapter action.
	GetViewModeType (see page 24060)	Suggests a view mode for this adapter action.
	GetVisible (see page 24061)	Indicates whether a button or hyperlink for this adapter action should be displayed on the HTML page.
	GetWebSnapObjClass (see page 24061)	Returns the class type for this adapter field.
	HandleRequest (see page 24061)	Executes the adapter action and generates a response.
	HasExecuteAccess (see page 24062)	Checks the end-user's right to execute this adapter action.
	ImplCreateRequestContext (see page 24062)	Creates an object that describes the action parameters and field values.
	ImplEndIterator (see page 24062)	Implements IIteratorSupport's EndIterator (see page 24053) method.
	ImplExecuteActionRequest (see page 8074)	Provides the underlying implementation for the ExecuteActionRequest method.
	ImplGetActionName (see page 24063)	Gets the name used to reference this adapter action with server-side script.
	ImplGetActionName (see page 24195)	Gets the name used to reference this adapter action with server-side script.
	ImplGetAdapterItemRequestParams (see page 8074)	Provides the underlying implementation for the GetAdapterItemRequestParams method.
	ImplGetDisplayLabel (see page 24064)	Returns the suggested display label for this adapter action.
	ImplGetExecuteActionResponse (see page 24064)	Generates a response after the adapter action has been executed.
	ImplGetFailureOptions (see page 24065)	Indicates whether to perform an HTTP redirect after execution of this adapter action fails.
	ImplGetIsAdapterActionList (see page 24065)	Indicates whether this adapter action may have multiple commands.
	ImplGetIteratorIndex (see page 24065)	Implements IIteratorIndex's GetIteratorIndex (see page 24059) method.
	ImplGetSuccessOptions (see page 24066)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	ImplGetSuccessOptions (see page 24196)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	ImplGetVariableName (see page 24066)	Gets the name used to reference this adapter action with server-side script.
	ImplGetVisible (see page 7819)	Provides the underlying implementation for the GetVisible method.
	ImplGetVisible (see page 24066)	Indicates whether a button or hyperlink for this adapter action should be displayed on the HTML page.
	ImplHandleRequest (see page 24067)	Executes the adapter action and generates a response.
	ImplHasExecuteAccess (see page 24067)	Checks the end-user's right to execute this adapter action.
	ImplInIterator (see page 24067)	Implements IIteratorIndex's InIterator (see page 24069) method.
	ImplIsDefaultAction (see page 24068)	Indicates whether this adapter action should be added, by default, to the parent adapter.
	ImplNextIteration (see page 24068)	Implements IIteratorSupport's NextIteration (see page 24070) method.
	ImplSetActionName (see page 24197)	Sets the name that is used to reference this adapter action with server-side script.
	ImplStartIterator (see page 24068)	Implements IIteratorSupport's StartIterator (see page 24071) method.
	ImplWebEnabled (see page 7820)	Provides the underlying implementation for the WebEnabled method.
	ImplWebEnabled (see page 7855)	Provides the underlying implementation for the WebEnabled method.
	ImplWebEnabled (see page 24069)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.

V	ImplWebEnabled (see page 24197)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.
	InIterator (see page 24069)	Implements IIteratorIndex's InIterator method.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsDefaultAction (see page 24070)	Indicates whether this adapter action should be added, by default, to the parent adapter.
V	IsDefaultField (see page 24728)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	NextIteration (see page 24070)	Implements IIteratorSupport's NextIteration method.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	ParentChanged (see page 24070)	Handles movement of the component to a different parent.
V	ParentChanged (see page 24728)	Responds when the WebParent (see page 24731) property changes.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 24729)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetActionName (see page 24197)	Sets the name that is used to reference this adapter action with server-side script.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDisplayLabel (see page 24071)	Set the value of the DisplayLabel (see page 24073) property.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 24729)	Sets the WebParent (see page 24731) property to be the same as this component's parent.
	SetWebParent (see page 24730)	Sets the value of the WebParent (see page 24731) property.
	StartIterator (see page 24071)	Implements IIteratorSupport's StartIterator method.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WebEnabled (see page 24071)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	Adapter (see page 7822)	Indicates the dataset adapter that uses this object to represent one of its actions.
R	Adapter (see page 24072)	Provides access to the parent adapter component.
R	Errors (see page 24073)	This is Errors, a member of class TBaseAdapterAction.
R	WebContainedComponentHelper (see page 24730)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.
R	WebParent (see page 24731)	Indicates the component that uses this TWebContainedComponent (see page 24722) as one of its Web items.

Public Events

	Name	Description
	OnExecute (see page 7822)	Occurs when server-side script executes this action.
	OnExecute (see page 24200)	Called to execute this action using parameters passed in the HTTP request.
	OnGetEnabled (see page 7823)	Occurs when the WebSnap application to determine whether a control or hyperlink for this action should be enabled.
	OnGetEnabled (see page 24200)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
V	Create (see page 7818)	Creates and initializes an instance of TCustomDataSetAdapterAction (see page 7811).
V	Create (see page 7853)	Creates and initializes an instance of TCustomDataSetAdapterRowAction (see page 7846).
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	Create (see page 24726)	Creates and initializes an instance of TWebContainedComponent (see page 24722).
	CreateRequestContext (see page 19681)	Creates an object that describes the adapter action parameters and adapter field values.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Destroy (see page 24726)	Frees an instance of TWebContainedComponent (see page 24722).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	EndIterator (see page 19723)	This is EndIterator, a member of class IIteratorSupport.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetActionName (see page 19755)	This is GetActionName, a member of class IWebGetActionName.
	GetAdapterItemRequestParams (see page 19692)	This is GetAdapterItemRequestParams, a member of class IGetAdapterItemRequestParams.

	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.
	GetDisplayLabel (see page 19756)	This is GetDisplayLabel, a member of class IWebGetDisplayLabel.
	GetDisplayStyle (see page 19700)	Returns the preferred display style for an adapter field or adapter action.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetFailureOptions (see page 964)	This is GetFailureOptions, a member of class IGetAdapterActionRedirectOptions.
	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	GetInputStyle (see page 19700)	Returns the preferred editing style for an adapter field.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIsAdapterActionList (see page 19717)	This is GetIsAdapterActionList, a member of class IIsAdapterActionList.
	GetIteratorIndex (see page 19721)	Returns the value of the IteratorIndex (see page 19721) property.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 24727)	Returns the object that uses this component to generate HTML.
	GetSuccessOptions (see page 964)	This is GetSuccessOptions, a member of class IGetAdapterActionRedirectOptions.
	GetVariableName (see page 15329)	This is GetVariableName, a member of class IWebVariableName.
	GetViewMode (see page 19701)	Returns the preferred mode of an adapter field.
	GetVisible (see page 19652)	This is GetVisible, a member of class IAdapterActionAttributes.
	HandleRequest (see page 19681)	Executes the adapter action and generates a response.
	HasExecuteAccess (see page 19651)	This is HasExecuteAccess, a member of class IAdapterActionAccess.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 24727)	Indicates whether this component appears in another component's list of Web items.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InIterator (see page 19721)	Indicates whether the object is iterating over its items.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsDefaultAction (see page 19768)	This is IsDefaultAction, a member of class IWebIsDefaultAction.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NextIteration (see page 19723)	Advances to the objects next item.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetActionName (see page 19783)	This is SetActionName, a member of class IWebSetActionName.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.
	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	StartIterator (see page 19724)	This is StartIterator, a member of class IIteratorSupport.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

	WebEnabled (see page 19752)	This is WebEnabled, a member of class IWebEnabled.

Public Properties

	Name	Description
	ActionName (see page 7821)	Identifies the name of this action when using server-side script.
R	ActionName (see page 19755)	This is ActionName, a member of class IWebGetActionName.
R	ActionName (see page 24072)	Identifies the name of this action when using server-side script.
	ActionName (see page 24198)	Identifies the name of this action when using server-side script.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
R	DataSet (see page 7822)	Indicates the dataset on which this action operates.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	FailureOptions (see page 965)	This is FailureOptions, a member of class IGetAdapterActionRedirectOptions.
	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.
R	IsAdapterActionList (see page 19717)	This is IsAdapterActionList, a member of class IIsAdapterActionList.
R	ItemCount (see page 24074)	Returns the number of items defined by an adapter action.
R	ItemIndex (see page 24074)	Returns the index of the current item of an adapter action.
R	IteratorIndex (see page 19721)	Indicates the index of the current item.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
R	SuccessOptions (see page 965)	This is SuccessOptions, a member of class IGetAdapterActionRedirectOptions.
R	VariableName (see page 15329)	This is VariableName, a member of class IWebVariableName.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
R	Visible (see page 19652)	This is Visible, a member of class IAdapterActionAttributes.

Published Events

	Name	Description
	OnAfterExecute (see page 8077)	Called after the adapter action has executed.
	OnAfterGetResponse (see page 8077)	Called after the adapter action response is generated.
	OnBeforeExecute (see page 8078)	Called before the adapter action is executed.
	OnBeforeGetResponse (see page 8078)	Called before the adapter action response is generated.
	OnGetParams (see page 8078)	Specifies name/value pairs needed to execute this adapter action.

Published Properties

	Name	Description
	ActionModes (see page 8075)	Indicates what dataset adapter modes this field supports.
	DisplayLabel (see page 8076)	Suggests a display label for this adapter action.
	ExecuteAccess (see page 8076)	Defines the rights required to execute this action.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	RedirectOptions (see page 8076)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	Tag (see page 2808)	Stores an integer value as part of a component.

41.1.26.2 TDataSetAdapterRowAction Methods

The methods of the TDataSetAdapterRowAction class are listed here.

Protected Methods

	Name	Description
	ImplExecuteActionRequest (see page 8074)	Provides the underlying implementation for the ExecuteActionRequest method.
	ImplGetAdapterItemRequestParams (see page 8074)	Provides the underlying implementation for the GetAdapterItemRequestParams method.

41.1.26.2.1 TDataSetAdapterRowAction.ImplExecuteActionRequest Method

Provides the underlying implementation for the ExecuteActionRequest method.

Pascal

```
procedure ImplExecuteActionRequest(AActionRequest: IActionRequest; AActionResponse:
IActionResponse); override;
```

C++

```
virtual __fastcall ImplExecuteActionRequest(IActionRequest AActionRequest, IActionResponse
AActionResponse);
```

Description

The ExecuteActionRequest method calls ImplExecuteActionRequest to execute this action in response to server-side script.

AActionRequest is an interface to the current request object. ImplExecuteActionRequest uses this to obtain information about the current request (such as the values of request parameters).

AActionResponse is an interface to the current response object. ImplExecuteActionRequest uses this to indicate the status of the emerging HTTP response.

ImplExecuteActionRequest generates an OnExecute (see page 7822) event, allowing you to provide the implementation for this action in an OnExecute (see page 7822) event handler. If you do not supply an OnExecute (see page 7822) event handler, ImplExecuteActionRequest calls the parent adapter's LocateAndApply method, to position the adapter's dataset on the record indicated by the current request and apply any updates that the request contains.

See Also

ExecuteActionRequest (see page 24053)

OnExecute (see page 7822)

LocateAndApply (see page 7796)

41.1.26.2.2 TDataSetAdapterRowAction.ImplGetAdapterItemRequestParams Method

Provides the underlying implementation for the GetAdapterItemRequestParams method.

Pascal

```
procedure ImplGetAdapterItemRequestParams(var AIdentifier: string; Params:
IAdapterItemRequestParams); override;
```

C++

```
virtual __fastcall ImplGetAdapterItemRequestParams(AnsiString AIdentifier,
IAdapterItemRequestParams Params);
```

Description

The GetAdapterItemRequestParams method calls ImplGetAdapterItemRequestParams to obtain the parameters this action needs when it executes. The name/value pairs this method provides are added to the HTML form and passed back in any HTTP request that form generates.

AIdentifier returns a unique identifier for this action object, which the WebSnap application uses to dispatch requests from the generated form to this object.

Params is an interface that ImplGetAdapterItemRequestParams uses to write the name/value pairs it needs.

ImplGetAdapterItemRequestParams first generates an OnGetActionParams event on the parent adapter, and then an OnGetParams (see page 8078) event on this action object.

See Also

GetAdapterItemRequestParams (see page 24055)

OnGetParams (see page 24077)

OnGetActionParams (see page 24187)

41.1.26.3 TDataSetAdapterRowAction Properties

The properties of the TDataSetAdapterRowAction class are listed here.

Published Properties

	Name	Description
	ActionModes (see page 8075)	Indicates what dataset adapter modes this field supports.
	DisplayLabel (see page 8076)	Suggests a display label for this adapter action.
	ExecuteAccess (see page 8076)	Defines the rights required to execute this action.
	RedirectOptions (see page 8076)	Indicates whether to perform an HTTP redirect after successfully executing this action.

41.1.26.3.1 TDataSetAdapterRowAction.ActionModes Property

Indicates what dataset adapter modes this field supports.

Pascal

```
property ActionModes: TDataSetAdapterModes;
```

C++

```
__property TDataSetAdapterModes ActionModes;
```

Description

ActionModes is a set of all the modes in which this adapter action can be used. If the parent dataset adapter is in a mode that is not included in this set, any forms generated using that adapter do not include a control for executing this action. Thus, for example, there is no sense in adding a control that applies edits to a form that presents a read-only view of the data. An apply action, then, should not include amBrowse in its action modes.

See Also

CanModify (see page 7154)

Adapter (see page 7752)

Mode (see page 7810)

GetDisplayStyle (see page 7739)

GetInputStyle (see page 7741)

GetViewMode (see page 7744)

41.1.26.3.2 TDataSetAdapterRowAction.DisplayLabel Property

Suggests a display label for this adapter action.

Pascal

```
property DisplayLabel: string;
```

C++

```
__property AnsiString DisplayLabel;
```

Description

Use this property to suggest a display label to use when generating HTML to display the a button or hyperlink to execute this adapter action. Typically the adapter action is displayed using server-side script, either generated or custom written. Server-side script uses the DisplayLabel property to access this value.

See Also

ImplGetDisplayLabel (see page 24064)

SetDisplayLabel (see page 24071)

41.1.26.3.3 TDataSetAdapterRowAction.ExecuteAccess Property

Defines the rights required to execute this action.

Pascal

```
property ExecuteAccess: string;
```

C++

```
__property AnsiString ExecuteAccess;
```

Description

The ExecuteAccess property defines the access rights required to execute this action. When server-side script accesses the CanExecute property, this value is checked against the end user's rights. Typically, an exception is raised when an end-user attempts to execute an adapter action that does not allow access.

See Also

TWebUserList (see page 25625)

hasexecuteaccess (see page 24162)

41.1.26.3.4 TDataSetAdapterRowAction.RedirectOptions Property

Indicates whether to perform an HTTP redirect after successfully executing this action.

Pascal

```
property RedirectOptions: TAdapterActionRedirectOptions;
```

C++

```
__property TAdapterActionRedirectOptions RedirectOptions;
```

Description

Set RedirectOptions to indicate that HTTP redirect should be performed after executing this adapter action. An HTTP redirect causes the browser to "forget" about the parameters passed when executing the adapter action. Without a redirect, the browser's Refresh or Reload command cause the last HTTP request to be resent, resulting in re-execution of the adapter action.

See Also

SendRedirect (see page 15201)

41.1.26.4 TDataSetAdapterRowAction Events

The events of the TDataSetAdapterRowAction class are listed here.

Published Events

	Name	Description
	OnAfterExecute (see page 8077)	Called after the adapter action has executed.
	OnAfterGetResponse (see page 8077)	Called after the adapter action response is generated.
	OnBeforeExecute (see page 8078)	Called before the adapter action is executed.
	OnBeforeGetResponse (see page 8078)	Called before the adapter action response is generated.
	OnGetParams (see page 8078)	Specifies name/value pairs needed to execute this adapter action.

41.1.26.4.1 TDataSetAdapterRowAction.OnAfterExecute Event

Called after the adapter action has executed.

Pascal

```
property OnAfterExecute: TActionExecuteEvent;
```

C++

```
__property TActionExecuteEvent OnAfterExecute;
```

Description

Implement OnAfterExecute to do something after the action has executed. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. OnAfterExecute is called by DoAfterExecuteActionRequest.

See Also

DoAfterExecuteActionRequest (see page 24051)

OnAfterExecuteAction (see page 24184)

OnBeforeExecute (see page 24076)

41.1.26.4.2 TDataSetAdapterRowAction.OnAfterGetResponse Event

Called after the adapter action response is generated.

Pascal

```
property OnAfterGetResponse: TActionExecuteEvent;
```

C++

```
__property TActionExecuteEvent OnAfterGetResponse;
```

Description

Implement OnAfterGetResponse to do something after the action response is generated. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. OnAfterGetResponse is called by DoAfterGetExecuteActionReponse.

See Also

DoBeforeGetExecuteActionResponse (see page 24052)

OnAfterGetResponse (see page 24075)

OnBeforeGetActionResponse (see page 24186)

41.1.26.4.3 TDataSetAdapterRowAction.OnBeforeExecute Event

Called before the adapter action is executed.

Pascal

```
property OnBeforeExecute: TActionExecuteHandledEvent;
```

C++

```
__property TActionExecuteHandledEvent OnBeforeExecute;
```

Description

Implement OnBeforeExecute to do something before the action is executed. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. Set the Handled flag to prevent the action from being executed. OnBeforeExecute is called by DoBeforeExecuteActionRequest.

See Also

DoBeforeExecuteActionRequest (see page 24052)

OnAfterExecute (see page 24075)

OnBeforeExecuteAction (see page 24186)

41.1.26.4.4 TDataSetAdapterRowAction.OnBeforeGetResponse Event

Called before the adapter action response is generated.

Pascal

```
property OnBeforeGetResponse: TActionExecuteHandledEvent;
```

C++

```
__property TActionExecuteHandledEvent OnBeforeGetResponse;
```

Description

Implement OnBeforeGetResponse to do something before the action response is generated. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. Set the Handled flag to indicate that the response has been generated and no further processing is needed. OnBeforeGetResponse is called by DoBeforeGetExecuteActionReponse.

See Also

DoBeforeGetExecuteActionResponse (see page 24052)

OnAfterGetResponse (see page 24075)

OnBeforeGetActionResponse (see page 24186)

41.1.26.4.5 TDataSetAdapterRowAction.OnGetParams Event

Specifies name/value pairs needed to execute this adapter action.

Pascal

```
property OnGetParams: TActionGetParamsEvent;
```

C++

```
__property TActionGetParamsEvent OnGetParams;
```

Description

Implement this event handler to specify the name/value needed to execute this action. For example, an action that deletes a row in a table will need a name/value pair that identifies the row to be deleted such as "Key=123".

See Also

ImplGetAdapterItemRequestParams (see page 24063)

41.1.27 TDataSetValuesList Class

TDataSetValuesList is an adapter component that provides a list of name/value pairs by retrieving values from a TDataSet.

Class Hierarchy

Pascal

```
TDataSetValuesList = class(TCustomDataSetValuesList);
```

C++

```
class TDataSetValuesList : public TCustomDataSetValuesList;
```

File

DBAdapt

Description

Use TDataSetValuesList to define a list of possible values for an adapter field by assigning the TDataSetValuesList component to the ValuesList property of the adapter field. Typically, the values are used to populate HTML elements such as a select list or radio buttons when generating HTML to edit an adapter field. The TAdapterPageProducer automatically generates appropriate HTML/JavaScript for an editable field when the ValuesList is set.

41.1.27.1 TDataSetValuesList Members

The following tables list the members exposed by TDataSetValuesList.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	AddAdapterModeHiddenField (see page 24149)	Defines a hidden field that passes the adapter's mode value in the HTTP request when an HTML form is submitted.
V	AddDefaultActions (see page 24399)	Adds default action components to this adapter.
V	AddDefaultFields (see page 24399)	Adds default field components to this adapter.
	AddOrigValueHiddenFields (see page 24149)	Defines hidden field(s) that pass the original values of adapter fields in the HTTP request when an HTML form is submitted.
	AddRecordKeysHiddenFields (see page 24149)	Defines hidden field(s) that pass key values in the HTTP request when an HTML form is submitted.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	CanAddActionClass (see page 24150)	Indicates whether a type of adapter action can be added to this adapter.
	CanAddFieldClass (see page 24150)	Indicates whether a type of adapter field can be added to this adapter.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	CheckModifyAccess (see page 24150)	This is CheckModifyAccess, a member of class TCustomAdapter.
	ClearAdapterValues (see page 24151)	Clears adapter state information.
	ClearErrors (see page 24151)	Clears the content of the adapter's Errors (see page 24182) property.
	CreateActionRequestContext (see page 24151)	Creates an object that describes the adapter action parameters and adapter field values.
V	CreateErrorsList (see page 24152)	Creates the object used to manage errors associated with this adapter.
	DefaultWebComponentsChange (see page 24400)	Notifies other components of changes to the list of default actions or fields.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	EncodeActionParams (see page 24152)	Writes name/value pairs that represent adapter state.
	EndIterator (see page 24152)	Implements IIteratorSupport's EndIterator method to support iterating over the data records of the adapter.
V	ExtractRequestParams (see page 24153)	Reads name/value pairs from the HTTP request.
	FindAction (see page 24153)	Returns an action component with a matching action name.
	FindField (see page 24154)	Returns an adapter field component with a matching field name.
	FindNamedAction (see page 24154)	Finds an action with a matching variable name.
	FindNamedField (see page 24154)	Finds an adapter field with a matching variable name.
V	FindNamedVariable (see page 24155)	Finds a field or action with a matching variable name.
	FindVariable (see page 24155)	Finds an adapter action or adapter field with the given variable name.
	FindVariableContainer (see page 24155)	Finds an adapter action or adapter field that is a container for other scriptable objects.
V	GetActionsClass (see page 24156)	Specifies the class to create as a container for adapter actions components.
V	GetActionsClass (see page 24400)	Specifies the class to create as a container for adapter actions components.
	GetActionsList (see page 24156)	Provides a list of action types that can be added to this adapter.
	GetAdapterActions (see page 24156)	Returns the adapter actions container object.
	GetAdapterErrors (see page 24157)	This is GetAdapterErrors, a member of class TCustomAdapter.
	GetAdapterErrorsList (see page 24157)	<insert text here>
	GetAdapterFields (see page 24157)	Returns the adapter fields container object.

	GetAdapterHiddenFields (see page 24157)	Returns a list of hidden fields that hold adapter state information.
	GetAdapterHiddenRecordFields (see page 24158)	Returns a list of hidden fields that associate HTML form fields and adapter field.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetChildren (see page 24158)	Provides the interface for a method that adapters use to return their child components.
V	GetDataClass (see page 24158)	Specifies the class to create as a container for adapter fields components.
V	GetDataClass (see page 24400)	Specifies the class to create as a container for adapter field components.
	GetDesigntimeWarnings (see page 7864)	Populates a design-time warnings object with any warnings that the dataset values list needs to emit.
	GetEchoActionFieldValues (see page 24159)	Returns the value of the echo flag.
	GetFieldsList (see page 24159)	Provides a list of field types that can be added to this adapter.
V	GetHiddenFieldOptions (see page 24159)	Indicates the types of hidden fields that this adapter requires in a submitted HTML form.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetIteratorIndex (see page 24160)	Implements IIteratorIndex's GetIteratorIndex method to support iterating over the data records of the adapter.
	GetListImage (see page 24128)	Returns an image associated with the current name/value pair.
	GetListImageOfValue (see page 24128)	Looks up an image for a value.
	GetListName (see page 24128)	Responsible returning the name of the name/value pair.
	GetListNameOfValue (see page 24128)	Looks up a name for a value.
	GetListValue (see page 24129)	Responsible for returning the value of the name/value pair.
V	GetNameFieldClass (see page 7865)	Returns the class of adapter field that is responsible for providing the value of the name/value pair.
V	GetNameFieldClass (see page 24129)	Returns the class of adapter field that is responsible for providing the value of the name/value pair.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
V	GetValueFieldClass (see page 7865)	Returns the class of adapter field that is responsible for providing the name of the name/value pair.
V	GetValueFieldClass (see page 24129)	Returns the class of adapter field that is responsible for providing the name of the name/value pair.
	GetVariable (see page 24160)	Returns an action or field.
	GetVariableCount (see page 24161)	Returns the total count of actions and fields.
	GetVariableName (see page 24161)	Gets the name used to reference this adapter with server-side script.
	GetVisibleActions (see page 24161)	This is GetVisibleActions, a member of class TCustomAdapter.
	GetVisibleFields (see page 24161)	This is GetVisibleFields, a member of class TCustomAdapter.
V	GetWebSnapObjClass (see page 24130)	Returns the class type for this adapter field.
V	GetWebSnapObjClass (see page 24162)	Returns the class type for this adapter field.
	HasExecuteAccess (see page 24162)	This is HasExecuteAccess, a member of class TCustomAdapter.
	HasModifyAccess (see page 24162)	This is HasModifyAccess, a member of class TCustomAdapter.
	HasViewAccess (see page 24162)	Checks the end-user's right to view this adapter's fields.
V	ImplCanAddActionClass (see page 24163)	Indicates whether a type of adapter action can be added to this adapter.
V	ImplCanAddFieldClass (see page 24130)	Indicates whether a type of adapter field can be added to this adapter.
V	ImplCanAddFieldClass (see page 24163)	Indicates whether a type of adapter field can be added to this adapter.
V	ImplClearAdapterValues (see page 24163)	Clears adapter state information.
V	ImplEndIterator (see page 7866)	Provides the underlying implementation for the EndIterator method.
V	ImplEndIterator (see page 24164)	Implements IIteratorSupport's EndIterator (see page 24152) method to support iterating over the data records of the adapter.
V	ImplFindVariable (see page 24164)	Finds an adapter action or adapter field child with a matching variable name.
V	ImplFindVariableContainer (see page 24164)	Finds an adapter action or adapter field that is a container for other scriptable objects.

	ImplGetActionsList (see page 24165)	Provides a list of action types that can be added to this adapter.
	ImplGetEchoActionFieldValues (see page 24165)	Returns the value of the echo flag.
	ImplGetFieldsList (see page 24130)	Adds default field components to this adapter.
	ImplGetFieldsList (see page 24165)	Provides a list of field types that can be added to this adapter.
	ImplGetIteratorIndex (see page 24166)	Implements IIteratorIndex's GetIteratorIndex (see page 24160) method to support iterating over the data records of the adapter.
	ImplGetListImage (see page 24131)	Responsible returning an image associated with the current name/value pair.
	ImplGetListImageOfValue (see page 24131)	Looks up an image for a value.
	ImplGetListName (see page 7866)	Provides the underlying implementation for the GetListName method.
	ImplGetListName (see page 24131)	Responsible returning the name of the name/value pair.
	ImplGetListNameOfValue (see page 7867)	Provides the underlying implementation for the GetListNameOfValue method.
	ImplGetListNameOfValue (see page 24132)	Looks up a name for a value.
	ImplGetListValue (see page 7867)	Provides the underlying implementation for the GetListValue method.
	ImplGetListValue (see page 24132)	Responsible for returning the value of the name/value pair.
	ImplGetVariable (see page 24166)	Returns an action or field.
	ImplGetVariableCount (see page 24167)	Returns the total count of actions and fields.
	ImplGetVariableName (see page 24167)	Gets the name used to reference this adapter with server-side script.
	ImplGetVisibleActions (see page 24167)	Returns a list of this adapter's action components.
	ImplGetVisibleActions (see page 24401)	Returns a list of this adapter's action components.
	ImplGetVisibleFields (see page 24167)	Returns a list of this adapter's field components.
	ImplGetVisibleFields (see page 24401)	Returns a list of this adapter's field components.
	ImplHasExecuteAccess (see page 24168)	Checks the end-user's right to execute this adapter's actions.
	ImplHasModifyAccess (see page 24168)	Checks the end-user's right to modify this adapter's fields.
	ImplHasViewAccess (see page 24169)	This is ImplHasViewAccess, a member of class TCustomAdapter.
	ImplInIterator (see page 24169)	Implements IIteratorIndex's InIterator (see page 24172) to support iterating over the data records of the adapter.
	ImplNextIteration (see page 7867)	Provides the underlying implementation for the NextIteration method.
	ImplNextIteration (see page 24169)	Implements IIteratorSupport's NextIteration (see page 24173) method to support iterating over the records of the adapter.
	ImplNotifyActivate (see page 24170)	Called when the web module is activated.
	ImplNotifyDeactivate (see page 7868)	Provides the underlying implementation for the NotifyDeactivate method.
	ImplNotifyDeactivate (see page 24170)	Called when the web module is deactivated.
	ImplSetActions (see page 24170)	Initializes the Actions (see page 24181) property.
	ImplSetActions (see page 24401)	Initializes the Actions (see page 24402) property.
	ImplSetData (see page 24171)	Initializes the Data (see page 24181) property.
	ImplSetData (see page 24402)	Initializes the Data (see page 24402) property.
	ImplSetEchoActionFieldValues (see page 24171)	Sets the echo flag for this adapter's fields.
	ImplStartIterator (see page 7868)	Provides the underlying implementation for the StartIterator method.
	ImplStartIterator (see page 24171)	Implements IIteratorSupport's StartIterator (see page 24176) method to support iterating over the records of the adapter.
	InIterator (see page 24172)	Implements IIteratorIndex's InIterator method to support iterating over the data records of the adapter.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsActionInUse (see page 24172)	Indicates whether a particular action has been added to the adapter.
	IsFieldInUse (see page 24172)	Indicates whether a particular field has been added to the adapter.
	ListHiddenFields (see page 24173)	This is ListHiddenFields, a member of class TCustomAdapter.
	ListHiddenRecordFields (see page 24173)	Specifies the HTML form hidden fields needed by the adapter.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	NextIteration (see page 24173)	Implements IIteratorSupport's NextIteration method to support iterating over the data records of the adapter.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	Notification (see page 7869)	Responds when components are created or destroyed.
	Notification (see page 24174)	Clears references to deleted components.
	NotifyActivate (see page 24174)	Called when the web module is activated.
	NotifyAdapterChange (see page 24174)	Notifies components that the adapter has changed in some way.

	NotifyDeactivate (see page 24175)	Called when the web module is deactivated.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetActions (see page 24175)	Initializes the Actions (see page 24181) property.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
V	SetData (see page 24175)	Initializes the Data (see page 24181) property.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetEchoActionFieldValues (see page 24176)	Sets the echo flag for this adapter's fields.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	StartIterator (see page 24176)	Implements IIteratorSupport's StartIterator method to support iterating over the records of the adapter.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateFieldsExecuteValues (see page 24177)	Executes the adapter's fields with values passed in the HTTP request.
V	UpdateFieldsGetAnyChanges (see page 24177)	Determines whether the values in the HTTP request change any adapter fields.
V	UpdateFieldsUpdateValues (see page 24178)	Updates the adapter's fields with values passed in the HTTP request.
V	UpdateFieldsValidateValues (see page 24178)	Validate the adapter's field values passed in the HTTP request.
V	UpdateRecordsGetAnyChanges (see page 24179)	Determines whether values passed in the HTTP request will change any adapter fields.
V	UpdateRecordsUpdateValues (see page 24180)	Updates adapter fields with values passed in the HTTP request.
V	UpdateRecordsValidateValues (see page 24180)	Validate the adapter's field values passed in the HTTP request.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WebComponentsChange (see page 24180)	WebComponentsChange is called when the list of adapter fields or adapter actions changes.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	DataSetPrepared (see page 7870)	Indicates whether the OnPrepareDataSet (see page 7871) event has occurred.
R	NotifyList (see page 24183)	Keeps track of components that are to be notified when the adapter is changed.
R	VisibleActions (see page 24184)	This is VisibleActions, a member of class TCustomAdapter.
R	VisibleFields (see page 24184)	This is VisibleFields, a member of class TCustomAdapter.

Public Events

	Name	Description
	OnAfterExecuteAction (see page 24184)	Occurs after an adapter action has executed.
	OnAfterGetActionResponse (see page 24185)	Occurs after the adapter action response is generated.
	OnAfterUpdateFields (see page 24185)	Occurs after values in the HTTP request are used to update adapter fields.
	OnAfterValidateFields (see page 24186)	Occurs after values in the HTTP request are validated by the adapter's fields.
	OnBeforeExecuteAction (see page 24186)	Occurs before an adapter action is executed.
	OnBeforeGetActionResponse (see page 24186)	Occurs before the adapter action response is generated.
	OnBeforeUpdateFields (see page 24187)	Occurs before values in the HTTP request are used to update adapter fields.
	OnBeforeValidateFields (see page 24187)	Occurs before values in the HTTP request are validated by the adapter's fields.

	OnGetActionParams (see page 24187)	Supplies name/value pairs needed to execute an adapter action.
	OnIterateRecords (see page 24188)	Occurs when the adapter needs to iterate over its data records.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AddNotify (see page 19726)	Registers an interest in change notifications.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	CanAddActionClass (see page 24567)	This is CanAddActionClass, a member of class IAdapterEditor.
	CanAddFieldClass (see page 24567)	This is CanAddFieldClass, a member of class IAdapterEditor.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	ClearAdapterValues (see page 24571)	This is ClearAdapterValues, a member of class IClearAdapterValues.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
V	Create (see page 7863)	Creates and initializes an instance of TCustomDataSetValuesList (see page 7855).
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	Create (see page 24146)	Constructor for TCustomAdapter (see page 24139).
	CreateActionRequestContext (see page 24572)	This is CreateActionRequestContext, a member of class ICreateActionRequestContext.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 7864)	Destroys an instance of TCustomDataSetValuesList (see page 7855).
V	Destroy (see page 22287)	Disposes of an object instance.
V	Destroy (see page 24146)	Destructor for TCustomAdapter (see page 24139).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	EndIterator (see page 19723)	This is EndIterator, a member of class IIteratorSupport.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindAction (see page 19744)	This is FindAction, a member of class IWebActionsList.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FindField (see page 19749)	This is FindField, a member of class IWebDataFields.
	FindVariable (see page 15330)	This is FindVariable, a member of class IWebVariablesContainer.
	FindVariableContainer (see page 15331)	This is FindVariableContainer, a member of class IWebVariablesContainer.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetActionsList (see page 19744)	This is GetActionsList, a member of class IWebActionsList.
	GetAdapterActions (see page 19686)	This is GetAdapterActions, a member of class IGetAdapterActions.

	GetAdapterErrors (see page 19688)	This is GetAdapterErrors, a member of class IGetAdapterErrors.
	GetAdapterErrorsList (see page 24578)	This is GetAdapterErrorsList, a member of class IGetAdapterErrorsList.
	GetAdapterFields (see page 19689)	This is GetAdapterFields, a member of class IGetAdapterFields.
	GetAdapterHiddenFields (see page 19690)	This is GetAdapterHiddenFields, a member of class IGetAdapterHiddenFields.
	GetAdapterHiddenRecordFields (see page 19690)	This is GetAdapterHiddenRecordFields, a member of class IGetAdapterHiddenFields.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetDesigntimeWarnings (see page 19697)	This is GetDesigntimeWarnings, a member of class IGetDesigntimeWarnings.
	GetEchoActionFieldValues (see page 24575)	This is GetEchoActionFieldValues, a member of class IEchoAdapterFieldValues.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetFieldsList (see page 19750)	This is GetFieldsList, a member of class IWebDataFields.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIteratorIndex (see page 19721)	Returns the value of the IteratorIndex (see page 19721) property.
	GetListImage (see page 19741)	Returns the image object associated with the current name/value pair.
	GetListImageOfValue (see page 19742)	Returns the image object associated with a specified value.
	GetListName (see page 19742)	Returns the name part of the current name/value pair.
	GetListNameOfValue (see page 19742)	Returns the name associated with a specified value.
	GetListValue (see page 19743)	Returns the value of the current name/value pair.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetVariable (see page 15331)	This is GetVariable, a member of class IWebVariablesContainer.
	GetVariableCount (see page 15331)	This is GetVariableCount, a member of class IWebVariablesContainer.
	GetVariableName (see page 15329)	This is GetVariableName, a member of class IWebVariableName.
	GetVisibleActions (see page 19745)	This is GetVisibleActions, a member of class IWebActionsList.
	GetVisibleFields (see page 19750)	This is GetVisibleFields, a member of class IWebDataFields.
	HasExecuteAccess (see page 19650)	This is HasExecuteAccess, a member of class IAdapterAccess.
	HasModifyAccess (see page 19650)	This is HasModifyAccess, a member of class IAdapterAccess.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	HasViewAccess (see page 19650)	This is HasViewAccess, a member of class IAdapterAccess.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InIterator (see page 19721)	Indicates whether the object is iterating over its items.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsActionInUse (see page 19745)	This is IsActionInUse, a member of class IWebActionsList.
	IsFieldInUse (see page 19750)	This is IsFieldInUse, a member of class IWebDataFields.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NextIteration (see page 19723)	Advances to the objects next item.
	NotifyActivate (see page 24778)	This is NotifyActivate, a member of class INotifyWebActivate.
	NotifyAdapterChange (see page 24568)	This is NotifyAdapterChange, a member of class IAdapterNotifyAdapterChange.
	NotifyDeactivate (see page 24778)	This is NotifyDeactivate, a member of class INotifyWebActivate.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.

	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
	RemoveNotify (see page 19726)	Unregisters interest in change notifications.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetEchoActionFieldValues (see page 24575)	This is SetEchoActionFieldValues, a member of class IEchoAdapterFieldValues.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	StartIterator (see page 19724)	This is StartIterator, a member of class IIteratorSupport.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
V	UpdateRecords (see page 24179)	Updates the adapter's fields with the field values passed in an HTTP request.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	EchoActionFieldValues (see page 24575)	This is EchoActionFieldValues, a member of class IEchoAdapterFieldValues.
	EchoActionFieldValues (see page 24182)	Modifies the adapter's echo flag.
R	Errors (see page 24182)	Returns an object used to track errors on behalf of this adapter.
	ExecuteAccess (see page 24183)	This is ExecuteAccess, a member of class TCustomAdapter.
R	IteratorIndex (see page 19721)	Indicates the index of the current item.
	ModifyAccess (see page 24183)	This is ModifyAccess, a member of class TCustomAdapter.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
R	VariableCount (see page 15331)	This is VariableCount, a member of class IWebVariablesContainer.
R	VariableName (see page 15329)	This is VariableName, a member of class IWebVariableName.
R	Variables (see page 15332)	This is Variables, a member of class IWebVariablesContainer.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	ViewAccess (see page 24183)	Identifies the rights required to view this adapter's fields.
R	VisibleActions (see page 19745)	This is VisibleActions, a member of class IWebActionsList.
R	VisibleFields (see page 19751)	This is VisibleFields, a member of class IWebDataFields.

Published Events

	Name	Description
	OnPrepareDataSet (see page 8090)	Occurs before the dataset values list uses its associated dataset.

Published Properties

	Name	Description
	Actions (see page 8088)	Container for adapter actions components.
	Data (see page 8088)	Container for adapter field components.
	DataSet (see page 8088)	Specifies the dataset that stores the names and values for this list.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	NameField (see page 8089)	Indicates the field in the associated dataset that supplies the name part of this list's name/value pairs.
	Tag (see page 2808)	Stores an integer value as part of a component.
	ValueField (see page 8089)	Indicates the field in the associated dataset that supplies the value part of this list's name/value pairs.

41.1.27.2 TDataSetValuesList Properties

The properties of the TDataSetValuesList class are listed here.

Published Properties

	Name	Description
	Actions (see page 8088)	Container for adapter actions components.
	Data (see page 8088)	Container for adapter field components.
	DataSet (see page 8088)	Specifies the dataset that stores the names and values for this list.
	NameField (see page 8089)	Indicates the field in the associated dataset that supplies the name part of this list's name/value pairs.
	ValueField (see page 8089)	Indicates the field in the associated dataset that supplies the value part of this list's name/value pairs.

41.1.27.2.1 TDataSetValuesList.Actions Property

Container for adapter actions components.

Pascal

```
property Actions: TAdapterActions;
```

C++

```
__property TAdapterDefaultActions Actions;__property TAdapterActions Actions;
```

Description

The Actions property is responsible for managing a list of child adapter fields. Responsibilities include streaming, insertion, deletion, and lookup of adapter actions by name.

See Also

TAdapterDefaultActions (see page 23770)

41.1.27.2.2 TDataSetValuesList.Data Property

Container for adapter field components.

Pascal

```
property Data: TAdapterFields;
```

C++

```
__property TAdapterDefaultFields Data;__property TAdapterFields Data;
```

Description

The Data property is responsible for managing a list of child adapter fields. Responsibilities include streaming, insertion, deletion, and lookup of adapter fields by name.

See Also

TAdapterDefaultFields (see page 23778)

41.1.27.2.3 TDataSetValuesList.DataSet Property

Specifies the dataset that stores the names and values for this list.

Pascal

```
property DataSet: TDataSet;
```

C++

```
__property TDataSet DataSet;
```

Description

Use DataSet to specify the dataset from which this adapter gets its name/value pairs. The names of the name/value pairs in this list are the values of the field that the NameField property specifies. The values are the corresponding values of the field that the ValueField property specifies.

Note: When the WebSnap application reads the value of DataSet for the first time, TCustomDataSetValuesList generates an OnPrepareDataSet event. This lets you perform any initializations that ensure the dataset contains the desired data.

See Also

NameField (see page 7870)

ValueField (see page 7871)

OnPrepareDataSet (see page 7871)

41.1.27.2.4 TDataSetValuesList.NameField Property

Indicates the field in the associated dataset that supplies the name part of this list's name/value pairs.

Pascal

```
property NameField: string;
```

C++

```
__property AnsiString NameField;
```

Description

Set NameField to specify the dataset field that holds the names of this adapter's name/value pairs. Each entry in TCustomDataSetValuesList is a name/value pair that corresponds to the values of the NameField and ValueField fields of the associated dataset for a single record in the dataset. NameField is the same as the FieldName property of the dataset field that supplies the names.

See Also

DataSet (see page 7869)

FieldName (see page 7164)

ValueField (see page 7871)

41.1.27.2.5 TDataSetValuesList.ValueField Property

Indicates the field in the associated dataset that supplies the value part of this list's name/value pairs.

Pascal

```
property ValueField: string;
```

C++

```
__property AnsiString ValueField;
```

Description

Set ValueField to specify the dataset field that holds the values of this adapter's name/value pairs. Each entry in TCustomDataSetValuesList is a name/value pair that corresponds to the values of the NameField and ValueField fields of the associated dataset for a single record in the dataset. ValueField is the same as the FieldName property of the dataset field that supplies the values.

See Also

DataSet (see page 7869)

FieldName (see page 7164)

NameField (see page 7870)

41.1.27.3 TDataSetValuesList Events

The events of the TDataSetValuesList class are listed here.

Published Events

	Name	Description
	OnPrepareDataSet (see page 8090)	Occurs before the dataset values list uses its associated dataset.

41.1.27.3.1 TDataSetValuesList.OnPrepareDataSet Event

Occurs before the dataset values list uses its associated dataset.

Pascal

```
property OnPrepareDataSet: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnPrepareDataSet;
```

Description

Write an OnPrepareDataSet event handler to prepare the associated dataset before this component fetches names and values from it. This lets you customize the data for each incoming request. For example, you can use this event to set query parameters based on parameters in the current HTTP request and then execute the query. (Use the global Web context to obtain information about the current HTTP request.)

TCustomDataSetValuesList generates an OnPrepareDataSet event the first time the application reads the DataSet property for a new HTTP request.

DataSet (see page 7869)

WebContext (see page 24687)

41.1.28 TLocateParams Class

TLocateParams is a collection of the key fields and their corresponding values that can be used to locate a record of a dataset adapter.

Class Hierarchy

System::TObject → DBAdapt.TLocateParams

Pascal

```
TLocateParams = class(TObject);
```

C++

```
class TLocateParams : public TObject;
```

File

DBAdapt

Description

TLocateParams is a collection of the key fields belonging to a single dataset adapter, along with their values. Each fieldname/value pair is stored as a string of the form Name=Value. TLocateParams provides access to these name/value pairs using the Items (see page 8095) property, or to the constituent names and values using the ParamNames (see page 8095) and ParamValues (see page 8096) properties.

Use the AdapterName (see page 8094) property to identify the dataset adapter whose key fields and values are in the collection. You can add new key field/value pairs by calling the AddParam (see page 8093) method.

See Also

TLocateParamsList (see page 8096)

TDataSetAdapter (see page 7872)

41.1.28.1 TLocateParams Members

The following tables list the members exposed by TLocateParams.

Public Methods

	Name	Description
	AddParam (see page 8093)	This is the overview for the AddParam method overload.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 8092)	Creates an initializes an instance of TLocateParams (see page 8090).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 8092)	Frees an instance of TLocateParams (see page 8090).
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.

	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
	AdapterName (see page 8094)	Specifies the name of the dataset adapter to which these key fields and values belong.
R	Count (see page 8094)	Indicates the number of fieldname/value pairs in the collection
R	Items (see page 8095)	Lists the key field names and values in this collection.
R	ParamNames (see page 8095)	Lists the key field names in this collection.
R	ParamValues (see page 8096)	Lists the key field values in this collection.

41.1.28.2 TLocateParams.Create Constructor

Creates an initializes an instance of TLocateParams (see page 8090).

Pascal

```
constructor Create(AList: TLocateParamsList);
```

C++

```
__fastcall TLocateParams(TLocateParamsList AList);
```

Description

WebSnap applications should not need to create instances of TLocateParams (see page 8090). These objects are created using the Add method of a TLocateParamsList (see page 8096) object.

AList is the TLocateParamsList (see page 8096) object that creates and stores the TLocateParams (see page 8090) instance.

See Also

Add (see page 8099)

41.1.28.3 TLocateParams.Destroy Destructor

Frees an instance of TLocateParams (see page 8090).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TLocateParams();
```

Description

WebSnap applications should not need to free instances of TLocateParams (see page 8090), as this is handled by the

TLocateParamsList (see page 8096) objects that create them. If you must free a TLocateParams (see page 8090) instance, use the Free method.

See Also

Free (see page 22300)

41.1.28.4 TLocateParams Methods

The methods of the TLocateParams class are listed here.

Public Methods

	Name	Description
	AddParam (see page 8093)	This is the overview for the AddParam method overload.

41.1.28.4.1 AddParam Method

This is the overview for the AddParam method overload.

Overload List

	Name	Description
	TLocateParams.AddParam (string) (see page 8093)	Adds a new key field name and value to the list.
	TLocateParams.AddParam (string, string) (see page 8093)	Adds a new key field name and value to the list.

41.1.28.4.1.1 TLocateParams.AddParam Method (string)

Adds a new key field name and value to the list.

Pascal

```
procedure AddParam(const ANameValue: string); overload;
procedure AddParam(const AName: string; const AValue: string); overload;
```

C++

```
__fastcall AddParam(const AnsiString ANameValue);
__fastcall AddParam(const AnsiString AName, const AnsiString AValue);
```

Description

Call AddParam to add a new key field name and value to the list. There are two forms of the AddParam method. The first syntax lets you supply the key field name and value as separate parameters. The second syntax lets you supply them as a string of the form 'Name=Value'.

AName is the name of the key field. This becomes the value of the ParamNames (see page 8095) property for the new entry.

AValue is the name of the key field's value. This becomes the value of the ParamValues (see page 8096) property for the new entry.

ANameValue is a string of the form 'Name=Value', where Name is the key field name and Value is its value. This becomes the value of the Items (see page 8095) property for the new entry.

See Also

Items (see page 8095)

ParamNames (see page 8095)

ParamValues (see page 8096)

41.1.28.5 TLocateParams Properties

The properties of the TLocateParams class are listed here.

Public Properties

	Name	Description
	AdapterName (see page 8094)	Specifies the name of the dataset adapter to which these key fields and values belong.
R	Count (see page 8094)	Indicates the number of fieldname/value pairs in the collection
R	Items (see page 8095)	Lists the key field names and values in this collection.
R	ParamNames (see page 8095)	Lists the key field names in this collection.
R	ParamValues (see page 8096)	Lists the key field values in this collection.

41.1.28.5.1 TLocateParams.AdapterName Property

Specifies the name of the dataset adapter to which these key fields and values belong.

Pascal

```
property AdapterName: string;
```

C++

```
__property AnsiString AdapterName;
```

Description

AdapterName identifies the dataset adapter that uses these key fields and value to locate a dataset record. This value is the same as the value of the dataset adapter's Name property.

See Also

TDataSetAdapter (see page 7872)

Name (see page 2805)

41.1.28.5.2 TLocateParams.Count Property

Indicates the number of fieldname/value pairs in the collection

Pascal

```
property Count: Integer;
```

C++

```
__property int Count;
```

Description

Count indicates the number of entries in the Items (see page 8095), ParamNames (see page 8095), or ParamValues (see page 8096) property array. Use this value as an upper bound for the index when iterating over all the fieldname/value pairs in this collection.

See Also

Items (see page 8095)

ParamNames (see page 8095)

ParamValues (see page 8096)

41.1.28.5.3 TLocateParams.Items Property

Lists the key field names and values in this collection.

Pascal

```
property Items [I: Integer]: string;
```

C++

```
__property AnsiString Items[int I];
```

Description

Use Items to obtain a key field name and value entry from the list. Each item is a string of the form 'Name=Value', where 'Name' is the name of a key field and 'Value' is its value on the identified record.

I is the index of the key field and value, where 0 specifies the first item, 1 specifies the second item, and so on. The Count (see page 8094) property gives an upper bound for this index.

Note: In Delphi, items is the default property of TLocateParams (see page 8090). That means the property name may be omitted in code. For example, the lines

Note: List := DataSetAdapter1.LocateParams[0];

Note: Param := List.Items[0];

Note: can also be written

Note: List := DataSetAdapter1.LocateParams[0];

Note: Param := List[0];

Note: Items provides indexed access to the entire 'Name=Value' string. To access just the key field name or just the value, use the ParamNames (see page 8095) or ParamValues (see page 8096) property instead.

See Also

Count (see page 8094)

ParamNames (see page 8095)

ParamValues (see page 8096)

operator_sb

41.1.28.5.4 TLocateParams.ParamNames Property

Lists the key field names in this collection.

Pascal

```
property ParamNames [I: Integer]: string;
```

C++

```
__property AnsiString ParamNames[int I];
```

Description

Use ParamNames to obtain a key field name from the list. This is the name of a key field of the dataset adapter.

I is the index of the key field name, where 0 specifies the first name, 1 specifies the second name, and so on. The Count (see page 8094) property gives an upper bound for this index.

Note: ParamNames lists only the names of the key fields. To obtain the corresponding values, use the ParamValues (see page 8096) property instead. To access the entire 'Name=Value' string, use the Items (see page 8095) property instead.

See Also

Count (see page 8094)

Items (see page 8095)

ParamValues (see page 8096)

41.1.28.5.5 TLocateParams.ParamValues Property

Lists the key field values in this collection.

Pascal

```
property ParamValues [I: Integer]: string;
```

C++

```
__property AnsiString ParamValues[int I];
```

Description

Use ParamValues to obtain a key field value from the list. This is the value of a key field of the dataset adapter.

I is the index of the key field value, where 0 specifies the first value, 1 specifies the second value, and so on. The Count (see page 8094) property gives an upper bound for this index.

Note: ParamValues lists only the values of the key fields. To obtain the corresponding key field names, use the ParamNames (see page 8095) property instead. To access the entire 'Name=Value' string, use the Items (see page 8095) property instead.

See Also

Count (see page 8094)

Items (see page 8095)

ParamNames (see page 8095)

41.1.29 TLocateParamsList Class

TLocateParamsList is a collection of TLocateParams (see page 8090) objects.

Class Hierarchy

System::TObject → DBAdapt.TLocateParamsList

Pascal

```
TLocateParamsList = class(TObject);
```

C++

```
class TLocateParamsList : public TObject;
```

File

DBAdapt

Description

TLocateParams (see page 8090) is a collection of TLocateParams (see page 8090) objects, where each TLocateParams (see page 8090) object lists the key fields and their values for a single dataset adapter. The entire collection of TLocateParams (see page 8090) gives the key fields and their values for a set of dataset adapters that are linked together in master/detail relationships.

TLocateParams (see page 8090) is useful for locating records of a dataset adapter. Because the dataset adapters are linked in master/detail relationships, it is impossible to locate a record in a detail dataset without first positioning the master datasets on their corresponding records.

See Also

TLocateParams (see page 8090)

TDataSetAdapter (see page 7872)

41.1.29.1 TLocateParamsList Members

The following tables list the members exposed by TLocateParamsList.

Public Methods

	Name	Description
	Add (see page 8099)	Adds a TLocateParams (see page 8090) object to the collection.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Clear (see page 8099)	Empties the TLocateParamsList (see page 8096).
	Create (see page 8098)	Creates an initializes an instance of TLocateParamsList (see page 8096).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 8098)	Frees an instance of TLocateParamsList (see page 8096).
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.

V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	ItemByAdapterName (see page 8100)	Returns the TLocateParams (see page 8090) object associated with a specified dataset adapter.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
R	Count (see page 8100)	Indicates the number of TLocateParams (see page 8090) objects in the collection.
R	Items (see page 8101)	Lists the key field/value lists for all the adapters that use this object to store their locate parameters.

41.1.29.2 TLocateParamsList.Create Constructor

Creates an initializes an instance of TLocateParamsList (see page 8096).

Pascal

```
constructor Create;
```

C++

```
__fastcall TLocateParamsList();
```

Description

WebSnap applications should not need to create instances of TLocateParamsList (see page 8096). DataSet adapters create these objects to collect information for locating their current record.

See Also

TDataSetAdapter (see page 7872)

41.1.29.3 TLocateParamsList.Destroy Destructor

Frees an instance of TLocateParamsList (see page 8096).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TLocateParamsList();
```

Description

WebSnap applications should not need to free instances of TLocateParamsList (see page 8096), as this is handled by the dataset adapters that create them. If you must free a TLocateParamsList (see page 8096) instance, use the Free method.

See Also

Free (see page 22300)

41.1.29.4 TLocateParamsList Methods

The methods of the TLocateParamsList class are listed here.

Public Methods

	Name	Description
	Add (see page 8099)	Adds a TLocateParams (see page 8090) object to the collection.
	Clear (see page 8099)	Empties the TLocateParamsList (see page 8096).
	ItemByAdapterName (see page 8100)	Returns the TLocateParams (see page 8090) object associated with a specified dataset adapter.

41.1.29.4.1 TLocateParamsList.Add Method

Adds a TLocateParams (see page 8090) object to the collection.

Pascal

```
function Add: TLocateParams;
```

C++

```
__fastcall TLocateParams Add();
```

Description

Call Add to insert a new TLocateParams (see page 8090) object into this collection.

Add returns the newly-inserted TLocateParams (see page 8090) object. The returned object is an empty list that is not yet associated with any dataset adapter. Set the returned object's AdapterName property to associate it with a dataset adapter, and then fill it by calling its AddParam method for every key field of that adapter.

See Also

Items (see page 8101)

Clear (see page 8099)

AdapterName (see page 8094)

AddParam (see page 8093)

41.1.29.4.2 TLocateParamsList.Clear Method

Empties the TLocateParamsList (see page 8096).

Pascal

```
procedure Clear;
```

C++

```
__fastcall Clear();
```

Description

Call Clear to empty the Items (see page 8101) property array.

See Also

Items (see page 8101)

Add (see page 8099)

41.1.29.4.3 TLocateParamsList.ItemByAdapterName Method

Returns the TLocateParams (see page 8090) object associated with a specified dataset adapter.

Pascal

```
function ItemByAdapterName(const AName: string): TLocateParams;
```

C++

```
__fastcall TLocateParams ItemByAdapterName(const AnsiString AName);
```

Description

Call ItemByAdapterName to access the list of key fields and values for a specified dataset adapter. ItemByAdapterName searches the Items (see page 8101) property array for an item whose AdapterName property matches the specified name.

AName is the name of the dataset adapter whose key fields you want to access. This is the same as the Name property of the TDataSetAdapter (see page 7872) object and the AdapterName property of the TLocateParams (see page 8090) object that holds its key fields and values.

ItemByAdapterName returns the TLocateParams (see page 8090) object for the specified adapter. If this TLocateParamsList (see page 8096) object does not include an item for the specified adapter, ItemByAdapterName returns nil (Delphi) or NULL (C++).

See Also

Items (see page 8101)

Name (see page 2805)

TDataSetAdapter (see page 7872)

AdapterName (see page 8094)

41.1.29.5 TLocateParamsList Properties

The properties of the TLocateParamsList class are listed here.

Public Properties

	Name	Description
R	Count (see page 8100)	Indicates the number of TLocateParams (see page 8090) objects in the collection.
R	Items (see page 8101)	Lists the key field/value lists for all the adapters that use this object to store their locate parameters.

41.1.29.5.1 TLocateParamsList.Count Property

Indicates the number of TLocateParams (see page 8090) objects in the collection.

Pascal

```
property Count: Integer;
```

C++

```
__property int Count;
```

Description

Count indicates the number of entries in the Items (see page 8101) property array. Use this value as an upper bound for the index when iterating over all the key field/value lists in this collection.

See Also

Items (see page 8101)

41.1.29.5.2 TLocateParamsList.Items Property

Lists the key field/value lists for all the adapters that use this object to store their locate parameters.

Pascal

```
property Items [I: Integer]: TLocateParams;
```

C++

```
__property TLocateParams Items[int I];
```

Description

Use Items to obtain a TLocateParams (see page 8090) object given its position in the list. Each TLocateParams (see page 8090) object holds the list of key fields and values for a single dataset adapter.

I is the index of the TLocateParams (see page 8090) object, where 0 specifies the first item, 1 specifies the second item, and so on. The Count (see page 8100) property gives an upper bound for this index.

Note: In Delphi, Items is the default property of TLocateParamsList (see page 8096). That means the property name may be omitted in code. For example, the line

Note: List := DataSetAdapter1.LocateParams.Items[0];

Note: can also be written

Note: List := DataSetAdapter1.LocateParams[0];

Note: Items provides indexed access to the key field/value lists. To access the list for a specified dataset adapter, use the ItemByAdapterName (see page 8100) method instead.

See Also

Count (see page 8100)

ItemByAdapterName (see page 8100)

TDataSetAdapter (see page 7872)

operator_sb

41.2 Interfaces

The following table lists interfaces in this documentation.

Interfaces

	Name	Description
	IAdapterDataSetComponent (see page 8102)	This is class DBAdapt.IAdapterDataSetComponent.
	IDataSetAdapterFieldClass (see page 8104)	This is class DBAdapt.IDataSetAdapterFieldClass.
	IGetDataSetKeyName (see page 8104)	This is class DBAdapt.IGetDataSetKeyName.
	IKeyParams (see page 8105)	IKeyParams lists the names and values of the fields a dataset adapter uses to uniquely identify database records.
	IPrepareDataSet (see page 8109)	This is class DBAdapt.IPrepareDataSet.

41.2.1 IAdapterDataSetComponent Interface

Class Hierarchy

DBAdapt.IAdapterDataSetComponent

Pascal

```
IAdapterDataSetComponent = interface;
```

C++

```
__interface IAdapterDataSetComponent;
```

File

DBAdapt

Description

This is class DBAdapt.IAdapterDataSetComponent.

41.2.1.1 IAdapterDataSetComponent Members

The following tables list the members exposed by IAdapterDataSetComponent.

Public Methods

	Name	Description
	GetDataSet (see page 8103)	This is GetDataSet, a member of class IAdapterDataSetComponent.
	SetDataSet (see page 8103)	This is SetDataSet, a member of class IAdapterDataSetComponent.

Public Properties

	Name	Description
	DataSet (see page 8103)	This is DataSet, a member of class IAdapterDataSetComponent.

41.2.1.2 IAdapterDataSetComponent Methods

The methods of the IAdapterDataSetComponent class are listed here.

Public Methods

	Name	Description
	GetDataSet (see page 8103)	This is GetDataSet, a member of class IAdapterDataSetComponent.
	SetDataSet (see page 8103)	This is SetDataSet, a member of class IAdapterDataSetComponent.

41.2.1.2.1 IAdapterDataSetComponent.GetDataSet Method

Pascal

```
function GetDataSet: TDataSet;
```

C++

```
__fastcall TDataSet GetDataSet();
```

Description

This is GetDataSet, a member of class IAdapterDataSetComponent.

41.2.1.2.2 IAdapterDataSetComponent.SetDataSet Method

Pascal

```
procedure SetDataSet(Value: TDataSet);
```

C++

```
__fastcall SetDataSet(TDataSet Value);
```

Description

This is SetDataSet, a member of class IAdapterDataSetComponent.

41.2.1.3 IAdapterDataSetComponent Properties

The properties of the IAdapterDataSetComponent class are listed here.

Public Properties

	Name	Description
	DataSet (see page 8103)	This is DataSet, a member of class IAdapterDataSetComponent.

41.2.1.3.1 IAdapterDataSetComponent.DataSet Property

Pascal

```
property DataSet: TDataSet;
```

C++

```
__property TDataSet DataSet;
```

Description

This is DataSet, a member of class IAdapterDataSetComponent.

41.2.2 IDataSetAdapterFieldClass Interface

Class Hierarchy

DBAdapt.IDataSetAdapterFieldClass

Pascal

```
IDataSetAdapterFieldClass = interface;
```

C++

```
__interface IDataSetAdapterFieldClass;
```

File

DBAdapt

Description

This is class DBAdapt.IDataSetAdapterFieldClass.

41.2.3 IGetDataSetKeyName Interface

Class Hierarchy

DBAdapt.IGetDataSetKeyName

Pascal

```
IGetDataSetKeyName = interface;
```

C++

```
__interface IGetDataSetKeyName;
```

File

DBAdapt

Description

This is class DBAdapt.IGetDataSetKeyName.

41.2.3.1 IGetDataSetKeyName Members

The following tables list the members exposed by IGetDataSetKeyName.

Public Methods

	Name	Description
	GetKeyName (see page 8105)	This is GetKeyName, a member of class IGetDataSetKeyName.

Public Properties

	Name	Description
R	KeyName (see page 8105)	This is KeyName, a member of class IGetDataSetKeyName.

41.2.3.2 IGetDataSetKeyName Methods

The methods of the IGetDataSetKeyName class are listed here.

Public Methods

	Name	Description
	GetKeyName (see page 8105)	This is GetKeyName, a member of class IGetDataSetKeyName.

41.2.3.2.1 IGetDataSetKeyName.GetKeyName Method

Pascal

```
function GetKeyName: string;
```

C++

```
__fastcall AnsiString GetKeyName();
```

Description

This is GetKeyName, a member of class IGetDataSetKeyName.

41.2.3.3 IGetDataSetKeyName Properties

The properties of the IGetDataSetKeyName class are listed here.

Public Properties

	Name	Description
R	KeyName (see page 8105)	This is KeyName, a member of class IGetDataSetKeyName.

41.2.3.3.1 IGetDataSetKeyName.KeyName Property

Pascal

```
property KeyName: string;
```

C++

```
__property AnsiString KeyName;
```

Description

This is KeyName, a member of class IGetDataSetKeyName.

41.2.4 IKeyParams Interface

IKeyParams lists the names and values of the fields a dataset adapter uses to uniquely identify database records.

Class Hierarchy

DBAdapt.IKeyParams

Pascal

```
IKeyParams = interface;
```

C++

```
__interface IKeyParams;
```

File

DBAdapt

Description

Dataset adapters (TDataSetAdapter (see page 7872)) use this interface internally to read the field values that uniquely identify database records. IKeyParams introduces two properties, Names (see page 8108) and Values (see page 8108), that represent the names of dataset fields and the corresponding values on a desired record. The set of names and values obtained from this interface identify a single database record.

Note: Method declarations that use IKeyParams use the _di_IKeyParams type instead. This type is a DelphiInterface wrapper around the IKeyParams interface:

typedef System (see page 22079):: DelphiInterface < IKeyParams > _di_IKeyParams;

See Also

TCustomDataSetAdapter (see page 7766)

TDataSetAdapter (see page 7872)

41.2.4.1 IKeyParams Members

The following tables list the members exposed by IKeyParams.

Public Methods

	Name	Description
	Count (see page 8106)	Returns the number of name/value pairs that can be read from this interface.
	GetName (see page 8107)	Returns the value of the Names (see page 8108) property.
	GetValue (see page 8107)	Returns the value of the Values (see page 8108) property.

Public Properties

	Name	Description
R	Names (see page 8108)	Lists the names of the key fields that uniquely identify dataset records.
R	Values (see page 8108)	Lists the values of the key fields that uniquely identify a specific dataset record.

41.2.4.2 IKeyParams Methods

The methods of the IKeyParams class are listed here.

Public Methods

	Name	Description
	Count (see page 8106)	Returns the number of name/value pairs that can be read from this interface.
	GetName (see page 8107)	Returns the value of the Names (see page 8108) property.
	GetValue (see page 8107)	Returns the value of the Values (see page 8108) property.

41.2.4.2.1 IKeyParams.Count Method

Returns the number of name/value pairs that can be read from this interface.

Pascal

```
function Count: Integer;
```

C++

```
__fastcall int Count();
```

Description

Count returns the number of key fields that this interface lists. The return value provides an upper bound to the index you can use when reading the Names (see page 8108) or Values (see page 8108) property.

See Also

Names (see page 8108)

Values (see page 8108)

41.2.4.2.2 IKeyParams.GetName Method

Returns the value of the Names (see page 8108) property.

Pascal

```
function GetName(I: Integer): string;
```

C++

```
__fastcall AnsiString GetName(int I);
```

Description

GetName is the read implementation of the Names (see page 8108) property.

I is the index of the fieldname to return.

See Also

Names (see page 8108)

41.2.4.2.3 IKeyParams.GetValue Method

Returns the value of the Values (see page 8108) property.

Pascal

```
function GetValue(I: Integer): string;
```

C++

```
__fastcall AnsiString GetValue(int I);
```

Description

GetValue is the read implementation of the Values (see page 8108) property.

I is the index of the field value to return.

See Also

Values (see page 8108)

41.2.4.3 IKeyParams Properties

The properties of the IKeyParams class are listed here.

Public Properties

	Name	Description
R	Names (see page 8108)	Lists the names of the key fields that uniquely identify dataset records.
R	Values (see page 8108)	Lists the values of the key fields that uniquely identify a specific dataset record.

41.2.4.3.1 IKeyParams.Names Property

Lists the names of the key fields that uniquely identify dataset records.

Pascal

```
property Names [I: Integer]: string;
```

C++

```
__property AnsiString Names[int I];
```

Description

Read Names to obtain the name of a key field. Each value in Names is equal to the FieldName property of a field in the target dataset.

I is the index of the field name, where 0 specifies the first key field, 1 specifies the second key field, and so on. The Count (see page 8106) method provides an upper bound for this index.

See Also

Values (see page 8108)

Count (see page 8106)

FieldName (see page 7164)

41.2.4.3.2 IKeyParams.Values Property

Lists the values of the key fields that uniquely identify a specific dataset record.

Pascal

```
property Values [I: Integer]: string;
```

C++

```
__property AnsiString Values[int I];
```

Description

Read Values to obtain the value of a key field. Each value in Values is equal to the AsString property of the corresponding field when the target dataset is positioned on the desired record.

I is the index of the field value, where 0 specifies the first key field, 1 specifies the second key field, and so on. The Count (see page 8106) method provides an upper bound for this index.

See Also

Names (see page 8108)

Count (see page 8106)

AsString (see page 7151)

41.2.5 IPrepareDataSet Interface

Class Hierarchy

DBAdapt.IPrepareDataSet

Pascal

```
IPrepareDataSet = interface;
```

C++

```
__interface IPrepareDataSet;
```

File

DBAdapt

Description

This is class DBAdapt.IPrepareDataSet.

41.2.5.1 IPrepareDataSet Members

The following tables list the members exposed by IPrepareDataSet.

Public Methods

	Name	Description
	PrepareDataSet (see page 8109)	This is PrepareDataSet, a member of class IPrepareDataSet.

41.2.5.2 IPrepareDataSet Methods

The methods of the IPrepareDataSet class are listed here.

Public Methods

	Name	Description
	PrepareDataSet (see page 8109)	This is PrepareDataSet, a member of class IPrepareDataSet.

41.2.5.2.1 IPrepareDataSet.PrepareDataSet Method

Pascal

```
procedure PrepareDataSet;
```

C++

```
__fastcall PrepareDataSet();
```

Description

This is PrepareDataSet, a member of class IPrepareDataSet.

41.3 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	AddLocateParamsString (see page 8110)	This is function DBAdapt.AddLocateParamsString.

41.3.1 DBAdapt.AddLocateParamsString Function

Pascal

```
procedure AddLocateParamsString(AAdapterName: string; AKeyName: string; AKeyValue: string;
AParams: TLocateParamsList);
```

C++

```
AddLocateParamsString(AnsiString AAdapterName, AnsiString AKeyName, AnsiString AKeyValue,
TLocateParamsList AParams);
```

File

DBAdapt

Description

This is function DBAdapt.AddLocateParamsString.

41.4 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TDataSetAdapterFieldFlag (see page 8111)	This is record DBAdapt.TDataSetAdapterFieldFlag.
	TDataSetAdapterMode (see page 8111)	This is record DBAdapt.TDataSetAdapterMode.
	TDataSetAdapterRequestParamOption (see page 8112)	This is record DBAdapt.TDataSetAdapterRequestParamOption.

41.4.1 DBAdapt.TDataSetAdapterFieldFlag Enumeration

Pascal

```
TDataSetAdapterFieldFlag = (
  ffInKey,
  ffInOrigValues
);
```

C++

```
enum TDataSetAdapterFieldFlag {
  ffInKey,
  ffInOrigValues
};
```

File

DBAdapt

Description

This is record DBAdapt.TDataSetAdapterFieldFlag.

41.4.2 DBAdapt.TDataSetAdapterMode Enumeration

Pascal

```
TDataSetAdapterMode = (
  amInsert,
  amEdit,
  amBrowse,
  amQuery
);
```

C++

```
enum TDataSetAdapterMode {
  amInsert,
  amEdit,
  amBrowse,
  amQuery
};
```

File

DBAdapt

Description

This is record DBAdapt.TDataSetAdapterMode.

41.4.3 DBAdapt.TDataSetAdapterRequestParamOption Enumeration

Pascal

```
TDataSetAdapterRequestParamOption = (
  poLocateParams,
  poCurrentPage
);
```

C++

```
enum TDataSetAdapterRequestParamOption {
  poLocateParams,
  poCurrentPage
};
```

File

DBAdapt

Description

This is record DBAdapt.TDataSetAdapterRequestParamOption.

41.5 Types

The following table lists types in this documentation.

Types

Name	Description
TDataAdapterFieldValidateValueEvent (see page 8113)	This is type DBAdapt.TDataAdapterFieldValidateValueEvent.
TDataSetAdapterFieldFlags (see page 8113)	This is type DBAdapt.TDataSetAdapterFieldFlags.
TDataSetAdapterFieldGetStringEvent (see page 8114)	This is type DBAdapt.TDataSetAdapterFieldGetStringEvent.
TDataSetAdapterFieldGetValueEvent (see page 8114)	This is type DBAdapt.TDataSetAdapterFieldGetValueEvent.
TDataSetAdapterFieldValueEvent (see page 8114)	This is type DBAdapt.TDataSetAdapterFieldValueEvent.
TDataSetAdapterImageFieldClass (see page 8115)	This is type DBAdapt.TDataSetAdapterImageFieldClass.
TDataSetAdapterModes (see page 8115)	This is type DBAdapt.TDataSetAdapterModes.
TDataSetAdapterRequestParamOptions (see page 8115)	This is type DBAdapt.TDataSetAdapterRequestParamOptions.

41.5.1 DBAdapt.TDataAdapterFieldValidateValueEvent Type

Pascal

```
TDataAdapterFieldValidateValueEvent = procedure (Sender: TObject; Field: TField; Value:
IActionFieldValue; var Handled: Boolean) of object;
```

C++

```
(Sender: TObject; Field: TField; Value: IActionFieldValue; var Handled: Boolean) (
TDataAdapterFieldValidateValueEvent)();
```

File

DBAdapt

Description

This is type DBAdapt.TDataAdapterFieldValidateValueEvent.

41.5.2 DBAdapt.TDataSetAdapterFieldFlags Type

Pascal

```
TDataSetAdapterFieldFlags = set of TDataSetAdapterFieldFlag;
```

C++

```
TDataSetAdapterFieldFlag TDataSetAdapterFieldFlags;
```

File

DBAdapt

Description

This is type DBAdapt.TDataSetAdapterFieldFlags.

41.5.3 DBAdapt.TDataSetAdapterFieldGetStringEvent Type

Pascal

```
TDataSetAdapterFieldGetStringEvent = procedure (Sender: TObject; Field: TField; var Value:
string) of object;
```

C++

```
(Sender: TObject; Field: TField; var Value: string) ( TDataSetAdapterFieldGetStringEvent)();
```

File

DBAdapt

Description

This is type DBAdapt.TDataSetAdapterFieldGetStringEvent.

41.5.4 DBAdapt.TDataSetAdapterFieldGetValueEvent Type

Pascal

```
TDataSetAdapterFieldGetValueEvent = procedure (Sender: TObject; Field: TField; var Value:
Variant) of object;
```

C++

```
(Sender: TObject; Field: TField; var Value: Variant) ( TDataSetAdapterFieldGetValueEvent)();
```

File

DBAdapt

Description

This is type DBAdapt.TDataSetAdapterFieldGetValueEvent.

41.5.5 DBAdapt.TDataSetAdapterFieldValueEvent Type

Pascal

```
TDataSetAdapterFieldValueEvent = procedure (Sender: TObject; Field: TField; Value: Variant) of
object;
```

C++

```
(Sender: TObject; Field: TField; Value: Variant) ( TDataSetAdapterFieldValueEvent)();
```

File

DBAdapt

Description

This is type DBAdapt.TDataSetAdapterFieldValueEvent.

41.5.6 DBAdapt.TDataSetAdapterImageFieldClass Type

Pascal

```
TDataSetAdapterImageFieldClass = class of TBaseDataSetAdapterImageField;
```

C++

```
TBaseDataSetAdapterImageField TDataSetAdapterImageFieldClass;
```

File

DBAdapt

Description

This is type DBAdapt.TDataSetAdapterImageFieldClass.

41.5.7 DBAdapt.TDataSetAdapterModes Type

Pascal

```
TDataSetAdapterModes = set of TDataSetAdapterMode;
```

C++

```
TDataSetAdapterMode TDataSetAdapterModes;
```

File

DBAdapt

Description

This is type DBAdapt.TDataSetAdapterModes.

41.5.8 DBAdapt.TDataSetAdapterRequestParamOptions Type

Pascal

```
TDataSetAdapterRequestParamOptions = set of TDataSetAdapterRequestParamOption;
```

C++

```
TDataSetAdapterRequestParamOption TDataSetAdapterRequestParamOptions;
```

File

DBAdapt

Description

This is type DBAdapt.TDataSetAdapterRequestParamOptions.

41.6 Variables

The following table lists variables in this documentation.

Variables

Name	Description
DataSetAdapterImageFieldClass (see page 8116)	This is variable DBAdapt.DataSetAdapterImageFieldClass.

41.6.1 DBAdapt.DataSetAdapterImageFieldClass Variable

Pascal

```
DataSetAdapterImageFieldClass: TDataSetAdapterImageFieldClass;
```

C++

```
TDataSetAdapterImageFieldClass DataSetAdapterImageFieldClass;
```

File

DBAdapt

Description

This is variable DBAdapt.DataSetAdapterImageFieldClass.

41.7 Constants

The following table lists constants in this documentation.

Constants

Name	Description
AllActionParamOptions (see page 8117)	This is constant DBAdapt.AllActionParamOptions.
AllImageParamOptions (see page 8117)	This is constant DBAdapt.AllImageParamOptions.
DataSetAdapterModeNames (see page 8117)	This is constant DBAdapt.DataSetAdapterModeNames.

41.7.1 DBAdapt.AllActionParamOptions Constant

Pascal

```
AllActionParamOptions = [poLocateParams, poCurrentPage];
```

C++

```
AllActionParamOptions = [poLocateParams, poCurrentPage];
```

File

DBAdapt

Description

This is constant DBAdapt.AllActionParamOptions.

41.7.2 DBAdapt.AllImageParamOptions Constant

Pascal

```
AllImageParamOptions = [poLocateParams];
```

C++

```
AllImageParamOptions = [poLocateParams];
```

File

DBAdapt

Description

This is constant DBAdapt.AllImageParamOptions.

41.7.3 DBAdapt.DataSetAdapterModeNames Constant

Pascal

```
DataSetAdapterModeNames: array[TDataSetAdapterMode] of string = ('Insert', 'Edit', 'Browse',
```

```
'Query');
```

C++

```
array[TDataSetAdapterMode] of string DataSetAdapterModeNames = ('Insert', 'Edit', 'Browse',
'Query');
```

File

DBAdapt

Description

This is constant DBAdapt.DataSetAdapterModeNames.

42 DBAdaptImg Namespace

This is namespace DBAdaptImg.

Topics

Name	Description
Classes (see page 8120)	The following table lists classes in this documentation.
Types (see page 8149)	The following table lists types in this documentation.

Classes

	Name	Description
	TCustomDataSetAdapterImageField (see page 8120)	TCustomDataSetAdapterImageField is the base class for adapter field objects that represent a graphic field from a database.
	TDataSetAdapterImageField (see page 8138)	tdatasetadapterimagefield is the adapter field object that represents a graphic field from a database.

Types

Name	Description
TImageDataSetFieldGetImageEvent (see page 8149)	This is type DBAdaptImg.TImageDataSetFieldGetImageEvent.

42.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TCustomDataSetAdapterImageField (see page 8120)	TCustomDataSetAdapterImageField is the base class for adapter field objects that represent a graphic field from a database.
	TDataSetAdapterImageField (see page 8138)	tdatasetadapterimagefield is the adapter field object that represents a graphic field from a database.

42.1.1 TCustomDataSetAdapterImageField Class

TCustomDataSetAdapterImageField is the base class for adapter field objects that represent a graphic field from a database.

Class Hierarchy

Pascal

```
TCustomDataSetAdapterImageField = class(TBaseDataSetAdapterImageField, IGetAdapterImage,
IGetAdapterItemRequestParams, IAdapterRequestHandler, IWebImageHREF);
```

C++

```
class TCustomDataSetAdapterImageField : public TBaseDataSetAdapterImageField, public
IGetAdapterImage, public IGetAdapterItemRequestParams, public IAdapterRequestHandler, public
IWebImageHREF;
```

File

DBAdaptImg

Description

TCustomDataSetAdapterImageField is the base class for all adapter field objects that represent graphics fields from a dataset (TGraphicField objects). TCustomDataSetAdapterImageField descendants are included as the fields of a dataset adapter (TDataSetAdapter) when that dataset adapter represents a database that includes graphics fields.

TCustomDataSetAdapterImageField represents a single field from a database table, and enables server-side script to refer to or update that field's value.

Do not use TCustomDataSetAdapterImageField directly: it is intended only as a base class. Instead, use a TCustomDataSetAdapterImageField descendant such as TDataSetAdapterImageField (see page 8138), which publishes several of the properties and events that you can use at design time to bind the adapter field to the corresponding dataset field.

See Also

TDataSetAdapterImageField (see page 8138)

TDataSetAdapter (see page 7872)

TGraphicField (see page 7257)

42.1.1.1 TCustomDataSetAdapterImageField Members

The following tables list the members exposed by TCustomDataSetAdapterImageField.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	AsFormatted (see page 23931)	Returns text used to generate a representation of the adapter field value.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	CheckModifyAccess (see page 23931)	Checks end-user rights to modify the adapter field value.
	CheckOrigValue (see page 7736)	Ensures that the current value of this field is the same as the original value.
	CheckOrUpdateValue (see page 8128)	Checks whether a specified request contains a valid value and, if requested, uses that value to update the database.
	CheckValueChange (see page 7737)	Indicates whether the current value of this field is the same as the original value.
	CheckViewAccess (see page 23931)	Checks end-user rights to view the adapter field value.
	CreateRequestContext (see page 8129)	Creates an object that describes the adapter action parameters and adapter field values.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	FullyQualifyInputName (see page 7738)	Indicates whether references to this field in HTML forms must be qualified with the name of the parent adapter.
V	FullyQualifyInputName (see page 23932)	Indicates whether the HTML input names must be qualified with the name of the adapter.
	GetAdapter (see page 7738)	Returns the value of the Adapter (see page 7752) property.
	GetAdapter (see page 23932)	GetAdapter returns the parent adapter component.
	GetAdapterImage (see page 8130)	Returns an interface that can be used to access the Image property of this adapter field.
	GetAdapterItemRequestParams (see page 8130)	Provides a unique identifier and a set of name/value pairs that can be used to identify this field's image file.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.

	GetContainerList (see page 24727)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
	GetDataSet (see page 7738)	Returns the dataset associated with this field's parent adapter.
V	GetDataSetFieldValue (see page 8131)	Returns the value of the associated dataset field.
V	GetDefaultDisplayLabel (see page 23932)	Provides the default display label for this adapter field.
V	GetDefaultFieldName (see page 23932)	Gets the default name used to reference this adapter field with server-side script.
	GetDisplayLabel (see page 23933)	Returns the suggested display label for this adapter field.
	GetDisplayStyle (see page 7739)	Returns a string value that suggests an HTML display style for this adapter field.
V	GetDisplayStyleType (see page 8131)	Returns the HTML display style type for this adapter field.
	GetDisplayWidth (see page 23933)	Returns the suggested display width for this adapter field.
	GetEchoActionFieldValue (see page 23933)	Returns the value of the echo flag.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetInputName (see page 23934)	Identifies the name to use when generating an HTML input for this adapter field.
	GetInputStyle (see page 7741)	Returns a string value that suggests an HTML editing style for this adapter field.
V	GetInputStyleType (see page 8132)	Returns the style of the HTML control to use for editing this adapter field.
	GetKeyName (see page 7742)	Returns the name of the associated dataset field if it appears in the index (key) that the parent dataset adapter uses.
	GetKeyParams (see page 7743)	Returns a list of fields that the parent dataset adapter uses to locate records, along with their current values in that adapter's dataset.
	GetMaxLength (see page 23934)	Returns the maximum length, in characters, that the user should be allowed to enter when entering a value for this adapter field.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetReadOnly (see page 7743)	Indicates whether the adapter field represents a read-only database field.
	GetRequired (see page 23934)	Indicates whether the end-user must enter a value for this adapter field.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetValue (see page 23935)	Gets the value of this adapter field as a Variant.
	GetVariableName (see page 23935)	Gets the name used to reference this adapter field with server-side script.
	GetViewMode (see page 7744)	Returns a string value that indicates what function a control that represents this field should perform.
V	GetViewModeType (see page 7744)	Returns the view mode for the function a control that represents this field should perform.
	GetVisible (see page 23935)	Indicates whether the value of this adapter field should be displayed to the end-user.
V	GetWebSnapObjClass (see page 23936)	Returns the class type for this adapter field.
	HandleRequest (see page 8132)	Handles incoming requests for the image value of this field.
	HasModifyAccess (see page 23936)	Checks the end-user's right to modify this adapter field.
	HasViewAccess (see page 23936)	Checks the end-user's right to view this adapter field.
V	ImplAsFormatted (see page 7745)	Provides the underlying implementation for the AsFormatted method.
V	ImplAsFormatted (see page 23937)	Returns text used to generate a representation of the adapter field value.
V	ImplCheckOrigValue (see page 7745)	Provides the underlying implementation for the CheckOrigValue (see page 7736) method.
V	ImplCheckValueChange (see page 8133)	Provides the underlying implementation for the CheckValueChange method.
	ImplCreateRequestContext (see page 8134)	Provides the underlying implementation for the CreateRequestContext (see page 8129) method.
V	ImplGetDisplayLabel (see page 7747)	Provides the underlying implementation for the GetDisplayLabel method.
V	ImplGetDisplayLabel (see page 23937)	Returns the suggested display label for this adapter field.
V	ImplGetDisplayWidth (see page 7747)	Provides the underlying implementation for the GetDisplayWidth method.
V	ImplGetDisplayWidth (see page 23937)	Returns the suggested display width for this adapter field.
V	ImplGetEchoActionFieldValue (see page 23938)	Returns the value of the echo flag.
V	ImplGetInputName (see page 23938)	Identifies the name to use when generating the HTML input for this adapter field.
V	ImplGetMaxLength (see page 23938)	Returns the maximum length, in characters, that the user should be allowed to enter when entering a value for this adapter field.
V	ImplGetRequired (see page 7747)	Provides the underlying implementation for the GetRequired method.
V	ImplGetRequired (see page 23939)	Indicates whether the end-user must enter a value for this adapter field.

	ImplGetValue (see page 7748)	Provides the underlying implementation for the GetValue method.
	ImplGetValue (see page 23939)	Gets the value of this adapter field as a Variant.
	ImplGetVariableName (see page 23939)	Gets the name used to reference this adapter field with server-side script.
	ImplGetVisible (see page 7748)	Provides the underlying implementation for the GetVisible method.
	ImplGetVisible (see page 23940)	Indicates whether the value of this adapter field should be displayed to the end-user.
	ImplHandleRequest (see page 8134)	Provides the underlying implementation for the HandleRequest (see page 8132) method.
	ImplHasModifyAccess (see page 23940)	Checks the end-user's right to modify this adapter field.
	ImplHasViewAccess (see page 23940)	Checks the end-user's right to view this adapter field.
	ImplSetEchoActionFieldValue (see page 23941)	Sets the echo flag for this adapter field.
	ImplSetFieldName (see page 7749)	Provides the underlying implementation for the SetFieldName method.
	ImplSetFieldName (see page 23941)	Sets the name that is used to reference this adapter field with server-side script.
	ImplUpdateValue (see page 8135)	Provides the underlying implementation for the UpdateValue method.
	ImplWebImageHREF (see page 8135)	Provides the underlying implementation for the WebImageHREF (see page 8136) method.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsDefaultField (see page 24728)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	Notification (see page 7750)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	ParentChanged (see page 23941)	Handles movement of the component to a different parent.
	ParentChanged (see page 24728)	Responds when the WebParent (see page 24731) property changes.
	PrepareDataSet (see page 7750)	Responds when the parent dataset adapter prepares its dataset.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	ReadState (see page 24729)	Reads the component's published properties, stored data, and owned components from a reader object.
	RenderAdapterImage (see page 8136)	Writes the image described by an image request to the current response message.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDataSetField (see page 7751)	Sets the value of the DataSetField (see page 7752) property.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetEchoActionFieldValue (see page 23942)	Sets the echo flag for this adapter field.
	SetFieldName (see page 23942)	Sets the name that is used to reference this adapter field with server-side script.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	SetParentComponent (see page 24729)	Sets the WebParent (see page 24731) property to be the same as this component's parent.
	SetWebParent (see page 24730)	Sets the value of the WebParent (see page 24731) property.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	UpdateValue (see page 7751)	Updates the adapter field when the user assigns a new value.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.

	WebImageHREF (see page 8136)	Retrieves a URL for an external image file that contains the value of this field.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	Adapter (see page 7752)	Indicates the dataset adapter that uses this object to represent one of its fields.
R	Adapter (see page 23943)	Returns the parent adapter component.
	DataSetField (see page 7752)	Specifies the name of the dataset field that this adapter field represents.
R	WebContainedComponentHelper (see page 24730)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.
R	WebParent (see page 24731)	Indicates the component that uses this TWebContainedComponent (see page 24722) as one of its Web items.

Public Events

	Name	Description
	OnGetDisplayText (see page 7754)	Occurs when the adapter field needs to supply its formatted value as a string that can appear in HTML forms.
	OnGetHREF (see page 8137)	Occurs when the WebSnap application needs the URL that clients use to request this field's image.
	OnGetImage (see page 8137)	Occurs when the WebSnap application receives a request for this field's image.
	OnGetValue (see page 7754)	Occurs when the adapter field needs to supply its value as a Variant.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	AsFormatted (see page 19682)	This is AsFormatted, a member of class IAsFormatted.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	CheckValueChange (see page 24570)	This is CheckValueChange, a member of class ICheckValueChange.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 8127)	Creates and initializes an instance of TCustomDataSetAdapterImageField (see page 8120).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Destroy (see page 24726)	Frees an instance of TWebContainedComponent (see page 24722).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FindField (see page 7737)	Returns the dataset field whose value this adapter field represents.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.

	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.
	GetDisplayLabel (see page 19756)	This is GetDisplayLabel, a member of class IWebGetDisplayLabel.
	GetDisplayStyle (see page 19700)	Returns the preferred display style for an adapter field or adapter action.
	GetDisplayWidth (see page 19757)	This is GetDisplayWidth, a member of class IWebGetDisplayWidth.
	GetEchoActionFieldValue (see page 24573)	This is GetEchoActionFieldValue, a member of class IEchoActionFieldValue.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetFieldName (see page 19758)	This is GetFieldName, a member of class IWebGetFieldName.
	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	GetInputName (see page 19767)	This is GetInputName, a member of class IWebInputName.
	GetInputStyle (see page 19700)	Returns the preferred editing style for an adapter field.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetKeyName (see page 8105)	This is GetKeyName, a member of class IGetDataSetKeyName.
	GetMaxLength (see page 19763)	This is GetMaxLength, a member of class IWebGetMaxLength.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetParentComponent (see page 24727)	Returns the object that uses this component to generate HTML.
	GetRequired (see page 19668)	This is GetRequired, a member of class IAdapterFieldAttributes.
	GetValue (see page 19759)	This is GetValue, a member of class IWebGetFieldValue.
	GetVariableName (see page 15329)	This is GetVariableName, a member of class IWebVariableName.
	GetViewMode (see page 19701)	Returns the preferred mode of an adapter field.
	GetVisible (see page 19668)	This is GetVisible, a member of class IAdapterFieldAttributes.
	HasModifyAccess (see page 19667)	This is HasModifyAccess, a member of class IAdapterFieldAccess.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	HasParent (see page 24727)	Indicates whether this component appears in another component's list of Web items.
	HasViewAccess (see page 19667)	This is HasViewAccess, a member of class IAdapterFieldAccess.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	PrepareDataSet (see page 8109)	This is PrepareDataSet, a member of class IPrepareDataSet.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.

	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.
	SetEchoActionFieldValue (see page 24573)	This is SetEchoActionFieldValue, a member of class IEchoActionFieldValue.
	SetFieldName (see page 19784)	This is SetFieldName, a member of class IWebSetFieldName.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	UpdateValue (see page 24584)	This is UpdateValue, a member of class IUpdateValue.

Public Properties

	Name	Description
R	ActionOrigValue (see page 23943)	Retrieve the original value of this adapter field.
R	ActionValue (see page 23943)	Retrieve the value for this adapter field entered by the end-user.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	EchoActionFieldValue (see page 24574)	This is EchoActionFieldValue, a member of class IEchoActionFieldValue.
	EchoActionFieldValue (see page 23944)	Used to echo the value(s) entered by the end-user when generating an HTML form.
	FieldFlags (see page 7752)	Indicates various attributes of the adapter field.
	FieldModes (see page 7753)	Indicates what dataset adapter modes this field supports.
R	FieldName (see page 19758)	This is FieldName, a member of class IWebGetFieldName.
	FieldName (see page 23944)	Identifies the name of this field when using server-side script.
	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.
R	InputName (see page 19767)	This is InputName, a member of class IWebInputName.
R	KeyName (see page 8105)	This is KeyName, a member of class IGetDataSetKeyName.
	ModifyAccess (see page 23944)	Identifies the rights required to update this field.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
R	Required (see page 19669)	This is Required, a member of class IAdapterFieldAttributes.
R	Value (see page 19760)	This is Value, a member of class IWebGetFieldValue.
R	Value (see page 23945)	Provides the value of an adapter field as a variant.
R	VariableName (see page 15329)	This is VariableName, a member of class IWebVariableName.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	ViewAccess (see page 23945)	Identifies the rights required to view this field.
R	Visible (see page 19669)	This is Visible, a member of class IAdapterFieldAttributes.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

42.1.1.2 TCustomDataSetAdapterImageField.Create Constructor

Creates and initializes an instance of TCustomDataSetAdapterImageField (see page 8120).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomDataSetAdapterImageField(TComponent * AOwner);
```

Description

The TCustomDataSetAdapterImageField (see page 8120) constructor allocates memory for the adapter field object and initializes its properties.

AOwner is the component that is responsible for starting the streaming process when a module containing the adapter field is loaded or saved. It becomes the value of the Owner property. Typically, AOwner is the Web module.

See Also

Owner (see page 2807)

42.1.1.3 TCustomDataSetAdapterImageField Methods

The methods of the TCustomDataSetAdapterImageField class are listed here.

Protected Methods

	Name	Description
	CheckOrUpdateValue (see page 8128)	Checks whether a specified request contains a valid value and, if requested, uses that value to update the database.
	CreateRequestContext (see page 8129)	Creates an object that describes the adapter action parameters and adapter field values.
	GetAdapterImage (see page 8130)	Returns an interface that can be used to access the Image property of this adapter field.
	GetAdapterItemRequestParams (see page 8130)	Provides a unique identifier and a set of name/value pairs that can be used to identify this field's image file.
V	GetDataSetFieldValue (see page 8131)	Returns the value of the associated dataset field.
V	GetDisplayStyleType (see page 8131)	Returns the HTML display style type for this adapter field.
V	GetInputStyleType (see page 8132)	Returns the style of the HTML control to use for editing this adapter field.
	HandleRequest (see page 8132)	Handles incoming requests for the image value of this field.
V	ImplCheckValueChange (see page 8133)	Provides the underlying implementation for the CheckValueChange method.
	ImplCreateRequestContext (see page 8134)	Provides the underlying implementation for the CreateRequestContext (see page 8129) method.
V	ImplHandleRequest (see page 8134)	Provides the underlying implementation for the HandleRequest (see page 8132) method.
V	ImplUpdateValue (see page 8135)	Provides the underlying implementation for the UpdateValue method.
V	ImplWebImageHREF (see page 8135)	Provides the underlying implementation for the WebImageHREF (see page 8136) method.
	RenderAdapterImage (see page 8136)	Writes the image described by an image request to the current response message.
	WebImageHREF (see page 8136)	Retrieves a URL for an external image file that contains the value of this field.

42.1.1.3.1 TCustomDataSetAdapterImageField.CheckOrUpdateValue Method

Checks whether a specified request contains a valid value and, if requested, uses that value to update the database.

Pascal

```
function CheckOrUpdateValue(AActionRequest: IActionRequest; AFieldIndex: Integer; AUpdate:
Boolean): Boolean;
```

C++

```
__fastcall Boolean CheckOrUpdateValue(IActionRequest AActionRequest, int AFieldIndex, Boolean
```

```
AUpdate);
```

Description

CheckOrUpdateValue is called internally by the implementation of both the UpdateValue and the CheckValueChange methods to check for a properly-formed image value from an incoming request message. If requested, it also updates the corresponding database field. If the request object does not contain an appropriate value (for example, multiple values or a value that is not in .bmp format), CheckOrUpdateValue raises an EAdapterFieldException exception.

AActionRequest is the interface of the action request object. CheckOrUpdateValue uses this interface to obtain the value from the incoming request to check or write to the database field.

AFieldIndex is the index of this field in the set of field values that AActionRequest maintains.

AUpdate indicates whether CheckOrUpdateValue should update the corresponding database field. If AUpdate is true, CheckOrUpdateValue assigns the properly validated value that it finds in AActionRequest to the associated database field. If AUpdate is false, CheckOrUpdateValue merely checks for the existence of an appropriate value.

CheckOrUpdateValue returns true if this is not an update request and the request contains a reference to an appropriate image file.

See Also

UpdateValue (see page 7751)

EAdapterFieldException (see page 23698)

CheckValueChange (see page 7737)

42.1.1.3.2 TCustomDataSetAdapterImageField.CreateRequestContext Method

Creates an object that describes the adapter action parameters and adapter field values.

Pascal

```
procedure CreateRequestContext(DispatchParams: IAdapterDispatchParams);
```

C++

```
__fastcall CreateRequestContext(IAdapterDispatchParams DispatchParams);
```

Description

CreateRequestContext creates a new request context based on the specified parameters and stores it with the global Web context. The adapter dispatcher calls this function before calling HandleRequest (see page 8132). The WebSnap can access the resulting request context by reading the AdapterRequest property of the Web context, which is available through the global WebContext function.

DispatchParams is an interface that contains the parameters that were included in the incoming request. These parameters can then be used to identify an image for this field's value.

See Also

AdapterRequest (see page 24655)

TAdapterDispatcher (see page 24840)

WebContext (see page 24687)

HandleRequest (see page 8132)

42.1.1.3.3 TCustomDataSetAdapterImageField.GetAdapterImage Method

Returns an interface that can be used to access the Image property of this adapter field.

Pascal

```
function GetAdapterImage: TComponent;
```

C++

```
__fastcall TComponent * GetAdapterImage();
```

Description

GetAdapterImage provides the implementation of the Image property on this adapter field. This method is called automatically when server-side script references the Image property. The resulting interface can then be used to obtain the value of the image.

GetAdapterImage checks the Mode property of the parent adapter for this field. If the parent dataset adapter is in insert mode or query mode, GetAdapterImage returns nil (Delphi) or NULL (C++), because there is no current value to the image field (it does not currently represent the value of a graphic field in the adapter's dataset). Otherwise, GetAdapterImage returns self (Delphi) or this (C++), so that the WebSnap application can obtain the current image for this field.

See Also

Mode (see page 7810)

Adapter (see page 7752)

42.1.1.3.4 TCustomDataSetAdapterImageField.GetAdapterItemRequestParams Method

Provides a unique identifier and a set of name/value pairs that can be used to identify this field's image file.

Pascal

```
procedure GetAdapterItemRequestParams(var AIdentifier: string; AParams:
IAdapterItemRequestParams);
```

C++

```
__fastcall GetAdapterItemRequestParams(AnsiString AIdentifier, IAdapterItemRequestParams
AParams);
```

Description

GetAdapterItemRequestParams is used (along with the OnGetHREF (see page 8137) event) to identify the URL that addresses the image file associated with this adapter field. When server-side script uses the Image.AsHREF property, this field generates an OnGetHREF (see page 8137) event. If an OnGetHREF (see page 8137) event handler does not provide a URL for an external file that contains the field's image, then the WebSnap application calls GetAdapterItemRequestParams to obtain the information it needs to locate or construct the field's image.

AIdentifer returns a unique identifier for this adapter field object.

AParams is the interface to which GetAdapterItemRequestParams writes a set of name/value pairs that identify the image for this field.

See Also

OnGetHREF (see page 8137)

42.1.1.3.5 TCustomDataSetAdapterImageField.GetDataSetFieldValue Method

Returns the value of the associated dataset field.

Pascal

```
function GetDataSetFieldValue(Field: TField): Variant; override;
```

C++

```
virtual __fastcall Variant GetDataSetFieldValue(TField Field);
```

Description

GetDataSetFieldValue returns the value of the associated dataset field, given a field object. This method is called by the implementation of the Value property when there is no OnGetValue event handler.

Field is the dataset field whose value this adapter field represents. It is the component that the FindField method returns.

In TCustomDataSetAdapterImageField (see page 8120), GetDataSetFieldValue returns the DisplayText property of the Field parameter. This is the text-readable value of the image field. From server-side script, the image itself is available through the Image property of this adapter field.

See Also

OnGetValue (see page 7754)

Value (see page 23945)

FindField (see page 7737)

DisplayText (see page 7162)

OnGetImage (see page 8137)

42.1.1.3.6 TCustomDataSetAdapterImageField.GetDisplayStyleType Method

Returns the HTML display style type for this adapter field.

Pascal

```
function GetDisplayStyleType(const AAdapterMode: string): TAdapterDisplayHTMLElementType;
override;
```

C++

```
virtual __fastcall TAdapterDisplayHTMLElementType GetDisplayStyleType(const AnsiString
AAdapterMode);
```

Description

GetDisplayStyleType returns the best way to display this field's value in HTML forms.

AAdapterMode indicates the current mode of the parent dataset adapter. It is one of the following values:

Value	Mode	Meaning
Insert	amInsert	The field value is to be used for entering a value in a newly inserted record.
Edit	amEdit	The field value is to be used for editing the current field value.
Browse	amBrowse	The field value is to be displayed in a read-only manner.
Query	amQuery	The field value represents a criterion to use in a generated query.

In TBaseDataSetAdapterField, GetDisplayStyleType returns htmldImage, indicating that the value should appear as an image.

See Also

GetDisplayStyle (see page 7739)

TDataSetAdapterModes (see page 8115)

GetInputStyleType (see page 8132)

42.1.1.3.7 TCustomDataSetAdapterImageField.GetInputStyleType Method

Returns the style of the HTML control to use for editing this adapter field.

Pascal

```
function GetInputStyleType(const AAdapterMode: string): TAdapterInputHTMLElementType; override;
```

C++

```
virtual __fastcall TAdapterInputHTMLElementType GetInputStyleType(const AnsiString
AAdapterMode);
```

Description

GetInputStyleType returns the recommended type of control to use for editing this field's value in HTML forms.

AAdapterMode indicates the current mode of the parent dataset adapter. It is one of the following values:

Value	Mode	Meaning
Insert	amInsert	The control is to be used for entering a field value in a newly inserted record.
Edit	amEdit	The control is to be used for editing the current field value.
Browse	amBrowse	The control is to be used for read-only display.
Query	amQuery	The control is to be used for entering a criterion to use in a generated query.

In TBaseDataSetAdapterField, GetInputStyleType always returns htmliFile, indicating that the default control is a file upload element.

See Also

GetInputStyle (see page 7741)

GetDisplayStyleType (see page 8131)

TDataSetAdapterModes (see page 8115)

42.1.1.3.8 TCustomDataSetAdapterImageField.HandleRequest Method

Handles incoming requests for the image value of this field.

Pascal

```
function HandleRequest(DispatchParams: IAdapterDispatchParams): Boolean;
```

C++

```
__fastcall Boolean HandleRequest(IAdapterDispatchParams DispatchParams);
```

Description

The adapter dispatcher calls HandleRequest to process incoming request messages directed at this adapter field. HandleRequest interprets the incoming parameters that accompany the request, uses them to locate the image that is the value of this field, and writes that image to the current response.

DispatchParams is an interface for reading the parameters that accompanied the incoming request message. These parameters, which originated from the GetAdapterItemRequestParams (see page 8130) method, identify the image that is the value of this field.

HandleRequest delegates the task of processing the image request to the ImplHandleRequest (see page 8134) method. ImplHandleRequest (see page 8134) then obtains the image by generating an OnGetImage (see page 8137) event or by retrieving the value of the associated graphic field object.

See Also

ImplHandleRequest (see page 8134)

OnGetImage (see page 8137)

TAdapterDispatcher (see page 24840)

GetAdapterItemRequestParams (see page 8130)

TGraphicField (see page 7257)

42.1.1.3.9 TCustomDataSetAdapterImageField.ImplCheckValueChange Method

Provides the underlying implementation for the CheckValueChange method.

Pascal

```
function ImplCheckValueChange(AActionRequest: IActionRequest; AFieldIndex: Integer): Boolean;
override;
```

C++

```
virtual __fastcall Boolean ImplCheckValueChange(IActionRequest AActionRequest, int
AFieldIndex);
```

Description

The CheckValueChange method calls ImplCheckValueChange to determine whether the value of this adapter field has changed from the value originally retrieved from the database table.

AActionRequest is the interface of the action request object. CheckOrigValue can use this interface to obtain information about the current request (such as the value of the hidden field that contains the original value).

AFieldIndex is the index of this field in the set of field values that AActionRequest maintains.

ImplCheckValueChange calls CheckOrUpdateValue (see page 8128) to verify that the request contains a value that can be assigned to the associated database field. If so, it returns true. Although this does not truly reflect whether the value has changed, it is a conservative approach that ensures no valid changes to the image are lost. If the request contains no value, this method returns false, indicating no update. If the request contains an invalid value, this method raises an EAdapterFieldException exception.

See Also

CheckValueChange (see page 7737)

Value (see page 23945)

CheckOrUpdateValue (see page 8128)

EAdapterFieldException (see page 23698)

42.1.1.3.10 TCustomDataSetAdapterImageField.ImplCreateRequestContext Method

Provides the underlying implementation for the CreateRequestContext (see page 8129) method.

Pascal

```
procedure ImplCreateRequestContext(DispatchParams: IAdapterDispatchParams);
```

C++

```
__fastcall ImplCreateRequestContext(IAdapterDispatchParams DispatchParams);
```

Description

CreateRequestContext (see page 8129) calls this method to create a request context based on the specified parameters and store it with the global Web context.

DispatchParams is an interface that contains the parameters that were included in the incoming request. These parameters can then be used to identify an image for this field's value.

See Also

AdapterRequest (see page 24655)

CreateRequestContext (see page 8129)

WebContext (see page 24687)

42.1.1.3.11 TCustomDataSetAdapterImageField.ImplHandleRequest Method

Provides the underlying implementation for the HandleRequest (see page 8132) method.

Pascal

```
function ImplHandleRequest(DispatchParams: IAdapterDispatchParams): Boolean; virtual;
```

C++

```
virtual __fastcall Boolean ImplHandleRequest(IAdapterDispatchParams DispatchParams);
```

Description

The HandleRequest (see page 8132) method calls ImplHandleRequest to process incoming request messages directed at this adapter field.

DispatchParams is an interface for reading the parameters that accompanied the incoming request message. These parameters identify the image that is the value of this field.

ImplHandleRequest uses the AParams interface to access interfaces for the current request and response objects. It then generates an OnGetImage (see page 8137) event to obtain the current image. If the OnGetImage (see page 8137) event handler does not provide an image, ImplHandleRequest retrieves the value of the associated graphic field object. Finally, ImplHandleRequest writes the image to the current response object.

See Also

HandleRequest (see page 8132)

OnGetImage (see page 8137)

TGraphicField (see page 7257)

42.1.1.3.12 TCustomDataSetAdapterImageField.ImplUpdateValue Method

Provides the underlying implementation for the UpdateValue method.

Pascal

```
procedure ImplUpdateValue(AActionRequest: IActionRequest; AFieldIndex: Integer); override;
```

C++

```
virtual __fastcall ImplUpdateValue(IActionRequest AActionRequest, int AFieldIndex);
```

Description

The UpdateValue method calls ImplUpdateValue to respond when the user assigns a new value to this field.

AActionRequest is interface of the action request object. ImplUpdateValue can use this interface to obtain information about the current request (such as the value the user assigned to this field).

AFieldIndex is the index of this field in the set of field values that AActionRequest maintains.

ImplUpdateValue calls the CheckOrUpdateValue (see page 8128) method to write the image that AActionRequest contains to the associated graphic field.

See Also

UpdateValue (see page 7751)

Value (see page 23945)

CheckOrUpdateValue (see page 8128)

42.1.1.3.13 TCustomDataSetAdapterImageField.ImplWebImageHREF Method

Provides the underlying implementation for the WebImageHREF (see page 8136) method.

Pascal

```
function ImplWebImageHREF(var AHREF: string): Boolean; virtual;
```

C++

```
virtual __fastcall Boolean ImplWebImageHREF(AnsiString AHREF);
```

Description

The WebImageHREF (see page 8136) method calls ImplWebImageHREF to obtain the URL for an external image file that contains the value of this field.

AHREF returns the URL that identifies the image of this field.

ImplWebImageHREF returns true if it supplies a URL as the value of the AHREF parameter, false if the HTML form must request images using a set of request parameters instead.

In TCustomDataSetAdapterImageField (see page 8120), ImplWebImageHREF returns a default image at design time. At runtime, this method generates an OnGetHREF (see page 8137) event, so that you can specify a URL in an event handler.

See Also

WebImageHREF (see page 8136)

OnGetHREF (see page 8137)

42.1.1.3.14 TCustomDataSetAdapterImageField.RenderAdapterImage Method

Writes the image described by an image request to the current response message.

Pascal

```
procedure RenderAdapterImage(ARequest: IImageRequest; AResponse: IImageResponse);
```

C++

```
__fastcall RenderAdapterImage(IImageRequest ARequest, IImageResponse AResponse);
```

Description

You should not need to use the RenderAdapterImage method. This method is used internally by the ImplHandleRequest (see page 8134) method to obtain the image that is the value of this field and write it to the current response message.

ARequest is an interface from which to read the name of the requested image.

AResponse is an interface for the current response object.

RenderAdapterImage generates an OnGetImage (see page 8137) event to allow an event handler to supply an image for writing to the response message. If there is no image supplied by an OnGetImage (see page 8137) event handler, RenderAdapterImage fetches the value of the associated graphic field. Finally, this method writes the content of the image to the current response message.

See Also

ImplHandleRequest (see page 8134)

OnGetImage (see page 8137)

TGraphicField (see page 7257)

42.1.1.3.15 TCustomDataSetAdapterImageField.WebImageHREF Method

Retrieves a URL for an external image file that contains the value of this field.

Pascal

```
function WebImageHREF(var AHREF: string): Boolean;
```

C++

```
__fastcall Boolean WebImageHREF(AnsiString AHREF);
```

Description

WebImageHREF is called when server-side script uses the Image.AsHREF property. WebImageHREF returns the value of the AsHREF property (a URL that identifies the image of this field) if it is available as a simple file reference. If, instead, the field generates images dynamically in response to requests, then WebImageHREF returns false and the information needed to generate the image is supplied instead by the GetAdapterItemRequestParams (see page 8130) method.

AHREF returns the URL that identifies the image of this field.

WebImageHREF returns true if it supplies a URL as the value of the AHREF parameter, false if the HTML form must request images using a set of request parameters instead.

WebImageHREF delegates the task of providing an URL to the ImplWebImageHREF (see page 8135) method. ImplWebImageHREF (see page 8135) then obtains the URL by generating an OnGetHREF (see page 8137) event.

See Also

ImplWebImageHREF (see page 8135)

OnGetHREF (see page 8137)

GetAdapterItemRequestParams (see page 8130)

IWebImageHREF (see page 19765)

42.1.1.4 TCustomDataSetAdapterImageField Events

The events of the TCustomDataSetAdapterImageField class are listed here.

Public Events

	Name	Description
	OnGetHREF (see page 8137)	Occurs when the WebSnap application needs the URL that clients use to request this field's image.
	OnGetImage (see page 8137)	Occurs when the WebSnap application receives a request for this field's image.

42.1.1.4.1 TCustomDataSetAdapterImageField.OnGetHREF Event

Occurs when the WebSnap application needs the URL that clients use to request this field's image.

Pascal

```
property OnGetHREF: TImageFieldGetHREFEvent;
```

C++

```
__property TImageFieldGetHREFEvent OnGetHREF;
```

Description

Write an OnGetHREF event handler to specify the URL that addresses this field's image. This event supplies the URL that is the value of the field's Image.AsHREF property in server-side script.

If you do not supply an URL using an OnGetHREF event handler, the dataset adapter image field constructs one automatically based on the request parameters for the image file.

See Also

OnGetImage (see page 8137)

42.1.1.4.2 TCustomDataSetAdapterImageField.OnGetImage Event

Occurs when the WebSnap application receives a request for this field's image.

Pascal

```
property OnGetImage: TImageDataSetFieldGetImageEvent;
```

C++

```
__property TImageDataSetFieldGetImageEvent OnGetImage;
```

Description

Write an OnGetImage event handler to supply the image that this adapter field returns in response to incoming request messages. This event occurs when a request arrives that is addressed to the URL that the OnGetHREF (see page 8137) event handler supplies. If you do not provide an OnGetImage event handler, this adapter field retrieves the image from its associated graphic field object.

OnGetHREF (see page 8137)

FindField (see page 7737)

ContentType (see page 15209)

42.1.2 TDataSetAdapterImageField Class

tdatasetadapterimagefield is the adapter field object that represents a graphic field from a database.

Class Hierarchy

Pascal

```
TDataSetAdapterImageField = class(TCustomDataSetAdapterImageField);
```

C++

```
class TDataSetAdapterImageField : public TCustomDataSetAdapterImageField;
```

File

DBAdaptImg

Description

Add tdatasetadapterimagefield as a child of a TDataSetAdapter component to represent a graphic field in the dataset associated with the dataset adapter. tdatasetadapterimagefield represents a single field from a database table, and enables server-side script to refer to or update that field's value.

tdatasetadapterimagefield supports several properties that can be used in server-side script. These include:

Image, which represents the value of the field as an image. You can specify a URL for this image using the Image.AsHREF property.

Value and DisplayText, both of which represent the value of the field as a text string.

DisplayLabel, which provides a text label that can be used to label HTML controls that represent the field.

Required, which indicates whether the graphic field requires a value.

Visible, which indicates whether HTML forms should include a control for this field.

TAdapterEditColumn (see page 25132)

42.1.2.1 TDataSetAdapterImageField Members

The following tables list the members exposed by TDataSetAdapterImageField.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	AsFormatted (see page 23931)	Returns text used to generate a representation of the adapter field value.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	CheckModifyAccess (see page 23931)	Checks end-user rights to modify the adapter field value.
	CheckOrigValue (see page 7736)	Ensures that the current value of this field is the same as the original value.
	CheckOrUpdateValue (see page 8128)	Checks whether a specified request contains a valid value and, if requested, uses that value to update the database.
	CheckValueChange (see page 7737)	Indicates whether the current value of this field is the same as the original value.
	CheckViewAccess (see page 23931)	Checks end-user rights to view the adapter field value.

	CreateRequestContext (see page 8129)	Creates an object that describes the adapter action parameters and adapter field values.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	FullyQualifyInputName (see page 7738)	Indicates whether references to this field in HTML forms must be qualified with the name of the parent adapter.
V	FullyQualifyInputName (see page 23932)	Indicates whether the HTML input names must be qualified with the name of the adapter.
	GetAdapter (see page 7738)	Returns the value of the Adapter (see page 7752) property.
	GetAdapter (see page 23932)	GetAdapter returns the parent adapter component.
	GetAdapterImage (see page 8130)	Returns an interface that can be used to access the Image property of this adapter field.
	GetAdapterItemRequestParams (see page 8130)	Provides a unique identifier and a set of name/value pairs that can be used to identify this field's image file.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetContainerList (see page 24727)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
	GetDataSet (see page 7738)	Returns the dataset associated with this field's parent adapter.
V	GetDataSetFieldValue (see page 7739)	Returns the value of the associated dataset field.
V	GetDataSetFieldValue (see page 8131)	Returns the value of the associated dataset field.
V	GetDefaultDisplayLabel (see page 23932)	Provides the default display label for this adapter field.
V	GetDefaultFieldName (see page 23932)	Gets the default name used to reference this adapter field with server-side script.
	GetDisplayLabel (see page 23933)	Returns the suggested display label for this adapter field.
	GetDisplayStyle (see page 7739)	Returns a string value that suggests an HTML display style for this adapter field.
V	GetDisplayStyleType (see page 7740)	Returns the HTML display style type for this adapter field.
V	GetDisplayStyleType (see page 8131)	Returns the HTML display style type for this adapter field.
	GetDisplayWidth (see page 23933)	Returns the suggested display width for this adapter field.
	GetEchoActionFieldValue (see page 23933)	Returns the value of the echo flag.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetInputName (see page 23934)	Identifies the name to use when generating an HTML input for this adapter field.
	GetInputStyle (see page 7741)	Returns a string value that suggests an HTML editing style for this adapter field.
V	GetInputStyleType (see page 7742)	Returns the style of the HTML control to use for editing this adapter field.
V	GetInputStyleType (see page 8132)	Returns the style of the HTML control to use for editing this adapter field.
	GetKeyName (see page 7742)	Returns the name of the associated dataset field if it appears in the index (key) that the parent dataset adapter uses.
	GetKeyParams (see page 7743)	Returns a list of fields that the parent dataset adapter uses to locate records, along with their current values in that adapter's dataset.
	GetMaxLength (see page 23934)	Returns the maximum length, in characters, that the user should be allowed to enter when entering a value for this adapter field.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetReadOnly (see page 7743)	Indicates whether the adapter field represents a read-only database field.
	GetRequired (see page 23934)	Indicates whether the end-user must enter a value for this adapter field.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetValue (see page 23935)	Gets the value of this adapter field as a Variant.
	GetVariableName (see page 23935)	Gets the name used to reference this adapter field with server-side script.
	GetViewMode (see page 7744)	Returns a string value that indicates what function a control that represents this field should perform.
V	GetViewModeType (see page 7744)	Returns the view mode for the function a control that represents this field should perform.

	GetVisible (see page 23935)	Indicates whether the value of this adapter field should be displayed to the end-user.
V	GetWebSnapObjClass (see page 23936)	Returns the class type for this adapter field.
	HandleRequest (see page 8132)	Handles incoming requests for the image value of this field.
	HasModifyAccess (see page 23936)	Checks the end-user's right to modify this adapter field.
	HasViewAccess (see page 23936)	Checks the end-user's right to view this adapter field.
V	ImplAsFormatted (see page 7745)	Provides the underlying implementation for the AsFormatted method.
V	ImplAsFormatted (see page 23937)	Returns text used to generate a representation of the adapter field value.
V	ImplCheckOrigValue (see page 7745)	Provides the underlying implementation for the CheckOrigValue (see page 7736) method.
V	ImplCheckValueChange (see page 7746)	Provides the underlying implementation for the CheckValueChange (see page 7737) method.
V	ImplCheckValueChange (see page 8133)	Provides the underlying implementation for the CheckValueChange method.
	ImplCreateRequestContext (see page 8134)	Provides the underlying implementation for the CreateRequestContext (see page 8129) method.
V	ImplGetDisplayLabel (see page 7747)	Provides the underlying implementation for the GetDisplayLabel method.
V	ImplGetDisplayLabel (see page 23937)	Returns the suggested display label for this adapter field.
V	ImplGetDisplayWidth (see page 7747)	Provides the underlying implementation for the GetDisplayWidth method.
V	ImplGetDisplayWidth (see page 23937)	Returns the suggested display width for this adapter field.
V	ImplGetEchoActionFieldValue (see page 23938)	Returns the value of the echo flag.
V	ImplGetInputName (see page 23938)	Identifies the name to use when generating the HTML input for this adapter field.
V	ImplGetMaxLength (see page 23938)	Returns the maximum length, in characters, that the user should be allowed to enter when entering a value for this adapter field.
V	ImplGetRequired (see page 7747)	Provides the underlying implementation for the GetRequired method.
V	ImplGetRequired (see page 23939)	Indicates whether the end-user must enter a value for this adapter field.
V	ImplGetValue (see page 7748)	Provides the underlying implementation for the GetValue method.
V	ImplGetValue (see page 23939)	Gets the value of this adapter field as a Variant.
V	ImplGetVariableName (see page 23939)	Gets the name used to reference this adapter field with server-side script.
V	ImplGetVisible (see page 7748)	Provides the underlying implementation for the GetVisible method.
V	ImplGetVisible (see page 23940)	Indicates whether the value of this adapter field should be displayed to the end-user.
V	ImplHandleRequest (see page 8134)	Provides the underlying implementation for the HandleRequest (see page 8132) method.
V	ImplHasModifyAccess (see page 23940)	Checks the end-user's right to modify this adapter field.
V	ImplHasViewAccess (see page 23940)	Checks the end-user's right to view this adapter field.
V	ImplSetEchoActionFieldValue (see page 23941)	Sets the echo flag for this adapter field.
V	ImplSetFieldName (see page 7749)	Provides the underlying implementation for the SetFieldName method.
V	ImplSetFieldName (see page 23941)	Sets the name that is used to reference this adapter field with server-side script.
V	ImplUpdateValue (see page 7749)	Provides the underlying implementation for the UpdateValue (see page 7751) method.
V	ImplUpdateValue (see page 8135)	Provides the underlying implementation for the UpdateValue method.
V	ImplWebImageHREF (see page 8135)	Provides the underlying implementation for the WebImageHREF (see page 8136) method.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	IsDefaultField (see page 24728)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	Notification (see page 7750)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	ParentChanged (see page 23941)	Handles movement of the component to a different parent.
V	ParentChanged (see page 24728)	Responds when the WebParent (see page 24731) property changes.
	PrepareDataSet (see page 7750)	Responds when the parent dataset adapter prepares its dataset.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 24729)	Reads the component's published properties, stored data, and owned components from a reader object.

	RenderAdapterImage (see page 8136)	Writes the image described by an image request to the current response message.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDataSetField (see page 7751)	Sets the value of the DataSetField (see page 7752) property.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetEchoActionFieldValue (see page 23942)	Sets the echo flag for this adapter field.
	SetFieldName (see page 23942)	Sets the name that is used to reference this adapter field with server-side script.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 24729)	Sets the WebParent (see page 24731) property to be the same as this component's parent.
	SetWebParent (see page 24730)	Sets the value of the WebParent (see page 24731) property.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	UpdateValue (see page 7751)	Updates the adapter field when the user assigns a new value.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WebImageHREF (see page 8136)	Retrieves a URL for an external image file that contains the value of this field.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	Adapter (see page 7752)	Indicates the dataset adapter that uses this object to represent one of its fields.
R	Adapter (see page 23943)	Returns the parent adapter component.
R	WebContainedComponentHelper (see page 24730)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.
R	WebParent (see page 24731)	Indicates the component that uses this TWebContainedComponent (see page 24722) as one of its Web items.

Public Events

	Name	Description
	OnGetDisplayText (see page 7754)	Occurs when the adapter field needs to supply its formatted value as a string that can appear in HTML forms.
	OnGetValue (see page 7754)	Occurs when the adapter field needs to supply its value as a Variant.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	AsFormatted (see page 19682)	This is AsFormatted, a member of class IAsFormatted.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	CheckValueChange (see page 24570)	This is CheckValueChange, a member of class ICheckValueChange.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.

	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
V	Create (see page 7735)	Creates and initializes an instance of TBaseDataSetAdapterField (see page 7729).
V	Create (see page 8127)	Creates and initializes an instance of TCustomDataSetAdapterImageField (see page 8120).
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	Create (see page 24726)	Creates and initializes an instance of TWebContainedComponent (see page 24722).
	CreateRequestContext (see page 19681)	Creates an object that describes the adapter action parameters and adapter field values.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Destroy (see page 24726)	Frees an instance of TWebContainedComponent (see page 24722).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FindField (see page 7737)	Returns the dataset field whose value this adapter field represents.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetAdapterImage (see page 19691)	This is GetAdapterImage, a member of class IGetAdapterImage.
	GetAdapterItemRequestParams (see page 19692)	This is GetAdapterItemRequestParams, a member of class IGetAdapterItemRequestParams.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.
	GetDisplayLabel (see page 19756)	This is GetDisplayLabel, a member of class IWebGetDisplayLabel.
	GetDisplayStyle (see page 19700)	Returns the preferred display style for an adapter field or adapter action.
	GetDisplayWidth (see page 19757)	This is GetDisplayWidth, a member of class IWebGetDisplayWidth.
	GetEchoActionFieldValue (see page 24573)	This is GetEchoActionFieldValue, a member of class IEchoActionFieldValue.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetFieldName (see page 19758)	This is GetFieldName, a member of class IWebGetFieldName.
	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	GetInputName (see page 19767)	This is GetInputName, a member of class IWebInputName.
	GetInputStyle (see page 19700)	Returns the preferred editing style for an adapter field.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetKeyName (see page 8105)	This is GetKeyName, a member of class IGetDataSetKeyName.
	GetMaxLength (see page 19763)	This is GetMaxLength, a member of class IWebGetMaxLength.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.

	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 24727)	Returns the object that uses this component to generate HTML.
	GetRequired (see page 19668)	This is GetRequired, a member of class IAdapterFieldAttributes.
	GetValue (see page 19759)	This is GetValue, a member of class IWebGetFieldValue.
	GetVariableName (see page 15329)	This is GetVariableName, a member of class IWebVariableName.
	GetViewMode (see page 19701)	Returns the preferred mode of an adapter field.
	GetVisible (see page 19668)	This is GetVisible, a member of class IAdapterFieldAttributes.
	HandleRequest (see page 19681)	Executes the adapter action and generates a response.
	HasModifyAccess (see page 19667)	This is HasModifyAccess, a member of class IAdapterFieldAccess.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 24727)	Indicates whether this component appears in another component's list of Web items.
	HasViewAccess (see page 19667)	This is HasViewAccess, a member of class IAdapterFieldAccess.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	PrepareDataSet (see page 8109)	This is PrepareDataSet, a member of class IPrepareDataSet.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.
	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.
	SetEchoActionFieldValue (see page 24573)	This is SetEchoActionFieldValue, a member of class IEchoActionFieldValue.
	SetFieldName (see page 19784)	This is SetFieldName, a member of class IWebSetFieldName.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	UpdateValue (see page 24584)	This is UpdateValue, a member of class IUpdateValue.
	WebImageHREF (see page 19766)	Retrieves a URL for an external image file.

Public Properties

	Name	Description
R	ActionOrigValue (see page 23943)	Retrieve the original value of this adapter field.
R	ActionValue (see page 23943)	Retrieve the value for this adapter field entered by the end-user.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.

	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	EchoActionFieldValue (see page 24574)	This is EchoActionFieldValue, a member of class IEchoActionFieldValue.
	EchoActionFieldValue (see page 23944)	Used to echo the value(s) entered by the end-user when generating an HTML form.
	FieldFlags (see page 7752)	Indicates various attributes of the adapter field.
R	FieldName (see page 19758)	This is FieldName, a member of class IWebGetFieldName.
	FieldName (see page 23944)	Identifies the name of this field when using server-side script.
	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.
R	InputName (see page 19767)	This is InputName, a member of class IWebInputName.
R	KeyName (see page 8105)	This is KeyName, a member of class IGetDataSetKeyName.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
R	Required (see page 19669)	This is Required, a member of class IAdapterFieldAttributes.
R	Value (see page 19760)	This is Value, a member of class IWebGetFieldValue.
R	Value (see page 23945)	Provides the value of an adapter field as a variant.
R	VariableName (see page 15329)	This is VariableName, a member of class IWebVariableName.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
R	Visible (see page 19669)	This is Visible, a member of class IAdapterFieldAttributes.

Published Events

	Name	Description
	OnGetHREF (see page 8147)	Occurs when the WebSnap application needs the URL that clients use to request this field's image.
	OnGetImage (see page 8148)	Occurs when the WebSnap application receives a request for this field's image.

Published Properties

	Name	Description
	DataSetField (see page 8145)	Specifies the name of the dataset field that this adapter field represents.
	FieldModes (see page 8146)	Indicates what dataset adapter modes this field supports.
	ModifyAccess (see page 8146)	Identifies the rights required to update this field.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.
	ViewAccess (see page 8147)	Identifies the rights required to view this field.

42.1.2.2 TDataSetAdapterImageField Properties

The properties of the TDataSetAdapterImageField class are listed here.

Published Properties

	Name	Description
	DataSetField (see page 8145)	Specifies the name of the dataset field that this adapter field represents.
	FieldModes (see page 8146)	Indicates what dataset adapter modes this field supports.
	ModifyAccess (see page 8146)	Identifies the rights required to update this field.
	ViewAccess (see page 8147)	Identifies the rights required to view this field.

42.1.2.2.1 TDataSetAdapterImageField.DataSetField Property

Specifies the name of the dataset field that this adapter field represents.

Pascal

```
property DataSetField: string;
```

C++

```
__property AnsiString DataSetField;
```

Description

DataSetField is the FieldName of the TField object whose value this adapter field represents. DataSetField can be the name of a simple field in a database table, the name of a subfield of an object field that has been qualified by the parent field's name, or the name of an aggregated field.

DataSetField is the same as the name of this adapter field in server-side script, except that the name of the adapter field omits any illegal characters (the only legal characters are the letters between a and z (or A and Z), digits, and the underline character).

If DataSetField is an empty string, this adapter field does not have a value, and the FindField method returns nil (Delphi) or NULL (C++).

See Also

FieldName (see page 7164)

FindField (see page 7737)

42.1.2.2.2 TDataSetAdapterImageField.FieldModes Property

Indicates what dataset adapter modes this field supports.

Pascal

```
property FieldModes: TDataSetAdapterModes;
```

C++

```
__property TDataSetAdapterModes FieldModes;
```

Description

FieldModes is a set of all the modes in which this adapter field can be used. If the parent dataset adapter is in a mode that is not included in this set, any forms generated using that adapter do not include a control to represent this field. Thus, for example, to make a field read-only, you can exclude amInsert and amEdit from FieldModes. Then, the field appears when the user is viewing or querying the dataset, but not when the user is editing or inserting a record.

See Also

CanModify (see page 7154)

Adapter (see page 7752)

Mode (see page 7810)

GetDisplayStyle (see page 7739)

GetInputStyle (see page 7741)

GetViewMode (see page 7744)

42.1.2.2.3 TDataSetAdapterImageField.ModifyAccess Property

Identifies the rights required to update this field.

Pascal

```
property ModifyAccess: string;
```

C++

```
__property AnsiString ModifyAccess;
```

Description

The ModifyAccess property defines the access rights required to modify this field. When server-side script accesses the CanModify property, this value is checked against the end user's rights. Typically, an exception is raised when an end-user attempts to updates an adapter field that does not allow access.

See Also

TWebUserList (see page 25625)

hasmodifyaccess (see page 24162)

42.1.2.2.4 TDataSetAdapterImageField.ViewAccess Property

Identifies the rights required to view this field.

Pascal

```
property ViewAccess: string;
```

C++

```
__property AnsiString ViewAccess;
```

Description

The ViewAccess property identifies the access rights required to view this field. When server-side script accesses the CanView property, this value is checked against the end user's rights. Typically, an exception is raised when an end-user attempts to view an adapter field that does not allow access.

See Also

TWebUserList (see page 25625)

HasViewAccess (see page 24162)

42.1.2.3 TDataSetAdapterImageField Events

The events of the TDataSetAdapterImageField class are listed here.

Published Events

	Name	Description
	OnGetHREF (see page 8147)	Occurs when the WebSnap application needs the URL that clients use to request this field's image.
	OnGetImage (see page 8148)	Occurs when the WebSnap application receives a request for this field's image.

42.1.2.3.1 TDataSetAdapterImageField.OnGetHREF Event

Occurs when the WebSnap application needs the URL that clients use to request this field's image.

Pascal

```
property OnGetHREF: TImageFieldGetHREFEvent;
```

C++

```
__property TImageFieldGetHREFEvent OnGetHREF;
```

Description

Write an OnGetHREF event handler to specify the URL that addresses this field's image. This event supplies the URL that is the value of the field's Image.AsHREF property in server-side script.

If you do not supply an URL using an OnGetHREF event handler, the dataset adapter image field constructs one automatically based on the request parameters for the image file.

See Also

OnGetImage (see page 8137)

42.1.2.3.2 TDataSetAdapterImageField.OnGetImage Event

Occurs when the WebSnap application receives a request for this field's image.

Pascal

```
property OnGetImage: TImageDataSetFieldGetImageEvent;
```

C++

```
__property TImageDataSetFieldGetImageEvent OnGetImage;
```

Description

Write an OnGetImage event handler to supply the image that this adapter field returns in response to incoming request messages. This event occurs when a request arrives that is addressed to the URL that the OnGetHREF event handler supplies. If you do not provide an OnGetImage event handler, this adapter field retrieves the image from its associated graphic field object.

OnGetHREF (see page 8137)

FindField (see page 7737)

ContentType (see page 15209)

42.2 Types

The following table lists types in this documentation.

Types

Name	Description
TImageDataSetFieldGetImageEvent (see page 8149)	This is type DBAdaptImg.TImageDataSetFieldGetImageEvent.

42.2.1 DBAdaptImg.TImageDataSetFieldGetImageEvent Type

Pascal

```
TImageDataSetFieldGetImageEvent = procedure (Sender: TObject; var MimeType: string; var Image:
TStream; var Owned: Boolean) of object;
```

C++

```
(Sender: TObject; var MimeType: string; var Image: TStream; var Owned: Boolean) (
TImageDataSetFieldGetImageEvent)();
```

File

DBAdaptImg

Description

This is type DBAdaptImg.TImageDataSetFieldGetImageEvent.

43 DBBdeWeb Namespace

This is namespace DBBdeWeb.

Topics

Name	Description
Classes (see page 8152)	The following table lists classes in this documentation.

Classes

	Name	Description
	TQueryTableProducer (see page 8152)	TQueryTableProducer assembles a sequence of HTML commands to display the result set of a query in a tabular format.

43.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TQueryTableProducer (see page 8152)	TQueryTableProducer assembles a sequence of HTML commands to display the result set of a query in a tabular format.

43.1.1 TQueryTableProducer Class

TQueryTableProducer assembles a sequence of HTML commands to display the result set of a query in a tabular format.

Class Hierarchy

Pascal

```
TQueryTableProducer = class(TDSTableProducer);
```

C++

```
class TQueryTableProducer : public TDSTableProducer;
```

File

DBBdeWeb

Description

Use TQueryTableProducer to produce an HTML table for the records of a parameterized query. The TQuery object obtains its parameters from an HTTP request message. If the request is a GET message, the parameters for the query are the QueryFields property of the request object. If the request is a POST message, the parameters for the query are the ContentFields property of the request object.

To produce an HTML table for a query that has no parameters, use the TDataSetTableProducer object instead.

Note: See the WebServ demo for an example of how to use TQueryTableProducer.

The Web Module

Using TQueryTableProducer

43.1.1.1 TQueryTableProducer Members

The following tables list the members exposed by TQueryTableProducer.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	AcquireLayoutLock (see page 10296)	Calls BeginLayout (see page 10297) when the HTML table is not currently being laid out.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	BeginLayout (see page 10297)	Increments a counter that indicates the number of times the computation of the column order was begun but not completed.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	ColumnHeader (see page 10298)	Returns the string of HTML <TH> tags that define the column headers for the table.
	DefineFieldMap (see page 10298)	Builds the Fields array in DataLink (see page 10309).
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	DoCreateContent (see page 10299)	This is DoCreateContent, a member of class TDSTableProducer.
	DoFormatCell (see page 10299)	Generates an OnFormatCell (see page 10314) event.
	DoGetCaption (see page 10300)	Generates an OnGetCaption event.
	EndLayout (see page 10300)	Decrements a counter that indicates the number of times the computation of the column order has been begun but not completed.
	FormatCell (see page 10301)	Returns an HTML tag of a specified type that reflects a set of specified options.
	GetAppDispatcher (see page 15108)	This is GetAppDispatcher, a member of class TCustomContentProducer.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetDataSet (see page 8158)	Provides the abstract prototype of a method to access the DataSet property.
	GetDataSource (see page 10302)	Returns the value of the DataSource (see page 10309) property.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	LayoutChanged (see page 10303)	Causes the Columns (see page 10308) property to be recomputed when the dataset changes or changes are made to individual column objects.

	LinkActive (see page 10303)	Recomputes the Columns (see page 10308) property when the dataset becomes active.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 8158)	Adjusts the properties of TDSTableProducer when its helper objects are destroyed.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	ProduceContent (see page 15108)	Returns the content that the producer creates.
	ProduceContentFromStream (see page 15109)	This is ProduceContentFromStream, a member of class TCustomContentProducer.
	ProduceContentFromString (see page 15109)	This is ProduceContentFromString, a member of class TCustomContentProducer.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	RowHeader (see page 10304)	Returns the HTML <TR> tag that defines each row of the HTML table.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetAppDispatcher (see page 15109)	This is SetAppDispatcher, a member of class TCustomContentProducer.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetColumns (see page 10304)	Sets the Columns (see page 10308) property.
V	SetDataSet (see page 8158)	Provides the abstract prototype of a method to set the DataSet property.
	SetDataSource (see page 10305)	Sets the DataSource (see page 10309) property.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	StoreColumns (see page 10305)	Indicates whether the Columns (see page 10308) property is stored when the TDSTableProducer (see page 10290) is saved.
	TableCaption (see page 10306)	Returns the HTML <Caption (see page 10307)> tag that defines the caption for the HTML table.
	TableHeader (see page 10306)	Returns the HTML <Table> tag for the HTML table.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	DataLink (see page 10309)	Manages the link to the dataset.
	DataSource (see page 10309)	Represents the link to the DataSet (see page 10309) of the TDSTableProducer (see page 10290).
R	InternalDataSource (see page 10311)	Represents the link to the dataset.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.

	BeginUpdate (see page 10297)	Increments a counter that indicates the number of changes to the contents of the HTML table that have been initiated but not completed.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Content (see page 8157)	Returns the HTML representation of the query results.
V	ContentFromStream (see page 15107)	Returns the content produced in response to input read from a stream.
V	ContentFromString (see page 15107)	Returns the content produced in response to an input string.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
V	Create (see page 10295)	Creates an instance of TDSTableProducer (see page 10290).
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 10295)	Destroys an instance of TDSTableProducer (see page 10290).
V	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	EndUpdate (see page 10301)	Decrements a counter that indicates the number of changes to the contents of the HTML table.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetAppDispatcher (see page 15220)	This is GetAppDispatcher, a member of class IGetAppDispatcher.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.

	ProduceContent (see page 15224)	Returns the content that the producer creates.
	ProduceContentFromStream (see page 15225)	This is ProduceContentFromStream, a member of class IProduceContentFrom.
	ProduceContentFromString (see page 15226)	This is ProduceContentFromString, a member of class IProduceContentFrom.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetAppDispatcher (see page 15227)	This is SetAppDispatcher, a member of class ISetAppDispatcher.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DataSet (see page 10309)	Specifies the dataset from which the data in the HTML table is taken.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	Dispatcher (see page 15109)	Provides access to the dispatcher for the Web server application that includes the TCustomContentProducer (see page 15102) object.
R	DispatcherComponent (see page 15110)	Provides access to the dispatcher component.
	Editor (see page 10310)	Writes changes made in the property editor at design time to the TDSTableProducer (see page 10290) object.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Events

	Name	Description
	OnCreateContent (see page 8164)	Occurs in descendants of TDSTableProducer when the Content method needs to generate the HTML table image.
	OnFormatCell (see page 8164)	Occurs when the HTML for a specified cell specified is about to be generated.
	OnGetTableCaption (see page 8165)	Occurs when the HTML table producer is about to generate the HTML for the table caption.

Published Properties

	Name	Description
	Caption (see page 8159)	Specifies the caption string that appears with the HTML table.
	CaptionAlignment (see page 8159)	Specifies where the Caption string should appear relative to the HTML table.
	Columns (see page 8160)	Describes the field bindings and display attributes of the columns in the HTML table.
	Footer (see page 8160)	Specifies a set of HTML commands that appear in the HTML document following the HTML table.
	Header (see page 8161)	Specifies a set of HTML commands that appear in the HTML document preceding the HTML table.
	MaxRows (see page 8161)	Specifies the maximum number of rows that appear in the HTML table.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Query (see page 8162)	Specifies the TQuery object that TQueryTableProducer (see page 8152) runs to obtain its data.

	RowAttributes (see page 8162)	Specifies the display attributes of all the rows in the HTML table.
	TableAttributes (see page 8163)	Specifies the display attributes that pertain to the entire HTML table produced by TDSTableProducer.
	Tag (see page 2808)	Stores an integer value as part of a component.

43.1.1.2 TQueryTableProducer Methods

The methods of the TQueryTableProducer class are listed here.

Protected Methods

	Name	Description
	GetDataSet (see page 8158)	Provides the abstract prototype of a method to access the DataSet property.
	Notification (see page 8158)	Adjusts the properties of TDSTableProducer when its helper objects are destroyed.
	SetDataSet (see page 8158)	Provides the abstract prototype of a method to set the DataSet property.

Public Methods

	Name	Description
	Content (see page 8157)	Returns the HTML representation of the query results.

43.1.1.2.1 TQueryTableProducer.Content Method

Returns the HTML representation of the query results.

Pascal

```
function Content: string; override;
```

C++

```
virtual __fastcall AnsiString Content();
```

Description

Call Content to run the query with the parameters taken from the HTTP request message and retrieve the resulting HTML representation. If the MethodType of the request is mtGet, the parameters for the query are the QueryFields property of the request. If the MethodType of the request is mtPost, the parameters for the query are the ContentFields property of the request.

After running the query, Content calls the OnCreateContent (see page 8164) event handler. If the OnCreateContent (see page 8164) event handler indicates that the Content method should continue, Content returns the Header (see page 8161) property, followed by an HTML table image of the records in the query, followed by the Footer (see page 8160) property. If the OnCreateContent (see page 8164) event handler indicates that the Content method should not continue, Content returns an empty string.

The string returned by Content can be used as the Content property of the response object associated with the request message.

See Also

Footer (see page 10310)

Header (see page 10311)

OnCreateContent (see page 10313)

ContentFields (see page 15177)

MethodType

QueryFields (see page 15187)

Content (see page 15207)

Using TQueryTableProducer

43.1.1.2.2 TQueryTableProducer.GetDataSet Method

Provides the abstract prototype of a method to access the DataSet property.

Pascal

```
function GetDataSet: TDataSet; override;
```

C++

```
virtual __fastcall TDataSet GetDataSet();
```

Description

Descendants of TDSTableProducer implement the GetDataSet method to access their specific implementation of the DataSet property. Descendants of TDSTableProducer restrict the DataSet property to different classes of TDataSet objects.

See Also

DataSet (see page 10309)

SetDataSet (see page 10305)

43.1.1.2.3 TQueryTableProducer.Notification Method

Adjusts the properties of TDSTableProducer when its helper objects are destroyed.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

Notification overrides the inherited method to respond to messages that the DataSource or one of its field objects is about to be destroyed. Notification sets the DataSource property to nil (Delphi) or NULL (C++), or unbinds the column that references the field component.

See Also

DataSource (see page 10309)

Columns (see page 10308)

43.1.1.2.4 TQueryTableProducer.SetDataSet Method

Provides the abstract prototype of a method to set the DataSet property.

Pascal

```
procedure SetDataSet(ADataSet: TDataSet); override;
```

C++

```
virtual __fastcall SetDataSet(TDataSet ADataSet);
```

Description

Descendants of TDSTableProducer override SetDataSet to ensure that the DataSet property can only be set to an appropriate descendant of TDataSet.

See Also

DataSet (see page 10309)

GetDataSet (see page 10302)

43.1.1.3 TQueryTableProducer Properties

The properties of the TQueryTableProducer class are listed here.

Published Properties

	Name	Description
	Caption (see page 8159)	Specifies the caption string that appears with the HTML table.
	CaptionAlignment (see page 8159)	Specifies where the Caption string should appear relative to the HTML table.
	Columns (see page 8160)	Describes the field bindings and display attributes of the columns in the HTML table.
	Footer (see page 8160)	Specifies a set of HTML commands that appear in the HTML document following the HTML table.
	Header (see page 8161)	Specifies a set of HTML commands that appear in the HTML document preceding the HTML table.
	MaxRows (see page 8161)	Specifies the maximum number of rows that appear in the HTML table.
	Query (see page 8162)	Specifies the TQuery object that TQueryTableProducer (see page 8152) runs to obtain its data.
	RowAttributes (see page 8162)	Specifies the display attributes of all the rows in the HTML table.
	TableAttributes (see page 8163)	Specifies the display attributes that pertain to the entire HTML table produced by TDSTableProducer.

43.1.1.3.1 TQueryTableProducer.Caption Property

Specifies the caption string that appears with the HTML table.

Pascal

```
property Caption: string;
```

C++

```
__property AnsiString Caption;
```

Description

Set Caption to add a caption to the HTML table that represents the dataset. Caption indicates the text that should appear inside the HTML CAPTION tag.

See Also

CaptionAlignment (see page 10308)

OnGetTableCaption (see page 10314)

Embedding Tables in HTML Documents

43.1.1.3.2 TQueryTableProducer.CaptionAlignment Property

Specifies where the Caption string should appear relative to the HTML table.

Pascal

```
property CaptionAlignment: THTMLCaptionAlignment;
```

C++

```
__property THTMLCaptionAlignment CaptionAlignment;
```

Description

Set CaptionAlignment to specify whether the Caption should appear above or below the HTML table.

CaptionAlignment is the value of the ALIGN option on the HTML CAPTION tag.

See Also

Caption (see page 10307)

Embedding Tables in HTML Documents

43.1.1.3.3 TQueryTableProducer.Columns Property

Describes the field bindings and display attributes of the columns in the HTML table.

Pascal

```
property Columns: THTMLTableColumns;
```

C++

```
__property THTMLTableColumns Columns;
```

Description

Use Columns to read or set the field bindings and display attributes of the columns in the HTML table. Each THTMLTableColumn object specifies the display attributes of the corresponding column. Each column object also specifies the name of the field the column represents. The field binding of a column designates a field within the dataset specified by the DataSet property.

Columns can be set at design time through a property editor, or programmatically at runtime.

See Also

DataSet (see page 10309)

DefineFieldMap (see page 10298)

Editor (see page 10310)

RowAttributes (see page 10312)

SetColumns (see page 10304)

StoreColumns (see page 10305)

TableAttributes (see page 10313)

THTMLTableColumn (see page 10318)

THTMLTableColumns (see page 10327)

Specifying the Columns

43.1.1.3.4 TQueryTableProducer.Footer Property

Specifies a set of HTML commands that appear in the HTML document following the HTML table.

Pascal

```
property Footer: TStrings;
```

C++

```
__property TStrings Footer;
```

Description

Set Footer to embed the representation of DataSet in a larger document. The Content method of TDSTableProducer descendants returns any Header commands, followed by the HTML table that represents the DataSet, followed by any Footer commands.

See Also

Content (see page 10282)

Content (see page 10847)

Content (see page 8157)

DataSet (see page 10309)

Header (see page 10311)

Embedding Tables in HTML Documents

43.1.1.3.5 TQueryTableProducer.Header Property

Specifies a set of HTML commands that appear in the HTML document preceding the HTML table.

Pascal

```
property Header: TStrings;
```

C++

```
__property TStrings Header;
```

Description

Set Header to embed the representation of DataSet in a larger document. The Content method of TDSTableProducer descendants returns any Header commands, followed by the HTML table that represents the DataSet, followed by any Footer commands.

See Also

Content (see page 10282)

Content (see page 10847)

Content (see page 8157)

DataSet (see page 10309)

Footer (see page 10310)

Embedding Tables in HTML Documents

43.1.1.3.6 TQueryTableProducer.MaxRows Property

Specifies the maximum number of rows that appear in the HTML table.

Pascal

```
property MaxRows: Integer;
```

C++

```
__property int MaxRows;
```

Description

Set MaxRows to change the upper limit on the size of the HTML table produced to represent the DataSet. MaxRows is initialized to 20.

If DataSet contains more than MaxRows records, only the first MaxRows records appear in the HTML commands produced by Content. If DataSet contains fewer than MaxRows records, the HTML table produced by TDSTableProducer will contain only enough rows to display all the records in DataSet.

See Also

Content (see page 10282)

Content (see page 10847)

Content (see page 8157)

DataSet (see page 10309)

Specifying the Row Attributes

43.1.1.3.7 TQueryTableProducer.Query Property

Specifies the TQuery object that TQueryTableProducer (see page 8152) runs to obtain its data.

Pascal

```
property Query: TQuery;
```

C++

```
__property TQuery Query;
```

Description

Set Query to specify the query to run to obtain the data for the HTML table. Use Query to set the query for the TQueryTableProducer (see page 8152) rather than the DataSource property: TQueryTableProducer (see page 8152) generates its data source internally.

The individual field bindings specified by the THTMLTableColumn objects in the Columns (see page 8160) property refer to fields in DataSet.

Note: Query is identical to the DataSet property, except Query does not use the TDataSet base class of the query object.

See Also

Columns (see page 10308)

DataSet (see page 10309)

DataSource (see page 10309)

FieldName (see page 10326)

Using TQueryTableProducer

43.1.1.3.8 TQueryTableProducer.RowAttributes Property

Specifies the display attributes of all the rows in the HTML table.

Pascal

```
property RowAttributes: THTMLTableRowAttributes;
```

C++

```
__property THTMLTableRowAttributes RowAttributes;
```

Description

Set RowAttributes to a THTMLTableRowAttributes object that describes the display attributes of the rows in the HTML table. Setting RowAttributes calls the Assign method of the THTMLTableRowAttributes object stored internally by TDSTableProducer. Thus, the memory for any row attributes object assigned to the RowAttributes property is never owned or freed by TDSTableProducer.

Note: Not all the properties of the row attributes object are copied when one row attributes object is assigned to another. To ensure that all the attributes represented by RowAttributes are set appropriately, read RowAttributes and set the individual properties of the THTMLTableRowAttributes object.

See Also

TableAttributes (see page 10313)

Title (see page 10327)

AssignTo (see page 15297)

Specifying the Row Attributes

43.1.1.3.9 TQueryTableProducer.TableAttributes Property

Specifies the display attributes that pertain to the entire HTML table produced by TDSTableProducer.

Pascal

```
property TableAttributes: THTMLTableAttributes;
```

C++

```
__property THTMLTableAttributes TableAttributes;
```

Description

Set TableAttributes to a THTMLTableAttributes object that describes the display attributes for the HTML TABLE tag. Setting TableAttributes calls the Assign method of the THTMLTableAttributes object stored internally by TDSTableProducer. Thus, the memory for any table attributes object assigned to the TableAttributes property is never owned or freed by TDSTableProducer.

Note: Not all the properties of the table attributes object are copied when one table attributes object is assigned to another. To ensure that all the attributes represented by TableAttributes are set appropriately, read TableAttributes and set the individual properties of the THTMLTableAttributes object.

See Also

RowAttributes (see page 10312)

AssignTo (see page 15291)

Title (see page 10327)

Specifying the Table Attributes

43.1.1.4 TQueryTableProducer Events

The events of the TQueryTableProducer class are listed here.

Published Events

	Name	Description
	OnCreateContent (see page 8164)	Occurs in descendants of TDSTableProducer when the Content method needs to generate the HTML table image.
	OnFormatCell (see page 8164)	Occurs when the HTML for a specified cell specified is about to be generated.
	OnGetTableCaption (see page 8165)	Occurs when the HTML table producer is about to generate the HTML for the table caption.

43.1.1.4.1 TQueryTableProducer.OnCreateContent Event

Occurs in descendants of TDSTableProducer when the Content method needs to generate the HTML table image.

Pascal

```
property OnCreateContent: TCreateContentEvent;
```

C++

```
__property TCreateContentEvent OnCreateContent;
```

Description

Write an OnCreateContent event handler to conditionally prevent the Content method from producing any HTML commands. Set the Continue parameter to false to make Content return an empty string.

See Also

Content (see page 10282)

Content (see page 10847)

Content (see page 8157)

docreatecontent (see page 10299)

43.1.1.4.2 TQueryTableProducer.OnFormatCell Event

Occurs when the HTML for a specified cell specified is about to be generated.

Pascal

```
property OnFormatCell: THTMLFormatCellEvent;
```

C++

```
__property THTMLFormatCellEvent OnFormatCell;
```

Description

Write an OnFormatCell event handler to change the appearance or contents of individual cells in the HTML table from the default values produced by TDSTableProducer.

See Also

Columns (see page 10308)

Content (see page 10282)

Content (see page 10847)

Content (see page 8157)

DoFormatCell (see page 10299)

DisplayText (see page 7162)

Align (see page 10324)

BgColor (see page 10325)

Custom (see page 10325)

VAlign (see page 10327)

43.1.1.4.3 TQueryTableProducer.OnGetTableCaption Event

Occurs when the HTML table producer is about to generate the HTML for the table caption.

Pascal

```
property OnGetTableCaption: THTMLGetTableCaptionEvent;
```

C++

```
__property THTMLGetTableCaptionEvent OnGetTableCaption;
```

Description

Write an OnGetTableCaption event handler to change the value or placement of the HTML table caption. The Caption and Alignment parameters are originally set to the values of the Caption and CaptionAlignment properties, respectively. The OnGetTableCaption event handler can change these values to alter the caption for the HTML table returned by the Content method.

See Also

Caption (see page 10307)

CaptionAlignment (see page 10308)

Content (see page 15106)

DoGetCaption (see page 10300)

44 DBCGrids Namespace

This is namespace DBCGrids.

Topics

Name	Description
Classes (see page 8168)	The following table lists classes in this documentation.
Structs, Records, Enums (see page 8257)	The following table lists structs, records, enums in this documentation.
Types (see page 8259)	The following table lists types in this documentation.

Classes

	Name	Description
	TDBCtrlGrid (see page 8168)	TDBCtrlGrid displays records from a data source in a free-form layout.
	TDBCtrlGridLink (see page 8240)	TDBCtrlGridLink helps manage data events for a TDBCtrlGrid (see page 8168) object.
	TDBCtrlPanel (see page 8244)	TDBCtrlPanel represents a panel in a TDBCtrlGrid (see page 8168) object.

Structs, Records, Enums

	Name	Description
	TDBCtrlGridBorder (see page 8257)	This is record DBCGrids.TDBCtrlGridBorder.
	TDBCtrlGridKey (see page 8257)	This is record DBCGrids.TDBCtrlGridKey.
	TDBCtrlGridOrientation (see page 8258)	This is record DBCGrids.TDBCtrlGridOrientation.

Types

Name	Description
TPaintPanelEvent (see page 8259)	This is type DBCGrids.TPaintPanelEvent.

44.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TDBCtrlGrid (see page 8168)	TDBCtrlGrid displays records from a data source in a free-form layout.
	TDBCtrlGridLink (see page 8240)	TDBCtrlGridLink helps manage data events for a TDBCtrlGrid (see page 8168) object.
	TDBCtrlPanel (see page 8244)	TDBCtrlPanel represents a panel in a TDBCtrlGrid (see page 8168) object.

44.1.1 TDBCtrlGrid Class

TDBCtrlGrid displays records from a data source in a free-form layout.

Class Hierarchy

Pascal

```
TDBCtrlGrid = class(TWinControl);
```

C++

```
class TDBCtrlGrid : public TWinControl;
```

File

dbcgrids

Description

Put a TDBCtrlGrid object on a form to display and edit the records from a database table or query. Unlike the TDBGrid object, which displays each record in a single row, TDBCtrlGrid allows a free-form layout for each record in the dataset. Each record is displayed in its own panel; Design one panel at design time and TDBCtrlGrid replicates that panel for each record displayed.

At runtime, users can use the database navigator (TDBNavigator) to move through data in the TDBCtrlGrid object, and to insert, delete, and edit the data. Edits made using the data grid are not posted to the underlying dataset until the user moves to a different record or closes the application.

Using Common Data Control Features

Grids

44.1.1.1 TDBCtrlGrid Members

The following tables list the members exposed by TDBCtrlGrid.

Protected Events

	Name	Description
	OnAlignInsertBefore (see page 6213)	Occurs when an object with custom alignment is aligned.
	OnAlignPosition (see page 6214)	Occurs when an object with custom alignment is aligned.
	OnCanResize (see page 5851)	Occurs when an attempt is made to resize the control.
	OnConstrainedResize (see page 5853)	Adjust resize constraints.
	OnContextPopup (see page 5854)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnDockDrop (see page 6214)	Occurs when another control is docked to the control.
	OnDockOver (see page 6216)	Occurs when another control is dragged over the control.
	OnEndDock (see page 5859)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnGetSiteInfo (see page 6223)	Returns the control's docking information.
	OnMouseWheel (see page 5869)	Occurs when the mouse wheel is rotated.
	OnMouseWheelDown (see page 5869)	Occurs when the mouse wheel is rotated downward.
	OnMouseWheelUp (see page 5870)	Occurs when the mouse wheel is rotated upward.
	OnResize (see page 5870)	Occurs immediately after the control is resized.
	OnStartDock (see page 5871)	Occurs when the user begins to drag a control with a DragKind (see page 5819) of dkDock.
	OnUnDock (see page 6230)	Occurs when the application tries to undock a control that is docked to the windowed control.

Protected Fields

	Name	Description
	FAnchorMove (see page 5733)	This is FAnchorMove, a member of class TControl.
	FAnchorOrigin (see page 5734)	This is FAnchorOrigin, a member of class TControl.
	FAnchorRules (see page 5734)	This is FAnchorRules, a member of class TControl.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FDesignSize (see page 6124)	This is FDesignSize, a member of class TWinControl.
	FDoubleBuffered (see page 6124)	This is FDoubleBuffered, a member of class TWinControl.
	FExplicitHeight (see page 5734)	This is FExplicitHeight, a member of class TControl.
	FExplicitLeft (see page 5734)	This is FExplicitLeft, a member of class TControl.
	FExplicitTop (see page 5734)	This is FExplicitTop, a member of class TControl.
	FExplicitWidth (see page 5735)	This is FExplicitWidth, a member of class TControl.
	FInImeComposition (see page 6125)	This is FInImeComposition, a member of class TWinControl.
	FOriginalParentSize (see page 5735)	This is FOriginalParentSize, a member of class TControl.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	ActionChange (see page 5737)	Responds when the action associated with the control changes.
V	ActionChange (see page 6127)	Updates the control to reflect changes in its associated action.
	AddBiDiModeExStyle (see page 6128)	Sets control's window style according to its bi-directional support.
V	AdjustClientRect (see page 6128)	Provides the interface that adjusts the ClientRect (see page 5810) property for idiosyncrasies of the window.
	AdjustSize (see page 5738)	Sets the size of the control as determined by the AutoSize (see page 5803) property.
V	AdjustSize (see page 6129)	Adjusts the control's size according to its contents and constraints.
V	AlignControls (see page 6129)	Aligns any controls for which the control is the parent within a specified area of the control.

	ArrangeControl (see page 6130)	This is ArrangeControl, a member of class TWinControl.
	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	AssignTo (see page 5739)	Overrides the inherited AssignTo function to enable assignments to TAction objects.
	AssignTo (see page 6130)	Copies the properties of the windowed control to another object.
	BeginAutoDrag (see page 5739)	Begin Automatic Drag.
	CalcCursorPos (see page 5741)	This is CalcCursorPos, a member of class TControl.
	CanAutoSize (see page 5741)	Indicates whether the control can resize itself automatically to accommodate its contents.
	CanAutoSize (see page 6131)	Indicates how the control can be resized.
	CanResize (see page 5742)	OnCanResize (see page 5851) event dispatcher.
	CanResize (see page 6132)	Indicates how the control can respond to a resize attempt.
	Changed (see page 5742)	Sends a CM_CHANGED (see page 6330) message to the control.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	ChangeScale (see page 5743)	Rescaling event dispatcher.
	ChangeScale (see page 6132)	Resize (see page 5780) and reposition children and self.
	Click (see page 5743)	Respond to user click.
	ConstrainedResize (see page 5746)	Notify control of resize with constraints.
	ConstrainedResize (see page 6133)	Generates an OnConstrainedResize (see page 5853) event.
	ControlsAligned (see page 6134)	This is ControlsAligned, a member of class TWinControl.
	CreateDockManager (see page 6134)	Creates the dock manager for the control.
	CreateHandle (see page 6135)	Creates underlying screen object.
	CreateParams (see page 8180)	Initializes a window-creation parameter data structure.
	CreateSubClass (see page 6136)	Creates a windowed control derived from an existing Windows window class.
	CreateWindowHandle (see page 6137)	Creates a Windows control to represent the control.
	CreateWnd (see page 8181)	Creates the underlying window.
	CustomAlignInsertBefore (see page 6137)	Returns placement order of custom-aligned child control.
	CustomAlignPosition (see page 6138)	Returns aligned position of custom-aligned child control.
	DblClick (see page 5747)	OnDblClick (see page 5854) event dispatcher.
	DefaultDockImage (see page 5747)	Handles the painting and erasing of a dock image.
	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	DefineProperties (see page 5748)	Provides methods to read and write the IsControl (see page 5829) property to a stream such as a form file.
	DefineProperties (see page 6139)	Provides methods to read and write the IsControl property to a stream such as a form file.
	DesignWndProc (see page 5749)	This is DesignWndProc, a member of class TControl.
	DestroyHandle (see page 6140)	Destroys the control's window without destroying the control.
	DestroyWindowHandle (see page 6140)	Destroys the window created in the CreateWindowHandle (see page 6137) method.
	DestroyWnd (see page 6141)	Destroys the control's window.
	DoAddDockClient (see page 6142)	Performs actions when a control is docked to the windowed control.
	DockOver (see page 6143)	Responds when a docking client is dragged over the windowed control.
	DockReplaceDockClient (see page 6143)	This is DockReplaceDockClient, a member of class TWinControl.
	DockTrackNoTarget (see page 5749)	Handles dragging of the control over an invalid docking target.
	DoContextPopup (see page 5750)	OnContextPopup (see page 5854) event dispatcher.
	DoDock (see page 5750)	Docking event dispatcher.
	DoDockOver (see page 6143)	Generates an OnDockOver (see page 6216) event.
	DoEndDock (see page 5750)	OnEndDock (see page 5859) event dispatcher.
	DoEndDrag (see page 5751)	OnEndDrag (see page 5860) event dispatcher.
	DoEnter (see page 6144)	Respond to receiving input focus.
	DoExit (see page 6144)	Respond to losing input focus
	DoFlipChildren (see page 6145)	Flips the control's children.

	DoKeyDown (see page 6145)	Performs some preprocessing before generating an OnKeyDown (see page 6225) event.
	DoKeyPress (see page 6146)	Performs some preprocessing before generating an OnKeyPress (see page 6227) event.
	DoKeyUp (see page 6146)	Performs some preprocessing before generating an OnKeyUp (see page 6228) event.
	DoMouseWheel (see page 5751)	Processes mouse wheel motion.
	DoMouseWheelDown (see page 5752)	OnMouseWheelDown (see page 5869) event dispatcher.
	DoMouseWheelUp (see page 5752)	OnMouseWheelUp (see page 5870) event dispatcher.
	DoRemoveDockClient (see page 6147)	Responds when a control is undocked from the windowed control.
	DoStartDock (see page 5753)	OnStartDock (see page 5871) event dispatcher.
	DoStartDrag (see page 5753)	OnStartDrag (see page 5871) event dispatcher.
	DoUnDock (see page 6147)	Undocks a control that is currently docked to the windowed control.
	DragCanceled (see page 5754)	Provides the interface for a method that responds to the cancellation of a drag.
	DragOver (see page 5755)	OnDragOver (see page 5857) event dispatcher.
	DrawDragDockImage (see page 5755)	Draws the dock image for the control.
	EraseDragDockImage (see page 5757)	Erases the dock image for the control.
	FindNextControl (see page 6149)	Returns the control's next child in the tab order after the specified control.
	FixupTabList (see page 6149)	Sorts the child controls by their tab order.
V	GetAction (see page 5758)	This is GetAction, a member of class TControl.
	GetActionLinkClass (see page 5758)	Returns the appropriate action link class that is associated with the control class.
V	GetActionLinkClass (see page 6152)	Returns the associated action link class.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
V	GetChildParent (see page 8183)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
V	GetChildren (see page 8183)	Calls a specified method for each child of the control.
V	GetClientOrigin (see page 5758)	Returns the screen coordinates of the top-left corner of the control's client area.
V	GetClientOrigin (see page 6153)	Returns the value of the ClientOrigin (see page 5809) property.
V	GetClientRect (see page 5759)	Returns a rectangle defining the client area of the control.
V	GetClientRect (see page 6154)	Returns the value of the ClientRect (see page 5810) property.
V	GetControlExtents (see page 6154)	Returns the smallest rectangle in which all the control's children fit.
V	GetDeviceContext (see page 5760)	Returns a device context for the control.
V	GetDeviceContext (see page 6155)	Provides access to a device context for the control.
	GetDockEdge (see page 5763)	Returns the edge on which another control should be docked when it is dragged over the control.
V	GetDragImages (see page 5763)	Returns the control's image list containing the image to be displayed while dragging.
V	GetEnabled (see page 5763)	Returns the value of the Enabled (see page 5821) property.
V	GetFloating (see page 5764)	Returns the value of the Floating (see page 5823) property.
V	GetFloatingDockSiteClass (see page 5764)	Returns the class used for the control when it is floating.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetPalette (see page 5765)	Returns the handle to a palette for use by the control.
	GetParentHandle (see page 6157)	Returns the window handle for the window of the control's parent.
	GetPopupMenu (see page 5765)	Returns the pop-up menu associated with the control.
	GetSiteInfo (see page 6158)	Generates an OnGetSiteInfo (see page 6223) event
	GetTopParentHandle (see page 6159)	Returns the window handle of the first window not associated with a VCL control that contains the windowed control.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	InvalidateDockHostSite (see page 6162)	This is InvalidateDockHostSite, a member of class TWinControl.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsControlActivateMsg (see page 6162)	This is IsControlActivateMsg, a member of class TWinControl.

	IsControlMouseMsg (see page 6162)	Indicates whether a specified mouse message is directed to one of the windowed control's child controls.
	IsQualifyingSite (see page 6163)	This is IsQualifyingSite, a member of class TWinControl.
	KeyPress (see page 6163)	Respond to keyboard input.
	KeyUp (see page 6164)	Respond to released key.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Loaded (see page 5771)	Initializes the control after it is loaded from a stream.
	MainWndProc (see page 6165)	Receives Windows messages for the control.
	MouseActivate (see page 5773)	This is MouseActivate, a member of class TControl.
	MouseDown (see page 5773)	OnMouseDown (see page 5862) event dispatcher.
	MouseMove (see page 5773)	Respond to mouse moving over control area..
	MouseUp (see page 5774)	OnMouseUp (see page 5867) event dispatcher.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	Notification (see page 5775)	Responds to notifications that components are being created or destroyed.
V	Notification (see page 6165)	Responds to notifications that components are being created or destroyed.
	NotifyControls (see page 6165)	Sends a message to all the child controls.
	PaintControls (see page 6166)	Paints each of the child controls in a windowed control using the specified device context.
	PaintHandler (see page 6166)	Responds to WM_PAINT messages.
V	PaintPanel (see page 8185)	This is PaintPanel, a member of class TDBCtrlGrid.
V	PaintWindow (see page 8185)	Renders the image of a windowed control.
	PaletteChanged (see page 5775)	Responds to changes in the system's palette by realizing the control's palette.
V	PaletteChanged (see page 6170)	Responds to changes in the system's palette by realizing the control's palette and the palette for each child control.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	PositionDockRect (see page 5777)	Positions the docking rectangle according to the current drag-and-dock state.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 8185)	Prepares the control for having its properties assigned values from a stream.
	RecreateWnd (see page 6171)	Recreate underlying Windows screen object.
	ReloadDockedControl (see page 6172)	Reloads a docked control.
	RemoveWindowProps (see page 6174)	This is RemoveWindowProps, a member of class TWinControl.
V	RequestAlign (see page 5780)	Instructs the parent of a control to reposition the control, enforcing its Align (see page 5798) property.
	ResetIme (see page 6174)	Restores the input method editor (IME) that was active when the application started.
	ResetImeComposition (see page 6175)	Directs the composition window of the input method editor (IME) to perform a specific action.
	Resize (see page 5780)	Respond to control resize.
	ScaleConstraints (see page 5781)	This is ScaleConstraints, a member of class TControl.
	ScaleControls (see page 6176)	Rescale child controls only.
	SelectFirst (see page 6177)	Locates first selectable child control.
	SelectNext (see page 6177)	Moves the input focus from the current child control to the next one in the tab order.
	SendCancelMode (see page 5781)	Cancels the modal state of the control.
	SendDockNotification (see page 5782)	Sends a Windows message to the control's host dock site.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
V	SetAutoSize (see page 5783)	This is SetAutoSize, a member of class TControl.
V	SetBiDiMode (see page 5783)	Sets the control's bi-directional mode.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
V	SetChildOrder (see page 6178)	Changes the order in which the child component appears in the list of child components returned by the GetChildren (see page 6153) method.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
V	SetDragMode (see page 5785)	Sets the drag mode for the control.
V	SetEnabled (see page 5785)	Sets the value of the Enabled (see page 5821) property.
	SetIme (see page 6181)	Activates an input method editor (IME) using the values specified by the ImeMode (see page 6207) and ImeName (see page 6208) properties.

	SetImeCompositionWindow (see page 6181)	Sets the position and font of the composition window.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
V	SetName (see page 5785)	Sets the name of the control.
V	SetParent (see page 5786)	Sets the parent of the control.
V	SetParent (see page 6182)	Sets the parent of the control.
V	SetParentBackground (see page 6182)	This is SetParentBackground, a member of class TWinControl.
V	SetParentBiDiMode (see page 5786)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 5787)	Sets the parent for the control.
	SetZOrder (see page 5788)	Repositions the control in its parent's control list, thereby changing position onscreen.
V	SetZOrder (see page 6182)	Moves the control to the top or bottom of the parent control's (or screen's) list of TWinControl (see page 6112) controls.
V	ShowControl (see page 6183)	Ensures that a specified child control is visible.
	UpdateBounds (see page 6185)	This is UpdateBounds, a member of class TWinControl.
	UpdateBoundsRect (see page 5789)	Changes the Top (see page 5844), Left (see page 5830), Width (see page 5849), and Height (see page 5825) properties of the control, but doesn't update its screen image and bypasses all resize events.
V	UpdateControlOriginalParentSize (see page 6186)	This is UpdateControlOriginalParentSize, a member of class TWinControl.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateExplicitBounds (see page 5789)	This is UpdateExplicitBounds, a member of class TControl.
	UpdateRecreatingFlag (see page 6186)	This is UpdateRecreatingFlag, a member of class TWinControl.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	UpdateUIState (see page 6186)	Updates form User Interface State as needed
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	VisibleChanging (see page 5791)	Provides the interface for a method that responds to changes in the control's visibility.
V	WndProc (see page 5791)	Provides specific message responses for the control.
V	WndProc (see page 6187)	Provides specific message responses for the control.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	ActionLink (see page 5798)	Contains the action link object associated with the control.
	AutoSize (see page 5803)	Specifies whether the control sizes itself automatically to accommodate its contents.
	BevelEdges (see page 6192)	Specifies which edges of the control are beveled.
	BevelInner (see page 6193)	Specifies the cut of the inner bevel.
	BevelKind (see page 6193)	Specifies the control's bevel style.
	BevelOuter (see page 6194)	Specifies the cut of the outer bevel.
	BevelWidth (see page 6194)	Specifies the width of the inner and outer bevels.
	BorderWidth (see page 6195)	Specifies the width of the control's border.
	Caption (see page 5806)	Specifies a text string that identifies the control to the user.
	Ctl3D (see page 6198)	Determines whether a control has a three-dimensional (3-D) or two-dimensional look.
	DefWndProc (see page 6199)	Specifies the default window procedure for the windowed control.
	DesktopFont (see page 5818)	Specifies whether the control uses the Windows icon font when writing text.
	DragKind (see page 5819)	Specifies whether the control is being dragged normally or for docking.

	ImeMode (see page 6207)	Determines the behavior of the input method editor (IME).
	ImeName (see page 6208)	Specifies the input method editor (IME) to use for converting keyboard input to Asian language characters.
	IsControl (see page 5829)	Determines whether a form stores its form-specific properties to a stream.
	MouseCapture (see page 5831)	Indicates whether the control has "captured" mouse events.
R	Panel (see page 8199)	This is Panel, a member of class TDBCtrlGrid.
	ParentBackground (see page 6209)	Determines whether control uses parent's theme background.
	ParentBiDiMode (see page 5833)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	ParentCtl3D (see page 6209)	Determines where a component looks to determine if it should appear three dimensional.
	ScalingFlags (see page 5840)	Reflects which attributes of the control have been scaled.
	Text (see page 5842)	Contains a text string associated with the control.
	WheelAccumulator (see page 5849)	Accumulates mouse wheel rotations.
	WindowHandle (see page 6212)	Provides access to a window handle for the control.
	WindowText (see page 5850)	Contains the text string of the control.

Public Events

	Name	Description
	WindowProc (see page 5872)	Points to the window procedure that responds to messages sent to the control.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	BeginDrag (see page 5740)	Starts the dragging of a control.
	BringToFront (see page 5740)	Puts the control in front of all other controls in its parent control.
	Broadcast (see page 6130)	Sends a message to each of the child controls.
	CanFocus (see page 6131)	Indicates whether a control can receive focus.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	ClientToParent (see page 5744)	Translates client coordinates to parent coordinates.
	ClientToScreen (see page 5744)	Translates a given point from client area coordinates to global screen coordinates.
	ContainsControl (see page 6133)	Indicates whether a specified control exists within the control.
	ControlAtPos (see page 6133)	Returns the child control located at a specified position within the control.
V	Create (see page 8179)	Creates and initializes an instance of TDBCtrlGrid (see page 8168).
	CreateParented (see page 6123)	Creates and initializes a control as the child of a specified non-VCL container.
	CreateParentedControl (see page 6136)	Creates and initializes a control as the child of a specified non-VCL window.
V	DefaultHandler (see page 5748)	Provides message handling for all messages that do not have specific handlers.
V	DefaultHandler (see page 6139)	Provides message handling for all messages that the control does not fully process itself.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 8179)	Destroys an instance of TDBCtrlGrid (see page 8168).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	DisableAlign (see page 6141)	Disables the realignment of child controls.

	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Dock (see page 5749)	Used internally to dock the control.
	DockDrop (see page 6142)	Generates an OnDockDrop (see page 6214) event.
	DoKey (see page 8181)	Implements the responses to a number of standard keystrokes.
	DragDrop (see page 5754)	OnDragDrop (see page 5855) event dispatcher.
	Dragging (see page 5754)	Indicates whether a control is being dragged.
	DrawTextBiDiModeFlags (see page 5756)	Returns the text flags that reflect the current setting of the BiDiMode (see page 5803) property.
	DrawTextBiDiModeFlagsReadingOnly (see page 5756)	Returns the text flag to add that indicates whether the control's text should read from right to left.
	EnableAlign (see page 6148)	Decrements the reference count incremented by the DisableAlign (see page 6141) method, eventually realigning the child controls.
	EndDrag (see page 5757)	Stops a control from being dragged any further.
	ExecuteAction (see page 8182)	Executes an action with the DB (see page 6725) control grid as its target.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindChildControl (see page 6148)	Returns a child control given its name.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FlipChildren (see page 6150)	Reverses the positions of child controls.
	Focused (see page 6150)	Determines whether the control has input focus.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetControlsAlignment (see page 5759)	Indicates how text is aligned within the control.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetParentComponent (see page 5765)	Returns the parent of the control.
	GetTabOrderList (see page 8183)	Overrides the default to remove all child controls from the tab order.
	GetTextBuf (see page 5766)	Retrieves the control's text, copies it into a buffer, and returns the number of characters copied.
	GetTextLen (see page 5767)	Returns the length of the control's text.
	HandleAllocated (see page 6159)	Reports whether a screen object handle exists for the control.
	HandleNeeded (see page 6160)	Creates a screen object for the control if it doesn't already exist.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	HasParent (see page 5768)	Indicates whether the control has a parent.
	Hide (see page 5769)	Makes the control invisible.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitiateAction (see page 5769)	Calls the action link's Update (see page 5789) method if the control is associated with an action link.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InsertControl (see page 6160)	Inserts a control into the Controls (see page 6197) array property.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	Invalidate (see page 5770)	Completely repaint control.
	Invalidate (see page 6161)	Schedules a control repaint.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.

	IsRightToLeft (see page 5770)	Indicates whether the control should be reversed right to left.
V	KeyDown (see page 8184)	Performs special processing when a key is pressed.
	ManualDock (see page 5771)	Docks the control.
	ManualFloat (see page 5772)	Undocks the control.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	MouseWheelHandler (see page 5774)	Dispatches messages received from a mouse wheel.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	PaintTo (see page 6167)	This is the overview for the PaintTo method overload.
	ParentToClient (see page 5776)	Translate parent coordinates to client coordinates.
	Perform (see page 5776)	Responds as if the control received a specified Windows message.
	PreProcessMessage (see page 6170)	This is PreProcessMessage, a member of class TWinControl.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	Realign (see page 6171)	Forces the control to realign children.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	Refresh (see page 5779)	Repaints the control on the screen.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveControl (see page 6172)	Removes a specified control from the Controls (see page 6197) array.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	Repaint (see page 5779)	Forces the control to repaint its image on the screen.
V	Repaint (see page 6174)	Repaints the entire control.
	ReplaceDockedControl (see page 5779)	Docks the control in the place where another control is already docked.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	ScaleBy (see page 6175)	Rescale control and its children.
	ScreenToClient (see page 5781)	Converts the screen coordinates of a specified point on the screen to client coordinates.
	ScrollBy (see page 6176)	Scroll control contents.
	SendToBack (see page 5782)	Puts a windowed control behind all other windowed controls, or puts a non-windowed control behind all other non-windowed controls.
V	SetBounds (see page 8186)	Sets the windowed control's boundary properties all at once.
	SetDesignVisible (see page 5784)	Makes a control visible at design time.
V	SetDesignVisible (see page 6178)	Makes a control visible at design time.
V	SetFocus (see page 6179)	Gives the input focus to the control.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	SetTextBuf (see page 5787)	Sets the text of the control.
	Show (see page 5788)	Makes a control visible.
V	Update (see page 5789)	Processes any pending paint messages immediately.
V	Update (see page 6183)	Forces the control to update.
V	UpdateAction (see page 8186)	Updates an action to reflect the current state of the grid.
	UpdateControlState (see page 6186)	Respond to state change.
	UseRightToLeftAlignment (see page 5790)	Specifies whether the control's alignment should be reversed right-to-left.
	UseRightToLeftReading (see page 5790)	Specifies whether the control is using a right-to-left reading order.
	UseRightToLeftScrollBar (see page 5791)	Specifies whether the vertical scroll bar appears on the left side of the control.

Public Properties

	Name	Description
	Action (see page 5797)	Designates the action associated with the control.
R	AlignDisabled (see page 6192)	Indicates child control realignment disabled.
	BiDiMode (see page 5803)	Specifies the bi-directional mode for the control.
	BoundsRect (see page 5803)	Specifies the bounding rectangle of the control, expressed in the coordinate system of the parent control.
R	Brush (see page 6195)	Determines the color and pattern used for painting the background of the control.

R	Canvas (see page 8193)	Indicates the drawing surface used to draw the TDBCtrlGridObject.
	ClientHeight (see page 5808)	Specifies the height of the control's client area in pixels.
R	ClientOrigin (see page 5809)	Specifies the screen coordinates (in pixels) of the top left corner of a control's client area.
R	ClientRect (see page 5810)	Specifies the size (in pixels) of a control's client area.
	ClientWidth (see page 5811)	Specifies the horizontal size of the control's client area in pixels.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
R	ControlCount (see page 6195)	Returns the number of child controls.
R	Controls (see page 6197)	Lists all child controls.
	ControlState (see page 5813)	Indicates the current state of a control at runtime.
	ControlStyle (see page 5814)	Determines style characteristics of the control.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	DockClientCount (see page 6199)	Specifies the number of controls that are docked on the windowed control.
R	DockClients (see page 6201)	Lists the controls that are docked to the windowed control.
	DockManager (see page 6202)	Specifies the control's docking manager interface.
	DockOrientation (see page 5818)	Specifies how the control is docked relative to other controls docked in the same parent.
	DockSite (see page 6204)	Specifies whether the control can be the target of drag-and-dock operations.
	DoubleBuffered (see page 6205)	Determines whether the control's image is rendered directly to the window or painted to an in-memory bitmap first.
	EditMode (see page 8197)	Determines whether the TDBCtrlGrid (see page 8168) can be used to insert, delete, or edit records.
R	ExplicitHeight (see page 5821)	Specifies the explicit vertical size of the control in pixels.
R	ExplicitLeft (see page 5822)	Specifies the explicit horizontal pixel coordinate of the left edge of a component relative to its parent.
R	ExplicitTop (see page 5822)	Specifies the explicit vertical pixel coordinate of the top edge of a component relative to its parent.
R	ExplicitWidth (see page 5822)	Specifies the explicit horizontal size of the control in pixels.
R	Floating (see page 5823)	Indicates whether the control is floating.
	FloatingDockSiteClass (see page 5823)	Specifies the class of the temporary control that hosts the control when it is floating.
R	Handle (see page 6207)	Provides access to the underlying Windows screen object for the control.
	HostDockSite (see page 5829)	Specifies the control in which the control is docked.
	LRDockWidth (see page 5831)	Specifies the width of the control when it is docked horizontally.
R	MouseInClient (see page 6209)	This is MouseInClient, a member of class TWinControl.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Padding (see page 6209)	Specifies the padding of a control.
R	PanelCount (see page 8200)	Specifies the number of records visible in the grid.
	PanelIndex (see page 8201)	Specifies the index of the panel in the grid that represents the current record.
	Parent (see page 5832)	Indicates the parent of the control.
	ParentWindow (see page 6210)	Reference to parent's underlying control.
R	Showing (see page 6210)	Indicates whether the control is showing on the screen.
	TBDockHeight (see page 5842)	Specifies the height of the control when it is docked vertically.
	UndockHeight (see page 5845)	Specifies the height of the control when it is floating.
	UndockWidth (see page 5846)	Specifies the width of the control when it is floating.
	UseDockManager (see page 6212)	Specifies whether the docking manager is used in drag-and-dock operations.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
R	VisibleDockClientCount (see page 6212)	Specifies the number of visible controls that are docked on the windowed control.

Published Events

	Name	Description
	OnClick (see page 8213)	Occurs when the user clicks the control.
	OnDblClick (see page 8215)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDragDrop (see page 8215)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 8218)	Occurs when the user drags an object over a control.
	OnEndDrag (see page 8220)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnEnter (see page 8221)	Occurs when a control receives the input focus.
	OnExit (see page 8224)	Occurs when the input focus shifts away from one control to another.
	OnKeyDown (see page 8225)	Occurs when a user presses any key while the control has focus.
	OnKeyPress (see page 8228)	Occurs when a key is pressed.
	OnKeyUp (see page 8229)	Occurs when the user releases a key that has been pressed.
	OnMouseActivate (see page 8231)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 8232)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseEnter (see page 8234)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 8234)	Occurs when the user moves the mouse outside of a control.
	OnMouseMove (see page 8234)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 8237)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnPaintPanel (see page 8239)	Occurs when TDBCtrlGrid (see page 8168) needs to draw a panel in the grid.
	OnStartDrag (see page 8240)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.

Published Properties

	Name	Description
	Align (see page 8188)	Determines how the control aligns within its container (parent control).
	AlignWithMargins (see page 5802)	Indicates whether a control should be constrained by margins.
	AllowDelete (see page 8191)	Determines whether the user can delete the current record from the dataset by pressing Ctrl+Delete.
	AllowInsert (see page 8192)	Determines whether the user can insert new records with the Insert key or append new records with the Ctrl+Insert key combination.
	Anchors (see page 8192)	Specifies how the control is anchored to its parent.
	ColCount (see page 8193)	Specifies the number of columns of panels shown in the grid.
	Color (see page 8193)	Specifies the background color of the control.
	Constraints (see page 8194)	Specifies the size constraints for the control.
	Cursor (see page 5815)	Specifies the image used to represent the mouse pointer when it passes into the region covered by the control.
	DataSource (see page 8195)	Identifies the link to the dataset where the TDBCtrlGrid (see page 8168) object finds its data.
	DragCursor (see page 8195)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragMode (see page 8195)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	Enabled (see page 8197)	Controls whether the control responds to mouse, keyboard, and timer events.
	Font (see page 8198)	Controls the attributes of text written on or in the control.
	Height (see page 5825)	Specifies the vertical size of the control in pixels.
	HelpContext (see page 5826)	Numeric ID for control's context-sensitive help topic
	HelpKeyword (see page 5826)	Keyword for control's context-sensitive help topic
	HelpType (see page 5827)	Indicates whether the control's context sensitive help topic is identified by context ID or by keyword.
	Hint (see page 5827)	Contains the text string that can appear when the user moves the mouse over the control.
	Left (see page 5830)	Specifies the horizontal coordinate of the left edge of a component relative to its parent.

	Margins (see page 5831)	Specifies the margins for the control.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Orientation (see page 8199)	Determines the order in which records from the dataset are displayed in the TDBCtrlGrid (see page 8168).
	PanelBorder (see page 8200)	Determines whether each panel is drawn with a raised border around it.
	PanelHeight (see page 8200)	Specifies the height (in pixels) of each panel.
	PanelWidth (see page 8201)	Specifies the width (in pixels) of each panel.
	ParentColor (see page 8201)	Determines where a control looks for its color information.
	ParentFont (see page 8202)	Determines where a control looks for its font information.
	ParentShowHint (see page 8202)	Determines where a control looks to find out if its Help Hint should be shown.
	PopupMenu (see page 8203)	Identifies the pop-up menu associated with the control.
	RowCount (see page 8207)	Specifies the number of rows of panels displayed in the grid.
	SelectedColor (see page 8208)	Specifies the background color of the panel that represents the current record in the dataset.
	ShowFocus (see page 8208)	Indicates whether to draw a focus rectangle around the current record in the TDBCtrlGrid (see page 8168) when it has input focus.
	ShowHint (see page 8209)	Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.
	TabOrder (see page 8210)	Indicates the position of the control in its parent's tab order.
	TabStop (see page 8211)	Determines if the user can tab to a control.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Top (see page 5844)	Specifies the Y coordinate of the top left corner of a control, relative to its parent or containing control in pixels.
	Visible (see page 8211)	Determines whether the component appears onscreen.
	Width (see page 5849)	Specifies the horizontal size of the control or form in pixels.

44.1.1.2 TDBCtrlGrid.Create Constructor

Creates and initializes an instance of TDBCtrlGrid (see page 8168).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TDBCtrlGrid(TComponent * AOwner);
```

Description

Call Create to create and initialize a TDBCtrlGrid (see page 8168) object at runtime.TDBCtrlGrid (see page 8168) objects placed in a form at design time are created automatically.

AOwner is a component that becomes the value of the Owner property. This component, typically the form, is responsible for freeing the TDBCtrlGrid (see page 8168) instance.

See Also

Owner (see page 2807)

44.1.1.3 TDBCtrlGrid.Destroy Destructor

Destroys an instance of TDBCtrlGrid (see page 8168).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TDBCtrlGrid();
```

Description

Do not call Destroy directly in an application. Instead, call Free, which checks that the TDBCtrlGrid (see page 8168) reference is not nil, and only then calls Destroy.

Destroy frees the helper objects used by TDBCtrlGrid (see page 8168) before calling the inherited destructor.

See Also

Free (see page 22300)

Create (see page 8179)

44.1.1.4 TDBCtrlGrid Methods

The methods of the TDBCtrlGrid class are listed here.

Protected Methods

	Name	Description
	CreateParams (see page 8180)	Initializes a window-creation parameter data structure.
	CreateWnd (see page 8181)	Creates the underlying window.
	GetChildParent (see page 8183)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 8183)	Calls a specified method for each child of the control.
	PaintPanel (see page 8185)	This is PaintPanel, a member of class TDBCtrlGrid.
	PaintWindow (see page 8185)	Renders the image of a windowed control.
	ReadState (see page 8185)	Prepares the control for having its properties assigned values from a stream.

Public Methods

	Name	Description
	DoKey (see page 8181)	Implements the responses to a number of standard keystrokes.
	ExecuteAction (see page 8182)	Executes an action with the DB (see page 6725) control grid as its target.
	GetTabOrderList (see page 8183)	Overrides the default to remove all child controls from the tab order.
	KeyDown (see page 8184)	Performs special processing when a key is pressed.
	SetBounds (see page 8186)	Sets the windowed control's boundary properties all at once.
	UpdateAction (see page 8186)	Updates an action to reflect the current state of the grid.

44.1.1.4.1 TDBCtrlGrid.CreateParams Method

Initializes a window-creation parameter data structure.

Pascal

```
procedure CreateParams(var Params: TCreateParams); override;
```

C++

```
virtual __fastcall CreateParams(TCreateParams Params);
```

Description

The CreateWnd method calls CreateParams to initialize the parameters it passes to CreateWindowHandle. Override CreateParams to customize the way a control creates its Windows representation. When overriding CreateParams, always call the inherited method first to set the default values, then make any desired adjustments.

CreateParams fills in the parameter that is passed as the value of the Params parameter. This data structure holds information

needed when telling Windows to create a window handle. The fields of a TCreateParams record become the parameters to a call to the CreateWindowEx API function.

TWinControl implements CreateParams by setting all the fields of Params to generic base values. A number of the standard controls override CreateParams to change one or more of the default values in Params.

See Also

CreateWindowHandle (see page 6137)

CreateWnd (see page 6137)

AddBiDiModeExStyle (see page 6128)

44.1.1.4.2 TDBCtrlGrid.CreateWnd Method

Creates the underlying window.

Pascal

```
procedure CreateWnd; override;
```

C++

```
virtual __fastcall CreateWnd();
```

Description

CreateWnd is called automatically when the control is first created or when the underlying screen object must be destroyed and recreated to reflect property changes. Override CreateWnd to pass additional initialization messages to the screen object when it is created.

See Also

CreateParams (see page 6135)

CreateWindowHandle (see page 6137)

Perform (see page 5776)

DestroyWnd (see page 6141)

44.1.1.4.3 TDBCtrlGrid.DoKey Method

Implements the responses to a number of standard keystrokes.

Pascal

```
procedure DoKey(Key: TDBCtrlGridKey);
```

C++

```
__fastcall DoKey(TDBCtrlGridKey Key);
```

Description

Call DoKey to perform the operation specified by the Key parameter. For example, use DoKey to remap keystrokes from an OnKeyDown (see page 8225) event handler.

The actions performed for the different values of Key are given in the following table:

Value	Action
gkNull	Do nothing.
gkEditMode	Toggle the EditMode (see page 8197) property.

gkPriorTab	Move to the previous panel.
gkNextTab	Move to the next panel.
gkLeft	Move one panel to the left.
gkRight	Move one panel to the right.
gkUp	Move one panel up.
gkDown	Move one panel down.
gkScrollUp	Move one panel up.
gkScrollDown	Move one panel down.
gkPageUp	Move ColCount (see page 8193) * RowCount (see page 8207) records up in the dataset.
gkPageDown	Move ColCount (see page 8193) * RowCount (see page 8207) records down in the dataset.
gkHome	Move to the first record in the dataset.
gkEnd	Move to the last record in the dataset.
gkInsert	Insert a new record prior to the current record in the dataset and set EditMode (see page 8197) to true.
gkAppend	Insert a new record at the end of the dataset and set EditMode (see page 8197) to true.
gkDelete	Delete the current record from the dataset and set EditMode (see page 8197) to false.
gkCancel	Cancel any edits not written to the dataset and set EditMode (see page 8197) to false.

See Also

AllowDelete (see page 8191)

AllowInsert (see page 8192)

EditMode (see page 8197)

KeyDown (see page 8184)

OnKeyDown (see page 6225)

44.1.1.4.4 TDBCtrlGrid.ExecuteAction Method

Executes an action with the DB (see page 6725) control grid as its target.

Pascal

```
function ExecuteAction(Action: TBasicAction): Boolean; override;
```

C++

```
virtual __fastcall Boolean ExecuteAction(TBasicAction Action);
```

Description

ExecuteAction is called automatically when the user invokes an action with the DB (see page 6725) control grid as its target. The Action parameter specifies the action that was invoked. ExecuteAction returns a boolean value indicating whether the action was successfully executed.

ExecuteAction first calls the inherited method, which checks whether the action knows how to execute with the grid as a target. If this does not successfully dispatch the action, ExecuteAction attempts to invoke the action with the grid's associated dataset as a target.

See Also

Execute (see page 2712)

DataSource (see page 8195)

UpdateAction (see page 8186)

44.1.1.4.5 TDBCtrlGrid.GetChildParent Method

Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.

Pascal

```
function GetChildParent: TComponent; override;
```

C++

```
virtual __fastcall TComponent * GetChildParent();
```

Description

GetChildParent is used internally in the component streaming system. It is not necessary to call it directly.

As implemented in TComponent, GetChildParent returns Self (Delphi) or this (C++). If GetChildParent returns nil (Delphi) or NULL (C++), the parent is assumed to be the root component currently being read (usually a form).

See Also

GetParentComponent (see page 2778)

44.1.1.4.6 TDBCtrlGrid.GetChildren Method

Calls a specified method for each child of the control.

Pascal

```
procedure GetChildren(Proc: TGetChildProc; Root: TComponent); override;
```

C++

```
virtual __fastcall GetChildren(TGetChildProc Proc, TComponent * Root);
```

Description

GetChildren is called by the streaming system that loads and saves components. Applications seldom need to call this routine.

GetChildren executes the callback specified by the Proc parameter for every child control listed by the Controls property that lists the Root parameter as its Owner.

Override GetChildren to limit or augment which child controls are saved with the control. When overriding GetChildren, call the procedure passed as the Proc parameter for every child control that should be saved. The Root parameter indicates the component (usually a form) that owns the control.

See Also

Controls (see page 6197)

Owner (see page 2807)

44.1.1.4.7 TDBCtrlGrid.GetTabOrderList Method

Overrides the default to remove all child controls from the tab order.

Pascal

```
procedure GetTabOrderList(List: TList); override;
```

C++

```
virtual __fastcall GetTabOrderList(TList List);
```

Description

GetTabOrderList returns an empty list. TDBCtrlGrid (see page 8168) implements its own handling of the tab key to move through the panels in database order.

See Also

TabOrder (see page 6211)

44.1.1.4.8 TDBCtrlGrid.KeyDown Method

Performs special processing when a key is pressed.

Pascal

```
procedure KeyDown(var Key: Word; Shift: TShiftState); override;
```

C++

```
virtual __fastcall KeyDown(Word Key, TShiftState Shift);
```

Description

After calling the OnKeyDown (see page 8225) event handler, KeyDown translates each combination of the Key and Shift parameters into a logical key code and calls the DoKey (see page 8181) method to perform the appropriate action.

KeyDown performs the following translations:

Key and Shift values	Key code
LeftArrow	gkLeft
RightArrow	gkRight
UpArrow	gkUp
DownArrow	gkDown
PageUp	gkPageUp
PageDown	gkPageDown
Home	gkHome
End	gkEnd
Return	gkEditMode
F2	gkEditMode
Insert	gkAppend
Ctrl+Insert	gkInsert
Ctrl+Delete	gkDelete
Escape	gkCancel
All other keys	gkNull

See Also

DoKey (see page 8181)

OnKeyDown (see page 6225)

44.1.1.4.9 TDBCtrlGrid.PaintPanel Method

Pascal

```
procedure PaintPanel(Index: Integer); virtual;
```

C++

```
virtual __fastcall PaintPanel(int Index);
```

Description

This is PaintPanel, a member of class TDBCtrlGrid.

44.1.1.4.10 TDBCtrlGrid.PaintWindow Method

Renders the image of a windowed control.

Pascal

```
procedure PaintWindow(DC: HDC); override;
```

C++

```
virtual __fastcall PaintWindow(HDC DC);
```

Description

Call PaintWindow to repaint the control. PaintWindow sends a WM_PAINT message to the windowed control's DefaultHandler method, setting the message record's WParam field to the value passed in DC and the other parameter and result fields to zeros.

See Also

DefaultHandler (see page 6139)

PaintTo (see page 6167)

DoubleBuffered (see page 6205)

44.1.1.4.11 TDBCtrlGrid.ReadState Method

Prepares the control for having its properties assigned values from a stream.

Pascal

```
procedure ReadState(Reader: TReader); override;
```

C++

```
virtual __fastcall ReadState(TReader Reader);
```

Description

Override ReadState to change the preparations the control makes as it readies itself to have its property values assigned from a stream. For example, a control might destroy temporary internal data structures or objects before new instances are loaded from the stream. Be sure to include a call to the inherited method when overriding ReadState.

As implemented in TWinControl, ReadState disables control alignment until all the child controls have been read from the stream, calls the inherited ReadState method, and re-enables the alignment of all the controls. The method then builds the tab order list of controls and synchronizes its visibility with that of its parent control.

See Also

Parent (see page 5832)

ReadState (see page 5778)

44.1.1.4.12 TDBCtrlGrid.SetBounds Method

Sets the windowed control's boundary properties all at once.

Pascal

```
procedure SetBounds(ALeft: Integer; ATop: Integer; AWidth: Integer; AHeight: Integer);
override;
```

C++

```
virtual __fastcall SetBounds(int ALeft, int ATop, int AWidth, int AHeight);
```

Description

Use SetBounds to change all of the control's boundary properties at once. The same effect can be achieved by setting the Left, Top, Width, and Height properties separately. By setting all four properties at once, SetBounds ensures that the control will not repaint between changes

Specify the values for the Left, Top, Width, and Height properties as the value of the ALeft, ATop, AWidth, and AHeight parameters, respectively.

See Also

Height (see page 5825)

Left (see page 5830)

Top (see page 5844)

Width (see page 5849)

44.1.1.4.13 TDBCtrlGrid.UpdateAction Method

Updates an action to reflect the current state of the grid.

Pascal

```
function UpdateAction(Action: TBasicAction): Boolean; override;
```

C++

```
virtual __fastcall Boolean UpdateAction(TBasicAction Action);
```

Description

UpdateAction is called automatically when the application is idle allow the grid to set action properties to reflect the current state of the grid. The Action parameter is the action to be updated. UpdateAction returns a boolean that indicates whether the action was updated by the grid.

As implemented in TDBCtrlGrid (see page 8168), UpdateAction checks whether the action relies on the state of the associated dataset, and if so, updates the action accordingly.

See Also

UpdateAction (see page 6887)

DataSource (see page 8195)

Update (see page 2714)

44.1.1.5 TDBCtrlGrid Properties

The properties of the TDBCtrlGrid class are listed here.

Protected Properties

	Name	Description
R	Panel (see page 8199)	This is Panel, a member of class TDBCtrlGrid.

Public Properties

	Name	Description
R	Canvas (see page 8193)	Indicates the drawing surface used to draw the TDBCtrlGridObject.
	EditMode (see page 8197)	Determines whether the TDBCtrlGrid (see page 8168) can be used to insert, delete, or edit records.
R	PanelCount (see page 8200)	Specifies the number of records visible in the grid.
	PanelIndex (see page 8201)	Specifies the index of the panel in the grid that represents the current record.

Published Properties

	Name	Description
	Align (see page 8188)	Determines how the control aligns within its container (parent control).
	AllowDelete (see page 8191)	Determines whether the user can delete the current record from the dataset by pressing Ctrl+Delete.
	AllowInsert (see page 8192)	Determines whether the user can insert new records with the Insert key or append new records with the Ctrl+Insert key combination.
	Anchors (see page 8192)	Specifies how the control is anchored to its parent.
	ColCount (see page 8193)	Specifies the number of columns of panels shown in the grid.
	Color (see page 8193)	Specifies the background color of the control.
	Constraints (see page 8194)	Specifies the size constraints for the control.
	DataSource (see page 8195)	Identifies the link to the dataset where the TDBCtrlGrid (see page 8168) object finds its data.
	DragCursor (see page 8195)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragMode (see page 8195)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	Enabled (see page 8197)	Controls whether the control responds to mouse, keyboard, and timer events.
	Font (see page 8198)	Controls the attributes of text written on or in the control.
	Orientation (see page 8199)	Determines the order in which records from the dataset are displayed in the TDBCtrlGrid (see page 8168).
	PanelBorder (see page 8200)	Determines whether each panel is drawn with a raised border around it.
	PanelHeight (see page 8200)	Specifies the height (in pixels) of each panel.
	PanelWidth (see page 8201)	Specifies the width (in pixels) of each panel.
	ParentColor (see page 8201)	Determines where a control looks for its color information.
	ParentFont (see page 8202)	Determines where a control looks for its font information.
	ParentShowHint (see page 8202)	Determines where a control looks to find out if its Help Hint should be shown.
	PopupMenu (see page 8203)	Identifies the pop-up menu associated with the control.
	RowCount (see page 8207)	Specifies the number of rows of panels displayed in the grid.
	SelectedColor (see page 8208)	Specifies the background color of the panel that represents the current record in the dataset.
	ShowFocus (see page 8208)	Indicates whether to draw a focus rectangle around the current record in the TDBCtrlGrid (see page 8168) when it has input focus.
	ShowHint (see page 8209)	Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.
	TabOrder (see page 8210)	Indicates the position of the control in its parent's tab order.
	TabStop (see page 8211)	Determines if the user can tab to a control.
	Visible (see page 8211)	Determines whether the component appears onscreen.

44.1.1.5.1 TDBCtrlGrid.Align Property

Determines how the control aligns within its container (parent control).

Pascal

```
property Align: TAlign;
```

C++

```
__property TAlign Align;
```

Description

Use Align to align a control to the top, bottom, left, or right of a form or panel and have it remain there even if the size of the form, panel, or component that contains the control changes. When the parent is resized, an aligned control also resizes so that it continues to span the top, bottom, left, or right edge of the parent.

For example, to use a panel component with various controls on it as a tool palette, change the panel's Align value to alLeft. The value of alLeft for the Align property of the panel guarantees that the tool palette remains on the left side of the form and always equals the client height of the form.

The default value of Align is alNone, which means a control remains where it is positioned on a form or panel.

Tip: If Align is set to alClient, the control fills the entire client area so that it is impossible to select the parent form by clicking on it. In this case, select the parent by selecting the control on the form and pressing Esc, or by using the Object Inspector.

Any number of child components within a single parent can have the same Align value, in which case they stack up along the edge of the parent. The child controls stack up in z-order. To adjust the order in which the controls stack up, drag the controls into their desired positions.

Note: To cause a control to maintain a specified relationship with an edge of its parent, but not necessarily lie along one edge of the parent, use the Anchors property instead.

C++ Examples:

```
/*
This example shows how to use a splitter to divide a form
into resizable panes.  All objects on the form are created
dynamically in the OnCreate event handler of the form. To
run this example, add ExtCtrls and FileCtrl to the uses
clause of the form’s implementation section.
Note that when creating a splitter dynamically at runtime,
it is important to set its position to the appropriate side
of the control it will resize.

44.1.1.5.2 TDBCtrlGrid.AllowDelete Property

Determines whether the user can delete the current record from the dataset by pressing Ctrl+Delete.

Pascal

```
property AllowDelete: Boolean;
```

C++

```
__property Boolean AllowDelete;
```

Description

Set AllowDelete to false to prevent the TDBCtrlGrid (see page 8168) object from deleting records.

When AllowDelete is false, TDBCtrlGrid (see page 8168) will not delete records from the dataset when the user presses Ctrl+Delete or the DoKey (see page 8181) method is called with the Key parameter set to gkDelete. The TDBCtrlGrid (see page 8168) object can still be used to insert records.

When AllowDelete is true (the default), TDBCtrlGrid (see page 8168) will delete the current record when the user presses Ctrl+Delete or when the DoKey (see page 8181) method is called with the Key parameter set to gkDelete. Even with AllowDelete set to true, records cannot be deleted unless the dataset is in edit mode.

See Also

DoKey (see page 8181)

44.1.1.5.3 TDBCtrlGrid.AllowInsert Property

Determines whether the user can insert new records with the Insert key or append new records with the Ctrl+Insert key combination.

Pascal

```
property AllowInsert: Boolean;
```

C++

```
__property Boolean AllowInsert;
```

Description

Set AllowInsert to false to prevent the TDBCtrlGrid (see page 8168) object from inserting records.

If AllowInsert is false, TDBCtrlGrid (see page 8168) does not insert records into the dataset when the user presses Insert or Ctrl+Insert or when the DoKey (see page 8181) method is called with the Key parameter set to gkInsert or gkAppend. The TDBCtrlGrid (see page 8168) object can still be used to delete records.

If AllowInsert is true (the default), TDBCtrlGrid (see page 8168) inserts a new record into the dataset before the current record when the user presses Insert or appends a new record to the end of the dataset when the user presses Ctrl+Insert. Even with AllowInsert set to true, records cannot be inserted unless the dataset is in edit mode.

See Also

DoKey (see page 8181)

44.1.1.5.4 TDBCtrlGrid.Anchors Property

Specifies how the control is anchored to its parent.

Pascal

```
property Anchors: TAnchors;
```

C++

```
__property TAnchors Anchors;
```

Description

Use Anchors to ensure that a control maintains its current position relative to an edge of its parent, even if the parent is resized. When its parent is resized, the control holds its position relative to the edges to which it is anchored.

If a control is anchored to opposite edges of its parent, the control stretches when its parent is resized. For example, if a control has its Anchors property set to [akLeft, akRight], the control stretches when the width of its parent changes.

Anchors is enforced only when the parent is resized. Thus, for example, if a control is anchored to opposite edges of a form at design time and the form is created in a maximized state, the control is not stretched because the form is not resized after the control is created.

Note: If a control should maintain contact with three edges of its parent (hugging one side of the parent and stretching the length of that side), use the Align property instead. Unlike Anchors, Align allows controls to adjust to changes in the size of other aligned sibling controls as well as changes to the parent's size.

See Also

Parent (see page 5832)

Align (see page 5798)

44.1.1.5.5 TDBCtrlGrid.Canvas Property

Indicates the drawing surface used to draw the TDBCtrlGridObject.

Pascal

```
property Canvas: TCanvas;
```

C++

```
__property TCanvas Canvas;
```

Description

Use the properties and methods of Canvas to draw an image of a panel in the TDBCtrlGrid (see page 8168) object from an OnPaintPanel (see page 8239) event handler.

See Also

OnPaintPanel (see page 8239)

44.1.1.5.6 TDBCtrlGrid.ColCount Property

Specifies the number of columns of panels shown in the grid.

Pascal

```
property ColCount: Integer;
```

C++

```
__property int ColCount;
```

Description

Set ColCount to the number of columns of panels that should appear in the TDBCtrlGrid (see page 8168) object. Each panel represents a separate record in the dataset.

Setting ColCount causes the TDBCtrlGrid (see page 8168) object to resize to accommodate the new number of columns. PanelWidth (see page 8201) doesn't change.

See Also

PanelWidth (see page 8201)

RowCount (see page 8207)

44.1.1.5.7 TDBCtrlGrid.Color Property

Specifies the background color of the control.

Pascal

```
property Color: TColor;
```

C++

```
__property TColor Color;
```

Description

Use Color to read or change the background color of the control.

If a control's ParentColor property is true, then changing the Color property of the control's parent automatically changes the Color property of the control. When the value of the Color property is changed, the control's ParentColor property is automatically

set to false.

C++ Examples:

```
/*
The following code changes the color of a shape control
using the Color dialog box. The example displays the Color
dialog box when the Button1 button is clicked, allowing the
user to select a color with the dialog box. When a color
value is selected with the dialog box, it is assigned to
the shape control.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  if (ColorDialog1->Execute())
    Shape1->Brush->Color = ColorDialog1->Color;
}
```

Delphi Examples:

```
{
The following code changes the color of a shape control
using the Color dialog box. The example displays the Color
dialog box when the Button1 button is clicked, allowing the
user to select a color with the dialog box. When a color
value is selected with the dialog box, it is assigned to
the shape control.
}
procedure TForm1.Button1Click(Sender: TObject);
begin
  if ColorDialog1.Execute then
    Shape1.Brush.Color := ColorDialog1.Color;
end;
```

See Also

ParentColor (see page 5834)

44.1.1.5.8 TDBCtrlGrid.Constraints Property

Specifies the size constraints for the control.

Pascal

```
property Constraints: TSizeConstraints;
```

C++

```
__property TSizeConstraints Constraints;
```

Description

Use Constraints to specify the minimum and maximum width and height of the control. When Constraints contains maximum or minimum values, the control cannot be resized to violate those constraints.

Note: Constraints apply to the height of the form. However, the height of the form depends on how large Windows makes the title bar. For example, Windows XP uses much larger title bars than other windowing systems. To work around this, note the ClientHeight when you design your form and set the constraints in the FormCreate event. In the following example, ClientHeight is represented by x: `Constraints.MinHeight := x + Height - ClientHeight`.

Warning: Do not set up constraints that conflict with the value of the Align or Anchors property. When these properties conflict, the response of the control to resize attempts is not well-defined.

See Also

AutoSize (see page 5803)

Align (see page 5798)

Anchors (see page 5802)

OnConstrainedResize (see page 5853)

OnCanResize (see page 5851)

44.1.1.5.9 TDBCtrlGrid.DataSource Property

Identifies the link to the dataset where the TDBCtrlGrid (see page 8168) object finds its data.

Pascal

```
property DataSource: TDataSource;
```

C++

```
__property TDataSource DataSource;
```

Description

Set DataSource to the TDataSource object that links to the dataset where the grid should fetch its data. DataSource allows the data-aware grid to read from, write to, and navigate around the dataset.

```
DBCtrlGrid1.DataSource := DataSource1;
DBCtrlGrid1->DataSource = DataSource1;
```

See Also

Creating a Grid That Contains Other Data-aware Controls

44.1.1.5.10 TDBCtrlGrid.DragCursor Property

Indicates the image used to represent the mouse pointer when the control is being dragged.

Pascal

```
property DragCursor: TCursor;
```

C++

```
__property TCursor DragCursor;
```

Description

Use the DragCursor property to change the cursor image presented when the control is being dragged.

Note: To make a custom cursor available for the DragCursor property, see the Cursor property.

See Also

Cursor (see page 5815)

DragKind (see page 5819)

DragMode (see page 5819)

44.1.1.5.11 TDBCtrlGrid.DragMode Property

Determines how the control initiates drag-and-drop or drag-and-dock operations.

Pascal

```
property DragMode: TDragMode;
```

C++

```
__property TDragMode DragMode;
```

Description

Use DragMode to control when the user can drag the control. Disable the drag-and-drop or drag-and-dock capability at runtime by setting the DragMode property value to dmManual. Enable automatic dragging by setting DragMode to dmAutomatic.

C++ Examples:

```
/*
The following code uses GetNodeAt to add a dragged node as a
child of the node under the mouse when it is dropped.  This
example requires a populated TreeView.  Also, the TTreeView
DragMode property set to dmAutomatic, and the TTreeView
OnDragOver event handler must be implemented to accept the
drop.
*/
void __fastcall TForm1::TreeView1DragDrop(TObject *Sender, TObject *Source,
      int X, int Y)
{
  if (Source != (TObject *)TreeView1 || TreeView1->Selected == NULL)
    return;
  THitTests HT = TreeView1->GetHitTestInfoAt(X, Y);
  TNodeAttachMode AttachMode;
  TTreeNode *Item = TreeView1->GetNodeAt(X, Y);
  if (HT.Contains(htOnItem) || HT.Contains(htOnIcon))
    AttachMode = naAddChild;
  else if (HT.Contains(htNowhere))
    AttachMode = naAdd;
  else if (HT.Contains(htOnIndent))
    AttachMode = naInsert;
  else
    return;
  TreeView1->Selected->MoveTo(Item, AttachMode);
}

void __fastcall TForm1::TreeView1DragOver(TObject *Sender, TObject *Source,
      int X, int Y, TDragState State, bool &Accept)
{
  Accept = (Source == (TObject *)TreeView1);
}
```

Delphi Examples:

```
{
The following code uses GetNodeAt to add a dragged node as a
child of the node under the mouse when it is dropped.  This
example requires a populated TreeView.  Also, the TTreeView
DragMode property set to dmAutomatic, and the TTreeView
OnDragOver event handler must be implemented to accept the
drop.
}
procedure TForm1.TreeView1DragDrop(Sender, Source: TObject; X, Y: Integer);
var
  AnItem: TTreeNode;
  AttachMode: TNodeAttachMode;
  HT: THitTests;
begin
  if TreeView1.Selected = nil then Exit;
  HT := TreeView1.GetHitTestInfoAt(X, Y);
  AnItem := TreeView1.GetNodeAt(X, Y);
  if (HT - [htOnItem, htOnIcon, htNowhere, htOnIndent] <> HT) then
```

```
    begin
      if (htOnItem in HT) or (htOnIcon in HT) then
        AttachMode := naAddChild
      else if htNowhere in HT then AttachMode := naAdd
      else if htOnIndent in HT then AttachMode := naInsert;
      TreeView1.Selected.MoveTo(AnItem, AttachMode);
    end;
  end;

  procedure TForm1.TreeView1DragOver(Sender, Source: TObject; X, Y: Integer;
    State: TDragState; var Accept: Boolean);
  begin
    Accept := Source is TTreeView;
  end;
```

Arranging the Order of Persistent Columns

44.1.1.5.12 TDBCtrlGrid.EditMode Property

Determines whether the TDBCtrlGrid (see page 8168) can be used to insert, delete, or edit records.

Pascal

```
property EditMode: Boolean;
```

C++

```
__property Boolean EditMode;
```

Description

Set EditMode to true to allow the user to edit the dataset using the grid. The user can toggle EditMode by pressing F2 or Enter. Inserting or deleting records using the grid will set EditMode to true.

See Also

AllowDelete (see page 8191)

AllowInsert (see page 8192)

DataSource (see page 8195)

DoKey (see page 8181)

44.1.1.5.13 TDBCtrlGrid.Enabled Property

Controls whether the control responds to mouse, keyboard, and timer events.

Pascal

```
property Enabled: Boolean;
```

C++

```
__property Boolean Enabled;
```

Description

Use Enabled to change the availability of the control to the user. To disable a control, set Enabled to false. Disabled controls appear dimmed. If Enabled is false, the control ignores mouse, keyboard, and timer events.

To re-enable a control, set Enabled to true. The control is no longer dimmed, and the user can use the control.

See Also

Visible (see page 5847)

DisableControls (see page 6925)

EnableControls (see page 6934)

Enabling Mouse

44.1.1.5.14 TDBCtrlGrid.Font Property

Controls the attributes of text written on or in the control.

Pascal

```
property Font: TFont;
```

C++

```
__property TFont Font;
```

Description

To change to a new font, specify a new TFont object. To modify a font, change the value of the Charset, Color, Height, Name, Pitch, Size, or Style of the TFont object.

C++ Examples:

```
/*
To use this example, place a TComboBox and TRichEdit or
TMemo on a form.  During form creation, a list of font names
is loaded into the combo box. When the combo box is clicked,
the memo or Rich Edit control font is set to the
corresponding font name in the combo box.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < Screen->Fonts->Count; i++)
   ComboBox1->Items->Add(Screen->Fonts->Strings[i]);
//  ComboBox1->Items = Screen->Fonts;  // Another way to do it.
}

void __fastcall TForm1::ComboBox1Change(TObject *Sender)
{
  RichEdit1->Font->Name = ComboBox1->Text;
}
```

Delphi Examples:

```
{
To use this example, place a TComboBox and TRichEdit or
TMemo on a form.  During form creation, a list of font names
```

```
is loaded into the combo box. When the combo box is clicked,
the memo or Rich Edit control font is set to the
corresponding font name in the combo box.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  i : Integer;
begin
  for i := 0 to Screen.Fonts.Count - 1 do
   ComboBox1.Items.Add(Screen.Fonts.Strings[i]);
//  ComboBox1.Items := Screen.Fonts;  // Another way to do it.
  RichEdit1.Lines.Text := 'How is it to be you?';
end;

procedure TForm1.ComboBox1Click(Sender: TObject);
begin
  RichEdit1.Font.Name := ComboBox1.Text;
end;
```

See Also

DesktopFont (see page 5818)

ParentFont (see page 5834)

Displaying and Editing Text in a Memo Control

44.1.1.5.15 TDBCtrlGrid.Orientation Property

Determines the order in which records from the dataset are displayed in the TDBCtrlGrid (see page 8168).

Pascal

```
property Orientation: TDBCtrlGridOrientation;
```

C++

```
__property TDBCtrlGridOrientation Orientation;
```

Description

Set Orientation to goVertical (the default) to have the panels ordered in rows with a vertical scroll bar. Set Orientation to goHorizontal to arrange panels in columns with a horizontal scroll bar.

See Also

ColCount (see page 8193)

RowCount (see page 8207)

44.1.1.5.16 TDBCtrlGrid.Panel Property

Pascal

```
property Panel: TDBCtrlPanel;
```

C++

```
__property TDBCtrlPanel Panel;
```

Description

This is Panel, a member of class TDBCtrlGrid.

44.1.1.5.17 TDBCtrlGrid.PanelBorder Property

Determines whether each panel is drawn with a raised border around it.

Pascal

```
property PanelBorder: TDBCtrlGridBorder;
```

C++

```
__property TDBCtrlGridBorder PanelBorder;
```

Description

The default value of gbRaised draws a raised border. Set PanelBorder to gbNone to eliminate the border.

See Also

OnPaintPanel (see page 8239)

44.1.1.5.18 TDBCtrlGrid.PanelCount Property

Specifies the number of records visible in the grid.

Pascal

```
property PanelCount: Integer;
```

C++

```
__property int PanelCount;
```

Description

TDBCtrlGrid (see page 8168) can represent a number of panels equal to the number in ColCount (see page 8193) times the number in RowCount (see page 8207). Usually, PanelCount will be the same as this value. PanelCount will be smaller than this if there are not enough records in the dataset to fill the entire grid.

See Also

ColCount (see page 8193)

RowCount (see page 8207)

44.1.1.5.19 TDBCtrlGrid.PanelHeight Property

Specifies the height (in pixels) of each panel.

Pascal

```
property PanelHeight: Integer;
```

C++

```
__property int PanelHeight;
```

Description

Set PanelHeight to the desired size of each panel in the grid. When the PanelHeight property is set, the grid resizes itself to fit the new panel height.

See Also

PanelWidth (see page 8201)

44.1.1.5.20 TDBCtrlGrid.PanelIndex Property

Specifies the index of the panel in the grid that represents the current record.

Pascal

```
property PanelIndex: Integer;
```

C++

```
__property int PanelIndex;
```

Description

Read PanelIndex to determine which panel represents the current record in the dataset. Set PanelIndex to move in the dataset to the record corresponding to a panel in the grid.

PanelIndex is a number in the range 0 to PanelCount (see page 8200) - 1, where 0 is the first panel, 1 is the second panel, and so on. The location of the panel with the index PanelIndex depends on the value of the Orientation (see page 8199) property. When Orientation (see page 8199) is goVertical, the panels are counted by rows. When Orientation (see page 8199) is goHorizontal, the panels are counted by columns.

See Also

Orientation (see page 8199)

PanelCount (see page 8200)

44.1.1.5.21 TDBCtrlGrid.PanelWidth Property

Specifies the width (in pixels) of each panel.

Pascal

```
property PanelWidth: Integer;
```

C++

```
__property int PanelWidth;
```

Description

Set PanelWidth to the desired size of each panel in the grid. When the PanelWidth property is set, the grid resizes itself to fit the new panel width.

See Also

PanelHeight (see page 8200)

44.1.1.5.22 TDBCtrlGrid.ParentColor Property

Determines where a control looks for its color information.

Pascal

```
property ParentColor: Boolean;
```

C++

```
__property Boolean ParentColor;
```

Description

To have a control use the same color as its parent control, set ParentColor to true. If ParentColor is false, the control uses its own Color property.

Set ParentColor to true for all controls in order to ensure that all the controls on a form have a uniform appearance. For example, if ParentColor is true for all controls in a form, changing the background color of the form to gray causes all the controls on the form to also have a gray background.

When the value of a control's Color property changes, ParentColor becomes false automatically.

See Also

Color (see page 5812)

Parent (see page 5832)

ParentFont (see page 5834)

ParentShowHint (see page 5835)

44.1.1.5.23 TDBCtrlGrid.ParentFont Property

Determines where a control looks for its font information.

Pascal

```
property ParentFont: Boolean;
```

C++

```
__property Boolean ParentFont;
```

Description

To have a control use the same font as its parent control, set ParentFont to true. If ParentFont is false, the control uses its own Font property. Many controls default ParentFont to true so that all the controls in a form or other container present a uniform appearance. When the value of a control's Font property changes, ParentFont becomes false automatically.

When ParentFont is true for a form, the form uses the default font.

See Also

Font (see page 5823)

Parent (see page 5832)

ParentColor (see page 5834)

ParentShowHint (see page 5835)

44.1.1.5.24 TDBCtrlGrid.ParentShowHint Property

Determines where a control looks to find out if its Help Hint should be shown.

Pascal

```
property ParentShowHint: Boolean;
```

C++

```
__property Boolean ParentShowHint;
```

Description

Use ParentShowHint to ensure that all the controls on a form either uniformly show their Help Hints or uniformly do not show them.

If ParentShowHint is true, the control uses the ShowHint property value of its parent. If ParentShowHint is false, the control uses the value of its own ShowHint property.

To provide Help Hints for only selected controls on a form, set the ShowHint property for those controls that should have Help Hints to true, and ParentShowHint becomes false automatically.

Note: Enable or disable all Help Hints for the entire application using the ShowHint property of the application object.

44.1.1.5.25 TDBCtrlGrid.PopupMenu Property

Identifies the pop-up menu associated with the control.

Pascal

```
property PopupMenu: TPopupMenu;
```

C++

```
__property TPopupMenu PopupMenu;
```

Description

Assign a value to PopupMenu to make a pop-up menu appear when the user selects the control and clicks the right mouse button. If the TPopupMenu's AutoPopup property is true, the pop-up menu appears automatically. If the menu's AutoPopup property is false, display the menu with a call to its Popup method from the control's OnContextPopup event handler.

C++ Examples:

```
/*
This example uses two edit boxes and one pop-up menu on a form.
The pop-up menu contains Cut, Copy, and Paste commands. This code
makes the pop-up menu available to both edit boxes:
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  PopupMenu1->AutoPopup = true;
  Edit1->PopupMenu = PopupMenu1;
  Edit2->PopupMenu = PopupMenu1;
}

/*
These are the cut, copy, and paste OnClick events for the commands
on the pop-up menu. Double click on the pop-up menu and add three
TMenuItems.  Then set the captions to "Cut", "Copy" and "Paste".
The names will be automatically set to "Cut1", "Copy1", and
"Paste1".  Then double click on the OnClick events and they will
be named "Cut1Click", "Copy1Click" and "Paste1Click" respectively.
Note: only the selected portion of the string in the edit box will
be copied, cut or replaced.
*/
void __fastcall TForm1::Copy1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
    if (pComponent->ClassNameIs("TEdit"))
      ((TEdit *)pComponent)->CopyToClipboard();
```

```
      else
        MessageBeep(0);
    }
    else
      MessageBeep(0);
  }

  void __fastcall TForm1::Cut1Click(TObject *Sender)
  {
    TComponent *pComponent = PopupMenu1->PopupComponent;
    if (pComponent)
    {
      if (pComponent->ClassNameIs("TEdit"))
        ((TEdit *)pComponent)->CutToClipboard();
      else
        MessageBeep(0);
    }
    else
      MessageBeep(0);
  }

  void __fastcall TForm1::Paste1Click(TObject *Sender)
  {
    TComponent *pComponent = PopupMenu1->PopupComponent;
    if (pComponent)
    {
      if (pComponent->ClassNameIs("TEdit"))
        ((TEdit *)pComponent)->PasteFromClipboard();
      else
        MessageBeep(0);
    }
    else
      MessageBeep(0);
  }
  /*
  This example demonstrates how to add and delete menu items
  to a popup menu at runtime and assign an event handler to
  the OnClick event.  Place a TPopupMenu and three buttons on
  the form named "AddButton", "EditButton",  and
  "DestroyButton" and add OnClick events to all three buttons.
  Put the TPopupMenu in the PopupMenu property of the form.
  Place the PopupMenuItemsClick procedure in the TForm1 type
  declaration so that it can be used as the method call for
  the menu item OnClick event.
  */
  void __fastcall TForm1::AddButtonClick(TObject *Sender)
  {
      const int num_items = 4;
      for (int index = 0; index < num_items; ++index)
      {
          TMenuItem *NewItem = new TMenuItem(PopupMenu1); // create the new item
          PopupMenu1->Items->Add(NewItem);// add it to the Popupmenu
          NewItem->Caption = "Menu Item " + IntToStr(index);
          NewItem->Tag = index;
          NewItem->OnClick = PopupMenuItemsClick;// assign it an event handler
          TNotifyEvent();
      }
  }

  void __fastcall TForm1::PopupMenuItemsClick(TObject *Sender)
  {
      TMenuItem *ClickedItem = dynamic_cast<TMenuItem *>(Sender);
      if (ClickedItem)
      {
          switch (ClickedItem->Tag)
          {
```

```
            case 0:
            {
                ShowMessage("first item clicked");
                break;
            }
            case 1:
            {
                ShowMessage("second item clicked");
                break;
            }
            case 2:
            {
                ShowMessage("third item clicked");
                break;
            }
            case 3:
            {
                ShowMessage("fourth item clicked");
                break;
            }
        }
    }
}

/*
To edit or destroy an item, grab its pointer via the Items
property.
*/
void __fastcall TForm1::EditButtonClick(TObject *Sender)
{
    const int index = 1;
    TMenuItem *ItemToEdit = PopupMenu->Items->Items[index];
    ItemToEdit->Caption = "Changed Caption";
}

void __fastcall TForm1::DestroyButtonClick(TObject *Sender)
{
    const int index = 2;
    TMenuItem *ItemToDelete = PopupMenu->Items->Items[index];
    delete ItemToDelete;
}
```

Delphi Examples:

```
{
This example uses two edit boxes and one pop-up menu on a form.
The pop-up menu contains Cut, Copy, and Paste commands. This code
makes the pop-up menu available to both edit boxes:
}
procedure TForm1.FormCreate(Sender: TObject);
begin
  PopupMenu1.AutoPopup := True;
  Edit1.PopupMenu := PopupMenu1;
  Edit2.PopupMenu := PopupMenu1;
end;

{
These are the cut, copy, and paste OnClick events for the commands
on the pop-up menu. Double click on the pop-up menu and add three
TMenuItems.  Then set the captions to "Cut", "Copy" and "Paste".
The names will be automatically set to "Cut1", "Copy1", and
"Paste1".  Then double click on the OnClick events and they will
be named "Cut1Click", "Copy1Click" and "Paste1Click" respectively.
Note: only the selected portion of the string in the edit box will
be copied, cut or replaced.
}
procedure TForm1.Copy1Click(Sender: TObject);
```

```
begin
  if PopupMenu1.PopupComponent = Edit1 then
   Edit1.CopyToClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.CopyToClipboard
  else
    Beep;
end;

procedure TForm1.Cut1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
    Edit1.CutToClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.CutToClipboard
  else
    Beep;
end;

procedure TForm1.Paste1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
    Edit1.PasteFromClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.PasteFromClipboard
  else
    Beep;
end;
{
This example demonstrates how to add and delete menu items
to a popup menu at runtime and assign an event handler to
the OnClick event.  Place a TPopupMenu and three buttons on
the form named "AddButton", "EditButton",  and
"DestroyButton" and add OnClick events to all three buttons.
Put the TPopupMenu in the PopupMenu property of the form.
Place the PopupMenuItemsClick procedure in the TForm1 type
declaration so that it can be used as the method call for
the menu item OnClick event.
}

44.1.1.5.26 TDBCtrlGrid.RowCount Property

Specifies the number of rows of panels displayed in the grid.

Pascal

```
property RowCount: Integer;
```

C++

```
__property int RowCount;
```

Description

Set RowCount to the number of rows of panels that should appear in the TDBCtrlGrid (see page 8168) object. Each panel represents a separate record in the dataset.

Setting RowCount causes the TDBCtrlGrid (see page 8168) object to resize to accommodate the new number of rows. PanelHeight (see page 8200) does not change.

See Also

ColCount (see page 8193)

PanelHeight (see page 8200)

44.1.1.5.27 TDBCtrlGrid.SelectedColor Property

Specifies the background color of the panel that represents the current record in the dataset.

Pascal

```
property SelectedColor: TColor;
```

C++

```
__property TColor SelectedColor;
```

Description

Set SelectedColor to a value other than value of the Color (see page 8193) property to make the panel that represents the current record stand out. TDBCtrlGrid (see page 8168) draws the selected panel using SelectedColor even when it does not have input focus. All other panels are drawn with the background set to the value of the Color (see page 8193) property.

See Also

Color (see page 5812)

44.1.1.5.28 TDBCtrlGrid.ShowFocus Property

Indicates whether to draw a focus rectangle around the current record in the TDBCtrlGrid (see page 8168) when it has input focus.

Pascal

```
property ShowFocus: Boolean;
```

C++

```
__property Boolean ShowFocus;
```

Description

Set ShowFocus to true to have TDBCtrlGrid (see page 8168) draw a focus rectangle around the current record when it has input focus. Set ShowFocus to false when providing visual feedback of focus in some other manner in an OnPaintPanel (see page 8239) event handler.

See Also

OnPaintPanel (see page 8239)

PanelIndex (see page 8201)

SelectedColor (see page 8208)

44.1.1.5.29 TDBCtrlGrid.ShowHint Property

Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.

Pascal

```
property ShowHint: Boolean;
```

C++

```
__property Boolean ShowHint;
```

Description

The Help Hint is the value of the Hint property, which is displayed in a box just beneath the control. Use ShowHint to determine whether a Help Hint appears for the control.

To enable Help Hint for a particular control, the application ShowHint property must be true and either

the control's own ShowHint property must be true, or

the control's ParentShowHint property must be true and its parent's ShowHint property must be true.

For example, imagine a check box within a group box. If the ShowHint property of the group box is true and the ParentShowHint property of the check box is true, but the ShowHint property of the check box is false, the check box still displays its Help Hint.

Changing the ShowHint value automatically sets the ParentShowHint property to false.

C++ Examples:

```
/*
This example uses an edit box and a list box on a form.
Items are added to the list box and a Help Hint is assigned
to both controls. The last statement enables the Help Hints
for the entire application.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  Edit1->Hint = "Enter your name";
  Edit1->ShowHint = true;

  char string[10];
  char index[3];
  for(int i = 1; i <= 10; i++)
  {
    strcpy(string, "Item");
    itoa(i, index, 10);
    strcat(string, index);
    ListBox1->Items->Add(string);
  }
  ListBox1->Hint = "Select an item";
  ListBox1->ShowHint = true;
  Application->ShowHint = true;
}
/*
Note: To see an example that displays the hints of controls
in some place other than in a Help Hint box, see the OnHint
example.
*/
```

Delphi Examples:

```
{
This example uses an edit box and a list box on a form.
Items are added to the list box and a Help Hint is assigned
to both controls. The last statement enables the Help Hints
for the entire application.
```

```
}
procedure TForm1.FormCreate(Sender: TObject);
var
  I: Integer;
begin
  Edit1.Hint := 'Enter your name';
  Edit1.ShowHint := True;
  with ListBox1 do
  begin
    for I := 1 to 10 do
      Items.Add('Item ' + IntToStr(I));
    Hint := 'Select an item';
    ShowHint := True;
  end;
  Application.ShowHint := True;
end;
{
Note: To see an example that displays the hints of controls
in some place other than in a Help Hint box, see the OnHint
example.
}

Displaying Fly-over Help

44.1.1.5.30 TDBCtrlGrid.TabOrder Property

Indicates the position of the control in its parent's tab order.

Pascal

```
property TabOrder: TTabOrder;
```

C++

```
__property TTabOrder TabOrder;
```

Description

TabOrder is the order in which child windows are visited when the user presses the Tab key. The control with the TabOrder value of 0 is the control that has the focus when the form first appears.

Initially, the tab order is always the order in which the controls were added to the form. The first control added to the form has a TabOrder value of 0, the second is 1, the third is 2, and so on. Change this by changing the TabOrder property.

Each control has a unique tab-order value within its parent. If you change the TabOrder property value of one control to be the same as the value of a second control, the TabOrder value for all the other controls changes. For example, suppose a control is sixth in the tab order. If you change the control's TabOrder property value to 3 (making the control fourth in the tab order), the control that was originally fourth in the tab order now becomes fifth, and the control that was fifth becomes sixth.

Assigning TabOrder a value greater than the number of controls contained in the parent control moves the control to the end of the tab order. The control does not take on the assigned value of TabOrder, but instead is given the number that assures the control is the last in the tab order.

Note: TabOrder is meaningful only if the TabStop property is true and if the control has a parent. (The TabOrder property of a form is not used unless the form is the child of another form.) A control with a TabOrder of -1 has no parent, and therefore cannot be reached by pressing the Tab key. To remove a parented control from the Tab order, set its TabStop property to false.

See Also

FindNextControl (see page 6149)

TabStop (see page 6211)

44.1.1.5.31 TDBCtrlGrid.TabStop Property

Determines if the user can tab to a control.

Pascal

```
property TabStop: Boolean;
```

C++

```
__property Boolean TabStop;
```

Description

Use the TabStop to allow or disallow access to the control using the Tab key.

If TabStop is true, the control is in the tab order. If TabStop is false, the control is not in the tab order and the user can't press the Tab key to move to the control.

Note: TabStop is not meaningful for a form unless the form assigns another form to be its parent.

See Also

TabOrder (see page 6211)

44.1.1.5.32 TDBCtrlGrid.Visible Property

Determines whether the component appears onscreen.

Pascal

```
property Visible: Boolean;
```

C++

```
__property Boolean Visible;
```

Description

Use the Visible property to control the visibility of the control at runtime. If Visible is true, the control appears. If Visible is false, the control is not visible.

Calling the Show method sets the control's Visible property to true. Calling the Hide method sets it to false.

C++ Examples:

```
/*
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
*/
void __fastcall TForm1::PageControl1Change(TObject *Sender)
{
  CheckBox1->Checked = PageControl1->ActivePage->Visible;
}

void __fastcall TForm1::CheckBox1Click(TObject *Sender)
{
```

```
  PageControl1->ActivePage->Visible = CheckBox1->Checked;
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < 10; i++)
  {
    TTabSheet *pPage = new TTabSheet(this);
    pPage->PageControl = PageControl1;
    pPage->Caption = AnsiString("Page") + IntToStr(i);
    TEdit *pEdit = new TEdit(this);
    pEdit->Parent = pPage;
    pEdit->Left = random(pPage->ClientWidth - pEdit->Width);
    pEdit->Top = random(pPage->ClientHeight - pEdit->Height);
  }
  PageControl1Change(Sender);
}
```

Delphi Examples:

```
{
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
}
procedure TForm1.CheckBox1Click(Sender: TObject);
begin
  PageControl1.ActivePage.Visible := CheckBox1.Checked;
end;

procedure TForm1.PageControl1Change(Sender: TObject);
begin
  CheckBox1.Checked := PageControl1.ActivePage.Visible;
end;

procedure TForm1.FormCreate(Sender: TObject);
var
  i: Integer;
begin
  for i := 0 to 9 do
    with TTabSheet.Create(Self) do
    begin
      PageControl := PageControl1;
      Caption := 'TabSheet' + IntToStr(i);
      with TEdit.Create(Self) do
      begin
        Parent := PageControl1.Pages[i];
        Left := Random(PageControl1.ActivePage.ClientWidth - Width);
        Top := Random(PageControl1.ActivePage.ClientHeight - Height);
      end;
    end;
    PageControl1Change(Sender);
end;
```

44.1.1.6 TDBCtrlGrid Events

The events of the TDBCtrlGrid class are listed here.

Published Events

	Name	Description
	OnClick (see page 8213)	Occurs when the user clicks the control.
	OnDblClick (see page 8215)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDragDrop (see page 8215)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 8218)	Occurs when the user drags an object over a control.
	OnEndDrag (see page 8220)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnEnter (see page 8221)	Occurs when a control receives the input focus.
	OnExit (see page 8224)	Occurs when the input focus shifts away from one control to another.
	OnKeyDown (see page 8225)	Occurs when a user presses any key while the control has focus.
	OnKeyPress (see page 8228)	Occurs when a key is pressed.
	OnKeyUp (see page 8229)	Occurs when the user releases a key that has been pressed.
	OnMouseActivate (see page 8231)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 8232)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseEnter (see page 8234)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 8234)	Occurs when the user moves the mouse outside of a control.
	OnMouseMove (see page 8234)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 8237)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnPaintPanel (see page 8239)	Occurs when TDBCtrlGrid (see page 8168) needs to draw a panel in the grid.
	OnStartDrag (see page 8240)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.

44.1.1.6.1 TDBCtrlGrid.OnClick Event

Occurs when the user clicks the control.

Pascal

```
property OnClick: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnClick;
```

Description

Use the OnClick event handler to respond when the user clicks the control. If the control has an associated action, and that action has an OnExecute method, the action's OnExecute method responds to click events unless it is superseded by an OnClick event handler.

Usually OnClick occurs when the user presses and releases the left mouse button with the mouse pointer over the control. This event can also occur when:

- The user selects an item in a grid, outline, list, or combo box by pressing an arrow key.
- The user presses Spacebar while a button or check box has focus.
- The user presses Enter when the active form has a default button (specified by the Default property).
- The user presses Esc when the active form has a cancel button (specified by the Cancel property).

- The user presses the accelerator key for a button or check box. For example, if the value of the Caption property of a check box is '&Bold', the B is underlined at runtime and the OnClick event of the check box is triggered when the user presses Alt+B. However, focus does not move to the control in these instances.
- The Checked property of a radio button is set to true.
- The value of the Checked property of a check box is changed.
- The Click method of a menu item is called.

For a form, an OnClick event occurs when the user clicks a blank area of the form or on a disabled component.

C++ Examples:

```
/*
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
*/
void __fastcall TForm1::PageControl1Change(TObject *Sender)
{
  CheckBox1->Checked = PageControl1->ActivePage->Visible;
}

void __fastcall TForm1::CheckBox1Click(TObject *Sender)
{
  PageControl1->ActivePage->Visible = CheckBox1->Checked;
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < 10; i++)
  {
    TTabSheet *pPage = new TTabSheet(this);
    pPage->PageControl = PageControl1;
    pPage->Caption = AnsiString("Page") + IntToStr(i);
    TEdit *pEdit = new TEdit(this);
    pEdit->Parent = pPage;
    pEdit->Left = random(pPage->ClientWidth - pEdit->Width);
    pEdit->Top = random(pPage->ClientHeight - pEdit->Height);
  }
  PageControl1Change(Sender);
}
```

Delphi Examples:

```
{
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
}
procedure TForm1.CheckBox1Click(Sender: TObject);
begin
  PageControl1.ActivePage.Visible := CheckBox1.Checked;
end;

procedure TForm1.PageControl1Change(Sender: TObject);
begin
  CheckBox1.Checked := PageControl1.ActivePage.Visible;
end;

procedure TForm1.FormCreate(Sender: TObject);
var
  i: Integer;
```

```
begin
  for i := 0 to 9 do
    with TTabSheet.Create(Self) do
    begin
      PageControl := PageControl1;
      Caption := 'TabSheet' + IntToStr(i);
      with TEdit.Create(Self) do
      begin
        Parent := PageControl1.Pages[i];
        Left := Random(PageControl1.ActivePage.ClientWidth - Width);
        Top := Random(PageControl1.ActivePage.ClientHeight - Height);
      end;
    end;
    PageControl1Change(Sender);
end;

44.1.1.6.2 TDBCtrlGrid.OnDblClick Event

Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.

Pascal

```
property OnDblClick: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnDblClick;
```

Description

Use the OnDblClick event to respond to mouse double-clicks.

See Also

OnClick (see page 5851)

Responding to User Actions at Runtime

44.1.1.6.3 TDBCtrlGrid.OnDragDrop Event

Occurs when the user drops an object being dragged.

Pascal

```
property OnDragDrop: TDragDropEvent;
```

C++

```
__property TDragDropEvent OnDragDrop;
```

Description

Use the OnDragDrop event handler to specify what happens when the user drops an object. The Source parameter of the OnDragDrop event is the object being dropped, and the Sender is the control the object is being dropped on. The X and Y parameters are the coordinates of the mouse positioned over the control.

C++ Examples:

```
/*
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
*/

// This OnDragOver event handler permits the list box to
// accept a dropped label:
void __fastcall TForm1::ListBox1DragOver(TObject *Sender, TObject *Source, int X, int Y,
TDragState State, bool &Accept)
{
   Accept = Source->ClassNameIs("TLabel");
}

/*
This OnDragDrop event handler implements the drop behavior.
*/
void __fastcall TForm1::ListBox1DragDrop(TObject *Sender, TObject *Source, int X, int Y)
{
  if (Sender->ClassNameIs("TListBox") && Source->ClassNameIs("TLabel"))
  {
    TListBox *DestList = (TListBox *)Sender;
    DestList->Font = ((TLabel *)Source)->Font;
    DestList->Color = ((TLabel *)Source)->Color;
    DestList->DoubleBuffered = true;
    DestList->Color = clWindow;
  }
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  ListBox1->Items->Add("Not");
  ListBox1->Items->Add("In");
  ListBox1->Items->Add("Alphabetical");
  ListBox1->Items->Add("Order");

}
```

Delphi Examples:

```
{
This code is an OnDragOver event handler that won't allow a
label control to be dropped on a panel control and stops the
dragging of the label as soon as the user drags the label
onto the panel:
Note: Set the label's DragMode property to dmAutomatic.
}
procedure TForm1.FormDragDrop(Sender, Source: TObject; X, Y: Integer);
begin
  TForm1(Source).Left := X;
  TForm1(Source).Top := Y;
end;

procedure TForm1.FormDragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
```

```
begin
  Accept := Source is TLabel;
end;

procedure TForm1.Panel1DragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := False;
  if (Source is TLabel) and (State = dsDragEnter) then
    (Source as TLabel).EndDrag(False);
end;
{
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
}

procedure TForm1.FormCreate(Sender: TObject);
begin
  ListBox1.Items.Add('Not');
  ListBox1.Items.Add('In');
  ListBox1.Items.Add('Alphabetical');
  ListBox1.Items.Add('Order');
end;

// This OnDragOver event handler permits the list box to
// accept a dropped label:

procedure TForm1.ListBox1DragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := Source is TLabel;
end;

// This OnDragDrop event handler implements the drop behavior.

procedure TForm1.ListBox1DragDrop(Sender, Source: TObject; X, Y: Integer);
begin
  if (Sender is TListBox) and (Source is TLabel) then
  begin
    with Sender as TListBox do
    begin
      Font := (Source as TLabel).Font;
      Color := (Source as TLabel).Color;
      DoubleBuffered := true;
      Color := clWindow;
    end;
  end;
end;

44.1.1.6.4 TDBCtrlGrid.OnDragOver Event

Occurs when the user drags an object over a control.

Pascal

```
property OnDragOver: TDragOverEvent;
```

C++

```
__property TDragOverEvent OnDragOver;
```

Description

Use an OnDragOver event to signal that the control can accept a dragged object so the user can drop or dock it.

Within the OnDragOver event handler, change the Accept parameter to false to reject the dragged object. Leave Accept as true to allow the user to drop or dock the dragged object on the control.

To change the shape of the cursor, indicating that the control can accept the dragged object, change the value of the DragCursor property for the control before the OnDragOver event occurs.

The Source is the object being dragged, the Sender is the potential drop or dock site, and X and Y are screen coordinates in pixels. The State parameter specifies how the dragged object is moving over the control.

Note: Within the OnDragOver event handler, the Accept parameter defaults to true. However, if an OnDragOver event handler is not supplied, the control rejects the dragged object, as if the Accept parameter were changed to false.

C++ Examples:

```
/*
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
*/

// This OnDragOver event handler permits the list box to
// accept a dropped label:
void __fastcall TForm1::ListBox1DragOver(TObject *Sender, TObject *Source, int X, int Y,
TDragState State, bool &Accept)
{
   Accept = Source->ClassNameIs("TLabel");
}

/*
This OnDragDrop event handler implements the drop behavior.
*/
void __fastcall TForm1::ListBox1DragDrop(TObject *Sender, TObject *Source, int X, int Y)
{
  if (Sender->ClassNameIs("TListBox") && Source->ClassNameIs("TLabel"))
  {
    TListBox *DestList = (TListBox *)Sender;
    DestList->Font = ((TLabel *)Source)->Font;
    DestList->Color = ((TLabel *)Source)->Color;
    DestList->DoubleBuffered = true;
    DestList->Color = clWindow;
  }
```

```
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  ListBox1->Items->Add("Not");
  ListBox1->Items->Add("In");
  ListBox1->Items->Add("Alphabetical");
  ListBox1->Items->Add("Order");

}
```

Delphi Examples:

```
{
This code is an OnDragOver event handler that won't allow a
label control to be dropped on a panel control and stops the
dragging of the label as soon as the user drags the label
onto the panel:
Note: Set the label's DragMode property to dmAutomatic.
}
procedure TForm1.FormDragDrop(Sender, Source: TObject; X, Y: Integer);
begin
  TForm1(Source).Left := X;
  TForm1(Source).Top := Y;
end;

procedure TForm1.FormDragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := Source is TLabel;
end;

procedure TForm1.Panel1DragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := False;
  if (Source is TLabel) and (State = dsDragEnter) then
    (Source as TLabel).EndDrag(False);
end;
{
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
}

procedure TForm1.FormCreate(Sender: TObject);
begin
  ListBox1.Items.Add('Not');
  ListBox1.Items.Add('In');
  ListBox1.Items.Add('Alphabetical');
  ListBox1.Items.Add('Order');
end;

// This OnDragOver event handler permits the list box to
// accept a dropped label:

procedure TForm1.ListBox1DragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := Source is TLabel;
end;

// This OnDragDrop event handler implements the drop behavior.
```

```
procedure TForm1.ListBox1DragDrop(Sender, Source: TObject; X, Y: Integer);
begin
  if (Sender is TListBox) and (Source is TLabel) then
  begin
    with Sender as TListBox do
    begin
      Font := (Source as TLabel).Font;
      Color := (Source as TLabel).Color;
      DoubleBuffered := true;
      Color := clWindow;
    end;
  end;
end;
```

44.1.1.6.5 TDBCtrlGrid.OnEndDrag Event

Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.

Pascal

```
property OnEndDrag: TEndDragEvent;
```

C++

```
__property TEndDragEvent OnEndDrag;
```

Description

Use the OnEndDrag event handler to specify any special processing that occurs when dragging stops.

C++ Examples:

```
/*
This code displays a message in a label named Status. The
message displayed depends on whether the dragged label
control was successfully dropped into and accepted by a
another control.
*/
void __fastcall TForm1::Label1EndDrag(TObject *Sender, TObject *Target, int X,
      int Y)
{
  if (Sender->ClassNameIs("TLabel"))
  {
    AnsiString S = ((TLabel *)Sender)->Name + " was dropped and ";
    if (Target)
      S = S + "accepted!";
    else
      S = S + "rejected.";
```

```
    Status->Caption = S;
  }
}
```

Delphi Examples:

```
{
This code displays a message in a label named Status. The
message displayed depends on whether the dragged label
control was successfully dropped into and accepted by a
another control.
}
procedure TForm1.Label1EndDrag(Sender, Target: TObject; X, Y: Integer);
var
  S: string;
begin
  S := (Sender as TLabel).Name + ' was dropped... and ';
  if Target <> nil then
    S := S + 'accepted!'
  else
    S := S + 'rejected!';
  Status.Caption := S;
end;
```

44.1.1.6.6 TDBCtrlGrid.OnEnter Event

Occurs when a control receives the input focus.

Pascal

```
property OnEnter: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnEnter;
```

Description

Use the OnEnter event handler to cause any special processing to occur when a control becomes active.

The OnEnter event does not occur when switching between forms or between another application and the application that includes the control.

When switching between controls in separate container controls such as the TPanel and the TGroupBox controls, an OnEnter event occurs for the container before the OnEnter event of the contained control.

Similarly, an OnExit event of the container occurs after the OnExit event of the control in a container when focus moves to another control outside the container.

For example, consider a form with an OK button and a group box that contains three radio buttons, where focus is currently on the OK button. When the user clicks one of the radio buttons, an OnExit event of the button occurs, followed by an OnEnter event on the group box, and finally an OnEnter event on the radio button that was clicked. If the user then clicks on the OK button, an OnExit event for the radio button occurs followed by an OnExit event for the group box, and then the button's OnEnter event occurs.

C++ Examples:

```
/*
This example takes an edit control, a button, and a rich
edit control on a form.  When the user presses the button, a
Font dialog appears.  When the user clicks the Apply (not OK)
button in the Font dialog, the currently selected font is
applied to the active control. Clicking the button sets the
ActiveControl to the button.  That is why we need to save
the ActiveControl in a shared OnEnter procedure.  In the rich
edit, only the text selected converts.
*/
TWinControl *myActiveControl;

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  FontDialog1->Options << fdApplyButton;
  FontDialog1->Execute();
}

void __fastcall TForm1::FontDialog1Apply(TObject *Sender, HWND Wnd)
{
  if (myActiveControl->ClassNameIs("TEdit"))
   ((TEdit *)myActiveControl)->Font->Assign(FontDialog1->Font);
  else if (myActiveControl->ClassNameIs("TRichEdit"))
    ((TRichEdit *)myActiveControl)->SelAttributes->Assign(FontDialog1->Font);
  else
    MessageBeep(0);
}

void __fastcall TForm1::Edit1Enter(TObject *Sender)
{
  myActiveControl = ActiveControl;
}
/*
This example uses an edit box and a memo control on a form.
When either the edit box or the memo is the active control,
it is colored yellow. When the active control becomes
inactive, the color of the control returns to the Windows
system color for a window.  These event handlers could also
be shared.
*/
void __fastcall TForm1::Edit1Enter(TObject *Sender)
{
  Edit1->Color = clYellow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Edit1Exit(TObject *Sender)
{
  Edit1->Color = clWindow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Memo1Enter(TObject *Sender)
{
  Memo1->Color = clYellow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Memo1Exit(TObject *Sender)
{
  Memo1->Color = clWindow;
}
```

Delphi Examples:

```
{
This example takes an edit control, a button, and a rich
edit control on a form.  When the user presses the button, a
Font dialog appears.  When the user clicks the Apply (not OK)
button in the Font dialog, the currently selected font is
```

```
applied to the active control. Clicking the button sets the
ActiveControl to the button.  That is why we need to save
the ActiveControl in a shared OnEnter procedure.  In the rich
edit, only the text selected converts.
}
procedure TForm1.Button1Click(Sender: TObject);
begin
   FontDialog1.Options := FontDialog1.Options + [fdApplyButton];
   FontDialog1.Execute;
end;

procedure TForm1.Edit1Enter(Sender: TObject);
begin
  myActiveControl := ActiveControl;
end;

procedure TForm1.FontDialog1Apply(Sender: TObject; Wnd: HWND);
begin
  if myActiveControl is TEdit then
    with myActiveControl as TEdit do
       Font.Assign(TFontDialog(Sender).Font)
  else if myActiveControl is TRichEdit then
    with myActiveControl as TRichEdit do
      SelAttributes.Assign(TFontDialog(Sender).Font)
  else
    Beep;
end;
{
This example uses an edit box and a memo control on a form.
When either the edit box or the memo is the active control,
it is colored yellow. When the active control becomes
inactive, the color of the control returns to the Windows
system color for a window.  These event handlers could also
be shared.
}
procedure TForm1.Edit1Enter(Sender: TObject);
begin
  Edit1.Color := clYellow;
end;

procedure TForm1.Edit1Exit(Sender: TObject);
begin
  Edit1.Color := clWindow;
end;

procedure TForm1.Memo1Enter(Sender: TObject);
begin
  Memo1.Color := clYellow;
end;

procedure TForm1.Memo1Exit(Sender: TObject);
begin
  Memo1.Color := clWindow;
end;
```

44.1.1.6.7 TDBCtrlGrid.OnExit Event

Occurs when the input focus shifts away from one control to another.

Pascal

```
property OnExit: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnExit;
```

Description

Use the OnExit event handler to provide special processing when the control ceases to be active.

The OnExit event does not occur when switching between forms or between another application and your application.

When switching between controls in separate container controls such as the TPanel and the TGroupBox controls, an OnExit event occurs for the control inside the container before the OnExit event of the container.

Similarly, an OnEnter event of the container occurs before the OnEnter event of the control in a container when focus moves to a control inside a container.

For example, consider a form with an OK button and a group box that contains three radio buttons, where focus is currently on the OK button. When the user clicks one of the radio buttons, an OnExit event of the button occurs, followed by an OnEnter event on the group box, and finally an OnEnter event on the radio button that was clicked. If the user then clicks on the OK button, an OnExit event for the radio button occurs followed by an OnExit event for the group box, and then the button's OnEnter event occurs.

Note: In some control classes the ActiveControl property updates before the OnExit event occurs.

C++ Examples:

```
/*
This example uses an edit box and a memo control on a form.
When either the edit box or the memo is the active control,
it is colored yellow. When the active control becomes
inactive, the color of the control returns to the Windows
system color for a window.  These event handlers could also
be shared.
*/
void __fastcall TForm1::Edit1Enter(TObject *Sender)
{
  Edit1->Color = clYellow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Edit1Exit(TObject *Sender)
{
  Edit1->Color = clWindow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Memo1Enter(TObject *Sender)
{
  Memo1->Color = clYellow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Memo1Exit(TObject *Sender)
{
  Memo1->Color = clWindow;
}
```

Delphi Examples:

```
{
This example uses an edit box and a memo control on a form.
When either the edit box or the memo is the active control,
it is colored yellow. When the active control becomes
inactive, the color of the control returns to the Windows
system color for a window.  These event handlers could also
be shared.
}
procedure TForm1.Edit1Enter(Sender: TObject);
begin
  Edit1.Color := clYellow;
end;

procedure TForm1.Edit1Exit(Sender: TObject);
begin
  Edit1.Color := clWindow;
end;

procedure TForm1.Memo1Enter(Sender: TObject);
begin
  Memo1.Color := clYellow;
end;

procedure TForm1.Memo1Exit(Sender: TObject);
begin
  Memo1.Color := clWindow;
end;
```

44.1.1.6.8 TDBCtrlGrid.OnKeyDown Event

Occurs when a user presses any key while the control has focus.

Pascal

```
property OnKeyDown: TKeyEvent;
```

C++

```
__property TKeyEvent OnKeyDown;
```

Description

Use the OnKeyDown event handler to specify special processing to occur when a key is pressed. The OnKeyDown handler can respond to keyboard keys, including function keys and keys combined with the `Shift`, `Alt`, and `Ctrl` keys, and pressed mouse buttons.

Note: TCheckBox does not fire OnKeyDown events for arrow keys.

The TKeyEvent type points to a method that handles keyboard events.

The Key parameter is the key on the keyboard. For non-alphanumeric keys, use virtual key codes to determine the key pressed. For more information, see Virtual Key codes.

The Shift parameter indicates whether the Shift, Alt, or Ctrl keys are combined with the keystroke.

An application gets Windows WM_KEYDOWN messages for all keys when the user presses a key. These messages indirectly fire the OnKeyDown event. If you set the Key to 0 there you prevent only any further processing of this message. But for keys that generate characters Windows also produces WM_CHAR. At the time your OnKeyDown event fires, the WM_CHAR message for the key will already be in the message queue. Setting Key to 0 does not stop it from being delivered, so it fires the

OnKeyPress event. You must set the Key to #0 to prevent the control from intercepting the WM_CHAR message.

This method of organizing key processing has advantages. Code that only deals with characters, including control characters like #13 for carriage return, #3 for Ctrl-C and so on, should go into the OnKeyPress event. Code that deals with keys that do not generate characters should be put into the OnKeyDown event.

C++ Examples:

```
/*
This example changes a form's color to aqua when the user
presses the F1 key, even when a control on the form has the
focus. When the user releases the key, the form returns to
its original color.  Set the KeyPreview on the form to True.
Set the OnKeyDown event to FormKeyDown and set the OnKeyUp
event to FormKeyUp.  Set the KeyPreview on the form to True.
*/
void __fastcall TForm1::FormKeyDown(TObject *Sender, WORD &Key,
      TShiftState Shift)
{
  if (Key == VK_F1)
  {
    FormColor = Form1->Color;
    Form1->Color = clAqua;
    if (ComboBox1->Text == "KeyDown")
      ComboBox1->Text = "KeyDown2";
    else
      ComboBox1->Text = "KeyDown";
    Form1->Refresh();
    Memo1->Lines->Add(ComboBox1->Text);
  }
}

void __fastcall TForm1::FormKeyUp(TObject *Sender, WORD &Key, TShiftState Shift)
{
  if (Key == VK_F1)
  {
    Form1->Color = FormColor;
    if (ComboBox1->Text == "KeyUp")
      ComboBox1->Text = "KeyUp2";
    else
      ComboBox1->Text = "KeyUp";
    Form1->Refresh();
    Memo1->Lines->Add(ComboBox1->Text);
  }
}
```

Delphi Examples:

```
{
This example changes a form's color to aqua when the user
presses the F1 key, even when a control on the form has the
focus. When the user releases the key, the form returns to
its original color.  Set the KeyPreview on the form to True.
Set the OnKeyDown event to FormKeyDown and set the OnKeyUp
event to FormKeyUp.  Set the KeyPreview on the form to True.
}
var
  FormColor: TColor;

```
__property TKeyPressEvent OnKeyPress;
```

Description

Use the OnKeyPress event handler to make something happen as a result of a single character key press.

The Key parameter in the OnKeyPress event handler is of type Char; therefore, the OnKeyPress event registers the ASCII character of the key pressed. Keys that don't correspond to an ASCII Char value (Shift or F1, for example) don't generate an OnKeyPress event. Key combinations (such as Shift+A), generate only one OnKeyPress event (for this example, Shift+A results in a Key value of "A" if Caps Lock is off). To respond to non-ASCII keys or key combinations, use the OnKeyDown or OnKeyUp event handlers.

An application gets Windows WM_KEYDOWN messages for all keys when the user presses a key. These messages indirectly fire the OnKeyDown event. If you set the Key to 0 there you prevent only any further processing of this message. But for keys that generate characters Windows also produces WM_CHAR. At the time your OnKeyDown event fires, the WM_CHAR message for the key will already be in the message queue. Setting Key to 0 does not stop it from being delivered, so it fires the OnKeyPress event. You must set the Key to #0 to prevent the control from intercepting the WM_CHAR message.

This method of organizing key processing has advantages. Code that only deals with characters, including control characters like #13 for carriage return, #3 for Ctrl-C and so on, should go into the OnKeyPress event. Code that deals with keys that do not generate characters should be put into the OnKeyDown event.

C++ Examples:

```
/*
This event handler displays a message dialog box specifying
which key was pressed:
*/

void __fastcall TForm1::FormKeyPress(TObject *Sender, char &Key)
{
  char keyString[25];
```

```
  keyString[0] = Key;
  strcpy(&keyString[1], " Was Pressed");
  TMsgDlgButtons() << mbOK;
  MessageDlg(AnsiString(keyString), TMsgDlgType(mtInformation), TMsgDlgButtons() << mbOK, 0);
}
```

Delphi Examples:

```
{
This event handler displays a message dialog box specifying
which key was pressed:
}
procedure TForm1.FormKeyPress(Sender: TObject; var Key: Char);
begin
  MessageDlg(Key + ' has been pressed', mtInformation, [mbOK], 0)
end;
```

44.1.1.6.10 TDBCtrlGrid.OnKeyUp Event

Occurs when the user releases a key that has been pressed.

Pascal

```
property OnKeyUp: TKeyEvent;
```

C++

```
__property TKeyEvent OnKeyUp;
```

Description

Use the OnKeyUp event handler to provide special processing that occurs when a key is released. The OnKeyUp handler can respond to all keyboard keys, including function keys and keys combined with the Shift, Alt, and Ctrl keys.

The TKeyEvent type points to a method that handles keyboard events. The Key parameter is the key on the keyboard. For non-alphanumeric keys, you must use virtual key codes to determine the key pressed. For more information, see Virtual Key codes.

The Shift parameter indicates whether the Shift, Alt, or Ctrl keys are combined with the keystroke.

C++ Examples:

```
/*
This example changes a form’s color to aqua when the user
presses the F1 key, even when a control on the form has the
focus. When the user releases the key, the form returns to
its original color.  Set the KeyPreview on the form to True.
Set the OnKeyDown event to FormKeyDown and set the OnKeyUp
event to FormKeyUp.  Set the KeyPreview on the form to True.
*/
void __fastcall TForm1::FormKeyDown(TObject *Sender, WORD &Key,
      TShiftState Shift)
{
  if (Key == VK_F1)
  {
    FormColor = Form1->Color;
    Form1->Color = clAqua;
    if (ComboBox1->Text == "KeyDown")
      ComboBox1->Text = "KeyDown2";
```

```
      else
        ComboBox1->Text = "KeyDown";
      Form1->Refresh();
      Memo1->Lines->Add(ComboBox1->Text);
    }
  }

  void __fastcall TForm1::FormKeyUp(TObject *Sender, WORD &Key, TShiftState Shift)
  {
    if (Key == VK_F1)
    {
      Form1->Color = FormColor;
      if (ComboBox1->Text == "KeyUp")
        ComboBox1->Text = "KeyUp2";
      else
        ComboBox1->Text = "KeyUp";
      Form1->Refresh();
      Memo1->Lines->Add(ComboBox1->Text);
    }
  }
```

Delphi Examples:

```
  {
  This example changes a form's color to aqua when the user
  presses the F1 key, even when a control on the form has the
  focus. When the user releases the key, the form returns to
  its original color.  Set the KeyPreview on the form to True.
  Set the OnKeyDown event to FormKeyDown and set the OnKeyUp
  event to FormKeyUp.  Set the KeyPreview on the form to True.
  }
  var
    FormColor: TColor;
  procedure TForm1.FormCreate(Sender: TObject);
  begin
    KeyPreview := True;
    FormColor := Form1.Color;
  end;

  procedure TForm1.FormKeyDown(
    Sender: TObject; var Key: Word; Shift: TShiftState);
  begin
    if Key = VK_F1 then
    begin
      Form1.Color := clAqua;
      if (ComboBox1.Text = 'KeyDown') then
        ComboBox1.Text := 'KeyDown2'
      else
        ComboBox1.Text := 'KeyDown';
      WriteLn(ComboBox1.Text);
    end;
  end;

  procedure TForm1.FormKeyUp(
    Sender: TObject; var Key: Word; Shift: TShiftState);
  begin
    if Key = VK_F1 then
    begin
      Form1.Color := FormColor;
      if (ComboBox1.Text = 'KeyUp') then
        ComboBox1.Text := 'KeyUp2'
      else
        ComboBox1.Text := 'KeyUp';
      WriteLn(ComboBox1.Text);
    end;
  end;

44.1.1.6.11 TDBCtrlGrid.OnMouseActivate Event

Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.

Pascal

```
property OnMouseActivate: TMouseActivateEvent;
```

C++

```
__property TMouseActivateEvent OnMouseActivate;
```

Description

Use the OnMouseActivate event handler to implement any special processing that should occur as a result of pressing a mouse button on a control when the parent top-level form is not active.

The event type is:

```
TMouseActivateEvent = procedure (Sender: TObject; Button: TMouseButton; ShiftState:
TShiftState;
X, Y: Integer; HitTest: Integer; var MouseActivate: TMouseActivate) of object;
```

When you click on a control and the parent top-level form is not active, this event fires on the control that the mouse cursor is over. MouseActivate is a protected virtual function in TControl. MouseActivate can be overridden in custom control descendants to provide special built-in processing of the OnMouseActivate events. If you leave the default value of MouseActivate as maDefault, the parent control fires the OnMouseActivate event and repeats the process all the way up to the top-level form. If no control in the chain sets the value of MouseActivate, the behavior is the same as if a control set TMouseActivate to maActivate. At any point, a control can set the value of TMouseActivate and the parent processing stops.

Some controls set focus to themselves when they get a button down message so, in some cases, setting maNoActivate appears to have no effect. For instance, a TButton control sets focus to itself in the WM_LBUTTONDOWN message regardless of whether or not TMouseActivate is set to maNoActivate. In this case, setting maNoActivateAndEat will work because the top-level form is not activated and the WM_LBUTTONDOWN message is suppressed.

The HitTest parameter is the hit test value obtained from the WM_NCHITTEST message. See Windows.pas for valid values and their meanings. In most cases this value will be HTCLIENT, which means that the user clicked in the client area of a control. However, in the case of a top-level form, this can take other values such as HTCAPTION, or HTBOTTOM. This allows the code to decide which value to set for MouseActivate, based on the HitTest code. For example, the following code in the OnMouseActivate event handler for a TForm forces the user to click into a non-client area to activate the form:

```
if HitTest = HTCLIENT then
    MouseActivate := maNoActivateAndEat;
```

Even though this event is tied to how Windows processes WM_MOUSEACTIVATE, the actual handling of the message is done at the TControl level, which is the point in the VCL hierarchy where the control has no window handle. The OnMouseActivate event is then simulated since the all TControl descendants also have OnMouseDown, OnMouseMove, and OnMouseUp events. This information is applicable to both VCL Win32 and VCL.NET.

44.1.1.6.12 TDBCtrlGrid.OnMouseDown Event

Occurs when the user presses a mouse button with the mouse pointer over a control.

Pascal

```
property OnMouseDown: TMouseEvent;
```

C++

```
__property TMouseEvent OnMouseDown;
```

Description

Use the OnMouseDown event handler to implement any special processing that should occur as a result of pressing a mouse button.

The OnMouseDown event handler can respond to left, right, or center mouse button presses and shift key plus mouse-button combinations. Shift keys are the Shift, Ctrl, and Alt keys. X and Y are the pixel coordinates of the mouse pointer in the client area of the Sender.

C++ Examples:

```
/*
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a
rectangle is drawn on the form. When the mouse button is
released, the rectangle appears on the form's canvas. Its
top-left and bottom-right corners are defined by the
location of the mouse pointer when the user pressed and
released the mouse button.  While the user drags the mouse,
the location of the top, left, bottom, and right sides of
the rectangle are displayed in the status bar.
*/
int StartX, StartY; // Declare at the top of the form's unit
// Use this code as the OnMouseDown event handler of the form:
void __fastcall TForm1::FormMouseDown(TObject *Sender, TMouseButton Button, TShiftState Shift,
int X, int Y)
{
  StartX = X;
  StartY = Y;
}

// Use this code as the OnMouseUp event handler of the form:
void __fastcall TForm1::FormMouseUp(TObject *Sender, TMouseButton Button, TShiftState Shift,
int X, int Y)
{
  Form1->Canvas->Rectangle(StartX, StartY, X, Y);
  StatusBar1->Panels->Items[0]->Text = "";
  StatusBar1->Panels->Items[1]->Text = "";
  StatusBar1->Panels->Items[2]->Text = "";
  StatusBar1->Panels->Items[3]->Text = "";
}

// Use this code as the OnMouseMove event handler of the form:
void __fastcall TForm1::FormMouseMove(TObject *Sender, TShiftState Shift, int X, int Y)
{
  if (Shift.Contains(ssLeft)) // make sure button is down
  {
    if (Y > StartY)
    {
      StatusBar1->Panels->Items[0]->Text = "Top: " + IntToStr(StartY);
```

```
      StatusBar1->Panels->Items[2]->Text = "Bottom: " + IntToStr(Y);
    }
    else
    {
      StatusBar1->Panels->Items[0]->Text = "Top: " + IntToStr(Y);
      StatusBar1->Panels->Items[2]->Text = "Bottom: " + IntToStr(StartY);
    }
    if (X > StartX)
    {
      StatusBar1->Panels->Items[1]->Text = "Left: " + IntToStr(StartX);
      StatusBar1->Panels->Items[3]->Text = "Right: " + IntToStr(X);
    }
    else
    {
      StatusBar1->Panels->Items[1]->Text = "Left: " + IntToStr(X);
      StatusBar1->Panels->Items[3]->Text = "Right: " + IntToStr(StartX);
    }
  }
}
```

44.1.1.6.13 TDBCtrlGrid.OnMouseEnter Event

Occurs when the user moves the mouse into a control.

Pascal

```
property OnMouseEnter: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnMouseEnter;
```

Description

Use the OnMouseEnter event handler to implement any special processing that should occur as a result of moving the mouse into a control when the parent top-level form is not active.

44.1.1.6.14 TDBCtrlGrid.OnMouseLeave Event

Occurs when the user moves the mouse outside of a control.

Pascal

```
property OnMouseLeave: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnMouseLeave;
```

Description

Use the OnMouseLeave event handler to implement any special processing that should occur as a result of moving the mouse outside of a control when the parent top-level form is not active.

44.1.1.6.15 TDBCtrlGrid.OnMouseMove Event

Occurs when the user moves the mouse pointer while the mouse pointer is over a control.

Pascal

```
property OnMouseMove: TMouseMoveEvent;
```

C++

```
__property TMouseMoveEvent OnMouseMove;
```

Description

Use the OnMouseMove event handler to respond when the mouse pointer moves after the control has captured the mouse.

Use the Shift parameter of the OnMouseDown event handler, to determine to the state of the shift keys and mouse buttons. Shift keys are the Shift, Ctrl, and Alt keys or shift key-mouse button combinations. X and Y are pixel coordinates of the new location of the mouse pointer in the client area of the Sender.

C++ Examples:

```
/*
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a
rectangle is drawn on the form. When the mouse button is
released, the rectangle appears on the form's canvas. Its
top-left and bottom-right corners are defined by the
location of the mouse pointer when the user pressed and
released the mouse button.  While the user drags the mouse,
the location of the top, left, bottom, and right sides of
the rectangle are displayed in the status bar.

44.1.1.6.16 TDBCtrlGrid.OnMouseUp Event

Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.

Pascal

```
property OnMouseUp: TMouseEvent;
```

C++

```
__property TMouseEvent OnMouseUp;
```

Description

Use an OnMouseUp event handler to implement special processing when the user releases a mouse button.

The OnMouseUp event handler can respond to left, right, or center mouse button presses and shift key plus mouse-button combinations. Shift keys are the Shift, Ctrl, and Alt keys. X and Y are the pixel coordinates of the mouse pointer in the client area of the Sender.

C++ Examples:

```
/*

      else
        begin
        StatusBar1.Panels[1].Text := 'Left: ' + IntToStr(X);
        StatusBar1.Panels[3].Text := 'Right: ' + IntToStr(StartX);
        end;
    end;
  end;
```

Responding to a Mouse-up Action

44.1.1.6.17 TDBCtrlGrid.OnPaintPanel Event

Occurs when TDBCtrlGrid (see page 8168) needs to draw a panel in the grid.

Pascal

```
property OnPaintPanel: TPaintPanelEvent;
```

C++

```
__property TPaintPanelEvent OnPaintPanel;
```

Description

Write an OnPaintPanel event handler to customize the drawing of a panel in the TDBCtrlGrid (see page 8168) object. TDBCtrlGrid (see page 8168) paints the background using the Color (see page 8193) or SelectedColor (see page 8208) property, including the raised border if it is specified by the PanelBorder (see page 8200) property. Then the OnPaintPanel event occurs to allow an event handler to add to the image of the panel.

The DBCtrlGrid parameter is the grid that contains the panel. The Index parameter is the index of the panel being painted, where 0 is the first panel, 1 is the second panel, and so on. Use the PanelIndex (see page 8201) property to determine whether the panel being drawn is selected.

Use the Canvas (see page 8193) property to paint the panel. The point (0,0) on the canvas is the upper left corner of the panel, and the point (PanelWidth (see page 8201), PanelHeight (see page 8200)) is the lower right corner.

Controls (see page 5711) placed on the panel are drawn separately and do not need to be drawn in an OnPaintPanel event handler.

See Also

Canvas (see page 8193)

Color (see page 5812)

PanelBorder (see page 8200)

PanelHeight (see page 8200)

PanelIndex (see page 8201)

PanelWidth (see page 8201)

SelectedColor (see page 8208)

44.1.1.6.18 TDBCtrlGrid.OnStartDrag Event

Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.

Pascal

```
property OnStartDrag: TStartDragEvent;
```

C++

```
__property TStartDragEvent OnStartDrag;
```

Description

Use the OnStartDrag event handler to implement special processing when the user starts to drag the control or an object it contains. OnStartDrag only occurs if DragKind is dkDrag.

Sender is the control that is about to be dragged, or that contains the object about to be dragged.

The OnStartDrag event handler can create a TDragControlObjectEx instance for the DragObject parameter to specify the drag cursor, or, optionally, a drag image list. If you create a TDragControlObjectEx instance, there is no need to call the Free method for the DragObject when dragging is over. If you create, instead, a TDragControlObject instance, your application is responsible for freeing the drag object instance.

If the OnStartDrag event handler sets the DragObject parameter to nil (Delphi) or NULL (C++), a TDragControlObject object is automatically created and dragging begins on the control itself.

Note: On some controls, such as TRichEdit, the underlying Windows control handles internal drag operations. For these controls, there are no OnStartDrag or OnEndDrag events for drag operations within the control.

See Also

OnEndDrag (see page 5860)

TDragControlObjectEx (see page 6007)

DragKind (see page 5819)

OnDragOver (see page 5857)

OnDragDrop (see page 5855)

44.1.2 TDBCtrlGridLink Class

TDBCtrlGridLink helps manage data events for a TDBCtrlGrid (see page 8168) object.

Class Hierarchy

Pascal

```
TDBCtrlGridLink = class(TDataLink);
```

C++

```
class TDBCtrlGridLink : public TDataLink;
```

File

dbcgrids

Description

TDBCtrlGridLink is tailored to work with a TDBCtrlGrid (see page 8168). It should only be used by the TDBCtrlGrid (see page 8168) class.

See Also

TDataSource (see page 7070)

TDBCtrlGrid (see page 8168)

44.1.2.1 TDBCtrlGridLink Members

The following tables list the members exposed by TDBCtrlGridLink.

Protected Methods

	Name	Description
	ActiveChanged (see page 8243)	Responds to changes in the Active property.
	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	CheckBrowseMode (see page 6880)	Allows the data-aware object to respond just before an event that changes the dataset state.
	DataEvent (see page 6881)	Responds to various events that occur while working with data.
	DataSetChanged (see page 8243)	Responds to changes in the dataset.
	DataSetScrolled (see page 6882)	Allows a response to scrolling the representation of the dataset within the data-aware object.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	EditingChanged (see page 6883)	Responds to changes in the editing state of the data source.
	FocusControl (see page 6884)	Provides the interface for a method to force focus to the data-aware component associated with the TDataLink (see page 6876).
	GetActiveRecord (see page 6884)	This is GetActiveRecord, a member of class TDataLink.
	GetBOF (see page 6884)	This is GetBOF, a member of class TDataLink.
	GetBufferCount (see page 6884)	This is GetBufferCount, a member of class TDataLink.
	GetEOF (see page 6885)	This is GetEOF, a member of class TDataLink.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetRecordCount (see page 6885)	This is GetRecordCount, a member of class TDataLink.
	LayoutChanged (see page 6885)	Responds to changes in the representation of the data by the data-aware object.
	MoveBy (see page 6885)	Repositions the dataset to another record relative to its active record.
	RecordChanged (see page 6886)	Responds to changes in the contents of the current record or field of the dataset.
	SetActiveRecord (see page 6886)	This is SetActiveRecord, a member of class TDataLink.
	SetBufferCount (see page 6887)	This is SetBufferCount, a member of class TDataLink.
	UpdateData (see page 6887)	Provides an interface for writing edits to a record in the dataset.

Protected Properties

	Name	Description
	VisualControl (see page 6894)	Indicates whether a visual control uses the datalink.

Public Methods

	Name	Description
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.

	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 8243)	Creates an instance of TDBCtrlGridLink (see page 8240).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 6879)	Destroys an instance of TDataLink (see page 6876).
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Edit (see page 6882)	Attempts to drive the data source into an editing state if it is not already in one.
	ExecuteAction (see page 6883)	Invokes an action with the datasource as its target.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	UpdateAction (see page 6887)	Updates an action to reflect the current state of the TDataLink (see page 6876).
	UpdateRecord (see page 6888)	Responds to notifications that edits should be posted to the dataset.

Public Properties

	Name	Description
R	Active (see page 6888)	Specifies whether the dataset that TDataLink (see page 6876) manages is active.
	ActiveRecord (see page 6889)	Specifies the index of the current record within the internal record buffer maintained by the dataset for the Owner of the TDataLink (see page 6876) object.
R	BOF (see page 6889)	Indicates whether the first record in a dataset is active.
	BufferCount (see page 6890)	Specifies the number of records cached by the dataset for the Owner of the TDataLink (see page 6876) object.
R	DataSet (see page 6890)	Specifies the TDataSet (see page 6894) object that represents the data that this TDataLink (see page 6876) is tracking.
	DataSource (see page 6891)	Specifies the TDataSource (see page 7070) object that the Owner of the TDataLink (see page 6876) uses to connect to the dataset.
	DataSourceFixed (see page 6891)	Indicates whether the DataSource (see page 6891) property can be set.
R	Editing (see page 6892)	Indicates whether the DataSource (see page 6891) is in edit mode.
R	Eof (see page 6892)	Indicates whether the last record in a dataset is active.
	ReadOnly (see page 6893)	Indicates whether the dataset for this TDataLink (see page 6876) can be modified.
R	RecordCount (see page 6893)	Indicates the number of records in the internal record buffer maintained by the dataset.

44.1.2.2 TDBCtrlGridLink.Create Constructor

Creates an instance of TDBCtrlGridLink (see page 8240).

Pascal

```
constructor Create(DBCtrlGrid: TDBCtrlGrid);
```

C++

```
__fastcall TDBCtrlGridLink(TDBCtrlGrid DBCtrlGrid);
```

Description

Applications should not call the Create method for a TDBCtrlGridLink (see page 8240) directly. The TDBCtrlGrid (see page 8168) that owns a TDBCtrlGridLink (see page 8240) calls Create from its own constructor.

See Also

Create (see page 6878)

44.1.2.3 TDBCtrlGridLink Methods

The methods of the TDBCtrlGridLink class are listed here.

Protected Methods

	Name	Description
	ActiveChanged (see page 8243)	Responds to changes in the Active property.
	DataSetChanged (see page 8243)	Responds to changes in the dataset.

44.1.2.3.1 TDBCtrlGridLink.ActiveChanged Method

Responds to changes in the Active property.

Pascal

```
procedure ActiveChanged; override;
```

C++

```
virtual __fastcall ActiveChanged();
```

Description

The ActiveChanged method defined by TDataLink merely provides an interface for a method that can respond to changes in the Active property. Derived objects that do not need to respond to such changes can allow the inherited method to ignore them.

See Also

Active (see page 6888)

44.1.2.3.2 TDBCtrlGridLink.DataSetChanged Method

Responds to changes in the dataset.

Pascal

```
procedure DataSetChanged; override;
```

C++

```
virtual __fastcall DataSetChanged();
```

Description

DataSetChanged responds to changes to the contents of the dataset. Anything that changes the contents of the dataset, whether it is editing the data, inserting or deleting records, or changing the key triggers this method. Changes specific to the representation of the data within the data-aware object, such as scrolling the dataset or changing the layout of data elements within the object, also trigger this method. DataSetChanged simply calls RecordChanged. Derived classes can override this procedure to make additional adjustments to changes in the dataset.

See Also

DataSetScrolled (see page 6882)

LayoutChanged (see page 6885)

RecordChanged (see page 6886)

44.1.3 TDBCtrlPanel Class

TDBCtrlPanel represents a panel in a TDBCtrlGrid (see page 8168) object.

Class Hierarchy

Pascal

```
TDBCtrlPanel = class(TWinControl);
```

C++

```
class TDBCtrlPanel : public TWinControl;
```

File

dbcgrids

Description

Use TDBCtrlPanel to hold the fields from a single record in a dataset. TDBCtrlGrid (see page 8168) represents the records in a dataset by arranging copies of the same TDBCtrlPanel object in rows or columns, where each panel represents a single record in the dataset.

Lay out a single panel at design time. Add data-aware edit controls or data display objects. At runtime, TDBCtrlGrid (see page 8168) replicates the panel for the records in the dataset.

The appearance of the panel is determined by the properties of the TDBCtrlGrid (see page 8168) object that contains the panel. The OnPaintPanel event of TDBCtrlGrid (see page 8168) allows customized painting of the panels.

See Also

TDBCtrlGrid (see page 8168)

TDBEdit (see page 8735)

TDBImage (see page 8813)

TDBMemo (see page 9149)

TDBRichEdit (see page 9343)

TDBText (see page 9433)

44.1.3.1 TDBCtrlPanel Members

The following tables list the members exposed by TDBCtrlPanel.

Protected Events

	Name	Description
	OnAlignInsertBefore (see page 6213)	Occurs when an object with custom alignment is aligned.
	OnAlignPosition (see page 6214)	Occurs when an object with custom alignment is aligned.
	OnCanResize (see page 5851)	Occurs when an attempt is made to resize the control.
	OnClick (see page 5851)	Occurs when the user clicks the control.
	OnConstrainedResize (see page 5853)	Adjust resize constraints.
	OnContextPopup (see page 5854)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnDblClick (see page 5854)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDockDrop (see page 6214)	Occurs when another control is docked to the control.
	OnDockOver (see page 6216)	Occurs when another control is dragged over the control.
	OnDragDrop (see page 5855)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 5857)	Occurs when the user drags an object over a control.
	OnEndDock (see page 5859)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 5860)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnEnter (see page 6219)	Occurs when a control receives the input focus.
	OnExit (see page 6221)	Occurs when the input focus shifts away from one control to another.
	OnGetSiteInfo (see page 6223)	Returns the control's docking information.
	OnKeyDown (see page 6225)	Occurs when a user presses any key while the control has focus.
	OnKeyPress (see page 6227)	Occurs when a key is pressed.
	OnKeyUp (see page 6228)	Occurs when the user releases a key that has been pressed.
	OnMouseActivate (see page 5861)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 5862)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseEnter (see page 5864)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 5864)	Occurs when the user moves the mouse outside of a control.
	OnMouseMove (see page 5865)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 5867)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnMouseWheel (see page 5869)	Occurs when the mouse wheel is rotated.
	OnMouseWheelDown (see page 5869)	Occurs when the mouse wheel is rotated downward.
	OnMouseWheelUp (see page 5870)	Occurs when the mouse wheel is rotated upward.
	OnResize (see page 5870)	Occurs immediately after the control is resized.
	OnStartDock (see page 5871)	Occurs when the user begins to drag a control with a DragKind (see page 5819) of dkDock.
	OnStartDrag (see page 5871)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.
	OnUnDock (see page 6230)	Occurs when the application tries to undock a control that is docked to the windowed control.

Protected Fields

	Name	Description
	FAnchorMove (see page 5733)	This is FAnchorMove, a member of class TControl.
	FAnchorOrigin (see page 5734)	This is FAnchorOrigin, a member of class TControl.
	FAnchorRules (see page 5734)	This is FAnchorRules, a member of class TControl.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FDesignSize (see page 6124)	This is FDesignSize, a member of class TWinControl.
	FDoubleBuffered (see page 6124)	This is FDoubleBuffered, a member of class TWinControl.
	FExplicitHeight (see page 5734)	This is FExplicitHeight, a member of class TControl.
	FExplicitLeft (see page 5734)	This is FExplicitLeft, a member of class TControl.
	FExplicitTop (see page 5734)	This is FExplicitTop, a member of class TControl.
	FExplicitWidth (see page 5735)	This is FExplicitWidth, a member of class TControl.
	FInImeComposition (see page 6125)	This is FInImeComposition, a member of class TWinControl.
	FOriginalParentSize (see page 5735)	This is FOriginalParentSize, a member of class TControl.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	ActionChange (see page 5737)	Responds when the action associated with the control changes.
V	ActionChange (see page 6127)	Updates the control to reflect changes in its associated action.
	AddBiDiModeExStyle (see page 6128)	Sets control's window style according to its bi-directional support.
V	AdjustClientRect (see page 6128)	Provides the interface that adjusts the ClientRect (see page 5810) property for idiosyncrasies of the window.
	AdjustSize (see page 5738)	Sets the size of the control as determined by the AutoSize (see page 5803) property.
V	AdjustSize (see page 6129)	Adjusts the control's size according to its contents and constraints.
V	AlignControls (see page 6129)	Aligns any controls for which the control is the parent within a specified area of the control.
	ArrangeControl (see page 6130)	This is ArrangeControl, a member of class TWinControl.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	AssignTo (see page 5739)	Overrides the inherited AssignTo function to enable assignments to TAction objects.
V	AssignTo (see page 6130)	Copies the properties of the windowed control to another object.
	BeginAutoDrag (see page 5739)	Begin Automatic Drag.
	CalcCursorPos (see page 5741)	This is CalcCursorPos, a member of class TControl.
V	CanAutoSize (see page 5741)	Indicates whether the control can resize itself automatically to accommodate its contents.
V	CanAutoSize (see page 6131)	Indicates how the control can be resized.
V	CanResize (see page 5742)	OnCanResize (see page 5851) event dispatcher.
V	CanResize (see page 6132)	Indicates how the control can respond to a resize attempt.
	Changed (see page 5742)	Sends a CM_CHANGED (see page 6330) message to the control.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	ChangeScale (see page 5743)	Rescaling event dispatcher.
V	ChangeScale (see page 6132)	Resize (see page 5780) and reposition children and self.
	Click (see page 5743)	Respond to user click.
V	ConstrainedResize (see page 5746)	Notify control of resize with constraints.
V	ConstrainedResize (see page 6133)	Generates an OnConstrainedResize (see page 5853) event.
	ControlsAligned (see page 6134)	This is ControlsAligned, a member of class TWinControl.
	CreateDockManager (see page 6134)	Creates the dock manager for the control.
V	CreateHandle (see page 6135)	Creates underlying screen object.
V	CreateParams (see page 8255)	Initializes a window-creation parameter data structure.
	CreateSubClass (see page 6136)	Creates a windowed control derived from an existing Windows window class.
V	CreateWindowHandle (see page 6137)	Creates a Windows control to represent the control.
V	CreateWnd (see page 6137)	Creates the underlying window.

	CustomAlignInsertBefore (see page 6137)	Returns placement order of custom-aligned child control.
	CustomAlignPosition (see page 6138)	Returns aligned position of custom-aligned child control.
	DblClick (see page 5747)	OnDblClick (see page 5854) event dispatcher.
	DefaultDockImage (see page 5747)	Handles the painting and erasing of a dock image.
	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	DefineProperties (see page 5748)	Provides methods to read and write the IsControl (see page 5829) property to a stream such as a form file.
	DefineProperties (see page 6139)	Provides methods to read and write the IsControl property to a stream such as a form file.
	DesignWndProc (see page 5749)	This is DesignWndProc, a member of class TControl.
	DestroyHandle (see page 6140)	Destroys the control's window without destroying the control.
	DestroyWindowHandle (see page 6140)	Destroys the window created in the CreateWindowHandle (see page 6137) method.
	DestroyWnd (see page 6141)	Destroys the control's window.
	DoAddDockClient (see page 6142)	Performs actions when a control is docked to the windowed control.
	DockOver (see page 6143)	Responds when a docking client is dragged over the windowed control.
	DockReplaceDockClient (see page 6143)	This is DockReplaceDockClient, a member of class TWinControl.
	DockTrackNoTarget (see page 5749)	Handles dragging of the control over an invalid docking target.
	DoContextPopup (see page 5750)	OnContextPopup (see page 5854) event dispatcher.
	DoDock (see page 5750)	Docking event dispatcher.
	DoDockOver (see page 6143)	Generates an OnDockOver (see page 6216) event.
	DoEndDock (see page 5750)	OnEndDock (see page 5859) event dispatcher.
	DoEndDrag (see page 5751)	OnEndDrag (see page 5860) event dispatcher.
	DoEnter (see page 6144)	Respond to receiving input focus.
	DoExit (see page 6144)	Respond to losing input focus
	DoFlipChildren (see page 6145)	Flips the control's children.
	DoKeyDown (see page 6145)	Performs some preprocessing before generating an OnKeyDown (see page 6225) event.
	DoKeyPress (see page 6146)	Performs some preprocessing before generating an OnKeyPress (see page 6227) event.
	DoKeyUp (see page 6146)	Performs some preprocessing before generating an OnKeyUp (see page 6228) event.
	DoMouseWheel (see page 5751)	Processes mouse wheel motion.
	DoMouseWheelDown (see page 5752)	OnMouseWheelDown (see page 5869) event dispatcher.
	DoMouseWheelUp (see page 5752)	OnMouseWheelUp (see page 5870) event dispatcher.
	DoRemoveDockClient (see page 6147)	Responds when a control is undocked from the windowed control.
	DoStartDock (see page 5753)	OnStartDock (see page 5871) event dispatcher.
	DoStartDrag (see page 5753)	OnStartDrag (see page 5871) event dispatcher.
	DoUnDock (see page 6147)	Undocks a control that is currently docked to the windowed control.
	DragCanceled (see page 5754)	Provides the interface for a method that responds to the cancellation of a drag.
	DragOver (see page 5755)	OnDragOver (see page 5857) event dispatcher.
	DrawDragDockImage (see page 5755)	Draws the dock image for the control.
	EraseDragDockImage (see page 5757)	Erases the dock image for the control.
	FindNextControl (see page 6149)	Returns the control's next child in the tab order after the specified control.
	FixupTabList (see page 6149)	Sorts the child controls by their tab order.
	GetAction (see page 5758)	This is GetAction, a member of class TControl.
	GetActionLinkClass (see page 5758)	Returns the appropriate action link class that is associated with the control class.
	GetActionLinkClass (see page 6152)	Returns the associated action link class.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetChildren (see page 6153)	Calls a specified method for each child of the control.
	GetClientOrigin (see page 5758)	Returns the screen coordinates of the top-left corner of the control's client area.

	GetClientOrigin (see page 6153)	Returns the value of the ClientOrigin (see page 5809) property.
	GetClientRect (see page 5759)	Returns a rectangle defining the client area of the control.
	GetClientRect (see page 6154)	Returns the value of the ClientRect (see page 5810) property.
	GetControlExtents (see page 6154)	Returns the smallest rectangle in which all the control's children fit.
	GetDeviceContext (see page 5760)	Returns a device context for the control.
	GetDeviceContext (see page 6155)	Provides access to a device context for the control.
	GetDockEdge (see page 5763)	Returns the edge on which another control should be docked when it is dragged over the control.
	GetDragImages (see page 5763)	Returns the control's image list containing the image to be displayed while dragging.
	GetEnabled (see page 5763)	Returns the value of the Enabled (see page 5821) property.
	GetFloating (see page 5764)	Returns the value of the Floating (see page 5823) property.
	GetFloatingDockSiteClass (see page 5764)	Returns the class used for the control when it is floating.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetPalette (see page 5765)	Returns the handle to a palette for use by the control.
	GetParentHandle (see page 6157)	Returns the window handle for the window of the control's parent.
	GetPopupMenu (see page 5765)	Returns the pop-up menu associated with the control.
	GetSiteInfo (see page 6158)	Generates an OnGetSiteInfo (see page 6223) event
	GetTopParentHandle (see page 6159)	Returns the window handle of the first window not associated with a VCL control that contains the windowed control.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	InvalidateDockHostSite (see page 6162)	This is InvalidateDockHostSite, a member of class TWinControl.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsControlActivateMsg (see page 6162)	This is IsControlActivateMsg, a member of class TWinControl.
	IsControlMouseMsg (see page 6162)	Indicates whether a specified mouse message is directed to one of the windowed control's child controls.
	IsQualifyingSite (see page 6163)	This is IsQualifyingSite, a member of class TWinControl.
	KeyDown (see page 6163)	Respond to key press events.
	KeyPress (see page 6163)	Respond to keyboard input.
	KeyUp (see page 6164)	Respond to released key.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Loaded (see page 5771)	Initializes the control after it is loaded from a stream.
	MainWndProc (see page 6165)	Receives Windows messages for the control.
	MouseActivate (see page 5773)	This is MouseActivate, a member of class TControl.
	MouseDown (see page 5773)	OnMouseDown (see page 5862) event dispatcher.
	MouseMove (see page 5773)	Respond to mouse moving over control area..
	MouseUp (see page 5774)	OnMouseUp (see page 5867) event dispatcher.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	Notification (see page 5775)	Responds to notifications that components are being created or destroyed.
	Notification (see page 6165)	Responds to notifications that components are being created or destroyed.
	NotifyControls (see page 6165)	Sends a message to all the child controls.
	PaintControls (see page 6166)	Paints each of the child controls in a windowed control using the specified device context.
	PaintHandler (see page 6166)	Responds to WM_PAINT messages.
	PaintWindow (see page 8256)	Renders the image of a windowed control.
	PaletteChanged (see page 5775)	Responds to changes in the system's palette by realizing the control's palette.
	PaletteChanged (see page 6170)	Responds to changes in the system's palette by realizing the control's palette and the palette for each child control.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	PositionDockRect (see page 5777)	Positions the docking rectangle according to the current drag-and-dock state.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.

	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	ReadState (see page 5778)	Prepares the control for having its properties assigned values read from a stream.
	ReadState (see page 6171)	Prepares the control for having its properties assigned values from a stream.
	RecreateWnd (see page 6171)	Recreate underlying Windows screen object.
	ReloadDockedControl (see page 6172)	Reloads a docked control.
	RemoveWindowProps (see page 6174)	This is RemoveWindowProps, a member of class TWinControl.
	RequestAlign (see page 5780)	Instructs the parent of a control to reposition the control, enforcing its Align (see page 5798) property.
	ResetIme (see page 6174)	Restores the input method editor (IME) that was active when the application started.
	ResetImeComposition (see page 6175)	Directs the composition window of the input method editor (IME) to perform a specific action.
	Resize (see page 5780)	Respond to control resize.
	ScaleConstraints (see page 5781)	This is ScaleConstraints, a member of class TControl.
	ScaleControls (see page 6176)	Rescale child controls only.
	SelectFirst (see page 6177)	Locates first selectable child control.
	SelectNext (see page 6177)	Moves the input focus from the current child control to the next one in the tab order.
	SendCancelMode (see page 5781)	Cancels the modal state of the control.
	SendDockNotification (see page 5782)	Sends a Windows message to the control's host dock site.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetAutoSize (see page 5783)	This is SetAutoSize, a member of class TControl.
	SetBiDiMode (see page 5783)	Sets the control's bi-directional mode.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetChildOrder (see page 6178)	Changes the order in which the child component appears in the list of child components returned by the GetChildren (see page 6153) method.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDragMode (see page 5785)	Sets the drag mode for the control.
	SetEnabled (see page 5785)	Sets the value of the Enabled (see page 5821) property.
	SetIme (see page 6181)	Activates an input method editor (IME) using the values specified by the ImeMode (see page 6207) and ImeName (see page 6208) properties.
	SetImeCompositionWindow (see page 6181)	Sets the position and font of the composition window.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetName (see page 5785)	Sets the name of the control.
	SetParent (see page 5786)	Sets the parent of the control.
	SetParent (see page 6182)	Sets the parent of the control.
	SetParentBackground (see page 6182)	This is SetParentBackground, a member of class TWinControl.
	SetParentBiDiMode (see page 5786)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	SetParentComponent (see page 5787)	Sets the parent for the control.
	SetZOrder (see page 5788)	Repositions the control in its parent's control list, thereby changing position onscreen.
	SetZOrder (see page 6182)	Moves the control to the top or bottom of the parent control's (or screen's) list of TWinControl (see page 6112) controls.
	ShowControl (see page 6183)	Ensures that a specified child control is visible.
	UpdateBounds (see page 6185)	This is UpdateBounds, a member of class TWinControl.
	UpdateBoundsRect (see page 5789)	Changes the Top (see page 5844), Left (see page 5830), Width (see page 5849), and Height (see page 5825) properties of the control, but doesn't update its screen image and bypasses all resize events.
	UpdateControlOriginalParentSize (see page 6186)	This is UpdateControlOriginalParentSize, a member of class TWinControl.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateExplicitBounds (see page 5789)	This is UpdateExplicitBounds, a member of class TControl.
	UpdateRecreatingFlag (see page 6186)	This is UpdateRecreatingFlag, a member of class TWinControl.

	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	UpdateUIState (see page 6186)	Updates form User Interface State as needed
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	VisibleChanging (see page 5791)	Provides the interface for a method that responds to changes in the control's visibility.
	WndProc (see page 5791)	Provides specific message responses for the control.
	WndProc (see page 6187)	Provides specific message responses for the control.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	ActionLink (see page 5798)	Contains the action link object associated with the control.
	AutoSize (see page 5803)	Specifies whether the control sizes itself automatically to accommodate its contents.
	BevelEdges (see page 6192)	Specifies which edges of the control are beveled.
	BevelInner (see page 6193)	Specifies the cut of the inner bevel.
	BevelKind (see page 6193)	Specifies the control's bevel style.
	BevelOuter (see page 6194)	Specifies the cut of the outer bevel.
	BevelWidth (see page 6194)	Specifies the width of the inner and outer bevels.
	BorderWidth (see page 6195)	Specifies the width of the control's border.
	Caption (see page 5806)	Specifies a text string that identifies the control to the user.
	Color (see page 5812)	Specifies the background color of the control.
	Ctl3D (see page 6198)	Determines whether a control has a three-dimensional (3-D) or two-dimensional look.
	DefWndProc (see page 6199)	Specifies the default window procedure for the windowed control.
	DesktopFont (see page 5818)	Specifies whether the control uses the Windows icon font when writing text.
	DragCursor (see page 5818)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 5819)	Specifies whether the control is being dragged normally or for docking.
	DragMode (see page 5819)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	Font (see page 5823)	Controls (see page 5711) the attributes of text written on or in the control.
	ImeMode (see page 6207)	Determines the behavior of the input method editor (IME).
	ImeName (see page 6208)	Specifies the input method editor (IME) to use for converting keyboard input to Asian language characters.
	IsControl (see page 5829)	Determines whether a form stores its form-specific properties to a stream.
	MouseCapture (see page 5831)	Indicates whether the control has "captured" mouse events.
	ParentBackground (see page 6209)	Determines whether control uses parent's theme background.
	ParentBiDiMode (see page 5833)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	ParentColor (see page 5834)	Determines where a control looks for its color information.
	ParentCtl3D (see page 6209)	Determines where a component looks to determine if it should appear three dimensional.
	ParentFont (see page 5834)	Determines where a control looks for its font information.
	ParentShowHint (see page 5835)	Determines where a control looks to find out if its Help Hint (see page 5827) should be shown.
	PopupMenu (see page 5835)	Identifies the pop-up menu associated with the control.
	ScalingFlags (see page 5840)	Reflects which attributes of the control have been scaled.
	Text (see page 5842)	Contains a text string associated with the control.
	WheelAccumulator (see page 5849)	Accumulates mouse wheel rotations.
	WindowHandle (see page 6212)	Provides access to a window handle for the control.
	WindowText (see page 5850)	Contains the text string of the control.

Public Events

	Name	Description
	WindowProc (see page 5872)	Points to the window procedure that responds to messages sent to the control.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	BeginDrag (see page 5740)	Starts the dragging of a control.
	BringToFront (see page 5740)	Puts the control in front of all other controls in its parent control.
	Broadcast (see page 6130)	Sends a message to each of the child controls.
	CanFocus (see page 6131)	Indicates whether a control can receive focus.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	ClientToParent (see page 5744)	Translates client coordinates to parent coordinates.
	ClientToScreen (see page 5744)	Translates a given point from client area coordinates to global screen coordinates.
	ContainsControl (see page 6133)	Indicates whether a specified control exists within the control.
	ControlAtPos (see page 6133)	Returns the child control located at a specified position within the control.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
V	Create (see page 5731)	Creates an instance of TControl (see page 5724).
V	Create (see page 6123)	Creates an instance of TWinControl (see page 6112).
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	CreateLinked (see page 8255)	Creates and initializes an instance of TDBCtrlPanel (see page 8244).
	CreateParented (see page 6123)	Creates and initializes a control as the child of a specified non-VCL container.
	CreateParentedControl (see page 6136)	Creates and initializes a control as the child of a specified non-VCL window.
V	DefaultHandler (see page 5748)	Provides message handling for all messages that do not have specific handlers.
V	DefaultHandler (see page 6139)	Provides message handling for all messages that the control does not fully process itself.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 5732)	Destroys an instance of TControl (see page 5724).
V	Destroy (see page 6124)	Destroys an instance of TWinControl (see page 6112).
V	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	DisableAlign (see page 6141)	Disables the realignment of child controls.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Dock (see page 5749)	Used internally to dock the control.
	DockDrop (see page 6142)	Generates an OnDockDrop (see page 6214) event.
	DragDrop (see page 5754)	OnDragDrop (see page 5855) event dispatcher.
	Dragging (see page 5754)	Indicates whether a control is being dragged.
	DrawTextBiDiModeFlags (see page 5756)	Returns the text flags that reflect the current setting of the BiDiMode (see page 5803) property.

	DrawTextBiDiModeFlagsReadingOnly (see page 5756)	Returns the text flag to add that indicates whether the control's text should read from right to left.
	EnableAlign (see page 6148)	Decrements the reference count incremented by the DisableAlign (see page 6141) method, eventually realigning the child controls.
	EndDrag (see page 5757)	Stops a control from being dragged any further.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindChildControl (see page 6148)	Returns a child control given its name.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FlipChildren (see page 6150)	Reverses the positions of child controls.
	Focused (see page 6150)	Determines whether the control has input focus.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetControlsAlignment (see page 5759)	Indicates how text is aligned within the control.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 5765)	Returns the parent of the control.
	GetTabOrderList (see page 6158)	Builds a list of controls in tab order.
	GetTextBuf (see page 5766)	Retrieves the control's text, copies it into a buffer, and returns the number of characters copied.
	GetTextLen (see page 5767)	Returns the length of the control's text.
	HandleAllocated (see page 6159)	Reports whether a screen object handle exists for the control.
	HandleNeeded (see page 6160)	Creates a screen object for the control if it doesn't already exist.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 5768)	Indicates whether the control has a parent.
	Hide (see page 5769)	Makes the control invisible.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
V	InitiateAction (see page 5769)	Calls the action link's Update (see page 5789) method if the control is associated with an action link.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InsertControl (see page 6160)	Inserts a control into the Controls (see page 6197) array property.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
V	Invalidate (see page 5770)	Completely repaint control.
V	Invalidate (see page 6161)	Schedules a control repaint.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	IsRightToLeft (see page 5770)	Indicates whether the control should be reversed right to left.
	ManualDock (see page 5771)	Docks the control.
	ManualFloat (see page 5772)	Undocks the control.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	MouseWheelHandler (see page 5774)	Dispatches messages received from a mouse wheel.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	PaintTo (see page 6167)	This is the overview for the PaintTo method overload.

	ParentToClient (see page 5776)	Translate parent coordinates to client coordinates.
	Perform (see page 5776)	Responds as if the control received a specified Windows message.
	PreProcessMessage (see page 6170)	This is PreProcessMessage, a member of class TWinControl.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	Realign (see page 6171)	Forces the control to realign children.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	Refresh (see page 5779)	Repaints the control on the screen.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveControl (see page 6172)	Removes a specified control from the Controls (see page 6197) array.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	Repaint (see page 5779)	Forces the control to repaint its image on the screen.
V	Repaint (see page 6174)	Repaints the entire control.
	ReplaceDockedControl (see page 5779)	Docks the control in the place where another control is already docked.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	ScaleBy (see page 6175)	Rescale control and its children.
	ScreenToClient (see page 5781)	Converts the screen coordinates of a specified point on the screen to client coordinates.
	ScrollBy (see page 6176)	Scroll control contents.
	SendToBack (see page 5782)	Puts a windowed control behind all other windowed controls, or puts a non-windowed control behind all other non-windowed controls.
V	SetBounds (see page 5783)	Sets the Left (see page 5830), Top (see page 5844), Width (see page 5849), and Height (see page 5825) properties all at once.
V	SetBounds (see page 6178)	Sets the windowed control's boundary properties all at once.
	SetDesignVisible (see page 5784)	Makes a control visible at design time.
V	SetDesignVisible (see page 6178)	Makes a control visible at design time.
V	SetFocus (see page 6179)	Gives the input focus to the control.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	SetTextBuf (see page 5787)	Sets the text of the control.
	Show (see page 5788)	Makes a control visible.
V	Update (see page 5789)	Processes any pending paint messages immediately.
V	Update (see page 6183)	Forces the control to update.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	UpdateControlState (see page 6186)	Respond to state change.
	UseRightToLeftAlignment (see page 5790)	Specifies whether the control's alignment should be reversed right-to-left.
	UseRightToLeftReading (see page 5790)	Specifies whether the control is using a right-to-left reading order.
	UseRightToLeftScrollBar (see page 5791)	Specifies whether the vertical scroll bar appears on the left side of the control.

Public Properties

	Name	Description
	Action (see page 5797)	Designates the action associated with the control.
	Align (see page 5798)	Determines how the control aligns within its container (parent control).
R	AlignDisabled (see page 6192)	Indicates child control realignment disabled.
	Anchors (see page 5802)	Specifies how the control is anchored to its parent.
	BiDiMode (see page 5803)	Specifies the bi-directional mode for the control.
	BoundsRect (see page 5803)	Specifies the bounding rectangle of the control, expressed in the coordinate system of the parent control.
R	Brush (see page 6195)	Determines the color and pattern used for painting the background of the control.
	ClientHeight (see page 5808)	Specifies the height of the control's client area in pixels.
R	ClientOrigin (see page 5809)	Specifies the screen coordinates (in pixels) of the top left corner of a control's client area.
R	ClientRect (see page 5810)	Specifies the size (in pixels) of a control's client area.
	ClientWidth (see page 5811)	Specifies the horizontal size of the control's client area in pixels.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.

R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Constraints (see page 5812)	Specifies the size constraints for the control.
R	ControlCount (see page 6195)	Returns the number of child controls.
R	Controls (see page 6197)	Lists all child controls.
	ControlState (see page 5813)	Indicates the current state of a control at runtime.
	ControlStyle (see page 5814)	Determines style characteristics of the control.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	DockClientCount (see page 6199)	Specifies the number of controls that are docked on the windowed control.
R	DockClients (see page 6201)	Lists the controls that are docked to the windowed control.
	DockManager (see page 6202)	Specifies the control's docking manager interface.
	DockOrientation (see page 5818)	Specifies how the control is docked relative to other controls docked in the same parent.
	DockSite (see page 6204)	Specifies whether the control can be the target of drag-and-dock operations.
	DoubleBuffered (see page 6205)	Determines whether the control's image is rendered directly to the window or painted to an in-memory bitmap first.
	Enabled (see page 5821)	Controls (see page 5711) whether the control responds to mouse, keyboard, and timer events.
R	ExplicitHeight (see page 5821)	Specifies the explicit vertical size of the control in pixels.
R	ExplicitLeft (see page 5822)	Specifies the explicit horizontal pixel coordinate of the left edge of a component relative to its parent.
R	ExplicitTop (see page 5822)	Specifies the explicit vertical pixel coordinate of the top edge of a component relative to its parent.
R	ExplicitWidth (see page 5822)	Specifies the explicit horizontal size of the control in pixels.
R	Floating (see page 5823)	Indicates whether the control is floating.
	FloatingDockSiteClass (see page 5823)	Specifies the class of the temporary control that hosts the control when it is floating.
R	Handle (see page 6207)	Provides access to the underlying Windows screen object for the control.
	HostDockSite (see page 5829)	Specifies the control in which the control is docked.
	LRDockWidth (see page 5831)	Specifies the width of the control when it is docked horizontally.
R	MouseInClient (see page 6209)	This is MouseInClient, a member of class TWinControl.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Padding (see page 6209)	Specifies the padding of a control.
	Parent (see page 5832)	Indicates the parent of the control.
	ParentWindow (see page 6210)	Reference to parent's underlying control.
	ShowHint (see page 5840)	Determines whether the control displays a Help Hint (see page 5827) when the mouse pointer rests momentarily on the control.
R	Showing (see page 6210)	Indicates whether the control is showing on the screen.
	TabOrder (see page 6211)	Indicates the position of the control in its parent's tab order.
	TabStop (see page 6211)	Determines if the user can tab to a control.
	TBDockHeight (see page 5842)	Specifies the height of the control when it is docked vertically.
	UndockHeight (see page 5845)	Specifies the height of the control when it is floating.
	UndockWidth (see page 5846)	Specifies the width of the control when it is floating.
	UseDockManager (see page 6212)	Specifies whether the docking manager is used in drag-and-dock operations.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	Visible (see page 5847)	Determines whether the component appears onscreen.
R	VisibleDockClientCount (see page 6212)	Specifies the number of visible controls that are docked on the windowed control.

Published Properties

	Name	Description
	AlignWithMargins (see page 5802)	Indicates whether a control should be constrained by margins.

	Cursor (see page 5815)	Specifies the image used to represent the mouse pointer when it passes into the region covered by the control.
	Height (see page 5825)	Specifies the vertical size of the control in pixels.
	HelpContext (see page 5826)	Numeric ID for control's context-sensitive help topic
	HelpKeyword (see page 5826)	Keyword for control's context-sensitive help topic
	HelpType (see page 5827)	Indicates whether the control's context sensitive help topic is identified by context ID or by keyword.
	Hint (see page 5827)	Contains the text string that can appear when the user moves the mouse over the control.
	Left (see page 5830)	Specifies the horizontal coordinate of the left edge of a component relative to its parent.
	Margins (see page 5831)	Specifies the margins for the control.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Top (see page 5844)	Specifies the Y coordinate of the top left corner of a control, relative to its parent or containing control in pixels.
	Width (see page 5849)	Specifies the horizontal size of the control or form in pixels.

44.1.3.2 TDBCtrlPanel.CreateLinked Constructor

Creates and initializes an instance of TDBCtrlPanel (see page 8244).

Pascal

```
constructor CreateLinked(DBCtrlGrid: TDBCtrlGrid);
```

C++

```
__fastcall TDBCtrlPanel(TDBCtrlGrid DBCtrlGrid);
```

Description

Do not call the constructor for TDBCtrlPanel (see page 8244) directly. TDBCtrlGrid (see page 8168) calls the CreateLinked method for TDBCtrlPanel (see page 8244) from its own constructor.

CreateLinked initializes the Parent property to the DBCtrlGrid parameter and initializes the ControlStyle property to include [csAcceptsControls, csCaptureMouse, csClickEvents, csDoubleClicks, csOpaque, csReplicatable].

44.1.3.3 TDBCtrlPanel Methods

The methods of the TDBCtrlPanel class are listed here.

Protected Methods

	Name	Description
	CreateParams (see page 8255)	Initializes a window-creation parameter data structure.
	PaintWindow (see page 8256)	Renders the image of a windowed control.

44.1.3.3.1 TDBCtrlPanel.CreateParams Method

Initializes a window-creation parameter data structure.

Pascal

```
procedure CreateParams(var Params: TCreateParams); override;
```

C++

```
virtual __fastcall CreateParams(TCreateParams Params);
```

Description

The CreateWnd method calls CreateParams to initialize the parameters it passes to CreateWindowHandle. Override CreateParams to customize the way a control creates its Windows representation. When overriding CreateParams, always call the inherited method first to set the default values, then make any desired adjustments.

CreateParams fills in the parameter that is passed as the value of the Params parameter. This data structure holds information needed when telling Windows to create a window handle. The fields of a TCreateParams record become the parameters to a call to the CreateWindowEx API function.

TWinControl implements CreateParams by setting all the fields of Params to generic base values. A number of the standard controls override CreateParams to change one or more of the default values in Params.

See Also

CreateWindowHandle (see page 6137)

CreateWnd (see page 6137)

AddBiDiModeExStyle (see page 6128)

44.1.3.3.2 TDBCtrlPanel.PaintWindow Method

Renders the image of a windowed control.

Pascal

```
procedure PaintWindow(DC: HDC); override;
```

C++

```
virtual __fastcall PaintWindow(HDC DC);
```

Description

Call PaintWindow to repaint the control. PaintWindow sends a WM_PAINT message to the windowed control's DefaultHandler method, setting the message record's WParam field to the value passed in DC and the other parameter and result fields to zeros.

See Also

DefaultHandler (see page 6139)

PaintTo (see page 6167)

DoubleBuffered (see page 6205)

44.2 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TDBCtrlGridBorder (see page 8257)	This is record DBCGrids.TDBCtrlGridBorder.
	TDBCtrlGridKey (see page 8257)	This is record DBCGrids.TDBCtrlGridKey.
	TDBCtrlGridOrientation (see page 8258)	This is record DBCGrids.TDBCtrlGridOrientation.

44.2.1 DBCGrids.TDBCtrlGridBorder Enumeration

Pascal

```
TDBCtrlGridBorder = (
  gbNone,
  gbRaised
);
```

C++

```
enum TDBCtrlGridBorder {
  gbNone,
  gbRaised
};
```

File

dbcgrids

Description

This is record DBCGrids.TDBCtrlGridBorder.

44.2.2 DBCGrids.TDBCtrlGridKey Enumeration

Pascal

```
TDBCtrlGridKey = (
  gkNull,
  gkEditMode,
  gkPriorTab,
  gkNextTab,
  gkLeft,
  gkRight,
  gkUp,
  gkDown,
  gkScrollUp,
  gkScrollDown,
  gkPageUp,
  gkPageDown,
  gkHome,
  gkEnd,
```

```
    gkInsert,
    gkAppend,
    gkDelete,
    gkCancel
  );
```

C++

```
  enum TDBCtrlGridKey {
    gkNull,
    gkEditMode,
    gkPriorTab,
    gkNextTab,
    gkLeft,
    gkRight,
    gkUp,
    gkDown,
    gkScrollUp,
    gkScrollDown,
    gkPageUp,
    gkPageDown,
    gkHome,
    gkEnd,
    gkInsert,
    gkAppend,
    gkDelete,
    gkCancel
  };
```

File

dbcgrids

Description

This is record DBCGrids.TDBCtrlGridKey.

44.2.3 DBCGrids.TDBCtrlGridOrientation Enumeration

Pascal

```
  TDBCtrlGridOrientation = (
    goVertical,
    goHorizontal
  );
```

C++

```
  enum TDBCtrlGridOrientation {
    goVertical,
    goHorizontal
  };
```

File

dbcgrids

Description

This is record DBCGrids.TDBCtrlGridOrientation.

44.3 Types

The following table lists types in this documentation.

Types

Name	Description
TPaintPanelEvent (see page 8259)	This is type DBCGrids.TPaintPanelEvent.

44.3.1 DBCGrids.TPaintPanelEvent Type

Pascal

```
TPaintPanelEvent = procedure (DBCtrlGrid: TDBCtrlGrid; Index: Integer) of object;
```

C++

```
(DBCtrlGrid: TDBCtrlGrid; Index: Integer) ( TPaintPanelEvent)();
```

File

dbcgrids

Description

This is type DBCGrids.TPaintPanelEvent.

45 DBClient Namespace

This is namespace DBClient.

Topics

Name	Description
Classes (see page 8263)	The following table lists classes in this documentation.
Functions (see page 8534)	The following table lists functions in this documentation.
Structs, Records, Enums (see page 8536)	The following table lists structs, records, enums in this documentation.
Types (see page 8541)	The following table lists types in this documentation.
Constants (see page 8545)	The following table lists constants in this documentation.

Classes

	Name	Description
	EDBClient (see page 8263)	EDBClient is the exception class for client dataset errors.
	EReconcileError (see page 8265)	EReconcileError is the exception class for client dataset update errors.
	TAggregate (see page 8268)	TAggregate represents a maintained aggregate in a client dataset.
	TAggregates (see page 8280)	TAggregates is a collection of TAggregate (see page 8268) objects.
	TClientBlobStream (see page 8285)	TClientBlobStream lets applications read from or write to BLOB fields in a client dataset.
	TClientDataSet (see page 8289)	TClientDataSet implements a database-independent dataset.
	TConnectionBroker (see page 8360)	TConnectionBroker centralizes the connection to an application server for a set of client datasets that all use the same connection.
	TCustomClientDataSet (see page 8373)	TCustomClientDataSet is the base class for datasets that cache their data in memory.
	TCustomRemoteServer (see page 8525)	TCustomRemoteServer is the base class for all components that connect to an application server in a multi-tiered database application.

Constants

Name	Description
AllParamTypes (see page 8545)	This is constant DBClient.AllParamTypes.
AllRecords (see page 8545)	This is constant DBClient.AllRecords.

Functions

	Name	Description
	PackageParams (see page 8534)	Converts a TParams object into an OleVariant that can be used in multi-tiered applications.
	UnpackParams (see page 8534)	Converts an OleVariant that represents a set of parameters into a TParams object.

Structs, Records, Enums

	Name	Description
	TDataPacketFormat (see page 8536)	TDataPacketFormat indicates how information is encoded in a data packet or delta packet.
	TDataSetOption (see page 8537)	This is record DBClient.TDataSetOption.
	TFetchOption (see page 8537)	TFetchOption and TFetchOptions (see page 8543) indicate the type of information about a record that a client dataset can request.
	TKeyBuffer (see page 8538)	This is record DBClient.TKeyBuffer.
	TRecInfo (see page 8538)	This is record DBClient.TRecInfo.
	TReconcileAction (see page 8539)	TReconcileAction indicates how a client dataset should handle a record whose update generated an error.
	TReconcileInfo (see page 8539)	This is record DBClient.TReconcileInfo.

Types

Name	Description
PKeyBuffer (see page 8541)	This is type DBClient.PKeyBuffer.
PRecInfo (see page 8541)	This is type DBClient.PRecInfo.
TAggUpdateEvent (see page 8542)	This is type DBClient.TAggUpdateEvent.
TCDSKeyBuffer (see page 8542)	This is type DBClient.TCDSKeyBuffer.
TCDSRecInfo (see page 8542)	This is type DBClient.TCDSRecInfo.
TDataSetOptions (see page 8543)	This is type DBClient.TDataSetOptions.
TFetchOptions (see page 8543)	This is type DBClient.TFetchOptions.
TFieldDescList (see page 8543)	This is type DBClient.TFieldDescList.
TGetUsernameEvent (see page 8544)	This is type DBClient.TGetUsernameEvent.
TReconcileErrorEvent (see page 8544)	This is type DBClient.TReconcileErrorEvent.
TRemoteEvent (see page 8544)	This is type DBClient.TRemoteEvent.

45.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	EDBClient (see page 8263)	EDBClient is the exception class for client dataset errors.
	EReconcileError (see page 8265)	EReconcileError is the exception class for client dataset update errors.
	TAggregate (see page 8268)	TAggregate represents a maintained aggregate in a client dataset.
	TAggregates (see page 8280)	TAggregates is a collection of TAggregate (see page 8268) objects.
	TClientBlobStream (see page 8285)	TClientBlobStream lets applications read from or write to BLOB fields in a client dataset.
	TClientDataSet (see page 8289)	TClientDataSet implements a database-independent dataset.
	TConnectionBroker (see page 8360)	TConnectionBroker centralizes the connection to an application server for a set of client datasets that all use the same connection.
	TCustomClientDataSet (see page 8373)	TCustomClientDataSet is the base class for datasets that cache their data in memory.
	TCustomRemoteServer (see page 8525)	TCustomRemoteServer is the base class for all components that connect to an application server in a multi-tiered database application.

45.1.1 EDBClient Class

EDBClient is the exception class for client dataset errors.

Class Hierarchy

Pascal

```
EDBClient = class(EDatabaseError);
```

C++

```
class EDBClient : public EDatabaseError;
```

File

DBClient

Description

EDBClient is raised if a client dataset encounters a problem in its normal functioning.

See Also

TClientDataSet (see page 8289)

45.1.1.1 EDBClient Members

The following tables list the members exposed by EDBClient.

Public Methods

	Name	Description
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 8264)	Creates and initializes an instance of EDBClient (see page 8263).
	CreateFmt (see page 22754)	Instantiates an instance of an exception with a formatted message string.
	CreateFmtHelp (see page 22755)	Instantiates an instance of an exception with a formatted message string and a help-context ID.
	CreateHelp (see page 22755)	Creates an instance of an exception with a simple message string and a help-context ID.
	CreateRes (see page 22756)	This is the overview for the CreateRes constructor overload.
	CreateResFmt (see page 22756)	This is the overview for the CreateResFmt constructor overload.
	CreateResFmtHelp (see page 22757)	This is the overview for the CreateResFmtHelp constructor overload.
	CreateResHelp (see page 22759)	This is the overview for the CreateResHelp constructor overload.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
R	ErrorCode (see page 8265)	The error code returned by the BDE.
	HelpContext (see page 22760)	Indicates the context ID number for context-sensitive online help associated with the exception.
	Message (see page 22760)	Message contains the text string to display in the exception dialog box when the exception is raised.

45.1.1.2 EDBClient.Create Constructor

Creates and initializes an instance of EDBClient (see page 8263).

Pascal

```
constructor Create(Message: string; ErrorCode: DBResult);
```

C++

```
__fastcall EDBClient(AnsiString Message, DBResult ErrorCode);
```

Description

Create generates an EDBClient (see page 8263) object. Message is the error message for the exception. ErrorCode (see page 8265) is the error code returned from the data access mechanism that led to this exception.

45.1.1.3 EDBClient Properties

The properties of the EDBClient class are listed here.

Public Properties

	Name	Description
R	ErrorCode (see page 8265)	The error code returned by the BDE.

45.1.1.3.1 EDBClient.ErrorCode Property

The error code returned by the BDE.

Pascal

```
property ErrorCode: DBResult;
```

C++

```
__property DBResult ErrorCode;
```

Description

ErrorCode is the error code returned by the BDE, ADO, dbExpress, or other underlying database access mechanism.

45.1.2 EReconcileError Class

EReconcileError is the exception class for client dataset update errors.

Class Hierarchy

System::TObject → SysUtils.Exception → DB.EDatabaseError → DBClient.EDBClient → DBClient.EReconcileError

Pascal

```
EReconcileError = class(EDBClient);
```

C++

```
class EReconcileError : public EDBClient;
```

File

DBClient

Description

EReconcileError is raised if an error occurs when updates are being applied from a TClientDataSet (see page 8289).

See Also

TCustomClientDataSet (see page 8373)

45.1.2.1 EReconcileError Members

The following tables list the members exposed by EReconcileError.

Public Methods

	Name	Description
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 8267)	Creates and initializes an instance of EReconcileError (see page 8265).
	CreateFmt (see page 22754)	Instantiates an instance of an exception with a formatted message string.
	CreateFmtHelp (see page 22755)	Instantiates an instance of an exception with a formatted message string and a help-context ID.
	CreateHelp (see page 22755)	Creates an instance of an exception with a simple message string and a help-context ID.
	CreateRes (see page 22756)	This is the overview for the CreateRes constructor overload.
	CreateResFmt (see page 22756)	This is the overview for the CreateResFmt constructor overload.
	CreateResFmtHelp (see page 22757)	This is the overview for the CreateResFmtHelp constructor overload.
	CreateResHelp (see page 22759)	This is the overview for the CreateResHelp constructor overload.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
R	Context (see page 8267)	Contains context information from the error stack.
R	ErrorCode (see page 8265)	The error code returned by the BDE.

	HelpContext (see page 22760)	Indicates the context ID number for context-sensitive online help associated with the exception.
	Message (see page 22760)	Message contains the text string to display in the exception dialog box when the exception is raised.
R	PreviousError (see page 8268)	Indicates the previous error in the reconcile process.

45.1.2.2 EReconcileError.Create Constructor

Creates and initializes an instance of EReconcileError (see page 8265).

Pascal

```
constructor Create(NativeError: string; Context: string; ErrorCode: DBResult; PreviousError:
DBResult);
```

C++

```
__fastcall EReconcileError(AnsiString NativeError, AnsiString Context, DBResult ErrorCode,
DBResult PreviousError);
```

Description

Create generates an EReconcileError (see page 8265) object.

NativeError is the runtime error message to display in the exception dialog box.

Context (see page 8267) provides context information about the error that occurred. If no context information is available, Context (see page 8267) is nil (Delphi) or NULL (C++). Context (see page 8267) initializes the Context (see page 8267) property.

ErrorCode (see page 8265) is the error code returned by the underlying database access mechanism (ADO, BDE, or dbExpress). Not all exceptions are associated with an error code. If there is no error code, ErrorCode (see page 8265) is 0.

PreviousError (see page 8268) is the error code of the last error in this reconciliation process. If the last exception did not have an error code, PreviousError (see page 8268) is 0.

45.1.2.3 EReconcileError Properties

The properties of the EReconcileError class are listed here.

Public Properties

	Name	Description
R	Context (see page 8267)	Contains context information from the error stack.
R	PreviousError (see page 8268)	Indicates the previous error in the reconcile process.

45.1.2.3.1 EReconcileError.Context Property

Contains context information from the error stack.

Pascal

```
property Context: string;
```

C++

```
__property AnsiString Context;
```

Description

Context contains any additional information returned with the error message. If no additional context information is available, Context is nil (Delphi) or NULL (C++).

See Also

ErrorCode (see page 8265)

45.1.2.3.2 EReconcileError.PreviousError Property

Indicates the previous error in the reconcile process.

Pascal

```
property PreviousError: DBResult;
```

C++

```
__property DBResult PreviousError;
```

Description

PreviousError is the error code of the last update error in this update operation. If the last update error did not have an error code, PreviousError is 0.

See Also

ErrorCode (see page 8265)

45.1.3 TAggregate Class

TAggregate represents a maintained aggregate in a client dataset.

Class Hierarchy

Pascal

```
TAggregate = class(TCollectionItem);
```

C++

```
class TAggregate : public TCollectionItem;
```

File

DBClient

Description

Use TAggregate to specify the formula for an aggregate that can be used by a client dataset. Each aggregate object describes a calculation that summarizes the data in a set of records. The group of records that is summarized is part of the aggregate object. Thus, if a client dataset is performing the same summary calculation over subgroups of records and over the entire dataset, it must use two separate TAggregate objects.

When aggregates summarize data over a group of records (rather than the entire client dataset), they must be associated with an index. The fields in the index define the possible groups of records. When a client dataset changes its index, any aggregate not associated with the new index becomes unavailable, and any active aggregate associated with the new index becomes available.

Aggregate objects can be created and used directly in code at runtime. At design time, you can use the Fields editor to add aggregate fields to a client dataset. When you define aggregate fields at design time, the Fields editor automatically creates the TAggregate objects for them.

See Also

TAggregates (see page 8280)

TAggregateField (see page 6743)

TClientDataSet (see page 8289)

TCustomClientDataSet (see page 8373)

TDataSet (see page 6894)

Specifying Aggregates

45.1.3.1 TAggregate Members

The following tables list the members exposed by TAggregate.

Protected Methods

	Name	Description
	Activate (see page 8271)	This is Activate, a member of class TAggregate.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	Changed (see page 2758)	Updates the collection to reflect changes to the collection item.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	GetOwner (see page 2759)	Returns the collection to which this item belongs.
	GetOwner (see page 2932)	Returns the owner of an object.
V	SetCollection (see page 2759)	Sets the value of the Collection (see page 2761) property.
V	SetDisplayName (see page 2760)	Sets the name of the collection item as it appears in the collection editor.
V	SetIndex (see page 2760)	Moves the collection item to a specified position in the parent collection.

Protected Properties

	Name	Description
R	DependentFields (see page 8276)	This is DependentFields, a member of class TAggregate.
	RecBufOfs (see page 8278)	This is RecBufOfs, a member of class TAggregate.

Public Methods

	Name	Description
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 8272)	Copies the properties of another TAggregate (see page 8268) object.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 8270)	Creates and initializes an instance of TAggregate (see page 8268).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 8271)	Destroys an instance of TAggregate (see page 8268).
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.

V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
V	GetDisplayName (see page 8272)	Specifies the name of the aggregate object as it appears in the Object Inspector.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2759)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	Value (see page 8273)	Returns the calculated value of the aggregate.

Public Properties

	Name	Description
	AggHandle (see page 8274)	Provides access to the aggregate handle.
	Collection (see page 2761)	Specifies the TCollection (see page 2731) instance to which the TCollectionItem (see page 2755) belongs.
R	DataSet (see page 8275)	Indicates the client dataset whose records are summarized by this aggregate.
R	DataSize (see page 8275)	Indicates the number of bytes needed to store the aggregate's value.
R	DataType (see page 8276)	Indicates the data type of the calculated value.
	DisplayName (see page 2761)	The name displayed in the Collection (see page 2761) editor.
R	ID (see page 2761)	A unique, permanent index for the item.
	Index (see page 2762)	Returns the item's position in the Items array of TCollection (see page 2731).
	InUse (see page 8278)	Indicates whether the aggregate value is currently available.

Published Events

	Name	Description
	OnUpdate (see page 8279)	Occurs when the value of the aggregate is recalculated.

Published Properties

	Name	Description
	Active (see page 8274)	Indicates whether the aggregate should be calculated.
	AggregateName (see page 8275)	Specifies the name user interface components use when describing the aggregate.
	Expression (see page 8276)	Specifies the formula used to calculate the aggregate value.
	GroupingLevel (see page 8277)	Specifies the set of records summarized by this aggregate.
	IndexName (see page 8278)	Specifies the index that is used to define subgroups of records.
	Visible (see page 8279)	Indicates whether controls should display the aggregated value.

45.1.3.2 TAggregate.Create Constructor

Creates and initializes an instance of TAggregate (see page 8268).

Pascal

```
constructor Create(Aggregates: TAggregates; ADataSet: TCustomClientDataSet); overload;
reintroduce;
```

C++

```
__fastcall TAggregate(TAggregates Aggregates, TCustomClientDataSet ADataSet);
```

Description

Most applications do not call Create to create an aggregate object. Instead, they call the Add method of the TAggregates (see page 8280) collection to which the aggregate should belong.

The Aggregates or Collection parameter specifies the TAggregates (see page 8280) collection to which the TAggregate (see page 8268) instance should belong.

The ADataSet parameter specifies the client dataset whose data the aggregate summarizes.

See Also

Add (see page 8282)

45.1.3.3 TAggregate.Destroy Destructor

Destroys an instance of TAggregate (see page 8268).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TAggregate();
```

Description

Do not call Destroy directly in an application. Instead, call Free, which checks that the TAggregate (see page 8268) reference is not nil before calling Destroy.

Destroy frees the internal buffer that is used for calculating values.

See Also

Free (see page 22300)

45.1.3.4 TAggregate Methods

The methods of the TAggregate class are listed here.

Protected Methods

	Name	Description
	Activate (see page 8271)	This is Activate, a member of class TAggregate.

Public Methods

	Name	Description
V	Assign (see page 8272)	Copies the properties of another TAggregate (see page 8268) object.
V	GetDisplayName (see page 8272)	Specifies the name of the aggregate object as it appears in the Object Inspector.
	Value (see page 8273)	Returns the calculated value of the aggregate.

45.1.3.4.1 TAggregate.Activate Method

Pascal

```
procedure Activate;
```

C++

```
__fastcall Activate();
```

Description

This is Activate, a member of class TAggregate.

45.1.3.4.2 TAggregate.Assign Method

Copies the properties of another TAggregate (see page 8268) object.

Pascal

```
procedure Assign(Source: TPersistent); override;
```

C++

```
virtual __fastcall Assign(TPersistent * Source);
```

Description

Call Assign to copy the properties of another object to the aggregate. If the Source object is another TAggregate (see page 8268) object, Assign copies the values of its Expression (see page 8276), Active (see page 8274), IndexName (see page 8278), and GroupingLevel (see page 8277) properties. Otherwise, Assign calls the inherited (Delphi) or parent class's (C++) method, which copies the properties of any object that can copy to a TAggregate (see page 8268) from its AssignTo method.

See Also

AssignTo (see page 2931)

Expression (see page 8276)

Active (see page 8274)

GroupingLevel (see page 8277)

IndexName (see page 8278)

45.1.3.4.3 TAggregate.GetDisplayName Method

Specifies the name of the aggregate object as it appears in the Object Inspector.

Pascal

```
function GetDisplayName: string; override;
```

C++

```
virtual __fastcall AnsiString GetDisplayName();
```

Description

GetDisplayName overrides the inherited method to provide more meaningful names for the aggregate when it appears in the object inspector. If the AggregateName (see page 8275) property is set, GetDisplayName returns that. Otherwise, if the Expression (see page 8276) property is set, it returns that. If all else fails, it calls the inherited method, which returns the class name with a number suffixed to ensure uniqueness.

See Also

AggregateName (see page 8275)

Expression (see page 8276)

45.1.3.4.4 TAggregate.Value Method

Returns the calculated value of the aggregate.

Pascal

```
function Value: Variant;
```

C++

```
__fastcall Variant Value();
```

Description

Call Value to obtain the evaluation of Expression (see page 8276) over the group of records specified by GroupingLevel (see page 8277). If GroupingLevel (see page 8277) is nonzero (that is, if the aggregate summarizes a subgroup of the records in the client dataset), Value summarizes the data for the group which contains the current record in the client dataset.

If the aggregate is not currently maintained, Value returns Null. An aggregate is not currently maintained when

The Active (see page 8274) property is false.

The DataSet (see page 8275) property is nil (Delphi) or NULL (C++).

The aggregate summarizes a subgroup and the IndexName (see page 8278) property does not match the current index of the client dataset.

See Also

Expression (see page 8276)

GroupingLevel (see page 8277)

Active (see page 8274)

DataSet (see page 8275)

IndexName (see page 8278)

Obtaining Aggregate Values

45.1.3.5 TAggregate Properties

The properties of the TAggregate class are listed here.

Protected Properties

	Name	Description
R	DependentFields (see page 8276)	This is DependentFields, a member of class TAggregate.
	RecBufOfs (see page 8278)	This is RecBufOfs, a member of class TAggregate.

Public Properties

	Name	Description
	AggHandle (see page 8274)	Provides access to the aggregate handle.
R	DataSet (see page 8275)	Indicates the client dataset whose records are summarized by this aggregate.
R	DataSize (see page 8275)	Indicates the number of bytes needed to store the aggregate's value.
R	DataType (see page 8276)	Indicates the data type of the calculated value.
	InUse (see page 8278)	Indicates whether the aggregate value is currently available.

Published Properties

	Name	Description
	Active (see page 8274)	Indicates whether the aggregate should be calculated.
	AggregateName (see page 8275)	Specifies the name user interface components use when describing the aggregate.
	Expression (see page 8276)	Specifies the formula used to calculate the aggregate value.
	GroupingLevel (see page 8277)	Specifies the set of records summarized by this aggregate.
	IndexName (see page 8278)	Specifies the index that is used to define subgroups of records.
	Visible (see page 8279)	Indicates whether controls should display the aggregated value.

45.1.3.5.1 TAggregate.Active Property

Indicates whether the aggregate should be calculated.

Pascal

```
property Active: Boolean;
```

C++

```
__property Boolean Active;
```

Description

Use the Active property to indicate that the aggregate value should be maintained. If Active is false, the value of the aggregate is never calculated.

If Active is true, the aggregate value is calculated unless:

It summarizes records over a group not defined by the current index.

The client dataset's AggregatesActive property is false.

Note: To determine whether the aggregate is currently maintained, read the InUse (see page 8278) property.

See Also

InUse (see page 8278)

AggregatesActive (see page 8461)

Value (see page 8273)

IndexName (see page 8278)

45.1.3.5.2 TAggregate.AggHandle Property

Provides access to the aggregate handle.

Pascal

```
property AggHandle: hDSAggregate;
```

C++

```
__property hDSAggregate AggHandle;
```

Description

AggHandle is the handle for the aggregate instance that is used by the utilities that implement the aggregate object's behavior. Most applications do not need to use this value.

Component writers can use AggHandle, if necessary, with the routines declared in the DSIntf (see page 11667) unit.

See Also

Handle (see page 6758)

45.1.3.5.3 TAggregate.AggregateName Property

Specifies the name user interface components use when describing the aggregate.

Pascal

```
property AggregateName: String;
```

C++

```
__property AnsiString AggregateName;
```

Description

Set AggregateName to provide a name that can be used to label values displayed to the user. When displaying aggregates, read AggregateName to obtain a label for the value.

See Also

Find (see page 8283)

IndexOf (see page 8284)

DisplayName (see page 6756)

45.1.3.5.4 TAggregate.DataSet Property

Indicates the client dataset whose records are summarized by this aggregate.

Pascal

```
property DataSet: TCustomClientDataSet;
```

C++

```
__property TCustomClientDataSet DataSet;
```

Description

Read DataSet to access the client dataset that uses this aggregate.

See Also

IndexName (see page 8278)

Aggregates (see page 8461)

45.1.3.5.5 TAggregate.DataSize Property

Indicates the number of bytes needed to store the aggregate's value.

Pascal

```
property DataSize: Integer;
```

C++

```
__property int DataSize;
```

Description

Read DataSize to determine how much memory is required to store the aggregate's value. This is useful when defining objects

that store aggregate values. For example, the Fields editor uses DataSize when defining aggregate fields.

See Also

DataType (see page 8276)

DataSize (see page 7157)

TAggregateField (see page 6743)

45.1.3.5.6 TAggregate.DataType Property

Indicates the data type of the calculated value.

Pascal

```
property DataType: TFieldType;
```

C++

```
__property TFieldType DataType;
```

Description

Read DataType to determine the data type of the value calculated by the aggregate. This may differ from the data type of the fields that are summarized. For example, an aggregate that counts non-null fields will return an integer (ftInteger), even if the records themselves are some other type.

See Also

DataSize (see page 8275)

DataType (see page 7159)

45.1.3.5.7 TAggregate.DependentFields Property

Pascal

```
property DependentFields: TBits;
```

C++

```
__property TBits DependentFields;
```

Description

This is DependentFields, a member of class TAggregate.

45.1.3.5.8 TAggregate.Expression Property

Specifies the formula used to calculate the aggregate value.

Pascal

```
property Expression: string;
```

C++

```
__property AnsiString Expression;
```

Description

Set Expression to indicate how aggregate values should be calculated. Expression is an expression that includes one or more of the summary operators in the following table:

Operator	Use
Sum	Totals the values for a numeric field or expression
Avg	Computes the average value for a numeric or date-time field or expression
Count	Specifies the number of non-blank values for a field or expression
Min	Indicates the minimum value for a string, numeric, or date-time field or expression
Max	Indicates the maximum value for a string, numeric, or date-time field or expression
Sum(Qty * Price)	legal -- summary of an expression on fields
Max(Field1) - Max(Field2)	legal -- expression on summaries
Avg(DiscountRate) * 100	legal -- expression of summary and constant
Min(Sum(Field1))	illegal -- nested summaries
Count(Field1) - Field2	illegal -- expression of summary and field

The summary operators act on field values or on expressions built from field values using the same operators you use to create filters. (You can't nest summary operators, however.) You can create expressions by using operators on summarized values with other summarized values, or on summarized values and constants. However, you can't combine summarized values with field values, because such expressions are ambiguous (there is no indication of which record should supply the field value.) These rules are illustrated in the following expressions:

Note: To specify the set of records summarized by this expression, use the GroupingLevel (see page 8277) property.

See Also

GroupingLevel (see page 8277)

Value (see page 8273)

Filter (see page 8476)

Specifying Aggregates

45.1.3.5.9 TAggregate.GroupingLevel Property

Specifies the set of records summarized by this aggregate.

Pascal

```
property GroupingLevel: Integer;
```

C++

```
__property int GroupingLevel;
```

Description

Use GroupingLevel to indicate the groups of records over which this aggregate is calculated. When GroupingLevel is 0 (the default), the aggregate summarizes all the records in the client dataset. When GroupingLevel is greater than 0, the aggregate summarizes each group of records that has the same values on the first GroupingLevel fields of the index.

GroupingLevel can be any value from 0 to the number of fields in the index specified by IndexName (see page 8278).

See Also

IndexName (see page 8278)

Expression (see page 8276)

45.1.3.5.10 TAggregate.IndexName Property

Specifies the index that is used to define subgroups of records.

Pascal

```
property IndexName: string;
```

C++

```
__property AnsiString IndexName;
```

Description

Set IndexName to specify an index that sorts the records of DataSet (see page 8275) into subgroups. Each subgroup is defined as a set of records which all have the same values on a set of fields. This defining set of fields is the first GroupingLevel (see page 8277) fields of the index.

IndexName is required for any aggregate that does not summarize all the records in the client dataset (GroupingLevel (see page 8277) > 0). When the index associated with an aggregate is not the current index of the client dataset, its value is unavailable.

See Also

DataSet (see page 8275)

GroupingLevel (see page 8277)

IndexName (see page 8483)

InUse (see page 8278)

45.1.3.5.11 TAggregate.InUse Property

Indicates whether the aggregate value is currently available.

Pascal

```
property InUse: Boolean;
```

C++

```
__property Boolean InUse;
```

Description

Read InUse to determine whether the Value (see page 8273) method returns a summarized value. When InUse is false, Value (see page 8273) returns Null. When InUse is true, the aggregate is maintained so that it calculates the formula specified by Expression (see page 8276) for the current set of records, including any edits to records in the current group.

See Also

Value (see page 8273)

Active (see page 8274)

Expression (see page 8276)

45.1.3.5.12 TAggregate.RecBufOfs Property

Pascal

```
property RecBufOfs: Integer;
```

C++

```
__property int RecBufOfs;
```

Description

This is RecBufOfs, a member of class TAggregate.

45.1.3.5.13 TAggregate.Visible Property

Indicates whether controls should display the aggregated value.

Pascal

```
property Visible: Boolean;
```

C++

```
__property Boolean Visible;
```

Description

Set Visible to indicate to controls that the aggregate value should be hidden. When Visible is false, its value is still calculated.

To prevent the aggregate from being calculated, use the Active (see page 8274) property instead.

See Also

InUse (see page 8278)

Active (see page 8274)

45.1.3.6 TAggregate Events

The events of the TAggregate class are listed here.

Published Events

	Name	Description
	OnUpdate (see page 8279)	Occurs when the value of the aggregate is recalculated.

45.1.3.6.1 TAggregate.OnUpdate Event

Occurs when the value of the aggregate is recalculated.

Pascal

```
property OnUpdate: TAggUpdateEvent;
```

C++

```
__property TAggUpdateEvent OnUpdate;
```

Description

Write an OnUpdate event handler to respond when the aggregate value is recomputed. For example, write code in an OnUpdate event handler to invalidate any controls that display the value of the aggregate so that they can repaint with the new value.

See Also

Value (see page 8273)

InUse (see page 8278)

Invalidate

45.1.4 TAggregates Class

TAggregates is a collection of TAggregate (see page 8268) objects.

Class Hierarchy

System::TObject → Classes.TPersistent → Classes.TCollection → DBClient.TAggregates

Pascal

```
TAggregates = class(TCollection);
```

C++

```
class TAggregates : public TCollection;
```

File

DBClient

Description

TAggregates is the type of the Aggregates property, which represents all the maintained aggregates for a client dataset. A single TAggregate (see page 8268) object represents each maintained aggregate. Maintained aggregates summarize data over the records in the client dataset.

TAggregates can include a mix of active and inactive aggregate objects. Active aggregates are updated dynamically as the data in the client dataset is edited. Inactive aggregates define a formula for summarizing data and a group of records to summarize, but these formulas are not evaluated. Aggregates can be inactive because they are not currently needed, or because the index that defines the group of records they summarize is inactive.

See Also

TAggregate (see page 8268)

TCustomClientDataSet (see page 8373)

45.1.4.1 TAggregates Members

The following tables list the members exposed by TAggregates.

Protected Methods

	Name	Description
V	Added (see page 2736)	Responds when items are added to the collection.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	Changed (see page 2740)	Responds when the collection or any of its items changes.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	Deleting (see page 2741)	Responds when items are deleted from the collection.
	GetAttr (see page 2743)	Returns the name of a custom attribute that can be retrieved using the GetItemAttr (see page 2745) method.
	GetAttrCount (see page 2744)	Returns the number of custom attributes associated with items in the collection.
	GetItem (see page 2744)	Returns a specified item in the collection.
	GetItemAttr (see page 2745)	Returns the value of a custom attribute assigned to one of the collection's items.
V	GetOwner (see page 8283)	Returns the owner of an object.
V	Notify (see page 2746)	Responds when items are added to or removed from the collection.
	SetItem (see page 2747)	Copies the properties of another item to a specified item in the collection.

	SetItemName (see page 2747)	Initializes the name of a newly inserted collection item.
	Update (see page 2747)	Updates the collection to reflect changes to its items.

Protected Properties

	Name	Description
	NextID (see page 2752)	Specifies a unique ID that can be assigned to the next added collection item.
	PropName (see page 2752)	Specifies the name of the property that the collection implements.
	UpdateCount (see page 2753)	Counts the number of times BeginUpdate (see page 2739) was called without a corresponding call to EndUpdate (see page 2742).

Public Methods

	Name	Description
	Add (see page 8282)	Creates a new TAggregate (see page 8268) object and adds it to the end of the Items (see page 8285) property array.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2736)	Copies the contents of another collection to the object where the method is executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	BeginUpdate (see page 2739)	Suspends screen repainting.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Clear (see page 8283)	Removes all aggregates from the Items (see page 8285) property array.
	Create (see page 8282)	Creates and initializes a TAggregates (see page 8280) object.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Delete (see page 2741)	Deletes a single item from the collection.
	Destroy (see page 2735)	Destroys the collection and each item in it.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 22287)	Disposes of an object instance.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	EndUpdate (see page 2742)	Re-enables screen repainting.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Find (see page 8283)	Returns the TAggregate (see page 8268) object with a specified name.
	FindItemID (see page 2743)	Returns the item with the specified ID.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetEnumerator (see page 2744)	Returns a TCollection (see page 2731) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2745)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	IndexOf (see page 8284)	Returns the index of the TAggregate (see page 8268) object with a specified name.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	Insert (see page 2746)	Creates a new TCollectionItem (see page 2755) instance and adds it to the Items (see page 2751) array.

	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	Owner (see page 2746)	Returns the Owner of the collection.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
	Capacity (see page 2748)	Provides access to the internal TList (see page 2868) Capacity property.
R	Count (see page 2749)	Returns the number of items in the collection.
R	ItemClass (see page 2751)	Indicates the class to which the collection's items belong.
	Items (see page 8285)	Provides indexed access to the TAggregate (see page 8268) objects in the collection.

45.1.4.2 TAggregates.Create Constructor

Creates and initializes a TAggregates (see page 8280) object.

Pascal

```
constructor Create(Owner: TPersistent);
```

C++

```
__fastcall TAggregates(TPersistent * Owner);
```

Description

Applications should not need to call the Create method directly. The client dataset that uses TAggregates (see page 8280) to represent its maintained aggregates creates this object from its own constructor.

45.1.4.3 TAggregates Methods

The methods of the TAggregates class are listed here.

Protected Methods

	Name	Description
V	GetOwner (see page 8283)	Returns the owner of an object.

Public Methods

	Name	Description
	Add (see page 8282)	Creates a new TAggregate (see page 8268) object and adds it to the end of the Items (see page 8285) property array.
	Clear (see page 8283)	Removes all aggregates from the Items (see page 8285) property array.
	Find (see page 8283)	Returns the TAggregate (see page 8268) object with a specified name.
	IndexOf (see page 8284)	Returns the index of the TAggregate (see page 8268) object with a specified name.

45.1.4.3.1 TAggregates.Add Method

Creates a new TAggregate (see page 8268) object and adds it to the end of the Items (see page 8285) property array.

Pascal

```
function Add: TAggregate;
```

C++

```
__fastcall TAggregate Add();
```

Description

Call Add to add a new aggregate to the set of aggregates that can be used with a client dataset. Once the aggregate is created and added using Add, its properties can be set to indicate how it is used.

See Also

Items (see page 8285)

45.1.4.3.2 TAggregates.Clear Method

Removes all aggregates from the Items (see page 8285) property array.

Pascal

```
procedure Clear;
```

C++

```
__fastcall Clear();
```

Description

Call Clear to empty the Items (see page 8285) property array. After Clear frees each aggregate in the Items (see page 8285) array, it informs the associated client dataset so that it can update it's ActiveAggs property.

See Also

Items (see page 8285)

ActiveAggs (see page 8460)

45.1.4.3.3 TAggregates.Find Method

Returns the TAggregate (see page 8268) object with a specified name.

Pascal

```
function Find(const DisplayName: string): TAggregate;
```

C++

```
__fastcall TAggregate Find(const AnsiString DisplayName);
```

Description

Call Find to obtain a specified TAggregate (see page 8268) object from the Items (see page 8285) property array. The DisplayName parameter specifies the value of the aggregate's AggregateName property. If there is no aggregate with the specified name in the Items (see page 8285) property array, Find returns nil (Delphi) or NULL (C++).

See Also

AggregateName (see page 8275)

IndexOf (see page 8284)

Items (see page 8285)

45.1.4.3.4 TAggregates.GetOwner Method

Returns the owner of an object.

Pascal

```
function GetOwner: TPersistent; override;
```

C++

```
virtual __fastcall TPersistent * GetOwner();
```

Description

GetOwner is used by the GetNamePath method to find the owner of a persistent object. GetNamePath and GetOwner are introduced in TPersistent so descendants such as collections can appear in the Object Inspector. As implemented in TPersistent, GetOwner returns nil (Delphi) or NULL (C++).

For TCollection, GetOwner returns the owner of the collection. For collection items, it returns the collection object into which the collection item has been inserted. For TComponent it is the value of the Owner property.

See Also

GetNamePath (see page 2932)

TCollection (see page 2731)

TComponent (see page 2762)

Owner (see page 2807)

45.1.4.3.5 TAggregates.IndexOf Method

Returns the index of the TAggregate (see page 8268) object with a specified name.

Pascal

```
function IndexOf(const DisplayName: string): Integer;
```

C++

```
__fastcall int IndexOf(const AnsiString DisplayName);
```

Description

Call IndexOf to obtain the index of a specified TAggregate (see page 8268) object in the Items (see page 8285) property array. The DisplayName parameter specifies the value of the aggregate's AggregateName property. If there is no aggregate with the specified name in the Items (see page 8285) property array, IndexOf returns -1.

See Also

AggregateName (see page 8275)

Find (see page 8283)

Items (see page 8285)

45.1.4.4 TAggregates Properties

The properties of the TAggregates class are listed here.

Public Properties

	Name	Description
	Items (see page 8285)	Provides indexed access to the TAggregate (see page 8268) objects in the collection.

45.1.4.4.1 TAggregates.Items Property

Provides indexed access to the TAggregate (see page 8268) objects in the collection.

Pascal

```
property Items [Index: Integer]: TAggregate;
```

C++

```
__property TAggregate Items[int Index];
```

Description

Use Items to access individual TAggregate (see page 8268) objects maintained by TAggregates (see page 8280).

In Delphi, Items is the default property of TAggregates (see page 8280), so the name of the Items property can be left off when using this property. Thus the line

```
FirstAggregate := TClientDataSet1.Aggregates.Items[0];
```

can be written

```
FirstAggregate := TClientDataSet1.Aggregates[0];
```

See Also

Aggregates (see page 8461)

operator_sb

45.1.5 TClientBlobStream Class

TClientBlobStream lets applications read from or write to BLOB fields in a client dataset.

Class Hierarchy

Pascal

```
TClientBlobStream = class(TMemoryStream);
```

C++

```
class TClientBlobStream : public TMemoryStream;
```

File

DBClient

Description

Use TClientBlobStream to access or modify the value of a Binary Large Object (BLOB) field in a client dataset. BLOB fields are TBlobField objects and descendants of TBlobField such as TGraphicField and TMemoField. BLOB fields in client datasets use client BLOB streams to implement many of their data access properties and methods.

TClientBlobStream allows objects that have no specialized knowledge of how data is stored in a BLOB field to read or write such data by employing the uniform stream interface.

To use a client BLOB stream, create an instance of TClientBlobStream, use the methods of the stream to read or write the data, and then free the BLOB stream. Do not use the same instance of TClientBlobStream to access data from more than one record. Instead, create a new TClientBlobStream object every time you need to read or write BLOB data on a new record.

Note: Explicitly creating a TClientBlobStream instance does not ensure that the current record has fetched its BLOB data. To ensure that the BLOB field contains its data before reading from the BLOB stream, call the client dataset's FetchBlobs method before creating the BLOB stream or use the client dataset's CreateBlobStream method to create the BLOB stream indirectly.

See Also

TBlobField (see page 6801)

TGraphicField (see page 7257)

TMemoField (see page 7348)

TClientDataSet (see page 8289)

TCustomClientDataSet (see page 8373)

TCustomClientDataSet (see page 8373)

45.1.5.1 TClientBlobStream Members

The following tables list the members exposed by TClientBlobStream.

Protected Methods

	Name	Description
	GetSize (see page 2982)	This is GetSize, a member of class TStream.
	Realloc (see page 2910)	This is Realloc, a member of class TMemoryStream.
	SetPointer (see page 2823)	Replaces the memory buffer associated with the memory stream.
	SetSize (see page 2989)	This is the overview for the SetSize method overload.

Protected Properties

	Name	Description
	Capacity (see page 2912)	This is Capacity, a member of class TMemoryStream.

Public Methods

	Name	Description
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Clear (see page 2909)	Frees the memory buffer, discarding all data associated with the memory stream.
	CopyFrom (see page 2979)	Copies a specified number of bytes from one stream to another.
	Create (see page 8287)	Creates and initializes an instance of TClientBlobStream (see page 8285).
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 8288)	Frees an instance of TClientBlobStream (see page 8285).
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FixupResourceHeader (see page 2981)	Patches the resource header for a resource that has been written to the stream.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.

	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	LoadFromFile (see page 2909)	Loads the entire contents of a file into the memory buffer.
	LoadFromStream (see page 2909)	Loads the entire contents of a stream into the memory buffer.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	Read (see page 2817)	Reads up to Count bytes from the memory stream into Buffer and advances the current position of the stream by the number of bytes read.
A	Read (see page 2982)	Introduces an abstract or pure virtual method responsible for reading from the stream.
	ReadBuffer (see page 2983)	Reads bytes from the stream into Buffer.
	ReadComponent (see page 2983)	Initiates streaming of components and their properties.
	ReadComponentRes (see page 2987)	Reads components and their properties from a stream in a resource file format.
	ReadResHeader (see page 2987)	Reads a resource-file header from the stream.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SaveToFile (see page 2818)	Writes the entire contents of the memory stream to the file with a given file name.
	SaveToStream (see page 2818)	Writes the entire contents of the memory stream to the stream object specified by Stream.
V	Seek (see page 2819)	Moves the current position of the stream by Offset bytes, relative to the origin specified by Origin.
V	Seek (see page 2988)	This is the overview for the Seek method overload.
V	SetSize (see page 2910)	Sets the Size (see page 2997) property of the memory stream.
	Truncate (see page 8288)	Discards all data in the BLOB field from the current position on.
V	Write (see page 8289)	Writes Count bytes from Buffer to the current position in the field and updates the current position by Count bytes.
	WriteBuffer (see page 2990)	Writes Count bytes from Buffer onto the stream and advances the current position of the stream by Count bytes.
	WriteComponent (see page 2990)	Initiates the writing of components and their properties to a stream.
	WriteComponentRes (see page 2994)	Writes components and their properties to a stream from a resource file format.
	WriteDescendent (see page 2994)	Streams components and their properties in inherited forms.
	WriteDescendentRes (see page 2995)	Streams components and their properties in inherited forms.
	WriteResourceHeader (see page 2995)	Writes a resource-file header to the stream.

Public Properties

	Name	Description
R	Memory (see page 2823)	Provides direct access to the memory pool allocated for the memory stream.
	Position (see page 2996)	Indicates the current offset into the stream for reading and writing.
	Size (see page 2997)	Indicates the size in bytes of the stream.

45.1.5.2 TClientBlobStream.Create Constructor

Creates and initializes an instance of TClientBlobStream (see page 8285).

Pascal

```
constructor Create(Field: TBlobField; Mode: TBlobStreamMode);
```

C++

```
__fastcall TClientBlobStream(TBlobField Field, TBlobStreamMode Mode);
```

Description

Call Create to obtain an instance of TClientBlobStream (see page 8285) for reading from or writing to a specific TBlobField object in a client dataset.

Create links the TClientBlobStream (see page 8285) to the field object specified by the Field parameter. Mode specifies whether the BLOB stream will be used to read data (bmRead), write data (bmWrite) or modify data (bmReadWrite).

Tip: Because Client datasets sometimes fetch BLOB data on demand, it is a good idea to use the Client dataset's CreateBlobStream method rather than calling the Client BLOB stream's constructor. CreateBlobStream ensures that BLOB data is fetched for the current record unless the FetchOnDemand property is false.

See Also

CreateBlobStream (see page 8401)

45.1.5.3 TClientBlobStream.Destroy Destructor

Frees an instance of TClientBlobStream (see page 8285).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TClientBlobStream();
```

Description

Do not call Destroy directly in an application. Instead call Free. Free verifies that the TBlobStream object is not nil and only then calls Destroy.

Destroy the TClientBlobStream (see page 8285) object by calling Free when it is no longer needed for reading from or writing to the BLOB field. Client blob streams should be destroyed when the client dataset changes the current record

Destroy triggers an OnDataChange event if the BLOB stream was used to overwrite or modify the data in the field. Destroy then frees any buffers that were allocated to handle the data.

See Also

Free (see page 22300)

OnDataChange (see page 9497)

45.1.5.4 TClientBlobStream Methods

The methods of the TClientBlobStream class are listed here.

Public Methods

	Name	Description
	Truncate (see page 8288)	Discards all data in the BLOB field from the current position on.
V	Write (see page 8289)	Writes Count bytes from Buffer to the current position in the field and updates the current position by Count bytes.

45.1.5.4.1 TClientBlobStream.Truncate Method

Discards all data in the BLOB field from the current position on.

Pascal

```
procedure Truncate;
```

C++

```
__fastcall Truncate();
```

Description

Use Truncate to limit the size of the BLOB data. Calling Truncate does the same thing as setting the Size property to the value of the Position property. Calling Truncate when the current position is 0 clears the contents of the BLOB field.

Note: Do not call Truncate when the TBlobStream was created in bmRead mode.

See Also

Size (see page 2997)

Position (see page 2996)

Create (see page 8287)

45.1.5.4.2 TClientBlobStream.Write Method

Writes Count bytes from Buffer to the current position in the field and updates the current position by Count bytes.

Pascal

```
function Write(const Buffer; Count: Longint): Longint; override;
```

C++

```
virtual __fastcall Longint Write(const  Buffer, Longint Count);
```

Description

Use Write to write Count bytes to the BLOB field, starting at the current position. The Write method for TClientBlobStream (see page 8285) always writes the entire Count bytes, as BLOB data does not necessarily include a termination character. Thus, Write is equivalent to the WriteBuffer method.

All the other data-writing methods of a BLOB stream (WriteBuffer, WriteComponent) call Write to do their actual writing.

Note: Do not call Write when the TClientBlobStream (see page 8285) was created in bmRead mode.

See Also

Position (see page 2996)

Create (see page 8287)

WriteBuffer (see page 2990)

45.1.6 TClientDataSet Class

TClientDataSet implements a database-independent dataset.

Class Hierarchy

Pascal

```
TClientDataSet = class(TCustomClientDataSet);
```

C++

```
class TClientDataSet : public TCustomClientDataSet;
```

File

DBClient

Description

TClientDataSet represents an in-memory dataset. A client dataset can be used as

A fully-functional, stand-alone, file-based dataset for single-tiered database applications. When used in this manner, the client dataset represents the data stored in a dedicated file on the user's hard disk.

A local in-memory buffer of the records from another dataset. The other (source) dataset can reside in the same form or data module as the client dataset (for example, when the client dataset provides navigation and editing support for the data from a unidirectional dataset). The source dataset can also reside on a separate system when the client dataset supports the client portion of a multi-tiered database application.

Note: The two functions described above are not mutually exclusive. An application can be designed to support the option of working with data offline, using the "briefcase" model. On site, the application uses TClientDataSet to communicate with the database server associated with a source dataset. When a user works off site, the client dataset writes a snapshot of the data to the hard disk. The application works with this snapshot off site, with the client dataset acting as a file-based dataset in a single-tiered application.

When a client dataset represents the data from another dataset, it communicates with that dataset through a dataset provider. The client dataset communicates with this provider through the IAppServer interface. When the provider is in the same form or data module as the client dataset, the IAppServer interface is implemented by a hidden object that is created for you. When used in a client application as part of a multi-tiered application, the client dataset passes all calls to the provider through a remote data module's IAppServer interface.

Types of Datasets

Choosing the Type of Dataset for Caching Updates

45.1.6.1 TClientDataSet Members

The following tables list the members exposed by TClientDataSet.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	ActivateBuffers (see page 6909)	This is ActivateBuffers, a member of class TDataSet.
	ActivateFilters (see page 8391)	This is ActivateFilters, a member of class TCustomClientDataSet.
V	AddDataPacket (see page 8391)	This is AddDataPacket, a member of class TCustomClientDataSet.
	AddFieldDesc (see page 8391)	This is AddFieldDesc, a member of class TCustomClientDataSet.
	AllocKeyBuffers (see page 8392)	This is AllocKeyBuffers, a member of class TCustomClientDataSet.
V	AllocRecordBuffer (see page 6909)	This is AllocRecordBuffer, a member of class TDataSet.
V	AllocRecordBuffer (see page 8393)	This is AllocRecordBuffer, a member of class TCustomClientDataSet.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	BindFields (see page 6915)	This is BindFields, a member of class TDataSet.
V	BlockReadNext (see page 6915)	This is BlockReadNext, a member of class TDataSet.
	BookmarkAvailable (see page 6916)	This is BookmarkAvailable, a member of class TDataSet.
V	CalculateFields (see page 6916)	This is CalculateFields, a member of class TDataSet.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	Check (see page 8397)	This is Check, a member of class TCustomClientDataSet.
V	CheckActive (see page 6917)	This is CheckActive, a member of class TDataSet.
	CheckBiDirectional (see page 6918)	This is CheckBiDirectional, a member of class TDataSet.
V	CheckDetailRecords (see page 8397)	This is CheckDetailRecords, a member of class TCustomClientDataSet.
V	CheckFieldCompatibility (see page 6919)	This is CheckFieldCompatibility, a member of class TDataSet.
V	CheckInactive (see page 6919)	This is CheckInactive, a member of class TDataSet.
V	CheckProviderEOF (see page 8397)	This is CheckProviderEOF, a member of class TCustomClientDataSet.
	CheckSetKeyMode (see page 8397)	This is CheckSetKeyMode, a member of class TCustomClientDataSet.
V	ClearBuffers (see page 6919)	This is ClearBuffers, a member of class TDataSet.
V	ClearCalcFields (see page 6919)	This is ClearCalcFields, a member of class TDataSet.
V	ClearCalcFields (see page 8398)	This is ClearCalcFields, a member of class TCustomClientDataSet.
V	CloseBlob (see page 6921)	This is CloseBlob, a member of class TDataSet.
V	CloseCursor (see page 6921)	This is CloseCursor, a member of class TDataSet.
V	CloseCursor (see page 8400)	This is CloseCursor, a member of class TCustomClientDataSet.
	ConstraintsStored (see page 8401)	This is ConstraintsStored, a member of class TCustomClientDataSet.
V	CreateFields (see page 6923)	This is CreateFields, a member of class TDataSet.
V	CreateNestedDataSet (see page 6923)	This is CreateNestedDataSet, a member of class TDataSet.
V	DataConvert (see page 6924)	This is DataConvert, a member of class TDataSet.
V	DataConvert (see page 8404)	This is DataConvert, a member of class TCustomClientDataSet.
V	DataEvent (see page 6924)	This is DataEvent, a member of class TDataSet.
V	DataEvent (see page 8404)	This is DataEvent, a member of class TCustomClientDataSet.
	DeactivateFilters (see page 8405)	This is DeactivateFilters, a member of class TCustomClientDataSet.
V	DefChanged (see page 6924)	This is DefChanged, a member of class TDataSet.
V	DefChanged (see page 8405)	This is DefChanged, a member of class TCustomClientDataSet.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.

	DefineProperties (see page 8405)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	DestroyFields (see page 6925)	This is DestroyFields, a member of class TDataSet.
	DestroyLookupCursor (see page 8406)	This is DestroyLookupCursor, a member of class TCustomClientDataSet.
	DoAfterApplyUpdates (see page 8407)	This is DoAfterApplyUpdates, a member of class TCustomClientDataSet.
	DoAfterCancel (see page 6927)	This is DoAfterCancel, a member of class TDataSet.
	DoAfterClose (see page 6927)	This is DoAfterClose, a member of class TDataSet.
	DoAfterDelete (see page 6928)	This is DoAfterDelete, a member of class TDataSet.
	DoAfterEdit (see page 6928)	This is DoAfterEdit, a member of class TDataSet.
	DoAfterExecute (see page 8407)	This is DoAfterExecute, a member of class TCustomClientDataSet.
	DoAfterGetParams (see page 8407)	This is DoAfterGetParams, a member of class TCustomClientDataSet.
	DoAfterGetRecords (see page 8407)	This is DoAfterGetRecords, a member of class TCustomClientDataSet.
	DoAfterInsert (see page 6928)	This is DoAfterInsert, a member of class TDataSet.
	DoAfterOpen (see page 6928)	This is DoAfterOpen, a member of class TDataSet.
	DoAfterPost (see page 6929)	This is DoAfterPost, a member of class TDataSet.
	DoAfterRefresh (see page 6929)	This is DoAfterRefresh, a member of class TDataSet.
	DoAfterRowRequest (see page 8408)	This is DoAfterRowRequest, a member of class TCustomClientDataSet.
	DoAfterScroll (see page 6929)	This is DoAfterScroll, a member of class TDataSet.
	DoApplyUpdates (see page 8408)	This is DoApplyUpdates, a member of class TCustomClientDataSet.
	DoBeforeApplyUpdates (see page 8408)	This is DoBeforeApplyUpdates, a member of class TCustomClientDataSet.
	DoBeforeCancel (see page 6929)	This is DoBeforeCancel, a member of class TDataSet.
	DoBeforeClose (see page 6929)	This is DoBeforeClose, a member of class TDataSet.
	DoBeforeDelete (see page 6930)	This is DoBeforeDelete, a member of class TDataSet.
	DoBeforeEdit (see page 6930)	This is DoBeforeEdit, a member of class TDataSet.
	DoBeforeExecute (see page 8408)	This is DoBeforeExecute, a member of class TCustomClientDataSet.
	DoBeforeGetParams (see page 8408)	This is DoBeforeGetParams, a member of class TCustomClientDataSet.
	DoBeforeGetRecords (see page 8409)	This is DoBeforeGetRecords, a member of class TCustomClientDataSet.
	DoBeforeInsert (see page 6930)	This is DoBeforeInsert, a member of class TDataSet.
	DoBeforeInsert (see page 8409)	This is DoBeforeInsert, a member of class TCustomClientDataSet.
	DoBeforeOpen (see page 6930)	This is DoBeforeOpen, a member of class TDataSet.
	DoBeforePost (see page 6931)	This is DoBeforePost, a member of class TDataSet.
	DoBeforeRefresh (see page 6931)	This is DoBeforeRefresh, a member of class TDataSet.
	DoBeforeRowRequest (see page 8409)	This is DoBeforeRowRequest, a member of class TCustomClientDataSet.
	DoBeforeScroll (see page 6931)	This is DoBeforeScroll, a member of class TDataSet.
	DoExecute (see page 8409)	This is DoExecute, a member of class TCustomClientDataSet.
	DoGetRecords (see page 8410)	This is DoGetRecords, a member of class TCustomClientDataSet.
	DoOnCalcFields (see page 6931)	This is DoOnCalcFields, a member of class TDataSet.
	DoOnNewRecord (see page 6931)	This is DoOnNewRecord, a member of class TDataSet.
	DoOnNewRecord (see page 8410)	This is DoOnNewRecord, a member of class TCustomClientDataSet.
	DoRowRequest (see page 8410)	This is DoRowRequest, a member of class TCustomClientDataSet.
	FetchMoreData (see page 8415)	This is FetchMoreData, a member of class TCustomClientDataSet.
	FieldByNumber (see page 6938)	This is FieldByNumber, a member of class TDataSet.
	FindRecord (see page 6942)	This is FindRecord, a member of class TDataSet.
	FindRecord (see page 8417)	This is FindRecord, a member of class TCustomClientDataSet.
	FreeFieldBuffers (see page 6946)	This is FreeFieldBuffers, a member of class TDataSet.
	FreeKeyBuffers (see page 8417)	This is FreeKeyBuffers, a member of class TCustomClientDataSet.
	FreeRecordBuffer (see page 6947)	This is FreeRecordBuffer, a member of class TDataSet.
	FreeRecordBuffer (see page 8417)	This is FreeRecordBuffer, a member of class TCustomClientDataSet.
	GetAggRecordCount (see page 6947)	This is GetAggRecordCount, a member of class TDataSet.
	GetAggregateValue (see page 6947)	This is GetAggregateValue, a member of class TDataSet.
	GetAggregateValue (see page 8418)	This is GetAggregateValue, a member of class TCustomClientDataSet.
	GetAppServer (see page 8418)	This is GetAppServer, a member of class TCustomClientDataSet.
	GetBookmarkData (see page 6949)	This is GetBookmarkData, a member of class TDataSet.
	GetBookmarkData (see page 8418)	This is GetBookmarkData, a member of class TCustomClientDataSet.
	GetBookmarkFlag (see page 6949)	This is GetBookmarkFlag, a member of class TDataSet.

V	GetBookmarkFlag (see page 8418)	This is GetBookmarkFlag, a member of class TCustomClientDataSet.
V	GetBookmarkStr (see page 6949)	This is GetBookmarkStr, a member of class TDataSet.
V	GetCalcFields (see page 6950)	This is GetCalcFields, a member of class TDataSet.
V	GetCanModify (see page 6950)	This is GetCanModify, a member of class TDataSet.
V	GetCanModify (see page 8418)	This is GetCanModify, a member of class TCustomClientDataSet.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetChildren (see page 6950)	This is GetChildren, a member of class TDataSet.
V	GetDataSource (see page 6951)	This is GetDataSource, a member of class TDataSet.
V	GetDataSource (see page 8419)	This is GetDataSource, a member of class TCustomClientDataSet.
V	GetFieldClass (see page 6952)	This is GetFieldClass, a member of class TDataSet.
V	GetFieldFullName (see page 6953)	This is GetFieldFullName, a member of class TDataSet.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
	GetIndexDefs (see page 6954)	This is GetIndexDefs, a member of class TDataSet.
	GetIndexField (see page 8421)	This is GetIndexField, a member of class TCustomClientDataSet.
	GetIndexFieldCount (see page 8421)	This is GetIndexFieldCount, a member of class TCustomClientDataSet.
V	GetIsClone (see page 8422)	This is GetIsClone, a member of class TCustomClientDataSet.
V	GetIsIndexField (see page 6954)	This is GetIsIndexField, a member of class TDataSet.
V	GetIsIndexField (see page 8422)	This is GetIsIndexField, a member of class TCustomClientDataSet.
	GetKeyBuffer (see page 8423)	This is GetKeyBuffer, a member of class TCustomClientDataSet.
	GetKeyExclusive (see page 8423)	This is GetKeyExclusive, a member of class TCustomClientDataSet.
	GetKeyFieldCount (see page 8423)	This is GetKeyFieldCount, a member of class TCustomClientDataSet.
V	GetNextRecord (see page 6955)	This is GetNextRecord, a member of class TDataSet.
V	GetNextRecords (see page 6955)	This is GetNextRecords, a member of class TDataSet.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
V	GetPriorRecord (see page 6955)	This is GetPriorRecord, a member of class TDataSet.
V	GetPriorRecords (see page 6955)	This is GetPriorRecords, a member of class TDataSet.
V	GetRecNo (see page 6956)	This is GetRecNo, a member of class TDataSet.
V	GetRecNo (see page 8425)	This is GetRecNo, a member of class TCustomClientDataSet.
A	GetRecord (see page 6956)	This is GetRecord, a member of class TDataSet.
V	GetRecord (see page 8425)	This is GetRecord, a member of class TCustomClientDataSet.
V	GetRecordCount (see page 6956)	This is GetRecordCount, a member of class TDataSet.
V	GetRecordCount (see page 8426)	This is GetRecordCount, a member of class TCustomClientDataSet.
V	GetRecordSize (see page 6956)	This is GetRecordSize, a member of class TDataSet.
V	GetRecordSize (see page 8426)	This is GetRecordSize, a member of class TCustomClientDataSet.
V	GetRemoteServer (see page 8426)	This is GetRemoteServer, a member of class TCustomClientDataSet.
V	GetStateFieldValue (see page 6956)	This is GetStateFieldValue, a member of class TDataSet.
V	GetStateFieldValue (see page 8426)	This is GetStateFieldValue, a member of class TCustomClientDataSet.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
V	InitFieldDefs (see page 6958)	This is InitFieldDefs, a member of class TDataSet.
	InitFieldDefsFromFields (see page 6959)	This is InitFieldDefsFromFields, a member of class TDataSet.
	InitKeyBuffer (see page 8428)	This is InitKeyBuffer, a member of class TCustomClientDataSet.
V	InitRecord (see page 6959)	This is InitRecord, a member of class TDataSet.
V	InitRecord (see page 8428)	This is InitRecord, a member of class TCustomClientDataSet.
V	InternalAddRecord (see page 6963)	This is InternalAddRecord, a member of class TDataSet.
V	InternalAddRecord (see page 8428)	This is InternalAddRecord, a member of class TCustomClientDataSet.
V	InternalCancel (see page 6963)	This is InternalCancel, a member of class TDataSet.
V	InternalCancel (see page 8429)	This is InternalCancel, a member of class TCustomClientDataSet.
A	InternalClose (see page 6963)	This is InternalClose, a member of class TDataSet.

	InternalClose (see page 8429)	This is InternalClose, a member of class TCustomClientDataSet.
	InternalDelete (see page 6964)	This is InternalDelete, a member of class TDataSet.
	InternalDelete (see page 8429)	This is InternalDelete, a member of class TCustomClientDataSet.
	InternalEdit (see page 6964)	This is InternalEdit, a member of class TDataSet.
	InternalEdit (see page 8429)	This is InternalEdit, a member of class TCustomClientDataSet.
	InternalFirst (see page 6964)	This is InternalFirst, a member of class TDataSet.
	InternalFirst (see page 8430)	This is InternalFirst, a member of class TCustomClientDataSet.
	InternalGetOptionalParam (see page 8430)	This is InternalGetOptionalParam, a member of class TCustomClientDataSet.
	InternalGotoBookmark (see page 6964)	This is InternalGotoBookmark, a member of class TDataSet.
	InternalGotoBookmark (see page 8430)	This is InternalGotoBookmark, a member of class TCustomClientDataSet.
	InternalHandleException (see page 6964)	This is InternalHandleException, a member of class TDataSet.
	InternalHandleException (see page 8430)	This is InternalHandleException, a member of class TCustomClientDataSet.
	InternalInitFieldDefs (see page 6965)	This is InternalInitFieldDefs, a member of class TDataSet.
	InternalInitFieldDefs (see page 8430)	This is InternalInitFieldDefs, a member of class TCustomClientDataSet.
	InternalInitRecord (see page 6965)	This is InternalInitRecord, a member of class TDataSet.
	InternalInitRecord (see page 8431)	This is InternalInitRecord, a member of class TCustomClientDataSet.
	InternalInsert (see page 6965)	This is InternalInsert, a member of class TDataSet.
	InternalInsert (see page 8431)	This is InternalInsert, a member of class TCustomClientDataSet.
	InternalLast (see page 6965)	This is InternalLast, a member of class TDataSet.
	InternalLast (see page 8431)	This is InternalLast, a member of class TCustomClientDataSet.
	InternalOpen (see page 6966)	This is InternalOpen, a member of class TDataSet.
	InternalOpen (see page 8431)	This is InternalOpen, a member of class TCustomClientDataSet.
	InternalPost (see page 6966)	This is InternalPost, a member of class TDataSet.
	InternalPost (see page 8432)	This is InternalPost, a member of class TCustomClientDataSet.
	InternalRefresh (see page 6966)	This is InternalRefresh, a member of class TDataSet.
	InternalRefresh (see page 8432)	This is InternalRefresh, a member of class TCustomClientDataSet.
	InternalSetOptionalParam (see page 8432)	This is InternalSetOptionalParam, a member of class TCustomClientDataSet.
	InternalSetToRecord (see page 6966)	This is InternalSetToRecord, a member of class TDataSet.
	InternalSetToRecord (see page 8432)	This is InternalSetToRecord, a member of class TCustomClientDataSet.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsCursorOpen (see page 6966)	This is IsCursorOpen, a member of class TDataSet.
	IsCursorOpen (see page 8432)	This is IsCursorOpen, a member of class TCustomClientDataSet.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Loaded (see page 6969)	Initializes the component after the form file has been read into memory.
	Loaded (see page 8433)	Initializes the component after the form file has been read into memory.
	LocateRecord (see page 8436)	This is LocateRecord, a member of class TCustomClientDataSet.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	Notification (see page 8437)	Forwards notification messages to all owned components.
	OpenCursor (see page 6976)	This is OpenCursor, a member of class TDataSet.
	OpenCursor (see page 8438)	This is OpenCursor, a member of class TCustomClientDataSet.
	OpenCursorComplete (see page 6977)	This is OpenCursorComplete, a member of class TDataSet.
	OpenParentDataSet (see page 6977)	This is OpenParentDataSet, a member of class TDataSet.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	PostKeyBuffer (see page 8439)	This is PostKeyBuffer, a member of class TCustomClientDataSet.
	PSEndTransaction (see page 6979)	Ends a transaction that was started by a call to PSStartTransaction.
	PSExecute (see page 6980)	Executes the SQL command associated with the dataset.
	PSExecuteStatement (see page 6980)	This is the overview for the PSExecuteStatement method overload.
	PSExecuteStatement (see page 7535)	This is the overview for the PSExecuteStatement method overload.
	PSGetAttributes (see page 6981)	Returns information that is stored in data packets as Name/Value pairs.
	PSGetCommandText (see page 6982)	Gets the SQL command to be executed by PSExecute.
	PSGetCommandText (see page 7537)	Gets the SQL command to be executed by PSExecute.
	PSGetCommandText (see page 8439)	Gets the SQL command to be executed by PSExecute.
	PSGetCommandTextW (see page 6982)	This is PSGetCommandTextW, a member of class TDataSet.
	PSGetCommandTextW (see page 7537)	This is PSGetCommandTextW, a member of class TWideDataSet.

	PSGetCommandType (see page 6982)	Gets the command type to be executed by PSExecute.
	PSGetCommandType (see page 8440)	Gets the command type to be executed by PSExecute.
	PSGetDefaultOrder (see page 6983)	Returns the definition of an index that imposes the default order on the data included in data packets.
	PSGetIndexDefs (see page 6983)	Returns the definitions of all specified indexes defined for the dataset.
	PSGetIndexDefs (see page 8440)	Returns the definitions of all specified indexes defined for the dataset.
	PSGetKeyFields (see page 6984)	Returns the names of all fields required to uniquely identify records in the data packet.
	PSGetKeyFields (see page 7538)	Returns the names of all fields required to uniquely identify records in the data packet.
	PSGetKeyFieldsW (see page 6984)	This is PSGetKeyFieldsW, a member of class TDataSet.
	PSGetKeyFieldsW (see page 7538)	This is PSGetKeyFieldsW, a member of class TWideDataSet.
	PSGetParams (see page 6984)	Returns the current parameter values of the dataset.
	PSGetQuoteChar (see page 6985)	Returns the character or characters to use in generated SQL statements to enclose quoted strings.
	PSGetQuoteChar (see page 7538)	Returns the character or characters to use in generated SQL statements to enclose quoted strings.
	PSGetQuoteCharW (see page 6985)	This is PSGetQuoteCharW, a member of class TDataSet.
	PSGetQuoteCharW (see page 7539)	This is PSGetQuoteCharW, a member of class TWideDataSet.
	PSGetTableName (see page 6985)	Returns the name of the dataset table that appears in generated SQL statements.
	PSGetTableName (see page 7539)	Returns the name of the dataset table that appears in generated SQL statements.
	PSGetTableNameW (see page 6986)	This is PSGetTableNameW, a member of class TDataSet.
	PSGetTableNameW (see page 7539)	This is PSGetTableNameW, a member of class TWideDataSet.
	PSGetUpdateException (see page 6986)	Generates an EUpdateError object based on another exception object.
	PSInTransaction (see page 6987)	Indicates whether actions against the dataset occur in the context of a transaction.
	PSIsSQLBased (see page 6987)	Indicates whether the dataset includes native SQL support.
	PSIsSQLSupported (see page 6987)	Indicates whether the dataset can execute SQL statements.
	PSReset (see page 6988)	Resets the dataset so that it is positioned on the first record.
	PSSetCommandText (see page 6988)	This is the overview for the PSSetCommandText method overload.
	PSSetCommandText (see page 7540)	This is the overview for the PSSetCommandText method overload.
	PSSetParams (see page 6989)	Assigns the specified parameter values to the dataset.
	PSStartTransaction (see page 6989)	Starts a transaction that encapsulates all activity until a call to PSEndTransaction.
	PSUpdateRecord (see page 6990)	Applies a single update to the underlying database table or tables.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadDataPacket (see page 8441)	This is ReadDataPacket, a member of class TCustomClientDataSet.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	RefreshInternalCalcFields (see page 6993)	This is RefreshInternalCalcFields, a member of class TDataSet.
	RefreshInternalCalcFields (see page 8441)	This is RefreshInternalCalcFields, a member of class TCustomClientDataSet.
	ResetAggField (see page 6993)	This is ResetAggField, a member of class TDataSet.
	ResetAggField (see page 8442)	This is ResetAggField, a member of class TCustomClientDataSet.
	ResetCursorRange (see page 8443)	This is ResetCursorRange, a member of class TCustomClientDataSet.
	RestoreState (see page 6993)	This is RestoreState, a member of class TDataSet.
	SetActive (see page 6994)	This is SetActive, a member of class TDataSet.
	SetAggregates (see page 8445)	This is SetAggregates, a member of class TCustomClientDataSet.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetAppServer (see page 8446)	This is SetAppServer, a member of class TCustomClientDataSet.
	SetBlockReadSize (see page 6994)	This is SetBlockReadSize, a member of class TDataSet.
	SetBookmarkData (see page 6994)	This is SetBookmarkData, a member of class TDataSet.
	SetBookmarkData (see page 8446)	This is SetBookmarkData, a member of class TCustomClientDataSet.
	SetBookmarkFlag (see page 6995)	This is SetBookmarkFlag, a member of class TDataSet.
	SetBookmarkFlag (see page 8446)	This is SetBookmarkFlag, a member of class TCustomClientDataSet.
	SetBookmarkStr (see page 6995)	This is SetBookmarkStr, a member of class TDataSet.
	SetBufListSize (see page 6995)	This is SetBufListSize, a member of class TDataSet.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetChildOrder (see page 6995)	This is SetChildOrder, a member of class TDataSet.

	SetCommandText (see page 8447)	This is SetCommandText, a member of class TCustomClientDataSet.
	SetCurrentRecord (see page 6996)	This is SetCurrentRecord, a member of class TDataSet.
	SetCursorRange (see page 8447)	This is SetCursorRange, a member of class TCustomClientDataSet.
	SetDataSetField (see page 6996)	This is SetDataSetField, a member of class TDataSet.
	SetDataSetField (see page 8447)	This is SetDataSetField, a member of class TCustomClientDataSet.
	SetDefaultFields (see page 6996)	This is SetDefaultFields, a member of class TDataSet.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetFieldData (see page 8447)	This is SetFieldData, a member of class TCustomClientDataSet.
	SetFieldData (see page 6996)	This is the overview for the SetFieldData method overload.
	SetFilterData (see page 8448)	This is SetFilterData, a member of class TCustomClientDataSet.
	SetFiltered (see page 6997)	This is SetFiltered, a member of class TDataSet.
	SetFiltered (see page 8448)	This is SetFiltered, a member of class TCustomClientDataSet.
	SetFilterOptions (see page 6998)	This is SetFilterOptions, a member of class TDataSet.
	SetFilterOptions (see page 8448)	This is SetFilterOptions, a member of class TCustomClientDataSet.
	SetFilterText (see page 6998)	This is SetFilterText, a member of class TDataSet.
	SetFilterText (see page 8448)	This is SetFilterText, a member of class TCustomClientDataSet.
	SetFound (see page 6998)	This is SetFound, a member of class TDataSet.
	SetIndexField (see page 8448)	This is SetIndexField, a member of class TCustomClientDataSet.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetKeyBuffer (see page 8449)	This is SetKeyBuffer, a member of class TCustomClientDataSet.
	SetKeyExclusive (see page 8449)	This is SetKeyExclusive, a member of class TCustomClientDataSet.
	SetKeyFieldCount (see page 8450)	This is SetKeyFieldCount, a member of class TCustomClientDataSet.
	SetKeyFields (see page 8450)	This is SetKeyFields, a member of class TCustomClientDataSet.
	SetLinkRanges (see page 8450)	This is SetLinkRanges, a member of class TCustomClientDataSet.
	SetModified (see page 6998)	This is SetModified, a member of class TDataSet.
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetName (see page 6999)	Sets the value of the Name property.
	SetObjectView (see page 6999)	This is SetObjectView, a member of class TDataSet.
	SetOnFilterRecord (see page 6999)	This is SetOnFilterRecord, a member of class TDataSet.
	SetOnFilterRecord (see page 8450)	This is SetOnFilterRecord, a member of class TCustomClientDataSet.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	SetProviderEOF (see page 8452)	This is SetProviderEOF, a member of class TCustomClientDataSet.
	SetRecNo (see page 6999)	This is SetRecNo, a member of class TDataSet.
	SetRecNo (see page 8454)	This is SetRecNo, a member of class TCustomClientDataSet.
	SetRemoteServer (see page 8454)	This is SetRemoteServer, a member of class TCustomClientDataSet.
	SetState (see page 7000)	This is SetState, a member of class TDataSet.
	SetStateFieldValue (see page 7000)	This is SetStateFieldValue, a member of class TDataSet.
	SetTempState (see page 7000)	This is SetTempState, a member of class TDataSet.
	SetUniDirectional (see page 7000)	This is SetUniDirectional, a member of class TDataSet.
	SwitchToIndex (see page 8455)	This is SwitchToIndex, a member of class TCustomClientDataSet.
	SyncCursors (see page 8455)	This is SyncCursors, a member of class TCustomClientDataSet.
	TempBuffer (see page 7001)	This is TempBuffer, a member of class TDataSet.
	UpdateBufferCount (see page 7001)	This is UpdateBufferCount, a member of class TDataSet.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateIndexDefs (see page 7002)	This is UpdateIndexDefs, a member of class TDataSet.
	UpdateIndexDefs (see page 8455)	This is UpdateIndexDefs, a member of class TCustomClientDataSet.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.

	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteDataPacket (see page 8456)	This is WriteDataPacket, a member of class TCustomClientDataSet.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	ActiveRecord (see page 7005)	Indicates the index of the active record in the internal cache of records.
R	BlobFieldCount (see page 7007)	Indicates the number of columns in the dataset that represent Binary large object (BLOB) fields.
	BookmarkSize (see page 7010)	Indicates the number of bytes used to represent a bookmark.
R	BufferCount (see page 7010)	Indicates the number of records in the internal cache.
R	Buffers (see page 7011)	Provides indexed access to the record buffers in the internal cache.
R	CalcBuffer (see page 7011)	Points to the record buffer used during an OnCalcFields (see page 7053) event.
R	CalcFieldsSize (see page 7012)	Indicates the number of bytes in a record buffer dedicated to storing calculated fields and lookup fields.
R	CurrentRecord (see page 7013)	Indicates the index of the current record in the internal cache of record buffers.
	DSBase (see page 8471)	Specifies the interface the client dataset uses to communicate with classes in Midas.dll or Midaslib.dcu (on Windows) or midas.so (on Linux).
R	DSCursor (see page 8471)	Provides access to the interface for the client dataset's data cursor.
	FieldNoOfs (see page 7022)	Specifies the offset needed to convert indexes in the Fields (see page 7023) property to field numbers.
R	InternalCalcFields (see page 7028)	Indicates whether the dataset includes internally calculated fields.
R	IsClone (see page 8484)	This is IsClone, a member of class TCustomClientDataSet.
	NestedDataSetClass (see page 7030)	Indicates the class type to use when creating nested datasets.
R	NestedDataSets (see page 7030)	Lists all nested datasets.
	ProviderEOF (see page 8491)	Indicates whether the client dataset has all of its data.
	Reserved (see page 7035)	For internal use only.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	ActiveBuffer (see page 6909)	Returns a pointer to the buffer for the active record.
	AddIndex (see page 8391)	Creates a new index for the client dataset.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Append (see page 6910)	Adds a new, empty record to the end of the dataset.
	AppendData (see page 8393)	Adds a newly fetched packet of records to those already stored in the client dataset.
	AppendRecord (see page 6911)	Adds a new, populated record to the end of the dataset and posts it.
	ApplyRange (see page 8393)	Applies a range to the dataset.
V	ApplyUpdates (see page 8394)	Sends all updated, inserted, and deleted records from the client dataset to the provider for writing to the database.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
V	BookmarkValid (see page 6916)	Indicates the validity of a specified bookmark.
V	BookmarkValid (see page 8395)	Tests the validity of a specified bookmark.
V	Cancel (see page 6916)	Cancels modifications to the active record if those changes are not yet posted.
V	Cancel (see page 8395)	Cancels unposted changes to the current record.
	CancelRange (see page 8396)	Removes any ranges currently in effect for the client dataset.
	CancelUpdates (see page 8396)	Clears all pending edits and clears the change log.
	CheckBrowseMode (see page 6918)	Automatically posts or cancels data changes when the active record changes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.

	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	ClearFields (see page 6919)	Clears the contents of all fields for the active record.
V	CloneCursor (see page 8398)	Shares the data belonging to another client dataset.
	Close (see page 6920)	Closes a dataset.
V	CompareBookmarks (see page 6921)	Implements a virtual function to compare two bookmarks.
V	CompareBookmarks (see page 8400)	Compares two bookmarks.
	ConstraintsDisabled (see page 8400)	Indicates whether constraints are enabled for a client dataset.
	ControlsDisabled (see page 6921)	Indicates whether data-aware controls update their display to reflect changes to the dataset.
	CopyFields (see page 6922)	This is CopyFields, a member of class TDataSet.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
V	Create (see page 6904)	Creates an instance of a TDataSet (see page 6894) component.
V	Create (see page 8386)	Creates and initializes instance of TCustomClientDataSet (see page 8373).
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	CreateBlobStream (see page 6922)	Provides the interface for a method that creates a blob stream for a Binary large object (BLOB) field in the dataset.
V	CreateBlobStream (see page 8401)	Returns a TClientBlobStream (see page 8285) object for reading or writing the data in a specified blob field.
	CreateDataSet (see page 8401)	Creates a new, empty client dataset.
	CursorPosChanged (see page 6923)	Marks the internal cursor position as invalid.
V	DataRequest (see page 8404)	Generates an OnDataRequest event on the associated provider
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Delete (see page 6924)	Deletes the active record and positions the dataset on the next record.
	DeleteIndex (see page 8406)	Deletes an index for the client dataset.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 6904)	Destroys the TDataSet (see page 6894) instance.
V	Destroy (see page 8387)	Destroys the instance of a client dataset component.
V	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	DisableConstraints (see page 8406)	Disables the enforcement of constraints.
	DisableControls (see page 6925)	Disables data display in data-aware controls associated with the dataset.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Edit (see page 6932)	Enables editing of data in the dataset.
	EditKey (see page 8410)	Enables modification of the search key buffer.
	EditRangeEnd (see page 8411)	Enables changing the ending value for an existing range.
	EditRangeStart (see page 8411)	Enables changing the starting value for an existing range.
V	EmptyDataSet (see page 8412)	Removes all records from the dataset.
	EnableConstraints (see page 8412)	Reenables enforcement of constraints when records are posted.
	EnableControls (see page 6934)	Re-enables data display in data-aware controls associated with the dataset.
V	Execute (see page 8413)	Executes an SQL command by the provider's dataset.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FetchBlobs (see page 8414)	Retrieves BLOB field values from the provider.
	FetchDetails (see page 8414)	Retrieves nested detail datasets from the provider.
	FetchParams (see page 8415)	Retrieves parameter values from the provider.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FieldByName (see page 6936)	Finds a field based on its name.

	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FindField (see page 6938)	Searches for a specified field in the dataset.
	FindFirst (see page 6939)	Implements a virtual method for positioning the dataset on the first record, respecting any filters.
V	FindKey (see page 8416)	Searches for a record containing specified field values.
	FindLast (see page 6940)	Implements a virtual method for positioning the dataset on the last record, respecting any filters.
	FindNearest (see page 8416)	Moves the cursor to the record that most closely matches a specified set of key values.
	FindNext (see page 6940)	Implements a virtual method for positioning the dataset on the next record, respecting any filters.
	FindPrior (see page 6941)	Implements a virtual method for positioning the dataset on the previous record, respecting any filters.
	First (see page 6942)	Moves to the first record in the dataset.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeBookmark (see page 6945)	Frees the resources allocated for a specified bookmark.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
V	GetBlobFieldData (see page 6947)	Reads BLOB data into a buffer.
V	GetBookmark (see page 6948)	Allocates a bookmark for the active record in the dataset.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
V	GetCurrentRecord (see page 6950)	Implements a virtual function to retrieve the current record in a buffer.
V	GetCurrentRecord (see page 8419)	Retrieves the current record into a buffer.
V	GetDetailDataSets (see page 6951)	Fills a list with a dataset for every detail dataset that is not the value of a nested dataset field.
V	GetDetailLinkFields (see page 6951)	Introduces a method to list the field components that link this dataset as a detail of a master dataset.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
V	GetFieldData (see page 6952)	This is the overview for the GetFieldData method overload.
V	GetFieldData (see page 8419)	This is the overview for the GetFieldData method overload.
	GetFieldList (see page 6953)	Retrieves a specified set of field objects into a list.
V	GetFieldNames (see page 6953)	This is the overview for the GetFieldNames method overload.
	GetGroupState (see page 8420)	Indicates where the current record sits within a specified group of records.
	GetIndexInfo (see page 8421)	Retrieves information about the current index.
	GetIndexNames (see page 8422)	Retrieves a list of available indexes for a client dataset.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
V	GetNextPacket (see page 8423)	Retrieves the next block of records from the provider.
	GetOptionalParam (see page 8425)	Retrieves a custom parameter from the data packet.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GotoBookmark (see page 6957)	Implements a virtual method to position the dataset on the record to which a specified bookmark points.
	GotoCurrent (see page 8427)	Sets the current record in this dataset the same as the current record in another, cloned dataset.
	GotoKey (see page 8427)	Moves the cursor to a record specified by the current key.
	GotoNearest (see page 8427)	Moves the cursor to the record that most closely matches the current key.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	Insert (see page 6959)	Inserts a new, empty record in the dataset.

	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InsertRecord (see page 6961)	Inserts a new, populated record to the dataset and posts it.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsEmpty (see page 6967)	Indicates whether the dataset contains no records.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	IsLinkedTo (see page 6967)	Indicates whether a dataset is linked to a specified data source.
V	IsSequenced (see page 6967)	Indicates whether the underlying database table uses record numbers to indicate the order of records.
	Last (see page 6968)	Moves to the last record in the dataset.
	LoadFromFile (see page 8433)	Loads a client dataset's data from a file.
	LoadFromStream (see page 8435)	Loads a client dataset's data from a stream.
V	Locate (see page 6970)	Implements a virtual method for searching a dataset for a specified record and making it the active record.
V	Locate (see page 8435)	Searches the dataset for a specified record and makes that record current.
V	Lookup (see page 6970)	Implements a virtual method to retrieve field values from a record that matches specified search values.
V	Lookup (see page 8436)	Retrieves field values from a record that matches specified search values.
	MergeChangeLog (see page 8437)	Merges any data changes in the change log into the client dataset, overwriting existing values.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	MoveBy (see page 6971)	Moves to another record relative to the active record in the dataset.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	Next (see page 6973)	Moves to the next record in the dataset.
	Open (see page 6976)	Opens the dataset.
V	Post (see page 6977)	Implements a virtual method to write a modified record to the database or change log.
V	Post (see page 8438)	Writes a modified record to the Data (see page 8467) property or the change log.
	Prior (see page 6979)	Moves to the previous record in the dataset.
	PSEndTransaction (see page 7578)	Ends a transaction that was started by a call to PSStartTransaction (see page 7586).
	PSEndTransaction (see page 7589)	Ends a transaction that was started by a call to PSStartTransaction (see page 7597).
	PSExecute (see page 7578)	Executes the SQL command associated with the dataset.
	PSExecute (see page 7590)	Executes the SQL command associated with the dataset.
	PSExecuteStatement (see page 7579)	Executes a specified SQL command.
	PSExecuteStatement (see page 7590)	Executes a specified SQL command.
	PSGetAttributes (see page 7579)	Returns information that is stored in data packets as Name/Value pairs.
	PSGetAttributes (see page 7591)	Returns information that is stored in data packets as Name/Value pairs.
	PSGetCommandText (see page 7579)	Gets the SQL command to be executed by PSExecute (see page 7578).
	PSGetCommandText (see page 7591)	Gets the SQL command to be executed by PSExecute (see page 7590).
	PSGetCommandType (see page 7580)	Gets the command type to be executed by PSExecute (see page 7578).
	PSGetCommandType (see page 7591)	Gets the command type to be executed by PSExecute (see page 7590).
	PSGetDefaultOrder (see page 7580)	Returns the definition of an index that imposes the default order on the data included in data packets.
	PSGetDefaultOrder (see page 7592)	Returns the definition of an index that imposes the default order on the data included in data packets.
	PSGetIndexDefs (see page 7581)	Returns the definitions of all specified indexes defined for the dataset.
	PSGetIndexDefs (see page 7592)	Returns the definitions of all specified indexes defined for the dataset.
	PSGetKeyFields (see page 7581)	Returns the names of all fields required to uniquely identify records in the data packet.
	PSGetKeyFields (see page 7593)	Returns the names of all fields required to uniquely identify records in the data packet.
	PSGetParams (see page 7582)	Returns the current parameter values of the dataset.
	PSGetParams (see page 7593)	Returns the current parameter values of the dataset.
	PSGetQuoteChar (see page 7582)	Returns the character or characters to use in generated SQL statements to enclose quoted strings.

	PSGetQuoteChar (see page 7594)	Returns the character or characters to use in generated SQL statements to enclose quoted strings.
	PSGetTableName (see page 7583)	Returns the name of the dataset table that appears in generated SQL statements.
	PSGetTableName (see page 7594)	Returns the name of the dataset table that appears in generated SQL statements.
	PSGetUpdateException (see page 7583)	Generates an EUpdateError (see page 6732) object based on another exception object.
	PSGetUpdateException (see page 7594)	Generates an EUpdateError (see page 6732) object based on another exception object.
	PSInTransaction (see page 7583)	Indicates whether actions against the dataset occur in the context of a transaction.
	PSInTransaction (see page 7595)	Indicates whether actions against the dataset occur in the context of a transaction.
	PSIsSQLBased (see page 7584)	Indicates whether the dataset includes native SQL support.
	PSIsSQLBased (see page 7595)	Indicates whether the dataset includes native SQL support.
	PSIsSQLSupported (see page 7584)	Indicates whether the dataset can execute SQL statements.
	PSIsSQLSupported (see page 7596)	Indicates whether the dataset can execute SQL statements.
	PSReset (see page 7585)	Resets the dataset so that it is positioned on the first record.
	PSReset (see page 7596)	Resets the dataset so that it is positioned on the first record.
	PSSetCommandText (see page 7585)	Assigns a specified SQL command to be executed by PSExecute (see page 7578).
	PSSetCommandText (see page 7596)	Assigns a specified SQL command to be executed by PSExecute (see page 7590).
	PSSetParams (see page 7586)	Assigns the specified parameter values to the dataset.
	PSSetParams (see page 7597)	Assigns the specified parameter values to the dataset.
	PSStartTransaction (see page 7586)	Starts a transaction that encapsulates all activity until a call to PSEndTransaction (see page 7578).
	PSStartTransaction (see page 7597)	Starts a transaction that encapsulates all activity until a call to PSEndTransaction (see page 7589).
	PSUpdateRecord (see page 7586)	Applies a single update to the underlying database table or tables.
	PSUpdateRecord (see page 7598)	Applies a single update to the underlying database table or tables.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	Reconcile (see page 8441)	Clears successfully updated records from the client dataset's cache of changes.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	Refresh (see page 6991)	Re-fetches data from the database to update a dataset's view of data.
	RefreshRecord (see page 8442)	Updates the base values of the current record to match the current values of the provider's dataset.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	Resync (see page 6994)	Re-fetches the active record and the records that precede and follow it.
	RevertRecord (see page 8443)	Undoes edits to the current record.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SaveToFile (see page 8443)	Saves a client dataset's data to an external file.
	SaveToStream (see page 8445)	Saves a client dataset's data to a stream.
	SetAltRecBuffers (see page 8446)	Sets record buffers when accessing field values.
	SetFields (see page 6997)	Sets the values for all fields in a record
	SetKey (see page 8449)	Enables setting of keys and ranges for a dataset prior to a search.
V	SetOptionalParam (see page 8450)	Saves a custom parameter with the data packet.
	SetProvider (see page 8451)	Associates the client dataset with a provider in the same process space.
	SetRange (see page 8452)	Sets the starting and ending values of a range, and applies it.
	SetRangeEnd (see page 8453)	Indicates that subsequent assignments to field values specify the end of the range of rows to include in the dataset.
	SetRangeStart (see page 8454)	Indicates that subsequent assignments to field values specify the start of the range of rows to include in the dataset.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.

V	Translate (see page 7001)	Implements a virtual procedure to copy a data string from a source to a destination, optionally performing character translation during the copy.
	UndoLastChange (see page 8455)	Undoes the last edit, insert, or delete operation to a record in the client dataset.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	UpdateCursorPos (see page 7001)	Positions the cursor on the active record.
	UpdateRecord (see page 7002)	Ensures that data-aware controls and detail datasets reflect record updates.
V	UpdateStatus (see page 7002)	Reports the update status for the active record.
V	UpdateStatus (see page 8456)	Reports the update status for the current record in the dataset.

Public Properties

	Name	Description
R	ActiveAggs (see page 8460)	Lists the maintained aggregates supported by the current index.
R	AggFields (see page 7006)	Contains any aggregate fields.
	AppServer (see page 8462)	Provides access to the interface the client dataset uses to communicate with a provider.
	BlockReadSize (see page 7007)	Determines how many record buffers are read in each block.
R	Bof (see page 7008)	Indicates whether the first record in the dataset is active.
	Bookmark (see page 7009)	Specifies the current bookmark in the dataset.
R	CanModify (see page 7012)	Indicates whether the dataset permits write access to data.
R	ChangeCount (see page 8463)	Indicates the number of changes in the change log.
R	CloneSource (see page 8464)	Indicates the client dataset (if any) with which this client dataset shares data.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Data (see page 8467)	Represents the data of the client dataset in a transportable format.
R	DataSize (see page 8469)	Indicates the number of bytes required to represent the Data (see page 8467) property.
R	DataSource (see page 7014)	Represents the data source of another dataset that supplies values to the dataset.
R	DefaultFields (see page 7014)	Indicates whether a dataset's underlying field components are generated dynamically when the dataset is opened.
R	Delta (see page 8470)	Represents a packet of change log data.
R	Designer (see page 7015)	Returns a pointer to the Dataset designer for the dataset.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	Eof (see page 7015)	Indicates whether a dataset is positioned at the last record.
R	FieldCount (see page 7017)	Indicates the number of field components associated with the dataset.
R	FieldDefList (see page 7019)	Points to the list of field definitions for the dataset.
R	FieldList (see page 7022)	Lists the field components of a dataset.
R	Fields (see page 7023)	Lists all non-aggregate field components of the dataset.
	FieldValues (see page 7025)	Provides access to the values for all fields in the active record for the dataset
R	Found (see page 7028)	Indicates whether or not moving to a different record is successful.
R	GroupingLevel (see page 8479)	Indicates the depth of grouping support provided by the current index.
R	HasAppServer (see page 8480)	Indicates whether the client dataset is connected to a provider.
R	IndexFieldCount (see page 8481)	Indicates the number of fields that make up the current index.
	IndexFields (see page 8482)	Specifies the fields associated with the current index.
R	IsUniDirectional (see page 7029)	Indicates whether the dataset is unidirectional.
	KeyExclusive (see page 8484)	Specifies the upper and lower boundaries for a range.
	KeyFieldCount (see page 8484)	Specifies the number of fields to use when conducting a partial key search on a multi-field key.
R	KeySize (see page 8485)	Indicates the size of the current key used for the dataset.
	LogChanges (see page 8485)	Indicates whether to maintain a change log separate from the data.
R	Modified (see page 7029)	Indicates whether the active record is modified.

R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	RecNo (see page 7031)	Indicates the active record in the dataset.
R	RecordCount (see page 7032)	Indicates the total number of records associated with the dataset.
R	RecordSize (see page 7035)	Indicates the size of a record in the dataset.
	SavePoint (see page 8494)	Represents the current state of edits when logging changes.
	SparseArrays (see page 7036)	Determines whether a unique TField (see page 7115) object is created for each element of an array field.
R	State (see page 7036)	Indicates the current operating mode of the dataset.
	StatusFilter (see page 8495)	Filters the client dataset so that it exposes only those records with a specific update status.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	XMLData (see page 8496)	Represents the data of the client dataset in XML.

Published Events

	Name	Description
	AfterApplyUpdates (see page 8332)	Occurs after the client dataset applies updates to the provider but before it attempts to reconcile update errors.
	AfterCancel (see page 8333)	Occurs after an application completes a request to cancel modifications to the active record.
	AfterClose (see page 8335)	Occurs after an application closes a dataset.
	AfterDelete (see page 8336)	Occurs after an application deletes a record.
	AfterEdit (see page 8339)	Occurs after an application starts editing a record.
	AfterExecute (see page 8340)	Occurs after the client dataset receives the results from an execute command.
	AfterGetParams (see page 8340)	Occurs after the client dataset receives parameter values from the provider.
	AfterGetRecords (see page 8341)	Occurs after the client dataset fetches a data packet from the provider.
	AfterInsert (see page 8342)	Occurs after an application inserts a new record.
	AfterOpen (see page 8342)	Occurs after an application completes opening a dataset and before any data access occurs.
	AfterPost (see page 8344)	Occurs after an application writes the active record to the database or change log and returns to browse state.
	AfterRefresh (see page 8344)	Occurs after an application refreshes the data in the dataset.
	AfterRowRequest (see page 8345)	Occurs after the client dataset fetches new information about the current record.
	AfterScroll (see page 8346)	Occurs after an application scrolls from one record to another.
	BeforeApplyUpdates (see page 8346)	Occurs before the client dataset applies updates to the remote server.
	BeforeCancel (see page 8347)	Occurs before an application executes a request to cancel changes to the active record.
	BeforeClose (see page 8347)	Occurs immediately before the dataset closes.
	BeforeDelete (see page 8348)	Occurs before an application attempts to delete the active record.
	BeforeEdit (see page 8348)	Occurs before an application enters edit mode for the active record.
	BeforeExecute (see page 8349)	Occurs before the client dataset executes the provider's query or stored procedure.
	BeforeGetParams (see page 8350)	Occurs before the client dataset fetches parameter values from the provider.
	BeforeGetRecords (see page 8350)	Occurs before the client dataset fetches a data packet from the provider.
	BeforeInsert (see page 8352)	Occurs before an application enters insert mode.
	BeforeOpen (see page 8353)	Occurs before an application executes a request to open a dataset.
	BeforePost (see page 8354)	Occurs before an application posts changes for the active record to the database or change log.
	BeforeRefresh (see page 8354)	Occurs immediately before an application refreshes the data in the dataset.
	BeforeRowRequest (see page 8355)	Occurs before the client dataset fetches new information about the current record.
	BeforeScroll (see page 8356)	Occurs before an application scrolls from one record to another.
	OnCalcFields (see page 8356)	Occurs when an application recalculates calculated fields.
	OnDeleteError (see page 8357)	Occurs when an application attempts to delete a record and an exception is raised.
	OnEditError (see page 8357)	Occurs when an application attempts to modify or insert a record and an exception is raised.
	OnFilterRecord (see page 8358)	Occurs each time a different record in the dataset becomes the active record and filtering is enabled.

	OnNewRecord (see page 8359)	Occurs when an application inserts or appends a new dataset record.
	OnPostError (see page 8359)	Occurs when an application attempts to modify or insert a record and an exception is raised.
	OnReconcileError (see page 8359)	Occurs when a client dataset needs to reconcile an update to a record that could not be applied.

Published Properties

	Name	Description
	Active (see page 8305)	Specifies whether the client dataset contains data.
	Aggregates (see page 8308)	Lists all aggregates that apply to the client dataset.
	AggregatesActive (see page 8308)	Specifies whether the client dataset calculates and maintains aggregate values.
	AutoCalcFields (see page 8309)	Determines when the OnCalcFields event is triggered and when lookup field values are calculated.
	CommandText (see page 8310)	Specifies an SQL command to be executed by the database server.
	ConnectionBroker (see page 8311)	Specifies a connection broker that handles the connection to an application server.
	Constraints (see page 8311)	Specifies record-level constraints that must be met when editing the data.
	DataSetField (see page 8312)	Indicates the TDataSetField component that represents this client dataset.
	DisableStringTrim (see page 8312)	Specifies whether trailing spaces are trimmed from field values when records are posted.
	FetchOnDemand (see page 8313)	Indicates whether to fetch data packets from the provider on an as-needed basis.
	FieldDefs (see page 8314)	Points to the list of field definitions for the dataset.
	FileName (see page 8317)	Specifies a file that stores the data of the client dataset.
	Filter (see page 8317)	Specifies the text of the current filter.
	Filtered (see page 8319)	Specifies whether or not filtering is active for a dataset.
	FilterOptions (see page 8320)	Specifies whether or not filtering is case insensitive, and whether or not partial comparisons are permitted when filtering records.
	IndexDefs (see page 8320)	Contains information about the indexes for a client dataset.
	IndexFieldNames (see page 8322)	Lists the fields to use as an index.
	IndexName (see page 8322)	Identifies an index for the client dataset.
	MasterFields (see page 8323)	Names one or more fields in a master table to link with corresponding fields in this dataset in order to establish a master-detail relationship.
	MasterSource (see page 8324)	Specifies a data source component for the master dataset when establishing a detail-master relationship between this dataset and another one.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	ObjectView (see page 8324)	Specifies whether fields are stored hierarchically or flattened out in the Fields property.
	PacketRecords (see page 8325)	Indicates the number or type of records in a single data packet.
	Params (see page 8326)	Contains parameter values that are sent to the provider.
	ProviderName (see page 8329)	Specifies the name of a provider component that supplies data to and applies updates from the client dataset..
	Ranged (see page 8329)	This is Ranged, a member of class TClientDataSet.
	ReadOnly (see page 8330)	Specifies whether the client dataset is read-only for this application.
	RemoteServer (see page 8330)	Specifies the connection component that this client dataset uses to connect to an application server.
	StoreDefs (see page 8331)	Indicates whether field and index definitions are saved with the client dataset.
	Tag (see page 2808)	Stores an integer value as part of a component.

45.1.6.2 TClientDataSet Properties

The properties of the TClientDataSet class are listed here.

Published Properties

	Name	Description
	Active (see page 8305)	Specifies whether the client dataset contains data.
	Aggregates (see page 8308)	Lists all aggregates that apply to the client dataset.
	AggregatesActive (see page 8308)	Specifies whether the client dataset calculates and maintains aggregate values.

	AutoCalcFields (see page 8309)	Determines when the OnCalcFields event is triggered and when lookup field values are calculated.
	CommandText (see page 8310)	Specifies an SQL command to be executed by the database server.
	ConnectionBroker (see page 8311)	Specifies a connection broker that handles the connection to an application server.
	Constraints (see page 8311)	Specifies record-level constraints that must be met when editing the data.
	DataSetField (see page 8312)	Indicates the TDataSetField component that represents this client dataset.
	DisableStringTrim (see page 8312)	Specifies whether trailing spaces are trimmed from field values when records are posted.
	FetchOnDemand (see page 8313)	Indicates whether to fetch data packets from the provider on an as-needed basis.
	FieldDefs (see page 8314)	Points to the list of field definitions for the dataset.
	FileName (see page 8317)	Specifies a file that stores the data of the client dataset.
	Filter (see page 8317)	Specifies the text of the current filter.
	Filtered (see page 8319)	Specifies whether or not filtering is active for a dataset.
	FilterOptions (see page 8320)	Specifies whether or not filtering is case insensitive, and whether or not partial comparisons are permitted when filtering records.
	IndexDefs (see page 8320)	Contains information about the indexes for a client dataset.
	IndexFieldNames (see page 8322)	Lists the fields to use as an index.
	IndexName (see page 8322)	Identifies an index for the client dataset.
	MasterFields (see page 8323)	Names one or more fields in a master table to link with corresponding fields in this dataset in order to establish a master-detail relationship.
	MasterSource (see page 8324)	Specifies a data source component for the master dataset when establishing a detail-master relationship between this dataset and another one.
	ObjectView (see page 8324)	Specifies whether fields are stored hierarchically or flattened out in the Fields property.
	PacketRecords (see page 8325)	Indicates the number or type of records in a single data packet.
	Params (see page 8326)	Contains parameter values that are sent to the provider.
	ProviderName (see page 8329)	Specifies the name of a provider component that supplies data to and applies updates from the client dataset..
	Ranged (see page 8329)	This is Ranged, a member of class TClientDataSet.
	ReadOnly (see page 8330)	Specifies whether the client dataset is read-only for this application.
	RemoteServer (see page 8330)	Specifies the connection component that this client dataset uses to connect to an application server.
	StoreDefs (see page 8331)	Indicates whether field and index definitions are saved with the client dataset.

45.1.6.2.1 TClientDataSet.Active Property

Specifies whether the client dataset contains data.

Pascal

```
property Active: Boolean;
```

C++

```
__property Boolean Active;
```

Description

Use Active to determine whether the client dataset makes its data available. When Active is false, the client dataset is closed; It can't manipulate the data it represents. When Active is true, data can be read or edited using the client dataset.

Setting Active to true:

1Fills the client dataset with data. Depending on the other properties of the client dataset, this data comes from:

The file specified by the FileName property.

The provider specified by the ProviderName property or SetProvider method. (For some TCustomClientDataSet descendants, this is an internal provider component)

The data that was active when the client dataset was deactivated (only if the application has run continuously since the dataset

was deactivated).

2Triggers a BeforeOpen event.

3Sets the State property to dsBrowse.

4Opens a cursor into the dataset.

5Triggers an After Open event.

If the client dataset has never been active previously, setting Active to true defines the structure (metadata) of the client dataset. This structure is retrieved with the data packet from the provider or stored on disk, or, if there is no data packet, it is built using the current value of the FieldDefs property or from the persistent field components listed by the Fields property.

If an error occurs during the dataset open, the dataset state is set to dsInactive, and the cursor is closed.

Setting Active to false:

1Triggers a BeforeClose event.

2Sets the State property to dsInactive.

3Closes the cursor, saving the current data to disk if the FileName property is set, and saving the current data packet to a cache so that it can be restored when the client dataset is reopened.

4Triggers an AfterClose event.

Note: Calling the Open method sets Active to true; calling the Close method sets Active to false.

Delphi Examples:

```
{
This example shows how to use the BeforeGetRecords event
handler (a TRemoteEventType value) to send the provider
information it needs for incremental data fetching. Before
fetching the next data packet, the client dataset packages
up the key value of the last record so that the provider
knows where to begin the next data packet. It also sends
some application-specific information, which is stored in
Memo1.  This method is used to pass the sql statement and the
value of the first field for the last record to the server so
that the server can return the correct records. The complete
project using this code example is in
Demos/DelphiWin32/VCLWin32/MIDAS/Pooler.
}
procedure TForm1.ClientDataSet1BeforeGetRecords(Sender: TObject; var OwnerData: OleVariant);
var
  LastValue: OleVariant;
  CDSClone: TClientDataSet;
begin
  if ClientDataSet1.Active then
  begin
    CDSClone := TClientDataSet.Create(Form1);
    try
      CDSClone.CloneCursor(ClientDataSet1, True);
      { turn off FetchOnDemand so that the clone only fetches
        the last LOCAL record }
      CDSClone.FetchOnDemand := False;
      CDSClone.Last;
      LastValue := CDSClone.Fields[0].AsString;
      CDSClone.Close;
    finally
      CDSClone.Free;
    end;
  end else
```

```
    LastValue := NULL;
  OwnerData := VarArrayOf([Memo1.Lines.Text, LastValue]);
end;

procedure TForm1.Button2Click(Sender: TObject);
begin
  ClientDataSet1.PacketRecords := StrToInt(Edit1.Text);
  ClientDataSet1.GetNextPacket;
end;
{
The following code fragment illustrates how DataSets and
DataSetCount can be used to ensure that an action is taken
for every open dataset.  Assign CheckButtonActive as the
AfterClose and AfterOpen event handlers for TClientDataSet1.
}
procedure TForm1.Button1Click(Sender: TObject);
var
  I: Integer;
begin
  if not RemoteServer1.Connected then
    RemoteServer1.Connected := True;
  ClientDataSet1.Close;
  with RemoteServer1 do
  begin
    for I := 0 to DataSetCount - 1 do
      DataSets[I].EnableControls;
  end;
  ClientDataSet1.Open;
end;

procedure TForm1.Button3Click(Sender: TObject);
var
  I: Integer;
begin
  ClientDataSet1.Close;
  RemoteServer1.Connected := False;
  with RemoteServer1 do
  begin
    for I := 0 to DataSetCount - 1 do
      DataSets[I].DisableControls;
  end;
end;

procedure TForm1.CheckButtonActive(DataSet: TDataSet);
begin
  Button1.Enabled := not ClientDataSet1.Active;
  Button2.Enabled := ClientDataSet1.Active;
  Button3.Enabled := ClientDataSet1.Active;
end;
```

45.1.6.2.2 TClientDataSet.Aggregates Property

Lists all aggregates that apply to the client dataset.

Pascal

```
property Aggregates: TAggregates;
```

C++

```
__property TAggregates Aggregates;
```

Description

Use Aggregates to define aggregates that summarize the data in the client dataset. Aggregates is a collection of TAggregate objects, each of which defines a formula for calculating an aggregate value from a group of records in the client dataset. The individual aggregates can summarize all the records in the client dataset or subgroups of records that have the same value on a set of fields. Aggregates that summarize a subgroup of records are associated with indexes, and can only be used when the associated index is current.

Do not use Aggregates to obtain summarized values maintained by the client dataset. Aggregates can contain TAggregate objects that are not currently active. Instead, use the ActiveAggs property, which represents only those TAggregate objects that are currently active.

Note: You do not need to add a TAggregate object to the Aggregates collection when you add an aggregate field using the Fields editor. The Fields editor automatically adds TAggregate objects to Aggregates for every aggregate field you define.

IndexName (see page 8483)

TAggregateField (see page 6743)

Obtaining Aggregate Values

Specifying Aggregates

Defining an Aggregate Field

45.1.6.2.3 TClientDataSet.AggregatesActive Property

Specifies whether the client dataset calculates and maintains aggregate values.

Pascal

```
property AggregatesActive: Boolean;
```

C++

```
__property Boolean AggregatesActive;
```

Description

Use AggregatesActive to indicate whether the client dataset should maintain aggregate values. When AggregatesActive is false (the default), the client dataset does not support maintained aggregates. This allows the client dataset to avoid the overhead of calculating values that the application is not using. When AggregatesActive is true, the client dataset calculates and maintains all aggregate values specified by the Aggregates property that are compatible with the current index.

When aggregates are maintained, the Value method of every active aggregate object returns a value that reflects the current data in the client dataset. When users edit the data in the dataset, these values are recalculated to reflect the user's changes.

Note: To selectively enable and disable aggregates rather than turning them all on or off at once, use the Active property of individual TAggregate objects. These objects are available through the Aggregates property.

See Also

ActiveAggs (see page 8460)

Aggregates (see page 8461)

IndexName (see page 8483)

Value (see page 8273)

Active (see page 8274)

45.1.6.2.4 TClientDataSet.AutoCalcFields Property

Determines when the OnCalcFields event is triggered and when lookup field values are calculated.

Pascal

```
property AutoCalcFields: Boolean;
```

C++

```
__property Boolean AutoCalcFields;
```

Description

Set AutoCalcFields to control when the OnCalcFields event is triggered to update calculated fields and when lookup fields are calculated.

A calculated field is one that derives its value from the values of one or more fields in the active record, sometimes with additional processing. Lookup fields are fields whose values come from a secondary dataset or lookup cache.

Note: Unidirectional datasets support calculated fields but not unidirectional fields. For unidirectional datasets, OnCalcFields only controls when calculated fields are updated.

When AutoCalcFields is true (the default), Lookup fields are recalculated and OnCalcFields is triggered when:

The dataset is opened.

The dataset is put into dsEdit state.

Focus moves from one visual control to another, or from one column to another in a data-aware grid and modifications have been made to the record.

When AutoCalcFields is false, Lookup fields are recalculated and the OnCalcFields event occurs only when

The dataset is opened.

The dataset is put into dsEdit state.

A record is retrieved from a database.

If an application permits users to change data, OnCalcFields is frequently triggered. In these cases an application may set AutoCalcFields to false to reduce the frequency with which the OnCalcFields event occurs and with which lookup values are fetched.

See Also

OnCalcFields (see page 7053)

Calculating Fields

45.1.6.2.5 TClientDataSet.CommandText Property

Specifies an SQL command to be executed by the database server.

Pascal

```
property CommandText: WideString;
```

C++

```
__property BSTR CommandText;
```

Description

CommandText specifies what data the client dataset wants to receive from its (internal or external) provider. It is either

An SQL statement (query) for the database server to execute.

The name of a table or stored procedure.

If the client dataset uses an internal provider, CommandText is required. On TSQLClientDataSet, the CommandType property indicates whether it represents a query, table name, or stored procedure name.

If the client dataset uses an external provider component, CommandText represents a replacement for the property that the source dataset uses to identify its data (the SQL of a query, or the name of a table or stored procedure). If the provider's Options property does not include poAllowCommandText (which, by default, it does not), then CommandText has no effect.

When CommandText is a non-empty string, its value is sent to the provider when the client dataset opens or when you call the Execute method. The specified SQL command, table, or stored procedure overrides the current value of the provider's associated dataset.

If the SQL statement takes parameters, be sure that they are in the correct order, as the provider performs parameter binding on CommandText statements by index only.

Delphi Examples:

```
{
The following code fragment illustrates how DataSets and
DataSetCount can be used to ensure that an action is taken
for every open dataset.  Assign CheckButtonActive as the
AfterClose and AfterOpen event handlers for TClientDataSet1.
}
procedure TForm1.Button1Click(Sender: TObject);
var
  I: Integer;
begin
  if not RemoteServer1.Connected then
    RemoteServer1.Connected := True;
  ClientDataSet1.Close;
  with RemoteServer1 do
  begin
    for I := 0 to DataSetCount - 1 do
      DataSets[I].EnableControls;
  end;
  // Memo1 must contain a "select * from xxx" employee, customer, client
  // Look in Program Files/Common Files/CodeGear Shared/Data for db files
  // Notice, using the CommandText, don't need a BeforeGetRecords event
  // handler for the ClientDataSet or the DataSetProvider.

  ClientDataSet1.CommandText := Memo1.Lines.Text;
  ClientDataSet1.Open;
end;
```

CommandType

Overriding the Dataset On the Application Server

Overview of Using Cached Updates

Setting Up a Simple Dataset

45.1.6.2.6 TClientDataSet.ConnectionBroker Property

Specifies a connection broker that handles the connection to an application server.

Pascal

```
property ConnectionBroker: TConnectionBroker;
```

C++

```
__property TConnectionBroker ConnectionBroker;
```

Description

Use ConnectionBroker to let a connection broker handle the connection to the server that supplies the client dataset with data. The connection broker specified by ConnectionBroker simply sets the RemoteServer property to the value of its Connection property.

ConnectionBroker adds an extra layer of indirection to the specification of a connection component. This can make it easier to change the component you use to connect to an application server. If you have several client datasets in an application that all use the same connection broker, then you can change the component that connects them all to the application server by changing a single property (the Connection property of the connection broker) rather than having to change the RemoteServer property for every client dataset in the application.

See Also

RemoteServer (see page 8493)

Connection (see page 8368)

Specifying a Provider

Specifying the Provider using TLocalConnection or TConnectionBroker

45.1.6.2.7 TClientDataSet.Constraints Property

Specifies record-level constraints that must be met when editing the data.

Pascal

```
property Constraints: TCheckConstraints;
```

C++

```
__property TCheckConstraints Constraints;
```

Description

Use Constraints to read or add record-level constraints to the dataset. Record-level constraints usually impose relationships between the fields in a single record. Constraints that limit the value of a single field should be added to the individual field components.

See Also

TCheckConstraint (see page 6841)

CustomConstraint (see page 7156)

ImportedConstraint (see page 7167)

Constraining Data Values

45.1.6.2.8 TClientDataSet.DataSetField Property

Indicates the TDataSetField component that represents this client dataset.

Pascal

```
property DataSetField: TDataSetField;
```

C++

```
__property TDataSetField DataSetField;
```

Description

Use DataSetField when the client dataset is the nested detail set of another (master) client dataset. Read DataSetField to access the data set field component in the master dataset that comprises this client dataset. Set DataSetField to a field component in the master dataset to assign this client dataset as the value of that field component.

When setting DataSetField, the ProviderName, RemoteServer, and FileName properties of the client dataset are cleared. This is because the client dataset's data is now maintained by the master table in which it is nested.

Note: The master dataset that includes the TDataSetField component must be another client dataset. Otherwise, setting DataSetField raises an exception. Further, setting DataSetField to a TDataSetField that is contained in the same client dataset leads to an exception (A dataset can't be nested in itself).

See Also

NestedDataSet (see page 7070)

ProviderName (see page 8492)

RemoteServer (see page 8493)

FileName (see page 8475)

45.1.6.2.9 TClientDataSet.DisableStringTrim Property

Specifies whether trailing spaces are trimmed from field values when records are posted.

Pascal

```
property DisableStringTrim: Boolean;
```

C++

```
__property Boolean DisableStringTrim;
```

Description

When DisableStringTrim is false, trailing spaces are trimmed from field values when records are posted. When DisableStringTrim is true, field values are posted exactly as typed, including any trailing spaces.

45.1.6.2.10 TClientDataSet.FetchOnDemand Property

Indicates whether to fetch data packets from the provider on an as-needed basis.

Pascal

```
property FetchOnDemand: Boolean;
```

C++

```
__property Boolean FetchOnDemand;
```

Description

By default FetchOnDemand is true, meaning that the client dataset fetches additional packets of data as needed (for example, as a user scrolls through data, or conducts a search). If the provider does not automatically include BLOB fields or nested detail sets in data packets, setting FetchOnDemand to true causes the client dataset to fetch these values when needed as well.

Set FetchOnDemand to false only if your application contains code that explicitly fetches data packets as needed using the GetNextPacket method. Similarly, if FetchOnDemand is false and the provider does not include BLOB data by default (Options includes poFetchBlobsOnDemand), the application must fetch BLOB fields explicitly using the FetchBlobs method. If the provider does not include nested detail sets (Options includes poFetchDetailsOnDemand) and FetchOnDemand is false, the application must fetch nested details explicitly using the FetchDetails method.

Delphi Examples:

```
{
This example shows how to use the BeforeGetRecords event
handler (a TRemoteEventType value) to send the provider
information it needs for incremental data fetching. Before
fetching the next data packet, the client dataset packages
up the key value of the last record so that the provider
knows where to begin the next data packet. It also sends
some application-specific information, which is stored in
Memo1.  This method is used to pass the sql statement and the
value of the first field for the last record to the server so
that the server can return the correct records. The complete
project using this code example is in
Demos/DelphiWin32/VCLWin32/MIDAS/Pooler.
}
procedure TForm1.ClientDataSet1BeforeGetRecords(Sender: TObject; var OwnerData: OleVariant);
var
  LastValue: OleVariant;
  CDSClone: TClientDataSet;
begin
  if ClientDataSet1.Active then
  begin
    CDSClone := TClientDataSet.Create(Form1);
    try
      CDSClone.CloneCursor(ClientDataSet1, True);
      { turn off FetchOnDemand so that the clone only fetches
        the last LOCAL record }
```

```
      CDSClone.FetchOnDemand := False;
      CDSClone.Last;
      LastValue := CDSClone.Fields[0].AsString;
      CDSClone.Close;
    finally
      CDSClone.Free;
    end;
  end else
    LastValue := NULL;
  OwnerData := VarArrayOf([Memo1.Lines.Text, LastValue]);
end;

procedure TForm1.Button2Click(Sender: TObject);
begin
  ClientDataSet1.PacketRecords := StrToInt(Edit1.Text);
  ClientDataSet1.GetNextPacket;
end;
```

Requesting Data from the Source Dataset or Document

45.1.6.2.11 TClientDataSet.FieldDefs Property

Points to the list of field definitions for the dataset.

Pascal

```
property FieldDefs: TFieldDefs;
```

C++

```
__property TFieldDefs FieldDefs;
```

Description

FieldDefs lists the field definitions for a dataset. While an application can examine FieldDefs to explore the field definitions for a dataset, it should not change these definitions unless creating a new table with CreateTable or CreateDataSet.

To access fields and field values in a dataset, use the Fields, AggFields, and FieldValues properties, and the FieldsByName method.

Note: If the dataset includes object field descendants, FieldDefs represents a hierarchical view of the data, meaning that the definitions include object field definitions. To determine the definitions in a flattened view, use FieldDefList instead.

C++ Examples:

```
/*
The following code creates and activates a client dataset in
the form's OnCreate event handler.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  TFieldDefs *pDefs = CDS2->FieldDefs;
  TFieldDef *pDef = pDefs->AddFieldDef();
  pDef->DataType = ftInteger;
  pDef->Name = "Field1";
```

```
  pDef = pDefs->AddFieldDef();
  pDef->DataType = ftString;
  pDef->Size = 10;
  pDef->Name = "Field2";

  TIndexDef *pIDef = CDS2->IndexDefs->AddIndexDef();
  pIDef->Fields = "Field1";
  pIDef->Name = "IntIndex";

  CDS2->CreateDataSet();
}
```

Delphi Examples:

```
{
The following code creates and activates a client dataset in
the form’s OnCreate event handler.
}
procedure TForm1.FormCreate(Sender: TObject);
begin
  with CDS2 do
  begin
    with FieldDefs.AddFieldDef do
    begin
      DataType := ftInteger;
      Name := 'Field1';
    end;
    with FieldDefs.AddFieldDef do
    begin
      DataType := ftString;
      Size := 10;
      Name := 'Field2';
    end;
    with IndexDefs.AddIndexDef do
    begin
      Fields := 'Field1';
      Name := 'IntIndex';
    end;
    CreateDataSet;
  end;
end;
{ The following example shows how to create a table. }
procedure TForm1.Button1Click(Sender: TObject);
begin
  Table1.Close;
  Table1.DeleteTable;
end;

procedure TForm1.FormCreate(Sender: TObject);
var
  i: Integer;
begin
  Table1:= TTable.Create(Form1);
  with Table1 do
  begin
    DatabaseName := 'DBDEMOS';
    TableType := ttParadox;
    TableName := 'CustInfo';
    Table1.Active := False;
    { Don't overwrite an existing table }
    if Table1.Exists then
      MessageDlg('CustInfo table already exists.', mtWarning, [mbOK], 0)
    else
    begin
      { The Table component must not be active }
      { First, describe the type of table and give }
```

```
        { it a name }
        { Next, describe the fields in the table }
        with FieldDefs do
        begin
          Clear;
          with AddFieldDef do
          begin
            Name := 'Field1';
            DataType := ftInteger;
            Required := True;
          end;
          with AddFieldDef do
          begin
            Name := 'Field2';
            DataType := ftString;
            Size := 30;
          end;
        end;
        { Next, describe any indexes }
        with IndexDefs do
        begin
          Clear;
          { The 1st index has no name because it is
          { a Paradox primary key }
          with AddIndexDef do
          begin
            Name := '';
            Fields := 'Field1';
            Options := [ixPrimary];
          end;
          with AddIndexDef do
          begin
            Name := 'Fld2Indx';
            Fields := 'Field2';
            Options := [ixCaseInsensitive];
          end;
        end;
        { Call the CreateTable method to create the table }
        CreateTable;
        Table1.Active:= True;
        for i := 1 to 20 do
          Table1.AppendRecord([i*111, i*222]);
      end;
    end;
    DS2.DataSet:= Table1;
    DBGrid2.DataSource.DataSet:= Table1;
    Table1.Active:= True;
  end;
```

Creating and Deleting Tables

45.1.6.2.12 TClientDataSet.FileName Property

Specifies a file that stores the data of the client dataset.

Pascal

```
property FileName: string;
```

C++

```
__property AnsiString FileName;
```

Description

Set FileName if the client dataset always reads its data from and writes its data to a single file. When FileName represents a valid file name, the client dataset automatically writes its data to that file when it is closed. When FileName specifies the name of an existing file, the client dataset automatically reads its data from that file when it is opened.

Changes are not merged into the data when it is saved to the file. This allows an application that employs the "briefcase" model to set FileName without losing updates that are destined for a database server. Single-tiered applications should explicitly merge changes before closing the dataset and saving the data to disk.

Note: When client datasets write their data to a file, they overwrite the contents of the file. Any previous contents of the file are lost.

To read from or write to a different file, use the LoadFromFile and SaveToFile methods instead. These methods can also be used to load and save data at times other than when the Active property changes.

45.1.6.2.13 TClientDataSet.Filter Property

Specifies the text of the current filter.

Pascal

```
property Filter: string;
```

C++

```
__property AnsiString Filter;
```

Description

Use Filter to specify a dataset filter. When filtering is applied to a client dataset, only those records that meet a filter's conditions are available to an application. Filter contains the string that describes the filter condition. Client datasets support the following set of filter operations: See the Limiting what records appear link at the bottom of this topic for a complete list of available filter operations.

Operator or function ComparisonsExampleComment

Operator or function Comparisons	Example	Comment
=	State = 'CA'	
<>	State <> 'CA'	
>=	DateEntered >= '1/1/1998'	
<=	Total <= 100,000	
>	Percentile > 50	
<	Field1 < Field2	
BLANK	State <> 'CA' or State = BLANK	Blank records do not appear unless explicitly included in the filter.
IS NULL	Field1 IS NULL	
IS NOT NULL	Field1 IS NOT NULL	
Logical operators		
and	State = 'CA' and Country = 'US'	
or	State = 'CA' or State = 'MA'	
not	not (State = 'CA')	
Arithmetic operators		
+	Total + 5 > 100	Applies to numbers, strings, or date (time) + number
-	Field1 - 7 <> 10	Applies to numbers, dates, or date (time) - number
*	Discount * 100 > 20	Applies to numbers only
/	Discount > Total / 5	Applies to numbers only
String functions		
Upper	Upper(Field1) = 'ALWAYS'	
Lower	Lower(Field1 + Field2) = 'josp'	
Substring	Substring(DateString,8) = '1998' | Substring(DateString,1,3) = 'JAN'	Value goes from position of second argument to end or number of chars in third arg. First char has position 1.
Trim	Trim(Field1 + Field2) | Trim(Field1, '-')	removes third argument from front and back. If no third argument, trims spaces.
TrimLeft	TrimLeft(StringField) | TrimLeft(Field1, '$') <> ''	See Trim
TrimRight	TrimRight(StringField) | TrimRight(Field1, '.') <> ''	See Trim
DateTime functions		

Year	Year(DateField) = 2000	
Month	Month(DateField) <> 12	
Day	Day(DateField) = 1	
Hour	Hour(DateField) < 16	
Minute	Minute(DateField) = 0	
Second	Second(DateField) = 30	
GetDate	GetDate - DateField > 7	Represents current date and time
Date	DateField = Date(GetDate)	Returns the date portion of a datetime value
Time	TimeField > Time(GetDate)	Returns the time portion of a datetime value
Miscellaneous		
Like	Memo LIKE '%filters%'	Works like SQL-92 without the ESC clause. When applied to BLOB fields, FilterOptions determines whether case is considered.
In	Day(DateField) in (1,7)	Works like SQL-92. Second argument is a list of values all with the same type.
*	State = 'M*'	Wildcard for partial comparisons

Filter (see page 7026)

45.1.6.2.14 TClientDataSet.Filtered Property

Specifies whether or not filtering is active for a dataset.

Pascal

```
property Filtered: Boolean;
```

C++

```
__property Boolean Filtered;
```

Description

Check Filtered to determine whether or not dataset filtering is in effect. If Filtered is true, then filtering is active. To apply filter conditions specified in the Filter property or the OnFilterRecord event handler, set Filtered to true. Because unidirectional datasets do not support filters, when you set Filtered to true on a unidirectional dataset, it raises an exception.

Note: When filtering is enabled, user edits to a record may mean that the record no longer meets a filter's test condition. The

next time an attempt is made to the read the record from the dataset while the filter is in effect, the record is not visible. If that happens, the next record that passes the filter condition becomes the active record.

45.1.6.2.15 TClientDataSet.FilterOptions Property

Specifies whether or not filtering is case insensitive, and whether or not partial comparisons are permitted when filtering records.

Pascal

```
property FilterOptions: TFilterOptions;
```

C++

```
__property TFilterOptions FilterOptions;
```

Description

Set FilterOptions to specify whether or not filtering is case insensitive when filtering on string or character fields, and whether or not partial comparisons for matching filter conditions is allowed.

Note: Because unidirectional datasets do not support filters, when you set the FilterOptions property of a unidirectional dataset, it raises an exception.

By default, FilterOptions is set to an empty set. For filters based on string fields, set FilterOptions to foCaseInsensitive to catch all variations on a string regardless of capitalization.

When a string in a filter ends with an asterisk (*), it can be used to match partial strings. To disable matching of partial strings and to treat the asterisk as a literal character in string comparisons, set FilterOptions to include foNoPartialCompare.

45.1.6.2.16 TClientDataSet.IndexDefs Property

Contains information about the indexes for a client dataset.

Pascal

```
property IndexDefs: TIndexDefs;
```

C++

```
__property TIndexDefs IndexDefs;
```

Description

Examine IndexDefs for index information. IndexDefs maintains an array of TIndexDef items, each of which describes an available index for the dataset. Set the value of IndexDefs before calling CreateDataSet to create a set of indexes with the client dataset.

Note: The index items in IndexDefs may not always reflect the current indexes available for a dataset. Before examining IndexDefs, call the IndexDefs.Update (Delphi) or IndexDefs->Update (C++) method to refresh the item list.

C++ Examples:

```
/*
This example uses the IndexName property to sort the records
in a client dataset on the Field2 field.
*/
void __fastcall TForm1::Button3Click(TObject *Sender)
{
  // If Active is True, Update will remove Fields added in FormCreate
  // and add the DEFAULT_ORDER and CHANGEINDEX Fields
  CDS2->Active = False;
  // Get the current available indices
  CDS2->IndexDefs->Update();
  // Find a field named "Field2"
  for (int I = 0; I < CDS2->IndexDefs->Count; I++)
    if (CDS2->IndexDefs->Items[I]->Fields == "Field2")
    {
      // set that index as the current index for the dataset}
      CDS2->IndexName = CDS2->IndexDefs->Items[I]->Name;
    }
  CDS2->Active = True;
}
```

Delphi Examples:

```
{
This example uses the IndexName property to sort the records
in a client dataset on the Field2 field.
}
procedure TForm1.Button3Click(Sender: TObject);
var
  I : Integer;
begin
  // If Active is True, Update will remove Fields added in FormCreate
  // and add the DEFAULT_ORDER and CHANGEINDEX Fields
  CDS2.Active := False;
  { Get the current available indices }
  CDS2.IndexDefs.Update;
  { Find a field named 'Field2' }
  for I := 0 to CDS2.IndexDefs.Count - 1 do
    if CDS2.IndexDefs.Items[I].Fields = 'Field2' then
    begin
      { set that index as the current index for the dataset}
      CDS2.IndexName := CDS2.IndexDefs.Items[I].Name;
    end;
  CDS2.Active := True;
end;
```

Adding a New Index

45.1.6.2.17 TClientDataSet.IndexFieldNames Property

Lists the fields to use as an index.

Pascal

```
property IndexFieldNames: Widestring;
```

C++

```
__property BSTR IndexFieldNames;
```

Description

Use IndexFieldNames as an alternative method of specifying the index to use for a client dataset. Specify the name of each field on which to index the dataset, separating names with semicolons. Ordering of field names is significant.

Note: Indexes added using IndexFieldNames do not support grouping or maintained aggregates.

Tip: Use IndexFieldNames to create sort orders on the fly at runtime.

Note: The IndexFieldNames and IndexName properties are mutually exclusive. Setting one clears the other.

IndexDefs (see page 8480)

IndexName (see page 8483)

Creating an Index with IndexFieldNames

Adding a New Index

45.1.6.2.18 TClientDataSet.IndexName Property

Identifies an index for the client dataset.

Pascal

```
property IndexName: Widestring;
```

C++

```
__property BSTR IndexName;
```

Description

Use IndexName to specify an alternative index for a client dataset.If IndexName is empty, the dataset's sort order is based on the IndexFieldNames property or on its default ordering in the data packet. Default ordering is determined by the predefined index, DEFAULT_ORDER.

If IndexName contains a valid index name, then that index is used to determine sort order of records.

Note: IndexFieldNames and IndexName are mutually exclusive. Setting one clears the other.

C++ Examples:

```
/*
This example uses the IndexName property to sort the records
```

```
in a client dataset on the Field2 field.
*/
void __fastcall TForm1::Button3Click(TObject *Sender)
{
  // If Active is True, Update will remove Fields added in FormCreate
  // and add the DEFAULT_ORDER and CHANGEINDEX Fields
  CDS2->Active = False;
  // Get the current available indices
  CDS2->IndexDefs->Update();
  // Find a field named "Field2"
  for (int I = 0; I < CDS2->IndexDefs->Count; I++)
    if (CDS2->IndexDefs->Items[I]->Fields == "Field2")
    {
      // set that index as the current index for the dataset}
      CDS2->IndexName = CDS2->IndexDefs->Items[I]->Name;
    }
  CDS2->Active = True;
}
```

Delphi Examples:

```
{
This example uses the IndexName property to sort the records
in a client dataset on the Field2 field.
}
procedure TForm1.Button3Click(Sender: TObject);
var
  I : Integer;
begin
  // If Active is True, Update will remove Fields added in FormCreate
  // and add the DEFAULT_ORDER and CHANGEINDEX Fields
  CDS2.Active := False;
  { Get the current available indices }
  CDS2.IndexDefs.Update;
  { Find a field named 'Field2' }
  for I := 0 to CDS2.IndexDefs.Count - 1 do
    if CDS2.IndexDefs.Items[I].Fields = 'Field2' then
    begin
      { set that index as the current index for the dataset}
      CDS2.IndexName := CDS2.IndexDefs.Items[I].Name;
    end;
  CDS2.Active := True;
end;
```

Deleting and Switching Indexes

45.1.6.2.19 TClientDataSet.MasterFields Property

Names one or more fields in a master table to link with corresponding fields in this dataset in order to establish a master-detail relationship.

Pascal

```
property MasterFields: Widestring;
```

C++

```
__property BSTR MasterFields;
```

Description

Use MasterFields after setting the MasterSource property to specify the names of one or more fields to use in establishing a detail-master relationship between this dataset and the one specified in MasterSource.

MasterFields is a string containing one or more field names in the master table. Separate field names with semicolons.

Each time the current record in the master table changes, the new values in those fields are used to select corresponding records in this dataset for display.

Note: At design time, use the Field Link designer to establish the master-detail relationship between two datasets.

See Also

MasterSource (see page 8486)

Making the Table a Detail of Another Dataset

45.1.6.2.20 TClientDataSet.MasterSource Property

Specifies a data source component for the master dataset when establishing a detail-master relationship between this dataset and another one.

Pascal

```
property MasterSource: TDataSource;
```

C++

```
__property TDataSource MasterSource;
```

Description

Use MasterSource to specify the name of the data source component whose DataSet property identifies a dataset to use as a master table in establishing a detail-master relationship between this dataset and another one.

At design time choose an available data source from the MasterSource property's drop-down list in the Object Inspector.

After setting the MasterSource property, specify which fields to use in the master table by setting the MasterFields property. At runtime each time the current record in the master table changes, the new values in those fields are used to select corresponding records in this dataset for display.

Note: At design time, use the Field Link designer to establish the master-detail relationship between two datasets.

Tip: MasterSource establishes a master/detail relationship using the traditional linked cursor approach. Alternately, client datasets can participate in master/detail relationships using nested datasets, where the detail dataset is stored with the master table's data. To assign a client dataset's data as the value of a nested detail, use the DataSetField property.

See Also

MasterFields (see page 8486)

Making the Table a Detail of Another Dataset

45.1.6.2.21 TClientDataSet.ObjectView Property

Specifies whether fields are stored hierarchically or flattened out in the Fields property.

Pascal

```
property ObjectView: Boolean;
```

C++

```
__property Boolean ObjectView;
```

Description

ObjectView affects the way the Fields property stores object fields and the way data-aware grids display ADT and array fields.

When ObjectView is true, the fields are stored hierarchically in the Fields property, meaning any child fields of an object field are referenced by the object field and don't appear sequentially after the object field in the TFields:: .Fields array. When ObjectView is false, the fields are stored sequentially in the Fields property, meaning any child fields of an object field are stored after the object field as siblings in the Fields array.

When ObjectView is false, object field types, such as TADTField, are not created. This switch is provided for increased compatibility with older data-aware controls, which may not handle object field types properly. The default is false for TBDEDataSet, and true for TClientDataSet.

Note: If the ObjectView property of the dataset provided to a TClientDataSet is false, then the TClientDataSet's ObjectView property always acts as false, since the data received is already flattened.

Working with Array Fields

45.1.6.2.22 TClientDataSet.PacketRecords Property

Indicates the number or type of records in a single data packet.

Pascal

```
property PacketRecords: Integer;
```

C++

```
__property int PacketRecords;
```

Description

Use PacketRecords to specify how many records should be contained in a single packet fetched from a provider, or to indicate that the packet returned should contain only metadata.

When a client dataset is instantiated, PacketRecords is automatically set to -1, meaning that a single packet should contain all records in the dataset.

If PacketRecords is greater than zero, then it specifies the number of records to return in a packet.

To retrieve the metadata for a dataset, set PacketRecords to 0. When PacketRecords is zero, the provider returns only information from its dataset that defines the database's structure, such as table, column, constraint, and domain definitions.

Warning: When PacketRecords is greater than 0, the client dataset must fetch its data incrementally. If the provider is on a stateless application server, the client dataset must inform the provider where to start fetching data. This communication can occur using a BeforeGetRecords event handler.

Delphi Examples:

```
{
This example shows how to use the BeforeGetRecords event
handler (a TRemoteEventType value) to send the provider
information it needs for incremental data fetching. Before
fetching the next data packet, the client dataset packages
up the key value of the last record so that the provider
knows where to begin the next data packet. It also sends
some application-specific information, which is stored in
Memo1.  This method is used to pass the sql statement and the
value of the first field for the last record to the server so
that the server can return the correct records. The complete
project using this code example is in
Demos/DelphiWin32/VCLWin32/MIDAS/Pooler.
}
procedure TForm1.ClientDataSet1BeforeGetRecords(Sender: TObject; var OwnerData: OleVariant);
var
  LastValue: OleVariant;
  CDSClone: TClientDataSet;
begin
  if ClientDataSet1.Active then
  begin
    CDSClone := TClientDataSet.Create(Form1);
    try
      CDSClone.CloneCursor(ClientDataSet1, True);
      { turn off FetchOnDemand so that the clone only fetches
        the last LOCAL record }
      CDSClone.FetchOnDemand := False;
      CDSClone.Last;
      LastValue := CDSClone.Fields[0].AsString;
      CDSClone.Close;
    finally
      CDSClone.Free;
    end;
  end else
    LastValue := NULL;
  OwnerData := VarArrayOf([Memo1.Lines.Text, LastValue]);
end;

procedure TForm1.Button2Click(Sender: TObject);
begin
  ClientDataSet1.PacketRecords := StrToInt(Edit1.Text);
  ClientDataSet1.GetNextPacket;
end;
```

Requesting Data from the Source Dataset or Document

Using the BDE to Cache Updates

Updating Data in dbExpress Applications

45.1.6.2.23 TClientDataSet.Params Property

Contains parameter values that are sent to the provider.

Pascal

```
property Params: TParams;
```

C++

```
__property TParams Params;
```

Description

Use Params to specify parameter values that the provider should pass to a source dataset. If the client dataset uses an internal provider, Params represents the values for any parameters used by the SQL statement specified by the CommandText property. If the client dataset uses an external provider that is associated with a dataset that represents a query or stored procedure, these parameter values supply input parameter values for that query or stored procedure and return any output parameters of a stored procedure. If the provider is associated with a TTable or TSQLTable component, Params limits the records that are sent in data packets. After specifying the parameters (at design time or runtime), they are sent to the provider automatically when the client dataset fetches data or executes a query or stored procedure using its Execute method.

To send parameter values to a query or stored procedure, for every parameter on the query or stored procedure for which the client dataset should send a value, add a parameter object (TParam) to Params. Assign each parameter object the same Name, DataType, and ParamType as the corresponding parameter on the query or stored procedure. These values are automatically encoded and sent to the provider when the client dataset fetches data.

To send parameter values to a TTable or TSQLTable, add a parameter object for each field in the table that is used to limit the values sent in data packets. Assign each parameter object the same Name and DataType as the corresponding field component on the table. These parameter values are automatically sent when the client dataset fetches data, and the records returned in data packets from the provider only contain records that match the assigned value on the corresponding fields. You can achieve the same affect by applying a filter to the field, but using Params is more efficient because the data need not be included in data packets.

Note: To initialize Params so that it reflects the parameters of a provider's associated query or stored procedure, call the FetchParams method.

Warning: The parameters are only applied to the provider when a query or stored procedure is run the first time the client dataset fetches records. To change parameter values and force a query or stored procedure to be rerun with new values, use the Execute method.

Delphi Examples:

```
{
This example fills in the parameters of a client dataset
from the entries of a list box.
}
procedure TForm1.Button4Click(Sender: TObject);
var
  I: Integer;
  ListItem: string;
begin
  { Call FetchParams to ensure parameters reflect server metadata }
  ClientDataSet1.FetchParams;
  with ClientDataSet1.Params do
  begin
    for I := 0 to Count - 1 do
    begin
      ListItem := ListBox1.Items[I];
      case Items[I].DataType of
        ftString:
          Items[I].AsString := ListItem;
        ftSmallInt:
          Items[I].AsSmallInt := StrToIntDef(ListItem, 0);
        ftInteger:
          Items[I].AsInteger := StrToIntDef(ListItem, 0);
```

```
          ftWord:
            Items[I].AsWord := StrToIntDef(ListItem, 0);
          ftBoolean:
            begin
              if ListItem = 'True' then
                Items[I].AsBoolean := True
              else
                Items[I].AsBoolean := False;
            end;
          ftFloat:
            Items[I].AsFloat := StrToFloat(ListItem);
          ftCurrency:
            Items[I].AsCurrency := StrToFloat(ListItem);
          ftBCD:
            Items[I].AsBCD := StrToCurr(ListItem);
          ftDate:
            Items[I].AsDate := StrToDate(ListItem);
          ftTime:
            Items[I].AsTime := StrToTime(ListItem);
          ftDateTime:
            Items[I].AsDateTime := StrToDateTime(ListItem);
        end;
      end;
    end;
  end;

  procedure TForm1.FormCreate(Sender: TObject);
  begin
    ListBox1.Items.Add('Here is a string');
    ListBox1.Items.Add('4');
    ListBox1.Items.Add('3456789');
    ListBox1.Items.Add('34');
    ListBox1.Items.Add('0');
    ListBox1.Items.Add('12.56');
    ListBox1.Items.Add('4.23');
    ListBox1.Items.Add('99.5');
    ListBox1.Items.Add('4/12/53');
    ListBox1.Items.Add('7:45:00');
    ListBox1.Items.Add('4/12/53 7:45:00');

  end;
```

45.1.6.2.24 TClientDataSet.ProviderName Property

Specifies the name of a provider component that supplies data to and applies updates from the client dataset..

Pascal

```
property ProviderName: string;
```

C++

```
__property AnsiString ProviderName;
```

Description

Use ProviderName to specify an external provider object that links the client dataset to another (source) dataset or to an XML document. This property is passed as a parameter to IAppServer interface calls when the client fetches data from or applies updates to the source dataset, or its database server, or the source XML document.

The provider specified by ProviderName can reside in the same application as the client dataset or in an application server running on another system.

If the provider is in the same application as the client dataset, it must have the same Owner as the client dataset. To use a local provider that has a different Owner, use the SetProvider method instead.

If the provider is on a remote application server, it must be exported by that application server. If the application server contains multiple provider objects, you can set ProviderName to any of them once the client dataset establishes an initial connection to the application server through its RemoteServer property. If the connection component is a Web connection or socket connection, or if the application server is registered on the client system (using TRegsvr.exe), ProviderName can be set from a drop-down in the Object Inspector once the RemoteServer property is set.

45.1.6.2.25 TClientDataSet.Ranged Property

Pascal

```
property Ranged: Boolean;
```

C++

```
__property Boolean Ranged;
```

Description

This is Ranged, a member of class TClientDataSet.

45.1.6.2.26 TClientDataSet.ReadOnly Property

Specifies whether the client dataset is read-only for this application.

Pascal

```
property ReadOnly: Boolean;
```

C++

```
__property Boolean ReadOnly;
```

Description

Use the ReadOnly property to prevent users from updating, inserting, or deleting data in the dataset. By default, ReadOnly is false, meaning users can potentially alter the dataset's data.

To guarantee that users cannot modify or add data to a dataset, set ReadOnly to true.

When ReadOnly is true, the dataset's CanModify property is false.

Note: Even if ReadOnly is false, users may not be able to modify or add data to a client dataset if it gets its data from a provider. The provider's Options property can limit whether data can be edited, and if so, what types of edits are allowed.

Active (see page 7004)

CanModify

Options (see page 18440)

45.1.6.2.27 TClientDataSet.RemoteServer Property

Specifies the connection component that this client dataset uses to connect to an application server.

Pascal

```
property RemoteServer: TCustomRemoteServer;
```

C++

```
__property TCustomRemoteServer RemoteServer;
```

Description

If the client dataset is in the client portion of a multi-tiered application, use RemoteServer to specify the connection component that connects to the application server. The connection component locates the application server and obtains its IAppServer interface, which the client dataset can use for communicating with a remote provider.

Although it is not required, you can also set RemoteServer to a TLocalConnection component when working with a provider that resides in the same application.

If a client application uses more than connection component, the application can change which connection a client dataset uses by changing the value for this property.

Tip: If you have several client datasets that all use the same connection component and you think you may change the connection component later (for example, to change the protocol), you can use the ConnectionBroker property to centralize the connection.

45.1.6.2.28 TClientDataSet.StoreDefs Property

Indicates whether field and index definitions are saved with the client dataset.

Pascal

```
property StoreDefs: Boolean;
```

C++

```
__property Boolean StoreDefs;
```

Description

If StoreDefs is true, the client dataset's index and field definitions are stored with the client dataset when the form or data module that contains it is saved. Setting StoreDefs to true makes the CreateDataSet method into a one-step procedure that creates fields and indexes at runtime.

45.1.6.3 TClientDataSet Events

The events of the TClientDataSet class are listed here.

Published Events

	Name	Description
	AfterApplyUpdates (see page 8332)	Occurs after the client dataset applies updates to the provider but before it attempts to reconcile update errors.
	AfterCancel (see page 8333)	Occurs after an application completes a request to cancel modifications to the active record.
	AfterClose (see page 8335)	Occurs after an application closes a dataset.
	AfterDelete (see page 8336)	Occurs after an application deletes a record.
	AfterEdit (see page 8339)	Occurs after an application starts editing a record.
	AfterExecute (see page 8340)	Occurs after the client dataset receives the results from an execute command.
	AfterGetParams (see page 8340)	Occurs after the client dataset receives parameter values from the provider.
	AfterGetRecords (see page 8341)	Occurs after the client dataset fetches a data packet from the provider.

	AfterInsert (see page 8342)	Occurs after an application inserts a new record.
	AfterOpen (see page 8342)	Occurs after an application completes opening a dataset and before any data access occurs.
	AfterPost (see page 8344)	Occurs after an application writes the active record to the database or change log and returns to browse state.
	AfterRefresh (see page 8344)	Occurs after an application refreshes the data in the dataset.
	AfterRowRequest (see page 8345)	Occurs after the client dataset fetches new information about the current record.
	AfterScroll (see page 8346)	Occurs after an application scrolls from one record to another.
	BeforeApplyUpdates (see page 8346)	Occurs before the client dataset applies updates to the remote server.
	BeforeCancel (see page 8347)	Occurs before an application executes a request to cancel changes to the active record.
	BeforeClose (see page 8347)	Occurs immediately before the dataset closes.
	BeforeDelete (see page 8348)	Occurs before an application attempts to delete the active record.
	BeforeEdit (see page 8348)	Occurs before an application enters edit mode for the active record.
	BeforeExecute (see page 8349)	Occurs before the client dataset executes the provider's query or stored procedure.
	BeforeGetParams (see page 8350)	Occurs before the client dataset fetches parameter values from the provider.
	BeforeGetRecords (see page 8350)	Occurs before the client dataset fetches a data packet from the provider.
	BeforeInsert (see page 8352)	Occurs before an application enters insert mode.
	BeforeOpen (see page 8353)	Occurs before an application executes a request to open a dataset.
	BeforePost (see page 8354)	Occurs before an application posts changes for the active record to the database or change log.
	BeforeRefresh (see page 8354)	Occurs immediately before an application refreshes the data in the dataset.
	BeforeRowRequest (see page 8355)	Occurs before the client dataset fetches new information about the current record.
	BeforeScroll (see page 8356)	Occurs before an application scrolls from one record to another.
	OnCalcFields (see page 8356)	Occurs when an application recalculates calculated fields.
	OnDeleteError (see page 8357)	Occurs when an application attempts to delete a record and an exception is raised.
	OnEditError (see page 8357)	Occurs when an application attempts to modify or insert a record and an exception is raised.
	OnFilterRecord (see page 8358)	Occurs each time a different record in the dataset becomes the active record and filtering is enabled.
	OnNewRecord (see page 8359)	Occurs when an application inserts or appends a new dataset record.
	OnPostError (see page 8359)	Occurs when an application attempts to modify or insert a record and an exception is raised.
	OnReconcileError (see page 8359)	Occurs when a client dataset needs to reconcile an update to a record that could not be applied.

45.1.6.3.1 TClientDataSet.AfterApplyUpdates Event

Occurs after the client dataset applies updates to the provider but before it attempts to reconcile update errors.

Pascal

```
property AfterApplyUpdates: TRemoteEvent;
```

C++

```
__property TRemoteEvent AfterApplyUpdates;
```

Description

Write an AfterApplyUpdates event handler to respond to custom information returned to the client dataset from a provider's AfterApplyUpdates event handler. AfterApplyUpdates is part of the mechanism by which a client dataset and a provider communicate information about updates. When working with a provider on a stateless application server, this mechanism allows the client dataset and the provider to communicate persistent state information.

When the application calls the client dataset's ApplyUpdates method, the following events occur:

1.The client dataset receives a BeforeApplyUpdates event, where it can encode custom information into an OleVariant that is passed to the provider as the OwnerData parameter.

2.The provider receives a BeforeApplyUpdates event, where it can respond to or change that information before it applies the updates.

3.The provider applies the updates, and receives an OnUpdateError event for any problem records.

4.The provider receives an AfterApplyUpdates event, where it can encode custom information into its OwnerData parameter or respond to information from the BeforeApplyUpdates event handler.

5.The client dataset receives an AfterApplyUpdates event, where it can respond to the custom information returned by the provider in its AfterApplyUpdates event handler.

6.The client dataset generates an OnReconcileError for every record that could not be applied by the provider.

Communicating with the Client Dataset

45.1.6.3.2 TClientDataSet.AfterCancel Event

Occurs after an application completes a request to cancel modifications to the active record.

Pascal

```
property AfterCancel: TDataSetNotifyEvent;
```

C++

```
__property TDataSetNotifyEvent AfterCancel;
```

Description

Write an AfterCancel event handler to take specific action after an application cancels changes to the active record. AfterCancel is called by the Cancel method after it updates the current position, releases the lock on the active record if necessary, and sets the dataset state to dsBrowse. If an application requires additional processing before returning control to a user after a Cancel event, code it in the AfterCancel event.

Delphi Examples:

```
{
This example updates the form's status bar with a message
when an AfterCancel event occurs.  Set the StatusBar
SimplePanel property to True.
}
procedure TForm1.Table1AfterCancel(DataSet: TDataSet);
begin
  StatusBar1.SimpleText := 'Record changes cancelled for ' + DataSet.Name;
end;

procedure TForm1.Button2Click(Sender: TObject);
begin
  Table1.Cancel;
end;
```

```
procedure TForm1.Button3Click(Sender: TObject);
begin
  Table1.Post
end;

procedure TForm1.FormCreate(Sender: TObject);
var
  i: Integer;
begin
  Table1:= TTable.Create(Form1);
  with Table1 do
  begin
    DatabaseName := 'DBDEMOS';
    TableType := ttParadox;
    TableName := 'CustInfo';
    Name := 'CustInfo';
    Table1.Active := False;
    { Don't overwrite an existing table }
    if Table1.Exists then
    begin
        Table1.Close;
        Table1.DeleteTable;
    end;
    begin
      { The Table component must not be active }
      { First, describe the type of table and give }
      { it a name }
      { Next, describe the fields in the table }
      with FieldDefs do
      begin
        Clear;
        with AddFieldDef do
        begin
          Name := 'Field1';
          DataType := ftInteger;
          Required := True;
        end;
        with AddFieldDef do
        begin
          Name := 'Field2';
          DataType := ftString;
          Size := 30;
        end;
      end;
      { Next, describe any indexes }
      with IndexDefs do
      begin
        Clear;
        { The 1st index has no name because it is
        { a Paradox primary key }
        with AddIndexDef do
        begin
          Name := '';
          Fields := 'Field1';
          Options := [ixPrimary];
        end;
        with AddIndexDef do
        begin
          Name := 'Fld2Indx';
          Fields := 'Field2';
          Options := [ixCaseInsensitive];
        end;
      end;
      { Call the CreateTable method to create the table }
      CreateTable;
```

```
      Table1.Active:= True;
      for i := 1 to 20 do
        Table1.AppendRecord([i*111, i*222]);
    end;
  end;
  DS2.DataSet:= Table1;
  DBGrid2.DataSource.DataSet:= Table1;
  Table1.AfterCancel:= Table1AfterCancel;
  Table1.Active:= True;
end;
```

See Also

BeforeCancel (see page 7048)

Cancel (see page 6916)

State (see page 7036)

45.1.6.3.3 TClientDataSet.AfterClose Event

Occurs after an application closes a dataset.

Pascal

```
property AfterClose: TDataSetNotifyEvent;
```

C++

```
__property TDataSetNotifyEvent AfterClose;
```

Description

Write an AfterClose event handler to take specific action immediately after an application closes a dataset. For example, as a security measure, an application might clear a PASSWORD entry from the Params property of a TSQLConnection component when the dataset is closed.

AfterClose is called after a dataset is closed and the dataset state is set to dsInactive.

Delphi Examples:

```
{
This example adds an entry to a memo with a message when an
AfterOpen event or an AfterClose event occurs.  Populate the
ClientDataSet events with CheckButtonActive.
}
procedure TForm1.CheckButtonActive(DataSet: TDataSet);
begin
  if (Button1.Enabled) then
    Memo2.Lines.Add('Now that the dataset is open, record information is available.')
  else
    Memo2.Lines.Add('Now that the dataset is closed, record information is not available.');
  Button1.Enabled := not ClientDataSet1.Active;
  Button2.Enabled := ClientDataSet1.Active;
  Button3.Enabled := ClientDataSet1.Active;
end;
{
The following code fragment illustrates how DataSets and
DataSetCount can be used to ensure that an action is taken
for every open dataset.  Assign CheckButtonActive as the
AfterClose and AfterOpen event handlers for TClientDataSet1.
}
procedure TForm1.Button1Click(Sender: TObject);
var
  I: Integer;
begin
  if not RemoteServer1.Connected then
```

```
      RemoteServer1.Connected := True;
    ClientDataSet1.Close;
    with RemoteServer1 do
    begin
      for I := 0 to DataSetCount - 1 do
        DataSets[I].EnableControls;
    end;
    ClientDataSet1.Open;
  end;

  procedure TForm1.Button3Click(Sender: TObject);
  var
    I: Integer;
  begin
    ClientDataSet1.Close;
    RemoteServer1.Connected := False;
    with RemoteServer1 do
    begin
      for I := 0 to DataSetCount - 1 do
        DataSets[I].DisableControls;
    end;
  end;

  procedure TForm1.CheckButtonActive(DataSet: TDataSet);
  begin
    Button1.Enabled := not ClientDataSet1.Active;
    Button2.Enabled := ClientDataSet1.Active;
    Button3.Enabled := ClientDataSet1.Active;
  end;
```

Opening and Closing Datasets

45.1.6.3.4 TClientDataSet.AfterDelete Event

Occurs after an application deletes a record.

Pascal

```
property AfterDelete: TDataSetNotifyEvent;
```

C++

```
__property TDataSetNotifyEvent AfterDelete;
```

Description

Write an AfterDelete event handler to take specific action immediately after an application deletes the active record in a dataset. AfterDelete is called by Delete after it deletes the record, sets the dataset state to dsBrowse, and repositions the current record.

C++ Examples:

```
/*
This example displays a message on the form's status bar
indicating the record count after a record is deleted.  Set
the StatusBar SimplePanel property to True.
```

```
*/
void __fastcall TForm1::Table1AfterDelete(TDataSet *DataSet)
{
  StatusBar1->SimpleText = Format(
    "There are now %d records in the table",
    ARRAYOFCONST(((int)DataSet->RecordCount)));
}

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  Table1->Delete();
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  Table1 = new TTable(Form1);
  Table1->Active = false; // The Table component must not be active
  Table1->DatabaseName = "DBDEMOS";
  Table1->TableType = ttParadox;
  Table1->TableName = "CustInfo";
  Table1->Active = False;
  if (!Table1->Exists) // Don't overwrite an existing table
  {
    Table1->Close();
    Table1->DeleteTable();
  }
  // The Table component must not be active
  // First, describe the type of table and give
  // it a name
  // Next, describe the fields in the table
  Table1->FieldDefs->Clear();
  TFieldDef *pNewDef = Table1->FieldDefs->AddFieldDef();
  pNewDef->Name = "Field1";
  pNewDef->DataType = ftInteger;
  pNewDef->Required = true;
  pNewDef = Table1->FieldDefs->AddFieldDef();
  pNewDef->Name = "Field2";
  pNewDef->DataType = ftString;
  pNewDef->Size = 30;
  // Next, describe any indexes
  Table1->IndexDefs->Clear();
  /* the 1st index has no name because it is a Paradox primary key */
  Table1->IndexDefs->Add("","Field1", TIndexOptions() <<ixPrimary << ixUnique);
  Table1->IndexDefs->Add("Fld2Index","Field2", TIndexOptions() << ixCaseInsensitive);
  // Now that we have specified what we want, create the table
  Table1->CreateTable();
  Table1->Active = True;
  for (int i = 1; i <= 20; i++)
    Table1->AppendRecord(ARRAYOFCONST((i*111, i*222)));
  DS2->DataSet = Table1;
  DBGrid2->DataSource->DataSet = Table1;
  Table1->AfterDelete = Table1AfterDelete;
  Table1->Active = True;
}
```

Delphi Examples:

```
{
This example displays a message on the form’s status bar
indicating the record count after a record is deleted.  Set
the StatusBar SimplePanel property to True.
}
procedure TForm1.Table1AfterDelete(DataSet: TDataSet);
begin
  StatusBar1.SimpleText := Format('There are now %d records in the table',
[DataSet.RecordCount]);
end;
```

```
procedure TForm1.Button1Click(Sender: TObject);
begin
  Table1.Delete;
end;

procedure TForm1.FormCreate(Sender: TObject);
var
  i: Integer;
begin
  Table1:= TTable.Create(Form1);
  with Table1 do
  begin
    DatabaseName := 'DBDEMOS';
    TableType := ttParadox;
    TableName := 'CustInfo';
    Name := 'CustInfo';
    Table1.Active := False;
    { Don't overwrite an existing table }
    if Table1.Exists then
    begin
        Table1.Close;
        Table1.DeleteTable;
    end;
    begin
      { The Table component must not be active }
      { First, describe the type of table and give }
      { it a name }
      { Next, describe the fields in the table }
      with FieldDefs do
      begin
        Clear;
        with AddFieldDef do
        begin
          Name := 'Field1';
          DataType := ftInteger;
          Required := True;
        end;
        with AddFieldDef do
        begin
          Name := 'Field2';
          DataType := ftString;
          Size := 30;
        end;
      end;
      { Next, describe any indexes }
      with IndexDefs do
      begin
        Clear;
        { The 1st index has no name because it is
        { a Paradox primary key }
        with AddIndexDef do
        begin
          Name := '';
          Fields := 'Field1';
          Options := [ixPrimary];
        end;
        with AddIndexDef do
        begin
          Name := 'Fld2Indx';
          Fields := 'Field2';
          Options := [ixCaseInsensitive];
        end;
      end;
      { Call the CreateTable method to create the table }
      CreateTable;
```

```
      Table1.Active:= True;
      for i := 1 to 20 do
        Table1.AppendRecord([i*111, i*222]);
    end;
  end;
  DS2.DataSet:= Table1;
  DBGrid2.DataSource.DataSet:= Table1;
  Table1.AfterDelete:= Table1AfterDelete;
  Table1.Active:= True;
end;
```

45.1.6.3.5 TClientDataSet.AfterEdit Event

Occurs after an application starts editing a record.

Pascal

```
property AfterEdit: TDataSetNotifyEvent;
```

C++

```
__property TDataSetNotifyEvent AfterEdit;
```

Description

Write an AfterEdit event handler to take specific action immediately after dataset enters edit mode. AfterEdit is called by Edit after it enables editing of a record, recalculates calculated fields, and calls the data event handler to process a record change.

Delphi Examples:

```
{
This example adds an entry to a memo with a message
when an AfterEdit event occurs and when a BeforeEdit event
occurs.  Click on Run SQL to populate the DBGrid.  Then
select a cell to edit and click the Edit current cell
button, or just start editing the cell to invoke the
BeforeEdit and AfterEdit events.
}
procedure TForm1.ClientDataSet1AfterEdit(DataSet: TDataSet);
begin
   Memo2.Lines.Add('After editing record' + IntToStr(DataSet.RecNo));
end;

procedure TForm1.ClientDataSet1BeforeEdit(DataSet: TDataSet);
begin
   Memo2.Lines.Add('Before editing record' + IntToStr(DataSet.RecNo));
end;

procedure TForm1.Button4Click(Sender: TObject);
begin
  ClientDataSet1.Edit;
end;
```

See Also

BeforeEdit (see page 7049)

Edit (see page 6932)

45.1.6.3.6 TClientDataSet.AfterExecute Event

Occurs after the client dataset receives the results from an execute command.

Pascal

```
property AfterExecute: TRemoteEvent;
```

C++

```
__property TRemoteEvent AfterExecute;
```

Description

Write an AfterExecute event handler to respond to custom information returned to the client dataset from a provider's AfterExecute event handler. AfterExecute is part of the mechanism by which a client dataset and a provider communicate information when executing an SQL command from the client. When working with a provider on a stateless application server, this mechanism allows the client dataset and the provider to communicate persistent state information.

When the application calls the client dataset's Execute method, the following events occur:

1.The client dataset receives a BeforeExecute event, where it can encode custom information into an OleVariant that is passed to the provider as the OwnerData parameter.

2.The provider receives a BeforeExecute event, where it can respond to or change that information before it executes the query or stored procedure.

3.The provider executes the appropriate command (either the command supplied by the CommandText property, or the command associated with a dataset such as a query or stored procedure).

4.The provider receives an AfterExecute event, where it can encode custom information into its OwnerData parameter or respond to information from the BeforeExecute event handler.

5.The client dataset unpacks any output parameters from the provider into the Params property and then receives an AfterExecute event, where it can respond to the custom information returned by the provider's AfterExecute event handler.

See Also

Execute (see page 8413)

AS_Execute (see page 16453)

Communicating with the Client Dataset

45.1.6.3.7 TClientDataSet.AfterGetParams Event

Occurs after the client dataset receives parameter values from the provider.

Pascal

```
property AfterGetParams: TRemoteEvent;
```

C++

```
__property TRemoteEvent AfterGetParams;
```

Description

Write an AfterGetParams event handler to respond to custom information returned to the client dataset from a provider's AfterGetParams event handler. AfterGetParams is part of the mechanism by which a client dataset and a provider communicate information when the client application calls FetchParams. When working with a provider on a stateless application server, this mechanism allows the client dataset and the provider to communicate persistent state information.

When the application calls the client dataset's FetchParams method, the following events occur:

1.The client dataset receives a BeforeGetParams event, where it can encode custom information into an OleVariant that is passed to the provider as the OwnerData parameter.

2.The provider receives a BeforeGetParams event, where it can respond to or change that information before it retrieves parameter values.

3.The provider encodes all of its dataset's current parameter values into an OleVariant.

4.The provider receives an AfterGetParams event, where it can encode custom information into its OwnerData parameter or respond to information from the BeforeGetParams event handler.

5.The client dataset unpacks the parameters from the provider into the Params property and then receives an AfterGetParams event, where it can respond to the custom information returned by the provider's AfterGetParams event handler.

See Also

FetchParams (see page 8415)

Communicating with the Client Dataset

45.1.6.3.8 TClientDataSet.AfterGetRecords Event

Occurs after the client dataset fetches a data packet from the provider.

Pascal

```
property AfterGetRecords: TRemoteEvent;
```

C++

```
__property TRemoteEvent AfterGetRecords;
```

Description

Write an AfterGetRecords event handler to respond to custom information returned to the client dataset from a provider's AfterGetRecords event handler. AfterGetRecords is part of the mechanism by which a client dataset and a provider communicate information about data fetching. When working with a provider on a stateless application server, this mechanism allows the client dataset and the provider to communicate persistent state information.

When the client dataset fetches data from the application server, the following events occur:

1. The client dataset receives a BeforeGetRecords event, where it can encode custom information into an OleVariant that is passed to the provider as the OwnerData parameter.
2. The provider receives a BeforeGetRecords event, where it can respond to or change that information before it creates a data packet.
3. The provider generates an OnGetData event where it can edit the data before creating a data packet, and then generates the

data packet.

4. The provider receives an AfterGetRecords event, where it can encode custom information into its OwnerData parameter or respond to information from the BeforeGetRecords event handler.
5. The client dataset receives an AfterGetRecords event, where it can respond to the custom information returned by the provider's AfterGetRecords event handler.

Communicating with the Client Dataset

45.1.6.3.9 TClientDataSet.AfterInsert Event

Occurs after an application inserts a new record.

Pascal

```
property AfterInsert: TDataSetNotifyEvent;
```

C++

```
__property TDataSetNotifyEvent AfterInsert;
```

Description

Write an AfterInsert event handler to take specific action immediately after an application inserts a record. The Insert and Append methods generate an AfterInsert event after inserting or appending a new record.

Delphi Examples:

```
{
This example updates a memo with a message when an
AfterInsert event or a BeforeInsert event occurs.
}
procedure TForm1.ClientDataSet1AfterInsert(DataSet: TDataSet);
begin
   Memo2.Lines.Add('After inserting a record');
end;

procedure TForm1.ClientDataSet1BeforeInsert(DataSet: TDataSet);
begin
   Memo2.Lines.Add('Before inserting a record');
end;
```

See Also

BeforeInsert (see page 7050)

Append (see page 6910)

Insert (see page 6959)

45.1.6.3.10 TClientDataSet.AfterOpen Event

Occurs after an application completes opening a dataset and before any data access occurs.

Pascal

```
property AfterOpen: TDataSetNotifyEvent;
```

C++

```
__property TDataSetNotifyEvent AfterOpen;
```

Description

Write an AfterOpen event handler to take specific action immediately after an application opens the dataset. AfterOpen is called after the dataset establishes access to its data and the dataset is put into dsBrowse state. For example, an AfterOpen event handler might check an ini file to determine the last record touched in the dataset the previous time the application ran, and position the dataset at that record.

Delphi Examples:

```
{
This example adds an entry to a memo with a message when an
AfterOpen event or an AfterClose event occurs.  Populate the
ClientDataSet events with CheckButtonActive.
}
procedure TForm1.CheckButtonActive(DataSet: TDataSet);
begin
  if (Button1.Enabled) then
    Memo2.Lines.Add('Now that the dataset is open, record information is available.')
  else
    Memo2.Lines.Add('Now that the dataset is closed, record information is not available.');
  Button1.Enabled := not ClientDataSet1.Active;
  Button2.Enabled := ClientDataSet1.Active;
  Button3.Enabled := ClientDataSet1.Active;
end;
{
The following code fragment illustrates how DataSets and
DataSetCount can be used to ensure that an action is taken
for every open dataset.  Assign CheckButtonActive as the
AfterClose and AfterOpen event handlers for TClientDataSet1.
}
procedure TForm1.Button1Click(Sender: TObject);
var
  I: Integer;
begin
  if not RemoteServer1.Connected then
    RemoteServer1.Connected := True;
  ClientDataSet1.Close;
  with RemoteServer1 do
  begin
    for I := 0 to DataSetCount - 1 do
      DataSets[I].EnableControls;
  end;
  ClientDataSet1.Open;
end;

procedure TForm1.Button3Click(Sender: TObject);
var
  I: Integer;
begin
  ClientDataSet1.Close;
  RemoteServer1.Connected := False;
  with RemoteServer1 do
  begin
    for I := 0 to DataSetCount - 1 do
      DataSets[I].DisableControls;
  end;
end;

procedure TForm1.CheckButtonActive(DataSet: TDataSet);
```

```
begin
  Button1.Enabled := not ClientDataSet1.Active;
  Button2.Enabled := ClientDataSet1.Active;
  Button3.Enabled := ClientDataSet1.Active;
end;
```

Opening and Closing Datasets

45.1.6.3.11 TClientDataSet.AfterPost Event

Occurs after an application writes the active record to the database or change log and returns to browse state.

Pascal

```
property AfterPost: TDataSetNotifyEvent;
```

C++

```
__property TDataSetNotifyEvent AfterPost;
```

Description

Write an AfterPost event handler to take specific action immediately after an application posts a change to the active record. AfterPost is called after a modification or insertion is made to a record.

Delphi Examples:

```
{
This example updates the form's status bar with a message
when an AfterPost event occurs.
}
procedure TForm1.ClientDataSet1AfterPost(DataSet: TDataSet);
begin
   Memo2.Lines.Add('Before posting a record');
end;
```

See Also

BeforePost (see page 7052)

Post (see page 6977)

45.1.6.3.12 TClientDataSet.AfterRefresh Event

Occurs after an application refreshes the data in the dataset.

Pascal

```
property AfterRefresh: TDataSetNotifyEvent;
```

C++

```
__property TDataSetNotifyEvent AfterRefresh;
```

Description

Write an AfterRefresh event handler to take specific action immediately after an application has updated the records in the

dataset. AfterRefresh is generated by calls to the Refresh method.

See Also

BeforeRefresh (see page 7052)

Refresh (see page 6991)

45.1.6.3.13 TClientDataSet.AfterRowRequest Event

Occurs after the client dataset fetches new information about the current record.

Pascal

```
property AfterRowRequest: TRemoteEvent;
```

C++

```
__property TRemoteEvent AfterRowRequest;
```

Description

Write an AfterRowRequest event handler to respond to custom information returned to the client dataset from a provider's AfterRowRequest event handler. AfterRowRequest is part of the mechanism by which a client dataset and a provider communicate information about data fetching. When working with a provider on a stateless application server, this mechanism allows the client dataset and the provider to communicate persistent state information.

When the client dataset fetches detail information about the current record or refreshes the current record, the following events occur:

1.The client dataset receives a BeforeRowRequest event, where it can encode custom information into an OleVariant that is passed to the provider as the OwnerData parameter.

2.The provider receives a BeforeRowRequest event, where it can respond to or change that information before it looks up the requested information.

3.The provider creates a delta packet that contains the requested information.

4.The provider receives an AfterRowRequest event, where it can encode custom information into its OwnerData parameter or respond to information from the BeforeRowRequest event handler.

5.The client dataset receives an AfterRowRequest event, where it can respond to the custom information returned by the provider's AfterRowRequest event handler.

Communicating with the Client Dataset

45.1.6.3.14 TClientDataSet.AfterScroll Event

Occurs after an application scrolls from one record to another.

Pascal

```
property AfterScroll: TDataSetNotifyEvent;
```

C++

```
__property TDataSetNotifyEvent AfterScroll;
```

Description

Write an AfterScroll event handler to take specific action immediately after an application scrolls to another record as a result of a call to the First, Last, MoveBy, Next, Prior, FindKey, FindFirst, FindNext, FindLast, FindPrior, and Locate methods. AfterScroll is called after all other events triggered by these methods and any other methods that switch from record to record in the dataset.

See Also

BeforeScroll (see page 7053)

First (see page 6942)

Last (see page 6968)

MoveBy (see page 6971)

Next (see page 6973)

Navigating Datasets

45.1.6.3.15 TClientDataSet.BeforeApplyUpdates Event

Occurs before the client dataset applies updates to the remote server.

Pascal

```
property BeforeApplyUpdates: TRemoteEvent;
```

C++

```
__property TRemoteEvent BeforeApplyUpdates;
```

Description

Write a BeforeApplyUpdates event handler to send custom information to the client dataset's provider. BeforeApplyUpdates is part of the mechanism by which a client dataset and a provider communicate information about updates. When working with a provider on a stateless application server, this mechanism allows the client dataset and the provider to communicate persistent state information.

When the application calls the client dataset's ApplyUpdates method, the following events occur:

1.The client dataset receives a BeforeApplyUpdates event, where it can encode custom information into an OleVariant that is passed to the provider as the OwnerData parameter.

2.The provider receives a BeforeApplyUpdates event, where it can respond to or change that information before it applies the updates.

3.The provider applies the updates and receives an OnUpdateError event for any problem records.

4.The provider receives an AfterApplyUpdates event, where it can encode custom information into its OwnerData parameter or respond to information from the BeforeApplyUpdates event handler.

5.The client dataset receives an AfterApplyUpdates event, where it can respond to the custom information returned by the provider's AfterApplyUpdates event handler.

See Also

ApplyUpdates (see page 8394)

Applying Updates

Communicating with the Client Dataset

45.1.6.3.16 TClientDataSet.BeforeCancel Event

Occurs before an application executes a request to cancel changes to the active record.

Pascal

```
property BeforeCancel: TDataSetNotifyEvent;
```

C++

```
__property TDataSetNotifyEvent BeforeCancel;
```

Description

Write a BeforeCancel event to take specific action before an application carries out a request to cancel changes. BeforeCancel is called by the Cancel method before it cancels a dataset operation such as Edit, Insert, or Delete.

An application might use the BeforeCancel event to record a user's changes in an undo buffer.

See Also

AfterCancel (see page 7038)

Delete (see page 6924)

Edit (see page 6932)

Insert (see page 6959)

45.1.6.3.17 TClientDataSet.BeforeClose Event

Occurs immediately before the dataset closes.

Pascal

```
property BeforeClose: TDataSetNotifyEvent;
```

C++

```
__property TDataSetNotifyEvent BeforeClose;
```

Description

Write a BeforeClose event to take specific action before an application closes a dataset. Calling Close or setting the Active property to false results in a call to the BeforeClose event handler.

See Also

Active (see page 7004)

AfterClose (see page 7040)

Close (see page 6920)

Opening and Closing Datasets

Posting Data

45.1.6.3.18 TClientDataSet.BeforeDelete Event

Occurs before an application attempts to delete the active record.

Pascal

```
property BeforeDelete: TDataSetNotifyEvent;
```

C++

```
__property TDataSetNotifyEvent BeforeDelete;
```

Description

Write a BeforeDelete event handler to take specific action before an application deletes the active record. BeforeDelete is called by Delete before it actually deletes a record.

In Delphi, making use of this event an application might, for example, display a dialog box asking for confirmation before deleting the record. On denial of confirmation, the application could abort the deletion by calling the Abort procedure.

See Also

AfterDelete (see page 7041)

Delete (see page 6924)

Abort (see page 22786)

45.1.6.3.19 TClientDataSet.BeforeEdit Event

Occurs before an application enters edit mode for the active record.

Pascal

```
property BeforeEdit: TDataSetNotifyEvent;
```

C++

```
__property TDataSetNotifyEvent BeforeEdit;
```

Description

Write a BeforeEdit event handler to take specific action before an application enables editing of the active record. For example, an application that keeps a log of database edits could use the BeforeEdit event to record the edit request, time, and user before entering edit state.

Delphi Examples:

```
{
This example adds an entry to a memo with a message
when an AfterEdit event occurs and when a BeforeEdit event
occurs.  Click on Run SQL to populate the DBGrid.  Then
select a cell to edit and click the Edit current cell
button, or just start editing the cell to invoke the
```

```
BeforeEdit and AfterEdit events.
}
procedure TForm1.ClientDataSet1AfterEdit(DataSet: TDataSet);
begin
   Memo2.Lines.Add('After editing record' + IntToStr(DataSet.RecNo));
end;

procedure TForm1.ClientDataSet1BeforeEdit(DataSet: TDataSet);
begin
   Memo2.Lines.Add('Before editing record' + IntToStr(DataSet.RecNo));
end;

procedure TForm1.Button4Click(Sender: TObject);
begin
  ClientDataSet1.Edit;
end;
```

See Also

State (see page 7036)

AfterEdit (see page 7044)

Edit (see page 6932)

45.1.6.3.20 TClientDataSet.BeforeExecute Event

Occurs before the client dataset executes the provider's query or stored procedure.

Pascal

```
property BeforeExecute: TRemoteEvent;
```

C++

```
__property TRemoteEvent BeforeExecute;
```

Description

Write a BeforeExecute event handler to send custom information to the client dataset's provider. BeforeExecute is part of the mechanism by which a client dataset and a provider communicate information when explicitly executing an SQL command by the provider's dataset. When working with a provider on a stateless application server, this mechanism allows the client dataset and the provider to communicate persistent state information.

When the application calls the client dataset's Execute method, the following events occur:

1.The client dataset receives a BeforeExecute event, where it can encode custom information into an OleVariant that is passed to the provider as the OwnerData parameter.

2.The provider receives a BeforeExecute event, where it can respond to or change that information before it executes the query or stored procedure.

3.The provider executes the appropriate command (either the command supplied by the CommandText property, or the command associated with a dataset such as a query or stored procedure).

4.The provider receives an AfterExecute event, where it can encode custom information into its OwnerData parameter or respond to information from the BeforeExecute event handler.

5.The client dataset unpacks any output parameters from the provider into the Params property and then receives an AfterExecute event, where it can respond to the custom information returned by the provider's AfterExecute event handler.

See Also

Execute (see page 8413)

AS_Execute (see page 16453)

Execute (see page 18466)

AfterExecute (see page 8504)

CommandText (see page 8465)

Communicating with the Client Dataset

45.1.6.3.21 TClientDataSet.BeforeGetParams Event

Occurs before the client dataset fetches parameter values from the provider.

Pascal

```
property BeforeGetParams: TRemoteEvent;
```

C++

```
__property TRemoteEvent BeforeGetParams;
```

Description

Write a BeforeGetParams event handler to send custom information to the client dataset's provider. BeforeGetparams is part of the mechanism by which a client dataset and a provider communicate information when passing parameter values from the provider's dataset. When working with a provider on a stateless application server, this mechanism allows the client dataset and the provider to communicate persistent state information.

When the application calls the client dataset's FetchParams method, the following events occur:

1.The client dataset receives a BeforeGetParams event, where it can encode custom information into an OleVariant that is passed to the provider as the OwnerData parameter.

2.The provider receives a BeforeGetParams event, where it can respond to or change that information before it retrieves parameter values.

3.The provider encodes all of its dataset's current parameter values into an OleVariant.

4.The provider receives an AfterGetParams event, where it can encode custom information into its OwnerData parameter or respond to information from the BeforeGetParams event handler.

5.The client dataset unpacks the parameters from the provider into the Params property and then receives an AfterGetParams event, where it can respond to the custom information returned by the provider's AfterGetParams event handler.

See Also

FetchParams (see page 8415)

AS_GetParams (see page 16454)

GetParams (see page 18467)

BeforeGetParams (see page 18480)

AfterGetParams (see page 8505)

Communicating with the Client Dataset

45.1.6.3.22 TClientDataSet.BeforeGetRecords Event

Occurs before the client dataset fetches a data packet from the provider.

Pascal

```
property BeforeGetRecords: TRemoteEvent;
```

C++

```
__property TRemoteEvent BeforeGetRecords;
```

Description

Write a BeforeGetRecords event handler to send custom information to the client dataset's provider. BeforeGetRecords is part of the mechanism by which a client dataset and a provider communicate information about data fetching. When working with a provider on a stateless application server, this mechanism allows the client dataset and the provider to communicate persistent state information.

When the client dataset fetches data from the application server, the following events occur:

1.The client dataset receives a BeforeGetRecords event, where it can encode custom information into an OleVariant that is passed to the provider as the OwnerData parameter.

2.The provider receives a BeforeGetRecords event, where it can respond to or change that information before it creates a data packet.

3.The provider generates the data packet.

4.The provider receives an AfterGetRecords event, where it can encode custom information into its OwnerData parameter or respond to information from the BeforeGetRecords event handler.

5.The client dataset receives an AfterGetRecords event, where it can respond to the custom information returned by the provider's AfterGetRecords event handler.

Delphi Examples:

```
{
This example shows how to use the BeforeGetRecords event
handler (a TRemoteEventType value) to send the provider
information it needs for incremental data fetching. Before
fetching the next data packet, the client dataset packages
up the key value of the last record so that the provider
knows where to begin the next data packet. It also sends
some application-specific information, which is stored in
Memo1.  This method is used to pass the sql statement and the
value of the first field for the last record to the server so
that the server can return the correct records. The complete
project using this code example is in
Demos/DelphiWin32/VCLWin32/MIDAS/Pooler.
}
procedure TForm1.ClientDataSet1BeforeGetRecords(Sender: TObject; var OwnerData: OleVariant);
var
  LastValue: OleVariant;
  CDSClone: TClientDataSet;
begin
  if ClientDataSet1.Active then
  begin
    CDSClone := TClientDataSet.Create(Form1);
    try
      CDSClone.CloneCursor(ClientDataSet1, True);
      { turn off FetchOnDemand so that the clone only fetches
        the last LOCAL record }
      CDSClone.FetchOnDemand := False;
      CDSClone.Last;
      LastValue := CDSClone.Fields[0].AsString;
      CDSClone.Close;
    finally
      CDSClone.Free;
    end;
```

```
    end else
      LastValue := NULL;
    OwnerData := VarArrayOf([Memo1.Lines.Text, LastValue]);
  end;

  procedure TForm1.Button2Click(Sender: TObject);
  begin
    ClientDataSet1.PacketRecords := StrToInt(Edit1.Text);
    ClientDataSet1.GetNextPacket;
  end;
```

See Also

AS_GetRecords (see page 16455)

BeforeGetRecords (see page 18480)

AfterGetRecords (see page 8506)

Communicating with the Client Dataset

45.1.6.3.23 TClientDataSet.BeforeInsert Event

Occurs before an application enters insert mode.

Pascal

```
property BeforeInsert: TDataSetNotifyEvent;
```

C++

```
__property TDataSetNotifyEvent BeforeInsert;
```

Description

Write a BeforeInsert event handler to take specific action before an application inserts or appends a new record. The Insert or Append method generates a BeforeInsert method before it sets the dataset into dsInsert state.

Delphi Examples:

```
{
This example updates a memo with a message when an
AfterInsert event or a BeforeInsert event occurs.
}
procedure TForm1.ClientDataSet1AfterInsert(DataSet: TDataSet);
begin
   Memo2.Lines.Add('After inserting a record');
end;

procedure TForm1.ClientDataSet1BeforeInsert(DataSet: TDataSet);
begin
   Memo2.Lines.Add('Before inserting a record');
end;
{
This example uses the BeforeInsert event to do data
validation. If the StrToInt function raises an exception,
the edit control's contents are set to a valid value so
that the assignment to the INTEGER field in the dataset
will succeed.  Continuing after the exception causes a
'0' to be placed in the PORTA field.
DataSet design:
This example requires a ClientDataSet, a DBGrid, a
DataSource and a DBNavigator.  Name the ClientDataSet CDS.
Set the DataSet property in the DataSource to CDS and name
that DataSource DS.  Set the DataSource in the DBNavigator
```

```
  to DS the DataSource in the DBGrid to DS.  Right click on CDS
  and select the Fields Editor, then right click on the Field
  Editor form and create two fields by selecting "new field".
  In the field configuration window, set the name to HOST, the
  Component value will automatically be set to CDSHOST.  Set
  the filed type to String.  In the field configuration window
  for the second field, set the name to PORTA, the Component
  value will automatically be set to CDSPORTA.  Set the field
  type to Integer.  The file used to load CDS must have an
  attribute name of HOST with an attribute type of string and
  an attribute name of PORTA with an attribute type of integer.
  Add DB, DBCtrls, Grids, DBGrids and DBClient to the uses clause.
  }
  {$IFNDEF UNICODE}
  uses SwSystem;
  {$ENDIF}

  procedure TForm1.Button3Click(Sender: TObject);
  begin
    CDS.Insert;
    CDS.FieldByName('PORTA').AsInteger := StrToInt(Edit1.Text);
    CDS.Post;
  end;

  procedure TForm1.CDSBeforeInsert(DataSet: TDataSet);
  begin
    try
    { Make sure edit field can be converted to integer --
     this will raise an exception if it can't }
      StrToInt(Edit1.Text);
    except
      Edit1.Text := '0';
    end;
  end;

  procedure TForm1.FormCreate(Sender: TObject);
  begin
  {$IFDEF UNICODE}
    CDS.LoadFromFile(GetCurrentDir + '\CDS.XML');
  {$ELSE}
    CDS.LoadFromFile(gsAppPath + 'CDS.XML');
  {$ENDIF}
  end;
```

45.1.6.3.24 TClientDataSet.BeforeOpen Event

Occurs before an application executes a request to open a dataset.

Pascal

```
property BeforeOpen: TDataSetNotifyEvent;
```

C++

```
__property TDataSetNotifyEvent BeforeOpen;
```

Description

Write a BeforeOpen event handler to take specific action before an application opens a dataset for viewing or editing. BeforeOpen is triggered when an application sets the Active property to true for a dataset or an application calls Open.

See Also

Active (see page 7004)

AfterOpen (see page 7045)

Open (see page 6976)

Opening and Closing Datasets

45.1.6.3.25 TClientDataSet.BeforePost Event

Occurs before an application posts changes for the active record to the database or change log.

Pascal

```
property BeforePost: TDataSetNotifyEvent;
```

C++

```
__property TDataSetNotifyEvent BeforePost;
```

Description

Write a BeforePost event handler to take specific action before an application posts dataset changes. BeforePost is triggered when an application calls the Post method. Post checks to make sure all required fields are present, then calls BeforePost before posting the record.

An application might use BeforePost to perform validity checks on data changes before committing them. If it encountered a validity problem, it could call Abort to cancel the Post operation (Delphi) or throw an exception (C++).

Delphi Examples:

```
{
This example checks for a valid entry in a TDBEdit control
and calls the Abort procedure if the control is empty; Abort
cancels the post before it happens.
}
procedure TForm1.ClientDataSet1BeforePost(DataSet: TDataSet);
begin
  if DBEdit1.Text = '' then
    Abort;
  DataSet.Fields[2].AsString := DBEdit1.Text;
end;
```

Post (see page 6977)

Abort (see page 22786)

Working with Field Component Methods at Runtime

45.1.6.3.26 TClientDataSet.BeforeRefresh Event

Occurs immediately before an application refreshes the data in the dataset.

Pascal

```
property BeforeRefresh: TDataSetNotifyEvent;
```

C++

```
__property TDataSetNotifyEvent BeforeRefresh;
```

Description

Write a BeforeRefresh event handler to take specific action immediately before an application updates the records in the dataset. BeforeRefresh is generated by calls to the Refresh method.

See Also

AfterRefresh (see page 7047)

Refresh (see page 6991)

45.1.6.3.27 TClientDataSet.BeforeRowRequest Event

Occurs before the client dataset fetches new information about the current record.

Pascal

```
property BeforeRowRequest: TRemoteEvent;
```

C++

```
__property TRemoteEvent BeforeRowRequest;
```

Description

Write a BeforeRowRequest event handler to send custom information to the client dataset's provider. BeforeRowRequest is part of the mechanism by which a client dataset and a provider communicate information about data fetching. When working with a provider on a stateless application server, this mechanism allows the client dataset and the provider to communicate persistent state information.

When the client dataset fetches detail information about the current record or refreshes the current record, the following events occur:

1.The client dataset receives a BeforeRowRequest event, where it can encode custom information into an OleVariant that is passed to the provider as the OwnerData parameter.

2.The provider on the application server receives a BeforeRowRequest event, where it can respond to or change that information before it looks up the requested information.

3.The provider creates a delta packet that contains the requested information.

4.The provider receives an AfterRowRequest event, where it can encode custom information into its OwnerData parameter or respond to information from the BeforeRowRequest event handler.

5.The client dataset receives an AfterRowRequest event, where it can respond to the custom information returned by the provider's AfterRowRequest event handler.

See Also

AS_RowRequest (see page 16456)

Communicating with the Client Dataset

45.1.6.3.28 TClientDataSet.BeforeScroll Event

Occurs before an application scrolls from one record to another.

Pascal

```
property BeforeScroll: TDataSetNotifyEvent;
```

C++

```
__property TDataSetNotifyEvent BeforeScroll;
```

Description

Write a BeforeScroll event handler to take specific action immediately before an application scrolls to another record as a result of a call to the First, Last, MoveBy, Next, Prior, FindKey, FindFirst, FindNext, FindLast, FindPrior, and Locate methods. BeforeScroll is called before all other events triggered by these methods and any other methods that switch from record to record in the dataset.

See Also

AfterScroll (see page 7047)

First (see page 6942)

Last (see page 6968)

MoveBy (see page 6971)

Next (see page 6973)

Prior (see page 6979)

Navigating Datasets

45.1.6.3.29 TClientDataSet.OnCalcFields Event

Occurs when an application recalculates calculated fields.

Pascal

```
property OnCalcFields: TDataSetNotifyEvent;
```

C++

```
__property TDataSetNotifyEvent OnCalcFields;
```

Description

Write an OnCalcFields event handler to take specific action when an application recalculates calculated fields. A calculated field is one that derives its value from the values in one or more fields in the dataset, sometimes with additional processing.

OnCalcFields is triggered when:

A dataset is opened.

A dataset is put into dsEdit state.

A record is retrieved from a database.

When the AutoCalcFields property is true, OnCalcFields is also triggered when:

Focus moves from one visual control to another, or from one column to another is a data-aware grid control and modifications were made to the record.

Note: When the AutoCalcFields property is true, an OnCalcFields event handler should not modify the dataset (or a linked dataset if it is part of a master-detail relationship), because such modifications retrigger the OnCalcField event, leading to infinite recursion.

If an application permits users to change data, OnCalcFields is frequently triggered. To reduce the frequency with which OnCalcFields occurs, set AutoCalcFields to false.

Warning: When the dataset is the master table of a master-detail relationship, OnCalcFields occurs before detail sets have been synchronized with the master table.

Open (see page 6976)

Post (see page 6977)

Calculating Fields

Using Internally Calculated Fields in Client Datasets

Defining a Calculated Field

45.1.6.3.30 TClientDataSet.OnDeleteError Event

Occurs when an application attempts to delete a record and an exception is raised.

Pascal

```
property OnDeleteError: TDataSetErrorEvent;
```

C++

```
__property TDataSetErrorEvent OnDeleteError;
```

Description

Write an OnDeleteError event handler to handle exceptions that occur when an attempt to delete a record fails.

See Also

OnEditError (see page 7054)

OnPostError (see page 7056)

Delete (see page 6924)

45.1.6.3.31 TClientDataSet.OnEditError Event

Occurs when an application attempts to modify or insert a record and an exception is raised.

Pascal

```
property OnEditError: TDataSetErrorEvent;
```

C++

```
__property TDataSetErrorEvent OnEditError;
```

Description

Write an OnEditError event handler to handle exceptions that occur when an attempt to edit a record fails.

See Also

OnDeleteError (see page 7054)

OnPostError (see page 7056)

Edit (see page 6932)

Insert (see page 6959)

45.1.6.3.32 TClientDataSet.OnFilterRecord Event

Occurs each time a different record in the dataset becomes the active record and filtering is enabled.

Pascal

```
property OnFilterRecord: TFilterRecordEvent;
```

C++

```
__property TFilterRecordEvent OnFilterRecord;
```

Description

Write an OnFilterRecord event handler to specify for each record in a dataset whether it should be visible to the application. To indicate that a record passes the filter condition, the OnFilterRecord event handler must set the Accept parameter to true. To exclude a record, set the Accept parameter to false. Most TDataSet descendants (such as ADO datasets or BDE-based datasets) initialize Accept to true before calling the OnFilterRecord event handler.

Warning: Do not supply an OnFilterRecord event handler to a unidirectional dataset. Unidirectional datasets do not support filters, and assigning an OnFilterRecord event handler causes the dataset to raise an exception.

Filtering is enabled if the Filtered property is true. When an application is processing a filter, the State property for the dataset is dsFilter.

Use an OnFilterRecord event handler to filter records using a criterion that can't be implemented using the Filter property. For example, using the Filter property, field comparisons are not supported against local tables (Paradox, dBASE, Access, FoxPro), but an OnFilterRecord event handler can implement any criterion at all.

Tip: Be sure that any interactions between the Filter property and the OnFilterRecord event handler do not result in an empty filter set when they are used simultaneously in an application.

Writing an OnFilterRecord Event Handler

45.1.6.3.33 TClientDataSet.OnNewRecord Event

Occurs when an application inserts or appends a new dataset record.

Pascal

```
property OnNewRecord: TDataSetNotifyEvent;
```

C++

```
__property TDataSetNotifyEvent OnNewRecord;
```

Description

Write an OnNewRecord event handler to take specific actions as an application inserts or appends a new record. OnNewRecord is called as part of the insert or append process. An application might use the OnNewRecord event to set initial values for a record or as a way of implementing cascading insertions in related datasets.

See Also

AfterInsert (see page 7044)

BeforeInsert (see page 7050)

45.1.6.3.34 TClientDataSet.OnPostError Event

Occurs when an application attempts to modify or insert a record and an exception is raised.

Pascal

```
property OnPostError: TDataSetErrorEvent;
```

C++

```
__property TDataSetErrorEvent OnPostError;
```

Description

Write an OnPostError event handler to handle exceptions that occur when an attempt to post a record fails.

See Also

OnDeleteError (see page 7054)

OnEditError (see page 7054)

Post (see page 6977)

45.1.6.3.35 TClientDataSet.OnReconcileError Event

Occurs when a client dataset needs to reconcile an update to a record that could not be applied.

Pascal

```
property OnReconcileError: TReconcileErrorEvent;
```

C++

```
__property TReconcileErrorEvent OnReconcileError;
```

Description

Write an OnReconcileError event handler to respond to error conditions that arise when the Reconcile method cycles through records that could not be applied to the database. This event handles only those update errors that were not handled in an OnUpdateError event handler.

The OnReconcileError event handler is called once for each record that could not be applied to the dataset or handled by the provider.

Warning: A provider can't detect when an update conflicts with another user's changes to a memo field. This situation does not generate an OnReconcileError event.

45.1.7 TConnectionBroker Class

TConnectionBroker centralizes the connection to an application server for a set of client datasets that all use the same connection.

Class Hierarchy

Pascal

```
TConnectionBroker = class(TCustomRemoteServer);
```

C++

```
class TConnectionBroker : public TCustomRemoteServer;
```

File

DBClient

Description

Use a connection broker when your application has several client datasets that all use the same connection component to establish a connection to an application server. If you set the ConnectionBroker property of all your client datasets to a single connection broker, then you can change the connection component that handles the connection to an application server for all of them by changing the connection broker's Connection (see page 8368) property. That is, instead of changing the RemoteServer property of every client dataset, you can change a single property on the connection broker.

Similarly, the connection broker centralizes the use of the application server's interface and events that occur when you open or close a connection to the application server. Thus, if you need to change the connection component (for example, to use a different protocol), you do need to rewrite your event handlers for the BeforeConnect (see page 8372), AfterConnect (see page 8371), OnGetUserName, OnLogin (see page 8370), BeforeDisconnect (see page 8372), or AfterDisconnect (see page 8372) events or any calls that use the connection broker's AppServer (see page 8532) property. The AppServer (see page 8532) property and the event handlers can reside on the protocol-neutral connection broker rather than on the connection component, and so will not disappear when you switch to a different connection component.

45.1.7.1 TConnectionBroker Members

The following tables list the members exposed by TConnectionBroker.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DoConnect (see page 6864)	Provides the interface for a method that opens a connection.
V	DoDisconnect (see page 6864)	Provides the interface for a method that terminates the connection.
V	GetAppServer (see page 8365)	Returns the value of the AppServer property.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetConnected (see page 8365)	Returns the value of the Connected property.
V	GetDataSet (see page 6865)	Returns a dataset, given its index in the DataSets (see page 6870) property array.
V	GetDataSetCount (see page 6865)	Returns the value of the DataSetCount (see page 6869) property.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).

	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 8366)	Initializes the connection component after all objects in the form or data module have been loaded.
V	Notification (see page 8366)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	RegisterClient (see page 6866)	Registers an object that uses the connection component.
	SendConnectEvent (see page 6867)	Informs all registered clients that use the connection component when a connection is opened or closed.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
V	SetAppServer (see page 8531)	Sets the AppServer (see page 8532) property.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
V	SetConnected (see page 8367)	Changes the value of the Connected property.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	UnRegisterClient (see page 6868)	Removes a registered client so that it is no longer associated with the connection component.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	StreamedConnected (see page 6874)	Indicates whether the Connected (see page 6868) property was true when the connection component was loaded from a stream.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Close (see page 6863)	Closes the connection.

	Create (see page 8364)	Creates an instance of a remote server component.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 2766)	Disposes of the component and its owned components.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 6863)	Destroys the instance of a connection component.
	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetProviderNames (see page 8530)	Executes a callback for all provider objects on the application server.
	GetServer (see page 8366)	Returns the IAppServer interface of the application server.
	GetServerList (see page 8531)	Returns a list of application servers (remote data modules) to which the component can connect.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	Open (see page 6866)	Opens the connection.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	AppServer (see page 8532)	Contains the interface for communicating with the application server.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
R	DataSetCount (see page 6869)	Indicates the number of datasets associated with the connection component.
R	DataSets (see page 6870)	Lists the datasets currently using this connection component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Events

	Name	Description
	AfterConnect (see page 8371)	Occurs after a connection is established.
	AfterDisconnect (see page 8372)	Occurs after the connection closes.
	BeforeConnect (see page 8372)	Occurs immediately before establishing a connection.
	BeforeDisconnect (see page 8372)	Occurs immediately before the connection closes.
	OnGetUsername (see page 8373)	This is OnGetUsername, a member of class TConnectionBroker.

Published Properties

	Name	Description
	Connected (see page 8368)	Determines whether a connection has been established to the remote source of data.
	Connection (see page 8368)	Specifies the connection component that actually forms the connection to the application server.
	LoginPrompt (see page 8369)	Specifies whether a login dialog appears immediately before opening a new connection.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	OnLogin (see page 8370)	Occurs when a communication channel opens to the server.
	Tag (see page 2808)	Stores an integer value as part of a component.

45.1.7.2 TConnectionBroker.Create Constructor

Creates an instance of a remote server component.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TConnectionBroker(TComponent * AOwner);
```

Description

Create instantiates an instance of a remote server component and initializes its properties.

AOwner is the component that is responsible for freeing the TCustomRemoteServer instance. It becomes the value of the Owner property.

See Also

Create (see page 6862)

Owner (see page 2807)

45.1.7.3 TConnectionBroker Methods

The methods of the TConnectionBroker class are listed here.

Protected Methods

	Name	Description
	GetAppServer (see page 8365)	Returns the value of the AppServer property.
	GetConnected (see page 8365)	Returns the value of the Connected property.
	Loaded (see page 8366)	Initializes the connection component after all objects in the form or data module have been loaded.
	Notification (see page 8366)	Forwards notification messages to all owned components.
	SetConnected (see page 8367)	Changes the value of the Connected property.

Public Methods

	Name	Description
	GetServer (see page 8366)	Returns the IAppServer interface of the application server.

45.1.7.3.1 TConnectionBroker.GetAppServer Method

Returns the value of the AppServer property.

Pascal

```
function GetAppServer: Variant; override;
```

C++

```
virtual __fastcall Variant GetAppServer();
```

Description

GetAppServer is the protected implementation of the AppServer property. Override GetAppServer to change the way this property is stored or managed.

See Also

AppServer (see page 8532)

GetServer (see page 8530)

45.1.7.3.2 TConnectionBroker.GetConnected Method

Returns the value of the Connected property.

Pascal

```
function GetConnected: Boolean; override;
```

C++

```
virtual __fastcall Boolean GetConnected();
```

Description

GetConnected is the protected read implementation of the Connected property. Descendant classes override this method to

return true if a connection is open and false otherwise. As defined in TCustomConnection, GetConnected always returns false.

See Also

Connected (see page 6868)

SetConnected (see page 6867)

45.1.7.3.3 TConnectionBroker.GetServer Method

Returns the IAppServer interface of the application server.

Pascal

```
function GetServer: IAppServer; override;
```

C++

```
virtual __fastcall IAppServer GetServer();
```

Description

Descendant classes override this function to return the interface of the application server after establishing a connection. As implemented in TCustomRemoteServer, GetServer always returns nil (Delphi) or NULL (C++).

See Also

Connected (see page 6868)

AppServer (see page 8532)

AppServer (see page 8462)

45.1.7.3.4 TConnectionBroker.Loaded Method

Initializes the connection component after all objects in the form or data module have been loaded.

Pascal

```
procedure Loaded; override;
```

C++

```
virtual __fastcall Loaded();
```

Description

Do not call the protected Loaded method. It is called automatically after the form or data module that contains the connection component has loaded all its owned objects. TCustomConnection overrides the inherited method to establish a connection if the Connected property is true.

See Also

StreamedConnected (see page 6874)

Loaded (see page 2782)

45.1.7.3.5 TConnectionBroker.Notification Method

Forwards notification messages to all owned components.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

Do not call the Notification method in an application. Notification is called automatically when the component specified by AComponent is about to be inserted or removed, as specified by Operation. By default, components pass along the notification to their owned components, if any.

A component can, if needed, act on the notification that a component is being inserted or removed. For example, if a component has object fields or properties that contain references to other components, it can check the notifications of component removals and invalidate those references as needed.

Note: Notification is not called for components that are freed implicitly (because their Owner is freed).

See Also

FreeNotification (see page 2775)

InsertComponent (see page 2780)

RemoveComponent (see page 2785)

Owner (see page 2807)

45.1.7.3.6 TConnectionBroker.SetConnected Method

Changes the value of the Connected property.

Pascal

```
procedure SetConnected(Value: Boolean); override;
```

C++

```
virtual __fastcall SetConnected(Boolean Value);
```

Description

SetConnected is the protected write implementation of the Connected property. Most descendants of TCustomConnection do not override this method to change the implementation of Connected. Instead, they override the DoConnect and DoDisconnect methods to change the way the connection is opened and closed.

Connected (see page 6868)

DoConnect (see page 6864)

DoDisconnect (see page 6864)

45.1.7.4 TConnectionBroker Properties

The properties of the TConnectionBroker class are listed here.

Published Properties

	Name	Description
	Connected (see page 8368)	Determines whether a connection has been established to the remote source of data.
	Connection (see page 8368)	Specifies the connection component that actually forms the connection to the application server.

	LoginPrompt (see page 8369)	Specifies whether a login dialog appears immediately before opening a new connection.
	OnLogin (see page 8370)	Occurs when a communication channel opens to the server.

45.1.7.4.1 TConnectionBroker.Connected Property

Determines whether a connection has been established to the remote source of data.

Pascal

```
property Connected: Boolean;
```

C++

```
__property Boolean Connected;
```

Description

Set Connected to true to open the connection. Set Connected to false to terminate the connection.

Setting Connected to true generates a BeforeConnect event, calls the protected DoConnect method to establish the connection, and generates an AfterConnect event. In addition, when setting Connected to true, TCustomConnection may display a login dialog, depending on the value of LoginPrompt.

Setting Connected to false generates a BeforeDisconnect event, calls the protected DoConnect method to drop the connection, and generates an AfterDisconnect event.

When deriving custom connection components from TCustomConnection, override GetConnected to return true when a connection is established, and override DoConnect and DoDisconnect to create and drop the connection.

Disconnecting from a Database Server

Connecting to a Database Server

45.1.7.4.2 TConnectionBroker.Connection Property

Specifies the connection component that actually forms the connection to the application server.

Pascal

```
property Connection: TCustomRemoteServer;
```

C++

```
__property TCustomRemoteServer Connection;
```

Description

Set Connection to the connection component that establishes a connection to the application server for all the client datasets listed in the DataSets property. For each client dataset listed in DataSets, the connection broker assigns Connection to its RemoteServer property. This connection locates the application server and obtains its IAppServer interface, which the client datasets then use for communicating with remote providers.

Connecting to a Data Store Using TADOConnection

Using TSimpleDataSet

45.1.7.4.3 TConnectionBroker.LoginPrompt Property

Specifies whether a login dialog appears immediately before opening a new connection.

Pascal

```
property LoginPrompt: Boolean;
```

C++

```
__property Boolean LoginPrompt;
```

Description

Set LoginPrompt to true to provide login support when establishing a connection. LoginPrompt controls two things: the occurrence of the OnLogin event, and the appearance of a default login dialog that prompts users for a name and password when you include DBLogDlg.hpp in your unit (C++) or add DBLogDlg to your uses clause (Delphi). When the OnLogin event occurs and when the default login dialog appears depend on the type of connection component:

For TDatabase, TIBDatabase, and TSQLConnection, the dialog appears after the BeforeConnect event and before the AfterConnect event, unless you supply an OnLogin event handler. If there is an OnLogin event handler, that event occurs in place of the login dialog, and there is no need to include DBLogDlg.hpp in your unit (C++) or add DBLogDlg to your uses clause (Delphi). If correct values for the user name and password are not supplied in the dialog or by the OnLogin event handler, the connection fails. The OnLogin event does not fire unless LoginPrompt is set to true.

For TADOConnection components, the dialog appears after the OnWillConnect event and before the BeforeConnect event. If there is an OnLogin event handler, that event occurs after the login dialog. If you do not include DBLogDlg.hpp in your unit (C++) or add DBLogDlg to your uses clause (Delphi), the OnLogin event occurs but there is no default login dialog. If correct values for the user name and password are not supplied in the dialog or by the OnLogin event handler, the connection fails. The OnLogin event does not fire unless LoginPrompt is set to true.

For DataSnap SOAP connection components, the dialog appears after the OnGetUsername event and before the BeforeConnect, AfterConnect, and OnLogin events. If the user cancels from the login dialog, no attempt is made to open a connection.

When LoginPrompt is false, the application must supply user name and password values programmatically:

For TDatabase, the user name and password can be supplied as USER NAME and PASSWORD parameters in the Params property.

For TADOConnection, the user name and password can be supplied as the ConnectionString property.

For TSQLConnection, the user name, password, and database can be supplied as UserName, Password, and Database parameters in the Params property, or provided as connection parameters associated with the connection name.

For DataSnap SOAP connection components, there is no built-in use for the user name and password supplied by the login dialog. (The UserName and Password properties of TWebConnection are unrelated).

Warning: Storing hard-coded user name and password entries as property values or in code for an OnLogin event handler can compromise server security.

OnLogin (see page 9994)

Controlling Server Login

45.1.7.4.4 TConnectionBroker.OnLogin Property

Occurs when a communication channel opens to the server.

Pascal

```
property OnLogin: TLoginEvent;
```

C++

```
__property TLoginEvent OnLogin;
```

Description

OnLogin occurs when connections are opened if the LoginPrompt property is true.

For DataSnap SOAP connection components, the following sequence of events occurs when opening a connection to an application server:

1. An OnGetUsername event occurs, where the application can supply an initial user name for the login dialog.
2. The login dialog appears, where the user can supply a user name and password.
3. A BeforeConnect event occurs, the connection is opened, and an AfterConnect event occurs.
4. The OnLogin event occurs, where you can write code to log in to the application server using the username and password that were provided in the remote login dialog.

   Note: Do not use the OnLogin event if the connection component provides a different scheme for logging in. For example, TWebConnection uses the Username and Password properties instead.

   For ADO connection components, the following sequence of events occurs when opening a connection to an application server:

1. A BeforeConnect event occurs.

2. An OnWillConnect event occurs, where the application can supply an initial user name and password for the login dialog, as well as the connection options and status.

3. The login dialog appears, where the user can supply a user name and password.

4. The OnLogin event occurs, where you can write code to respond to the user-supplied values. (For example, you could convert an application-specific user name and password to database user name and password).

5. The connection is opened, and an AfterConnect event occurs.

Note: Some

C connection components that do not connect to an application server in a multitiered database application replace the OnLogin event defined in TCustomConnection with a different event that occurs before a connection is established.

45.1.7.5 TConnectionBroker Events

The events of the TConnectionBroker class are listed here.

Published Events

	Name	Description
	AfterConnect (see page 8371)	Occurs after a connection is established.
	AfterDisconnect (see page 8372)	Occurs after the connection closes.
	BeforeConnect (see page 8372)	Occurs immediately before establishing a connection.
	BeforeDisconnect (see page 8372)	Occurs immediately before the connection closes.
	OnGetUsername (see page 8373)	This is OnGetUsername, a member of class TConnectionBroker.

45.1.7.5.1 TConnectionBroker.AfterConnect Event

Occurs after a connection is established.

Pascal

```
property AfterConnect: TNotifyEvent;
```

C++

```
__property TNotifyEvent AfterConnect;
```

Description

Write an AfterConnect event handler to take application-specific actions immediately after the connection component opens a connection to the remote source of database information.

See Also

BeforeConnect (see page 6875)

Connected (see page 6868)

Connecting to a Database Server

45.1.7.5.2 TConnectionBroker.AfterDisconnect Event

Occurs after the connection closes.

Pascal

```
property AfterDisconnect: TNotifyEvent;
```

C++

```
__property TNotifyEvent AfterDisconnect;
```

Description

Write an AfterDisconnect event handler to take application-specific actions after the connection component drops a connection.

See Also

BeforeDisconnect (see page 6875)

Connected (see page 6868)

Disconnecting from a Database Server

45.1.7.5.3 TConnectionBroker.BeforeConnect Event

Occurs immediately before establishing a connection.

Pascal

```
property BeforeConnect: TNotifyEvent;
```

C++

```
__property TNotifyEvent BeforeConnect;
```

Description

Write a BeforeConnect event handler to take application-specific actions before the connection component opens a connection to the remote source of database information.

See Also

AfterConnect (see page 6874)

Connected (see page 6868)

Connecting to a Database Server

45.1.7.5.4 TConnectionBroker.BeforeDisconnect Event

Occurs immediately before the connection closes.

Pascal

```
property BeforeDisconnect: TNotifyEvent;
```

C++

```
__property TNotifyEvent BeforeDisconnect;
```

Description

Write a BeforeDisconnect event handler to take application-specific actions before dropping a connection.

Delphi Examples:

```
{
This BeforeDisconnect event handler makes sure that the
client dataset has applied all its pending updates before
terminating the connection to the server.
}
procedure TForm1.RemoteServer1BeforeDisconnect(Sender: TObject);
begin
  if (ClientDataSet1.ChangeCount > 0) then
    ClientDataSet1.ApplyUpdates(-1);
end;
```

Disconnecting from a Database Server

45.1.7.5.5 TConnectionBroker.OnGetUsername Event

Pascal

```
property OnGetUsername: TGetUsernameEvent;
```

C++

```
__property TGetUsernameEvent OnGetUsername;
```

Description

This is OnGetUsername, a member of class TConnectionBroker.

45.1.8 TCustomClientDataSet Class

TCustomClientDataSet is the base class for datasets that cache their data in memory.

Class Hierarchy

Pascal

```
TCustomClientDataSet = class(TWideDataSet);
```

C++

```
class TCustomClientDataSet : public TWideDataSet;
```

File

DBClient

Description

TCustomClientDataSet represents an in-memory dataset that stores its data in transportable data packets. On Windows, it relies on Midas.dll or Midaslib.dcu, and On Linux, it relies on midas.so to provide the underlying support for managing database operations such as navigating records, posting records to a change log, filtering records, and so on.

There are two basic ways a client dataset can obtain its data and apply its updates:

It can read from and write to a dedicated file on disk, acting as a file-based dataset.

It can obtain records from another dataset and post updates to that dataset or its database server. When working with another dataset, the client dataset communicates with that source dataset using a dataset provider. Depending on the TCustomClientDataSet descendant, the provider and the source dataset can be external to the client dataset, or they can be internal, owned objects.

Client datasets are used primarily for caching updates or to represent the dataset in the client portion of a multi-tiered database application.

Do not create instances of TCustomClientDataSet. TCustomClientDataSet is intended only as a base class for datasets that store data in memory as data packets. To add this functionality to a database application, use a TCustomClientDataSet descendant such as TClientDataSet (see page 8289), TBDEClientDataSet, or TSQLClientDataSet.

45.1.8.1 TCustomClientDataSet Members

The following tables list the members exposed by TCustomClientDataSet.

Protected Events

	Name	Description
	AfterApplyUpdates (see page 8497)	Occurs after the client dataset applies updates to the provider but before it attempts to reconcile update errors.
	AfterCancel (see page 8498)	Occurs after an application completes a request to cancel modifications to the active record.
	AfterClose (see page 8500)	Occurs after an application closes a dataset.
	AfterDelete (see page 8501)	Occurs after an application deletes a record.
	AfterEdit (see page 8504)	Occurs after an application starts editing a record.
	AfterExecute (see page 8504)	Occurs after the client dataset receives the results from an execute command.
	AfterGetParams (see page 8505)	Occurs after the client dataset receives parameter values from the provider.
	AfterGetRecords (see page 8506)	Occurs after the client dataset fetches a data packet from the provider.
	AfterInsert (see page 8507)	Occurs after an application inserts a new record.
	AfterOpen (see page 8507)	Occurs after an application completes opening a dataset and before any data access occurs.
	AfterPost (see page 8509)	Occurs after an application writes the active record to the database or change log and returns to browse state.
	AfterRefresh (see page 8509)	Occurs after an application refreshes the data in the dataset.
	AfterRowRequest (see page 8509)	Occurs after the client dataset fetches new information about the current record.
	AfterScroll (see page 8510)	Occurs after an application scrolls from one record to another.
	BeforeApplyUpdates (see page 8511)	Occurs before the client dataset applies updates to the remote server.
	BeforeCancel (see page 8512)	Occurs before an application executes a request to cancel changes to the active record.

	BeforeClose (see page 8512)	Occurs immediately before the dataset closes.
	BeforeDelete (see page 8512)	Occurs before an application attempts to delete the active record.
	BeforeEdit (see page 8513)	Occurs before an application enters edit mode for the active record.
	BeforeExecute (see page 8514)	Occurs before the client dataset executes the provider's query or stored procedure.
	BeforeGetParams (see page 8514)	Occurs before the client dataset fetches parameter values from the provider.
	BeforeGetRecords (see page 8515)	Occurs before the client dataset fetches a data packet from the provider.
	BeforeInsert (see page 8517)	Occurs before an application enters insert mode.
	BeforeOpen (see page 8518)	Occurs before an application executes a request to open a dataset.
	BeforePost (see page 8518)	Occurs before an application posts changes for the active record to the database or change log.
	BeforeRefresh (see page 8519)	Occurs immediately before an application refreshes the data in the dataset.
	BeforeRowRequest (see page 8520)	Occurs before the client dataset fetches new information about the current record.
	BeforeScroll (see page 8520)	Occurs before an application scrolls from one record to another.
	OnCalcFields (see page 8521)	Occurs when an application recalculates calculated fields.
	OnDeleteError (see page 8522)	Occurs when an application attempts to delete a record and an exception is raised.
	OnEditError (see page 8522)	Occurs when an application attempts to modify or insert a record and an exception is raised.
	OnFilterRecord (see page 8523)	Occurs each time a different record in the dataset becomes the active record and filtering is enabled.
	OnNewRecord (see page 8523)	Occurs when an application inserts or appends a new dataset record.
	OnPostError (see page 8524)	Occurs when an application attempts to modify or insert a record and an exception is raised.
	OnReconcileError (see page 8524)	Occurs when a client dataset needs to reconcile an update to a record that could not be applied.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	ActivateBuffers (see page 6909)	This is ActivateBuffers, a member of class TDataSet.
	ActivateFilters (see page 8391)	This is ActivateFilters, a member of class TCustomClientDataSet.
V	AddDataPacket (see page 8391)	This is AddDataPacket, a member of class TCustomClientDataSet.
	AddFieldDesc (see page 8391)	This is AddFieldDesc, a member of class TCustomClientDataSet.
	AllocKeyBuffers (see page 8392)	This is AllocKeyBuffers, a member of class TCustomClientDataSet.
V	AllocRecordBuffer (see page 8393)	This is AllocRecordBuffer, a member of class TCustomClientDataSet.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	BindFields (see page 6915)	This is BindFields, a member of class TDataSet.
V	BlockReadNext (see page 6915)	This is BlockReadNext, a member of class TDataSet.
	BookmarkAvailable (see page 6916)	This is BookmarkAvailable, a member of class TDataSet.
V	CalculateFields (see page 6916)	This is CalculateFields, a member of class TDataSet.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	Check (see page 8397)	This is Check, a member of class TCustomClientDataSet.
V	CheckActive (see page 6917)	This is CheckActive, a member of class TDataSet.
	CheckBiDirectional (see page 6918)	This is CheckBiDirectional, a member of class TDataSet.
V	CheckDetailRecords (see page 8397)	This is CheckDetailRecords, a member of class TCustomClientDataSet.
V	CheckFieldCompatibility (see page 6919)	This is CheckFieldCompatibility, a member of class TDataSet.
V	CheckInactive (see page 6919)	This is CheckInactive, a member of class TDataSet.
V	CheckProviderEOF (see page 8397)	This is CheckProviderEOF, a member of class TCustomClientDataSet.
	CheckSetKeyMode (see page 8397)	This is CheckSetKeyMode, a member of class TCustomClientDataSet.
V	ClearBuffers (see page 6919)	This is ClearBuffers, a member of class TDataSet.

	ClearCalcFields (see page 8398)	This is ClearCalcFields, a member of class TCustomClientDataSet.
	CloseBlob (see page 6921)	This is CloseBlob, a member of class TDataSet.
	CloseCursor (see page 8400)	This is CloseCursor, a member of class TCustomClientDataSet.
	ConstraintsStored (see page 8401)	This is ConstraintsStored, a member of class TCustomClientDataSet.
	CreateFields (see page 6923)	This is CreateFields, a member of class TDataSet.
	CreateNestedDataSet (see page 6923)	This is CreateNestedDataSet, a member of class TDataSet.
	DataConvert (see page 8404)	This is DataConvert, a member of class TCustomClientDataSet.
	DataEvent (see page 8404)	This is DataEvent, a member of class TCustomClientDataSet.
	DeactivateFilters (see page 8405)	This is DeactivateFilters, a member of class TCustomClientDataSet.
	DefChanged (see page 8405)	This is DefChanged, a member of class TCustomClientDataSet.
	DefineProperties (see page 8405)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	DestroyFields (see page 6925)	This is DestroyFields, a member of class TDataSet.
	DestroyLookupCursor (see page 8406)	This is DestroyLookupCursor, a member of class TCustomClientDataSet.
	DoAfterApplyUpdates (see page 8407)	This is DoAfterApplyUpdates, a member of class TCustomClientDataSet.
	DoAfterCancel (see page 6927)	This is DoAfterCancel, a member of class TDataSet.
	DoAfterClose (see page 6927)	This is DoAfterClose, a member of class TDataSet.
	DoAfterDelete (see page 6928)	This is DoAfterDelete, a member of class TDataSet.
	DoAfterEdit (see page 6928)	This is DoAfterEdit, a member of class TDataSet.
	DoAfterExecute (see page 8407)	This is DoAfterExecute, a member of class TCustomClientDataSet.
	DoAfterGetParams (see page 8407)	This is DoAfterGetParams, a member of class TCustomClientDataSet.
	DoAfterGetRecords (see page 8407)	This is DoAfterGetRecords, a member of class TCustomClientDataSet.
	DoAfterInsert (see page 6928)	This is DoAfterInsert, a member of class TDataSet.
	DoAfterOpen (see page 6928)	This is DoAfterOpen, a member of class TDataSet.
	DoAfterPost (see page 6929)	This is DoAfterPost, a member of class TDataSet.
	DoAfterRefresh (see page 6929)	This is DoAfterRefresh, a member of class TDataSet.
	DoAfterRowRequest (see page 8408)	This is DoAfterRowRequest, a member of class TCustomClientDataSet.
	DoAfterScroll (see page 6929)	This is DoAfterScroll, a member of class TDataSet.
	DoApplyUpdates (see page 8408)	This is DoApplyUpdates, a member of class TCustomClientDataSet.
	DoBeforeApplyUpdates (see page 8408)	This is DoBeforeApplyUpdates, a member of class TCustomClientDataSet.
	DoBeforeCancel (see page 6929)	This is DoBeforeCancel, a member of class TDataSet.
	DoBeforeClose (see page 6929)	This is DoBeforeClose, a member of class TDataSet.
	DoBeforeDelete (see page 6930)	This is DoBeforeDelete, a member of class TDataSet.
	DoBeforeEdit (see page 6930)	This is DoBeforeEdit, a member of class TDataSet.
	DoBeforeExecute (see page 8408)	This is DoBeforeExecute, a member of class TCustomClientDataSet.
	DoBeforeGetParams (see page 8408)	This is DoBeforeGetParams, a member of class TCustomClientDataSet.
	DoBeforeGetRecords (see page 8409)	This is DoBeforeGetRecords, a member of class TCustomClientDataSet.
	DoBeforeInsert (see page 8409)	This is DoBeforeInsert, a member of class TCustomClientDataSet.
	DoBeforeOpen (see page 6930)	This is DoBeforeOpen, a member of class TDataSet.
	DoBeforePost (see page 6931)	This is DoBeforePost, a member of class TDataSet.
	DoBeforeRefresh (see page 6931)	This is DoBeforeRefresh, a member of class TDataSet.
	DoBeforeRowRequest (see page 8409)	This is DoBeforeRowRequest, a member of class TCustomClientDataSet.
	DoBeforeScroll (see page 6931)	This is DoBeforeScroll, a member of class TDataSet.
	DoExecute (see page 8409)	This is DoExecute, a member of class TCustomClientDataSet.
	DoGetRecords (see page 8410)	This is DoGetRecords, a member of class TCustomClientDataSet.
	DoOnCalcFields (see page 6931)	This is DoOnCalcFields, a member of class TDataSet.
	DoOnNewRecord (see page 8410)	This is DoOnNewRecord, a member of class TCustomClientDataSet.
	DoRowRequest (see page 8410)	This is DoRowRequest, a member of class TCustomClientDataSet.
	FetchMoreData (see page 8415)	This is FetchMoreData, a member of class TCustomClientDataSet.
	FieldByNumber (see page 6938)	This is FieldByNumber, a member of class TDataSet.
	FindRecord (see page 8417)	This is FindRecord, a member of class TCustomClientDataSet.
	FreeFieldBuffers (see page 6946)	This is FreeFieldBuffers, a member of class TDataSet.
	FreeKeyBuffers (see page 8417)	This is FreeKeyBuffers, a member of class TCustomClientDataSet.
	FreeRecordBuffer (see page 8417)	This is FreeRecordBuffer, a member of class TCustomClientDataSet.
	GetAggRecordCount (see page 6947)	This is GetAggRecordCount, a member of class TDataSet.

	GetAggregateValue (see page 8418)	This is GetAggregateValue, a member of class TCustomClientDataSet.
	GetAppServer (see page 8418)	This is GetAppServer, a member of class TCustomClientDataSet.
	GetBookmarkData (see page 8418)	This is GetBookmarkData, a member of class TCustomClientDataSet.
	GetBookmarkFlag (see page 8418)	This is GetBookmarkFlag, a member of class TCustomClientDataSet.
	GetBookmarkStr (see page 6949)	This is GetBookmarkStr, a member of class TDataSet.
	GetCalcFields (see page 6950)	This is GetCalcFields, a member of class TDataSet.
	GetCanModify (see page 8418)	This is GetCanModify, a member of class TCustomClientDataSet.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetChildren (see page 6950)	This is GetChildren, a member of class TDataSet.
	GetDataSource (see page 8419)	This is GetDataSource, a member of class TCustomClientDataSet.
	GetFieldClass (see page 6952)	This is GetFieldClass, a member of class TDataSet.
	GetFieldFullName (see page 6953)	This is GetFieldFullName, a member of class TDataSet.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetIndexDefs (see page 6954)	This is GetIndexDefs, a member of class TDataSet.
	GetIndexField (see page 8421)	This is GetIndexField, a member of class TCustomClientDataSet.
	GetIndexFieldCount (see page 8421)	This is GetIndexFieldCount, a member of class TCustomClientDataSet.
	GetIsClone (see page 8422)	This is GetIsClone, a member of class TCustomClientDataSet.
	GetIsIndexField (see page 8422)	This is GetIsIndexField, a member of class TCustomClientDataSet.
	GetKeyBuffer (see page 8423)	This is GetKeyBuffer, a member of class TCustomClientDataSet.
	GetKeyExclusive (see page 8423)	This is GetKeyExclusive, a member of class TCustomClientDataSet.
	GetKeyFieldCount (see page 8423)	This is GetKeyFieldCount, a member of class TCustomClientDataSet.
	GetNextRecord (see page 6955)	This is GetNextRecord, a member of class TDataSet.
	GetNextRecords (see page 6955)	This is GetNextRecords, a member of class TDataSet.
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetPriorRecord (see page 6955)	This is GetPriorRecord, a member of class TDataSet.
	GetPriorRecords (see page 6955)	This is GetPriorRecords, a member of class TDataSet.
	GetRecNo (see page 8425)	This is GetRecNo, a member of class TCustomClientDataSet.
	GetRecord (see page 8425)	This is GetRecord, a member of class TCustomClientDataSet.
	GetRecordCount (see page 8426)	This is GetRecordCount, a member of class TCustomClientDataSet.
	GetRecordSize (see page 8426)	This is GetRecordSize, a member of class TCustomClientDataSet.
	GetRemoteServer (see page 8426)	This is GetRemoteServer, a member of class TCustomClientDataSet.
	GetStateFieldValue (see page 8426)	This is GetStateFieldValue, a member of class TCustomClientDataSet.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	InitFieldDefs (see page 6958)	This is InitFieldDefs, a member of class TDataSet.
	InitFieldDefsFromFields (see page 6959)	This is InitFieldDefsFromFields, a member of class TDataSet.
	InitKeyBuffer (see page 8428)	This is InitKeyBuffer, a member of class TCustomClientDataSet.
	InitRecord (see page 8428)	This is InitRecord, a member of class TCustomClientDataSet.
	InternalAddRecord (see page 8428)	This is InternalAddRecord, a member of class TCustomClientDataSet.
	InternalCancel (see page 8429)	This is InternalCancel, a member of class TCustomClientDataSet.
	InternalClose (see page 8429)	This is InternalClose, a member of class TCustomClientDataSet.
	InternalDelete (see page 8429)	This is InternalDelete, a member of class TCustomClientDataSet.
	InternalEdit (see page 8429)	This is InternalEdit, a member of class TCustomClientDataSet.
	InternalFirst (see page 8430)	This is InternalFirst, a member of class TCustomClientDataSet.
	InternalGetOptionalParam (see page 8430)	This is InternalGetOptionalParam, a member of class TCustomClientDataSet.
	InternalGotoBookmark (see page 8430)	This is InternalGotoBookmark, a member of class TCustomClientDataSet.
	InternalHandleException (see page 8430)	This is InternalHandleException, a member of class TCustomClientDataSet.
	InternalInitFieldDefs (see page 8430)	This is InternalInitFieldDefs, a member of class TCustomClientDataSet.
	InternalInitRecord (see page 8431)	This is InternalInitRecord, a member of class TCustomClientDataSet.

	InternalInsert (see page 8431)	This is InternalInsert, a member of class TCustomClientDataSet.
	InternalLast (see page 8431)	This is InternalLast, a member of class TCustomClientDataSet.
	InternalOpen (see page 8431)	This is InternalOpen, a member of class TCustomClientDataSet.
	InternalPost (see page 8432)	This is InternalPost, a member of class TCustomClientDataSet.
	InternalRefresh (see page 8432)	This is InternalRefresh, a member of class TCustomClientDataSet.
	InternalSetOptionalParam (see page 8432)	This is InternalSetOptionalParam, a member of class TCustomClientDataSet.
	InternalSetToRecord (see page 8432)	This is InternalSetToRecord, a member of class TCustomClientDataSet.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsCursorOpen (see page 8432)	This is IsCursorOpen, a member of class TCustomClientDataSet.
	Loaded (see page 8433)	Initializes the component after the form file has been read into memory.
	LocateRecord (see page 8436)	This is LocateRecord, a member of class TCustomClientDataSet.
	Notification (see page 8437)	Forwards notification messages to all owned components.
	OpenCursor (see page 8438)	This is OpenCursor, a member of class TCustomClientDataSet.
	OpenCursorComplete (see page 6977)	This is OpenCursorComplete, a member of class TDataSet.
	OpenParentDataSet (see page 6977)	This is OpenParentDataSet, a member of class TDataSet.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	PostKeyBuffer (see page 8439)	This is PostKeyBuffer, a member of class TCustomClientDataSet.
	PSEndTransaction (see page 6979)	Ends a transaction that was started by a call to PSStartTransaction.
	PSExecute (see page 6980)	Executes the SQL command associated with the dataset.
	PSExecuteStatement (see page 6980)	This is the overview for the PSExecuteStatement method overload.
	PSExecuteStatement (see page 7535)	This is the overview for the PSExecuteStatement method overload.
	PSGetAttributes (see page 6981)	Returns information that is stored in data packets as Name/Value pairs.
	PSGetCommandText (see page 8439)	Gets the SQL command to be executed by PSExecute.
	PSGetCommandTextW (see page 6982)	This is PSGetCommandTextW, a member of class TDataSet.
	PSGetCommandTextW (see page 7537)	This is PSGetCommandTextW, a member of class TWideDataSet.
	PSGetCommandType (see page 8440)	Gets the command type to be executed by PSExecute.
	PSGetDefaultOrder (see page 6983)	Returns the definition of an index that imposes the default order on the data included in data packets.
	PSGetIndexDefs (see page 8440)	Returns the definitions of all specified indexes defined for the dataset.
	PSGetKeyFields (see page 6984)	Returns the names of all fields required to uniquely identify records in the data packet.
	PSGetKeyFields (see page 7538)	Returns the names of all fields required to uniquely identify records in the data packet.
	PSGetKeyFieldsW (see page 6984)	This is PSGetKeyFieldsW, a member of class TDataSet.
	PSGetKeyFieldsW (see page 7538)	This is PSGetKeyFieldsW, a member of class TWideDataSet.
	PSGetParams (see page 6984)	Returns the current parameter values of the dataset.
	PSGetQuoteChar (see page 6985)	Returns the character or characters to use in generated SQL statements to enclose quoted strings.
	PSGetQuoteChar (see page 7538)	Returns the character or characters to use in generated SQL statements to enclose quoted strings.
	PSGetQuoteCharW (see page 6985)	This is PSGetQuoteCharW, a member of class TDataSet.
	PSGetQuoteCharW (see page 7539)	This is PSGetQuoteCharW, a member of class TWideDataSet.
	PSGetTableName (see page 6985)	Returns the name of the dataset table that appears in generated SQL statements.
	PSGetTableName (see page 7539)	Returns the name of the dataset table that appears in generated SQL statements.
	PSGetTableNameW (see page 6986)	This is PSGetTableNameW, a member of class TDataSet.
	PSGetTableNameW (see page 7539)	This is PSGetTableNameW, a member of class TWideDataSet.
	PSGetUpdateException (see page 6986)	Generates an EUpdateError object based on another exception object.
	PSInTransaction (see page 6987)	Indicates whether actions against the dataset occur in the context of a transaction.
	PSIsSQLBased (see page 6987)	Indicates whether the dataset includes native SQL support.
	PSIsSQLSupported (see page 6987)	Indicates whether the dataset can execute SQL statements.
	PSReset (see page 6988)	Resets the dataset so that it is positioned on the first record.
	PSSetCommandText (see page 6988)	This is the overview for the PSSetCommandText method overload.
	PSSetCommandText (see page 7540)	This is the overview for the PSSetCommandText method overload.
	PSSetParams (see page 6989)	Assigns the specified parameter values to the dataset.

	PSStartTransaction (see page 6989)	Starts a transaction that encapsulates all activity until a call to PSEndTransaction.
	PSUpdateRecord (see page 6990)	Applies a single update to the underlying database table or tables.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadDataPacket (see page 8441)	This is ReadDataPacket, a member of class TCustomClientDataSet.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	RefreshInternalCalcFields (see page 8441)	This is RefreshInternalCalcFields, a member of class TCustomClientDataSet.
	ResetAggField (see page 8442)	This is ResetAggField, a member of class TCustomClientDataSet.
	ResetCursorRange (see page 8443)	This is ResetCursorRange, a member of class TCustomClientDataSet.
	RestoreState (see page 6993)	This is RestoreState, a member of class TDataSet.
	SetActive (see page 6994)	This is SetActive, a member of class TDataSet.
	SetAggregates (see page 8445)	This is SetAggregates, a member of class TCustomClientDataSet.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetAppServer (see page 8446)	This is SetAppServer, a member of class TCustomClientDataSet.
	SetBlockReadSize (see page 6994)	This is SetBlockReadSize, a member of class TDataSet.
	SetBookmarkData (see page 8446)	This is SetBookmarkData, a member of class TCustomClientDataSet.
	SetBookmarkFlag (see page 8446)	This is SetBookmarkFlag, a member of class TCustomClientDataSet.
	SetBookmarkStr (see page 6995)	This is SetBookmarkStr, a member of class TDataSet.
	SetBufListSize (see page 6995)	This is SetBufListSize, a member of class TDataSet.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetChildOrder (see page 6995)	This is SetChildOrder, a member of class TDataSet.
	SetCommandText (see page 8447)	This is SetCommandText, a member of class TCustomClientDataSet.
	SetCurrentRecord (see page 6996)	This is SetCurrentRecord, a member of class TDataSet.
	SetCursorRange (see page 8447)	This is SetCursorRange, a member of class TCustomClientDataSet.
	SetDataSetField (see page 8447)	This is SetDataSetField, a member of class TCustomClientDataSet.
	SetDefaultFields (see page 6996)	This is SetDefaultFields, a member of class TDataSet.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetFieldData (see page 8447)	This is SetFieldData, a member of class TCustomClientDataSet.
	SetFieldData (see page 6996)	This is the overview for the SetFieldData method overload.
	SetFilterData (see page 8448)	This is SetFilterData, a member of class TCustomClientDataSet.
	SetFiltered (see page 8448)	This is SetFiltered, a member of class TCustomClientDataSet.
	SetFilterOptions (see page 8448)	This is SetFilterOptions, a member of class TCustomClientDataSet.
	SetFilterText (see page 8448)	This is SetFilterText, a member of class TCustomClientDataSet.
	SetFound (see page 6998)	This is SetFound, a member of class TDataSet.
	SetIndexField (see page 8448)	This is SetIndexField, a member of class TCustomClientDataSet.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetKeyBuffer (see page 8449)	This is SetKeyBuffer, a member of class TCustomClientDataSet.
	SetKeyExclusive (see page 8449)	This is SetKeyExclusive, a member of class TCustomClientDataSet.
	SetKeyFieldCount (see page 8450)	This is SetKeyFieldCount, a member of class TCustomClientDataSet.
	SetKeyFields (see page 8450)	This is SetKeyFields, a member of class TCustomClientDataSet.
	SetLinkRanges (see page 8450)	This is SetLinkRanges, a member of class TCustomClientDataSet.
	SetModified (see page 6998)	This is SetModified, a member of class TDataSet.
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetName (see page 6999)	Sets the value of the Name property.
	SetObjectView (see page 6999)	This is SetObjectView, a member of class TDataSet.
	SetOnFilterRecord (see page 8450)	This is SetOnFilterRecord, a member of class TCustomClientDataSet.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	SetProviderEOF (see page 8452)	This is SetProviderEOF, a member of class TCustomClientDataSet.
	SetRecNo (see page 8454)	This is SetRecNo, a member of class TCustomClientDataSet.
	SetRemoteServer (see page 8454)	This is SetRemoteServer, a member of class TCustomClientDataSet.
	SetState (see page 7000)	This is SetState, a member of class TDataSet.
	SetStateFieldValue (see page 7000)	This is SetStateFieldValue, a member of class TDataSet.
	SetTempState (see page 7000)	This is SetTempState, a member of class TDataSet.
	SetUniDirectional (see page 7000)	This is SetUniDirectional, a member of class TDataSet.

	SwitchToIndex (see page 8455)	This is SwitchToIndex, a member of class TCustomClientDataSet.
	SyncCursors (see page 8455)	This is SyncCursors, a member of class TCustomClientDataSet.
	TempBuffer (see page 7001)	This is TempBuffer, a member of class TDataSet.
	UpdateBufferCount (see page 7001)	This is UpdateBufferCount, a member of class TDataSet.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateIndexDefs (see page 8455)	This is UpdateIndexDefs, a member of class TCustomClientDataSet.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteDataPacket (see page 8456)	This is WriteDataPacket, a member of class TCustomClientDataSet.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	ActiveRecord (see page 7005)	Indicates the index of the active record in the internal cache of records.
	Aggregates (see page 8461)	Lists all aggregates that apply to the client dataset.
	AggregatesActive (see page 8461)	Specifies whether the client dataset calculates and maintains aggregate values.
	AutoCalcFields (see page 8463)	Determines when the OnCalcFields event is triggered and when lookup field values are calculated.
R	BlobFieldCount (see page 7007)	Indicates the number of columns in the dataset that represent Binary large object (BLOB) fields.
	BookmarkSize (see page 7010)	Indicates the number of bytes used to represent a bookmark.
R	BufferCount (see page 7010)	Indicates the number of records in the internal cache.
R	Buffers (see page 7011)	Provides indexed access to the record buffers in the internal cache.
R	CalcBuffer (see page 7011)	Points to the record buffer used during an OnCalcFields (see page 7053) event.
R	CalcFieldsSize (see page 7012)	Indicates the number of bytes in a record buffer dedicated to storing calculated fields and lookup fields.
	CommandText (see page 8465)	Specifies an SQL command to be executed by the database server.
	Constraints (see page 8466)	Specifies record-level constraints that must be met when editing the data.
R	CurrentRecord (see page 7013)	Indicates the index of the current record in the internal cache of record buffers.
	DisableStringTrim (see page 8470)	Specifies whether trailing spaces are trimmed from field values when records are posted.
	DSBase (see page 8471)	Specifies the interface the client dataset uses to communicate with classes in Midas.dll or Midaslib.dcu (on Windows) or midas.so (on Linux).
R	DSCursor (see page 8471)	Provides access to the interface for the client dataset's data cursor.
	FetchOnDemand (see page 8471)	Indicates whether to fetch data packets from the provider on an as-needed basis.
	FieldDefs (see page 8472)	Points to the list of field definitions for the dataset.
	FieldNoOfs (see page 7022)	Specifies the offset needed to convert indexes in the Fields (see page 7023) property to field numbers.
	Filter (see page 8476)	Specifies the text of the current filter.
	Filtered (see page 8478)	Specifies whether or not filtering is active for a dataset.
	FilterOptions (see page 8478)	Specifies whether or not filtering is case insensitive, and whether or not partial comparisons are permitted when filtering records.
	IndexDefs (see page 8480)	Contains information about the indexes for a client dataset.
	IndexName (see page 8483)	Identifies an index for the client dataset.
R	InternalCalcFields (see page 7028)	Indicates whether the dataset includes internally calculated fields.
R	IsClone (see page 8484)	This is IsClone, a member of class TCustomClientDataSet.
	MasterSource (see page 8486)	Specifies a data source component for the master dataset when establishing a detail-master relationship between this dataset and another one.
	NestedDataSetClass (see page 7030)	Indicates the class type to use when creating nested datasets.
R	NestedDataSets (see page 7030)	Lists all nested datasets.

	ObjectView (see page 8487)	Specifies whether fields are stored hierarchically or flattened out in the Fields property.
	Params (see page 8489)	Contains parameter values that are sent to the provider.
	ProviderEOF (see page 8491)	Indicates whether the client dataset has all of its data.
R	Ranged (see page 8492)	This is Ranged, a member of class TCustomClientDataSet.
	ReadOnly (see page 8493)	Specifies whether the client dataset is read-only for this application.
	Reserved (see page 7035)	For internal use only.
	StoreDefs (see page 8495)	Indicates whether field and index definitions are saved with the client dataset.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	ActiveBuffer (see page 6909)	Returns a pointer to the buffer for the active record.
	AddIndex (see page 8391)	Creates a new index for the client dataset.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Append (see page 6910)	Adds a new, empty record to the end of the dataset.
	AppendData (see page 8393)	Adds a newly fetched packet of records to those already stored in the client dataset.
	AppendRecord (see page 6911)	Adds a new, populated record to the end of the dataset and posts it.
	ApplyRange (see page 8393)	Applies a range to the dataset.
V	ApplyUpdates (see page 8394)	Sends all updated, inserted, and deleted records from the client dataset to the provider for writing to the database.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
V	BookmarkValid (see page 8395)	Tests the validity of a specified bookmark.
V	Cancel (see page 8395)	Cancels unposted changes to the current record.
	CancelRange (see page 8396)	Removes any ranges currently in effect for the client dataset.
	CancelUpdates (see page 8396)	Clears all pending edits and clears the change log.
	CheckBrowseMode (see page 6918)	Automatically posts or cancels data changes when the active record changes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	ClearFields (see page 6919)	Clears the contents of all fields for the active record.
V	CloneCursor (see page 8398)	Shares the data belonging to another client dataset.
	Close (see page 6920)	Closes a dataset.
V	CompareBookmarks (see page 8400)	Compares two bookmarks.
	ConstraintsDisabled (see page 8400)	Indicates whether constraints are enabled for a client dataset.
	ControlsDisabled (see page 6921)	Indicates whether data-aware controls update their display to reflect changes to the dataset.
	CopyFields (see page 6922)	This is CopyFields, a member of class TDataSet.
V	Create (see page 8386)	Creates and initializes instance of TCustomClientDataSet (see page 8373).
V	CreateBlobStream (see page 8401)	Returns a TClientBlobStream (see page 8285) object for reading or writing the data in a specified blob field.
	CreateDataSet (see page 8401)	Creates a new, empty client dataset.
	CursorPosChanged (see page 6923)	Marks the internal cursor position as invalid.
V	DataRequest (see page 8404)	Generates an OnDataRequest event on the associated provider
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Delete (see page 6924)	Deletes the active record and positions the dataset on the next record.
	DeleteIndex (see page 8406)	Deletes an index for the client dataset.
V	Destroy (see page 8387)	Destroys the instance of a client dataset component.

	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	DisableConstraints (see page 8406)	Disables the enforcement of constraints.
	DisableControls (see page 6925)	Disables data display in data-aware controls associated with the dataset.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Edit (see page 6932)	Enables editing of data in the dataset.
	EditKey (see page 8410)	Enables modification of the search key buffer.
	EditRangeEnd (see page 8411)	Enables changing the ending value for an existing range.
	EditRangeStart (see page 8411)	Enables changing the starting value for an existing range.
V	EmptyDataSet (see page 8412)	Removes all records from the dataset.
	EnableConstraints (see page 8412)	Reenables enforcement of constraints when records are posted.
	EnableControls (see page 6934)	Re-enables data display in data-aware controls associated with the dataset.
V	Execute (see page 8413)	Executes an SQL command by the provider's dataset.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FetchBlobs (see page 8414)	Retrieves BLOB field values from the provider.
	FetchDetails (see page 8414)	Retrieves nested detail datasets from the provider.
	FetchParams (see page 8415)	Retrieves parameter values from the provider.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FieldByName (see page 6936)	Finds a field based on its name.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FindField (see page 6938)	Searches for a specified field in the dataset.
	FindFirst (see page 6939)	Implements a virtual method for positioning the dataset on the first record, respecting any filters.
V	FindKey (see page 8416)	Searches for a record containing specified field values.
	FindLast (see page 6940)	Implements a virtual method for positioning the dataset on the last record, respecting any filters.
	FindNearest (see page 8416)	Moves the cursor to the record that most closely matches a specified set of key values.
	FindNext (see page 6940)	Implements a virtual method for positioning the dataset on the next record, respecting any filters.
	FindPrior (see page 6941)	Implements a virtual method for positioning the dataset on the previous record, respecting any filters.
	First (see page 6942)	Moves to the first record in the dataset.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeBookmark (see page 6945)	Frees the resources allocated for a specified bookmark.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
V	GetBlobFieldData (see page 6947)	Reads BLOB data into a buffer.
V	GetBookmark (see page 6948)	Allocates a bookmark for the active record in the dataset.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
V	GetCurrentRecord (see page 8419)	Retrieves the current record into a buffer.
V	GetDetailDataSets (see page 6951)	Fills a list with a dataset for every detail dataset that is not the value of a nested dataset field.
V	GetDetailLinkFields (see page 6951)	Introduces a method to list the field components that link this dataset as a detail of a master dataset.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
V	GetFieldData (see page 6952)	This is the overview for the GetFieldData method overload.
V	GetFieldData (see page 8419)	This is the overview for the GetFieldData method overload.
	GetFieldList (see page 6953)	Retrieves a specified set of field objects into a list.
V	GetFieldNames (see page 6953)	This is the overview for the GetFieldNames method overload.
	GetGroupState (see page 8420)	Indicates where the current record sits within a specified group of records.
	GetIndexInfo (see page 8421)	Retrieves information about the current index.
	GetIndexNames (see page 8422)	Retrieves a list of available indexes for a client dataset.

	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
V	GetNextPacket (see page 8423)	Retrieves the next block of records from the provider.
	GetOptionalParam (see page 8425)	Retrieves a custom parameter from the data packet.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GotoBookmark (see page 6957)	Implements a virtual method to position the dataset on the record to which a specified bookmark points.
	GotoCurrent (see page 8427)	Sets the current record in this dataset the same as the current record in another, cloned dataset.
	GotoKey (see page 8427)	Moves the cursor to a record specified by the current key.
	GotoNearest (see page 8427)	Moves the cursor to the record that most closely matches the current key.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	Insert (see page 6959)	Inserts a new, empty record in the dataset.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InsertRecord (see page 6961)	Inserts a new, populated record to the dataset and posts it.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsEmpty (see page 6967)	Indicates whether the dataset contains no records.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	IsLinkedTo (see page 6967)	Indicates whether a dataset is linked to a specified data source.
V	IsSequenced (see page 6967)	Indicates whether the underlying database table uses record numbers to indicate the order of records.
	Last (see page 6968)	Moves to the last record in the dataset.
	LoadFromFile (see page 8433)	Loads a client dataset's data from a file.
	LoadFromStream (see page 8435)	Loads a client dataset's data from a stream.
V	Locate (see page 8435)	Searches the dataset for a specified record and makes that record current.
V	Lookup (see page 8436)	Retrieves field values from a record that matches specified search values.
	MergeChangeLog (see page 8437)	Merges any data changes in the change log into the client dataset, overwriting existing values.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	MoveBy (see page 6971)	Moves to another record relative to the active record in the dataset.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	Next (see page 6973)	Moves to the next record in the dataset.
	Open (see page 6976)	Opens the dataset.
V	Post (see page 8438)	Writes a modified record to the Data (see page 8467) property or the change log.
	Prior (see page 6979)	Moves to the previous record in the dataset.
	PSEndTransaction (see page 7578)	Ends a transaction that was started by a call to PSStartTransaction (see page 7586).
	PSEndTransaction (see page 7589)	Ends a transaction that was started by a call to PSStartTransaction (see page 7597).
	PSExecute (see page 7578)	Executes the SQL command associated with the dataset.
	PSExecute (see page 7590)	Executes the SQL command associated with the dataset.
	PSExecuteStatement (see page 7579)	Executes a specified SQL command.
	PSExecuteStatement (see page 7590)	Executes a specified SQL command.
	PSGetAttributes (see page 7579)	Returns information that is stored in data packets as Name/Value pairs.
	PSGetAttributes (see page 7591)	Returns information that is stored in data packets as Name/Value pairs.
	PSGetDefaultOrder (see page 7580)	Returns the definition of an index that imposes the default order on the data included in data packets.

	PSGetDefaultOrder (see page 7592)	Returns the definition of an index that imposes the default order on the data included in data packets.
	PSGetKeyFields (see page 7581)	Returns the names of all fields required to uniquely identify records in the data packet.
	PSGetKeyFields (see page 7593)	Returns the names of all fields required to uniquely identify records in the data packet.
	PSGetParams (see page 7582)	Returns the current parameter values of the dataset.
	PSGetParams (see page 7593)	Returns the current parameter values of the dataset.
	PSGetQuoteChar (see page 7582)	Returns the character or characters to use in generated SQL statements to enclose quoted strings.
	PSGetQuoteChar (see page 7594)	Returns the character or characters to use in generated SQL statements to enclose quoted strings.
	PSGetTableName (see page 7583)	Returns the name of the dataset table that appears in generated SQL statements.
	PSGetTableName (see page 7594)	Returns the name of the dataset table that appears in generated SQL statements.
	PSGetUpdateException (see page 7583)	Generates an EUpdateError (see page 6732) object based on another exception object.
	PSGetUpdateException (see page 7594)	Generates an EUpdateError (see page 6732) object based on another exception object.
	PSInTransaction (see page 7583)	Indicates whether actions against the dataset occur in the context of a transaction.
	PSInTransaction (see page 7595)	Indicates whether actions against the dataset occur in the context of a transaction.
	PSIsSQLBased (see page 7584)	Indicates whether the dataset includes native SQL support.
	PSIsSQLBased (see page 7595)	Indicates whether the dataset includes native SQL support.
	PSIsSQLSupported (see page 7584)	Indicates whether the dataset can execute SQL statements.
	PSIsSQLSupported (see page 7596)	Indicates whether the dataset can execute SQL statements.
	PSReset (see page 7585)	Resets the dataset so that it is positioned on the first record.
	PSReset (see page 7596)	Resets the dataset so that it is positioned on the first record.
	PSSetCommandText (see page 7585)	Assigns a specified SQL command to be executed by PSExecute (see page 7578).
	PSSetCommandText (see page 7596)	Assigns a specified SQL command to be executed by PSExecute (see page 7590).
	PSSetParams (see page 7586)	Assigns the specified parameter values to the dataset.
	PSSetParams (see page 7597)	Assigns the specified parameter values to the dataset.
	PSStartTransaction (see page 7586)	Starts a transaction that encapsulates all activity until a call to PSEndTransaction (see page 7578).
	PSStartTransaction (see page 7597)	Starts a transaction that encapsulates all activity until a call to PSEndTransaction (see page 7589).
	PSUpdateRecord (see page 7586)	Applies a single update to the underlying database table or tables.
	PSUpdateRecord (see page 7598)	Applies a single update to the underlying database table or tables.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	Reconcile (see page 8441)	Clears successfully updated records from the client dataset's cache of changes.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	Refresh (see page 6991)	Re-fetches data from the database to update a dataset's view of data.
	RefreshRecord (see page 8442)	Updates the base values of the current record to match the current values of the provider's dataset.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	Resync (see page 6994)	Re-fetches the active record and the records that precede and follow it.
	RevertRecord (see page 8443)	Undoes edits to the current record.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SaveToFile (see page 8443)	Saves a client dataset's data to an external file.
	SaveToStream (see page 8445)	Saves a client dataset's data to a stream.
	SetAltRecBuffers (see page 8446)	Sets record buffers when accessing field values.
	SetFields (see page 6997)	Sets the values for all fields in a record

	SetKey (see page 8449)	Enables setting of keys and ranges for a dataset prior to a search.
V	SetOptionalParam (see page 8450)	Saves a custom parameter with the data packet.
	SetProvider (see page 8451)	Associates the client dataset with a provider in the same process space.
	SetRange (see page 8452)	Sets the starting and ending values of a range, and applies it.
	SetRangeEnd (see page 8453)	Indicates that subsequent assignments to field values specify the end of the range of rows to include in the dataset.
	SetRangeStart (see page 8454)	Indicates that subsequent assignments to field values specify the start of the range of rows to include in the dataset.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
V	Translate (see page 7001)	Implements a virtual procedure to copy a data string from a source to a destination, optionally performing character translation during the copy.
	UndoLastChange (see page 8455)	Undoes the last edit, insert, or delete operation to a record in the client dataset.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	UpdateCursorPos (see page 7001)	Positions the cursor on the active record.
	UpdateRecord (see page 7002)	Ensures that data-aware controls and detail datasets reflect record updates.
V	UpdateStatus (see page 8456)	Reports the update status for the current record in the dataset.

Public Properties

	Name	Description
	Active (see page 8458)	Specifies whether the client dataset contains data.
R	ActiveAggs (see page 8460)	Lists the maintained aggregates supported by the current index.
R	AggFields (see page 7006)	Contains any aggregate fields.
	AppServer (see page 8462)	Provides access to the interface the client dataset uses to communicate with a provider.
	BlockReadSize (see page 7007)	Determines how many record buffers are read in each block.
R	Bof (see page 7008)	Indicates whether the first record in the dataset is active.
	Bookmark (see page 7009)	Specifies the current bookmark in the dataset.
R	CanModify (see page 7012)	Indicates whether the dataset permits write access to data.
R	ChangeCount (see page 8463)	Indicates the number of changes in the change log.
R	CloneSource (see page 8464)	Indicates the client dataset (if any) with which this client dataset shares data.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	ConnectionBroker (see page 8466)	Specifies a connection broker that handles the connection to an application server.
	Data (see page 8467)	Represents the data of the client dataset in a transportable format.
	DataSetField (see page 8469)	Indicates the TDataSetField component that represents this client dataset.
R	DataSize (see page 8469)	Indicates the number of bytes required to represent the Data (see page 8467) property.
R	DataSource (see page 7014)	Represents the data source of another dataset that supplies values to the dataset.
R	DefaultFields (see page 7014)	Indicates whether a dataset's underlying field components are generated dynamically when the dataset is opened.
R	Delta (see page 8470)	Represents a packet of change log data.
R	Designer (see page 7015)	Returns a pointer to the Dataset designer for the dataset.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	Eof (see page 7015)	Indicates whether a dataset is positioned at the last record.
R	FieldCount (see page 7017)	Indicates the number of field components associated with the dataset.
R	FieldDefList (see page 7019)	Points to the list of field definitions for the dataset.
R	FieldList (see page 7022)	Lists the field components of a dataset.
R	Fields (see page 7023)	Lists all non-aggregate field components of the dataset.
	FieldValues (see page 7025)	Provides access to the values for all fields in the active record for the dataset

	FileName (see page 8475)	Specifies a file that stores the data of the client dataset.
R	Found (see page 7028)	Indicates whether or not moving to a different record is successful.
R	GroupingLevel (see page 8479)	Indicates the depth of grouping support provided by the current index.
R	HasAppServer (see page 8480)	Indicates whether the client dataset is connected to a provider.
R	IndexFieldCount (see page 8481)	Indicates the number of fields that make up the current index.
	IndexFieldNames (see page 8482)	Lists the fields to use as an index.
	IndexFields (see page 8482)	Specifies the fields associated with the current index.
R	IsUniDirectional (see page 7029)	Indicates whether the dataset is unidirectional.
	KeyExclusive (see page 8484)	Specifies the upper and lower boundaries for a range.
	KeyFieldCount (see page 8484)	Specifies the number of fields to use when conducting a partial key search on a multi-field key.
R	KeySize (see page 8485)	Indicates the size of the current key used for the dataset.
	LogChanges (see page 8485)	Indicates whether to maintain a change log separate from the data.
	MasterFields (see page 8486)	Names one or more fields in a master table to link with corresponding fields in this dataset in order to establish a master-detail relationship.
R	Modified (see page 7029)	Indicates whether the active record is modified.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	PacketRecords (see page 8488)	Indicates the number or type of records in a single data packet.
	ProviderName (see page 8492)	Specifies the name of a provider component that supplies data to and applies updates from the client dataset..
	RecNo (see page 7031)	Indicates the active record in the dataset.
R	RecordCount (see page 7032)	Indicates the total number of records associated with the dataset.
R	RecordSize (see page 7035)	Indicates the size of a record in the dataset.
	RemoteServer (see page 8493)	Specifies the connection component that this client dataset uses to connect to an application server.
	SavePoint (see page 8494)	Represents the current state of edits when logging changes.
	SparseArrays (see page 7036)	Determines whether a unique TField (see page 7115) object is created for each element of an array field.
R	State (see page 7036)	Indicates the current operating mode of the dataset.
	StatusFilter (see page 8495)	Filters the client dataset so that it exposes only those records with a specific update status.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	XMLData (see page 8496)	Represents the data of the client dataset in XML.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

45.1.8.2 TCustomClientDataSet.Create Constructor

Creates and initializes instance of TCustomClientDataSet (see page 8373).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomClientDataSet(TComponent * AOwner);
```

Description

Call Create to instantiate a client dataset component at runtime. Client datasets added to forms or data modules at design time are created automatically.

AOwner is a component, typically a form or data module, that is responsible for freeing the client dataset.

See Also

Destroy (see page 8387)

Owner (see page 2807)

45.1.8.3 TCustomClientDataSet.Destroy Destructor

Destroys the instance of a client dataset component.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TCustomClientDataSet();
```

Description

Do not call Destroy directly in an application. Usually destruction of datasets is handled automatically. If an application creates its own instances of a dataset without assigning an Owner, however, it should call Free, which verifies that the dataset component is not nil before calling Destroy.

See Also

Owner (see page 2807)

Create (see page 8386)

Free (see page 22300)

45.1.8.4 TCustomClientDataSet Methods

The methods of the TCustomClientDataSet class are listed here.

Protected Methods

	Name	Description
	ActivateFilters (see page 8391)	This is ActivateFilters, a member of class TCustomClientDataSet.
V	AddDataPacket (see page 8391)	This is AddDataPacket, a member of class TCustomClientDataSet.
	AddFieldDesc (see page 8391)	This is AddFieldDesc, a member of class TCustomClientDataSet.
	AllocKeyBuffers (see page 8392)	This is AllocKeyBuffers, a member of class TCustomClientDataSet.
V	AllocRecordBuffer (see page 8393)	This is AllocRecordBuffer, a member of class TCustomClientDataSet.
	Check (see page 8397)	This is Check, a member of class TCustomClientDataSet.
V	CheckDetailRecords (see page 8397)	This is CheckDetailRecords, a member of class TCustomClientDataSet.
V	CheckProviderEOF (see page 8397)	This is CheckProviderEOF, a member of class TCustomClientDataSet.
	CheckSetKeyMode (see page 8397)	This is CheckSetKeyMode, a member of class TCustomClientDataSet.
V	ClearCalcFields (see page 8398)	This is ClearCalcFields, a member of class TCustomClientDataSet.
V	CloseCursor (see page 8400)	This is CloseCursor, a member of class TCustomClientDataSet.
	ConstraintsStored (see page 8401)	This is ConstraintsStored, a member of class TCustomClientDataSet.
V	DataConvert (see page 8404)	This is DataConvert, a member of class TCustomClientDataSet.
V	DataEvent (see page 8404)	This is DataEvent, a member of class TCustomClientDataSet.
	DeactivateFilters (see page 8405)	This is DeactivateFilters, a member of class TCustomClientDataSet.
V	DefChanged (see page 8405)	This is DefChanged, a member of class TCustomClientDataSet.
V	DefineProperties (see page 8405)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DestroyLookupCursor (see page 8406)	This is DestroyLookupCursor, a member of class TCustomClientDataSet.
V	DoAfterApplyUpdates (see page 8407)	This is DoAfterApplyUpdates, a member of class TCustomClientDataSet.

	DoAfterExecute (see page 8407)	This is DoAfterExecute, a member of class TCustomClientDataSet.
	DoAfterGetParams (see page 8407)	This is DoAfterGetParams, a member of class TCustomClientDataSet.
	DoAfterGetRecords (see page 8407)	This is DoAfterGetRecords, a member of class TCustomClientDataSet.
	DoAfterRowRequest (see page 8408)	This is DoAfterRowRequest, a member of class TCustomClientDataSet.
	DoApplyUpdates (see page 8408)	This is DoApplyUpdates, a member of class TCustomClientDataSet.
	DoBeforeApplyUpdates (see page 8408)	This is DoBeforeApplyUpdates, a member of class TCustomClientDataSet.
	DoBeforeExecute (see page 8408)	This is DoBeforeExecute, a member of class TCustomClientDataSet.
	DoBeforeGetParams (see page 8408)	This is DoBeforeGetParams, a member of class TCustomClientDataSet.
	DoBeforeGetRecords (see page 8409)	This is DoBeforeGetRecords, a member of class TCustomClientDataSet.
	DoBeforeInsert (see page 8409)	This is DoBeforeInsert, a member of class TCustomClientDataSet.
	DoBeforeRowRequest (see page 8409)	This is DoBeforeRowRequest, a member of class TCustomClientDataSet.
	DoExecute (see page 8409)	This is DoExecute, a member of class TCustomClientDataSet.
	DoGetRecords (see page 8410)	This is DoGetRecords, a member of class TCustomClientDataSet.
	DoOnNewRecord (see page 8410)	This is DoOnNewRecord, a member of class TCustomClientDataSet.
	DoRowRequest (see page 8410)	This is DoRowRequest, a member of class TCustomClientDataSet.
	FetchMoreData (see page 8415)	This is FetchMoreData, a member of class TCustomClientDataSet.
	FindRecord (see page 8417)	This is FindRecord, a member of class TCustomClientDataSet.
	FreeKeyBuffers (see page 8417)	This is FreeKeyBuffers, a member of class TCustomClientDataSet.
	FreeRecordBuffer (see page 8417)	This is FreeRecordBuffer, a member of class TCustomClientDataSet.
	GetAggregateValue (see page 8418)	This is GetAggregateValue, a member of class TCustomClientDataSet.
	GetAppServer (see page 8418)	This is GetAppServer, a member of class TCustomClientDataSet.
	GetBookmarkData (see page 8418)	This is GetBookmarkData, a member of class TCustomClientDataSet.
	GetBookmarkFlag (see page 8418)	This is GetBookmarkFlag, a member of class TCustomClientDataSet.
	GetCanModify (see page 8418)	This is GetCanModify, a member of class TCustomClientDataSet.
	GetDataSource (see page 8419)	This is GetDataSource, a member of class TCustomClientDataSet.
	GetIndexField (see page 8421)	This is GetIndexField, a member of class TCustomClientDataSet.
	GetIndexFieldCount (see page 8421)	This is GetIndexFieldCount, a member of class TCustomClientDataSet.
	GetIsClone (see page 8422)	This is GetIsClone, a member of class TCustomClientDataSet.
	GetIsIndexField (see page 8422)	This is GetIsIndexField, a member of class TCustomClientDataSet.
	GetKeyBuffer (see page 8423)	This is GetKeyBuffer, a member of class TCustomClientDataSet.
	GetKeyExclusive (see page 8423)	This is GetKeyExclusive, a member of class TCustomClientDataSet.
	GetKeyFieldCount (see page 8423)	This is GetKeyFieldCount, a member of class TCustomClientDataSet.
	GetRecNo (see page 8425)	This is GetRecNo, a member of class TCustomClientDataSet.
	GetRecord (see page 8425)	This is GetRecord, a member of class TCustomClientDataSet.
	GetRecordCount (see page 8426)	This is GetRecordCount, a member of class TCustomClientDataSet.
	GetRecordSize (see page 8426)	This is GetRecordSize, a member of class TCustomClientDataSet.
	GetRemoteServer (see page 8426)	This is GetRemoteServer, a member of class TCustomClientDataSet.
	GetStateFieldValue (see page 8426)	This is GetStateFieldValue, a member of class TCustomClientDataSet.
	InitKeyBuffer (see page 8428)	This is InitKeyBuffer, a member of class TCustomClientDataSet.
	InitRecord (see page 8428)	This is InitRecord, a member of class TCustomClientDataSet.
	InternalAddRecord (see page 8428)	This is InternalAddRecord, a member of class TCustomClientDataSet.
	InternalCancel (see page 8429)	This is InternalCancel, a member of class TCustomClientDataSet.
	InternalClose (see page 8429)	This is InternalClose, a member of class TCustomClientDataSet.
	InternalDelete (see page 8429)	This is InternalDelete, a member of class TCustomClientDataSet.
	InternalEdit (see page 8429)	This is InternalEdit, a member of class TCustomClientDataSet.
	InternalFirst (see page 8430)	This is InternalFirst, a member of class TCustomClientDataSet.
	InternalGetOptionalParam (see page 8430)	This is InternalGetOptionalParam, a member of class TCustomClientDataSet.
	InternalGotoBookmark (see page 8430)	This is InternalGotoBookmark, a member of class TCustomClientDataSet.
	InternalHandleException (see page 8430)	This is InternalHandleException, a member of class TCustomClientDataSet.
	InternalInitFieldDefs (see page 8430)	This is InternalInitFieldDefs, a member of class TCustomClientDataSet.
	InternalInitRecord (see page 8431)	This is InternalInitRecord, a member of class TCustomClientDataSet.
	InternalInsert (see page 8431)	This is InternalInsert, a member of class TCustomClientDataSet.
	InternalLast (see page 8431)	This is InternalLast, a member of class TCustomClientDataSet.
	InternalOpen (see page 8431)	This is InternalOpen, a member of class TCustomClientDataSet.

	InternalPost (see page 8432)	This is InternalPost, a member of class TCustomClientDataSet.
	InternalRefresh (see page 8432)	This is InternalRefresh, a member of class TCustomClientDataSet.
	InternalSetOptionalParam (see page 8432)	This is InternalSetOptionalParam, a member of class TCustomClientDataSet.
	InternalSetToRecord (see page 8432)	This is InternalSetToRecord, a member of class TCustomClientDataSet.
	IsCursorOpen (see page 8432)	This is IsCursorOpen, a member of class TCustomClientDataSet.
	Loaded (see page 8433)	Initializes the component after the form file has been read into memory.
	LocateRecord (see page 8436)	This is LocateRecord, a member of class TCustomClientDataSet.
	Notification (see page 8437)	Forwards notification messages to all owned components.
	OpenCursor (see page 8438)	This is OpenCursor, a member of class TCustomClientDataSet.
	PostKeyBuffer (see page 8439)	This is PostKeyBuffer, a member of class TCustomClientDataSet.
	PSGetCommandText (see page 8439)	Gets the SQL command to be executed by PSExecute.
	PSGetCommandType (see page 8440)	Gets the command type to be executed by PSExecute.
	PSGetIndexDefs (see page 8440)	Returns the definitions of all specified indexes defined for the dataset.
	ReadDataPacket (see page 8441)	This is ReadDataPacket, a member of class TCustomClientDataSet.
	RefreshInternalCalcFields (see page 8441)	This is RefreshInternalCalcFields, a member of class TCustomClientDataSet.
	ResetAggField (see page 8442)	This is ResetAggField, a member of class TCustomClientDataSet.
	ResetCursorRange (see page 8443)	This is ResetCursorRange, a member of class TCustomClientDataSet.
	SetAggregates (see page 8445)	This is SetAggregates, a member of class TCustomClientDataSet.
	SetAppServer (see page 8446)	This is SetAppServer, a member of class TCustomClientDataSet.
	SetBookmarkData (see page 8446)	This is SetBookmarkData, a member of class TCustomClientDataSet.
	SetBookmarkFlag (see page 8446)	This is SetBookmarkFlag, a member of class TCustomClientDataSet.
	SetCommandText (see page 8447)	This is SetCommandText, a member of class TCustomClientDataSet.
	SetCursorRange (see page 8447)	This is SetCursorRange, a member of class TCustomClientDataSet.
	SetDataSetField (see page 8447)	This is SetDataSetField, a member of class TCustomClientDataSet.
	SetFieldData (see page 8447)	This is SetFieldData, a member of class TCustomClientDataSet.
	SetFilterData (see page 8448)	This is SetFilterData, a member of class TCustomClientDataSet.
	SetFiltered (see page 8448)	This is SetFiltered, a member of class TCustomClientDataSet.
	SetFilterOptions (see page 8448)	This is SetFilterOptions, a member of class TCustomClientDataSet.
	SetFilterText (see page 8448)	This is SetFilterText, a member of class TCustomClientDataSet.
	SetIndexField (see page 8448)	This is SetIndexField, a member of class TCustomClientDataSet.
	SetKeyBuffer (see page 8449)	This is SetKeyBuffer, a member of class TCustomClientDataSet.
	SetKeyExclusive (see page 8449)	This is SetKeyExclusive, a member of class TCustomClientDataSet.
	SetKeyFieldCount (see page 8450)	This is SetKeyFieldCount, a member of class TCustomClientDataSet.
	SetKeyFields (see page 8450)	This is SetKeyFields, a member of class TCustomClientDataSet.
	SetLinkRanges (see page 8450)	This is SetLinkRanges, a member of class TCustomClientDataSet.
	SetOnFilterRecord (see page 8450)	This is SetOnFilterRecord, a member of class TCustomClientDataSet.
	SetProviderEOF (see page 8452)	This is SetProviderEOF, a member of class TCustomClientDataSet.
	SetRecNo (see page 8454)	This is SetRecNo, a member of class TCustomClientDataSet.
	SetRemoteServer (see page 8454)	This is SetRemoteServer, a member of class TCustomClientDataSet.
	SwitchToIndex (see page 8455)	This is SwitchToIndex, a member of class TCustomClientDataSet.
	SyncCursors (see page 8455)	This is SyncCursors, a member of class TCustomClientDataSet.
	UpdateIndexDefs (see page 8455)	This is UpdateIndexDefs, a member of class TCustomClientDataSet.
	WriteDataPacket (see page 8456)	This is WriteDataPacket, a member of class TCustomClientDataSet.

Public Methods

	Name	Description
	AddIndex (see page 8391)	Creates a new index for the client dataset.
	AppendData (see page 8393)	Adds a newly fetched packet of records to those already stored in the client dataset.
	ApplyRange (see page 8393)	Applies a range to the dataset.
	ApplyUpdates (see page 8394)	Sends all updated, inserted, and deleted records from the client dataset to the provider for writing to the database.
	BookmarkValid (see page 8395)	Tests the validity of a specified bookmark.
	Cancel (see page 8395)	Cancels unposted changes to the current record.
	CancelRange (see page 8396)	Removes any ranges currently in effect for the client dataset.

	CancelUpdates (see page 8396)	Clears all pending edits and clears the change log.
V	CloneCursor (see page 8398)	Shares the data belonging to another client dataset.
V	CompareBookmarks (see page 8400)	Compares two bookmarks.
	ConstraintsDisabled (see page 8400)	Indicates whether constraints are enabled for a client dataset.
V	CreateBlobStream (see page 8401)	Returns a TClientBlobStream (see page 8285) object for reading or writing the data in a specified blob field.
	CreateDataSet (see page 8401)	Creates a new, empty client dataset.
V	DataRequest (see page 8404)	Generates an OnDataRequest event on the associated provider
	DeleteIndex (see page 8406)	Deletes an index for the client dataset.
	DisableConstraints (see page 8406)	Disables the enforcement of constraints.
	EditKey (see page 8410)	Enables modification of the search key buffer.
	EditRangeEnd (see page 8411)	Enables changing the ending value for an existing range.
	EditRangeStart (see page 8411)	Enables changing the starting value for an existing range.
V	EmptyDataSet (see page 8412)	Removes all records from the dataset.
	EnableConstraints (see page 8412)	Reenables enforcement of constraints when records are posted.
V	Execute (see page 8413)	Executes an SQL command by the provider's dataset.
	FetchBlobs (see page 8414)	Retrieves BLOB field values from the provider.
	FetchDetails (see page 8414)	Retrieves nested detail datasets from the provider.
	FetchParams (see page 8415)	Retrieves parameter values from the provider.
V	FindKey (see page 8416)	Searches for a record containing specified field values.
	FindNearest (see page 8416)	Moves the cursor to the record that most closely matches a specified set of key values.
V	GetCurrentRecord (see page 8419)	Retrieves the current record into a buffer.
V	GetFieldData (see page 8419)	This is the overview for the GetFieldData method overload.
	GetGroupState (see page 8420)	Indicates where the current record sits within a specified group of records.
	GetIndexInfo (see page 8421)	Retrieves information about the current index.
	GetIndexNames (see page 8422)	Retrieves a list of available indexes for a client dataset.
V	GetNextPacket (see page 8423)	Retrieves the next block of records from the provider.
	GetOptionalParam (see page 8425)	Retrieves a custom parameter from the data packet.
	GotoCurrent (see page 8427)	Sets the current record in this dataset the same as the current record in another, cloned dataset.
	GotoKey (see page 8427)	Moves the cursor to a record specified by the current key.
	GotoNearest (see page 8427)	Moves the cursor to the record that most closely matches the current key.
	LoadFromFile (see page 8433)	Loads a client dataset's data from a file.
	LoadFromStream (see page 8435)	Loads a client dataset's data from a stream.
V	Locate (see page 8435)	Searches the dataset for a specified record and makes that record current.
V	Lookup (see page 8436)	Retrieves field values from a record that matches specified search values.
	MergeChangeLog (see page 8437)	Merges any data changes in the change log into the client dataset, overwriting existing values.
V	Post (see page 8438)	Writes a modified record to the Data (see page 8467) property or the change log.
	Reconcile (see page 8441)	Clears successfully updated records from the client dataset's cache of changes.
	RefreshRecord (see page 8442)	Updates the base values of the current record to match the current values of the provider's dataset.
	RevertRecord (see page 8443)	Undoes edits to the current record.
	SaveToFile (see page 8443)	Saves a client dataset's data to an external file.
	SaveToStream (see page 8445)	Saves a client dataset's data to a stream.
	SetAltRecBuffers (see page 8446)	Sets record buffers when accessing field values.
	SetKey (see page 8449)	Enables setting of keys and ranges for a dataset prior to a search.
V	SetOptionalParam (see page 8450)	Saves a custom parameter with the data packet.
	SetProvider (see page 8451)	Associates the client dataset with a provider in the same process space.
	SetRange (see page 8452)	Sets the starting and ending values of a range, and applies it.
	SetRangeEnd (see page 8453)	Indicates that subsequent assignments to field values specify the end of the range of rows to include in the dataset.
	SetRangeStart (see page 8454)	Indicates that subsequent assignments to field values specify the start of the range of rows to include in the dataset.
	UndoLastChange (see page 8455)	Undoes the last edit, insert, or delete operation to a record in the client dataset.

	UpdateStatus (see page 8456)	Reports the update status for the current record in the dataset.

45.1.8.4.1 TCustomClientDataSet.ActivateFilters Method

Pascal

```
procedure ActivateFilters;
```

C++

```
__fastcall ActivateFilters();
```

Description

This is ActivateFilters, a member of class TCustomClientDataSet.

45.1.8.4.2 TCustomClientDataSet.AddDataPacket Method

Pascal

```
procedure AddDataPacket(const Data: OleVariant; HitEOF: Boolean); virtual;
```

C++

```
virtual __fastcall AddDataPacket(const OleVariant Data, Boolean HitEOF);
```

Description

This is AddDataPacket, a member of class TCustomClientDataSet.

45.1.8.4.3 TCustomClientDataSet.AddFieldDesc Method

Pascal

```
procedure AddFieldDesc(FieldDescs: TFieldDescList; var DescNo: Integer; var FieldID: Integer;
FieldDefs: TFieldDefs);
```

C++

```
__fastcall AddFieldDesc(TFieldDescList FieldDescs, int DescNo, int FieldID, TFieldDefs
FieldDefs);
```

Description

This is AddFieldDesc, a member of class TCustomClientDataSet.

45.1.8.4.4 TCustomClientDataSet.AddIndex Method

Creates a new index for the client dataset.

Pascal

```
procedure AddIndex(const Name: string; const Fields: string; Options: TIndexOptions; const
DescFields: string = ''; const CaseInsFields: string = ''; const GroupingLevel: Integer = 0);
```

C++

```
__fastcall AddIndex(const AnsiString Name, const AnsiString Fields, TIndexOptions Options,
const AnsiString DescFields = '', const AnsiString CaseInsFields = '', const int GroupingLevel
= 0);
```

Description

Call AddIndex to create a new index for the client dataset.

Name is the name of the new index.

Fields is a semicolon-delimited list of the fields to include in the index.

Options is a (potentially empty) set that can include up to two TIndexOptions values. The valid members for that set include ixDescending (specifying that the index sorts in descending alphanumeric order) and ixCaseInsensitive (specifying that the index should ignore case when sorting).

Warning: AddIndex raises an exception if you attempt to create an index that includes any other TIndexOptions values .

DescFields is a semicolon-delimited list of field names. Use DescFields instead of an Options value that includes ixDescending to create an index that is in ascending order on some fields and descending order on others. All fields named in DescFields are sorted in descending order.

CaseInsFields is a semicolon-delimited list of field names. Use CaseInsFields instead of an Options value that includes ixCaseInsensitive to create an index that is case-insensitive on some fields and case-sensitive on others. All fields named in CaseInsFields are sorted without regard to case.

GroupingLevel (see page 8479) is the default grouping level supported by the index. When the client dataset uses this index, grouping information is automatically available for subgroups defined by up to GroupingLevel (see page 8479) fields in the index. (If the client dataset uses maintained aggregates, information about more deeply nested groups can become available when the aggregates are defined on a grouping level greater than the default value of the index). GroupingLevel (see page 8479) can be any value from 0 to the number of fields in the index.

Note: Indexes added by AddIndex are not saved with data when using SaveToFile (see page 8443). They do not persist when the client dataset is closed. (That is, they are lost when you reopen the client dataset). You can't call AddIndex when the dataset is closed.

Tip: You can support maintained aggregates using an index added with AddIndex.

See Also

DeleteIndex (see page 8406)

IndexDefs (see page 8480)

IndexName (see page 8483)

GroupingLevel (see page 7291)

GroupingLevel (see page 8479)

Adding a New Index

45.1.8.4.5 TCustomClientDataSet.AllocKeyBuffers Method

Pascal

```
procedure AllocKeyBuffers;
```

C++

```
__fastcall AllocKeyBuffers();
```

Description

This is AllocKeyBuffers, a member of class TCustomClientDataSet.

45.1.8.4.6 TCustomClientDataSet.AllocRecordBuffer Method

Pascal

```
function AllocRecordBuffer: PChar; override;
```

C++

```
virtual __fastcall const char * AllocRecordBuffer();
```

Description

This is AllocRecordBuffer, a member of class TCustomClientDataSet.

45.1.8.4.7 TCustomClientDataSet.AppendData Method

Adds a newly fetched packet of records to those already stored in the client dataset.

Pascal

```
procedure AppendData(const Data: OleVariant; HitEOF: Boolean);
```

C++

```
__fastcall AppendData(const OleVariant Data, Boolean HitEOF);
```

Description

Use AppendData to add a newly fetched packet of records from a provider to the client dataset. Data (see page 8467) indicates the packet of records to add. HitEOF indicates whether the provider encountered the end of the dataset when it fetched the records from the database server.

Most applications call GetNextPacket (see page 8423) instead to fetch a packet of records and automatically add them to those already available. Use AppendData when fetching data packets directly from the provider rather than letting the client dataset fetch data.

See Also

GetNextPacket (see page 8423)

TDataSetProvider (see page 18508)

45.1.8.4.8 TCustomClientDataSet.ApplyRange Method

Applies a range to the dataset.

Pascal

```
procedure ApplyRange;
```

C++

```
__fastcall ApplyRange();
```

Description

Call ApplyRange to cause a range established with SetRangeStart (see page 8454) and SetRangeEnd (see page 8453), or EditRangeStart (see page 8411) and EditRangeEnd (see page 8411), to take effect. When a range is in effect, only those records that fall within the range are available to the application for viewing and editing.

After a call to ApplyRange, the cursor is left on the first record in the range.

See Also

CancelRange (see page 8396)

EditRangeEnd (see page 8411)

EditRangeStart (see page 8411)

SetRange (see page 8452)

SetRangeEnd (see page 8453)

SetRangeStart (see page 8454)

Applying or Canceling a Range

Modifying a Range

45.1.8.4.9 TCustomClientDataSet.ApplyUpdates Method

Sends all updated, inserted, and deleted records from the client dataset to the provider for writing to the database.

Pascal

```
function ApplyUpdates(MaxErrors: Integer): Integer; virtual;
```

C++

```
virtual __fastcall int ApplyUpdates(int MaxErrors);
```

Description

Call ApplyUpdates to write all updated, inserted, and deleted records from the client dataset to the database or source dataset. MaxErrors indicates the maximum number of errors that the provider should allow before prematurely stopping the update operation. Set MaxErrors to –1 to indicate that there is no limit to the number of errors.

ApplyUpdates

1.Generates a BeforeApplyUpdates (see page 8511) event. (This event may not be public on some TCustomClientDataSet (see page 8373) descendants.)

2.Calls the provider to apply the updates in the Delta (see page 8470) property and receives any records returned by the provider because they generated errors when it attempted to apply them to the database.

3.Generates an AfterApplyUpdates (see page 8497) event. (This event may not be public on some TCustomClientDataSet (see page 8373) descendants.)

4.Calls the client dataset's Reconcile (see page 8441) method to reconcile any records that are returned in step 2.

Warning: The provider can't detect when an update conflicts with another user's changes to a memo field. The server will not detect and return these conflicts as errors.

ApplyUpdates returns the number of errors it encountered. Based on this return value and the setting of MaxErrors, successfully applied records are removed from the client dataset's change log. If the update process is aborted before all updates are applied, any unapplied updates remain in the change log.

Delphi Examples:

```
{
This BeforeDisconnect event handler makes sure that the
client dataset has applied all its pending updates before
terminating the connection to the server.
}
procedure TForm1.RemoteServer1BeforeDisconnect(Sender: TObject);
begin
  if (ClientDataSet1.ChangeCount > 0) then
    ClientDataSet1.ApplyUpdates(-1);
end;
```

See Also

Reconcile (see page 8441)

Using the BDE to Cache Updates

Connecting a Client Dataset to Another Dataset in the Same Application

Communicating with the Client Dataset

Updating Data in dbExpress Applications

45.1.8.4.10 TCustomClientDataSet.BookmarkValid Method

Tests the validity of a specified bookmark.

Pascal

```
function BookmarkValid(Bookmark: TBookmark): Boolean; override;
```

C++

```
virtual __fastcall Boolean BookmarkValid(TBookmark Bookmark);
```

Description

Call BookmarkValid to determine if a bookmark is valid. Bookmark is the bookmark pointer to test. If the bookmark is valid, BookmarkValid returns true. Otherwise it returns false.

See Also

CompareBookmarks (see page 8400)

45.1.8.4.11 TCustomClientDataSet.Cancel Method

Cancels unposted changes to the current record.

Pascal

```
procedure Cancel; override;
```

C++

```
virtual __fastcall Cancel();
```

Description

Call Cancel to undo modifications made to one or more fields belonging to the current record. As long as those changes are not already posted to the change log, Cancel returns the record to its previous state, and sets the dataset state to dsBrowse.

Note: Do not confuse Cancel with the RevertRecord (see page 8443) method, which also backs out changes to the current record. Cancel backs out unposted changes while RevertRecord (see page 8443) removes changes that have already been posted to the change log.

See Also

Post (see page 8438)

State (see page 7036)

CancelUpdates (see page 8396)

RevertRecord (see page 8443)

UndoLastChange (see page 8455)

LogChanges (see page 8485)

45.1.8.4.12 TCustomClientDataSet.CancelRange Method

Removes any ranges currently in effect for the client dataset.

Pascal

```
procedure CancelRange;
```

C++

```
__fastcall CancelRange();
```

Description

Call CancelRange to remove a range currently applied to a client dataset. Canceling a range reenables access to all records in the dataset.

See Also

ApplyRange (see page 8393)

EditRangeEnd (see page 8411)

EditRangeStart (see page 8411)

SetRange (see page 8452)

SetRangeEnd (see page 8453)

SetRangeStart (see page 8454)

Applying or Canceling a Range

45.1.8.4.13 TCustomClientDataSet.CancelUpdates Method

Clears all pending edits and clears the change log.

Pascal

```
procedure CancelUpdates;
```

C++

```
__fastcall CancelUpdates();
```

Description

Call CancelUpdates to back out all pending updates from the Delta (see page 8470) property. Delta (see page 8470) is a Variant maintained by the client dataset to record updates, inserts, and deletes.

See Also

ApplyUpdates (see page 8394)

Delta (see page 8470)

RevertRecord (see page 8443)

UndoLastChange (see page 8455)

45.1.8.4.14 TCustomClientDataSet.Check Method

Pascal

```
procedure Check(Status: DBResult);
```

C++

```
__fastcall Check(DBResult Status);
```

Description

This is Check, a member of class TCustomClientDataSet.

45.1.8.4.15 TCustomClientDataSet.CheckDetailRecords Method

Pascal

```
procedure CheckDetailRecords; virtual;
```

C++

```
virtual __fastcall CheckDetailRecords();
```

Description

This is CheckDetailRecords, a member of class TCustomClientDataSet.

45.1.8.4.16 TCustomClientDataSet.CheckProviderEOF Method

Pascal

```
procedure CheckProviderEOF; virtual;
```

C++

```
virtual __fastcall CheckProviderEOF();
```

Description

This is CheckProviderEOF, a member of class TCustomClientDataSet.

45.1.8.4.17 TCustomClientDataSet.CheckSetKeyMode Method

Pascal

```
procedure CheckSetKeyMode;
```

C++

```
__fastcall CheckSetKeyMode();
```

Description

This is CheckSetKeyMode, a member of class TCustomClientDataSet.

45.1.8.4.18 TCustomClientDataSet.ClearCalcFields Method

Pascal

```
procedure ClearCalcFields(Buffer: PChar); override;
```

C++

```
virtual __fastcall ClearCalcFields(const char * Buffer);
```

Description

This is ClearCalcFields, a member of class TCustomClientDataSet.

45.1.8.4.19 TCustomClientDataSet.CloneCursor Method

Shares the data belonging to another client dataset.

Pascal

```
procedure CloneCursor(Source: TCustomClientDataSet; Reset: Boolean; KeepSettings: Boolean =
False); virtual;
```

C++

```
virtual __fastcall CloneCursor(TCustomClientDataSet Source, Boolean Reset, Boolean
KeepSettings = False);
```

Description

Call CloneCursor to share the data belonging to another client dataset. Source indicates another client dataset whose data is to be shared.

Reset and KeepSettings determine how to set the values of the following properties and events:

Filter (see page 8476), Filtered (see page 8478), FilterOptions (see page 8478), and OnFilterRecord (see page 8523)

IndexName (see page 8483)

MasterSource (see page 8486) and MasterFields (see page 8486)

ReadOnly (see page 8493)

RemoteServer (see page 8493) and ProviderName (see page 8492)

If Reset and KeepSettings are both false, the values of the properties listed above are all set to match the source dataset.

If Reset is true, the properties listed above are all cleared.

If Reset is false and KeepSettings is true, the properties listed above are not changed. In this case, the application must ensure that existing indexes, providers, and so on are compatible with the cloned data.

After calling CloneCursor, the data for the client dataset is the same as the data for Source. Edits performed by either client dataset are reflected in the data of both datasets.

Note: Because cloned cursors are shared, changing properties that affect the cursor affect both datasets. For example, setting the ReadOnly (see page 8493) property of either dataset will make both datasets read-only.

Delphi Examples:

```
{
This example shows how to use the BeforeGetRecords event
handler (a TRemoteEventType value) to send the provider
information it needs for incremental data fetching. Before
fetching the next data packet, the client dataset packages
up the key value of the last record so that the provider
knows where to begin the next data packet. It also sends
some application-specific information, which is stored in
Memo1.  This method is used to pass the sql statement and the
value of the first field for the last record to the server so
that the server can return the correct records. The complete
project using this code example is in
Demos/DelphiWin32/VCLWin32/MIDAS/Pooler.
}
procedure TForm1.ClientDataSet1BeforeGetRecords(Sender: TObject; var OwnerData: OleVariant);
var
  LastValue: OleVariant;
  CDSClone: TClientDataSet;
begin
  if ClientDataSet1.Active then
  begin
    CDSClone := TClientDataSet.Create(Form1);
    try
      CDSClone.CloneCursor(ClientDataSet1, True);
      { turn off FetchOnDemand so that the clone only fetches
        the last LOCAL record }
      CDSClone.FetchOnDemand := False;
      CDSClone.Last;
      LastValue := CDSClone.Fields[0].AsString;
      CDSClone.Close;
    finally
      CDSClone.Free;
    end;
  end else
    LastValue := NULL;
  OwnerData := VarArrayOf([Memo1.Lines.Text, LastValue]);
end;

procedure TForm1.Button2Click(Sender: TObject);
begin
  ClientDataSet1.PacketRecords := StrToInt(Edit1.Text);
  ClientDataSet1.GetNextPacket;
end;
```

45.1.8.4.20 TCustomClientDataSet.CloseCursor Method

Pascal

```
procedure CloseCursor; override;
```

C++

```
virtual __fastcall CloseCursor();
```

Description

This is CloseCursor, a member of class TCustomClientDataSet.

45.1.8.4.21 TCustomClientDataSet.CompareBookmarks Method

Compares two bookmarks.

Pascal

```
function CompareBookmarks(Bookmark1: TBookmark; Bookmark2: TBookmark): Integer; override;
```

C++

```
virtual __fastcall int CompareBookmarks(TBookmark Bookmark1, TBookmark Bookmark2);
```

Description

Call CompareBookmarks to determine if two bookmarks are identical. Bookmark1 and Bookmark2 are the bookmarks to compare. CompareBookmarks returns -1 if Bookmark1 is less than Bookmark2, 1 if Bookmark1 is greater than Bookmark2, and 0 if the bookmarks are identical or nil (Delphi) or NULL (C++).

See Also

BookmarkValid (see page 8395)

45.1.8.4.22 TCustomClientDataSet.ConstraintsDisabled Method

Indicates whether constraints are enabled for a client dataset.

Pascal

```
function ConstraintsDisabled: Boolean;
```

C++

```
__fastcall Boolean ConstraintsDisabled();
```

Description

Call ConstraintsDisabled to determine if constraints are currently disabled for a client dataset. If ConstraintsDisabled returns true, constraints are not enforced when edits are posted. If false, constraints are enforced when records are posted.

See Also

DisableConstraints (see page 8406)

EnableConstraints (see page 8412)

CustomConstraint (see page 7156)

ImportedConstraint (see page 7167)

Constraints (see page 7013)

45.1.8.4.23 TCustomClientDataSet.ConstraintsStored Method

Pascal

```
function ConstraintsStored: Boolean;
```

C++

```
__fastcall Boolean ConstraintsStored();
```

Description

This is ConstraintsStored, a member of class TCustomClientDataSet.

45.1.8.4.24 TCustomClientDataSet.CreateBlobStream Method

Returns a TClientBlobStream (see page 8285) object for reading or writing the data in a specified blob field.

Pascal

```
function CreateBlobStream(Field: TField; Mode: TBlobStreamMode): TStream; override;
```

C++

```
virtual __fastcall TStream CreateBlobStream(TField Field, TBlobStreamMode Mode);
```

Description

Call CreateBlobStream to obtain a stream for reading data from or writing data to a binary large object (BLOB) field. The Field parameter must specify a TBlobField component from the Fields property array. The Mode parameter specifies whether the stream will be used for reading, writing, or updating the contents of the field.

Note: Calling CreateBlobStream ensures that the current record has fetched its BLOB data if the FetchOnDemand (see page 8471) property is true. If FetchOnDemand (see page 8471) is false and the provider does not include BLOB data in data packets by default, call FetchBlobs (see page 8414) before calling CreateBlobStream.

See Also

Fields (see page 7023)

TClientBlobStream (see page 8285)

FetchBlobs (see page 8414)

FetchOnDemand (see page 8471)

45.1.8.4.25 TCustomClientDataSet.CreateDataSet Method

Creates a new, empty client dataset.

Pascal

```
procedure CreateDataSet;
```

C++

```
__fastcall CreateDataSet();
```

Description

Call CreateDataSet at runtime to create a new, empty client dataset that can then be edited and saved.

If the FieldDefs (see page 8472) property contains values, these values are used to create field definitions. Otherwise the Fields property is used. One or both of these properties must contain values in order to create a dataset. If neither property is set, CreateDataSet raises an exception.

If the IndexDefs (see page 8480) property contains values, these values are used to create indexes for the dataset. Indexes created from the IndexDefs (see page 8480) property are saved with the client dataset when it is saved to a file.

Note: You can create a dataset at design time as well: Create (see page 8386) persistent field components or field definitions. Then right-click the client dataset and select Create (see page 8386) Data (see page 8467) Set.

C++ Examples:

```
/*
The following code creates and activates a client dataset in
the form's OnCreate event handler.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  TFieldDefs *pDefs = CDS2->FieldDefs;
  TFieldDef *pDef = pDefs->AddFieldDef();
  pDef->DataType = ftInteger;
  pDef->Name = "Field1";

  pDef = pDefs->AddFieldDef();
  pDef->DataType = ftString;
  pDef->Size = 10;
  pDef->Name = "Field2";

  TIndexDef *pIDef = CDS2->IndexDefs->AddIndexDef();
  pIDef->Fields = "Field1";
  pIDef->Name = "IntIndex";

  CDS2->CreateDataSet();
}
```

Delphi Examples:

```
{
This example requires two ClientDataSets, two DBGrids, two
DataSources and two DBNavigators.  Name the two
ClientDataSets CDS and CDS2. Set the DataSet property in the
first DataSource to CDS and name that DataSource DS.  Set the
DataSet property in the second DataSource to CDS2 and name
that DataSource DS2.  Set the DataSource in the first
DBNavigator to DS and the DataSource in the second DBNavigator
to DS2.  Set the DataSource in the first DBGrid to DS and the
DataSource in the second DBGrid to DS2.  Right click on CDS
and select the Fields Editor, then right click on the Field
Editor form and create two fields by selecting "new field".
In the field configuration window, set the name to HOST, the
Component value will automatically be set to CDSHOST.  Set
the filed type to String.  In the field configuration window
for the second field, set the name to PORTA, the Component
value will automatically be set to CDSPORTA.  Set the field
type to Integer.  The file used to load CDS must have an
attribute name of HOST with an attribute type of string and
an attribute name of PORTA with an attribute type of integer.
Add DB, DBCtrls, Grids, DBGrids, DBClient and SwSystem to the
uses clause.  "LoadFormFile" to start with the file, or
"CreateDataSet" to start from scratch.  You must "CloseDataSet"
after a "LoadFromFile" before you can do another "CreateDataSet".
}
{$IFNDEF UNICODE}
uses SwSystem;
```

```
{$ENDIF}

procedure TForm1.Button1Click(Sender: TObject);
begin
{$IFDEF UNICODE}
  CDS.LoadFromFile(GetCurrentDir + '\CDS.XML');
{$ELSE}
  CDS.LoadFromFile(gsAppPath + 'CDS.XML');
{$ENDIF}
end;

procedure TForm1.Button2Click(Sender: TObject);
begin
{$IFDEF UNICODE}
  CDS.SaveToFile(GetCurrentDir + '\CDS.XML', dfXML);
{$ELSE}
  CDS.SaveToFile(gsAppPath + 'CDS.XML', dfXML);
{$ENDIF}
end;

procedure TForm1.Button3Click(Sender: TObject);
begin
  CDS.CreateDataSet;
end;

procedure TForm1.Button4Click(Sender: TObject);
begin
  CDS2.Data := CDS.Data;
end;

procedure TForm1.Button5Click(Sender: TObject);
begin
  CDS.Close;
end;
{
The following code creates and activates a client dataset in
the form’s OnCreate event handler.
}
procedure TForm1.FormCreate(Sender: TObject);
begin
  with CDS2 do
  begin
    with FieldDefs.AddFieldDef do
    begin
      DataType := ftInteger;
      Name := 'Field1';
    end;
    with FieldDefs.AddFieldDef do
    begin
      DataType := ftString;
      Size := 10;
      Name := 'Field2';
    end;
    with IndexDefs.AddIndexDef do
    begin
      Fields := 'Field1';
      Name := 'IntIndex';
    end;
    CreateDataSet;
  end;
end;
```

45.1.8.4.26 TCustomClientDataSet.DataConvert Method

Pascal

```
procedure DataConvert(Field: TField; Source: Pointer; Dest: Pointer; ToNative: Boolean);
override;
```

C++

```
virtual __fastcall DataConvert(TField Field, void * Source, void * Dest, Boolean ToNative);
```

Description

This is DataConvert, a member of class TCustomClientDataSet.

45.1.8.4.27 TCustomClientDataSet.DataEvent Method

Pascal

```
procedure DataEvent(Event: TDataEvent; Info: Longint); override;
```

C++

```
virtual __fastcall DataEvent(TDataEvent Event, Longint Info);
```

Description

This is DataEvent, a member of class TCustomClientDataSet.

45.1.8.4.28 TCustomClientDataSet.DataRequest Method

Generates an OnDataRequest event on the associated provider

Pascal

```
function DataRequest(Data: OleVariant): OleVariant; virtual;
```

C++

```
virtual __fastcall OleVariant DataRequest(OleVariant Data);
```

Description

Call DataRequest to invoke an OnDataRequest event handler. This method is provided to allow application developers to customize the communication between a client application and an external provider component.

There is no predefined meaning for the Input parameter or the returned value. Instead, the Data (see page 8467) parameter provides the input parameter to an OnDataRequest event handler and DataRequest returns the value that that event handler returns.

Responding to Client-generated Events

45.1.8.4.29 TCustomClientDataSet.DeactivateFilters Method

Pascal

```
procedure DeactivateFilters;
```

C++

```
__fastcall DeactivateFilters();
```

Description

This is DeactivateFilters, a member of class TCustomClientDataSet.

45.1.8.4.30 TCustomClientDataSet.DefChanged Method

Pascal

```
procedure DefChanged(Sender: TObject); override;
```

C++

```
virtual __fastcall DefChanged(TObject * Sender);
```

Description

This is DefChanged, a member of class TCustomClientDataSet.

45.1.8.4.31 TCustomClientDataSet.DefineProperties Method

Designates methods for storing an object's unpublished data on a stream such as a form file.

Pascal

```
procedure DefineProperties(Filer: TFiler); override;
```

C++

```
virtual __fastcall DefineProperties(TFiler Filer);
```

Description

TComponent overrides the DefineProperties method defined in TPersistent to define "fake" Top and Left properties. These are defined so that components that are not controls can be manipulated at design-time. However, the Top and Left properties are hidden, that is, they are not published, because only controls appear at run-time.

DefineProperties is virtual; descendant classes can override it. When overriding DefineProperties, be aware that the Ancestor property of Filer might be set, and that this property can determine whether or not it is appropriate to write properties.

DefineProperties is called automatically as part of the component streaming system; do not call it directly.

See Also

Ancestor (see page 2839)

DefineProperties (see page 2931)

DefineProperty (see page 2838)

45.1.8.4.32 TCustomClientDataSet.DeleteIndex Method

Deletes an index for the client dataset.

Pascal

```
procedure DeleteIndex(const Name: string);
```

C++

```
__fastcall DeleteIndex(const AnsiString Name);
```

Description

Call DeleteIndex to remove an index for a client dataset. Name is the name of the index to delete.

Note: You cannot delete the reserved indexes, DEFAULT_ORDER and CHANGEINDEX.

See Also

AddIndex (see page 8391)

IndexDefs (see page 8480)

Deleting and Switching Indexes

45.1.8.4.33 TCustomClientDataSet.DestroyLookupCursor Method

Pascal

```
procedure DestroyLookupCursor; virtual;
```

C++

```
virtual __fastcall DestroyLookupCursor();
```

Description

This is DestroyLookupCursor, a member of class TCustomClientDataSet.

45.1.8.4.34 TCustomClientDataSet.DisableConstraints Method

Disables the enforcement of constraints.

Pascal

```
procedure DisableConstraints;
```

C++

```
__fastcall DisableConstraints();
```

Description

Call DisableConstraints to prevent, on a temporary basis, enforcement of constraints that have been assigned to the dataset or its fields. For example, when an application iterates through a client dataset, it may improve performance to disable constraints temporarily.

Note: Calling DisableConstraints increments a reference count. As long as this reference count is greater than zero, constraints are disabled for the dataset. To prevent accidental disabling of constraints, always group a call to DisableConstraints with a call to EnableConstraints (see page 8412).

See Also

45.1.8.4.35 TCustomClientDataSet.DoAfterApplyUpdates Method

Pascal

```
procedure DoAfterApplyUpdates(var OwnerData: OleVariant); virtual;
```

C++

```
virtual __fastcall DoAfterApplyUpdates(OleVariant OwnerData);
```

Description

This is DoAfterApplyUpdates, a member of class TCustomClientDataSet.

45.1.8.4.36 TCustomClientDataSet.DoAfterExecute Method

Pascal

```
procedure DoAfterExecute(var OwnerData: OleVariant); virtual;
```

C++

```
virtual __fastcall DoAfterExecute(OleVariant OwnerData);
```

Description

This is DoAfterExecute, a member of class TCustomClientDataSet.

45.1.8.4.37 TCustomClientDataSet.DoAfterGetParams Method

Pascal

```
procedure DoAfterGetParams(var OwnerData: OleVariant); virtual;
```

C++

```
virtual __fastcall DoAfterGetParams(OleVariant OwnerData);
```

Description

This is DoAfterGetParams, a member of class TCustomClientDataSet.

45.1.8.4.38 TCustomClientDataSet.DoAfterGetRecords Method

Pascal

```
procedure DoAfterGetRecords(var OwnerData: OleVariant); virtual;
```

C++

```
virtual __fastcall DoAfterGetRecords(OleVariant OwnerData);
```

Description

This is DoAfterGetRecords, a member of class TCustomClientDataSet.

45.1.8.4.39 TCustomClientDataSet.DoAfterRowRequest Method

Pascal

```
procedure DoAfterRowRequest(var OwnerData: OleVariant); virtual;
```

C++

```
virtual __fastcall DoAfterRowRequest(OleVariant OwnerData);
```

Description

This is DoAfterRowRequest, a member of class TCustomClientDataSet.

45.1.8.4.40 TCustomClientDataSet.DoApplyUpdates Method

Pascal

```
function DoApplyUpdates(Delta: OleVariant; MaxErrors: Integer; out ErrorCount: Integer):
OleVariant; virtual;
```

C++

```
virtual __fastcall OleVariant DoApplyUpdates(OleVariant Delta, int MaxErrors, int ErrorCount);
```

Description

This is DoApplyUpdates, a member of class TCustomClientDataSet.

45.1.8.4.41 TCustomClientDataSet.DoBeforeApplyUpdates Method

Pascal

```
procedure DoBeforeApplyUpdates(var OwnerData: OleVariant); virtual;
```

C++

```
virtual __fastcall DoBeforeApplyUpdates(OleVariant OwnerData);
```

Description

This is DoBeforeApplyUpdates, a member of class TCustomClientDataSet.

45.1.8.4.42 TCustomClientDataSet.DoBeforeExecute Method

Pascal

```
procedure DoBeforeExecute(var OwnerData: OleVariant); virtual;
```

C++

```
virtual __fastcall DoBeforeExecute(OleVariant OwnerData);
```

Description

This is DoBeforeExecute, a member of class TCustomClientDataSet.

45.1.8.4.43 TCustomClientDataSet.DoBeforeGetParams Method

Pascal

```
procedure DoBeforeGetParams(var OwnerData: OleVariant); virtual;
```

C++

```
virtual __fastcall DoBeforeGetParams(OleVariant OwnerData);
```

Description

This is DoBeforeGetParams, a member of class TCustomClientDataSet.

45.1.8.4.44 TCustomClientDataSet.DoBeforeGetRecords Method

Pascal

```
procedure DoBeforeGetRecords(var OwnerData: OleVariant); virtual;
```

C++

```
virtual __fastcall DoBeforeGetRecords(OleVariant OwnerData);
```

Description

This is DoBeforeGetRecords, a member of class TCustomClientDataSet.

45.1.8.4.45 TCustomClientDataSet.DoBeforeInsert Method

Pascal

```
procedure DoBeforeInsert; override;
```

C++

```
virtual __fastcall DoBeforeInsert();
```

Description

This is DoBeforeInsert, a member of class TCustomClientDataSet.

45.1.8.4.46 TCustomClientDataSet.DoBeforeRowRequest Method

Pascal

```
procedure DoBeforeRowRequest(var OwnerData: OleVariant); virtual;
```

C++

```
virtual __fastcall DoBeforeRowRequest(OleVariant OwnerData);
```

Description

This is DoBeforeRowRequest, a member of class TCustomClientDataSet.

45.1.8.4.47 TCustomClientDataSet.DoExecute Method

Pascal

```
procedure DoExecute(Params: OleVariant); virtual;
```

C++

```
virtual __fastcall DoExecute(OleVariant Params);
```

Description

This is DoExecute, a member of class TCustomClientDataSet.

45.1.8.4.48 TCustomClientDataSet.DoGetRecords Method

Pascal

```
function DoGetRecords(Count: Integer; out RecsOut: Integer; Options: Integer; const
CommandText: WideString; Params: OleVariant): OleVariant; virtual;
```

C++

```
virtual __fastcall OleVariant DoGetRecords(int Count, int RecsOut, int Options, const BSTR
CommandText, OleVariant Params);
```

Description

This is DoGetRecords, a member of class TCustomClientDataSet.

45.1.8.4.49 TCustomClientDataSet.DoOnNewRecord Method

Pascal

```
procedure DoOnNewRecord; override;
```

C++

```
virtual __fastcall DoOnNewRecord();
```

Description

This is DoOnNewRecord, a member of class TCustomClientDataSet.

45.1.8.4.50 TCustomClientDataSet.DoRowRequest Method

Pascal

```
function DoRowRequest(Row: OleVariant; RequestType: Integer): OleVariant; virtual;
```

C++

```
virtual __fastcall OleVariant DoRowRequest(OleVariant Row, int RequestType);
```

Description

This is DoRowRequest, a member of class TCustomClientDataSet.

45.1.8.4.51 TCustomClientDataSet.EditKey Method

Enables modification of the search key buffer.

Pascal

```
procedure EditKey;
```

C++

```
__fastcall EditKey();
```

Description

Call EditKey to put the client dataset in dsSetKey state while preserving the current contents of the current search key buffer. To determine current search keys, you can use the IndexFields (see page 8482) property to iterate over the fields used by the current index.

EditKey is especially useful when performing multiple searches where only one or two field values among many change between each search.

GotoNearest (see page 8427)

SetKey (see page 8449)

State (see page 7036)

45.1.8.4.52 TCustomClientDataSet.EditRangeEnd Method

Enables changing the ending value for an existing range.

Pascal

```
procedure EditRangeEnd;
```

C++

```
__fastcall EditRangeEnd();
```

Description

Call EditRangeEnd to change the ending value for an existing range. To specify an end range value, call FieldByName after calling EditRangeEnd. After assigning a new ending value, call ApplyRange (see page 8393) to activate the modified range.

See Also

ApplyRange (see page 8393)

CancelRange (see page 8396)

EditRangeStart (see page 8411)

FieldByName (see page 6936)

IndexFieldNames (see page 8482)

KeyExclusive (see page 8484)

SetRange (see page 8452)

SetRangeEnd (see page 8453)

SetRangeStart (see page 8454)

Modifying a Range

45.1.8.4.53 TCustomClientDataSet.EditRangeStart Method

Enables changing the starting value for an existing range.

Pascal

```
procedure EditRangeStart;
```

C++

```
__fastcall EditRangeStart();
```

Description

Call EditRangeStart to change the starting value for an existing range. To specify a start range value, call FieldByName after calling EditRangeStart. After assigning a new ending value, call ApplyRange (see page 8393) to activate the modified range.

See Also

ApplyRange (see page 8393)

CancelRange (see page 8396)

EditRangeEnd (see page 8411)

FieldByName (see page 6936)

SetRange (see page 8452)

SetRangeEnd (see page 8453)

SetRangeStart (see page 8454)

Modifying a Range

45.1.8.4.54 TCustomClientDataSet.EmptyDataSet Method

Removes all records from the dataset.

Pascal

```
procedure EmptyDataSet; virtual;
```

C++

```
virtual __fastcall EmptyDataSet();
```

Description

Call EmptyDataSet to empty the client dataset.

See Also

Data (see page 8467)

45.1.8.4.55 TCustomClientDataSet.EnableConstraints Method

Reenables enforcement of constraints when records are posted.

Pascal

```
procedure EnableConstraints;
```

C++

```
__fastcall EnableConstraints();
```

Description

Call EnableConstraints to turn on constraints previously disabled by a call to DisableConstraints (see page 8406).

Note: Calling EnableConstraints decrements a reference count. When this reference count is zero constraints are enabled for the dataset. To prevent accidental disabling of constraints, always follow a call to DisableConstraints (see page 8406) with a matching call to EnableConstraints.

See Also

DisableConstraints (see page 8406)

ConstraintsDisabled (see page 8400)

Constraints (see page 7013)

ImportedConstraint (see page 7167)

CustomConstraint (see page 7156)

Handling Constraints from the Server

45.1.8.4.56 TCustomClientDataSet.Execute Method

Executes an SQL command by the provider's dataset.

Pascal

```
procedure Execute; virtual;
```

C++

```
virtual __fastcall Execute();
```

Description

Execute allows the client dataset to interact with a query or stored procedure that does not generate a result set. Call Execute to execute the command specified by CommandText (see page 8465) or the provider's query or stored procedure. If CommandText (see page 8465) is not an empty string and the provider Options allow clients to supply a CommandText (see page 8465) value, then Execute passes CommandText (see page 8465) to the provider along with the Params (see page 8489) property (to supply parameters for the statement). Otherwise, Execute tells the provider to apply any Params (see page 8489) and execute its associated query or stored procedure. After executing the appropriate statement, the provider returns any output parameters and Execute updates the Params (see page 8489) property to reflect them.

When the application calls Execute, the client dataset receives a BeforeExecute (see page 8514) event before the request is passed to the provider component. After the provider executes the query or stored procedure, it returns any output parameters, which are used to update the Params (see page 8489) property. Finally, the client dataset receives an AfterExecute (see page 8504) event.

Note: Do not use Execute to execute a query or stored procedure that returns a cursor. Most datasets use separate commands to execute queries or stored procedures when they do or don't return data. When a provider passes the Execute command on to its dataset, the dataset uses the command for executing queries or stored procedures that don't return a cursor.

See Also

ExecSQL (see page 10075)

ExecProc (see page 10156)

BeforeExecute (see page 8514)

AfterExecute (see page 8504)

Params (see page 8489)

CommandText (see page 8465)

Getting Parameters from the Application Server

Overriding the Dataset On the Application Server

Sending Query or Stored Procedure Parameters

Communicating with the Client Dataset

45.1.8.4.57 TCustomClientDataSet.FetchBlobs Method

Retrieves BLOB field values from the provider.

Pascal

```
procedure FetchBlobs;
```

C++

```
__fastcall FetchBlobs();
```

Description

Call FetchBlobs to retrieve BLOB field values from a provider when this information is not provided automatically. BLOB field values are automatically included in data packets unless the provider includes poFetchBlobsOnDemand in its Options property. (If the client dataset uses an internal provider, that provider's Options property is available as the client dataset's Options property)

There is no need to call FetchBlobs if the provider automatically includes BLOB data or if the client dataset's FetchOnDemand (see page 8471) property is true.

See Also

RowRequest (see page 18472)

FetchOnDemand (see page 8471)

Options (see page 18440)

BeforeRowRequest (see page 8520)

AfterRowRequest (see page 8509)

Options

Requesting Data from the Source Dataset or Document

Communicating with the Client Dataset

45.1.8.4.58 TCustomClientDataSet.FetchDetails Method

Retrieves nested detail datasets from the provider.

Pascal

```
procedure FetchDetails;
```

C++

```
__fastcall FetchDetails();
```

Description

Call FetchDetails to retrieve nested detail sets from a provider when this information is not provided automatically. Nested details are automatically included in data packets unless the provider includes poFetchDetailsOnDemand in its Options property. (If the client dataset uses an internal provider, that provider's Options property is available as the client dataset's Options property)

FetchDetails updates the current record to include the missing detail data sets.

There is no need to call FetchDetails if the provider automatically includes nested detail sets or if the client dataset's FetchOnDemand (see page 8471) property is true.

See Also

RowRequest (see page 18472)

FetchOnDemand (see page 8471)

Options (see page 18440)

Communicating with the Client Dataset

45.1.8.4.59 TCustomClientDataSet.FetchMoreData Method

Pascal

```
procedure FetchMoreData(All: Boolean); virtual;
```

C++

```
virtual __fastcall FetchMoreData(Boolean All);
```

Description

This is FetchMoreData, a member of class TCustomClientDataSet.

45.1.8.4.60 TCustomClientDataSet.FetchParams Method

Retrieves parameter values from the provider.

Pascal

```
procedure FetchParams;
```

C++

```
__fastcall FetchParams();
```

Description

Call FetchParams to initialize the Params (see page 8489) property with the current parameter values on the provider's dataset. FetchParams does nothing unless the provider's dataset can supply parameter values.

Note: At design time, you can fetch parameter values by right-clicking the client dataset and choosing Fetch Params (see page 8489).

Warning: If the provider is on a stateless application server, the values returned by FetchParams can be changed at any time by other clients. To obtain output parameters from a stateless application server, use the Execute (see page 8413) method instead.

Getting Parameters from the Application Server

Passing Parameters to the Source Dataset

Communicating with the Client Dataset

45.1.8.4.61 TCustomClientDataSet.FindKey Method

Searches for a record containing specified field values.

Pascal

```
function FindKey(const KeyValues: array of const): Boolean; virtual;
```

C++

```
virtual __fastcall Boolean FindKey(const array of const KeyValues);
```

Description

Call FindKey to search for a specific record in a dataset. KeyValues contains a comma-delimited array of field values, called a key. Each value in the key can be a literal, a variable, nil (Delphi), or NULL (C++). If the number of values passed in KeyValues is less than the number of columns in the index used for the search, the missing values are assumed to be NULL. For C++, KeyValues_Size indicates the index of the last value in the KeyValues array. This is one less than the number of key values.

If a search is successful, FindKey positions the cursor on the matching record and returns true. Otherwise the cursor is not moved, and FindKey returns false.

Executing a Search with Find Methods

45.1.8.4.62 TCustomClientDataSet.FindNearest Method

Moves the cursor to the record that most closely matches a specified set of key values.

Pascal

```
procedure FindNearest(const KeyValues: array of const);
```

C++

```
__fastcall FindNearest(const array of const KeyValues);
```

Description

Call FindNearest to move the cursor to a specific record in a dataset or to the first record in the dataset that matches or is greater than the values specified in the KeyValues parameter. If there are no records that match or exceed the specified criteria, FindNearest positions the cursor on the last record in the table. The KeyExclusive (see page 8484) property controls whether matching values are considered.

KeyValues contains a comma-delimited array of field values, called a key. If the number of values passed in KeyValues is less than the number of columns in the index used for the search, the missing values are assumed to be NULL.. For C++,

KeyValues_Size specifies the index of the last value in the KeyValues array. This is one less than the number of key values.

Note: FindNearest works only with string data types.

Locate (see page 8435)

Executing a Search with Find Methods

45.1.8.4.63 TCustomClientDataSet.FindRecord Method

Pascal

```
function FindRecord(Restart: Boolean; GoForward: Boolean): Boolean; override;
```

C++

```
virtual __fastcall Boolean FindRecord(Boolean Restart, Boolean GoForward);
```

Description

This is FindRecord, a member of class TCustomClientDataSet.

45.1.8.4.64 TCustomClientDataSet.FreeKeyBuffers Method

Pascal

```
procedure FreeKeyBuffers;
```

C++

```
__fastcall FreeKeyBuffers();
```

Description

This is FreeKeyBuffers, a member of class TCustomClientDataSet.

45.1.8.4.65 TCustomClientDataSet.FreeRecordBuffer Method

Pascal

```
procedure FreeRecordBuffer(var Buffer: PChar); override;
```

C++

```
virtual __fastcall FreeRecordBuffer(const char * Buffer);
```

Description

This is FreeRecordBuffer, a member of class TCustomClientDataSet.

45.1.8.4.66 TCustomClientDataSet.GetAggregateValue Method

Pascal

```
function GetAggregateValue(Field: TField): Variant; override;
```

C++

```
virtual __fastcall Variant GetAggregateValue(TField Field);
```

Description

This is GetAggregateValue, a member of class TCustomClientDataSet.

45.1.8.4.67 TCustomClientDataSet.GetAppServer Method

Pascal

```
function GetAppServer: IAppServer; virtual;
```

C++

```
virtual __fastcall IAppServer GetAppServer();
```

Description

This is GetAppServer, a member of class TCustomClientDataSet.

45.1.8.4.68 TCustomClientDataSet.GetBookmarkData Method

Pascal

```
procedure GetBookmarkData(Buffer: PChar; Data: Pointer); override;
```

C++

```
virtual __fastcall GetBookmarkData(const char * Buffer, void * Data);
```

Description

This is GetBookmarkData, a member of class TCustomClientDataSet.

45.1.8.4.69 TCustomClientDataSet.GetBookmarkFlag Method

Pascal

```
function GetBookmarkFlag(Buffer: PChar): TBookmarkFlag; override;
```

C++

```
virtual __fastcall TBookmarkFlag GetBookmarkFlag(const char * Buffer);
```

Description

This is GetBookmarkFlag, a member of class TCustomClientDataSet.

45.1.8.4.70 TCustomClientDataSet.GetCanModify Method

Pascal

```
function GetCanModify: Boolean; override;
```

C++

```
virtual __fastcall Boolean GetCanModify();
```

Description

This is GetCanModify, a member of class TCustomClientDataSet.

45.1.8.4.71 TCustomClientDataSet.GetCurrentRecord Method

Retrieves the current record into a buffer.

Pascal

```
function GetCurrentRecord(Buffer: PChar): Boolean; override;
```

C++

```
virtual __fastcall Boolean GetCurrentRecord(const char * Buffer);
```

Description

Most applications should not need to call GetCurrentRecord. TCustomClientDataSet (see page 8373) automatically allocates a buffer for the active record.

Call GetCurrentRecord to copy the current record into a buffer allocated by the application. Buffer must be at least as big as the number of bytes indicated by the RecordSize property.

See Also

RecordSize

ActiveBuffer (see page 6909)

CreateBlobStream (see page 8401)

45.1.8.4.72 TCustomClientDataSet.GetDataSource Method

Pascal

```
function GetDataSource: TDataSource; override;
```

C++

```
virtual __fastcall TDataSource GetDataSource();
```

Description

This is GetDataSource, a member of class TCustomClientDataSet.

45.1.8.4.73 GetFieldData Method

This is the overview for the GetFieldData method overload.

Overload List

	Name	Description
	TCustomClientDataSet.GetFieldData (Integer, Pointer) (see page 8419)	Retrieves the current value of a field.
	TCustomClientDataSet.GetFieldData (TField, Pointer) (see page 8419)	Retrieves the current value of a field.

45.1.8.4.73.1 TCustomClientDataSet.GetFieldData Method (Integer, Pointer)

Retrieves the current value of a field.

Pascal

```
function GetFieldData(Field: TField; Buffer: Pointer): Boolean; override;
function GetFieldData(FieldNo: Integer; Buffer: Pointer): Boolean; override; overload;
```

C++

```
virtual __fastcall Boolean GetFieldData(TField Field, void * Buffer);
virtual __fastcall Boolean GetFieldData(int FieldNo, void * Buffer);
```

Description

Call GetFieldData to obtain the value of a field component as it is stored in the record buffer. TField objects call GetFieldData to implement their GetData method.

The Field or FieldNo parameter indicates the field whose data should be fetched. Field specifies the component itself, while FieldNo indicates its field number. The Buffer parameter is a memory buffer with sufficient space to accept the value of the field as it exists in the database (unformatted and untranslated). NativeFormat indicates whether the dataset fetches the field in the IDE's native format for the field type. When NativeFormat is false, the dataset must convert the field value to the native type using its Translate method. This allows the field to handle data from different types of datasets (ADO-based, BDE-based, and so on) in a uniform manner.

GetFieldData returns a value that indicates whether the data was successfully fetched.

See Also

GetData (see page 7131)

Translate (see page 7001)

45.1.8.4.74 TCustomClientDataSet.GetGroupState Method

Indicates where the current record sits within a specified group of records.

Pascal

```
function GetGroupState(Level: Integer): TGroupPosInds;
```

C++

```
__fastcall TGroupPosInds GetGroupState(int Level);
```

Description

Call GetGroupState to determine where the current record falls in the group of records specified by the Level parameter.

Level identifies a group by its grouping level on the current index. Grouping level 1 is the set of records with the same value on the first field in the index. Grouping level 2 is the set of records with the same values on the first two fields in the index, and so on. If Level specifies a grouping level greater than the GroupingLevel (see page 8479) property, GetGroupState raises an exception.

GetGroupState returns a set that indicates where the current record falls in the current grouping level. It has one of the following values:

Value	Meaning
[gbMiddle]	The current record is neither the first nor the last in the group.
[gbFirst]	The current record is the first in the group, which contains at least two records.
[gbLast]	The current record is the last in the group, which contains at least two records.
[gbFirst,gbLast]	The current record is the only record in the group.

Note: If AggregatesActive (see page 8461) is false or the current index does not support grouping, GetGroupState returns an

empty set.

See Also

GroupingLevel (see page 8479)

IndexName (see page 8483)

GroupingLevel (see page 7291)

AggregatesActive (see page 8461)

Obtaining Aggregate Values

Using Indexes to Group Data

45.1.8.4.75 TCustomClientDataSet.GetIndexField Method

Pascal

```
function GetIndexField(Index: Integer): TField;
```

C++

```
__fastcall TField GetIndexField(int Index);
```

Description

This is GetIndexField, a member of class TCustomClientDataSet.

45.1.8.4.76 TCustomClientDataSet.GetIndexFieldCount Method

Pascal

```
function GetIndexFieldCount: Integer;
```

C++

```
__fastcall int GetIndexFieldCount();
```

Description

This is GetIndexFieldCount, a member of class TCustomClientDataSet.

45.1.8.4.77 TCustomClientDataSet.GetIndexInfo Method

Retrieves information about the current index.

Pascal

```
procedure GetIndexInfo(IndexName: string);
```

C++

```
__fastcall GetIndexInfo(AnsiString IndexName);
```

Description

Call GetIndexInfo to populate a dataset's internal index fields with information about the current index, including its field count, map, and key size.

Pass the name of the current index as the IndexName (see page 8483) to retrieve the default grouping level of the index as well. If an empty string is supplied for IndexName (see page 8483), no grouping level information is retrieved.

Warning: Do not pass GetIndexInfo the name of any index other than the current index.

See Also

FieldCount (see page 7017)

IndexDefs (see page 8480)

KeySize (see page 8485)

GetIndexNames (see page 8422)

GroupingLevel (see page 7291)

45.1.8.4.78 TCustomClientDataSet.GetIndexNames Method

Retrieves a list of available indexes for a client dataset.

Pascal

```
procedure GetIndexNames(List: TStrings);
```

C++

```
__fastcall GetIndexNames(TStrings List);
```

Description

Call GetIndexNames to retrieve a list of all available indexes for a client dataset. List is a string list object, created and maintained by the application, into which to retrieve the index names.

Note: Two indexes are automatically generated for all client datasets:

DEFAULT_ORDER, which describes the order of data when it is put into the data packet.

CHANGEINDEX, which orders the data as it would if it were a delta assigned to another dataset.

See Also

IndexName (see page 8483)

Obtaining Information About Indexes

45.1.8.4.79 TCustomClientDataSet.GetIsClone Method

Pascal

```
function GetIsClone: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean GetIsClone();
```

Description

This is GetIsClone, a member of class TCustomClientDataSet.

45.1.8.4.80 TCustomClientDataSet.GetIsIndexField Method

Pascal

```
function GetIsIndexField(Field: TField): Boolean; override;
```

C++

```
virtual __fastcall Boolean GetIsIndexField(TField Field);
```

Description

This is GetIsIndexField, a member of class TCustomClientDataSet.

45.1.8.4.81 TCustomClientDataSet.GetKeyBuffer Method

Pascal

```
function GetKeyBuffer(KeyIndex: TKeyIndex): PKeyBuffer;
```

C++

```
__fastcall PKeyBuffer GetKeyBuffer(TKeyIndex KeyIndex);
```

Description

This is GetKeyBuffer, a member of class TCustomClientDataSet.

45.1.8.4.82 TCustomClientDataSet.GetKeyExclusive Method

Pascal

```
function GetKeyExclusive: Boolean;
```

C++

```
__fastcall Boolean GetKeyExclusive();
```

Description

This is GetKeyExclusive, a member of class TCustomClientDataSet.

45.1.8.4.83 TCustomClientDataSet.GetKeyFieldCount Method

Pascal

```
function GetKeyFieldCount: Integer;
```

C++

```
__fastcall int GetKeyFieldCount();
```

Description

This is GetKeyFieldCount, a member of class TCustomClientDataSet.

45.1.8.4.84 TCustomClientDataSet.GetNextPacket Method

Retrieves the next block of records from the provider.

Pascal

```
function GetNextPacket: Integer; virtual;
```

C++

```
virtual __fastcall int GetNextPacket();
```

Description

Call GetNextPacket to retrieve the next sequential block of records from a provider. To specify the maximum number of records to return in a packet, set the PacketRecords (see page 8488) property before calling GetNextPacket. A packet is appended to those records already stored in the Data (see page 8467) property.

GetNextPacket returns the number of records added to Data (see page 8467). If the return value is 0, the client dataset has

already received all available records from the provider.

Warning: If the provider is in a stateless application server, you must use a BeforeGetRecords (see page 8515) event handler to ensure that the data packet returns the correct set of records.

Delphi Examples:

```
{
This example shows how to use the BeforeGetRecords event
handler (a TRemoteEventType value) to send the provider
information it needs for incremental data fetching. Before
fetching the next data packet, the client dataset packages
up the key value of the last record so that the provider
knows where to begin the next data packet. It also sends
some application-specific information, which is stored in
Memo1.  This method is used to pass the sql statement and the
value of the first field for the last record to the server so
that the server can return the correct records. The complete
project using this code example is in
Demos/DelphiWin32/VCLWin32/MIDAS/Pooler.
}
procedure TForm1.ClientDataSet1BeforeGetRecords(Sender: TObject; var OwnerData: OleVariant);
var
  LastValue: OleVariant;
  CDSClone: TClientDataSet;
begin
  if ClientDataSet1.Active then
  begin
    CDSClone := TClientDataSet.Create(Form1);
    try
      CDSClone.CloneCursor(ClientDataSet1, True);
      { turn off FetchOnDemand so that the clone only fetches
        the last LOCAL record }
      CDSClone.FetchOnDemand := False;
      CDSClone.Last;
      LastValue := CDSClone.Fields[0].AsString;
      CDSClone.Close;
    finally
      CDSClone.Free;
    end;
  end else
    LastValue := NULL;
  OwnerData := VarArrayOf([Memo1.Lines.Text, LastValue]);
end;

procedure TForm1.Button2Click(Sender: TObject);
begin
  ClientDataSet1.PacketRecords := StrToInt(Edit1.Text);
  ClientDataSet1.GetNextPacket;
end;
```

45.1.8.4.85 TCustomClientDataSet.GetOptionalParam Method

Retrieves a custom parameter from the data packet.

Pascal

```
function GetOptionalParam(const ParamName: string): OleVariant;
```

C++

```
__fastcall OleVariant GetOptionalParam(const AnsiString ParamName);
```

Description

Application developers can add custom information to the data packet using the client dataset's SetOptionalParam (see page 8450) method or a provider's OnGetDataSetProperties event. This information is saved with the data packet when it is saved to a file or stream, and copied with the value of the Data (see page 8467) property. Call GetOptionalParam to retrieve this custom information from the data packet.

The ParamName parameter specifies the name under which the custom information was stored.

Note: Do not confuse the optional data retrieved by this method with the Params (see page 8489) property.

45.1.8.4.86 TCustomClientDataSet.GetRecNo Method

Pascal

```
function GetRecNo: Integer; override;
```

C++

```
virtual __fastcall int GetRecNo();
```

Description

This is GetRecNo, a member of class TCustomClientDataSet.

45.1.8.4.87 TCustomClientDataSet.GetRecord Method

Pascal

```
function GetRecord(Buffer: PChar; GetMode: TGetMode; DoCheck: Boolean): TGetResult; override;
```

C++

```
virtual __fastcall TGetResult GetRecord(const char * Buffer, TGetMode GetMode, Boolean
DoCheck);
```

Description

This is GetRecord, a member of class TCustomClientDataSet.

45.1.8.4.88 TCustomClientDataSet.GetRecordCount Method

Pascal

```
function GetRecordCount: Integer; override;
```

C++

```
virtual __fastcall int GetRecordCount();
```

Description

This is GetRecordCount, a member of class TCustomClientDataSet.

45.1.8.4.89 TCustomClientDataSet.GetRecordSize Method

Pascal

```
function GetRecordSize: Word; override;
```

C++

```
virtual __fastcall Word GetRecordSize();
```

Description

This is GetRecordSize, a member of class TCustomClientDataSet.

45.1.8.4.90 TCustomClientDataSet.GetRemoteServer Method

Pascal

```
function GetRemoteServer: TCustomRemoteServer; virtual;
```

C++

```
virtual __fastcall TCustomRemoteServer GetRemoteServer();
```

Description

This is GetRemoteServer, a member of class TCustomClientDataSet.

45.1.8.4.91 TCustomClientDataSet.GetStateFieldValue Method

Pascal

```
function GetStateFieldValue(State: TDataSetState; Field: TField): Variant; override;
```

C++

```
virtual __fastcall Variant GetStateFieldValue(TDataSetState State, TField Field);
```

Description

This is GetStateFieldValue, a member of class TCustomClientDataSet.

45.1.8.4.92 TCustomClientDataSet.GotoCurrent Method

Sets the current record in this dataset the same as the current record in another, cloned dataset.

Pascal

```
procedure GotoCurrent(DataSet: TCustomClientDataSet);
```

C++

```
__fastcall GotoCurrent(TCustomClientDataSet DataSet);
```

Description

Call GotoCurrent to position the cursor on the same record that is current in the specified dataset. DataSet is the cloned dataset whose cursor position is to be matched in this dataset.

GotoCurrent is only useful for synchronizing two client datasets that use separate data sources to view and edit the same data.

See Also

CloneCursor (see page 8398)

45.1.8.4.93 TCustomClientDataSet.GotoKey Method

Moves the cursor to a record specified by the current key.

Pascal

```
function GotoKey: Boolean;
```

C++

```
__fastcall Boolean GotoKey();
```

Description

Use GotoKey to move to a record specified by key values assigned with previous calls to SetKey (see page 8449) or EditKey (see page 8410) and actual search values indicated in the search key buffer.

If GotoKey finds a matching record, it positions the cursor on the record and returns true. Otherwise the current cursor position remains unchanged, and GotoKey returns false.

See Also

FindKey (see page 8416)

GotoNearest (see page 8427)

SetKey (see page 8449)

State (see page 7036)

Executing a Search with Goto Methods

45.1.8.4.94 TCustomClientDataSet.GotoNearest Method

Moves the cursor to the record that most closely matches the current key.

Pascal

```
procedure GotoNearest;
```

C++

```
__fastcall GotoNearest();
```

Description

Call GotoNearest to position the cursor on the record that is either the exact record specified by the current key values in the key buffer, or on the first record whose values exceed those specified. If there is no record that matches or exceeds the specified criteria, GotoNearest positions the cursor on the last record in the dataset.

Note: KeyExclusive (see page 8484) determines which records are considered part of a search range.

Before calling GotoNearest, an application must specify key values by calling SetKey (see page 8449) or EditKey (see page 8410) to put the dataset is dsSetKey state, and then use FieldByName to populate the buffer with search values.

45.1.8.4.95 TCustomClientDataSet.InitKeyBuffer Method

Pascal

```
function InitKeyBuffer(Buffer: PKeyBuffer): PKeyBuffer;
```

C++

```
__fastcall PKeyBuffer InitKeyBuffer(PKeyBuffer Buffer);
```

Description

This is InitKeyBuffer, a member of class TCustomClientDataSet.

45.1.8.4.96 TCustomClientDataSet.InitRecord Method

Pascal

```
procedure InitRecord(Buffer: PChar); override;
```

C++

```
virtual __fastcall InitRecord(const char * Buffer);
```

Description

This is InitRecord, a member of class TCustomClientDataSet.

45.1.8.4.97 TCustomClientDataSet.InternalAddRecord Method

Pascal

```
procedure InternalAddRecord(Buffer: Pointer; Append: Boolean); override;
```

C++

```
virtual __fastcall InternalAddRecord(void * Buffer, Boolean Append);
```

Description

This is InternalAddRecord, a member of class TCustomClientDataSet.

45.1.8.4.98 TCustomClientDataSet.InternalCancel Method

Pascal

```
procedure InternalCancel; override;
```

C++

```
virtual __fastcall InternalCancel();
```

Description

This is InternalCancel, a member of class TCustomClientDataSet.

45.1.8.4.99 TCustomClientDataSet.InternalClose Method

Pascal

```
procedure InternalClose; override;
```

C++

```
virtual __fastcall InternalClose();
```

Description

This is InternalClose, a member of class TCustomClientDataSet.

45.1.8.4.100 TCustomClientDataSet.InternalDelete Method

Pascal

```
procedure InternalDelete; override;
```

C++

```
virtual __fastcall InternalDelete();
```

Description

This is InternalDelete, a member of class TCustomClientDataSet.

45.1.8.4.101 TCustomClientDataSet.InternalEdit Method

Pascal

```
procedure InternalEdit; override;
```

C++

```
virtual __fastcall InternalEdit();
```

Description

This is InternalEdit, a member of class TCustomClientDataSet.

45.1.8.4.102 TCustomClientDataSet.InternalFirst Method

Pascal

```
procedure InternalFirst; override;
```

C++

```
virtual __fastcall InternalFirst();
```

Description

This is InternalFirst, a member of class TCustomClientDataSet.

45.1.8.4.103 TCustomClientDataSet.InternalGetOptionalParam Method

Pascal

```
function InternalGetOptionalParam(const ParamName: string; FieldNo: Integer = 0): OleVariant;
```

C++

```
__fastcall OleVariant InternalGetOptionalParam(const AnsiString ParamName, int FieldNo = 0);
```

Description

This is InternalGetOptionalParam, a member of class TCustomClientDataSet.

45.1.8.4.104 TCustomClientDataSet.InternalGotoBookmark Method

Pascal

```
procedure InternalGotoBookmark(Bookmark: TBookmark); override;
```

C++

```
virtual __fastcall InternalGotoBookmark(TBookmark Bookmark);
```

Description

This is InternalGotoBookmark, a member of class TCustomClientDataSet.

45.1.8.4.105 TCustomClientDataSet.InternalHandleException Method

Pascal

```
procedure InternalHandleException; override;
```

C++

```
virtual __fastcall InternalHandleException();
```

Description

This is InternalHandleException, a member of class TCustomClientDataSet.

45.1.8.4.106 TCustomClientDataSet.InternalInitFieldDefs Method

Pascal

```
procedure InternalInitFieldDefs; override;
```

C++

```
virtual __fastcall InternalInitFieldDefs();
```

Description

This is InternalInitFieldDefs, a member of class TCustomClientDataSet.

45.1.8.4.107 TCustomClientDataSet.InternalInitRecord Method

Pascal

```
procedure InternalInitRecord(Buffer: PChar); override;
```

C++

```
virtual __fastcall InternalInitRecord(const char * Buffer);
```

Description

This is InternalInitRecord, a member of class TCustomClientDataSet.

45.1.8.4.108 TCustomClientDataSet.InternalInsert Method

Pascal

```
procedure InternalInsert; override;
```

C++

```
virtual __fastcall InternalInsert();
```

Description

This is InternalInsert, a member of class TCustomClientDataSet.

45.1.8.4.109 TCustomClientDataSet.InternalLast Method

Pascal

```
procedure InternalLast; override;
```

C++

```
virtual __fastcall InternalLast();
```

Description

This is InternalLast, a member of class TCustomClientDataSet.

45.1.8.4.110 TCustomClientDataSet.InternalOpen Method

Pascal

```
procedure InternalOpen; override;
```

C++

```
virtual __fastcall InternalOpen();
```

Description

This is InternalOpen, a member of class TCustomClientDataSet.

45.1.8.4.111 TCustomClientDataSet.InternalPost Method

Pascal

```
procedure InternalPost; override;
```

C++

```
virtual __fastcall InternalPost();
```

Description

This is InternalPost, a member of class TCustomClientDataSet.

45.1.8.4.112 TCustomClientDataSet.InternalRefresh Method

Pascal

```
procedure InternalRefresh; override;
```

C++

```
virtual __fastcall InternalRefresh();
```

Description

This is InternalRefresh, a member of class TCustomClientDataSet.

45.1.8.4.113 TCustomClientDataSet.InternalSetOptionalParam Method

Pascal

```
procedure InternalSetOptionalParam(const ParamName: string; const Value: OleVariant;
IncludeInDelta: Boolean = False; FieldNo: Integer = 0);
```

C++

```
__fastcall InternalSetOptionalParam(const AnsiString ParamName, const OleVariant Value,
Boolean IncludeInDelta = False, int FieldNo = 0);
```

Description

This is InternalSetOptionalParam, a member of class TCustomClientDataSet.

45.1.8.4.114 TCustomClientDataSet.InternalSetToRecord Method

Pascal

```
procedure InternalSetToRecord(Buffer: PChar); override;
```

C++

```
virtual __fastcall InternalSetToRecord(const char * Buffer);
```

Description

This is InternalSetToRecord, a member of class TCustomClientDataSet.

45.1.8.4.115 TCustomClientDataSet.IsCursorOpen Method

Pascal

```
function IsCursorOpen: Boolean; override;
```

C++

```
virtual __fastcall Boolean IsCursorOpen();
```

Description

This is IsCursorOpen, a member of class TCustomClientDataSet.

45.1.8.4.116 TCustomClientDataSet.Loaded Method

Initializes the component after the form file has been read into memory.

Pascal

```
procedure Loaded; override;
```

C++

```
virtual __fastcall Loaded();
```

Description

Do not call the protected Loaded method. The streaming system calls this method after it loads the component's form from a stream.

When the streaming system loads a form or data module from its form file, it first constructs the form component by calling its constructor, then reads its property values from the form file. After reading all the property values for all the components, the streaming system calls the Loaded methods of each component in the order the components were created. This gives the components a chance to initialize any data that depends on the values of other components or other parts of itself.

Note: All references to sibling components are resolved by the time Loaded is called. Loaded is the first place that sibling pointers can be used after being streamed in.

As implemented in TComponent, Loaded clears the csLoading flag in the ComponentState property, indicating that the component is no longer loading.

Warning: Loaded may be called multiple times on inherited forms. It is called every time a level of inheritance is streamed in. Do not allocate memory in an overridden Loaded method without first checking that the memory has not been allocated in a previous call.

See Also

ComponentState (see page 2804)

Create (see page 2766)

TReader (see page 2933)

45.1.8.4.117 TCustomClientDataSet.LoadFromFile Method

Loads a client dataset's data from a file.

Pascal

```
procedure LoadFromFile(const FileName: string = '');
```

C++

```
__fastcall LoadFromFile(const AnsiString FileName = '');
```

Description

Call LoadFromFile to populate the Data (see page 8467) property of the client dataset with data stored in an external file. FileName (see page 8475) is the name of the file containing the data to load. If the FileName (see page 8475) parameter is

an empty string, or if this parameter is omitted (Delphi), LoadFromFile reads from the file specified by the FileName (see page 8475) property.

To load data from a file at design time, right-click on the client dataset and choose Load from File.

Note: FileName (see page 8475) must contain data saved to a file by a previous call to this or another client dataset's SaveToFile (see page 8443) method, or by a TXMLTransform component

.

Delphi Examples:

```
{
This example requires two ClientDataSets, two DBGrids, two
DataSources and two DBNavigators.  Name the two
ClientDataSets CDS and CDS2. Set the DataSet property in the
first DataSource to CDS and name that DataSource DS.  Set the
DataSet property in the second DataSource to CDS2 and name
that DataSource DS2.  Set the DataSource in the first
DBNavigator to DS and the DataSource in the second DBNavigator
to DS2.  Set the DataSource in the first DBGrid to DS and the
DataSource in the second DBGrid to DS2.  Right click on CDS
and select the Fields Editor, then right click on the Field
Editor form and create two fields by selecting "new field".
In the field configuration window, set the name to HOST, the
Component value will automatically be set to CDSHOST.  Set
the filed type to String.  In the field configuration window
for the second field, set the name to PORTA, the Component
value will automatically be set to CDSPORTA.  Set the field
type to Integer.  The file used to load CDS must have an
attribute name of HOST with an attribute type of string and
an attribute name of PORTA with an attribute type of integer.
Add DB, DBCtrls, Grids, DBGrids, DBClient and SwSystem to the
uses clause.  "LoadFormFile" to start with the file, or
"CreateDataSet" to start from scratch.  You must "CloseDataSet"
after a "LoadFromFile" before you can do another "CreateDataSet".
}
{$IFNDEF UNICODE}
uses SwSystem;
{$ENDIF}

procedure TForm1.Button1Click(Sender: TObject);
begin
{$IFDEF UNICODE}
  CDS.LoadFromFile(GetCurrentDir + '\CDS.XML');
{$ELSE}
  CDS.LoadFromFile(gsAppPath + 'CDS.XML');
{$ENDIF}
end;

procedure TForm1.Button2Click(Sender: TObject);
begin
{$IFDEF UNICODE}
  CDS.SaveToFile(GetCurrentDir + '\CDS.XML', dfXML);
{$ELSE}
  CDS.SaveToFile(gsAppPath + 'CDS.XML', dfXML);
{$ENDIF}
end;

procedure TForm1.Button3Click(Sender: TObject);
begin
  CDS.CreateDataSet;
end;

procedure TForm1.Button4Click(Sender: TObject);
begin
```

```
  CDS2.Data := CDS.Data;
end;

procedure TForm1.Button5Click(Sender: TObject);
begin
  CDS.Close;
end;
```

LoadFromStream (see page 8435)

SaveToFile (see page 8443)

FileName (see page 8475)

TXMLTransform (see page 26467)

Loading Data from a File or Stream

Using a Dedicated File on Disk

45.1.8.4.118 TCustomClientDataSet.LoadFromStream Method

Loads a client dataset's data from a stream.

Pascal

```
procedure LoadFromStream(Stream: TStream);
```

C++

```
__fastcall LoadFromStream(TStream Stream);
```

Description

Call LoadFromStream to populate the Data (see page 8467) property of the client dataset with data from a stream. Stream is the name of the stream from which to read data.

Note: Stream must contain data in a client dataset's internal format (for example, data written to a stream by another client dataset using the SaveToStream (see page 8445) method.

See Also

LoadFromFile (see page 8433)

SaveToStream (see page 8445)

45.1.8.4.119 TCustomClientDataSet.Locate Method

Searches the dataset for a specified record and makes that record current.

Pascal

```
function Locate(const KeyFields: string; const KeyValues: Variant; Options: TLocateOptions):
Boolean; override;
```

C++

```
virtual __fastcall Boolean Locate(const AnsiString KeyFields, const Variant KeyValues,
TLocateOptions Options);
```

Description

Call Locate to search a dataset for a specific record and position the cursor on it. KeyFields is a string containing a semicolon-delimited list of field names on which to search.

KeyValues is a Variant containing the values to match in the key fields. If KeyFields lists a single field, KeyValues represents the search value for that field. If KeyFields lists multiple fields, pass a Variant array as the KeyValues parameter. In Delphi, you can construct a variant array on the fly using the VarArrayOf routine. For example:

```
with CustTable do
  Locate('Company;Contact;Phone', VarArrayOf(['Sight Diver', 'P', '831-431-1000']),
[loPartialKey]);
TLocateOptions Opts;
Opts.Clear();
Opts << loPartialKey;
Variant locvalues[3];
locvalues[0] = Variant("Sight Diver");
locvalues[1] = Variant("P");
locvalues[2] = Variant("831-431-1000");
CustTable->Locate("Company;Contact;Phone", VarArrayOf(locvalues, 2), Opts);
```

Options is a set that optionally specifies additional search latitude when searching on string fields. If Options contains the loCaseInsensitive setting, then Locate ignores case when matching fields. If Options contains the loPartialKey setting, then the KeyValues parameter can specify incomplete strings for field values. (For example, in the previous statement, the Contact field would match any record where Contact begins with 'P'). If Options is an empty set, or if the KeyFields are not string fields, Options is ignored.

Locate returns true if it finds a matching record, and makes that record the current one. Otherwise Locate returns false.

FindField (see page 6938)

FindFirst (see page 6939)

FindKey (see page 8416)

Lookup (see page 8436)

45.1.8.4.120 TCustomClientDataSet.LocateRecord Method

Pascal

```
function LocateRecord(const KeyFields: string; const KeyValues: Variant; Options:
TLocateOptions; SyncCursor: Boolean): Boolean;
```

C++

```
__fastcall Boolean LocateRecord(const AnsiString KeyFields, const Variant KeyValues,
TLocateOptions Options, Boolean SyncCursor);
```

Description

This is LocateRecord, a member of class TCustomClientDataSet.

45.1.8.4.121 TCustomClientDataSet.Lookup Method

Retrieves field values from a record that matches specified search values.

Pascal

```
function Lookup(const KeyFields: string; const KeyValues: Variant; const ResultFields:
string): Variant; override;
```

C++

```
virtual __fastcall Variant Lookup(const AnsiString KeyFields, const Variant KeyValues, const
AnsiString ResultFields);
```

Description

Call Lookup to retrieve values for specified fields from a record that matches search criteria. KeyFields is a string containing a semicolon-delimited list of field names on which to search.

KeyValues is a Variant containing the values to match in the key fields. To specify multiple search values, pass KeyValues as a variant array as an argument, or, in Delphi, construct a variant array on the fly using the VarArrayOf routine. For example (C++):

```
Variant locvalues[2];
locvalues[0] = Variant("Sight Diver");
locvalues[1] = Variant("Kato Paphos");
Variant LookupResults = CustTable->Lookup("Company;City", VarArrayOf(locvalues, 1),
"Company;Addr1;Addr2;State;Zip");
```

ResultFields is a string containing a semicolon-delimited list of field names whose values should be returned from the matching record.

Lookup returns a variant array containing the values from the fields specified in ResultFields.

See Also

Locate (see page 8435)

45.1.8.4.122 TCustomClientDataSet.MergeChangeLog Method

Merges any data changes in the change log into the client dataset, overwriting existing values.

Pascal

```
procedure MergeChangeLog;
```

C++

```
__fastcall MergeChangeLog();
```

Description

Call MergeChangeLog to merge changes in the change log into the actual data for the dataset, effectively creating a new data baseline. Existing values for which changes exist are overwritten.

Note: This method is seldom called explicitly when using a provider because is called automatically by ApplyUpdates (see page 8394) as part of the updating process. In file-based applications, MergeChangeLog must be called explicitly if LogChanges (see page 8485) is true.

See Also

Delta (see page 8470)

LogChanges (see page 8485)

Reconcile (see page 8441)

Merging Changes into Data

45.1.8.4.123 TCustomClientDataSet.Notification Method

Forwards notification messages to all owned components.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

Do not call the Notification method in an application. Notification is called automatically when the component specified by AComponent is about to be inserted or removed, as specified by Operation. By default, components pass along the notification to their owned components, if any.

A component can, if needed, act on the notification that a component is being inserted or removed. For example, if a component has object fields or properties that contain references to other components, it can check the notifications of component removals and invalidate those references as needed.

Note: Notification is not called for components that are freed implicitly (because their Owner is freed).

See Also

FreeNotification (see page 2775)

InsertComponent (see page 2780)

RemoveComponent (see page 2785)

Owner (see page 2807)

45.1.8.4.124 TCustomClientDataSet.OpenCursor Method

Pascal

```
procedure OpenCursor(InfoQuery: Boolean); override;
```

C++

```
virtual __fastcall OpenCursor(Boolean InfoQuery);
```

Description

This is OpenCursor, a member of class TCustomClientDataSet.

45.1.8.4.125 TCustomClientDataSet.Post Method

Writes a modified record to the Data (see page 8467) property or the change log.

Pascal

```
procedure Post; override;
```

C++

```
virtual __fastcall Post();
```

Description

Call Post to commit changes to the current record. Methods that change the dataset state, such as Edit, Insert, or Append, or that move from one record to another, such as First, Last, Next, and Prior automatically call Post.

Note: If the LogChanges (see page 8485) property is true, Post updates the change log specified by the Delta (see page 8470) property. If LogChanges (see page 8485) is false, Post writes the changes directly to the Data (see page 8467) property.

Delphi Examples:

```
{
This example appends a new record to a table or client
dataset when the user clicks a button. The two fields
Field1 and Field2 are filled from the contents of two edit
```

```
controls.  This example requires a populated TTable or
TDataSet with the appropriate field values.
}
procedure TForm1.Button1Click(Sender: TObject);
begin
  Customers.Append;
  Customers.FieldValues['Field1'] := StrToInt(Edit1.text);
  Customers.FieldValues['Field2'] := Edit2.text;
  Customers.Post;
end;
```

See Also

Delta (see page 8470)

LogChanges (see page 8485)

Data (see page 8467)

45.1.8.4.126 TCustomClientDataSet.PostKeyBuffer Method

Pascal

```
procedure PostKeyBuffer(Commit: Boolean);
```

C++

```
__fastcall PostKeyBuffer(Boolean Commit);
```

Description

This is PostKeyBuffer, a member of class TCustomClientDataSet.

45.1.8.4.127 TCustomClientDataSet.PSGetCommandText Method

Gets the SQL command to be executed by PSExecute.

Pascal

```
function PSGetCommandText: string; override;
```

C++

```
virtual __fastcall AnsiString PSGetCommandText();
```

Description

If the provider's Options property includes poAllowCommandText, clients can supply an SQL command along with a call to GetRecords or Execute. This command is passed to the dataset by a call to PSSetCommandText, and subsequently executed by a call to PSExecute.

See Also

CommandText (see page 8465)

PSExecute (see page 7578)

PSSetCommandText (see page 7585)

GetRecords (see page 18468)

Execute (see page 18466)

Options (see page 18440)

45.1.8.4.128 TCustomClientDataSet.PSGetCommandType Method

Gets the command type to be executed by PSExecute.

Pascal

```
function PSGetCommandType: TPSCommandType; override;
```

C++

```
virtual __fastcall TPSCommandType PSGetCommandType();
```

Description

PSGetCommandType gets the command type executed by PSExecute. The type may be a type of SQL command or other command types, such as stored procedures.

See Also

CommandText (see page 8465)

PSExecute (see page 7578)

PSGetCommandText (see page 7579)

Execute (see page 18466)

Options (see page 18440)

45.1.8.4.129 TCustomClientDataSet.PSGetIndexDefs Method

Returns the definitions of all specified indexes defined for the dataset.

Pascal

```
function PSGetIndexDefs(IndexTypes: TIndexOptions): TIndexDefs; override;
```

C++

```
virtual __fastcall TIndexDefs PSGetIndexDefs(TIndexOptions IndexTypes);
```

Description

The provider component calls PSGetIndexDefs to locate an index that contains information it needs. For example, it uses PSGetIndexDefs to locate an index that contains the key fields returned by PSGetKeyFields. This information allows the provider to locate the records that need to change when it applies updates. The provider also calls this method to locate indexes that it adds to the metadata of data packets.

IndexTypes indicates the options required of the returned indexes. PSGetIndexDefs returns all indexes whose Options property includes the specified flags.

PSGetIndexDefs returns a TIndexDefs object that contains all the indexes of the dataset that match the IndexTypes parameter.

See Also

Options (see page 7291)

PSGetKeyFields (see page 7581)

PSGetDefaultOrder (see page 7580)

45.1.8.4.130 TCustomClientDataSet.ReadDataPacket Method

Pascal

```
procedure ReadDataPacket(Stream: TStream; ReadSize: Boolean);
```

C++

```
__fastcall ReadDataPacket(TStream Stream, Boolean ReadSize);
```

Description

This is ReadDataPacket, a member of class TCustomClientDataSet.

45.1.8.4.131 TCustomClientDataSet.Reconcile Method

Clears successfully updated records from the client dataset's cache of changes.

Pascal

```
function Reconcile(const Results: OleVariant): Boolean;
```

C++

```
__fastcall Boolean Reconcile(const OleVariant Results);
```

Description

Reconcile is called by the ApplyUpdates (see page 8394) method to update the client dataset so that it reflects the result of an update. Reconcile is called after the provider has attempted to apply all updates in the client dataset's Delta (see page 8470) property. (The provider may be internal to the client dataset, an external component in the same application as the client dataset, or on a separate application server.)

Results is a Variant, returned by the ApplyUpdates (see page 8394) method of a provider, that contains error information and record information for each record that could not be applied. Reconcile generates an OnReconcileError (see page 8524) event for every record in Results (every record that was not successfully applied by the provider). Finally, Reconcile adjusts the Delta (see page 8470) property so that it includes only those records that were not successfully applied. Any changes made in the OnReconcileError (see page 8524) event are reflected in the new value of Delta (see page 8470).

Reconcile returns a value that indicates whether reconciling is successful. If true, Reconcile succeeded without error. If false, one or more errors could not be reconciled.

See Also

ApplyUpdates (see page 8394)

OnReconcileError (see page 8524)

Applying Updates

Using the BDE to Cache Updates

Updating Data in dbExpress Applications

45.1.8.4.132 TCustomClientDataSet.RefreshInternalCalcFields Method

Pascal

```
procedure RefreshInternalCalcFields(Buffer: PChar); override;
```

C++

```
virtual __fastcall RefreshInternalCalcFields(const char * Buffer);
```

Description

This is RefreshInternalCalcFields, a member of class TCustomClientDataSet.

45.1.8.4.133 TCustomClientDataSet.RefreshRecord Method

Updates the base values of the current record to match the current values of the provider's dataset.

Pascal

```
procedure RefreshRecord;
```

C++

```
__fastcall RefreshRecord();
```

Description

Call Refresh to change the base values of the current record to match the current value on the server. Refresh replaces the original values obtained from a provider, but leaves any changes in the change log intact.

Warning: RefreshRecord should be used with care. If the user has modified the current record, refreshing the original values may mask update conflicts. When the application calls ApplyUpdates (see page 8394), no reconcile error will occur, even where this is appropriate.

Note: A similar method, Refresh, replaces the entire contents of the client dataset with the current values supplied by the provider. Unlike RefreshRecord, which leaves unapplied changes in the change log, Refresh raises an exception when the change log is not empty.

See Also

Refresh (see page 6991)

LogChanges (see page 8485)

BeforeRowRequest (see page 8520)

45.1.8.4.134 TCustomClientDataSet.ResetAggField Method

Pascal

```
procedure ResetAggField(Field: TField); override;
```

C++

```
virtual __fastcall ResetAggField(TField Field);
```

Description

This is ResetAggField, a member of class TCustomClientDataSet.

45.1.8.4.135 TCustomClientDataSet.ResetCursorRange Method

Pascal

```
function ResetCursorRange: Boolean;
```

C++

```
__fastcall Boolean ResetCursorRange();
```

Description

This is ResetCursorRange, a member of class TCustomClientDataSet.

45.1.8.4.136 TCustomClientDataSet.RevertRecord Method

Undoes edits to the current record.

Pascal

```
procedure RevertRecord;
```

C++

```
__fastcall RevertRecord();
```

Description

Call RevertRecord to remove any modifications made to the current record. RevertRecord can only remove modifications to records that are still in the change log. Changes that have been removed because they were applied by a provider or merged into the Data (see page 8467) property can't be undone using RevertRecord.

Note: To undo the last edit made to a record, call UndoLastChange (see page 8455). To cancel all pending modifications, call CancelUpdates (see page 8396). To undo all edits since an application-defined state, use the SavePoint (see page 8494) property.

See Also

ApplyUpdates (see page 8394)

CancelUpdates (see page 8396)

Reconcile (see page 8441)

UndoLastChange (see page 8455)

StatusFilter (see page 8495)

Undoing Changes

Using the BDE to Cache Updates

Updating Data in dbExpress Applications

45.1.8.4.137 TCustomClientDataSet.SaveToFile Method

Saves a client dataset's data to an external file.

Pascal

```
procedure SaveToFile(const FileName: string = ''; Format: TDataPacketFormat = dfBinary);
```

C++

```
__fastcall SaveToFile(const AnsiString FileName = '', TDataPacketFormat Format = dfBinary);
```

Description

Call SaveToFile to write a client dataset's data to an external file for later use by this or other client datasets.

FileName (see page 8475) is the name of the external file to use. If the file already exists, its current contents are overwritten. If an empty string is passed for the FileName (see page 8475) parameter (or, in Delphi, if this parameter is omitted), the data is saved to the file specified by the FileName (see page 8475) property.

Format indicates what format to use when saving the data, binary (dfBinary) or XML (dfXML), or UTF8-based XML (dfXMLUTF8).

Delphi Examples:

```
{
This example requires two ClientDataSets, two DBGrids, two
DataSources and two DBNavigators.  Name the two
ClientDataSets CDS and CDS2. Set the DataSet property in the
first DataSource to CDS and name that DataSource DS.  Set the
DataSet property in the second DataSource to CDS2 and name
that DataSource DS2.  Set the DataSource in the first
DBNavigator to DS and the DataSource in the second DBNavigator
to DS2.  Set the DataSource in the first DBGrid to DS and the
DataSource in the second DBGrid to DS2.  Right click on CDS
and select the Fields Editor, then right click on the Field
Editor form and create two fields by selecting "new field".
In the field configuration window, set the name to HOST, the
Component value will automatically be set to CDSHOST.  Set
the filed type to String.  In the field configuration window
for the second field, set the name to PORTA, the Component
value will automatically be set to CDSPORTA.  Set the field
type to Integer.  The file used to load CDS must have an
attribute name of HOST with an attribute type of string and
an attribute name of PORTA with an attribute type of integer.
Add DB, DBCtrls, Grids, DBGrids, DBClient and SwSystem to the
uses clause.  "LoadFormFile" to start with the file, or
"CreateDataSet" to start from scratch.  You must "CloseDataSet"
after a "LoadFromFile" before you can do another "CreateDataSet".
}
{$IFNDEF UNICODE}
uses SwSystem;
{$ENDIF}

procedure TForm1.Button1Click(Sender: TObject);
begin
{$IFDEF UNICODE}
  CDS.LoadFromFile(GetCurrentDir + '\CDS.XML');
{$ELSE}
  CDS.LoadFromFile(gsAppPath + 'CDS.XML');
{$ENDIF}
end;

procedure TForm1.Button2Click(Sender: TObject);
begin
{$IFDEF UNICODE}
  CDS.SaveToFile(GetCurrentDir + '\CDS.XML', dfXML);
{$ELSE}
  CDS.SaveToFile(gsAppPath + 'CDS.XML', dfXML);
{$ENDIF}
end;

procedure TForm1.Button3Click(Sender: TObject);
begin
```

```
    CDS.CreateDataSet;
  end;

  procedure TForm1.Button4Click(Sender: TObject);
  begin
    CDS2.Data := CDS.Data;
  end;

  procedure TForm1.Button5Click(Sender: TObject);
  begin
    CDS.Close;
  end;
```

See Also

LoadFromFile (see page 8433)

SaveToStream (see page 8445)

FileName (see page 8475)

Saving Data to a File or Stream

Using a Dedicated File on Disk

45.1.8.4.138 TCustomClientDataSet.SaveToStream Method

Saves a client dataset's data to a stream.

Pascal

```
procedure SaveToStream(Stream: TStream; Format: TDataPacketFormat = dfBinary);
```

C++

```
__fastcall SaveToStream(TStream Stream, TDataPacketFormat Format = dfBinary);
```

Description

Call SaveToStream to write a client dataset's data to a stream.

Stream is the name of an existing stream to write to.

Format indicates what format to use when saving the data, binary (dfBinary) or XML (dfXML), or UTF8-based XML (dfXMLUTF8).

If the stream requires a buffer, use the DataSize (see page 8469) property to determine the required size of the buffer.

See Also

LoadFromStream (see page 8435)

SaveToFile (see page 8443)

DataSize (see page 8469)

Saving Data to a File or Stream

45.1.8.4.139 TCustomClientDataSet.SetAggregates Method

Pascal

```
procedure SetAggregates(Value: TAggregates); virtual;
```

C++

```
virtual __fastcall SetAggregates(TAggregates Value);
```

Description

This is SetAggregates, a member of class TCustomClientDataSet.

45.1.8.4.140 TCustomClientDataSet.SetAltRecBuffers Method

Sets record buffers when accessing field values.

Pascal

```
procedure SetAltRecBuffers(Old: PChar; New: PChar; Cur: PChar);
```

C++

```
__fastcall SetAltRecBuffers(const char * Old, const char * New, const char * Cur);
```

Description

Applications do not normally need to call this method. SetAltRecBuffers sets pointers to records buffers that are used when accessing the OldValue, NewValue, and CurValue properties of a field component belonging to the client dataset. These value are accessed only while processing updates.

See Also

TField (see page 7115)

45.1.8.4.141 TCustomClientDataSet.SetAppServer Method

Pascal

```
procedure SetAppServer(Value: IAppServer); virtual;
```

C++

```
virtual __fastcall SetAppServer(IAppServer Value);
```

Description

This is SetAppServer, a member of class TCustomClientDataSet.

45.1.8.4.142 TCustomClientDataSet.SetBookmarkData Method

Pascal

```
procedure SetBookmarkData(Buffer: PChar; Data: Pointer); override;
```

C++

```
virtual __fastcall SetBookmarkData(const char * Buffer, void * Data);
```

Description

This is SetBookmarkData, a member of class TCustomClientDataSet.

45.1.8.4.143 TCustomClientDataSet.SetBookmarkFlag Method

Pascal

```
procedure SetBookmarkFlag(Buffer: PChar; Value: TBookmarkFlag); override;
```

C++

```
virtual __fastcall SetBookmarkFlag(const char * Buffer, TBookmarkFlag Value);
```

Description

This is SetBookmarkFlag, a member of class TCustomClientDataSet.

45.1.8.4.144 TCustomClientDataSet.SetCommandText Method

Pascal

```
procedure SetCommandText(Value: WideString); virtual;
```

C++

```
virtual __fastcall SetCommandText(BSTR Value);
```

Description

This is SetCommandText, a member of class TCustomClientDataSet.

45.1.8.4.145 TCustomClientDataSet.SetCursorRange Method

Pascal

```
function SetCursorRange: Boolean;
```

C++

```
__fastcall Boolean SetCursorRange();
```

Description

This is SetCursorRange, a member of class TCustomClientDataSet.

45.1.8.4.146 TCustomClientDataSet.SetDataSetField Method

Pascal

```
procedure SetDataSetField(const Value: TDataSetField); override;
```

C++

```
virtual __fastcall SetDataSetField(const TDataSetField Value);
```

Description

This is SetDataSetField, a member of class TCustomClientDataSet.

45.1.8.4.147 TCustomClientDataSet.SetFieldData Method

Pascal

```
procedure SetFieldData(Field: TField; Buffer: Pointer); override;
```

C++

```
virtual __fastcall SetFieldData(TField Field, void * Buffer);
```

Description

This is SetFieldData, a member of class TCustomClientDataSet.

45.1.8.4.148 TCustomClientDataSet.SetFilterData Method

Pascal

```
procedure SetFilterData(const Text: string; Options: TFilterOptions);
```

C++

```
__fastcall SetFilterData(const AnsiString Text, TFilterOptions Options);
```

Description

This is SetFilterData, a member of class TCustomClientDataSet.

45.1.8.4.149 TCustomClientDataSet.SetFiltered Method

Pascal

```
procedure SetFiltered(Value: Boolean); override;
```

C++

```
virtual __fastcall SetFiltered(Boolean Value);
```

Description

This is SetFiltered, a member of class TCustomClientDataSet.

45.1.8.4.150 TCustomClientDataSet.SetFilterOptions Method

Pascal

```
procedure SetFilterOptions(Value: TFilterOptions); override;
```

C++

```
virtual __fastcall SetFilterOptions(TFilterOptions Value);
```

Description

This is SetFilterOptions, a member of class TCustomClientDataSet.

45.1.8.4.151 TCustomClientDataSet.SetFilterText Method

Pascal

```
procedure SetFilterText(const Value: string); override;
```

C++

```
virtual __fastcall SetFilterText(const AnsiString Value);
```

Description

This is SetFilterText, a member of class TCustomClientDataSet.

45.1.8.4.152 TCustomClientDataSet.SetIndexField Method

Pascal

```
procedure SetIndexField(Index: Integer; Value: TField);
```

C++

```
__fastcall SetIndexField(int Index, TField Value);
```

Description

This is SetIndexField, a member of class TCustomClientDataSet.

45.1.8.4.153 TCustomClientDataSet.SetKey Method

Enables setting of keys and ranges for a dataset prior to a search.

Pascal

```
procedure SetKey;
```

C++

```
__fastcall SetKey();
```

Description

Call SetKey to put the dataset into dsSetKey state and clear the current contents of the search key buffer. Use FieldByName to supply the buffer then with a new set of values prior to conducting a search.

Note: To modify an existing key or range, call EditKey (see page 8410).

See Also

EditKey (see page 8410)

FieldByName (see page 6936)

GotoKey (see page 8427)

SetRange (see page 8452)

SetRangeEnd (see page 8453)

SetRangeStart (see page 8454)

State (see page 7036)

Executing a Search with Goto Methods

45.1.8.4.154 TCustomClientDataSet.SetKeyBuffer Method

Pascal

```
procedure SetKeyBuffer(KeyIndex: TKeyIndex; Clear: Boolean);
```

C++

```
__fastcall SetKeyBuffer(TKeyIndex KeyIndex, Boolean Clear);
```

Description

This is SetKeyBuffer, a member of class TCustomClientDataSet.

45.1.8.4.155 TCustomClientDataSet.SetKeyExclusive Method

Pascal

```
procedure SetKeyExclusive(Value: Boolean);
```

C++

```
__fastcall SetKeyExclusive(Boolean Value);
```

Description

This is SetKeyExclusive, a member of class TCustomClientDataSet.

45.1.8.4.156 TCustomClientDataSet.SetKeyFieldCount Method

Pascal

```
procedure SetKeyFieldCount(Value: Integer);
```

C++

```
__fastcall SetKeyFieldCount(int Value);
```

Description

This is SetKeyFieldCount, a member of class TCustomClientDataSet.

45.1.8.4.157 TCustomClientDataSet.SetKeyFields Method

Pascal

```
procedure SetKeyFields(KeyIndex: TKeyIndex; const Values: array of const);
```

C++

```
__fastcall SetKeyFields(TKeyIndex KeyIndex, const array of const Values);
```

Description

This is SetKeyFields, a member of class TCustomClientDataSet.

45.1.8.4.158 TCustomClientDataSet.SetLinkRanges Method

Pascal

```
procedure SetLinkRanges(MasterFields: TList);
```

C++

```
__fastcall SetLinkRanges(TList MasterFields);
```

Description

This is SetLinkRanges, a member of class TCustomClientDataSet.

45.1.8.4.159 TCustomClientDataSet.SetOnFilterRecord Method

Pascal

```
procedure SetOnFilterRecord(const Value: TFilterRecordEvent); override;
```

C++

```
virtual __fastcall SetOnFilterRecord(const TFilterRecordEvent Value);
```

Description

This is SetOnFilterRecord, a member of class TCustomClientDataSet.

45.1.8.4.160 TCustomClientDataSet.SetOptionalParam Method

Saves a custom parameter with the data packet.

Pascal

```
procedure SetOptionalParam(const ParamName: string; const Value: OleVariant; IncludeInDelta:
Boolean = False); virtual;
```

C++

```
virtual __fastcall SetOptionalParam(const AnsiString ParamName, const OleVariant Value,
Boolean IncludeInDelta = False);
```

Description

You can add custom information to a data packet using the SetOptionalParam method. This information is saved with the data packet when it is saved to a file or stream, and copied with the value of the Data (see page 8467) property. For example, by setting a parameter in the OnGetData event of provider, application servers can include custom information with the data that is sent to client applications. Call GetOptionalParam (see page 8425) to retrieve the custom information from the data packet.

The ParamName parameter specifies the name under which the custom information is stored. It can be any value except one of the following:

UNIQUE_KEY	DEFAULT_ORDER	CHANGE_LOG	SERVER_COL
CONSTRAINTS	DATASET_CONTEXT	DATASET_DELTA	LCID
BDERECORD_X	TABLE_NAME	MD_FIELDLINKS	UPDATEMODE

The Value parameter is an OleVariant that represents the custom information.

The IncludeInDelta parameter specifies whether the parameter is also stored with the Delta (see page 8470) property. By including the parameter in the Delta (see page 8470) property, it is sent along with updates to the provider. The provider can then retrieve this information using the GetOptionalParam (see page 8425) method of the client dataset passed as a parameter to an OnUpdateData event handler.

Note: Do not confuse the optional data saved by this method with the Params (see page 8489) property.

See Also

GetOptionalParam (see page 8425)

Data (see page 8467)

Delta (see page 8470)

OnUpdateData (see page 18443)

Adding Application-specific Information to the Data

45.1.8.4.161 TCustomClientDataSet.SetProvider Method

Associates the client dataset with a provider in the same process space.

Pascal

```
procedure SetProvider(Provider: TComponent);
```

C++

```
__fastcall SetProvider(TComponent * Provider);
```

Description

Use SetProvider to specify a local provider component that provides data to and applies updates from the client dataset. The

client dataset communicates with this provider using the IAppServer interface specified by the AppServer (see page 8462) property.

Do not call SetProvider if the client dataset already uses an internal provider component. Also, do not use SetProvider for remote providers on an application server. If the provider is not in the same process space as the client dataset, use the ProviderName (see page 8492) property. If the provider has the same Owner as the client dataset, you can also use the ProviderName (see page 8492) property.

The Provider (see page 18419) parameter must be a descendant of TCustomProvider. Otherwise, SetProvider raises an exception.

Note: If you close the client dataset after assigning a provider using the SetProvider method, when you reopen the client dataset you must call SetProvider again to reassign that provider.

Specifying a Provider

45.1.8.4.162 TCustomClientDataSet.SetProviderEOF Method

Pascal

```
procedure SetProviderEOF(Value: Boolean); virtual;
```

C++

```
virtual __fastcall SetProviderEOF(Boolean Value);
```

Description

This is SetProviderEOF, a member of class TCustomClientDataSet.

45.1.8.4.163 TCustomClientDataSet.SetRange Method

Sets the starting and ending values of a range, and applies it.

Pascal

```
procedure SetRange(const StartValues: array of const; const EndValues: array of const);
```

C++

```
__fastcall SetRange(const array of const StartValues, const array of const EndValues);
```

Description

Call SetRange to specify a range and apply it to the dataset. The new range replaces the currently specified range, if any.

StartValues indicates the field values that designate the first record in the range. In C++, StartValues_Size is the index of the last value in the StartValues array.

EndValues indicates the field values that designate the last record in the range. In C++, EndValues_Size is the index of the last value in the EndValues array.

SetRange combines the functionality of SetRangeStart (see page 8454), SetRangeEnd (see page 8453), and ApplyRange (see page 8393) in a single procedure call. SetRange performs the following functions:

1Puts the dataset into dsSetKey state.

2Erases any previously specified starting range values and ending range values.

3Sets the start and end range values.

4Applies the range to the dataset.

After a call to SetRange, the cursor is left on the first record in the range.

If either StartValues or EndValues has fewer elements than the number of fields in the current index, then the remaining entries are set to NULL.

IndexFieldNames (see page 8482)

KeyExclusive (see page 8484)

SetRangeEnd (see page 8453)

SetRangeStart (see page 8454)

45.1.8.4.164 TCustomClientDataSet.SetRangeEnd Method

Indicates that subsequent assignments to field values specify the end of the range of rows to include in the dataset.

Pascal

```
procedure SetRangeEnd;
```

C++

```
__fastcall SetRangeEnd();
```

Description

Call SetRangeEnd to put the dataset into dsSetKey state, erase any previous end range values, and set them to NULL. Subsequent field assignments made with FieldByName specify the actual set of ending values for a range.

After assigning end-range values, call ApplyRange (see page 8393) to activate the modified range.

SetRangeStart (see page 8454)

45.1.8.4.165 TCustomClientDataSet.SetRangeStart Method

Indicates that subsequent assignments to field values specify the start of the range of rows to include in the dataset.

Pascal

```
procedure SetRangeStart;
```

C++

```
__fastcall SetRangeStart();
```

Description

Call SetRangeStart to put the dataset into dsSetKey state, erase any previous start range values, and set them to NULL. Subsequent field assignments to FieldByName specify the actual set of starting values for a range.

After assigning start-range values, call ApplyRange (see page 8393) to activate the modified range.

See Also

ApplyRange (see page 8393)

CancelRange (see page 8396)

EditRangeEnd (see page 8411)

EditRangeStart (see page 8411)

FieldByName (see page 6936)

45.1.8.4.166 TCustomClientDataSet.SetRecNo Method

Pascal

```
procedure SetRecNo(Value: Integer); override;
```

C++

```
virtual __fastcall SetRecNo(int Value);
```

Description

This is SetRecNo, a member of class TCustomClientDataSet.

45.1.8.4.167 TCustomClientDataSet.SetRemoteServer Method

Pascal

```
procedure SetRemoteServer(Value: TCustomRemoteServer); virtual;
```

C++

```
virtual __fastcall SetRemoteServer(TCustomRemoteServer Value);
```

Description

This is SetRemoteServer, a member of class TCustomClientDataSet.

45.1.8.4.168 TCustomClientDataSet.SwitchToIndex Method

Pascal

```
procedure SwitchToIndex(const IndexName: string);
```

C++

```
__fastcall SwitchToIndex(const AnsiString IndexName);
```

Description

This is SwitchToIndex, a member of class TCustomClientDataSet.

45.1.8.4.169 TCustomClientDataSet.SyncCursors Method

Pascal

```
procedure SyncCursors(Cursor1: IDSCursor; Cursor2: IDSCursor);
```

C++

```
__fastcall SyncCursors(IDSCursor Cursor1, IDSCursor Cursor2);
```

Description

This is SyncCursors, a member of class TCustomClientDataSet.

45.1.8.4.170 TCustomClientDataSet.UndoLastChange Method

Undoes the last edit, insert, or delete operation to a record in the client dataset.

Pascal

```
function UndoLastChange(FollowChange: Boolean): Boolean;
```

C++

```
__fastcall Boolean UndoLastChange(Boolean FollowChange);
```

Description

Call UndoLastChange to undo the last edit, insert, or delete operation to a record in the client dataset. FollowChange indicates whether to reposition the cursor on the restored record. If FollowChange is true, the cursor is positioned on the restored record. If FollowChange is false, the cursor remains on current record.

See Also

LogChanges (see page 8485)

Undoing Changes

45.1.8.4.171 TCustomClientDataSet.UpdateIndexDefs Method

Pascal

```
procedure UpdateIndexDefs; override;
```

C++

```
virtual __fastcall UpdateIndexDefs();
```

Description

This is UpdateIndexDefs, a member of class TCustomClientDataSet.

45.1.8.4.172 TCustomClientDataSet.UpdateStatus Method

Reports the update status for the current record in the dataset.

Pascal

```
function UpdateStatus: TUpdateStatus; override;
```

C++

```
virtual __fastcall TUpdateStatus UpdateStatus();
```

Description

Call UpdateStatus to determine the update status for the current record in the client dataset. Update status can change frequently as records are edited, inserted, or deleted. UpdateStatus offers a convenient method for applications to assess the current status before undertaking or completing operations that depend on the update status of the current record.

Note: To determine whether there are updates pending for an entire dataset, check the ChangeCount (see page 8463) property.

45.1.8.4.173 TCustomClientDataSet.WriteDataPacket Method

Pascal

```
procedure WriteDataPacket(Stream: TStream; WriteSize: Boolean; Format: TDataPacketFormat =
dfBinary);
```

C++

```
__fastcall WriteDataPacket(TStream Stream, Boolean WriteSize, TDataPacketFormat Format =
dfBinary);
```

Description

This is WriteDataPacket, a member of class TCustomClientDataSet.

45.1.8.5 TCustomClientDataSet Properties

The properties of the TCustomClientDataSet class are listed here.

Protected Properties

	Name	Description
	Aggregates (see page 8461)	Lists all aggregates that apply to the client dataset.
	AggregatesActive (see page 8461)	Specifies whether the client dataset calculates and maintains aggregate values.
	AutoCalcFields (see page 8463)	Determines when the OnCalcFields event is triggered and when lookup field values are calculated.
	CommandText (see page 8465)	Specifies an SQL command to be executed by the database server.
	Constraints (see page 8466)	Specifies record-level constraints that must be met when editing the data.
	DisableStringTrim (see page 8470)	Specifies whether trailing spaces are trimmed from field values when records are posted.
	DSBase (see page 8471)	Specifies the interface the client dataset uses to communicate with classes in Midas.dll or Midaslib.dcu (on Windows) or midas.so (on Linux).
R	DSCursor (see page 8471)	Provides access to the interface for the client dataset's data cursor.
	FetchOnDemand (see page 8471)	Indicates whether to fetch data packets from the provider on an as-needed basis.
	FieldDefs (see page 8472)	Points to the list of field definitions for the dataset.
	Filter (see page 8476)	Specifies the text of the current filter.
	Filtered (see page 8478)	Specifies whether or not filtering is active for a dataset.
	FilterOptions (see page 8478)	Specifies whether or not filtering is case insensitive, and whether or not partial comparisons are permitted when filtering records.
	IndexDefs (see page 8480)	Contains information about the indexes for a client dataset.
	IndexName (see page 8483)	Identifies an index for the client dataset.
R	IsClone (see page 8484)	This is IsClone, a member of class TCustomClientDataSet.
	MasterSource (see page 8486)	Specifies a data source component for the master dataset when establishing a detail-master relationship between this dataset and another one.
	ObjectView (see page 8487)	Specifies whether fields are stored hierarchically or flattened out in the Fields property.
	Params (see page 8489)	Contains parameter values that are sent to the provider.
	ProviderEOF (see page 8491)	Indicates whether the client dataset has all of its data.
R	Ranged (see page 8492)	This is Ranged, a member of class TCustomClientDataSet.
	ReadOnly (see page 8493)	Specifies whether the client dataset is read-only for this application.
	StoreDefs (see page 8495)	Indicates whether field and index definitions are saved with the client dataset.

Public Properties

	Name	Description
	Active (see page 8458)	Specifies whether the client dataset contains data.
R	ActiveAggs (see page 8460)	Lists the maintained aggregates supported by the current index.
	AppServer (see page 8462)	Provides access to the interface the client dataset uses to communicate with a provider.
R	ChangeCount (see page 8463)	Indicates the number of changes in the change log.
R	CloneSource (see page 8464)	Indicates the client dataset (if any) with which this client dataset shares data.
	ConnectionBroker (see page 8466)	Specifies a connection broker that handles the connection to an application server.
	Data (see page 8467)	Represents the data of the client dataset in a transportable format.
	DataSetField (see page 8469)	Indicates the TDataSetField component that represents this client dataset.
R	DataSize (see page 8469)	Indicates the number of bytes required to represent the Data (see page 8467) property.
R	Delta (see page 8470)	Represents a packet of change log data.
	FileName (see page 8475)	Specifies a file that stores the data of the client dataset.
R	GroupingLevel (see page 8479)	Indicates the depth of grouping support provided by the current index.
R	HasAppServer (see page 8480)	Indicates whether the client dataset is connected to a provider.
R	IndexFieldCount (see page 8481)	Indicates the number of fields that make up the current index.
	IndexFieldNames (see page 8482)	Lists the fields to use as an index.
	IndexFields (see page 8482)	Specifies the fields associated with the current index.
	KeyExclusive (see page 8484)	Specifies the upper and lower boundaries for a range.
	KeyFieldCount (see page 8484)	Specifies the number of fields to use when conducting a partial key search on a multi-field key.
R	KeySize (see page 8485)	Indicates the size of the current key used for the dataset.

	LogChanges (see page 8485)	Indicates whether to maintain a change log separate from the data.
	MasterFields (see page 8486)	Names one or more fields in a master table to link with corresponding fields in this dataset in order to establish a master-detail relationship.
	PacketRecords (see page 8488)	Indicates the number or type of records in a single data packet.
	ProviderName (see page 8492)	Specifies the name of a provider component that supplies data to and applies updates from the client dataset..
	RemoteServer (see page 8493)	Specifies the connection component that this client dataset uses to connect to an application server.
	SavePoint (see page 8494)	Represents the current state of edits when logging changes.
	StatusFilter (see page 8495)	Filters the client dataset so that it exposes only those records with a specific update status.
	XMLData (see page 8496)	Represents the data of the client dataset in XML.

45.1.8.5.1 TCustomClientDataSet.Active Property

Specifies whether the client dataset contains data.

Pascal

```
property Active: Boolean;
```

C++

```
__property Boolean Active;
```

Description

Use Active to determine whether the client dataset makes its data available. When Active is false, the client dataset is closed; It can't manipulate the data it represents. When Active is true, data can be read or edited using the client dataset.

Setting Active to true:

1Fills the client dataset with data. Depending on the other properties of the client dataset, this data comes from:

The file specified by the FileName (see page 8475) property.

The provider specified by the ProviderName (see page 8492) property or SetProvider (see page 8451) method. (For some TCustomClientDataSet (see page 8373) descendants, this is an internal provider component)

The data that was active when the client dataset was deactivated (only if the application has run continuously since the dataset was deactivated).

2Triggers a BeforeOpen (see page 8518) event.

3Sets the State property to dsBrowse.

4Opens a cursor into the dataset.

5Triggers an After Open event.

If the client dataset has never been active previously, setting Active to true defines the structure (metadata) of the client dataset. This structure is retrieved with the data packet from the provider or stored on disk, or, if there is no data packet, it is built using the current value of the FieldDefs (see page 8472) property or from the persistent field components listed by the Fields property.

If an error occurs during the dataset open, the dataset state is set to dsInactive, and the cursor is closed.

Setting Active to false:

1Triggers a BeforeClose (see page 8512) event.

2Sets the State property to dsInactive.

3Closes the cursor, saving the current data to disk if the FileName (see page 8475) property is set, and saving the current

data packet to a cache so that it can be restored when the client dataset is reopened.

4Triggers an AfterClose (see page 8500) event.

Note: Calling the Open method sets Active to true; calling the Close method sets Active to false.

Delphi Examples:

```
{
This example shows how to use the BeforeGetRecords event
handler (a TRemoteEventType value) to send the provider
information it needs for incremental data fetching. Before
fetching the next data packet, the client dataset packages
up the key value of the last record so that the provider
knows where to begin the next data packet. It also sends
some application-specific information, which is stored in
Memo1.  This method is used to pass the sql statement and the
value of the first field for the last record to the server so
that the server can return the correct records. The complete
project using this code example is in
Demos/DelphiWin32/VCLWin32/MIDAS/Pooler.
}
procedure TForm1.ClientDataSet1BeforeGetRecords(Sender: TObject; var OwnerData: OleVariant);
var
  LastValue: OleVariant;
  CDSClone: TClientDataSet;
begin
  if ClientDataSet1.Active then
  begin
    CDSClone := TClientDataSet.Create(Form1);
    try
      CDSClone.CloneCursor(ClientDataSet1, True);
      { turn off FetchOnDemand so that the clone only fetches
        the last LOCAL record }
      CDSClone.FetchOnDemand := False;
      CDSClone.Last;
      LastValue := CDSClone.Fields[0].AsString;
      CDSClone.Close;
    finally
      CDSClone.Free;
    end;
  end else
    LastValue := NULL;
  OwnerData := VarArrayOf([Memo1.Lines.Text, LastValue]);
end;

procedure TForm1.Button2Click(Sender: TObject);
begin
  ClientDataSet1.PacketRecords := StrToInt(Edit1.Text);
  ClientDataSet1.GetNextPacket;
end;
{
The following code fragment illustrates how DataSets and
DataSetCount can be used to ensure that an action is taken
for every open dataset.  Assign CheckButtonActive as the
AfterClose and AfterOpen event handlers for TClientDataSet1.
}
procedure TForm1.Button1Click(Sender: TObject);
var
  I: Integer;
begin
  if not RemoteServer1.Connected then
    RemoteServer1.Connected := True;
  ClientDataSet1.Close;
  with RemoteServer1 do
```

```
    begin
      for I := 0 to DataSetCount - 1 do
        DataSets[I].EnableControls;
    end;
    ClientDataSet1.Open;
  end;

  procedure TForm1.Button3Click(Sender: TObject);
  var
    I: Integer;
  begin
    ClientDataSet1.Close;
    RemoteServer1.Connected := False;
    with RemoteServer1 do
    begin
      for I := 0 to DataSetCount - 1 do
        DataSets[I].DisableControls;
    end;
  end;

  procedure TForm1.CheckButtonActive(DataSet: TDataSet);
  begin
    Button1.Enabled := not ClientDataSet1.Active;
    Button2.Enabled := ClientDataSet1.Active;
    Button3.Enabled := ClientDataSet1.Active;
  end;
```

45.1.8.5.2 TCustomClientDataSet.ActiveAggs Property

Lists the maintained aggregates supported by the current index.

Pascal

```
property ActiveAggs [Index: Integer]: TList;
```

C++

```
__property TList ActiveAggs[int Index];
```

Description

Read ActiveAggs to obtain a list of currently maintained aggregates for a specified grouping level. The Index parameter specifies whether the aggregates summarize data over the entire client dataset (Index = 0), over the current value of the first grouping level (Index = 1), over the current value of the second grouping level (Index = 2), and so on.

ActiveAggs is a List object (TList) whose items are a subset of the possible aggregates maintained by the Aggregates (see page 8461) property. If there are no aggregates maintained for the specified grouping level, the value of ActiveAggs is either an

empty list ornil (Delphi) or NULL (C++).

Note: Each grouping level is determined by the current index. Grouping level 1 is the set of records with the same value on the first field in the index. Grouping level 2 is the set of records with the same values on the first two fields in the index, and so on.

See Also

Aggregates (see page 8461)

AggregatesActive (see page 8461)

GroupingLevel (see page 8479)

IndexName (see page 8483)

45.1.8.5.3 TCustomClientDataSet.Aggregates Property

Lists all aggregates that apply to the client dataset.

Pascal

```
property Aggregates: TAggregates;
```

C++

```
__property TAggregates Aggregates;
```

Description

Use Aggregates to define aggregates that summarize the data in the client dataset. Aggregates is a collection of TAggregate (see page 8268) objects, each of which defines a formula for calculating an aggregate value from a group of records in the client dataset. The individual aggregates can summarize all the records in the client dataset or subgroups of records that have the same value on a set of fields. Aggregates that summarize a subgroup of records are associated with indexes, and can only be used when the associated index is current.

Do not use Aggregates to obtain summarized values maintained by the client dataset. Aggregates can contain TAggregate (see page 8268) objects that are not currently active. Instead, use the ActiveAggs (see page 8460) property, which represents only those TAggregate (see page 8268) objects that are currently active.

Note: You do not need to add a TAggregate (see page 8268) object to the Aggregates collection when you add an aggregate field using the Fields editor. The Fields editor automatically adds TAggregate (see page 8268) objects to Aggregates for every aggregate field you define.

ActiveAggs (see page 8460)

TAggregate (see page 8268)

IndexName (see page 8483)

TAggregateField (see page 6743)

Obtaining Aggregate Values

Specifying Aggregates

Defining an Aggregate Field

45.1.8.5.4 TCustomClientDataSet.AggregatesActive Property

Specifies whether the client dataset calculates and maintains aggregate values.

Pascal

```
property AggregatesActive: Boolean;
```

C++

```
__property Boolean AggregatesActive;
```

Description

Use AggregatesActive to indicate whether the client dataset should maintain aggregate values. When AggregatesActive is false (the default), the client dataset does not support maintained aggregates. This allows the client dataset to avoid the overhead of calculating values that the application is not using. When AggregatesActive is true, the client dataset calculates and maintains all aggregate values specified by the Aggregates (see page 8461) property that are compatible with the current index.

When aggregates are maintained, the Value method of every active aggregate object returns a value that reflects the current data in the client dataset. When users edit the data in the dataset, these values are recalculated to reflect the user's changes.

Note: To selectively enable and disable aggregates rather than turning them all on or off at once, use the Active (see page 8458) property of individual TAggregate (see page 8268) objects. These objects are available through the Aggregates (see page 8461) property.

See Also

ActiveAggs (see page 8460)

Aggregates (see page 8461)

IndexName (see page 8483)

Value (see page 8273)

Active (see page 8274)

45.1.8.5.5 TCustomClientDataSet.AppServer Property

Provides access to the interface the client dataset uses to communicate with a provider.

Pascal

```
property AppServer: IAppServer;
```

C++

```
__property IAppServer AppServer;
```

Description

Use AppServer to communicate with the provider that supplies data to and resolves updates for the client dataset. If the client dataset uses a provider in the same process space, AppServer is the interface to an internally created object that dispatches IAppServer calls to the local or internal provider. If the provider is on a remote application server, AppServer has the same value as the AppServer property of the connection component.

Applications don't need to work directly with the IAppServer interface. The properties and methods of the client dataset are automatically translated into IAppServer calls as needed.

See Also

HasAppServer (see page 8480)

AppServer (see page 8532)

SetProvider (see page 8451)

ProviderName (see page 8492)

TDataSetProvider (see page 18508)

Overriding the Dataset On the Application Server

Communicating with the Client Dataset

45.1.8.5.6 TCustomClientDataSet.AutoCalcFields Property

Determines when the OnCalcFields event is triggered and when lookup field values are calculated.

Pascal

```
property AutoCalcFields: Boolean;
```

C++

```
__property Boolean AutoCalcFields;
```

Description

Set AutoCalcFields to control when the OnCalcFields event is triggered to update calculated fields and when lookup fields are calculated.

A calculated field is one that derives its value from the values of one or more fields in the active record, sometimes with additional processing. Lookup fields are fields whose values come from a secondary dataset or lookup cache.

Note: Unidirectional datasets support calculated fields but not unidirectional fields. For unidirectional datasets, OnCalcFields only controls when calculated fields are updated.

When AutoCalcFields is true (the default), Lookup fields are recalculated and OnCalcFields is triggered when:

The dataset is opened.

The dataset is put into dsEdit state.

Focus moves from one visual control to another, or from one column to another in a data-aware grid and modifications have been made to the record.

When AutoCalcFields is false, Lookup fields are recalculated and the OnCalcFields event occurs only when

The dataset is opened.

The dataset is put into dsEdit state.

A record is retrieved from a database.

If an application permits users to change data, OnCalcFields is frequently triggered. In these cases an application may set AutoCalcFields to false to reduce the frequency with which the OnCalcFields event occurs and with which lookup values are fetched.

See Also

OnCalcFields (see page 7053)

Calculating Fields

45.1.8.5.7 TCustomClientDataSet.ChangeCount Property

Indicates the number of changes in the change log.

Pascal

```
property ChangeCount: Integer;
```

C++

```
__property int ChangeCount;
```

Description

Check (see page 8397) ChangeCount to determine how many modifications are pending for the dataset. ChangeCount increases when the data is edited. It is reset when updates are applied or merged and any differences are reconciled by the client dataset.

Delphi Examples:

```
{
This BeforeDisconnect event handler makes sure that the
client dataset has applied all its pending updates before
terminating the connection to the server.
}
procedure TForm1.RemoteServer1BeforeDisconnect(Sender: TObject);
begin
  if (ClientDataSet1.ChangeCount > 0) then
    ClientDataSet1.ApplyUpdates(-1);
end;
```

Merging Changes into Data

Undoing Changes

Using the BDE to Cache Updates

Updating Data in dbExpress Applications

45.1.8.5.8 TCustomClientDataSet.CloneSource Property

Indicates the client dataset (if any) with which this client dataset shares data.

Pascal

```
property CloneSource: TCustomClientDataSet;
```

C++

```
__property TCustomClientDataSet CloneSource;
```

Description

Read CloneSource to access another client dataset that shares its data cursor with this one. CloneSource is set by the CloneCursor (see page 8398) method when the datasets are linked.

If the client dataset has not called CloneCursor (see page 8398) to share the data cursor of another client dataset, CloneSource is nil (Delphi) or NULL (C++).

See Also

CloneCursor (see page 8398)

45.1.8.5.9 TCustomClientDataSet.CommandText Property

Specifies an SQL command to be executed by the database server.

Pascal

```
property CommandText: WideString;
```

C++

```
__property BSTR CommandText;
```

Description

CommandText specifies what data the client dataset wants to receive from its (internal or external) provider. It is either

An SQL statement (query) for the database server to execute.

The name of a table or stored procedure.

If the client dataset uses an internal provider, CommandText is required. On TSQLClientDataSet, the CommandType property indicates whether it represents a query, table name, or stored procedure name.

If the client dataset uses an external provider component, CommandText represents a replacement for the property that the source dataset uses to identify its data (the SQL of a query, or the name of a table or stored procedure). If the provider's Options property does not include poAllowCommandText (which, by default, it does not), then CommandText has no effect.

When CommandText is a non-empty string, its value is sent to the provider when the client dataset opens or when you call the Execute (see page 8413) method. The specified SQL command, table, or stored procedure overrides the current value of the provider's associated dataset.

If the SQL statement takes parameters, be sure that they are in the correct order, as the provider performs parameter binding on CommandText statements by index only.

Delphi Examples:

```
{
The following code fragment illustrates how DataSets and
DataSetCount can be used to ensure that an action is taken
for every open dataset.  Assign CheckButtonActive as the
AfterClose and AfterOpen event handlers for TClientDataSet1.
}
procedure TForm1.Button1Click(Sender: TObject);
var
  I: Integer;
begin
  if not RemoteServer1.Connected then
    RemoteServer1.Connected := True;
  ClientDataSet1.Close;
  with RemoteServer1 do
  begin
    for I := 0 to DataSetCount - 1 do
      DataSets[I].EnableControls;
  end;
  // Memo1 must contain a "select * from xxx" employee, customer, client
  // Look in Program Files/Common Files/CodeGear Shared/Data for db files
  // Notice, using the CommandText, don't need a BeforeGetRecords event
  // handler for the ClientDataSet or the DataSetProvider.

  ClientDataSet1.CommandText := Memo1.Lines.Text;
  ClientDataSet1.Open;
```

```
end;
```

CommandType

Overriding the Dataset On the Application Server

Overview of Using Cached Updates

Setting Up a Simple Dataset

45.1.8.5.10 TCustomClientDataSet.ConnectionBroker Property

Specifies a connection broker that handles the connection to an application server.

Pascal

```
property ConnectionBroker: TConnectionBroker;
```

C++

```
__property TConnectionBroker ConnectionBroker;
```

Description

Use ConnectionBroker to let a connection broker handle the connection to the server that supplies the client dataset with data. The connection broker specified by ConnectionBroker simply sets the RemoteServer (see page 8493) property to the value of its Connection property.

ConnectionBroker adds an extra layer of indirection to the specification of a connection component. This can make it easier to change the component you use to connect to an application server. If you have several client datasets in an application that all use the same connection broker, then you can change the component that connects them all to the application server by changing a single property (the Connection property of the connection broker) rather than having to change the RemoteServer (see page 8493) property for every client dataset in the application.

RemoteServer (see page 8493)

Connection (see page 8368)

Specifying a Provider

Specifying the Provider using TLocalConnection or TConnectionBroker

45.1.8.5.11 TCustomClientDataSet.Constraints Property

Specifies record-level constraints that must be met when editing the data.

Pascal

```
property Constraints: TCheckConstraints;
```

C++

```
__property TCheckConstraints Constraints;
```

Description

Use Constraints to read or add record-level constraints to the dataset. Record-level constraints usually impose relationships between the fields in a single record. Constraints that limit the value of a single field should be added to the individual field components.

See Also

TCheckConstraint (see page 6841)

CustomConstraint (see page 7156)

ImportedConstraint (see page 7167)

Constraining Data Values

45.1.8.5.12 TCustomClientDataSet.Data Property

Represents the data of the client dataset in a transportable format.

Pascal

```
property Data: OleVariant;
```

C++

```
__property OleVariant Data;
```

Description

Data represents the client dataset's local, in-memory copy of its data, encoded as a data packet. This is the data in the binary format used internally by the client dataset.

This data packet can originate from a provider, a file on disk, or the Data property of another client data set.

Note: To obtain a copy of the client dataset's data as an XML data packet instead of in a binary format, use the XMLData (see page 8496) property.

Delphi Examples:

```
{
This example requires two ClientDataSets, two DBGrids, two
DataSources and two DBNavigators.  Name the two
ClientDataSets CDS and CDS2. Set the DataSet property in the
first DataSource to CDS and name that DataSource DS.  Set the
DataSet property in the second DataSource to CDS2 and name
that DataSource DS2.  Set the DataSource in the first
DBNavigator to DS and the DataSource in the second DBNavigator
to DS2.  Set the DataSource in the first DBGrid to DS and the
DataSource in the second DBGrid to DS2.  Right click on CDS
and select the Fields Editor, then right click on the Field
Editor form and create two fields by selecting "new field".
In the field configuration window, set the name to HOST, the
Component value will automatically be set to CDSHOST.  Set
the filed type to String.  In the field configuration window
for the second field, set the name to PORTA, the Component
value will automatically be set to CDSPORTA.  Set the field
```

```
type to Integer.  The file used to load CDS must have an
attribute name of HOST with an attribute type of string and
an attribute name of PORTA with an attribute type of integer.
Add DB, DBCtrls, Grids, DBGrids, DBClient and SwSystem to the
uses clause.  "LoadFormFile" to start with the file, or
"CreateDataSet" to start from scratch.  You must "CloseDataSet"
after a "LoadFromFile" before you can do another "CreateDataSet".
}
{$IFNDEF UNICODE}
uses SwSystem;
{$ENDIF}

procedure TForm1.Button1Click(Sender: TObject);
begin
{$IFDEF UNICODE}
  CDS.LoadFromFile(GetCurrentDir + '\CDS.XML');
{$ELSE}
  CDS.LoadFromFile(gsAppPath + 'CDS.XML');
{$ENDIF}
end;

procedure TForm1.Button2Click(Sender: TObject);
begin
{$IFDEF UNICODE}
  CDS.SaveToFile(GetCurrentDir + '\CDS.XML', dfXML);
{$ELSE}
  CDS.SaveToFile(gsAppPath + 'CDS.XML', dfXML);
{$ENDIF}
end;

procedure TForm1.Button3Click(Sender: TObject);
begin
  CDS.CreateDataSet;
end;

procedure TForm1.Button4Click(Sender: TObject);
begin
  CDS2.Data := CDS.Data;
end;

procedure TForm1.Button5Click(Sender: TObject);
begin
  CDS.Close;
end;
```

Applying Updates

Editing Data

Merging Changes into Data

Communicating with the Client Dataset

45.1.8.5.13 TCustomClientDataSet.DataSetField Property

Indicates the TDataSetField component that represents this client dataset.

Pascal

```
property DataSetField: TDataSetField;
```

C++

```
__property TDataSetField DataSetField;
```

Description

Use DataSetField when the client dataset is the nested detail set of another (master) client dataset. Read DataSetField to access the data set field component in the master dataset that comprises this client dataset. Set DataSetField to a field component in the master dataset to assign this client dataset as the value of that field component.

When setting DataSetField, the ProviderName (see page 8492), RemoteServer (see page 8493), and FileName (see page 8475) properties of the client dataset are cleared. This is because the client dataset's data is now maintained by the master table in which it is nested.

Note: The master dataset that includes the TDataSetField component must be another client dataset. Otherwise, setting DataSetField raises an exception. Further, setting DataSetField to a TDataSetField that is contained in the same client dataset leads to an exception (A dataset can't be nested in itself).

See Also

NestedDataSet (see page 7070)

ProviderName (see page 8492)

RemoteServer (see page 8493)

FileName (see page 8475)

45.1.8.5.14 TCustomClientDataSet.DataSize Property

Indicates the number of bytes required to represent the Data (see page 8467) property.

Pascal

```
property DataSize: Integer;
```

C++

```
__property int DataSize;
```

Description

Read DataSize to determine the number of bytes required for storing the client dataset's data. For example, before streaming the Data (see page 8467) property to a fixed size buffer using the SaveToStream (see page 8445) method, read DataSize to determine the necessary size of that buffer.

See Also

Data (see page 8467)

SaveToStream (see page 8445)

RecordSize

45.1.8.5.15 TCustomClientDataSet.Delta Property

Represents a packet of change log data.

Pascal

```
property Delta: OleVariant;
```

C++

```
__property OleVariant Delta;
```

Description

Use Delta to pass a packet of change log data from the client dataset to a provider. Delta contains only information about those records inserted, modified, or deleted through the client.

When the client dataset is linked to a provider, Delta is passed as an argument to the ApplyUpdates (see page 8394) and Reconcile (see page 8441) methods, which use the information in the change log to update the database. On return from successful application of updates, Delta is cleared. If update errors occur, the value of Delta after applying updates depends on the error tolerance allowed by the client dataset. This value is

- All change log data when the maximum number of tolerated errors is encountered and all changes are rolled back.
- Only those changes that could not be applied when fewer errors occurred than the maximum specified as a tolerance level.

In file-based applications, Delta is cleared when the changes are merged into the Data (see page 8467) property using the MergeChangeLog (see page 8437) method.

See Also

ApplyUpdates (see page 8394)

Data (see page 8467)

MergeChangeLog (see page 8437)

Reconcile (see page 8441)

AS_ApplyUpdates (see page 16451)

Applying Updates

Editing Data

45.1.8.5.16 TCustomClientDataSet.DisableStringTrim Property

Specifies whether trailing spaces are trimmed from field values when records are posted.

Pascal

```
property DisableStringTrim: Boolean;
```

C++

```
__property Boolean DisableStringTrim;
```

Description

When DisableStringTrim is false, trailing spaces are trimmed from field values when records are posted. When DisableStringTrim is true, field values are posted exactly as typed, including any trailing spaces.

45.1.8.5.17 TCustomClientDataSet.DSBase Property

Specifies the interface the client dataset uses to communicate with classes in Midas.dll or Midaslib.dcu (on Windows) or midas.so (on Linux).

Pascal

```
property DSBase: IDSBase;
```

C++

```
__property IDSBase DSBase;
```

Description

Applications do not use the protected DSBase property. Client datasets use this interface internally to implement database operations.

See Also

DSCursor (see page 8471)

45.1.8.5.18 TCustomClientDataSet.DSCursor Property

Provides access to the interface for the client dataset's data cursor.

Pascal

```
property DSCursor: IDSCursor;
```

C++

```
__property IDSCursor DSCursor;
```

Description

Applications do not use the protected DSCursor property. Client datasets obtain this interface when the Active (see page 8458) property is set to true. They use the interface for navigating, posting edits, filtering records, and so on.

See Also

DSBase (see page 8471)

Active (see page 7004)

45.1.8.5.19 TCustomClientDataSet.FetchOnDemand Property

Indicates whether to fetch data packets from the provider on an as-needed basis.

Pascal

```
property FetchOnDemand: Boolean;
```

C++

```
__property Boolean FetchOnDemand;
```

Description

By default FetchOnDemand is true, meaning that the client dataset fetches additional packets of data as needed (for example, as a user scrolls through data, or conducts a search). If the provider does not automatically include BLOB fields or nested detail sets in data packets, setting FetchOnDemand to true causes the client dataset to fetch these values when needed as well.

Set FetchOnDemand to false only if your application contains code that explicitly fetches data packets as needed using the GetNextPacket (see page 8423) method. Similarly, if FetchOnDemand is false and the provider does not include BLOB data

by default (Options includes poFetchBlobsOnDemand), the application must fetch BLOB fields explicitly using the FetchBlobs (see page 8414) method. If the provider does not include nested detail sets (Options includes poFetchDetailsOnDemand) and FetchOnDemand is false, the application must fetch nested details explicitly using the FetchDetails (see page 8414) method.

Delphi Examples:

```
{
This example shows how to use the BeforeGetRecords event
handler (a TRemoteEventType value) to send the provider
information it needs for incremental data fetching. Before
fetching the next data packet, the client dataset packages
up the key value of the last record so that the provider
knows where to begin the next data packet. It also sends
some application-specific information, which is stored in
Memo1.  This method is used to pass the sql statement and the
value of the first field for the last record to the server so
that the server can return the correct records. The complete
project using this code example is in
Demos/DelphiWin32/VCLWin32/MIDAS/Pooler.
}
procedure TForm1.ClientDataSet1BeforeGetRecords(Sender: TObject; var OwnerData: OleVariant);
var
  LastValue: OleVariant;
  CDSClone: TClientDataSet;
begin
  if ClientDataSet1.Active then
  begin
    CDSClone := TClientDataSet.Create(Form1);
    try
      CDSClone.CloneCursor(ClientDataSet1, True);
      { turn off FetchOnDemand so that the clone only fetches
        the last LOCAL record }
      CDSClone.FetchOnDemand := False;
      CDSClone.Last;
      LastValue := CDSClone.Fields[0].AsString;
      CDSClone.Close;
    finally
      CDSClone.Free;
    end;
  end else
    LastValue := NULL;
  OwnerData := VarArrayOf([Memo1.Lines.Text, LastValue]);
end;

procedure TForm1.Button2Click(Sender: TObject);
begin
  ClientDataSet1.PacketRecords := StrToInt(Edit1.Text);
  ClientDataSet1.GetNextPacket;
end;
```

Requesting Data from the Source Dataset or Document

45.1.8.5.20 TCustomClientDataSet.FieldDefs Property

Points to the list of field definitions for the dataset.

Pascal

```
property FieldDefs: TFieldDefs;
```

C++

```
__property TFieldDefs FieldDefs;
```

Description

FieldDefs lists the field definitions for a dataset. While an application can examine FieldDefs to explore the field definitions for a dataset, it should not change these definitions unless creating a new table with CreateTable or CreateDataSet.

To access fields and field values in a dataset, use the Fields, AggFields, and FieldValues properties, and the FieldsByName method.

Note: If the dataset includes object field descendants, FieldDefs represents a hierarchical view of the data, meaning that the definitions include object field definitions. To determine the definitions in a flattened view, use FieldDefList instead.

C++ Examples:

```
/*
The following code creates and activates a client dataset in
the form's OnCreate event handler.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  TFieldDefs *pDefs = CDS2->FieldDefs;
  TFieldDef *pDef = pDefs->AddFieldDef();
  pDef->DataType = ftInteger;
  pDef->Name = "Field1";

  pDef = pDefs->AddFieldDef();
  pDef->DataType = ftString;
  pDef->Size = 10;
  pDef->Name = "Field2";

  TIndexDef *pIDef = CDS2->IndexDefs->AddIndexDef();
  pIDef->Fields = "Field1";
  pIDef->Name = "IntIndex";

  CDS2->CreateDataSet();
}
```

Delphi Examples:

```
{
The following code creates and activates a client dataset in
the form's OnCreate event handler.
}
procedure TForm1.FormCreate(Sender: TObject);
begin
  with CDS2 do
  begin
    with FieldDefs.AddFieldDef do
    begin
      DataType := ftInteger;
      Name := 'Field1';
    end;
    with FieldDefs.AddFieldDef do
    begin
      DataType := ftString;
      Size := 10;
      Name := 'Field2';
    end;
```

```
      with IndexDefs.AddIndexDef do
      begin
        Fields := 'Field1';
        Name := 'IntIndex';
      end;
      CreateDataSet;
    end;
  end;
  { The following example shows how to create a table. }
  procedure TForm1.Button1Click(Sender: TObject);
  begin
    Table1.Close;
    Table1.DeleteTable;
  end;

  procedure TForm1.FormCreate(Sender: TObject);
  var
    i: Integer;
  begin
    Table1:= TTable.Create(Form1);
    with Table1 do
    begin
      DatabaseName := 'DBDEMOS';
      TableType := ttParadox;
      TableName := 'CustInfo';
      Table1.Active := False;
      { Don't overwrite an existing table }
      if Table1.Exists then
        MessageDlg('CustInfo table already exists.', mtWarning, [mbOK], 0)
      else
      begin
        { The Table component must not be active }
        { First, describe the type of table and give }
        { it a name }
        { Next, describe the fields in the table }
        with FieldDefs do
        begin
          Clear;
          with AddFieldDef do
          begin
            Name := 'Field1';
            DataType := ftInteger;
            Required := True;
          end;
          with AddFieldDef do
          begin
            Name := 'Field2';
            DataType := ftString;
            Size := 30;
          end;
        end;
        { Next, describe any indexes }
        with IndexDefs do
        begin
          Clear;
          { The 1st index has no name because it is
          { a Paradox primary key }
          with AddIndexDef do
          begin
            Name := '';
            Fields := 'Field1';
            Options := [ixPrimary];
          end;
          with AddIndexDef do
          begin
            Name := 'Fld2Indx';
```

```
            Fields := 'Field2';
            Options := [ixCaseInsensitive];
          end;
        end;
        { Call the CreateTable method to create the table }
        CreateTable;
        Table1.Active:= True;
        for i := 1 to 20 do
          Table1.AppendRecord([i*111, i*222]);
      end;
    end;
    DS2.DataSet:= Table1;
    DBGrid2.DataSource.DataSet:= Table1;
    Table1.Active:= True;
  end;
```

Creating and Deleting Tables

45.1.8.5.21 TCustomClientDataSet.FileName Property

Specifies a file that stores the data of the client dataset.

Pascal

```
property FileName: string;
```

C++

```
__property AnsiString FileName;
```

Description

Set FileName if the client dataset always reads its data from and writes its data to a single file. When FileName represents a valid file name, the client dataset automatically writes its data to that file when it is closed. When FileName specifies the name of an existing file, the client dataset automatically reads its data from that file when it is opened.

Changes are not merged into the data when it is saved to the file. This allows an application that employs the "briefcase" model to set FileName without losing updates that are destined for a database server. Single-tiered applications should explicitly merge changes before closing the dataset and saving the data to disk.

Note: When client datasets write their data to a file, they overwrite the contents of the file. Any previous contents of the file are

lost.

To read from or write to a different file, use the LoadFromFile (see page 8433) and SaveToFile (see page 8443) methods instead. These methods can also be used to load and save data at times other than when the Active (see page 8458) property changes.

SaveToFile (see page 8443)

Loading Data from a File or Stream

Saving Data to a File or Stream

Using a Dedicated File on Disk

45.1.8.5.22 TCustomClientDataSet.Filter Property

Specifies the text of the current filter.

Pascal

```
property Filter: string;
```

C++

```
__property AnsiString Filter;
```

Description

Use Filter to specify a dataset filter. When filtering is applied to a client dataset, only those records that meet a filter's conditions are available to an application. Filter contains the string that describes the filter condition. Client datasets support the following set of filter operations: See the Limiting what records appear link at the bottom of this topic for a complete list of available filter operations.

Operator or function ComparisonsExampleComment

Operator or function Comparisons	Example	Comment
=	State = 'CA'	
<>	State <> 'CA'	
>=	DateEntered >= '1/1/1998'	
<=	Total <= 100,000	
>	Percentile > 50	
<	Field1 < Field2	
BLANK	State <> 'CA' or State = BLANK	Blank records do not appear unless explicitly included in the filter.
IS NULL	Field1 IS NULL	
IS NOT NULL	Field1 IS NOT NULL	

Logical operators		
and	State = 'CA' and Country = 'US'	
or	State = 'CA' or State = 'MA'	
not	not (State = 'CA')	
Arithmetic operators		
+	Total + 5 > 100	Applies to numbers, strings, or date (time) + number
-	Field1 - 7 <> 10	Applies to numbers, dates, or date (time) - number
*	Discount * 100 > 20	Applies to numbers only
/	Discount > Total / 5	Applies to numbers only
String functions		
Upper	Upper(Field1) = 'ALWAYS'	
Lower	Lower(Field1 + Field2) = 'josp'	
Substring	Substring(DateString,8) = '1998' | Substring(DateString,1,3) = 'JAN'	Value goes from position of second argument to end or number of chars in third arg. First char has position 1.
Trim	Trim(Field1 + Field2) | Trim(Field1, '-')	removes third argument from front and back. If no third argument, trims spaces.
TrimLeft	TrimLeft(StringField) | TrimLeft(Field1, '$') <> ''	See Trim
TrimRight	TrimRight(StringField) | TrimRight(Field1, '.') <> ''	See Trim
DateTime functions		
Year	Year(DateField) = 2000	
Month	Month(DateField) <> 12	
Day	Day(DateField) = 1	
Hour	Hour(DateField) < 16	
Minute	Minute(DateField) = 0	
Second	Second(DateField) = 30	
GetDate	GetDate - DateField > 7	Represents current date and time
Date	DateField = Date(GetDate)	Returns the date portion of a datetime value
Time	TimeField > Time(GetDate)	Returns the time portion of a datetime value
Miscellaneous		
Like	Memo LIKE '%filters%'	Works like SQL-92 without the ESC clause. When applied to BLOB fields, FilterOptions (see page 8478) determines whether case is considered.
In	Day(DateField) in (1,7)	Works like SQL-92. Second argument is a list of values all with the same type.
*	State = 'M*'	Wildcard for partial comparisons

OnFilterRecord (see page 7055)

Filter (see page 7026)

45.1.8.5.23 TCustomClientDataSet.Filtered Property

Specifies whether or not filtering is active for a dataset.

Pascal

```
property Filtered: Boolean;
```

C++

```
__property Boolean Filtered;
```

Description

Check (see page 8397) Filtered to determine whether or not dataset filtering is in effect. If Filtered is true, then filtering is active. To apply filter conditions specified in the Filter (see page 8476) property or the OnFilterRecord (see page 8523) event handler, set Filtered to true. Because unidirectional datasets do not support filters, when you set Filtered to true on a unidirectional dataset, it raises an exception.

Note: When filtering is enabled, user edits to a record may mean that the record no longer meets a filter's test condition. The next time an attempt is made to the read the record from the dataset while the filter is in effect, the record is not visible. If that happens, the next record that passes the filter condition becomes the active record.

See Also

Filter (see page 7026)

FilterOptions (see page 7027)

OnFilterRecord (see page 7055)

Locate (see page 6970)

Lookup (see page 6970)

45.1.8.5.24 TCustomClientDataSet.FilterOptions Property

Specifies whether or not filtering is case insensitive, and whether or not partial comparisons are permitted when filtering records.

Pascal

```
property FilterOptions: TFilterOptions;
```

C++

```
__property TFilterOptions FilterOptions;
```

Description

Set FilterOptions to specify whether or not filtering is case insensitive when filtering on string or character fields, and whether or

not partial comparisons for matching filter conditions is allowed.

Note: Because unidirectional datasets do not support filters, when you set the FilterOptions property of a unidirectional dataset, it raises an exception.

By default, FilterOptions is set to an empty set. For filters based on string fields, set FilterOptions to foCaseInsensitive to catch all variations on a string regardless of capitalization.

When a string in a filter ends with an asterisk (*), it can be used to match partial strings. To disable matching of partial strings and to treat the asterisk as a literal character in string comparisons, set FilterOptions to include foNoPartialCompare.

45.1.8.5.25 TCustomClientDataSet.GroupingLevel Property

Indicates the depth of grouping support provided by the current index.

Pascal

```
property GroupingLevel: Integer;
```

C++

```
__property int GroupingLevel;
```

Description

Read GroupingLevel to determine the maximum level group for which grouping support is available. Client datasets provide grouping support in two ways:

The GetGroupState (see page 8420) method indicates where the current record falls within a group.

The ActiveAggs (see page 8460) property provides summary information over all the records in a group.

A group is defined as the set of records that have the same value on each of a set of fields. A level 0 group is the set of all records in the client dataset. A level 1 group is the set of records with the same value on the first field of the index. A level 2 group is the set of records with the same values on each of the first two fields of the index. A level n group is the set of records with the same values on each of the first n fields of the index.

By default, GroupingLevel is the default grouping level of the current index or the maximum grouping level of a maintained aggregate on the current index, whichever is greater. GroupingLevel can never be greater than IndexFieldCount (see page 8481).

See Also

IndexName (see page 8483)

GetGroupState (see page 8420)

ActiveAggs (see page 8460)

GroupingLevel (see page 7291)

IndexFieldCount (see page 8481)

45.1.8.5.26 TCustomClientDataSet.HasAppServer Property

Indicates whether the client dataset is connected to a provider.

Pascal

```
property HasAppServer: Boolean;
```

C++

```
__property Boolean HasAppServer;
```

Description

Read HasAppServer to determine whether the client dataset gets its data from an IAppServer interface. When HasAppServer is true, the client can interact with an internal provider, a local provider in the same process space, or a provider on a remote application server using the IAppServer interface.

Use HasAppServer to check whether the client dataset is connected rather than reading the AppServer (see page 8462) property. Reading AppServer (see page 8462) causes the client dataset to establish a connection and obtain an IAppServer interface if it does not already have one.

See Also

IAppServer (see page 16450)

AppServer (see page 8462)

ProviderName (see page 8492)

45.1.8.5.27 TCustomClientDataSet.IndexDefs Property

Contains information about the indexes for a client dataset.

Pascal

```
property IndexDefs: TIndexDefs;
```

C++

```
__property TIndexDefs IndexDefs;
```

Description

Examine IndexDefs for index information. IndexDefs maintains an array of TIndexDef items, each of which describes an available index for the dataset. Set the value of IndexDefs before calling CreateDataSet (see page 8401) to create a set of indexes with the client dataset.

Note: The index items in IndexDefs may not always reflect the current indexes available for a dataset. Before examining IndexDefs, call the IndexDefs.Update (Delphi) or IndexDefs->Update (C++) method to refresh the item list.

C++ Examples:

```
/*
This example uses the IndexName property to sort the records
in a client dataset on the Field2 field.
*/
void __fastcall TForm1::Button3Click(TObject *Sender)
{
  // If Active is True, Update will remove Fields added in FormCreate
  // and add the DEFAULT_ORDER and CHANGEINDEX Fields
  CDS2->Active = False;
  // Get the current available indices
```

```
  CDS2->IndexDefs->Update();
  // Find a field named "Field2"
  for (int I = 0; I < CDS2->IndexDefs->Count; I++)
    if (CDS2->IndexDefs->Items[I]->Fields == "Field2")
    {
      // set that index as the current index for the dataset}
      CDS2->IndexName = CDS2->IndexDefs->Items[I]->Name;
    }
  CDS2->Active = True;
}
```

Delphi Examples:

```
{
This example uses the IndexName property to sort the records
in a client dataset on the Field2 field.
}
procedure TForm1.Button3Click(Sender: TObject);
var
  I : Integer;
begin
  // If Active is True, Update will remove Fields added in FormCreate
  // and add the DEFAULT_ORDER and CHANGEINDEX Fields
  CDS2.Active := False;
  { Get the current available indices }
  CDS2.IndexDefs.Update;
  { Find a field named 'Field2' }
  for I := 0 to CDS2.IndexDefs.Count - 1 do
    if CDS2.IndexDefs.Items[I].Fields = 'Field2' then
    begin
      { set that index as the current index for the dataset}
      CDS2.IndexName := CDS2.IndexDefs.Items[I].Name;
    end;
  CDS2.Active := True;
end;
```

CreateDataSet (see page 8401)

Adding a New Index

45.1.8.5.28 TCustomClientDataSet.IndexFieldCount Property

Indicates the number of fields that make up the current index.

Pascal

```
property IndexFieldCount: Integer;
```

C++

```
__property int IndexFieldCount;
```

Description

Check (see page 8397) IndexFieldCount to determine how many fields are used by the current index for the dataset.

See Also

IndexFieldNames (see page 8482)

IndexDefs (see page 8480)

45.1.8.5.29 TCustomClientDataSet.IndexFieldNames Property

Lists the fields to use as an index.

Pascal

```
property IndexFieldNames: Widestring;
```

C++

```
__property BSTR IndexFieldNames;
```

Description

Use IndexFieldNames as an alternative method of specifying the index to use for a client dataset. Specify the name of each field on which to index the dataset, separating names with semicolons. Ordering of field names is significant.

Note: Indexes added using IndexFieldNames do not support grouping or maintained aggregates.

Tip: Use IndexFieldNames to create sort orders on the fly at runtime.

Note: The IndexFieldNames and IndexName (see page 8483) properties are mutually exclusive. Setting one clears the other.

See Also

IndexDefs (see page 8480)

IndexName (see page 8483)

Creating an Index with IndexFieldNames

Adding a New Index

45.1.8.5.30 TCustomClientDataSet.IndexFields Property

Specifies the fields associated with the current index.

Pascal

```
property IndexFields [Index: Integer]: TField;
```

C++

```
__property TField IndexFields[int Index];
```

Description

IndexFields is a zero-based array of field objects, each of which corresponds to a field in the current index. Index is an ordinal value indicating the position of a field in the index. The first field in the index is IndexFields[0], the second is IndexFields[1], and so on.

Note: Do not set IndexField directly. Instead use the IndexFieldNames (see page 8482) property to order datasets on the fly at runtime.

See Also

AddIndex (see page 8391)

IndexDefs (see page 8480)

IndexFieldNames (see page 8482)

IndexName (see page 8483)

45.1.8.5.31 TCustomClientDataSet.IndexName Property

Identifies an index for the client dataset.

Pascal

```
property IndexName: Widestring;
```

C++

```
__property BSTR IndexName;
```

Description

Use IndexName to specify an alternative index for a client dataset.If IndexName is empty, the dataset's sort order is based on the IndexFieldNames (see page 8482) property or on its default ordering in the data packet. Default ordering is determined by the predefined index, DEFAULT_ORDER.

If IndexName contains a valid index name, then that index is used to determine sort order of records.

Note: IndexFieldNames (see page 8482) and IndexName are mutually exclusive. Setting one clears the other.

C++ Examples:

```
/*
This example uses the IndexName property to sort the records
in a client dataset on the Field2 field.
*/
void __fastcall TForm1::Button3Click(TObject *Sender)
{
  // If Active is True, Update will remove Fields added in FormCreate
  // and add the DEFAULT_ORDER and CHANGEINDEX Fields
  CDS2->Active = False;
  // Get the current available indices
  CDS2->IndexDefs->Update();
  // Find a field named "Field2"
  for (int I = 0; I < CDS2->IndexDefs->Count; I++)
    if (CDS2->IndexDefs->Items[I]->Fields == "Field2")
    {
      // set that index as the current index for the dataset}
      CDS2->IndexName = CDS2->IndexDefs->Items[I]->Name;
    }
  CDS2->Active = True;
}
```

Delphi Examples:

```
{
This example uses the IndexName property to sort the records
in a client dataset on the Field2 field.
}
procedure TForm1.Button3Click(Sender: TObject);
var
  I : Integer;
begin
  // If Active is True, Update will remove Fields added in FormCreate
  // and add the DEFAULT_ORDER and CHANGEINDEX Fields
  CDS2.Active := False;
  { Get the current available indices }
  CDS2.IndexDefs.Update;
  { Find a field named 'Field2' }
  for I := 0 to CDS2.IndexDefs.Count - 1 do
```

```
      if CDS2.IndexDefs.Items[I].Fields = 'Field2' then
      begin
        { set that index as the current index for the dataset}
        CDS2.IndexName := CDS2.IndexDefs.Items[I].Name;
      end;
    CDS2.Active := True;
  end;
```

IndexFieldNames (see page 8482)

Deleting and Switching Indexes

45.1.8.5.32 TCustomClientDataSet.IsClone Property

Pascal

```
property IsClone: Boolean;
```

C++

```
__property Boolean IsClone;
```

Description

This is IsClone, a member of class TCustomClientDataSet.

45.1.8.5.33 TCustomClientDataSet.KeyExclusive Property

Specifies the upper and lower boundaries for a range.

Pascal

```
property KeyExclusive: Boolean;
```

C++

```
__property Boolean KeyExclusive;
```

Description

Use KeyExclusive to specify whether a range includes or excludes the records that match its specified starting and ending values. By default, KeyExclusive is false, meaning that matching values are included.

To restrict a range to those records that are greater than the specified starting value and less than the specified ending value, set KeyExclusive to true.

See Also

FindNearest (see page 8416)

GotoNearest (see page 8427)

SetRange (see page 8452)

SetRangeEnd (see page 8453)

SetRangeStart (see page 8454)

45.1.8.5.34 TCustomClientDataSet.KeyFieldCount Property

Specifies the number of fields to use when conducting a partial key search on a multi-field key.

Pascal

```
property KeyFieldCount: Integer;
```

C++

```
__property int KeyFieldCount;
```

Description

Use KeyFieldCount to limit a search based on a multi-field key to a consecutive subset of the fields in that key. For example, if the primary key for a dataset consists of three fields, a partial-key search can be conducted using only the first field in the key by setting KeyFieldCount to 1. Setting KeyFieldCount to 0 allows the client dataset to search on all key fields.

Note: Searches are only conducted based on consecutive key fields beginning with the first field in the key. For example if a key consists of three fields, an application can set KeyFieldCount to 1 to search on the first field, 2 to search on the first and second fields, or 3 to search on all fields. By default KeyFieldCount is initially set to include all fields in a search.

GotoKey (see page 8427)

GotoNearest (see page 8427)

Locate (see page 8435)

45.1.8.5.35 TCustomClientDataSet.KeySize Property

Indicates the size of the current key used for the dataset.

Pascal

```
property KeySize: Word;
```

C++

```
__property Word KeySize;
```

Description

Examine KeySize to determine the size of the current key used for the client dataset. KeySize corresponds to the size of the key fields in the primary index for the dataset.

See Also

RecordSize

45.1.8.5.36 TCustomClientDataSet.LogChanges Property

Indicates whether to maintain a change log separate from the data.

Pascal

```
property LogChanges: Boolean;
```

C++

```
__property Boolean LogChanges;
```

Description

Use LogChanges to control whether changes made to the data in a client dataset are recorded. When LogChanges is true (the

default), all changes are recorded in the Delta (see page 8470) property. They can later be applied to a database or source dataset, backed out, or merged into the Data (see page 8467) property. When LogChanges is false, data changes are made directly to the Data (see page 8467) property and cannot be applied to a database or source dataset via a provider.

Warning: Never set LogChanges to false if the client dataset uses an internal provider unless the data is read-only. Setting LogChanges to false results in a client dataset that can't apply updates.

Tip: When using a client dataset in a file-based application where data changes made by the application are never applied to another dataset, set LogChanges to false to conserve system resources.

Editing Data

Merging Changes into Data

45.1.8.5.37 TCustomClientDataSet.MasterFields Property

Names one or more fields in a master table to link with corresponding fields in this dataset in order to establish a master-detail relationship.

Pascal

```
property MasterFields: Widestring;
```

C++

```
__property BSTR MasterFields;
```

Description

Use MasterFields after setting the MasterSource (see page 8486) property to specify the names of one or more fields to use in establishing a detail-master relationship between this dataset and the one specified in MasterSource (see page 8486).

MasterFields is a string containing one or more field names in the master table. Separate field names with semicolons.

Each time the current record in the master table changes, the new values in those fields are used to select corresponding records in this dataset for display.

Note: At design time, use the Field Link designer to establish the master-detail relationship between two datasets.

See Also

MasterSource (see page 8486)

Making the Table a Detail of Another Dataset

45.1.8.5.38 TCustomClientDataSet.MasterSource Property

Specifies a data source component for the master dataset when establishing a detail-master relationship between this dataset and another one.

Pascal

```
property MasterSource: TDataSource;
```

C++

```
__property TDataSource MasterSource;
```

Description

Use MasterSource to specify the name of the data source component whose DataSet property identifies a dataset to use as a master table in establishing a detail-master relationship between this dataset and another one.

At design time choose an available data source from the MasterSource property's drop-down list in the Object Inspector.

After setting the MasterSource property, specify which fields to use in the master table by setting the MasterFields (see page 8486) property. At runtime each time the current record in the master table changes, the new values in those fields are used to select corresponding records in this dataset for display.

Note: At design time, use the Field Link designer to establish the master-detail relationship between two datasets.

Tip: MasterSource establishes a master/detail relationship using the traditional linked cursor approach. Alternately, client datasets can participate in master/detail relationships using nested datasets, where the detail dataset is stored with the master table's data. To assign a client dataset's data as the value of a nested detail, use the DataSetField (see page 8469) property.

See Also

MasterFields (see page 8486)

Making the Table a Detail of Another Dataset

45.1.8.5.39 TCustomClientDataSet.ObjectView Property

Specifies whether fields are stored hierarchically or flattened out in the Fields property.

Pascal

```
property ObjectView: Boolean;
```

C++

```
__property Boolean ObjectView;
```

Description

ObjectView affects the way the Fields property stores object fields and the way data-aware grids display ADT and array fields.

When ObjectView is true, the fields are stored hierarchically in the Fields property, meaning any child fields of an object field are referenced by the object field and don't appear sequentially after the object field in the TFields:: .Fields array. When ObjectView is false, the fields are stored sequentially in the Fields property, meaning any child fields of an object field are stored after the object field as siblings in the Fields array.

When ObjectView is false, object field types, such as TADTField, are not created. This switch is provided for increased compatibility with older data-aware controls, which may not handle object field types properly. The default is false for TBDEDataSet, and true for TClientDataSet.

Note: If the ObjectView property of the dataset provided to a TClientDataSet is false, then the TClientDataSet's ObjectView property always acts as false, since the data received is already flattened.

Working with Array Fields

45.1.8.5.40 TCustomClientDataSet.PacketRecords Property

Indicates the number or type of records in a single data packet.

Pascal

```
property PacketRecords: Integer;
```

C++

```
__property int PacketRecords;
```

Description

Use PacketRecords to specify how many records should be contained in a single packet fetched from a provider, or to indicate that the packet returned should contain only metadata.

When a client dataset is instantiated, PacketRecords is automatically set to -1, meaning that a single packet should contain all records in the dataset.

If PacketRecords is greater than zero, then it specifies the number of records to return in a packet.

To retrieve the metadata for a dataset, set PacketRecords to 0. When PacketRecords is zero, the provider returns only information from its dataset that defines the database's structure, such as table, column, constraint, and domain definitions.

Warning: When PacketRecords is greater than 0, the client dataset must fetch its data incrementally. If the provider is on a stateless application server, the client dataset must inform the provider where to start fetching data. This communication can occur using a BeforeGetRecords (see page 8515) event handler.

Delphi Examples:

```
{
This example shows how to use the BeforeGetRecords event
handler (a TRemoteEventType value) to send the provider
information it needs for incremental data fetching. Before
fetching the next data packet, the client dataset packages
up the key value of the last record so that the provider
knows where to begin the next data packet. It also sends
some application-specific information, which is stored in
Memo1.  This method is used to pass the sql statement and the
value of the first field for the last record to the server so
that the server can return the correct records. The complete
project using this code example is in
Demos/DelphiWin32/VCLWin32/MIDAS/Pooler.
}
procedure TForm1.ClientDataSet1BeforeGetRecords(Sender: TObject; var OwnerData: OleVariant);
var
  LastValue: OleVariant;
  CDSClone: TClientDataSet;
begin
  if ClientDataSet1.Active then
  begin
```

```
      CDSClone := TClientDataSet.Create(Form1);
      try
        CDSClone.CloneCursor(ClientDataSet1, True);
        { turn off FetchOnDemand so that the clone only fetches
          the last LOCAL record }
        CDSClone.FetchOnDemand := False;
        CDSClone.Last;
        LastValue := CDSClone.Fields[0].AsString;
        CDSClone.Close;
      finally
        CDSClone.Free;
      end;
    end else
      LastValue := NULL;
    OwnerData := VarArrayOf([Memo1.Lines.Text, LastValue]);
  end;

  procedure TForm1.Button2Click(Sender: TObject);
  begin
    ClientDataSet1.PacketRecords := StrToInt(Edit1.Text);
    ClientDataSet1.GetNextPacket;
  end;
```

BeforeGetRecords (see page 8515)

Requesting Data from the Source Dataset or Document

Using the BDE to Cache Updates

Updating Data in dbExpress Applications

45.1.8.5.41 TCustomClientDataSet.Params Property

Contains parameter values that are sent to the provider.

Pascal

```
property Params: TParams;
```

C++

```
__property TParams Params;
```

Description

Use Params to specify parameter values that the provider should pass to a source dataset. If the client dataset uses an internal provider, Params represents the values for any parameters used by the SQL statement specified by the CommandText (see page 8465) property. If the client dataset uses an external provider that is associated with a dataset that represents a query or stored procedure, these parameter values supply input parameter values for that query or stored procedure and return any output parameters of a stored procedure. If the provider is associated with a TTable or TSQLTable component, Params limits the records that are sent in data packets. After specifying the parameters (at design time or runtime), they are sent to the provider automatically when the client dataset fetches data or executes a query or stored procedure using its Execute (see page 8413) method.

To send parameter values to a query or stored procedure, for every parameter on the query or stored procedure for which the client dataset should send a value, add a parameter object (TParam) to Params. Assign each parameter object the same Name, DataType, and ParamType as the corresponding parameter on the query or stored procedure. These values are automatically encoded and sent to the provider when the client dataset fetches data.

To send parameter values to a TTable or TSQLTable, add a parameter object for each field in the table that is used to limit the values sent in data packets. Assign each parameter object the same Name and DataType as the corresponding field component on the table. These parameter values are automatically sent when the client dataset fetches data, and the records returned in data packets from the provider only contain records that match the assigned value on the corresponding fields. You can achieve the same affect by applying a filter to the field, but using Params is more efficient because the data need not be included in data packets.

Note: To initialize Params so that it reflects the parameters of a provider's associated query or stored procedure, call the FetchParams (see page 8415) method.

Warning: The parameters are only applied to the provider when a query or stored procedure is run the first time the client dataset fetches records. To change parameter values and force a query or stored procedure to be rerun with new values, use the Execute (see page 8413) method.

Delphi Examples:

```
{
This example fills in the parameters of a client dataset
from the entries of a list box.
}
procedure TForm1.Button4Click(Sender: TObject);
var
  I: Integer;
  ListItem: string;
begin
  { Call FetchParams to ensure parameters reflect server metadata }
  ClientDataSet1.FetchParams;
  with ClientDataSet1.Params do
  begin
    for I := 0 to Count - 1 do
    begin
      ListItem := ListBox1.Items[I];
      case Items[I].DataType of
        ftString:
          Items[I].AsString := ListItem;
        ftSmallInt:
          Items[I].AsSmallInt := StrToIntDef(ListItem, 0);
        ftInteger:
          Items[I].AsInteger := StrToIntDef(ListItem, 0);
        ftWord:
          Items[I].AsWord := StrToIntDef(ListItem, 0);
        ftBoolean:
          begin
            if ListItem = 'True' then
              Items[I].AsBoolean := True
            else
              Items[I].AsBoolean := False;
          end;
        ftFloat:
          Items[I].AsFloat := StrToFloat(ListItem);
        ftCurrency:
          Items[I].AsCurrency := StrToFloat(ListItem);
        ftBCD:
          Items[I].AsBCD := StrToCurr(ListItem);
        ftDate:
          Items[I].AsDate := StrToDate(ListItem);
        ftTime:
          Items[I].AsTime := StrToTime(ListItem);
        ftDateTime:
          Items[I].AsDateTime := StrToDateTime(ListItem);
```

```
      end;
    end;
  end;
end;

procedure TForm1.FormCreate(Sender: TObject);
begin
  ListBox1.Items.Add('Here is a string');
  ListBox1.Items.Add('4');
  ListBox1.Items.Add('3456789');
  ListBox1.Items.Add('34');
  ListBox1.Items.Add('0');
  ListBox1.Items.Add('12.56');
  ListBox1.Items.Add('4.23');
  ListBox1.Items.Add('99.5');
  ListBox1.Items.Add('4/12/53');
  ListBox1.Items.Add('7:45:00');
  ListBox1.Items.Add('4/12/53 7:45:00');

end;
```

Passing Parameters to the Source Dataset

Sending Query or Stored Procedure Parameters

Setting Up a Simple Dataset

45.1.8.5.42 TCustomClientDataSet.ProviderEOF Property

Indicates whether the client dataset has all of its data.

Pascal

```
property ProviderEOF: Boolean;
```

C++

```
__property Boolean ProviderEOF;
```

Description

ProviderEOF is used internally to check whether an associated provider has supplied the client dataset with its last record. If the client dataset fetches its data from a file or represents a nested detail dataset, ProviderEOF is always true. If the client dataset fetches its data from a provider, it sets ProviderEOF to true when it is certain that it has fetched the last data packet from the provider.

Note: When ProviderEOF is false, it is possible that the provider has supplied the last record but the client dataset has not yet

tried to obtain the next record. That is, when ProviderEOF is true, there is definitely no need to fetch more records, but when ProviderEOF is false, it is uncertain.

TDataSetProvider (see page 18508)

ProviderName (see page 8492)

AppendData (see page 8393)

45.1.8.5.43 TCustomClientDataSet.ProviderName Property

Specifies the name of a provider component that supplies data to and applies updates from the client dataset..

Pascal

```
property ProviderName: string;
```

C++

```
__property AnsiString ProviderName;
```

Description

Use ProviderName to specify an external provider object that links the client dataset to another (source) dataset or to an XML document. This property is passed as a parameter to IAppServer interface calls when the client fetches data from or applies updates to the source dataset, or its database server, or the source XML document.

The provider specified by ProviderName can reside in the same application as the client dataset or in an application server running on another system.

If the provider is in the same application as the client dataset, it must have the same Owner as the client dataset. To use a local provider that has a different Owner, use the SetProvider (see page 8451) method instead.

If the provider is on a remote application server, it must be exported by that application server. If the application server contains multiple provider objects, you can set ProviderName to any of them once the client dataset establishes an initial connection to the application server through its RemoteServer (see page 8493) property. If the connection component is a Web connection or socket connection, or if the application server is registered on the client system (using TRegsvr.exe), ProviderName can be set from a drop-down in the Object Inspector once the RemoteServer (see page 8493) property is set.

45.1.8.5.44 TCustomClientDataSet.Ranged Property

Pascal

```
property Ranged: Boolean;
```

C++

```
__property Boolean Ranged;
```

Description

This is Ranged, a member of class TCustomClientDataSet.

45.1.8.5.45 TCustomClientDataSet.ReadOnly Property

Specifies whether the client dataset is read-only for this application.

Pascal

```
property ReadOnly: Boolean;
```

C++

```
__property Boolean ReadOnly;
```

Description

Use the ReadOnly property to prevent users from updating, inserting, or deleting data in the dataset. By default, ReadOnly is false, meaning users can potentially alter the dataset's data.

To guarantee that users cannot modify or add data to a dataset, set ReadOnly to true.

When ReadOnly is true, the dataset's CanModify property is false.

Note: Even if ReadOnly is false, users may not be able to modify or add data to a client dataset if it gets its data from a provider. The provider's Options property can limit whether data can be edited, and if so, what types of edits are allowed.

CanModify

Options (see page 18440)

45.1.8.5.46 TCustomClientDataSet.RemoteServer Property

Specifies the connection component that this client dataset uses to connect to an application server.

Pascal

```
property RemoteServer: TCustomRemoteServer;
```

C++

```
__property TCustomRemoteServer RemoteServer;
```

Description

If the client dataset is in the client portion of a multi-tiered application, use RemoteServer to specify the connection component that connects to the application server. The connection component locates the application server and obtains its IAppServer interface, which the client dataset can use for communicating with a remote provider.

Although it is not required, you can also set RemoteServer to a TLocalConnection component when working with a provider that resides in the same application.

If a client application uses more than connection component, the application can change which connection a client dataset uses by changing the value for this property.

Tip: If you have several client datasets that all use the same connection component and you think you may change the

connection component later (for example, to change the protocol), you can use the ConnectionBroker (see page 8466) property to centralize the connection.

Using a Multi-Tiered Architecture

Specifying the Provider using TLocalConnection or TConnectionBroker

45.1.8.5.47 TCustomClientDataSet.SavePoint Property

Represents the current state of edits when logging changes.

Pascal

```
property SavePoint: Integer;
```

C++

```
__property int SavePoint;
```

Description

Use SavePoint to save and later revert to an editing state. SavePoint is an integer that represents the current state of the change log. To use SavePoint to roll back the changes in the change log to an earlier state, set SavePoint to the value it had before the changes that should be rolled back.

Thus, when the client dataset is in a state you may want to return to, assign SavePoint to a variable:

```
BeforeChanges := ClientDataSet1.SavePoint;
BeforeChanges = ClientDataSet->SavePoint;
```

Later, to roll back all edits that were made since that point, assign the variable to SavePoint:

```
ClientDataSet1.SavePoint := BeforeChanges;
ClientDataSet->SavePoint = BeforeChanges;
```

Warning: Client datasets can't return to a SavePoint once the change log has been backed out to a prior state. This includes undoing changes by setting SavePoint to a previously saved value, backing out too many changes using the RevertRecord (see page 8443) method, or clearing the change log using CancelUpdates (see page 8396). Trying to set SavePoint to a state that is no longer available in the change log raises an exception.

Undoing Changes

45.1.8.5.48 TCustomClientDataSet.StatusFilter Property

Filters the client dataset so that it exposes only those records with a specific update status.

Pascal

```
property StatusFilter: TUpdateStatusSet;
```

C++

```
__property TUpdateStatusSet StatusFilter;
```

Description

Use StatusFilter to limit the client dataset to records that represent a specific update status. This can be useful when processing updates in a provider's event handlers (or, if the client dataset has an internal provider, in its own BeforeUpdateRecord event handler).

StatusFilter is a set of TUpdateStatus values. It can indicate more than one type of update. If StatusFilter is an empty set (the default), the client dataset appears as if all updates in the change log have been incorporated.

Including usUnmodified in StatusFilter has no effect.

45.1.8.5.49 TCustomClientDataSet.StoreDefs Property

Indicates whether field and index definitions are saved with the client dataset.

Pascal

```
property StoreDefs: Boolean;
```

C++

```
__property Boolean StoreDefs;
```

Description

If StoreDefs is true, the client dataset's index and field definitions are stored with the client dataset when the form or data module that contains it is saved. Setting StoreDefs to true makes the CreateDataSet (see page 8401) method into a one-step procedure that creates fields and indexes at runtime.

See Also

FieldDefs (see page 7019)

IndexDefs (see page 8480)

CreateDataSet (see page 8401)

45.1.8.5.50 TCustomClientDataSet.XMLData Property

Represents the data of the client dataset in XML.

Pascal

```
property XMLData: string;
```

C++

```
__property AnsiString XMLData;
```

Description

XMLData represents the client dataset's local, in-memory copy of its data, encoded as an XML data packet. This is the same as the Data (see page 8467) property, except that the data is represented in XML rather than the binary format used internally by the client dataset.

45.1.8.6 TCustomClientDataSet Events

The events of the TCustomClientDataSet class are listed here.

Protected Events

	Name	Description
	AfterApplyUpdates (see page 8497)	Occurs after the client dataset applies updates to the provider but before it attempts to reconcile update errors.
	AfterCancel (see page 8498)	Occurs after an application completes a request to cancel modifications to the active record.
	AfterClose (see page 8500)	Occurs after an application closes a dataset.
	AfterDelete (see page 8501)	Occurs after an application deletes a record.
	AfterEdit (see page 8504)	Occurs after an application starts editing a record.
	AfterExecute (see page 8504)	Occurs after the client dataset receives the results from an execute command.
	AfterGetParams (see page 8505)	Occurs after the client dataset receives parameter values from the provider.
	AfterGetRecords (see page 8506)	Occurs after the client dataset fetches a data packet from the provider.
	AfterInsert (see page 8507)	Occurs after an application inserts a new record.
	AfterOpen (see page 8507)	Occurs after an application completes opening a dataset and before any data access occurs.
	AfterPost (see page 8509)	Occurs after an application writes the active record to the database or change log and returns to browse state.
	AfterRefresh (see page 8509)	Occurs after an application refreshes the data in the dataset.
	AfterRowRequest (see page 8509)	Occurs after the client dataset fetches new information about the current record.
	AfterScroll (see page 8510)	Occurs after an application scrolls from one record to another.
	BeforeApplyUpdates (see page 8511)	Occurs before the client dataset applies updates to the remote server.
	BeforeCancel (see page 8512)	Occurs before an application executes a request to cancel changes to the active record.
	BeforeClose (see page 8512)	Occurs immediately before the dataset closes.
	BeforeDelete (see page 8512)	Occurs before an application attempts to delete the active record.

	BeforeEdit (see page 8513)	Occurs before an application enters edit mode for the active record.
	BeforeExecute (see page 8514)	Occurs before the client dataset executes the provider's query or stored procedure.
	BeforeGetParams (see page 8514)	Occurs before the client dataset fetches parameter values from the provider.
	BeforeGetRecords (see page 8515)	Occurs before the client dataset fetches a data packet from the provider.
	BeforeInsert (see page 8517)	Occurs before an application enters insert mode.
	BeforeOpen (see page 8518)	Occurs before an application executes a request to open a dataset.
	BeforePost (see page 8518)	Occurs before an application posts changes for the active record to the database or change log.
	BeforeRefresh (see page 8519)	Occurs immediately before an application refreshes the data in the dataset.
	BeforeRowRequest (see page 8520)	Occurs before the client dataset fetches new information about the current record.
	BeforeScroll (see page 8520)	Occurs before an application scrolls from one record to another.
	OnCalcFields (see page 8521)	Occurs when an application recalculates calculated fields.
	OnDeleteError (see page 8522)	Occurs when an application attempts to delete a record and an exception is raised.
	OnEditError (see page 8522)	Occurs when an application attempts to modify or insert a record and an exception is raised.
	OnFilterRecord (see page 8523)	Occurs each time a different record in the dataset becomes the active record and filtering is enabled.
	OnNewRecord (see page 8523)	Occurs when an application inserts or appends a new dataset record.
	OnPostError (see page 8524)	Occurs when an application attempts to modify or insert a record and an exception is raised.
	OnReconcileError (see page 8524)	Occurs when a client dataset needs to reconcile an update to a record that could not be applied.

45.1.8.6.1 TCustomClientDataSet.AfterApplyUpdates Event

Occurs after the client dataset applies updates to the provider but before it attempts to reconcile update errors.

Pascal

```
property AfterApplyUpdates: TRemoteEvent;
```

C++

```
__property TRemoteEvent AfterApplyUpdates;
```

Description

Write an AfterApplyUpdates event handler to respond to custom information returned to the client dataset from a provider's AfterApplyUpdates event handler. AfterApplyUpdates is part of the mechanism by which a client dataset and a provider communicate information about updates. When working with a provider on a stateless application server, this mechanism allows the client dataset and the provider to communicate persistent state information.

When the application calls the client dataset's ApplyUpdates (see page 8394) method, the following events occur:

1.The client dataset receives a BeforeApplyUpdates (see page 8511) event, where it can encode custom information into an OleVariant that is passed to the provider as the OwnerData parameter.

2.The provider receives a BeforeApplyUpdates (see page 8511) event, where it can respond to or change that information before it applies the updates.

3.The provider applies the updates, and receives an OnUpdateError event for any problem records.

4.The provider receives an AfterApplyUpdates event, where it can encode custom information into its OwnerData parameter or respond to information from the BeforeApplyUpdates (see page 8511) event handler.

5.The client dataset receives an AfterApplyUpdates event, where it can respond to the custom information returned by the provider in its AfterApplyUpdates event handler.

6.The client dataset generates an OnReconcileError (see page 8524) for every record that could not be applied by the provider.

Communicating with the Client Dataset

45.1.8.6.2 TCustomClientDataSet.AfterCancel Event

Occurs after an application completes a request to cancel modifications to the active record.

Pascal

```
property AfterCancel: TDataSetNotifyEvent;
```

C++

```
__property TDataSetNotifyEvent AfterCancel;
```

Description

Write an AfterCancel event handler to take specific action after an application cancels changes to the active record. AfterCancel is called by the Cancel method after it updates the current position, releases the lock on the active record if necessary, and sets the dataset state to dsBrowse. If an application requires additional processing before returning control to a user after a Cancel event, code it in the AfterCancel event.

Delphi Examples:

```
{
This example updates the form's status bar with a message
when an AfterCancel event occurs.  Set the StatusBar
SimplePanel property to True.
}
procedure TForm1.Table1AfterCancel(DataSet: TDataSet);
begin
  StatusBar1.SimpleText := 'Record changes cancelled for ' + DataSet.Name;
end;

procedure TForm1.Button2Click(Sender: TObject);
begin
  Table1.Cancel;
end;

procedure TForm1.Button3Click(Sender: TObject);
begin
  Table1.Post
end;

procedure TForm1.FormCreate(Sender: TObject);
var
  i: Integer;
begin
  Table1:= TTable.Create(Form1);
  with Table1 do
  begin
```

```
      DatabaseName := 'DBDEMOS';
      TableType := ttParadox;
      TableName := 'CustInfo';
      Name := 'CustInfo';
      Table1.Active := False;
      { Don't overwrite an existing table }
      if Table1.Exists then
      begin
          Table1.Close;
          Table1.DeleteTable;
      end;
      begin
        { The Table component must not be active }
        { First, describe the type of table and give }
        { it a name }
        { Next, describe the fields in the table }
        with FieldDefs do
        begin
          Clear;
          with AddFieldDef do
          begin
            Name := 'Field1';
            DataType := ftInteger;
            Required := True;
          end;
          with AddFieldDef do
          begin
            Name := 'Field2';
            DataType := ftString;
            Size := 30;
          end;
        end;
        { Next, describe any indexes }
        with IndexDefs do
        begin
          Clear;
          { The 1st index has no name because it is
          { a Paradox primary key }
          with AddIndexDef do
          begin
            Name := '';
            Fields := 'Field1';
            Options := [ixPrimary];
          end;
          with AddIndexDef do
          begin
            Name := 'Fld2Indx';
            Fields := 'Field2';
            Options := [ixCaseInsensitive];
          end;
        end;
        { Call the CreateTable method to create the table }
        CreateTable;
        Table1.Active:= True;
        for i := 1 to 20 do
          Table1.AppendRecord([i*111, i*222]);
      end;
    end;
    DS2.DataSet:= Table1;
    DBGrid2.DataSource.DataSet:= Table1;
    Table1.AfterCancel:= Table1AfterCancel;
    Table1.Active:= True;
  end;
```

See Also

BeforeCancel (see page 7048)

Cancel (see page 6916)

State (see page 7036)

45.1.8.6.3 TCustomClientDataSet.AfterClose Event

Occurs after an application closes a dataset.

Pascal

```
property AfterClose: TDataSetNotifyEvent;
```

C++

```
__property TDataSetNotifyEvent AfterClose;
```

Description

Write an AfterClose event handler to take specific action immediately after an application closes a dataset. For example, as a security measure, an application might clear a PASSWORD entry from the Params property of a TSQLConnection component when the dataset is closed.

AfterClose is called after a dataset is closed and the dataset state is set to dsInactive.

Delphi Examples:

```
{
This example adds an entry to a memo with a message when an
AfterOpen event or an AfterClose event occurs.  Populate the
ClientDataSet events with CheckButtonActive.
}
procedure TForm1.CheckButtonActive(DataSet: TDataSet);
begin
  if (Button1.Enabled) then
    Memo2.Lines.Add('Now that the dataset is open, record information is available.')
  else
    Memo2.Lines.Add('Now that the dataset is closed, record information is not available.');
  Button1.Enabled := not ClientDataSet1.Active;
  Button2.Enabled := ClientDataSet1.Active;
  Button3.Enabled := ClientDataSet1.Active;
end;
{
The following code fragment illustrates how DataSets and
DataSetCount can be used to ensure that an action is taken
for every open dataset.  Assign CheckButtonActive as the
AfterClose and AfterOpen event handlers for TClientDataSet1.
}
procedure TForm1.Button1Click(Sender: TObject);
var
  I: Integer;
begin
  if not RemoteServer1.Connected then
    RemoteServer1.Connected := True;
  ClientDataSet1.Close;
  with RemoteServer1 do
  begin
    for I := 0 to DataSetCount - 1 do
      DataSets[I].EnableControls;
  end;
  ClientDataSet1.Open;
end;

procedure TForm1.Button3Click(Sender: TObject);
var
  I: Integer;
begin
```

```
    ClientDataSet1.Close;
    RemoteServer1.Connected := False;
    with RemoteServer1 do
    begin
      for I := 0 to DataSetCount - 1 do
        DataSets[I].DisableControls;
    end;
  end;

  procedure TForm1.CheckButtonActive(DataSet: TDataSet);
  begin
    Button1.Enabled := not ClientDataSet1.Active;
    Button2.Enabled := ClientDataSet1.Active;
    Button3.Enabled := ClientDataSet1.Active;
  end;
```

Opening and Closing Datasets

45.1.8.6.4 TCustomClientDataSet.AfterDelete Event

Occurs after an application deletes a record.

Pascal

```
property AfterDelete: TDataSetNotifyEvent;
```

C++

```
__property TDataSetNotifyEvent AfterDelete;
```

Description

Write an AfterDelete event handler to take specific action immediately after an application deletes the active record in a dataset. AfterDelete is called by Delete after it deletes the record, sets the dataset state to dsBrowse, and repositions the current record.

C++ Examples:

```
/*
This example displays a message on the form's status bar
indicating the record count after a record is deleted.  Set
the StatusBar SimplePanel property to True.
*/
void __fastcall TForm1::Table1AfterDelete(TDataSet *DataSet)
{
  StatusBar1->SimpleText = Format(
    "There are now %d records in the table",
    ARRAYOFCONST(((int)DataSet->RecordCount)));
}

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  Table1->Delete();
}

void __fastcall TForm1::FormCreate(TObject *Sender)
```

```
{
  Table1 = new TTable(Form1);
  Table1->Active = false; // The Table component must not be active
  Table1->DatabaseName = "DBDEMOS";
  Table1->TableType = ttParadox;
  Table1->TableName = "CustInfo";
  Table1->Active = False;
  if (!Table1->Exists) // Don't overwrite an existing table
  {
    Table1->Close();
    Table1->DeleteTable();
  }
  // The Table component must not be active
  // First, describe the type of table and give
  // it a name
  // Next, describe the fields in the table
  Table1->FieldDefs->Clear();
  TFieldDef *pNewDef = Table1->FieldDefs->AddFieldDef();
  pNewDef->Name = "Field1";
  pNewDef->DataType = ftInteger;
  pNewDef->Required = true;
  pNewDef = Table1->FieldDefs->AddFieldDef();
  pNewDef->Name = "Field2";
  pNewDef->DataType = ftString;
  pNewDef->Size = 30;
  // Next, describe any indexes
  Table1->IndexDefs->Clear();
  /* the 1st index has no name because it is a Paradox primary key */
  Table1->IndexDefs->Add("","Field1", TIndexOptions() <<ixPrimary << ixUnique);
  Table1->IndexDefs->Add("Fld2Index","Field2", TIndexOptions() << ixCaseInsensitive);
  // Now that we have specified what we want, create the table
  Table1->CreateTable();
  Table1->Active = True;
  for (int i = 1; i <= 20; i++)
    Table1->AppendRecord(ARRAYOFCONST((i*111, i*222)));
  DS2->DataSet = Table1;
  DBGrid2->DataSource->DataSet = Table1;
  Table1->AfterDelete = Table1AfterDelete;
  Table1->Active = True;
}
```

Delphi Examples:

```
{
This example displays a message on the form’s status bar
indicating the record count after a record is deleted.  Set
the StatusBar SimplePanel property to True.
}
procedure TForm1.Table1AfterDelete(DataSet: TDataSet);
begin
  StatusBar1.SimpleText := Format('There are now %d records in the table',
[DataSet.RecordCount]);
end;

procedure TForm1.Button1Click(Sender: TObject);
begin
  Table1.Delete;
end;

procedure TForm1.FormCreate(Sender: TObject);
var
  i: Integer;
begin
  Table1:= TTable.Create(Form1);
  with Table1 do
  begin
    DatabaseName := 'DBDEMOS';
```

```
      TableType := ttParadox;
      TableName := 'CustInfo';
      Name := 'CustInfo';
      Table1.Active := False;
      { Don't overwrite an existing table }
      if Table1.Exists then
      begin
          Table1.Close;
          Table1.DeleteTable;
      end;
      begin
        { The Table component must not be active }
        { First, describe the type of table and give }
        { it a name }
        { Next, describe the fields in the table }
        with FieldDefs do
        begin
          Clear;
          with AddFieldDef do
          begin
            Name := 'Field1';
            DataType := ftInteger;
            Required := True;
          end;
          with AddFieldDef do
          begin
            Name := 'Field2';
            DataType := ftString;
            Size := 30;
          end;
        end;
        { Next, describe any indexes }
        with IndexDefs do
        begin
          Clear;
          { The 1st index has no name because it is
          { a Paradox primary key }
          with AddIndexDef do
          begin
            Name := '';
            Fields := 'Field1';
            Options := [ixPrimary];
          end;
          with AddIndexDef do
          begin
            Name := 'Fld2Indx';
            Fields := 'Field2';
            Options := [ixCaseInsensitive];
          end;
        end;
        { Call the CreateTable method to create the table }
        CreateTable;
        Table1.Active:= True;
        for i := 1 to 20 do
          Table1.AppendRecord([i*111, i*222]);
      end;
    end;
    DS2.DataSet:= Table1;
    DBGrid2.DataSource.DataSet:= Table1;
    Table1.AfterDelete:= Table1AfterDelete;
    Table1.Active:= True;
  end;
```

45.1.8.6.5 TCustomClientDataSet.AfterEdit Event

Occurs after an application starts editing a record.

Pascal

```
property AfterEdit: TDataSetNotifyEvent;
```

C++

```
__property TDataSetNotifyEvent AfterEdit;
```

Description

Write an AfterEdit event handler to take specific action immediately after dataset enters edit mode. AfterEdit is called by Edit after it enables editing of a record, recalculates calculated fields, and calls the data event handler to process a record change.

Delphi Examples:

```
{
This example adds an entry to a memo with a message
when an AfterEdit event occurs and when a BeforeEdit event
occurs.  Click on Run SQL to populate the DBGrid.  Then
select a cell to edit and click the Edit current cell
button, or just start editing the cell to invoke the
BeforeEdit and AfterEdit events.
}
procedure TForm1.ClientDataSet1AfterEdit(DataSet: TDataSet);
begin
   Memo2.Lines.Add('After editing record' + IntToStr(DataSet.RecNo));
end;

procedure TForm1.ClientDataSet1BeforeEdit(DataSet: TDataSet);
begin
   Memo2.Lines.Add('Before editing record' + IntToStr(DataSet.RecNo));
end;

procedure TForm1.Button4Click(Sender: TObject);
begin
  ClientDataSet1.Edit;
end;
```

BeforeEdit (see page 7049)

Edit (see page 6932)

45.1.8.6.6 TCustomClientDataSet.AfterExecute Event

Occurs after the client dataset receives the results from an execute command.

Pascal

```
property AfterExecute: TRemoteEvent;
```

C++

```
__property TRemoteEvent AfterExecute;
```

Description

Write an AfterExecute event handler to respond to custom information returned to the client dataset from a provider's

AfterExecute event handler. AfterExecute is part of the mechanism by which a client dataset and a provider communicate information when executing an SQL command from the client. When working with a provider on a stateless application server, this mechanism allows the client dataset and the provider to communicate persistent state information.

When the application calls the client dataset's Execute (see page 8413) method, the following events occur:

1.The client dataset receives a BeforeExecute (see page 8514) event, where it can encode custom information into an OleVariant that is passed to the provider as the OwnerData parameter.

2.The provider receives a BeforeExecute (see page 8514) event, where it can respond to or change that information before it executes the query or stored procedure.

3.The provider executes the appropriate command (either the command supplied by the CommandText (see page 8465) property, or the command associated with a dataset such as a query or stored procedure).

4.The provider receives an AfterExecute event, where it can encode custom information into its OwnerData parameter or respond to information from the BeforeExecute (see page 8514) event handler.

5.The client dataset unpacks any output parameters from the provider into the Params (see page 8489) property and then receives an AfterExecute event, where it can respond to the custom information returned by the provider's AfterExecute event handler.

See Also

Execute (see page 8413)

AS_Execute (see page 16453)

Execute (see page 18466)

AfterExecute (see page 18476)

CommandText (see page 8465)

Communicating with the Client Dataset

45.1.8.6.7 TCustomClientDataSet.AfterGetParams Event

Occurs after the client dataset receives parameter values from the provider.

Pascal

```
property AfterGetParams: TRemoteEvent;
```

C++

```
__property TRemoteEvent AfterGetParams;
```

Description

Write an AfterGetParams event handler to respond to custom information returned to the client dataset from a provider's AfterGetParams event handler. AfterGetParams is part of the mechanism by which a client dataset and a provider communicate information when the client application calls FetchParams (see page 8415). When working with a provider on a stateless application server, this mechanism allows the client dataset and the provider to communicate persistent state information.

When the application calls the client dataset's FetchParams (see page 8415) method, the following events occur:

1.The client dataset receives a BeforeGetParams (see page 8514) event, where it can encode custom information into an OleVariant that is passed to the provider as the OwnerData parameter.

2.The provider receives a BeforeGetParams (see page 8514) event, where it can respond to or change that information before it retrieves parameter values.

3.The provider encodes all of its dataset's current parameter values into an OleVariant.

4.The provider receives an AfterGetParams event, where it can encode custom information into its OwnerData parameter or respond to information from the BeforeGetParams (see page 8514) event handler.

5.The client dataset unpacks the parameters from the provider into the Params (see page 8489) property and then receives an AfterGetParams event, where it can respond to the custom information returned by the provider's AfterGetParams event handler.

See Also

FetchParams (see page 8415)

Communicating with the Client Dataset

45.1.8.6.8 TCustomClientDataSet.AfterGetRecords Event

Occurs after the client dataset fetches a data packet from the provider.

Pascal

```
property AfterGetRecords: TRemoteEvent;
```

C++

```
__property TRemoteEvent AfterGetRecords;
```

Description

Write an AfterGetRecords event handler to respond to custom information returned to the client dataset from a provider's AfterGetRecords event handler. AfterGetRecords is part of the mechanism by which a client dataset and a provider communicate information about data fetching. When working with a provider on a stateless application server, this mechanism allows the client dataset and the provider to communicate persistent state information.

When the client dataset fetches data from the application server, the following events occur:

1. The client dataset receives a BeforeGetRecords (see page 8515) event, where it can encode custom information into an OleVariant that is passed to the provider as the OwnerData parameter.
2. The provider receives a BeforeGetRecords (see page 8515) event, where it can respond to or change that information before it creates a data packet.
3. The provider generates an OnGetData event where it can edit the data before creating a data packet, and then generates the data packet.
4. The provider receives an AfterGetRecords event, where it can encode custom information into its OwnerData parameter or respond to information from the BeforeGetRecords (see page 8515) event handler.
5. The client dataset receives an AfterGetRecords event, where it can respond to the custom information returned by the provider's AfterGetRecords event handler.

Communicating with the Client Dataset

45.1.8.6.9 TCustomClientDataSet.AfterInsert Event

Occurs after an application inserts a new record.

Pascal

```
property AfterInsert: TDataSetNotifyEvent;
```

C++

```
__property TDataSetNotifyEvent AfterInsert;
```

Description

Write an AfterInsert event handler to take specific action immediately after an application inserts a record. The Insert and Append methods generate an AfterInsert event after inserting or appending a new record.

Delphi Examples:

```
{
This example updates a memo with a message when an
AfterInsert event or a BeforeInsert event occurs.
}
procedure TForm1.ClientDataSet1AfterInsert(DataSet: TDataSet);
begin
   Memo2.Lines.Add('After inserting a record');
end;

procedure TForm1.ClientDataSet1BeforeInsert(DataSet: TDataSet);
begin
   Memo2.Lines.Add('Before inserting a record');
end;
```

See Also

BeforeInsert (see page 7050)

Append (see page 6910)

Insert (see page 6959)

45.1.8.6.10 TCustomClientDataSet.AfterOpen Event

Occurs after an application completes opening a dataset and before any data access occurs.

Pascal

```
property AfterOpen: TDataSetNotifyEvent;
```

C++

```
__property TDataSetNotifyEvent AfterOpen;
```

Description

Write an AfterOpen event handler to take specific action immediately after an application opens the dataset. AfterOpen is called after the dataset establishes access to its data and the dataset is put into dsBrowse state. For example, an AfterOpen event handler might check an ini file to determine the last record touched in the dataset the previous time the application ran, and position the dataset at that record.

Delphi Examples:

```
{
This example adds an entry to a memo with a message when an
```

```
AfterOpen event or an AfterClose event occurs.  Populate the
ClientDataSet events with CheckButtonActive.
}
procedure TForm1.CheckButtonActive(DataSet: TDataSet);
begin
  if (Button1.Enabled) then
    Memo2.Lines.Add('Now that the dataset is open, record information is available.')
  else
    Memo2.Lines.Add('Now that the dataset is closed, record information is not available.');
  Button1.Enabled := not ClientDataSet1.Active;
  Button2.Enabled := ClientDataSet1.Active;
  Button3.Enabled := ClientDataSet1.Active;
end;
{
The following code fragment illustrates how DataSets and
DataSetCount can be used to ensure that an action is taken
for every open dataset.  Assign CheckButtonActive as the
AfterClose and AfterOpen event handlers for TClientDataSet1.
}
procedure TForm1.Button1Click(Sender: TObject);
var
  I: Integer;
begin
  if not RemoteServer1.Connected then
    RemoteServer1.Connected := True;
  ClientDataSet1.Close;
  with RemoteServer1 do
  begin
    for I := 0 to DataSetCount - 1 do
      DataSets[I].EnableControls;
  end;
  ClientDataSet1.Open;
end;

procedure TForm1.Button3Click(Sender: TObject);
var
  I: Integer;
begin
  ClientDataSet1.Close;
  RemoteServer1.Connected := False;
  with RemoteServer1 do
  begin
    for I := 0 to DataSetCount - 1 do
      DataSets[I].DisableControls;
  end;
end;

procedure TForm1.CheckButtonActive(DataSet: TDataSet);
begin
  Button1.Enabled := not ClientDataSet1.Active;
  Button2.Enabled := ClientDataSet1.Active;
  Button3.Enabled := ClientDataSet1.Active;
end;
```

Opening and Closing Datasets

45.1.8.6.11 TCustomClientDataSet.AfterPost Event

Occurs after an application writes the active record to the database or change log and returns to browse state.

Pascal

```
property AfterPost: TDataSetNotifyEvent;
```

C++

```
__property TDataSetNotifyEvent AfterPost;
```

Description

Write an AfterPost event handler to take specific action immediately after an application posts a change to the active record. AfterPost is called after a modification or insertion is made to a record.

Delphi Examples:

```
{
This example updates the form's status bar with a message
when an AfterPost event occurs.
}
procedure TForm1.ClientDataSet1AfterPost(DataSet: TDataSet);
begin
   Memo2.Lines.Add('Before posting a record');
end;
```

See Also

BeforePost (see page 7052)

Post (see page 6977)

45.1.8.6.12 TCustomClientDataSet.AfterRefresh Event

Occurs after an application refreshes the data in the dataset.

Pascal

```
property AfterRefresh: TDataSetNotifyEvent;
```

C++

```
__property TDataSetNotifyEvent AfterRefresh;
```

Description

Write an AfterRefresh event handler to take specific action immediately after an application has updated the records in the dataset. AfterRefresh is generated by calls to the Refresh method.

See Also

BeforeRefresh (see page 7052)

Refresh (see page 6991)

45.1.8.6.13 TCustomClientDataSet.AfterRowRequest Event

Occurs after the client dataset fetches new information about the current record.

Pascal

```
property AfterRowRequest: TRemoteEvent;
```

C++

```
__property TRemoteEvent AfterRowRequest;
```

Description

Write an AfterRowRequest event handler to respond to custom information returned to the client dataset from a provider's AfterRowRequest event handler. AfterRowRequest is part of the mechanism by which a client dataset and a provider communicate information about data fetching. When working with a provider on a stateless application server, this mechanism allows the client dataset and the provider to communicate persistent state information.

When the client dataset fetches detail information about the current record or refreshes the current record, the following events occur:

1.The client dataset receives a BeforeRowRequest (see page 8520) event, where it can encode custom information into an OleVariant that is passed to the provider as the OwnerData parameter.

2.The provider receives a BeforeRowRequest (see page 8520) event, where it can respond to or change that information before it looks up the requested information.

3.The provider creates a delta packet that contains the requested information.

4.The provider receives an AfterRowRequest event, where it can encode custom information into its OwnerData parameter or respond to information from the BeforeRowRequest (see page 8520) event handler.

5.The client dataset receives an AfterRowRequest event, where it can respond to the custom information returned by the provider's AfterRowRequest event handler.

Communicating with the Client Dataset

45.1.8.6.14 TCustomClientDataSet.AfterScroll Event

Occurs after an application scrolls from one record to another.

Pascal

```
property AfterScroll: TDataSetNotifyEvent;
```

C++

```
__property TDataSetNotifyEvent AfterScroll;
```

Description

Write an AfterScroll event handler to take specific action immediately after an application scrolls to another record as a result of a call to the First, Last, MoveBy, Next, Prior, FindKey, FindFirst, FindNext, FindLast, FindPrior, and Locate methods. AfterScroll is called after all other events triggered by these methods and any other methods that switch from record to record in the dataset.

See Also

BeforeScroll (see page 7053)

First (see page 6942)

Last (see page 6968)

MoveBy (see page 6971)

Next (see page 6973)

Prior (see page 6979)

Navigating Datasets

45.1.8.6.15 TCustomClientDataSet.BeforeApplyUpdates Event

Occurs before the client dataset applies updates to the remote server.

Pascal

```
property BeforeApplyUpdates: TRemoteEvent;
```

C++

```
__property TRemoteEvent BeforeApplyUpdates;
```

Description

Write a BeforeApplyUpdates event handler to send custom information to the client dataset's provider. BeforeApplyUpdates is part of the mechanism by which a client dataset and a provider communicate information about updates. When working with a provider on a stateless application server, this mechanism allows the client dataset and the provider to communicate persistent state information.

When the application calls the client dataset's ApplyUpdates (see page 8394) method, the following events occur:

1.The client dataset receives a BeforeApplyUpdates event, where it can encode custom information into an OleVariant that is passed to the provider as the OwnerData parameter.

2.The provider receives a BeforeApplyUpdates event, where it can respond to or change that information before it applies the updates.

3.The provider applies the updates and receives an OnUpdateError event for any problem records.

4.The provider receives an AfterApplyUpdates (see page 8497) event, where it can encode custom information into its OwnerData parameter or respond to information from the BeforeApplyUpdates event handler.

5.The client dataset receives an AfterApplyUpdates (see page 8497) event, where it can respond to the custom information returned by the provider's AfterApplyUpdates (see page 8497) event handler.

Applying Updates

Communicating with the Client Dataset

45.1.8.6.16 TCustomClientDataSet.BeforeCancel Event

Occurs before an application executes a request to cancel changes to the active record.

Pascal

```
property BeforeCancel: TDataSetNotifyEvent;
```

C++

```
__property TDataSetNotifyEvent BeforeCancel;
```

Description

Write a BeforeCancel event to take specific action before an application carries out a request to cancel changes. BeforeCancel is called by the Cancel method before it cancels a dataset operation such as Edit, Insert, or Delete.

An application might use the BeforeCancel event to record a user's changes in an undo buffer.

See Also

AfterCancel (see page 7038)

Delete (see page 6924)

Edit (see page 6932)

Insert (see page 6959)

45.1.8.6.17 TCustomClientDataSet.BeforeClose Event

Occurs immediately before the dataset closes.

Pascal

```
property BeforeClose: TDataSetNotifyEvent;
```

C++

```
__property TDataSetNotifyEvent BeforeClose;
```

Description

Write a BeforeClose event to take specific action before an application closes a dataset. Calling Close or setting the Active property to false results in a call to the BeforeClose event handler.

See Also

Active (see page 7004)

AfterClose (see page 7040)

Close (see page 6920)

Opening and Closing Datasets

Posting Data

45.1.8.6.18 TCustomClientDataSet.BeforeDelete Event

Occurs before an application attempts to delete the active record.

Pascal

```
property BeforeDelete: TDataSetNotifyEvent;
```

C++

```
__property TDataSetNotifyEvent BeforeDelete;
```

Description

Write a BeforeDelete event handler to take specific action before an application deletes the active record. BeforeDelete is called by Delete before it actually deletes a record.

In Delphi, making use of this event an application might, for example, display a dialog box asking for confirmation before deleting the record. On denial of confirmation, the application could abort the deletion by calling the Abort procedure.

See Also

AfterDelete (see page 7041)

Delete (see page 6924)

Abort (see page 22786)

45.1.8.6.19 TCustomClientDataSet.BeforeEdit Event

Occurs before an application enters edit mode for the active record.

Pascal

```
property BeforeEdit: TDataSetNotifyEvent;
```

C++

```
__property TDataSetNotifyEvent BeforeEdit;
```

Description

Write a BeforeEdit event handler to take specific action before an application enables editing of the active record. For example, an application that keeps a log of database edits could use the BeforeEdit event to record the edit request, time, and user before entering edit state.

Delphi Examples:

```
{
This example adds an entry to a memo with a message
when an AfterEdit event occurs and when a BeforeEdit event
occurs.  Click on Run SQL to populate the DBGrid.  Then
select a cell to edit and click the Edit current cell
button, or just start editing the cell to invoke the
BeforeEdit and AfterEdit events.
}
procedure TForm1.ClientDataSet1AfterEdit(DataSet: TDataSet);
begin
   Memo2.Lines.Add('After editing record' + IntToStr(DataSet.RecNo));
end;

procedure TForm1.ClientDataSet1BeforeEdit(DataSet: TDataSet);
begin
   Memo2.Lines.Add('Before editing record' + IntToStr(DataSet.RecNo));
end;

procedure TForm1.Button4Click(Sender: TObject);
begin
  ClientDataSet1.Edit;
end;
```

See Also

State (see page 7036)

AfterEdit (see page 7044)

Edit (see page 6932)

45.1.8.6.20 TCustomClientDataSet.BeforeExecute Event

Occurs before the client dataset executes the provider's query or stored procedure.

Pascal

```
property BeforeExecute: TRemoteEvent;
```

C++

```
__property TRemoteEvent BeforeExecute;
```

Description

Write a BeforeExecute event handler to send custom information to the client dataset's provider. BeforeExecute is part of the mechanism by which a client dataset and a provider communicate information when explicitly executing an SQL command by the provider's dataset. When working with a provider on a stateless application server, this mechanism allows the client dataset and the provider to communicate persistent state information.

When the application calls the client dataset's Execute (see page 8413) method, the following events occur:

1.The client dataset receives a BeforeExecute event, where it can encode custom information into an OleVariant that is passed to the provider as the OwnerData parameter.

2.The provider receives a BeforeExecute event, where it can respond to or change that information before it executes the query or stored procedure.

3.The provider executes the appropriate command (either the command supplied by the CommandText (see page 8465) property, or the command associated with a dataset such as a query or stored procedure).

4.The provider receives an AfterExecute (see page 8504) event, where it can encode custom information into its OwnerData parameter or respond to information from the BeforeExecute event handler.

5.The client dataset unpacks any output parameters from the provider into the Params (see page 8489) property and then receives an AfterExecute (see page 8504) event, where it can respond to the custom information returned by the provider's AfterExecute (see page 8504) event handler.

See Also

Execute (see page 8413)

AS_Execute (see page 16453)

Execute (see page 18466)

beforeexecute (see page 18479)

AfterExecute (see page 8504)

CommandText (see page 8465)

Communicating with the Client Dataset

45.1.8.6.21 TCustomClientDataSet.BeforeGetParams Event

Occurs before the client dataset fetches parameter values from the provider.

Pascal

```
property BeforeGetParams: TRemoteEvent;
```

C++

```
__property TRemoteEvent BeforeGetParams;
```

Description

Write a BeforeGetParams event handler to send custom information to the client dataset's provider. BeforeGetparams is part of the mechanism by which a client dataset and a provider communicate information when passing parameter values from the provider's dataset. When working with a provider on a stateless application server, this mechanism allows the client dataset and the provider to communicate persistent state information.

When the application calls the client dataset's FetchParams (see page 8415) method, the following events occur:

1.The client dataset receives a BeforeGetParams event, where it can encode custom information into an OleVariant that is passed to the provider as the OwnerData parameter.

2.The provider receives a BeforeGetParams event, where it can respond to or change that information before it retrieves parameter values.

3.The provider encodes all of its dataset's current parameter values into an OleVariant.

4.The provider receives an AfterGetParams (see page 8505) event, where it can encode custom information into its OwnerData parameter or respond to information from the BeforeGetParams event handler.

5.The client dataset unpacks the parameters from the provider into the Params (see page 8489) property and then receives an AfterGetParams (see page 8505) event, where it can respond to the custom information returned by the provider's AfterGetParams (see page 8505) event handler.

See Also

FetchParams (see page 8415)

AS_GetParams (see page 16454)

GetParams (see page 18467)

BeforeGetParams (see page 18480)

AfterGetParams (see page 8505)

Communicating with the Client Dataset

45.1.8.6.22 TCustomClientDataSet.BeforeGetRecords Event

Occurs before the client dataset fetches a data packet from the provider.

Pascal

```
property BeforeGetRecords: TRemoteEvent;
```

C++

```
__property TRemoteEvent BeforeGetRecords;
```

Description

Write a BeforeGetRecords event handler to send custom information to the client dataset's provider. BeforeGetRecords is part of the mechanism by which a client dataset and a provider communicate information about data fetching. When working with a provider on a stateless application server, this mechanism allows the client dataset and the provider to communicate persistent state information.

When the client dataset fetches data from the application server, the following events occur:

1.The client dataset receives a BeforeGetRecords event, where it can encode custom information into an OleVariant that is

passed to the provider as the OwnerData parameter.

2.The provider receives a BeforeGetRecords event, where it can respond to or change that information before it creates a data packet.

3.The provider generates the data packet.

4.The provider receives an AfterGetRecords (see page 8506) event, where it can encode custom information into its OwnerData parameter or respond to information from the BeforeGetRecords event handler.

5.The client dataset receives an AfterGetRecords (see page 8506) event, where it can respond to the custom information returned by the provider's AfterGetRecords (see page 8506) event handler.

Delphi Examples:

```
{
This example shows how to use the BeforeGetRecords event
handler (a TRemoteEventType value) to send the provider
information it needs for incremental data fetching. Before
fetching the next data packet, the client dataset packages
up the key value of the last record so that the provider
knows where to begin the next data packet. It also sends
some application-specific information, which is stored in
Memo1.  This method is used to pass the sql statement and the
value of the first field for the last record to the server so
that the server can return the correct records. The complete
project using this code example is in
Demos/DelphiWin32/VCLWin32/MIDAS/Pooler.
}
procedure TForm1.ClientDataSet1BeforeGetRecords(Sender: TObject; var OwnerData: OleVariant);
var
  LastValue: OleVariant;
  CDSClone: TClientDataSet;
begin
  if ClientDataSet1.Active then
  begin
    CDSClone := TClientDataSet.Create(Form1);
    try
      CDSClone.CloneCursor(ClientDataSet1, True);
      { turn off FetchOnDemand so that the clone only fetches
        the last LOCAL record }
      CDSClone.FetchOnDemand := False;
      CDSClone.Last;
      LastValue := CDSClone.Fields[0].AsString;
      CDSClone.Close;
    finally
      CDSClone.Free;
    end;
  end else
    LastValue := NULL;
  OwnerData := VarArrayOf([Memo1.Lines.Text, LastValue]);
end;

procedure TForm1.Button2Click(Sender: TObject);
begin
  ClientDataSet1.PacketRecords := StrToInt(Edit1.Text);
  ClientDataSet1.GetNextPacket;
end;
```

AfterGetRecords (see page 8506)

Communicating with the Client Dataset

45.1.8.6.23 TCustomClientDataSet.BeforeInsert Event

Occurs before an application enters insert mode.

Pascal

```
property BeforeInsert: TDataSetNotifyEvent;
```

C++

```
__property TDataSetNotifyEvent BeforeInsert;
```

Description

Write a BeforeInsert event handler to take specific action before an application inserts or appends a new record. The Insert or Append method generates a BeforeInsert method before it sets the dataset into dsInsert state.

Delphi Examples:

```
{
This example updates a memo with a message when an
AfterInsert event or a BeforeInsert event occurs.
}
procedure TForm1.ClientDataSet1AfterInsert(DataSet: TDataSet);
begin
   Memo2.Lines.Add('After inserting a record');
end;

procedure TForm1.ClientDataSet1BeforeInsert(DataSet: TDataSet);
begin
   Memo2.Lines.Add('Before inserting a record');
end;
{
This example uses the BeforeInsert event to do data
validation. If the StrToInt function raises an exception,
the edit control’s contents are set to a valid value so
that the assignment to the INTEGER field in the dataset
will succeed.  Continuing after the exception causes a
'0' to be placed in the PORTA field.
DataSet design:
This example requires a ClientDataSet, a DBGrid, a
DataSource and a DBNavigator.  Name the ClientDataSet CDS.
Set the DataSet property in the DataSource to CDS and name
that DataSource DS.  Set the DataSource in the DBNavigator
to DS the DataSource in the DBGrid to DS.  Right click on CDS
and select the Fields Editor, then right click on the Field
Editor form and create two fields by selecting "new field".
In the field configuration window, set the name to HOST, the
Component value will automatically be set to CDSHOST.  Set
the filed type to String.  In the field configuration window
for the second field, set the name to PORTA, the Component
value will automatically be set to CDSPORTA.  Set the field
type to Integer.  The file used to load CDS must have an
attribute name of HOST with an attribute type of string and
an attribute name of PORTA with an attribute type of integer.
Add DB, DBCtrls, Grids, DBGrids and DBClient to the uses clause.
}
{$IFNDEF UNICODE}
uses SwSystem;
{$ENDIF}

procedure TForm1.Button3Click(Sender: TObject);
```

```
begin
  CDS.Insert;
  CDS.FieldByName('PORTA').AsInteger := StrToInt(Edit1.Text);
  CDS.Post;
end;

procedure TForm1.CDSBeforeInsert(DataSet: TDataSet);
begin
  try
  { Make sure edit field can be converted to integer --
   this will raise an exception if it can't }
    StrToInt(Edit1.Text);
  except
    Edit1.Text := '0';
  end;
end;

procedure TForm1.FormCreate(Sender: TObject);
begin
{$IFDEF UNICODE}
  CDS.LoadFromFile(GetCurrentDir + '\CDS.XML');
{$ELSE}
  CDS.LoadFromFile(gsAppPath + 'CDS.XML');
{$ENDIF}
end;
```

45.1.8.6.24 TCustomClientDataSet.BeforeOpen Event

Occurs before an application executes a request to open a dataset.

Pascal

```
property BeforeOpen: TDataSetNotifyEvent;
```

C++

```
__property TDataSetNotifyEvent BeforeOpen;
```

Description

Write a BeforeOpen event handler to take specific action before an application opens a dataset for viewing or editing. BeforeOpen is triggered when an application sets the Active property to true for a dataset or an application calls Open.

See Also

Active (see page 7004)

AfterOpen (see page 7045)

Open (see page 6976)

Opening and Closing Datasets

45.1.8.6.25 TCustomClientDataSet.BeforePost Event

Occurs before an application posts changes for the active record to the database or change log.

Pascal

```
property BeforePost: TDataSetNotifyEvent;
```

C++

```
__property TDataSetNotifyEvent BeforePost;
```

Description

Write a BeforePost event handler to take specific action before an application posts dataset changes. BeforePost is triggered when an application calls the Post method. Post checks to make sure all required fields are present, then calls BeforePost before posting the record.

An application might use BeforePost to perform validity checks on data changes before committing them. If it encountered a validity problem, it could call Abort to cancel the Post operation (Delphi) or throw an exception (C++).

Delphi Examples:

```
{
This example checks for a valid entry in a TDBEdit control
and calls the Abort procedure if the control is empty; Abort
cancels the post before it happens.
}
procedure TForm1.ClientDataSet1BeforePost(DataSet: TDataSet);
begin
  if DBEdit1.Text = '' then
    Abort;
  DataSet.Fields[2].AsString := DBEdit1.Text;
end;
```

Post (see page 6977)

Abort (see page 22786)

Working with Field Component Methods at Runtime

45.1.8.6.26 TCustomClientDataSet.BeforeRefresh Event

Occurs immediately before an application refreshes the data in the dataset.

Pascal

```
property BeforeRefresh: TDataSetNotifyEvent;
```

C++

```
__property TDataSetNotifyEvent BeforeRefresh;
```

Description

Write a BeforeRefresh event handler to take specific action immediately before an application updates the records in the dataset. BeforeRefresh is generated by calls to the Refresh method.

See Also

AfterRefresh (see page 7047)

Refresh (see page 6991)

45.1.8.6.27 TCustomClientDataSet.BeforeRowRequest Event

Occurs before the client dataset fetches new information about the current record.

Pascal

```
property BeforeRowRequest: TRemoteEvent;
```

C++

```
__property TRemoteEvent BeforeRowRequest;
```

Description

Write a BeforeRowRequest event handler to send custom information to the client dataset's provider. BeforeRowRequest is part of the mechanism by which a client dataset and a provider communicate information about data fetching. When working with a provider on a stateless application server, this mechanism allows the client dataset and the provider to communicate persistent state information.

When the client dataset fetches detail information about the current record or refreshes the current record, the following events occur:

1.The client dataset receives a BeforeRowRequest event, where it can encode custom information into an OleVariant that is passed to the provider as the OwnerData parameter.

2.The provider on the application server receives a BeforeRowRequest event, where it can respond to or change that information before it looks up the requested information.

3.The provider creates a delta packet that contains the requested information.

4.The provider receives an AfterRowRequest (see page 8509) event, where it can encode custom information into its OwnerData parameter or respond to information from the BeforeRowRequest event handler.

5.The client dataset receives an AfterRowRequest (see page 8509) event, where it can respond to the custom information returned by the provider's AfterRowRequest (see page 8509) event handler.

See Also

AS_RowRequest (see page 16456)

RowRequest (see page 18472)

BeforeRowRequest (see page 18482)

AfterRowRequest (see page 8509)

FetchParams (see page 8415)

RefreshRecord (see page 8442)

Communicating with the Client Dataset

45.1.8.6.28 TCustomClientDataSet.BeforeScroll Event

Occurs before an application scrolls from one record to another.

Pascal

```
property BeforeScroll: TDataSetNotifyEvent;
```

C++

```
__property TDataSetNotifyEvent BeforeScroll;
```

Description

Write a BeforeScroll event handler to take specific action immediately before an application scrolls to another record as a result of a call to the First, Last, MoveBy, Next, Prior, FindKey, FindFirst, FindNext, FindLast, FindPrior, and Locate methods. BeforeScroll is called before all other events triggered by these methods and any other methods that switch from record to record in the dataset.

See Also

AfterScroll (see page 7047)

First (see page 6942)

Last (see page 6968)

MoveBy (see page 6971)

Next (see page 6973)

Prior (see page 6979)

Navigating Datasets

45.1.8.6.29 TCustomClientDataSet.OnCalcFields Event

Occurs when an application recalculates calculated fields.

Pascal

```
property OnCalcFields: TDataSetNotifyEvent;
```

C++

```
__property TDataSetNotifyEvent OnCalcFields;
```

Description

Write an OnCalcFields event handler to take specific action when an application recalculates calculated fields. A calculated field is one that derives its value from the values in one or more fields in the dataset, sometimes with additional processing.

OnCalcFields is triggered when:

A dataset is opened.

A dataset is put into dsEdit state.

A record is retrieved from a database.

When the AutoCalcFields property is true, OnCalcFields is also triggered when:

Focus moves from one visual control to another, or from one column to another is a data-aware grid control and modifications were made to the record.

Note: When the AutoCalcFields property is true, an OnCalcFields event handler should not modify the dataset (or a linked dataset if it is part of a master-detail relationship), because such modifications retrigger the OnCalcField event, leading to infinite recursion.

If an application permits users to change data, OnCalcFields is frequently triggered. To reduce the frequency with which OnCalcFields occurs, set AutoCalcFields to false.

Warning: When the dataset is the master table of a master-detail relationship, OnCalcFields occurs before detail sets have

been synchronized with the master table.

AutoCalcFields (see page 7006)

Open (see page 6976)

Post (see page 6977)

Calculating Fields

Using Internally Calculated Fields in Client Datasets

Defining a Calculated Field

45.1.8.6.30 TCustomClientDataSet.OnDeleteError Event

Occurs when an application attempts to delete a record and an exception is raised.

Pascal

```
property OnDeleteError: TDataSetErrorEvent;
```

C++

```
__property TDataSetErrorEvent OnDeleteError;
```

Description

Write an OnDeleteError event handler to handle exceptions that occur when an attempt to delete a record fails.

See Also

OnEditError (see page 7054)

OnPostError (see page 7056)

Delete (see page 6924)

45.1.8.6.31 TCustomClientDataSet.OnEditError Event

Occurs when an application attempts to modify or insert a record and an exception is raised.

Pascal

```
property OnEditError: TDataSetErrorEvent;
```

C++

```
__property TDataSetErrorEvent OnEditError;
```

Description

Write an OnEditError event handler to handle exceptions that occur when an attempt to edit a record fails.

See Also

OnDeleteError (see page 7054)

OnPostError (see page 7056)

Edit (see page 6932)

Insert (see page 6959)

45.1.8.6.32 TCustomClientDataSet.OnFilterRecord Event

Occurs each time a different record in the dataset becomes the active record and filtering is enabled.

Pascal

```
property OnFilterRecord: TFilterRecordEvent;
```

C++

```
__property TFilterRecordEvent OnFilterRecord;
```

Description

Write an OnFilterRecord event handler to specify for each record in a dataset whether it should be visible to the application. To indicate that a record passes the filter condition, the OnFilterRecord event handler must set the Accept parameter to true. To exclude a record, set the Accept parameter to false. Most TDataSet descendants (such as ADO datasets or BDE-based datasets) initialize Accept to true before calling the OnFilterRecord event handler.

Warning: Do not supply an OnFilterRecord event handler to a unidirectional dataset. Unidirectional datasets do not support filters, and assigning an OnFilterRecord event handler causes the dataset to raise an exception.

Filtering is enabled if the Filtered property is true. When an application is processing a filter, the State property for the dataset is dsFilter.

Use an OnFilterRecord event handler to filter records using a criterion that can't be implemented using the Filter property. For example, using the Filter property, field comparisons are not supported against local tables (Paradox, dBASE, Access, FoxPro), but an OnFilterRecord event handler can implement any criterion at all.

Tip: Be sure that any interactions between the Filter property and the OnFilterRecord event handler do not result in an empty filter set when they are used simultaneously in an application.

Writing an OnFilterRecord Event Handler

45.1.8.6.33 TCustomClientDataSet.OnNewRecord Event

Occurs when an application inserts or appends a new dataset record.

Pascal

```
property OnNewRecord: TDataSetNotifyEvent;
```

C++

```
__property TDataSetNotifyEvent OnNewRecord;
```

Description

Write an OnNewRecord event handler to take specific actions as an application inserts or appends a new record. OnNewRecord

is called as part of the insert or append process. An application might use the OnNewRecord event to set initial values for a record or as a way of implementing cascading insertions in related datasets.

See Also

AfterInsert (see page 7044)

BeforeInsert (see page 7050)

45.1.8.6.34 TCustomClientDataSet.OnPostError Event

Occurs when an application attempts to modify or insert a record and an exception is raised.

Pascal

```
property OnPostError: TDataSetErrorEvent;
```

C++

```
__property TDataSetErrorEvent OnPostError;
```

Description

Write an OnPostError event handler to handle exceptions that occur when an attempt to post a record fails.

See Also

OnDeleteError (see page 7054)

OnEditError (see page 7054)

Post (see page 6977)

45.1.8.6.35 TCustomClientDataSet.OnReconcileError Event

Occurs when a client dataset needs to reconcile an update to a record that could not be applied.

Pascal

```
property OnReconcileError: TReconcileErrorEvent;
```

C++

```
__property TReconcileErrorEvent OnReconcileError;
```

Description

Write an OnReconcileError event handler to respond to error conditions that arise when the Reconcile (see page 8441) method cycles through records that could not be applied to the database. This event handles only those update errors that were not handled in an OnUpdateError event handler.

The OnReconcileError event handler is called once for each record that could not be applied to the dataset or handled by the provider.

Warning: A provider can't detect when an update conflicts with another user's changes to a memo field. This situation does not generate an OnReconcileError event.

45.1.9 TCustomRemoteServer Class

TCustomRemoteServer is the base class for all components that connect to an application server in a multi-tiered database application.

Class Hierarchy

Pascal

```
TCustomRemoteServer = class(TCustomConnection);
```

C++

```
class TCustomRemoteServer : public TCustomConnection;
```

File

DBClient

Description

Do not create instances of TCustomRemoteServer. TCustomRemoteServer introduces the properties and methods needed to connect to a remote application server and make its IAppServer interface available to one or more client datasets. Descendant classes, which are often called DataSnap connection components, override many of TCustomRemoteServer's methods to create or close connections to the application server and to manage the interface communication with the application server.

To enable a client application to connect to an application server, use a descendant of TCustomRemoteServer such as TSOAPConnection, TSocketConnection, TWebConnection, or TDCOMConnection.

See Also

TClientDataSet (see page 8289)

TBaseProvider (see page 18423)

TSocketConnection (see page 18928)

TDCOMConnection (see page 16008)

Using a Multi-Tiered Architecture

45.1.9.1 TCustomRemoteServer Members

The following tables list the members exposed by TCustomRemoteServer.

Protected Events

	Name	Description
	OnGetUsername (see page 8533)	This is OnGetUsername, a member of class TCustomRemoteServer.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DoConnect (see page 6864)	Provides the interface for a method that opens a connection.
V	DoDisconnect (see page 6864)	Provides the interface for a method that terminates the connection.
V	GetAppServer (see page 8530)	Returns the value of the AppServer (see page 8532) property.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetConnected (see page 6865)	Returns the value of the Connected (see page 6868) property.
V	GetDataSet (see page 6865)	Returns a dataset, given its index in the DataSets (see page 6870) property array.
V	GetDataSetCount (see page 6865)	Returns the value of the DataSetCount (see page 6869) property.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Loaded (see page 6866)	Initializes the connection component after all objects in the form or data module have been loaded.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	RegisterClient (see page 6866)	Registers an object that uses the connection component.
	SendConnectEvent (see page 6867)	Informs all registered clients that use the connection component when a connection is opened or closed.

	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetAppServer (see page 8531)	Sets the AppServer (see page 8532) property.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetConnected (see page 6867)	Changes the value of the Connected (see page 6868) property.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	UnRegisterClient (see page 6868)	Removes a registered client so that it is no longer associated with the connection component.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	StreamedConnected (see page 6874)	Indicates whether the Connected (see page 6868) property was true when the connection component was loaded from a stream.

Public Events

	Name	Description
	AfterConnect (see page 6874)	Occurs after a connection is established.
	AfterDisconnect (see page 6875)	Occurs after the connection closes.
	BeforeConnect (see page 6875)	Occurs immediately before establishing a connection.
	BeforeDisconnect (see page 6875)	Occurs immediately before the connection closes.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Close (see page 6863)	Closes the connection.
	Create (see page 8529)	Creates an instance of a remote server component.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 2766)	Disposes of the component and its owned components.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.

V	Destroy (see page 6863)	Destroys the instance of a connection component.
V	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetProviderNames (see page 8530)	Executes a callback for all provider objects on the application server.
V	GetServer (see page 8530)	Returns the IAppServer interface of the application server.
V	GetServerList (see page 8531)	Returns a list of application servers (remote data modules) to which the component can connect.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	Open (see page 6866)	Opens the connection.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	AppServer (see page 8532)	Contains the interface for communicating with the application server.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.

	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Connected (see page 6868)	Determines whether a connection has been established to the remote source of data.
R	DataSetCount (see page 6869)	Indicates the number of datasets associated with the connection component.
R	DataSets (see page 6870)	Lists the datasets currently using this connection component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	LoginPrompt (see page 6872)	Specifies whether a login dialog appears immediately before opening a new connection.
	OnLogin (see page 6873)	Occurs when a communication channel opens to the server.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

45.1.9.2 TCustomRemoteServer.Create Constructor

Creates an instance of a remote server component.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomRemoteServer(TComponent * AOwner);
```

Description

Create instantiates an instance of a remote server component and initializes its properties.

AOwner is the component that is responsible for freeing the TCustomRemoteServer (see page 8525) instance. It becomes the value of the Owner property.

See Also

Create (see page 6862)

Owner (see page 2807)

45.1.9.3 TCustomRemoteServer Methods

The methods of the TCustomRemoteServer class are listed here.

Protected Methods

	Name	Description
V	GetAppServer (see page 8530)	Returns the value of the AppServer (see page 8532) property.
V	SetAppServer (see page 8531)	Sets the AppServer (see page 8532) property.

Public Methods

	Name	Description
	GetProviderNames (see page 8530)	Executes a callback for all provider objects on the application server.
	GetServer (see page 8530)	Returns the IAppServer interface of the application server.
	GetServerList (see page 8531)	Returns a list of application servers (remote data modules) to which the component can connect.

45.1.9.3.1 TCustomRemoteServer.GetAppServer Method

Returns the value of the AppServer (see page 8532) property.

Pascal

```
function GetAppServer: Variant; virtual;
```

C++

```
virtual __fastcall Variant GetAppServer();
```

Description

GetAppServer is the protected implementation of the AppServer (see page 8532) property. Override GetAppServer to change the way this property is stored or managed.

See Also

AppServer (see page 8532)

GetServer (see page 8530)

45.1.9.3.2 TCustomRemoteServer.GetProviderNames Method

Executes a callback for all provider objects on the application server.

Pascal

```
procedure GetProviderNames(Proc: TGetStrProc); virtual;
```

C++

```
virtual __fastcall GetProviderNames(TGetStrProc Proc);
```

Description

Call GetProviderNames to execute the procedure specified by the Proc parameter for every provider exposed by the application server. For every provider listed by the remote data module's AS_GetProviderNames method, Proc is called with the name of the provider.

See Also

AS_GetProviderNames (see page 16454)

AppServer (see page 8532)

ProviderName (see page 8492)

45.1.9.3.3 TCustomRemoteServer.GetServer Method

Returns the IAppServer interface of the application server.

Pascal

```
function GetServer: IAppServer; virtual;
```

C++

```
virtual __fastcall IAppServer GetServer();
```

Description

Descendant classes override this function to return the interface of the application server after establishing a connection. As implemented in TCustomRemoteServer (see page 8525), GetServer always returns nil (Delphi) or NULL (C++).

See Also

Connected (see page 6868)

AppServer (see page 8532)

AppServer (see page 8462)

45.1.9.3.4 TCustomRemoteServer.GetServerList Method

Returns a list of application servers (remote data modules) to which the component can connect.

Pascal

```
function GetServerList: OleVariant; virtual;
```

C++

```
virtual __fastcall OleVariant GetServerList();
```

Description

Connection components use GetServerList internally to fill the drop down list in the Object Inspector for the ServerName property.

As implemented in TCustomRemoteServer (see page 8525), GetServerList always returns NULL. Descendant classes override this method to return a list of application servers that are on the local machine and registered in the system registry (TDispatchConnection), or fetched from the server machine (TStreamedConnection).

See Also

ServerName (see page 16030)

45.1.9.3.5 TCustomRemoteServer.SetAppServer Method

Sets the AppServer (see page 8532) property.

Pascal

```
procedure SetAppServer(Value: Variant); virtual;
```

C++

```
virtual __fastcall SetAppServer(Variant Value);
```

Description

SetAppServer allows descendants of TCustomRemoteServer (see page 8525) to set the read-only AppServer (see page 8532) property when they establish a connection to the application server.

See Also

AppServer (see page 8532)

Connected (see page 6868)

45.1.9.4 TCustomRemoteServer Properties

The properties of the TCustomRemoteServer class are listed here.

Public Properties

	Name	Description
R	AppServer (see page 8532)	Contains the interface for communicating with the application server.

45.1.9.4.1 TCustomRemoteServer.AppServer Property

Contains the interface for communicating with the application server.

Pascal

```
property AppServer: Variant;
```

C++

```
__property Variant AppServer;
```

Description

AppServer provides read-only access to the interface returned by the application server's remote data module (a descendant of IAppServer). If the remote data module is not a SOAP data module, client applications can communicate directly with the application server through this interface.

In Delphi, when calling methods directly using AppServer, the client application uses late binding. For details on how to improve on this, see Calling server interfaces .

Note: In C++, to call this interface, you must obtain a dispatch interface from this Variant. The dispatch interface has the same name as the application server's interface, but with the string "Disp" appended. Thus, if the remote data module in the application server is called MyAppServer, you can use AppServer to call its interface as follows:

Note: IDispatch* disp = (IDispatch*)(MyConnection->AppServer);

Note: IMyAppServerDisp TempInterface((IMyAppServer*)disp);

Note: TempInterface.SpecialMethod(x,y);

Note: To use the IAppServer methods of the application server's interface, obtain an interface using the GetServer (see page 8530) method instead.

TClientDataSet (see page 8289)

GetServer (see page 8530)

TRemoteDataModule (see page 6585)

IAppServer (see page 16450)

45.1.9.5 TCustomRemoteServer Events

The events of the TCustomRemoteServer class are listed here.

Protected Events

	Name	Description
	OnGetUsername (see page 8533)	This is OnGetUsername, a member of class TCustomRemoteServer.

45.1.9.5.1 TCustomRemoteServer.OnGetUsername Event

Pascal

```
property OnGetUsername: TGetUsernameEvent;
```

C++

```
__property TGetUsernameEvent OnGetUsername;
```

Description

This is OnGetUsername, a member of class TCustomRemoteServer.

45.2 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	PackageParams (see page 8534)	Converts a TParams object into an OleVariant that can be used in multi-tiered applications.
	UnpackParams (see page 8534)	Converts an OleVariant that represents a set of parameters into a TParams object.

45.2.1 DBClient.PackageParams Function

Converts a TParams object into an OleVariant that can be used in multi-tiered applications.

Pascal

```
function PackageParams(Params: TParams; Types: TParamTypes = AllParamTypes): OleVariant;
```

C++

```
OleVariant PackageParams(TParams Params, TParamTypes Types = AllParamTypes);
```

File

DBClient

Description

IAppServer methods that pass parameter values to or from the application server use an OleVariant to represent those parameters. Client datasets use PackageParams to convert their Params property into the OleVariant format. Use PackageParams to encode parameter values when using the IAppServer interface directly rather than using the methods of TClientDataSet (see page 8289).

The Params parameter is a TParams object (usually the Params property of the source component) whose parameter values are to be encoded.

The Types (see page 23293) parameter indicates which parameters from the Params parameter are to be included. This allows applications to include, for example, only input parameters if no others are needed.

PackageParams returns an OleVariant that encodes the parameter values as a Variant array.

See Also

IAppServer

TCustomClientDataSet (see page 8373)

UnpackParams (see page 8534)

45.2.2 DBClient.UnpackParams Function

Converts an OleVariant that represents a set of parameters into a TParams object.

Pascal

```
procedure UnpackParams(const Source: OleVariant; Dest: TParams);
```

C++

```
UnpackParams(const OleVariant Source, TParams Dest);
```

File

DBClient

Description

Client datasets use UnpackParams update their Params property with parameter values received over an IAppServer interface. Use UnpackParams to decode parameter values when using the IAppServer interface directly rather than using the methods of TClientDataSet (see page 8289).

The Source parameter is an OleVariant that represents a set of parameter values. Parameter values can be encoded into this format using the PackageParams (see page 8534) function.

The Dest parameter is a TParams object (usually the Params property of a destination component) that receives the parameter values.

IAppServer

TCustomClientDataSet (see page 8373)

PackageParams (see page 8534)

45.3 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TDataPacketFormat (see page 8536)	TDataPacketFormat indicates how information is encoded in a data packet or delta packet.
	TDataSetOption (see page 8537)	This is record DBClient.TDataSetOption.
	TFetchOption (see page 8537)	TFetchOption and TFetchOptions (see page 8543) indicate the type of information about a record that a client dataset can request.
	TReconcileAction (see page 8539)	TReconcileAction indicates how a client dataset should handle a record whose update generated an error.

Records

	Name	Description
	TKeyBuffer (see page 8538)	This is record DBClient.TKeyBuffer.
	TRecInfo (see page 8538)	This is record DBClient.TRecInfo.
	TReconcileInfo (see page 8539)	This is record DBClient.TReconcileInfo.

45.3.1 DBClient.TDataPacketFormat Enumeration

TDataPacketFormat indicates how information is encoded in a data packet or delta packet.

Pascal

```
TDataPacketFormat = (
  dfBinary,
  dfXML,
  dfXMLUTF8
);
```

C++

```
enum TDataPacketFormat {
  dfBinary,
  dfXML,
  dfXMLUTF8
};
```

File

DBClient

Description

TDataPacketFormat indicates how a provider encodes database information into data packets. The following table lists the possible values:

Value	Meaning
dfBinary	Information is encoded in binary format.
dfXML	Information is encoded in XML, with extended characters encoded using an escape sequence.
dfXMLUTF8	Information is encoded in XML, with extended characters represented using UTF8.

45.3.2 DBClient.TDataSetOption Enumeration

Pascal

```
TDataSetOption = (
  doDisableInserts,
  doDisableDeletes,
  doDisableEdits,
  doNoResetCall
);
```

C++

```
enum TDataSetOption {
  doDisableInserts,
  doDisableDeletes,
  doDisableEdits,
  doNoResetCall
};
```

File

DBClient

Description

This is record DBClient.TDataSetOption.

45.3.3 DBClient.TFetchOption Enumeration

TFetchOption and TFetchOptions (see page 8543) indicate the type of information about a record that a client dataset can request.

Pascal

```
TFetchOption = (
  foRecord,
  foBlobs,
  foDetails
);
```

C++

```
enum TFetchOption {
  foRecord,
  foBlobs,
  foDetails
};
```

File

DBClient

Description

Providers encode the flags received from a client dataset that indicate what type of row information they require into a value of type TFetchOptions (see page 8543). This value is used internally when assembling the requested information. TFetchOptions (see page 8543) is a set that includes zero or more of the following values:

Value	Meaning
foRecord	The values of fields on the current record. (Used to refresh records).
foBlobs	The values of BLOB fields on the current record. (Used to implement delayed fetching of BLOB data).
foDetails	Any nested dataset fields for the current record. (Used to implement delayed fetching of detail datasets.

45.3.4 DBClient.TKeyBuffer Record

Pascal

```
TKeyBuffer = record
  Modified: Boolean;
  Exclusive: Boolean;
  FieldCount: Integer;
  Data: record;
end;
```

C++

```
struct TKeyBuffer {
  Boolean Modified;
  Boolean Exclusive;
  int FieldCount;
  record Data;
};
```

File

DBClient

Description

This is record DBClient.TKeyBuffer.

45.3.5 DBClient.TRecInfo Record

Pascal

```
TRecInfo = packed record
  RecordNumber: Longint;
  BookmarkFlag: TBookmarkFlag;
  Attribute: DSAttr;
end;
```

C++

```
struct TRecInfo {
  Longint RecordNumber;
  TBookmarkFlag BookmarkFlag;
  DSAttr Attribute;
};
```

File

DBClient

Description

This is record DBClient.TRecInfo.

45.3.6 DBClient.TReconcileAction Enumeration

TReconcileAction indicates how a client dataset should handle a record whose update generated an error.

Pascal

```
TReconcileAction = (
  raSkip,
  raAbort,
  raMerge,
  raCorrect,
  raCancel,
  raRefresh
);
```

C++

```
enum TReconcileAction {
  raSkip,
  raAbort,
  raMerge,
  raCorrect,
  raCancel,
  raRefresh
};
```

File

DBClient

Description

TReconcileAction is the type of the return parameter in a client dataset's OnReconcileError event handler. It indicates the action to take when the OnReconcileError handler exits. The following table lists the possible values and what they indicate:

Value	Meaning
raSkip	Skip updating the record that raised the error condition, and leave the unapplied changes in the change log.
raAbort	Abort the entire reconcile operation.
raMerge	Merge the updated record with the record on the server.
raCorrect	Replace the current updated record with the value of the record in the event handler.
raCancel	Back out all changes for this record, reverting to the original field values.
raRefresh	Back out all changes for this record, replacing it with the current values from the server.

See Also

TCustomClientDataSet (see page 8373)

TResolverResponse (see page 18620)

45.3.7 DBClient.TReconcileInfo Record

Pascal

```
TReconcileInfo = record
  DataSet: TDataSet;
```

```
    UpdateKind: TUpdateKind;
    ReconcileError: EReconcileError;
    ActionRef: ^TReconcileAction;
  end;
```

C++

```
  struct TReconcileInfo {
    TDataSet DataSet;
    TUpdateKind UpdateKind;
    EReconcileError ReconcileError;
    ^TReconcileAction ActionRef;
  };
```

File

DBClient

Description

This is record DBClient.TReconcileInfo.

45.4 Types

The following table lists types in this documentation.

Types

Name	Description
PKeyBuffer (see page 8541)	This is type DBClient.PKeyBuffer.
PRecInfo (see page 8541)	This is type DBClient.PRecInfo.
TAggUpdateEvent (see page 8542)	This is type DBClient.TAggUpdateEvent.
TCDSKeyBuffer (see page 8542)	This is type DBClient.TCDSKeyBuffer.
TCDSRecInfo (see page 8542)	This is type DBClient.TCDSRecInfo.
TDataSetOptions (see page 8543)	This is type DBClient.TDataSetOptions.
TFetchOptions (see page 8543)	This is type DBClient.TFetchOptions.
TFieldDescList (see page 8543)	This is type DBClient.TFieldDescList.
TGetUsernameEvent (see page 8544)	This is type DBClient.TGetUsernameEvent.
TReconcileErrorEvent (see page 8544)	This is type DBClient.TReconcileErrorEvent.
TRemoteEvent (see page 8544)	This is type DBClient.TRemoteEvent.

45.4.1 DBClient.PKeyBuffer Type

Pascal

```
PKeyBuffer = ^TKeyBuffer;
```

C++

```
^TKeyBuffer PKeyBuffer;
```

File

DBClient

Description

This is type DBClient.PKeyBuffer.

45.4.2 DBClient.PRecInfo Type

Pascal

```
PRecInfo = ^TRecInfo;
```

C++

```
^TRecInfo PRecInfo;
```

File

DBClient

Description

This is type DBClient.PRecInfo.

45.4.3 DBClient.TAggUpdateEvent Type

Pascal

```
TAggUpdateEvent = procedure (Agg: TAggregate) of object;
```

C++

```
(Agg: TAggregate) ( TAggUpdateEvent)();
```

File

DBClient

Description

This is type DBClient.TAggUpdateEvent.

45.4.4 DBClient.TCDSKeyBuffer Type

Pascal

```
TCDSKeyBuffer = TKeyBuffer;
```

C++

```
TKeyBuffer TCDSKeyBuffer;
```

File

DBClient

Description

This is type DBClient.TCDSKeyBuffer.

45.4.5 DBClient.TCDSRecInfo Type

Pascal

```
TCDSRecInfo = TRecInfo;
```

C++

```
TRecInfo TCDSRecInfo;
```

File

DBClient

Description

This is type DBClient.TCDSRecInfo.

45.4.6 DBClient.TDataSetOptions Type

Pascal

```
TDataSetOptions = set of TDataSetOption;
```

C++

```
TDataSetOption TDataSetOptions;
```

File

DBClient

Description

This is type DBClient.TDataSetOptions.

45.4.7 DBClient.TFetchOptions Type

Pascal

```
TFetchOptions = set of TFetchOption;
```

C++

```
TFetchOption TFetchOptions;
```

File

DBClient

Description

This is type DBClient.TFetchOptions.

45.4.8 DBClient.TFieldDescList Type

Pascal

```
TFieldDescList = array of DSFLDDesc;
```

C++

```
array of DSFLDDesc TFieldDescList;
```

File

DBClient

Description

This is type DBClient.TFieldDescList.

45.4.9 DBClient.TGetUsernameEvent Type

Pascal

```
TGetUsernameEvent = procedure (Sender: TObject; var Username: string) of object;
```

C++

```
(Sender: TObject; var Username: string) ( TGetUsernameEvent)();
```

File

DBClient

Description

This is type DBClient.TGetUsernameEvent.

45.4.10 DBClient.TReconcileErrorEvent Type

Pascal

```
TReconcileErrorEvent = procedure (DataSet: TCustomClientDataSet; E: EReconcileError;
UpdateKind: TUpdateKind; var Action: TReconcileAction) of object;
```

C++

```
(DataSet: TCustomClientDataSet; E: EReconcileError; UpdateKind: TUpdateKind; var Action:
TReconcileAction) ( TReconcileErrorEvent)();
```

File

DBClient

Description

This is type DBClient.TReconcileErrorEvent.

45.4.11 DBClient.TRemoteEvent Type

Pascal

```
TRemoteEvent = procedure (Sender: TObject; var OwnerData: OleVariant) of object;
```

C++

```
(Sender: TObject; var OwnerData: OleVariant) ( TRemoteEvent)();
```

File

DBClient

Description

This is type DBClient.TRemoteEvent.

45.5 Constants

The following table lists constants in this documentation.

Constants

Name	Description
AllParamTypes (see page 8545)	This is constant DBClient.AllParamTypes.
AllRecords (see page 8545)	This is constant DBClient.AllRecords.

45.5.1 DBClient.AllParamTypes Constant

Pascal

```
AllParamTypes = [ptUnknown, ptInput, ptOutput, ptInputOutput, ptResult];
```

C++

```
AllParamTypes = [ptUnknown, ptInput, ptOutput, ptInputOutput, ptResult];
```

File

DBClient

Description

This is constant DBClient.AllParamTypes.

45.5.2 DBClient.AllRecords Constant

Pascal

```
AllRecords = -1;
```

C++

```
AllRecords = -1;
```

File

DBClient

Description

This is constant DBClient.AllRecords.

46 DBClientActns Namespace

This is namespace DBClientActns.

Topics

Name	Description
Classes (see page 8548)	The following table lists classes in this documentation.

Classes

	Name	Description
	TClientDataSetApply (see page 8548)	TClientDataSetApply causes a target client dataset to apply the updates in its change log.
	TClientDataSetRevert (see page 8556)	TClientDataSetRevert causes a target client dataset to back out all changes to the current record.
	TClientDataSetUndo (see page 8563)	TClientDataSetUndo causes a target client dataset to back out the last edit to the current record.
	TReconcileActionLink (see page 8570)	TReconcileActionLink helps a TClientDataSetApply (see page 8548) action display a dialog when the client dataset encounters reconcile errors.

46.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TClientDataSetApply (see page 8548)	TClientDataSetApply causes a target client dataset to apply the updates in its change log.
	TClientDataSetRevert (see page 8556)	TClientDataSetRevert causes a target client dataset to back out all changes to the current record.
	TClientDataSetUndo (see page 8563)	TClientDataSetUndo causes a target client dataset to back out the last edit to the current record.
	TReconcileActionLink (see page 8570)	TReconcileActionLink helps a TClientDataSetApply (see page 8548) action display a dialog when the client dataset encounters reconcile errors.

46.1.1 TClientDataSetApply Class

TClientDataSetApply causes a target client dataset to apply the updates in its change log.

Class Hierarchy

Pascal

```
TClientDataSetApply = class(TDataSetAction);
```

C++

```
class TClientDataSetApply : public TDataSetAction;
```

File

DBClientActns

Description

Add TClientDataSetApply to an action list or action manager to allow users to apply the updates that a client dataset caches. Controls (see page 5711) such as menu items and tool buttons linked to this action cause the target dataset to apply the updates in its change log. If you set the DisplayErrorDlg (see page 8556) property to true, then if the applying of updates results in errors, TClientDataSetApply displays an error dialog so that the user can indicate how to respond to those errors.

TClientDataSetApply is designed to work with a target that is a TDataSource component whose dataset is a TClientDataSet instance. You can explicitly provide this target by setting the DataSource (see page 8555) property, or you can allow the action to infer the data source from an active data-aware control. TClientDataSetApply automatically disables itself if it does not have a target data source attached to an active client dataset.

TClientDatasetApply action automatically generates a reconcile error dialog, so you do not have to write any code to invoke the dialog. Typically, you would assign the OnReconcileError (TClientDataset) event and write the code to invoke the dialog.

See Also

TClientDataSetRevert (see page 8556)

TClientDataSetUndo (see page 8563)

TCustomClientDataSet (see page 8373)

TDataSource (see page 7070)

TReconcileActionLink (see page 8570)

TClientDataSet (see page 8289)

46.1.1.1 TClientDataSetApply Members

The following tables list the members exposed by TClientDataSetApply.

Protected Events

	Name	Description
	OnChange (see page 2716)	Occurs when one of the action's properties changes.

Protected Fields

	Name	Description
	FClients (see page 2711)	This is FClients, a member of class TBasicAction.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FImage (see page 302)	This is FImage, a member of class TCustomAction.
	FMask (see page 303)	This is FMask, a member of class TCustomAction.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 303)	Copies the properties of this action to a destination object.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	Change (see page 2712)	Generates an OnChange (see page 2716) event.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	DoReconcileError (see page 8554)	This is DoReconcileError, a member of class TClientDataSetApply.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetDataSet (see page 7655)	This is GetDataSet, a member of class TDataSetAction.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
V	HandleShortCut (see page 306)	Executes the action when the user types on of its short cuts.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2713)	Responds when components are created or destroyed.
V	Notification (see page 2783)	Forwards notification messages to all owned components.

	Notification (see page 7656)	Responds when components are created or destroyed.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 294)	This is ReadState, a member of class TContainedAction.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetHelpContext (see page 306)	This is SetHelpContext, a member of class TCustomAction.
	SetHelpKeyword (see page 306)	This is SetHelpKeyword, a member of class TCustomAction.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 307)	Sets the value of the Name property.
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetOnExecute (see page 2714)	Assigns an OnExecute (see page 2716) event handler.
	SetParentComponent (see page 294)	This is SetParentComponent, a member of class TContainedAction.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	SavedEnabledState (see page 313)	Saves the value of the Enabled (see page 310) property when the action is suspended.

Public Events

	Name	Description
	OnExecute (see page 2716)	Occurs when the client event that is linked to it fires.
	OnHint (see page 315)	Occurs when the mouse pauses over a client control or menu item.
	OnUpdate (see page 2718)	Occurs when the application is idle or when the action list updates.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.

	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 8553)	Creates an instance of TClientDataSetApply (see page 8548).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 8553)	Frees the memory associated with the TClientDataSetApply (see page 8548) object.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DoHint (see page 303)	Generates an OnHint (see page 315) event.
V	Execute (see page 293)	Responds when the client control "fires".
V	Execute (see page 304)	Responds when a client control "fires".
	Execute (see page 2712)	Generates an OnExecute (see page 2716) event.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
V	ExecuteTarget (see page 8554)	Applies any updates the target client dataset has cached in its change log.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
V	GetParentComponent (see page 293)	Returns the action list or action manager that contains the action.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	HandlesTarget (see page 2713)	Introduces an interface for verifying that the type, and state, of a target component or control are appropriate for the action.
V	HandlesTarget (see page 7656)	Indicates whether the action can execute its function.
V	HasParent (see page 294)	Indicates whether the action is contained in an action list or action manager.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RegisterChanges (see page 2713)	Associates the action with an action link.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)

V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UnRegisterChanges (see page 2714)	Breaks the association between the action and the action link.
V	Update (see page 295)	Indicates whether the action updates itself.
V	Update (see page 2714)	Provides an opportunity to execute centralized code when an application is idle.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
V	UpdateTarget (see page 8555)	Enables or disables the action, depending on the state of the target dataset.

Public Properties

	Name	Description
	ActionComponent (see page 2715)	Indicates the client component that caused this action to execute.
	ActionList (see page 295)	Indicates the action list or action manager that contains the action.
	AutoCheck (see page 308)	Controls (see page 5711) whether the Checked (see page 308) property toggles when the action executes.
	Caption (see page 308)	Represents the caption of client controls and menu items.
	Checked (see page 308)	Indicates whether client controls and menu items appear checked.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DisableIfNoHandler (see page 310)	Indicates whether client components should be disabled if no handler is found.
	Enabled (see page 310)	Indicates whether client controls and menu items are enabled.
	GroupIndex (see page 311)	Indicates whether the action acts like a radio button with other actions in the same action list.
	HelpContext (see page 311)	Indicates the help context ID for client controls and menu items.
	HelpKeyword (see page 311)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 312)	Indicates the mechanism for client controls and menu items to use when invoking help.
	Hint (see page 312)	Indicates the Help hint for client controls and menu items.
	ImageIndex (see page 313)	Indicates the ImageIndex property for client controls and menu items.
	Index (see page 296)	Specifies the index of the action in its action list or action manager.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	SecondaryShortCuts (see page 314)	Specifies the short cuts (in addition to ShortCut (see page 314)) for triggering clients.
	ShortCut (see page 314)	Specifies the ShortCut property for client menu items.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	Visible (see page 314)	Specifies the Visible property for client controls and menu items.

Published Events

	Name	Description
	OnExecute (see page 261)	Occurs when the client event that is linked to it fires.
	OnHint (see page 263)	Occurs when the mouse pauses over a client control or menu item.
	OnUpdate (see page 263)	Occurs when the application is idle or when the action list updates.

Published Properties

	Name	Description
	AutoCheck (see page 255)	Controls whether the Checked property toggles when the action executes.
	Caption (see page 255)	Represents the caption of client controls and menu items.
	Category (see page 296)	Specifies the category under which the action appears in its action list or action manager.

	Checked (see page 256)	Indicates whether client controls and menu items appear checked.
	DataSource (see page 8555)	Provides access to the target of the action.
	DisplayErrorDlg (see page 8556)	Indicates whether the action should display a reconcile dialog when applying updates results in errors.
	Enabled (see page 257)	Indicates whether client controls and menu items are enabled.
	GroupIndex (see page 257)	Indicates whether the action acts like a radio button with other actions in the same action list.
	HelpContext (see page 258)	Indicates the help context ID for client controls and menu items.
	HelpKeyword (see page 258)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 259)	Indicates the mechanism for client controls and menu items to use when invoking help.
	Hint (see page 259)	Indicates the Help hint for client controls and menu items.
	ImageIndex (see page 259)	Indicates the ImageIndex property for client controls and menu items.
	MaxErrors (see page 8556)	Indicates the maximum number of errors that can be allowed when applying updates.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	SecondaryShortCuts (see page 260)	Specifies the short cuts (in addition to ShortCut) for triggering clients.
	ShortCut (see page 260)	Specifies the ShortCut property for client menu items.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Visible (see page 261)	Specifies the Visible property for client controls and menu items.

46.1.1.2 TClientDataSetApply.Create Constructor

Creates an instance of TClientDataSetApply (see page 8548).

Pascal

```
constructor Create(Owner: TComponent); override;
```

C++

```
virtual __fastcall TClientDataSetApply(TComponent * Owner);
```

Description

Most applications do not need to call the TClientDataSetApply (see page 8548) constructor because actions are added at design time to an action manager or action list.

AOwner specifies the Owner for the action. This is the component that is responsible for freeing the TClientDataSetApply (see page 8548) instance.

See Also

Owner (see page 2807)

46.1.1.3 TClientDataSetApply.Destroy Destructor

Frees the memory associated with the TClientDataSetApply (see page 8548) object.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TClientDataSetApply();
```

Description

Do not explicitly destroy actions. Action objects are created and destroyed by the action manager or action list that contains them.

See Also

delete

46.1.1.4 TClientDataSetApply Methods

The methods of the TClientDataSetApply class are listed here.

Protected Methods

	Name	Description
	DoReconcileError (see page 8554)	This is DoReconcileError, a member of class TClientDataSetApply.

Public Methods

	Name	Description
	ExecuteTarget (see page 8554)	Applies any updates the target client dataset has cached in its change log.
	UpdateTarget (see page 8555)	Enables or disables the action, depending on the state of the target dataset.

46.1.1.4.1 TClientDataSetApply.DoReconcileError Method

Pascal

```
procedure DoReconcileError(ReconcileInfo: TReconcileInfo);
```

C++

```
__fastcall DoReconcileError(TReconcileInfo ReconcileInfo);
```

Description

This is DoReconcileError, a member of class TClientDataSetApply.

46.1.1.4.2 TClientDataSetApply.ExecuteTarget Method

Applies any updates the target client dataset has cached in its change log.

Pascal

```
procedure ExecuteTarget(Target: TObject); override;
```

C++

```
virtual __fastcall ExecuteTarget(TObject * Target);
```

Description

You can call ExecuteTarget directly to execute this action, or it can be called automatically when the action fires in response to a user action (for example, when the user selects a menu item or presses a tool button that is linked to this action).

ExecuteTarget checks that Target is a data source component whose DataSet property references a TClientDataSet instance. If the DataSource (see page 8555) property is set, Target must be the same data source.

If Target is a valid data source, ExecuteTarget calls the associated client dataset's ApplyUpdates method, passing in the value of the MaxErrors (see page 8556) property. If the client dataset encounters errors applying its updates, and if the DisplayErrorDlg (see page 8556) property is true, then TClientDataSetApply (see page 8548) responds to those errors by displaying a dialog where the user can indicate how to handle them.

See Also

ApplyUpdates (see page 8394)

DataSource (see page 7657)

DataSet (see page 7078)

MaxErrors (see page 8556)

DisplayErrorDlg (see page 8556)

46.1.1.4.3 TClientDataSetApply.UpdateTarget Method

Enables or disables the action, depending on the state of the target dataset.

Pascal

```
procedure UpdateTarget(Target: TObject); override;
```

C++

```
virtual __fastcall UpdateTarget(TObject * Target);
```

Description

Do not call the UpdateTarget method. This method is called automatically so that actions can update themselves according to current conditions.

In TClientDataSetApply (see page 8548), UpdateTarget checks whether the current target object (specified by the Target parameter) is a data source whose dataset is an active TClientDataSet instance that has changes in its change log. If so, it sets Enabled to true. If not, UpdateTarget sets Enabled to false.

See Also

Enabled (see page 310)

46.1.1.5 TClientDataSetApply Properties

The properties of the TClientDataSetApply class are listed here.

Published Properties

	Name	Description
	DataSource (see page 8555)	Provides access to the target of the action.
	DisplayErrorDlg (see page 8556)	Indicates whether the action should display a reconcile dialog when applying updates results in errors.
	MaxErrors (see page 8556)	Indicates the maximum number of errors that can be allowed when applying updates.

46.1.1.5.1 TClientDataSetApply.DataSource Property

Provides access to the target of the action.

Pascal

```
property DataSource: TDataSource;
```

C++

```
__property TDataSource DataSource;
```

Description

DataSource is the data source that represents the dataset on which the action performs its function. You can set this property to indicate the dataset that is the target of the action.

If you do not explicitly set the DataSource property, it is obtained from an active data-aware control when the action fires.

See Also

DataSet (see page 7078)

46.1.1.5.2 TClientDataSetApply.DisplayErrorDlg Property

Indicates whether the action should display a reconcile dialog when applying updates results in errors.

Pascal

```
property DisplayErrorDlg: Boolean;
```

C++

```
__property Boolean DisplayErrorDlg;
```

Description

Set DisplayErrorDlg to indicate whether you want the action to respond when the target client dataset encounters an OnReconcileError event.

When DisplayErrorDlg is true, TClientDataSetApply (see page 8548) is informed when the target client dataset encounters update errors and responds by calling the HandleReconcileError function. The resulting choice of reconcile action is used to initialize the Action parameter of the client dataset's OnReconcileError event handler if it exists. If the client dataset does not have an OnReconcileError event handler, the chosen reconcile action determines the client dataset's response to the update error.

See Also

HandleReconcileError

OnReconcileError (see page 8524)

46.1.1.5.3 TClientDataSetApply.MaxErrors Property

Indicates the maximum number of errors that can be allowed when applying updates.

Pascal

```
property MaxErrors: Integer;
```

C++

```
__property int MaxErrors;
```

Description

MaxErrors indicates the maximum number of errors that are allowed before prematurely stopping an update operation. Set MaxErrors to –1 to indicate that there is no limit to the number of errors.

TClientDataSetApply (see page 8548) passes the value of MaxErrors as the value of the MaxErrors parameter when it calls the ApplyUpdates method of the target client dataset.

See Also

ApplyUpdates (see page 8394)

46.1.2 TClientDataSetRevert Class

TClientDataSetRevert causes a target client dataset to back out all changes to the current record.

Class Hierarchy

Pascal

```
TClientDataSetRevert = class(TDataSetAction);
```

C++

```
class TClientDataSetRevert : public TDataSetAction;
```

File

DBClientActns

Description

Add TClientDataSetRevert to an action list or action manager to allow users to undo changes to the current record of a client dataset. Controls (see page 5711) such as menu items and tool buttons linked to this action cause the target dataset to back out all edits to the current record.

TClientDataSetRevert is designed to work with a target that is a TDataSource component whose dataset is a TClientDataSet instance. You can explicitly provide this target by setting the DataSource (see page 8563) property, or you can allow the action to infer the data source from an active data-aware control. TClientDataSetRevert automatically disables itself if it does not have a target data source attached to an active client dataset.

See Also

TClientDataSetApply (see page 8548)

TClientDataSetUndo (see page 8563)

TCustomClientDataSet (see page 8373)

TDataSource (see page 7070)

TClientDataSet (see page 8289)

46.1.2.1 TClientDataSetRevert Members

The following tables list the members exposed by TClientDataSetRevert.

Protected Events

	Name	Description
	OnChange (see page 2716)	Occurs when one of the action's properties changes.

Protected Fields

	Name	Description
	FClients (see page 2711)	This is FClients, a member of class TBasicAction.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FImage (see page 302)	This is FImage, a member of class TCustomAction.
	FMask (see page 303)	This is FMask, a member of class TCustomAction.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.

	AssignTo (see page 303)	Copies the properties of this action to a destination object.
	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	Change (see page 2712)	Generates an OnChange (see page 2716) event.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetDataSet (see page 7655)	This is GetDataSet, a member of class TDataSetAction.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	HandleShortCut (see page 306)	Executes the action when the user types on of its short cuts.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Notification (see page 2713)	Responds when components are created or destroyed.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	Notification (see page 7656)	Responds when components are created or destroyed.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 294)	This is ReadState, a member of class TContainedAction.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetHelpContext (see page 306)	This is SetHelpContext, a member of class TCustomAction.
	SetHelpKeyword (see page 306)	This is SetHelpKeyword, a member of class TCustomAction.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 307)	Sets the value of the Name property.
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetOnExecute (see page 2714)	Assigns an OnExecute (see page 2716) event handler.
	SetParentComponent (see page 294)	This is SetParentComponent, a member of class TContainedAction.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	SavedEnabledState (see page 313)	Saves the value of the Enabled (see page 310) property when the action is suspended.

Public Events

	Name	Description
	OnExecute (see page 2716)	Occurs when the client event that is linked to it fires.
	OnHint (see page 315)	Occurs when the mouse pauses over a client control or menu item.
	OnUpdate (see page 2718)	Occurs when the application is idle or when the action list updates.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 254)	Creates and initializes a TAction (see page 249) object.
V	Create (see page 301)	Instantiates and initializes a TCustomAction (see page 297) object.
V	Create (see page 2710)	Instantiates and initializes a TBasicAction (see page 2707) object.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 292)	Destroys the instance of the contained action.
V	Destroy (see page 302)	Frees an instance of TCustomAction (see page 297).
V	Destroy (see page 2711)	Disposes of an instance of a TBasicAction (see page 2707) object.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DoHint (see page 303)	Generates an OnHint (see page 315) event.
V	Execute (see page 293)	Responds when the client control "fires".
V	Execute (see page 304)	Responds when a client control "fires".
	Execute (see page 2712)	Generates an OnExecute (see page 2716) event.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
V	ExecuteTarget (see page 8562)	Backs out all changes to the current record of the target client dataset.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.

	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
V	GetParentComponent (see page 293)	Returns the action list or action manager that contains the action.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	HandlesTarget (see page 2713)	Introduces an interface for verifying that the type, and state, of a target component or control are appropriate for the action.
V	HandlesTarget (see page 7656)	Indicates whether the action can execute its function.
V	HasParent (see page 294)	Indicates whether the action is contained in an action list or action manager.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RegisterChanges (see page 2713)	Associates the action with an action link.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UnRegisterChanges (see page 2714)	Breaks the association between the action and the action link.
V	Update (see page 295)	Indicates whether the action updates itself.
V	Update (see page 2714)	Provides an opportunity to execute centralized code when an application is idle.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
V	UpdateTarget (see page 8562)	Enables or disables the action, depending on the state of the target dataset.

Public Properties

	Name	Description
	ActionComponent (see page 2715)	Indicates the client component that caused this action to execute.
	ActionList (see page 295)	Indicates the action list or action manager that contains the action.
	AutoCheck (see page 308)	Controls (see page 5711) whether the Checked (see page 308) property toggles when the action executes.
	Caption (see page 308)	Represents the caption of client controls and menu items.
	Checked (see page 308)	Indicates whether client controls and menu items appear checked.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.

R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DisableIfNoHandler (see page 310)	Indicates whether client components should be disabled if no handler is found.
	Enabled (see page 310)	Indicates whether client controls and menu items are enabled.
	GroupIndex (see page 311)	Indicates whether the action acts like a radio button with other actions in the same action list.
	HelpContext (see page 311)	Indicates the help context ID for client controls and menu items.
	HelpKeyword (see page 311)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 312)	Indicates the mechanism for client controls and menu items to use when invoking help.
	Hint (see page 312)	Indicates the Help hint for client controls and menu items.
	ImageIndex (see page 313)	Indicates the ImageIndex property for client controls and menu items.
	Index (see page 296)	Specifies the index of the action in its action list or action manager.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	SecondaryShortCuts (see page 314)	Specifies the short cuts (in addition to ShortCut (see page 314)) for triggering clients.
	ShortCut (see page 314)	Specifies the ShortCut property for client menu items.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	Visible (see page 314)	Specifies the Visible property for client controls and menu items.

Published Events

	Name	Description
	OnExecute (see page 261)	Occurs when the client event that is linked to it fires.
	OnHint (see page 263)	Occurs when the mouse pauses over a client control or menu item.
	OnUpdate (see page 263)	Occurs when the application is idle or when the action list updates.

Published Properties

	Name	Description
	AutoCheck (see page 255)	Controls whether the Checked property toggles when the action executes.
	Caption (see page 255)	Represents the caption of client controls and menu items.
	Category (see page 296)	Specifies the category under which the action appears in its action list or action manager.
	Checked (see page 256)	Indicates whether client controls and menu items appear checked.
	DataSource (see page 8563)	Provides access to the target of the action.
	Enabled (see page 257)	Indicates whether client controls and menu items are enabled.
	GroupIndex (see page 257)	Indicates whether the action acts like a radio button with other actions in the same action list.
	HelpContext (see page 258)	Indicates the help context ID for client controls and menu items.
	HelpKeyword (see page 258)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 259)	Indicates the mechanism for client controls and menu items to use when invoking help.
	Hint (see page 259)	Indicates the Help hint for client controls and menu items.
	ImageIndex (see page 259)	Indicates the ImageIndex property for client controls and menu items.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	SecondaryShortCuts (see page 260)	Specifies the short cuts (in addition to ShortCut) for triggering clients.
	ShortCut (see page 260)	Specifies the ShortCut property for client menu items.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Visible (see page 261)	Specifies the Visible property for client controls and menu items.

46.1.2.2 TClientDataSetRevert Methods

The methods of the TClientDataSetRevert class are listed here.

Public Methods

	Name	Description
	ExecuteTarget (see page 8562)	Backs out all changes to the current record of the target client dataset.
	UpdateTarget (see page 8562)	Enables or disables the action, depending on the state of the target dataset.

46.1.2.2.1 TClientDataSetRevert.ExecuteTarget Method

Backs out all changes to the current record of the target client dataset.

Pascal

```
procedure ExecuteTarget(Target: TObject); override;
```

C++

```
virtual __fastcall ExecuteTarget(TObject * Target);
```

Description

You can call ExecuteTarget directly to execute this action, or it can be called automatically when the action fires in response to a user action (for example, when the user selects a menu item or presses a tool button that is linked to this action).

ExecuteTarget checks that Target is a data source component whose DataSet property references a TClientDataSet instance. If the DataSource (see page 8563) property is set, Target must be the same data source.

If Target is a valid data source, ExecuteTarget calls the associated client dataset's RevertRecord method. This returns the record to the values it held when first fetched from the source dataset. Note that unlike the TClientDataSetUndo (see page 8563) action, this backs out all edits to the record, not just those made during the last edit operation.

See Also

RevertRecord (see page 8443)

DataSource (see page 7657)

DataSet (see page 7078)

46.1.2.2.2 TClientDataSetRevert.UpdateTarget Method

Enables or disables the action, depending on the state of the target dataset.

Pascal

```
procedure UpdateTarget(Target: TObject); override;
```

C++

```
virtual __fastcall UpdateTarget(TObject * Target);
```

Description

Do not call the UpdateTarget method. This method is called automatically so that actions can update themselves according to current conditions.

In TClientDataSetRevert (see page 8556), UpdateTarget checks whether the current target object (specified by the Target parameter) is a data source whose dataset is an active TClientDataSet instance whose current record has been edited. If so, it sets Enabled to true. If not, UpdateTarget sets Enabled to false.

See Also

Enabled (see page 310)

46.1.2.3 TClientDataSetRevert Properties

The properties of the TClientDataSetRevert class are listed here.

Published Properties

	Name	Description
	DataSource (see page 8563)	Provides access to the target of the action.

46.1.2.3.1 TClientDataSetRevert.DataSource Property

Provides access to the target of the action.

Pascal

```
property DataSource: TDataSource;
```

C++

```
__property TDataSource DataSource;
```

Description

DataSource is the data source that represents the dataset on which the action performs its function. You can set this property to indicate the dataset that is the target of the action.

If you do not explicitly set the DataSource property, it is obtained from an active data-aware control when the action fires.

See Also

DataSet (see page 7078)

46.1.3 TClientDataSetUndo Class

TClientDataSetUndo causes a target client dataset to back out the last edit to the current record.

Class Hierarchy

Pascal

```
TClientDataSetUndo = class(TDataSetAction);
```

C++

```
class TClientDataSetUndo : public TDataSetAction;
```

File

DBClientActns

Description

Add TClientDataSetUndo to an action list or action manager to allow users to back out the last edit to the current record of a client dataset. Controls (see page 5711) such as menu items and tool buttons linked to this action cause the target dataset to undo the last edit.

TClientDataSetUndo is designed to work with a target that is a TDataSource component whose dataset is a TClientDataSet instance. You can explicitly provide this target by setting the DataSource (see page 8569) property, or you can allow the action to infer the data source from an active data-aware control. TClientDataSetUndo automatically disables itself if it does not have a target data source attached to an active client dataset.

See Also

TClientDataSetRevert (see page 8556)

TClientDataSetApply (see page 8548)

TCustomClientDataSet (see page 8373)

TDataSource (see page 7070)

TClientDataSet (see page 8289)

46.1.3.1 TClientDataSetUndo Members

The following tables list the members exposed by TClientDataSetUndo.

Protected Events

	Name	Description
	OnChange (see page 2716)	Occurs when one of the action's properties changes.

Protected Fields

	Name	Description
	FClients (see page 2711)	This is FClients, a member of class TBasicAction.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FImage (see page 302)	This is FImage, a member of class TCustomAction.
	FMask (see page 303)	This is FMask, a member of class TCustomAction.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 303)	Copies the properties of this action to a destination object.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	Change (see page 2712)	Generates an OnChange (see page 2716) event.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetDataSet (see page 7655)	This is GetDataSet, a member of class TDataSetAction.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).

	HandleShortCut (see page 306)	Executes the action when the user types on of its short cuts.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Notification (see page 2713)	Responds when components are created or destroyed.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	Notification (see page 7656)	Responds when components are created or destroyed.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 294)	This is ReadState, a member of class TContainedAction.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetHelpContext (see page 306)	This is SetHelpContext, a member of class TCustomAction.
	SetHelpKeyword (see page 306)	This is SetHelpKeyword, a member of class TCustomAction.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 307)	Sets the value of the Name property.
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetOnExecute (see page 2714)	Assigns an OnExecute (see page 2716) event handler.
	SetParentComponent (see page 294)	This is SetParentComponent, a member of class TContainedAction.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	SavedEnabledState (see page 313)	Saves the value of the Enabled (see page 310) property when the action is suspended.

Public Events

	Name	Description
	OnExecute (see page 2716)	Occurs when the client event that is linked to it fires.
	OnHint (see page 315)	Occurs when the mouse pauses over a client control or menu item.
	OnUpdate (see page 2718)	Occurs when the application is idle or when the action list updates.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.

	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 254)	Creates and initializes a TAction (see page 249) object.
V	Create (see page 301)	Instantiates and initializes a TCustomAction (see page 297) object.
V	Create (see page 2710)	Instantiates and initializes a TBasicAction (see page 2707) object.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 292)	Destroys the instance of the contained action.
V	Destroy (see page 302)	Frees an instance of TCustomAction (see page 297).
V	Destroy (see page 2711)	Disposes of an instance of a TBasicAction (see page 2707) object.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DoHint (see page 303)	Generates an OnHint (see page 315) event.
V	Execute (see page 293)	Responds when the client control "fires".
V	Execute (see page 304)	Responds when a client control "fires".
	Execute (see page 2712)	Generates an OnExecute (see page 2716) event.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
V	ExecuteTarget (see page 8568)	Backs out the last change to the current record of the target client dataset.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
V	GetParentComponent (see page 293)	Returns the action list or action manager that contains the action.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	HandlesTarget (see page 2713)	Introduces an interface for verifying that the type, and state, of a target component or control are appropriate for the action.
V	HandlesTarget (see page 7656)	Indicates whether the action can execute its function.
V	HasParent (see page 294)	Indicates whether the action is contained in an action list or action manager.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.

	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RegisterChanges (see page 2713)	Associates the action with an action link.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UnRegisterChanges (see page 2714)	Breaks the association between the action and the action link.
V	Update (see page 295)	Indicates whether the action updates itself.
V	Update (see page 2714)	Provides an opportunity to execute centralized code when an application is idle.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
V	UpdateTarget (see page 8569)	Enables or disables the action, depending on the state of the target dataset.

Public Properties

	Name	Description
	ActionComponent (see page 2715)	Indicates the client component that caused this action to execute.
	ActionList (see page 295)	Indicates the action list or action manager that contains the action.
	AutoCheck (see page 308)	Controls (see page 5711) whether the Checked (see page 308) property toggles when the action executes.
	Caption (see page 308)	Represents the caption of client controls and menu items.
	Checked (see page 308)	Indicates whether client controls and menu items appear checked.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DisableIfNoHandler (see page 310)	Indicates whether client components should be disabled if no handler is found.
	Enabled (see page 310)	Indicates whether client controls and menu items are enabled.
	GroupIndex (see page 311)	Indicates whether the action acts like a radio button with other actions in the same action list.
	HelpContext (see page 311)	Indicates the help context ID for client controls and menu items.
	HelpKeyword (see page 311)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 312)	Indicates the mechanism for client controls and menu items to use when invoking help.
	Hint (see page 312)	Indicates the Help hint for client controls and menu items.
	ImageIndex (see page 313)	Indicates the ImageIndex property for client controls and menu items.
	Index (see page 296)	Specifies the index of the action in its action list or action manager.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	SecondaryShortCuts (see page 314)	Specifies the short cuts (in addition to ShortCut (see page 314)) for triggering clients.
	ShortCut (see page 314)	Specifies the ShortCut property for client menu items.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	Visible (see page 314)	Specifies the Visible property for client controls and menu items.

Published Events

	Name	Description
	OnExecute (see page 261)	Occurs when the client event that is linked to it fires.
	OnHint (see page 263)	Occurs when the mouse pauses over a client control or menu item.
	OnUpdate (see page 263)	Occurs when the application is idle or when the action list updates.

Published Properties

	Name	Description
	AutoCheck (see page 255)	Controls whether the Checked property toggles when the action executes.
	Caption (see page 255)	Represents the caption of client controls and menu items.
	Category (see page 296)	Specifies the category under which the action appears in its action list or action manager.
	Checked (see page 256)	Indicates whether client controls and menu items appear checked.
	DataSource (see page 8569)	Provides access to the target of the action.
	Enabled (see page 257)	Indicates whether client controls and menu items are enabled.
	FollowChange (see page 8570)	Indicates whether the client dataset should keep its cursor on the same record, even after backing out the last edit.
	GroupIndex (see page 257)	Indicates whether the action acts like a radio button with other actions in the same action list.
	HelpContext (see page 258)	Indicates the help context ID for client controls and menu items.
	HelpKeyword (see page 258)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 259)	Indicates the mechanism for client controls and menu items to use when invoking help.
	Hint (see page 259)	Indicates the Help hint for client controls and menu items.
	ImageIndex (see page 259)	Indicates the ImageIndex property for client controls and menu items.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	SecondaryShortCuts (see page 260)	Specifies the short cuts (in addition to ShortCut) for triggering clients.
	ShortCut (see page 260)	Specifies the ShortCut property for client menu items.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Visible (see page 261)	Specifies the Visible property for client controls and menu items.

46.1.3.2 TClientDataSetUndo Methods

The methods of the TClientDataSetUndo class are listed here.

Public Methods

	Name	Description
	ExecuteTarget (see page 8568)	Backs out the last change to the current record of the target client dataset.
	UpdateTarget (see page 8569)	Enables or disables the action, depending on the state of the target dataset.

46.1.3.2.1 TClientDataSetUndo.ExecuteTarget Method

Backs out the last change to the current record of the target client dataset.

Pascal

```
procedure ExecuteTarget(Target: TObject); override;
```

C++

```
virtual __fastcall ExecuteTarget(TObject * Target);
```

Description

You can call ExecuteTarget directly to execute this action, or it can be called automatically when the action fires in response to a user action (for example, when the user selects a menu item or presses a tool button that is linked to this action).

ExecuteTarget checks that Target is a data source component whose DataSet property references a TClientDataSet instance. If the DataSource (see page 8569) property is set, Target must be the same data source.

If Target is a valid data source, ExecuteTarget calls the associated client dataset's UndoLastChange method, passing in the value of the FollowChange (see page 8570) property.

See Also

UndoLastChange (see page 8455)

DataSource (see page 7657)

DataSet (see page 7078)

FollowChange (see page 8570)

46.1.3.2.2 TClientDataSetUndo.UpdateTarget Method

Enables or disables the action, depending on the state of the target dataset.

Pascal

```
procedure UpdateTarget(Target: TObject); override;
```

C++

```
virtual __fastcall UpdateTarget(TObject * Target);
```

Description

Do not call the UpdateTarget method. This method is called automatically so that actions can update themselves according to current conditions.

In TClientDataSetUndo (see page 8563), UpdateTarget checks whether the current target object (specified by the Target parameter) is a data source whose dataset is an active TClientDataSet instance that has changes in its change log. If so, it sets Enabled to true. If not, UpdateTarget sets Enabled to false.

See Also

Enabled (see page 310)

46.1.3.3 TClientDataSetUndo Properties

The properties of the TClientDataSetUndo class are listed here.

Published Properties

	Name	Description
	DataSource (see page 8569)	Provides access to the target of the action.
	FollowChange (see page 8570)	Indicates whether the client dataset should keep its cursor on the same record, even after backing out the last edit.

46.1.3.3.1 TClientDataSetUndo.DataSource Property

Provides access to the target of the action.

Pascal

```
property DataSource: TDataSource;
```

C++

```
__property TDataSource DataSource;
```

Description

DataSource is the data source that represents the dataset on which the action performs its function. You can set this property to indicate the dataset that is the target of the action.

If you do not explicitly set the DataSource property, it is obtained from an active data-aware control when the action fires.

See Also

DataSet (see page 7078)

46.1.3.3.2 TClientDataSetUndo.FollowChange Property

Indicates whether the client dataset should keep its cursor on the same record, even after backing out the last edit.

Pascal

```
property FollowChange: Boolean;
```

C++

```
__property Boolean FollowChange;
```

Description

FollowChange indicates how the target client dataset should determine the current record after backing out the last edit. When FollowChange is true, the record whose edit was just backed out remains current. When FollowChange is false, the record in the current position remains current, even if undoing the last edit causes the record to move to a different position in the dataset's sort order.

TClientDataSetUndo (see page 8563) passes the value of FollowChange as the value of the FollowChange parameter when it calls the UndoLastChange method of the target client dataset.

See Also

UndoLastChange (see page 8455)

46.1.4 TReconcileActionLink Class

TReconcileActionLink helps a TClientDataSetApply (see page 8548) action display a dialog when the client dataset encounters reconcile errors.

Class Hierarchy

Pascal

```
TReconcileActionLink = class(TDataLink);
```

C++

```
class TReconcileActionLink : public TDataLink;
```

File

DBClientActns

Description

Applications should not need to use TReconcileActionLink directly. The TClientDataSetApply (see page 8548) class creates an instance of this data link internally when its DisplayErrorDlg property it true. This allows the TClientDataSetApply (see page

8548) instance to respond when its target (a data source) encounters reconcile errors. That is, when the client data set associated with the target data source has an OnReconcileError event, this data link notifies the TClientDataSetApply (see page 8548) instance, which displays a dialog that lets the use indicate how to respond to the error.

See Also

TClientDataSetApply (see page 8548)

TCustomClientDataSet (see page 8373)

TDataSource (see page 7070)

46.1.4.1 TReconcileActionLink Members

The following tables list the members exposed by TReconcileActionLink.

Protected Methods

	Name	Description
	ActiveChanged (see page 6880)	Responds to changes in the Active (see page 6888) property.
	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	CheckBrowseMode (see page 6880)	Allows the data-aware object to respond just before an event that changes the dataset state.
	DataEvent (see page 8573)	Responds to various events that occur while working with data.
	DataSetChanged (see page 6881)	Responds to changes in the dataset.
	DataSetScrolled (see page 6882)	Allows a response to scrolling the representation of the dataset within the data-aware object.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	EditingChanged (see page 6883)	Responds to changes in the editing state of the data source.
	FocusControl (see page 6884)	Provides the interface for a method to force focus to the data-aware component associated with the TDataLink (see page 6876).
	GetActiveRecord (see page 6884)	This is GetActiveRecord, a member of class TDataLink.
	GetBOF (see page 6884)	This is GetBOF, a member of class TDataLink.
	GetBufferCount (see page 6884)	This is GetBufferCount, a member of class TDataLink.
	GetEOF (see page 6885)	This is GetEOF, a member of class TDataLink.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetRecordCount (see page 6885)	This is GetRecordCount, a member of class TDataLink.
	LayoutChanged (see page 6885)	Responds to changes in the representation of the data by the data-aware object.
	MoveBy (see page 6885)	Repositions the dataset to another record relative to its active record.
	RecordChanged (see page 6886)	Responds to changes in the contents of the current record or field of the dataset.
	SetActiveRecord (see page 6886)	This is SetActiveRecord, a member of class TDataLink.
	SetBufferCount (see page 6887)	This is SetBufferCount, a member of class TDataLink.
	UpdateData (see page 6887)	Provides an interface for writing edits to a record in the dataset.

Protected Properties

	Name	Description
	VisualControl (see page 6894)	Indicates whether a visual control uses the datalink.

Public Methods

	Name	Description
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).

	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 6878)	Creates an instance of TDataLink (see page 6876).
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 6879)	Destroys an instance of TDataLink (see page 6876).
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Edit (see page 6882)	Attempts to drive the data source into an editing state if it is not already in one.
	ExecuteAction (see page 6883)	Invokes an action with the datasource as its target.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	UpdateAction (see page 6887)	Updates an action to reflect the current state of the TDataLink (see page 6876).
	UpdateRecord (see page 6888)	Responds to notifications that edits should be posted to the dataset.

Public Properties

	Name	Description
R	Active (see page 6888)	Specifies whether the dataset that TDataLink (see page 6876) manages is active.
	ActiveRecord (see page 6889)	Specifies the index of the current record within the internal record buffer maintained by the dataset for the Owner of the TDataLink (see page 6876) object.
	ApplyAction (see page 8573)	Specifies the client dataset apply action that uses this action link to respond to reconcile errors.
R	BOF (see page 6889)	Indicates whether the first record in a dataset is active.
	BufferCount (see page 6890)	Specifies the number of records cached by the dataset for the Owner of the TDataLink (see page 6876) object.
R	DataSet (see page 6890)	Specifies the TDataSet (see page 6894) object that represents the data that this TDataLink (see page 6876) is tracking.
	DataSource (see page 6891)	Specifies the TDataSource (see page 7070) object that the Owner of the TDataLink (see page 6876) uses to connect to the dataset.
	DataSourceFixed (see page 6891)	Indicates whether the DataSource (see page 6891) property can be set.
R	Editing (see page 6892)	Indicates whether the DataSource (see page 6891) is in edit mode.
R	Eof (see page 6892)	Indicates whether the last record in a dataset is active.
	ReadOnly (see page 6893)	Indicates whether the dataset for this TDataLink (see page 6876) can be modified.

R	RecordCount (see page 6893)	Indicates the number of records in the internal record buffer maintained by the dataset.

46.1.4.2 TReconcileActionLink Methods

The methods of the TReconcileActionLink class are listed here.

Protected Methods

	Name	Description
V	DataEvent (see page 8573)	Responds to various events that occur while working with data.

46.1.4.2.1 TReconcileActionLink.DataEvent Method

Responds to various events that occur while working with data.

Pascal

```
procedure DataEvent(Event: TDataEvent; Info: Integer); override;
```

C++

```
virtual __fastcall DataEvent(TDataEvent Event, int Info);
```

Description

DataEvent is called automatically when various data events occur. Event indicates the event that just occurred. Info provides additional context information for some events.

In TReconcileActionLink (see page 8570), DataEvent first calls the method inherited from TDataLink to dispatch most events by calling appropriate methods. Then, if the data event is deReconcileError, it notifies the action specified by the ApplyAction (see page 8573) property so that it can display an error dialog.

See Also

DataEvent (see page 6881)

ApplyAction (see page 8573)

46.1.4.3 TReconcileActionLink Properties

The properties of the TReconcileActionLink class are listed here.

Public Properties

	Name	Description
	ApplyAction (see page 8573)	Specifies the client dataset apply action that uses this action link to respond to reconcile errors.

46.1.4.3.1 TReconcileActionLink.ApplyAction Property

Specifies the client dataset apply action that uses this action link to respond to reconcile errors.

Pascal

```
property ApplyAction: TClientDataSetApply;
```

C++

```
__property TClientDataSetApply ApplyAction;
```

Description

This property is set by the TClientDataSetApply (see page 8548) instance that owns this TReconcileActionLink (see page 8570) instance. It provides access to that TClientDataSetApply (see page 8548) instance.

When the client dataset that is the value of the DataSet property encounters an OnReconcileError event, the TReconcileActionLink (see page 8570) instance forwards this notification to the action that is the value of ApplyAction. If that action's DisplayErrorDlg property is true, it then responds by calling the HandleReconcileError function to display a dialog in which the user can specify how to respond to the update errors.

See Also

DisplayErrorDlg (see page 8556)

HandleReconcileError

DataSet (see page 6890)

OnReconcileError (see page 8524)

47 DBCtrls Namespace

This is namespace DBCtrls.

Topics

Name	Description
Classes (see page 8577)	The following table lists classes in this documentation.
Functions (see page 9536)	The following table lists functions in this documentation.
Structs, Records, Enums (see page 9538)	The following table lists structs, records, enums in this documentation.
Types (see page 9541)	The following table lists types in this documentation.
Constants (see page 9543)	The following table lists constants in this documentation.

Classes

	Name	Description
	TDataSourceLink (see page 8577)	TDataSourceLink helps manage the link to the data source for a TDBLookupControl (see page 9044) object.
	TDBCheckBox (see page 8582)	TDBCheckBox is a data-aware control that allows the user to select or deselect a single value.
	TDBComboBox (see page 8657)	TDBComboBox represents a data-aware combo box control.
	TDBEdit (see page 8735)	TDBEdit represents a single-line edit control that can display and edit a field in a dataset.
	TDBImage (see page 8813)	TDBImage represents a graphic image from a BLOB (binary large object) field of the current record of a dataset.
	TDBListBox (see page 8884)	TDBListBox represents a data-aware list box that allows users to change field values by selecting an item from a list.
	TDBLookupComboBox (see page 8963)	TDBLookupComboBox represents a combo box that identifies a set of field values in one dataset with a corresponding set of values from another dataset.
	TDBLookupControl (see page 9044)	TDBLookupControl is the base class for controls that provide the user with a list of lookup items for filling in fields that require data from another dataset.
	TDBLookupListBox (see page 9070)	TDBLookupListBox provides a list of lookup items for filling in fields that require data from another dataset.
	TDBMemo (see page 9149)	TDBMemo represents a multiline edit control that can display and edit a field in a dataset.
	TDBNavigator (see page 9230)	TDBNavigator (the database navigator) is used to move through the data in a dataset and perform operations on the data, such as inserting a blank record or posting a record.
	TDBRadioGroup (see page 9283)	TDBRadioGroup represents a group of radio buttons connected to a database.
	TDBRichEdit (see page 9343)	TDBRichEdit represents a multiline edit control that can display and edit a rich text memo field in a dataset.
	TDBText (see page 9433)	TDBText represents a data-aware control that displays the value of a field on a form.

	TFieldDataLink (see page 9487)	TFieldDataLink helps a data-aware windowed control manage its link to a TField object and respond to data events.
	TListSourceLink (see page 9498)	TListSourceLink helps manage the link to the ListSource of a TDBLookupControl (see page 9044) object.
	TNavButton (see page 9502)	This is class DBCtrls.TNavButton.
	TNavDataLink (see page 9513)	TNavDataLink helps manage the link to the dataset for a TDBNavigator (see page 9230) object.
	TPaintControl (see page 9518)	TPaintControl draws data aware controls that are replicated in a data control grid.
	TPopupDataList (see page 9521)	This is class DBCtrls.TPopupDataList.

Constants

Name	Description
InitRepeatPause (see page 9543)	This is constant DBCtrls.InitRepeatPause.
RepeatPause (see page 9543)	This is constant DBCtrls.RepeatPause.
SpaceSize (see page 9543)	This is constant DBCtrls.SpaceSize.

Functions

	Name	Description
	DBUseRightToLeftAlignment (see page 9536)	Indicates whether a data-aware control's alignment is reversed to a right-to-left mode.
	OkToChangeFieldAlignment (see page 9536)	This is function DBCtrls.OkToChangeFieldAlignment.

Structs, Records, Enums

	Name	Description
	TDropDownAlign (see page 9538)	TDropDownAlign indicates the relative alignment of a drop-down list to the edit portion of a DB (see page 6725) lookup combo box.
	TNavGlyph (see page 9539)	This is record DBCtrls.TNavGlyph.
	TNavigateBtn (see page 9539)	TNavigateBtn defines values identifying different possible buttons on a TDBNavigator (see page 9230) object.

Types

Name	Description
ENavClick (see page 9541)	This is type DBCtrls.ENavClick.
TNavButtonSet (see page 9541)	This is type DBCtrls.TNavButtonSet.
TNavButtonStyle (see page 9541)	This is type DBCtrls.TNavButtonStyle.

47.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TDataSourceLink (see page 8577)	TDataSourceLink helps manage the link to the data source for a TDBLookupControl (see page 9044) object.
	TDBCheckBox (see page 8582)	TDBCheckBox is a data-aware control that allows the user to select or deselect a single value.
	TDBComboBox (see page 8657)	TDBComboBox represents a data-aware combo box control.
	TDBEdit (see page 8735)	TDBEdit represents a single-line edit control that can display and edit a field in a dataset.
	TDBImage (see page 8813)	TDBImage represents a graphic image from a BLOB (binary large object) field of the current record of a dataset.
	TDBListBox (see page 8884)	TDBListBox represents a data-aware list box that allows users to change field values by selecting an item from a list.
	TDBLookupComboBox (see page 8963)	TDBLookupComboBox represents a combo box that identifies a set of field values in one dataset with a corresponding set of values from another dataset.
	TDBLookupControl (see page 9044)	TDBLookupControl is the base class for controls that provide the user with a list of lookup items for filling in fields that require data from another dataset.
	TDBLookupListBox (see page 9070)	TDBLookupListBox provides a list of lookup items for filling in fields that require data from another dataset.
	TDBMemo (see page 9149)	TDBMemo represents a multiline edit control that can display and edit a field in a dataset.
	TDBNavigator (see page 9230)	TDBNavigator (the database navigator) is used to move through the data in a dataset and perform operations on the data, such as inserting a blank record or posting a record.
	TDBRadioGroup (see page 9283)	TDBRadioGroup represents a group of radio buttons connected to a database.
	TDBRichEdit (see page 9343)	TDBRichEdit represents a multiline edit control that can display and edit a rich text memo field in a dataset.
	TDBText (see page 9433)	TDBText represents a data-aware control that displays the value of a field on a form.
	TFieldDataLink (see page 9487)	TFieldDataLink helps a data-aware windowed control manage its link to a TField object and respond to data events.
	TListSourceLink (see page 9498)	TListSourceLink helps manage the link to the ListSource of a TDBLookupControl (see page 9044) object.
	TNavButton (see page 9502)	This is class DBCtrls.TNavButton.
	TNavDataLink (see page 9513)	TNavDataLink helps manage the link to the dataset for a TDBNavigator (see page 9230) object.
	TPaintControl (see page 9518)	TPaintControl draws data aware controls that are replicated in a data control grid.
	TPopupDataList (see page 9521)	This is class DBCtrls.TPopupDataList.

47.1.1 TDataSourceLink Class

TDataSourceLink helps manage the link to the data source for a TDBLookupControl (see page 9044) object.

Class Hierarchy

Pascal

```
TDataSourceLink = class(TDataLink);
```

C++

```
class TDataSourceLink : public TDataLink;
```

File

DBCtrls

Description

TDataSourceLink is tailored to work with TDBLookupControl (see page 9044). It should only be used by the TDBLookupControl (see page 9044) class.

See Also

TDataSource (see page 7070)

TDBLookupControl (see page 9044)

47.1.1.1 TDataSourceLink Members

The following tables list the members exposed by TDataSourceLink.

Protected Methods

	Name	Description
	ActiveChanged (see page 8580)	Informs the TDBLookupControl (see page 9044) of changes in the Active property of its DataSource.
	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	CheckBrowseMode (see page 6880)	Allows the data-aware object to respond just before an event that changes the dataset state.
	DataEvent (see page 6881)	Responds to various events that occur while working with data.
	DataSetChanged (see page 6881)	Responds to changes in the dataset.
	DataSetScrolled (see page 6882)	Allows a response to scrolling the representation of the dataset within the data-aware object.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	EditingChanged (see page 6883)	Responds to changes in the editing state of the data source.
	FocusControl (see page 8581)	Moves input focus to the data field of the TDBLookupControl (see page 9044) object.
	GetActiveRecord (see page 6884)	This is GetActiveRecord, a member of class TDataLink.
	GetBOF (see page 6884)	This is GetBOF, a member of class TDataLink.
	GetBufferCount (see page 6884)	This is GetBufferCount, a member of class TDataLink.
	GetEOF (see page 6885)	This is GetEOF, a member of class TDataLink.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetRecordCount (see page 6885)	This is GetRecordCount, a member of class TDataLink.
	LayoutChanged (see page 8581)	Responds to changes in the representation of the data.
	MoveBy (see page 6885)	Repositions the dataset to another record relative to its active record.
	RecordChanged (see page 8581)	Informs the TDBLookupControl (see page 9044) of changes in the current record or field of the DataSource.
	SetActiveRecord (see page 6886)	This is SetActiveRecord, a member of class TDataLink.
	SetBufferCount (see page 6887)	This is SetBufferCount, a member of class TDataLink.
	UpdateData (see page 6887)	Provides an interface for writing edits to a record in the dataset.

Protected Properties

	Name	Description
	VisualControl (see page 6894)	Indicates whether a visual control uses the datalink.

Public Methods

	Name	Description
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 8580)	Creates an instance of TDataLink.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 6879)	Destroys an instance of TDataLink (see page 6876).
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Edit (see page 6882)	Attempts to drive the data source into an editing state if it is not already in one.
	ExecuteAction (see page 6883)	Invokes an action with the datasource as its target.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	UpdateAction (see page 6887)	Updates an action to reflect the current state of the TDataLink (see page 6876).
	UpdateRecord (see page 6888)	Responds to notifications that edits should be posted to the dataset.

Public Properties

	Name	Description
R	Active (see page 6888)	Specifies whether the dataset that TDataLink (see page 6876) manages is active.
	ActiveRecord (see page 6889)	Specifies the index of the current record within the internal record buffer maintained by the dataset for the Owner of the TDataLink (see page 6876) object.
R	BOF (see page 6889)	Indicates whether the first record in a dataset is active.
	BufferCount (see page 6890)	Specifies the number of records cached by the dataset for the Owner of the TDataLink (see page 6876) object.
R	DataSet (see page 6890)	Specifies the TDataSet (see page 6894) object that represents the data that this TDataLink (see page 6876) is tracking.
	DataSource (see page 6891)	Specifies the TDataSource (see page 7070) object that the Owner of the TDataLink (see page 6876) uses to connect to the dataset.

	DataSourceFixed (see page 6891)	Indicates whether the DataSource (see page 6891) property can be set.
R	Editing (see page 6892)	Indicates whether the DataSource (see page 6891) is in edit mode.
R	Eof (see page 6892)	Indicates whether the last record in a dataset is active.
	ReadOnly (see page 6893)	Indicates whether the dataset for this TDataLink (see page 6876) can be modified.
R	RecordCount (see page 6893)	Indicates the number of records in the internal record buffer maintained by the dataset.

47.1.1.2 TDataSourceLink.Create Constructor

Creates an instance of TDataLink.

Pascal

```
constructor Create;
```

C++

```
__fastcall TDataSourceLink();
```

Description

Create is called from the constructor of any data-aware object that uses a TDataLink to implement its DataSource property.

After calling the inherited constructor, Create initializes the BufferCount property to 1. Data-aware objects that use a TDataLink object to manage their link to a DataSource should change the BufferCount property to the number or records they represent, after calling the inherited constructor.

See Also

BufferCount (see page 6890)

47.1.1.3 TDataSourceLink Methods

The methods of the TDataSourceLink class are listed here.

Protected Methods

	Name	Description
V	ActiveChanged (see page 8580)	Informs the TDBLookupControl (see page 9044) of changes in the Active property of its DataSource.
V	FocusControl (see page 8581)	Moves input focus to the data field of the TDBLookupControl (see page 9044) object.
V	LayoutChanged (see page 8581)	Responds to changes in the representation of the data.
V	RecordChanged (see page 8581)	Informs the TDBLookupControl (see page 9044) of changes in the current record or field of the DataSource.

47.1.1.3.1 TDataSourceLink.ActiveChanged Method

Informs the TDBLookupControl (see page 9044) of changes in the Active property of its DataSource.

Pascal

```
procedure ActiveChanged; override;
```

C++

```
virtual __fastcall ActiveChanged();
```

Description

Applications cannot call the ActiveChanged procedure directly. Changes in the Active property trigger this procedure. When the

Active property becomes true, ActiveChanged causes the TDBLookupControl (see page 9044) object to re-acquire its DataField property. This ensures that the lookup control is working with the correct field component.

See Also

Active (see page 6888)

Active (see page 7004)

State (see page 7080)

DataField (see page 9062)

47.1.1.3.2 TDataSourceLink.FocusControl Method

Moves input focus to the data field of the TDBLookupControl (see page 9044) object.

Pascal

```
procedure FocusControl(Field: TFieldRef); override;
```

C++

```
virtual __fastcall FocusControl(TFieldRef Field);
```

Description

Applications cannot call the FocusControl procedure. It is called automatically when a field component in the DataSet tries to set focus to a control on the form that represents the field. FocusControl moves focus to the DataField of the TDBLookupControl (see page 9044) if it matches the Field parameter.

See Also

DataField (see page 9062)

FocusControl (see page 7128)

47.1.1.3.3 TDataSourceLink.LayoutChanged Method

Responds to changes in the representation of the data.

Pascal

```
procedure LayoutChanged; override;
```

C++

```
virtual __fastcall LayoutChanged();
```

Description

LayoutChanged updates the associated lookup control so that its field bindings remain accurate when the field order in the dataset changes.

See Also

DataSetChanged (see page 6881)

47.1.1.3.4 TDataSourceLink.RecordChanged Method

Informs the TDBLookupControl (see page 9044) of changes in the current record or field of the DataSource.

Pascal

```
procedure RecordChanged(Field: TField); override;
```

C++

```
virtual __fastcall RecordChanged(TField Field);
```

Description

Applications cannot call RecordChanged directly. It is triggered automatically after changes in the contents of the current record. If the Field parameter is the key field of the lookup control, or if the Field parameter is nil (Delphi) or NULL (C++), indicating that the entire record changed, RecordChanged causes the lookup control to refetch the value of its key field.

See Also

KeyField (see page 9064)

UpdateData (see page 6887)

47.1.2 TDBCheckBox Class

TDBCheckBox is a data-aware control that allows the user to select or deselect a single value.

Class Hierarchy

Pascal

```
TDBCheckBox = class(TCustomCheckBox);
```

C++

```
class TDBCheckBox : public TCustomCheckBox;
```

File

DBCtrls

Description

Use TDBCheckBox to place a data-aware check box on a form. A check box presents an option to the user; the user can check it to select the option or uncheck it to deselect the option. A database check box (TDBCheckBox) is much like an ordinary check box (TCheckBox), except that it is aware of the data in a particular field of a dataset. Because check boxes can represent only two values (checked and unchecked), database check boxes are most appropriate for boolean fields. They can, however, be used to group the values of any field into two sets.

For applications that don't require the data-aware capabilities of TDBCheckBox, use TCheckBox instead to conserve system resources.

Handling Boolean Field Values with Check Boxes

Using Common Data Control Features

Check Boxes

47.1.2.1 TDBCheckBox Members

The following tables list the members exposed by TDBCheckBox.

Protected Events

	Name	Description
	OnAlignInsertBefore (see page 6213)	Occurs when an object with custom alignment is aligned.
	OnAlignPosition (see page 6214)	Occurs when an object with custom alignment is aligned.
	OnCanResize (see page 5851)	Occurs when an attempt is made to resize the control.
	OnConstrainedResize (see page 5853)	Adjust resize constraints.
	OnDblClick (see page 5854)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDockDrop (see page 6214)	Occurs when another control is docked to the control.
	OnDockOver (see page 6216)	Occurs when another control is dragged over the control.
	OnGetSiteInfo (see page 6223)	Returns the control's docking information.
	OnMouseWheel (see page 5869)	Occurs when the mouse wheel is rotated.
	OnMouseWheelDown (see page 5869)	Occurs when the mouse wheel is rotated downward.
	OnMouseWheelUp (see page 5870)	Occurs when the mouse wheel is rotated upward.
	OnResize (see page 5870)	Occurs immediately after the control is resized.
	OnUnDock (see page 6230)	Occurs when the application tries to undock a control that is docked to the windowed control.

Protected Fields

	Name	Description
	FAnchorMove (see page 5733)	This is FAnchorMove, a member of class TControl.
	FAnchorOrigin (see page 5734)	This is FAnchorOrigin, a member of class TControl.
	FAnchorRules (see page 5734)	This is FAnchorRules, a member of class TControl.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FDesignSize (see page 6124)	This is FDesignSize, a member of class TWinControl.
	FDoubleBuffered (see page 6124)	This is FDoubleBuffered, a member of class TWinControl.
	FExplicitHeight (see page 5734)	This is FExplicitHeight, a member of class TControl.
	FExplicitLeft (see page 5734)	This is FExplicitLeft, a member of class TControl.
	FExplicitTop (see page 5734)	This is FExplicitTop, a member of class TControl.
	FExplicitWidth (see page 5735)	This is FExplicitWidth, a member of class TControl.
	FInImeComposition (see page 6125)	This is FInImeComposition, a member of class TWinControl.
	FOriginalParentSize (see page 5735)	This is FOriginalParentSize, a member of class TControl.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	ActionChange (see page 5737)	Responds when the action associated with the control changes.
V	ActionChange (see page 6127)	Updates the control to reflect changes in its associated action.
V	ActionChange (see page 20992)	Updates the button control to reflect changes in its associated action.
	AddBiDiModeExStyle (see page 6128)	Sets control's window style according to its bi-directional support.
V	AdjustClientRect (see page 6128)	Provides the interface that adjusts the ClientRect (see page 5810) property for idiosyncrasies of the window.
	AdjustSize (see page 5738)	Sets the size of the control as determined by the AutoSize (see page 5803) property.
V	AdjustSize (see page 6129)	Adjusts the control's size according to its contents and constraints.
V	AlignControls (see page 6129)	Aligns any controls for which the control is the parent within a specified area of the control.
	ArrangeControl (see page 6130)	This is ArrangeControl, a member of class TWinControl.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.

	AssignTo (see page 5739)	Overrides the inherited AssignTo function to enable assignments to TAction objects.
	AssignTo (see page 6130)	Copies the properties of the windowed control to another object.
	BeginAutoDrag (see page 5739)	Begin Automatic Drag.
	CalcCursorPos (see page 5741)	This is CalcCursorPos, a member of class TControl.
	CanAutoSize (see page 5741)	Indicates whether the control can resize itself automatically to accommodate its contents.
	CanAutoSize (see page 6131)	Indicates how the control can be resized.
	CanResize (see page 5742)	OnCanResize (see page 5851) event dispatcher.
	CanResize (see page 6132)	Indicates how the control can respond to a resize attempt.
	Changed (see page 5742)	Sends a CM_CHANGED (see page 6330) message to the control.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	ChangeScale (see page 5743)	Rescaling event dispatcher.
	ChangeScale (see page 6132)	Resize (see page 5780) and reposition children and self.
	Click (see page 5743)	Respond to user click.
	Click (see page 21149)	Click generates an OnClick event.
	ConstrainedResize (see page 5746)	Notify control of resize with constraints.
	ConstrainedResize (see page 6133)	Generates an OnConstrainedResize (see page 5853) event.
	ControlsAligned (see page 6134)	This is ControlsAligned, a member of class TWinControl.
	CreateDockManager (see page 6134)	Creates the dock manager for the control.
	CreateHandle (see page 6135)	Creates underlying screen object.
	CreateParams (see page 6135)	Initializes a window-creation parameter data structure.
	CreateParams (see page 20993)	Initializes a window-creation parameter data structure.
	CreateParams (see page 21149)	Initializes a window-creation parameter record.
	CreateSubClass (see page 6136)	Creates a windowed control derived from an existing Windows window class.
	CreateWindowHandle (see page 6137)	Creates a Windows control to represent the control.
	CreateWnd (see page 6137)	Creates the underlying window.
	CreateWnd (see page 21150)	Creates a Windows control corresponding to the check box.
	CustomAlignInsertBefore (see page 6137)	Returns placement order of custom-aligned child control.
	CustomAlignPosition (see page 6138)	Returns aligned position of custom-aligned child control.
	DblClick (see page 5747)	OnDblClick (see page 5854) event dispatcher.
	DefaultDockImage (see page 5747)	Handles the painting and erasing of a dock image.
	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	DefineProperties (see page 5748)	Provides methods to read and write the IsControl (see page 5829) property to a stream such as a form file.
	DefineProperties (see page 6139)	Provides methods to read and write the IsControl property to a stream such as a form file.
	DesignWndProc (see page 5749)	This is DesignWndProc, a member of class TControl.
	DestroyHandle (see page 6140)	Destroys the control's window without destroying the control.
	DestroyWindowHandle (see page 6140)	Destroys the window created in the CreateWindowHandle (see page 6137) method.
	DestroyWnd (see page 6141)	Destroys the control's window.
	DoAddDockClient (see page 6142)	Performs actions when a control is docked to the windowed control.
	DockOver (see page 6143)	Responds when a docking client is dragged over the windowed control.
	DockReplaceDockClient (see page 6143)	This is DockReplaceDockClient, a member of class TWinControl.
	DockTrackNoTarget (see page 5749)	Handles dragging of the control over an invalid docking target.
	DoContextPopup (see page 5750)	OnContextPopup (see page 5854) event dispatcher.
	DoDock (see page 5750)	Docking event dispatcher.
	DoDockOver (see page 6143)	Generates an OnDockOver (see page 6216) event.
	DoEndDock (see page 5750)	OnEndDock (see page 5859) event dispatcher.
	DoEndDrag (see page 5751)	OnEndDrag (see page 5860) event dispatcher.
	DoEnter (see page 6144)	Respond to receiving input focus.
	DoExit (see page 6144)	Respond to losing input focus

	DoFlipChildren (see page 6145)	Flips the control's children.
	DoKeyDown (see page 6145)	Performs some preprocessing before generating an OnKeyDown (see page 6225) event.
	DoKeyPress (see page 6146)	Performs some preprocessing before generating an OnKeyPress (see page 6227) event.
	DoKeyUp (see page 6146)	Performs some preprocessing before generating an OnKeyUp (see page 6228) event.
	DoMouseWheel (see page 5751)	Processes mouse wheel motion.
	DoMouseWheelDown (see page 5752)	OnMouseWheelDown (see page 5869) event dispatcher.
	DoMouseWheelUp (see page 5752)	OnMouseWheelUp (see page 5870) event dispatcher.
	DoRemoveDockClient (see page 6147)	Responds when a control is undocked from the windowed control.
	DoStartDock (see page 5753)	OnStartDock (see page 5871) event dispatcher.
	DoStartDrag (see page 5753)	OnStartDrag (see page 5871) event dispatcher.
	DoUnDock (see page 6147)	Undocks a control that is currently docked to the windowed control.
	DragCanceled (see page 5754)	Provides the interface for a method that responds to the cancellation of a drag.
	DragOver (see page 5755)	OnDragOver (see page 5857) event dispatcher.
	DrawDragDockImage (see page 5755)	Draws the dock image for the control.
	EraseDragDockImage (see page 5757)	Erases the dock image for the control.
	FindNextControl (see page 6149)	Returns the control's next child in the tab order after the specified control.
	FixupTabList (see page 6149)	Sorts the child controls by their tab order.
	GetAction (see page 5758)	This is GetAction, a member of class TControl.
	GetActionLinkClass (see page 5758)	Returns the appropriate action link class that is associated with the control class.
	GetActionLinkClass (see page 6152)	Returns the associated action link class.
	GetActionLinkClass (see page 20993)	Returns the appropriate action link class that is associated with button controls.
	GetChecked (see page 20993)	Returns whether the button control is checked.
	GetChecked (see page 21150)	Returns the value of the Checked (see page 20995) property.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetChildren (see page 6153)	Calls a specified method for each child of the control.
	GetClientOrigin (see page 5758)	Returns the screen coordinates of the top-left corner of the control's client area.
	GetClientOrigin (see page 6153)	Returns the value of the ClientOrigin (see page 5809) property.
	GetClientRect (see page 5759)	Returns a rectangle defining the client area of the control.
	GetClientRect (see page 6154)	Returns the value of the ClientRect (see page 5810) property.
	GetControlExtents (see page 6154)	Returns the smallest rectangle in which all the control's children fit.
	GetDeviceContext (see page 5760)	Returns a device context for the control.
	GetDeviceContext (see page 6155)	Provides access to a device context for the control.
	GetDockEdge (see page 5763)	Returns the edge on which another control should be docked when it is dragged over the control.
	GetDragImages (see page 5763)	Returns the control's image list containing the image to be displayed while dragging.
	GetEnabled (see page 5763)	Returns the value of the Enabled (see page 5821) property.
	GetFloating (see page 5764)	Returns the value of the Floating (see page 5823) property.
	GetFloatingDockSiteClass (see page 5764)	Returns the class used for the control when it is floating.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetPalette (see page 5765)	Returns the handle to a palette for use by the control.
	GetParentHandle (see page 6157)	Returns the window handle for the window of the control's parent.
	GetPopupMenu (see page 5765)	Returns the pop-up menu associated with the control.
	GetSiteInfo (see page 6158)	Generates an OnGetSiteInfo (see page 6223) event
	GetTopParentHandle (see page 6159)	Returns the window handle of the first window not associated with a VCL control that contains the windowed control.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.

	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	InvalidateDockHostSite (see page 6162)	This is InvalidateDockHostSite, a member of class TWinControl.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsControlActivateMsg (see page 6162)	This is IsControlActivateMsg, a member of class TWinControl.
	IsControlMouseMsg (see page 6162)	Indicates whether a specified mouse message is directed to one of the windowed control's child controls.
	IsQualifyingSite (see page 6163)	This is IsQualifyingSite, a member of class TWinControl.
	KeyDown (see page 6163)	Respond to key press events.
V	KeyPress (see page 8595)	Respond to keyboard input.
	KeyUp (see page 6164)	Respond to released key.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Loaded (see page 5771)	Initializes the control after it is loaded from a stream.
	MainWndProc (see page 6165)	Receives Windows messages for the control.
	MouseActivate (see page 5773)	This is MouseActivate, a member of class TControl.
	MouseDown (see page 5773)	OnMouseDown (see page 5862) event dispatcher.
	MouseMove (see page 5773)	Respond to mouse moving over control area..
	MouseUp (see page 5774)	OnMouseUp (see page 5867) event dispatcher.
V	Notification (see page 8595)	Responds to notifications that components are being created or destroyed.
	NotifyControls (see page 6165)	Sends a message to all the child controls.
	PaintControls (see page 6166)	Paints each of the child controls in a windowed control using the specified device context.
	PaintHandler (see page 6166)	Responds to WM_PAINT messages.
V	PaintWindow (see page 6169)	Renders the image of a windowed control.
	PaletteChanged (see page 5775)	Responds to changes in the system's palette by realizing the control's palette.
V	PaletteChanged (see page 6170)	Responds to changes in the system's palette by realizing the control's palette and the palette for each child control.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	PositionDockRect (see page 5777)	Positions the docking rectangle according to the current drag-and-dock state.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 5778)	Prepares the control for having its properties assigned values read from a stream.
V	ReadState (see page 6171)	Prepares the control for having its properties assigned values from a stream.
	RecreateWnd (see page 6171)	Recreate underlying Windows screen object.
	ReloadDockedControl (see page 6172)	Reloads a docked control.
	RemoveWindowProps (see page 6174)	This is RemoveWindowProps, a member of class TWinControl.
V	RequestAlign (see page 5780)	Instructs the parent of a control to reposition the control, enforcing its Align (see page 5798) property.
	ResetIme (see page 6174)	Restores the input method editor (IME) that was active when the application started.
	ResetImeComposition (see page 6175)	Directs the composition window of the input method editor (IME) to perform a specific action.
	Resize (see page 5780)	Respond to control resize.
	ScaleConstraints (see page 5781)	This is ScaleConstraints, a member of class TControl.
	ScaleControls (see page 6176)	Rescale child controls only.
	SelectFirst (see page 6177)	Locates first selectable child control.
	SelectNext (see page 6177)	Moves the input focus from the current child control to the next one in the tab order.
	SendCancelMode (see page 5781)	Cancels the modal state of the control.
	SendDockNotification (see page 5782)	Sends a Windows message to the control's host dock site.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
V	SetAutoSize (see page 5783)	This is SetAutoSize, a member of class TControl.
V	SetBiDiMode (see page 5783)	Sets the control's bi-directional mode.
V	SetChecked (see page 20994)	Sets the Checked (see page 20995) property.
V	SetChecked (see page 21151)	Sets the value of the Checked (see page 20995) property.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.

	SetChildOrder (see page 6178)	Changes the order in which the child component appears in the list of child components returned by the GetChildren (see page 6153) method.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDragMode (see page 5785)	Sets the drag mode for the control.
	SetEnabled (see page 5785)	Sets the value of the Enabled (see page 5821) property.
	SetIme (see page 6181)	Activates an input method editor (IME) using the values specified by the ImeMode (see page 6207) and ImeName (see page 6208) properties.
	SetImeCompositionWindow (see page 6181)	Sets the position and font of the composition window.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetName (see page 5785)	Sets the name of the control.
	SetParent (see page 5786)	Sets the parent of the control.
	SetParent (see page 6182)	Sets the parent of the control.
	SetParentBackground (see page 6182)	This is SetParentBackground, a member of class TWinControl.
	SetParentBiDiMode (see page 5786)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	SetParentComponent (see page 5787)	Sets the parent for the control.
	SetZOrder (see page 5788)	Repositions the control in its parent's control list, thereby changing position onscreen.
	SetZOrder (see page 6182)	Moves the control to the top or bottom of the parent control's (or screen's) list of TWinControl (see page 6112) controls.
	ShowControl (see page 6183)	Ensures that a specified child control is visible.
	Toggle (see page 8596)	Changes the state of the check box.
	UpdateBounds (see page 6185)	This is UpdateBounds, a member of class TWinControl.
	UpdateBoundsRect (see page 5789)	Changes the Top (see page 5844), Left (see page 5830), Width (see page 5849), and Height (see page 5825) properties of the control, but doesn't update its screen image and bypasses all resize events.
	UpdateControlOriginalParentSize (see page 6186)	This is UpdateControlOriginalParentSize, a member of class TWinControl.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateExplicitBounds (see page 5789)	This is UpdateExplicitBounds, a member of class TControl.
	UpdateRecreatingFlag (see page 6186)	This is UpdateRecreatingFlag, a member of class TWinControl.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	UpdateUIState (see page 6186)	Updates form User Interface State as needed
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	VisibleChanging (see page 5791)	Provides the interface for a method that responds to changes in the control's visibility.
	WndProc (see page 8597)	Handles Windows messages.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	ActionLink (see page 5798)	Contains the action link object associated with the control.
	AutoSize (see page 5803)	Specifies whether the control sizes itself automatically to accommodate its contents.
	BevelEdges (see page 6192)	Specifies which edges of the control are beveled.
	BevelInner (see page 6193)	Specifies the cut of the inner bevel.
	BevelKind (see page 6193)	Specifies the control's bevel style.
	BevelOuter (see page 6194)	Specifies the cut of the outer bevel.
	BevelWidth (see page 6194)	Specifies the width of the inner and outer bevels.

	BorderWidth (see page 6195)	Specifies the width of the control's border.
	ClicksDisabled (see page 20996)	This is ClicksDisabled, a member of class TButtonControl.
	DefWndProc (see page 6199)	Specifies the default window procedure for the windowed control.
	DesktopFont (see page 5818)	Specifies whether the control uses the Windows icon font when writing text.
	ImeMode (see page 6207)	Determines the behavior of the input method editor (IME).
	ImeName (see page 6208)	Specifies the input method editor (IME) to use for converting keyboard input to Asian language characters.
	IsControl (see page 5829)	Determines whether a form stores its form-specific properties to a stream.
	MouseCapture (see page 5831)	Indicates whether the control has "captured" mouse events.
	ParentBackground (see page 6209)	Determines whether control uses parent's theme background.
	ScalingFlags (see page 5840)	Reflects which attributes of the control have been scaled.
	Text (see page 5842)	Contains a text string associated with the control.
	WheelAccumulator (see page 5849)	Accumulates mouse wheel rotations.
	WindowHandle (see page 6212)	Provides access to a window handle for the control.
	WindowText (see page 5850)	Contains the text string of the control.

Public Events

	Name	Description
	WindowProc (see page 5872)	Points to the window procedure that responds to messages sent to the control.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	BeginDrag (see page 5740)	Starts the dragging of a control.
	BringToFront (see page 5740)	Puts the control in front of all other controls in its parent control.
	Broadcast (see page 6130)	Sends a message to each of the child controls.
	CanFocus (see page 6131)	Indicates whether a control can receive focus.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	ClientToParent (see page 5744)	Translates client coordinates to parent coordinates.
	ClientToScreen (see page 5744)	Translates a given point from client area coordinates to global screen coordinates.
	ContainsControl (see page 6133)	Indicates whether a specified control exists within the control.
	ControlAtPos (see page 6133)	Returns the child control located at a specified position within the control.
V	Create (see page 8593)	Creates an instance of TDBCheckBox (see page 8582).
	CreateParented (see page 6123)	Creates and initializes a control as the child of a specified non-VCL container.
	CreateParentedControl (see page 6136)	Creates and initializes a control as the child of a specified non-VCL window.
V	DefaultHandler (see page 5748)	Provides message handling for all messages that do not have specific handlers.
V	DefaultHandler (see page 6139)	Provides message handling for all messages that the control does not fully process itself.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 8594)	Destroys an instance of TDBCheckBox (see page 8582).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	DisableAlign (see page 6141)	Disables the realignment of child controls.

	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Dock (see page 5749)	Used internally to dock the control.
	DockDrop (see page 6142)	Generates an OnDockDrop (see page 6214) event.
	DragDrop (see page 5754)	OnDragDrop (see page 5855) event dispatcher.
	Dragging (see page 5754)	Indicates whether a control is being dragged.
	DrawTextBiDiModeFlags (see page 5756)	Returns the text flags that reflect the current setting of the BiDiMode (see page 5803) property.
	DrawTextBiDiModeFlagsReadingOnly (see page 5756)	Returns the text flag to add that indicates whether the control's text should read from right to left.
	EnableAlign (see page 6148)	Decrements the reference count incremented by the DisableAlign (see page 6141) method, eventually realigning the child controls.
	EndDrag (see page 5757)	Stops a control from being dragged any further.
	ExecuteAction (see page 8594)	Invokes an action with the TDBCheckBox (see page 8582) as its target.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindChildControl (see page 6148)	Returns a child control given its name.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FlipChildren (see page 6150)	Reverses the positions of child controls.
	Focused (see page 6150)	Determines whether the control has input focus.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetControlsAlignment (see page 5759)	Indicates how text is aligned within the control.
	GetControlsAlignment (see page 21151)	Returns the alignment of the check box caption.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetParentComponent (see page 5765)	Returns the parent of the control.
	GetTabOrderList (see page 6158)	Builds a list of controls in tab order.
	GetTextBuf (see page 5766)	Retrieves the control's text, copies it into a buffer, and returns the number of characters copied.
	GetTextLen (see page 5767)	Returns the length of the control's text.
	HandleAllocated (see page 6159)	Reports whether a screen object handle exists for the control.
	HandleNeeded (see page 6160)	Creates a screen object for the control if it doesn't already exist.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	HasParent (see page 5768)	Indicates whether the control has a parent.
	Hide (see page 5769)	Makes the control invisible.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitiateAction (see page 5769)	Calls the action link's Update (see page 5789) method if the control is associated with an action link.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InsertControl (see page 6160)	Inserts a control into the Controls (see page 6197) array property.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	Invalidate (see page 5770)	Completely repaint control.
	Invalidate (see page 6161)	Schedules a control repaint.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.

	IsRightToLeft (see page 5770)	Indicates whether the control should be reversed right to left.
	ManualDock (see page 5771)	Docks the control.
	ManualFloat (see page 5772)	Undocks the control.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	MouseWheelHandler (see page 5774)	Dispatches messages received from a mouse wheel.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	PaintTo (see page 6167)	This is the overview for the PaintTo method overload.
	ParentToClient (see page 5776)	Translate parent coordinates to client coordinates.
	Perform (see page 5776)	Responds as if the control received a specified Windows message.
	PreProcessMessage (see page 6170)	This is PreProcessMessage, a member of class TWinControl.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	Realign (see page 6171)	Forces the control to realign children.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	Refresh (see page 5779)	Repaints the control on the screen.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveControl (see page 6172)	Removes a specified control from the Controls (see page 6197) array.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	Repaint (see page 5779)	Forces the control to repaint its image on the screen.
V	Repaint (see page 6174)	Repaints the entire control.
	ReplaceDockedControl (see page 5779)	Docks the control in the place where another control is already docked.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	ScaleBy (see page 6175)	Rescale control and its children.
	ScreenToClient (see page 5781)	Converts the screen coordinates of a specified point on the screen to client coordinates.
	ScrollBy (see page 6176)	Scroll control contents.
	SendToBack (see page 5782)	Puts a windowed control behind all other windowed controls, or puts a non-windowed control behind all other non-windowed controls.
V	SetBounds (see page 5783)	Sets the Left (see page 5830), Top (see page 5844), Width (see page 5849), and Height (see page 5825) properties all at once.
V	SetBounds (see page 6178)	Sets the windowed control's boundary properties all at once.
	SetDesignVisible (see page 5784)	Makes a control visible at design time.
V	SetDesignVisible (see page 6178)	Makes a control visible at design time.
V	SetFocus (see page 6179)	Gives the input focus to the control.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	SetTextBuf (see page 5787)	Sets the text of the control.
	Show (see page 5788)	Makes a control visible.
V	Update (see page 5789)	Processes any pending paint messages immediately.
V	Update (see page 6183)	Forces the control to update.
V	UpdateAction (see page 8596)	Updates an action to reflect the current state of the TDBCheckBox (see page 8582).
	UpdateControlState (see page 6186)	Respond to state change.
V	UseRightToLeftAlignment (see page 8596)	Specifies whether the control's alignment should be reversed right-to-left.
	UseRightToLeftReading (see page 5790)	Specifies whether the control is using a right-to-left reading order.
	UseRightToLeftScrollBar (see page 5791)	Specifies whether the vertical scroll bar appears on the left side of the control.

Public Properties

	Name	Description
R	AlignDisabled (see page 6192)	Indicates child control realignment disabled.
	BoundsRect (see page 5803)	Specifies the bounding rectangle of the control, expressed in the coordinate system of the parent control.
R	Brush (see page 6195)	Determines the color and pattern used for painting the background of the control.

	Checked (see page 8607)	Specifies whether the button control is checked.
	ClientHeight (see page 5808)	Specifies the height of the control's client area in pixels.
R	ClientOrigin (see page 5809)	Specifies the screen coordinates (in pixels) of the top left corner of a control's client area.
R	ClientRect (see page 5810)	Specifies the size (in pixels) of a control's client area.
	ClientWidth (see page 5811)	Specifies the horizontal size of the control's client area in pixels.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
R	ControlCount (see page 6195)	Returns the number of child controls.
R	Controls (see page 6197)	Lists all child controls.
	ControlState (see page 5813)	Indicates the current state of a control at runtime.
	ControlStyle (see page 5814)	Determines style characteristics of the control.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	DockClientCount (see page 6199)	Specifies the number of controls that are docked on the windowed control.
R	DockClients (see page 6201)	Lists the controls that are docked to the windowed control.
	DockManager (see page 6202)	Specifies the control's docking manager interface.
	DockOrientation (see page 5818)	Specifies how the control is docked relative to other controls docked in the same parent.
	DockSite (see page 6204)	Specifies whether the control can be the target of drag-and-dock operations.
	DoubleBuffered (see page 6205)	Determines whether the control's image is rendered directly to the window or painted to an in-memory bitmap first.
R	ExplicitHeight (see page 5821)	Specifies the explicit vertical size of the control in pixels.
R	ExplicitLeft (see page 5822)	Specifies the explicit horizontal pixel coordinate of the left edge of a component relative to its parent.
R	ExplicitTop (see page 5822)	Specifies the explicit vertical pixel coordinate of the top edge of a component relative to its parent.
R	ExplicitWidth (see page 5822)	Specifies the explicit horizontal size of the control in pixels.
R	Field (see page 8613)	Indicates the TField object whose current value the check box represents.
R	Floating (see page 5823)	Indicates whether the control is floating.
	FloatingDockSiteClass (see page 5823)	Specifies the class of the temporary control that hosts the control when it is floating.
R	Handle (see page 6207)	Provides access to the underlying Windows screen object for the control.
	HostDockSite (see page 5829)	Specifies the control in which the control is docked.
	LRDockWidth (see page 5831)	Specifies the width of the control when it is docked horizontally.
R	MouseInClient (see page 6209)	This is MouseInClient, a member of class TWinControl.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Padding (see page 6209)	Specifies the padding of a control.
	Parent (see page 5832)	Indicates the parent of the control.
	ParentWindow (see page 6210)	Reference to parent's underlying control.
R	Showing (see page 6210)	Indicates whether the control is showing on the screen.
	State (see page 8623)	Indicates whether the check box is selected, deselected, or grayed.
	TBDockHeight (see page 5842)	Specifies the height of the control when it is docked vertically.
	UndockHeight (see page 5845)	Specifies the height of the control when it is floating.
	UndockWidth (see page 5846)	Specifies the width of the control when it is floating.
	UseDockManager (see page 6212)	Specifies whether the docking manager is used in drag-and-dock operations.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
R	VisibleDockClientCount (see page 6212)	Specifies the number of visible controls that are docked on the windowed control.

Published Events

	Name	Description
	OnClick (see page 8629)	Occurs when the user clicks the control.
	OnContextPopup (see page 8631)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnDragDrop (see page 8631)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 8634)	Occurs when the user drags an object over a control.
	OnEndDock (see page 8636)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 8637)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnEnter (see page 8638)	Occurs when a control receives the input focus.
	OnExit (see page 8640)	Occurs when the input focus shifts away from one control to another.
	OnKeyDown (see page 8642)	Occurs when a user presses any key while the control has focus.
	OnKeyPress (see page 8644)	Occurs when a key is pressed.
	OnKeyUp (see page 8645)	Occurs when the user releases a key that has been pressed.
	OnMouseActivate (see page 8647)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 8648)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseEnter (see page 8650)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 8651)	Occurs when the user moves the mouse outside of a control.
	OnMouseMove (see page 8651)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 8653)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnStartDock (see page 8655)	Occurs when the user begins to drag a control with a DragKind of dkDock.
	OnStartDrag (see page 8656)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.

Published Properties

	Name	Description
	Action (see page 8598)	Designates the action associated with the control.
	Align (see page 8599)	Determines how the control aligns within its container (parent control).
	Alignment (see page 8602)	This is Alignment, a member of class TDBCheckBox.
	AlignWithMargins (see page 5802)	Indicates whether a control should be constrained by margins.
	AllowGrayed (see page 8602)	Determines whether check box can be in a "grayed" state.
	Anchors (see page 8603)	Specifies how the control is anchored to its parent.
	BiDiMode (see page 8604)	Specifies the bi-directional mode for the control.
	Caption (see page 8604)	Specifies a text string that identifies the control to the user.
	Color (see page 8608)	Specifies the background color of the control.
	Constraints (see page 8609)	Specifies the size constraints for the control.
	Ctl3D (see page 8609)	Determines whether a control has a three-dimensional (3-D) or two-dimensional look.
	Cursor (see page 5815)	Specifies the image used to represent the mouse pointer when it passes into the region covered by the control.
	DataField (see page 8610)	Identifies the field from which the data-aware control displays data.
	DataSource (see page 8610)	Links the check box to a dataset.
	DragCursor (see page 8611)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 8611)	Specifies whether the control is being dragged normally or for docking.
	DragMode (see page 8611)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	Enabled (see page 8613)	Controls whether the control responds to mouse, keyboard, and timer events.
	Font (see page 8614)	Controls the attributes of text written on or in the control.
	Height (see page 5825)	Specifies the vertical size of the control in pixels.
	HelpContext (see page 5826)	Numeric ID for control's context-sensitive help topic
	HelpKeyword (see page 5826)	Keyword for control's context-sensitive help topic

	HelpType (see page 5827)	Indicates whether the control's context sensitive help topic is identified by context ID or by keyword.
	Hint (see page 5827)	Contains the text string that can appear when the user moves the mouse over the control.
	Left (see page 5830)	Specifies the horizontal coordinate of the left edge of a component relative to its parent.
	Margins (see page 5831)	Specifies the margins for the control.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	ParentBiDiMode (see page 8615)	Specifies whether the control uses its parent's BiDiMode.
	ParentColor (see page 8615)	Determines where a control looks for its color information.
	ParentCtl3D (see page 8616)	Determines where a component looks to determine if it should appear three dimensional.
	ParentFont (see page 8616)	Determines where a control looks for its font information.
	ParentShowHint (see page 8616)	Determines where a control looks to find out if its Help Hint should be shown.
	PopupMenu (see page 8617)	Identifies the pop-up menu associated with the control.
	ReadOnly (see page 8622)	Determines whether the user can change the value of the field.
	ShowHint (see page 8622)	Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.
	TabOrder (see page 8624)	Indicates the position of the control in its parent's tab order.
	TabStop (see page 8625)	Determines if the user can tab to a control.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Top (see page 5844)	Specifies the Y coordinate of the top left corner of a control, relative to its parent or containing control in pixels.
	ValueChecked (see page 8625)	Specifies the field value that corresponds to the checked state of the check box.
	ValueUnchecked (see page 8626)	Specifies the field value that corresponds to the unchecked state of the check box.
	Visible (see page 8626)	Determines whether the component appears onscreen.
	Width (see page 5849)	Specifies the horizontal size of the control or form in pixels.
	WordWrap (see page 8628)	Specifies whether the button text wraps to fit the width of the control.

47.1.2.2 TDBCheckBox.Create Constructor

Creates an instance of TDBCheckBox (see page 8582).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TDBCheckBox(TComponent * AOwner);
```

Description

Call Create to instantiate a TDBCheckBox (see page 8582) object at runtime. For TDBCheckBox (see page 8582) objects placed on forms or data modules at design time, Create is called automatically.

Pass a single Component as a parameter to provide the TDBCheckBox (see page 8582) object with an Owner that is responsible for freeing it.After calling the inherited constructor to allocate and initialize a generic check box, Create

Adds csReplicatable to ControlStyle.

Creates and initializes the helper objects needed to link to a dataset.

See Also

Destroy (see page 8594)

Create (see page 21148)

TFieldDataLink (see page 9487)

47.1.2.3 TDBCheckBox.Destroy Destructor

Destroys an instance of TDBCheckBox (see page 8582).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TDBCheckBox();
```

Description

Do not call Destroy directly in an application. Instead, call Free. Free verifies that the TDBCheckBox (see page 8582) reference is not nil and only then calls Destroy.

Destroy frees the helper objects of the TDBCheckBox (see page 8582) before calling the inherited destructor.

See Also

Create (see page 8593)

Free (see page 22300)

47.1.2.4 TDBCheckBox Methods

The methods of the TDBCheckBox class are listed here.

Protected Methods

	Name	Description
	KeyPress (see page 8595)	Respond to keyboard input.
	Notification (see page 8595)	Responds to notifications that components are being created or destroyed.
	Toggle (see page 8596)	Changes the state of the check box.
	WndProc (see page 8597)	Handles Windows messages.

Public Methods

	Name	Description
	ExecuteAction (see page 8594)	Invokes an action with the TDBCheckBox (see page 8582) as its target.
	UpdateAction (see page 8596)	Updates an action to reflect the current state of the TDBCheckBox (see page 8582).
	UseRightToLeftAlignment (see page 8596)	Specifies whether the control's alignment should be reversed right-to-left.

47.1.2.4.1 TDBCheckBox.ExecuteAction Method

Invokes an action with the TDBCheckBox (see page 8582) as its target.

Pascal

```
function ExecuteAction(Action: TBasicAction): Boolean; override;
```

C++

```
virtual __fastcall Boolean ExecuteAction(TBasicAction Action);
```

Description

ExecuteAction is called automatically when the user invokes an action with the TDBCheckBox (see page 8582) as a target. The Action (see page 8598) parameter specifies the action that was invoked. ExecuteAction returns trueif the action was successfully dispatched, and false if the TDBCheckBox (see page 8582) could not handle the action.

See Also

UpdateAction (see page 8596)

Execute (see page 2712)

HandlesTarget (see page 2713)

47.1.2.4.2 TDBCheckBox.KeyPress Method

Respond to keyboard input.

Pascal

```
procedure KeyPress(var Key: Char); override;
```

C++

```
virtual __fastcall KeyPress(Char Key);
```

Description

When a windowed control receives a key-press message (WM_CHAR) from Windows, its message handler calls the DoKeyPress method. If DoKeyPress determines that the control should, in fact, process the character, it calls KeyPress, passing the key code in the Key parameter.

KeyPress calls any event handler attached to the OnKeyPress event. Override KeyPress to provide other responses in addition to the event-handler call.

Either KeyPress or the OnKeyPress event handler it calls can suppress further processing of a character by setting the Key parameter to zero.

Note: The Key parameter is the character represented by the key that is pressed, not a Windows virtual key code.

See Also

KeyDown (see page 6163)

KeyUp (see page 6164)

OnKeyPress (see page 6227)

47.1.2.4.3 TDBCheckBox.Notification Method

Responds to notifications that components are being created or destroyed.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

Notification allows TControl to update its PopupMenu property when the pop-up menu it refers to is destroyed.

Override the Notification method to respond to notifications that other components are about to be destroyed or have just been created. Use the Notification method to update controls that rely on other objects. Remove references to objects that are going away so that the control does not refer to objects that have been destroyed. For example, data-aware objects override the Notification method to update themselves when their data source is removed. Some objects respond to notifications that other objects of a specific type are being created. For example, the session component sets the Session property of new data-aware controls to itself when the AutoSessionName property is true.

By default, components pass along the notification to their owned components, if any.

See Also

PopupMenu (see page 5835)

Notification (see page 2783)

47.1.2.4.4 TDBCheckBox.Toggle Method

Changes the state of the check box.

Pascal

```
procedure Toggle; override;
```

C++

```
virtual __fastcall Toggle();
```

Description

Use the Toggle method to select or deselect the check box programmatically. Toggle switches among the valid check-box states—from checked to unchecked to grayed, or from checked to unchecked.

See Also

AllowGrayed (see page 21152)

State (see page 21153)

47.1.2.4.5 TDBCheckBox.UpdateAction Method

Updates an action to reflect the current state of the TDBCheckBox (see page 8582).

Pascal

```
function UpdateAction(Action: TBasicAction): Boolean; override;
```

C++

```
virtual __fastcall Boolean UpdateAction(TBasicAction Action);
```

Description

UpdateAction is called automatically when the application is idle to give the TDBCheckBox (see page 8582) an opportunity to update associated actions. This allows actions to be grayed, checked, or to otherwise reflect the status of the TDBCheckBox (see page 8582) they target.

The Action (see page 8598) parameter specifies the action component that should be updated. UpdateAction returns trueif the action component now reflects the state of the component, and false if it did not know how to update the action.

See Also

ExecuteAction (see page 8594)

UpdateTarget (see page 2715)

HandlesTarget (see page 2713)

47.1.2.4.6 TDBCheckBox.UseRightToLeftAlignment Method

Specifies whether the control's alignment should be reversed right-to-left.

Pascal

```
function UseRightToLeftAlignment: Boolean; override;
```

C++

```
virtual __fastcall Boolean UseRightToLeftAlignment();
```

Description

Controls call UseRightToLeftAlignment when implementing the BiDiMode property. UseRightToLeftAlignment indicates whether the control's alignment should be reversed right-to-left. This information can be used when painting the control or when responding to mouse events.

UseRightToLeftAlignment returns true if the application is running on a system with a Middle Eastern locale and the BiDiMode property is bdRightToLeft. Otherwise, it returns false. Descendants override UseRightToLeftAlignment if alignment in Middle Eastern locales depends on other factors.

See Also

BiDiMode (see page 5803)

GetControlsAlignment (see page 5759)

Text (see page 5842)

Caption (see page 5806)

47.1.2.4.7 TDBCheckBox.WndProc Method

Handles Windows messages.

Pascal

```
procedure WndProc(var Message: TMessage); override;
```

C++

```
virtual __fastcall WndProc(TMessage Message);
```

Description

WndProc enables button objects to receive input focus when WM_LBUTTONDOWN and WM_LBUTTONDBLCLK messages occur.

See Also

WndProc (see page 5791)

47.1.2.5 TDBCheckBox Properties

The properties of the TDBCheckBox class are listed here.

Public Properties

	Name	Description
	Checked (see page 8607)	Specifies whether the button control is checked.
R	Field (see page 8613)	Indicates the TField object whose current value the check box represents.
	State (see page 8623)	Indicates whether the check box is selected, deselected, or grayed.

Published Properties

	Name	Description
	Action (see page 8598)	Designates the action associated with the control.

	Align (see page 8599)	Determines how the control aligns within its container (parent control).
	Alignment (see page 8602)	This is Alignment, a member of class TDBCheckBox.
	AllowGrayed (see page 8602)	Determines whether check box can be in a "grayed" state.
	Anchors (see page 8603)	Specifies how the control is anchored to its parent.
	BiDiMode (see page 8604)	Specifies the bi-directional mode for the control.
	Caption (see page 8604)	Specifies a text string that identifies the control to the user.
	Color (see page 8608)	Specifies the background color of the control.
	Constraints (see page 8609)	Specifies the size constraints for the control.
	Ctl3D (see page 8609)	Determines whether a control has a three-dimensional (3-D) or two-dimensional look.
	DataField (see page 8610)	Identifies the field from which the data-aware control displays data.
	DataSource (see page 8610)	Links the check box to a dataset.
	DragCursor (see page 8611)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 8611)	Specifies whether the control is being dragged normally or for docking.
	DragMode (see page 8611)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	Enabled (see page 8613)	Controls whether the control responds to mouse, keyboard, and timer events.
	Font (see page 8614)	Controls the attributes of text written on or in the control.
	ParentBiDiMode (see page 8615)	Specifies whether the control uses its parent's BiDiMode.
	ParentColor (see page 8615)	Determines where a control looks for its color information.
	ParentCtl3D (see page 8616)	Determines where a component looks to determine if it should appear three dimensional.
	ParentFont (see page 8616)	Determines where a control looks for its font information.
	ParentShowHint (see page 8616)	Determines where a control looks to find out if its Help Hint should be shown.
	PopupMenu (see page 8617)	Identifies the pop-up menu associated with the control.
	ReadOnly (see page 8622)	Determines whether the user can change the value of the field.
	ShowHint (see page 8622)	Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.
	TabOrder (see page 8624)	Indicates the position of the control in its parent's tab order.
	TabStop (see page 8625)	Determines if the user can tab to a control.
	ValueChecked (see page 8625)	Specifies the field value that corresponds to the checked state of the check box.
	ValueUnchecked (see page 8626)	Specifies the field value that corresponds to the unchecked state of the check box.
	Visible (see page 8626)	Determines whether the component appears onscreen.
	WordWrap (see page 8628)	Specifies whether the button text wraps to fit the width of the control.

47.1.2.5.1 TDBCheckBox.Action Property

Designates the action associated with the control.

Pascal

```
property Action: TBasicAction;
```

C++

```
__property TBasicAction Action;
```

Description

Action is the action object that is associated with the control. Actions allow an application to centralize the response to user commands. When a control is associated with an action, the action determines the appropriate properties and events of the control (such as whether the control is enabled or how it responds to an OnClick event).

To create actions at design time, place an action list component on a form or data module. Double click the action list to bring up the action list editor. Add actions in the editor using its context menu. Once the actions have been added using the action list editor, they appear in the drop-down list for the Action property in the Object Inspector.

47.1.2.5.2 TDBCheckBox.Align Property

Determines how the control aligns within its container (parent control).

Pascal

```
property Align: TAlign;
```

C++

```
__property TAlign Align;
```

Description

Use Align to align a control to the top, bottom, left, or right of a form or panel and have it remain there even if the size of the form, panel, or component that contains the control changes. When the parent is resized, an aligned control also resizes so that it continues to span the top, bottom, left, or right edge of the parent.

For example, to use a panel component with various controls on it as a tool palette, change the panel's Align value to alLeft. The value of alLeft for the Align property of the panel guarantees that the tool palette remains on the left side of the form and always equals the client height of the form.

The default value of Align is alNone, which means a control remains where it is positioned on a form or panel.

Tip: If Align is set to alClient, the control fills the entire client area so that it is impossible to select the parent form by clicking on it. In this case, select the parent by selecting the control on the form and pressing Esc, or by using the Object Inspector.

Any number of child components within a single parent can have the same Align value, in which case they stack up along the edge of the parent. The child controls stack up in z-order. To adjust the order in which the controls stack up, drag the controls into their desired positions.

Note: To cause a control to maintain a specified relationship with an edge of its parent, but not necessarily lie along one edge of the parent, use the Anchors property instead.

C++ Examples:

```
/*
This example shows how to use a splitter to divide a form
into resizable panes.  All objects on the form are created
dynamically in the OnCreate event handler of the form. To
run this example, add ExtCtrls and FileCtrl to the uses
clause of the form’s implementation section.
Note that when creating a splitter dynamically at runtime,
it is important to set its position to the appropriate side
of the control it will resize.
*/
#include <Extctrls.hpp>
#include <Filectrl.hpp>

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  TSplitter* ps = new TSplitter(Form1);
  TFileListBox* pflb = new TFileListBox(Form1);
  TDirectoryListBox* pdlb = new TDirectoryListBox(Form1);

  // Line up the directory list box on the left of the form.
  pdlb->Parent = Form1;
  pdlb->Align = alLeft;
  pdlb->Width = Form1->ClientWidth/3;

  // Now use the splitter to divide the directory pane from the file pane.
  ps->Parent = Form1;
```

```
  ps->Left = pdlb->Left + pdlb->Width + 1; // Move to right of directory list.
  ps->Align = pdlb->Align; // Give same alignment as directory list.

  // Each pane must be at least one quarter of the form's width.
  ps->MinSize = Form1->ClientWidth/4;

  // Finally, create the last pane - a file list box.
  pflb->Parent = Form1;
  pflb->Align = alClient;
  pdlb->FileList = pflb; // Link the file list box to the directory list box.
}
/*
Dynamically create a TProgressBar control and align it to
the bottom of the form.
*/

#include <ComCtrls.hpp>
#include <Controls.hpp>

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  TProgressBar *ProgressBar = new TProgressBar(this);
  ProgressBar->Parent = this;
  ProgressBar->Align = alBottom;
  TButton *Button1 = new TButton(this);
  Button1->Parent = this;
}
/*
This example dynamically creates a Page Control, then a
series of Tab Sheets on the Page Control.
*/
#include <Comctrls.hpp>
TPageControl* ppc;
const int MAXTABS = 3;
TTabSheet* pts[MAXTABS];
const char * ppcTabTitles[] = { "ShortString", "Orders", "Items", "Parts" };
int iTabTitles = sizeof(ppcTabTitles)/sizeof(ppcTabTitles[0]);
const TColor colorPalette[12] = {
  clRed, clGreen, clYellow, clBlue, clWhite, clFuchsia,
  clTeal, clNavy, clMaroon, clLime, clOlive, clPurple};

void __fastcall TForm1::FormCreate(TObject *Sender)
{
    ppc = new TPageControl(this);
    ppc->Parent = this;
    ppc->Align = alClient;
    for (int i=0;i<iTabTitles;i++)
  {
        pts[i] = new TTabSheet(this);
        pts[i]->PageControl = ppc;
        pts[i]->Name = AnsiString("pts") + ppcTabTitles[i];
        pts[i]->Caption = ppcTabTitles[i];
        pts[i]->Brush->Color = colorPalette[i];
  }
}//---------------------------------------------------------------------------
void __fastcall TForm1::FormDestroy(TObject *Sender)
{
  for (int i=0;i<iTabTitles;i++)
        delete pts[i];
    delete ppc;
}
```

Delphi Examples:

```
{
This example shows how to use a splitter to divide a form
into resizable panes.  All objects on the form are created
```

```
dynamically in the OnCreate event handler of the form. To
run this example, add ExtCtrls and FileCtrl to the uses
clause of the form's implementation section.
Note that when creating a splitter dynamically at runtime,
it is important to set its position to the appropriate side
of the control it will resize.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  Split: TSplitter;
  Files: TFileListBox;
  Dirs: TDirectoryListBox;
begin
  { first add a directory list box to the form }
  Dirs := TDirectoryListBox.Create(Form1);
  { line it up on the left of the form }
  Dirs.Parent := Form1;
  Dirs.Align := alLeft;
  Dirs.Width := Form1.ClientWidth div 3;
{ now add the splitter to divide the directory pane from the file pane }
  Split := TSplitter.Create(Form1);
  Split.Parent := Form1;
  { make sure the splitter is to the right of the directory list box! }
  Split.Left := Dirs.Left + Dirs.Width + 1;
  Split.Align := Dirs.Align; { give it the same alignment as the directory }
  { each pane must be at least one quarter of the form's width }
  Split.MinSize := Form1.ClientWidth div 4;
  { Finally, create the last pane – a file list box }
  Files := TFileListBox.Create(Form1);
  Files.Parent := Form1;
  Files.Align := alClient;
  Dirs.FileList := Files; { link the file list box to the directory list box }
end;
{
Dynamically create a TProgressBar control and align it to
the bottom of the form.

47.1.2.5.3 TDBCheckBox.Alignment Property

Pascal

```
property Alignment: TLeftRight;
```

C++

```
__property TLeftRight Alignment;
```

Description

This is Alignment, a member of class TDBCheckBox.

47.1.2.5.4 TDBCheckBox.AllowGrayed Property

Determines whether check box can be in a "grayed" state.

Pascal

```
property AllowGrayed: Boolean;
```

C++

```
__property Boolean AllowGrayed;
```

Description

If AllowGrayed is set to true, the check box has three possible states: checked, unchecked, and grayed. If AllowGrayed is set to

false, the check box has only two possible states: checked and unchecked.

C++ Examples:

```
/*
This example uses a check box on a form. When the
application runs, the check box is initially checked. When
the user clicks it, the check box is unchecked. Clicking it
again grays the check box.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  CheckBox1->AllowGrayed = true;
  CheckBox1->State = cbChecked;
}
```

Delphi Examples:

```
{
This example uses a check box on a form. When the
application runs, the check box is initially checked. When
the user clicks it, the check box is unchecked. Clicking it
again grays the check box.
}
procedure TForm1.FormCreate(Sender: TObject);
begin
  CheckBox1.AllowGrayed := True;
  CheckBox1.State := cbChecked;
end;
```

See Also

Checked

State (see page 21153)

47.1.2.5.5 TDBCheckBox.Anchors Property

Specifies how the control is anchored to its parent.

Pascal

```
property Anchors: TAnchors;
```

C++

```
__property TAnchors Anchors;
```

Description

Use Anchors to ensure that a control maintains its current position relative to an edge of its parent, even if the parent is resized. When its parent is resized, the control holds its position relative to the edges to which it is anchored.

If a control is anchored to opposite edges of its parent, the control stretches when its parent is resized. For example, if a control has its Anchors property set to [akLeft, akRight], the control stretches when the width of its parent changes.

Anchors is enforced only when the parent is resized. Thus, for example, if a control is anchored to opposite edges of a form at design time and the form is created in a maximized state, the control is not stretched because the form is not resized after the control is created.

Note: If a control should maintain contact with three edges of its parent (hugging one side of the parent and stretching the length of that side), use the Align property instead. Unlike Anchors, Align allows controls to adjust to changes in the size of other aligned sibling controls as well as changes to the parent's size.

See Also

Parent (see page 5832)

Align (see page 5798)

47.1.2.5.6 TDBCheckBox.BiDiMode Property

Specifies the bi-directional mode for the control.

Pascal

```
property BiDiMode: TBiDiMode;
```

C++

```
__property TBiDiMode BiDiMode;
```

Description

Use BiDiMode to enable the control to adjust its appearance and behavior automatically when the application runs in a locale that reads from right to left instead of left to right. The bi-directional mode controls the reading order for the text, the placement of the vertical scroll bar, and whether the alignment is changed.

Alignment does not change for controls that are known to contain number, date, time, or currency values. For example, with data aware controls, the alignment does not change for the following field types: ftSmallint, ftInteger, ftWord, ftFloat, ftCurrency, ftBCD, ftDate, ftTime, ftDateTime, ftAutoInc.

See Also

UseRightToLeftAlignment (see page 5790)

UseRightToLeftReading (see page 5790)

UseRightToLeftScrollBar (see page 5791)

Including Bi-directional Functionality in Applications

47.1.2.5.7 TDBCheckBox.Caption Property

Specifies a text string that identifies the control to the user.

Pascal

```
property Caption: TCaption;
```

C++

```
__property TCaption Caption;
```

Description

Use Caption to specify the text string that labels the control.

To underline a character in a Caption that labels a component, include an ampersand (&) before the character. This type of character is called an accelerator character. The user can then select the component by pressing Alt while typing the underlined character. To display an ampersand character in the caption, use two ampersands (&&).

Note: Controls that display text use either the Caption property or the Text property to specify the text value. Which property is used depends on the type of control. In general, Caption is used for text that appears as a window title or label, while Text is used for text that appears as the content of a control.

C++ Examples:

```
/*
The following code keeps the size of the label control
constant, even though the length of the label's caption
changes. As a result, the caption of the label is probably
too long to display in the label when the user clicks the
button:
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  Label1->AutoSize = false;
  Label1->Caption = "This string is too long as the caption of this label";
}
/*
This example requires a TPageControl populated by several
TabSheets, a TEdit and a TButton. When the button is
clicked, the caption of the active tab changes to that of
the TEdit.  These lines of code could also be written:
PageControl1.ActivePage.Caption := Edit1.Text;
This would make a TTabSheet variable unnecessary since
PageControl1.->ActivePage is already of type TTabSheet.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  TTabSheet *sheet = PageControl1->ActivePage;
  sheet->Caption = Edit1->Text;
}
/*
This example creates a ToolBar and adds ToolButtons to it.
Include ComCtlrs in the uses clause.
*/
#include <comctrls.hpp>

void AddButtons(TToolBar *toolBar, TStringList *captions)
{
  for (int i = 0; i < captions->Count; i++)
  {
    TToolButton *button = new TToolButton(toolBar);
    button->Parent = toolBar;
    button->Caption = captions->Strings[i];
    if (button->Caption == "|")
      button->Style = tbsSeparator;
    else
      button->Style = tbsButton;
  }
}

TToolBar *myToolBar;

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  myToolBar = new TToolBar(this);
  myToolBar->Parent = this;
  TStringList *captions = new TStringList();
  captions->Add("New");
  captions->Add("Save");
  captions->Add("|");
  captions->Add("Cut");
  captions->Add("Copy");
  captions->Add("Paste");
  AddButtons(myToolBar, captions);
  delete captions;
  myToolBar->ShowCaptions = True;
  myToolBar->Height = 40;
}
```

```
void __fastcall TForm1::FormDestroy(TObject *Sender)
{
  for (int I = myToolBar->ButtonCount - 1; I >= 0; I--)
    delete myToolBar->Buttons[I];
  delete myToolBar;
}
```

Delphi Examples:

```
{
The following code keeps the size of the label control
constant, even though the length of the label's caption
changes. As a result, the caption of the label is probably
too long to display in the label when the user clicks the
button:
}
procedure TForm1.Button1Click(Sender: TObject);
begin
  Label1.AutoSize := False;
  Label1.Caption :=
    'This string is too long as the caption of this label';
end;
{
This example requires a TPageControl populated by several
TabSheets, a TEdit and a TButton. When the button is
clicked, the caption of the active tab changes to that of
the TEdit.  These lines of code could also be written:
PageControl1.ActivePage.Caption := Edit1.Text;
This would obviate the need for a TTabSheet variable since
PageControl1.->ActivePage is already of type TTabSheet.
}
procedure TForm1.Button1Click(Sender: TObject);
var
  sheet: TTabSheet;
begin
  sheet := PageControl1.ActivePage;
  sheet.Caption := Edit1.Text;
end;
{
This example creates a ToolBar and adds ToolButtons to it.
Include ComCtlrs in the uses clause.
}
procedure AddButtons(ToolBar: TToolBar;
  Const ButtonCaptions: array of String);
var
  I: Integer;
begin
  for I := 0 to High(ButtonCaptions) do
    begin
      with TToolButton.Create(ToolBar) do
      begin
        Parent := ToolBar;
        Caption := ButtonCaptions[I];
        if (ButtonCaptions[I] = '|') then
          Style := tbsSeparator
        else
          Style := tbsButton;
      end;
    end;
end;

procedure TForm1.FormCreate(Sender: TObject);
begin
  ToolBar1 := TToolBar.Create(Self);
  ToolBar1.Parent := Self;
  AddButtons(ToolBar1, ['New', 'Save', '|', 'Cut', 'Copy', 'Paste']);
```

```
  ToolBar1.ShowCaptions := True;
  ToolBar1.Height := 40;
end;

procedure TForm1.FormDestroy(Sender: TObject);
var
  I: Integer;
begin
  for I := ToolBar1.ButtonCount - 1 downto 0 do
    ToolBar1.Buttons[I].Free;
  ToolBar1.Free;
end;
```

47.1.2.5.8 TDBCheckBox.Checked Property

Specifies whether the button control is checked.

Pascal

```
property Checked: Boolean;
```

C++

```
__property Boolean Checked;
```

Description

Use Checked to determine whether a button control is checked.

C++ Examples:

```
/*
This example requires a PageControl with no pages created,
and a TCheckBox. During the form create, a series of tabs
will be created on the Page Control that exceed the Page
Control's width.  When the Check Box control is clicked, the
setting of the MultiLine property is toggled, alternately
stacking the tabs vertically, or along a single line
horizontally.
*/

void __fastcall TForm1::CheckBox1Click(TObject *Sender)
{
  PageControl1->MultiLine = CheckBox1->Checked;
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  CheckBox1->Caption = "Stack Tabs?";
  for (int i = 0; i < 20; i++)
  {
    TTabSheet *pPage = new TTabSheet(PageControl1);
    pPage->PageControl = PageControl1;
    pPage->Caption = AnsiString("Page") + IntToStr(i);
  }
}
```

Delphi Examples:

```
{
This example requires a PageControl with no pages created,
and a TCheckBox. During the form create, a series of tabs
will be created on the Page Control that exceed the Page
Control's width.  When the Check Box control is clicked, the
setting of the MultiLine property is toggled, alternately
stacking the tabs vertically, or along a single line
horizontally.
}
```

```
procedure TForm1.CheckBox1Click(Sender: TObject);
begin
  PageControl1.MultiLine := CheckBox1.Checked;
end;

procedure TForm1.FormCreate(Sender: TObject);
var
  i: Integer;
begin
  Checkbox1.Caption := 'Stack Tabs?';
  for i := 0 to 20 do
    with TTabSheet.Create(Self) do
    begin
      PageControl := PageControl1;
      Caption := 'Tab #' + IntToStr(i);
    end;
end;
```

See Also

WndProc (see page 5791)

47.1.2.5.9 TDBCheckBox.Color Property

Specifies the background color of the control.

Pascal

```
property Color: TColor;
```

C++

```
__property TColor Color;
```

Description

Use Color to read or change the background color of the control.

If a control's ParentColor property is true, then changing the Color property of the control's parent automatically changes the Color property of the control. When the value of the Color property is changed, the control's ParentColor property is automatically set to false.

C++ Examples:

```
/*
The following code changes the color of a shape control
using the Color dialog box. The example displays the Color
dialog box when the Button1 button is clicked, allowing the
user to select a color with the dialog box. When a color
value is selected with the dialog box, it is assigned to
the shape control.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  if (ColorDialog1->Execute())
    Shape1->Brush->Color = ColorDialog1->Color;
}
```

Delphi Examples:

```
{
The following code changes the color of a shape control
using the Color dialog box. The example displays the Color
dialog box when the Button1 button is clicked, allowing the
user to select a color with the dialog box. When a color
value is selected with the dialog box, it is assigned to
the shape control.
```

```
}
procedure TForm1.Button1Click(Sender: TObject);
begin
  if ColorDialog1.Execute then
    Shape1.Brush.Color := ColorDialog1.Color;
end;
```

See Also

ParentColor (see page 5834)

47.1.2.5.10 TDBCheckBox.Constraints Property

Specifies the size constraints for the control.

Pascal

```
property Constraints: TSizeConstraints;
```

C++

```
__property TSizeConstraints Constraints;
```

Description

Use Constraints to specify the minimum and maximum width and height of the control. When Constraints contains maximum or minimum values, the control cannot be resized to violate those constraints.

Note: Constraints apply to the height of the form. However, the height of the form depends on how large Windows makes the title bar. For example, Windows XP uses much larger title bars than other windowing systems. To work around this, note the ClientHeight when you design your form and set the constraints in the FormCreate event. In the following example, ClientHeight is represented by x: `Constraints.MinHeight := x + Height - ClientHeight`.

Warning: Do not set up constraints that conflict with the value of the Align or Anchors property. When these properties conflict, the response of the control to resize attempts is not well-defined.

See Also

AutoSize (see page 5803)

Align (see page 5798)

Anchors (see page 5802)

OnConstrainedResize (see page 5853)

OnCanResize (see page 5851)

47.1.2.5.11 TDBCheckBox.Ctl3D Property

Determines whether a control has a three-dimensional (3-D) or two-dimensional look.

Pascal

```
property Ctl3D: Boolean;
```

C++

```
__property Boolean Ctl3D;
```

Description

Ctl3D is provided for backward compatibility. It is not used by 32-bit versions of Windows or NT4.0 and later, with the exception of Windows XP Home, where it is used on occasion.

On earlier platforms, Ctl3D controlled whether the control had a flat or beveled appearance.

See Also

ParentCtl3D (see page 6209)

BevelKind (see page 6193)

BevelInner (see page 6193)

BevelOuter (see page 6194)

BorderWidth (see page 6195)

47.1.2.5.12 TDBCheckBox.DataField Property

Identifies the field from which the data-aware control displays data.

Pascal

```
property DataField: WideString;
```

C++

```
__property BSTR DataField;
```

Description

Set DataField to the field name of the field component that the check box represents. Access by the TDBCheckBox (see page 8582) to the dataset in which the field is located is provided by a TDataSource component, specified in the DataSource (see page 8610) property.

```
DBCheckBox1.DataField := 'HasPaid';
DBCheckBox1->DataField = "HasPaid";
```

See Also

DataSource (see page 8610)

Field (see page 8613)

47.1.2.5.13 TDBCheckBox.DataSource Property

Links the check box to a dataset.

Pascal

```
property DataSource: TDataSource;
```

C++

```
__property TDataSource DataSource;
```

Description

Specify the data source component through which the data from a dataset component is provided to the TDBCheckBox (see page 8582). To allow the check box to represent the data for a field, both the DataSource and the DataField (see page 8610) properties must be set.

```
DBCheckBox1.DataSource := DataSource1;
DBCheckBox1->DataSource = DataSource1;
```

See Also

DataField (see page 8610)

Field (see page 8613)

47.1.2.5.14 TDBCheckBox.DragCursor Property

Indicates the image used to represent the mouse pointer when the control is being dragged.

Pascal

```
property DragCursor: TCursor;
```

C++

```
__property TCursor DragCursor;
```

Description

Use the DragCursor property to change the cursor image presented when the control is being dragged.

Note: To make a custom cursor available for the DragCursor property, see the Cursor property.

See Also

Cursor (see page 5815)

DragKind (see page 5819)

DragMode (see page 5819)

47.1.2.5.15 TDBCheckBox.DragKind Property

Specifies whether the control is being dragged normally or for docking.

Pascal

```
property DragKind: TDragKind;
```

C++

```
__property TDragKind DragKind;
```

Description

Use DragKind to get or set whether the control participates in drag-and-drop operations, or drag-and-dock operations.

See Also

DragCursor (see page 5818)

DragMode (see page 5819)

47.1.2.5.16 TDBCheckBox.DragMode Property

Determines how the control initiates drag-and-drop or drag-and-dock operations.

Pascal

```
property DragMode: TDragMode;
```

C++

```
__property TDragMode DragMode;
```

Description

Use DragMode to control when the user can drag the control. Disable the drag-and-drop or drag-and-dock capability at runtime by setting the DragMode property value to dmManual. Enable automatic dragging by setting DragMode to dmAutomatic.

C++ Examples:

```
/*
The following code uses GetNodeAt to add a dragged node as a
child of the node under the mouse when it is dropped.  This
example requires a populated TreeView.  Also, the TTreeView
DragMode property set to dmAutomatic, and the TTreeView
OnDragOver event handler must be implemented to accept the
drop.
*/
void __fastcall TForm1::TreeView1DragDrop(TObject *Sender, TObject *Source,
      int X, int Y)
{
  if (Source != (TObject *)TreeView1 || TreeView1->Selected == NULL)
    return;
  THitTests HT = TreeView1->GetHitTestInfoAt(X, Y);
  TNodeAttachMode AttachMode;
  TTreeNode *Item = TreeView1->GetNodeAt(X, Y);
  if (HT.Contains(htOnItem) || HT.Contains(htOnIcon))
    AttachMode = naAddChild;
  else if (HT.Contains(htNowhere))
    AttachMode = naAdd;
  else if (HT.Contains(htOnIndent))
    AttachMode = naInsert;
  else
    return;
  TreeView1->Selected->MoveTo(Item, AttachMode);
}

void __fastcall TForm1::TreeView1DragOver(TObject *Sender, TObject *Source,
      int X, int Y, TDragState State, bool &Accept)
{
  Accept = (Source == (TObject *)TreeView1);
}
```

Delphi Examples:

```
{
The following code uses GetNodeAt to add a dragged node as a
child of the node under the mouse when it is dropped.  This
example requires a populated TreeView.  Also, the TTreeView
DragMode property set to dmAutomatic, and the TTreeView
OnDragOver event handler must be implemented to accept the
drop.
}
procedure TForm1.TreeView1DragDrop(Sender, Source: TObject; X, Y: Integer);
var
  AnItem: TTreeNode;
  AttachMode: TNodeAttachMode;
  HT: THitTests;
begin
  if TreeView1.Selected = nil then Exit;
  HT := TreeView1.GetHitTestInfoAt(X, Y);
  AnItem := TreeView1.GetNodeAt(X, Y);
  if (HT - [htOnItem, htOnIcon, htNowhere, htOnIndent] <> HT) then
  begin
    if (htOnItem in HT) or (htOnIcon in HT) then
      AttachMode := naAddChild
    else if htNowhere in HT then AttachMode := naAdd
    else if htOnIndent in HT then AttachMode := naInsert;
    TreeView1.Selected.MoveTo(AnItem, AttachMode);
  end;
end;

procedure TForm1.TreeView1DragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := Source is TTreeView;
end;
```

OnStartDrag (see page 5871)

DragKind (see page 5819)

Arranging the Order of Persistent Columns

47.1.2.5.17 TDBCheckBox.Enabled Property

Controls whether the control responds to mouse, keyboard, and timer events.

Pascal

```
property Enabled: Boolean;
```

C++

```
__property Boolean Enabled;
```

Description

Use Enabled to change the availability of the control to the user. To disable a control, set Enabled to false. Disabled controls appear dimmed. If Enabled is false, the control ignores mouse, keyboard, and timer events.

To re-enable a control, set Enabled to true. The control is no longer dimmed, and the user can use the control.

See Also

Visible (see page 5847)

DisableControls (see page 6925)

EnableControls (see page 6934)

Enabling Mouse

47.1.2.5.18 TDBCheckBox.Field Property

Indicates the TField object whose current value the check box represents.

Pascal

```
property Field: TField;
```

C++

```
__property TField Field;
```

Description

Use the TField reference provided by the Field property when you want to change the value of the data in the field programmatically.

```
DBCheckBox1.Field.AsBoolean := True;
```

```
DBCheckBox1->Field->AsBoolean = true;
```

See Also

DataField (see page 8610)

DataSource (see page 8610)

47.1.2.5.19 TDBCheckBox.Font Property

Controls the attributes of text written on or in the control.

Pascal

```
property Font: TFont;
```

C++

```
__property TFont Font;
```

Description

To change to a new font, specify a new TFont object. To modify a font, change the value of the Charset, Color, Height, Name, Pitch, Size, or Style of the TFont object.

C++ Examples:

```
/*
To use this example, place a TComboBox and TRichEdit or
TMemo on a form.  During form creation, a list of font names
is loaded into the combo box. When the combo box is clicked,
the memo or Rich Edit control font is set to the
corresponding font name in the combo box.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < Screen->Fonts->Count; i++)
   ComboBox1->Items->Add(Screen->Fonts->Strings[i]);
//  ComboBox1->Items = Screen->Fonts;  // Another way to do it.
}

void __fastcall TForm1::ComboBox1Change(TObject *Sender)
{
  RichEdit1->Font->Name = ComboBox1->Text;
}
```

Delphi Examples:

```
{
To use this example, place a TComboBox and TRichEdit or
TMemo on a form.  During form creation, a list of font names
is loaded into the combo box. When the combo box is clicked,
the memo or Rich Edit control font is set to the
corresponding font name in the combo box.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  i : Integer;
begin
  for i := 0 to Screen.Fonts.Count - 1 do
   ComboBox1.Items.Add(Screen.Fonts.Strings[i]);
//  ComboBox1.Items := Screen.Fonts;  // Another way to do it.
  RichEdit1.Lines.Text := 'How is it to be you?';
end;

procedure TForm1.ComboBox1Click(Sender: TObject);
begin
```

```
  RichEdit1.Font.Name := ComboBox1.Text;
end;
```

See Also

DesktopFont (see page 5818)

ParentFont (see page 5834)

Displaying and Editing Text in a Memo Control

47.1.2.5.20 TDBCheckBox.ParentBiDiMode Property

Specifies whether the control uses its parent's BiDiMode.

Pascal

```
property ParentBiDiMode: Boolean;
```

C++

```
__property Boolean ParentBiDiMode;
```

Description

Use ParentBiDiMode to get or set whether the control uses its parent's BiDiMode. When ParentBiDiMode is true, the control's BiDiMode property is always equal to that of its parent. If ParentBiDiMode is false, the control uses its own BiDiMode property.

Set ParentBiDiMode to true for all controls in a form in order to ensure that the entire user interface adjusts to Middle Eastern locales in a uniform manner.

When the value of the control's BiDiMode property changes, ParentBiDiMode becomes false automatically.

See Also

Parent (see page 5832)

BiDiMode (see page 5803)

47.1.2.5.21 TDBCheckBox.ParentColor Property

Determines where a control looks for its color information.

Pascal

```
property ParentColor: Boolean;
```

C++

```
__property Boolean ParentColor;
```

Description

To have a control use the same color as its parent control, set ParentColor to true. If ParentColor is false, the control uses its own Color property.

Set ParentColor to true for all controls in order to ensure that all the controls on a form have a uniform appearance. For example, if ParentColor is true for all controls in a form, changing the background color of the form to gray causes all the controls on the form to also have a gray background.

When the value of a control's Color property changes, ParentColor becomes false automatically.

See Also

Color (see page 5812)

Parent (see page 5832)

ParentFont (see page 5834)

ParentShowHint (see page 5835)

47.1.2.5.22 TDBCheckBox.ParentCtl3D Property

Determines where a component looks to determine if it should appear three dimensional.

Pascal

```
property ParentCtl3D: Boolean;
```

C++

```
__property Boolean ParentCtl3D;
```

Description

ParentCtl3D is provided for backwards compatibility. It has no effect on 32-bit versions of Windows or NT 4.0 and later.

ParentCtl3D determines whether the control uses its parent's Ctl3D property.

See Also

Ctl3D (see page 6198)

47.1.2.5.23 TDBCheckBox.ParentFont Property

Determines where a control looks for its font information.

Pascal

```
property ParentFont: Boolean;
```

C++

```
__property Boolean ParentFont;
```

Description

To have a control use the same font as its parent control, set ParentFont to true. If ParentFont is false, the control uses its own Font property. Many controls default ParentFont to true so that all the controls in a form or other container present a uniform appearance. When the value of a control's Font property changes, ParentFont becomes false automatically.

When ParentFont is true for a form, the form uses the default font.

See Also

Font (see page 5823)

Parent (see page 5832)

ParentColor (see page 5834)

ParentShowHint (see page 5835)

47.1.2.5.24 TDBCheckBox.ParentShowHint Property

Determines where a control looks to find out if its Help Hint should be shown.

Pascal

```
property ParentShowHint: Boolean;
```

C++

```
__property Boolean ParentShowHint;
```

Description

Use ParentShowHint to ensure that all the controls on a form either uniformly show their Help Hints or uniformly do not show them.

If ParentShowHint is true, the control uses the ShowHint property value of its parent. If ParentShowHint is false, the control uses the value of its own ShowHint property.

To provide Help Hints for only selected controls on a form, set the ShowHint property for those controls that should have Help Hints to true, and ParentShowHint becomes false automatically.

Note: Enable or disable all Help Hints for the entire application using the ShowHint property of the application object.

See Also

Hint (see page 5827)

Parent (see page 5832)

ParentColor (see page 5834)

ParentFont (see page 5834)

ShowHint (see page 5840)

47.1.2.5.25 TDBCheckBox.PopupMenu Property

Identifies the pop-up menu associated with the control.

Pascal

```
property PopupMenu: TPopupMenu;
```

C++

```
__property TPopupMenu PopupMenu;
```

Description

Assign a value to PopupMenu to make a pop-up menu appear when the user selects the control and clicks the right mouse button. If the TPopupMenu's AutoPopup property is true, the pop-up menu appears automatically. If the menu's AutoPopup property is false, display the menu with a call to its Popup method from the control's OnContextPopup event handler.

C++ Examples:

```
/*
This example uses two edit boxes and one pop-up menu on a form.
The pop-up menu contains Cut, Copy, and Paste commands. This code
makes the pop-up menu available to both edit boxes:
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  PopupMenu1->AutoPopup = true;
  Edit1->PopupMenu = PopupMenu1;
  Edit2->PopupMenu = PopupMenu1;
}

/*
These are the cut, copy, and paste OnClick events for the commands
on the pop-up menu. Double click on the pop-up menu and add three
TMenuItems.  Then set the captions to "Cut", "Copy" and "Paste".
The names will be automatically set to "Cut1", "Copy1", and
```

```
"Paste1".  Then double click on the OnClick events and they will
be named "Cut1Click", "Copy1Click" and "Paste1Click" respectively.
Note: only the selected portion of the string in the edit box will
be copied, cut or replaced.
*/
void __fastcall TForm1::Copy1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
    if (pComponent->ClassNameIs("TEdit"))
      ((TEdit *)pComponent)->CopyToClipboard();
    else
      MessageBeep(0);
  }
  else
    MessageBeep(0);
}

void __fastcall TForm1::Cut1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
    if (pComponent->ClassNameIs("TEdit"))
      ((TEdit *)pComponent)->CutToClipboard();
    else
      MessageBeep(0);
  }
  else
    MessageBeep(0);
}

void __fastcall TForm1::Paste1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
    if (pComponent->ClassNameIs("TEdit"))
      ((TEdit *)pComponent)->PasteFromClipboard();
    else
      MessageBeep(0);
  }
  else
    MessageBeep(0);
}
/*
This example demonstrates how to add and delete menu items
to a popup menu at runtime and assign an event handler to
the OnClick event.  Place a TPopupMenu and three buttons on
the form named "AddButton", "EditButton",  and
"DestroyButton" and add OnClick events to all three buttons.
Put the TPopupMenu in the PopupMenu property of the form.
Place the PopupMenuItemsClick procedure in the TForm1 type
declaration so that it can be used as the method call for
the menu item OnClick event.
*/
void __fastcall TForm1::AddButtonClick(TObject *Sender)
{
    const int num_items = 4;
    for (int index = 0; index < num_items; ++index)
    {
        TMenuItem *NewItem = new TMenuItem(PopupMenu1); // create the new item
        PopupMenu1->Items->Add(NewItem);// add it to the Popupmenu
        NewItem->Caption = "Menu Item " + IntToStr(index);
        NewItem->Tag = index;
```

```
        NewItem->OnClick = PopupMenuItemsClick;// assign it an event handler
        TNotifyEvent();
    }
}

void __fastcall TForm1::PopupMenuItemsClick(TObject *Sender)
{
    TMenuItem *ClickedItem = dynamic_cast<TMenuItem *>(Sender);
    if (ClickedItem)
    {
        switch (ClickedItem->Tag)
        {
            case 0:
            {
                ShowMessage("first item clicked");
                break;
            }
            case 1:
            {
                ShowMessage("second item clicked");
                break;
            }
            case 2:
            {
                ShowMessage("third item clicked");
                break;
            }
            case 3:
            {
                ShowMessage("fourth item clicked");
                break;
            }
        }
    }
}

/*
To edit or destroy an item, grab its pointer via the Items
property.
*/
void __fastcall TForm1::EditButtonClick(TObject *Sender)
{
    const int index = 1;
    TMenuItem *ItemToEdit = PopupMenu->Items->Items[index];
    ItemToEdit->Caption = "Changed Caption";
}

void __fastcall TForm1::DestroyButtonClick(TObject *Sender)
{
    const int index = 2;
    TMenuItem *ItemToDelete = PopupMenu->Items->Items[index];
    delete ItemToDelete;
}
```

Delphi Examples:

```
{
This example uses two edit boxes and one pop-up menu on a form.
The pop-up menu contains Cut, Copy, and Paste commands. This code
makes the pop-up menu available to both edit boxes:
}
procedure TForm1.FormCreate(Sender: TObject);
begin
  PopupMenu1.AutoPopup := True;
  Edit1.PopupMenu := PopupMenu1;
  Edit2.PopupMenu := PopupMenu1;
end;
```

```
{
These are the cut, copy, and paste OnClick events for the commands
on the pop-up menu. Double click on the pop-up menu and add three
TMenuItems.  Then set the captions to "Cut", "Copy" and "Paste".
The names will be automatically set to "Cut1", "Copy1", and
"Paste1".  Then double click on the OnClick events and they will
be named "Cut1Click", "Copy1Click" and "Paste1Click" respectively.
Note: only the selected portion of the string in the edit box will
be copied, cut or replaced.
}
procedure TForm1.Copy1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
   Edit1.CopyToClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.CopyToClipboard
  else
    Beep;
end;

procedure TForm1.Cut1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
    Edit1.CutToClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.CutToClipboard
  else
    Beep;
end;

procedure TForm1.Paste1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
    Edit1.PasteFromClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.PasteFromClipboard
  else
    Beep;
end;
{
This example demonstrates how to add and delete menu items
to a popup menu at runtime and assign an event handler to
the OnClick event.  Place a TPopupMenu and three buttons on
the form named "AddButton", "EditButton",  and
"DestroyButton" and add OnClick events to all three buttons.
Put the TPopupMenu in the PopupMenu property of the form.
Place the PopupMenuItemsClick procedure in the TForm1 type
declaration so that it can be used as the method call for
the menu item OnClick event.
}

type
  TForm1 = class(TForm)
    AddButton: TButton;
    EditButton: TButton;
    DestroyButton: TButton;
    PopupMenu1: TPopupMenu;
    procedure AddButtonClick(Sender: TObject);
    procedure EditButtonClick(Sender: TObject);
    procedure DestroyButtonClick(Sender: TObject);
    procedure FormDestroy(Sender: TObject);
  private
    { Private declarations }
  public
    procedure PopupMenuItemsClick(Sender: TObject);
```

```
  end;

var
  Form1: TForm1;

implementation

{$R *.dfm}

procedure TForm1.AddButtonClick(Sender: TObject);
var
  index: Integer;
  NewItem: TMenuItem;
begin
  for index := 0 to 3 do
  begin
    NewItem :=
      TMenuItem.Create(PopupMenu1); // create the new item
    PopupMenu1.Items.Add(NewItem);// add it to the Popupmenu
    NewItem.Caption := 'Menu Item ' + IntToStr(index);
    NewItem.Tag := index;
    NewItem.OnClick :=
      PopupMenuItemsClick; // assign it an event handler
  end;
end;

47.1.2.5.26 TDBCheckBox.ReadOnly Property

Determines whether the user can change the value of the field.

Pascal

```
property ReadOnly: Boolean;
```

C++

```
__property Boolean ReadOnly;
```

Description

Use ReadOnly to specify whether the check box allows the user to change the field value by checking or unchecking the box. When ReadOnly is true, the check box can only be used to display the value of the field on the current record. When ReadOnly is false, the user can use the check box to change the field value.

See Also

Field (see page 8613)

47.1.2.5.27 TDBCheckBox.ShowHint Property

Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.

Pascal

```
property ShowHint: Boolean;
```

C++

```
__property Boolean ShowHint;
```

Description

The Help Hint is the value of the Hint property, which is displayed in a box just beneath the control. Use ShowHint to determine whether a Help Hint appears for the control.

To enable Help Hint for a particular control, the application ShowHint property must be true and either

the control's own ShowHint property must be true, or

the control's ParentShowHint property must be true and its parent's ShowHint property must be true.

For example, imagine a check box within a group box. If the ShowHint property of the group box is true and the ParentShowHint property of the check box is true, but the ShowHint property of the check box is false, the check box still displays its Help Hint.

Changing the ShowHint value automatically sets the ParentShowHint property to false.

C++ Examples:

```
/*
This example uses an edit box and a list box on a form.
Items are added to the list box and a Help Hint is assigned
to both controls. The last statement enables the Help Hints
for the entire application.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  Edit1->Hint = "Enter your name";
  Edit1->ShowHint = true;

  char string[10];
  char index[3];
  for(int i = 1; i <= 10; i++)
```

```
    {
      strcpy(string, "Item");
      itoa(i, index, 10);
      strcat(string, index);
      ListBox1->Items->Add(string);
    }
    ListBox1->Hint = "Select an item";
    ListBox1->ShowHint = true;
    Application->ShowHint = true;
  }
  /*
  Note: To see an example that displays the hints of controls
  in some place other than in a Help Hint box, see the OnHint
  example.
  */
```

Delphi Examples:

```
{
This example uses an edit box and a list box on a form.
Items are added to the list box and a Help Hint is assigned
to both controls. The last statement enables the Help Hints
for the entire application.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  I: Integer;
begin
  Edit1.Hint := 'Enter your name';
  Edit1.ShowHint := True;
  with ListBox1 do
  begin
    for I := 1 to 10 do
      Items.Add('Item ' + IntToStr(I));
    Hint := 'Select an item';
    ShowHint := True;
  end;
  Application.ShowHint := True;
end;
{
Note: To see an example that displays the hints of controls
in some place other than in a Help Hint box, see the OnHint
example.
}

Displaying Fly-over Help

47.1.2.5.28 TDBCheckBox.State Property

Indicates whether the check box is selected, deselected, or grayed.

Pascal

```
property State: TCheckBoxState;
```

C++

```
__property TCheckBoxState State;
```

Description

Use State to determine whether the check box is checked (cbChecked), unchecked (cbUnchecked), or grayed (cbGrayed).

C++ Examples:

```
/*
This example uses a check box on a form. When the
application runs, the check box is initially checked. When
the user clicks it, the check box is unchecked. Clicking it
again grays the check box.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  CheckBox1->AllowGrayed = true;
  CheckBox1->State = cbChecked;
}
```

Delphi Examples:

```
{
This example uses a check box on a form. When the
application runs, the check box is initially checked. When
the user clicks it, the check box is unchecked. Clicking it
again grays the check box.
}
procedure TForm1.FormCreate(Sender: TObject);
begin
  CheckBox1.AllowGrayed := True;
  CheckBox1.State := cbChecked;
end;
```

See Also

AllowGrayed (see page 21152)

Checked

47.1.2.5.29 TDBCheckBox.TabOrder Property

Indicates the position of the control in its parent's tab order.

Pascal

```
property TabOrder: TTabOrder;
```

C++

```
__property TTabOrder TabOrder;
```

Description

TabOrder is the order in which child windows are visited when the user presses the Tab key. The control with the TabOrder value of 0 is the control that has the focus when the form first appears.

Initially, the tab order is always the order in which the controls were added to the form. The first control added to the form has a TabOrder value of 0, the second is 1, the third is 2, and so on. Change this by changing the TabOrder property.

Each control has a unique tab-order value within its parent. If you change the TabOrder property value of one control to be the same as the value of a second control, the TabOrder value for all the other controls changes. For example, suppose a control is sixth in the tab order. If you change the control's TabOrder property value to 3 (making the control fourth in the tab order), the control that was originally fourth in the tab order now becomes fifth, and the control that was fifth becomes sixth.

Assigning TabOrder a value greater than the number of controls contained in the parent control moves the control to the end of the tab order. The control does not take on the assigned value of TabOrder, but instead is given the number that assures the

control is the last in the tab order.

Note: TabOrder is meaningful only if the TabStop property is true and if the control has a parent. (The TabOrder property of a form is not used unless the form is the child of another form.) A control with a TabOrder of -1 has no parent, and therefore cannot be reached by pressing the Tab key. To remove a parented control from the Tab order, set its TabStop property to false.

See Also

FindNextControl (see page 6149)

TabStop (see page 6211)

47.1.2.5.30 TDBCheckBox.TabStop Property

Determines if the user can tab to a control.

Pascal

```
property TabStop: Boolean;
```

C++

```
__property Boolean TabStop;
```

Description

Use the TabStop to allow or disallow access to the control using the Tab key.

If TabStop is true, the control is in the tab order. If TabStop is false, the control is not in the tab order and the user can't press the Tab key to move to the control.

Note: TabStop is not meaningful for a form unless the form assigns another form to be its parent.

See Also

TabOrder (see page 6211)

47.1.2.5.31 TDBCheckBox.ValueChecked Property

Specifies the field value that corresponds to the checked state of the check box.

Pascal

```
property ValueChecked: string;
```

C++

```
__property AnsiString ValueChecked;
```

Description

Use ValueChecked to specify the field value represented by the check box when it is checked. If the value of the ValueChecked property is equal to the data in the field of the current record of the dataset, the database check box appears checked. When the user checks the database check box, the field value is set to ValueChecked.

ValueChecked can represent more than one value in a semicolon-delimited list of items. If any of the items matches the contents of the field of the current record in the dataset, the check box appears checked. For example, set the value of ValueChecked string like this:

```
DBCheckBox1.ValueChecked := 'True;Yes;On';
DBCheckBox1->ValueChecked = "True;Yes;On";
```

If the contents of the associated field is the string true, Yes, or On, the check box is checked. The value of the field is compared to ValueChecked in a case-insensitive comparison. If the user selects a check box where ValueChecked represents more than one value, the first item in the list is assigned to the field.

If the contents of the field of the current record matches a string specified as the value of the ValueUnchecked (see page 8626) property, the check box appears unchecked. If the contents of the field matches no string in either ValueChecked or ValueUnchecked (see page 8626), the check box appears gray.

Note: If the DataField (see page 8610) of the database check box is a logical field, the check box is always checked if the contents of the field is true, and it is always unchecked if the contents of the field is false. The values of the ValueChecked and ValueUnchecked (see page 8626) properties have no affect on logical fields.

See Also

TBooleanField (see page 6822)

ValueUnchecked (see page 8626)

Handling Boolean Field Values with Check Boxes

47.1.2.5.32 TDBCheckBox.ValueUnchecked Property

Specifies the field value that corresponds to the unchecked state of the check box.

Pascal

```
property ValueUnchecked: string;
```

C++

```
__property AnsiString ValueUnchecked;
```

Description

Use ValueUnchecked to specify the field value represented by the check box when it is unchecked. If the value of the ValueUnchecked property is equal to the data in the field of the current record of the dataset, the database check box appears unchecked. When the user unchecks the database check box, the field value is set to ValueUnchecked.

ValueUnchecked can represent more than one value in a semicolon-delimited list of items. If any of the items matches the contents of the field of the current record in the dataset, the check box appears unchecked. For example, set the value of ValueUnchecked string like this:

```
DBCheckBox1.ValueUnchecked := 'False;No;Off';
DBCheckBox1->ValueUnchecked = "False;No;Off";
```

If the contents of the associated field is the string false, No, or Off, the check box appears unchecked. The value of the field is compared to ValueUnchecked in a case-insensitive comparison. If the user unchecks a check box where ValueUnchecked represents more than one value, the first item in the list is assigned to the field.

If the contents of the field of the current record matches a string specified as the value of the ValueChecked (see page 8625) property, the check box appears checked. If the contents of the field matches no string in either ValueChecked (see page 8625) or ValueUnchecked, the check box appears gray.

Note: If the DataField (see page 8610) of the database check box is a logical field, the check box is always unchecked if the contents of the field is false, and it is always checked if the contents of the field is true. The values of the ValueChecked (see page 8625) and ValueUnchecked properties have no affect on logical fields.

ValueChecked (see page 8625)

Handling Boolean Field Values with Check Boxes

47.1.2.5.33 TDBCheckBox.Visible Property

Determines whether the component appears onscreen.

Pascal

```
property Visible: Boolean;
```

C++

```
__property Boolean Visible;
```

Description

Use the Visible property to control the visibility of the control at runtime. If Visible is true, the control appears. If Visible is false, the control is not visible.

Calling the Show method sets the control's Visible property to true. Calling the Hide method sets it to false.

C++ Examples:

```
/*
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
*/
void __fastcall TForm1::PageControl1Change(TObject *Sender)
{
  CheckBox1->Checked = PageControl1->ActivePage->Visible;
}

void __fastcall TForm1::CheckBox1Click(TObject *Sender)
{
  PageControl1->ActivePage->Visible = CheckBox1->Checked;
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < 10; i++)
  {
    TTabSheet *pPage = new TTabSheet(this);
    pPage->PageControl = PageControl1;
    pPage->Caption = AnsiString("Page") + IntToStr(i);
    TEdit *pEdit = new TEdit(this);
    pEdit->Parent = pPage;
    pEdit->Left = random(pPage->ClientWidth - pEdit->Width);
    pEdit->Top = random(pPage->ClientHeight - pEdit->Height);
  }
  PageControl1Change(Sender);
}
```

Delphi Examples:

```
{
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
}
procedure TForm1.CheckBox1Click(Sender: TObject);
begin
  PageControl1.ActivePage.Visible := CheckBox1.Checked;
end;

procedure TForm1.PageControl1Change(Sender: TObject);
begin
  CheckBox1.Checked := PageControl1.ActivePage.Visible;
end;
```

```
procedure TForm1.FormCreate(Sender: TObject);
var
  i: Integer;
begin
  for i := 0 to 9 do
    with TTabSheet.Create(Self) do
    begin
      PageControl := PageControl1;
      Caption := 'TabSheet' + IntToStr(i);
      with TEdit.Create(Self) do
      begin
        Parent := PageControl1.Pages[i];
        Left := Random(PageControl1.ActivePage.ClientWidth - Width);
        Top := Random(PageControl1.ActivePage.ClientHeight - Height);
      end;
    end;
    PageControl1Change(Sender);
end;
```

47.1.2.5.34 TDBCheckBox.WordWrap Property

Specifies whether the button text wraps to fit the width of the control.

Pascal

```
property WordWrap: Boolean;
```

C++

```
__property Boolean WordWrap;
```

Description

Set WordWrap to true to allow the display of multiple lines of text. When WordWrap is true, text that is too wide for the control wraps at the right margin.

Set WordWrap to false to limit the text to a single line. When WordWrap is false, text that is too wide for the control appears truncated.

See Also

ClientWidth (see page 5811)

47.1.2.6 TDBCheckBox Events

The events of the TDBCheckBox class are listed here.

Published Events

	Name	Description
	OnClick (see page 8629)	Occurs when the user clicks the control.
	OnContextPopup (see page 8631)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnDragDrop (see page 8631)	Occurs when the user drops an object being dragged.

	OnDragOver (see page 8634)	Occurs when the user drags an object over a control.
	OnEndDock (see page 8636)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 8637)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnEnter (see page 8638)	Occurs when a control receives the input focus.
	OnExit (see page 8640)	Occurs when the input focus shifts away from one control to another.
	OnKeyDown (see page 8642)	Occurs when a user presses any key while the control has focus.
	OnKeyPress (see page 8644)	Occurs when a key is pressed.
	OnKeyUp (see page 8645)	Occurs when the user releases a key that has been pressed.
	OnMouseActivate (see page 8647)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 8648)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseEnter (see page 8650)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 8651)	Occurs when the user moves the mouse outside of a control.
	OnMouseMove (see page 8651)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 8653)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnStartDock (see page 8655)	Occurs when the user begins to drag a control with a DragKind of dkDock.
	OnStartDrag (see page 8656)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.

47.1.2.6.1 TDBCheckBox.OnClick Event

Occurs when the user clicks the control.

Pascal

```
property OnClick: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnClick;
```

Description

Use the OnClick event handler to respond when the user clicks the control. If the control has an associated action, and that action has an OnExecute method, the action's OnExecute method responds to click events unless it is superseded by an OnClick event handler.

Usually OnClick occurs when the user presses and releases the left mouse button with the mouse pointer over the control. This event can also occur when:

- The user selects an item in a grid, outline, list, or combo box by pressing an arrow key.
- The user presses Spacebar while a button or check box has focus.
- The user presses Enter when the active form has a default button (specified by the Default property).
- The user presses Esc when the active form has a cancel button (specified by the Cancel property).
- The user presses the accelerator key for a button or check box. For example, if the value of the Caption property of a check box is '&Bold', the B is underlined at runtime and the OnClick event of the check box is triggered when the user presses Alt+B. However, focus does not move to the control in these instances.
- The Checked property of a radio button is set to true.
- The value of the Checked property of a check box is changed.
- The Click method of a menu item is called.

For a form, an OnClick event occurs when the user clicks a blank area of the form or on a disabled component.

C++ Examples:

```
/*
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
*/
void __fastcall TForm1::PageControl1Change(TObject *Sender)
{
  CheckBox1->Checked = PageControl1->ActivePage->Visible;
}

void __fastcall TForm1::CheckBox1Click(TObject *Sender)
{
  PageControl1->ActivePage->Visible = CheckBox1->Checked;
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < 10; i++)
  {
    TTabSheet *pPage = new TTabSheet(this);
    pPage->PageControl = PageControl1;
    pPage->Caption = AnsiString("Page") + IntToStr(i);
    TEdit *pEdit = new TEdit(this);
    pEdit->Parent = pPage;
    pEdit->Left = random(pPage->ClientWidth - pEdit->Width);
    pEdit->Top = random(pPage->ClientHeight - pEdit->Height);
  }
  PageControl1Change(Sender);
}
```

Delphi Examples:

```
{
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
}
procedure TForm1.CheckBox1Click(Sender: TObject);
begin
  PageControl1.ActivePage.Visible := CheckBox1.Checked;
end;

procedure TForm1.PageControl1Change(Sender: TObject);
begin
  CheckBox1.Checked := PageControl1.ActivePage.Visible;
end;

procedure TForm1.FormCreate(Sender: TObject);
var
  i: Integer;
begin
  for i := 0 to 9 do
    with TTabSheet.Create(Self) do
    begin
      PageControl := PageControl1;
      Caption := 'TabSheet' + IntToStr(i);
      with TEdit.Create(Self) do
      begin
        Parent := PageControl1.Pages[i];
        Left := Random(PageControl1.ActivePage.ClientWidth - Width);
        Top := Random(PageControl1.ActivePage.ClientHeight - Height);
      end;
    end;
```

```
    PageControl1Change(Sender);
end;
```

Adding Silent Video Clips to an Application

47.1.2.6.2 TDBCheckBox.OnContextPopup Event

Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).

Pascal

```
property OnContextPopup: TContextPopupEvent;
```

C++

```
__property TContextPopupEvent OnContextPopup;
```

Description

The OnContextPopup handler is called when the user uses the mouse or keyboard to request a popup menu. The OnContextPopup event is generated by a WM_CONTEXTMENU message, which is itself generated by the user clicking the right mouse button or by pressing SHIFT+F10 or the Applications key.

This event is especially useful when the control does not have an associated popup menu (the PopupMenu property is not set) or if the AutoPopup property of the control's associated popup menu is false. However, the OnContextPopup can also be used to override the automatic context menu that appears when the control has an associated popup menu with an AutoPopup property of true. In this last case, if the event handler displays its own menu, it should set the Handled parameter to true to suppress the default context menu.

The handler's MousePos parameter indicates the position of the mouse, in client coordinates.. If the event was not generated by a mouse click, MousePos is (-1,-1).

Note: Parent controls receive an OnContextPopup event before their child controls. In addition, for many child controls, the default window procedure causes the parent control to receive an OnContextPopup event after the child control. As a result, when parent controls do not set Handled to true in an OnContextPopup event handler, the event handler may be called multiple times for each context menu invocation.

TPopupMenu (see page 16169)

PopupMenu (see page 5835)

AutoPopup (see page 16178)

47.1.2.6.3 TDBCheckBox.OnDragDrop Event

Occurs when the user drops an object being dragged.

Pascal

```
property OnDragDrop: TDragDropEvent;
```

C++

```
__property TDragDropEvent OnDragDrop;
```

Description

Use the OnDragDrop event handler to specify what happens when the user drops an object. The Source parameter of the OnDragDrop event is the object being dropped, and the Sender is the control the object is being dropped on. The X and Y parameters are the coordinates of the mouse positioned over the control.

C++ Examples:

```
/*
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
*/

// This OnDragOver event handler permits the list box to
// accept a dropped label:
void __fastcall TForm1::ListBox1DragOver(TObject *Sender, TObject *Source, int X, int Y,
TDragState State, bool &Accept)
{
   Accept = Source->ClassNameIs("TLabel");
}

/*
This OnDragDrop event handler implements the drop behavior.
*/
void __fastcall TForm1::ListBox1DragDrop(TObject *Sender, TObject *Source, int X, int Y)
{
  if (Sender->ClassNameIs("TListBox") && Source->ClassNameIs("TLabel"))
  {
    TListBox *DestList = (TListBox *)Sender;
    DestList->Font = ((TLabel *)Source)->Font;
    DestList->Color = ((TLabel *)Source)->Color;
    DestList->DoubleBuffered = true;
    DestList->Color = clWindow;
  }
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  ListBox1->Items->Add("Not");
  ListBox1->Items->Add("In");
  ListBox1->Items->Add("Alphabetical");
  ListBox1->Items->Add("Order");

}
```

Delphi Examples:

```
{
This code is an OnDragOver event handler that won't allow a
label control to be dropped on a panel control and stops the
dragging of the label as soon as the user drags the label
onto the panel:
Note: Set the label's DragMode property to dmAutomatic.
}
procedure TForm1.FormDragDrop(Sender, Source: TObject; X, Y: Integer);
```

```
begin
  TForm1(Source).Left := X;
  TForm1(Source).Top := Y;
end;

procedure TForm1.FormDragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := Source is TLabel;
end;

procedure TForm1.Panel1DragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := False;
  if (Source is TLabel) and (State = dsDragEnter) then
    (Source as TLabel).EndDrag(False);
end;
{
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
}

procedure TForm1.FormCreate(Sender: TObject);
begin
  ListBox1.Items.Add('Not');
  ListBox1.Items.Add('In');
  ListBox1.Items.Add('Alphabetical');
  ListBox1.Items.Add('Order');
end;

// This OnDragOver event handler permits the list box to
// accept a dropped label:

procedure TForm1.ListBox1DragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := Source is TLabel;
end;

// This OnDragDrop event handler implements the drop behavior.

procedure TForm1.ListBox1DragDrop(Sender, Source: TObject; X, Y: Integer);
begin
  if (Sender is TListBox) and (Source is TLabel) then
  begin
    with Sender as TListBox do
    begin
      Font := (Source as TLabel).Font;
      Color := (Source as TLabel).Color;
      DoubleBuffered := true;
      Color := clWindow;
    end;
  end;
end;

47.1.2.6.4 TDBCheckBox.OnDragOver Event

Occurs when the user drags an object over a control.

Pascal

```
property OnDragOver: TDragOverEvent;
```

C++

```
__property TDragOverEvent OnDragOver;
```

Description

Use an OnDragOver event to signal that the control can accept a dragged object so the user can drop or dock it.

Within the OnDragOver event handler, change the Accept parameter to false to reject the dragged object. Leave Accept as true to allow the user to drop or dock the dragged object on the control.

To change the shape of the cursor, indicating that the control can accept the dragged object, change the value of the DragCursor property for the control before the OnDragOver event occurs.

The Source is the object being dragged, the Sender is the potential drop or dock site, and X and Y are screen coordinates in pixels. The State parameter specifies how the dragged object is moving over the control.

Note: Within the OnDragOver event handler, the Accept parameter defaults to true. However, if an OnDragOver event handler is not supplied, the control rejects the dragged object, as if the Accept parameter were changed to false.

C++ Examples:

```
/*
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
*/

// This OnDragOver event handler permits the list box to
// accept a dropped label:
void __fastcall TForm1::ListBox1DragOver(TObject *Sender, TObject *Source, int X, int Y,
TDragState State, bool &Accept)
{
   Accept = Source->ClassNameIs("TLabel");
}

/*
This OnDragDrop event handler implements the drop behavior.
*/
void __fastcall TForm1::ListBox1DragDrop(TObject *Sender, TObject *Source, int X, int Y)
{
  if (Sender->ClassNameIs("TListBox") && Source->ClassNameIs("TLabel"))
  {
```

```
    TListBox *DestList = (TListBox *)Sender;
    DestList->Font = ((TLabel *)Source)->Font;
    DestList->Color = ((TLabel *)Source)->Color;
    DestList->DoubleBuffered = true;
    DestList->Color = clWindow;
  }
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  ListBox1->Items->Add("Not");
  ListBox1->Items->Add("In");
  ListBox1->Items->Add("Alphabetical");
  ListBox1->Items->Add("Order");

}
```

Delphi Examples:

```
{
This code is an OnDragOver event handler that won't allow a
label control to be dropped on a panel control and stops the
dragging of the label as soon as the user drags the label
onto the panel:
Note: Set the label's DragMode property to dmAutomatic.
}
procedure TForm1.FormDragDrop(Sender, Source: TObject; X, Y: Integer);
begin
  TForm1(Source).Left := X;
  TForm1(Source).Top := Y;
end;

procedure TForm1.FormDragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := Source is TLabel;
end;

procedure TForm1.Panel1DragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := False;
  if (Source is TLabel) and (State = dsDragEnter) then
    (Source as TLabel).EndDrag(False);
end;
{
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
}

procedure TForm1.FormCreate(Sender: TObject);
begin
  ListBox1.Items.Add('Not');
  ListBox1.Items.Add('In');
  ListBox1.Items.Add('Alphabetical');
  ListBox1.Items.Add('Order');
end;

// This OnDragOver event handler permits the list box to
// accept a dropped label:

procedure TForm1.ListBox1DragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
```

```
begin
  Accept := Source is TLabel;
end;

// This OnDragDrop event handler implements the drop behavior.

procedure TForm1.ListBox1DragDrop(Sender, Source: TObject; X, Y: Integer);
begin
  if (Sender is TListBox) and (Source is TLabel) then
  begin
    with Sender as TListBox do
    begin
      Font := (Source as TLabel).Font;
      Color := (Source as TLabel).Color;
      DoubleBuffered := true;
      Color := clWindow;
    end;
  end;
end;
```

47.1.2.6.5 TDBCheckBox.OnEndDock Event

Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.

Pascal

```
property OnEndDock: TEndDragEvent;
```

C++

```
__property TEndDragEvent OnEndDock;
```

Description

Use OnEndDock to specify actions or special processing that when a drag-and-dock operation stops.

See Also

DragKind (see page 5819)

47.1.2.6.6 TDBCheckBox.OnEndDrag Event

Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.

Pascal

```
property OnEndDrag: TEndDragEvent;
```

C++

```
__property TEndDragEvent OnEndDrag;
```

Description

Use the OnEndDrag event handler to specify any special processing that occurs when dragging stops.

C++ Examples:

```
/*
This code displays a message in a label named Status. The
message displayed depends on whether the dragged label
control was successfully dropped into and accepted by a
another control.
*/
void __fastcall TForm1::Label1EndDrag(TObject *Sender, TObject *Target, int X,
      int Y)
{
  if (Sender->ClassNameIs("TLabel"))
  {
    AnsiString S = ((TLabel *)Sender)->Name + " was dropped and ";
    if (Target)
      S = S + "accepted!";
    else
      S = S + "rejected.";
    Status->Caption = S;
  }
}
```

Delphi Examples:

```
{
This code displays a message in a label named Status. The
message displayed depends on whether the dragged label
control was successfully dropped into and accepted by a
another control.
}
procedure TForm1.Label1EndDrag(Sender, Target: TObject; X, Y: Integer);
var
  S: string;
begin
  S := (Sender as TLabel).Name + ' was dropped... and ';
  if Target <> nil then
    S := S + 'accepted!'
  else
    S := S + 'rejected!';
  Status.Caption := S;
end;
```

47.1.2.6.7 TDBCheckBox.OnEnter Event

Occurs when a control receives the input focus.

Pascal

```
property OnEnter: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnEnter;
```

Description

Use the OnEnter event handler to cause any special processing to occur when a control becomes active.

The OnEnter event does not occur when switching between forms or between another application and the application that includes the control.

When switching between controls in separate container controls such as the TPanel and the TGroupBox controls, an OnEnter event occurs for the container before the OnEnter event of the contained control.

Similarly, an OnExit event of the container occurs after the OnExit event of the control in a container when focus moves to another control outside the container.

For example, consider a form with an OK button and a group box that contains three radio buttons, where focus is currently on the OK button. When the user clicks one of the radio buttons, an OnExit event of the button occurs, followed by an OnEnter event on the group box, and finally an OnEnter event on the radio button that was clicked. If the user then clicks on the OK button, an OnExit event for the radio button occurs followed by an OnExit event for the group box, and then the button's OnEnter event occurs.

C++ Examples:

```
/*
This example takes an edit control, a button, and a rich
edit control on a form.  When the user presses the button, a
Font dialog appears.  When the user clicks the Apply (not OK)
button in the Font dialog, the currently selected font is
applied to the active control. Clicking the button sets the
ActiveControl to the button.  That is why we need to save
the ActiveControl in a shared OnEnter procedure.  In the rich
edit, only the text selected converts.
*/
TWinControl *myActiveControl;

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  FontDialog1->Options << fdApplyButton;
  FontDialog1->Execute();
}

void __fastcall TForm1::FontDialog1Apply(TObject *Sender, HWND Wnd)
{
  if (myActiveControl->ClassNameIs("TEdit"))
   ((TEdit *)myActiveControl)->Font->Assign(FontDialog1->Font);
  else if (myActiveControl->ClassNameIs("TRichEdit"))
    ((TRichEdit *)myActiveControl)->SelAttributes->Assign(FontDialog1->Font);
  else
    MessageBeep(0);
}

void __fastcall TForm1::Edit1Enter(TObject *Sender)
{
  myActiveControl = ActiveControl;
```

```
}
/*
This example uses an edit box and a memo control on a form.
When either the edit box or the memo is the active control,
it is colored yellow. When the active control becomes
inactive, the color of the control returns to the Windows
system color for a window.  These event handlers could also
be shared.
*/
void __fastcall TForm1::Edit1Enter(TObject *Sender)
{
  Edit1->Color = clYellow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Edit1Exit(TObject *Sender)
{
  Edit1->Color = clWindow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Memo1Enter(TObject *Sender)
{
  Memo1->Color = clYellow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Memo1Exit(TObject *Sender)
{
  Memo1->Color = clWindow;
}
```

Delphi Examples:

```
{
This example takes an edit control, a button, and a rich
edit control on a form.  When the user presses the button, a
Font dialog appears.  When the user clicks the Apply (not OK)
button in the Font dialog, the currently selected font is
applied to the active control. Clicking the button sets the
ActiveControl to the button.  That is why we need to save
the ActiveControl in a shared OnEnter procedure.  In the rich
edit, only the text selected converts.
}
procedure TForm1.Button1Click(Sender: TObject);
begin
   FontDialog1.Options := FontDialog1.Options + [fdApplyButton];
   FontDialog1.Execute;
end;

procedure TForm1.Edit1Enter(Sender: TObject);
begin
  myActiveControl := ActiveControl;
end;

procedure TForm1.FontDialog1Apply(Sender: TObject; Wnd: HWND);
begin
  if myActiveControl is TEdit then
    with myActiveControl as TEdit do
       Font.Assign(TFontDialog(Sender).Font)
  else if myActiveControl is TRichEdit then
    with myActiveControl as TRichEdit do
      SelAttributes.Assign(TFontDialog(Sender).Font)
  else
    Beep;
end;
{
This example uses an edit box and a memo control on a form.
When either the edit box or the memo is the active control,
it is colored yellow. When the active control becomes
```

```
inactive, the color of the control returns to the Windows
system color for a window.  These event handlers could also
be shared.
}
procedure TForm1.Edit1Enter(Sender: TObject);
begin
  Edit1.Color := clYellow;
end;

procedure TForm1.Edit1Exit(Sender: TObject);
begin
  Edit1.Color := clWindow;
end;

procedure TForm1.Memo1Enter(Sender: TObject);
begin
  Memo1.Color := clYellow;
end;

procedure TForm1.Memo1Exit(Sender: TObject);
begin
  Memo1.Color := clWindow;
end;
```

47.1.2.6.8 TDBCheckBox.OnExit Event

Occurs when the input focus shifts away from one control to another.

Pascal

```
property OnExit: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnExit;
```

Description

Use the OnExit event handler to provide special processing when the control ceases to be active.

The OnExit event does not occur when switching between forms or between another application and your application.

When switching between controls in separate container controls such as the TPanel and the TGroupBox controls, an OnExit event occurs for the control inside the container before the OnExit event of the container.

Similarly, an OnEnter event of the container occurs before the OnEnter event of the control in a container when focus moves to a control inside a container.

For example, consider a form with an OK button and a group box that contains three radio buttons, where focus is currently on the OK button. When the user clicks one of the radio buttons, an OnExit event of the button occurs, followed by an OnEnter event on the group box, and finally an OnEnter event on the radio button that was clicked. If the user then clicks on the OK button, an OnExit event for the radio button occurs followed by an OnExit event for the group box, and then the button's OnEnter event occurs.

Note: In some control classes the ActiveControl property updates before the OnExit event occurs.

C++ Examples:

```
/*
This example uses an edit box and a memo control on a form.
When either the edit box or the memo is the active control,
it is colored yellow. When the active control becomes
inactive, the color of the control returns to the Windows
system color for a window.  These event handlers could also
be shared.
*/
void __fastcall TForm1::Edit1Enter(TObject *Sender)
{
  Edit1->Color = clYellow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Edit1Exit(TObject *Sender)
{
  Edit1->Color = clWindow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Memo1Enter(TObject *Sender)
{
  Memo1->Color = clYellow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Memo1Exit(TObject *Sender)
{
  Memo1->Color = clWindow;
}
```

Delphi Examples:

```
{
This example uses an edit box and a memo control on a form.
When either the edit box or the memo is the active control,
it is colored yellow. When the active control becomes
inactive, the color of the control returns to the Windows
system color for a window.  These event handlers could also
be shared.
}
procedure TForm1.Edit1Enter(Sender: TObject);
begin
  Edit1.Color := clYellow;
end;

procedure TForm1.Edit1Exit(Sender: TObject);
begin
  Edit1.Color := clWindow;
end;

procedure TForm1.Memo1Enter(Sender: TObject);
begin
  Memo1.Color := clYellow;
end;

procedure TForm1.Memo1Exit(Sender: TObject);
begin
  Memo1.Color := clWindow;
end;
```

OnEnter (see page 6219)

ActiveControl (see page 13896)

47.1.2.6.9 TDBCheckBox.OnKeyDown Event

Occurs when a user presses any key while the control has focus.

Pascal

```
property OnKeyDown: TKeyEvent;
```

C++

```
__property TKeyEvent OnKeyDown;
```

Description

Use the OnKeyDown event handler to specify special processing to occur when a key is pressed. The OnKeyDown handler can respond to keyboard keys, including function keys and keys combined with the `Shift`, `Alt`, and `Ctrl` keys, and pressed mouse buttons.

Note: TCheckBox does not fire OnKeyDown events for arrow keys.

The TKeyEvent type points to a method that handles keyboard events.

The Key parameter is the key on the keyboard. For non-alphanumeric keys, use virtual key codes to determine the key pressed. For more information, see Virtual Key codes.

The Shift parameter indicates whether the Shift, Alt, or Ctrl keys are combined with the keystroke.

An application gets Windows WM_KEYDOWN messages for all keys when the user presses a key. These messages indirectly fire the OnKeyDown event. If you set the Key to 0 there you prevent only any further processing of this message. But for keys that generate characters Windows also produces WM_CHAR. At the time your OnKeyDown event fires, the WM_CHAR message for the key will already be in the message queue. Setting Key to 0 does not stop it from being delivered, so it fires the OnKeyPress event. You must set the Key to #0 to prevent the control from intercepting the WM_CHAR message.

This method of organizing key processing has advantages. Code that only deals with characters, including control characters like #13 for carriage return, #3 for Ctrl-C and so on, should go into the OnKeyPress event. Code that deals with keys that do not generate characters should be put into the OnKeyDown event.

C++ Examples:

```
/*
This example changes a form's color to aqua when the user
presses the F1 key, even when a control on the form has the
focus. When the user releases the key, the form returns to
its original color.  Set the KeyPreview on the form to True.
Set the OnKeyDown event to FormKeyDown and set the OnKeyUp
event to FormKeyUp.  Set the KeyPreview on the form to True.
*/
void __fastcall TForm1::FormKeyDown(TObject *Sender, WORD &Key,
      TShiftState Shift)
{
  if (Key == VK_F1)
  {
    FormColor = Form1->Color;
    Form1->Color = clAqua;
    if (ComboBox1->Text == "KeyDown")
      ComboBox1->Text = "KeyDown2";
    else
      ComboBox1->Text = "KeyDown";
    Form1->Refresh();
    Memo1->Lines->Add(ComboBox1->Text);
  }
}

void __fastcall TForm1::FormKeyUp(TObject *Sender, WORD &Key, TShiftState Shift)
```

```
{
  if (Key == VK_F1)
  {
    Form1->Color = FormColor;
    if (ComboBox1->Text == "KeyUp")
      ComboBox1->Text = "KeyUp2";
    else
      ComboBox1->Text = "KeyUp";
    Form1->Refresh();
    Memo1->Lines->Add(ComboBox1->Text);
  }
}
```

Delphi Examples:

```
{
This example changes a form's color to aqua when the user
presses the F1 key, even when a control on the form has the
focus. When the user releases the key, the form returns to
its original color.  Set the KeyPreview on the form to True.
Set the OnKeyDown event to FormKeyDown and set the OnKeyUp
event to FormKeyUp.  Set the KeyPreview on the form to True.
}
var
  FormColor: TColor;
procedure TForm1.FormCreate(Sender: TObject);
begin
  KeyPreview := True;
  FormColor := Form1.Color;
end;

procedure TForm1.FormKeyDown(
  Sender: TObject; var Key: Word; Shift: TShiftState);
begin
  if Key = VK_F1 then
  begin
    Form1.Color := clAqua;
    if (ComboBox1.Text = 'KeyDown') then
      ComboBox1.Text := 'KeyDown2'
    else
      ComboBox1.Text := 'KeyDown';
    WriteLn(ComboBox1.Text);
  end;
end;

47.1.2.6.10 TDBCheckBox.OnKeyPress Event

Occurs when a key is pressed.

Pascal

```
property OnKeyPress: TKeyPressEvent;
```

C++

```
__property TKeyPressEvent OnKeyPress;
```

Description

Use the OnKeyPress event handler to make something happen as a result of a single character key press.

The Key parameter in the OnKeyPress event handler is of type Char; therefore, the OnKeyPress event registers the ASCII character of the key pressed. Keys that don't correspond to an ASCII Char value (Shift or F1, for example) don't generate an OnKeyPress event. Key combinations (such as Shift+A), generate only one OnKeyPress event (for this example, Shift+A results in a Key value of "A" if Caps Lock is off). To respond to non-ASCII keys or key combinations, use the OnKeyDown or OnKeyUp event handlers.

An application gets Windows WM_KEYDOWN messages for all keys when the user presses a key. These messages indirectly fire the OnKeyDown event. If you set the Key to 0 there you prevent only any further processing of this message. But for keys that generate characters Windows also produces WM_CHAR. At the time your OnKeyDown event fires, the WM_CHAR message for the key will already be in the message queue. Setting Key to 0 does not stop it from being delivered, so it fires the OnKeyPress event. You must set the Key to #0 to prevent the control from intercepting the WM_CHAR message.

This method of organizing key processing has advantages. Code that only deals with characters, including control characters like #13 for carriage return, #3 for Ctrl-C and so on, should go into the OnKeyPress event. Code that deals with keys that do not generate characters should be put into the OnKeyDown event.

C++ Examples:

```
/*
This event handler displays a message dialog box specifying
which key was pressed:
*/

void __fastcall TForm1::FormKeyPress(TObject *Sender, char &Key)
{
  char keyString[25];
  keyString[0] = Key;
  strcpy(&keyString[1], " Was Pressed");
  TMsgDlgButtons() << mbOK;
  MessageDlg(AnsiString(keyString), TMsgDlgType(mtInformation), TMsgDlgButtons() << mbOK, 0);
}
```

Delphi Examples:

```
{
This event handler displays a message dialog box specifying
which key was pressed:
}
procedure TForm1.FormKeyPress(Sender: TObject; var Key: Char);
begin
  MessageDlg(Key + ' has been pressed', mtInformation, [mbOK], 0)
end;
```

47.1.2.6.11 TDBCheckBox.OnKeyUp Event

Occurs when the user releases a key that has been pressed.

Pascal

```
property OnKeyUp: TKeyEvent;
```

C++

```
__property TKeyEvent OnKeyUp;
```

Description

Use the OnKeyUp event handler to provide special processing that occurs when a key is released. The OnKeyUp handler can respond to all keyboard keys, including function keys and keys combined with the Shift, Alt, and Ctrl keys.

The TKeyEvent type points to a method that handles keyboard events. The Key parameter is the key on the keyboard. For non-alphanumeric keys, you must use virtual key codes to determine the key pressed. For more information, see Virtual Key codes.

The Shift parameter indicates whether the Shift, Alt, or Ctrl keys are combined with the keystroke.

C++ Examples:

```
/*
This example changes a form's color to aqua when the user
presses the F1 key, even when a control on the form has the
focus. When the user releases the key, the form returns to
its original color.  Set the KeyPreview on the form to True.
Set the OnKeyDown event to FormKeyDown and set the OnKeyUp
event to FormKeyUp.  Set the KeyPreview on the form to True.
*/
void __fastcall TForm1::FormKeyDown(TObject *Sender, WORD &Key,
      TShiftState Shift)
{
  if (Key == VK_F1)
  {
    FormColor = Form1->Color;
    Form1->Color = clAqua;
    if (ComboBox1->Text == "KeyDown")
      ComboBox1->Text = "KeyDown2";
    else
      ComboBox1->Text = "KeyDown";
    Form1->Refresh();
    Memo1->Lines->Add(ComboBox1->Text);
  }
}

void __fastcall TForm1::FormKeyUp(TObject *Sender, WORD &Key, TShiftState Shift)
{
  if (Key == VK_F1)
  {
    Form1->Color = FormColor;
    if (ComboBox1->Text == "KeyUp")
      ComboBox1->Text = "KeyUp2";
    else
      ComboBox1->Text = "KeyUp";
    Form1->Refresh();
    Memo1->Lines->Add(ComboBox1->Text);
  }
}
```

Delphi Examples:

```
{
This example changes a form's color to aqua when the user
presses the F1 key, even when a control on the form has the
focus. When the user releases the key, the form returns to
its original color.  Set the KeyPreview on the form to True.
Set the OnKeyDown event to FormKeyDown and set the OnKeyUp
event to FormKeyUp.  Set the KeyPreview on the form to True.
}
var
```

```
    FormColor: TColor;
  procedure TForm1.FormCreate(Sender: TObject);
  begin
    KeyPreview := True;
    FormColor := Form1.Color;
  end;

  procedure TForm1.FormKeyDown(
    Sender: TObject; var Key: Word; Shift: TShiftState);
  begin
    if Key = VK_F1 then
    begin
      Form1.Color := clAqua;
      if (ComboBox1.Text = 'KeyDown') then
        ComboBox1.Text := 'KeyDown2'
      else
        ComboBox1.Text := 'KeyDown';
      WriteLn(ComboBox1.Text);
    end;
  end;

  procedure TForm1.FormKeyUp(
    Sender: TObject; var Key: Word; Shift: TShiftState);
  begin
    if Key = VK_F1 then
    begin
      Form1.Color := FormColor;
      if (ComboBox1.Text = 'KeyUp') then
        ComboBox1.Text := 'KeyUp2'
      else
        ComboBox1.Text := 'KeyUp';
      WriteLn(ComboBox1.Text);
    end;
  end;
```

47.1.2.6.12 TDBCheckBox.OnMouseActivate Event

Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.

Pascal

```
property OnMouseActivate: TMouseActivateEvent;
```

C++

```
__property TMouseActivateEvent OnMouseActivate;
```

Description

Use the OnMouseActivate event handler to implement any special processing that should occur as a result of pressing a mouse button on a control when the parent top-level form is not active.

The event type is:

```
TMouseActivateEvent = procedure (Sender: TObject; Button: TMouseButton; ShiftState:
TShiftState;
X, Y: Integer; HitTest: Integer; var MouseActivate: TMouseActivate) of object;
```

When you click on a control and the parent top-level form is not active, this event fires on the control that the mouse cursor is over. MouseActivate is a protected virtual function in TControl. MouseActivate can be overridden in custom control descendants to provide special built-in processing of the OnMouseActivate events. If you leave the default value of MouseActivate as

maDefault, the parent control fires the OnMouseActivate event and repeats the process all the way up to the top-level form. If no control in the chain sets the value of MouseActivate, the behavior is the same as if a control set TMouseActivate to maActivate. At any point, a control can set the value of TMouseActivate and the parent processing stops.

Some controls set focus to themselves when they get a button down message so, in some cases, setting maNoActivate appears to have no effect. For instance, a TButton control sets focus to itself in the WM_LBUTTONDOWN message regardless of whether or not TMouseActivate is set to maNoActivate. In this case, setting maNoActivateAndEat will work because the top-level form is not activated and the WM_LBUTTONDOWN message is suppressed.

The HitTest parameter is the hit test value obtained from the WM_NCHITTEST message. See Windows.pas for valid values and their meanings. In most cases this value will be HTCLIENT, which means that the user clicked in the client area of a control. However, in the case of a top-level form, this can take other values such as HTCAPTION, or HTBOTTOM. This allows the code to decide which value to set for MouseActivate, based on the HitTest code. For example, the following code in the OnMouseActivate event handler for a TForm forces the user to click into a non-client area to activate the form:

```
if HitTest = HTCLIENT then
    MouseActivate := maNoActivateAndEat;
```

Even though this event is tied to how Windows processes WM_MOUSEACTIVATE, the actual handling of the message is done at the TControl level, which is the point in the VCL hierarchy where the control has no window handle. The OnMouseActivate event is then simulated since the all TControl descendants also have OnMouseDown, OnMouseMove, and OnMouseUp events. This information is applicable to both VCL Win32 and VCL.NET.

47.1.2.6.13 TDBCheckBox.OnMouseDown Event

Occurs when the user presses a mouse button with the mouse pointer over a control.

Pascal

```
property OnMouseDown: TMouseEvent;
```

C++

```
__property TMouseEvent OnMouseDown;
```

Description

Use the OnMouseDown event handler to implement any special processing that should occur as a result of pressing a mouse button.

The OnMouseDown event handler can respond to left, right, or center mouse button presses and shift key plus mouse-button combinations. Shift keys are the Shift, Ctrl, and Alt keys. X and Y are the pixel coordinates of the mouse pointer in the client area of the Sender.

C++ Examples:

```
/*
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a
rectangle is drawn on the form. When the mouse button is
released, the rectangle appears on the form’s canvas. Its
```

```
top-left and bottom-right corners are defined by the
location of the mouse pointer when the user pressed and
released the mouse button.  While the user drags the mouse,
the location of the top, left, bottom, and right sides of
the rectangle are displayed in the status bar.
*/
int StartX, StartY; // Declare at the top of the form's unit
// Use this code as the OnMouseDown event handler of the form:
void __fastcall TForm1::FormMouseDown(TObject *Sender, TMouseButton Button, TShiftState Shift,
int X, int Y)
{
  StartX = X;
  StartY = Y;
}

// Use this code as the OnMouseUp event handler of the form:
void __fastcall TForm1::FormMouseUp(TObject *Sender, TMouseButton Button, TShiftState Shift,
int X, int Y)
{
  Form1->Canvas->Rectangle(StartX, StartY, X, Y);
  StatusBar1->Panels->Items[0]->Text = "";
  StatusBar1->Panels->Items[1]->Text = "";
  StatusBar1->Panels->Items[2]->Text = "";
  StatusBar1->Panels->Items[3]->Text = "";
}

// Use this code as the OnMouseMove event handler of the form:
void __fastcall TForm1::FormMouseMove(TObject *Sender, TShiftState Shift, int X, int Y)
{
  if (Shift.Contains(ssLeft)) // make sure button is down
  {
    if (Y > StartY)
    {
      StatusBar1->Panels->Items[0]->Text = "Top: " + IntToStr(StartY);
      StatusBar1->Panels->Items[2]->Text = "Bottom: " + IntToStr(Y);
    }
    else
    {
      StatusBar1->Panels->Items[0]->Text = "Top: " + IntToStr(Y);
      StatusBar1->Panels->Items[2]->Text = "Bottom: " + IntToStr(StartY);
    }
    if (X > StartX)
    {
      StatusBar1->Panels->Items[1]->Text = "Left: " + IntToStr(StartX);
      StatusBar1->Panels->Items[3]->Text = "Right: " + IntToStr(X);
    }

47.1.2.6.14 TDBCheckBox.OnMouseEnter Event

Occurs when the user moves the mouse into a control.

Pascal

```
property OnMouseEnter: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnMouseEnter;
```

Description

Use the OnMouseEnter event handler to implement any special processing that should occur as a result of moving the mouse into a control when the parent top-level form is not active.

47.1.2.6.15 TDBCheckBox.OnMouseLeave Event

Occurs when the user moves the mouse outside of a control.

Pascal

```
property OnMouseLeave: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnMouseLeave;
```

Description

Use the OnMouseLeave event handler to implement any special processing that should occur as a result of moving the mouse outside of a control when the parent top-level form is not active.

47.1.2.6.16 TDBCheckBox.OnMouseMove Event

Occurs when the user moves the mouse pointer while the mouse pointer is over a control.

Pascal

```
property OnMouseMove: TMouseMoveEvent;
```

C++

```
__property TMouseMoveEvent OnMouseMove;
```

Description

Use the OnMouseMove event handler to respond when the mouse pointer moves after the control has captured the mouse.

Use the Shift parameter of the OnMouseDown event handler, to determine to the state of the shift keys and mouse buttons. Shift keys are the Shift, Ctrl, and Alt keys or shift key-mouse button combinations. X and Y are pixel coordinates of the new location of the mouse pointer in the client area of the Sender.

C++ Examples:

```
/*
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a

47.1.2.6.17 TDBCheckBox.OnMouseUp Event

Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.

Pascal

```
property OnMouseUp: TMouseEvent;
```

C++

```
__property TMouseEvent OnMouseUp;
```

Description

Use an OnMouseUp event handler to implement special processing when the user releases a mouse button.

The OnMouseUp event handler can respond to left, right, or center mouse button presses and shift key plus mouse-button combinations. Shift keys are the Shift, Ctrl, and Alt keys. X and Y are the pixel coordinates of the mouse pointer in the client area of the Sender.

C++ Examples:

```
/*
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a

Responding to a Mouse-up Action

47.1.2.6.18 TDBCheckBox.OnStartDock Event

Occurs when the user begins to drag a control with a DragKind of dkDock.

Pascal

```
property OnStartDock: TStartDockEvent;
```

C++

```
__property TStartDockEvent OnStartDock;
```

Description

Use the OnStartDock event handler to implement special processing when the user starts a drag-and-dock operation by dragging the control.

The OnStartDock event handler can create a TDragDockObjectEx object for the DragObject parameter to specify the appearance of the dragging rectangle and how the dragged control interacts with potential docking sites. If you return TDragDockObjectEx as the drag object, there is no need to call the Free method for the DragObject when dragging is over. If you use TDragDockObject, your application is responsible for freeing the drag object.

If the OnStartDock event handler sets the DragObject parameter to nil (Delphi) or NULL (C++), a TDragDockObject object is automatically created.

Note: This information applies to Win32 applications only.

47.1.2.6.19 TDBCheckBox.OnStartDrag Event

Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.

Pascal

```
property OnStartDrag: TStartDragEvent;
```

C++

```
__property TStartDragEvent OnStartDrag;
```

Description

Use the OnStartDrag event handler to implement special processing when the user starts to drag the control or an object it contains. OnStartDrag only occurs if DragKind is dkDrag.

Sender is the control that is about to be dragged, or that contains the object about to be dragged.

The OnStartDrag event handler can create a TDragControlObjectEx instance for the DragObject parameter to specify the drag cursor, or, optionally, a drag image list. If you create a TDragControlObjectEx instance, there is no need to call the Free method for the DragObject when dragging is over. If you create, instead, a TDragControlObject instance, your application is responsible for freeing the drag object instance.

If the OnStartDrag event handler sets the DragObject parameter to nil (Delphi) or NULL (C++), a TDragControlObject object is automatically created and dragging begins on the control itself.

Note: On some controls, such as TRichEdit, the underlying Windows control handles internal drag operations. For these controls, there are no OnStartDrag or OnEndDrag events for drag operations within the control.

47.1.3 TDBComboBox Class

TDBComboBox represents a data-aware combo box control.

Class Hierarchy

Pascal

```
TDBComboBox = class(TCustomComboBox);
```

C++

```
class TDBComboBox : public TCustomComboBox;
```

File

DBCtrls

Description

Use TDBComboBox to allow users to change the value of a field on the current record in a dataset either by selecting an item from a list or by typing in the edit box part of the control. The selected item or entered text becomes the new value of the field if the database combo box's ReadOnly (see page 8703) property is false. The combo box can be customized to enable or disable typing in the edit region of the control, to display the list as a drop down or as a permanently displayed list, to sort the items in the list, and so on.

Using Common Data Control Features

47.1.3.1 TDBComboBox Members

The following tables list the members exposed by TDBComboBox.

Protected Events

	Name	Description
	OnAlignInsertBefore (see page 6213)	Occurs when an object with custom alignment is aligned.

	OnAlignPosition (see page 6214)	Occurs when an object with custom alignment is aligned.
	OnCanResize (see page 5851)	Occurs when an attempt is made to resize the control.
	OnCloseUp (see page 21199)	Occurs when the drop-down list closes up due to some user action.
	OnConstrainedResize (see page 5853)	Adjust resize constraints.
	OnDockDrop (see page 6214)	Occurs when another control is docked to the control.
	OnDockOver (see page 6216)	Occurs when another control is dragged over the control.
	OnGetSiteInfo (see page 6223)	Returns the control's docking information.
	OnMouseActivate (see page 5861)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 5862)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseMove (see page 5865)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 5867)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnMouseWheel (see page 5869)	Occurs when the mouse wheel is rotated.
	OnMouseWheelDown (see page 5869)	Occurs when the mouse wheel is rotated downward.
	OnMouseWheelUp (see page 5870)	Occurs when the mouse wheel is rotated upward.
	OnResize (see page 5870)	Occurs immediately after the control is resized.
	OnSelect (see page 21201)	Occurs when the user selects a string in the drop-down list.
	OnUnDock (see page 6230)	Occurs when the application tries to undock a control that is docked to the windowed control.

Protected Fields

	Name	Description
	FAnchorMove (see page 5733)	This is FAnchorMove, a member of class TControl.
	FAnchorOrigin (see page 5734)	This is FAnchorOrigin, a member of class TControl.
	FAnchorRules (see page 5734)	This is FAnchorRules, a member of class TControl.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FDefEditProc (see page 21167)	This is FDefEditProc, a member of class TCustomCombo.
	FDefListProc (see page 21167)	This is FDefListProc, a member of class TCustomCombo.
	FDesignSize (see page 6124)	This is FDesignSize, a member of class TWinControl.
	FDoubleBuffered (see page 6124)	This is FDoubleBuffered, a member of class TWinControl.
	FDropHandle (see page 21168)	This is FDropHandle, a member of class TCustomCombo.
	FDroppingDown (see page 21168)	This is FDroppingDown, a member of class TCustomCombo.
	FEditHandle (see page 21168)	This is FEditHandle, a member of class TCustomCombo.
	FEditInstance (see page 21168)	This is FEditInstance, a member of class TCustomCombo.
	FExplicitHeight (see page 5734)	This is FExplicitHeight, a member of class TControl.
	FExplicitLeft (see page 5734)	This is FExplicitLeft, a member of class TControl.
	FExplicitTop (see page 5734)	This is FExplicitTop, a member of class TControl.
	FExplicitWidth (see page 5735)	This is FExplicitWidth, a member of class TControl.
	FFocusChanged (see page 21168)	This is FFocusChanged, a member of class TCustomCombo.
	FInImeComposition (see page 6125)	This is FInImeComposition, a member of class TWinControl.
	FIsFocused (see page 21169)	This is FIsFocused, a member of class TCustomCombo.
	FListHandle (see page 21169)	This is FListHandle, a member of class TCustomCombo.
	FListInstance (see page 21169)	This is FListInstance, a member of class TCustomCombo.
	FOriginalParentSize (see page 5735)	This is FOriginalParentSize, a member of class TControl.
	FSaveIndex (see page 21169)	This is FSaveIndex, a member of class TCustomCombo.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	ActionChange (see page 5737)	Responds when the action associated with the control changes.
V	ActionChange (see page 6127)	Updates the control to reflect changes in its associated action.
	AddBiDiModeExStyle (see page 6128)	Sets control's window style according to its bi-directional support.

	AdjustClientRect (see page 6128)	Provides the interface that adjusts the ClientRect (see page 5810) property for idiosyncrasies of the window.
	AdjustDropDown (see page 21171)	Adjusts the size and position of the drop down list.
	AdjustSize (see page 5738)	Sets the size of the control as determined by the AutoSize (see page 5803) property.
	AdjustSize (see page 6129)	Adjusts the control's size according to its contents and constraints.
	AlignControls (see page 6129)	Aligns any controls for which the control is the parent within a specified area of the control.
	ArrangeControl (see page 6130)	This is ArrangeControl, a member of class TWinControl.
	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	AssignTo (see page 5739)	Overrides the inherited AssignTo function to enable assignments to TAction objects.
	AssignTo (see page 6130)	Copies the properties of the windowed control to another object.
	BeginAutoDrag (see page 5739)	Begin Automatic Drag.
	CalcCursorPos (see page 5741)	This is CalcCursorPos, a member of class TControl.
	CanAutoSize (see page 5741)	Indicates whether the control can resize itself automatically to accommodate its contents.
	CanAutoSize (see page 6131)	Indicates how the control can be resized.
	CanResize (see page 5742)	OnCanResize (see page 5851) event dispatcher.
	CanResize (see page 6132)	Indicates how the control can respond to a resize attempt.
	Change (see page 8671)	Generates an OnChange event.
	Changed (see page 5742)	Sends a CM_CHANGED (see page 6330) message to the control.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	ChangeScale (see page 5743)	Rescaling event dispatcher.
	ChangeScale (see page 6132)	Resize (see page 5780) and reposition children and self.
	Click (see page 8671)	Respond to user click.
	CloseUp (see page 21172)	Generates an OnCloseUp (see page 21199) event.
	ComboWndProc (see page 8671)	Responds to Windows messages sent to the edit control or drop-down list.
	ConstrainedResize (see page 5746)	Notify control of resize with constraints.
	ConstrainedResize (see page 6133)	Generates an OnConstrainedResize (see page 5853) event.
	ControlsAligned (see page 6134)	This is ControlsAligned, a member of class TWinControl.
	CreateDockManager (see page 6134)	Creates the dock manager for the control.
	CreateHandle (see page 6135)	Creates underlying screen object.
	CreateParams (see page 6135)	Initializes a window-creation parameter data structure.
	CreateParams (see page 21215)	Initializes the window-creation parameter record.
	CreateSubClass (see page 6136)	Creates a windowed control derived from an existing Windows window class.
	CreateWindowHandle (see page 6137)	Creates a Windows control to represent the control.
	CreateWnd (see page 8672)	Creates the Windows control that represents the combo box.
	CustomAlignInsertBefore (see page 6137)	Returns placement order of custom-aligned child control.
	CustomAlignPosition (see page 6138)	Returns aligned position of custom-aligned child control.
	DblClick (see page 5747)	OnDblClick (see page 5854) event dispatcher.
	DefaultDockImage (see page 5747)	Handles the painting and erasing of a dock image.
	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	DefineProperties (see page 5748)	Provides methods to read and write the IsControl (see page 5829) property to a stream such as a form file.
	DefineProperties (see page 6139)	Provides methods to read and write the IsControl property to a stream such as a form file.
	DesignWndProc (see page 5749)	This is DesignWndProc, a member of class TControl.
	DestroyHandle (see page 6140)	Destroys the control's window without destroying the control.
	DestroyWindowHandle (see page 6140)	Destroys the window created in the CreateWindowHandle (see page 6137) method.
	DestroyWindowHandle (see page 21174)	Destroys all of the windows controls that implement the combo box.
	DestroyWnd (see page 6141)	Destroys the control's window.
	DestroyWnd (see page 21215)	Destroys the Windows control that represents the combo box.

	DoAddDockClient (see page 6142)	Performs actions when a control is docked to the windowed control.
	DockOver (see page 6143)	Responds when a docking client is dragged over the windowed control.
V	DockReplaceDockClient (see page 6143)	This is DockReplaceDockClient, a member of class TWinControl.
	DockTrackNoTarget (see page 5749)	Handles dragging of the control over an invalid docking target.
	DoContextPopup (see page 5750)	OnContextPopup (see page 5854) event dispatcher.
	DoDock (see page 5750)	Docking event dispatcher.
	DoDockOver (see page 6143)	Generates an OnDockOver (see page 6216) event.
	DoEndDock (see page 5750)	OnEndDock (see page 5859) event dispatcher.
	DoEndDrag (see page 5751)	OnEndDrag (see page 5860) event dispatcher.
	DoEnter (see page 6144)	Respond to receiving input focus.
	DoExit (see page 6144)	Respond to losing input focus
	DoFlipChildren (see page 6145)	Flips the control's children.
	DoKeyDown (see page 6145)	Performs some preprocessing before generating an OnKeyDown (see page 6225) event.
	DoKeyPress (see page 6146)	Performs some preprocessing before generating an OnKeyPress (see page 6227) event.
	DoKeyUp (see page 6146)	Performs some preprocessing before generating an OnKeyUp (see page 6228) event.
	DoMouseWheel (see page 5751)	Processes mouse wheel motion.
	DoMouseWheelDown (see page 5752)	OnMouseWheelDown (see page 5869) event dispatcher.
	DoMouseWheelUp (see page 5752)	OnMouseWheelUp (see page 5870) event dispatcher.
	DoRemoveDockClient (see page 6147)	Responds when a control is undocked from the windowed control.
	DoStartDock (see page 5753)	OnStartDock (see page 5871) event dispatcher.
	DoStartDrag (see page 5753)	OnStartDrag (see page 5871) event dispatcher.
	DoUnDock (see page 6147)	Undocks a control that is currently docked to the windowed control.
	DragCanceled (see page 5754)	Provides the interface for a method that responds to the cancellation of a drag.
	DragOver (see page 5755)	OnDragOver (see page 5857) event dispatcher.
	DrawDragDockImage (see page 5755)	Draws the dock image for the control.
V	DrawItem (see page 21216)	Generates an OnDrawItem (see page 21224) event.
V	DropDown (see page 8672)	Generates an OnDropDown event.
V	EditWndProc (see page 21175)	Responds to Windows messages that are sent to the edit control portion of the combo box.
	EraseDragDockImage (see page 5757)	Erases the dock image for the control.
	FindNextControl (see page 6149)	Returns the control's next child in the tab order after the specified control.
	FixupTabList (see page 6149)	Sorts the child controls by their tab order.
V	GetAction (see page 5758)	This is GetAction, a member of class TControl.
	GetActionLinkClass (see page 5758)	Returns the appropriate action link class that is associated with the control class.
V	GetActionLinkClass (see page 6152)	Returns the associated action link class.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetChildren (see page 6153)	Calls a specified method for each child of the control.
V	GetClientOrigin (see page 5758)	Returns the screen coordinates of the top-left corner of the control's client area.
V	GetClientOrigin (see page 6153)	Returns the value of the ClientOrigin (see page 5809) property.
V	GetClientRect (see page 5759)	Returns a rectangle defining the client area of the control.
V	GetClientRect (see page 6154)	Returns the value of the ClientRect (see page 5810) property.
V	GetControlExtents (see page 6154)	Returns the smallest rectangle in which all the control's children fit.
A	GetCount (see page 5942)	Returns the number of items in the list.
V	GetCount (see page 21176)	Returns the value of the ItemCount (see page 21186) property.
V	GetDeviceContext (see page 5760)	Returns a device context for the control.
V	GetDeviceContext (see page 6155)	Provides access to a device context for the control.
	GetDockEdge (see page 5763)	Returns the edge on which another control should be docked when it is dragged over the control.
V	GetDragImages (see page 5763)	Returns the control's image list containing the image to be displayed while dragging.

	GetDroppedDown (see page 21176)	Returns the value of the DroppedDown (see page 21185) property.
V	GetEnabled (see page 5763)	Returns the value of the Enabled (see page 5821) property.
V	GetFloating (see page 5764)	Returns the value of the Floating (see page 5823) property.
V	GetFloatingDockSiteClass (see page 5764)	Returns the class used for the control when it is floating.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
A	GetItemCount (see page 21176)	Returns the value of the ItemCount (see page 21186) property.
V	GetItemCount (see page 21216)	Returns the number of items in the Items (see page 21187) property list.
A	GetItemHt (see page 21177)	Returns the value of the ItemHeight (see page 21186) property.
V	GetItemHt (see page 21216)	Returns the value of the ItemHeight (see page 21186) property.
A	GetItemIndex (see page 5942)	Returns the value of the ItemIndex (see page 5944) property.
V	GetItemIndex (see page 21177)	Returns the value of the ItemIndex property.
A	GetItemsClass (see page 21177)	Indicates the class that implements the Items (see page 21187) property.
V	GetItemsClass (see page 21217)	Returns the class used to implement the Items (see page 21187) property.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetPalette (see page 5765)	Returns the handle to a palette for use by the control.
	GetParentHandle (see page 6157)	Returns the window handle for the window of the control's parent.
	GetPopupMenu (see page 5765)	Returns the pop-up menu associated with the control.
	GetSelLength (see page 21178)	Returns the value of the SelLength (see page 21190) property.
	GetSelStart (see page 21178)	Returns the value of the SelStart (see page 21193) property.
	GetSelText (see page 21217)	Returns the value of the SelText (see page 21222) property.
	GetSiteInfo (see page 6158)	Generates an OnGetSiteInfo (see page 6223) event
	GetTopParentHandle (see page 6159)	Returns the window handle of the first window not associated with a VCL control that contains the windowed control.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	InvalidateDockHostSite (see page 6162)	This is InvalidateDockHostSite, a member of class TWinControl.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsControlActivateMsg (see page 6162)	This is IsControlActivateMsg, a member of class TWinControl.
	IsControlMouseMsg (see page 6162)	Indicates whether a specified mouse message is directed to one of the windowed control's child controls.
	IsQualifyingSite (see page 6163)	This is IsQualifyingSite, a member of class TWinControl.
V	KeyDown (see page 8673)	Respond to key press events.
V	KeyPress (see page 8674)	Responds to WM_CHAR messages sent to the combo box.
	KeyUp (see page 6164)	Respond to released key.
	ListWndProc (see page 21178)	Responds to Windows messages that are sent to the drop-down list portion of the combo box.
V	Loaded (see page 8674)	Initializes the combo box after its form is loaded into memory.
	MainWndProc (see page 6165)	Receives Windows messages for the control.
V	MeasureItem (see page 21218)	Generates an OnMeasureItem (see page 21225) event.
	MouseActivate (see page 5773)	This is MouseActivate, a member of class TControl.
	MouseDown (see page 5773)	OnMouseDown (see page 5862) event dispatcher.
	MouseMove (see page 5773)	Respond to mouse moving over control area..
	MouseUp (see page 5774)	OnMouseUp (see page 5867) event dispatcher.
V	Notification (see page 8675)	Responds to notifications that components are being created or destroyed.
	NotifyControls (see page 6165)	Sends a message to all the child controls.
	PaintControls (see page 6166)	Paints each of the child controls in a windowed control using the specified device context.
	PaintHandler (see page 6166)	Responds to WM_PAINT messages.
V	PaintWindow (see page 6169)	Renders the image of a windowed control.
	PaletteChanged (see page 5775)	Responds to changes in the system's palette by realizing the control's palette.
V	PaletteChanged (see page 6170)	Responds to changes in the system's palette by realizing the control's palette and the palette for each child control.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.

	PositionDockRect (see page 5777)	Positions the docking rectangle according to the current drag-and-dock state.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 5778)	Prepares the control for having its properties assigned values read from a stream.
V	ReadState (see page 6171)	Prepares the control for having its properties assigned values from a stream.
	RecreateWnd (see page 6171)	Recreate underlying Windows screen object.
	ReloadDockedControl (see page 6172)	Reloads a docked control.
	RemoveWindowProps (see page 6174)	This is RemoveWindowProps, a member of class TWinControl.
V	RequestAlign (see page 5780)	Instructs the parent of a control to reposition the control, enforcing its Align (see page 5798) property.
	ResetIme (see page 6174)	Restores the input method editor (IME) that was active when the application started.
	ResetImeComposition (see page 6175)	Directs the composition window of the input method editor (IME) to perform a specific action.
	Resize (see page 5780)	Respond to control resize.
	ScaleConstraints (see page 5781)	This is ScaleConstraints, a member of class TControl.
	ScaleControls (see page 6176)	Rescale child controls only.
	Select (see page 21179)	Generates an OnSelect (see page 21201) event.
	SelectFirst (see page 6177)	Locates first selectable child control.
	SelectItem (see page 21218)	Selects a specified item from the drop-down list.
	SelectNext (see page 6177)	Moves the input focus from the current child control to the next one in the tab order.
	SendCancelMode (see page 5781)	Cancels the modal state of the control.
	SendDockNotification (see page 5782)	Sends a Windows message to the control's host dock site.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
V	SetAutoSize (see page 5783)	This is SetAutoSize, a member of class TControl.
V	SetBiDiMode (see page 5783)	Sets the control's bi-directional mode.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
V	SetChildOrder (see page 6178)	Changes the order in which the child component appears in the list of child components returned by the GetChildren (see page 6153) method.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
V	SetDragMode (see page 5785)	Sets the drag mode for the control.
V	SetDropDownCount (see page 21180)	Sets the value of the DropDownCount (see page 21185) property.
	SetDroppedDown (see page 21180)	Sets the value of the DroppedDown (see page 21185) property.
V	SetEnabled (see page 5785)	Sets the value of the Enabled (see page 5821) property.
	SetIme (see page 6181)	Activates an input method editor (IME) using the values specified by the ImeMode (see page 6207) and ImeName (see page 6208) properties.
	SetImeCompositionWindow (see page 6181)	Sets the position and font of the composition window.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetItemHeight (see page 21181)	Sets the value of the ItemHeight (see page 21186) property.
A	SetItemIndex (see page 5943)	Sets the value of the ItemIndex (see page 5944) property.
V	SetItemIndex (see page 21181)	Sets the value of the ItemIndex property.
V	SetItems (see page 8675)	Sets the value of the Items property.
	SetMaxLength (see page 21182)	Sets the value of the MaxLength (see page 21189) property.
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
V	SetName (see page 5785)	Sets the name of the control.
V	SetParent (see page 5786)	Sets the parent of the control.
V	SetParent (see page 6182)	Sets the parent of the control.
V	SetParentBackground (see page 6182)	This is SetParentBackground, a member of class TWinControl.
V	SetParentBiDiMode (see page 5786)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 5787)	Sets the parent for the control.
	SetSelLength (see page 21182)	Sets the value of the SelLength (see page 21190) property.
	SetSelStart (see page 21182)	Sets the value of the SelStart (see page 21193) property.

V	SetStyle (see page 8676)	This is SetStyle, a member of class TDBComboBox.
	SetZOrder (see page 5788)	Repositions the control in its parent's control list, thereby changing position onscreen.
V	SetZOrder (see page 6182)	Moves the control to the top or bottom of the parent control's (or screen's) list of TWinControl (see page 6112) controls.
V	ShowControl (see page 6183)	Ensures that a specified child control is visible.
	UpdateBounds (see page 6185)	This is UpdateBounds, a member of class TWinControl.
	UpdateBoundsRect (see page 5789)	Changes the Top (see page 5844), Left (see page 5830), Width (see page 5849), and Height (see page 5825) properties of the control, but doesn't update its screen image and bypasses all resize events.
V	UpdateControlOriginalParentSize (see page 6186)	This is UpdateControlOriginalParentSize, a member of class TWinControl.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateExplicitBounds (see page 5789)	This is UpdateExplicitBounds, a member of class TControl.
	UpdateRecreatingFlag (see page 6186)	This is UpdateRecreatingFlag, a member of class TWinControl.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	UpdateUIState (see page 6186)	Updates form User Interface State as needed
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	VisibleChanging (see page 5791)	Provides the interface for a method that responds to changes in the control's visibility.
V	WndProc (see page 8677)	Processes messages received by the combo box.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	ActionLink (see page 5798)	Contains the action link object associated with the control.
	AutoSize (see page 5803)	Specifies whether the control sizes itself automatically to accommodate its contents.
	BorderWidth (see page 6195)	Specifies the width of the control's border.
	Caption (see page 5806)	Specifies a text string that identifies the control to the user.
	DefWndProc (see page 6199)	Specifies the default window procedure for the windowed control.
	DesktopFont (see page 5818)	Specifies whether the control uses the Windows icon font when writing text.
R	EditHandle (see page 21185)	Returns the window handle for the edit portion of the combo box.
	IsControl (see page 5829)	Determines whether a form stores its form-specific properties to a stream.
R	ItemCount (see page 21186)	Specifies the number of items in the drop-down list.
R	ListHandle (see page 21189)	Provides access to the window handle of the list of items in the combo box.
	MaxLength (see page 21189)	Specifies the maximum number of characters the user can type into the edit portion of the combo box.
	MouseCapture (see page 5831)	Indicates whether the control has "captured" mouse events.
	ParentBackground (see page 6209)	Determines whether control uses parent's theme background.
	ScalingFlags (see page 5840)	Reflects which attributes of the control have been scaled.
	WheelAccumulator (see page 5849)	Accumulates mouse wheel rotations.
	WindowHandle (see page 6212)	Provides access to a window handle for the control.
	WindowText (see page 5850)	Contains the text string of the control.

Public Events

	Name	Description
	WindowProc (see page 5872)	Points to the window procedure that responds to messages sent to the control.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
A	AddItem (see page 5940)	Adds an item to the list control.
V	AddItem (see page 21170)	Adds an item to the drop-down list of items.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	BeginDrag (see page 5740)	Starts the dragging of a control.
	BringToFront (see page 5740)	Puts the control in front of all other controls in its parent control.
	Broadcast (see page 6130)	Sends a message to each of the child controls.
	CanFocus (see page 6131)	Indicates whether a control can receive focus.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
A	Clear (see page 5940)	Deletes all of the items from the list control.
V	Clear (see page 21172)	Deletes all text from the edit box and all items from the Items (see page 21187) list.
A	ClearSelection (see page 5940)	Removes the selection, leaving all items unselected.
V	ClearSelection (see page 21172)	Deselects any selected items in the drop-down list.
	ClientToParent (see page 5744)	Translates client coordinates to parent coordinates.
	ClientToScreen (see page 5744)	Translates a given point from client area coordinates to global screen coordinates.
	ContainsControl (see page 6133)	Indicates whether a specified control exists within the control.
	ControlAtPos (see page 6133)	Returns the child control located at a specified position within the control.
A	CopySelection (see page 5941)	Copies the selected item or items to another TCustomListControl (see page 5928) descendant.
V	CopySelection (see page 21173)	Copies the selected item in the drop-down list to another list control.
V	Create (see page 8669)	Creates an instance of TDBComboBox (see page 8657).
	CreateParented (see page 6123)	Creates and initializes a control as the child of a specified non-VCL container.
	CreateParentedControl (see page 6136)	Creates and initializes a control as the child of a specified non-VCL window.
V	DefaultHandler (see page 5748)	Provides message handling for all messages that do not have specific handlers.
V	DefaultHandler (see page 6139)	Provides message handling for all messages that the control does not fully process itself.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
A	DeleteSelected (see page 5941)	Deletes all the selected items.
V	DeleteSelected (see page 21174)	Deletes the selected item from the drop-down list.
V	Destroy (see page 8670)	Destroys an instance of TDBComboBox (see page 8657).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	DisableAlign (see page 6141)	Disables the realignment of child controls.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Dock (see page 5749)	Used internally to dock the control.
	DockDrop (see page 6142)	Generates an OnDockDrop (see page 6214) event.
	DragDrop (see page 5754)	OnDragDrop (see page 5855) event dispatcher.
	Dragging (see page 5754)	Indicates whether a control is being dragged.
	DrawTextBiDiModeFlags (see page 5756)	Returns the text flags that reflect the current setting of the BiDiMode (see page 5803) property.

	DrawTextBiDiModeFlagsReadingOnly (see page 5756)	Returns the text flag to add that indicates whether the control's text should read from right to left.
	EnableAlign (see page 6148)	Decrements the reference count incremented by the DisableAlign (see page 6141) method, eventually realigning the child controls.
	EndDrag (see page 5757)	Stops a control from being dragged any further.
V	ExecuteAction (see page 8673)	Invokes an action with the TDBComboBox (see page 8657) as its target.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindChildControl (see page 6148)	Returns a child control given its name.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FlipChildren (see page 6150)	Reverses the positions of child controls.
	Focused (see page 6150)	Determines whether the control has input focus.
V	Focused (see page 21175)	Indicates whether the combo box has input focus.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetControlsAlignment (see page 5759)	Indicates how text is aligned within the control.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 5765)	Returns the parent of the control.
	GetTabOrderList (see page 6158)	Builds a list of controls in tab order.
	GetTextBuf (see page 5766)	Retrieves the control's text, copies it into a buffer, and returns the number of characters copied.
	GetTextLen (see page 5767)	Returns the length of the control's text.
	HandleAllocated (see page 6159)	Reports whether a screen object handle exists for the control.
	HandleNeeded (see page 6160)	Creates a screen object for the control if it doesn't already exist.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 5768)	Indicates whether the control has a parent.
	Hide (see page 5769)	Makes the control invisible.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
V	InitiateAction (see page 5769)	Calls the action link's Update (see page 5789) method if the control is associated with an action link.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InsertControl (see page 6160)	Inserts a control into the Controls (see page 6197) array property.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
V	Invalidate (see page 5770)	Completely repaint control.
V	Invalidate (see page 6161)	Schedules a control repaint.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	IsRightToLeft (see page 5770)	Indicates whether the control should be reversed right to left.
	ManualDock (see page 5771)	Docks the control.
	ManualFloat (see page 5772)	Undocks the control.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	MouseWheelHandler (see page 5774)	Dispatches messages received from a mouse wheel.
V	MoveSelection (see page 5942)	Moves all selected items to another list control.

V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	PaintTo (see page 6167)	This is the overview for the PaintTo method overload.
	ParentToClient (see page 5776)	Translate parent coordinates to client coordinates.
	Perform (see page 5776)	Responds as if the control received a specified Windows message.
	PreProcessMessage (see page 6170)	This is PreProcessMessage, a member of class TWinControl.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	Realign (see page 6171)	Forces the control to realign children.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	Refresh (see page 5779)	Repaints the control on the screen.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveControl (see page 6172)	Removes a specified control from the Controls (see page 6197) array.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	Repaint (see page 5779)	Forces the control to repaint its image on the screen.
V	Repaint (see page 6174)	Repaints the entire control.
	ReplaceDockedControl (see page 5779)	Docks the control in the place where another control is already docked.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	ScaleBy (see page 6175)	Rescale control and its children.
	ScreenToClient (see page 5781)	Converts the screen coordinates of a specified point on the screen to client coordinates.
	ScrollBy (see page 6176)	Scroll control contents.
A	SelectAll (see page 5943)	Selects all items or all text in the selected item.
V	SelectAll (see page 21180)	Selects the entire block of text in the edit box.
	SendToBack (see page 5782)	Puts a windowed control behind all other windowed controls, or puts a non-windowed control behind all other non-windowed controls.
V	SetBounds (see page 5783)	Sets the Left (see page 5830), Top (see page 5844), Width (see page 5849), and Height (see page 5825) properties all at once.
V	SetBounds (see page 6178)	Sets the windowed control's boundary properties all at once.
	SetDesignVisible (see page 5784)	Makes a control visible at design time.
V	SetDesignVisible (see page 6178)	Makes a control visible at design time.
V	SetFocus (see page 6179)	Gives the input focus to the control.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	SetTextBuf (see page 5787)	Sets the text of the control.
	Show (see page 5788)	Makes a control visible.
V	Update (see page 5789)	Processes any pending paint messages immediately.
V	Update (see page 6183)	Forces the control to update.
V	UpdateAction (see page 8676)	Updates an action to reflect the current state of the TDBComboBox (see page 8657).
	UpdateControlState (see page 6186)	Respond to state change.
V	UseRightToLeftAlignment (see page 8676)	Specifies whether the control's alignment should be reversed right-to-left.
	UseRightToLeftReading (see page 5790)	Specifies whether the control is using a right-to-left reading order.
	UseRightToLeftScrollBar (see page 5791)	Specifies whether the vertical scroll bar appears on the left side of the control.

Public Properties

	Name	Description
	Action (see page 5797)	Designates the action associated with the control.
R	AlignDisabled (see page 6192)	Indicates child control realignment disabled.
	AutoCloseUp (see page 21220)	Specifies whether the drop-down closes up automatically when the user selects an item.
	AutoCompleteDelay (see page 21220)	Specifies the delay between a key press and an attempt to autocomplete the field.
	BoundsRect (see page 5803)	Specifies the bounding rectangle of the control, expressed in the coordinate system of the parent control.
R	Brush (see page 6195)	Determines the color and pattern used for painting the background of the control.

R	Canvas (see page 21184)	Provides access to the drawing surface of the combo box.
	ClientHeight (see page 5808)	Specifies the height of the control's client area in pixels.
R	ClientOrigin (see page 5809)	Specifies the screen coordinates (in pixels) of the top left corner of a control's client area.
R	ClientRect (see page 5810)	Specifies the size (in pixels) of a control's client area.
	ClientWidth (see page 5811)	Specifies the horizontal size of the control's client area in pixels.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
R	ControlCount (see page 6195)	Returns the number of child controls.
R	Controls (see page 6197)	Lists all child controls.
	ControlState (see page 5813)	Indicates the current state of a control at runtime.
	ControlStyle (see page 5814)	Determines style characteristics of the control.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	DockClientCount (see page 6199)	Specifies the number of controls that are docked on the windowed control.
R	DockClients (see page 6201)	Lists the controls that are docked to the windowed control.
	DockManager (see page 6202)	Specifies the control's docking manager interface.
	DockOrientation (see page 5818)	Specifies how the control is docked relative to other controls docked in the same parent.
	DockSite (see page 6204)	Specifies whether the control can be the target of drag-and-dock operations.
	DoubleBuffered (see page 6205)	Determines whether the control's image is rendered directly to the window or painted to an in-memory bitmap first.
	DroppedDown (see page 21185)	Indicates whether the drop-down list is currently displayed.
R	ExplicitHeight (see page 5821)	Specifies the explicit vertical size of the control in pixels.
R	ExplicitLeft (see page 5822)	Specifies the explicit horizontal pixel coordinate of the left edge of a component relative to its parent.
R	ExplicitTop (see page 5822)	Specifies the explicit vertical pixel coordinate of the top edge of a component relative to its parent.
R	ExplicitWidth (see page 5822)	Specifies the explicit horizontal size of the control in pixels.
R	Field (see page 8692)	Identifies the TField object whose current value the combo box represents.
R	Floating (see page 5823)	Indicates whether the control is floating.
	FloatingDockSiteClass (see page 5823)	Specifies the class of the temporary control that hosts the control when it is floating.
R	Handle (see page 6207)	Provides access to the underlying Windows screen object for the control.
	HostDockSite (see page 5829)	Specifies the control in which the control is docked.
	ItemIndex (see page 5944)	Specifies the index of the selected item.
	LRDockWidth (see page 5831)	Specifies the width of the control when it is docked horizontally.
R	MouseInClient (see page 6209)	This is MouseInClient, a member of class TWinControl.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Padding (see page 6209)	Specifies the padding of a control.
	Parent (see page 5832)	Indicates the parent of the control.
	ParentWindow (see page 6210)	Reference to parent's underlying control.
	SelLength (see page 21190)	Specifies the length, in characters, of the selected text in the edit portion of the combo box.
	SelStart (see page 21193)	Specifies the position of the first selected character in the edit portion of the combo box.
	SelText (see page 21222)	Represents the selected text in the edit region.
R	Showing (see page 6210)	Indicates whether the control is showing on the screen.
	TBDockHeight (see page 5842)	Specifies the height of the control when it is docked vertically.
	Text (see page 8708)	Specifies the value in the edit portion of the combo box.
	UndockHeight (see page 5845)	Specifies the height of the control when it is floating.
	UndockWidth (see page 5846)	Specifies the width of the control when it is floating.

	UseDockManager (see page 6212)	Specifies whether the docking manager is used in drag-and-dock operations.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
R	VisibleDockClientCount (see page 6212)	Specifies the number of visible controls that are docked on the windowed control.

Published Events

	Name	Description
	OnChange (see page 8710)	Occurs when the user changes the text displayed in the edit region.
	OnClick (see page 8712)	Occurs when the user clicks the control.
	OnContextPopup (see page 8714)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnDblClick (see page 8715)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDragDrop (see page 8715)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 8717)	Occurs when the user drags an object over a control.
	OnDrawItem (see page 8720)	Occurs when an item in an owner-draw combo box needs to be displayed.
	OnDropDown (see page 8720)	Occurs when the user opens the drop-down list.
	OnEndDock (see page 8722)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 8722)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnEnter (see page 8723)	Occurs when a control receives the input focus.
	OnExit (see page 8726)	Occurs when the input focus shifts away from one control to another.
	OnKeyDown (see page 8727)	Occurs when a user presses any key while the control has focus.
	OnKeyPress (see page 8730)	Occurs when a key is pressed.
	OnKeyUp (see page 8731)	Occurs when the user releases a key that has been pressed.
	OnMeasureItem (see page 8733)	Occurs when an item in a csOwnerDrawVariable combo box needs to be redisplayed.
	OnMouseEnter (see page 8733)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 8733)	Occurs when the user moves the mouse outside of a control.
	OnStartDock (see page 8734)	Occurs when the user begins to drag a control with a DragKind of dkDock.
	OnStartDrag (see page 8734)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.

Published Properties

	Name	Description
	Align (see page 8678)	Determines how the control aligns within its container (parent control).
	AlignWithMargins (see page 5802)	Indicates whether a control should be constrained by margins.
	Anchors (see page 8682)	Specifies how the control is anchored to its parent.
	AutoComplete (see page 8682)	Positions to matching list items as you type.
	AutoDropDown (see page 8683)	Specifies whether the drop-down list drops down automatically in response to user keystrokes.
	BevelEdges (see page 8683)	Specifies which edges of the control are beveled.
	BevelInner (see page 8683)	Specifies the cut of the inner bevel.
	BevelKind (see page 8684)	Specifies the control's bevel style.
	BevelOuter (see page 8684)	Specifies the cut of the outer bevel.
	BevelWidth (see page 8685)	Specifies the width of the inner and outer bevels.
	BiDiMode (see page 8685)	Specifies the bi-directional mode for the control.
	CharCase (see page 8686)	Determines the case of the text in the combo box.
	Color (see page 8686)	Specifies the background color of the control.
	Constraints (see page 8687)	Specifies the size constraints for the control.
	Ctl3D (see page 8688)	Determines whether a control has a three-dimensional (3-D) or two-dimensional look.
	Cursor (see page 5815)	Specifies the image used to represent the mouse pointer when it passes into the region covered by the control.
	DataField (see page 8688)	Identifies the field from which the combo box displays data.
	DataSource (see page 8689)	Links the combo box to a dataset.

	DragCursor (see page 8689)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 8689)	Specifies whether the control is being dragged normally or for docking.
	DragMode (see page 8690)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	DropDownCount (see page 8691)	Specifies the maximum number of items displayed in the drop-down list.
	Enabled (see page 8692)	Controls whether the control responds to mouse, keyboard, and timer events.
	Font (see page 8693)	Controls the attributes of text written on or in the control.
	Height (see page 5825)	Specifies the vertical size of the control in pixels.
	HelpContext (see page 5826)	Numeric ID for control's context-sensitive help topic
	HelpKeyword (see page 5826)	Keyword for control's context-sensitive help topic
	HelpType (see page 5827)	Indicates whether the control's context sensitive help topic is identified by context ID or by keyword.
	Hint (see page 5827)	Contains the text string that can appear when the user moves the mouse over the control.
	ImeMode (see page 8694)	Determines the behavior of the input method editor (IME).
	ImeName (see page 8694)	Specifies the input method editor (IME) to use for converting keyboard input to Asian language characters.
	ItemHeight (see page 8695)	Specifies the height, in pixels, of the items in the drop-down list.
W	Items (see page 8695)	Contains the strings that appear in the list of the database combo box.
	Left (see page 5830)	Specifies the horizontal coordinate of the left edge of a component relative to its parent.
	Margins (see page 5831)	Specifies the margins for the control.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	ParentBiDiMode (see page 8696)	Specifies whether the control uses its parent's BiDiMode.
	ParentColor (see page 8696)	Determines where a control looks for its color information.
	ParentCtl3D (see page 8697)	Determines where a component looks to determine if it should appear three dimensional.
	ParentFont (see page 8697)	Determines where a control looks for its font information.
	ParentShowHint (see page 8698)	Determines where a control looks to find out if its Help Hint should be shown.
	PopupMenu (see page 8698)	Identifies the pop-up menu associated with the control.
	ReadOnly (see page 8703)	Determines if the user can change the value of the field.
	ShowHint (see page 8703)	Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.
	Sorted (see page 8705)	Determines whether the list portion of the combo box is alphabetized.
	Style (see page 8706)	Determines how the combo box displays its items.
	TabOrder (see page 8707)	Indicates the position of the control in its parent's tab order.
	TabStop (see page 8707)	Determines if the user can tab to a control.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Top (see page 5844)	Specifies the Y coordinate of the top left corner of a control, relative to its parent or containing control in pixels.
	Visible (see page 8708)	Determines whether the component appears onscreen.
	Width (see page 5849)	Specifies the horizontal size of the control or form in pixels.

47.1.3.2 TDBComboBox.Create Constructor

Creates an instance of TDBComboBox (see page 8657).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TDBComboBox(TComponent * AOwner);
```

Description

Call Create to instantiate a TDBComboBox (see page 8657) object at runtime. For TDBComboBox (see page 8657) objects placed on forms at design time, Create is called automatically.

AOwner is the component, typically the form, that is responsible for freeing the combo box. It becomes the value of the Owner property.

See Also

Destroy (see page 8670)

Owner (see page 2807)

47.1.3.3 TDBComboBox.Destroy Destructor

Destroys an instance of TDBComboBox (see page 8657).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TDBComboBox();
```

Description

Do not call Destroy directly in an application. Instead, call Free. Free verifies that the TDBComboBox (see page 8657) reference is not nil and only then calls Destroy.

See Also

Create (see page 8669)

Free (see page 22300)

TFieldDataLink (see page 9487)

47.1.3.4 TDBComboBox Methods

The methods of the TDBComboBox class are listed here.

Protected Methods

	Name	Description
	Change (see page 8671)	Generates an OnChange event.
	Click (see page 8671)	Respond to user click.
	ComboWndProc (see page 8671)	Responds to Windows messages sent to the edit control or drop-down list.
	CreateWnd (see page 8672)	Creates the Windows control that represents the combo box.
	DropDown (see page 8672)	Generates an OnDropDown event.
	KeyDown (see page 8673)	Respond to key press events.
	KeyPress (see page 8674)	Responds to WM_CHAR messages sent to the combo box.
	Loaded (see page 8674)	Initializes the combo box after its form is loaded into memory.
	Notification (see page 8675)	Responds to notifications that components are being created or destroyed.
	SetItems (see page 8675)	Sets the value of the Items property.
	SetStyle (see page 8676)	This is SetStyle, a member of class TDBComboBox.
	WndProc (see page 8677)	Processes messages received by the combo box.

Public Methods

	Name	Description
	ExecuteAction (see page 8673)	Invokes an action with the TDBComboBox (see page 8657) as its target.
	UpdateAction (see page 8676)	Updates an action to reflect the current state of the TDBComboBox (see page 8657).
	UseRightToLeftAlignment (see page 8676)	Specifies whether the control's alignment should be reversed right-to-left.

47.1.3.4.1 TDBComboBox.Change Method

Generates an OnChange event.

Pascal

```
procedure Change; override;
```

C++

```
virtual __fastcall Change();
```

Description

Change is called automatically in response to notifications that the text has changed. It responds by generating an OnChange event. Override this method to add additional processing when the text changes, or to block the OnChange event.

See Also

OnChange (see page 21197)

Changed (see page 5742)

47.1.3.4.2 TDBComboBox.Click Method

Respond to user click.

Pascal

```
procedure Click; override;
```

C++

```
virtual __fastcall Click();
```

Description

Click is called automatically when the user left-clicks the control. Component or application code can call Click to simulate a user mouse click. This is often done in menu actions and hotkey handlers.

As implemented in TControl, Click queries whether the OnClick event handler exists and is different from the OnExecute handler for the control's Action. If this is true, the OnClick event handler is called. If this is false, and the Action OnExecute event handler exists, the Action's Execute method is called. Override Click to provide additional behavior.

See Also

Action (see page 5797)

OnExecute (see page 2716)

Execute (see page 2712)

DblClick (see page 5747)

OnClick (see page 5851)

47.1.3.4.3 TDBComboBox.ComboWndProc Method

Responds to Windows messages sent to the edit control or drop-down list.

Pascal

```
procedure ComboWndProc(var Message: TMessage; ComboWnd: HWnd; ComboProc: Pointer); override;
```

C++

```
virtual __fastcall ComboWndProc(TMessage Message, HWnd ComboWnd, void * ComboProc);
```

Description

ComboWndProc handles the common processing of Windows messages sent to the edit region or list portion of the combo box. It is called by the EditWndProc and ListWndProc methods to take care of all processing that is not specific to the edit region or drop-down list.

The Message parameter describes the Windows message. The ComboWnd parameter is the windows handle for the edit region or list. The ComboProc parameter is a pointer to the default window procedure for the window that received the message. ComboWndProc provides default responses to focus events, mouse events, and key strokes.

Override ComboWndProc to change the way the combo box responds to Windows messages. When overriding ComboWndProc, be sure to call the parent class's method to process all unhandled messages.

Note: Do not confuse ComboWndProc with the WndProc method. ComboWndProc responds to messages that are sent to the edit region or drop-down list. WndProc responds to messages sent to the combo box itself.

See Also

WndProc (see page 21183)

EditWndProc (see page 21175)

ListWndProc (see page 21178)

47.1.3.4.4 TDBComboBox.CreateWnd Method

Creates the Windows control that represents the combo box.

Pascal

```
procedure CreateWnd; override;
```

C++

```
virtual __fastcall CreateWnd();
```

Description

The CreateHandle method calls CreateWnd to handle the particulars of creating the combo box window. TCustomCombo overrides the inherited method to ensure that the newly-created window and the TCustomCombo properties correctly reflect each other.

The Windows control for the combo box can be temporarily destroyed and recreated in order to set properties that require changing the window creation parameters. Thus, CreateWnd may be called more than once during the lifetime of the TCustomCombo instance.

See Also

CreateHandle (see page 6135)

47.1.3.4.5 TDBComboBox.DropDown Method

Generates an OnDropDown event.

Pascal

```
procedure DropDown; override;
```

C++

```
virtual __fastcall DropDown();
```

Description

DropDown is called automatically when the DroppedDown property changes to true. It responds by generating an OnDropDown event. To perform additional processing or block the OnDropDown event, override DropDown.

See Also

OnDropDown (see page 21199)

DroppedDown (see page 21185)

47.1.3.4.6 TDBComboBox.ExecuteAction Method

Invokes an action with the TDBComboBox (see page 8657) as its target.

Pascal

```
function ExecuteAction(Action: TBasicAction): Boolean; override;
```

C++

```
virtual __fastcall Boolean ExecuteAction(TBasicAction Action);
```

Description

ExecuteAction is called automatically when the user invokes an action with the TDBComboBox (see page 8657) as a target. The Action parameter specifies the action that was invoked. ExecuteAction returns trueif the action was successfully dispatched, and false if the TDBComboBox (see page 8657) could not handle the action.

See Also

UpdateAction (see page 8676)

Execute (see page 2712)

HandlesTarget (see page 2713)

47.1.3.4.7 TDBComboBox.KeyDown Method

Respond to key press events.

Pascal

```
procedure KeyDown(var Key: Word; Shift: TShiftState); override;
```

C++

```
virtual __fastcall KeyDown(Word Key, TShiftState Shift);
```

Description

When a windowed control receives a key-down message (WM_KEYDOWN) from Windows, its message handler calls the DoKeyDown method. If DoKeyDown determines that the control should, in fact, process the character, it calls KeyDown, passing the key code and shift-key state in the Key and Shift parameters, respectively.

KeyDown calls any event handler attached to the OnKeyDown event. Override KeyDown to provide other responses in addition to the event-handler call.

The Key parameter is the key on the keyboard. For non-alphanumeric keys, you must use WinAPI virtual key codes to determine the key pressed. For more information, search for virtual key codes in the Win32 Developer's Reference (WIN32.HLP).

The Shift parameter indicates whether the Shift, Alt, or Ctrl keys are combined with the keystroke.

Either KeyDown or the OnKeyDown event handler it calls can suppress further processing of a key by setting the Key parameter to zero.

See Also

KeyUp (see page 6164)

OnKeyDown (see page 6225)

DoKeyDown (see page 6145)

DoKeyPress (see page 6146)

DoKeyUp (see page 6146)

47.1.3.4.8 TDBComboBox.KeyPress Method

Responds to WM_CHAR messages sent to the combo box.

Pascal

```
procedure KeyPress(var Key: Char); override;
```

C++

```
virtual __fastcall KeyPress(Char Key);
```

Description

KeyPress processes standard keystroke messages for the combo box control. If the KeyPress method does not handle the keystroke, it calls the inherited method, which generates an OnKeyPress event.

Key is the character represented by the key that was pressed. If the KeyPress method changes Key to 0, no further processing occurs for the keystroke.

See Also

KeyDown (see page 6163)

KeyUp (see page 6164)

OnKeyPress (see page 6227)

47.1.3.4.9 TDBComboBox.Loaded Method

Initializes the combo box after its form is loaded into memory.

Pascal

```
procedure Loaded; override;
```

C++

```
virtual __fastcall Loaded();
```

Description

Do not call the protected Loaded method. The component streaming system calls this method after it loads the combo box's form from a stream.

TCustomCombo overrides the inherited method to select the item specified by the ItemIndex property once the form is fully loaded.

See Also

Loaded (see page 2782)

ItemIndex

47.1.3.4.10 TDBComboBox.Notification Method

Responds to notifications that components are being created or destroyed.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

Notification allows TControl to update its PopupMenu property when the pop-up menu it refers to is destroyed.

Override the Notification method to respond to notifications that other components are about to be destroyed or have just been created. Use the Notification method to update controls that rely on other objects. Remove references to objects that are going away so that the control does not refer to objects that have been destroyed. For example, data-aware objects override the Notification method to update themselves when their data source is removed. Some objects respond to notifications that other objects of a specific type are being created. For example, the session component sets the Session property of new data-aware controls to itself when the AutoSessionName property is true.

By default, components pass along the notification to their owned components, if any.

See Also

PopupMenu (see page 5835)

Notification (see page 2783)

47.1.3.4.11 TDBComboBox.SetItems Method

Sets the value of the Items property.

Pascal

```
procedure SetItems(const Value: TStrings); override;
```

C++

```
virtual __fastcall SetItems(const TStrings Value);
```

Description

SetItems is the protected write implementation for the Items property. It copies the strings (and possibly their associated objects) from Value to the Items property.

See Also

Items (see page 21187)

Assign (see page 3043)

47.1.3.4.12 TDBComboBox.SetStyle Method

Pascal

```
procedure SetStyle(Value: TComboboxStyle); override;
```

C++

```
virtual __fastcall SetStyle(TComboboxStyle Value);
```

Description

This is SetStyle, a member of class TDBComboBox.

47.1.3.4.13 TDBComboBox.UpdateAction Method

Updates an action to reflect the current state of the TDBComboBox (see page 8657).

Pascal

```
function UpdateAction(Action: TBasicAction): Boolean; override;
```

C++

```
virtual __fastcall Boolean UpdateAction(TBasicAction Action);
```

Description

UpdateAction is called automatically when the application is idle to give the TDBComboBox (see page 8657) an opportunity to update associated actions. This allows actions to be grayed, checked, or to otherwise reflect the status of the TDBComboBox (see page 8657) they target.

The Action parameter specifies the action component that should be updated. UpdateAction returns trueif the action component now reflects the state of the component, and false if it did not know how to update the action.

See Also

ExecuteAction (see page 8673)

UpdateTarget (see page 2715)

HandlesTarget (see page 2713)

47.1.3.4.14 TDBComboBox.UseRightToLeftAlignment Method

Specifies whether the control's alignment should be reversed right-to-left.

Pascal

```
function UseRightToLeftAlignment: Boolean; override;
```

C++

```
virtual __fastcall Boolean UseRightToLeftAlignment();
```

Description

Controls call UseRightToLeftAlignment when implementing the BiDiMode property. UseRightToLeftAlignment indicates whether the control's alignment should be reversed right-to-left. This information can be used when painting the control or when responding to mouse events.

UseRightToLeftAlignment returns true if the application is running on a system with a Middle Eastern locale and the BiDiMode property is bdRightToLeft. Otherwise, it returns false. Descendants override UseRightToLeftAlignment if alignment in Middle Eastern locales depends on other factors.

See Also

BiDiMode (see page 5803)

GetControlsAlignment (see page 5759)

Text (see page 5842)

Caption (see page 5806)

47.1.3.4.15 TDBComboBox.WndProc Method

Processes messages received by the combo box.

Pascal

```
procedure WndProc(var Message: TMessage); override;
```

C++

```
virtual __fastcall WndProc(TMessage Message);
```

Description

WndProc is the first method to received Windows messages that are sent to the combo box. Messages sent to the child windows of the combo box (for the edit region and the list portion) go to the EditWndProc or ListWndProc method instead. WndProc handles messages about changes to the system colors defined in the Windows control panel, and closes up the drop-down list when the Enter key or the Escape key is pressed. All other messages are passed to Dispatch for default processing.

See Also

ComboWndProc (see page 21173)

Dispatch

WndProc (see page 6187)

EditWndProc (see page 21175)

ListWndProc (see page 21178)

47.1.3.5 TDBComboBox Properties

The properties of the TDBComboBox class are listed here.

Public Properties

	Name	Description
R	Field (see page 8692)	Identifies the TField object whose current value the combo box represents.
	Text (see page 8708)	Specifies the value in the edit portion of the combo box.

Published Properties

	Name	Description
	Align (see page 8678)	Determines how the control aligns within its container (parent control).
	Anchors (see page 8682)	Specifies how the control is anchored to its parent.
	AutoComplete (see page 8682)	Positions to matching list items as you type.
	AutoDropDown (see page 8683)	Specifies whether the drop-down list drops down automatically in response to user keystrokes.
	BevelEdges (see page 8683)	Specifies which edges of the control are beveled.
	BevelInner (see page 8683)	Specifies the cut of the inner bevel.
	BevelKind (see page 8684)	Specifies the control's bevel style.

	BevelOuter (see page 8684)	Specifies the cut of the outer bevel.
	BevelWidth (see page 8685)	Specifies the width of the inner and outer bevels.
	BiDiMode (see page 8685)	Specifies the bi-directional mode for the control.
	CharCase (see page 8686)	Determines the case of the text in the combo box.
	Color (see page 8686)	Specifies the background color of the control.
	Constraints (see page 8687)	Specifies the size constraints for the control.
	Ctl3D (see page 8688)	Determines whether a control has a three-dimensional (3-D) or two-dimensional look.
	DataField (see page 8688)	Identifies the field from which the combo box displays data.
	DataSource (see page 8689)	Links the combo box to a dataset.
	DragCursor (see page 8689)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 8689)	Specifies whether the control is being dragged normally or for docking.
	DragMode (see page 8690)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	DropDownCount (see page 8691)	Specifies the maximum number of items displayed in the drop-down list.
	Enabled (see page 8692)	Controls whether the control responds to mouse, keyboard, and timer events.
	Font (see page 8693)	Controls the attributes of text written on or in the control.
	ImeMode (see page 8694)	Determines the behavior of the input method editor (IME).
	ImeName (see page 8694)	Specifies the input method editor (IME) to use for converting keyboard input to Asian language characters.
	ItemHeight (see page 8695)	Specifies the height, in pixels, of the items in the drop-down list.
W	Items (see page 8695)	Contains the strings that appear in the list of the database combo box.
	ParentBiDiMode (see page 8696)	Specifies whether the control uses its parent's BiDiMode.
	ParentColor (see page 8696)	Determines where a control looks for its color information.
	ParentCtl3D (see page 8697)	Determines where a component looks to determine if it should appear three dimensional.
	ParentFont (see page 8697)	Determines where a control looks for its font information.
	ParentShowHint (see page 8698)	Determines where a control looks to find out if its Help Hint should be shown.
	PopupMenu (see page 8698)	Identifies the pop-up menu associated with the control.
	ReadOnly (see page 8703)	Determines if the user can change the value of the field.
	ShowHint (see page 8703)	Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.
	Sorted (see page 8705)	Determines whether the list portion of the combo box is alphabetized.
	Style (see page 8706)	Determines how the combo box displays its items.
	TabOrder (see page 8707)	Indicates the position of the control in its parent's tab order.
	TabStop (see page 8707)	Determines if the user can tab to a control.
	Visible (see page 8708)	Determines whether the component appears onscreen.

47.1.3.5.1 TDBComboBox.Align Property

Determines how the control aligns within its container (parent control).

Pascal

```
property Align: TAlign;
```

C++

```
__property TAlign Align;
```

Description

Use Align to align a control to the top, bottom, left, or right of a form or panel and have it remain there even if the size of the form, panel, or component that contains the control changes. When the parent is resized, an aligned control also resizes so that it continues to span the top, bottom, left, or right edge of the parent.

For example, to use a panel component with various controls on it as a tool palette, change the panel's Align value to alLeft. The value of alLeft for the Align property of the panel guarantees that the tool palette remains on the left side of the form and always equals the client height of the form.

The default value of Align is alNone, which means a control remains where it is positioned on a form or panel.

Tip: If Align is set to alClient, the control fills the entire client area so that it is impossible to select the parent form by clicking on it. In this case, select the parent by selecting the control on the form and pressing Esc, or by using the Object Inspector.

Any number of child components within a single parent can have the same Align value, in which case they stack up along the edge of the parent. The child controls stack up in z-order. To adjust the order in which the controls stack up, drag the controls into their desired positions.

Note: To cause a control to maintain a specified relationship with an edge of its parent, but not necessarily lie along one edge of the parent, use the Anchors property instead.

C++ Examples:

```
/*
This example shows how to use a splitter to divide a form
into resizable panes.  All objects on the form are created
dynamically in the OnCreate event handler of the form. To
run this example, add ExtCtrls and FileCtrl to the uses
clause of the form’s implementation section.
Note that when creating a splitter dynamically at runtime,
it is important to set its position to the appropriate side
of the control it will resize.
*/
#include <Extctrls.hpp>
#include <Filectrl.hpp>

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  TSplitter* ps = new TSplitter(Form1);
  TFileListBox* pflb = new TFileListBox(Form1);
  TDirectoryListBox* pdlb = new TDirectoryListBox(Form1);

  // Line up the directory list box on the left of the form.
  pdlb->Parent = Form1;
  pdlb->Align = alLeft;
  pdlb->Width = Form1->ClientWidth/3;

  // Now use the splitter to divide the directory pane from the file pane.
  ps->Parent = Form1;
  ps->Left = pdlb->Left + pdlb->Width + 1; // Move to right of directory list.
  ps->Align = pdlb->Align; // Give same alignment as directory list.

  // Each pane must be at least one quarter of the form's width.
  ps->MinSize = Form1->ClientWidth/4;

  // Finally, create the last pane - a file list box.
  pflb->Parent = Form1;
  pflb->Align = alClient;
  pdlb->FileList = pflb; // Link the file list box to the directory list box.
}
/*
Dynamically create a TProgressBar control and align it to
the bottom of the form.
*/

#include <ComCtrls.hpp>
#include <Controls.hpp>

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  TProgressBar *ProgressBar = new TProgressBar(this);
  ProgressBar->Parent = this;
```

```
  ProgressBar->Align = alBottom;
  TButton *Button1 = new TButton(this);
  Button1->Parent = this;
}
/*
This example dynamically creates a Page Control, then a
series of Tab Sheets on the Page Control.
*/
#include <Comctrls.hpp>
TPageControl* ppc;
const int MAXTABS = 3;
TTabSheet* pts[MAXTABS];
const char * ppcTabTitles[] = { "ShortString", "Orders", "Items", "Parts" };
int iTabTitles = sizeof(ppcTabTitles)/sizeof(ppcTabTitles[0]);
const TColor colorPalette[12] = {
  clRed, clGreen, clYellow, clBlue, clWhite, clFuchsia,
  clTeal, clNavy, clMaroon, clLime, clOlive, clPurple};

void __fastcall TForm1::FormCreate(TObject *Sender)
{
    ppc = new TPageControl(this);
    ppc->Parent = this;
    ppc->Align = alClient;
    for (int i=0;i<iTabTitles;i++)
  {
        pts[i] = new TTabSheet(this);
        pts[i]->PageControl = ppc;
        pts[i]->Name = AnsiString("pts") + ppcTabTitles[i];
        pts[i]->Caption = ppcTabTitles[i];
        pts[i]->Brush->Color = colorPalette[i];
  }
}//---------------------------------------------------------------------------
void __fastcall TForm1::FormDestroy(TObject *Sender)
{
  for (int i=0;i<iTabTitles;i++)
        delete pts[i];
    delete ppc;
}
```

Delphi Examples:

```
{
This example shows how to use a splitter to divide a form
into resizable panes.  All objects on the form are created
dynamically in the OnCreate event handler of the form. To
run this example, add ExtCtrls and FileCtrl to the uses
clause of the form's implementation section.
Note that when creating a splitter dynamically at runtime,
it is important to set its position to the appropriate side
of the control it will resize.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  Split: TSplitter;
  Files: TFileListBox;
  Dirs: TDirectoryListBox;
begin
  { first add a directory list box to the form }
  Dirs := TDirectoryListBox.Create(Form1);
  { line it up on the left of the form }
  Dirs.Parent := Form1;
  Dirs.Align := alLeft;
  Dirs.Width := Form1.ClientWidth div 3;
{ now add the splitter to divide the directory pane from the file pane }
  Split := TSplitter.Create(Form1);
  Split.Parent := Form1;
  { make sure the splitter is to the right of the directory list box! }
```

```
    Split.Left := Dirs.Left + Dirs.Width + 1;
    Split.Align := Dirs.Align; { give it the same alignment as the directory }
    { each pane must be at least one quarter of the form's width }
    Split.MinSize := Form1.ClientWidth div 4;
    { Finally, create the last pane – a file list box }
    Files := TFileListBox.Create(Form1);
    Files.Parent := Form1;
    Files.Align := alClient;
    Dirs.FileList := Files; { link the file list box to the directory list box }
  end;
  {
  Dynamically create a TProgressBar control and align it to
  the bottom of the form.
  }

  var

Parent (see page 5832)

Anchors (see page 5802)

47.1.3.5.2 TDBComboBox.Anchors Property

Specifies how the control is anchored to its parent.

Pascal

```
property Anchors: TAnchors;
```

C++

```
__property TAnchors Anchors;
```

Description

Use Anchors to ensure that a control maintains its current position relative to an edge of its parent, even if the parent is resized. When its parent is resized, the control holds its position relative to the edges to which it is anchored.

If a control is anchored to opposite edges of its parent, the control stretches when its parent is resized. For example, if a control has its Anchors property set to [akLeft, akRight], the control stretches when the width of its parent changes.

Anchors is enforced only when the parent is resized. Thus, for example, if a control is anchored to opposite edges of a form at design time and the form is created in a maximized state, the control is not stretched because the form is not resized after the control is created.

Note: If a control should maintain contact with three edges of its parent (hugging one side of the parent and stretching the length of that side), use the Align property instead. Unlike Anchors, Align allows controls to adjust to changes in the size of other aligned sibling controls as well as changes to the parent's size.

See Also

Parent (see page 5832)

Align (see page 5798)

47.1.3.5.3 TDBComboBox.AutoComplete Property

Positions to matching list items as you type.

Pascal

```
property AutoComplete: Boolean;
```

C++

```
__property Boolean AutoComplete;
```

Description

AutoComplete will position to matching list values as you type, saving you keystrokes.

As you type, the ItemIndex property is updated with the list entry that matches the characters you have entered. As you type,

different list entries may match, and ItemIndex changes accordingly.

There is a delay of AutoCompleteDelay milliseconds between the characters typed and the autocomplete operation.

See Also

AutoCompleteDelay (see page 21220)

47.1.3.5.4 TDBComboBox.AutoDropDown Property

Specifies whether the drop-down list drops down automatically in response to user keystrokes.

Pascal

```
property AutoDropDown: Boolean;
```

C++

```
__property Boolean AutoDropDown;
```

Description

When AutoDropDown is true, the combo box automatically drops down its list when the user starts typing a string while the combo box has focus.

When AutoDropDown is false, the user must explicitly use the drop-down button to drop down the combo box list.

See Also

autocomplete (see page 21220)

OnDropDown (see page 21199)

DroppedDown (see page 21185)

47.1.3.5.5 TDBComboBox.BevelEdges Property

Specifies which edges of the control are beveled.

Pascal

```
property BevelEdges: TBevelEdges;
```

C++

```
__property TBevelEdges BevelEdges;
```

Description

Use BevelEdges to get or set which edges of the control are beveled. The BevelInner, BevelOuter, and BevelKind properties determine the appearance of the specified edges.

See Also

BevelInner (see page 6193)

BevelOuter (see page 6194)

BevelKind (see page 6193)

47.1.3.5.6 TDBComboBox.BevelInner Property

Specifies the cut of the inner bevel.

Pascal

```
property BevelInner: TBevelCut;
```

C++

```
__property TBevelCut BevelInner;
```

Description

Use BevelInner to specify whether the inner bevel has a raised, lowered, or flat look.

The inner bevel appears immediately inside the outer bevel. If there is no outer bevel (BevelOuter is bvNone), the inner bevel appears immediately inside the border.

See Also

BevelEdges (see page 6192)

BevelOuter (see page 6194)

BevelKind (see page 6193)

BevelWidth (see page 6194)

BorderWidth (see page 6195)

47.1.3.5.7 TDBComboBox.BevelKind Property

Specifies the control's bevel style.

Pascal

```
property BevelKind: TBevelKind;
```

C++

```
__property TBevelKind BevelKind;
```

Description

Use BevelKind to modify the appearance of a bevel. BevelKind influences how sharply the bevel stands out.

BevelKind, in combination with BevelWidth and the cut of the bevel specified by BevelInner or BevelOuter, can create a variety of effects. Experiment with various combinations to get the look you want.

See Also

BevelEdges (see page 6192)

BevelOuter (see page 6194)

BevelInner (see page 6193)

BevelWidth (see page 6194)

47.1.3.5.8 TDBComboBox.BevelOuter Property

Specifies the cut of the outer bevel.

Pascal

```
property BevelOuter: TBevelCut;
```

C++

```
__property TBevelCut BevelOuter;
```

Description

Use BevelInner to specify whether the outer bevel has a raised, lowered, or flat look.

The outer bevel appears immediately inside the border and outside the inner bevel.

See Also

BevelEdges (see page 6192)

BevelInner (see page 6193)

BevelKind (see page 6193)

BevelWidth (see page 6194)

47.1.3.5.9 TDBComboBox.BevelWidth Property

Specifies the width of the inner and outer bevels.

Pascal

```
property BevelWidth: TBevelWidth;
```

C++

```
__property TBevelWidth BevelWidth;
```

Description

Use BevelWidth to specify the width, in pixels, of the inner and outer bevels.

See Also

BevelEdges (see page 6192)

BevelInner (see page 6193)

BevelKind (see page 6193)

BevelOuter (see page 6194)

47.1.3.5.10 TDBComboBox.BiDiMode Property

Specifies the bi-directional mode for the control.

Pascal

```
property BiDiMode: TBiDiMode;
```

C++

```
__property TBiDiMode BiDiMode;
```

Description

Use BiDiMode to enable the control to adjust its appearance and behavior automatically when the application runs in a locale that reads from right to left instead of left to right. The bi-directional mode controls the reading order for the text, the placement of the vertical scroll bar, and whether the alignment is changed.

Alignment does not change for controls that are known to contain number, date, time, or currency values. For example, with data aware controls, the alignment does not change for the following field types: ftSmallint, ftInteger, ftWord, ftFloat, ftCurrency, ftBCD, ftDate, ftTime, ftDateTime, ftAutoInc.

See Also

UseRightToLeftAlignment (see page 5790)

UseRightToLeftReading (see page 5790)

UseRightToLeftScrollBar (see page 5791)

Including Bi-directional Functionality in Applications

47.1.3.5.11 TDBComboBox.CharCase Property

Determines the case of the text in the combo box.

Pascal

```
property CharCase: TEditCharCase;
```

C++

```
__property TEditCharCase CharCase;
```

Description

Use CharCase to force the contents of the combo box into upper or lower case.

When CharCase is set to ecLowerCase or ecUpperCase, the case of characters is converted as the user types into the combo box. Changing the CharCase property changes the actual text, not just its appearance; case information is lost and cannot be recaptured by changing CharCase back to ecNormal.

See Also

Text (see page 5842)

47.1.3.5.12 TDBComboBox.Color Property

Specifies the background color of the control.

Pascal

```
property Color: TColor;
```

C++

```
__property TColor Color;
```

Description

Use Color to read or change the background color of the control.

If a control's ParentColor property is true, then changing the Color property of the control's parent automatically changes the Color property of the control. When the value of the Color property is changed, the control's ParentColor property is automatically set to false.

C++ Examples:

```
/*
The following code changes the color of a shape control
using the Color dialog box. The example displays the Color
dialog box when the Button1 button is clicked, allowing the
user to select a color with the dialog box. When a color
value is selected with the dialog box, it is assigned to
the shape control.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
```

```
  if (ColorDialog1->Execute())
    Shape1->Brush->Color = ColorDialog1->Color;
}
```

Delphi Examples:

```
{
The following code changes the color of a shape control
using the Color dialog box. The example displays the Color
dialog box when the Button1 button is clicked, allowing the
user to select a color with the dialog box. When a color
value is selected with the dialog box, it is assigned to
the shape control.
}
procedure TForm1.Button1Click(Sender: TObject);
begin
  if ColorDialog1.Execute then
    Shape1.Brush.Color := ColorDialog1.Color;
end;
```

See Also

ParentColor (see page 5834)

47.1.3.5.13 TDBComboBox.Constraints Property

Specifies the size constraints for the control.

Pascal

```
property Constraints: TSizeConstraints;
```

C++

```
__property TSizeConstraints Constraints;
```

Description

Use Constraints to specify the minimum and maximum width and height of the control. When Constraints contains maximum or minimum values, the control cannot be resized to violate those constraints.

Note: Constraints apply to the height of the form. However, the height of the form depends on how large Windows makes the title bar. For example, Windows XP uses much larger title bars than other windowing systems. To work around this, note the ClientHeight when you design your form and set the constraints in the FormCreate event. In the following example, ClientHeight is represented by x: `Constraints.MinHeight := x + Height - ClientHeight`.

Warning: Do not set up constraints that conflict with the value of the Align or Anchors property. When these properties conflict, the response of the control to resize attempts is not well-defined.

See Also

AutoSize (see page 5803)

Align (see page 5798)

Anchors (see page 5802)

OnConstrainedResize (see page 5853)

OnCanResize (see page 5851)

47.1.3.5.14 TDBComboBox.Ctl3D Property

Determines whether a control has a three-dimensional (3-D) or two-dimensional look.

Pascal

```
property Ctl3D: Boolean;
```

C++

```
__property Boolean Ctl3D;
```

Description

Ctl3D is provided for backward compatibility. It is not used by 32-bit versions of Windows or NT4.0 and later, with the exception of Windows XP Home, where it is used on occasion.

On earlier platforms, Ctl3D controlled whether the control had a flat or beveled appearance.

See Also

ParentCtl3D (see page 6209)

BevelKind (see page 6193)

BevelInner (see page 6193)

BevelOuter (see page 6194)

BorderWidth (see page 6195)

47.1.3.5.15 TDBComboBox.DataField Property

Identifies the field from which the combo box displays data.

Pascal

```
property DataField: WideString;
```

C++

```
__property BSTR DataField;
```

Description

Set DataField to specify which field is represented by the combo box. (Note that this is does not refer to the source of the list, but to the field into which the selected value is inserted. The list values must be supplied manually using the Items (see page 8695) property.) The combo box displays the current value of this field, and allows the user to set the value of this field on the current record. The dataset the field is located in is specified by the DataSource (see page 8689) property.

```
DBComboBox1.DataField := 'CountryName';
DBComboBox1->DataField = "CountryName";
```

Tip: For a data-aware combo box component, where the list values are automatically supplied, use a TDBLookupComboBox (see page 8963) instead.

See Also

DataSource (see page 8689)

Field (see page 8692)

Items (see page 8695)

TDBLookupComboBox (see page 8963)

Using TDBListBox and TDBComboBox

47.1.3.5.16 TDBComboBox.DataSource Property

Links the combo box to a dataset.

Pascal

```
property DataSource: TDataSource;
```

C++

```
__property TDataSource DataSource;
```

Description

Specify the data source component that identifies the dataset in which the target field is found. To allow the combo box to represent the data for a field, both the DataSource and the DataField (see page 8688) properties must be set.

```
DBComboBox1.DataSource := DataSource1;
DBComboBox1->DataSource = DataSource1;
```

See Also

DataField (see page 8688)

Items (see page 8695)

47.1.3.5.17 TDBComboBox.DragCursor Property

Indicates the image used to represent the mouse pointer when the control is being dragged.

Pascal

```
property DragCursor: TCursor;
```

C++

```
__property TCursor DragCursor;
```

Description

Use the DragCursor property to change the cursor image presented when the control is being dragged.

Note: To make a custom cursor available for the DragCursor property, see the Cursor property.

See Also

Cursor (see page 5815)

DragKind (see page 5819)

DragMode (see page 5819)

47.1.3.5.18 TDBComboBox.DragKind Property

Specifies whether the control is being dragged normally or for docking.

Pascal

```
property DragKind: TDragKind;
```

C++

```
__property TDragKind DragKind;
```

Description

Use DragKind to get or set whether the control participates in drag-and-drop operations, or drag-and-dock operations.

See Also

DragCursor (see page 5818)

DragMode (see page 5819)

47.1.3.5.19 TDBComboBox.DragMode Property

Determines how the control initiates drag-and-drop or drag-and-dock operations.

Pascal

```
property DragMode: TDragMode;
```

C++

```
__property TDragMode DragMode;
```

Description

Use DragMode to control when the user can drag the control. Disable the drag-and-drop or drag-and-dock capability at runtime by setting the DragMode property value to dmManual. Enable automatic dragging by setting DragMode to dmAutomatic.

C++ Examples:

```
/*
The following code uses GetNodeAt to add a dragged node as a
child of the node under the mouse when it is dropped.  This
example requires a populated TreeView.  Also, the TTreeView
DragMode property set to dmAutomatic, and the TTreeView
OnDragOver event handler must be implemented to accept the
drop.
*/
void __fastcall TForm1::TreeView1DragDrop(TObject *Sender, TObject *Source,
      int X, int Y)
{
  if (Source != (TObject *)TreeView1 || TreeView1->Selected == NULL)
    return;
  THitTests HT = TreeView1->GetHitTestInfoAt(X, Y);
  TNodeAttachMode AttachMode;
  TTreeNode *Item = TreeView1->GetNodeAt(X, Y);
  if (HT.Contains(htOnItem) || HT.Contains(htOnIcon))
    AttachMode = naAddChild;
  else if (HT.Contains(htNowhere))
    AttachMode = naAdd;
  else if (HT.Contains(htOnIndent))
    AttachMode = naInsert;
  else
    return;
  TreeView1->Selected->MoveTo(Item, AttachMode);
}

void __fastcall TForm1::TreeView1DragOver(TObject *Sender, TObject *Source,
      int X, int Y, TDragState State, bool &Accept)
{
  Accept = (Source == (TObject *)TreeView1);
}
```

Delphi Examples:

```
{
The following code uses GetNodeAt to add a dragged node as a
child of the node under the mouse when it is dropped.  This
```

```
example requires a populated TreeView.  Also, the TTreeView
DragMode property set to dmAutomatic, and the TTreeView
OnDragOver event handler must be implemented to accept the
drop.
}
procedure TForm1.TreeView1DragDrop(Sender, Source: TObject; X, Y: Integer);
var
  AnItem: TTreeNode;
  AttachMode: TNodeAttachMode;
  HT: THitTests;
begin
  if TreeView1.Selected = nil then Exit;
  HT := TreeView1.GetHitTestInfoAt(X, Y);
  AnItem := TreeView1.GetNodeAt(X, Y);
  if (HT - [htOnItem, htOnIcon, htNowhere, htOnIndent] <> HT) then
  begin
    if (htOnItem in HT) or (htOnIcon in HT) then
      AttachMode := naAddChild
    else if htNowhere in HT then AttachMode := naAdd
    else if htOnIndent in HT then AttachMode := naInsert;
    TreeView1.Selected.MoveTo(AnItem, AttachMode);
  end;
end;

procedure TForm1.TreeView1DragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := Source is TTreeView;
end;
```

See Also

OnStartDrag (see page 5871)

DragKind (see page 5819)

Arranging the Order of Persistent Columns

47.1.3.5.20 TDBComboBox.DropDownCount Property

Specifies the maximum number of items displayed in the drop-down list.

Pascal

```
property DropDownCount: Integer;
```

C++

```
__property int DropDownCount;
```

Description

By default, the drop-down list is long enough to contain eight items without requiring the user to scroll to see them all. To make the drop-down list smaller or larger, specify a number larger or smaller than eight as the DropDownCount value.

If the DropDownCount value is larger than the number of items in the Items property, the drop-down list will be just large enough to hold all the possible choices and no more. If the DropDownCount value is smaller then the number of item in the Items property, the drop down list will display a scroll bar.

See Also

Items (see page 21187)

ItemCount (see page 21186)

47.1.3.5.21 TDBComboBox.Enabled Property

Controls whether the control responds to mouse, keyboard, and timer events.

Pascal

```
property Enabled: Boolean;
```

C++

```
__property Boolean Enabled;
```

Description

Use Enabled to change the availability of the control to the user. To disable a control, set Enabled to false. Disabled controls appear dimmed. If Enabled is false, the control ignores mouse, keyboard, and timer events.

To re-enable a control, set Enabled to true. The control is no longer dimmed, and the user can use the control.

See Also

Visible (see page 5847)

DisableControls (see page 6925)

EnableControls (see page 6934)

Enabling Mouse

47.1.3.5.22 TDBComboBox.Field Property

Identifies the TField object whose current value the combo box represents.

Pascal

```
property Field: TField;
```

C++

```
__property TField Field;
```

Description

Use the TField reference provided by the Field property when you want to change the value of the data in the field programmatically.

```
DBComboBox1.Field.AsString := 'Brazil';
DBComboBox1->Field->AsString = "Brazil";
```

See Also

DataField (see page 8688)

47.1.3.5.23 TDBComboBox.Font Property

Controls the attributes of text written on or in the control.

Pascal

```
property Font: TFont;
```

C++

```
__property TFont Font;
```

Description

To change to a new font, specify a new TFont object. To modify a font, change the value of the Charset, Color, Height, Name, Pitch, Size, or Style of the TFont object.

C++ Examples:

```
/*
To use this example, place a TComboBox and TRichEdit or
TMemo on a form.  During form creation, a list of font names
is loaded into the combo box. When the combo box is clicked,
the memo or Rich Edit control font is set to the
corresponding font name in the combo box.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < Screen->Fonts->Count; i++)
   ComboBox1->Items->Add(Screen->Fonts->Strings[i]);
//  ComboBox1->Items = Screen->Fonts;  // Another way to do it.
}

void __fastcall TForm1::ComboBox1Change(TObject *Sender)
{
  RichEdit1->Font->Name = ComboBox1->Text;
}
```

Delphi Examples:

```
{
To use this example, place a TComboBox and TRichEdit or
TMemo on a form.  During form creation, a list of font names
is loaded into the combo box. When the combo box is clicked,
the memo or Rich Edit control font is set to the
corresponding font name in the combo box.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  i : Integer;
begin
  for i := 0 to Screen.Fonts.Count - 1 do
   ComboBox1.Items.Add(Screen.Fonts.Strings[i]);
//  ComboBox1.Items := Screen.Fonts;  // Another way to do it.
  RichEdit1.Lines.Text := 'How is it to be you?';
end;

procedure TForm1.ComboBox1Click(Sender: TObject);
begin
  RichEdit1.Font.Name := ComboBox1.Text;
end;
```

DesktopFont (see page 5818)

ParentFont (see page 5834)

Displaying and Editing Text in a Memo Control

47.1.3.5.24 TDBComboBox.ImeMode Property

Determines the behavior of the input method editor (IME).

Pascal

```
property ImeMode: TImeMode;
```

C++

```
__property TImeMode ImeMode;
```

Description

Set ImeMode to configure the way an IME processes user keystrokes. An IME is a front-end input processor for Asian language characters. The IME hooks all keyboard input, converts it to Asian characters in a conversion window, and sends the converted characters or strings on to the application.

ImeMode allows a control to influence the type of conversion performed by the IME so that it is appropriate for the input expected by the control. For example, a control that only accepts numeric input might specify an ImeMode of imClose, as no conversion is necessary for numeric input.

Note: The value of ImeMode only takes effect when the control receives focus. To change the value of ImeMode when the control already has input focus, call the SetIme method.

See Also

ImeName (see page 6208)

ResetIme (see page 6174)

ResetImeComposition (see page 6175)

SetIme (see page 6181)

SetImeCompositionWindow (see page 6181)

47.1.3.5.25 TDBComboBox.ImeName Property

Specifies the input method editor (IME) to use for converting keyboard input to Asian language characters.

Pascal

```
property ImeName: TImeName;
```

C++

```
__property TImeName ImeName;
```

Description

Set ImeName to specify which IME to use for converting keystrokes. An IME is a front-end input processor for Asian language characters. The IME hooks all keyboard input, converts it to Asian characters in a conversion window, and sends the converted characters or strings on to the application.

ImeName must specify one of the IMEs that has been installed through the Windows control panel. The property inspector provides a drop-down list of all currently installed IMEs on the system. At runtime, applications can obtain a list of currently installed IMEs from the global Screen variable.

If ImeName specifies an unavailable IME, the IME that was active when the application started is used instead. No exception is generated.

Note: The value of ImeName only takes effect when the control receives focus. To change the value of ImeName after the control has input focus, call the SetIme method.

See Also

ImeMode (see page 6207)

ResetIme (see page 6174)

SetIme (see page 6181)

DefaultIme (see page 14216)

Imes (see page 14227)

47.1.3.5.26 TDBComboBox.ItemHeight Property

Specifies the height, in pixels, of the items in the drop-down list.

Pascal

```
property ItemHeight: Integer;
```

C++

```
__property int ItemHeight;
```

Description

Read ItemHeight to determine the height of the items in the drop-down list.

The effect of setting ItemHeight varies, depending on the type of combo box and the style. For example, TComboBox lets you set the item height only when Style is set to csOwnerDrawFixed or csOwnerDrawVariable. If Style is csOwnerDrawVariable, ItemHeight is the default height for drawing list items, but this value can be overridden by an OnMeasureItem event handler.

TComboBoxEx does not let you change the value of ItemHeight.

Note: Combo boxes that do not support changes to ItemHeight do not raise an exception when you attempt to change ItemHeight; they simply ignore the attempt.

See Also

Items (see page 21187)

OnMeasureItem (see page 21225)

Style (see page 21224)

47.1.3.5.27 TDBComboBox.Items Property

Contains the strings that appear in the list of the database combo box.

Pascal

```
property Items: TStrings;
```

C++

```
__property TStrings Items;
```

Description

Use Items to supply the values in the list from which the user can choose. Because Items is an object of type TStrings, you can add, delete, insert, and move items using the Add, Delete, Insert, Exchange, and Move methods of the TStrings object. For example, to add each string to the combo box list, write code such as the following:

while not CountryTbl.Eof do begin

```
DBComboBox1.Items.Add(CountryTbl.FieldByName('Country').AsString);
CountryTbl.Next;
```

end;

while (!CountryTbl->Eof)

```
{
  DBComboBox1->Items->Add(CountryTbl->FieldByName("Country")->AsString);
  CountryTbl->Next();
}
```

The ItemIndex property determines which item is selected, if any.

See Also

ItemIndex

47.1.3.5.28 TDBComboBox.ParentBiDiMode Property

Specifies whether the control uses its parent's BiDiMode.

Pascal

```
property ParentBiDiMode: Boolean;
```

C++

```
__property Boolean ParentBiDiMode;
```

Description

Use ParentBiDiMode to get or set whether the control uses its parent's BiDiMode. When ParentBiDiMode is true, the control's BiDiMode property is always equal to that of its parent. If ParentBiDiMode is false, the control uses its own BiDiMode property.

Set ParentBiDiMode to true for all controls in a form in order to ensure that the entire user interface adjusts to Middle Eastern locales in a uniform manner.

When the value of the control's BiDiMode property changes, ParentBiDiMode becomes false automatically.

See Also

Parent (see page 5832)

BiDiMode (see page 5803)

47.1.3.5.29 TDBComboBox.ParentColor Property

Determines where a control looks for its color information.

Pascal

```
property ParentColor: Boolean;
```

C++

```
__property Boolean ParentColor;
```

Description

To have a control use the same color as its parent control, set ParentColor to true. If ParentColor is false, the control uses its own Color property.

Set ParentColor to true for all controls in order to ensure that all the controls on a form have a uniform appearance. For example, if ParentColor is true for all controls in a form, changing the background color of the form to gray causes all the controls on the

form to also have a gray background.

When the value of a control's Color property changes, ParentColor becomes false automatically.

See Also

Color (see page 5812)

Parent (see page 5832)

ParentFont (see page 5834)

ParentShowHint (see page 5835)

47.1.3.5.30 TDBComboBox.ParentCtl3D Property

Determines where a component looks to determine if it should appear three dimensional.

Pascal

```
property ParentCtl3D: Boolean;
```

C++

```
__property Boolean ParentCtl3D;
```

Description

ParentCtl3D is provided for backwards compatibility. It has no effect on 32-bit versions of Windows or NT 4.0 and later.

ParentCtl3D determines whether the control uses its parent's Ctl3D property.

See Also

Ctl3D (see page 6198)

47.1.3.5.31 TDBComboBox.ParentFont Property

Determines where a control looks for its font information.

Pascal

```
property ParentFont: Boolean;
```

C++

```
__property Boolean ParentFont;
```

Description

To have a control use the same font as its parent control, set ParentFont to true. If ParentFont is false, the control uses its own Font property. Many controls default ParentFont to true so that all the controls in a form or other container present a uniform appearance. When the value of a control's Font property changes, ParentFont becomes false automatically.

When ParentFont is true for a form, the form uses the default font.

See Also

Font (see page 5823)

ParentColor (see page 5834)

ParentShowHint (see page 5835)

47.1.3.5.32 TDBComboBox.ParentShowHint Property

Determines where a control looks to find out if its Help Hint should be shown.

Pascal

```
property ParentShowHint: Boolean;
```

C++

```
__property Boolean ParentShowHint;
```

Description

Use ParentShowHint to ensure that all the controls on a form either uniformly show their Help Hints or uniformly do not show them.

If ParentShowHint is true, the control uses the ShowHint property value of its parent. If ParentShowHint is false, the control uses the value of its own ShowHint property.

To provide Help Hints for only selected controls on a form, set the ShowHint property for those controls that should have Help Hints to true, and ParentShowHint becomes false automatically.

Note: Enable or disable all Help Hints for the entire application using the ShowHint property of the application object.

47.1.3.5.33 TDBComboBox.PopupMenu Property

Identifies the pop-up menu associated with the control.

Pascal

```
property PopupMenu: TPopupMenu;
```

C++

```
__property TPopupMenu PopupMenu;
```

Description

Assign a value to PopupMenu to make a pop-up menu appear when the user selects the control and clicks the right mouse button. If the TPopupMenu's AutoPopup property is true, the pop-up menu appears automatically. If the menu's AutoPopup property is false, display the menu with a call to its Popup method from the control's OnContextPopup event handler.

C++ Examples:

```
/*
This example uses two edit boxes and one pop-up menu on a form.
The pop-up menu contains Cut, Copy, and Paste commands. This code
makes the pop-up menu available to both edit boxes:
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  PopupMenu1->AutoPopup = true;
  Edit1->PopupMenu = PopupMenu1;
```

```
  Edit2->PopupMenu = PopupMenu1;
}

/*
These are the cut, copy, and paste OnClick events for the commands
on the pop-up menu. Double click on the pop-up menu and add three
TMenuItems.  Then set the captions to "Cut", "Copy" and "Paste".
The names will be automatically set to "Cut1", "Copy1", and
"Paste1".  Then double click on the OnClick events and they will
be named "Cut1Click", "Copy1Click" and "Paste1Click" respectively.
Note: only the selected portion of the string in the edit box will
be copied, cut or replaced.
*/
void __fastcall TForm1::Copy1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
    if (pComponent->ClassNameIs("TEdit"))
      ((TEdit *)pComponent)->CopyToClipboard();
    else
      MessageBeep(0);
  }
  else
    MessageBeep(0);
}

void __fastcall TForm1::Cut1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
    if (pComponent->ClassNameIs("TEdit"))
      ((TEdit *)pComponent)->CutToClipboard();
    else
      MessageBeep(0);
  }
  else
    MessageBeep(0);
}

void __fastcall TForm1::Paste1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
    if (pComponent->ClassNameIs("TEdit"))
      ((TEdit *)pComponent)->PasteFromClipboard();
    else
      MessageBeep(0);
  }
  else
    MessageBeep(0);
}
/*
This example demonstrates how to add and delete menu items
to a popup menu at runtime and assign an event handler to
the OnClick event.  Place a TPopupMenu and three buttons on
the form named "AddButton", "EditButton",  and
"DestroyButton" and add OnClick events to all three buttons.
Put the TPopupMenu in the PopupMenu property of the form.
Place the PopupMenuItemsClick procedure in the TForm1 type
declaration so that it can be used as the method call for
the menu item OnClick event.
*/
void __fastcall TForm1::AddButtonClick(TObject *Sender)
```

```
{
    const int num_items = 4;
    for (int index = 0; index < num_items; ++index)
    {
        TMenuItem *NewItem = new TMenuItem(PopupMenu1); // create the new item
        PopupMenu1->Items->Add(NewItem);// add it to the Popupmenu
        NewItem->Caption = "Menu Item " + IntToStr(index);
        NewItem->Tag = index;
        NewItem->OnClick = PopupMenuItemsClick;// assign it an event handler
        TNotifyEvent();
    }
}

void __fastcall TForm1::PopupMenuItemsClick(TObject *Sender)
{
    TMenuItem *ClickedItem = dynamic_cast<TMenuItem *>(Sender);
    if (ClickedItem)
    {
        switch (ClickedItem->Tag)
        {
            case 0:
            {
                ShowMessage("first item clicked");
                break;
            }
            case 1:
            {
                ShowMessage("second item clicked");
                break;
            }
            case 2:
            {
                ShowMessage("third item clicked");
                break;
            }
            case 3:
            {
                ShowMessage("fourth item clicked");
                break;
            }
        }
    }
}

/*
To edit or destroy an item, grab its pointer via the Items
property.
*/
void __fastcall TForm1::EditButtonClick(TObject *Sender)
{
    const int index = 1;
    TMenuItem *ItemToEdit = PopupMenu->Items->Items[index];
    ItemToEdit->Caption = "Changed Caption";
}

void __fastcall TForm1::DestroyButtonClick(TObject *Sender)
{
    const int index = 2;
    TMenuItem *ItemToDelete = PopupMenu->Items->Items[index];
    delete ItemToDelete;
}
```

Delphi Examples:

```
{
This example uses two edit boxes and one pop-up menu on a form.
The pop-up menu contains Cut, Copy, and Paste commands. This code
```

```
makes the pop-up menu available to both edit boxes:
}
procedure TForm1.FormCreate(Sender: TObject);
begin
  PopupMenu1.AutoPopup := True;
  Edit1.PopupMenu := PopupMenu1;
  Edit2.PopupMenu := PopupMenu1;
end;

{
These are the cut, copy, and paste OnClick events for the commands
on the pop-up menu. Double click on the pop-up menu and add three
TMenuItems.  Then set the captions to "Cut", "Copy" and "Paste".
The names will be automatically set to "Cut1", "Copy1", and
"Paste1".  Then double click on the OnClick events and they will
be named "Cut1Click", "Copy1Click" and "Paste1Click" respectively.
Note: only the selected portion of the string in the edit box will
be copied, cut or replaced.
}
procedure TForm1.Copy1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
   Edit1.CopyToClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.CopyToClipboard
  else
    Beep;
end;

procedure TForm1.Cut1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
    Edit1.CutToClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.CutToClipboard
  else
    Beep;
end;

procedure TForm1.Paste1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
    Edit1.PasteFromClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.PasteFromClipboard
  else
    Beep;
end;
{
This example demonstrates how to add and delete menu items
to a popup menu at runtime and assign an event handler to
the OnClick event.  Place a TPopupMenu and three buttons on
the form named "AddButton", "EditButton",  and
"DestroyButton" and add OnClick events to all three buttons.
Put the TPopupMenu in the PopupMenu property of the form.
Place the PopupMenuItemsClick procedure in the TForm1 type
declaration so that it can be used as the method call for
the menu item OnClick event.
}

type
  TForm1 = class(TForm)
    AddButton: TButton;
    EditButton: TButton;

47.1.3.5.34 TDBComboBox.ReadOnly Property

Determines if the user can change the value of the field.

Pascal

```
property ReadOnly: Boolean;
```

C++

```
__property Boolean ReadOnly;
```

Description

Set ReadOnly to specify whether the combo box should be used for display purposes only. If ReadOnly is true, the combo box can only be used to display the value of the field on the current record. If ReadOnly is false, the user can use the combo box to edit the field's value.

Field (see page 8692)

Edit (see page 6932)

47.1.3.5.35 TDBComboBox.ShowHint Property

Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.

Pascal

```
property ShowHint: Boolean;
```

C++

```
__property Boolean ShowHint;
```

Description

The Help Hint is the value of the Hint property, which is displayed in a box just beneath the control. Use ShowHint to determine whether a Help Hint appears for the control.

To enable Help Hint for a particular control, the application ShowHint property must be true and either

the control's own ShowHint property must be true, or

the control's ParentShowHint property must be true and its parent's ShowHint property must be true.

For example, imagine a check box within a group box. If the ShowHint property of the group box is true and the ParentShowHint property of the check box is true, but the ShowHint property of the check box is false, the check box still displays its Help Hint.

Changing the ShowHint value automatically sets the ParentShowHint property to false.

C++ Examples:

```
/*
This example uses an edit box and a list box on a form.
Items are added to the list box and a Help Hint is assigned
```

```
to both controls. The last statement enables the Help Hints
for the entire application.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  Edit1->Hint = "Enter your name";
  Edit1->ShowHint = true;

  char string[10];
  char index[3];
  for(int i = 1; i <= 10; i++)
  {
    strcpy(string, "Item");
    itoa(i, index, 10);
    strcat(string, index);
    ListBox1->Items->Add(string);
  }
  ListBox1->Hint = "Select an item";
  ListBox1->ShowHint = true;
  Application->ShowHint = true;
}
/*
Note: To see an example that displays the hints of controls
in some place other than in a Help Hint box, see the OnHint
example.
*/
```

Delphi Examples:

```
{
This example uses an edit box and a list box on a form.
Items are added to the list box and a Help Hint is assigned
to both controls. The last statement enables the Help Hints
for the entire application.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  I: Integer;
begin
  Edit1.Hint := 'Enter your name';
  Edit1.ShowHint := True;
  with ListBox1 do
  begin
    for I := 1 to 10 do
      Items.Add('Item ' + IntToStr(I));
    Hint := 'Select an item';
    ShowHint := True;
  end;
  Application.ShowHint := True;
end;
{
Note: To see an example that displays the hints of controls
in some place other than in a Help Hint box, see the OnHint
example.
}

Displaying Fly-over Help

47.1.3.5.36 TDBComboBox.Sorted Property

Determines whether the list portion of the combo box is alphabetized.

Pascal

```
property Sorted: Boolean;
```

C++

```
__property Boolean Sorted;
```

Description

Set Sorted to true to sort the items in the Items list alphabetically. New items added to the list while Sorted is true are inserted in the correct alphabetical position.

When Sorted is changed from false to true, the original order of the items is lost. Setting Sorted back to false does not restore the original order.

C++ Examples:

```
/*
This example fills the list of a combo box with the set of
open forms when the user drops down the list. The list is
regenerated every time the list is dropped down, so if the
application opens or closes forms, the combo box stays current.
*/
#include "Unit2.h"
#include "Unit3.h"

void __fastcall TForm1::ComboBox1DropDown(TObject *Sender)
{
  ComboBox1->Items->BeginUpdate(); // prevent repaints until done
  ComboBox1->Items->Clear(); // empty the list of any old values
  for (int i = 0; i < Screen->CustomFormCount; i++)
  {
    if (((TForm1 *)Screen->CustomForms[i])->Visible)
      ComboBox1->Items->Add(Screen->CustomForms[i]->Caption);  // add form names
  }
  ComboBox1->Items->EndUpdate(); //reenable painting
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  ComboBox1->Sorted = True; // make sure the form names are sorted
}

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  Form2->Show();
}

void __fastcall TForm1::Button2Click(TObject *Sender)
{
  Form3->Show();
}
```

Delphi Examples:

```
{
This example fills the list of a combo box with the set of
open forms when the user drops down the list. The list is
regenerated every time the list is dropped down, so if the
application opens or closes forms, the combo box stays current.
}
```

```
procedure TForm1.ComboBox1DropDown(Sender: TObject);
var
  I: Integer;
begin
  with ComboBox1 do
  begin
    Items.BeginUpdate; { prevent repaints until done }
    Items.Clear; { empty the list of any old values }
    for I := 0 to Screen.CustomFormCount - 1 do
    begin
      if (Screen.CustomForms[I].Visible) then
        Items.Add(Screen.CustomForms[I].Caption); { add form name }
    end;
    Items.EndUpdate; {reenable painting }
  end;
end;

procedure TForm1.FormCreate(Sender: TObject);
begin
  ComboBox1.Sorted := True; { make sure the form names are sorted }
end;

procedure TForm1.Button1Click(Sender: TObject);
begin
  Form2.Show;
end;

procedure TForm1.Button2Click(Sender: TObject);
begin
  Form3.Show;
end;
```

Items

Using TDBListBox and TDBComboBox

47.1.3.5.37 TDBComboBox.Style Property

Determines how the combo box displays its items.

Pascal

```
property Style: TComboBoxStyle;
```

C++

```
__property TComboBoxStyle Style;
```

Description

Use Style to specify whether the user can type values into the edit region as well as select values from the list, whether the list drops down when the user clicks a button or if it is always displayed, whether the list is owner-drawn, and so on. By default, Style is csDropDown, meaning that the combo box displays each item as a string in a drop-down list, and that users can edit the value in the edit region. Style can be any of the values: csDropDown, csSimple, csDropDownList, csOwnerDrawFixed, and csOwnerDrawVariable.

Owner-draw combo boxes can display items other than strings. For example, a combo box could display graphical images along with or instead of its strings. Owner-draw combo boxes require more programming, however, as the application must render the image for each item in the list.

When Style is csOwnerDrawFixed or csOwnerDrawVariable, the OnDrawItem (see page 8720) event occurs when the list items need to be drawn. If Style is csOwnerDrawVariable, an OnMeasureItem (see page 8733) event occurs as well.
