55.1.14.4.4 TDBXConnectionEx.ProductVersion Property

Product version.

Pascal

```
property ProductVersion: WideString;
```

C++

```
__property BSTR ProductVersion;
```

Description

Returns empty string if not implemented. Otherwise a string is returned with the format nn.nn.nnnn, where the first two digits are the major version, the second two digits are the minor version, and the last four digits are the release version. This value can be overridden by setting the TDBXPropertyNamesEx.ProductVersion connection property. Note that TDBXPropertyNamesEx.ProductVersion is the name of the property, not the property itself.

See Also

TDBXPropertyNamesEx (see page 10574)

55.1.15 TDBXConnectionFactory Class

Abstract base class used for creating new instances of TDBXConnection (see page 10398)

Class Hierarchy

Pascal

```
TDBXConnectionFactory = class;
```

C++

```
class TDBXConnectionFactory;
```

File

DBXCommon

Description

This abstract base class can be used for creating new instances of TDBXConnection (see page 10398).

TDBXConnection.GetConnectionFactory (see page 10427) is a class static method that returns a TDBXConnectionFactory singleton. This singleton instance defaults to the TDBXIniFileConnectionFactory (see page 10501) class. The dbxconnections.ini and dbxdrivers.ini files are loaded from the file names specified under the HKEY_CURRENT_USER\TDBXRegistryKey (see page 10684) windows registry setting. If this registry key is not set, the ini files are loaded from the location of the application's executable.

A TDBXConnectionFactory manages a collection of named driver and connection property sets. A separate TDBXProperties (see page 10559) object is used for each driver and connection property set. The driver properties contain enough information to load and instantiate a driver implementation. The connection properties include driver properties and contain enough information to instantiate a connection.

Connecting to a Database using the dbExpress Driver Framework

TDBXConnection (see page 10398)

TDBXIniFileConnectionFactory (see page 10501)

TDBXProperties (see page 10559)

GetConnectionFactory (see page 10427)

55.1.15.1 TDBXConnectionFactory Members

The following tables list the members exposed by TDBXConnectionFactory.

Protected Methods

	Name	Description
	DerivedClose (see page 10426)	This is DerivedClose, a member of class TDBXConnectionFactory.
	DerivedOpen (see page 10426)	This is DerivedOpen, a member of class TDBXConnectionFactory.
	GetErrorEvent (see page 10429)	This is GetErrorEvent, a member of class TDBXConnectionFactory.
	GetTraceFlags (see page 10429)	This is GetTraceFlags, a member of class TDBXConnectionFactory.
	GetTraceInfoEvent (see page 10429)	This is GetTraceInfoEvent, a member of class TDBXConnectionFactory.
	SetErrorEvent (see page 10430)	This is SetErrorEvent, a member of class TDBXConnectionFactory.
	SetTraceFlags (see page 10430)	This is SetTraceFlags, a member of class TDBXConnectionFactory.
	SetTraceInfoEvent (see page 10431)	This is SetTraceInfoEvent, a member of class TDBXConnectionFactory.

Public Events

	Name	Description
	OnError (see page 10432)	TDBXErrorEvent (see page 10671) handler.
	OnTrace (see page 10432)	TDBXTraceInfoEvent handler.

Public Methods

	Name	Description
	Close (see page 10425)	Closes the factory.
	Create (see page 10423)	Creates an instance of TDBXConnectionFactory (see page 10422)
	Destroy (see page 10424)	Destroys a TDBXConnectionFactory (see page 10422)
	GetConnection (see page 10426)	This is the overview for the GetConnection method overload.
	GetConnectionDriver (see page 10427)	Gets a TDBXDriver (see page 10472) instance for a connection name
	GetConnectionFactory (see page 10427)	Gets a TDBXConnectionFactory (see page 10422) singleton
	GetConnectionItems (see page 10428)	Adds names of all connections to Items list.
	GetConnectionProperties (see page 10428)	Gets a TDBXPropertiesinstance for a connection name
	GetDriver (see page 10428)	Returns TDBXDriver (see page 10472) instance for a driver name
	GetDriverProperties (see page 10429)	Returns TDBXProperties (see page 10559) instance of driver properties
	Open (see page 10430)	Opens the TDBXConnectionFactory (see page 10422)
	SetConnectionFactory (see page 10430)	Change the default TDBXConnectionFactorysingleton

Public Properties

	Name	Description
	TraceFlags (see page 10431)	Trace flags to enable or disable tracing categories

Strict protected Fields

	Name	Description
	FDBXContext (see page 10424)	This is FDBXContext, a member of class TDBXConnectionFactory.

Strict protected Methods

	Name	Description
	CreateDelegatePaths (see page 10426)	This is CreateDelegatePaths, a member of class TDBXConnectionFactory.

55.1.15.2 TDBXConnectionFactory.Create Constructor

Creates an instance of TDBXConnectionFactory (see page 10422)

Pascal

```
constructor Create;
```

C++

```
__fastcall TDBXConnectionFactory();
```

Description

This constructor creates and initializes an instance of TDBXConnectionFactory (see page 10422). You can create a new TDBXConnection (see page 10398) object from this object that allows you to connect to a database. The dbxconnections.ini and dbxdrivers.ini files can specify all the information about the database connection for TDBXConnectionFactory (see page 10422) to create the connection.

See Also

Connecting to a Database using the dbExpress Driver Framework

TDBXConnection (see page 10398)

55.1.15.3 TDBXConnectionFactory.Destroy Destructor

Destroys a TDBXConnectionFactory (see page 10422)

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TDBXConnectionFactory();
```

Description

This destructor destroys an instance of TDBXConnectionFactory (see page 10422).

55.1.15.4 TDBXConnectionFactory Fields

The fields of the TDBXConnectionFactory class are listed here.

Strict protected Fields

	Name	Description
	FDBXContext (see page 10424)	This is FDBXContext, a member of class TDBXConnectionFactory.

55.1.15.4.1 TDBXConnectionFactory.FDBXContext Field

Pascal

```
FDBXContext: TDBXContext;
```

C++

```
TDBXContext FDBXContext;
```

Description

This is FDBXContext, a member of class TDBXConnectionFactory.

55.1.15.5 TDBXConnectionFactory Methods

The methods of the TDBXConnectionFactory class are listed here.

Protected Methods

	Name	Description
	DerivedClose (see page 10426)	This is DerivedClose, a member of class TDBXConnectionFactory.
	DerivedOpen (see page 10426)	This is DerivedOpen, a member of class TDBXConnectionFactory.
	GetErrorEvent (see page 10429)	This is GetErrorEvent, a member of class TDBXConnectionFactory.
	GetTraceFlags (see page 10429)	This is GetTraceFlags, a member of class TDBXConnectionFactory.
	GetTraceInfoEvent (see page 10429)	This is GetTraceInfoEvent, a member of class TDBXConnectionFactory.
	SetErrorEvent (see page 10430)	This is SetErrorEvent, a member of class TDBXConnectionFactory.
	SetTraceFlags (see page 10430)	This is SetTraceFlags, a member of class TDBXConnectionFactory.
	SetTraceInfoEvent (see page 10431)	This is SetTraceInfoEvent, a member of class TDBXConnectionFactory.

Public Methods

	Name	Description
	Close (see page 10425)	Closes the factory.
	GetConnection (see page 10426)	This is the overview for the GetConnection method overload.
	GetConnectionDriver (see page 10427)	Gets a TDBXDriver (see page 10472) instance for a connection name
	GetConnectionFactory (see page 10427)	Gets a TDBXConnectionFactory (see page 10422) singleton
	GetConnectionItems (see page 10428)	Adds names of all connections to Items list.
	GetConnectionProperties (see page 10428)	Gets a TDBXPropertiesinstance for a connection name
	GetDriver (see page 10428)	Returns TDBXDriver (see page 10472) instance for a driver name
	GetDriverProperties (see page 10429)	Returns TDBXProperties (see page 10559) instance of driver properties
	Open (see page 10430)	Opens the TDBXConnectionFactory (see page 10422)
	SetConnectionFactory (see page 10430)	Change the default TDBXConnectionFactorysingleton

Strict protected Methods

	Name	Description
	CreateDelegatePaths (see page 10426)	This is CreateDelegatePaths, a member of class TDBXConnectionFactory.

55.1.15.5.1 TDBXConnectionFactory.Close Method

Closes the factory.

Pascal

```
procedure Close; virtual;
```

C++

```
virtual __fastcall Close();
```

Description

This method closes the TDBXConnectionFactory (see page 10422). A call to Close then Open (see page 10430) reloads the contents of a TDBXConnectionFactory (see page 10422).

See Also

Open (see page 10430)

55.1.15.5.2 TDBXConnectionFactory.CreateDelegatePaths Method

Pascal

```
procedure CreateDelegatePaths;
```

C++

```
__fastcall CreateDelegatePaths();
```

Description

This is CreateDelegatePaths, a member of class TDBXConnectionFactory.

55.1.15.5.3 TDBXConnectionFactory.DerivedClose Method

Pascal

```
procedure DerivedClose; virtual; abstract;
```

C++

```
virtual __fastcall DerivedClose() = 0;
```

Description

This is DerivedClose, a member of class TDBXConnectionFactory.

55.1.15.5.4 TDBXConnectionFactory.DerivedOpen Method

Pascal

```
procedure DerivedOpen; virtual; abstract;
```

C++

```
virtual __fastcall DerivedOpen() = 0;
```

Description

This is DerivedOpen, a member of class TDBXConnectionFactory.

55.1.15.5.5 GetConnection Method

This is the overview for the GetConnection method overload.

Overload List

	Name	Description
	TDBXConnectionFactory.GetConnection (TDBXProperties) (see page 10426)	Creates a TDBXConnection (see page 10398) instance for connecting to a database
	TDBXConnectionFactory.GetConnection (WideString, WideString, WideString) (see page 10426)	Creates a TDBXConnection (see page 10398) instance for connecting to a database

55.1.15.5.5.1 TDBXConnectionFactory.GetConnection Method (TDBXProperties)

Creates a TDBXConnection (see page 10398) instance for connecting to a database

Pascal

```
function GetConnection(const ConnectionName: WideString; const UserName: WideString; const
Password: WideString): TDBXConnection; overload;
function GetConnection(ConnectionProperties: TDBXProperties): TDBXConnection; overload;
```

C++

```
__fastcall TDBXConnection GetConnection(const BSTR ConnectionName, const BSTR UserName, const
BSTR Password);
__fastcall TDBXConnection GetConnection(TDBXProperties ConnectionProperties);
```

Description

This method creates a TDBXConnection (see page 10398) instance for connecting to a database.

If the **UserName** parameter is an empty string, then **ConnectionName**'s associated TDBXProperties (see page 10559) setting for TDBXPropertyNamesUserName is used.

If the **Password**parameter is an empty string, then **ConnectionName**'s associated TDBXProperties (see page 10559) setting for TDBXPropertyNamesPassword is used.

Note: Call TDBXDriver.Freewhen the TDBXConnection (see page 10398) is no longer needed.

See Also

Connecting to a Database using the dbExpress Driver Framework

TDBXConnection (see page 10398)

TDBXProperties (see page 10559)

TDBXPropertyNames (see page 10566)

UserName (see page 10574)

Password (see page 10573)

55.1.15.5.6 TDBXConnectionFactory.GetConnectionDriver Method

Gets a TDBXDriver (see page 10472) instance for a connection name

Pascal

```
function GetConnectionDriver(const ConnectionName: WideString): TDBXDelegateDriver; overload;
```

C++

```
__fastcall TDBXDelegateDriver GetConnectionDriver(const BSTR ConnectionName);
```

Description

This method gets the associated TDBXDriver (see page 10472) instance for the supplied **ConnectionName**.

Note: Call TDBXDriver.Free when the TDBXDriver (see page 10472) is no longer needed.

See Also

TDBXDriver (see page 10472)

55.1.15.5.7 TDBXConnectionFactory.GetConnectionFactory Method

Gets a TDBXConnectionFactory (see page 10422) singleton

Pascal

```
class function GetConnectionFactory: TDBXConnectionFactory; static;
```

C++

```
static __fastcall TDBXConnectionFactory GetConnectionFactory();
```

Description

This method returns a class static TDBXConnectionFactory (see page 10422) singleton that can be used to create new TDBXConnection (see page 10398) instances.

See Also

TDBXConnection (see page 10398)

TDBXConnectionFactory (see page 10422)

55.1.15.5.8 TDBXConnectionFactory.GetConnectionItems Method

Adds names of all connections to Items list.

Pascal

```
procedure GetConnectionItems(Items: TStrings);
```

C++

```
__fastcall GetConnectionItems(TStrings Items);
```

Description

This method adds the names of all connections in the TDBXConnectionFactory (see page 10422) to the Items list.

55.1.15.5.9 TDBXConnectionFactory.GetConnectionProperties Method

Gets a TDBXPropertiesinstance for a connection name

Pascal

```
function GetConnectionProperties(const ConnectionName: WideString): TDBXProperties;
```

C++

```
__fastcall TDBXProperties GetConnectionProperties(const BSTR ConnectionName);
```

Description

This method returns a TDBXProperties (see page 10559) instance describing the connection properties for the given **ConnectionName**.

See Also

TDBXProperties (see page 10559)

55.1.15.5.10 TDBXConnectionFactory.GetDriver Method

Returns TDBXDriver (see page 10472) instance for a driver name

Pascal

```
function GetDriver(const DriverName: WideString): TDBXDriver; overload;
```

C++

```
__fastcall TDBXDriver GetDriver(const BSTR DriverName);
```

Description

This method returns a TDBXDriver (see page 10472) instance for the **DriverName** parameter.

Note: Call TDBXDriver.Free when the returned value is no longer needed.

See Also

TDBXDriver (see page 10472)

55.1.15.5.11 TDBXConnectionFactory.GetDriverProperties Method

Returns TDBXProperties (see page 10559) instance of driver properties

Pascal

```
function GetDriverProperties(const DriverName: WideString): TDBXProperties;
```

C++

```
__fastcall TDBXProperties GetDriverProperties(const BSTR DriverName);
```

Description

This method returns a TDBXProperties (see page 10559) instance of driver properties for the **DriverName** parameter.

See Also

TDBXProperties (see page 10559)

55.1.15.5.12 TDBXConnectionFactory.GetErrorEvent Method

Pascal

```
function GetErrorEvent: TDBXErrorEvent; virtual;
```

C++

```
virtual __fastcall TDBXErrorEvent GetErrorEvent();
```

Description

This is GetErrorEvent, a member of class TDBXConnectionFactory.

55.1.15.5.13 TDBXConnectionFactory.GetTraceFlags Method

Pascal

```
function GetTraceFlags: TDBXTraceFlag; virtual;
```

C++

```
virtual __fastcall TDBXTraceFlag GetTraceFlags();
```

Description

This is GetTraceFlags, a member of class TDBXConnectionFactory.

55.1.15.5.14 TDBXConnectionFactory.GetTraceInfoEvent Method

Pascal

```
function GetTraceInfoEvent: TDBXTraceEvent; virtual;
```

C++

```
virtual __fastcall TDBXTraceEvent GetTraceInfoEvent();
```

Description

This is GetTraceInfoEvent, a member of class TDBXConnectionFactory.

55.1.15.5.15 TDBXConnectionFactory.Open Method

Opens the TDBXConnectionFactory (see page 10422)

Pascal

```
procedure Open; virtual;
```

C++

```
virtual __fastcall Open();
```

Description

This method opens the TDBXConnectionFactory (see page 10422) instance, making it ready for use.

55.1.15.5.16 TDBXConnectionFactory.SetConnectionFactory Method

Change the default TDBXConnectionFactorysingleton

Pascal

```
class procedure SetConnectionFactory(ConnectionFactory: TDBXConnectionFactory); static;
```

C++

```
static __fastcall SetConnectionFactory(TDBXConnectionFactory ConnectionFactory);
```

Description

This method changes the default TDBXConnectionFactory (see page 10422) singleton that is returned by the GetConnectionFactoryclass static method.

Note: This method can be called only once, when an application is initialized.

See Also

GetConnectionFactory (see page 10427)

55.1.15.5.17 TDBXConnectionFactory.SetErrorEvent Method

Pascal

```
procedure SetErrorEvent(ErrorEvent: TDBXErrorEvent); virtual;
```

C++

```
virtual __fastcall SetErrorEvent(TDBXErrorEvent ErrorEvent);
```

Description

This is SetErrorEvent, a member of class TDBXConnectionFactory.

55.1.15.5.18 TDBXConnectionFactory.SetTraceFlags Method

Pascal

```
procedure SetTraceFlags(TraceFlags: TDBXTraceFlag); virtual;
```

C++

```
virtual __fastcall SetTraceFlags(TDBXTraceFlag TraceFlags);
```

Description

This is SetTraceFlags, a member of class TDBXConnectionFactory.

55.1.15.5.19 TDBXConnectionFactory.SetTraceInfoEvent Method

Pascal

```
procedure SetTraceInfoEvent(TraceInfoEvent: TDBXTraceEvent); virtual;
```

C++

```
virtual __fastcall SetTraceInfoEvent(TDBXTraceEvent TraceInfoEvent);
```

Description

This is SetTraceInfoEvent, a member of class TDBXConnectionFactory.

55.1.15.6 TDBXConnectionFactory Properties

The properties of the TDBXConnectionFactory class are listed here.

Public Properties

	Name	Description
	TraceFlags (see page 10431)	Trace flags to enable or disable tracing categories

55.1.15.6.1 TDBXConnectionFactory.TraceFlags Property

Trace flags to enable or disable tracing categories

Pascal

```
property TraceFlags: TDBXTraceFlag;
```

C++

```
__property TDBXTraceFlag TraceFlags;
```

Description

This property contains the TDBXTraceFlags (see page 10617) for which tracing should be enabled. This value is a logical OR of the trace flags in the TDBXTraceFlags (see page 10617) class.

See Also

TDBXTraceFlags (see page 10617)

55.1.15.7 TDBXConnectionFactory Events

The events of the TDBXConnectionFactory class are listed here.

Public Events

	Name	Description
	OnError (see page 10432)	TDBXErrorEvent (see page 10671) handler.
	OnTrace (see page 10432)	TDBXTraceInfoEvent handler.

55.1.15.7.1 TDBXConnectionFactory.OnError Event

TDBXErrorEvent (see page 10671) handler.

Pascal

```
property OnError: TDBXErrorEvent;
```

C++

```
__property TDBXErrorEvent OnError;
```

Description

The TDBXErrorEvent (see page 10671) handler is called before a TDBXError (see page 10486) exception is raised. This TDBXErrorEvent (see page 10671) is propagated to all TDBXConnection (see page 10398) and TDBXDriver (see page 10472) instances created by this TDBXConnectionFactory (see page 10422).

See Also

TDBXConnection (see page 10398)

TDBXDriver (see page 10472)

TDBXError (see page 10486)

TDBXErrorEvent (see page 10671)

55.1.15.7.2 TDBXConnectionFactory.OnTrace Event

TDBXTraceInfoEvent handler.

Pascal

```
property OnTrace: TDBXTraceEvent;
```

C++

```
__property TDBXTraceEvent OnTrace;
```

Description

The TDBXTraceInfoEvent handler is called for driver trace events. This TDBXTraceInfoEvent is propagated to all TDBXConnection (see page 10398) and TDBXDriver (see page 10472) instances created by this TDBXConnectionFactory (see page 10422).

See Also

TDBXConnection (see page 10398)

TDBXDriver (see page 10472)

TDBXTraceInfoEvent

55.1.16 TDBXContext Class

Context information for a connection.

Class Hierarchy

Pascal

```
TDBXContext = class;
```

C++

```
class TDBXContext;
```

File

DBXCommon

Description

This class holds context information mostly of use to dbExpress driver writers. Access to a TDBXContext instance should not be provided to applications using the dbExpress driver framework. A TDBXContext instance contains members that need to be shared across a single TDBXConnection (see page 10398) and all of its related objects, such as a TDBXCommand (see page 10378) or a TDBXReader (see page 10576). All objects created directly or indirectly from a TDBXConnection (see page 10398) use the same instance of TDBXContext as the TDBXConnection (see page 10398) that created them.

See Also

TDBXCommand (see page 10378)

TDBXConnection (see page 10398)

TDBXReader (see page 10576)

55.1.16.1 TDBXContext Members

The following tables list the members exposed by TDBXContext.

Protected Fields

	Name	Description
	FOnErrorDBXContext (see page 10435)	This is FOnErrorDBXContext, a member of class TDBXContext.
	FOnTraceDBXContext (see page 10435)	This is FOnTraceDBXContext, a member of class TDBXContext.

Protected Methods

	Name	Description
	Create (see page 10434)	This is the overview for the Create constructor overload.

Public Events

	Name	Description
	OnError (see page 10437)	TDBXErrorEvent (see page 10671) handler.
	OnTrace (see page 10438)	TDBXTraceEvent (see page 10672) handler.

Public Methods

	Name	Description
V	Destroy (see page 10434)	Destroys an instance of TDBXContext (see page 10432).
	Error (see page 10435)	Create (see page 10434) error event.
	IsTracing (see page 10436)	Is tracing enabled.
	Trace (see page 10436)	Create (see page 10434) trace event.

Public Properties

	Name	Description
R	ClosedByteReader (see page 10436)	Indicates closed byte readers that have no more rows.
	TraceFlags (see page 10437)	Collection of TDBXTraceFlags (see page 10617).

55.1.16.2 Create Constructor

This is the overview for the Create constructor overload.

Overload List

	Name	Description
	TDBXContext.Create () (see page 10434)	Creates an instance of TDBXContext (see page 10432)
	TDBXContext.Create (TDBXContext) (see page 10434)	Creates an instance of TDBXContext (see page 10432)

55.1.16.2.1 TDBXContext.Create Constructor ()

Creates an instance of TDBXContext (see page 10432)

Pascal

```
constructor Create(DBXContext: TDBXContext); overload;
constructor Create; overload;
```

C++

```
__fastcall TDBXContext(TDBXContext DBXContext);
__fastcall TDBXContext();
```

Description

This constructor creates and initializes an instance of TDBXContext (see page 10432).

See Also

Destroy (see page 10434)

55.1.16.3 TDBXContext.Destroy Destructor

Destroys an instance of TDBXContext (see page 10432).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TDBXContext();
```

Description

This destructor destroys an instance of TDBXContext (see page 10432).

55.1.16.4 TDBXContext Fields

The fields of the TDBXContext class are listed here.

Protected Fields

	Name	Description
	FOnErrorDBXContext (see page 10435)	This is FOnErrorDBXContext, a member of class TDBXContext.
	FOnTraceDBXContext (see page 10435)	This is FOnTraceDBXContext, a member of class TDBXContext.

55.1.16.4.1 TDBXContext.FOnErrorDBXContext Field

Pascal

```
FOnErrorDBXContext: TDBXContext;
```

C++

```
TDBXContext FOnErrorDBXContext;
```

Description

This is FOnErrorDBXContext, a member of class TDBXContext.

55.1.16.4.2 TDBXContext.FOnTraceDBXContext Field

Pascal

```
FOnTraceDBXContext: TDBXContext;
```

C++

```
TDBXContext FOnTraceDBXContext;
```

Description

This is FOnTraceDBXContext, a member of class TDBXContext.

55.1.16.5 TDBXContext Methods

The methods of the TDBXContext class are listed here.

Public Methods

	Name	Description
	Error (see page 10435)	Create (see page 10434) error event.
	IsTracing (see page 10436)	Is tracing enabled.
	Trace (see page 10436)	Create (see page 10434) trace event.

55.1.16.5.1 TDBXContext.Error Method

Create (see page 10434) error event.

Pascal

```
procedure Error(ErrorCode: TDBXErrorCode; ErrorMessage: WideString);
```

C++

```
__fastcall Error(TDBXErrorCode ErrorCode, BSTR ErrorMessage);
```

Description

This method creates a TDBXErrorEvent (see page 10671) error event. **ErrorCode** is one of the defined TDBXErrorCodes (see page 10489) values and **ErrorMessage** is the appropriate error text.

See Also

TDBXErrorCodes (see page 10489)

TDBXErrorEvent (see page 10671)

55.1.16.5.2 TDBXContext.IsTracing Method

Is tracing enabled.

Pascal

```
function IsTracing(TraceFlags: TDBXTraceFlag): Boolean;
```

C++

```
__fastcall Boolean IsTracing(TDBXTraceFlag TraceFlags);
```

Description

This method returns true if tracing is enabled for the given **TDBXTraceFlag (see page 10673)** and false otherwise.

See Also

TDBXTraceFlags (see page 10617)

55.1.16.5.3 TDBXContext.Trace Method

Create (see page 10434) trace event.

Pascal

```
function Trace(TraceFlag: TDBXTraceFlag; TraceMessage: WideString): CBRType;
```

C++

```
__fastcall CBRType Trace(TDBXTraceFlag TraceFlag, BSTR TraceMessage);
```

Description

This method creates a TDBXTraceEvent (see page 10672) trace event. .**TraceFlag** is one of the defined TDBXTraceFlags (see page 10617) values and **TraceMessage** is appropriate text.

See Also

TDBXTraceFlags (see page 10617)

TDBXTraceEvent (see page 10672)

55.1.16.6 TDBXContext Properties

The properties of the TDBXContext class are listed here.

Public Properties

	Name	Description
R	ClosedByteReader (see page 10436)	Indicates closed byte readers that have no more rows.
	TraceFlags (see page 10437)	Collection of TDBXTraceFlags (see page 10617).

55.1.16.6.1 TDBXContext.ClosedByteReader Property

Indicates closed byte readers that have no more rows.

Pascal

```
property ClosedByteReader: TDBXByteReader;
```

C++

```
__property TDBXByteReader ClosedByteReader;
```

Description

The framework marks TDBXByteReaders with no more rows as closed with this property.

See Also

TDBXByteReaders

ClosedReader

55.1.16.6.2 TDBXContext.TraceFlags Property

Collection of TDBXTraceFlags (see page 10617).

Pascal

```
property TraceFlags: TDBXTraceFlag;
```

C++

```
__property TDBXTraceFlag TraceFlags;
```

Description

This property holds a collection of TDBXTraceFlags (see page 10617) constants for which tracing is enabled. You can set this value to enable or disable various trace events.

See Also

TDBXTraceFlags (see page 10617)

Trace (see page 10436)

55.1.16.7 TDBXContext Events

The events of the TDBXContext class are listed here.

Public Events

	Name	Description
	OnError (see page 10437)	TDBXErrorEvent (see page 10671) handler.
	OnTrace (see page 10438)	TDBXTraceEvent (see page 10672) handler.

55.1.16.7.1 TDBXContext.OnError Event

TDBXErrorEvent (see page 10671) handler.

Pascal

```
property OnError: TDBXErrorEvent;
```

C++

```
__property TDBXErrorEvent OnError;
```

Description

This property contains the TDBXErrorEvent (see page 10671) handler.

See Also

TDBXErrorCodes (see page 10489)

Error (see page 10435)

TDBXErrorEvent (see page 10671)

55.1.16.7.2 TDBXContext.OnTrace Event

TDBXTraceEvent (see page 10672) handler.

Pascal

```
property OnTrace: TDBXTraceEvent;
```

C++

```
__property TDBXTraceEvent OnTrace;
```

Description

This property contains the TDBXTraceEvent (see page 10672) handler.

See Also

TDBXTraceFlags (see page 10617)

Trace (see page 10436)

TDBXTraceEvent (see page 10672)

55.1.17 TDBXCursorValue Class

Implementation of TDBXWritableValue (see page 10661) for TDBXDataTypes.CursorType.

Class Hierarchy

Pascal

```
TDBXCursorValue = class(TDBXWritableValue);
```

C++

```
class TDBXCursorValue : public TDBXWritableValue;
```

File

DBXCommon

Description

TDBXCursorValue implements TDBXWritableValue (see page 10661) for TDBXDataTypes.CursorType. This class is used for Oracle drivers to specify that a Reader (Oracle Cursor) gets returned from the execution of a stored procedure.

See Also

TDBXDataTypes (see page 10447)

TDBXWritableValue (see page 10661)

55.1.17.1 TDBXCursorValue Members

The following tables list the members exposed by TDBXCursorValue.

Protected Methods

	Name	Description
	Create (see page 10627)	Enter a short sentence, starting with a verb, that states the basic purpose of the property.
	Create (see page 10662)	Creates an instance of TDBXWritableValue (see page 10661)
	GetDbxContext (see page 10630)	Get context information for a connection associated with value.
V	SetPendingValue (see page 10666)	This is SetPendingValue, a member of class TDBXWritableValue.

Protected Properties

	Name	Description
R	DbxContext (see page 10633)	Context information for a connection associated with value.

Public Methods

	Name	Description
	CreateValue (see page 10628)	Creates values for both the TDBXReader (see page 10576) and TDBXParameterList (see page 10553) classes.
V	Destroy (see page 10627)	Enter a short sentence, starting with a verb, that states the basic purpose of the property.
V	Destroy (see page 10663)	Destroys a TDBXWritableValue (see page 10661) instance.
V	GetAnsiString (see page 10629)	Gets the string value for ANSI strings.
V	GetBcd (see page 10629)	Gets the BCD value for binary-compressed decimal data types.
V	GetBoolean (see page 10629)	Gets the boolean value for boolean data types.
V	GetBytes (see page 10629)	Gets the byte array value for byte array and blob types.
V	GetDate (see page 10630)	Gets the date value for date data types.
V	GetDouble (see page 10630)	Gets the double floating point value for double data types.
V	GetInt16 (see page 10631)	Gets the smallInt value for 16-byte integer data types.
V	GetInt32 (see page 10631)	Gets the 32-byte integer value for 32-byte integer data types.
V	GetInt64 (see page 10631)	Gets the 64-byte integer value for 64-byte integer data types.
V	GetTime (see page 10631)	Gets the time value for time data types.
V	GetTimeStamp (see page 10632)	Gets the timestamp value for timestamp data types.
V	GetValueSize (see page 10632)	Gets the size in bytes for values.
V	GetWideString (see page 10632)	Gets the wide string value for wide string data types.
V	IsNull (see page 10440)	Returns true if the value is **null**.
V	SetAnsiString (see page 10663)	Sets the string value for ANSI strings.
V	SetBcd (see page 10664)	Sets the BCD value for binary-compressed decimal data types.
V	SetBoolean (see page 10664)	Sets the boolean value for boolean data types..
V	SetDate (see page 10664)	Sets the date value for date data types..
V	SetDouble (see page 10664)	Sets the double floating point value for double data types.
V	SetDynamicBytes (see page 10665)	Sets the dynamic array value for byte array and blob types.
V	SetInt16 (see page 10665)	Sets the the smallInt value for 16-byte integer data types.
V	SetInt32 (see page 10665)	Sets the 32-byte integer value for 32-byte integer data types.
V	SetInt64 (see page 10665)	Sets the 64-byte integer value for 64-byte integer data types.
V	SetNull (see page 10666)	Sets a writable value of any type to null.
V	SetStaticBytes (see page 10666)	Sets the open array value for byte array and blob types
V	SetTime (see page 10666)	Sets the time value for time data types.
V	SetTimeStamp (see page 10667)	Sets the timestamp value for timestamp data types.
V	SetWideString (see page 10667)	Sets the wide string value for wide string data types.

Public Properties

	Name	Description
R	ValueType (see page 10633)	Gets the value type for this value.

55.1.17.2 TDBXCursorValue Methods

The methods of the TDBXCursorValue class are listed here.

Public Methods

	Name	Description
V	IsNull (see page 10440)	Returns true if the value is **null**.

55.1.17.2.1 TDBXCursorValue.IsNull Method

Returns true if the value is **null**.

Pascal

```
function IsNull: Boolean; override;
```

C++

```
virtual __fastcall Boolean IsNull();
```

Description

Returns true if the value is **null**. This method should be called before calling any of the Get methods. If the value is null, the Get methods will throw TDBXError exception if they are called.

55.1.18 TDBXDatabaseMetaData Class

Common database specific metadata.

Class Hierarchy

Pascal

```
TDBXDatabaseMetaData = class;
```

C++

```
class TDBXDatabaseMetaData;
```

File

DBXCommon

Description

TDBXDatabaseMetadata provides convenient access to common database specific metadata. This metadata can also be retrieved by creating a TDBXCommand (see page 10378) instance with its CommandType property set to TDBXCommandTypes.DbxMetadata, setting its TDBXCommand.Text property to 'GetDatabase', and calling TDBXCommand.ExecuteQuery. For most applications, it is more straightforward and efficient to retrieve this metadata using TDBXDatabaseMetadata because it executes the 'GetDatabase' command once and caches the retrieved metadata.

See Also

TDBXCommand (see page 10378)

TDBXCommandTypes (see page 10396)

CommandType (see page 10388)

Text (see page 10390)

ExecuteQuery (see page 10384)

55.1.18.1 TDBXDatabaseMetaData Members

The following tables list the members exposed by TDBXDatabaseMetaData.

Protected Fields

	Name	Description
	FDBXContext (see page 10442)	This is FDBXContext, a member of class TDBXDatabaseMetaData.

Protected Methods

	Name	Description
	Create (see page 10441)	Creates an instance of TDBXDatabaseMetaData (see page 10440)

Public Properties

	Name	Description
R	MaxCommands (see page 10442)	Maximum number of commands that can be created
R	ProcedureQuoteChar (see page 10442)	Quote character used for identifying stored procedures in commands.
R	QuoteChar (see page 10443)	Quote character used for quoting identifiers in commands.
R	SupportsNestedTransactions (see page 10443)	Indicates whether driver supports nested transactions
R	SupportsRowSetSize (see page 10443)	Is TDBXCommand.RowSetSize property supported?
R	SupportsTransactions (see page 10444)	Indicates whether the driver supports transactions

55.1.18.2 TDBXDatabaseMetaData.Create Constructor

Creates an instance of TDBXDatabaseMetaData (see page 10440)

Pascal

```
constructor Create(DBXContext: TDBXContext);
```

C++

```
__fastcall TDBXDatabaseMetaData(TDBXContext DBXContext);
```

Description

This constructor creates and initializes an instance of TDBXDatabaseMetaData (see page 10440).

55.1.18.3 TDBXDatabaseMetaData Fields

The fields of the TDBXDatabaseMetaData class are listed here.

Protected Fields

	Name	Description
	FDBXContext (see page 10442)	This is FDBXContext, a member of class TDBXDatabaseMetaData.

55.1.18.3.1 TDBXDatabaseMetaData.FDBXContext Field

Pascal

```
FDBXContext: TDBXContext;
```

C++

```
TDBXContext FDBXContext;
```

Description

This is FDBXContext, a member of class TDBXDatabaseMetaData.

55.1.18.4 TDBXDatabaseMetaData Properties

The properties of the TDBXDatabaseMetaData class are listed here.

Public Properties

	Name	Description
R	MaxCommands (see page 10442)	Maximum number of commands that can be created
R	ProcedureQuoteChar (see page 10442)	Quote character used for identifying stored procedures in commands.
R	QuoteChar (see page 10443)	Quote character used for quoting identifiers in commands.
R	SupportsNestedTransactions (see page 10443)	Indicates whether driver supports nested transactions
R	SupportsRowSetSize (see page 10443)	Is TDBXCommand.RowSetSize property supported?
R	SupportsTransactions (see page 10444)	Indicates whether the driver supports transactions

55.1.18.4.1 TDBXDatabaseMetaData.MaxCommands Property

Maximum number of commands that can be created

Pascal

```
property MaxCommands: TInt32;
```

C++

```
__property TInt32 MaxCommands;
```

Description

This property indicates the maximum number of commands that can be created.

55.1.18.4.2 TDBXDatabaseMetaData.ProcedureQuoteChar Property

Quote character used for identifying stored procedures in commands.

Pascal

```
property ProcedureQuoteChar: WideString;
```

C++

```
__property BSTR ProcedureQuoteChar;
```

Description

This property contains the quote character used for quoting identifiers for stored procedures in the TDBXCommand.Text property.

See Also

TDBXCommand (see page 10378)

TDBXCommand.Text

55.1.18.4.3 TDBXDatabaseMetaData.QuoteChar Property

Quote character used for quoting identifiers in commands.

Pascal

```
property QuoteChar: WideString;
```

C++

```
__property BSTR QuoteChar;
```

Description

This property contains the quote character used for quoting identifiers in the TDBXCommand.Text property.

Warning: deprecated. Use QuotePrefix and QuoteSuffix properties in TDBXDatabaseMetaDataEx (see page 10444).

See Also

TDBXCommand (see page 10378)

TDBXDatabaseMetaDataEx (see page 10444)

QuotePrefix (see page 10446)

QuoteSuffix (see page 10446)

Text (see page 10390)

55.1.18.4.4 TDBXDatabaseMetaData.SupportsNestedTransactions Property

Indicates whether driver supports nested transactions

Pascal

```
property SupportsNestedTransactions: Boolean;
```

C++

```
__property Boolean SupportsNestedTransactions;
```

Description

This property is true if the driver support nested transactions and false otherwise.

See Also

SupportsTransactions (see page 10444)

55.1.18.4.5 TDBXDatabaseMetaData.SupportsRowSetSize Property

Is TDBXCommand.RowSetSize property supported?

Pascal

```
property SupportsRowSetSize: Boolean;
```

C++

```
__property Boolean SupportsRowSetSize;
```

Description

This property indicates whether the TDBXCommand.RowSetSize property is supported to control row buffering when executing

queries. The constant DBXDefaultRowSetSize (see page 10675) is the default row buffering size to use for drivers that return true for this property.

See Also

TDBXCommand (see page 10378)

RowSetSize (see page 10390)

55.1.18.4.6 TDBXDatabaseMetaData.SupportsTransactions Property

Indicates whether the driver supports transactions

Pascal

```
property SupportsTransactions: Boolean;
```

C++

```
__property Boolean SupportsTransactions;
```

Description

This property is true if the driver support transactions and false otherwise.

See Also

SupportsNestedTransactions (see page 10443)

55.1.19 TDBXDatabaseMetaDataEx Class

Temporary extension of TDBXDatabaseMetaData (see page 10440).

Class Hierarchy

Pascal

```
TDBXDatabaseMetaDataEx = class(TDBXDatabaseMetaData);
```

C++

```
class TDBXDatabaseMetaDataEx : public TDBXDatabaseMetaData;
```

File

DBXCommon

Description

TDBXDatabaseMetaDataEx is an extension of the TDBXDatabaseMetaData (see page 10440) class, which provides convenient access to common database specific metadata.

Note: Classes (see page 2685) ending in “Ex” are temporary classes that exist to avoid breaking interfaces. Their contents will be migrated to their base class in the next release.

See Also

TDBXDatabaseMetaData (see page 10440)

55.1.19.1 TDBXDatabaseMetaDataEx Members

The following tables list the members exposed by TDBXDatabaseMetaDataEx.

Protected Fields

	Name	Description
	FDBXContext (see page 10442)	This is FDBXContext, a member of class TDBXDatabaseMetaData.

Protected Methods

	Name	Description
	Create (see page 10445)	Creates an instance of TDBXDatabaseMetaDataEx (see page 10444)

Public Properties

	Name	Description
R	MaxCommands (see page 10442)	Maximum number of commands that can be created
R	MetaDataVersion (see page 10446)	dbExpress version of metadata supported.
R	ProcedureQuoteChar (see page 10442)	Quote character used for identifying stored procedures in commands.
R	QuoteChar (see page 10443)	Quote character used for quoting identifiers in commands.
R	QuotePrefix (see page 10446)	Character to start a quoted identifier.
R	QuoteSuffix (see page 10446)	Character to end a quoted identifier.
R	SupportsLowerCaseIdentifiers (see page 10446)	Lowercase identifiers are stored in lowercase characters in the database.
R	SupportsNestedTransactions (see page 10443)	Indicates whether driver supports nested transactions
R	SupportsRowSetSize (see page 10443)	Is TDBXCommand.RowSetSize property supported?
R	SupportsTransactions (see page 10444)	Indicates whether the driver supports transactions
R	SupportsUpperCaseIdentifiers (see page 10447)	Uppercase identifiers are stored in uppercase characters in the database.

55.1.19.2 TDBXDatabaseMetaDataEx.Create Constructor

Creates an instance of TDBXDatabaseMetaDataEx (see page 10444)

Pascal

```
constructor Create(DBXContext: TDBXContext);
```

C++

```
__fastcall TDBXDatabaseMetaDataEx(TDBXContext DBXContext);
```

Description

This constructor creates and initializes an instance of TDBXDatabaseMetaDataEx (see page 10444).

55.1.19.3 TDBXDatabaseMetaDataEx Properties

The properties of the TDBXDatabaseMetaDataEx class are listed here.

Public Properties

	Name	Description
R	MetaDataVersion (see page 10446)	dbExpress version of metadata supported.
R	QuotePrefix (see page 10446)	Character to start a quoted identifier.
R	QuoteSuffix (see page 10446)	Character to end a quoted identifier.
R	SupportsLowerCaseIdentifiers (see page 10446)	Lowercase identifiers are stored in lowercase characters in the database.
R	SupportsUpperCaseIdentifiers (see page 10447)	Uppercase identifiers are stored in uppercase characters in the database.

55.1.19.3.1 TDBXDatabaseMetaDataEx.MetaDataVersion Property

dbExpress version of metadata supported.

Pascal

```
property MetaDataVersion: String;
```

C++

```
__property AnsiString MetaDataVersion;
```

Description

Returns dbExpress version of metadata supported. It is one of the following values:

Constant	Description
DBXVersion30 (see page 10676)	dbExpress 3.0.
DBXVersion40 (see page 10676)	dbExpress 4.0.

55.1.19.3.2 TDBXDatabaseMetaDataEx.QuotePrefix Property

Character to start a quoted identifier.

Pascal

```
property QuotePrefix: WideString;
```

C++

```
__property BSTR QuotePrefix;
```

Description

QuotePrefix contains the character to start a quoted identifier.

See Also

QuoteSuffix (see page 10446)

55.1.19.3.3 TDBXDatabaseMetaDataEx.QuoteSuffix Property

Character to end a quoted identifier.

Pascal

```
property QuoteSuffix: WideString;
```

C++

```
__property BSTR QuoteSuffix;
```

Description

QuoteSuffix contains the character to end a quoted identifier.

See Also

QuotePrefix (see page 10446)

55.1.19.3.4 TDBXDatabaseMetaDataEx.SupportsLowerCaseIdentifiers Property

Lowercase identifiers are stored in lowercase characters in the database.

Pascal

```
property SupportsLowerCaseIdentifiers: Boolean;
```

C++

```
__property Boolean SupportsLowerCaseIdentifiers;
```

Description

SupportsLowerCaseIdentifiers indicates whether lowercase identifiers are stored in lowercase characters in the database.

See Also

SupportsUpperCaseIdentifiers (see page 10447)

55.1.19.3.5 TDBXDatabaseMetaDataEx.SupportsUpperCaseIdentifiers Property

Uppercase identifiers are stored in uppercase characters in the database.

Pascal

```
property SupportsUpperCaseIdentifiers: Boolean;
```

C++

```
__property Boolean SupportsUpperCaseIdentifiers;
```

Description

SupportsUpperCaseIdentifiers indicates whether uppercase identifiers are stored in uppercase characters in the database.

See Also

SupportsLowerCaseIdentifiers (see page 10446)

55.1.20 TDBXDataTypes Class

Data types supported by the dbExpress framework (TDBX).

Class Hierarchy

Pascal

```
TDBXDataTypes = class;
```

C++

```
class TDBXDataTypes;
```

File

DBXCommon

Description

The dbExpress framework (TDBX) supports a variety of data types. This class provides a list of constants for all the types. TDBXType (see page 10673) is a type for TDBXDataTypes.

This table lists the data types.

Constant	Description
UnknownType (see page 10458)	UnknownType (see page 10458)
AnsiStringType (see page 10451)	8 bit ANSI String
DateType (see page 10453)	32 bit Date
BlobType (see page 10452)	Blob with a subtype
BooleanType (see page 10453)	16 big Boolean
Int16Type (see page 10454)	16 bit signed integer
Int32Type (see page 10455)	32 bit signed integer
DoubleType (see page 10453)	64 bit floating point
BcdType (see page 10452)	TBcd decimal from the FMTBcd (see page 13627) unit
BytesType (see page 10453)	Fixed length byte array
TimeType (see page 10457)	32 bit Time
UInt16Type (see page 10457)	TSql Unsigned 16 bit integer
Uint32Type (see page 10457)	Unsigned 32 bit integer
VarBytesType (see page 10458)	Variable length byte array with maximum length of 64 kilobytes
CursorType (see page 10453)	Oracle cursor type
Int64Type (see page 10455)	64 bit integer
Uint64Type (see page 10457)	unsigned 64 bit integer
AdtType (see page 10451)	Abstract data type
ArrayType (see page 10451)	Array data type
RefType (see page 10456)	Reference data type
TableType (see page 10456)	Nested table data type
TimeStampType (see page 10457)	TSQLTimeStamp in the SqlTimSt (see page 20383) unit
WideStringType (see page 10458)	UCS2 Unicode string
MaxBaseTypes (see page 10455)	Maximum number of base types excluding sub types
MoneySubType (see page 10455)	Monetary sub type
MemoSubType (see page 10455)	8 bit char blob
BinarySubType (see page 10452)	Binary blob
WideMemoSubType (see page 10458)	Unicode blob
HMemoSubType (see page 10454)	CLOB
HBinarySubType (see page 10454)	BLOB
BFileSubType (see page 10452)	BFILE
FixedSubType (see page 10454)	Fixed length char
AutoIncSubType (see page 10451)	32 bit integer autoincrement
AdtNestedTableSubType (see page 10451)	ADT for nested table (has no name)
AdtDateSubType (see page 10450)	DATE (OCIDate) within an ADT
OracleTimeStampSubType (see page 10456)	Oracle time stamp
OracleIntervalSubType (see page 10456)	Oracle Interval

See Also

TDBXType (see page 10673)

55.1.20.1 TDBXDataTypes Members

The following tables list the members exposed by TDBXDataTypes.

Public Constants

	Name	Description
	AdtDateSubType (see page 10450)	This is AdtDateSubType, a member of class TDBXDataTypes.
	AdtNestedTableSubType (see page 10451)	This is AdtNestedTableSubType, a member of class TDBXDataTypes.
	AdtType (see page 10451)	This is AdtType, a member of class TDBXDataTypes.
	AnsiStringType (see page 10451)	This is AnsiStringType, a member of class TDBXDataTypes.
	ArrayType (see page 10451)	This is ArrayType, a member of class TDBXDataTypes.
	AutoIncSubType (see page 10451)	This is AutoIncSubType, a member of class TDBXDataTypes.
	BcdType (see page 10452)	This is BcdType, a member of class TDBXDataTypes.
	BFileSubType (see page 10452)	This is BFileSubType, a member of class TDBXDataTypes.
	BinarySubType (see page 10452)	This is BinarySubType, a member of class TDBXDataTypes.
	BlobType (see page 10452)	This is BlobType, a member of class TDBXDataTypes.
	BooleanType (see page 10453)	This is BooleanType, a member of class TDBXDataTypes.
	BytesType (see page 10453)	This is BytesType, a member of class TDBXDataTypes.
	CursorType (see page 10453)	This is CursorType, a member of class TDBXDataTypes.
	DateType (see page 10453)	This is DateType, a member of class TDBXDataTypes.
	DoubleType (see page 10453)	This is DoubleType, a member of class TDBXDataTypes.
	FixedSubType (see page 10454)	This is FixedSubType, a member of class TDBXDataTypes.
	HBinarySubType (see page 10454)	This is HBinarySubType, a member of class TDBXDataTypes.
	HMemoSubType (see page 10454)	This is HMemoSubType, a member of class TDBXDataTypes.
	Int16Type (see page 10454)	This is Int16Type, a member of class TDBXDataTypes.
	Int32Type (see page 10455)	This is Int32Type, a member of class TDBXDataTypes.
	Int64Type (see page 10455)	This is Int64Type, a member of class TDBXDataTypes.
	MaxBaseTypes (see page 10455)	This is MaxBaseTypes, a member of class TDBXDataTypes.
	MemoSubType (see page 10455)	This is MemoSubType, a member of class TDBXDataTypes.
	MoneySubType (see page 10455)	This is MoneySubType, a member of class TDBXDataTypes.
	OracleIntervalSubType (see page 10456)	This is OracleIntervalSubType, a member of class TDBXDataTypes.
	OracleTimeStampSubType (see page 10456)	This is OracleTimeStampSubType, a member of class TDBXDataTypes.
	RefType (see page 10456)	This is RefType, a member of class TDBXDataTypes.
	TableType (see page 10456)	This is TableType, a member of class TDBXDataTypes.
	TimeStampType (see page 10457)	This is TimeStampType, a member of class TDBXDataTypes.
	TimeType (see page 10457)	This is TimeType, a member of class TDBXDataTypes.
	UInt16Type (see page 10457)	This is UInt16Type, a member of class TDBXDataTypes.
	Uint32Type (see page 10457)	This is Uint32Type, a member of class TDBXDataTypes.
	Uint64Type (see page 10457)	This is Uint64Type, a member of class TDBXDataTypes.
	UnknownType (see page 10458)	This is UnknownType, a member of class TDBXDataTypes.
	VarBytesType (see page 10458)	This is VarBytesType, a member of class TDBXDataTypes.
	WideMemoSubType (see page 10458)	This is WideMemoSubType, a member of class TDBXDataTypes.
	WideStringType (see page 10458)	This is WideStringType, a member of class TDBXDataTypes.

55.1.20.2 TDBXDataTypes Constants

The constants of the TDBXDataTypes class are listed here.

Public Constants

	Name	Description
	AdtDateSubType (see page 10450)	This is AdtDateSubType, a member of class TDBXDataTypes.
	AdtNestedTableSubType (see page 10451)	This is AdtNestedTableSubType, a member of class TDBXDataTypes.
	AdtType (see page 10451)	This is AdtType, a member of class TDBXDataTypes.
	AnsiStringType (see page 10451)	This is AnsiStringType, a member of class TDBXDataTypes.
	ArrayType (see page 10451)	This is ArrayType, a member of class TDBXDataTypes.
	AutoIncSubType (see page 10451)	This is AutoIncSubType, a member of class TDBXDataTypes.
	BcdType (see page 10452)	This is BcdType, a member of class TDBXDataTypes.
	BFileSubType (see page 10452)	This is BFileSubType, a member of class TDBXDataTypes.
	BinarySubType (see page 10452)	This is BinarySubType, a member of class TDBXDataTypes.
	BlobType (see page 10452)	This is BlobType, a member of class TDBXDataTypes.
	BooleanType (see page 10453)	This is BooleanType, a member of class TDBXDataTypes.
	BytesType (see page 10453)	This is BytesType, a member of class TDBXDataTypes.
	CursorType (see page 10453)	This is CursorType, a member of class TDBXDataTypes.
	DateType (see page 10453)	This is DateType, a member of class TDBXDataTypes.
	DoubleType (see page 10453)	This is DoubleType, a member of class TDBXDataTypes.
	FixedSubType (see page 10454)	This is FixedSubType, a member of class TDBXDataTypes.
	HBinarySubType (see page 10454)	This is HBinarySubType, a member of class TDBXDataTypes.
	HMemoSubType (see page 10454)	This is HMemoSubType, a member of class TDBXDataTypes.
	Int16Type (see page 10454)	This is Int16Type, a member of class TDBXDataTypes.
	Int32Type (see page 10455)	This is Int32Type, a member of class TDBXDataTypes.
	Int64Type (see page 10455)	This is Int64Type, a member of class TDBXDataTypes.
	MaxBaseTypes (see page 10455)	This is MaxBaseTypes, a member of class TDBXDataTypes.
	MemoSubType (see page 10455)	This is MemoSubType, a member of class TDBXDataTypes.
	MoneySubType (see page 10455)	This is MoneySubType, a member of class TDBXDataTypes.
	OracleIntervalSubType (see page 10456)	This is OracleIntervalSubType, a member of class TDBXDataTypes.
	OracleTimeStampSubType (see page 10456)	This is OracleTimeStampSubType, a member of class TDBXDataTypes.
	RefType (see page 10456)	This is RefType, a member of class TDBXDataTypes.
	TableType (see page 10456)	This is TableType, a member of class TDBXDataTypes.
	TimeStampType (see page 10457)	This is TimeStampType, a member of class TDBXDataTypes.
	TimeType (see page 10457)	This is TimeType, a member of class TDBXDataTypes.
	UInt16Type (see page 10457)	This is UInt16Type, a member of class TDBXDataTypes.
	Uint32Type (see page 10457)	This is Uint32Type, a member of class TDBXDataTypes.
	Uint64Type (see page 10457)	This is Uint64Type, a member of class TDBXDataTypes.
	UnknownType (see page 10458)	This is UnknownType, a member of class TDBXDataTypes.
	VarBytesType (see page 10458)	This is VarBytesType, a member of class TDBXDataTypes.
	WideMemoSubType (see page 10458)	This is WideMemoSubType, a member of class TDBXDataTypes.
	WideStringType (see page 10458)	This is WideStringType, a member of class TDBXDataTypes.

55.1.20.2.1 TDBXDataTypes.AdtDateSubType Constant

Pascal

```
const AdtDateSubType = 37;
```

C++

```
AdtDateSubType = 37;
```

Description

This is AdtDateSubType, a member of class TDBXDataTypes.

55.1.20.2.2 TDBXDataTypes.AdtNestedTableSubType Constant

Pascal

```
const AdtNestedTableSubType = 35;
```

C++

```
AdtNestedTableSubType = 35;
```

Description

This is AdtNestedTableSubType, a member of class TDBXDataTypes.

55.1.20.2.3 TDBXDataTypes.AdtType Constant

Pascal

```
const AdtType = 20;
```

C++

```
AdtType = 20;
```

Description

This is AdtType, a member of class TDBXDataTypes.

55.1.20.2.4 TDBXDataTypes.AnsiStringType Constant

Pascal

```
const AnsiStringType = 1;
```

C++

```
AnsiStringType = 1;
```

Description

This is AnsiStringType, a member of class TDBXDataTypes.

55.1.20.2.5 TDBXDataTypes.ArrayType Constant

Pascal

```
const ArrayType = 21;
```

C++

```
ArrayType = 21;
```

Description

This is ArrayType, a member of class TDBXDataTypes.

55.1.20.2.6 TDBXDataTypes.AutoIncSubType Constant

Pascal

```
const AutoIncSubType = 29;
```

C++

```
AutoIncSubType = 29;
```

Description

This is AutoIncSubType, a member of class TDBXDataTypes.

55.1.20.2.7 TDBXDataTypes.BcdType Constant

Pascal

```
const BcdType = 8;
```

C++

```
BcdType = 8;
```

Description

This is BcdType, a member of class TDBXDataTypes.

55.1.20.2.8 TDBXDataTypes.BFileSubType Constant

Pascal

```
const BFileSubType = 36;
```

C++

```
BFileSubType = 36;
```

Description

This is BFileSubType, a member of class TDBXDataTypes.

55.1.20.2.9 TDBXDataTypes.BinarySubType Constant

Pascal

```
const BinarySubType = 23;
```

C++

```
BinarySubType = 23;
```

Description

This is BinarySubType, a member of class TDBXDataTypes.

55.1.20.2.10 TDBXDataTypes.BlobType Constant

Pascal

```
const BlobType = 3;
```

C++

```
BlobType = 3;
```

Description

This is BlobType, a member of class TDBXDataTypes.

55.1.20.2.11 TDBXDataTypes.BooleanType Constant

Pascal

```
const BooleanType = 4;
```

C++

```
BooleanType = 4;
```

Description

This is BooleanType, a member of class TDBXDataTypes.

55.1.20.2.12 TDBXDataTypes.BytesType Constant

Pascal

```
const BytesType = 9;
```

C++

```
BytesType = 9;
```

Description

This is BytesType, a member of class TDBXDataTypes.

55.1.20.2.13 TDBXDataTypes.CursorType Constant

Pascal

```
const CursorType = 17;
```

C++

```
CursorType = 17;
```

Description

This is CursorType, a member of class TDBXDataTypes.

55.1.20.2.14 TDBXDataTypes.DateType Constant

Pascal

```
const DateType = 2;
```

C++

```
DateType = 2;
```

Description

This is DateType, a member of class TDBXDataTypes.

55.1.20.2.15 TDBXDataTypes.DoubleType Constant

Pascal

```
const DoubleType = 7;
```

C++

```
DoubleType = 7;
```

Description

This is DoubleType, a member of class TDBXDataTypes.

55.1.20.2.16 TDBXDataTypes.FixedSubType Constant

Pascal

```
const FixedSubType = 31;
```

C++

```
FixedSubType = 31;
```

Description

This is FixedSubType, a member of class TDBXDataTypes.

55.1.20.2.17 TDBXDataTypes.HBinarySubType Constant

Pascal

```
const HBinarySubType = 34;
```

C++

```
HBinarySubType = 34;
```

Description

This is HBinarySubType, a member of class TDBXDataTypes.

55.1.20.2.18 TDBXDataTypes.HMemoSubType Constant

Pascal

```
const HMemoSubType = 33;
```

C++

```
HMemoSubType = 33;
```

Description

This is HMemoSubType, a member of class TDBXDataTypes.

55.1.20.2.19 TDBXDataTypes.Int16Type Constant

Pascal

```
const Int16Type = 5;
```

C++

```
Int16Type = 5;
```

Description

This is Int16Type, a member of class TDBXDataTypes.

55.1.20.2.20 TDBXDataTypes.Int32Type Constant

Pascal

```
const Int32Type = 6;
```

C++

```
Int32Type = 6;
```

Description

This is Int32Type, a member of class TDBXDataTypes.

55.1.20.2.21 TDBXDataTypes.Int64Type Constant

Pascal

```
const Int64Type = 18;
```

C++

```
Int64Type = 18;
```

Description

This is Int64Type, a member of class TDBXDataTypes.

55.1.20.2.22 TDBXDataTypes.MaxBaseTypes Constant

Pascal

```
const MaxBaseTypes = 27;
```

C++

```
MaxBaseTypes = 27;
```

Description

This is MaxBaseTypes, a member of class TDBXDataTypes.

55.1.20.2.23 TDBXDataTypes.MemoSubType Constant

Pascal

```
const MemoSubType = 22;
```

C++

```
MemoSubType = 22;
```

Description

This is MemoSubType, a member of class TDBXDataTypes.

55.1.20.2.24 TDBXDataTypes.MoneySubType Constant

Pascal

```
const MoneySubType = 21;
```

C++

```
MoneySubType = 21;
```

Description

This is MoneySubType, a member of class TDBXDataTypes.

55.1.20.2.25 TDBXDataTypes.OracleIntervalSubType Constant

Pascal

```
const OracleIntervalSubType = 39;
```

C++

```
OracleIntervalSubType = 39;
```

Description

This is OracleIntervalSubType, a member of class TDBXDataTypes.

55.1.20.2.26 TDBXDataTypes.OracleTimeStampSubType Constant

Pascal

```
const OracleTimeStampSubType = 38;
```

C++

```
OracleTimeStampSubType = 38;
```

Description

This is OracleTimeStampSubType, a member of class TDBXDataTypes.

55.1.20.2.27 TDBXDataTypes.RefType Constant

Pascal

```
const RefType = 22;
```

C++

```
RefType = 22;
```

Description

This is RefType, a member of class TDBXDataTypes.

55.1.20.2.28 TDBXDataTypes.TableType Constant

Pascal

```
const TableType = 23;
```

C++

```
TableType = 23;
```

Description

This is TableType, a member of class TDBXDataTypes.

55.1.20.2.29 TDBXDataTypes.TimeStampType Constant

Pascal

```
const TimeStampType = 24;
```

C++

```
TimeStampType = 24;
```

Description

This is TimeStampType, a member of class TDBXDataTypes.

55.1.20.2.30 TDBXDataTypes.TimeType Constant

Pascal

```
const TimeType = 10;
```

C++

```
TimeType = 10;
```

Description

This is TimeType, a member of class TDBXDataTypes.

55.1.20.2.31 TDBXDataTypes.UInt16Type Constant

Pascal

```
const UInt16Type = 12;
```

C++

```
UInt16Type = 12;
```

Description

This is UInt16Type, a member of class TDBXDataTypes.

55.1.20.2.32 TDBXDataTypes.Uint32Type Constant

Pascal

```
const Uint32Type = 13;
```

C++

```
Uint32Type = 13;
```

Description

This is Uint32Type, a member of class TDBXDataTypes.

55.1.20.2.33 TDBXDataTypes.Uint64Type Constant

Pascal

```
const Uint64Type = 19;
```

C++

```
Uint64Type = 19;
```

Description

This is Uint64Type, a member of class TDBXDataTypes.

55.1.20.2.34 TDBXDataTypes.UnknownType Constant

Pascal

```
const UnknownType = 0;
```

C++

```
UnknownType = 0;
```

Description

This is UnknownType, a member of class TDBXDataTypes.

55.1.20.2.35 TDBXDataTypes.VarBytesType Constant

Pascal

```
const VarBytesType = 15;
```

C++

```
VarBytesType = 15;
```

Description

This is VarBytesType, a member of class TDBXDataTypes.

55.1.20.2.36 TDBXDataTypes.WideMemoSubType Constant

Pascal

```
const WideMemoSubType = 32;
```

C++

```
WideMemoSubType = 32;
```

Description

This is WideMemoSubType, a member of class TDBXDataTypes.

55.1.20.2.37 TDBXDataTypes.WideStringType Constant

Pascal

```
const WideStringType = 26;
```

C++

```
WideStringType = 26;
```

Description

This is WideStringType, a member of class TDBXDataTypes.

55.1.21 TDBXDataTypesEx Class

Data types supported by dbExpress.

Class Hierarchy

DBXCommon.TDBXDataTypesEx

Pascal

```
TDBXDataTypesEx = class;
```

C++

```
class TDBXDataTypesEx;
```

File

DBXCommon

Description

TDBXDataTypesEx lists additional data types supported by dbExpress.

Note: Classes (see page 2685) ending in “Ex” are temporary classes that exist to avoid breaking interfaces. Their contents will be migrated to their base class in the next release.

This table contains data types.

Constant	Description
SingleType (see page 10461)	32 bit floating point
Int8Type (see page 10460)	8 bit signed integer
Uint8Type (see page 10461)	8 bit unsigned integer
ObjectType (see page 10460)	Object serialization
CharArrayType (see page 10460)	Character array
IntervalType (see page 10460)	Time Interval

See Also

TDBXDataTypes (see page 10447)

55.1.21.1 TDBXDataTypesEx Members

The following tables list the members exposed by TDBXDataTypesEx.

Public Constants

	Name	Description
	CharArrayType (see page 10460)	This is CharArrayType, a member of class TDBXDataTypesEx.
	Int8Type (see page 10460)	This is Int8Type, a member of class TDBXDataTypesEx.
	IntervalType (see page 10460)	This is IntervalType, a member of class TDBXDataTypesEx.
	ObjectType (see page 10460)	This is ObjectType, a member of class TDBXDataTypesEx.
	SingleType (see page 10461)	This is SingleType, a member of class TDBXDataTypesEx.
	Uint8Type (see page 10461)	This is Uint8Type, a member of class TDBXDataTypesEx.

55.1.21.2 TDBXDataTypesEx Constants

The constants of the TDBXDataTypesEx class are listed here.

Public Constants

	Name	Description
	CharArrayType (see page 10460)	This is CharArrayType, a member of class TDBXDataTypesEx.
	Int8Type (see page 10460)	This is Int8Type, a member of class TDBXDataTypesEx.
	IntervalType (see page 10460)	This is IntervalType, a member of class TDBXDataTypesEx.
	ObjectType (see page 10460)	This is ObjectType, a member of class TDBXDataTypesEx.
	SingleType (see page 10461)	This is SingleType, a member of class TDBXDataTypesEx.
	Uint8Type (see page 10461)	This is Uint8Type, a member of class TDBXDataTypesEx.

55.1.21.2.1 TDBXDataTypesEx.CharArrayType Constant

Pascal

```
const CharArrayType = 31;
```

C++

```
CharArrayType = 31;
```

Description

This is CharArrayType, a member of class TDBXDataTypesEx.

55.1.21.2.2 TDBXDataTypesEx.Int8Type Constant

Pascal

```
const Int8Type = 28;
```

C++

```
Int8Type = 28;
```

Description

This is Int8Type, a member of class TDBXDataTypesEx.

55.1.21.2.3 TDBXDataTypesEx.IntervalType Constant

Pascal

```
const IntervalType = 32;
```

C++

```
IntervalType = 32;
```

Description

This is IntervalType, a member of class TDBXDataTypesEx.

55.1.21.2.4 TDBXDataTypesEx.ObjectType Constant

Pascal

```
const ObjectType = 30;
```

C++

```
ObjectType = 30;
```

Description

This is ObjectType, a member of class TDBXDataTypesEx.

55.1.21.2.5 TDBXDataTypesEx.SingleType Constant

Pascal

```
const SingleType = 27;
```

C++

```
SingleType = 27;
```

Description

This is SingleType, a member of class TDBXDataTypesEx.

55.1.21.2.6 TDBXDataTypesEx.Uint8Type Constant

Pascal

```
const Uint8Type = 29;
```

C++

```
Uint8Type = 29;
```

Description

This is Uint8Type, a member of class TDBXDataTypesEx.

55.1.22 TDBXDateValue Class

Implementation of writable date type values.

Class Hierarchy

Pascal

```
TDBXDateValue = class(TDBXWritableValue);
```

C++

```
class TDBXDateValue : public TDBXWritableValue;
```

File

DBXCommon

Description

Implementation of TDBXWritableValue (see page 10661) for TDBXDataTypes.DateType values.

55.1.22.1 TDBXDateValue Members

The following tables list the members exposed by TDBXDateValue.

Protected Methods

	Name	Description
	Create (see page 10627)	Enter a short sentence, starting with a verb, that states the basic purpose of the property.
	Create (see page 10662)	Creates an instance of TDBXWritableValue (see page 10661)
	GetDbxContext (see page 10630)	Get context information for a connection associated with value.
V	SetPendingValue (see page 10666)	This is SetPendingValue, a member of class TDBXWritableValue.

Protected Properties

	Name	Description
R	DbxContext (see page 10633)	Context information for a connection associated with value.

Public Methods

	Name	Description
	CreateValue (see page 10628)	Creates values for both the TDBXReader (see page 10576) and TDBXParameterList (see page 10553) classes.
V	Destroy (see page 10627)	Enter a short sentence, starting with a verb, that states the basic purpose of the property.
V	Destroy (see page 10663)	Destroys a TDBXWritableValue (see page 10661) instance.
V	GetAnsiString (see page 10629)	Gets the string value for ANSI strings.
V	GetBcd (see page 10629)	Gets the BCD value for binary-compressed decimal data types.
V	GetBoolean (see page 10629)	Gets the boolean value for boolean data types.
V	GetBytes (see page 10629)	Gets the byte array value for byte array and blob types.
V	GetDate (see page 10463)	Gets the date value for date data types.
V	GetDouble (see page 10630)	Gets the double floating point value for double data types.
V	GetInt16 (see page 10631)	Gets the smallInt value for 16-byte integer data types.
V	GetInt32 (see page 10631)	Gets the 32-byte integer value for 32-byte integer data types.
V	GetInt64 (see page 10631)	Gets the 64-byte integer value for 64-byte integer data types.
V	GetTime (see page 10631)	Gets the time value for time data types.
V	GetTimeStamp (see page 10632)	Gets the timestamp value for timestamp data types.
V	GetValueSize (see page 10632)	Gets the size in bytes for values.
V	GetWideString (see page 10632)	Gets the wide string value for wide string data types.
V	IsNull (see page 10463)	Returns true if the value is **null**.
V	SetAnsiString (see page 10663)	Sets the string value for ANSI strings.
V	SetBcd (see page 10664)	Sets the BCD value for binary-compressed decimal data types.
V	SetBoolean (see page 10664)	Sets the boolean value for boolean data types..
V	SetDate (see page 10463)	Sets the date value for date data types..
V	SetDouble (see page 10664)	Sets the double floating point value for double data types.
V	SetDynamicBytes (see page 10665)	Sets the dynamic array value for byte array and blob types.
V	SetInt16 (see page 10665)	Sets the the smallInt value for 16-byte integer data types.
V	SetInt32 (see page 10665)	Sets the 32-byte integer value for 32-byte integer data types.
V	SetInt64 (see page 10665)	Sets the 64-byte integer value for 64-byte integer data types.
V	SetNull (see page 10666)	Sets a writable value of any type to null.
V	SetStaticBytes (see page 10666)	Sets the open array value for byte array and blob types
V	SetTime (see page 10666)	Sets the time value for time data types.
V	SetTimeStamp (see page 10667)	Sets the timestamp value for timestamp data types.
V	SetWideString (see page 10667)	Sets the wide string value for wide string data types.

Public Properties

	Name	Description
R	ValueType (see page 10633)	Gets the value type for this value.

55.1.22.2 TDBXDateValue Methods

The methods of the TDBXDateValue class are listed here.

Public Methods

	Name	Description
V	GetDate (see page 10463)	Gets the date value for date data types.
V	IsNull (see page 10463)	Returns true if the value is **null**.
V	SetDate (see page 10463)	Sets the date value for date data types..

55.1.22.2.1 TDBXDateValue.GetDate Method

Gets the date value for date data types.

Pascal

```
function GetDate: TDBXDate; override;
```

C++

```
virtual __fastcall TDBXDate GetDate();
```

Description

Gets the date value for TDBXValue (see page 10626) instances with a data type of DateType. Throws a TDBXError (see page 10486) exception if IsNull (see page 10463) is true.

55.1.22.2.2 TDBXDateValue.IsNull Method

Returns true if the value is **null**.

Pascal

```
function IsNull: Boolean; override;
```

C++

```
virtual __fastcall Boolean IsNull();
```

Description

Returns true if the value is **null**. This method should be called before calling any of the Get methods. If the value is null, the Get methods will throw TDBXError (see page 10486) exception if they are called.

55.1.22.2.3 TDBXDateValue.SetDate Method

Sets the date value for date data types..

Pascal

```
procedure SetDate(Value: TDBXDate); override;
```

C++

```
virtual __fastcall SetDate(TDBXDate Value);
```

Description

SetDate

Sets the date value for TDBXValue (see page 10626) instances with a data type of DateType.

55.1.23 TDBXDelegateDriver Class

Delegate driver base class.

Class Hierarchy

Pascal

```
TDBXDelegateDriver = class(TDBXDriverEx);
```

C++

```
class TDBXDelegateDriver : public TDBXDriverEx;
```

File

DBXCommon

Description

This is the delegate driver base class. The TDBXConnectionFactory.GetDriver method also returns an instance of TDBXDelegateDriver, so it can control the loading and unloading of drivers.

See Also

TDBXConnectionFactory (see page 10422)

GetDriver (see page 10428)

55.1.23.1 TDBXDelegateDriver Members

The following tables list the members exposed by TDBXDelegateDriver.

Protected Fields

	Name	Description
	FCommandFactories (see page 10479)	This is FCommandFactories, a member of class TDBXDriverEx.
	FDBXContext (see page 10473)	This is FDBXContext, a member of class TDBXDriver.
	FDriverLoader (see page 10474)	This is FDriverLoader, a member of class TDBXDriver.

Protected Methods

	Name	Description
	AddCommandFactory (see page 10479)	This is AddCommandFactory, a member of class TDBXDriverEx.
V	Close (see page 10466)	This is Close, a member of class TDBXDelegateDriver.
	Create (see page 10465)	This is Create, a member of class TDBXDelegateDriver.
V	CreateConnection (see page 10466)	Create instance of TDBXConnection.
V	CreateMorphCommand (see page 10466)	This is CreateMorphCommand, a member of class TDBXDelegateDriver.
V	GetDriverName (see page 10466)	This is GetDriverName, a member of class TDBXDelegateDriver.
V	GetDriverProperties (see page 10467)	This is GetDriverProperties, a member of class TDBXDelegateDriver.
	LoadMetaDataCommandFactory (see page 10479)	This is LoadMetaDataCommandFactory, a member of class TDBXDriverEx.

	SetDriverName (see page 10467)	This is SetDriverName, a member of class TDBXDelegateDriver.
	SetDriverProperties (see page 10467)	This is SetDriverProperties, a member of class TDBXDelegateDriver.

Public Methods

	Name	Description
	Destroy (see page 10465)	This is Destroy, a member of class TDBXDelegateDriver.
	GetDriverVersion (see page 10467)	Returns version information for this driver.

Public Properties

	Name	Description
	DriverName (see page 10476)	A unique name for this driver.
	DriverProperties (see page 10477)	Driver-specific properties for a particular driver.

Strict protected Methods

	Name	Description
	CacheUntilFinalization (see page 10474)	This is CacheUntilFinalization, a member of class TDBXDriver.

55.1.23.2 TDBXDelegateDriver.Create Constructor

Pascal

```
constructor Create(Driver: TDBXDriver);
```

C++

```
__fastcall TDBXDelegateDriver(TDBXDriver Driver);
```

Description

This is Create, a member of class TDBXDelegateDriver.

55.1.23.3 TDBXDelegateDriver.Destroy Destructor

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TDBXDelegateDriver();
```

Description

This is Destroy, a member of class TDBXDelegateDriver.

55.1.23.4 TDBXDelegateDriver Methods

The methods of the TDBXDelegateDriver class are listed here.

Protected Methods

	Name	Description
	Close (see page 10466)	This is Close, a member of class TDBXDelegateDriver.
	CreateConnection (see page 10466)	Create instance of TDBXConnection.
	CreateMorphCommand (see page 10466)	This is CreateMorphCommand, a member of class TDBXDelegateDriver.
	GetDriverName (see page 10466)	This is GetDriverName, a member of class TDBXDelegateDriver.
	GetDriverProperties (see page 10467)	This is GetDriverProperties, a member of class TDBXDelegateDriver.
	SetDriverName (see page 10467)	This is SetDriverName, a member of class TDBXDelegateDriver.

	SetDriverProperties (see page 10467)	This is SetDriverProperties, a member of class TDBXDelegateDriver.

Public Methods

	Name	Description
	GetDriverVersion (see page 10467)	Returns version information for this driver.

55.1.23.4.1 TDBXDelegateDriver.Close Method

Pascal

```
procedure Close; override;
```

C++

```
virtual __fastcall Close();
```

Description

This is Close, a member of class TDBXDelegateDriver.

55.1.23.4.2 TDBXDelegateDriver.CreateConnection Method

Create instance of TDBXConnection.

Pascal

```
function CreateConnection(ConnectionBuilder: TDBXConnectionBuilder): TDBXConnection; override;
```

C++

```
virtual __fastcall TDBXConnection CreateConnection(TDBXConnectionBuilder ConnectionBuilder);
```

Description

Used by TDBXConnectionFactory to create instances of TDBXConnection.

See Also

TDBXConnection (see page 10398)

TDBXConnectionFactory (see page 10422)

55.1.23.4.3 TDBXDelegateDriver.CreateMorphCommand Method

Pascal

```
function CreateMorphCommand(DbxContext: TDBXContext; Connection: TDBXConnection;
MorphicCommand: TDBXCommand): TDBXCommand; override;
```

C++

```
virtual __fastcall TDBXCommand CreateMorphCommand(TDBXContext DbxContext, TDBXConnection
Connection, TDBXCommand MorphicCommand);
```

Description

This is CreateMorphCommand, a member of class TDBXDelegateDriver.

55.1.23.4.4 TDBXDelegateDriver.GetDriverName Method

Pascal

```
function GetDriverName: WideString; override;
```

C++

```
virtual __fastcall BSTR GetDriverName();
```

Description

This is GetDriverName, a member of class TDBXDelegateDriver.

55.1.23.4.5 TDBXDelegateDriver.GetDriverProperties Method

Pascal

```
function GetDriverProperties: TDBXProperties; override;
```

C++

```
virtual __fastcall TDBXProperties GetDriverProperties();
```

Description

This is GetDriverProperties, a member of class TDBXDelegateDriver.

55.1.23.4.6 TDBXDelegateDriver.GetDriverVersion Method

Returns version information for this driver.

Pascal

```
function GetDriverVersion: WideString; override;
```

C++

```
virtual __fastcall BSTR GetDriverVersion();
```

Description

Use GetDriverVersion to return version information for an instance of TDBXDriver.

55.1.23.4.7 TDBXDelegateDriver.SetDriverName Method

Pascal

```
procedure SetDriverName(const DriverName: WideString); override;
```

C++

```
virtual __fastcall SetDriverName(const BSTR DriverName);
```

Description

This is SetDriverName, a member of class TDBXDelegateDriver.

55.1.23.4.8 TDBXDelegateDriver.SetDriverProperties Method

Pascal

```
procedure SetDriverProperties(DriverProperties: TDBXProperties); override;
```

C++

```
virtual __fastcall SetDriverProperties(TDBXProperties DriverProperties);
```

Description

This is SetDriverProperties, a member of class TDBXDelegateDriver.

55.1.24 TDBXDelegateItem Class

Used by driver implementors.

Class Hierarchy

DBXCommon.TDBXDelegateItem

Pascal

```
TDBXDelegateItem = class;
```

C++

```
class TDBXDelegateItem;
```

File

DBXCommon

Description

This class is used by driver implementors.

See Also

TDBXDelegateDriver (see page 10464)

55.1.24.1 TDBXDelegateItem Members

The following tables list the members exposed by TDBXDelegateItem.

Public Fields

	Name	Description
	FName (see page 10469)	This is FName, a member of class TDBXDelegateItem.
	FNext (see page 10469)	This is FNext, a member of class TDBXDelegateItem.
	FProperties (see page 10469)	This is FProperties, a member of class TDBXDelegateItem.

Public Methods

	Name	Description
	Destroy (see page 10468)	Destroys an instance of TDBXDelegateItem (see page 10468).

55.1.24.2 TDBXDelegateItem.Destroy Destructor

Destroys an instance of TDBXDelegateItem (see page 10468).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TDBXDelegateItem();
```

Description

This destructor destroys an instance of TDBXDelegateItem (see page 10468).

55.1.24.3 TDBXDelegateItem Fields

The fields of the TDBXDelegateItem class are listed here.

Public Fields

	Name	Description
	FName (see page 10469)	This is FName, a member of class TDBXDelegateItem.
	FNext (see page 10469)	This is FNext, a member of class TDBXDelegateItem.
	FProperties (see page 10469)	This is FProperties, a member of class TDBXDelegateItem.

55.1.24.3.1 TDBXDelegateItem.FName Field

Pascal

```
FName: WideString;
```

C++

```
BSTR FName;
```

Description

This is FName, a member of class TDBXDelegateItem.

55.1.24.3.2 TDBXDelegateItem.FNext Field

Pascal

```
FNext: TDBXDelegateItem;
```

C++

```
TDBXDelegateItem FNext;
```

Description

This is FNext, a member of class TDBXDelegateItem.

55.1.24.3.3 TDBXDelegateItem.FProperties Field

Pascal

```
FProperties: TDBXProperties;
```

C++

```
TDBXProperties FProperties;
```

Description

This is FProperties, a member of class TDBXDelegateItem.

55.1.25 TDBXDoubleValue Class

Implementation of double-precision floating point values.

Class Hierarchy

Pascal

```
TDBXDoubleValue = class(TDBXWritableValue);
```

C++

```
class TDBXDoubleValue : public TDBXWritableValue;
```

File

DBXCommon

Description

Implementation of TDBXWritableValue (see page 10661) for TDBXDataTypes.DoubleType values.

55.1.25.1 TDBXDoubleValue Members

The following tables list the members exposed by TDBXDoubleValue.

Protected Methods

	Name	Description
	Create (see page 10627)	Enter a short sentence, starting with a verb, that states the basic purpose of the property.
	Create (see page 10662)	Creates an instance of TDBXWritableValue (see page 10661)
	GetDbxContext (see page 10630)	Get context information for a connection associated with value.
V	SetPendingValue (see page 10666)	This is SetPendingValue, a member of class TDBXWritableValue.

Protected Properties

	Name	Description
R	DbxContext (see page 10633)	Context information for a connection associated with value.

Public Methods

	Name	Description
	CreateValue (see page 10628)	Creates values for both the TDBXReader (see page 10576) and TDBXParameterList (see page 10553) classes.
V	Destroy (see page 10627)	Enter a short sentence, starting with a verb, that states the basic purpose of the property.
V	Destroy (see page 10663)	Destroys a TDBXWritableValue (see page 10661) instance.
V	GetAnsiString (see page 10629)	Gets the string value for ANSI strings.
V	GetBcd (see page 10629)	Gets the BCD value for binary-compressed decimal data types.
V	GetBoolean (see page 10629)	Gets the boolean value for boolean data types.
V	GetBytes (see page 10629)	Gets the byte array value for byte array and blob types.
V	GetDate (see page 10630)	Gets the date value for date data types.
V	GetDouble (see page 10471)	Gets the double floating point value for double data types.
V	GetInt16 (see page 10631)	Gets the smallInt value for 16-byte integer data types.
V	GetInt32 (see page 10631)	Gets the 32-byte integer value for 32-byte integer data types.
V	GetInt64 (see page 10631)	Gets the 64-byte integer value for 64-byte integer data types.
V	GetTime (see page 10631)	Gets the time value for time data types.
V	GetTimeStamp (see page 10632)	Gets the timestamp value for timestamp data types.
V	GetValueSize (see page 10632)	Gets the size in bytes for values.
V	GetWideString (see page 10632)	Gets the wide string value for wide string data types.
V	IsNull (see page 10471)	Returns true if the value is **null**.
V	SetAnsiString (see page 10663)	Sets the string value for ANSI strings.
V	SetBcd (see page 10664)	Sets the BCD value for binary-compressed decimal data types.
V	SetBoolean (see page 10664)	Sets the boolean value for boolean data types..
V	SetDate (see page 10664)	Sets the date value for date data types..
V	SetDouble (see page 10472)	Sets the double floating point value for double data types.

	SetDynamicBytes (see page 10665)	Sets the dynamic array value for byte array and blob types.
	SetInt16 (see page 10665)	Sets the the smallInt value for 16-byte integer data types.
	SetInt32 (see page 10665)	Sets the 32-byte integer value for 32-byte integer data types.
	SetInt64 (see page 10665)	Sets the 64-byte integer value for 64-byte integer data types.
	SetNull (see page 10666)	Sets a writable value of any type to null.
	SetStaticBytes (see page 10666)	Sets the open array value for byte array and blob types
	SetTime (see page 10666)	Sets the time value for time data types.
	SetTimeStamp (see page 10667)	Sets the timestamp value for timestamp data types.
	SetWideString (see page 10667)	Sets the wide string value for wide string data types.

Public Properties

	Name	Description
	ValueType (see page 10633)	Gets the value type for this value.

55.1.25.2 TDBXDoubleValue Methods

The methods of the TDBXDoubleValue class are listed here.

Public Methods

	Name	Description
	GetDouble (see page 10471)	Gets the double floating point value for double data types.
	IsNull (see page 10471)	Returns true if the value is **null**.
	SetDouble (see page 10472)	Sets the double floating point value for double data types.

55.1.25.2.1 TDBXDoubleValue.GetDouble Method

Gets the double floating point value for double data types.

Pascal

```
function GetDouble: Double; override;
```

C++

```
virtual __fastcall Double GetDouble();
```

Description

Gets the double floating point value for TDBXValue (see page 10626) instances with a data type of DoubleType. Throws a TDBXError (see page 10486) exception if IsNull (see page 10471) is true.

55.1.25.2.2 TDBXDoubleValue.IsNull Method

Returns true if the value is **null**.

Pascal

```
function IsNull: Boolean; override;
```

C++

```
virtual __fastcall Boolean IsNull();
```

Description

Returns true if the value is **null**. This method should be called before calling any of the Get methods. If the value is null, the Get methods will throw TDBXError (see page 10486) exception if they are called.

55.1.25.2.3 TDBXDoubleValue.SetDouble Method

Sets the double floating point value for double data types.

Pascal

```
procedure SetDouble(Value: Double); override;
```

C++

```
virtual __fastcall SetDouble(Double Value);
```

Description

Sets the double floating point value for TDBXValue (see page 10626) instances with a data type of DoubleType.

55.1.26 TDBXDriver Class

Driver class for DBX framework.

Class Hierarchy

DBXCommon.TDBXDriver

Pascal

```
TDBXDriver = class;
```

C++

```
class TDBXDriver;
```

File

DBXCommon

Description

Driver class for DBX framework. Loads client libraries if needed.

The DBX framework manages reference counts for all drivers that are loaded. When all TDBXConnection (see page 10398) and TDBXDriver instances are freed, the driver is unloaded. So if an application holds on to an instance of TDBXConnection (see page 10398) or TDBXDriver, that driver will not be unloaded.

55.1.26.1 TDBXDriver Members

The following tables list the members exposed by TDBXDriver.

Protected Fields

	Name	Description
	FDBXContext (see page 10473)	This is FDBXContext, a member of class TDBXDriver.
	FDriverLoader (see page 10474)	This is FDriverLoader, a member of class TDBXDriver.

Protected Methods

	Name	Description
A	Close (see page 10474)	This is Close, a member of class TDBXDriver.
A	CreateConnection (see page 10475)	Create instance of TDBXConnection (see page 10398).
V	GetDriverName (see page 10475)	This is GetDriverName, a member of class TDBXDriver.

V	GetDriverProperties (see page 10475)	This is GetDriverProperties, a member of class TDBXDriver.
V	SetDriverName (see page 10476)	This is SetDriverName, a member of class TDBXDriver.
V	SetDriverProperties (see page 10476)	This is SetDriverProperties, a member of class TDBXDriver.

Public Methods

	Name	Description
V	Destroy (see page 10473)	This is Destroy, a member of class TDBXDriver.
A	GetDriverVersion (see page 10475)	Returns version information for this driver.

Public Properties

	Name	Description
R	DriverName (see page 10476)	A unique name for this driver.
R	DriverProperties (see page 10477)	Driver-specific properties for a particular driver.

Strict protected Methods

	Name	Description
	CacheUntilFinalization (see page 10474)	This is CacheUntilFinalization, a member of class TDBXDriver.

55.1.26.2 TDBXDriver.Destroy Destructor

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TDBXDriver();
```

Description

This is Destroy, a member of class TDBXDriver.

55.1.26.3 TDBXDriver Fields

The fields of the TDBXDriver class are listed here.

Protected Fields

	Name	Description
	FDBXContext (see page 10473)	This is FDBXContext, a member of class TDBXDriver.
	FDriverLoader (see page 10474)	This is FDriverLoader, a member of class TDBXDriver.

55.1.26.3.1 TDBXDriver.FDBXContext Field

Pascal

```
FDBXContext: TDBXContext;
```

C++

```
TDBXContext FDBXContext;
```

Description

This is FDBXContext, a member of class TDBXDriver.

55.1.26.3.2 TDBXDriver.FDriverLoader Field

Pascal

```
FDriverLoader: TDBXDriverLoader;
```

C++

```
TDBXDriverLoader FDriverLoader;
```

Description

This is FDriverLoader, a member of class TDBXDriver.

55.1.26.4 TDBXDriver Methods

The methods of the TDBXDriver class are listed here.

Protected Methods

	Name	Description
	Close (see page 10474)	This is Close, a member of class TDBXDriver.
	CreateConnection (see page 10475)	Create instance of TDBXConnection (see page 10398).
	GetDriverName (see page 10475)	This is GetDriverName, a member of class TDBXDriver.
	GetDriverProperties (see page 10475)	This is GetDriverProperties, a member of class TDBXDriver.
	SetDriverName (see page 10476)	This is SetDriverName, a member of class TDBXDriver.
	SetDriverProperties (see page 10476)	This is SetDriverProperties, a member of class TDBXDriver.

Public Methods

	Name	Description
	GetDriverVersion (see page 10475)	Returns version information for this driver.

Strict protected Methods

	Name	Description
	CacheUntilFinalization (see page 10474)	This is CacheUntilFinalization, a member of class TDBXDriver.

55.1.26.4.1 TDBXDriver.CacheUntilFinalization Method

Pascal

```
procedure CacheUntilFinalization;
```

C++

```
__fastcall CacheUntilFinalization();
```

Description

This is CacheUntilFinalization, a member of class TDBXDriver.

55.1.26.4.2 TDBXDriver.Close Method

Pascal

```
procedure Close; virtual; abstract;
```

C++

```
virtual __fastcall Close() = 0;
```

Description

This is Close, a member of class TDBXDriver.

55.1.26.4.3 TDBXDriver.CreateConnection Method

Create instance of TDBXConnection (see page 10398).

Pascal

```
function CreateConnection(ConnectionBuilder: TDBXConnectionBuilder): TDBXConnection; virtual;
abstract;
```

C++

```
virtual __fastcall TDBXConnection CreateConnection(TDBXConnectionBuilder ConnectionBuilder) =
0;
```

Description

Used by TDBXConnectionFactory (see page 10422) to create instances of TDBXConnection (see page 10398).

See Also

TDBXConnection (see page 10398)

TDBXConnectionFactory (see page 10422)

55.1.26.4.4 TDBXDriver.GetDriverName Method

Pascal

```
function GetDriverName: WideString; virtual;
```

C++

```
virtual __fastcall BSTR GetDriverName();
```

Description

This is GetDriverName, a member of class TDBXDriver.

55.1.26.4.5 TDBXDriver.GetDriverProperties Method

Pascal

```
function GetDriverProperties: TDBXProperties; virtual;
```

C++

```
virtual __fastcall TDBXProperties GetDriverProperties();
```

Description

This is GetDriverProperties, a member of class TDBXDriver.

55.1.26.4.6 TDBXDriver.GetDriverVersion Method

Returns version information for this driver.

Pascal

```
function GetDriverVersion: WideString; virtual; abstract;
```

C++

```
virtual __fastcall BSTR GetDriverVersion() = 0;
```

Description

Use GetDriverVersion to return version information for an instance of TDBXDriver (see page 10472).

55.1.26.4.7 TDBXDriver.SetDriverName Method

Pascal

```
procedure SetDriverName(const DriverName: WideString); virtual;
```

C++

```
virtual __fastcall SetDriverName(const BSTR DriverName);
```

Description

This is SetDriverName, a member of class TDBXDriver.

55.1.26.4.8 TDBXDriver.SetDriverProperties Method

Pascal

```
procedure SetDriverProperties(DriverProperties: TDBXProperties); virtual;
```

C++

```
virtual __fastcall SetDriverProperties(TDBXProperties DriverProperties);
```

Description

This is SetDriverProperties, a member of class TDBXDriver.

55.1.26.5 TDBXDriver Properties

The properties of the TDBXDriver class are listed here.

Public Properties

	Name	Description
R	DriverName (see page 10476)	A unique name for this driver.
R	DriverProperties (see page 10477)	Driver-specific properties for a particular driver.

55.1.26.5.1 TDBXDriver.DriverName Property

A unique name for this driver.

Pascal

```
property DriverName: WideString;
```

C++

```
__property BSTR DriverName;
```

Description

A unique name for the driver referenced in an instance of TDBXDriver (see page 10472).

55.1.26.5.2 TDBXDriver.DriverProperties Property

Driver-specific properties for a particular driver.

Pascal

```
property DriverProperties: TDBXProperties;
```

C++

```
__property TDBXProperties DriverProperties;
```

Description

Driver-specific properties for an instance of TDBXDriver (see page 10472).

55.1.27 TDBXDriverEx Class

Class Hierarchy

Pascal

```
TDBXDriverEx = class(TDBXDriver);
```

C++

```
class TDBXDriverEx : public TDBXDriver;
```

File

DBXCommon

Description

This is class DBXCommon.TDBXDriverEx.

55.1.27.1 TDBXDriverEx Members

The following tables list the members exposed by TDBXDriverEx.

Protected Fields

	Name	Description
	FCommandFactories (see page 10479)	This is FCommandFactories, a member of class TDBXDriverEx.
	FDBXContext (see page 10473)	This is FDBXContext, a member of class TDBXDriver.
	FDriverLoader (see page 10474)	This is FDriverLoader, a member of class TDBXDriver.

Protected Methods

	Name	Description
	AddCommandFactory (see page 10479)	This is AddCommandFactory, a member of class TDBXDriverEx.
A	Close (see page 10474)	This is Close, a member of class TDBXDriver.
A	CreateConnection (see page 10475)	Create instance of TDBXConnection (see page 10398).
V	CreateMorphCommand (see page 10479)	This is CreateMorphCommand, a member of class TDBXDriverEx.
V	GetDriverName (see page 10475)	This is GetDriverName, a member of class TDBXDriver.
V	GetDriverProperties (see page 10475)	This is GetDriverProperties, a member of class TDBXDriver.
	LoadMetaDataCommandFactory (see page 10479)	This is LoadMetaDataCommandFactory, a member of class TDBXDriverEx.

	SetDriverName (see page 10476)	This is SetDriverName, a member of class TDBXDriver.
	SetDriverProperties (see page 10476)	This is SetDriverProperties, a member of class TDBXDriver.

Public Methods

	Name	Description
	Create (see page 10478)	This is Create, a member of class TDBXDriverEx.
	Destroy (see page 10478)	This is Destroy, a member of class TDBXDriverEx.
	GetDriverVersion (see page 10475)	Returns version information for this driver.

Public Properties

	Name	Description
	DriverName (see page 10476)	A unique name for this driver.
	DriverProperties (see page 10477)	Driver-specific properties for a particular driver.

Strict protected Methods

	Name	Description
	CacheUntilFinalization (see page 10474)	This is CacheUntilFinalization, a member of class TDBXDriver.

55.1.27.2 TDBXDriverEx.Create Constructor

Pascal

```
constructor Create;
```

C++

```
__fastcall TDBXDriverEx();
```

Description

This is Create, a member of class TDBXDriverEx.

55.1.27.3 TDBXDriverEx.Destroy Destructor

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TDBXDriverEx();
```

Description

This is Destroy, a member of class TDBXDriverEx.

55.1.27.4 TDBXDriverEx Fields

The fields of the TDBXDriverEx class are listed here.

Protected Fields

	Name	Description
	FCommandFactories (see page 10479)	This is FCommandFactories, a member of class TDBXDriverEx.

55.1.27.4.1 TDBXDriverEx.FCommandFactories Field

Pascal

```
FCommandFactories: TWidestrings;
```

C++

```
TWidestrings FCommandFactories;
```

Description

This is FCommandFactories, a member of class TDBXDriverEx.

55.1.27.5 TDBXDriverEx Methods

The methods of the TDBXDriverEx class are listed here.

Protected Methods

	Name	Description
	AddCommandFactory (see page 10479)	This is AddCommandFactory, a member of class TDBXDriverEx.
V	CreateMorphCommand (see page 10479)	This is CreateMorphCommand, a member of class TDBXDriverEx.
	LoadMetaDataCommandFactory (see page 10479)	This is LoadMetaDataCommandFactory, a member of class TDBXDriverEx.

55.1.27.5.1 TDBXDriverEx.AddCommandFactory Method

Pascal

```
procedure AddCommandFactory(Name: WideString; OnCreateCommand: TDBXCreateCommandEvent);
```

C++

```
__fastcall AddCommandFactory(BSTR Name, TDBXCreateCommandEvent OnCreateCommand);
```

Description

This is AddCommandFactory, a member of class TDBXDriverEx.

55.1.27.5.2 TDBXDriverEx.CreateMorphCommand Method

Pascal

```
function CreateMorphCommand(DbxContext: TDBXContext; Connection: TDBXConnection;
MorphicCommand: TDBXCommand): TDBXCommand; virtual;
```

C++

```
virtual __fastcall TDBXCommand CreateMorphCommand(TDBXContext DbxContext, TDBXConnection
Connection, TDBXCommand MorphicCommand);
```

Description

This is CreateMorphCommand, a member of class TDBXDriverEx.

55.1.27.5.3 TDBXDriverEx.LoadMetaDataCommandFactory Method

Pascal

```
procedure LoadMetaDataCommandFactory(const MetaDataCommandFactoryClassName: WideString; const
MetaDataCommandFactoryPackageName: WideString);
```

C++

```
__fastcall LoadMetaDataCommandFactory(const BSTR MetaDataCommandFactoryClassName, const BSTR
MetaDataCommandFactoryPackageName);
```

Description

This is LoadMetaDataCommandFactory, a member of class TDBXDriverEx.

55.1.28 TDBXDriverHelp Class

Used by driver implementors to access private or protected API.

Class Hierarchy

DBXCommon.TDBXDriverHelp

Pascal

```
TDBXDriverHelp = class;
```

C++

```
class TDBXDriverHelp;
```

File

DBXCommon

Description

This class is used only by driver implementors to access private or protected constructors, procedures or functions.

55.1.28.1 TDBXDriverHelp Members

The following tables list the members exposed by TDBXDriverHelp.

Public Methods

	Name	Description
	CreateConnectionBuilder (see page 10481)	This is CreateConnectionBuilder, a member of class TDBXDriverHelp.
	CreateTDBXContext (see page 10481)	This is CreateTDBXContext, a member of class TDBXDriverHelp.
	CreateTDBXParameter (see page 10481)	This is CreateTDBXParameter, a member of class TDBXDriverHelp.
	CreateTDBXProperties (see page 10481)	This is CreateTDBXProperties, a member of class TDBXDriverHelp.
	CreateTDBXValueType (see page 10481)	This is CreateTDBXValueType, a member of class TDBXDriverHelp.

55.1.28.2 TDBXDriverHelp Methods

The methods of the TDBXDriverHelp class are listed here.

Public Methods

	Name	Description
	CreateConnectionBuilder (see page 10481)	This is CreateConnectionBuilder, a member of class TDBXDriverHelp.
	CreateTDBXContext (see page 10481)	This is CreateTDBXContext, a member of class TDBXDriverHelp.
	CreateTDBXParameter (see page 10481)	This is CreateTDBXParameter, a member of class TDBXDriverHelp.
	CreateTDBXProperties (see page 10481)	This is CreateTDBXProperties, a member of class TDBXDriverHelp.
	CreateTDBXValueType (see page 10481)	This is CreateTDBXValueType, a member of class TDBXDriverHelp.

55.1.28.2.1 TDBXDriverHelp.CreateConnectionBuilder Method

Pascal

```
class function CreateConnectionBuilder(ConnectionBuilder: TDBXConnectionBuilder):
TDBXConnectionBuilder; static;
```

C++

```
static __fastcall TDBXConnectionBuilder CreateConnectionBuilder(TDBXConnectionBuilder
ConnectionBuilder);
```

Description

This is CreateConnectionBuilder, a member of class TDBXDriverHelp.

55.1.28.2.2 TDBXDriverHelp.CreateTDBXContext Method

Pascal

```
class function CreateTDBXContext: TDBXContext; static;
```

C++

```
static __fastcall TDBXContext CreateTDBXContext();
```

Description

This is CreateTDBXContext, a member of class TDBXDriverHelp.

55.1.28.2.3 TDBXDriverHelp.CreateTDBXParameter Method

Pascal

```
class function CreateTDBXParameter(DBXContext: TDBXContext): TDBXParameter; static;
```

C++

```
static __fastcall TDBXParameter CreateTDBXParameter(TDBXContext DBXContext);
```

Description

This is CreateTDBXParameter, a member of class TDBXDriverHelp.

55.1.28.2.4 TDBXDriverHelp.CreateTDBXProperties Method

Pascal

```
class function CreateTDBXProperties(DBXContext: TDBXContext): TDBXProperties; static;
```

C++

```
static __fastcall TDBXProperties CreateTDBXProperties(TDBXContext DBXContext);
```

Description

This is CreateTDBXProperties, a member of class TDBXDriverHelp.

55.1.28.2.5 TDBXDriverHelp.CreateTDBXValueType Method

Pascal

```
class function CreateTDBXValueType(DBXContext: TDBXContext): TDBXValueType; static;
```

C++

```
static __fastcall TDBXValueType CreateTDBXValueType(TDBXContext DBXContext);
```

Description

This is CreateTDBXValueType, a member of class TDBXDriverHelp.

55.1.29 TDBXDriverHelpEx Class

Class Hierarchy

Pascal

```
TDBXDriverHelpEx = class(TDBXDriverHelp);
```

C++

```
class TDBXDriverHelpEx : public TDBXDriverHelp;
```

File

DBXCommon

Description

This is class DBXCommon.TDBXDriverHelpEx.

55.1.29.1 TDBXDriverHelpEx Members

The following tables list the members exposed by TDBXDriverHelpEx.

Public Methods

	Name	Description
	CreateConnectionBuilder (see page 10481)	This is CreateConnectionBuilder, a member of class TDBXDriverHelp.
	CreateTDBXContext (see page 10481)	This is CreateTDBXContext, a member of class TDBXDriverHelp.
	CreateTDBXParameter (see page 10481)	This is CreateTDBXParameter, a member of class TDBXDriverHelp.
	CreateTDBXProperties (see page 10481)	This is CreateTDBXProperties, a member of class TDBXDriverHelp.
	CreateTDBXValueType (see page 10483)	This is CreateTDBXValueType, a member of class TDBXDriverHelpEx.
	GetStreamReader (see page 10483)	This is GetStreamReader, a member of class TDBXDriverHelpEx.
	IsReadOnlyValueType (see page 10483)	This is IsReadOnlyValueType, a member of class TDBXDriverHelpEx.
	UpdateParameterType (see page 10483)	This is UpdateParameterType, a member of class TDBXDriverHelpEx.

55.1.29.2 TDBXDriverHelpEx Methods

The methods of the TDBXDriverHelpEx class are listed here.

Public Methods

	Name	Description
	CreateTDBXValueType (see page 10483)	This is CreateTDBXValueType, a member of class TDBXDriverHelpEx.
	GetStreamReader (see page 10483)	This is GetStreamReader, a member of class TDBXDriverHelpEx.
	IsReadOnlyValueType (see page 10483)	This is IsReadOnlyValueType, a member of class TDBXDriverHelpEx.
	UpdateParameterType (see page 10483)	This is UpdateParameterType, a member of class TDBXDriverHelpEx.

55.1.29.2.1 TDBXDriverHelpEx.CreateTDBXValueType Method

Pascal

```
class function CreateTDBXValueType(DBXContext: TDBXContext; DBXRow: TDBXRow): TDBXValueType;
overload; static;
```

C++

```
static __fastcall TDBXValueType CreateTDBXValueType(TDBXContext DBXContext, TDBXRow DBXRow);
```

Description

This is CreateTDBXValueType, a member of class TDBXDriverHelpEx.

55.1.29.2.2 TDBXDriverHelpEx.GetStreamReader Method

Pascal

```
class function GetStreamReader(Value: TDBXStreamValue): TDBXStreamReader; overload; static;
```

C++

```
static __fastcall TDBXStreamReader GetStreamReader(TDBXStreamValue Value);
```

Description

This is GetStreamReader, a member of class TDBXDriverHelpEx.

55.1.29.2.3 TDBXDriverHelpEx.IsReadOnlyValueType Method

Pascal

```
class function IsReadOnlyValueType(ValueType: TDBXValueType): Boolean; static;
```

C++

```
static __fastcall Boolean IsReadOnlyValueType(TDBXValueType ValueType);
```

Description

This is IsReadOnlyValueType, a member of class TDBXDriverHelpEx.

55.1.29.2.4 TDBXDriverHelpEx.UpdateParameterType Method

Pascal

```
class procedure UpdateParameterType(Parameter: TDBXParameter);
```

C++

```
__fastcall UpdateParameterType(TDBXParameter Parameter);
```

Description

This is UpdateParameterType, a member of class TDBXDriverHelpEx.

55.1.30 TDBXDriverLoader Class

Collection of parameters needed when loading a driver.

Class Hierarchy

Pascal

```
TDBXDriverLoader = class(TClassRegistryObject);
```

C++

```
class TDBXDriverLoader : public TClassRegistryObject;
```

File

DBXCommon

Description

This class is used by driver implementors. It provides a collection of parameters needed when loading a driver. By collecting them in a single record, parameters can be added without breaking older drivers. TDBXDriverLoader implementations can be registered with the TDBXDriverRegistry (see page 10485) to load a driver by a string based name.

See Also

TDBXDriverRegistry (see page 10485)

55.1.30.1 TDBXDriverLoader Members

The following tables list the members exposed by TDBXDriverLoader.

Protected Fields

	Name	Description
	FLoaderName (see page 10484)	This is FLoaderName, a member of class TDBXDriverLoader.

Public Methods

	Name	Description
	Load (see page 10485)	Load driver with parameters.

55.1.30.2 TDBXDriverLoader Fields

The fields of the TDBXDriverLoader class are listed here.

Protected Fields

	Name	Description
	FLoaderName (see page 10484)	This is FLoaderName, a member of class TDBXDriverLoader.

55.1.30.2.1 TDBXDriverLoader.FLoaderName Field

Pascal

```
FLoaderName: WideString;
```

C++

```
BSTR FLoaderName;
```

Description

This is FLoaderName, a member of class TDBXDriverLoader.

55.1.30.3 TDBXDriverLoader Methods

The methods of the TDBXDriverLoader class are listed here.

Public Methods

	Name	Description
	Load (see page 10485)	Load driver with parameters.

55.1.30.3.1 TDBXDriverLoader.Load Method

Load driver with parameters.

Pascal

```
function Load(DriverDef: TDBXDriverDef): TDBXDriver; virtual; abstract;
```

C++

```
virtual __fastcall TDBXDriver Load(TDBXDriverDef DriverDef) = 0;
```

Description

This method loads a driver using the provided **DriverDef** parameters.

55.1.31 TDBXDriverRegistry Class

Registry (see page 18633) for TDBXDriverLoader (see page 10483) keyed by driver name.

Class Hierarchy

DBXCommon.TDBXDriverRegistry

Pascal

```
TDBXDriverRegistry = class;
```

C++

```
class TDBXDriverRegistry;
```

File

DBXCommon

Description

This class is used by driver implementors. It provides a registry of TDBXDriverLoader (see page 10483) instances that is keyed by a driver name string.

See Also

TDBXDriverLoader (see page 10483)

55.1.31.1 TDBXDriverRegistry Members

The following tables list the members exposed by TDBXDriverRegistry.

Public Methods

	Name	Description
	Create (see page 10486)	Creates an instance of TDBXDriverRegistry (see page 10485)
V	Destroy (see page 10486)	Destroys a TDBXDriverRegistry (see page 10485) instance.

55.1.31.2 TDBXDriverRegistry.Create Constructor

Creates an instance of TDBXDriverRegistry (see page 10485)

Pascal

```
constructor Create;
```

C++

```
__fastcall TDBXDriverRegistry();
```

Description

This constructor creates and initializes an instance of TDBXDriverRegistry (see page 10485).

See Also

Destroy (see page 10486)

55.1.31.3 TDBXDriverRegistry.Destroy Destructor

Destroys a TDBXDriverRegistry (see page 10485) instance.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TDBXDriverRegistry();
```

Description

This destructor destroys an instance of TDBXDriverRegistry (see page 10485).

See Also

Create (see page 10486)

55.1.32 TDBXError Class

Exception type for all dbExpress framework (TDBX) errors.

Class Hierarchy

Pascal

```
TDBXError = class(Exception);
```

C++

```
class TDBXError : public Exception;
```

File

DBXCommon

Description

In general, methods in the dbExpress framework (TDBX) raise exceptions rather than return error codes. TDBXError is the exception class for all TDBX errors.

See Also

TDBXErrorCodes (see page 10489)

55.1.32.1 TDBXError Members

The following tables list the members exposed by TDBXError.

Public Methods

	Name	Description
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 10488)	Create a TDBXError (see page 10486) instance.
	CreateFmt (see page 22754)	Instantiates an instance of an exception with a formatted message string.
	CreateFmtHelp (see page 22755)	Instantiates an instance of an exception with a formatted message string and a help-context ID.
	CreateHelp (see page 22755)	Creates an instance of an exception with a simple message string and a help-context ID.
	CreateRes (see page 22756)	This is the overview for the CreateRes constructor overload.
	CreateResFmt (see page 22756)	This is the overview for the CreateResFmt constructor overload.
	CreateResFmtHelp (see page 22757)	This is the overview for the CreateResFmtHelp constructor overload.
	CreateResHelp (see page 22759)	This is the overview for the CreateResHelp constructor overload.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ErrorCodeToString (see page 10488)	Convert known error codes to String.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.

	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
	ErrorCode (see page 10489)	TDBXErrorCode (see page 10670) for an exception
	HelpContext (see page 22760)	Indicates the context ID number for context-sensitive online help associated with the exception.
	Message (see page 10489)	Explanation of exception

55.1.32.2 TDBXError.Create Constructor

Create a TDBXError (see page 10486) instance.

Pascal

```
constructor Create(ErrorCode: TDBXErrorCode; const ErrorMessage: WideString);
```

C++

```
__fastcall TDBXError(TDBXErrorCode ErrorCode, const BSTR ErrorMessage);
```

Description

Create creates and initializes an instance of the TDBXErrorclass, the exception class for the dbExpress framework. New exceptions you create should inherit from TDBXError (see page 10486).

See Also

TDBXError (see page 10486)

55.1.32.3 TDBXError Methods

The methods of the TDBXError class are listed here.

Public Methods

	Name	Description
	ErrorCodeToString (see page 10488)	Convert known error codes to String.

55.1.32.3.1 TDBXError.ErrorCodeToString Method

Convert known error codes to String.

Pascal

```
class function ErrorCodeToString(ErrorCode: TDBXErrorCode): WideString; static;
```

C++

```
static __fastcall BSTR ErrorCodeToString(TDBXErrorCode ErrorCode);
```

Description

ErrorCodeToString converts known error codes in TDBXErrorCode (see page 10670) to a `String`.

See Also

TDBXErrorCode (see page 10670)

55.1.32.4 TDBXError Properties

The properties of the TDBXError class are listed here.

Public Properties

	Name	Description
R	ErrorCode (see page 10489)	TDBXErrorCode (see page 10670) for an exception
R	Message (see page 10489)	Explanation of exception

55.1.32.4.1 TDBXError.ErrorCode Property

TDBXErrorCode (see page 10670) for an exception

Pascal

```
property ErrorCode: TDBXErrorCode;
```

C++

```
__property TDBXErrorCode ErrorCode;
```

Description

Use ErrorCode to get the TDBXErrorCode (see page 10670) value for an exception. See the `const` section of TDBXErrorCodes (see page 10489) class for a list of common error codes with explanations.

See Also

TDBXError (see page 10486)

TDBXErrorCode (see page 10670)

55.1.32.4.2 TDBXError.Message Property

Explanation of exception

Pascal

```
property Message: WideString;
```

C++

```
__property BSTR Message;
```

Description

This property contains text explaining the reason an exception occurred. Also see the ErrorCode (see page 10489) property for exception information.

See Also

TDBXError (see page 10486)

ErrorCode (see page 10489)

55.1.33 TDBXErrorCodes Class

Error codes for dbExpress framework (TDBX) exceptions

Class Hierarchy

DBXCommon.TDBXErrorCodes

Pascal

```
TDBXErrorCodes = class;
```

C++

```
class TDBXErrorCodes;
```

File

DBXCommon

Description

In general, methods in the dbExpress framework (TDBX) raise exceptions rather than return error codes. This class encapsulates the error codes for the standard exceptions.

This table contains the standard error codes for TDBX exceptions.

Constant	Description
None (see page 10498)	Successful completion.
Warning (see page 10500)	Non fatal warning. Currently unused.
NoMemory (see page 10498)	Insufficient memory to complete the operation.
UnsupportedFieldType (see page 10500)	Field type is not supported by this driver.
InvalidHandle (see page 10495)	Unexpected internal error. Occurs if attempting to use a TDBX Object such as a connection, command, or reader that is already closed.
NotSupported (see page 10499)	Unsupported feature for the driver in use. Typically caused by unsupported metadata related requests.
InvalidTime (see page 10496)	Invalid value for a TDBXDataTypes.TIME field.
InvalidType (see page 10497)	Invalid value read operation attempted for a TDBXReader (see page 10576) or a TDBXParameter (see page 10545) field. Use a get method of the correct type for this field.
InvalidOrdinal (see page 10495)	Ordinal used to access a TDBXReader (see page 10576) column or a TDBXParameter (see page 10545) is out of range.
InvalidParameter (see page 10496)	Invalid use of a parameter. Common causes of this error include: 1) Parameter already bound. 2) TDBXParameterDirections (see page 10549) setting used is not supported by this driver.
EOF (see page 10494)	Used internally by DBXDynalink drivers to indicate that a TDBXReader (see page 10576) has no more rows.
ParameterNotSet (see page 10499)	One or more parameters for a TDBXCommand (see page 10378) has not been set.
InvalidUserOrPassword (see page 10497)	User name or password provided for a TDBXConnection (see page 10398) is not valid.
InvalidPrecision (see page 10496)	Attempt to set a TDBXParameter (see page 10545) with an invalid precision or read a value with a TDBXDataTypes (see page 10447) value that is not large enough.
InvalidLength (see page 10495)	Unexpected error. Insufficient storage provided to retrieve a TDBXParameter (see page 10545) value.

InvalidIsolationLevel (see page 10495)	TDBXIsolations (see page 10513) level used is not valid for this driver.
InvalidTransactionId (see page 10497)	Unexpected internal error. Transaction id is either expired or invalid.
DuplicateTransactionId (see page 10494)	Unexpected internal error. Transaction id is already in use by an active transaction.
DriverRestricted (see page 10494)	This driver is not available for the Delphi SKU purchased.
TransactionActive (see page 10500)	Operation cannot be completed with a transaction active for the TDBXConnection (see page 10398).
MultipleTransactionNotEnabled (see page 10498)	Support for multiple transactions is not enabled for this driver.
ConnectionFailed (see page 10493)	TDBXConnection.Open connect operation failed.
DriverInitFailed (see page 10493)	Driver could not be properly initialized. Client library may be missing, installed improperly, have the wrong version.
OptimisticLockFailed (see page 10499)	Optimistic lock failed. Oracle driver return this error: "OCI-21700: object does not exist or is marked for delete".
InvalidReference (see page 10496)	Unexpected internal error accessing an Oracle REF object.
NoTable (see page 10499)	Unexpected internal error accessing an Oracle REF object.
MissingParameterMarker (see page 10497)	Parameterized query is missing a '?' parameter marker.
NotImplemented (see page 10499)	Feature not implemented.
DriverIncompatible (see page 10493)	Deprecated. Driver is not compatible with version of VCL data access components in use.
InvalidArgument (see page 10494)	Argument used for an operation is invalid.
InvalidOperation (see page 10495)	Attempted operation is invalid.
NoData (see page 10498)	Used internally by DBXDynalink drivers. Not an error. Indicates either there are no more rows for a TDBXReader (see page 10576) or there is no more data when reading blob fields.
MaxCommonErrors (see page 10497)	Max common errors.
VendorError (see page 10500)	Vendor specific error.

See Also

TDBXError (see page 10486)

55.1.33.1 TDBXErrorCodes Members

The following tables list the members exposed by TDBXErrorCodes.

Public Constants

	Name	Description
	ConnectionFailed (see page 10493)	This is ConnectionFailed, a member of class TDBXErrorCodes.
	DriverIncompatible (see page 10493)	This is DriverIncompatible, a member of class TDBXErrorCodes.
	DriverInitFailed (see page 10493)	This is DriverInitFailed, a member of class TDBXErrorCodes.
	DriverRestricted (see page 10494)	This is DriverRestricted, a member of class TDBXErrorCodes.
	DuplicateTransactionId (see page 10494)	This is DuplicateTransactionId, a member of class TDBXErrorCodes.
	EOF (see page 10494)	This is EOF, a member of class TDBXErrorCodes.
	InvalidArgument (see page 10494)	This is InvalidArgument, a member of class TDBXErrorCodes.
	InvalidHandle (see page 10495)	This is InvalidHandle, a member of class TDBXErrorCodes.
	InvalidIsolationLevel (see page 10495)	This is InvalidIsolationLevel, a member of class TDBXErrorCodes.
	InvalidLength (see page 10495)	This is InvalidLength, a member of class TDBXErrorCodes.
	InvalidOperation (see page 10495)	This is InvalidOperation, a member of class TDBXErrorCodes.
	InvalidOrdinal (see page 10495)	This is InvalidOrdinal, a member of class TDBXErrorCodes.
	InvalidParameter (see page 10496)	This is InvalidParameter, a member of class TDBXErrorCodes.
	InvalidPrecision (see page 10496)	This is InvalidPrecision, a member of class TDBXErrorCodes.
	InvalidReference (see page 10496)	This is InvalidReference, a member of class TDBXErrorCodes.
	InvalidTime (see page 10496)	This is InvalidTime, a member of class TDBXErrorCodes.
	InvalidTransactionId (see page 10497)	This is InvalidTransactionId, a member of class TDBXErrorCodes.
	InvalidType (see page 10497)	This is InvalidType, a member of class TDBXErrorCodes.
	InvalidUserOrPassword (see page 10497)	This is InvalidUserOrPassword, a member of class TDBXErrorCodes.
	MaxCommonErrors (see page 10497)	This is MaxCommonErrors, a member of class TDBXErrorCodes.
	MissingParameterMarker (see page 10497)	This is MissingParameterMarker, a member of class TDBXErrorCodes.
	MultipleTransactionNotEnabled (see page 10498)	This is MultipleTransactionNotEnabled, a member of class TDBXErrorCodes.
	NoData (see page 10498)	This is NoData, a member of class TDBXErrorCodes.
	NoMemory (see page 10498)	This is NoMemory, a member of class TDBXErrorCodes.
	None (see page 10498)	This is None, a member of class TDBXErrorCodes.
	NoTable (see page 10499)	This is NoTable, a member of class TDBXErrorCodes.
	NotImplemented (see page 10499)	This is NotImplemented, a member of class TDBXErrorCodes.
	NotSupported (see page 10499)	This is NotSupported, a member of class TDBXErrorCodes.
	OptimisticLockFailed (see page 10499)	This is OptimisticLockFailed, a member of class TDBXErrorCodes.
	ParameterNotSet (see page 10499)	This is ParameterNotSet, a member of class TDBXErrorCodes.
	TransactionActive (see page 10500)	This is TransactionActive, a member of class TDBXErrorCodes.
	UnsupportedFieldType (see page 10500)	This is UnsupportedFieldType, a member of class TDBXErrorCodes.
	VendorError (see page 10500)	This is VendorError, a member of class TDBXErrorCodes.
	Warning (see page 10500)	This is Warning, a member of class TDBXErrorCodes.

55.1.33.2 TDBXErrorCodes Constants

The constants of the TDBXErrorCodes class are listed here.

Public Constants

	Name	Description
	ConnectionFailed (see page 10493)	This is ConnectionFailed, a member of class TDBXErrorCodes.
	DriverIncompatible (see page 10493)	This is DriverIncompatible, a member of class TDBXErrorCodes.
	DriverInitFailed (see page 10493)	This is DriverInitFailed, a member of class TDBXErrorCodes.
	DriverRestricted (see page 10494)	This is DriverRestricted, a member of class TDBXErrorCodes.
	DuplicateTransactionId (see page 10494)	This is DuplicateTransactionId, a member of class TDBXErrorCodes.
	EOF (see page 10494)	This is EOF, a member of class TDBXErrorCodes.
	InvalidArgument (see page 10494)	This is InvalidArgument, a member of class TDBXErrorCodes.
	InvalidHandle (see page 10495)	This is InvalidHandle, a member of class TDBXErrorCodes.
	InvalidIsolationLevel (see page 10495)	This is InvalidIsolationLevel, a member of class TDBXErrorCodes.
	InvalidLength (see page 10495)	This is InvalidLength, a member of class TDBXErrorCodes.

	InvalidOperation (see page 10495)	This is InvalidOperation, a member of class TDBXErrorCodes.
	InvalidOrdinal (see page 10495)	This is InvalidOrdinal, a member of class TDBXErrorCodes.
	InvalidParameter (see page 10496)	This is InvalidParameter, a member of class TDBXErrorCodes.
	InvalidPrecision (see page 10496)	This is InvalidPrecision, a member of class TDBXErrorCodes.
	InvalidReference (see page 10496)	This is InvalidReference, a member of class TDBXErrorCodes.
	InvalidTime (see page 10496)	This is InvalidTime, a member of class TDBXErrorCodes.
	InvalidTransactionId (see page 10497)	This is InvalidTransactionId, a member of class TDBXErrorCodes.
	InvalidType (see page 10497)	This is InvalidType, a member of class TDBXErrorCodes.
	InvalidUserOrPassword (see page 10497)	This is InvalidUserOrPassword, a member of class TDBXErrorCodes.
	MaxCommonErrors (see page 10497)	This is MaxCommonErrors, a member of class TDBXErrorCodes.
	MissingParameterMarker (see page 10497)	This is MissingParameterMarker, a member of class TDBXErrorCodes.
	MultipleTransactionNotEnabled (see page 10498)	This is MultipleTransactionNotEnabled, a member of class TDBXErrorCodes.
	NoData (see page 10498)	This is NoData, a member of class TDBXErrorCodes.
	NoMemory (see page 10498)	This is NoMemory, a member of class TDBXErrorCodes.
	None (see page 10498)	This is None, a member of class TDBXErrorCodes.
	NoTable (see page 10499)	This is NoTable, a member of class TDBXErrorCodes.
	NotImplemented (see page 10499)	This is NotImplemented, a member of class TDBXErrorCodes.
	NotSupported (see page 10499)	This is NotSupported, a member of class TDBXErrorCodes.
	OptimisticLockFailed (see page 10499)	This is OptimisticLockFailed, a member of class TDBXErrorCodes.
	ParameterNotSet (see page 10499)	This is ParameterNotSet, a member of class TDBXErrorCodes.
	TransactionActive (see page 10500)	This is TransactionActive, a member of class TDBXErrorCodes.
	UnsupportedFieldType (see page 10500)	This is UnsupportedFieldType, a member of class TDBXErrorCodes.
	VendorError (see page 10500)	This is VendorError, a member of class TDBXErrorCodes.
	Warning (see page 10500)	This is Warning, a member of class TDBXErrorCodes.

55.1.33.2.1 TDBXErrorCodes.ConnectionFailed Constant

Pascal

```
const ConnectionFailed = $0015;
```

C++

```
ConnectionFailed = 0x0015;
```

Description

This is ConnectionFailed, a member of class TDBXErrorCodes.

55.1.33.2.2 TDBXErrorCodes.DriverIncompatible Constant

Pascal

```
const DriverIncompatible = $001C;
```

C++

```
DriverIncompatible = 0x001C;
```

Description

This is DriverIncompatible, a member of class TDBXErrorCodes.

55.1.33.2.3 TDBXErrorCodes.DriverInitFailed Constant

Pascal

```
const DriverInitFailed = $0016;
```

C++

```
DriverInitFailed = 0x0016;
```

Description

This is DriverInitFailed, a member of class TDBXErrorCodes.

55.1.33.2.4 TDBXErrorCodes.DriverRestricted Constant

Pascal

```
const DriverRestricted = $0012;
```

C++

```
DriverRestricted = 0x0012;
```

Description

This is DriverRestricted, a member of class TDBXErrorCodes.

55.1.33.2.5 TDBXErrorCodes.DuplicateTransactionId Constant

Pascal

```
const DuplicateTransactionId = $0011;
```

C++

```
DuplicateTransactionId = 0x0011;
```

Description

This is DuplicateTransactionId, a member of class TDBXErrorCodes.

55.1.33.2.6 TDBXErrorCodes.EOF Constant

Pascal

```
const EOF = $000A;
```

C++

```
EOF = 0x000A;
```

Description

This is EOF, a member of class TDBXErrorCodes.

55.1.33.2.7 TDBXErrorCodes.InvalidArgument Constant

Pascal

```
const InvalidArgument = $001D;
```

C++

```
InvalidArgument = 0x001D;
```

Description

This is InvalidArgument, a member of class TDBXErrorCodes.

55.1.33.2.8 TDBXErrorCodes.InvalidHandle Constant

Pascal

```
const InvalidHandle = $0004;
```

C++

```
InvalidHandle = 0x0004;
```

Description

This is InvalidHandle, a member of class TDBXErrorCodes.

55.1.33.2.9 TDBXErrorCodes.InvalidIsolationLevel Constant

Pascal

```
const InvalidIsolationLevel = $000F;
```

C++

```
InvalidIsolationLevel = 0x000F;
```

Description

This is InvalidIsolationLevel, a member of class TDBXErrorCodes.

55.1.33.2.10 TDBXErrorCodes.InvalidLength Constant

Pascal

```
const InvalidLength = $000E;
```

C++

```
InvalidLength = 0x000E;
```

Description

This is InvalidLength, a member of class TDBXErrorCodes.

55.1.33.2.11 TDBXErrorCodes.InvalidOperation Constant

Pascal

```
const InvalidOperation = $001E;
```

C++

```
InvalidOperation = 0x001E;
```

Description

This is InvalidOperation, a member of class TDBXErrorCodes.

55.1.33.2.12 TDBXErrorCodes.InvalidOrdinal Constant

Pascal

```
const InvalidOrdinal = $0008;
```

C++

```
InvalidOrdinal = 0x0008;
```

Description

This is InvalidOrdinal, a member of class TDBXErrorCodes.

55.1.33.2.13 TDBXErrorCodes.InvalidParameter Constant

Pascal

```
const InvalidParameter = $0009;
```

C++

```
InvalidParameter = 0x0009;
```

Description

This is InvalidParameter, a member of class TDBXErrorCodes.

55.1.33.2.14 TDBXErrorCodes.InvalidPrecision Constant

Pascal

```
const InvalidPrecision = $000D;
```

C++

```
InvalidPrecision = 0x000D;
```

Description

This is InvalidPrecision, a member of class TDBXErrorCodes.

55.1.33.2.15 TDBXErrorCodes.InvalidReference Constant

Pascal

```
const InvalidReference = $0018;
```

C++

```
InvalidReference = 0x0018;
```

Description

This is InvalidReference, a member of class TDBXErrorCodes.

55.1.33.2.16 TDBXErrorCodes.InvalidTime Constant

Pascal

```
const InvalidTime = $0006;
```

C++

```
InvalidTime = 0x0006;
```

Description

This is InvalidTime, a member of class TDBXErrorCodes.

55.1.33.2.17 TDBXErrorCodes.InvalidTransactionId Constant

Pascal

```
const InvalidTransactionId = $0010;
```

C++

```
InvalidTransactionId = 0x0010;
```

Description

This is InvalidTransactionId, a member of class TDBXErrorCodes.

55.1.33.2.18 TDBXErrorCodes.InvalidType Constant

Pascal

```
const InvalidType = $0007;
```

C++

```
InvalidType = 0x0007;
```

Description

This is InvalidType, a member of class TDBXErrorCodes.

55.1.33.2.19 TDBXErrorCodes.InvalidUserOrPassword Constant

Pascal

```
const InvalidUserOrPassword = $000C;
```

C++

```
InvalidUserOrPassword = 0x000C;
```

Description

This is InvalidUserOrPassword, a member of class TDBXErrorCodes.

55.1.33.2.20 TDBXErrorCodes.MaxCommonErrors Constant

Pascal

```
const MaxCommonErrors = $0064;
```

C++

```
MaxCommonErrors = 0x0064;
```

Description

This is MaxCommonErrors, a member of class TDBXErrorCodes.

55.1.33.2.21 TDBXErrorCodes.MissingParameterMarker Constant

Pascal

```
const MissingParameterMarker = $001A;
```

C++

```
MissingParameterMarker = 0x001A;
```

Description

This is MissingParameterMarker, a member of class TDBXErrorCodes.

55.1.33.2.22 TDBXErrorCodes.MultipleTransactionNotEnabled Constant

Pascal

```
const MultipleTransactionNotEnabled = $0014;
```

C++

```
MultipleTransactionNotEnabled = 0x0014;
```

Description

This is MultipleTransactionNotEnabled, a member of class TDBXErrorCodes.

55.1.33.2.23 TDBXErrorCodes.NoData Constant

Pascal

```
const NoData = $0064;
```

C++

```
NoData = 0x0064;
```

Description

This is NoData, a member of class TDBXErrorCodes.

55.1.33.2.24 TDBXErrorCodes.NoMemory Constant

Pascal

```
const NoMemory = $0002;
```

C++

```
NoMemory = 0x0002;
```

Description

This is NoMemory, a member of class TDBXErrorCodes.

55.1.33.2.25 TDBXErrorCodes.None Constant

Pascal

```
const None = $0000;
```

C++

```
None = 0x0000;
```

Description

This is None, a member of class TDBXErrorCodes.

55.1.33.2.26 TDBXErrorCodes.NoTable Constant

Pascal

```
const NoTable = $0019;
```

C++

```
NoTable = 0x0019;
```

Description

This is NoTable, a member of class TDBXErrorCodes.

55.1.33.2.27 TDBXErrorCodes.NotImplemented Constant

Pascal

```
const NotImplemented = $001B;
```

C++

```
NotImplemented = 0x001B;
```

Description

This is NotImplemented, a member of class TDBXErrorCodes.

55.1.33.2.28 TDBXErrorCodes.NotSupported Constant

Pascal

```
const NotSupported = $0005;
```

C++

```
NotSupported = 0x0005;
```

Description

This is NotSupported, a member of class TDBXErrorCodes.

55.1.33.2.29 TDBXErrorCodes.OptimisticLockFailed Constant

Pascal

```
const OptimisticLockFailed = $0017;
```

C++

```
OptimisticLockFailed = 0x0017;
```

Description

This is OptimisticLockFailed, a member of class TDBXErrorCodes.

55.1.33.2.30 TDBXErrorCodes.ParameterNotSet Constant

Pascal

```
const ParameterNotSet = $000B;
```

C++

```
ParameterNotSet = 0x000B;
```

Description

This is ParameterNotSet, a member of class TDBXErrorCodes.

55.1.33.2.31 TDBXErrorCodes.TransactionActive Constant

Pascal

```
const TransactionActive = $0013;
```

C++

```
TransactionActive = 0x0013;
```

Description

This is TransactionActive, a member of class TDBXErrorCodes.

55.1.33.2.32 TDBXErrorCodes.UnsupportedFieldType Constant

Pascal

```
const UnsupportedFieldType = $0003;
```

C++

```
UnsupportedFieldType = 0x0003;
```

Description

This is UnsupportedFieldType, a member of class TDBXErrorCodes.

55.1.33.2.33 TDBXErrorCodes.VendorError Constant

Pascal

```
const VendorError = $0065;
```

C++

```
VendorError = 0x0065;
```

Description

This is VendorError, a member of class TDBXErrorCodes.

55.1.33.2.34 TDBXErrorCodes.Warning Constant

Pascal

```
const Warning = $0001;
```

C++

```
Warning = 0x0001;
```

Description

This is Warning, a member of class TDBXErrorCodes.

55.1.34 TDBXIniFileConnectionFactory Class

Creates new instances of TDBXConnection (see page 10398) from the dbxdrivers.ini and dbxconnections.ini files

Class Hierarchy

Pascal

```
TDBXIniFileConnectionFactory = class(TDBXConnectionFactory);
```

C++

```
class TDBXIniFileConnectionFactory : public TDBXConnectionFactory;
```

File

DBXCommon

Description

This class is an extension of TDBXConnectionFactory (see page 10422) that can be used to create new instances of TDBXConnection (see page 10398). It gets driver and connection properties from the dbxdrivers.ini and dbxconnections.ini files for a given connection name.

See Also

Connecting to a Database using the dbExpress Driver Framework

TDBXConnection (see page 10398)

TDBXConnectionFactory (see page 10422)

55.1.34.1 TDBXIniFileConnectionFactory Members

The following tables list the members exposed by TDBXIniFileConnectionFactory.

Protected Methods

	Name	Description
	DerivedClose (see page 10503)	This is DerivedClose, a member of class TDBXIniFileConnectionFactory.
	DerivedOpen (see page 10503)	This is DerivedOpen, a member of class TDBXIniFileConnectionFactory.
	GetErrorEvent (see page 10429)	This is GetErrorEvent, a member of class TDBXConnectionFactory.
	GetTraceFlags (see page 10429)	This is GetTraceFlags, a member of class TDBXConnectionFactory.
	GetTraceInfoEvent (see page 10429)	This is GetTraceInfoEvent, a member of class TDBXConnectionFactory.
	SetErrorEvent (see page 10430)	This is SetErrorEvent, a member of class TDBXConnectionFactory.
	SetTraceFlags (see page 10430)	This is SetTraceFlags, a member of class TDBXConnectionFactory.
	SetTraceInfoEvent (see page 10431)	This is SetTraceInfoEvent, a member of class TDBXConnectionFactory.

Public Events

	Name	Description
	OnError (see page 10432)	TDBXErrorEvent (see page 10671) handler.
	OnTrace (see page 10432)	TDBXTraceInfoEvent handler.

Public Methods

	Name	Description
	Close (see page 10425)	Closes the factory.

	Create (see page 10502)	Creates an instance of TDBXIniFileConnectionFactory (see page 10501)
	Destroy (see page 10502)	Destroys an instance of TDBXIniFileConnectionFactory (see page 10501)
	GetConnection (see page 10426)	This is the overview for the GetConnection method overload.
	GetConnectionDriver (see page 10427)	Gets a TDBXDriver (see page 10472) instance for a connection name
	GetConnectionFactory (see page 10427)	Gets a TDBXConnectionFactory (see page 10422) singleton
	GetConnectionItems (see page 10428)	Adds names of all connections to Items list.
	GetConnectionProperties (see page 10428)	Gets a TDBXPropertiesinstance for a connection name
	GetDriver (see page 10428)	Returns TDBXDriver (see page 10472) instance for a driver name
	GetDriverProperties (see page 10429)	Returns TDBXProperties (see page 10559) instance of driver properties
	Open (see page 10430)	Opens the TDBXConnectionFactory (see page 10422)
	SetConnectionFactory (see page 10430)	Change the default TDBXConnectionFactorysingleton

Public Properties

	Name	Description
	ConnectionsFile (see page 10503)	File name for the connections ini file
	DriversFile (see page 10504)	File name for the drivers ini file
	TraceFlags (see page 10431)	Trace flags to enable or disable tracing categories

Strict protected Fields

	Name	Description
	FDBXContext (see page 10424)	This is FDBXContext, a member of class TDBXConnectionFactory.

Strict protected Methods

	Name	Description
	CreateDelegatePaths (see page 10426)	This is CreateDelegatePaths, a member of class TDBXConnectionFactory.

55.1.34.2 TDBXIniFileConnectionFactory.Create Constructor

Creates an instance of TDBXIniFileConnectionFactory (see page 10501)

Pascal

```
constructor Create;
```

C++

```
__fastcall TDBXIniFileConnectionFactory();
```

Description

This constructor creates and initializes an instance of TDBXIniFileConnectionFactory (see page 10501). You can create a new TDBXConnection (see page 10398) object from this object that allows you to connect to a database. This class gets driver and connection properties from the dbxdrivers.ini and dbxconnections.ini files for a given connection name.

See Also

TDBXConnection (see page 10398)

TDBXIniFileConnectionFactory (see page 10501)

55.1.34.3 TDBXIniFileConnectionFactory.Destroy Destructor

Destroys an instance of TDBXIniFileConnectionFactory (see page 10501)

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TDBXIniFileConnectionFactory();
```

Description

This destructor destroys an instance of TDBXIniFileConnectionFactory (see page 10501).

55.1.34.4 TDBXIniFileConnectionFactory Methods

The methods of the TDBXIniFileConnectionFactory class are listed here.

Protected Methods

	Name	Description
	DerivedClose (see page 10503)	This is DerivedClose, a member of class TDBXIniFileConnectionFactory.
	DerivedOpen (see page 10503)	This is DerivedOpen, a member of class TDBXIniFileConnectionFactory.

55.1.34.4.1 TDBXIniFileConnectionFactory.DerivedClose Method

Pascal

```
procedure DerivedClose; override;
```

C++

```
virtual __fastcall DerivedClose();
```

Description

This is DerivedClose, a member of class TDBXIniFileConnectionFactory.

55.1.34.4.2 TDBXIniFileConnectionFactory.DerivedOpen Method

Pascal

```
procedure DerivedOpen; override;
```

C++

```
virtual __fastcall DerivedOpen();
```

Description

This is DerivedOpen, a member of class TDBXIniFileConnectionFactory.

55.1.34.5 TDBXIniFileConnectionFactory Properties

The properties of the TDBXIniFileConnectionFactory class are listed here.

Public Properties

	Name	Description
	ConnectionsFile (see page 10503)	File name for the connections ini file
	DriversFile (see page 10504)	File name for the drivers ini file

55.1.34.5.1 TDBXIniFileConnectionFactory.ConnectionsFile Property

File name for the connections ini file

Pascal

```
property ConnectionsFile: WideString;
```

C++

```
__property BSTR ConnectionsFile;
```

Description

This property contains the file name for the connections ini file.

55.1.34.5.2 TDBXIniFileConnectionFactory.DriversFile Property

File name for the drivers ini file

Pascal

```
property DriversFile: WideString;
```

C++

```
__property BSTR DriversFile;
```

Description

This property contains the file name for the drivers ini file.

55.1.35 TDBXIniFileConnectionFactoryEx Class

Extension of TDBXIniFileConnectionFactory (see page 10501).

Class Hierarchy

Pascal

```
TDBXIniFileConnectionFactoryEx = class(TDBXIniFileConnectionFactory);
```

C++

```
class TDBXIniFileConnectionFactoryEx : public TDBXIniFileConnectionFactory;
```

File

DBXCommon

Description

TDBXIniFileConnectionFactoryEx is an extension of TDBXIniFileConnectionFactory (see page 10501).

Note: Classes (see page 2685) ending in “Ex” are temporary classes that exist to avoid breaking interfaces. Their contents will be migrated to their base class in the next release.

See Also

TDBXIniFileConnectionFactory (see page 10501)

55.1.35.1 TDBXIniFileConnectionFactoryEx Members

The following tables list the members exposed by TDBXIniFileConnectionFactoryEx.

Protected Methods

	Name	Description
	DerivedClose (see page 10426)	This is DerivedClose, a member of class TDBXConnectionFactory.
	DerivedClose (see page 10503)	This is DerivedClose, a member of class TDBXIniFileConnectionFactory.
	DerivedOpen (see page 10426)	This is DerivedOpen, a member of class TDBXConnectionFactory.
	DerivedOpen (see page 10503)	This is DerivedOpen, a member of class TDBXIniFileConnectionFactory.
	GetErrorEvent (see page 10429)	This is GetErrorEvent, a member of class TDBXConnectionFactory.
	GetTraceFlags (see page 10429)	This is GetTraceFlags, a member of class TDBXConnectionFactory.
	GetTraceInfoEvent (see page 10429)	This is GetTraceInfoEvent, a member of class TDBXConnectionFactory.
	SetErrorEvent (see page 10430)	This is SetErrorEvent, a member of class TDBXConnectionFactory.
	SetTraceFlags (see page 10430)	This is SetTraceFlags, a member of class TDBXConnectionFactory.
	SetTraceInfoEvent (see page 10431)	This is SetTraceInfoEvent, a member of class TDBXConnectionFactory.

Public Events

	Name	Description
	OnError (see page 10432)	TDBXErrorEvent (see page 10671) handler.
	OnTrace (see page 10432)	TDBXTraceInfoEvent handler.

Public Methods

	Name	Description
	Close (see page 10425)	Closes the factory.
	Create (see page 10423)	Creates an instance of TDBXConnectionFactory (see page 10422)
	Create (see page 10502)	Creates an instance of TDBXIniFileConnectionFactory (see page 10501)
	Destroy (see page 10424)	Destroys a TDBXConnectionFactory (see page 10422)
	Destroy (see page 10502)	Destroys an instance of TDBXIniFileConnectionFactory (see page 10501)
	GetConnection (see page 10426)	This is the overview for the GetConnection method overload.
	GetConnectionDriver (see page 10427)	Gets a TDBXDriver (see page 10472) instance for a connection name
	GetConnectionFactory (see page 10427)	Gets a TDBXConnectionFactory (see page 10422) singleton
	GetConnectionItems (see page 10428)	Adds names of all connections to Items list.
	GetConnectionProperties (see page 10428)	Gets a TDBXPropertiesinstance for a connection name
	GetDriver (see page 10428)	Returns TDBXDriver (see page 10472) instance for a driver name
	GetDriverItems (see page 10506)	Adds names of all Drivers in factory to Items list.
	GetDriverProperties (see page 10429)	Returns TDBXProperties (see page 10559) instance of driver properties
	Open (see page 10430)	Opens the TDBXConnectionFactory (see page 10422)
	SetConnectionFactory (see page 10430)	Change the default TDBXConnectionFactorysingleton

Public Properties

	Name	Description
	ConnectionsFile (see page 10503)	File name for the connections ini file
	DriversFile (see page 10504)	File name for the drivers ini file
	TraceFlags (see page 10431)	Trace flags to enable or disable tracing categories

Strict protected Fields

	Name	Description
	FDBXContext (see page 10424)	This is FDBXContext, a member of class TDBXConnectionFactory.

Strict protected Methods

	Name	Description
	CreateDelegatePaths (see page 10426)	This is CreateDelegatePaths, a member of class TDBXConnectionFactory.

55.1.35.2 TDBXIniFileConnectionFactoryEx Methods

The methods of the TDBXIniFileConnectionFactoryEx class are listed here.

Public Methods

	Name	Description
	GetDriverItems (see page 10506)	Adds names of all Drivers in factory to Items list.

55.1.35.2.1 TDBXIniFileConnectionFactoryEx.GetDriverItems Method

Adds names of all Drivers in factory to Items list.

Pascal

```
procedure GetDriverItems(Items: TStrings);
```

C++

```
__fastcall GetDriverItems(TStrings Items);
```

Description

GetDriverItems adds the names of all Drivers in the factory to the Items list.

55.1.36 TDBXInt16Value Class

Implementation of 16-byte integer values.

Class Hierarchy

Pascal

```
TDBXInt16Value = class(TDBXWritableValue);
```

C++

```
class TDBXInt16Value : public TDBXWritableValue;
```

File

DBXCommon

Description

Implementation of TDBXWritableValue (see page 10661) for TDBXDataTypes.Int16Type values.

55.1.36.1 TDBXInt16Value Members

The following tables list the members exposed by TDBXInt16Value.

Protected Methods

	Name	Description
	Create (see page 10627)	Enter a short sentence, starting with a verb, that states the basic purpose of the property.
	Create (see page 10662)	Creates an instance of TDBXWritableValue (see page 10661)
	GetDbxContext (see page 10630)	Get context information for a connection associated with value.
V	SetPendingValue (see page 10666)	This is SetPendingValue, a member of class TDBXWritableValue.

Protected Properties

	Name	Description
R	DbxContext (see page 10633)	Context information for a connection associated with value.

Public Methods

	Name	Description
	CreateValue (see page 10628)	Creates values for both the TDBXReader (see page 10576) and TDBXParameterList (see page 10553) classes.
V	Destroy (see page 10627)	Enter a short sentence, starting with a verb, that states the basic purpose of the property.
V	Destroy (see page 10663)	Destroys a TDBXWritableValue (see page 10661) instance.
V	GetAnsiString (see page 10629)	Gets the string value for ANSI strings.
V	GetBcd (see page 10629)	Gets the BCD value for binary-compressed decimal data types.
V	GetBoolean (see page 10629)	Gets the boolean value for boolean data types.
V	GetBytes (see page 10629)	Gets the byte array value for byte array and blob types.
V	GetDate (see page 10630)	Gets the date value for date data types.
V	GetDouble (see page 10630)	Gets the double floating point value for double data types.
V	GetInt16 (see page 10508)	Gets the smallInt value for 16-byte integer data types.
V	GetInt32 (see page 10631)	Gets the 32-byte integer value for 32-byte integer data types.
V	GetInt64 (see page 10631)	Gets the 64-byte integer value for 64-byte integer data types.
V	GetTime (see page 10631)	Gets the time value for time data types.
V	GetTimeStamp (see page 10632)	Gets the timestamp value for timestamp data types.
V	GetValueSize (see page 10632)	Gets the size in bytes for values.
V	GetWideString (see page 10632)	Gets the wide string value for wide string data types.
V	IsNull (see page 10508)	Returns true if the value is **null**.
V	SetAnsiString (see page 10663)	Sets the string value for ANSI strings.
V	SetBcd (see page 10664)	Sets the BCD value for binary-compressed decimal data types.
V	SetBoolean (see page 10664)	Sets the boolean value for boolean data types..
V	SetDate (see page 10664)	Sets the date value for date data types..
V	SetDouble (see page 10664)	Sets the double floating point value for double data types.
V	SetDynamicBytes (see page 10665)	Sets the dynamic array value for byte array and blob types.
V	SetInt16 (see page 10508)	Sets the the smallInt value for 16-byte integer data types.
V	SetInt32 (see page 10665)	Sets the 32-byte integer value for 32-byte integer data types.
V	SetInt64 (see page 10665)	Sets the 64-byte integer value for 64-byte integer data types.
V	SetNull (see page 10666)	Sets a writable value of any type to null.
V	SetStaticBytes (see page 10666)	Sets the open array value for byte array and blob types
V	SetTime (see page 10666)	Sets the time value for time data types.
V	SetTimeStamp (see page 10667)	Sets the timestamp value for timestamp data types.
V	SetWideString (see page 10667)	Sets the wide string value for wide string data types.

Public Properties

	Name	Description
R	ValueType (see page 10633)	Gets the value type for this value.

55.1.36.2 TDBXInt16Value Methods

The methods of the TDBXInt16Value class are listed here.

Public Methods

	Name	Description
V	GetInt16 (see page 10508)	Gets the smallInt value for 16-byte integer data types.
V	IsNull (see page 10508)	Returns true if the value is **null**.
V	SetInt16 (see page 10508)	Sets the the smallInt value for 16-byte integer data types.

55.1.36.2.1 TDBXInt16Value.GetInt16 Method

Gets the smallInt value for 16-byte integer data types.

Pascal

```
function GetInt16: SmallInt; override;
```

C++

```
virtual __fastcall SmallInt GetInt16();
```

Description

Gets the smallInt value for TDBXValue (see page 10626) instances with a data type of Int16Type. Throws a TDBXError (see page 10486) exception if IsNull (see page 10508) is true.

55.1.36.2.2 TDBXInt16Value.IsNull Method

Returns true if the value is **null**.

Pascal

```
function IsNull: Boolean; override;
```

C++

```
virtual __fastcall Boolean IsNull();
```

Description

Returns true if the value is **null**. This method should be called before calling any of the Get methods. If the value is null, the Get methods will throw TDBXError (see page 10486) exception if they are called.

55.1.36.2.3 TDBXInt16Value.SetInt16 Method

Sets the the smallInt value for 16-byte integer data types.

Pascal

```
procedure SetInt16(Value: SmallInt); override;
```

C++

```
virtual __fastcall SetInt16(SmallInt Value);
```

Description

Sets the the smallInt value for TDBXValue (see page 10626) instances with a data type of Int16Type.

55.1.37 TDBXInt32Value Class

Implementation of writable 32-byte integer values.

Class Hierarchy

Pascal

```
TDBXInt32Value = class(TDBXWritableValue);
```

C++

```
class TDBXInt32Value : public TDBXWritableValue;
```

File

DBXCommon

Description

Implementation of TDBXWritableValue (see page 10661) for TDBXDataTypes.Int32Type values.

55.1.37.1 TDBXInt32Value Members

The following tables list the members exposed by TDBXInt32Value.

Protected Methods

	Name	Description
	Create (see page 10627)	Enter a short sentence, starting with a verb, that states the basic purpose of the property.
	Create (see page 10662)	Creates an instance of TDBXWritableValue (see page 10661)
	GetDbxContext (see page 10630)	Get context information for a connection associated with value.
V	SetPendingValue (see page 10666)	This is SetPendingValue, a member of class TDBXWritableValue.

Protected Properties

	Name	Description
R	DbxContext (see page 10633)	Context information for a connection associated with value.

Public Methods

	Name	Description
	CreateValue (see page 10628)	Creates values for both the TDBXReader (see page 10576) and TDBXParameterList (see page 10553) classes.
V	Destroy (see page 10627)	Enter a short sentence, starting with a verb, that states the basic purpose of the property.
V	Destroy (see page 10663)	Destroys a TDBXWritableValue (see page 10661) instance.
V	GetAnsiString (see page 10629)	Gets the string value for ANSI strings.
V	GetBcd (see page 10629)	Gets the BCD value for binary-compressed decimal data types.
V	GetBoolean (see page 10629)	Gets the boolean value for boolean data types.
V	GetBytes (see page 10629)	Gets the byte array value for byte array and blob types.
V	GetDate (see page 10630)	Gets the date value for date data types.
V	GetDouble (see page 10630)	Gets the double floating point value for double data types.
V	GetInt16 (see page 10631)	Gets the smallInt value for 16-byte integer data types.
V	GetInt32 (see page 10510)	Gets the 32-byte integer value for 32-byte integer data types.
V	GetInt64 (see page 10631)	Gets the 64-byte integer value for 64-byte integer data types.
V	GetTime (see page 10631)	Gets the time value for time data types.
V	GetTimeStamp (see page 10632)	Gets the timestamp value for timestamp data types.
V	GetValueSize (see page 10632)	Gets the size in bytes for values.
V	GetWideString (see page 10632)	Gets the wide string value for wide string data types.
V	IsNull (see page 10510)	Returns true if the value is **null**.
V	SetAnsiString (see page 10663)	Sets the string value for ANSI strings.
V	SetBcd (see page 10664)	Sets the BCD value for binary-compressed decimal data types.
V	SetBoolean (see page 10664)	Sets the boolean value for boolean data types..
V	SetDate (see page 10664)	Sets the date value for date data types..
V	SetDouble (see page 10664)	Sets the double floating point value for double data types.
V	SetDynamicBytes (see page 10665)	Sets the dynamic array value for byte array and blob types.
V	SetInt16 (see page 10665)	Sets the the smallInt value for 16-byte integer data types.

	SetInt32 (see page 10511)	Sets the 32-byte integer value for 32-byte integer data types.
	SetInt64 (see page 10665)	Sets the 64-byte integer value for 64-byte integer data types.
	SetNull (see page 10666)	Sets a writable value of any type to null.
	SetStaticBytes (see page 10666)	Sets the open array value for byte array and blob types
	SetTime (see page 10666)	Sets the time value for time data types.
	SetTimeStamp (see page 10667)	Sets the timestamp value for timestamp data types.
	SetWideString (see page 10667)	Sets the wide string value for wide string data types.

Public Properties

	Name	Description
	ValueType (see page 10633)	Gets the value type for this value.

55.1.37.2 TDBXInt32Value Methods

The methods of the TDBXInt32Value class are listed here.

Public Methods

	Name	Description
	GetInt32 (see page 10510)	Gets the 32-byte integer value for 32-byte integer data types.
	IsNull (see page 10510)	Returns true if the value is **null**.
	SetInt32 (see page 10511)	Sets the 32-byte integer value for 32-byte integer data types.

55.1.37.2.1 TDBXInt32Value.GetInt32 Method

Gets the 32-byte integer value for 32-byte integer data types.

Pascal

```
function GetInt32: TInt32; override;
```

C++

```
virtual __fastcall TInt32 GetInt32();
```

Description

Gets the 32-byte integer value for TDBXValue (see page 10626) instances with a data type of Int32Type. Throws a TDBXError (see page 10486) exception if IsNull (see page 10510) is true.

55.1.37.2.2 TDBXInt32Value.IsNull Method

Returns true if the value is **null**.

Pascal

```
function IsNull: Boolean; override;
```

C++

```
virtual __fastcall Boolean IsNull();
```

Description

Returns true if the value is **null**. This method should be called before calling any of the Get methods. If the value is null, the Get methods will throw TDBXError (see page 10486) exception if they are called.

55.1.37.2.3 TDBXInt32Value.SetInt32 Method

Sets the 32-byte integer value for 32-byte integer data types.

Pascal

```
procedure SetInt32(Value: TInt32); override;
```

C++

```
virtual __fastcall SetInt32(TInt32 Value);
```

Description

Sets the 32-byte integer value for TDBXValue (see page 10626) instances with a data type of Int32Type.

55.1.38 TDBXInt64Value Class

Implementation of writable 64-byte integer values.

Class Hierarchy

Pascal

```
TDBXInt64Value = class(TDBXWritableValue);
```

C++

```
class TDBXInt64Value : public TDBXWritableValue;
```

File

DBXCommon

Description

Implementation of TDBXWritableValue (see page 10661) for TDBXDataTypes (see page 10447). Int64Type values.

55.1.38.1 TDBXInt64Value Members

The following tables list the members exposed by TDBXInt64Value.

Protected Methods

	Name	Description
	Create (see page 10627)	Enter a short sentence, starting with a verb, that states the basic purpose of the property.
	Create (see page 10662)	Creates an instance of TDBXWritableValue (see page 10661)
	GetDbxContext (see page 10630)	Get context information for a connection associated with value.
V	SetPendingValue (see page 10666)	This is SetPendingValue, a member of class TDBXWritableValue.

Protected Properties

	Name	Description
R	DbxContext (see page 10633)	Context information for a connection associated with value.

Public Methods

	Name	Description
	CreateValue (see page 10628)	Creates values for both the TDBXReader (see page 10576) and TDBXParameterList (see page 10553) classes.
	Destroy (see page 10627)	Enter a short sentence, starting with a verb, that states the basic purpose of the property.
	Destroy (see page 10663)	Destroys a TDBXWritableValue (see page 10661) instance.
	GetAnsiString (see page 10629)	Gets the string value for ANSI strings.
	GetBcd (see page 10629)	Gets the BCD value for binary-compressed decimal data types.
	GetBoolean (see page 10629)	Gets the boolean value for boolean data types.
	GetBytes (see page 10629)	Gets the byte array value for byte array and blob types.
	GetDate (see page 10630)	Gets the date value for date data types.
	GetDouble (see page 10630)	Gets the double floating point value for double data types.
	GetInt16 (see page 10631)	Gets the smallInt value for 16-byte integer data types.
	GetInt32 (see page 10631)	Gets the 32-byte integer value for 32-byte integer data types.
	GetInt64 (see page 10512)	Gets the 64-byte integer value for 64-byte integer data types.
	GetTime (see page 10631)	Gets the time value for time data types.
	GetTimeStamp (see page 10632)	Gets the timestamp value for timestamp data types.
	GetValueSize (see page 10632)	Gets the size in bytes for values.
	GetWideString (see page 10632)	Gets the wide string value for wide string data types.
	IsNull (see page 10513)	Returns true if the value is **null**.
	SetAnsiString (see page 10663)	Sets the string value for ANSI strings.
	SetBcd (see page 10664)	Sets the BCD value for binary-compressed decimal data types.
	SetBoolean (see page 10664)	Sets the boolean value for boolean data types..
	SetDate (see page 10664)	Sets the date value for date data types..
	SetDouble (see page 10664)	Sets the double floating point value for double data types.
	SetDynamicBytes (see page 10665)	Sets the dynamic array value for byte array and blob types.
	SetInt16 (see page 10665)	Sets the the smallInt value for 16-byte integer data types.
	SetInt32 (see page 10665)	Sets the 32-byte integer value for 32-byte integer data types.
	SetInt64 (see page 10513)	Sets the 64-byte integer value for 64-byte integer data types.
	SetNull (see page 10666)	Sets a writable value of any type to null.
	SetStaticBytes (see page 10666)	Sets the open array value for byte array and blob types
	SetTime (see page 10666)	Sets the time value for time data types.
	SetTimeStamp (see page 10667)	Sets the timestamp value for timestamp data types.
	SetWideString (see page 10667)	Sets the wide string value for wide string data types.

Public Properties

	Name	Description
	ValueType (see page 10633)	Gets the value type for this value.

55.1.38.2 TDBXInt64Value Methods

The methods of the TDBXInt64Value class are listed here.

Public Methods

	Name	Description
	GetInt64 (see page 10512)	Gets the 64-byte integer value for 64-byte integer data types.
	IsNull (see page 10513)	Returns true if the value is **null**.
	SetInt64 (see page 10513)	Sets the 64-byte integer value for 64-byte integer data types.

55.1.38.2.1 TDBXInt64Value.GetInt64 Method

Gets the 64-byte integer value for 64-byte integer data types.

Pascal

```
function GetInt64: Int64; override;
```

C++

```
virtual __fastcall Int64 GetInt64();
```

Description

Gets the 64-byte integer value for TDBXValue (see page 10626) instances with a data type of Int64Type. Throws a TDBXError (see page 10486) exception if IsNull (see page 10513) is true.

55.1.38.2.2 TDBXInt64Value.IsNull Method

Returns true if the value is **null**.

Pascal

```
function IsNull: Boolean; override;
```

C++

```
virtual __fastcall Boolean IsNull();
```

Description

Returns true if the value is **null**. This method should be called before calling any of the Get methods. If the value is null, the Get methods will throw TDBXError (see page 10486) exception if they are called.

55.1.38.2.3 TDBXInt64Value.SetInt64 Method

Sets the 64-byte integer value for 64-byte integer data types.

Pascal

```
procedure SetInt64(Value: Int64); override;
```

C++

```
virtual __fastcall SetInt64(Int64 Value);
```

Description

Sets the 64-byte integer value for TDBXValue (see page 10626) instances with a data type of Int64Type.

55.1.39 TDBXIsolations Class

Isolation levels supported by TDBXTransaction (see page 10623).

Class Hierarchy

Pascal

```
TDBXIsolations = class;
```

C++

```
class TDBXIsolations;
```

File

DBXCommon

Description

Isolation levels supported by the TDBXTransaction (see page 10623) class. The isolation level indicates how much transactions can interact with each other.

This table shows isolation levels constants.

Constant	Description
ReadCommitted (see page 10515)	Current transaction sees only changes that have been committed, but can receive an inconsistent view of the data if additional changes are committed before the transaction ends.
RepeatableRead (see page 10515)	Current transaction is guaranteed a consistent view of the data, which includes only changes committed by other transactions at the start of the transaction.
DirtyRead (see page 10515)	Current transaction sees all changes made by other transactions, even if they have not yet been committed. This option is not available for the Oracle driver.
Serializable (see page 10515)	Available since dbExpress 4. Current transaction sees no changes made by other transactions including phantoms.
SnapShot (see page 10515)	Available since dbExpress 4. Read only transaction that provides a transactionally consistent snapshot of the database.

See Also

TDBXTransaction (see page 10623)

55.1.39.1 TDBXIsolations Members

The following tables list the members exposed by TDBXIsolations.

Public Constants

	Name	Description
	DirtyRead (see page 10515)	This is DirtyRead, a member of class TDBXIsolations.
	ReadCommitted (see page 10515)	This is ReadCommitted, a member of class TDBXIsolations.
	RepeatableRead (see page 10515)	This is RepeatableRead, a member of class TDBXIsolations.
	Serializable (see page 10515)	This is Serializable, a member of class TDBXIsolations.
	SnapShot (see page 10515)	This is SnapShot, a member of class TDBXIsolations.

55.1.39.2 TDBXIsolations Constants

The constants of the TDBXIsolations class are listed here.

Public Constants

	Name	Description
	DirtyRead (see page 10515)	This is DirtyRead, a member of class TDBXIsolations.
	ReadCommitted (see page 10515)	This is ReadCommitted, a member of class TDBXIsolations.
	RepeatableRead (see page 10515)	This is RepeatableRead, a member of class TDBXIsolations.

	Serializable (see page 10515)	This is Serializable, a member of class TDBXIsolations.
	SnapShot (see page 10515)	This is SnapShot, a member of class TDBXIsolations.

55.1.39.2.1 TDBXIsolations.DirtyRead Constant

Pascal

```
const DirtyRead = 2;
```

C++

```
DirtyRead = 2;
```

Description

This is DirtyRead, a member of class TDBXIsolations.

55.1.39.2.2 TDBXIsolations.ReadCommitted Constant

Pascal

```
const ReadCommitted = 0;
```

C++

```
ReadCommitted = 0;
```

Description

This is ReadCommitted, a member of class TDBXIsolations.

55.1.39.2.3 TDBXIsolations.RepeatableRead Constant

Pascal

```
const RepeatableRead = 1;
```

C++

```
RepeatableRead = 1;
```

Description

This is RepeatableRead, a member of class TDBXIsolations.

55.1.39.2.4 TDBXIsolations.Serializable Constant

Pascal

```
const Serializable = 3;
```

C++

```
Serializable = 3;
```

Description

This is Serializable, a member of class TDBXIsolations.

55.1.39.2.5 TDBXIsolations.SnapShot Constant

Pascal

```
const SnapShot = 4;
```

C++

```
SnapShot = 4;
```

Description

This is SnapShot, a member of class TDBXIsolations.

55.1.40 TDBXLookAheadStreamReader Class

Used internally by driver implementations and TDBXStreamValue (see page 10608).

Class Hierarchy

Pascal

```
TDBXLookAheadStreamReader = class(TDBXStreamReader);
```

C++

```
class TDBXLookAheadStreamReader : public TDBXStreamReader;
```

File

DBXCommon

Description

TDBXLookAheadStreamReader is used internally by driver implementations and TDBXStreamValue (see page 10608).

See Also

TDBXStreamValue (see page 10608)

55.1.40.1 TDBXLookAheadStreamReader Members

The following tables list the members exposed by TDBXLookAheadStreamReader.

Public Methods

	Name	Description
	ConvertToMemoryStream (see page 10517)	This is ConvertToMemoryStream, a member of class TDBXLookAheadStreamReader.
V	Destroy (see page 10516)	This is Destroy, a member of class TDBXLookAheadStreamReader.
V	Eos (see page 10517)	This is Eos, a member of class TDBXLookAheadStreamReader.
V	Read (see page 10517)	This is Read, a member of class TDBXLookAheadStreamReader.
	SetStream (see page 10518)	This is SetStream, a member of class TDBXLookAheadStreamReader.
V	Size (see page 10518)	This is Size, a member of class TDBXLookAheadStreamReader.

55.1.40.2 TDBXLookAheadStreamReader.Destroy Destructor

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TDBXLookAheadStreamReader();
```

Description

This is Destroy, a member of class TDBXLookAheadStreamReader.

55.1.40.3 TDBXLookAheadStreamReader Methods

The methods of the TDBXLookAheadStreamReader class are listed here.

Public Methods

	Name	Description
	ConvertToMemoryStream (see page 10517)	This is ConvertToMemoryStream, a member of class TDBXLookAheadStreamReader.
	Eos (see page 10517)	This is Eos, a member of class TDBXLookAheadStreamReader.
	Read (see page 10517)	This is Read, a member of class TDBXLookAheadStreamReader.
	SetStream (see page 10518)	This is SetStream, a member of class TDBXLookAheadStreamReader.
	Size (see page 10518)	This is Size, a member of class TDBXLookAheadStreamReader.

55.1.40.3.1 TDBXLookAheadStreamReader.ConvertToMemoryStream Method

Pascal

```
function ConvertToMemoryStream: TStream;
```

C++

```
__fastcall TStream ConvertToMemoryStream();
```

Description

This is ConvertToMemoryStream, a member of class TDBXLookAheadStreamReader.

55.1.40.3.2 TDBXLookAheadStreamReader.Eos Method

Pascal

```
function Eos: Boolean; override;
```

C++

```
virtual __fastcall Boolean Eos();
```

Description

This is Eos, a member of class TDBXLookAheadStreamReader.

55.1.40.3.3 TDBXLookAheadStreamReader.Read Method

Pascal

```
function Read(const Buffer: TBytes; Offset: Integer; Count: Integer): Integer; override;
```

C++

```
virtual __fastcall int Read(const TBytes Buffer, int Offset, int Count);
```

Description

This is Read, a member of class TDBXLookAheadStreamReader.

55.1.40.3.4 TDBXLookAheadStreamReader.SetStream Method

Pascal

```
procedure SetStream(Stream: TStream);
```

C++

```
__fastcall SetStream(TStream Stream);
```

Description

This is SetStream, a member of class TDBXLookAheadStreamReader.

55.1.40.3.5 TDBXLookAheadStreamReader.Size Method

Pascal

```
function Size: Int64; override;
```

C++

```
virtual __fastcall Int64 Size();
```

Description

This is Size, a member of class TDBXLookAheadStreamReader.

55.1.41 TDBXMemoryConnectionFactory Class

Implementation of TDBXConnectionFactory (see page 10422) that does not load driver and connection properties.

Class Hierarchy

Pascal

```
TDBXMemoryConnectionFactory = class(TDBXConnectionFactory);
```

C++

```
class TDBXMemoryConnectionFactory : public TDBXConnectionFactory;
```

File

DBXCommon

Description

Implementation of TDBXConnectionFactory (see page 10422) that does not load driver and connection properties from initialization files. It is used by VCL when the dbxconnections.ini and dbxdrivers.ini files cannot be found.

See Also

TDBXConnectionFactory (see page 10422)

55.1.41.1 TDBXMemoryConnectionFactory Members

The following tables list the members exposed by TDBXMemoryConnectionFactory.

Protected Methods

	Name	Description
	DerivedClose (see page 10520)	This is DerivedClose, a member of class TDBXMemoryConnectionFactory.
	DerivedOpen (see page 10520)	This is DerivedOpen, a member of class TDBXMemoryConnectionFactory.
	GetErrorEvent (see page 10429)	This is GetErrorEvent, a member of class TDBXConnectionFactory.
	GetTraceFlags (see page 10429)	This is GetTraceFlags, a member of class TDBXConnectionFactory.
	GetTraceInfoEvent (see page 10429)	This is GetTraceInfoEvent, a member of class TDBXConnectionFactory.
	SetErrorEvent (see page 10430)	This is SetErrorEvent, a member of class TDBXConnectionFactory.
	SetTraceFlags (see page 10430)	This is SetTraceFlags, a member of class TDBXConnectionFactory.
	SetTraceInfoEvent (see page 10431)	This is SetTraceInfoEvent, a member of class TDBXConnectionFactory.

Public Events

	Name	Description
	OnError (see page 10432)	TDBXErrorEvent (see page 10671) handler.
	OnTrace (see page 10432)	TDBXTraceInfoEvent handler.

Public Methods

	Name	Description
	Close (see page 10425)	Closes the factory.
	Create (see page 10519)	Creates an instance of TDBXMemoryConnectionFactory (see page 10518)
	Destroy (see page 10520)	Destroys a TDBXMemoryConnectionFactory (see page 10518) instance.
	GetConnection (see page 10426)	This is the overview for the GetConnection method overload.
	GetConnectionDriver (see page 10427)	Gets a TDBXDriver (see page 10472) instance for a connection name
	GetConnectionFactory (see page 10427)	Gets a TDBXConnectionFactory (see page 10422) singleton
	GetConnectionItems (see page 10428)	Adds names of all connections to Items list.
	GetConnectionProperties (see page 10428)	Gets a TDBXPropertiesinstance for a connection name
	GetDriver (see page 10428)	Returns TDBXDriver (see page 10472) instance for a driver name
	GetDriverProperties (see page 10429)	Returns TDBXProperties (see page 10559) instance of driver properties
	Open (see page 10430)	Opens the TDBXConnectionFactory (see page 10422)
	SetConnectionFactory (see page 10430)	Change the default TDBXConnectionFactorysingleton

Public Properties

	Name	Description
	TraceFlags (see page 10431)	Trace flags to enable or disable tracing categories

Strict protected Fields

	Name	Description
	FDBXContext (see page 10424)	This is FDBXContext, a member of class TDBXConnectionFactory.

Strict protected Methods

	Name	Description
	CreateDelegatePaths (see page 10426)	This is CreateDelegatePaths, a member of class TDBXConnectionFactory.

55.1.41.2 TDBXMemoryConnectionFactory.Create Constructor

Creates an instance of TDBXMemoryConnectionFactory (see page 10518)

Pascal

```
constructor Create;
```

C++

```
__fastcall TDBXMemoryConnectionFactory();
```

Description

This constructor creates and initializes an instance of TDBXMemoryConnectionFactory (see page 10518).

See Also

Destroy (see page 10520)

55.1.41.3 TDBXMemoryConnectionFactory.Destroy Destructor

Destroys a TDBXMemoryConnectionFactory (see page 10518) instance.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TDBXMemoryConnectionFactory();
```

Description

This destructor destroys an instance of TDBXMemoryConnectionFactory (see page 10518).

See Also

Create (see page 10519)

55.1.41.4 TDBXMemoryConnectionFactory Methods

The methods of the TDBXMemoryConnectionFactory class are listed here.

Protected Methods

	Name	Description
	DerivedClose (see page 10520)	This is DerivedClose, a member of class TDBXMemoryConnectionFactory.
	DerivedOpen (see page 10520)	This is DerivedOpen, a member of class TDBXMemoryConnectionFactory.

55.1.41.4.1 TDBXMemoryConnectionFactory.DerivedClose Method

Pascal

```
procedure DerivedClose; override;
```

C++

```
virtual __fastcall DerivedClose();
```

Description

This is DerivedClose, a member of class TDBXMemoryConnectionFactory.

55.1.41.4.2 TDBXMemoryConnectionFactory.DerivedOpen Method

Pascal

```
procedure DerivedOpen; override;
```

C++

```
virtual __fastcall DerivedOpen();
```

Description

This is DerivedOpen, a member of class TDBXMemoryConnectionFactory.

55.1.42 TDBXMetaDatabaseColumnNames Class

Column names for metadata.

Class Hierarchy

DBXCommon.TDBXMetaDatabaseColumnNames

Pascal

```
TDBXMetaDatabaseColumnNames = class;
```

C++

```
class TDBXMetaDatabaseColumnNames;
```

File

DBXCommon

Description

TDBXMetaDatabaseColumnNames provides column names to access various kinds of database metadata.

This table contains column names in the metadata dataset for obtaining specific metadata.

Constant	Metadata column
QuoteChar (see page 10524)	Deprecated. Use QuotePrefix (see page 10524) and QuoteSuffix (see page 10524) properties in TDBXDatabaseMetaDataEx (see page 10444). Quote character used for quoting identifiers in the TDBXCommand.Text property
ProcedureQuoteChar (see page 10523)	Quote character used for quoting identifiers for stored procedures in the TDBXCommand.Text property.
MaxCommands (see page 10523)	Maximum number of commands that can be created.
SupportsTransactions (see page 10525)	Indicates whether the driver supports transactions.
SupportsNestedTransactions (see page 10524)	Indicates whether the driver supports nested transactions.
SupportsRowSetSize (see page 10525)	Indicates whether TDBXCommand.RowSetSize property is supported to control row buffering when executing queries.
ProductVersion (see page 10523)	ProductVersion (see page 10523) number in the format nn.nn.nnnn.
QuotePrefix (see page 10524)	Character to start a quoted identifier.
QuoteSuffix (see page 10524)	Character to end a quoted identifier.
SupportsLowerCaseIdentifiers (see page 10524)	Indicates whether lowercase identifiers are stored in lowercase characters on the database.
SupportsUpperCaseIdentifiers (see page 10525)	Indicates whether uppercase identifiers are stored in uppercase characters on the database.

See Also

TDBXCommand (see page 10378)

TDBXDatabaseMetaData (see page 10440)

TDBXDatabaseMetaDataEx (see page 10444)

RowSetSize (see page 10390)

Text (see page 10390)

55.1.42.1 TDBXMetaDatabaseColumnNames Members

The following tables list the members exposed by TDBXMetaDatabaseColumnNames.

Public Constants

	Name	Description
	MaxCommands (see page 10523)	This is MaxCommands, a member of class TDBXMetaDatabaseColumnNames.
	ProcedureQuoteChar (see page 10523)	This is ProcedureQuoteChar, a member of class TDBXMetaDatabaseColumnNames.
	ProductName (see page 10523)	This is ProductName, a member of class TDBXMetaDatabaseColumnNames.
	ProductVersion (see page 10523)	This is ProductVersion, a member of class TDBXMetaDatabaseColumnNames.
	QuoteChar (see page 10524)	This is QuoteChar, a member of class TDBXMetaDatabaseColumnNames.
	QuotePrefix (see page 10524)	This is QuotePrefix, a member of class TDBXMetaDatabaseColumnNames.
	QuoteSuffix (see page 10524)	This is QuoteSuffix, a member of class TDBXMetaDatabaseColumnNames.
	SupportsLowerCaseIdentifiers (see page 10524)	This is SupportsLowerCaseIdentifiers, a member of class TDBXMetaDatabaseColumnNames.
	SupportsNestedTransactions (see page 10524)	This is SupportsNestedTransactions, a member of class TDBXMetaDatabaseColumnNames.
	SupportsRowSetSize (see page 10525)	This is SupportsRowSetSize, a member of class TDBXMetaDatabaseColumnNames.
	SupportsTransactions (see page 10525)	This is SupportsTransactions, a member of class TDBXMetaDatabaseColumnNames.
	SupportsUpperCaseIdentifiers (see page 10525)	This is SupportsUpperCaseIdentifiers, a member of class TDBXMetaDatabaseColumnNames.

55.1.42.2 TDBXMetaDatabaseColumnNames Constants

The constants of the TDBXMetaDatabaseColumnNames class are listed here.

Public Constants

	Name	Description
	MaxCommands (see page 10523)	This is MaxCommands, a member of class TDBXMetaDatabaseColumnNames.
	ProcedureQuoteChar (see page 10523)	This is ProcedureQuoteChar, a member of class TDBXMetaDatabaseColumnNames.
	ProductName (see page 10523)	This is ProductName, a member of class TDBXMetaDatabaseColumnNames.
	ProductVersion (see page 10523)	This is ProductVersion, a member of class TDBXMetaDatabaseColumnNames.
	QuoteChar (see page 10524)	This is QuoteChar, a member of class TDBXMetaDatabaseColumnNames.
	QuotePrefix (see page 10524)	This is QuotePrefix, a member of class TDBXMetaDatabaseColumnNames.
	QuoteSuffix (see page 10524)	This is QuoteSuffix, a member of class TDBXMetaDatabaseColumnNames.
	SupportsLowerCaseIdentifiers (see page 10524)	This is SupportsLowerCaseIdentifiers, a member of class TDBXMetaDatabaseColumnNames.
	SupportsNestedTransactions (see page 10524)	This is SupportsNestedTransactions, a member of class TDBXMetaDatabaseColumnNames.
	SupportsRowSetSize (see page 10525)	This is SupportsRowSetSize, a member of class TDBXMetaDatabaseColumnNames.

	SupportsTransactions (see page 10525)	This is SupportsTransactions, a member of class TDBXMetaDatabaseColumnNames.
	SupportsUpperCaseIdentifiers (see page 10525)	This is SupportsUpperCaseIdentifiers, a member of class TDBXMetaDatabaseColumnNames.

55.1.42.2.1 TDBXMetaDatabaseColumnNames.MaxCommands Constant

Pascal

```
const MaxCommands = 'MaxCommands';
```

C++

```
MaxCommands = 'MaxCommands';
```

Description

This is MaxCommands, a member of class TDBXMetaDatabaseColumnNames.

55.1.42.2.2 TDBXMetaDatabaseColumnNames.ProcedureQuoteChar Constant

Pascal

```
const ProcedureQuoteChar = 'ProcedureQuoteChar';
```

C++

```
ProcedureQuoteChar = 'ProcedureQuoteChar';
```

Description

This is ProcedureQuoteChar, a member of class TDBXMetaDatabaseColumnNames.

55.1.42.2.3 TDBXMetaDatabaseColumnNames.ProductName Constant

Pascal

```
const ProductName = 'ProductName';
```

C++

```
ProductName = 'ProductName';
```

Description

This is ProductName, a member of class TDBXMetaDatabaseColumnNames.

55.1.42.2.4 TDBXMetaDatabaseColumnNames.ProductVersion Constant

Pascal

```
const ProductVersion = 'ProductVersion';
```

C++

```
ProductVersion = 'ProductVersion';
```

Description

This is ProductVersion, a member of class TDBXMetaDatabaseColumnNames.

55.1.42.2.5 TDBXMetaDatabaseColumnNames.QuoteChar Constant

Pascal

```
const QuoteChar = 'QuoteChar';
```

C++

```
QuoteChar = 'QuoteChar';
```

Description

This is QuoteChar, a member of class TDBXMetaDatabaseColumnNames.

55.1.42.2.6 TDBXMetaDatabaseColumnNames.QuotePrefix Constant

Pascal

```
const QuotePrefix = 'QuotePrefix';
```

C++

```
QuotePrefix = 'QuotePrefix';
```

Description

This is QuotePrefix, a member of class TDBXMetaDatabaseColumnNames.

55.1.42.2.7 TDBXMetaDatabaseColumnNames.QuoteSuffix Constant

Pascal

```
const QuoteSuffix = 'QuoteSuffix';
```

C++

```
QuoteSuffix = 'QuoteSuffix';
```

Description

This is QuoteSuffix, a member of class TDBXMetaDatabaseColumnNames.

55.1.42.2.8 TDBXMetaDatabaseColumnNames.SupportsLowerCaseIdentifiers Constant

Pascal

```
const SupportsLowerCaseIdentifiers = 'SupportsLowerCaseIdentifiers';
```

C++

```
SupportsLowerCaseIdentifiers = 'SupportsLowerCaseIdentifiers';
```

Description

This is SupportsLowerCaseIdentifiers, a member of class TDBXMetaDatabaseColumnNames.

55.1.42.2.9 TDBXMetaDatabaseColumnNames.SupportsNestedTransactions Constant

Pascal

```
const SupportsNestedTransactions = 'SupportsNestedTransactions';
```

C++

```
SupportsNestedTransactions = 'SupportsNestedTransactions';
```

Description

This is SupportsNestedTransactions, a member of class TDBXMetaDatabaseColumnNames.

55.1.42.2.10 TDBXMetaDatabaseColumnNames.SupportsRowSetSize Constant

Pascal

```
const SupportsRowSetSize = 'SupportsRowSetSize';
```

C++

```
SupportsRowSetSize = 'SupportsRowSetSize';
```

Description

This is SupportsRowSetSize, a member of class TDBXMetaDatabaseColumnNames.

55.1.42.2.11 TDBXMetaDatabaseColumnNames.SupportsTransactions Constant

Pascal

```
const SupportsTransactions = 'SupportsTransactions';
```

C++

```
SupportsTransactions = 'SupportsTransactions';
```

Description

This is SupportsTransactions, a member of class TDBXMetaDatabaseColumnNames.

55.1.42.2.12 TDBXMetaDatabaseColumnNames.SupportsUpperCaseIdentifiers Constant

Pascal

```
const SupportsUpperCaseIdentifiers = 'SupportsUpperCaseIdentifiers';
```

C++

```
SupportsUpperCaseIdentifiers = 'SupportsUpperCaseIdentifiers';
```

Description

This is SupportsUpperCaseIdentifiers, a member of class TDBXMetaDatabaseColumnNames.

55.1.43 TDBXMetaDataCommands Class

List of available metadata commands to get metadata.

Class Hierarchy

DBXCommon.TDBXMetaDataCommands

Pascal

```
TDBXMetaDataCommands = class;
```

C++

```
class TDBXMetaDataCommands;
```

File

DBXCommon

Description

You can use metadata commands to get database metadata, such as a list of tables in a database. Set the TDBXCommand.CommandType property to TDBXCommandTypes.DBXMetadata and set TDBXCommand.Text to one of the constants in the table to acquire the designated metadata. TDBXCommand.ExecuteQuery returns a TDBXReader (see page 10576) to access the metadata.

This table lists the types of metadata you can obtain.

Constant	Description
GetDatabase (see page 10529)	Set TDBXCommand.Text to 'GetDatabase (see page 10529)'. When the command is executed, a TDBXReader (see page 10576) instance is returned with a single row of database specific metadata.
GetDataTypes (see page 10529)	Set TDBXCommand.Text to 'GetDataTypes (see page 10529)'. When the command is executed, a TDBXReader (see page 10576) instance is returned with metadata for the data types supported by the driver. The TDBXDataTypesColumns and TDBXDataTypesIndex classes describe and provide access to this metadata's columns.
GetTables (see page 10531)	Set TDBXCommand.Text to 'GetTables (see page 10531) [catalog.[schema.[table]]] [table-types]'. 'table-types' is a space separated list of one or more of the constants in TDBXMetadataTableTypes. When the command is executed, a TDBXReader (see page 10576) instance is returned with metadata for the specified table(s). The TDBXTablesColumns and TDBXTablesIndex classes describe and provide access to this metadata's columns.
GetColumns (see page 10529)	Set TDBXCommand.Text to 'GetColumns (see page 10529) [catalog.[schema.[table]]]'. When the command is executed, a TDBXReader (see page 10576) instance is returned with metadata for the columns of the specified table(s). The TDBXColumnsColumns and TDBXColumnsIndex classes describe and provide access to this metadata's columns.
GetForeignKeys (see page 10530)	Set TDBXCommand.Text to 'GetForeignKeys (see page 10530) [catalog.[schema.[table]]]'. When the command is executed, a TDBXReader (see page 10576) instance is returned with metadata for the foreign keys of the specified table(s). The TDBXForeignKeysColumns and TDBXForeignKeysIndex classes describe and provide access to this metadata's columns.
GetForeignKeyColumns (see page 10529)	Set TDBXCommand.Text to 'GetForeignKeyColumns (see page 10529) [[[catalog.]schema.]table [foreign-key] [PrimaryKey|ForeignKey]]'[PrimaryKey|ForeignKey]. When the command is executed, a TDBXReader (see page 10576) instance is returned with metadata for each column pair in the specified foreign keys of the specified table(s). The TDBXForeignKeyColumnsColumns and TDBXForeignKeyColumnsIndex classes describe and provide access to this metadata's columns.

GetIndexes (see page 10530)	Set TDBXCommand.Text to 'GetIndexes (see page 10530) [[[catalog.]schema.]table]'. When the command is executed, a TDBXReader (see page 10576) instance is returned with metadata for the indexes of the specified table(s). The TDBXIndexesColumns and TDBXIndexesIndex classes describe and provide access to this metadata's columns.
GetIndexColumns (see page 10530)	Set TDBXCommand.Text to 'GetIndexColumns (see page 10530) [[[catalog.]schema.]table [index]]'. When the command is executed, a TDBXReader (see page 10576) instance is returned with metadata for the columns in the indexes of the specified table(s). The TDBXIndexColumnsColumns and TDBXIndexColumnsIndex classes describe and provide access to this metadata's columns.
GetPackages (see page 10530)	Set TDBXCommand.Text to 'GetPackages (see page 10530)'. When the command is executed, a TDBXReader (see page 10576) instance is returned with metadata for the specified package(s). The TDBXPackagesColumns and TDBXPackagesIndex classes describe and provide access to this metadata's columns.
GetProcedures (see page 10531)	Set TDBXCommand.Text to 'GetProcedures (see page 10531) [catalog.][schema.][procedure]'. When the command is executed, a TDBXReader (see page 10576) instance is returned with metadata for the specified procedure(s). The TDBXProceduresColumns and TDBXProceduresIndex classes describe and provide access to this metadata's columns.
GetProcedureParameters (see page 10531)	Set TDBXCommand.Text to 'GetProcedureParameters (see page 10531) [[[catalog.]schema.]procedure]'. When the command is executed, a TDBXReader (see page 10576) instance is returned with metadata about the parameters of the specified procedure(s). The TDBXProcedureParametersColumns and TDBXProcedureParametersIndex classes describe and provide access to this metadata's columns.
GetUsers (see page 10531)	Set TDBXCommand.Text to 'GetUsers (see page 10531)'. When the command is executed, a TDBXReader (see page 10576) instance is returned with metadata for the specified user(s). The TDBXUsersColumns and TDBXUsersIndex classes describe and provide access to this metadata's columns.

55.1.43.1 TDBXMetaDataCommands Members

The following tables list the members exposed by TDBXMetaDataCommands.

Public Constants

	Name	Description
	GetColumns (see page 10529)	This is GetColumns, a member of class TDBXMetaDataCommands.
	GetDatabase (see page 10529)	This is GetDatabase, a member of class TDBXMetaDataCommands.
	GetDataTypes (see page 10529)	This is GetDataTypes, a member of class TDBXMetaDataCommands.
	GetForeignKeyColumns (see page 10529)	This is GetForeignKeyColumns, a member of class TDBXMetaDataCommands.
	GetForeignKeys (see page 10530)	This is GetForeignKeys, a member of class TDBXMetaDataCommands.
	GetIndexColumns (see page 10530)	This is GetIndexColumns, a member of class TDBXMetaDataCommands.
	GetIndexes (see page 10530)	This is GetIndexes, a member of class TDBXMetaDataCommands.
	GetPackages (see page 10530)	This is GetPackages, a member of class TDBXMetaDataCommands.
	GetProcedureParameters (see page 10531)	This is GetProcedureParameters, a member of class TDBXMetaDataCommands.
	GetProcedures (see page 10531)	This is GetProcedures, a member of class TDBXMetaDataCommands.
	GetTables (see page 10531)	This is GetTables, a member of class TDBXMetaDataCommands.
	GetUsers (see page 10531)	This is GetUsers, a member of class TDBXMetaDataCommands.

55.1.43.2 TDBXMetaDataCommands Constants

The constants of the TDBXMetaDataCommands class are listed here.

Public Constants

	Name	Description
	GetColumns (see page 10529)	This is GetColumns, a member of class TDBXMetaDataCommands.
	GetDatabase (see page 10529)	This is GetDatabase, a member of class TDBXMetaDataCommands.
	GetDataTypes (see page 10529)	This is GetDataTypes, a member of class TDBXMetaDataCommands.

	GetForeignKeyColumns (see page 10529)	This is GetForeignKeyColumns, a member of class TDBXMetaDataCommands.
	GetForeignKeys (see page 10530)	This is GetForeignKeys, a member of class TDBXMetaDataCommands.
	GetIndexColumns (see page 10530)	This is GetIndexColumns, a member of class TDBXMetaDataCommands.
	GetIndexes (see page 10530)	This is GetIndexes, a member of class TDBXMetaDataCommands.
	GetPackages (see page 10530)	This is GetPackages, a member of class TDBXMetaDataCommands.
	GetProcedureParameters (see page 10531)	This is GetProcedureParameters, a member of class TDBXMetaDataCommands.
	GetProcedures (see page 10531)	This is GetProcedures, a member of class TDBXMetaDataCommands.
	GetTables (see page 10531)	This is GetTables, a member of class TDBXMetaDataCommands.
	GetUsers (see page 10531)	This is GetUsers, a member of class TDBXMetaDataCommands.

55.1.43.2.1 TDBXMetaDataCommands.GetColumns Constant

Pascal

```
const GetColumns = 'GetColumns';
```

C++

```
GetColumns = 'GetColumns';
```

Description

This is GetColumns, a member of class TDBXMetaDataCommands.

55.1.43.2.2 TDBXMetaDataCommands.GetDatabase Constant

Pascal

```
const GetDatabase = 'GetDatabase';
```

C++

```
GetDatabase = 'GetDatabase';
```

Description

This is GetDatabase, a member of class TDBXMetaDataCommands.

55.1.43.2.3 TDBXMetaDataCommands.GetDataTypes Constant

Pascal

```
const GetDataTypes = 'GetDataTypes';
```

C++

```
GetDataTypes = 'GetDataTypes';
```

Description

This is GetDataTypes, a member of class TDBXMetaDataCommands.

55.1.43.2.4 TDBXMetaDataCommands.GetForeignKeyColumns Constant

Pascal

```
const GetForeignKeyColumns = 'GetForeignKeyColumns';
```

C++

```
GetForeignKeyColumns = 'GetForeignKeyColumns';
```

Description

This is GetForeignKeyColumns, a member of class TDBXMetaDataCommands.

55.1.43.2.5 TDBXMetaDataCommands.GetForeignKeys Constant

Pascal

```
const GetForeignKeys = 'GetForeignKeys';
```

C++

```
GetForeignKeys = 'GetForeignKeys';
```

Description

This is GetForeignKeys, a member of class TDBXMetaDataCommands.

55.1.43.2.6 TDBXMetaDataCommands.GetIndexColumns Constant

Pascal

```
const GetIndexColumns = 'GetIndexColumns';
```

C++

```
GetIndexColumns = 'GetIndexColumns';
```

Description

This is GetIndexColumns, a member of class TDBXMetaDataCommands.

55.1.43.2.7 TDBXMetaDataCommands.GetIndexes Constant

Pascal

```
const GetIndexes = 'GetIndexes';
```

C++

```
GetIndexes = 'GetIndexes';
```

Description

This is GetIndexes, a member of class TDBXMetaDataCommands.

55.1.43.2.8 TDBXMetaDataCommands.GetPackages Constant

Pascal

```
const GetPackages = 'GetPackages';
```

C++

```
GetPackages = 'GetPackages';
```

Description

This is GetPackages, a member of class TDBXMetaDataCommands.

55.1.43.2.9 TDBXMetaDataCommands.GetProcedureParameters Constant

Pascal

```
const GetProcedureParameters = 'GetProcedureParameters';
```

C++

```
GetProcedureParameters = 'GetProcedureParameters';
```

Description

This is GetProcedureParameters, a member of class TDBXMetaDataCommands.

55.1.43.2.10 TDBXMetaDataCommands.GetProcedures Constant

Pascal

```
const GetProcedures = 'GetProcedures';
```

C++

```
GetProcedures = 'GetProcedures';
```

Description

This is GetProcedures, a member of class TDBXMetaDataCommands.

55.1.43.2.11 TDBXMetaDataCommands.GetTables Constant

Pascal

```
const GetTables = 'GetTables';
```

C++

```
GetTables = 'GetTables';
```

Description

This is GetTables, a member of class TDBXMetaDataCommands.

55.1.43.2.12 TDBXMetaDataCommands.GetUsers Constant

Pascal

```
const GetUsers = 'GetUsers';
```

C++

```
GetUsers = 'GetUsers';
```

Description

This is GetUsers, a member of class TDBXMetaDataCommands.

55.1.44 TDBXMetaDataCommandsEx Class

Temporary extension of TDBXMetaDataCommands (see page 10525) class.

Class Hierarchy

DBXCommon.TDBXMetaDataCommandsEx

Pascal

```
TDBXMetaDataCommandsEx = class;
```

C++

```
class TDBXMetaDataCommandsEx;
```

File

DBXCommon

Description

You can use metadata commands to get database metadata, such as a list of tables in a database. Set the TDBXCommand.CommandType property to TDBXCommandTypes.DBXMetadata and set TDBXCommand.Text to one of the constants in the table to acquire the designated metadata. TDBXCommand.ExecuteQuery returns a TDBXReader (see page 10576) to access the metadata.

Note: Classes (see page 2685) ending in “Ex” are temporary classes that exist to avoid breaking interfaces. Their contents will be migrated to their base class in the next release.

This table lists the types of extended metadata you can obtain.

Constant	Description
GetCatalogs (see page 10535)	Set TDBXCommand.Text to 'GetCatalogs (see page 10535)'. When the command is executed, a TDBXReader (see page 10576) instance is returned with a list of existing catalogs in the database. The TDBXCatalogsColumns and TDBXCatalogsIndex classes describe and provide access to this metadata's columns.
GetSchemas (see page 10536)	Set TDBXCommand.Text to 'GetSchemas (see page 10536) [catalog]'. When the command is executed, a TDBXReader (see page 10576) instance is returned with a list of existing schemas in the specified catalog(s). The TDBXSchemasColumns and TDBXSchemasIndex classes describe and provide access to this metadata's columns.
GetProcedureSources (see page 10536)	Set TDBXCommand.Text to 'GetProcedureSources (see page 10536) [[[catalog.]schema.]procedure]'. When the command is executed, a TDBXReader (see page 10576) instance is returned with source of the specified procedure(s). The TDBXProcedureSourcesColumns and TDBXProcedureSourcesIndex classes describe and provide access to this metadata's columns.
GetPackageSources (see page 10535)	Set TDBXCommand.Text to 'GetPackageSources (see page 10535) [[[catalog.]schema.]package]'. When the command is executed, a TDBXReader (see page 10576) instance is returned with source of the specified package(s). The TDBXPackageSourcesColumns and TDBXPackageSourcesIndex classes describe and provide access to this metadata's columns.
GetRoles (see page 10536)	Set TDBXCommand.Text to 'GetRoles (see page 10536)'. When the command is executed, a TDBXReader (see page 10576) instance is returned with a list of existing role(s). The TDBXRolesColumns and TDBXRolesIndex classes describe and provide access to this metadata's columns.

GetReservedWords (see page 10536)	Set TDBXCommand.Text to 'GetReservedWords (see page 10536)'. When the command is executed, a TDBXReader (see page 10576) instance is returned with a list of reserved words for the database. The TDBXReservedWordsColumns and TDBXReservedWordsIndex classes describe and provide access to this metadata's columns.
GetViews (see page 10537)	Set TDBXCommand.Text to 'GetViews (see page 10537) [[[catalog.]schema.]view]'. When the command is executed, a TDBXReader (see page 10576) instance is returned with metadata for the view(s) specified. The TDBXViewsColumns and TDBXViewsIndex classes describe and provide access to this metadata's columns.
GetSynonyms (see page 10536)	Set TDBXCommand.Text to 'GetSynonyms (see page 10536) [[[catalog.]schema.]synonym]'. When the command is executed, a TDBXReader (see page 10576) instance is returned with metadata for the synonym(s) specified. The TDBXSynonymsColumns and TDBXSynonymsIndex classes describe and provide access to this metadata's columns.
GetPackageProcedures (see page 10535)	Set TDBXCommand.Text to 'GetPackageProcedures (see page 10535) [[[[[catalog.]schema.]package].procedure][procedure-type]]'.When the command is executed, a TDBXReader (see page 10576) instance is returned with metadata for the specified package procedure(s). The TDBXPackageProceduresColumns and TDBXPackageProceduresIndex classes describe and provide access to this metadata's columns.
GetPackageProcedureParameters (see page 10535)	Set TDBXCommand.Text to 'GetPackageProcedureParameters (see page 10535) [[[catalog.]schema.]package]'. When the command is executed, a TDBXReader (see page 10576) instance is returned with metadata for the parameters of the specified package procedure(s). The TDBXPackageProcedureParametersColumns and TDBXPackageProcedureParametersIndex classes describe and provide access to this metadata's columns.

55.1.44.1 TDBXMetaDataCommandsEx Members

The following tables list the members exposed by TDBXMetaDataCommandsEx.

Public Constants

	Name	Description
	GetCatalogs (see page 10535)	This is GetCatalogs, a member of class TDBXMetaDataCommandsEx.
	GetPackageProcedureParameters (see page 10535)	This is GetPackageProcedureParameters, a member of class TDBXMetaDataCommandsEx.
	GetPackageProcedures (see page 10535)	This is GetPackageProcedures, a member of class TDBXMetaDataCommandsEx.
	GetPackageSources (see page 10535)	This is GetPackageSources, a member of class TDBXMetaDataCommandsEx.
	GetProcedureSources (see page 10536)	This is GetProcedureSources, a member of class TDBXMetaDataCommandsEx.
	GetReservedWords (see page 10536)	This is GetReservedWords, a member of class TDBXMetaDataCommandsEx.
	GetRoles (see page 10536)	This is GetRoles, a member of class TDBXMetaDataCommandsEx.
	GetSchemas (see page 10536)	This is GetSchemas, a member of class TDBXMetaDataCommandsEx.
	GetSynonyms (see page 10536)	This is GetSynonyms, a member of class TDBXMetaDataCommandsEx.
	GetViews (see page 10537)	This is GetViews, a member of class TDBXMetaDataCommandsEx.

55.1.44.2 TDBXMetaDataCommandsEx Constants

The constants of the TDBXMetaDataCommandsEx class are listed here.

Public Constants

	Name	Description
	GetCatalogs (see page 10535)	This is GetCatalogs, a member of class TDBXMetaDataCommandsEx.
	GetPackageProcedureParameters (see page 10535)	This is GetPackageProcedureParameters, a member of class TDBXMetaDataCommandsEx.
	GetPackageProcedures (see page 10535)	This is GetPackageProcedures, a member of class TDBXMetaDataCommandsEx.
	GetPackageSources (see page 10535)	This is GetPackageSources, a member of class TDBXMetaDataCommandsEx.

	GetProcedureSources (see page 10536)	This is GetProcedureSources, a member of class TDBXMetaDataCommandsEx.
	GetReservedWords (see page 10536)	This is GetReservedWords, a member of class TDBXMetaDataCommandsEx.
	GetRoles (see page 10536)	This is GetRoles, a member of class TDBXMetaDataCommandsEx.
	GetSchemas (see page 10536)	This is GetSchemas, a member of class TDBXMetaDataCommandsEx.
	GetSynonyms (see page 10536)	This is GetSynonyms, a member of class TDBXMetaDataCommandsEx.
	GetViews (see page 10537)	This is GetViews, a member of class TDBXMetaDataCommandsEx.

55.1.44.2.1 TDBXMetaDataCommandsEx.GetCatalogs Constant

Pascal

```
const GetCatalogs = 'GetCatalogs';
```

C++

```
GetCatalogs = 'GetCatalogs';
```

Description

This is GetCatalogs, a member of class TDBXMetaDataCommandsEx.

55.1.44.2.2 TDBXMetaDataCommandsEx.GetPackageProcedureParameters Constant

Pascal

```
const GetPackageProcedureParameters = 'GetPackageProcedureParameters';
```

C++

```
GetPackageProcedureParameters = 'GetPackageProcedureParameters';
```

Description

This is GetPackageProcedureParameters, a member of class TDBXMetaDataCommandsEx.

55.1.44.2.3 TDBXMetaDataCommandsEx.GetPackageProcedures Constant

Pascal

```
const GetPackageProcedures = 'GetPackageProcedures';
```

C++

```
GetPackageProcedures = 'GetPackageProcedures';
```

Description

This is GetPackageProcedures, a member of class TDBXMetaDataCommandsEx.

55.1.44.2.4 TDBXMetaDataCommandsEx.GetPackageSources Constant

Pascal

```
const GetPackageSources = 'GetPackageSources';
```

C++

```
GetPackageSources = 'GetPackageSources';
```

Description

This is GetPackageSources, a member of class TDBXMetaDataCommandsEx.

55.1.44.2.5 TDBXMetaDataCommandsEx.GetProcedureSources Constant

Pascal

```
const GetProcedureSources = 'GetProcedureSources';
```

C++

```
GetProcedureSources = 'GetProcedureSources';
```

Description

This is GetProcedureSources, a member of class TDBXMetaDataCommandsEx.

55.1.44.2.6 TDBXMetaDataCommandsEx.GetReservedWords Constant

Pascal

```
const GetReservedWords = 'GetReservedWords';
```

C++

```
GetReservedWords = 'GetReservedWords';
```

Description

This is GetReservedWords, a member of class TDBXMetaDataCommandsEx.

55.1.44.2.7 TDBXMetaDataCommandsEx.GetRoles Constant

Pascal

```
const GetRoles = 'GetRoles';
```

C++

```
GetRoles = 'GetRoles';
```

Description

This is GetRoles, a member of class TDBXMetaDataCommandsEx.

55.1.44.2.8 TDBXMetaDataCommandsEx.GetSchemas Constant

Pascal

```
const GetSchemas = 'GetSchemas';
```

C++

```
GetSchemas = 'GetSchemas';
```

Description

This is GetSchemas, a member of class TDBXMetaDataCommandsEx.

55.1.44.2.9 TDBXMetaDataCommandsEx.GetSynonyms Constant

Pascal

```
const GetSynonyms = 'GetSynonyms';
```

C++

```
GetSynonyms = 'GetSynonyms';
```

Description

This is GetSynonyms, a member of class TDBXMetaDataCommandsEx.

55.1.44.2.10 TDBXMetaDataCommandsEx.GetViews Constant

Pascal

```
const GetViews = 'GetViews';
```

C++

```
GetViews = 'GetViews';
```

Description

This is GetViews, a member of class TDBXMetaDataCommandsEx.

55.1.45 TDBXMetaDataKeyword Class

Keyword for metadata.

Class Hierarchy

DBXCommon.TDBXMetaDataKeyword

Pascal

```
TDBXMetaDataKeyword = class;
```

C++

```
class TDBXMetaDataKeyword;
```

File

DBXCommon

Description

TDBXMetaDataKeyword contains constants for metadata keywords.

This table contains metadata keywords.

Constant	Description
PrimaryKey (see page 10538)	PrimaryKey (see page 10538)
ForeignKey (see page 10538)	ForeignKey (see page 10538)

55.1.45.1 TDBXMetaDataKeyword Members

The following tables list the members exposed by TDBXMetaDataKeyword.

Public Constants

	Name	Description
	ForeignKey (see page 10538)	This is ForeignKey, a member of class TDBXMetaDataKeyword.
	PrimaryKey (see page 10538)	This is PrimaryKey, a member of class TDBXMetaDataKeyword.

55.1.45.2 TDBXMetaDataKeyword Constants

The constants of the TDBXMetaDataKeyword class are listed here.

Public Constants

	Name	Description
	ForeignKey (see page 10538)	This is ForeignKey, a member of class TDBXMetaDataKeyword.
	PrimaryKey (see page 10538)	This is PrimaryKey, a member of class TDBXMetaDataKeyword.

55.1.45.2.1 TDBXMetaDataKeyword.ForeignKey Constant

Pascal

```
const ForeignKey = 'ForeignKey';
```

C++

```
ForeignKey = 'ForeignKey';
```

Description

This is ForeignKey, a member of class TDBXMetaDataKeyword.

55.1.45.2.2 TDBXMetaDataKeyword.PrimaryKey Constant

Pascal

```
const PrimaryKey = 'PrimaryKey';
```

C++

```
PrimaryKey = 'PrimaryKey';
```

Description

This is PrimaryKey, a member of class TDBXMetaDataKeyword.

55.1.46 TDBXMetaDataProcedureTypes Class

Constants passed to TDBXMetaDataCommands.GetProcedures metadata command.

Class Hierarchy

Pascal

```
TDBXMetaDataProcedureTypes = class;
```

C++

```
class TDBXMetaDataProcedureTypes;
```

File

DBXCommon

Description

One or more of these constants in TDBXMetaDataProcedureTypes may be passed to the

TDBXMetaDataCommands.GetProcedures metadata command.

This table contains the procedure types.

Constant	Description
ProcedureType (see page 10539)	Get procedures.
FunctionType (see page 10539)	Get functions.

See Also

TDBXMetaDataCommands (see page 10525)

55.1.46.1 TDBXMetaDataProcedureTypes Members

The following tables list the members exposed by TDBXMetaDataProcedureTypes.

Public Constants

	Name	Description
	FunctionType (see page 10539)	This is FunctionType, a member of class TDBXMetaDataProcedureTypes.
	ProcedureType (see page 10539)	This is ProcedureType, a member of class TDBXMetaDataProcedureTypes.

55.1.46.2 TDBXMetaDataProcedureTypes Constants

The constants of the TDBXMetaDataProcedureTypes class are listed here.

Public Constants

	Name	Description
	FunctionType (see page 10539)	This is FunctionType, a member of class TDBXMetaDataProcedureTypes.
	ProcedureType (see page 10539)	This is ProcedureType, a member of class TDBXMetaDataProcedureTypes.

55.1.46.2.1 TDBXMetaDataProcedureTypes.FunctionType Constant

Pascal

```
const FunctionType = 'Function';
```

C++

```
FunctionType = 'Function';
```

Description

This is FunctionType, a member of class TDBXMetaDataProcedureTypes.

55.1.46.2.2 TDBXMetaDataProcedureTypes.ProcedureType Constant

Pascal

```
const ProcedureType = 'Procedure';
```

C++

```
ProcedureType = 'Procedure';
```

Description

This is ProcedureType, a member of class TDBXMetaDataProcedureTypes.

55.1.47 TDBXMetaDataTableTypes Class

Constants for the GetTables metadata command

Class Hierarchy

DBXCommon.TDBXMetaDataTableTypes

Pascal

```
TDBXMetaDataTableTypes = class;
```

C++

```
class TDBXMetaDataTableTypes;
```

File

DBXCommon

Description

The TDBXMetaDataCommands (see page 10525) class lists types of database metadata you can acquire. This class's constants may be passed to the GetTables command in TDBXMetaDataCommands (see page 10525).

This table lists the tables for which you can get metadata.

Constant	Description
Table (see page 10541)	Get tables
View (see page 10541)	Get Views
SystemTable (see page 10541)	Get System (see page 22079) tables
Synonym (see page 10541)	Get synonyms

See Also

TDBXMetaDataCommands (see page 10525)

55.1.47.1 TDBXMetaDataTableTypes Members

The following tables list the members exposed by TDBXMetaDataTableTypes.

Public Constants

	Name	Description
	Synonym (see page 10541)	This is Synonym, a member of class TDBXMetaDataTableTypes.
	SystemTable (see page 10541)	This is SystemTable, a member of class TDBXMetaDataTableTypes.
	Table (see page 10541)	This is Table, a member of class TDBXMetaDataTableTypes.
	View (see page 10541)	This is View, a member of class TDBXMetaDataTableTypes.

55.1.47.2 TDBXMetaDataTableTypes Constants

The constants of the TDBXMetaDataTableTypes class are listed here.

Public Constants

	Name	Description
	Synonym (see page 10541)	This is Synonym, a member of class TDBXMetaDataTableTypes.
	SystemTable (see page 10541)	This is SystemTable, a member of class TDBXMetaDataTableTypes.
	Table (see page 10541)	This is Table, a member of class TDBXMetaDataTableTypes.
	View (see page 10541)	This is View, a member of class TDBXMetaDataTableTypes.

55.1.47.2.1 TDBXMetaDataTableTypes.Synonym Constant

Pascal

```
const Synonym = 'Synonym';
```

C++

```
Synonym = 'Synonym';
```

Description

This is Synonym, a member of class TDBXMetaDataTableTypes.

55.1.47.2.2 TDBXMetaDataTableTypes.SystemTable Constant

Pascal

```
const SystemTable = 'SystemTable';
```

C++

```
SystemTable = 'SystemTable';
```

Description

This is SystemTable, a member of class TDBXMetaDataTableTypes.

55.1.47.2.3 TDBXMetaDataTableTypes.Table Constant

Pascal

```
const Table = 'Table';
```

C++

```
Table = 'Table';
```

Description

This is Table, a member of class TDBXMetaDataTableTypes.

55.1.47.2.4 TDBXMetaDataTableTypes.View Constant

Pascal

```
const View = 'View';
```

C++

```
View = 'View';
```

Description

This is View, a member of class TDBXMetaDataTableTypes.

55.1.48 TDBXMetaDataTableTypesEx Class

Temporary extension of TDBXMetaDataTableTypes (see page 10540) class.

Class Hierarchy

DBXCommon.TDBXMetaDataTableTypesEx

Pascal

```
TDBXMetaDataTableTypesEx = class;
```

C++

```
class TDBXMetaDataTableTypesEx;
```

File

DBXCommon

Description

The TDBXMetaDataCommandsEx (see page 10531) class lists additional types of database metadata you can acquire. This class's constants may be passed to the GetTables command in TDBXMetaDataCommands (see page 10525).

Note: Classes (see page 2685) ending in “Ex” are temporary classes that exist to avoid breaking interfaces. Their contents will be migrated to their base class in the next release.

This table contains tables for which you can get metadata.

Constant	Description
SystemView (see page 10543)	SystemView (see page 10543)

See Also

TDBXMetaDataTableTypes (see page 10540)

TDBXMetaDataCommands (see page 10525)

55.1.48.1 TDBXMetaDataTableTypesEx Members

The following tables list the members exposed by TDBXMetaDataTableTypesEx.

Public Constants

	Name	Description
	SystemView (see page 10543)	This is SystemView, a member of class TDBXMetaDataTableTypesEx.

55.1.48.2 TDBXMetaDataTableTypesEx Constants

The constants of the TDBXMetaDataTableTypesEx class are listed here.

Public Constants

	Name	Description
	SystemView (see page 10543)	This is SystemView, a member of class TDBXMetaDataTableTypesEx.

55.1.48.2.1 TDBXMetaDataTableTypesEx.SystemView Constant

Pascal

```
const SystemView = 'SystemView';
```

C++

```
SystemView = 'SystemView';
```

Description

This is SystemView, a member of class TDBXMetaDataTableTypesEx.

55.1.49 TDBXNullValue Class

Class Hierarchy

Pascal

```
TDBXNullValue = class(TDBXWritableValue);
```

C++

```
class TDBXNullValue : public TDBXWritableValue;
```

File

DBXCommon

Description

This is class DBXCommon.TDBXNullValue.

55.1.49.1 TDBXNullValue Members

The following tables list the members exposed by TDBXNullValue.

Protected Methods

	Name	Description
	Create (see page 10544)	Creates an instance of TDBXWritableValue
	GetDbxContext (see page 10630)	Get context information for a connection associated with value.
V	SetPendingValue (see page 10666)	This is SetPendingValue, a member of class TDBXWritableValue.

Protected Properties

	Name	Description
R	DbxContext (see page 10633)	Context information for a connection associated with value.

Public Methods

	Name	Description
	CreateValue (see page 10628)	Creates values for both the TDBXReader (see page 10576) and TDBXParameterList (see page 10553) classes.
V	Destroy (see page 10544)	Destroys a TDBXWritableValue instance.
V	GetAnsiString (see page 10629)	Gets the string value for ANSI strings.
V	GetBcd (see page 10629)	Gets the BCD value for binary-compressed decimal data types.

	GetBoolean (see page 10629)	Gets the boolean value for boolean data types.
	GetBytes (see page 10629)	Gets the byte array value for byte array and blob types.
	GetDate (see page 10630)	Gets the date value for date data types.
	GetDouble (see page 10630)	Gets the double floating point value for double data types.
	GetInt16 (see page 10631)	Gets the smallInt value for 16-byte integer data types.
	GetInt32 (see page 10631)	Gets the 32-byte integer value for 32-byte integer data types.
	GetInt64 (see page 10631)	Gets the 64-byte integer value for 64-byte integer data types.
	GetTime (see page 10631)	Gets the time value for time data types.
	GetTimeStamp (see page 10632)	Gets the timestamp value for timestamp data types.
	GetValueSize (see page 10632)	Gets the size in bytes for values.
	GetWideString (see page 10632)	Gets the wide string value for wide string data types.
	IsNull (see page 10545)	Returns true if the value is **null**.
	SetAnsiString (see page 10663)	Sets the string value for ANSI strings.
	SetBcd (see page 10664)	Sets the BCD value for binary-compressed decimal data types.
	SetBoolean (see page 10664)	Sets the boolean value for boolean data types..
	SetDate (see page 10664)	Sets the date value for date data types..
	SetDouble (see page 10664)	Sets the double floating point value for double data types.
	SetDynamicBytes (see page 10665)	Sets the dynamic array value for byte array and blob types.
	SetInt16 (see page 10665)	Sets the the smallInt value for 16-byte integer data types.
	SetInt32 (see page 10665)	Sets the 32-byte integer value for 32-byte integer data types.
	SetInt64 (see page 10665)	Sets the 64-byte integer value for 64-byte integer data types.
	SetNull (see page 10666)	Sets a writable value of any type to null.
	SetStaticBytes (see page 10666)	Sets the open array value for byte array and blob types
	SetTime (see page 10666)	Sets the time value for time data types.
	SetTimeStamp (see page 10667)	Sets the timestamp value for timestamp data types.
	SetWideString (see page 10667)	Sets the wide string value for wide string data types.

Public Properties

	Name	Description
	ValueType (see page 10633)	Gets the value type for this value.

55.1.49.2 TDBXNullValue.Create Constructor

Creates an instance of TDBXWritableValue

Pascal

```
constructor Create(ValueType: TDBXValueType);
```

C++

```
__fastcall TDBXNullValue(TDBXValueType ValueType);
```

Description

This constructor creates and initializes an instance of TDBXWritableValue.

See Also

Destroy (see page 10663)

55.1.49.3 TDBXNullValue.Destroy Destructor

Destroys a TDBXWritableValue instance.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TDBXNullValue();
```

Description

This destructor destroys an instance of TDBXWritableValue.

See Also

Create (see page 10662)

55.1.49.4 TDBXNullValue Methods

The methods of the TDBXNullValue class are listed here.

Public Methods

	Name	Description
	IsNull (see page 10545)	Returns true if the value is **null**.

55.1.49.4.1 TDBXNullValue.IsNull Method

Returns true if the value is **null**.

Pascal

```
function IsNull: Boolean; override;
```

C++

```
virtual __fastcall Boolean IsNull();
```

Description

Returns true if the value is **null**. This method should be called before calling any of the Get methods. If the value is null, the Get methods will throw TDBXError exception if they are called.

55.1.50 TDBXParameter Class

Individual parameters for queries and stored commands.

Class Hierarchy

Pascal

```
TDBXParameter = class(TDBXValueType);
```

C++

```
class TDBXParameter : public TDBXValueType;
```

File

DBXCommon

Description

TDBXParameter should be created by calling CreateParameter for each "?" parameter marker specified in the Text property. Once a TDBXParameter is created, it must be added to a TDBXCommand (see page 10378) parameter list by calling

.AddParameter method.

55.1.50.1 TDBXParameter Members

The following tables list the members exposed by TDBXParameter.

Protected Methods

	Name	Description
	Create (see page 10547)	Creates an instance of TDBXParameter (see page 10545)
V	GetChildPosition (see page 10638)	Get ChildPosition (see page 10645) property.
V	GetDataType (see page 10639)	Get DataType (see page 10646) property.
V	GetFlags (see page 10639)	Get ValueTypeFlags (see page 10648) property.
V	GetName (see page 10639)	Get Name (see page 10646) property.
V	GetOrdinal (see page 10639)	Get Ordinal (see page 10646) property.
V	GetParameterDirection (see page 10640)	Get ParameterDirection (see page 10647) property.
V	GetPrecision (see page 10640)	Get Precision (see page 10647) property.
V	GetScale (see page 10640)	Get Scale (see page 10647) property.
V	GetSize (see page 10641)	Get Size (see page 10648) property.
V	GetSubType (see page 10641)	Get SubType (see page 10648) property.
V	GetValue (see page 10547)	This is GetValue, a member of class TDBXParameter.
V	SetChildPosition (see page 10641)	Set ChildPosition (see page 10645) property.
V	SetDataType (see page 10642)	Set DataType (see page 10646) property.
V	SetDbxRow (see page 10548)	This is SetDbxRow, a member of class TDBXParameter.
V	SetFlags (see page 10642)	Set ValueTypeFlags (see page 10648) property.
V	SetName (see page 10642)	Set Name (see page 10646) property.
V	SetNullable (see page 10642)	Set ChildPosition (see page 10645) property.
V	SetOrdinal (see page 10643)	Set Ordinal (see page 10646) property.
V	SetParameter (see page 10548)	This is SetParameter, a member of class TDBXParameter.
V	SetParameterDirection (see page 10643)	Set ParameterDirection (see page 10647) property.
V	SetPrecision (see page 10643)	Set Precision (see page 10647) property.
V	SetScale (see page 10644)	Set Scale (see page 10647) property.
V	SetSize (see page 10644)	Set Size (see page 10648) property.
V	SetSubType (see page 10644)	Set SubType (see page 10648) property.

Public Methods

	Name	Description
V	Destroy (see page 10547)	Destructor.

Public Properties

	Name	Description
R	AutoIncrement (see page 10645)	Gets the value that determines whether or not this describes an autoincrement value.
	ChildPosition (see page 10645)	Used by TDBXParameter (see page 10545) instances. Child position of Oracle ADT and Array types
	DataType (see page 10646)	Value data type.
	Name (see page 10646)	Name for this value.
	Nullable (see page 10646)	Determines whether or not a parameter can be set to null.
	Ordinal (see page 10646)	Ordinal position of this value.
	ParameterDirection (see page 10647)	Gets or sets the direction of a parameter.
	Precision (see page 10647)	The maximum number of digits allowed in the parameter.
R	ReadOnly (see page 10647)	True if this TDBXValueType (see page 10636) is read-only.
	Scale (see page 10647)	The maximum number of digits used to represent the property.
R	Searchable (see page 10648)	True if this TDBXValueType (see page 10636) is searchable.
	Size (see page 10648)	The size of the parameter value in bytes.

	SubType (see page 10648)	Data sub-type.
R	Value (see page 10548)	Used to read and write parameter values.
	ValueTypeFlags (see page 10648)	TDBXValue (see page 10626) metadata for TDBXReader (see page 10576).

Strict protected Fields

	Name	Description
	FDBXContext (see page 10637)	This is FDBXContext, a member of class TDBXValueType.

55.1.50.2 TDBXParameter.Create Constructor

Creates an instance of TDBXParameter (see page 10545)

Pascal

```
constructor Create(DbxContext: TDBXContext);
```

C++

```
__fastcall TDBXParameter(TDBXContext DbxContext);
```

Description

This constructor creates and initializes an instance of TDBXParameter (see page 10545).

See Also

Destroy (see page 10547)

55.1.50.3 TDBXParameter.Destroy Destructor

Destructor.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TDBXParameter();
```

Description

Use Destroy to destroy an instance of TDBXParameter (see page 10545).

55.1.50.4 TDBXParameter Methods

The methods of the TDBXParameter class are listed here.

Protected Methods

	Name	Description
V	GetValue (see page 10547)	This is GetValue, a member of class TDBXParameter.
V	SetDbxRow (see page 10548)	This is SetDbxRow, a member of class TDBXParameter.
V	SetParameter (see page 10548)	This is SetParameter, a member of class TDBXParameter.

55.1.50.4.1 TDBXParameter.GetValue Method

Pascal

```
function GetValue: TDBXWritableValue; virtual;
```

C++

```
virtual __fastcall TDBXWritableValue GetValue();
```

Description

This is GetValue, a member of class TDBXParameter.

55.1.50.4.2 TDBXParameter.SetDbxRow Method

Pascal

```
procedure SetDbxRow(DbxRow: TDBXRow); virtual;
```

C++

```
virtual __fastcall SetDbxRow(TDBXRow DbxRow);
```

Description

This is SetDbxRow, a member of class TDBXParameter.

55.1.50.4.3 TDBXParameter.SetParameter Method

Pascal

```
procedure SetParameter; virtual;
```

C++

```
virtual __fastcall SetParameter();
```

Description

This is SetParameter, a member of class TDBXParameter.

55.1.50.5 TDBXParameter Properties

The properties of the TDBXParameter class are listed here.

Public Properties

	Name	Description
R	Value (see page 10548)	Used to read and write parameter values.

55.1.50.5.1 TDBXParameter.Value Property

Used to read and write parameter values.

Pascal

```
property Value: TDBXWritableValue;
```

C++

```
__property TDBXWritableValue Value;
```

Description

Returns a TDBXWritableValueinstance that can be used to read and write parameter values.

55.1.51 TDBXParameterDirections Class

Parameter types supported by TDBXParameter (see page 10545)

Class Hierarchy

DBXCommon.TDBXParameterDirections

Pascal

```
TDBXParameterDirections = class;
```

C++

```
class TDBXParameterDirections;
```

File

DBXCommon

Description

Parameter types supported by the TDBXParameter (see page 10545) class.

This table contains parameter direction constants.

Constant	Description
Unknown (see page 10551)	The parameter type is unknown (generates an error).
InParameter (see page 10550)	Input parameter.
OutParameter (see page 10550)	Output parameter.
InOutParameter (see page 10550)	Input/Output parameter.
ReturnParameter (see page 10550)	Return parameter.

See Also

TDBXParameter (see page 10545)

55.1.51.1 TDBXParameterDirections Members

The following tables list the members exposed by TDBXParameterDirections.

Public Constants

	Name	Description
	InOutParameter (see page 10550)	This is InOutParameter, a member of class TDBXParameterDirections.
	InParameter (see page 10550)	This is InParameter, a member of class TDBXParameterDirections.
	OutParameter (see page 10550)	This is OutParameter, a member of class TDBXParameterDirections.
	ReturnParameter (see page 10550)	This is ReturnParameter, a member of class TDBXParameterDirections.
	Unknown (see page 10551)	This is Unknown, a member of class TDBXParameterDirections.

55.1.51.2 TDBXParameterDirections Constants

The constants of the TDBXParameterDirections class are listed here.

Public Constants

	Name	Description
	InOutParameter (see page 10550)	This is InOutParameter, a member of class TDBXParameterDirections.
	InParameter (see page 10550)	This is InParameter, a member of class TDBXParameterDirections.
	OutParameter (see page 10550)	This is OutParameter, a member of class TDBXParameterDirections.
	ReturnParameter (see page 10550)	This is ReturnParameter, a member of class TDBXParameterDirections.
	Unknown (see page 10551)	This is Unknown, a member of class TDBXParameterDirections.

55.1.51.2.1 TDBXParameterDirections.InOutParameter Constant

Pascal

```
const InOutParameter = 3;
```

C++

```
InOutParameter = 3;
```

Description

This is InOutParameter, a member of class TDBXParameterDirections.

55.1.51.2.2 TDBXParameterDirections.InParameter Constant

Pascal

```
const InParameter = 1;
```

C++

```
InParameter = 1;
```

Description

This is InParameter, a member of class TDBXParameterDirections.

55.1.51.2.3 TDBXParameterDirections.OutParameter Constant

Pascal

```
const OutParameter = 2;
```

C++

```
OutParameter = 2;
```

Description

This is OutParameter, a member of class TDBXParameterDirections.

55.1.51.2.4 TDBXParameterDirections.ReturnParameter Constant

Pascal

```
const ReturnParameter = 4;
```

C++

```
ReturnParameter = 4;
```

Description

This is ReturnParameter, a member of class TDBXParameterDirections.

55.1.51.2.5 TDBXParameterDirections.Unknown Constant

Pascal

```
const Unknown = 0;
```

C++

```
Unknown = 0;
```

Description

This is Unknown, a member of class TDBXParameterDirections.

55.1.52 TDBXParameterEx Class

Extension of TDBXParameter (see page 10545).

Class Hierarchy

Pascal

```
TDBXParameterEx = class(TDBXParameter);
```

C++

```
class TDBXParameterEx : public TDBXParameter;
```

File

DBXCommon

Description

TDBXParameterEx is an extension of TDBXParameter (see page 10545).

Note: Classes (see page 2685) ending in “Ex” are temporary classes that exist to avoid breaking interfaces. Their contents will be migrated to their base class in the next release.

See Also

TDBXParameter (see page 10545)

55.1.52.1 TDBXParameterEx Members

The following tables list the members exposed by TDBXParameterEx.

Protected Methods

	Name	Description
	Create (see page 10547)	Creates an instance of TDBXParameter (see page 10545)
	Create (see page 10637)	Creates an instance of TDBXValueType (see page 10636)
V	GetChildPosition (see page 10638)	Get ChildPosition (see page 10645) property.
V	GetDataType (see page 10639)	Get DataType (see page 10646) property.
V	GetFlags (see page 10639)	Get ValueTypeFlags (see page 10648) property.
V	GetName (see page 10639)	Get Name (see page 10646) property.
V	GetOrdinal (see page 10639)	Get Ordinal (see page 10646) property.
V	GetParameterDirection (see page 10640)	Get ParameterDirection (see page 10647) property.

	GetPrecision (see page 10640)	Get Precision (see page 10647) property.
	GetScale (see page 10640)	Get Scale (see page 10647) property.
	GetSize (see page 10641)	Get Size (see page 10648) property.
	GetSubType (see page 10641)	Get SubType (see page 10648) property.
	GetValue (see page 10547)	This is GetValue, a member of class TDBXParameter.
	SetChildPosition (see page 10641)	Set ChildPosition (see page 10645) property.
	SetDataType (see page 10642)	Set DataType (see page 10646) property.
	SetDbxRow (see page 10548)	This is SetDbxRow, a member of class TDBXParameter.
	SetFlags (see page 10642)	Set ValueTypeFlags (see page 10648) property.
	SetName (see page 10642)	Set Name (see page 10646) property.
	SetNullable (see page 10642)	Set ChildPosition (see page 10645) property.
	SetOrdinal (see page 10643)	Set Ordinal (see page 10646) property.
	SetParameter (see page 10548)	This is SetParameter, a member of class TDBXParameter.
	SetParameterDirection (see page 10643)	Set ParameterDirection (see page 10647) property.
	SetPrecision (see page 10643)	Set Precision (see page 10647) property.
	SetScale (see page 10644)	Set Scale (see page 10647) property.
	SetSize (see page 10644)	Set Size (see page 10648) property.
	SetSubType (see page 10644)	Set SubType (see page 10648) property.

Public Methods

	Name	Description
	Assign (see page 10553)	Copies field values from one parameter to other.
	Clone (see page 10553)	Creates new TDBXParameter (see page 10545) instance and copies field values to new instance.
	Destroy (see page 10547)	Destructor.

Public Properties

	Name	Description
R	AutoIncrement (see page 10645)	Gets the value that determines whether or not this describes an autoincrement value.
	ChildPosition (see page 10645)	Used by TDBXParameter (see page 10545) instances. Child position of Oracle ADT and Array types
	DataType (see page 10646)	Value data type.
	Name (see page 10646)	Name for this value.
	Nullable (see page 10646)	Determines whether or not a parameter can be set to null.
	Ordinal (see page 10646)	Ordinal position of this value.
	ParameterDirection (see page 10647)	Gets or sets the direction of a parameter.
	Precision (see page 10647)	The maximum number of digits allowed in the parameter.
R	ReadOnly (see page 10647)	True if this TDBXValueType (see page 10636) is read-only.
	Scale (see page 10647)	The maximum number of digits used to represent the property.
R	Searchable (see page 10648)	True if this TDBXValueType (see page 10636) is searchable.
	Size (see page 10648)	The size of the parameter value in bytes.
	SubType (see page 10648)	Data sub-type.
R	Value (see page 10548)	Used to read and write parameter values.
	ValueTypeFlags (see page 10648)	TDBXValue (see page 10626) metadata for TDBXReader (see page 10576).

Strict protected Fields

	Name	Description
	FDBXContext (see page 10637)	This is FDBXContext, a member of class TDBXValueType.

55.1.52.2 TDBXParameterEx Methods

The methods of the TDBXParameterEx class are listed here.

Public Methods

	Name	Description
	Assign (see page 10553)	Copies field values from one parameter to other.
	Clone (see page 10553)	Creates new TDBXParameter (see page 10545) instance and copies field values to new instance.

55.1.52.2.1 TDBXParameterEx.Assign Method

Copies field values from one parameter to other.

Pascal

```
procedure Assign(Source: TDBXParameter); virtual;
```

C++

```
virtual __fastcall Assign(TDBXParameter Source);
```

Description

Assign copies field values from one parameter to the other.

See Also

TDBXParameter (see page 10545)

55.1.52.2.2 TDBXParameterEx.Clone Method

Creates new TDBXParameter (see page 10545) instance and copies field values to new instance.

Pascal

```
function Clone: TObject; virtual;
```

C++

```
virtual __fastcall TObject * Clone();
```

Description

Clone creates a new TDBXParameter (see page 10545) instance and calls Assign (see page 10553) to copy field values to new instance.

See Also

TDBXParameter (see page 10545)

Assign (see page 10553)

55.1.53 TDBXParameterList Class

A collection of TDBXParameter (see page 10545) instances that can be used to get and set parameters for a TDBXCommand (see page 10378).

Class Hierarchy

DBXCommon.TDBXParameterList

Pascal

```
TDBXParameterList = class;
```

C++

```
class TDBXParameterList;
```

File

DBXCommon

Description

The Parameters property returns an instance of TDBXParameterList. The TDBXParameterList manages a collection of TDBXParameter (see page 10545) instances that can be used to get and set parameters for a TDBXCommand (see page 10378). The lifetime of all TDBXParameter (see page 10545) instances added to this list will be managed by this list. So when Free is called, Free will also be called for all items in the list.

55.1.53.1 TDBXParameterList Members

The following tables list the members exposed by TDBXParameterList.

Protected Fields

	Name	Description
	FDBXContext (see page 10555)	This is FDBXContext, a member of class TDBXParameterList.

Protected Methods

	Name	Description
	Create (see page 10554)	Creates an instance of TDBXParameterList (see page 10553)
V	GetCount (see page 10556)	Number parameters in list.
V	GetParameterByOrdinal (see page 10557)	Get parameter by ordinal position.

Public Methods

	Name	Description
V	AddParameter (see page 10556)	Add a parameter to this list.
V	ClearParameters (see page 10556)	Remove all parameters.
V	Destroy (see page 10555)	Destroys a TDBXParameterList (see page 10553) instance.
V	GetOrdinal (see page 10556)	The ordinal index for the named parameter.
V	InsertParameter (see page 10557)	Inserts parameter into this list at the specified ordinal position.
V	RemoveParameter (see page 10557)	This is the overview for the RemoveParameter method overload.
V	SetCount (see page 10558)	Sets the length of the list to the specified number of parameters.
V	SetParameter (see page 10558)	Add a parameter to this list at the specified ordinal position.

Public Properties

	Name	Description
R	Count (see page 10559)	The number of parameters in this list.
R	Parameter (see page 10559)	Individual; TDBXParameter (see page 10545) instance.

55.1.53.2 TDBXParameterList.Create Constructor

Creates an instance of TDBXParameterList (see page 10553)

Pascal

```
constructor Create(DBXContext: TDBXContext; Command: TDBXCommand);
```

C++

```
__fastcall TDBXParameterList(TDBXContext DBXContext, TDBXCommand Command);
```

Description

This constructor creates and initializes an instance of TDBXParameterList (see page 10553).

See Also

Destroy (see page 10555)

55.1.53.3 TDBXParameterList.Destroy Destructor

Destroys a TDBXParameterList (see page 10553) instance.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TDBXParameterList();
```

Description

This destructor destroys an instance of TDBXParameterList (see page 10553).

See Also

Create (see page 10554)

55.1.53.4 TDBXParameterList Fields

The fields of the TDBXParameterList class are listed here.

Protected Fields

	Name	Description
	FDBXContext (see page 10555)	This is FDBXContext, a member of class TDBXParameterList.

55.1.53.4.1 TDBXParameterList.FDBXContext Field

Pascal

```
FDBXContext: TDBXContext;
```

C++

```
TDBXContext FDBXContext;
```

Description

This is FDBXContext, a member of class TDBXParameterList.

55.1.53.5 TDBXParameterList Methods

The methods of the TDBXParameterList class are listed here.

Protected Methods

	Name	Description
	GetCount (see page 10556)	Number parameters in list.
	GetParameterByOrdinal (see page 10557)	Get parameter by ordinal position.

Public Methods

	Name	Description
	AddParameter (see page 10556)	Add a parameter to this list.
	ClearParameters (see page 10556)	Remove all parameters.
	GetOrdinal (see page 10556)	The ordinal index for the named parameter.
	InsertParameter (see page 10557)	Inserts parameter into this list at the specified ordinal position.
	RemoveParameter (see page 10557)	This is the overview for the RemoveParameter method overload.
	SetCount (see page 10558)	Sets the length of the list to the specified number of parameters.
	SetParameter (see page 10558)	Add a parameter to this list at the specified ordinal position.

55.1.53.5.1 TDBXParameterList.AddParameter Method

Add a parameter to this list.

Pascal

```
procedure AddParameter(Parameter: TDBXParameter); virtual;
```

C++

```
virtual __fastcall AddParameter(TDBXParameter Parameter);
```

Description

Add a TDBXParameter (see page 10545) instance to this list.

55.1.53.5.2 TDBXParameterList.ClearParameters Method

Remove all parameters.

Pascal

```
procedure ClearParameters; virtual; overload;
```

C++

```
virtual __fastcall ClearParameters();
```

Description

Remove and call Free for all parameters.

55.1.53.5.3 TDBXParameterList.GetCount Method

Number parameters in list.

Pascal

```
function GetCount: TInt32; virtual;
```

C++

```
virtual __fastcall TInt32 GetCount();
```

Description

GetCount holds the number of parameters in the parameter list.

55.1.53.5.4 TDBXParameterList.GetOrdinal Method

The ordinal index for the named parameter.

Pascal

```
function GetOrdinal(const Name: WideString): Integer; virtual;
```

C++

```
virtual __fastcall int GetOrdinal(const BSTR Name);
```

Description

UseGetOrdinal to get the ordinal position for the parameter specified by name.

55.1.53.5.5 TDBXParameterList.GetParameterByOrdinal Method

Get parameter by ordinal position.

Pascal

```
function GetParameterByOrdinal(const Ordinal: TInt32): TDBXParameter; virtual;
```

C++

```
virtual __fastcall TDBXParameter GetParameterByOrdinal(const TInt32 Ordinal);
```

Description

GetParameterByOrdinal returns the parameter in the specified ordinal position.

See Also

GetOrdinal (see page 10556)

55.1.53.5.6 TDBXParameterList.InsertParameter Method

Inserts parameter into this list at the specified ordinal position.

Pascal

```
procedure InsertParameter(Ordinal: Integer; Parameter: TDBXParameter); virtual;
```

C++

```
virtual __fastcall InsertParameter(int Ordinal, TDBXParameter Parameter);
```

Description

Use InsertParameter to insert a TDBXParameter (see page 10545) instance to this list at the specified ordinal position.

55.1.53.5.7 RemoveParameter Method

This is the overview for the RemoveParameter method overload.

Overload List

	Name	Description
	TDBXParameterList.RemoveParameter (Integer) (see page 10558)	Removes a parameter instance from this list.
	TDBXParameterList.RemoveParameter (TDBXParameter) (see page 10558)	Removes a parameter instance from this list.

55.1.53.5.7.1 TDBXParameterList.RemoveParameter Method (Integer)

Removes a parameter instance from this list.

Pascal

```
procedure RemoveParameter(Ordinal: Integer); virtual; overload;
procedure RemoveParameter(Parameter: TDBXParameter); virtual; overload;
```

C++

```
virtual __fastcall RemoveParameter(int Ordinal);
virtual __fastcall RemoveParameter(TDBXParameter Parameter);
```

Description

Use RemoveParameter to remove a TDBXParameter (see page 10545) instance from this list at either the specified ordinal position. or by specifying the instance of TDBXParameter (see page 10545) to be removed. The Free method will be called for the removed parameter.

55.1.53.5.8 TDBXParameterList.SetCount Method

Sets the length of the list to the specified number of parameters.

Pascal

```
procedure SetCount(Count: TInt32); virtual;
```

C++

```
virtual __fastcall SetCount(TInt32 Count);
```

Description

Set the length of the list to the specifed number of parameters. If this grows the list, new items will be set to **null**. If this shrinks the list, items beyond the new length will be released by calling the ;Free method.

55.1.53.5.9 TDBXParameterList.SetParameter Method

Add a parameter to this list at the specified ordinal position.

Pascal

```
procedure SetParameter(Ordinal: Integer; Parameter: TDBXParameter); virtual;
```

C++

```
virtual __fastcall SetParameter(int Ordinal, TDBXParameter Parameter);
```

Description

Add a TDBXParameter (see page 10545) instance to this list at the specified ordinal position.

55.1.53.6 TDBXParameterList Properties

The properties of the TDBXParameterList class are listed here.

Public Properties

	Name	Description
R	Count (see page 10559)	The number of parameters in this list.
R	Parameter (see page 10559)	Individual; TDBXParameter (see page 10545) instance.

55.1.53.6.1 TDBXParameterList.Count Property

The number of parameters in this list.

Pascal

```
property Count: TInt32;
```

C++

```
__property TInt32 Count;
```

Description

Count gets the number of parameters in this list.

55.1.53.6.2 TDBXParameterList.Parameter Property

Individual; TDBXParameter (see page 10545) instance.

Pascal

```
property Parameter [const Name: WideString]: TDBXParameter;
```

C++

```
__property TDBXParameter Parameter[BSTR const Name];
```

Description

Either gets the TDBXParameter (see page 10545) instance at the Ordinal position in the list or gets the TDBXParameter (see page 10545) instance that has the Name property provided.

55.1.54 TDBXProperties Class

Manages connection and driver level name/value pair property settings.

Class Hierarchy

Pascal

```
TDBXProperties = class;
```

C++

```
class TDBXProperties;
```

File

DBXCommon

Description

The TDBXProperties class manages connection and driver level name/value pair property settings.

55.1.54.1 TDBXProperties Members

The following tables list the members exposed by TDBXProperties.

Public Methods

	Name	Description
	Add (see page 10561)	Add a name/value pair.
	AddProperties (see page 10561)	Add (see page 10561) the name/value pairs from List into this instance of TDBXProperties (see page 10559).
	Clone (see page 10562)	Creates a new instance of TDBXProperties (see page 10559) with a copy of the same name/value pairs
	Create (see page 10560)	This is the overview for the Create constructor overload.
V	Destroy (see page 10561)	Destroys an instance of the TDBXProperties (see page 10559) class.
	GetBoolean (see page 10562)	Get property value as a Boolean.
	GetInteger (see page 10562)	Get property value as an Integer.
	GetLists (see page 10562)	Get the Names and Values (see page 10564) as two separate TWideStringArray (see page 10674) lists.
	GetRequiredValue (see page 10563)	Get property value as a string.
	SetProperties (see page 10563)	Sets the semicolon-separated name/value pairs from ConnectionString into this instance of TDBXProperties (see page 10559).

Public Properties

	Name	Description
R	Properties (see page 10563)	TWideString property name for TDBXProperties (see page 10559) name/value pairs.
	Values (see page 10564)	TWideString property value for TDBXProperties (see page 10559) name/value pairs.

55.1.54.2 Create Constructor

This is the overview for the Create constructor overload.

Overload List

	Name	Description
	TDBXProperties.Create () (see page 10560)	Create an instance of the TDBXProperties (see page 10559) class.
	TDBXProperties.Create (TDBXContext) (see page 10560)	Create an instance of the TDBXProperties (see page 10559) class.

55.1.54.2.1 TDBXProperties.Create Constructor ()

Create an instance of the TDBXProperties (see page 10559) class.

Pascal

```
constructor Create(DBXContext: TDBXContext); overload;
constructor Create; overload;
```

C++

```
__fastcall TDBXProperties(TDBXContext DBXContext);
__fastcall TDBXProperties();
```

Description

Use Create to create an instance of the TDBXProperties (see page 10559) class.

55.1.54.3 TDBXProperties.Destroy Destructor

Destroys an instance of the TDBXProperties (see page 10559) class.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TDBXProperties();
```

Description

Use Destroy to destroy an instance of the TDBXProperties (see page 10559) class.

55.1.54.4 TDBXProperties Methods

The methods of the TDBXProperties class are listed here.

Public Methods

	Name	Description
	Add (see page 10561)	Add a name/value pair.
	AddProperties (see page 10561)	Add (see page 10561) the name/value pairs from List into this instance of TDBXProperties (see page 10559).
	Clone (see page 10562)	Creates a new instance of TDBXProperties (see page 10559) with a copy of the same name/value pairs
	GetBoolean (see page 10562)	Get property value as a Boolean.
	GetInteger (see page 10562)	Get property value as an Integer.
	GetLists (see page 10562)	Get the Names and Values (see page 10564) as two separate TWideStringArray (see page 10674) lists.
	GetRequiredValue (see page 10563)	Get property value as a string.
	SetProperties (see page 10563)	Sets the semicolon-separated name/value pairs from ConnectionString into this instance of TDBXProperties (see page 10559).

55.1.54.4.1 TDBXProperties.Add Method

Add a name/value pair.

Pascal

```
procedure Add(const Name: WideString; const Value: WideString);
```

C++

```
__fastcall Add(const BSTR Name, const BSTR Value);
```

Description

Use Add to add a name/value pair for connection and driver properties.

55.1.54.4.2 TDBXProperties.AddProperties Method

Add (see page 10561) the name/value pairs from List into this instance of TDBXProperties (see page 10559).

Pascal

```
procedure AddProperties(List: TWideStrings); overload;
```

C++

```
__fastcall AddProperties(TWideStrings List);
```

Description

Use AddProperties to add the name/value pairs from List into this instance of TDBXProperties (see page 10559).

55.1.54.4.3 TDBXProperties.Clone Method

Creates a new instance of TDBXProperties (see page 10559) with a copy of the same name/value pairs

Pascal

```
function Clone: TDBXProperties;
```

C++

```
__fastcall TDBXProperties Clone();
```

Description

Use Clone to create a new instance of TDBXProperties (see page 10559) with a copy of the same name/value pairs

55.1.54.4.4 TDBXProperties.GetBoolean Method

Get property value as a Boolean.

Pascal

```
function GetBoolean(const Name: WideString): Boolean;
```

C++

```
__fastcall Boolean GetBoolean(const BSTR Name);
```

Description

Use GetBoolean to get a TDBXProperties (see page 10559) property value as a Boolean.

55.1.54.4.5 TDBXProperties.GetInteger Method

Get property value as an Integer.

Pascal

```
function GetInteger(const Name: WideString): Integer;
```

C++

```
__fastcall int GetInteger(const BSTR Name);
```

Description

Use GetInteger to get a TDBXProperties (see page 10559) property value as an Integer.

55.1.54.4.6 TDBXProperties.GetLists Method

Get the Names and Values (see page 10564) as two separate TWideStringArray (see page 10674) lists.

Pascal

```
procedure GetLists(var Names: TWideStringArray; var Values: TWideStringArray);
```

C++

```
__fastcall GetLists(TWideStringArray Names, TWideStringArray Values);
```

Description

Use GetLists to get the Names and Values (see page 10564) of an instance of TDBXProperties (see page 10559) as two separate TWideStringArray (see page 10674) lists.

55.1.54.4.7 TDBXProperties.GetRequiredValue Method

Get property value as a string.

Pascal

```
function GetRequiredValue(const Name: WideString): WideString;
```

C++

```
__fastcall BSTR GetRequiredValue(const BSTR Name);
```

Description

Use GetRequiredValue to get a TDBXPropertiesproperty value as a string. Throws an exception if this TDBXProperties (see page 10559) instance does not contain a property with the given name.

55.1.54.4.8 TDBXProperties.SetProperties Method

Sets the semicolon-separated name/value pairs from ConnectionString into this instance of TDBXProperties (see page 10559).

Pascal

```
procedure SetProperties(const ConnectionString: WideString); overload;
```

C++

```
__fastcall SetProperties(const BSTR ConnectionString);
```

Description

Use SetProperties to set the semicolon-separated name/value pairs from ConnectionString into this instance of TDBXProperties (see page 10559).

55.1.54.5 TDBXProperties Properties

The properties of the TDBXProperties class are listed here.

Public Properties

	Name	Description
R	Properties (see page 10563)	TWideString property name for TDBXProperties (see page 10559) name/value pairs.
	Values (see page 10564)	TWideString property value for TDBXProperties (see page 10559) name/value pairs.

55.1.54.5.1 TDBXProperties.Properties Property

TWideString property name for TDBXProperties (see page 10559) name/value pairs.

Pascal

```
property Properties: TWideStrings;
```

C++

```
__property TWideStrings Properties;
```

Description

TDBXProperties.Properties holds the name for connection and driver properties.

55.1.54.5.2 TDBXProperties.Values Property

TWideString property value for TDBXProperties (see page 10559) name/value pairs.

Pascal

```
property Values [const Name: WideString]: WideString;
```

C++

```
__property BSTR Values[BSTR const Name];
```

Description

TDBXProperties.Values holds the value for connection and driver properties.

55.1.55 TDBXPropertiesItem Class

Contains a set of TDBXProperties (see page 10559).

Class Hierarchy

DBXCommon.TDBXPropertiesItem

Pascal

```
TDBXPropertiesItem = class;
```

C++

```
class TDBXPropertiesItem;
```

File

DBXCommon

Description

This class is used by driver implementors. It contains a set of TDBXProperties (see page 10559).

See Also

TDBXProperties (see page 10559)

55.1.55.1 TDBXPropertiesItem Members

The following tables list the members exposed by TDBXPropertiesItem.

Public Fields

	Name	Description
	FDeletgatePath (see page 10565)	This is FDeletgatePath, a member of class TDBXPropertiesItem.
	FProperties (see page 10566)	This is FProperties, a member of class TDBXPropertiesItem.

Public Methods

	Name	Description
	Create (see page 10565)	Creates an instance of TDBXPropertiesItem (see page 10564)
V	Destroy (see page 10565)	Destroys a TDBXPropertiesItem (see page 10564) instance.

55.1.55.2 TDBXPropertiesItem.Create Constructor

Creates an instance of TDBXPropertiesItem (see page 10564)

Pascal

```
constructor Create(Properties: TDBXProperties);
```

C++

```
__fastcall TDBXPropertiesItem(TDBXProperties Properties);
```

Description

This constructor creates and initializes an instance of TDBXPropertiesItem (see page 10564).

See Also

Destroy (see page 10565)

55.1.55.3 TDBXPropertiesItem.Destroy Destructor

Destroys a TDBXPropertiesItem (see page 10564) instance.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TDBXPropertiesItem();
```

Description

This destructor destroys an instance of TDBXPropertiesItem (see page 10564).

See Also

Create (see page 10565)

55.1.55.4 TDBXPropertiesItem Fields

The fields of the TDBXPropertiesItem class are listed here.

Public Fields

	Name	Description
	FDeletgatePath (see page 10565)	This is FDeletgatePath, a member of class TDBXPropertiesItem.
	FProperties (see page 10566)	This is FProperties, a member of class TDBXPropertiesItem.

55.1.55.4.1 TDBXPropertiesItem.FDeletgatePath Field

Pascal

```
FDeletgatePath: TDBXDelegateItem;
```

C++

```
TDBXDelegateItem FDeletgatePath;
```

Description

This is FDeletgatePath, a member of class TDBXPropertiesItem.

55.1.55.4.2 TDBXPropertiesItem.FProperties Field

Pascal

```
FProperties: TDBXProperties;
```

C++

```
TDBXProperties FProperties;
```

Description

This is FProperties, a member of class TDBXPropertiesItem.

55.1.56 TDBXPropertyNames Class

Property names for connections and drivers.

Class Hierarchy

DBXCommon.TDBXPropertyNames

Pascal

```
TDBXPropertyNames = class;
```

C++

```
class TDBXPropertyNames;
```

File

DBXCommon

Description

Property names are used for both connections and drivers to provide information, such as user names and passwords.

This table contains property names.

Constant	Description
ConnectionName (see page 10569)	Name of connection. If connection properties are read from the dbxconnections.ini file, this is the ini file section name. AdoDbx Client can use this property setting for a simple one property connection string. Connection names can also be used to load a connection from a TDBXConnectionFactory (see page 10422) instance.
InstalledDrivers (see page 10572)	dbxdrivers.ini section that specifies which drivers are enabled.
GetDriverFunc (see page 10571)	Used by DBXDynalink drivers to specify exported entry point for loading a driver prior to dbExpress 4.

VendorLib (see page 10574)	Used by DBXDynalink drivers. Name of a vendor specific client library.
ErrorResourceFile (see page 10571)	Used only by Linux versions of dbExpress to specify a localized error message file.
LibraryName (see page 10572)	Used by DBXDynalink drivers to specify the name of the DBXDynalink DLL.
DriverName (see page 10570)	Unique name for a dbExpress driver. Used by the dbxconnections.ini file to refer to a connections driver in the dbxdrivers.ini file.
Host	Host name of a database server that a driver connects to.
Port (see page 10573)	Port (see page 10573) number of a database server that a driver connects to.
Database (see page 10569)	Name of a database to connect to.
UserName (see page 10574)	Login user name used to connect to a database.
Password (see page 10573)	Login password name used to connect to a database.
Role (see page 10573)	Login role used to connect to a database.
IsolationLevel (see page 10572)	Initial transaction isolation to use when connecting to a database. Transaction isolation can also be specified when a transaction is started.
MaxBlobSize (see page 10572)	Maximum BLOB size. Set to –1 to specify no limit.
DelegateConnection (see page 10569)	Delegate connection used by this connection. Delegate connections implement the dbExpress 4 driver framework. They can perform pre or post processing of all public and protected methods before delegating to the real connection or another delegate connection.
DriverUnit (see page 10571)	Used to provide informative error message when driver cannot be loaded.
DriverPackage (see page 10570)	Used to load a native driver dynamically. **Deprecated**. Preferable to just add the a comma plus the package name to the end of the **DriverPackageLoader (see page 10571)** property setting.
DelegateDriver (see page 10570)	Indicates that this driver is a delegate and can only be used in conjunction with a non-delegate driver.
DriverAssembly (see page 10570)	Used to load a managed driver dynamically. **Deprecated**. Preferable to just add the a comma plus the package name to the end of the **DriverPackageLoader (see page 10571)** property setting.
DriverPackageLoader (see page 10571)	Native Driver loader class used to load a native driver dynamically from a package. Comma separated class and package name.
DriverAssemblyLoader (see page 10570)	Managed Driver loader class used to load a managed driver dynamically from an assembly. Comma separated class and package name.
DelegateDriver (see page 10570)	Indicates that this driver is a delegate and can only be used in conjunction with a non-delegate driver.

SchemaOverride (see page 10573)	Most applications should not need to use this constant. It is provided for backwards compatibility of the dbExpress VCL. VCL components use this setting to scope metadata requests. This property should be set to **user-name.override-schema-name**. For example, tables created by the MSSQL sa user are placed in the dbo schema. In this case, SchemaOverride (see page 10573) can be set to 'sa.dbo'. This causes VCL to specify the 'dbo' schema for metadata requests when a connection is made using the 'sa' user. An SQL `'%'` like pattern can also be used for the user-name and the override-schema-name. For example, `'%.%'` causes the schema to not be specified at all for all users.

See Also

TDBXConnection (see page 10398)

TDBXDriver (see page 10472)

55.1.56.1 TDBXPropertyNames Members

The following tables list the members exposed by TDBXPropertyNames.

Public Constants

	Name	Description
	ConnectionName (see page 10569)	This is ConnectionName, a member of class TDBXPropertyNames.
	Database (see page 10569)	This is Database, a member of class TDBXPropertyNames.
	DelegateConnection (see page 10569)	This is DelegateConnection, a member of class TDBXPropertyNames.
	DelegateDriver (see page 10570)	This is DelegateDriver, a member of class TDBXPropertyNames.
	DriverAssembly (see page 10570)	This is DriverAssembly, a member of class TDBXPropertyNames.
	DriverAssemblyLoader (see page 10570)	This is DriverAssemblyLoader, a member of class TDBXPropertyNames.
	DriverName (see page 10570)	This is DriverName, a member of class TDBXPropertyNames.
	DriverPackage (see page 10570)	This is DriverPackage, a member of class TDBXPropertyNames.
	DriverPackageLoader (see page 10571)	This is DriverPackageLoader, a member of class TDBXPropertyNames.
	DriverUnit (see page 10571)	This is DriverUnit, a member of class TDBXPropertyNames.
	ErrorResourceFile (see page 10571)	This is ErrorResourceFile, a member of class TDBXPropertyNames.
	GetDriverFunc (see page 10571)	This is GetDriverFunc, a member of class TDBXPropertyNames.
	HostName (see page 10572)	This is HostName, a member of class TDBXPropertyNames.
	InstalledDrivers (see page 10572)	This is InstalledDrivers, a member of class TDBXPropertyNames.
	IsolationLevel (see page 10572)	This is IsolationLevel, a member of class TDBXPropertyNames.
	LibraryName (see page 10572)	This is LibraryName, a member of class TDBXPropertyNames.
	MaxBlobSize (see page 10572)	This is MaxBlobSize, a member of class TDBXPropertyNames.
	Password (see page 10573)	This is Password, a member of class TDBXPropertyNames.
	Port (see page 10573)	This is Port, a member of class TDBXPropertyNames.
	Role (see page 10573)	This is Role, a member of class TDBXPropertyNames.
	SchemaOverride (see page 10573)	This is SchemaOverride, a member of class TDBXPropertyNames.
	UserName (see page 10574)	This is UserName, a member of class TDBXPropertyNames.
	VendorLib (see page 10574)	This is VendorLib, a member of class TDBXPropertyNames.

55.1.56.2 TDBXPropertyNames Constants

The constants of the TDBXPropertyNames class are listed here.

Public Constants

	Name	Description
	ConnectionName (see page 10569)	This is ConnectionName, a member of class TDBXPropertyNames.
	Database (see page 10569)	This is Database, a member of class TDBXPropertyNames.
	DelegateConnection (see page 10569)	This is DelegateConnection, a member of class TDBXPropertyNames.

	DelegateDriver (see page 10570)	This is DelegateDriver, a member of class TDBXPropertyNames.
	DriverAssembly (see page 10570)	This is DriverAssembly, a member of class TDBXPropertyNames.
	DriverAssemblyLoader (see page 10570)	This is DriverAssemblyLoader, a member of class TDBXPropertyNames.
	DriverName (see page 10570)	This is DriverName, a member of class TDBXPropertyNames.
	DriverPackage (see page 10570)	This is DriverPackage, a member of class TDBXPropertyNames.
	DriverPackageLoader (see page 10571)	This is DriverPackageLoader, a member of class TDBXPropertyNames.
	DriverUnit (see page 10571)	This is DriverUnit, a member of class TDBXPropertyNames.
	ErrorResourceFile (see page 10571)	This is ErrorResourceFile, a member of class TDBXPropertyNames.
	GetDriverFunc (see page 10571)	This is GetDriverFunc, a member of class TDBXPropertyNames.
	HostName (see page 10572)	This is HostName, a member of class TDBXPropertyNames.
	InstalledDrivers (see page 10572)	This is InstalledDrivers, a member of class TDBXPropertyNames.
	IsolationLevel (see page 10572)	This is IsolationLevel, a member of class TDBXPropertyNames.
	LibraryName (see page 10572)	This is LibraryName, a member of class TDBXPropertyNames.
	MaxBlobSize (see page 10572)	This is MaxBlobSize, a member of class TDBXPropertyNames.
	Password (see page 10573)	This is Password, a member of class TDBXPropertyNames.
	Port (see page 10573)	This is Port, a member of class TDBXPropertyNames.
	Role (see page 10573)	This is Role, a member of class TDBXPropertyNames.
	SchemaOverride (see page 10573)	This is SchemaOverride, a member of class TDBXPropertyNames.
	UserName (see page 10574)	This is UserName, a member of class TDBXPropertyNames.
	VendorLib (see page 10574)	This is VendorLib, a member of class TDBXPropertyNames.

55.1.56.2.1 TDBXPropertyNames.ConnectionName Constant

Pascal

```
const ConnectionName = 'ConnectionName';
```

C++

```
ConnectionName = 'ConnectionName';
```

Description

This is ConnectionName, a member of class TDBXPropertyNames.

55.1.56.2.2 TDBXPropertyNames.Database Constant

Pascal

```
const Database = 'Database';
```

C++

```
Database = 'Database';
```

Description

This is Database, a member of class TDBXPropertyNames.

55.1.56.2.3 TDBXPropertyNames.DelegateConnection Constant

Pascal

```
const DelegateConnection = 'DelegateConnection';
```

C++

```
DelegateConnection = 'DelegateConnection';
```

Description

This is DelegateConnection, a member of class TDBXPropertyNames.

55.1.56.2.4 TDBXPropertyNames.DelegateDriver Constant

Pascal

```
const DelegateDriver = 'DelegateDriver';
```

C++

```
DelegateDriver = 'DelegateDriver';
```

Description

This is DelegateDriver, a member of class TDBXPropertyNames.

55.1.56.2.5 TDBXPropertyNames.DriverAssembly Constant

Pascal

```
const DriverAssembly = 'DriverAssembly';
```

C++

```
DriverAssembly = 'DriverAssembly';
```

Description

This is DriverAssembly, a member of class TDBXPropertyNames.

55.1.56.2.6 TDBXPropertyNames.DriverAssemblyLoader Constant

Pascal

```
const DriverAssemblyLoader = 'DriverAssemblyLoader';
```

C++

```
DriverAssemblyLoader = 'DriverAssemblyLoader';
```

Description

This is DriverAssemblyLoader, a member of class TDBXPropertyNames.

55.1.56.2.7 TDBXPropertyNames.DriverName Constant

Pascal

```
const DriverName = 'DriverName';
```

C++

```
DriverName = 'DriverName';
```

Description

This is DriverName, a member of class TDBXPropertyNames.

55.1.56.2.8 TDBXPropertyNames.DriverPackage Constant

Pascal

```
const DriverPackage = 'DriverPackage';
```

C++

```
DriverPackage = 'DriverPackage';
```

Description

This is DriverPackage, a member of class TDBXPropertyNames.

55.1.56.2.9 TDBXPropertyNames.DriverPackageLoader Constant

Pascal

```
const DriverPackageLoader = 'DriverPackageLoader';
```

C++

```
DriverPackageLoader = 'DriverPackageLoader';
```

Description

This is DriverPackageLoader, a member of class TDBXPropertyNames.

55.1.56.2.10 TDBXPropertyNames.DriverUnit Constant

Pascal

```
const DriverUnit = 'DriverUnit';
```

C++

```
DriverUnit = 'DriverUnit';
```

Description

This is DriverUnit, a member of class TDBXPropertyNames.

55.1.56.2.11 TDBXPropertyNames.ErrorResourceFile Constant

Pascal

```
const ErrorResourceFile = 'ErrorResourceFile';
```

C++

```
ErrorResourceFile = 'ErrorResourceFile';
```

Description

This is ErrorResourceFile, a member of class TDBXPropertyNames.

55.1.56.2.12 TDBXPropertyNames.GetDriverFunc Constant

Pascal

```
const GetDriverFunc = 'GetDriverFunc';
```

C++

```
GetDriverFunc = 'GetDriverFunc';
```

Description

This is GetDriverFunc, a member of class TDBXPropertyNames.

55.1.56.2.13 TDBXPropertyNames.HostName Constant

Pascal

```
const HostName = 'HostName';
```

C++

```
HostName = 'HostName';
```

Description

This is HostName, a member of class TDBXPropertyNames.

55.1.56.2.14 TDBXPropertyNames.InstalledDrivers Constant

Pascal

```
const InstalledDrivers = 'Installed Drivers';
```

C++

```
InstalledDrivers = 'Installed Drivers';
```

Description

This is InstalledDrivers, a member of class TDBXPropertyNames.

55.1.56.2.15 TDBXPropertyNames.IsolationLevel Constant

Pascal

```
const IsolationLevel = 'IsolationLevel';
```

C++

```
IsolationLevel = 'IsolationLevel';
```

Description

This is IsolationLevel, a member of class TDBXPropertyNames.

55.1.56.2.16 TDBXPropertyNames.LibraryName Constant

Pascal

```
const LibraryName = 'LibraryName';
```

C++

```
LibraryName = 'LibraryName';
```

Description

This is LibraryName, a member of class TDBXPropertyNames.

55.1.56.2.17 TDBXPropertyNames.MaxBlobSize Constant

Pascal

```
const MaxBlobSize = 'MaxBlobSize';
```

C++

```
MaxBlobSize = 'MaxBlobSize';
```

Description

This is MaxBlobSize, a member of class TDBXPropertyNames.

55.1.56.2.18 TDBXPropertyNames.Password Constant

Pascal

```
const Password = 'Password';
```

C++

```
Password = 'Password';
```

Description

This is Password, a member of class TDBXPropertyNames.

55.1.56.2.19 TDBXPropertyNames.Port Constant

Pascal

```
const Port = 'Port';
```

C++

```
Port = 'Port';
```

Description

This is Port, a member of class TDBXPropertyNames.

55.1.56.2.20 TDBXPropertyNames.Role Constant

Pascal

```
const Role = 'Role';
```

C++

```
Role = 'Role';
```

Description

This is Role, a member of class TDBXPropertyNames.

55.1.56.2.21 TDBXPropertyNames.SchemaOverride Constant

Pascal

```
const SchemaOverride = 'SchemaOverride';
```

C++

```
SchemaOverride = 'SchemaOverride';
```

Description

This is SchemaOverride, a member of class TDBXPropertyNames.

55.1.56.2.22 TDBXPropertyNames.UserName Constant

Pascal

```
const UserName = 'User_Name';
```

C++

```
UserName = 'User_Name';
```

Description

This is UserName, a member of class TDBXPropertyNames.

55.1.56.2.23 TDBXPropertyNames.VendorLib Constant

Pascal

```
const VendorLib = 'VendorLib';
```

C++

```
VendorLib = 'VendorLib';
```

Description

This is VendorLib, a member of class TDBXPropertyNames.

55.1.57 TDBXPropertyNamesEx Class

Temporary extension of TDBXPropertyNames (see page 10566) class.

Class Hierarchy

DBXCommon.TDBXPropertyNamesEx

Pascal

```
TDBXPropertyNamesEx = class;
```

C++

```
class TDBXPropertyNamesEx;
```

File

DBXCommon

Description

TDBXPropertyNamesEx contains common property names for both connections and drivers.

Note: Classes (see page 2685) ending in “Ex” are temporary classes that exist to avoid breaking interfaces. Their contents will be migrated to their base class in the next release.

This table contains property names.

Constant	Description
MetaDataPackageLoader (see page 10576)	Native MetaData loader class used to load a native driver dynamically from a package.

MetaDataAssemblyLoader (see page 10575)	Managed MetaData loader class used to load a managed driver dynamically from an assembly.
ProductVersion (see page 10576)	Can be specified as a driver property as an override of the TDBXConnectionEx.ProductVersion (see page 10576) property. This may be necessary for drivers that do not have the ability to report the product version. The ProductVersion (see page 10576) is a number in the format nn.nn.nnnn.
ProductName (see page 10576)	Provides the product name for the dbExpress metadata.

See Also

TDBXConnectionEx (see page 10417)

TDBXPropertyNames (see page 10566)

ProductVersion (see page 10421)

55.1.57.1 TDBXPropertyNamesEx Members

The following tables list the members exposed by TDBXPropertyNamesEx.

Public Constants

	Name	Description
	MetaDataAssemblyLoader (see page 10575)	This is MetaDataAssemblyLoader, a member of class TDBXPropertyNamesEx.
	MetaDataPackageLoader (see page 10576)	This is MetaDataPackageLoader, a member of class TDBXPropertyNamesEx.
	ProductName (see page 10576)	This is ProductName, a member of class TDBXPropertyNamesEx.
	ProductVersion (see page 10576)	This is ProductVersion, a member of class TDBXPropertyNamesEx.

55.1.57.2 TDBXPropertyNamesEx Constants

The constants of the TDBXPropertyNamesEx class are listed here.

Public Constants

	Name	Description
	MetaDataAssemblyLoader (see page 10575)	This is MetaDataAssemblyLoader, a member of class TDBXPropertyNamesEx.
	MetaDataPackageLoader (see page 10576)	This is MetaDataPackageLoader, a member of class TDBXPropertyNamesEx.
	ProductName (see page 10576)	This is ProductName, a member of class TDBXPropertyNamesEx.
	ProductVersion (see page 10576)	This is ProductVersion, a member of class TDBXPropertyNamesEx.

55.1.57.2.1 TDBXPropertyNamesEx.MetaDataAssemblyLoader Constant

Pascal

```
const MetaDataAssemblyLoader = 'MetaDataAssemblyLoader';
```

C++

```
MetaDataAssemblyLoader = 'MetaDataAssemblyLoader';
```

Description

This is MetaDataAssemblyLoader, a member of class TDBXPropertyNamesEx.

55.1.57.2.2 TDBXPropertyNamesEx.MetaDataPackageLoader Constant

Pascal

```
const MetaDataPackageLoader = 'MetaDataPackageLoader';
```

C++

```
MetaDataPackageLoader = 'MetaDataPackageLoader';
```

Description

This is MetaDataPackageLoader, a member of class TDBXPropertyNamesEx.

55.1.57.2.3 TDBXPropertyNamesEx.ProductName Constant

Pascal

```
const ProductName = 'ProductName';
```

C++

```
ProductName = 'ProductName';
```

Description

This is ProductName, a member of class TDBXPropertyNamesEx.

55.1.57.2.4 TDBXPropertyNamesEx.ProductVersion Constant

Pascal

```
const ProductVersion = 'ProductVersion';
```

C++

```
ProductVersion = 'ProductVersion';
```

Description

This is ProductVersion, a member of class TDBXPropertyNamesEx.

55.1.58 TDBXReader Class

TDBXReader provides a unidirectional reader for a collection of database rows

Class Hierarchy

Pascal

```
TDBXReader = class;
```

C++

```
class TDBXReader;
```

File

DBXCommon

Description

TDBXReader provides a forward only reader for a collection of database rows.

TDBXReader is returned by TDBXCommand.ExecuteQuery. Call TDBXReader.Next (see page 10582) to access the first and successive rows in the collection. Row values can be accessed using the Value (see page 10584) array property. Value (see page 10584) is overloaded so it can be indexed either by ordinal position or by column name.

Note: When an application is no longer needs a TDBXReader instance, it should call TDBXReader.Free. This ensures that all resources associated with the TDBXReader are released.

See Also

Connecting to a Database using the dbExpress Driver Framework

TDBXCommand (see page 10378)

Value (see page 10584)

ExecuteQuery (see page 10384)

Next (see page 10582)

55.1.58.1 TDBXReader Members

The following tables list the members exposed by TDBXReader.

Protected Methods

	Name	Description
	Create (see page 10578)	Creates an instance of TDBXReader (see page 10576)
A	DerivedClose (see page 10580)	This is DerivedClose, a member of class TDBXReader.
A	DerivedNext (see page 10580)	This is DerivedNext, a member of class TDBXReader.
V	GetByteReader (see page 10580)	This is GetByteReader, a member of class TDBXReader.
V	GetColumnCount (see page 10580)	Returns number of columns accessible from the Value (see page 10584) property.
V	GetValue (see page 10582)	This is GetValue, a member of class TDBXReader.
V	GetValueByName (see page 10582)	This is GetValueByName, a member of class TDBXReader.
V	GetValueType (see page 10582)	This is GetValueType, a member of class TDBXReader.
V	SetValues (see page 10583)	This is SetValues, a member of class TDBXReader.

Public Events

	Name	Description
R	OnErrorEvent (see page 10585)	Error handling event.

Public Methods

	Name	Description
V	Destroy (see page 10578)	Destroys an instance of TDBXReader (see page 10576).
V	GetObjectTypeName (see page 10581)	Object type name for ADT and Array Types (see page 23293).
V	GetOrdinal (see page 10581)	Returns ordinal position in Value (see page 10584) property for **Name**.
V	Next (see page 10582)	Navigate to first and successive rows.

Public Properties

	Name	Description
R	ByteReader (see page 10583)	Read values from a byte array.
R	Closed (see page 10583)	This is Closed, a member of class TDBXReader.
R	ColumnCount (see page 10584)	Number of columns that can be accessed from the Value (see page 10584) array.

R	Value (see page 10584)	Instance of TDBXValueat **Ordinal** position.
R	ValueType (see page 10584)	Instance of TDBXValueType (see page 10636) at **Ordinal** position.

Strict protected Fields

	Name	Description
	FDBXContext (see page 10579)	This is FDBXContext, a member of class TDBXReader.
	FDbxRow (see page 10579)	This is FDbxRow, a member of class TDBXReader.

Strict protected Methods

	Name	Description
	FailIfClosed (see page 10580)	This is FailIfClosed, a member of class TDBXReader.
	GetErrorEvent (see page 10581)	This is GetErrorEvent, a member of class TDBXReader.

55.1.58.2 TDBXReader.Create Constructor

Creates an instance of TDBXReader (see page 10576)

Pascal

```
constructor Create(DBXContext: TDBXContext; DbxRow: TDBXRow; ByteReader: TDBXByteReader);
```

C++

```
__fastcall TDBXReader(TDBXContext DBXContext, TDBXRow DbxRow, TDBXByteReader ByteReader);
```

Description

This constructor creates and initializes an instance of TDBXReader (see page 10576).

See Also

Destroy (see page 10578)

55.1.58.3 TDBXReader.Destroy Destructor

Destroys an instance of TDBXReader (see page 10576).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TDBXReader();
```

Description

This destructor destroys an instance of TDBXReader (see page 10576).

55.1.58.4 TDBXReader Fields

The fields of the TDBXReader class are listed here.

Strict protected Fields

	Name	Description
	FDBXContext (see page 10579)	This is FDBXContext, a member of class TDBXReader.
	FDbxRow (see page 10579)	This is FDbxRow, a member of class TDBXReader.

55.1.58.4.1 TDBXReader.FDBXContext Field

Pascal

```
FDBXContext: TDBXContext;
```

C++

```
TDBXContext FDBXContext;
```

Description

This is FDBXContext, a member of class TDBXReader.

55.1.58.4.2 TDBXReader.FDbxRow Field

Pascal

```
FDbxRow: TDBXRow;
```

C++

```
TDBXRow FDbxRow;
```

Description

This is FDbxRow, a member of class TDBXReader.

55.1.58.5 TDBXReader Methods

The methods of the TDBXReader class are listed here.

Protected Methods

	Name	Description
	DerivedClose (see page 10580)	This is DerivedClose, a member of class TDBXReader.
	DerivedNext (see page 10580)	This is DerivedNext, a member of class TDBXReader.
	GetByteReader (see page 10580)	This is GetByteReader, a member of class TDBXReader.
	GetColumnCount (see page 10580)	Returns number of columns accessible from the Value (see page 10584) property.
	GetValue (see page 10582)	This is GetValue, a member of class TDBXReader.
	GetValueByName (see page 10582)	This is GetValueByName, a member of class TDBXReader.
	GetValueType (see page 10582)	This is GetValueType, a member of class TDBXReader.
	SetValues (see page 10583)	This is SetValues, a member of class TDBXReader.

Public Methods

	Name	Description
	GetObjectTypeName (see page 10581)	Object type name for ADT and Array Types (see page 23293).
	GetOrdinal (see page 10581)	Returns ordinal position in Value (see page 10584) property for **Name**.
	Next (see page 10582)	Navigate to first and successive rows.

Strict protected Methods

	Name	Description
	FailIfClosed (see page 10580)	This is FailIfClosed, a member of class TDBXReader.
	GetErrorEvent (see page 10581)	This is GetErrorEvent, a member of class TDBXReader.

55.1.58.5.1 TDBXReader.DerivedClose Method

Pascal

```
procedure DerivedClose; virtual; abstract;
```

C++

```
virtual __fastcall DerivedClose() = 0;
```

Description

This is DerivedClose, a member of class TDBXReader.

55.1.58.5.2 TDBXReader.DerivedNext Method

Pascal

```
function DerivedNext: Boolean; virtual; abstract;
```

C++

```
virtual __fastcall Boolean DerivedNext() = 0;
```

Description

This is DerivedNext, a member of class TDBXReader.

55.1.58.5.3 TDBXReader.FailIfClosed Method

Pascal

```
procedure FailIfClosed;
```

C++

```
__fastcall FailIfClosed();
```

Description

This is FailIfClosed, a member of class TDBXReader.

55.1.58.5.4 TDBXReader.GetByteReader Method

Pascal

```
function GetByteReader: TDBXByteReader; virtual;
```

C++

```
virtual __fastcall TDBXByteReader GetByteReader();
```

Description

This is GetByteReader, a member of class TDBXReader.

55.1.58.5.5 TDBXReader.GetColumnCount Method

Returns number of columns accessible from the Value (see page 10584) property.

Pascal

```
function GetColumnCount: TInt32; virtual;
```

C++

```
virtual __fastcall TInt32 GetColumnCount();
```

Description

This method returns the number of columns accessible from the Value (see page 10584) array property.

See Also

Connecting to a Database using the dbExpress Driver Framework

Value (see page 10584)

55.1.58.5.6 TDBXReader.GetErrorEvent Method

Pascal

```
function GetErrorEvent: TDBXErrorEvent;
```

C++

```
__fastcall TDBXErrorEvent GetErrorEvent();
```

Description

This is GetErrorEvent, a member of class TDBXReader.

55.1.58.5.7 TDBXReader.GetObjectTypeName Method

Object type name for ADT and Array Types (see page 23293).

Pascal

```
function GetObjectTypeName(Ordinal: TInt32): WideString; virtual;
```

C++

```
virtual __fastcall BSTR GetObjectTypeName(TInt32 Ordinal);
```

Description

GetObjectTypeName returns the object type name for ADT and Array Types (see page 23293). The Oracle driver supports these data types.

55.1.58.5.8 TDBXReader.GetOrdinal Method

Returns ordinal position in Value (see page 10584) property for **Name**.

Pascal

```
function GetOrdinal(const Name: WideString): TInt32; virtual; overload;
```

C++

```
virtual __fastcall TInt32 GetOrdinal(const BSTR Name);
```

Description

This method returns the ordinal position in the Value (see page 10584) array property of the column with the given **Name**.

See Also

Value (see page 10584)

55.1.58.5.9 TDBXReader.GetValue Method

Pascal

```
function GetValue(const Ordinal: TInt32): TDBXValue; virtual;
```

C++

```
virtual __fastcall TDBXValue GetValue(const TInt32 Ordinal);
```

Description

This is GetValue, a member of class TDBXReader.

55.1.58.5.10 TDBXReader.GetValueByName Method

Pascal

```
function GetValueByName(const Name: WideString): TDBXValue; virtual;
```

C++

```
virtual __fastcall TDBXValue GetValueByName(const BSTR Name);
```

Description

This is GetValueByName, a member of class TDBXReader.

55.1.58.5.11 TDBXReader.GetValueType Method

Pascal

```
function GetValueType(const Ordinal: TInt32): TDBXValueType; virtual;
```

C++

```
virtual __fastcall TDBXValueType GetValueType(const TInt32 Ordinal);
```

Description

This is GetValueType, a member of class TDBXReader.

55.1.58.5.12 TDBXReader.Next Method

Navigate to first and successive rows.

Pascal

```
function Next: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean Next();
```

Description

This method navigates to the first and successive rows of the database. It returns false when there are no more rows.

See Also

Connecting to a Database using the dbExpress Driver Framework

55.1.58.5.13 TDBXReader.SetValues Method

Pascal

```
procedure SetValues(Values: TDBXValueArray); virtual;
```

C++

```
virtual __fastcall SetValues(TDBXValueArray Values);
```

Description

This is SetValues, a member of class TDBXReader.

55.1.58.6 TDBXReader Properties

The properties of the TDBXReader class are listed here.

Public Properties

	Name	Description
R	ByteReader (see page 10583)	Read values from a byte array.
R	Closed (see page 10583)	This is Closed, a member of class TDBXReader.
R	ColumnCount (see page 10584)	Number of columns that can be accessed from the Value (see page 10584) array.
R	Value (see page 10584)	Instance of TDBXValueat **Ordinal** position.
R	ValueType (see page 10584)	Instance of TDBXValueType (see page 10636) at **Ordinal** position.

55.1.58.6.1 TDBXReader.ByteReader Property

Read values from a byte array.

Pascal

```
property ByteReader: TDBXByteReader;
```

C++

```
__property TDBXByteReader ByteReader;
```

Description

This property is used by TDataSet to read values from a byte array instead of distinct scalar values. It contains a TDBXByteReader (see page 10368) instance. This is a convenience property for TDataSet.

See Also

TDataSet (see page 6894)

TDBXByteReader (see page 10368)

55.1.58.6.2 TDBXReader.Closed Property

Pascal

```
property Closed: Boolean;
```

C++

```
__property Boolean Closed;
```

Description

This is Closed, a member of class TDBXReader.

55.1.58.6.3 TDBXReader.ColumnCount Property

Number of columns that can be accessed from the Value (see page 10584) array.

Pascal

```
property ColumnCount: TInt32;
```

C++

```
__property TInt32 ColumnCount;
```

Description

ColumnCount holds the number of columns that can be accessed from the Value (see page 10584) array property.

See Also

Value (see page 10584)

55.1.58.6.4 TDBXReader.Value Property

Instance of TDBXValueat **Ordinal** position.

Pascal

```
property Value [const Name: WideString]: TDBXValue;
```

C++

```
__property TDBXValue Value[BSTR const Name];
```

Description

This property holds an instance of TDBXValue (see page 10626) for the **Ordinal** position in the current row.

See Also

TDBXValue (see page 10626)

55.1.58.6.5 TDBXReader.ValueType Property

Instance of TDBXValueType (see page 10636) at **Ordinal** position.

Pascal

```
property ValueType [const Ordinal: TInt32]: TDBXValueType;
```

C++

```
__property TDBXValueType ValueType[TInt32 const Ordinal];
```

Description

This property contains an instance of TDBXValueType (see page 10636) for the **Ordinal** position in the current row.

See Also

TDBXValueType (see page 10636)

55.1.58.7 TDBXReader Events

The events of the TDBXReader class are listed here.

Public Events

	Name	Description
	OnErrorEvent (see page 10585)	Error handling event.

55.1.58.7.1 TDBXReader.OnErrorEvent Event

Error handling event.

Pascal

```
property OnErrorEvent: TDBXErrorEvent;
```

C++

```
__property TDBXErrorEvent OnErrorEvent;
```

Description

This property contains a TDBXErrorEvent (see page 10671) error handling event for this TDBXReader (see page 10576).

See Also

TDBXError (see page 10486)

TDBXErrorCodes (see page 10489)

55.1.59 TDBXReaderByteReader Class

Implementation of TDBXByteReader (see page 10368).

Class Hierarchy

Pascal

```
TDBXReaderByteReader = class(TDBXByteReader);
```

C++

```
class TDBXReaderByteReader : public TDBXByteReader;
```

File

DBXCommon

Description

This class Is used by driver implementors who do not want to provide an optimized TDBXByteReader (see page 10368) implementation. It is an implementation of TDBXByteReader (see page 10368) on top of a TDBXReader (see page 10576) implementation.

See Also

TDBXByteReader (see page 10368)

TDBXReader (see page 10576)

55.1.59.1 TDBXReaderByteReader Members

The following tables list the members exposed by TDBXReaderByteReader.

Public Methods

	Name	Description
	Create (see page 10586)	Creates an instance of TDBXReaderByteReader (see page 10585)
	GetAnsiString (see page 10587)	This is GetAnsiString, a member of class TDBXReaderByteReader.
	GetBcd (see page 10587)	This is GetBcd, a member of class TDBXReaderByteReader.
	GetByteLength (see page 10587)	This is GetByteLength, a member of class TDBXReaderByteReader.
	GetBytes (see page 10587)	This is GetBytes, a member of class TDBXReaderByteReader.
	GetDate (see page 10588)	This is GetDate, a member of class TDBXReaderByteReader.
	GetDouble (see page 10588)	This is GetDouble, a member of class TDBXReaderByteReader.
	GetInt16 (see page 10588)	This is GetInt16, a member of class TDBXReaderByteReader.
	GetInt32 (see page 10588)	This is GetInt32, a member of class TDBXReaderByteReader.
	GetInt64 (see page 10589)	This is GetInt64, a member of class TDBXReaderByteReader.
	GetTime (see page 10589)	This is GetTime, a member of class TDBXReaderByteReader.
	GetTimeStamp (see page 10589)	This is GetTimeStamp, a member of class TDBXReaderByteReader.
	GetWideString (see page 10589)	This is GetWideString, a member of class TDBXReaderByteReader.

Strict protected Fields

	Name	Description
	FDBXContext (see page 10369)	This is FDBXContext, a member of class TDBXByteReader.

55.1.59.2 TDBXReaderByteReader.Create Constructor

Creates an instance of TDBXReaderByteReader (see page 10585)

Pascal

```
constructor Create(DBXContext: TDBXContext; DbxReader: TDBXReader);
```

C++

```
__fastcall TDBXReaderByteReader(TDBXContext DBXContext, TDBXReader DbxReader);
```

Description

This constructor creates and initializes an instance of TDBXReaderByteReader (see page 10585).

55.1.59.3 TDBXReaderByteReader Methods

The methods of the TDBXReaderByteReader class are listed here.

Public Methods

	Name	Description
	GetAnsiString (see page 10587)	This is GetAnsiString, a member of class TDBXReaderByteReader.
	GetBcd (see page 10587)	This is GetBcd, a member of class TDBXReaderByteReader.
	GetByteLength (see page 10587)	This is GetByteLength, a member of class TDBXReaderByteReader.
	GetBytes (see page 10587)	This is GetBytes, a member of class TDBXReaderByteReader.
	GetDate (see page 10588)	This is GetDate, a member of class TDBXReaderByteReader.
	GetDouble (see page 10588)	This is GetDouble, a member of class TDBXReaderByteReader.
	GetInt16 (see page 10588)	This is GetInt16, a member of class TDBXReaderByteReader.
	GetInt32 (see page 10588)	This is GetInt32, a member of class TDBXReaderByteReader.

	GetInt64 (see page 10589)	This is GetInt64, a member of class TDBXReaderByteReader.
	GetTime (see page 10589)	This is GetTime, a member of class TDBXReaderByteReader.
	GetTimeStamp (see page 10589)	This is GetTimeStamp, a member of class TDBXReaderByteReader.
	GetWideString (see page 10589)	This is GetWideString, a member of class TDBXReaderByteReader.

55.1.59.3.1 TDBXReaderByteReader.GetAnsiString Method

Pascal

```
procedure GetAnsiString(Ordinal: TInt32; const Value: TBytes; Offset: TInt32; var IsNull:
LongBool); override;
```

C++

```
virtual __fastcall GetAnsiString(TInt32 Ordinal, const TBytes Value, TInt32 Offset, LongBool
IsNull);
```

Description

This is GetAnsiString, a member of class TDBXReaderByteReader.

55.1.59.3.2 TDBXReaderByteReader.GetBcd Method

Pascal

```
procedure GetBcd(Ordinal: TInt32; const Value: TBytes; Offset: TInt32; var IsNull: LongBool);
override;
```

C++

```
virtual __fastcall GetBcd(TInt32 Ordinal, const TBytes Value, TInt32 Offset, LongBool IsNull);
```

Description

This is GetBcd, a member of class TDBXReaderByteReader.

55.1.59.3.3 TDBXReaderByteReader.GetByteLength Method

Pascal

```
procedure GetByteLength(Ordinal: TInt32; var Length: Int64; var IsNull: LongBool); override;
```

C++

```
virtual __fastcall GetByteLength(TInt32 Ordinal, Int64 Length, LongBool IsNull);
```

Description

This is GetByteLength, a member of class TDBXReaderByteReader.

55.1.59.3.4 TDBXReaderByteReader.GetBytes Method

Pascal

```
function GetBytes(Ordinal: TInt32; Offset: Int64; const Value: TBytes; ValueOffset: Int64;
Length: Int64; var IsNull: LongBool): Int64; override;
```

C++

```
virtual __fastcall Int64 GetBytes(TInt32 Ordinal, Int64 Offset, const TBytes Value, Int64
ValueOffset, Int64 Length, LongBool IsNull);
```

Description

This is GetBytes, a member of class TDBXReaderByteReader.

55.1.59.3.5 TDBXReaderByteReader.GetDate Method

Pascal

```
procedure GetDate(Ordinal: TInt32; const Value: TBytes; Offset: TInt32; var IsNull: LongBool);
override;
```

C++

```
virtual __fastcall GetDate(TInt32 Ordinal, const TBytes Value, TInt32 Offset, LongBool IsNull);
```

Description

This is GetDate, a member of class TDBXReaderByteReader.

55.1.59.3.6 TDBXReaderByteReader.GetDouble Method

Pascal

```
procedure GetDouble(Ordinal: TInt32; const Value: TBytes; Offset: TInt32; var IsNull:
LongBool); override;
```

C++

```
virtual __fastcall GetDouble(TInt32 Ordinal, const TBytes Value, TInt32 Offset, LongBool
IsNull);
```

Description

This is GetDouble, a member of class TDBXReaderByteReader.

55.1.59.3.7 TDBXReaderByteReader.GetInt16 Method

Pascal

```
procedure GetInt16(Ordinal: TInt32; const Value: TBytes; Offset: TInt32; var IsNull:
LongBool); override;
```

C++

```
virtual __fastcall GetInt16(TInt32 Ordinal, const TBytes Value, TInt32 Offset, LongBool
IsNull);
```

Description

This is GetInt16, a member of class TDBXReaderByteReader.

55.1.59.3.8 TDBXReaderByteReader.GetInt32 Method

Pascal

```
procedure GetInt32(Ordinal: TInt32; const Value: TBytes; Offset: TInt32; var IsNull:
LongBool); override;
```

C++

```
virtual __fastcall GetInt32(TInt32 Ordinal, const TBytes Value, TInt32 Offset, LongBool
IsNull);
```

Description

This is GetInt32, a member of class TDBXReaderByteReader.

55.1.59.3.9 TDBXReaderByteReader.GetInt64 Method

Pascal

```
procedure GetInt64(Ordinal: TInt32; const Value: TBytes; Offset: TInt32; var IsNull:
LongBool); override;
```

C++

```
virtual __fastcall GetInt64(TInt32 Ordinal, const TBytes Value, TInt32 Offset, LongBool
IsNull);
```

Description

This is GetInt64, a member of class TDBXReaderByteReader.

55.1.59.3.10 TDBXReaderByteReader.GetTime Method

Pascal

```
procedure GetTime(Ordinal: TInt32; const Value: TBytes; Offset: TInt32; var IsNull: LongBool);
override;
```

C++

```
virtual __fastcall GetTime(TInt32 Ordinal, const TBytes Value, TInt32 Offset, LongBool IsNull);
```

Description

This is GetTime, a member of class TDBXReaderByteReader.

55.1.59.3.11 TDBXReaderByteReader.GetTimeStamp Method

Pascal

```
procedure GetTimeStamp(Ordinal: TInt32; const Value: TBytes; Offset: TInt32; var IsNull:
LongBool); override;
```

C++

```
virtual __fastcall GetTimeStamp(TInt32 Ordinal, const TBytes Value, TInt32 Offset, LongBool
IsNull);
```

Description

This is GetTimeStamp, a member of class TDBXReaderByteReader.

55.1.59.3.12 TDBXReaderByteReader.GetWideString Method

Pascal

```
procedure GetWideString(Ordinal: TInt32; const Value: TBytes; Offset: TInt32; var IsNull:
LongBool); override;
```

C++

```
virtual __fastcall GetWideString(TInt32 Ordinal, const TBytes Value, TInt32 Offset, LongBool
IsNull);
```

Description

This is GetWideString, a member of class TDBXReaderByteReader.

55.1.60 TDBXRow Class

Represents a row in a database.

Class Hierarchy

DBXCommon.TDBXRow

Pascal

```
TDBXRow = class;
```

C++

```
class TDBXRow;
```

File

DBXCommon

Description

This class represents a row in a database. It provides a set of methods for manipulating database record data. It is extended by driver implementations. It is not used directly by applications.

55.1.60.1 TDBXRow Members

The following tables list the members exposed by TDBXRow.

Protected Fields

	Name	Description
	FGeneration (see page 10592)	This is FGeneration, a member of class TDBXRow.

Protected Methods

	Name	Description
	Create (see page 10591)	Creates an instance of TDBXRow (see page 10590)
V	GetAnsiString (see page 10593)	This is GetAnsiString, a member of class TDBXRow.
V	GetBcd (see page 10593)	This is GetBcd, a member of class TDBXRow.
V	GetBoolean (see page 10593)	This is GetBoolean, a member of class TDBXRow.
V	GetByteLength (see page 10593)	This is GetByteLength, a member of class TDBXRow.
V	GetBytes (see page 10594)	This is GetBytes, a member of class TDBXRow.
V	GetDate (see page 10594)	This is GetDate, a member of class TDBXRow.
V	GetDouble (see page 10594)	This is GetDouble, a member of class TDBXRow.
V	GetInt16 (see page 10594)	This is GetInt16, a member of class TDBXRow.
V	GetInt32 (see page 10595)	This is GetInt32, a member of class TDBXRow.
V	GetInt64 (see page 10595)	This is GetInt64, a member of class TDBXRow.
V	GetObjectTypeName (see page 10595)	This is GetObjectTypeName, a member of class TDBXRow.
V	GetTime (see page 10595)	This is GetTime, a member of class TDBXRow.
V	GetTimeStamp (see page 10595)	This is GetTimeStamp, a member of class TDBXRow.
V	GetWideString (see page 10596)	This is GetWideString, a member of class TDBXRow.
V	SetBCD (see page 10596)	This is SetBCD, a member of class TDBXRow.
V	SetBoolean (see page 10596)	This is SetBoolean, a member of class TDBXRow.
V	SetDate (see page 10597)	This is SetDate, a member of class TDBXRow.
V	SetDouble (see page 10597)	This is SetDouble, a member of class TDBXRow.
V	SetDynamicBytes (see page 10597)	This is SetDynamicBytes, a member of class TDBXRow.

	SetInt16 (see page 10597)	This is SetInt16, a member of class TDBXRow.
	SetInt32 (see page 10597)	This is SetInt32, a member of class TDBXRow.
	SetInt64 (see page 10598)	This is SetInt64, a member of class TDBXRow.
	SetNull (see page 10598)	This is SetNull, a member of class TDBXRow.
	SetString (see page 10598)	This is SetString, a member of class TDBXRow.
	SetTime (see page 10598)	This is SetTime, a member of class TDBXRow.
	SetTimestamp (see page 10599)	This is SetTimestamp, a member of class TDBXRow.
	SetValueType (see page 10599)	This is SetValueType, a member of class TDBXRow.
	SetWideString (see page 10599)	This is SetWideString, a member of class TDBXRow.

Protected Properties

	Name	Description
	Generation (see page 10599)	This is Generation, a member of class TDBXRow.

Strict protected Fields

	Name	Description
	FDBXContext (see page 10591)	This is FDBXContext, a member of class TDBXRow.

Strict protected Methods

	Name	Description
	NotImplemented (see page 10596)	This is NotImplemented, a member of class TDBXRow.

55.1.60.2 TDBXRow.Create Constructor

Creates an instance of TDBXRow (see page 10590)

Pascal

```
constructor Create(DBXContext: TDBXContext);
```

C++

```
__fastcall TDBXRow(TDBXContext DBXContext);
```

Description

This constructor creates and initializes an instance of TDBXRow (see page 10590).

55.1.60.3 TDBXRow Fields

The fields of the TDBXRow class are listed here.

Protected Fields

	Name	Description
	FGeneration (see page 10592)	This is FGeneration, a member of class TDBXRow.

Strict protected Fields

	Name	Description
	FDBXContext (see page 10591)	This is FDBXContext, a member of class TDBXRow.

55.1.60.3.1 TDBXRow.FDBXContext Field

Pascal

```
FDBXContext: TDBXContext;
```

C++

```
TDBXContext FDBXContext;
```

Description

This is FDBXContext, a member of class TDBXRow.

55.1.60.3.2 TDBXRow.FGeneration Field

Pascal

```
FGeneration: TInt32;
```

C++

```
TInt32 FGeneration;
```

Description

This is FGeneration, a member of class TDBXRow.

55.1.60.4 TDBXRow Methods

The methods of the TDBXRow class are listed here.

Protected Methods

	Name	Description
	GetAnsiString (see page 10593)	This is GetAnsiString, a member of class TDBXRow.
	GetBcd (see page 10593)	This is GetBcd, a member of class TDBXRow.
	GetBoolean (see page 10593)	This is GetBoolean, a member of class TDBXRow.
	GetByteLength (see page 10593)	This is GetByteLength, a member of class TDBXRow.
	GetBytes (see page 10594)	This is GetBytes, a member of class TDBXRow.
	GetDate (see page 10594)	This is GetDate, a member of class TDBXRow.
	GetDouble (see page 10594)	This is GetDouble, a member of class TDBXRow.
	GetInt16 (see page 10594)	This is GetInt16, a member of class TDBXRow.
	GetInt32 (see page 10595)	This is GetInt32, a member of class TDBXRow.
	GetInt64 (see page 10595)	This is GetInt64, a member of class TDBXRow.
	GetObjectTypeName (see page 10595)	This is GetObjectTypeName, a member of class TDBXRow.
	GetTime (see page 10595)	This is GetTime, a member of class TDBXRow.
	GetTimeStamp (see page 10595)	This is GetTimeStamp, a member of class TDBXRow.
	GetWideString (see page 10596)	This is GetWideString, a member of class TDBXRow.
	SetBCD (see page 10596)	This is SetBCD, a member of class TDBXRow.
	SetBoolean (see page 10596)	This is SetBoolean, a member of class TDBXRow.
	SetDate (see page 10597)	This is SetDate, a member of class TDBXRow.
	SetDouble (see page 10597)	This is SetDouble, a member of class TDBXRow.
	SetDynamicBytes (see page 10597)	This is SetDynamicBytes, a member of class TDBXRow.
	SetInt16 (see page 10597)	This is SetInt16, a member of class TDBXRow.
	SetInt32 (see page 10597)	This is SetInt32, a member of class TDBXRow.
	SetInt64 (see page 10598)	This is SetInt64, a member of class TDBXRow.
	SetNull (see page 10598)	This is SetNull, a member of class TDBXRow.
	SetString (see page 10598)	This is SetString, a member of class TDBXRow.
	SetTime (see page 10598)	This is SetTime, a member of class TDBXRow.
	SetTimestamp (see page 10599)	This is SetTimestamp, a member of class TDBXRow.
	SetValueType (see page 10599)	This is SetValueType, a member of class TDBXRow.
	SetWideString (see page 10599)	This is SetWideString, a member of class TDBXRow.

Strict protected Methods

	Name	Description
	NotImplemented (see page 10596)	This is NotImplemented, a member of class TDBXRow.

55.1.60.4.1 TDBXRow.GetAnsiString Method

Pascal

```
procedure GetAnsiString(DbxValue: TDBXAnsiStringValue; var AnsiStringBuilder:
TDBXAnsiStringBuilder; var IsNull: LongBool); virtual;
```

C++

```
virtual __fastcall GetAnsiString(TDBXAnsiStringValue DbxValue, TDBXAnsiStringBuilder
AnsiStringBuilder, LongBool IsNull);
```

Description

This is GetAnsiString, a member of class TDBXRow.

55.1.60.4.2 TDBXRow.GetBcd Method

Pascal

```
procedure GetBcd(DbxValue: TDBXBcdValue; var Value: TBcd; var IsNull: LongBool); virtual;
```

C++

```
virtual __fastcall GetBcd(TDBXBcdValue DbxValue, TBcd Value, LongBool IsNull);
```

Description

This is GetBcd, a member of class TDBXRow.

55.1.60.4.3 TDBXRow.GetBoolean Method

Pascal

```
procedure GetBoolean(DbxValue: TDBXBooleanValue; var Value: LongBool; var IsNull: LongBool);
virtual;
```

C++

```
virtual __fastcall GetBoolean(TDBXBooleanValue DbxValue, LongBool Value, LongBool IsNull);
```

Description

This is GetBoolean, a member of class TDBXRow.

55.1.60.4.4 TDBXRow.GetByteLength Method

Pascal

```
procedure GetByteLength(DbxValue: TDBXByteArrayValue; var ByteLength: Int64; var IsNull:
LongBool); virtual;
```

C++

```
virtual __fastcall GetByteLength(TDBXByteArrayValue DbxValue, Int64 ByteLength, LongBool
IsNull);
```

Description

This is GetByteLength, a member of class TDBXRow.

55.1.60.4.5 TDBXRow.GetBytes Method

Pascal

```
procedure GetBytes(DbxValue: TDBXByteArrayValue; Offset: Int64; const Buffer: TBytes;
BufferOffset: Int64; Length: Int64; var ReturnLength: Int64; var IsNull: LongBool); virtual;
```

C++

```
virtual __fastcall GetBytes(TDBXByteArrayValue DbxValue, Int64 Offset, const TBytes Buffer,
Int64 BufferOffset, Int64 Length, Int64 ReturnLength, LongBool IsNull);
```

Description

This is GetBytes, a member of class TDBXRow.

55.1.60.4.6 TDBXRow.GetDate Method

Pascal

```
procedure GetDate(DbxValue: TDBXDateValue; var Value: TDBXDate; var IsNull: LongBool); virtual;
```

C++

```
virtual __fastcall GetDate(TDBXDateValue DbxValue, TDBXDate Value, LongBool IsNull);
```

Description

This is GetDate, a member of class TDBXRow.

55.1.60.4.7 TDBXRow.GetDouble Method

Pascal

```
procedure GetDouble(DbxValue: TDBXDoubleValue; var Value: Double; var IsNull: LongBool);
virtual;
```

C++

```
virtual __fastcall GetDouble(TDBXDoubleValue DbxValue, Double Value, LongBool IsNull);
```

Description

This is GetDouble, a member of class TDBXRow.

55.1.60.4.8 TDBXRow.GetInt16 Method

Pascal

```
procedure GetInt16(DbxValue: TDBXInt16Value; var Value: SmallInt; var IsNull: LongBool);
virtual;
```

C++

```
virtual __fastcall GetInt16(TDBXInt16Value DbxValue, SmallInt Value, LongBool IsNull);
```

Description

This is GetInt16, a member of class TDBXRow.

55.1.60.4.9 TDBXRow.GetInt32 Method

Pascal

```
procedure GetInt32(DbxValue: TDBXInt32Value; var Value: TInt32; var IsNull: LongBool); virtual;
```

C++

```
virtual __fastcall GetInt32(TDBXInt32Value DbxValue, TInt32 Value, LongBool IsNull);
```

Description

This is GetInt32, a member of class TDBXRow.

55.1.60.4.10 TDBXRow.GetInt64 Method

Pascal

```
procedure GetInt64(DbxValue: TDBXInt64Value; var Value: Int64; var IsNull: LongBool); virtual;
```

C++

```
virtual __fastcall GetInt64(TDBXInt64Value DbxValue, Int64 Value, LongBool IsNull);
```

Description

This is GetInt64, a member of class TDBXRow.

55.1.60.4.11 TDBXRow.GetObjectTypeName Method

Pascal

```
function GetObjectTypeName(Ordinal: TInt32): WideString; virtual;
```

C++

```
virtual __fastcall BSTR GetObjectTypeName(TInt32 Ordinal);
```

Description

This is GetObjectTypeName, a member of class TDBXRow.

55.1.60.4.12 TDBXRow.GetTime Method

Pascal

```
procedure GetTime(DbxValue: TDBXTimeValue; var Value: TDBXTime; var IsNull: LongBool); virtual;
```

C++

```
virtual __fastcall GetTime(TDBXTimeValue DbxValue, TDBXTime Value, LongBool IsNull);
```

Description

This is GetTime, a member of class TDBXRow.

55.1.60.4.13 TDBXRow.GetTimeStamp Method

Pascal

```
procedure GetTimeStamp(DbxValue: TDBXTimeStampValue; var Value: TSQLTimeStamp; var IsNull:
LongBool); virtual;
```

C++

```
virtual __fastcall GetTimeStamp(TDBXTimeStampValue DbxValue, TSQLTimeStamp Value, LongBool
IsNull);
```

Description

This is GetTimeStamp, a member of class TDBXRow.

55.1.60.4.14 TDBXRow.GetWideString Method

Pascal

```
procedure GetWideString(DbxValue: TDBXWideStringValue; var WideStringBuilder:
TDBXWideStringBuilder; var IsNull: LongBool); virtual;
```

C++

```
virtual __fastcall GetWideString(TDBXWideStringValue DbxValue, TDBXWideStringBuilder
WideStringBuilder, LongBool IsNull);
```

Description

This is GetWideString, a member of class TDBXRow.

55.1.60.4.15 TDBXRow.NotImplemented Method

Pascal

```
procedure NotImplemented;
```

C++

```
__fastcall NotImplemented();
```

Description

This is NotImplemented, a member of class TDBXRow.

55.1.60.4.16 TDBXRow.SetBCD Method

Pascal

```
procedure SetBCD(DbxValue: TDBXBcdValue; var Value: TBcd); virtual;
```

C++

```
virtual __fastcall SetBCD(TDBXBcdValue DbxValue, TBcd Value);
```

Description

This is SetBCD, a member of class TDBXRow.

55.1.60.4.17 TDBXRow.SetBoolean Method

Pascal

```
procedure SetBoolean(DbxValue: TDBXBooleanValue; Value: Boolean); virtual;
```

C++

```
virtual __fastcall SetBoolean(TDBXBooleanValue DbxValue, Boolean Value);
```

Description

This is SetBoolean, a member of class TDBXRow.

55.1.60.4.18 TDBXRow.SetDate Method

Pascal

```
procedure SetDate(DbxValue: TDBXDateValue; Value: TDBXDate); virtual;
```

C++

```
virtual __fastcall SetDate(TDBXDateValue DbxValue, TDBXDate Value);
```

Description

This is SetDate, a member of class TDBXRow.

55.1.60.4.19 TDBXRow.SetDouble Method

Pascal

```
procedure SetDouble(DbxValue: TDBXDoubleValue; Value: Double); virtual;
```

C++

```
virtual __fastcall SetDouble(TDBXDoubleValue DbxValue, Double Value);
```

Description

This is SetDouble, a member of class TDBXRow.

55.1.60.4.20 TDBXRow.SetDynamicBytes Method

Pascal

```
procedure SetDynamicBytes(DbxValue: TDBXValue; Offset: Int64; const Buffer: TBytes;
BufferOffset: Int64; Length: Int64); virtual;
```

C++

```
virtual __fastcall SetDynamicBytes(TDBXValue DbxValue, Int64 Offset, const TBytes Buffer,
Int64 BufferOffset, Int64 Length);
```

Description

This is SetDynamicBytes, a member of class TDBXRow.

55.1.60.4.21 TDBXRow.SetInt16 Method

Pascal

```
procedure SetInt16(DbxValue: TDBXInt16Value; Value: SmallInt); virtual;
```

C++

```
virtual __fastcall SetInt16(TDBXInt16Value DbxValue, SmallInt Value);
```

Description

This is SetInt16, a member of class TDBXRow.

55.1.60.4.22 TDBXRow.SetInt32 Method

Pascal

```
procedure SetInt32(DbxValue: TDBXInt32Value; Value: TInt32); virtual;
```

C++

```
virtual __fastcall SetInt32(TDBXInt32Value DbxValue, TInt32 Value);
```

Description

This is SetInt32, a member of class TDBXRow.

55.1.60.4.23 TDBXRow.SetInt64 Method

Pascal

```
procedure SetInt64(DbxValue: TDBXInt64Value; Value: Int64); virtual;
```

C++

```
virtual __fastcall SetInt64(TDBXInt64Value DbxValue, Int64 Value);
```

Description

This is SetInt64, a member of class TDBXRow.

55.1.60.4.24 TDBXRow.SetNull Method

Pascal

```
procedure SetNull(DbxValue: TDBXValue); virtual;
```

C++

```
virtual __fastcall SetNull(TDBXValue DbxValue);
```

Description

This is SetNull, a member of class TDBXRow.

55.1.60.4.25 TDBXRow.SetString Method

Pascal

```
procedure SetString(DbxValue: TDBXAnsiStringValue; const Value: String); virtual;
```

C++

```
virtual __fastcall SetString(TDBXAnsiStringValue DbxValue, const AnsiString Value);
```

Description

This is SetString, a member of class TDBXRow.

55.1.60.4.26 TDBXRow.SetTime Method

Pascal

```
procedure SetTime(DbxValue: TDBXTimeValue; Value: TDBXTime); virtual;
```

C++

```
virtual __fastcall SetTime(TDBXTimeValue DbxValue, TDBXTime Value);
```

Description

This is SetTime, a member of class TDBXRow.

55.1.60.4.27 TDBXRow.SetTimestamp Method

Pascal

```
procedure SetTimestamp(DbxValue: TDBXTimeStampValue; var Value: TSQLTimeStamp); virtual;
```

C++

```
virtual __fastcall SetTimestamp(TDBXTimeStampValue DbxValue, TSQLTimeStamp Value);
```

Description

This is SetTimestamp, a member of class TDBXRow.

55.1.60.4.28 TDBXRow.SetValueType Method

Pascal

```
procedure SetValueType(ValueType: TDBXValueType); virtual;
```

C++

```
virtual __fastcall SetValueType(TDBXValueType ValueType);
```

Description

This is SetValueType, a member of class TDBXRow.

55.1.60.4.29 TDBXRow.SetWideString Method

Pascal

```
procedure SetWideString(DbxValue: TDBXWideStringValue; const Value: WideString); virtual;
```

C++

```
virtual __fastcall SetWideString(TDBXWideStringValue DbxValue, const BSTR Value);
```

Description

This is SetWideString, a member of class TDBXRow.

55.1.60.5 TDBXRow Properties

The properties of the TDBXRow class are listed here.

Protected Properties

	Name	Description
	Generation (see page 10599)	This is Generation, a member of class TDBXRow.

55.1.60.5.1 TDBXRow.Generation Property

Pascal

```
property Generation: TInt32;
```

C++

```
__property TInt32 Generation;
```

Description

This is Generation, a member of class TDBXRow.

55.1.61 TDBXRowEx Class

Class Hierarchy

Pascal

```
TDBXRowEx = class(TDBXRow);
```

C++

```
class TDBXRowEx : public TDBXRow;
```

File

DBXCommon

Description

This is class DBXCommon.TDBXRowEx.

55.1.61.1 TDBXRowEx Members

The following tables list the members exposed by TDBXRowEx.

Protected Fields

	Name	Description
	FGeneration (see page 10592)	This is FGeneration, a member of class TDBXRow.

Protected Methods

	Name	Description
	Create (see page 10591)	Creates an instance of TDBXRow (see page 10590)
V	CreateCustomValue (see page 10601)	This is CreateCustomValue, a member of class TDBXRowEx.
V	GetAnsiString (see page 10593)	This is GetAnsiString, a member of class TDBXRow.
V	GetBcd (see page 10593)	This is GetBcd, a member of class TDBXRow.
V	GetBoolean (see page 10593)	This is GetBoolean, a member of class TDBXRow.
V	GetByteLength (see page 10593)	This is GetByteLength, a member of class TDBXRow.
V	GetBytes (see page 10594)	This is GetBytes, a member of class TDBXRow.
V	GetDate (see page 10594)	This is GetDate, a member of class TDBXRow.
V	GetDouble (see page 10594)	This is GetDouble, a member of class TDBXRow.
V	GetInt16 (see page 10594)	This is GetInt16, a member of class TDBXRow.
V	GetInt32 (see page 10595)	This is GetInt32, a member of class TDBXRow.
V	GetInt64 (see page 10595)	This is GetInt64, a member of class TDBXRow.
V	GetLength (see page 10602)	This is GetLength, a member of class TDBXRowEx.
V	GetObjectTypeName (see page 10595)	This is GetObjectTypeName, a member of class TDBXRow.
V	GetStream (see page 10602)	This is the overview for the GetStream method overload.
V	GetStreamBytes (see page 10603)	This is GetStreamBytes, a member of class TDBXRowEx.
V	GetStreamLength (see page 10603)	This is GetStreamLength, a member of class TDBXRowEx.
V	GetTime (see page 10595)	This is GetTime, a member of class TDBXRow.
V	GetTimeStamp (see page 10595)	This is GetTimeStamp, a member of class TDBXRow.

	GetWideChars (see page 10603)	This is GetWideChars, a member of class TDBXRowEx.
	GetWideString (see page 10596)	This is GetWideString, a member of class TDBXRow.
	SetBCD (see page 10596)	This is SetBCD, a member of class TDBXRow.
	SetBoolean (see page 10596)	This is SetBoolean, a member of class TDBXRow.
	SetDate (see page 10597)	This is SetDate, a member of class TDBXRow.
	SetDouble (see page 10597)	This is SetDouble, a member of class TDBXRow.
	SetDynamicBytes (see page 10597)	This is SetDynamicBytes, a member of class TDBXRow.
	SetInt16 (see page 10597)	This is SetInt16, a member of class TDBXRow.
	SetInt32 (see page 10597)	This is SetInt32, a member of class TDBXRow.
	SetInt64 (see page 10598)	This is SetInt64, a member of class TDBXRow.
	SetNull (see page 10598)	This is SetNull, a member of class TDBXRow.
	SetStream (see page 10603)	This is SetStream, a member of class TDBXRowEx.
	SetString (see page 10598)	This is SetString, a member of class TDBXRow.
	SetTime (see page 10598)	This is SetTime, a member of class TDBXRow.
	SetTimestamp (see page 10599)	This is SetTimestamp, a member of class TDBXRow.
	SetValueType (see page 10599)	This is SetValueType, a member of class TDBXRow.
	SetWideChars (see page 10604)	This is SetWideChars, a member of class TDBXRowEx.
	SetWideString (see page 10599)	This is SetWideString, a member of class TDBXRow.
	UseExtendedTypes (see page 10604)	This is UseExtendedTypes, a member of class TDBXRowEx.

Protected Properties

	Name	Description
	Generation (see page 10599)	This is Generation, a member of class TDBXRow.

Strict protected Fields

	Name	Description
	FDBXContext (see page 10591)	This is FDBXContext, a member of class TDBXRow.

Strict protected Methods

	Name	Description
	NotImplemented (see page 10596)	This is NotImplemented, a member of class TDBXRow.

55.1.61.2 TDBXRowEx Methods

The methods of the TDBXRowEx class are listed here.

Protected Methods

	Name	Description
	CreateCustomValue (see page 10601)	This is CreateCustomValue, a member of class TDBXRowEx.
	GetLength (see page 10602)	This is GetLength, a member of class TDBXRowEx.
	GetStream (see page 10602)	This is the overview for the GetStream method overload.
	GetStreamBytes (see page 10603)	This is GetStreamBytes, a member of class TDBXRowEx.
	GetStreamLength (see page 10603)	This is GetStreamLength, a member of class TDBXRowEx.
	GetWideChars (see page 10603)	This is GetWideChars, a member of class TDBXRowEx.
	SetStream (see page 10603)	This is SetStream, a member of class TDBXRowEx.
	SetWideChars (see page 10604)	This is SetWideChars, a member of class TDBXRowEx.
	UseExtendedTypes (see page 10604)	This is UseExtendedTypes, a member of class TDBXRowEx.

55.1.61.2.1 TDBXRowEx.CreateCustomValue Method

Pascal

```
function CreateCustomValue(ValueType: TDBXValueType): TDBXValue; virtual;
```

C++

```
virtual __fastcall TDBXValue CreateCustomValue(TDBXValueType ValueType);
```

Description

This is CreateCustomValue, a member of class TDBXRowEx.

55.1.61.2.2 TDBXRowEx.GetLength Method

Pascal

```
procedure GetLength(DbxValue: TDBXValue; var ByteLength: Int64; var IsNull: LongBool); virtual;
```

C++

```
virtual __fastcall GetLength(TDBXValue DbxValue, Int64 ByteLength, LongBool IsNull);
```

Description

This is GetLength, a member of class TDBXRowEx.

55.1.61.2.3 GetStream Method

This is the overview for the GetStream method overload.

Overload List

	Name	Description
	TDBXRowEx.GetStream (TDBXStreamValue, TStream, LongBool) (see page 10602)	This is GetStream, a member of class TDBXRowEx.
	TDBXRowEx.GetStream (TDBXWideStringValue, TStream, LongBool) (see page 10602)	This is GetStream, a member of class TDBXRowEx.

55.1.61.2.3.1 TDBXRowEx.GetStream Method (TDBXStreamValue, TStream, LongBool)

Pascal

```
procedure GetStream(DbxValue: TDBXStreamValue; var Stream: TStream; var IsNull: LongBool);
virtual; overload;
```

C++

```
virtual __fastcall GetStream(TDBXStreamValue DbxValue, TStream Stream, LongBool IsNull);
```

Description

This is GetStream, a member of class TDBXRowEx.

55.1.61.2.3.2 TDBXRowEx.GetStream Method (TDBXWideStringValue, TStream, LongBool)

Pascal

```
procedure GetStream(DbxValue: TDBXWideStringValue; var Stream: TStream; var IsNull: LongBool);
virtual; overload;
```

C++

```
virtual __fastcall GetStream(TDBXWideStringValue DbxValue, TStream Stream, LongBool IsNull);
```

Description

This is GetStream, a member of class TDBXRowEx.

55.1.61.2.4 TDBXRowEx.GetStreamBytes Method

Pascal

```
procedure GetStreamBytes(DbxValue: TDBXStreamValue; const Buffer: TBytes; BufferOffset: Int64;
Length: Int64; ReturnLength: Int64; var IsNull: LongBool); virtual;
```

C++

```
virtual __fastcall GetStreamBytes(TDBXStreamValue DbxValue, const TBytes Buffer, Int64
BufferOffset, Int64 Length, Int64 ReturnLength, LongBool IsNull);
```

Description

This is GetStreamBytes, a member of class TDBXRowEx.

55.1.61.2.5 TDBXRowEx.GetStreamLength Method

Pascal

```
procedure GetStreamLength(DbxValue: TDBXStreamValue; StreamLength: Int64; var IsNull:
LongBool); virtual;
```

C++

```
virtual __fastcall GetStreamLength(TDBXStreamValue DbxValue, Int64 StreamLength, LongBool
IsNull);
```

Description

This is GetStreamLength, a member of class TDBXRowEx.

55.1.61.2.6 TDBXRowEx.GetWideChars Method

Pascal

```
procedure GetWideChars(DbxValue: TDBXWideStringValue; var WideChars: TDBXWideChars; var Count:
Integer; var IsNull: LongBool); virtual;
```

C++

```
virtual __fastcall GetWideChars(TDBXWideStringValue DbxValue, TDBXWideChars WideChars, int
Count, LongBool IsNull);
```

Description

This is GetWideChars, a member of class TDBXRowEx.

55.1.61.2.7 TDBXRowEx.SetStream Method

Pascal

```
procedure SetStream(DbxValue: TDBXStreamValue; StreamReader: TDBXStreamReader); virtual;
overload;
```

C++

```
virtual __fastcall SetStream(TDBXStreamValue DbxValue, TDBXStreamReader StreamReader);
```

Description

This is SetStream, a member of class TDBXRowEx.

55.1.61.2.8 TDBXRowEx.SetWideChars Method

Pascal

```
procedure SetWideChars(DbxValue: TDBXWideStringValue; const Value: WideString); virtual;
```

C++

```
virtual __fastcall SetWideChars(TDBXWideStringValue DbxValue, const BSTR Value);
```

Description

This is SetWideChars, a member of class TDBXRowEx.

55.1.61.2.9 TDBXRowEx.UseExtendedTypes Method

Pascal

```
function UseExtendedTypes: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean UseExtendedTypes();
```

Description

This is UseExtendedTypes, a member of class TDBXRowEx.

55.1.62 TDBXStateItem Class

Class Hierarchy

Pascal

```
TDBXStateItem = class;
```

C++

```
class TDBXStateItem;
```

File

DBXCommon

Description

This is class DBXCommon.TDBXStateItem.

55.1.62.1 TDBXStateItem Members

The following tables list the members exposed by TDBXStateItem.

Public Methods

	Name	Description
	Close (see page 10605)	This is Close, a member of class TDBXStateItem.

55.1.62.2 TDBXStateItem Methods

The methods of the TDBXStateItem class are listed here.

Public Methods

	Name	Description
	Close (see page 10605)	This is Close, a member of class TDBXStateItem.

55.1.62.2.1 TDBXStateItem.Close Method

Pascal

```
procedure Close; virtual; abstract;
```

C++

```
virtual __fastcall Close() = 0;
```

Description

This is Close, a member of class TDBXStateItem.

55.1.63 TDBXStateItemList Class

Class Hierarchy

DBXCommon.TDBXStateItemList

Pascal

```
TDBXStateItemList = class;
```

C++

```
class TDBXStateItemList;
```

File

DBXCommon

Description

This is class DBXCommon.TDBXStateItemList.

55.1.63.1 TDBXStateItemList Members

The following tables list the members exposed by TDBXStateItemList.

Public Methods

	Name	Description
	AddStateItem (see page 10606)	This is AddStateItem, a member of class TDBXStateItemList.
	Destroy (see page 10606)	This is Destroy, a member of class TDBXStateItemList.
	GetStateItem (see page 10606)	This is GetStateItem, a member of class TDBXStateItemList.
	RemoveAndFreeStateItem (see page 10606)	This is RemoveAndFreeStateItem, a member of class TDBXStateItemList.

55.1.63.2 TDBXStateItemList.Destroy Destructor

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TDBXStateItemList();
```

Description

This is Destroy, a member of class TDBXStateItemList.

55.1.63.3 TDBXStateItemList Methods

The methods of the TDBXStateItemList class are listed here.

Public Methods

	Name	Description
	AddStateItem (see page 10606)	This is AddStateItem, a member of class TDBXStateItemList.
	GetStateItem (see page 10606)	This is GetStateItem, a member of class TDBXStateItemList.
	RemoveAndFreeStateItem (see page 10606)	This is RemoveAndFreeStateItem, a member of class TDBXStateItemList.

55.1.63.3.1 TDBXStateItemList.AddStateItem Method

Pascal

```
procedure AddStateItem(Name: WideString; Item: TDBXStateItem);
```

C++

```
__fastcall AddStateItem(BSTR Name, TDBXStateItem Item);
```

Description

This is AddStateItem, a member of class TDBXStateItemList.

55.1.63.3.2 TDBXStateItemList.GetStateItem Method

Pascal

```
function GetStateItem(Name: WideString): TDBXStateItem;
```

C++

```
__fastcall TDBXStateItem GetStateItem(BSTR Name);
```

Description

This is GetStateItem, a member of class TDBXStateItemList.

55.1.63.3.3 TDBXStateItemList.RemoveAndFreeStateItem Method

Pascal

```
procedure RemoveAndFreeStateItem(Name: WideString);
```

C++

```
__fastcall RemoveAndFreeStateItem(BSTR Name);
```

Description

This is RemoveAndFreeStateItem, a member of class TDBXStateItemList.

55.1.64 TDBXStreamReader Class

Used internally by driver implementations and TDBXStreamValue (see page 10608).

Class Hierarchy

DBXCommon.TDBXStreamReader

Pascal

```
TDBXStreamReader = class;
```

C++

```
class TDBXStreamReader;
```

File

DBXCommon

Description

TDBXStreamReader is used internally by driver implementations and TDBXStreamValue (see page 10608).

See Also

TDBXStreamValue (see page 10608)

55.1.64.1 TDBXStreamReader Members

The following tables list the members exposed by TDBXStreamReader.

Public Methods

	Name	Description
	Eos (see page 10608)	This is Eos, a member of class TDBXStreamReader.
	Read (see page 10608)	This is Read, a member of class TDBXStreamReader.
	Size (see page 10608)	This is Size, a member of class TDBXStreamReader.

55.1.64.2 TDBXStreamReader Methods

The methods of the TDBXStreamReader class are listed here.

Public Methods

	Name	Description
	Eos (see page 10608)	This is Eos, a member of class TDBXStreamReader.
	Read (see page 10608)	This is Read, a member of class TDBXStreamReader.
	Size (see page 10608)	This is Size, a member of class TDBXStreamReader.

55.1.64.2.1 TDBXStreamReader.Eos Method

Pascal

```
function Eos: Boolean; virtual; abstract;
```

C++

```
virtual __fastcall Boolean Eos() = 0;
```

Description

This is Eos, a member of class TDBXStreamReader.

55.1.64.2.2 TDBXStreamReader.Read Method

Pascal

```
function Read(const Buffer: TBytes; Offset: Integer; Size: Integer): Integer; virtual;
abstract;
```

C++

```
virtual __fastcall int Read(const TBytes Buffer, int Offset, int Size) = 0;
```

Description

This is Read, a member of class TDBXStreamReader.

55.1.64.2.3 TDBXStreamReader.Size Method

Pascal

```
function Size: Int64; virtual; abstract;
```

C++

```
virtual __fastcall Int64 Size() = 0;
```

Description

This is Size, a member of class TDBXStreamReader.

55.1.65 TDBXStreamValue Class

Implementation of TDBXWritableValue (see page 10661) for TDBXDataTypes.ByteArrayType values.

Class Hierarchy

Pascal

```
TDBXStreamValue = class(TDBXByteArrayValue);
```

C++

```
class TDBXStreamValue : public TDBXByteArrayValue;
```

File

DBXCommon

Description

TDBXStreamValue implements TDBXWritableValue (see page 10661) for TDBXDataTypes.ByteArrayType values.

See Also

TDBXByteStreamReader (see page 10374)

TDBXDataTypes (see page 10447)

TDBXStreamReader (see page 10607)

TDBXWritableValue (see page 10661)

55.1.65.1 TDBXStreamValue Members

The following tables list the members exposed by TDBXStreamValue.

Protected Methods

	Name	Description
	GetDbxContext (see page 10630)	Get context information for a connection associated with value.
V	SetPendingValue (see page 10666)	This is SetPendingValue, a member of class TDBXWritableValue.

Protected Properties

	Name	Description
R	DbxContext (see page 10633)	Context information for a connection associated with value.

Public Methods

	Name	Description
	Create (see page 10610)	Creates an instance of TDBXStreamValue (see page 10608)
	CreateValue (see page 10628)	Creates values for both the TDBXReader (see page 10576) and TDBXParameterList (see page 10553) classes.
V	Destroy (see page 10610)	Destroy a TDBXByteArrayValue instance
V	GetAnsiString (see page 10629)	Gets the string value for ANSI strings.
V	GetBcd (see page 10629)	Gets the BCD value for binary-compressed decimal data types.
V	GetBoolean (see page 10629)	Gets the boolean value for boolean data types.
V	GetBytes (see page 10366)	Gets the byte array value for byte array and blob types.
V	GetBytes (see page 10629)	Gets the byte array value for byte array and blob types.
V	GetDate (see page 10630)	Gets the date value for date data types.
V	GetDouble (see page 10630)	Gets the double floating point value for double data types.
V	GetInt16 (see page 10631)	Gets the smallInt value for 16-byte integer data types.
V	GetInt32 (see page 10631)	Gets the 32-byte integer value for 32-byte integer data types.
V	GetInt64 (see page 10631)	Gets the 64-byte integer value for 64-byte integer data types.
V	GetStream (see page 10611)	This is GetStream, a member of class TDBXStreamValue.
V	GetTime (see page 10631)	Gets the time value for time data types.
V	GetTimeStamp (see page 10632)	Gets the timestamp value for timestamp data types.
V	GetValueSize (see page 10611)	Gets the size in bytes for values.
V	GetWideString (see page 10632)	Gets the wide string value for wide string data types.
V	IsNull (see page 10367)	Returns true if the value is **null**.
A	IsNull (see page 10632)	Returns true if the value is **null**.
V	SetAnsiString (see page 10663)	Sets the string value for ANSI strings.
V	SetBcd (see page 10664)	Sets the BCD value for binary-compressed decimal data types.
V	SetBoolean (see page 10664)	Sets the boolean value for boolean data types..
V	SetDate (see page 10664)	Sets the date value for date data types..
V	SetDouble (see page 10664)	Sets the double floating point value for double data types.
V	SetDynamicBytes (see page 10611)	Sets the dynamic array value for byte array and blob types.

	SetInt16 (see page 10665)	Sets the the smallInt value for 16-byte integer data types.
	SetInt32 (see page 10665)	Sets the 32-byte integer value for 32-byte integer data types.
	SetInt64 (see page 10665)	Sets the 64-byte integer value for 64-byte integer data types.
	SetNull (see page 10666)	Sets a writable value of any type to null.
	SetStaticBytes (see page 10367)	Sets the open array value for byte array and blob types
	SetStaticBytes (see page 10666)	Sets the open array value for byte array and blob types
	SetStream (see page 10611)	This is SetStream, a member of class TDBXStreamValue.
	SetTime (see page 10666)	Sets the time value for time data types.
	SetTimeStamp (see page 10667)	Sets the timestamp value for timestamp data types.
	SetWideString (see page 10667)	Sets the wide string value for wide string data types.
	UpdateType (see page 10612)	This is UpdateType, a member of class TDBXStreamValue.

Public Properties

	Name	Description
	ValueType (see page 10633)	Gets the value type for this value.

55.1.65.2 TDBXStreamValue.Create Constructor

Creates an instance of TDBXStreamValue (see page 10608)

Pascal

```
constructor Create(ValueType: TDBXValueType);
```

C++

```
__fastcall TDBXStreamValue(TDBXValueType ValueType);
```

Description

This constructor creates and initializes an instance of TDBXStreamValue (see page 10608).

See Also

Destroy (see page 10610)

55.1.65.3 TDBXStreamValue.Destroy Destructor

Destroy a TDBXByteArrayValue instance

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TDBXStreamValue();
```

Description

This method destroys a TDBXByteArrayValue instance.

55.1.65.4 TDBXStreamValue Methods

The methods of the TDBXStreamValue class are listed here.

Public Methods

	Name	Description
	GetStream (see page 10611)	This is GetStream, a member of class TDBXStreamValue.
	GetValueSize (see page 10611)	Gets the size in bytes for values.
	SetDynamicBytes (see page 10611)	Sets the dynamic array value for byte array and blob types.
	SetStream (see page 10611)	This is SetStream, a member of class TDBXStreamValue.
	UpdateType (see page 10612)	This is UpdateType, a member of class TDBXStreamValue.

55.1.65.4.1 TDBXStreamValue.GetStream Method

Pascal

```
function GetStream: TStream; virtual;
```

C++

```
virtual __fastcall TStream GetStream();
```

Description

This is GetStream, a member of class TDBXStreamValue.

55.1.65.4.2 TDBXStreamValue.GetValueSize Method

Gets the size in bytes for values.

Pascal

```
function GetValueSize: Int64; override;
```

C++

```
virtual __fastcall Int64 GetValueSize();
```

Description

Gets the size in bytes for a TDBXValue. For string data types the number of characters is returned. Throws a TDBXError exception if IsNull is true.

55.1.65.4.3 TDBXStreamValue.SetDynamicBytes Method

Sets the dynamic array value for byte array and blob types.

Pascal

```
procedure SetDynamicBytes(Offset: Int64; const Buffer: TBytes; BufferOffset: Int64; Count:
Int64); override;
```

C++

```
virtual __fastcall SetDynamicBytes(Int64 Offset, const TBytes Buffer, Int64 BufferOffset,
Int64 Count);
```

Description

Sets the dynamic array value for TDBXValue instances with a data type of BytesType and .BlobType.

55.1.65.4.4 TDBXStreamValue.SetStream Method

Pascal

```
procedure SetStream(const Stream: TStream); virtual;
```

C++

```
virtual __fastcall SetStream(const TStream Stream);
```

Description

This is SetStream, a member of class TDBXStreamValue.

55.1.65.4.5 TDBXStreamValue.UpdateType Method

Pascal

```
procedure UpdateType; override;
```

C++

```
virtual __fastcall UpdateType();
```

Description

This is UpdateType, a member of class TDBXStreamValue.

55.1.66 TDBXTimeStampValue Class

Implementation of writable timestamp values.

Class Hierarchy

Pascal

```
TDBXTimeStampValue = class(TDBXWritableValue);
```

C++

```
class TDBXTimeStampValue : public TDBXWritableValue;
```

File

DBXCommon

Description

Implementation of TDBXWritableValue (see page 10661) for TDBXDataTypes.TimeStampType values.

55.1.66.1 TDBXTimeStampValue Members

The following tables list the members exposed by TDBXTimeStampValue.

Protected Methods

	Name	Description
	Create (see page 10627)	Enter a short sentence, starting with a verb, that states the basic purpose of the property.
	Create (see page 10662)	Creates an instance of TDBXWritableValue (see page 10661)
	GetDbxContext (see page 10630)	Get context information for a connection associated with value.
V	SetPendingValue (see page 10666)	This is SetPendingValue, a member of class TDBXWritableValue.

Protected Properties

	Name	Description
R	DbxContext (see page 10633)	Context information for a connection associated with value.

Public Methods

	Name	Description
	CreateValue (see page 10628)	Creates values for both the TDBXReader (see page 10576) and TDBXParameterList (see page 10553) classes.
V	Destroy (see page 10627)	Enter a short sentence, starting with a verb, that states the basic purpose of the property.
V	Destroy (see page 10663)	Destroys a TDBXWritableValue (see page 10661) instance.
V	GetAnsiString (see page 10629)	Gets the string value for ANSI strings.
V	GetBcd (see page 10629)	Gets the BCD value for binary-compressed decimal data types.
V	GetBoolean (see page 10629)	Gets the boolean value for boolean data types.
V	GetBytes (see page 10629)	Gets the byte array value for byte array and blob types.
V	GetDate (see page 10630)	Gets the date value for date data types.
V	GetDouble (see page 10630)	Gets the double floating point value for double data types.
V	GetInt16 (see page 10631)	Gets the smallInt value for 16-byte integer data types.
V	GetInt32 (see page 10631)	Gets the 32-byte integer value for 32-byte integer data types.
V	GetInt64 (see page 10631)	Gets the 64-byte integer value for 64-byte integer data types.
V	GetTime (see page 10631)	Gets the time value for time data types.
V	GetTimeStamp (see page 10614)	Gets the timestamp value for timestamp data types.
V	GetValueSize (see page 10632)	Gets the size in bytes for values.
V	GetWideString (see page 10632)	Gets the wide string value for wide string data types.
V	IsNull (see page 10614)	Returns true if the value is **null**.
V	SetAnsiString (see page 10663)	Sets the string value for ANSI strings.
V	SetBcd (see page 10664)	Sets the BCD value for binary-compressed decimal data types.
V	SetBoolean (see page 10664)	Sets the boolean value for boolean data types..
V	SetDate (see page 10664)	Sets the date value for date data types..
V	SetDouble (see page 10664)	Sets the double floating point value for double data types.
V	SetDynamicBytes (see page 10665)	Sets the dynamic array value for byte array and blob types.
V	SetInt16 (see page 10665)	Sets the the smallInt value for 16-byte integer data types.
V	SetInt32 (see page 10665)	Sets the 32-byte integer value for 32-byte integer data types.
V	SetInt64 (see page 10665)	Sets the 64-byte integer value for 64-byte integer data types.
V	SetNull (see page 10666)	Sets a writable value of any type to null.
V	SetStaticBytes (see page 10666)	Sets the open array value for byte array and blob types
V	SetTime (see page 10666)	Sets the time value for time data types.
V	SetTimeStamp (see page 10614)	Sets the timestamp value for timestamp data types.
V	SetWideString (see page 10667)	Sets the wide string value for wide string data types.

Public Properties

	Name	Description
R	ValueType (see page 10633)	Gets the value type for this value.

55.1.66.2 TDBXTimeStampValue Methods

The methods of the TDBXTimeStampValue class are listed here.

Public Methods

	Name	Description
V	GetTimeStamp (see page 10614)	Gets the timestamp value for timestamp data types.
V	IsNull (see page 10614)	Returns true if the value is **null**.
V	SetTimeStamp (see page 10614)	Sets the timestamp value for timestamp data types.

55.1.66.2.1 TDBXTimeStampValue.GetTimeStamp Method

Gets the timestamp value for timestamp data types.

Pascal

```
function GetTimeStamp: TSQLTimeStamp; override;
```

C++

```
virtual __fastcall TSQLTimeStamp GetTimeStamp();
```

Description

Gets the timestamp value for TDBXValue (see page 10626) instances with a data types of TimeStampType. Throws a TDBXError (see page 10486) exception if IsNull (see page 10614) is true.

55.1.66.2.2 TDBXTimeStampValue.IsNull Method

Returns true if the value is **null**.

Pascal

```
function IsNull: Boolean; override;
```

C++

```
virtual __fastcall Boolean IsNull();
```

Description

Returns true if the value is **null**. This method should be called before calling any of the Get methods. If the value is null, the Get methods will throw TDBXError (see page 10486) exception if they are called.

55.1.66.2.3 TDBXTimeStampValue.SetTimeStamp Method

Sets the timestamp value for timestamp data types.

Pascal

```
procedure SetTimeStamp(const Value: TSQLTimeStamp); override;
```

C++

```
virtual __fastcall SetTimeStamp(const TSQLTimeStamp Value);
```

Description

Sets the timestamp value for TDBXValue (see page 10626) instances with a data types of TimeStampType.

55.1.67 TDBXTimeValue Class

Implementation of writable time values.

Class Hierarchy

Pascal

```
TDBXTimeValue = class(TDBXWritableValue);
```

C++

```
class TDBXTimeValue : public TDBXWritableValue;
```

File

DBXCommon

Description

Implementation of TDBXWritableValue (see page 10661) for TDBXDataTypes.TimeType values.

55.1.67.1 TDBXTimeValue Members

The following tables list the members exposed by TDBXTimeValue.

Protected Methods

	Name	Description
	Create (see page 10627)	Enter a short sentence, starting with a verb, that states the basic purpose of the property.
	Create (see page 10662)	Creates an instance of TDBXWritableValue (see page 10661)
	GetDbxContext (see page 10630)	Get context information for a connection associated with value.
V	SetPendingValue (see page 10666)	This is SetPendingValue, a member of class TDBXWritableValue.

Protected Properties

	Name	Description
R	DbxContext (see page 10633)	Context information for a connection associated with value.

Public Methods

	Name	Description
	CreateValue (see page 10628)	Creates values for both the TDBXReader (see page 10576) and TDBXParameterList (see page 10553) classes.
V	Destroy (see page 10627)	Enter a short sentence, starting with a verb, that states the basic purpose of the property.
V	Destroy (see page 10663)	Destroys a TDBXWritableValue (see page 10661) instance.
V	GetAnsiString (see page 10629)	Gets the string value for ANSI strings.
V	GetBcd (see page 10629)	Gets the BCD value for binary-compressed decimal data types.
V	GetBoolean (see page 10629)	Gets the boolean value for boolean data types.
V	GetBytes (see page 10629)	Gets the byte array value for byte array and blob types.
V	GetDate (see page 10630)	Gets the date value for date data types.
V	GetDouble (see page 10630)	Gets the double floating point value for double data types.
V	GetInt16 (see page 10631)	Gets the smallInt value for 16-byte integer data types.
V	GetInt32 (see page 10631)	Gets the 32-byte integer value for 32-byte integer data types.
V	GetInt64 (see page 10631)	Gets the 64-byte integer value for 64-byte integer data types.
V	GetTime (see page 10616)	Gets the time value for time data types.
V	GetTimeStamp (see page 10632)	Gets the timestamp value for timestamp data types.
V	GetValueSize (see page 10632)	Gets the size in bytes for values.
V	GetWideString (see page 10632)	Gets the wide string value for wide string data types.
V	IsNull (see page 10616)	Returns true if the value is **null**.
V	SetAnsiString (see page 10663)	Sets the string value for ANSI strings.
V	SetBcd (see page 10664)	Sets the BCD value for binary-compressed decimal data types.
V	SetBoolean (see page 10664)	Sets the boolean value for boolean data types..
V	SetDate (see page 10664)	Sets the date value for date data types..
V	SetDouble (see page 10664)	Sets the double floating point value for double data types.
V	SetDynamicBytes (see page 10665)	Sets the dynamic array value for byte array and blob types.
V	SetInt16 (see page 10665)	Sets the the smallInt value for 16-byte integer data types.

	SetInt32 (see page 10665)	Sets the 32-byte integer value for 32-byte integer data types.
	SetInt64 (see page 10665)	Sets the 64-byte integer value for 64-byte integer data types.
	SetNull (see page 10666)	Sets a writable value of any type to null.
	SetStaticBytes (see page 10666)	Sets the open array value for byte array and blob types
	SetTime (see page 10617)	Sets the time value for time data types.
	SetTimeStamp (see page 10667)	Sets the timestamp value for timestamp data types.
	SetWideString (see page 10667)	Sets the wide string value for wide string data types.

Public Properties

	Name	Description
	ValueType (see page 10633)	Gets the value type for this value.

55.1.67.2 TDBXTimeValue Methods

The methods of the TDBXTimeValue class are listed here.

Public Methods

	Name	Description
	GetTime (see page 10616)	Gets the time value for time data types.
	IsNull (see page 10616)	Returns true if the value is **null**.
	SetTime (see page 10617)	Sets the time value for time data types.

55.1.67.2.1 TDBXTimeValue.GetTime Method

Gets the time value for time data types.

Pascal

```
function GetTime: TDBXTime; override;
```

C++

```
virtual __fastcall TDBXTime GetTime();
```

Description

Gets the time value for TDBXValue (see page 10626) instances with a data type of TimeType. Throws a TDBXError (see page 10486) exception if IsNull (see page 10616) is true.

55.1.67.2.2 TDBXTimeValue.IsNull Method

Returns true if the value is **null**.

Pascal

```
function IsNull: Boolean; override;
```

C++

```
virtual __fastcall Boolean IsNull();
```

Description

Returns true if the value is **null**. This method should be called before calling any of the Get methods. If the value is null, the Get methods will throw TDBXError (see page 10486) exception if they are called.

55.1.67.2.3 TDBXTimeValue.SetTime Method

Sets the time value for time data types.

Pascal

```
procedure SetTime(Value: TDBXTime); override;
```

C++

```
virtual __fastcall SetTime(TDBXTime Value);
```

Description

Sets the time value for TDBXValue (see page 10626) instances with a data type of TimeType.

55.1.68 TDBXTraceFlags Class

Flags to indicate tracing type.

Class Hierarchy

DBXCommon.TDBXTraceFlags

Pascal

```
TDBXTraceFlags = class;
```

C++

```
class TDBXTraceFlags;
```

File

DBXCommon

Description

These flags indicate what items should be traced. Logically OR the flags together for all items that you want to trace.

This table lists the traceable items.

Constant	Description
None (see page 10621)	Trace nothing
Prepare (see page 10621)	Prepared query statements
Execute (see page 10620)	Executed query statements
Error (see page 10620)	Errors
Command (see page 10619)	Command (see page 10619) related operations
Connect (see page 10619)	Connect (see page 10619) and disconnect
Transact (see page 10621)	Transaction commit, rollback
Blob (see page 10619)	Blob (see page 10619) access
Misc (see page 10620)	Miscellaneous
Vendor (see page 10622)	Vendor (see page 10622) specific operations
Parameter (see page 10621)	TDBXParameter (see page 10545) access
Reader (see page 10621)	TDBXReader (see page 10576) operations

DriverLoad (see page 10619)	Driver (see page 10619) loading operations
MetaData (see page 10620)	Metadata access operations
Driver (see page 10619)	Driver (see page 10619) operations

See Also

TDBXParameter (see page 10545)

TDBXReader (see page 10576)

55.1.68.1 TDBXTraceFlags Members

The following tables list the members exposed by TDBXTraceFlags.

Public Constants

	Name	Description
	Blob (see page 10619)	This is Blob, a member of class TDBXTraceFlags.
	Command (see page 10619)	This is Command, a member of class TDBXTraceFlags.
	Connect (see page 10619)	This is Connect, a member of class TDBXTraceFlags.
	Driver (see page 10619)	This is Driver, a member of class TDBXTraceFlags.
	DriverLoad (see page 10619)	This is DriverLoad, a member of class TDBXTraceFlags.
	Error (see page 10620)	This is Error, a member of class TDBXTraceFlags.
	Execute (see page 10620)	This is Execute, a member of class TDBXTraceFlags.
	MetaData (see page 10620)	This is MetaData, a member of class TDBXTraceFlags.
	Misc (see page 10620)	This is Misc, a member of class TDBXTraceFlags.
	None (see page 10621)	This is None, a member of class TDBXTraceFlags.
	Parameter (see page 10621)	This is Parameter, a member of class TDBXTraceFlags.
	Prepare (see page 10621)	This is Prepare, a member of class TDBXTraceFlags.
	Reader (see page 10621)	This is Reader, a member of class TDBXTraceFlags.
	Transact (see page 10621)	This is Transact, a member of class TDBXTraceFlags.
	Vendor (see page 10622)	This is Vendor, a member of class TDBXTraceFlags.

55.1.68.2 TDBXTraceFlags Constants

The constants of the TDBXTraceFlags class are listed here.

Public Constants

	Name	Description
	Blob (see page 10619)	This is Blob, a member of class TDBXTraceFlags.
	Command (see page 10619)	This is Command, a member of class TDBXTraceFlags.
	Connect (see page 10619)	This is Connect, a member of class TDBXTraceFlags.
	Driver (see page 10619)	This is Driver, a member of class TDBXTraceFlags.
	DriverLoad (see page 10619)	This is DriverLoad, a member of class TDBXTraceFlags.
	Error (see page 10620)	This is Error, a member of class TDBXTraceFlags.
	Execute (see page 10620)	This is Execute, a member of class TDBXTraceFlags.
	MetaData (see page 10620)	This is MetaData, a member of class TDBXTraceFlags.
	Misc (see page 10620)	This is Misc, a member of class TDBXTraceFlags.
	None (see page 10621)	This is None, a member of class TDBXTraceFlags.
	Parameter (see page 10621)	This is Parameter, a member of class TDBXTraceFlags.
	Prepare (see page 10621)	This is Prepare, a member of class TDBXTraceFlags.
	Reader (see page 10621)	This is Reader, a member of class TDBXTraceFlags.

	Transact (see page 10621)	This is Transact, a member of class TDBXTraceFlags.
	Vendor (see page 10622)	This is Vendor, a member of class TDBXTraceFlags.

55.1.68.2.1 TDBXTraceFlags.Blob Constant

Pascal

```
const Blob = $0040;
```

C++

```
Blob = 0x0040;
```

Description

This is Blob, a member of class TDBXTraceFlags.

55.1.68.2.2 TDBXTraceFlags.Command Constant

Pascal

```
const Command = $0008;
```

C++

```
Command = 0x0008;
```

Description

This is Command, a member of class TDBXTraceFlags.

55.1.68.2.3 TDBXTraceFlags.Connect Constant

Pascal

```
const Connect = $0010;
```

C++

```
Connect = 0x0010;
```

Description

This is Connect, a member of class TDBXTraceFlags.

55.1.68.2.4 TDBXTraceFlags.Driver Constant

Pascal

```
const Driver = $2000;
```

C++

```
Driver = 0x2000;
```

Description

This is Driver, a member of class TDBXTraceFlags.

55.1.68.2.5 TDBXTraceFlags.DriverLoad Constant

Pascal

```
const DriverLoad = $0800;
```

C++

```
DriverLoad = 0x0800;
```

Description

This is DriverLoad, a member of class TDBXTraceFlags.

55.1.68.2.6 TDBXTraceFlags.Error Constant

Pascal

```
const Error = $0004;
```

C++

```
Error = 0x0004;
```

Description

This is Error, a member of class TDBXTraceFlags.

55.1.68.2.7 TDBXTraceFlags.Execute Constant

Pascal

```
const Execute = $0002;
```

C++

```
Execute = 0x0002;
```

Description

This is Execute, a member of class TDBXTraceFlags.

55.1.68.2.8 TDBXTraceFlags.MetaData Constant

Pascal

```
const MetaData = $1000;
```

C++

```
MetaData = 0x1000;
```

Description

This is MetaData, a member of class TDBXTraceFlags.

55.1.68.2.9 TDBXTraceFlags.Misc Constant

Pascal

```
const Misc = $0080;
```

C++

```
Misc = 0x0080;
```

Description

This is Misc, a member of class TDBXTraceFlags.

55.1.68.2.10 TDBXTraceFlags.None Constant

Pascal

```
const None = $0000;
```

C++

```
None = 0x0000;
```

Description

This is None, a member of class TDBXTraceFlags.

55.1.68.2.11 TDBXTraceFlags.Parameter Constant

Pascal

```
const Parameter = $0200;
```

C++

```
Parameter = 0x0200;
```

Description

This is Parameter, a member of class TDBXTraceFlags.

55.1.68.2.12 TDBXTraceFlags.Prepare Constant

Pascal

```
const Prepare = $0001;
```

C++

```
Prepare = 0x0001;
```

Description

This is Prepare, a member of class TDBXTraceFlags.

55.1.68.2.13 TDBXTraceFlags.Reader Constant

Pascal

```
const Reader = $0400;
```

C++

```
Reader = 0x0400;
```

Description

This is Reader, a member of class TDBXTraceFlags.

55.1.68.2.14 TDBXTraceFlags.Transact Constant

Pascal

```
const Transact = $0020;
```

C++

```
Transact = 0x0020;
```

Description

This is Transact, a member of class TDBXTraceFlags.

55.1.68.2.15 TDBXTraceFlags.Vendor Constant

Pascal

```
const Vendor = $0100;
```

C++

```
Vendor = 0x0100;
```

Description

This is Vendor, a member of class TDBXTraceFlags.

55.1.69 TDBXTraceInfo Record

Trace information for TDBXTraceEvent (see page 10672) handlers.

Pascal

```
TDBXTraceInfo = packed record
end;
```

C++

```
struct TDBXTraceInfo {
};
```

File

DBXCommon

Description

TDBXTraceInfo is passed in to TDBXTraceEvent (see page 10672) handlers.

Message (see page 10623) is trace information for a TDBXTraceEvent (see page 10672).

TraceFlag (see page 10623) is a set of TDBXTraceFlags (see page 10617) tracing categories for a TDBXTraceEvent (see page 10672).

See Also

TDBXTraceFlags (see page 10617)

TDBXTraceEvent (see page 10672)

55.1.69.1 TDBXTraceInfo Members

The following tables list the members exposed by TDBXTraceInfo.

Public Properties

	Name	Description
	Message (see page 10623)	This is Message, a member of class TDBXTraceInfo.
	TraceFlag (see page 10623)	This is TraceFlag, a member of class TDBXTraceInfo.

55.1.69.2 TDBXTraceInfo Properties

The properties of the TDBXTraceInfo class are listed here.

Public Properties

	Name	Description
	Message (see page 10623)	This is Message, a member of class TDBXTraceInfo.
	TraceFlag (see page 10623)	This is TraceFlag, a member of class TDBXTraceInfo.

55.1.69.2.1 TDBXTraceInfo.Message Property

Pascal

```
property Message: WideString;
```

C++

```
__property BSTR Message;
```

Description

This is Message, a member of class TDBXTraceInfo.

55.1.69.2.2 TDBXTraceInfo.TraceFlag Property

Pascal

```
property TraceFlag: TDBXTraceFlag;
```

C++

```
__property TDBXTraceFlag TraceFlag;
```

Description

This is TraceFlag, a member of class TDBXTraceInfo.

55.1.70 TDBXTransaction Class

Transaction management class.

Class Hierarchy

DBXCommon.TDBXTransaction

Pascal

```
TDBXTransaction = class;
```

C++

```
class TDBXTransaction;
```

File

DBXCommon

Description

A TDBXTransaction is created when you call BeginTransaction. CommitFreeAndNil, RollbackFreeAndNil, or

RollbackIncompleteFreeAndNil must be called to complete a transaction. The TDBXIsolation (see page 10671) transaction isolation level can be set when the transaction is begun. SupportsTransactions must be true for an application to be able to use transactions. Nested transactions can be used if SupportsNestedTransactionsis true.

55.1.70.1 TDBXTransaction Members

The following tables list the members exposed by TDBXTransaction.

Protected Methods

	Name	Description
	Create (see page 10624)	Creates an instance of TDBXTransaction (see page 10623)

Public Methods

	Name	Description
V	Destroy (see page 10624)	Destroy an instance of TDBXTransaction (see page 10623).

Public Properties

	Name	Description
R	Connection (see page 10625)	TDBXConnection (see page 10398) instance that created the TDBXTransaction (see page 10623).

Strict protected Fields

	Name	Description
	FIsolationLevel (see page 10625)	This is FIsolationLevel, a member of class TDBXTransaction.

55.1.70.2 TDBXTransaction.Create Constructor

Creates an instance of TDBXTransaction (see page 10623)

Pascal

```
constructor Create(Connection: TDBXConnection);
```

C++

```
__fastcall TDBXTransaction(TDBXConnection Connection);
```

Description

This constructor creates and initializes an instance of TDBXTransaction (see page 10623).

See Also

Destroy (see page 10624)

55.1.70.3 TDBXTransaction.Destroy Destructor

Destroy an instance of TDBXTransaction (see page 10623).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TDBXTransaction();
```

Description

Use Destroy to destroy an instance of TDBXTransaction (see page 10623).

55.1.70.4 TDBXTransaction Fields

The fields of the TDBXTransaction class are listed here.

Strict protected Fields

	Name	Description
	FIsolationLevel (see page 10625)	This is FIsolationLevel, a member of class TDBXTransaction.

55.1.70.4.1 TDBXTransaction.FIsolationLevel Field

Pascal

```
FIsolationLevel: TDBXIsolation;
```

C++

```
TDBXIsolation FIsolationLevel;
```

Description

This is FIsolationLevel, a member of class TDBXTransaction.

55.1.70.5 TDBXTransaction Properties

The properties of the TDBXTransaction class are listed here.

Public Properties

	Name	Description
R	Connection (see page 10625)	TDBXConnection (see page 10398) instance that created the TDBXTransaction (see page 10623).

55.1.70.5.1 TDBXTransaction.Connection Property

TDBXConnection (see page 10398) instance that created the TDBXTransaction (see page 10623).

Pascal

```
property Connection: TDBXConnection;
```

C++

```
__property TDBXConnection Connection;
```

Description

Connection contains the TDBXConnection (see page 10398) instance that created this TDBXTransaction (see page 10623) instance.

See Also

TDBXConnection (see page 10398)

55.1.71 TDBXValue Class

Gets and sets values for TDBXReader (see page 10576) and TDBXParameterList (see page 10553) classes.

Class Hierarchy

DBXCommon.TDBXValue

Pascal

```
TDBXValue = class;
```

C++

```
class TDBXValue;
```

File

DBXCommon

Description

TDBXValue provides value support for the classes TDBXReader (see page 10576) and TDBXParameterList (see page 10553). Gets and sets values for Value and Value properties.

55.1.71.1 TDBXValue Members

The following tables list the members exposed by TDBXValue.

Protected Methods

	Name	Description
	Create (see page 10627)	Enter a short sentence, starting with a verb, that states the basic purpose of the property.
	GetDbxContext (see page 10630)	Get context information for a connection associated with value.

Protected Properties

	Name	Description
R	DbxContext (see page 10633)	Context information for a connection associated with value.

Public Methods

	Name	Description
	CreateValue (see page 10628)	Creates values for both the TDBXReader (see page 10576) and TDBXParameterList (see page 10553) classes.
V	Destroy (see page 10627)	Enter a short sentence, starting with a verb, that states the basic purpose of the property.
V	GetAnsiString (see page 10629)	Gets the string value for ANSI strings.
V	GetBcd (see page 10629)	Gets the BCD value for binary-compressed decimal data types.
V	GetBoolean (see page 10629)	Gets the boolean value for boolean data types.
V	GetBytes (see page 10629)	Gets the byte array value for byte array and blob types.
V	GetDate (see page 10630)	Gets the date value for date data types.
V	GetDouble (see page 10630)	Gets the double floating point value for double data types.
V	GetInt16 (see page 10631)	Gets the smallInt value for 16-byte integer data types.
V	GetInt32 (see page 10631)	Gets the 32-byte integer value for 32-byte integer data types.
V	GetInt64 (see page 10631)	Gets the 64-byte integer value for 64-byte integer data types.
V	GetTime (see page 10631)	Gets the time value for time data types.
V	GetTimeStamp (see page 10632)	Gets the timestamp value for timestamp data types.

	GetValueSize (see page 10632)	Gets the size in bytes for values.
	GetWideString (see page 10632)	Gets the wide string value for wide string data types.
	IsNull (see page 10632)	Returns true if the value is **null**.

Public Properties

	Name	Description
	ValueType (see page 10633)	Gets the value type for this value.

55.1.71.2 TDBXValue.Create Constructor

Enter a short sentence, starting with a verb, that states the basic purpose of the property.

Pascal

```
constructor Create(ValueType: TDBXValueType);
```

C++

```
__fastcall TDBXValue(TDBXValueType ValueType);
```

Description

The long description elaborates on the short description, containing no more than a paragraph or two.

55.1.71.3 TDBXValue.Destroy Destructor

Enter a short sentence, starting with a verb, that states the basic purpose of the property.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TDBXValue();
```

Description

The long description elaborates on the short description, containing no more than a paragraph or two.

55.1.71.4 TDBXValue Methods

The methods of the TDBXValue class are listed here.

Protected Methods

	Name	Description
	GetDbxContext (see page 10630)	Get context information for a connection associated with value.

Public Methods

	Name	Description
	CreateValue (see page 10628)	Creates values for both the TDBXReader (see page 10576) and TDBXParameterList (see page 10553) classes.
	GetAnsiString (see page 10629)	Gets the string value for ANSI strings.
	GetBcd (see page 10629)	Gets the BCD value for binary-compressed decimal data types.
	GetBoolean (see page 10629)	Gets the boolean value for boolean data types.
	GetBytes (see page 10629)	Gets the byte array value for byte array and blob types.
	GetDate (see page 10630)	Gets the date value for date data types.
	GetDouble (see page 10630)	Gets the double floating point value for double data types.
	GetInt16 (see page 10631)	Gets the smallInt value for 16-byte integer data types.
	GetInt32 (see page 10631)	Gets the 32-byte integer value for 32-byte integer data types.
	GetInt64 (see page 10631)	Gets the 64-byte integer value for 64-byte integer data types.
	GetTime (see page 10631)	Gets the time value for time data types.
	GetTimeStamp (see page 10632)	Gets the timestamp value for timestamp data types.
	GetValueSize (see page 10632)	Gets the size in bytes for values.
	GetWideString (see page 10632)	Gets the wide string value for wide string data types.
	IsNull (see page 10632)	Returns true if the value is **null**.

55.1.71.4.1 TDBXValue.CreateValue Method

Creates values for both the TDBXReader (see page 10576) and TDBXParameterList (see page 10553) classes.

Pascal

```
class function CreateValue(DBXContext: TDBXContext; ValueType: TDBXValueType; DbxRow: TDBXRow;
ReadOnlyType: Boolean): TDBXValue;
```

C++

```
__fastcall TDBXValue CreateValue(TDBXContext DBXContext, TDBXValueType ValueType, TDBXRow
DbxRow, Boolean ReadOnlyType);
```

Description

Creates values for Value and Value properties.

55.1.71.4.2 TDBXValue.GetAnsiString Method

Gets the string value for ANSI strings.

Pascal

```
function GetAnsiString: String; virtual;
```

C++

```
virtual __fastcall AnsiString GetAnsiString();
```

Description

Gets the string value for TDBXValue (see page 10626) instances with a data type of AnsiStringType. Throws a TDBXError (see page 10486) exception if IsNull (see page 10632) is true.

55.1.71.4.3 TDBXValue.GetBcd Method

Gets the BCD value for binary-compressed decimal data types.

Pascal

```
function GetBcd: TBcd; virtual;
```

C++

```
virtual __fastcall TBcd GetBcd();
```

Description

Gets the TBcd value for TDBXValue (see page 10626) instances with a with a data type of BcdType. Throws a TDBXError (see page 10486) exception if IsNull (see page 10632) is true.

55.1.71.4.4 TDBXValue.GetBoolean Method

Gets the boolean value for boolean data types.

Pascal

```
function GetBoolean: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean GetBoolean();
```

Description

Gets the boolean value for TDBXValue (see page 10626) instances with a data types of BooleanType. Throws a TDBXError (see page 10486) exception if IsNull (see page 10632) is true.

55.1.71.4.5 TDBXValue.GetBytes Method

Gets the byte array value for byte array and blob types.

Pascal

```
function GetBytes(Offset: Int64; const Buffer: TBytes; BufferOffset: Int64; Length: Int64):
Int64; virtual; overload;
```

C++

```
virtual __fastcall Int64 GetBytes(Int64 Offset, const TBytes Buffer, Int64 BufferOffset, Int64
Length);
```

Description

Gets the byte array value for TDBXValue (see page 10626) instances with a data type of BytesType and .BlobType. Throws a TDBXError (see page 10486) exception if IsNull (see page 10632) is true.

55.1.71.4.6 TDBXValue.GetDate Method

Gets the date value for date data types.

Pascal

```
function GetDate: TDBXDate; virtual;
```

C++

```
virtual __fastcall TDBXDate GetDate();
```

Description

Gets the date value for TDBXValue (see page 10626) instances with a data type of DateType. Throws a TDBXError (see page 10486) exception if IsNull (see page 10632) is true.

55.1.71.4.7 TDBXValue.GetDbxContext Method

Get context information for a connection associated with value.

Pascal

```
function GetDbxContext: TDBXContext;
```

C++

```
__fastcall TDBXContext GetDbxContext();
```

Description

GetDbxContext gets the value of the DbxContext (see page 10633) property, which holds the TDBXContext (see page 10432) associated with the value. This is used by driver writers.

See Also

TDBXContext (see page 10432)

DbxContext (see page 10633)

55.1.71.4.8 TDBXValue.GetDouble Method

Gets the double floating point value for double data types.

Pascal

```
function GetDouble: Double; virtual;
```

C++

```
virtual __fastcall Double GetDouble();
```

Description

Gets the double floating point value for TDBXValue (see page 10626) instances with a data type of DoubleType. Throws a TDBXError (see page 10486) exception if IsNull (see page 10632) is true.

55.1.71.4.9 TDBXValue.GetInt16 Method

Gets the smallInt value for 16-byte integer data types.

Pascal

```
function GetInt16: SmallInt; virtual;
```

C++

```
virtual __fastcall SmallInt GetInt16();
```

Description

Gets the smallInt value for TDBXValue (see page 10626) instances with a data type of Int16Type. Throws a TDBXError (see page 10486) exception if IsNull (see page 10632) is true.

55.1.71.4.10 TDBXValue.GetInt32 Method

Gets the 32-byte integer value for 32-byte integer data types.

Pascal

```
function GetInt32: TInt32; virtual;
```

C++

```
virtual __fastcall TInt32 GetInt32();
```

Description

Gets the 32-byte integer value for TDBXValue (see page 10626) instances with a data type of Int32Type. Throws a TDBXError (see page 10486) exception if IsNull (see page 10632) is true.

55.1.71.4.11 TDBXValue.GetInt64 Method

Gets the 64-byte integer value for 64-byte integer data types.

Pascal

```
function GetInt64: Int64; virtual;
```

C++

```
virtual __fastcall Int64 GetInt64();
```

Description

Gets the 64-byte integer value for TDBXValue (see page 10626) instances with a data type of Int64Type. Throws a TDBXError (see page 10486) exception if IsNull (see page 10632) is true.

55.1.71.4.12 TDBXValue.GetTime Method

Gets the time value for time data types.

Pascal

```
function GetTime: TDBXTime; virtual;
```

C++

```
virtual __fastcall TDBXTime GetTime();
```

Description

Gets the time value for TDBXValue (see page 10626) instances with a data type of TimeType. Throws a TDBXError (see page 10486) exception if IsNull (see page 10632) is true.

55.1.71.4.13 TDBXValue.GetTimeStamp Method

Gets the timestamp value for timestamp data types.

Pascal

```
function GetTimeStamp: TSQLTimeStamp; virtual;
```

C++

```
virtual __fastcall TSQLTimeStamp GetTimeStamp();
```

Description

Gets the timestamp value for TDBXValue (see page 10626) instances with a data types of TimeStampType. Throws a TDBXError (see page 10486) exception if IsNull (see page 10632) is true.

55.1.71.4.14 TDBXValue.GetValueSize Method

Gets the size in bytes for values.

Pascal

```
function GetValueSize: Int64; virtual;
```

C++

```
virtual __fastcall Int64 GetValueSize();
```

Description

Gets the size in bytes for a TDBXValue (see page 10626). For string data types the number of characters is returned. Throws a TDBXError (see page 10486) exception if IsNull (see page 10632) is true.

55.1.71.4.15 TDBXValue.GetWideString Method

Gets the wide string value for wide string data types.

Pascal

```
function GetWideString: WideString; virtual;
```

C++

```
virtual __fastcall BSTR GetWideString();
```

Description

Gets the wide string value for TDBXValue (see page 10626) instances with a data type of WideString. Throws a TDBXError (see page 10486) exception if IsNull (see page 10632) is true.

55.1.71.4.16 TDBXValue.IsNull Method

Returns true if the value is **null**.

Pascal

```
function IsNull: Boolean; virtual; abstract;
```

C++

```
virtual __fastcall Boolean IsNull() = 0;
```

Description

Returns true if the value is **null**. This method should be called before calling any of the Get methods. If the value is null, the Get methods will throw TDBXError (see page 10486) exception if they are called.

55.1.71.5 TDBXValue Properties

The properties of the TDBXValue class are listed here.

Protected Properties

	Name	Description
R	DbxContext (see page 10633)	Context information for a connection associated with value.

Public Properties

	Name	Description
R	ValueType (see page 10633)	Gets the value type for this value.

55.1.71.5.1 TDBXValue.DbxContext Property

Context information for a connection associated with value.

Pascal

```
property DbxContext: TDBXContext;
```

C++

```
__property TDBXContext DbxContext;
```

Description

DbxContext holds the TDBXContext (see page 10432) associated with the value. This is used by driver writers.

See Also

TDBXContext (see page 10432)

GetDbxContext (see page 10630)

55.1.71.5.2 TDBXValue.ValueType Property

Gets the value type for this value.

Pascal

```
property ValueType: TDBXValueType;
```

C++

```
__property TDBXValueType ValueType;
```

Description

Gets the TDBXValueType (see page 10636) for this TDBXValue (see page 10626).

55.1.72 TDBXValueList Class

Manage a list of TDBXValueType (see page 10636) instances.

Class Hierarchy

DBXCommon.TDBXValueList

Pascal

```
TDBXValueList = class;
```

C++

```
class TDBXValueList;
```

File

DBXCommon

Description

This class is used internally by TDBXParameterList (see page 10553) to manage a list of TDBXValueType (see page 10636) instances.

See Also

TDBXParameterList (see page 10553)

TDBXValueType (see page 10636)

55.1.72.1 TDBXValueList Members

The following tables list the members exposed by TDBXValueList.

Public Methods

	Name	Description
	Destroy (see page 10634)	Destroys a TDBXValueList (see page 10634) instance.

Strict private Fields

	Name	Description
	FLastOrdinal (see page 10635)	This is FLastOrdinal, a member of class TDBXValueList.
	FValueTypeArray (see page 10635)	This is FValueTypeArray, a member of class TDBXValueList.

Strict private Methods

	Name	Description
	FindOrdinal (see page 10635)	This is FindOrdinal, a member of class TDBXValueList.

55.1.72.2 TDBXValueList.Destroy Destructor

Destroys a TDBXValueList (see page 10634) instance.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TDBXValueList();
```

Description

This destructor destroys an instance of TDBXValueList (see page 10634).

55.1.72.3 TDBXValueList Fields

The fields of the TDBXValueList class are listed here.

Strict private Fields

	Name	Description
	FLastOrdinal (see page 10635)	This is FLastOrdinal, a member of class TDBXValueList.
	FValueTypeArray (see page 10635)	This is FValueTypeArray, a member of class TDBXValueList.

55.1.72.3.1 TDBXValueList.FLastOrdinal Field

Pascal

```
FLastOrdinal: Integer;
```

C++

```
int FLastOrdinal;
```

Description

This is FLastOrdinal, a member of class TDBXValueList.

55.1.72.3.2 TDBXValueList.FValueTypeArray Field

Pascal

```
FValueTypeArray: array of TDBXValueType;
```

C++

```
array of TDBXValueType FValueTypeArray;
```

Description

This is FValueTypeArray, a member of class TDBXValueList.

55.1.72.4 TDBXValueList Methods

The methods of the TDBXValueList class are listed here.

Strict private Methods

	Name	Description
	FindOrdinal (see page 10635)	This is FindOrdinal, a member of class TDBXValueList.

55.1.72.4.1 TDBXValueList.FindOrdinal Method

Pascal

```
function FindOrdinal(const Name: WideString; StartOrdinal: TInt32; EndOrdinal: TInt32):
TInt32; virtual;
```

C++

```
virtual __fastcall TInt32 FindOrdinal(const BSTR Name, TInt32 StartOrdinal, TInt32 EndOrdinal);
```

Description

This is FindOrdinal, a member of class TDBXValueList.

55.1.73 TDBXValueType Class

Metadata for TDBXReader (see page 10576) columns and TDBXParameter (see page 10545) parameters.

Class Hierarchy

DBXCommon.TDBXValueType

Pascal

```
TDBXValueType = class;
```

C++

```
class TDBXValueType;
```

File

DBXCommon

Description

TDBXValueType properties describe the types expected or returned by queries and stored commands.

55.1.73.1 TDBXValueType Members

The following tables list the members exposed by TDBXValueType.

Protected Methods

	Name	Description
	Create (see page 10637)	Creates an instance of TDBXValueType (see page 10636)
	GetChildPosition (see page 10638)	Get ChildPosition (see page 10645) property.
	GetDataType (see page 10639)	Get DataType (see page 10646) property.
	GetFlags (see page 10639)	Get ValueTypeFlags (see page 10648) property.
	GetName (see page 10639)	Get Name (see page 10646) property.
	GetOrdinal (see page 10639)	Get Ordinal (see page 10646) property.
	GetParameterDirection (see page 10640)	Get ParameterDirection (see page 10647) property.
	GetPrecision (see page 10640)	Get Precision (see page 10647) property.
	GetScale (see page 10640)	Get Scale (see page 10647) property.
	GetSize (see page 10641)	Get Size (see page 10648) property.
	GetSubType (see page 10641)	Get SubType (see page 10648) property.
	SetChildPosition (see page 10641)	Set ChildPosition (see page 10645) property.
	SetDataType (see page 10642)	Set DataType (see page 10646) property.
	SetFlags (see page 10642)	Set ValueTypeFlags (see page 10648) property.
	SetName (see page 10642)	Set Name (see page 10646) property.
	SetNullable (see page 10642)	Set ChildPosition (see page 10645) property.
	SetOrdinal (see page 10643)	Set Ordinal (see page 10646) property.
	SetParameterDirection (see page 10643)	Set ParameterDirection (see page 10647) property.
	SetPrecision (see page 10643)	Set Precision (see page 10647) property.

V	SetScale (see page 10644)	Set Scale (see page 10647) property.
V	SetSize (see page 10644)	Set Size (see page 10648) property.
V	SetSubType (see page 10644)	Set SubType (see page 10648) property.

Public Properties

	Name	Description
R	AutoIncrement (see page 10645)	Gets the value that determines whether or not this describes an autoincrement value.
	ChildPosition (see page 10645)	Used by TDBXParameter (see page 10545) instances. Child position of Oracle ADT and Array types
	DataType (see page 10646)	Value data type.
	Name (see page 10646)	Name for this value.
	Nullable (see page 10646)	Determines whether or not a parameter can be set to null.
	Ordinal (see page 10646)	Ordinal position of this value.
	ParameterDirection (see page 10647)	Gets or sets the direction of a parameter.
	Precision (see page 10647)	The maximum number of digits allowed in the parameter.
R	ReadOnly (see page 10647)	True if this TDBXValueType (see page 10636) is read-only.
	Scale (see page 10647)	The maximum number of digits used to represent the property.
R	Searchable (see page 10648)	True if this TDBXValueType (see page 10636) is searchable.
	Size (see page 10648)	The size of the parameter value in bytes.
	SubType (see page 10648)	Data sub-type.
	ValueTypeFlags (see page 10648)	TDBXValue (see page 10626) metadata for TDBXReader (see page 10576).

Strict protected Fields

	Name	Description
	FDBXContext (see page 10637)	This is FDBXContext, a member of class TDBXValueType.

55.1.73.2 TDBXValueType.Create Constructor

Creates an instance of TDBXValueType (see page 10636)

Pascal

```
constructor Create(DBXContext: TDBXContext);
```

C++

```
__fastcall TDBXValueType(TDBXContext DBXContext);
```

Description

This constructor creates and initializes an instance of TDBXValueType (see page 10636).

55.1.73.3 TDBXValueType Fields

The fields of the TDBXValueType class are listed here.

Strict protected Fields

	Name	Description
	FDBXContext (see page 10637)	This is FDBXContext, a member of class TDBXValueType.

55.1.73.3.1 TDBXValueType.FDBXContext Field

Pascal

```
FDBXContext: TDBXContext;
```

C++

```
TDBXContext FDBXContext;
```

Description

This is FDBXContext, a member of class TDBXValueType.

55.1.73.4 TDBXValueType Methods

The methods of the TDBXValueType class are listed here.

Protected Methods

	Name	Description
	GetChildPosition (see page 10638)	Get ChildPosition (see page 10645) property.
	GetDataType (see page 10639)	Get DataType (see page 10646) property.
	GetFlags (see page 10639)	Get ValueTypeFlags (see page 10648) property.
	GetName (see page 10639)	Get Name (see page 10646) property.
	GetOrdinal (see page 10639)	Get Ordinal (see page 10646) property.
	GetParameterDirection (see page 10640)	Get ParameterDirection (see page 10647) property.
	GetPrecision (see page 10640)	Get Precision (see page 10647) property.
	GetScale (see page 10640)	Get Scale (see page 10647) property.
	GetSize (see page 10641)	Get Size (see page 10648) property.
	GetSubType (see page 10641)	Get SubType (see page 10648) property.
	SetChildPosition (see page 10641)	Set ChildPosition (see page 10645) property.
	SetDataType (see page 10642)	Set DataType (see page 10646) property.
	SetFlags (see page 10642)	Set ValueTypeFlags (see page 10648) property.
	SetName (see page 10642)	Set Name (see page 10646) property.
	SetNullable (see page 10642)	Set ChildPosition (see page 10645) property.
	SetOrdinal (see page 10643)	Set Ordinal (see page 10646) property.
	SetParameterDirection (see page 10643)	Set ParameterDirection (see page 10647) property.
	SetPrecision (see page 10643)	Set Precision (see page 10647) property.
	SetScale (see page 10644)	Set Scale (see page 10647) property.
	SetSize (see page 10644)	Set Size (see page 10648) property.
	SetSubType (see page 10644)	Set SubType (see page 10648) property.

55.1.73.4.1 TDBXValueType.GetChildPosition Method

Get ChildPosition (see page 10645) property.

Pascal

```
function GetChildPosition: TInt32; virtual;
```

C++

```
virtual __fastcall TInt32 GetChildPosition();
```

Description

GetChildPosition gets the ChildPosition (see page 10645) property.

See Also

ChildPosition (see page 10645)

55.1.73.4.2 TDBXValueType.GetDataType Method

Get DataType (see page 10646) property.

Pascal

```
function GetDataType: TDBXType; virtual;
```

C++

```
virtual __fastcall TDBXType GetDataType();
```

Description

GetDataType gets the DataType (see page 10646) property.

See Also

DataType (see page 10646)

55.1.73.4.3 TDBXValueType.GetFlags Method

Get ValueTypeFlags (see page 10648) property.

Pascal

```
function GetFlags: TInt32; virtual;
```

C++

```
virtual __fastcall TInt32 GetFlags();
```

Description

GetFlags gets the ValueTypeFlags (see page 10648) property.

See Also

ValueTypeFlags (see page 10648)

55.1.73.4.4 TDBXValueType.GetName Method

Get Name (see page 10646) property.

Pascal

```
function GetName: WideString; virtual;
```

C++

```
virtual __fastcall BSTR GetName();
```

Description

GetName gets the Name (see page 10646) property.

See Also

Name (see page 10646)

55.1.73.4.5 TDBXValueType.GetOrdinal Method

Get Ordinal (see page 10646) property.

Pascal

```
function GetOrdinal: TInt32; virtual;
```

C++

```
virtual __fastcall TInt32 GetOrdinal();
```

Description

GetOrdinal gets the Ordinal (see page 10646) property.

See Also

Ordinal (see page 10646)

55.1.73.4.6 TDBXValueType.GetParameterDirection Method

Get ParameterDirection (see page 10647) property.

Pascal

```
function GetParameterDirection: TDBXParameterDirection; virtual;
```

C++

```
virtual __fastcall TDBXParameterDirection GetParameterDirection();
```

Description

GetParameterDirection gets the ParameterDirection (see page 10647) property.

See Also

ParameterDirection (see page 10647)

55.1.73.4.7 TDBXValueType.GetPrecision Method

Get Precision (see page 10647) property.

Pascal

```
function GetPrecision: Int64; virtual;
```

C++

```
virtual __fastcall Int64 GetPrecision();
```

Description

GetPrecision gets the Precision (see page 10647) property.

See Also

Precision (see page 10647)

55.1.73.4.8 TDBXValueType.GetScale Method

Get Scale (see page 10647) property.

Pascal

```
function GetScale: TInt32; virtual;
```

C++

```
virtual __fastcall TInt32 GetScale();
```

Description

GetScale gets the Scale (see page 10647) property.

See Also

Scale (see page 10647)

55.1.73.4.9 TDBXValueType.GetSize Method

Get Size (see page 10648) property.

Pascal

```
function GetSize: Int64; virtual;
```

C++

```
virtual __fastcall Int64 GetSize();
```

Description

GetSize gets the Size (see page 10648) property.

See Also

Size (see page 10648)

55.1.73.4.10 TDBXValueType.GetSubType Method

Get SubType (see page 10648) property.

Pascal

```
function GetSubType: TDBXType; virtual;
```

C++

```
virtual __fastcall TDBXType GetSubType();
```

Description

GetSubType gets the SubType (see page 10648) property.

See Also

SubType (see page 10648)

55.1.73.4.11 TDBXValueType.SetChildPosition Method

Set ChildPosition (see page 10645) property.

Pascal

```
procedure SetChildPosition(ChildPosition: TInt32); virtual;
```

C++

```
virtual __fastcall SetChildPosition(TInt32 ChildPosition);
```

Description

SetChildPosition sets the ChildPosition (see page 10645) property.

See Also

ChildPosition (see page 10645)

55.1.73.4.12 TDBXValueType.SetDataType Method

Set DataType (see page 10646) property.

Pascal

```
procedure SetDataType(DataType: TDBXType); virtual;
```

C++

```
virtual __fastcall SetDataType(TDBXType DataType);
```

Description

SetDataType sets the DataType (see page 10646) property.

See Also

DataType (see page 10646)

55.1.73.4.13 TDBXValueType.SetFlags Method

Set ValueTypeFlags (see page 10648) property.

Pascal

```
procedure SetFlags(Flags: TInt32); virtual;
```

C++

```
virtual __fastcall SetFlags(TInt32 Flags);
```

Description

SetFlags sets theValueTypeFlags property.

See Also

ValueTypeFlags (see page 10648)

55.1.73.4.14 TDBXValueType.SetName Method

Set Name (see page 10646) property.

Pascal

```
procedure SetName(const Name: WideString); virtual;
```

C++

```
virtual __fastcall SetName(const BSTR Name);
```

Description

SetName sets the Name (see page 10646) property.

See Also

Name (see page 10646)

55.1.73.4.15 TDBXValueType.SetNullable Method

Set ChildPosition (see page 10645) property.

Pascal

```
procedure SetNullable(NullableValue: Boolean); virtual;
```

C++

```
virtual __fastcall SetNullable(Boolean NullableValue);
```

Description

SetChildPosition (see page 10641) sets the ChildPosition (see page 10645) property.

See Also

ChildPosition (see page 10645)

55.1.73.4.16 TDBXValueType.SetOrdinal Method

Set Ordinal (see page 10646) property.

Pascal

```
procedure SetOrdinal(Ordinal: TInt32); virtual;
```

C++

```
virtual __fastcall SetOrdinal(TInt32 Ordinal);
```

Description

SetOrdinal sets the Ordinal (see page 10646) property.

See Also

Ordinal (see page 10646)

55.1.73.4.17 TDBXValueType.SetParameterDirection Method

Set ParameterDirection (see page 10647) property.

Pascal

```
procedure SetParameterDirection(ParameterDirection: TDBXParameterDirection); virtual;
```

C++

```
virtual __fastcall SetParameterDirection(TDBXParameterDirection ParameterDirection);
```

Description

SetParameterDirection sets the ParameterDirection (see page 10647) property.

See Also

ParameterDirection (see page 10647)

55.1.73.4.18 TDBXValueType.SetPrecision Method

Set Precision (see page 10647) property.

Pascal

```
procedure SetPrecision(Precision: Int64); virtual;
```

C++

```
virtual __fastcall SetPrecision(Int64 Precision);
```

Description

SetPrecision sets the Precision (see page 10647) property.

See Also

Precision (see page 10647)

55.1.73.4.19 TDBXValueType.SetScale Method

Set Scale (see page 10647) property.

Pascal

```
procedure SetScale(Scale: TInt32); virtual;
```

C++

```
virtual __fastcall SetScale(TInt32 Scale);
```

Description

SetScale sets the Scale (see page 10647) property.

See Also

Scale (see page 10647)

55.1.73.4.20 TDBXValueType.SetSize Method

Set Size (see page 10648) property.

Pascal

```
procedure SetSize(Size: Int64); virtual;
```

C++

```
virtual __fastcall SetSize(Int64 Size);
```

Description

SetSize sets the Size (see page 10648) property.

See Also

Size (see page 10648)

55.1.73.4.21 TDBXValueType.SetSubType Method

Set SubType (see page 10648) property.

Pascal

```
procedure SetSubType(SubType: TDBXType); virtual;
```

C++

```
virtual __fastcall SetSubType(TDBXType SubType);
```

Description

SetSubType sets the SubType (see page 10648) property.

See Also

SubType (see page 10648)

55.1.73.5 TDBXValueType Properties

The properties of the TDBXValueType class are listed here.

Public Properties

	Name	Description
R	AutoIncrement (see page 10645)	Gets the value that determines whether or not this describes an autoincrement value.
	ChildPosition (see page 10645)	Used by TDBXParameter (see page 10545) instances. Child position of Oracle ADT and Array types
	DataType (see page 10646)	Value data type.
	Name (see page 10646)	Name for this value.
	Nullable (see page 10646)	Determines whether or not a parameter can be set to null.
	Ordinal (see page 10646)	Ordinal position of this value.
	ParameterDirection (see page 10647)	Gets or sets the direction of a parameter.
	Precision (see page 10647)	The maximum number of digits allowed in the parameter.
R	ReadOnly (see page 10647)	True if this TDBXValueType (see page 10636) is read-only.
	Scale (see page 10647)	The maximum number of digits used to represent the property.
R	Searchable (see page 10648)	True if this TDBXValueType (see page 10636) is searchable.
	Size (see page 10648)	The size of the parameter value in bytes.
	SubType (see page 10648)	Data sub-type.
	ValueTypeFlags (see page 10648)	TDBXValue (see page 10626) metadata for TDBXReader (see page 10576).

55.1.73.5.1 TDBXValueType.AutoIncrement Property

Gets the value that determines whether or not this describes an autoincrement value.

Pascal

```
property AutoIncrement: Boolean;
```

C++

```
__property Boolean AutoIncrement;
```

Description

Use AutoIncrement to get the value that determines whether or not this TDBXValueType (see page 10636) instance describes an autoincrement value.

55.1.73.5.2 TDBXValueType.ChildPosition Property

Used by TDBXParameter (see page 10545) instances. Child position of Oracle ADT and Array types

Pascal

```
property ChildPosition: TInt32;
```

C++

```
__property TInt32 ChildPosition;
```

Description

Use ChildPosition through TDBXParameter (see page 10545) instances to get or set the child position of Oracle ADT and Array types

55.1.73.5.3 TDBXValueType.DataType Property

Value data type.

Pascal

```
property DataType: TDBXType;
```

C++

```
__property TDBXType DataType;
```

Description

Returns one of the const values from TDBXDataTypes (see page 10447).

55.1.73.5.4 TDBXValueType.Name Property

Name for this value.

Pascal

```
property Name: WideString;
```

C++

```
__property BSTR Name;
```

Description

Name for this value. This value can be used as an index Value and Parameter array properties.

55.1.73.5.5 TDBXValueType.Nullable Property

Determines whether or not a parameter can be set to null.

Pascal

```
property Nullable: Boolean;
```

C++

```
__property Boolean Nullable;
```

Description

Gets or sets the value that determines whether or not a parameter can be set to null.

55.1.73.5.6 TDBXValueType.Ordinal Property

Ordinal position of this value.

Pascal

```
property Ordinal: TInt32;
```

C++

```
__property TInt32 Ordinal;
```

Description

Returns the ordinal position of this value for a TDBXReader (see page 10576) or TDBXParameterList (see page 10553).

55.1.73.5.7 TDBXValueType.ParameterDirection Property

Gets or sets the direction of a parameter.

Pascal

```
property ParameterDirection: TDBXParameterDirection;
```

C++

```
__property TDBXParameterDirection ParameterDirection;
```

Description

Use ParameterDirection to get or set the direction of a parameter. This parameter can be any of the TDBXParameterDirections (see page 10549) const values.

55.1.73.5.8 TDBXValueType.Precision Property

The maximum number of digits allowed in the parameter.

Pascal

```
property Precision: Int64;
```

C++

```
__property Int64 Precision;
```

Description

The maximum number of digits allowed in the parameter, including both significant and fractional.

55.1.73.5.9 TDBXValueType.ReadOnly Property

True if this TDBXValueType (see page 10636) is read-only.

Pascal

```
property ReadOnly: Boolean;
```

C++

```
__property Boolean ReadOnly;
```

Description

If ReadOnly is true, this TDBXValueType (see page 10636) parameter is read-only; if false, it can be read and set.

55.1.73.5.10 TDBXValueType.Scale Property

The maximum number of digits used to represent the property.

Pascal

```
property Scale: TInt32;
```

C++

```
__property TInt32 Scale;
```

Description

Gets or sets the maximum number of digits used to represent the property.

55.1.73.5.11 TDBXValueType.Searchable Property

True if this TDBXValueType (see page 10636) is searchable.

Pascal

```
property Searchable: Boolean;
```

C++

```
__property Boolean Searchable;
```

Description

Gets the value that indicates whether or not this TDBXValueType (see page 10636) parameter is searchable.

55.1.73.5.12 TDBXValueType.Size Property

The size of the parameter value in bytes.

Pascal

```
property Size: Int64;
```

C++

```
__property Int64 Size;
```

Description

Gets or sets the size of the parameter value in bytes. For string data, Size gets or sets the size of the parameter in characters.

55.1.73.5.13 TDBXValueType.SubType Property

Data sub-type.

Pascal

```
property SubType: TInt32;
```

C++

```
__property TInt32 SubType;
```

Description

Returns one of the "sub-type" const values from TDBXDataTypes (see page 10447).

55.1.73.5.14 TDBXValueType.ValueTypeFlags Property

TDBXValue (see page 10626) metadata for TDBXReader (see page 10576).

Pascal

```
property ValueTypeFlags: TInt32;
```

C++

```
__property TInt32 ValueTypeFlags;
```

Description

Used by drivers to set TDBXValue (see page 10626) metadata for TDBXReader (see page 10576).

55.1.74 TDBXValueTypeEx Class

Extension of TDBXValueType (see page 10636).

Class Hierarchy

Pascal

```
TDBXValueTypeEx = class(TDBXValueType);
```

C++

```
class TDBXValueTypeEx : public TDBXValueType;
```

File

DBXCommon

Description

TDBXValueTypeEx is an extension of TDBXValueType (see page 10636).

Note: Classes (see page 2685) ending in “Ex” are temporary classes that exist to avoid breaking interfaces. Their contents will be migrated to their base class in the next release.

See Also

TDBXValueType (see page 10636)

55.1.74.1 TDBXValueTypeEx Members

The following tables list the members exposed by TDBXValueTypeEx.

Protected Methods

	Name	Description
	Create (see page 10637)	Creates an instance of TDBXValueType (see page 10636)
	GetChildPosition (see page 10638)	Get ChildPosition (see page 10645) property.
	GetDataType (see page 10639)	Get DataType (see page 10646) property.
	GetFlags (see page 10639)	Get ValueTypeFlags (see page 10648) property.
	GetName (see page 10639)	Get Name (see page 10646) property.
	GetOrdinal (see page 10639)	Get Ordinal (see page 10646) property.
	GetParameterDirection (see page 10640)	Get ParameterDirection (see page 10647) property.
	GetPrecision (see page 10640)	Get Precision (see page 10647) property.
	GetScale (see page 10640)	Get Scale (see page 10647) property.
	GetSize (see page 10641)	Get Size (see page 10648) property.
	GetSubType (see page 10641)	Get SubType (see page 10648) property.
	SetChildPosition (see page 10641)	Set ChildPosition (see page 10645) property.
	SetDataType (see page 10642)	Set DataType (see page 10646) property.
	SetFlags (see page 10642)	Set ValueTypeFlags (see page 10648) property.
	SetName (see page 10642)	Set Name (see page 10646) property.
	SetNullable (see page 10642)	Set ChildPosition (see page 10645) property.
	SetOrdinal (see page 10643)	Set Ordinal (see page 10646) property.
	SetParameterDirection (see page 10643)	Set ParameterDirection (see page 10647) property.
	SetPrecision (see page 10643)	Set Precision (see page 10647) property.

V	SetScale (see page 10644)	Set Scale (see page 10647) property.
V	SetSize (see page 10644)	Set Size (see page 10648) property.
V	SetSubType (see page 10644)	Set SubType (see page 10648) property.

Public Methods

	Name	Description
	DataTypeName (see page 10650)	Gets WideString for TDBXType (see page 10673).
	InvalidTypeAccess (see page 10651)	Raises **InvalidType** TDBXError (see page 10486) exception.

Public Properties

	Name	Description
R	AutoIncrement (see page 10645)	Gets the value that determines whether or not this describes an autoincrement value.
	ChildPosition (see page 10645)	Used by TDBXParameter (see page 10545) instances. Child position of Oracle ADT and Array types
	DataType (see page 10646)	Value data type.
	Name (see page 10646)	Name for this value.
	Nullable (see page 10646)	Determines whether or not a parameter can be set to null.
	Ordinal (see page 10646)	Ordinal position of this value.
	ParameterDirection (see page 10647)	Gets or sets the direction of a parameter.
	Precision (see page 10647)	The maximum number of digits allowed in the parameter.
R	ReadOnly (see page 10647)	True if this TDBXValueType (see page 10636) is read-only.
	Scale (see page 10647)	The maximum number of digits used to represent the property.
R	Searchable (see page 10648)	True if this TDBXValueType (see page 10636) is searchable.
	Size (see page 10648)	The size of the parameter value in bytes.
	SubType (see page 10648)	Data sub-type.
	ValueTypeFlags (see page 10648)	TDBXValue (see page 10626) metadata for TDBXReader (see page 10576).

Strict protected Fields

	Name	Description
	FDBXContext (see page 10637)	This is FDBXContext, a member of class TDBXValueType.

55.1.74.2 TDBXValueTypeEx Methods

The methods of the TDBXValueTypeEx class are listed here.

Public Methods

	Name	Description
	DataTypeName (see page 10650)	Gets WideString for TDBXType (see page 10673).
	InvalidTypeAccess (see page 10651)	Raises **InvalidType** TDBXError (see page 10486) exception.

55.1.74.2.1 TDBXValueTypeEx.DataTypeName Method

Gets WideString for TDBXType (see page 10673).

Pascal

```
class function DataTypeName(DataType: TDBXType): WideString; static;
```

C++

```
static __fastcall BSTR DataTypeName(TDBXType DataType);
```

Description

DataTypeName gets a WideString value for a TDBXType (see page 10673).

See Also

TDBXDataTypes (see page 10447)

TDBXType (see page 10673)

55.1.74.2.2 TDBXValueTypeEx.InvalidTypeAccess Method

Raises **InvalidType** TDBXError (see page 10486) exception.

Pascal

```
class procedure InvalidTypeAccess(ExpectedDataType: TDBXType; DataType: TDBXType); static;
```

C++

```
static __fastcall InvalidTypeAccess(TDBXType ExpectedDataType, TDBXType DataType);
```

Description

InvalidTypeAccess raises an **InvalidType** TDBXError (see page 10486) exception.

See Also

TDBXError (see page 10486)

55.1.75 TDBXValueTypeFlags Class

Flags used by TDBXValueType (see page 10636).

Class Hierarchy

Pascal

```
TDBXValueTypeFlags = class;
```

C++

```
class TDBXValueTypeFlags;
```

File

DBXCommon

Description

These flags provide information about a TDBXValueType (see page 10636) instance. The TDBXValueType.GetFlags method returns a bit mask of these flags logically ORed together.

This table shows the flag constants.

Constant	Description
Nullable (see page 10652)	Value is nullable
ReadOnly (see page 10653)	Value is read only
Searchable (see page 10653)	Value is searchable
AutoIncrement (see page 10652)	Value is autoincrement
ReadOnlyType (see page 10653)	Value is read only

See Also

TDBXValueType (see page 10636)

GetFlags (see page 10639)

55.1.75.1 TDBXValueTypeFlags Members

The following tables list the members exposed by TDBXValueTypeFlags.

Public Constants

	Name	Description
	AutoIncrement (see page 10652)	This is AutoIncrement, a member of class TDBXValueTypeFlags.
	Nullable (see page 10652)	This is Nullable, a member of class TDBXValueTypeFlags.
	ReadOnly (see page 10653)	This is ReadOnly, a member of class TDBXValueTypeFlags.
	ReadOnlyType (see page 10653)	This is ReadOnlyType, a member of class TDBXValueTypeFlags.
	Searchable (see page 10653)	This is Searchable, a member of class TDBXValueTypeFlags.

55.1.75.2 TDBXValueTypeFlags Constants

The constants of the TDBXValueTypeFlags class are listed here.

Public Constants

	Name	Description
	AutoIncrement (see page 10652)	This is AutoIncrement, a member of class TDBXValueTypeFlags.
	Nullable (see page 10652)	This is Nullable, a member of class TDBXValueTypeFlags.
	ReadOnly (see page 10653)	This is ReadOnly, a member of class TDBXValueTypeFlags.
	ReadOnlyType (see page 10653)	This is ReadOnlyType, a member of class TDBXValueTypeFlags.
	Searchable (see page 10653)	This is Searchable, a member of class TDBXValueTypeFlags.

55.1.75.2.1 TDBXValueTypeFlags.AutoIncrement Constant

Pascal

```
const AutoIncrement = $08;
```

C++

```
AutoIncrement = 0x08;
```

Description

This is AutoIncrement, a member of class TDBXValueTypeFlags.

55.1.75.2.2 TDBXValueTypeFlags.Nullable Constant

Pascal

```
const Nullable = $01;
```

C++

```
Nullable = 0x01;
```

Description

This is Nullable, a member of class TDBXValueTypeFlags.

55.1.75.2.3 TDBXValueTypeFlags.ReadOnly Constant

Pascal

```
const ReadOnly = $02;
```

C++

```
ReadOnly = 0x02;
```

Description

This is ReadOnly, a member of class TDBXValueTypeFlags.

55.1.75.2.4 TDBXValueTypeFlags.ReadOnlyType Constant

Pascal

```
const ReadOnlyType = $20;
```

C++

```
ReadOnlyType = 0x20;
```

Description

This is ReadOnlyType, a member of class TDBXValueTypeFlags.

55.1.75.2.5 TDBXValueTypeFlags.Searchable Constant

Pascal

```
const Searchable = $04;
```

C++

```
Searchable = 0x04;
```

Description

This is Searchable, a member of class TDBXValueTypeFlags.

55.1.76 TDBXValueTypeFlagsEx Class

Temporary extension of TDBXValueTypeFlags (see page 10651) class.

Class Hierarchy

Pascal

```
TDBXValueTypeFlagsEx = class(TDBXValueTypeFlags);
```

C++

```
class TDBXValueTypeFlagsEx : public TDBXValueTypeFlags;
```

File

DBXCommon

Description

This class is an extension of the TDBXValueTypeFlags (see page 10651) class. Its flags provide information about a TDBXValueType (see page 10636) instance.

Note: Classes (see page 2685) ending in "Ex" are temporary classes that exist to avoid breaking interfaces. Their contents will be migrated to their base class in the next release.

This table contains the flag constants.

Constant	Description
ExtendedType (see page 10654)	Used internally to indicate that most recent value types should be used if applicable. Only used by the most up to date driver implementations since use of these types breaks old interfaces.

See Also

TDBXValueType (see page 10636)

TDBXValueTypeFlags (see page 10651)

55.1.76.1 TDBXValueTypeFlagsEx Members

The following tables list the members exposed by TDBXValueTypeFlagsEx.

Public Constants

	Name	Description
	AutoIncrement (see page 10652)	This is AutoIncrement, a member of class TDBXValueTypeFlags.
	ExtendedType (see page 10654)	This is ExtendedType, a member of class TDBXValueTypeFlagsEx.
	Nullable (see page 10652)	This is Nullable, a member of class TDBXValueTypeFlags.
	ReadOnly (see page 10653)	This is ReadOnly, a member of class TDBXValueTypeFlags.
	ReadOnlyType (see page 10653)	This is ReadOnlyType, a member of class TDBXValueTypeFlags.
	Searchable (see page 10653)	This is Searchable, a member of class TDBXValueTypeFlags.

55.1.76.2 TDBXValueTypeFlagsEx Constants

The constants of the TDBXValueTypeFlagsEx class are listed here.

Public Constants

	Name	Description
	ExtendedType (see page 10654)	This is ExtendedType, a member of class TDBXValueTypeFlagsEx.

55.1.76.2.1 TDBXValueTypeFlagsEx.ExtendedType Constant

Pascal

```
const ExtendedType = $40;
```

C++

```
ExtendedType = 0x40;
```

Description

This is ExtendedType, a member of class TDBXValueTypeFlagsEx.

55.1.77 TDBXWideCharsValue Class

Class Hierarchy

Pascal

```
TDBXWideCharsValue = class(TDBXWideStringValue);
```

C++

```
class TDBXWideCharsValue : public TDBXWideStringValue;
```

File

DBXCommon

Description

This is class DBXCommon.TDBXWideCharsValue.

55.1.77.1 TDBXWideCharsValue Members

The following tables list the members exposed by TDBXWideCharsValue.

Protected Methods

	Name	Description
	GetDbxContext (see page 10630)	Get context information for a connection associated with value.
V	SetPendingValue (see page 10666)	This is SetPendingValue, a member of class TDBXWritableValue.

Protected Properties

	Name	Description
R	DbxContext (see page 10633)	Context information for a connection associated with value.

Public Methods

	Name	Description
	Create (see page 10656)	Creates an instance of TDBXWideStringValue
	CreateValue (see page 10628)	Creates values for both the TDBXReader (see page 10576) and TDBXParameterList (see page 10553) classes.
V	Destroy (see page 10656)	Destroys a TDBXWideStringValue instance.
V	GetAnsiString (see page 10629)	Gets the string value for ANSI strings.
V	GetBcd (see page 10629)	Gets the BCD value for binary-compressed decimal data types.
V	GetBoolean (see page 10629)	Gets the boolean value for boolean data types.
V	GetBytes (see page 10629)	Gets the byte array value for byte array and blob types.
V	GetDate (see page 10630)	Gets the date value for date data types.
V	GetDouble (see page 10630)	Gets the double floating point value for double data types.
V	GetInt16 (see page 10631)	Gets the smallInt value for 16-byte integer data types.
V	GetInt32 (see page 10631)	Gets the 32-byte integer value for 32-byte integer data types.
V	GetInt64 (see page 10631)	Gets the 64-byte integer value for 64-byte integer data types.
V	GetStream (see page 10657)	This is GetStream, a member of class TDBXWideCharsValue.
V	GetTime (see page 10631)	Gets the time value for time data types.
V	GetTimeStamp (see page 10632)	Gets the timestamp value for timestamp data types.
V	GetValueSize (see page 10632)	Gets the size in bytes for values.
V	GetWideString (see page 10657)	Gets the wide string value for wide string data types.

	IsNull (see page 10657)	Returns true if the value is **null**.
	SetAnsiString (see page 10663)	Sets the string value for ANSI strings.
	SetBcd (see page 10664)	Sets the BCD value for binary-compressed decimal data types.
	SetBoolean (see page 10664)	Sets the boolean value for boolean data types..
	SetDate (see page 10664)	Sets the date value for date data types..
	SetDouble (see page 10664)	Sets the double floating point value for double data types.
	SetDynamicBytes (see page 10665)	Sets the dynamic array value for byte array and blob types.
	SetInt16 (see page 10665)	Sets the the smallInt value for 16-byte integer data types.
	SetInt32 (see page 10665)	Sets the 32-byte integer value for 32-byte integer data types.
	SetInt64 (see page 10665)	Sets the 64-byte integer value for 64-byte integer data types.
	SetNull (see page 10666)	Sets a writable value of any type to null.
	SetStaticBytes (see page 10666)	Sets the open array value for byte array and blob types
	SetTime (see page 10666)	Sets the time value for time data types.
	SetTimeStamp (see page 10667)	Sets the timestamp value for timestamp data types.
	SetWideString (see page 10658)	Sets the wide string value for wide string data types.

Public Properties

	Name	Description
	ValueType (see page 10633)	Gets the value type for this value.

55.1.77.2 TDBXWideCharsValue.Create Constructor

Creates an instance of TDBXWideStringValue

Pascal

```
constructor Create(ValueType: TDBXValueType);
```

C++

```
__fastcall TDBXWideCharsValue(TDBXValueType ValueType);
```

Description

This constructor creates and initializes an instance of TDBXWideStringValue.

See Also

Destroy (see page 10660)

55.1.77.3 TDBXWideCharsValue.Destroy Destructor

Destroys a TDBXWideStringValue instance.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TDBXWideCharsValue();
```

Description

This destructor destroys an instance of TDBXWideStringValue.

See Also

Create (see page 10659)

55.1.77.4 TDBXWideCharsValue Methods

The methods of the TDBXWideCharsValue class are listed here.

Public Methods

	Name	Description
	GetStream (see page 10657)	This is GetStream, a member of class TDBXWideCharsValue.
	GetWideString (see page 10657)	Gets the wide string value for wide string data types.
	IsNull (see page 10657)	Returns true if the value is **null**.
	SetWideString (see page 10658)	Sets the wide string value for wide string data types.

55.1.77.4.1 TDBXWideCharsValue.GetStream Method

Pascal

```
function GetStream: TStream; virtual;
```

C++

```
virtual __fastcall TStream GetStream();
```

Description

This is GetStream, a member of class TDBXWideCharsValue.

55.1.77.4.2 TDBXWideCharsValue.GetWideString Method

Gets the wide string value for wide string data types.

Pascal

```
function GetWideString: WideString; override;
```

C++

```
virtual __fastcall BSTR GetWideString();
```

Description

Gets the wide string value for TDBXValue instances with a data type of WideString. Throws a TDBXError exception if IsNull is true.

55.1.77.4.3 TDBXWideCharsValue.IsNull Method

Returns true if the value is **null**.

Pascal

```
function IsNull: Boolean; override;
```

C++

```
virtual __fastcall Boolean IsNull();
```

Description

Returns true if the value is **null**. This method should be called before calling any of the Get methods. If the value is null, the Get methods will throw TDBXError exception if they are called.

55.1.77.4.4 TDBXWideCharsValue.SetWideString Method

Sets the wide string value for wide string data types.

Pascal

```
procedure SetWideString(const Value: WideString); override;
```

C++

```
virtual __fastcall SetWideString(const BSTR Value);
```

Description

Sets the wide string value for TDBXValue instances with a data type of WideString.

55.1.78 TDBXWideStringValue Class

Implementation of writable wide string values.

Class Hierarchy

Pascal

```
TDBXWideStringValue = class(TDBXWritableValue);
```

C++

```
class TDBXWideStringValue : public TDBXWritableValue;
```

File

DBXCommon

Description

Implementation of TDBXWritableValue (see page 10661) for TDBXDataTypes (see page 10447). WideStringType values.

55.1.78.1 TDBXWideStringValue Members

The following tables list the members exposed by TDBXWideStringValue.

Protected Methods

	Name	Description
	Create (see page 10659)	Creates an instance of TDBXWideStringValue (see page 10658)
	GetDbxContext (see page 10630)	Get context information for a connection associated with value.
V	SetPendingValue (see page 10666)	This is SetPendingValue, a member of class TDBXWritableValue.

Protected Properties

	Name	Description
R	DbxContext (see page 10633)	Context information for a connection associated with value.

Public Methods

	Name	Description
	CreateValue (see page 10628)	Creates values for both the TDBXReader (see page 10576) and TDBXParameterList (see page 10553) classes.

	Destroy (see page 10660)	Destroys a TDBXWideStringValue (see page 10658) instance.
	GetAnsiString (see page 10629)	Gets the string value for ANSI strings.
	GetBcd (see page 10629)	Gets the BCD value for binary-compressed decimal data types.
	GetBoolean (see page 10629)	Gets the boolean value for boolean data types.
	GetBytes (see page 10629)	Gets the byte array value for byte array and blob types.
	GetDate (see page 10630)	Gets the date value for date data types.
	GetDouble (see page 10630)	Gets the double floating point value for double data types.
	GetInt16 (see page 10631)	Gets the smallInt value for 16-byte integer data types.
	GetInt32 (see page 10631)	Gets the 32-byte integer value for 32-byte integer data types.
	GetInt64 (see page 10631)	Gets the 64-byte integer value for 64-byte integer data types.
	GetTime (see page 10631)	Gets the time value for time data types.
	GetTimeStamp (see page 10632)	Gets the timestamp value for timestamp data types.
	GetValueSize (see page 10632)	Gets the size in bytes for values.
	GetWideString (see page 10660)	Gets the wide string value for wide string data types.
	IsNull (see page 10660)	Returns true if the value is **null**.
	SetAnsiString (see page 10663)	Sets the string value for ANSI strings.
	SetBcd (see page 10664)	Sets the BCD value for binary-compressed decimal data types.
	SetBoolean (see page 10664)	Sets the boolean value for boolean data types..
	SetDate (see page 10664)	Sets the date value for date data types..
	SetDouble (see page 10664)	Sets the double floating point value for double data types.
	SetDynamicBytes (see page 10665)	Sets the dynamic array value for byte array and blob types.
	SetInt16 (see page 10665)	Sets the the smallInt value for 16-byte integer data types.
	SetInt32 (see page 10665)	Sets the 32-byte integer value for 32-byte integer data types.
	SetInt64 (see page 10665)	Sets the 64-byte integer value for 64-byte integer data types.
	SetNull (see page 10666)	Sets a writable value of any type to null.
	SetStaticBytes (see page 10666)	Sets the open array value for byte array and blob types
	SetTime (see page 10666)	Sets the time value for time data types.
	SetTimeStamp (see page 10667)	Sets the timestamp value for timestamp data types.
	SetWideString (see page 10661)	Sets the wide string value for wide string data types.

Public Properties

	Name	Description
	ValueType (see page 10633)	Gets the value type for this value.

55.1.78.2 TDBXWideStringValue.Create Constructor

Creates an instance of TDBXWideStringValue (see page 10658)

Pascal

```
constructor Create(ValueType: TDBXValueType);
```

C++

```
__fastcall TDBXWideStringValue(TDBXValueType ValueType);
```

Description

This constructor creates and initializes an instance of TDBXWideStringValue (see page 10658).

See Also

Destroy (see page 10660)

55.1.78.3 TDBXWideStringValue.Destroy Destructor

Destroys a TDBXWideStringValue (see page 10658) instance.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TDBXWideStringValue();
```

Description

This destructor destroys an instance of TDBXWideStringValue (see page 10658).

See Also

Create (see page 10659)

55.1.78.4 TDBXWideStringValue Methods

The methods of the TDBXWideStringValue class are listed here.

Public Methods

	Name	Description
	GetWideString (see page 10660)	Gets the wide string value for wide string data types.
	IsNull (see page 10660)	Returns true if the value is **null**.
	SetWideString (see page 10661)	Sets the wide string value for wide string data types.

55.1.78.4.1 TDBXWideStringValue.GetWideString Method

Gets the wide string value for wide string data types.

Pascal

```
function GetWideString: WideString; override;
```

C++

```
virtual __fastcall BSTR GetWideString();
```

Description

Gets the wide string value for TDBXValue (see page 10626) instances with a data type of WideString. Throws a TDBXError (see page 10486) exception if IsNull (see page 10660) is true.

55.1.78.4.2 TDBXWideStringValue.IsNull Method

Returns true if the value is **null**.

Pascal

```
function IsNull: Boolean; override;
```

C++

```
virtual __fastcall Boolean IsNull();
```

Description

Returns true if the value is **null**. This method should be called before calling any of the Get methods. If the value is null, the Get

methods will throw TDBXError (see page 10486) exception if they are called.

55.1.78.4.3 TDBXWideStringValue.SetWideString Method

Sets the wide string value for wide string data types.

Pascal

```
procedure SetWideString(const Value: WideString); override;
```

C++

```
virtual __fastcall SetWideString(const BSTR Value);
```

Description

Sets the wide string value for TDBXValue (see page 10626) instances with a data type of WideString.

55.1.79 TDBXWritableValue Class

Extension of TDBXValue (see page 10626) that adds the ability to set a value.

Class Hierarchy

Pascal

```
TDBXWritableValue = class(TDBXValue);
```

C++

```
class TDBXWritableValue : public TDBXValue;
```

File

DBXCommon

Description

Extension of TDBXValue (see page 10626) that adds the ability to set a value. This is only used by Value. Value array property uses the readonly TDBXValue (see page 10626).

55.1.79.1 TDBXWritableValue Members

The following tables list the members exposed by TDBXWritableValue.

Protected Methods

	Name	Description
	Create (see page 10662)	Creates an instance of TDBXWritableValue (see page 10661)
	GetDbxContext (see page 10630)	Get context information for a connection associated with value.
V	SetPendingValue (see page 10666)	This is SetPendingValue, a member of class TDBXWritableValue.

Protected Properties

	Name	Description
R	DbxContext (see page 10633)	Context information for a connection associated with value.

Public Methods

	Name	Description
	CreateValue (see page 10628)	Creates values for both the TDBXReader (see page 10576) and TDBXParameterList (see page 10553) classes.
	Destroy (see page 10663)	Destroys a TDBXWritableValue (see page 10661) instance.
	GetAnsiString (see page 10629)	Gets the string value for ANSI strings.
	GetBcd (see page 10629)	Gets the BCD value for binary-compressed decimal data types.
	GetBoolean (see page 10629)	Gets the boolean value for boolean data types.
	GetBytes (see page 10629)	Gets the byte array value for byte array and blob types.
	GetDate (see page 10630)	Gets the date value for date data types.
	GetDouble (see page 10630)	Gets the double floating point value for double data types.
	GetInt16 (see page 10631)	Gets the smallInt value for 16-byte integer data types.
	GetInt32 (see page 10631)	Gets the 32-byte integer value for 32-byte integer data types.
	GetInt64 (see page 10631)	Gets the 64-byte integer value for 64-byte integer data types.
	GetTime (see page 10631)	Gets the time value for time data types.
	GetTimeStamp (see page 10632)	Gets the timestamp value for timestamp data types.
	GetValueSize (see page 10632)	Gets the size in bytes for values.
	GetWideString (see page 10632)	Gets the wide string value for wide string data types.
	IsNull (see page 10632)	Returns true if the value is **null**.
	SetAnsiString (see page 10663)	Sets the string value for ANSI strings.
	SetBcd (see page 10664)	Sets the BCD value for binary-compressed decimal data types.
	SetBoolean (see page 10664)	Sets the boolean value for boolean data types..
	SetDate (see page 10664)	Sets the date value for date data types..
	SetDouble (see page 10664)	Sets the double floating point value for double data types.
	SetDynamicBytes (see page 10665)	Sets the dynamic array value for byte array and blob types.
	SetInt16 (see page 10665)	Sets the the smallInt value for 16-byte integer data types.
	SetInt32 (see page 10665)	Sets the 32-byte integer value for 32-byte integer data types.
	SetInt64 (see page 10665)	Sets the 64-byte integer value for 64-byte integer data types.
	SetNull (see page 10666)	Sets a writable value of any type to null.
	SetStaticBytes (see page 10666)	Sets the open array value for byte array and blob types
	SetTime (see page 10666)	Sets the time value for time data types.
	SetTimeStamp (see page 10667)	Sets the timestamp value for timestamp data types.
	SetWideString (see page 10667)	Sets the wide string value for wide string data types.

Public Properties

	Name	Description
	ValueType (see page 10633)	Gets the value type for this value.

55.1.79.2 TDBXWritableValue.Create Constructor

Creates an instance of TDBXWritableValue (see page 10661)

Pascal

```
constructor Create(ValueType: TDBXValueType);
```

C++

```
__fastcall TDBXWritableValue(TDBXValueType ValueType);
```

Description

This constructor creates and initializes an instance of TDBXWritableValue (see page 10661).

See Also

Destroy (see page 10663)

55.1.79.3 TDBXWritableValue.Destroy Destructor

Destroys a TDBXWritableValue (see page 10661) instance.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TDBXWritableValue();
```

Description

This destructor destroys an instance of TDBXWritableValue (see page 10661).

See Also

Create (see page 10662)

55.1.79.4 TDBXWritableValue Methods

The methods of the TDBXWritableValue class are listed here.

Protected Methods

	Name	Description
	SetPendingValue (see page 10666)	This is SetPendingValue, a member of class TDBXWritableValue.

Public Methods

	Name	Description
	SetAnsiString (see page 10663)	Sets the string value for ANSI strings.
	SetBcd (see page 10664)	Sets the BCD value for binary-compressed decimal data types.
	SetBoolean (see page 10664)	Sets the boolean value for boolean data types..
	SetDate (see page 10664)	Sets the date value for date data types..
	SetDouble (see page 10664)	Sets the double floating point value for double data types.
	SetDynamicBytes (see page 10665)	Sets the dynamic array value for byte array and blob types.
	SetInt16 (see page 10665)	Sets the the smallInt value for 16-byte integer data types.
	SetInt32 (see page 10665)	Sets the 32-byte integer value for 32-byte integer data types.
	SetInt64 (see page 10665)	Sets the 64-byte integer value for 64-byte integer data types.
	SetNull (see page 10666)	Sets a writable value of any type to null.
	SetStaticBytes (see page 10666)	Sets the open array value for byte array and blob types
	SetTime (see page 10666)	Sets the time value for time data types.
	SetTimeStamp (see page 10667)	Sets the timestamp value for timestamp data types.
	SetWideString (see page 10667)	Sets the wide string value for wide string data types.

55.1.79.4.1 TDBXWritableValue.SetAnsiString Method

Sets the string value for ANSI strings.

Pascal

```
procedure SetAnsiString(const Value: String); virtual;
```

C++

```
virtual __fastcall SetAnsiString(const AnsiString Value);
```

Description

Sets the string value for TDBXValue (see page 10626) instances with a data type of AnsiStringType.

55.1.79.4.2 TDBXWritableValue.SetBcd Method

Sets the BCD value for binary-compressed decimal data types.

Pascal

```
procedure SetBcd(const Value: TBcd); virtual;
```

C++

```
virtual __fastcall SetBcd(const TBcd Value);
```

Description

Sets the TBcd value for TDBXValue (see page 10626) instances with a with a data type of BcdType.

55.1.79.4.3 TDBXWritableValue.SetBoolean Method

Sets the boolean value for boolean data types..

Pascal

```
procedure SetBoolean(Value: Boolean); virtual;
```

C++

```
virtual __fastcall SetBoolean(Boolean Value);
```

Description

Sets the boolean value for TDBXValue (see page 10626) instances with a data types of BooleanType..

55.1.79.4.4 TDBXWritableValue.SetDate Method

Sets the date value for date data types..

Pascal

```
procedure SetDate(Value: TDBXDate); virtual;
```

C++

```
virtual __fastcall SetDate(TDBXDate Value);
```

Description

Sets the date value for TDBXValue (see page 10626) instances with a data type of DateType.

55.1.79.4.5 TDBXWritableValue.SetDouble Method

Sets the double floating point value for double data types.

Pascal

```
procedure SetDouble(Value: Double); virtual;
```

C++

```
virtual __fastcall SetDouble(Double Value);
```

Description

Sets the double floating point value for TDBXValue (see page 10626) instances with a data type of DoubleType.

55.1.79.4.6 TDBXWritableValue.SetDynamicBytes Method

Sets the dynamic array value for byte array and blob types.

Pascal

```
procedure SetDynamicBytes(Offset: Int64; const Buffer: TBytes; BufferOffset: Int64; Length:
Int64); virtual;
```

C++

```
virtual __fastcall SetDynamicBytes(Int64 Offset, const TBytes Buffer, Int64 BufferOffset,
Int64 Length);
```

Description

Sets the dynamic array value for TDBXValue (see page 10626) instances with a data type of BytesType and .BlobType.

55.1.79.4.7 TDBXWritableValue.SetInt16 Method

Sets the the smallInt value for 16-byte integer data types.

Pascal

```
procedure SetInt16(Value: SmallInt); virtual;
```

C++

```
virtual __fastcall SetInt16(SmallInt Value);
```

Description

Sets the the smallInt value for TDBXValue (see page 10626) instances with a data type of Int16Type.

55.1.79.4.8 TDBXWritableValue.SetInt32 Method

Sets the 32-byte integer value for 32-byte integer data types.

Pascal

```
procedure SetInt32(Value: TInt32); virtual;
```

C++

```
virtual __fastcall SetInt32(TInt32 Value);
```

Description

Sets the 32-byte integer value for TDBXValue (see page 10626) instances with a data type of Int32Type.

55.1.79.4.9 TDBXWritableValue.SetInt64 Method

Sets the 64-byte integer value for 64-byte integer data types.

Pascal

```
procedure SetInt64(Value: Int64); virtual;
```

C++

```
virtual __fastcall SetInt64(Int64 Value);
```

Description

Sets the 64-byte integer value for TDBXValue (see page 10626) instances with a data type of Int64Type.

55.1.79.4.10 TDBXWritableValue.SetNull Method

Sets a writable value of any type to null.

Pascal

```
procedure SetNull; virtual;
```

C++

```
virtual __fastcall SetNull();
```

Description

Sets a TDBXWritableValue (see page 10661) instance of any type to null.

55.1.79.4.11 TDBXWritableValue.SetPendingValue Method

Pascal

```
procedure SetPendingValue; virtual;
```

C++

```
virtual __fastcall SetPendingValue();
```

Description

This is SetPendingValue, a member of class TDBXWritableValue.

55.1.79.4.12 TDBXWritableValue.SetStaticBytes Method

Sets the open array value for byte array and blob types

Pascal

```
procedure SetStaticBytes(Offset: Int64; const Buffer: array of Byte; BufferOffset: Int64;
Length: Int64); virtual;
```

C++

```
virtual __fastcall SetStaticBytes(Int64 Offset, const array of Byte Buffer, Int64
BufferOffset, Int64 Length);
```

Description

Sets the open array value for TDBXValue (see page 10626) instances with a data type of BytesType and .BlobType.

55.1.79.4.13 TDBXWritableValue.SetTime Method

Sets the time value for time data types.

Pascal

```
procedure SetTime(Value: TDBXTime); virtual;
```

C++

```
virtual __fastcall SetTime(TDBXTime Value);
```

Description

Sets the time value for TDBXValue (see page 10626) instances with a data type of TimeType.

55.1.79.4.14 TDBXWritableValue.SetTimeStamp Method

Sets the timestamp value for timestamp data types.

Pascal

```
procedure SetTimeStamp(const Value: TSQLTimeStamp); virtual;
```

C++

```
virtual __fastcall SetTimeStamp(const TSQLTimeStamp Value);
```

Description

Sets the timestamp value for TDBXValue (see page 10626) instances with a data types of TimeStampType.

55.1.79.4.15 TDBXWritableValue.SetWideString Method

Sets the wide string value for wide string data types.

Pascal

```
procedure SetWideString(const Value: WideString); virtual;
```

C++

```
virtual __fastcall SetWideString(const BSTR Value);
```

Description

Sets the wide string value for TDBXValue (see page 10626) instances with a data type of WideString.

55.2 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Records

	Name	Description
	TDBXDriverDef (see page 10668)	Collection of parameters needed when loading a driver.

55.2.1 DBXCommon.TDBXDriverDef Record

Collection of parameters needed when loading a driver.

Pascal

```
TDBXDriverDef = packed record
  FDriverName: WideString;
  FDriverProperties: TDBXProperties;
  FDBXContext: TDBXContext;
end;
```

C++

```
struct TDBXDriverDef {
  BSTR FDriverName;
  TDBXProperties FDriverProperties;
  TDBXContext FDBXContext;
};
```

File

DBXCommon

Description

Used by driver implementors. Collection of parameters needed when loading a driver. By collecting these in a single record, parameters can be added without necessarily breaking older drivers.

55.3 Types

The following table lists types in this documentation.

Types

Name	Description
TDBXChars (see page 10669)	This is type DBXCommon.TDBXChars.
TDBXCreateCommandEvent (see page 10669)	This is type DBXCommon.TDBXCreateCommandEvent.
TDBXDate (see page 10670)	This is type DBXCommon.TDBXDate.
TDBXDriverLoaderClass (see page 10670)	This is type DBXCommon.TDBXDriverLoaderClass.
TDBXErrorCode (see page 10670)	This is type DBXCommon.TDBXErrorCode.
TDBXErrorEvent (see page 10671)	Event handler for TDBXConnection.OnErrorEvent property.
TDBXIsolation (see page 10671)	This is type DBXCommon.TDBXIsolation.
TDBXParameterDirection (see page 10671)	This is type DBXCommon.TDBXParameterDirection.
TDBXTime (see page 10672)	This is type DBXCommon.TDBXTime.
TDBXTraceEvent (see page 10672)	Tracing information for drivers.
TDBXTraceFlag (see page 10673)	This is type DBXCommon.TDBXTraceFlag.
TDBXType (see page 10673)	Type for TDBXDataTypes (see page 10447).
TDBXValueArray (see page 10673)	This is type DBXCommon.TDBXValueArray.
TWideStringArray (see page 10674)	This is type DBXCommon.TWideStringArray.

55.3.1 DBXCommon.TDBXChars Type

Pascal

```
TDBXChars = array of Char;
```

C++

```
array of Char TDBXChars;
```

File

DBXCommon

Description

This is type DBXCommon.TDBXChars.

55.3.2 DBXCommon.TDBXCreateCommandEvent Type

Pascal

```
TDBXCreateCommandEvent = function (DbxContext: TDBXContext; Connection: TDBXConnection;
MorphicCommand: TDBXCommand): TDBXCommand of object;
```

C++

```
(DbxContext: TDBXContext; Connection: TDBXConnection; MorphicCommand: TDBXCommand):
TDBXCommand ( TDBXCreateCommandEvent)();
```

File

DBXCommon

Description

This is type DBXCommon.TDBXCreateCommandEvent.

55.3.3 DBXCommon.TDBXDate Type

Pascal

```
TDBXDate = TInt32;
```

C++

```
TInt32 TDBXDate;
```

File

DBXCommon

Description

This is type DBXCommon.TDBXDate.

55.3.4 DBXCommon.TDBXDriverLoaderClass Type

Pascal

```
TDBXDriverLoaderClass = class of TDBXDriverLoader;
```

C++

```
TDBXDriverLoader TDBXDriverLoaderClass;
```

File

DBXCommon

Description

This is type DBXCommon.TDBXDriverLoaderClass.

55.3.5 DBXCommon.TDBXErrorCode Type

Pascal

```
TDBXErrorCode = TInt32;
```

C++

```
TInt32 TDBXErrorCode;
```

File

DBXCommon

Description

This is type DBXCommon.TDBXErrorCode.

55.3.6 DBXCommon.TDBXErrorEvent Type

Event handler for TDBXConnection.OnErrorEvent property.

Pascal

```
TDBXErrorEvent = procedure (DBXError: TDBXError) of object;
```

C++

```
(DBXError: TDBXError) ( TDBXErrorEvent)();
```

File

DBXCommon

Description

TDBXErrorEvent is an event handler that can be set on the TDBXConnection.OnErrorEvent property. This event is called just before a TDBXError (see page 10486) exception is raised. This allows implementors to perform processing before the exception is raised. dbExpress VCL components use this event to raise an exception of a different type.

See Also

TDBXConnection (see page 10398)

TDBXError (see page 10486)

OnErrorEvent (see page 10411)

55.3.7 DBXCommon.TDBXIsolation Type

Pascal

```
TDBXIsolation = TInt32;
```

C++

```
TInt32 TDBXIsolation;
```

File

DBXCommon

Description

This is type DBXCommon.TDBXIsolation.

55.3.8 DBXCommon.TDBXParameterDirection Type

Pascal

```
TDBXParameterDirection = TInt32;
```

C++

```
TInt32 TDBXParameterDirection;
```

File

DBXCommon

Description

This is type DBXCommon.TDBXParameterDirection.

55.3.9 DBXCommon.TDBXTime Type

Pascal

```
TDBXTime = TInt32;
```

C++

```
TInt32 TDBXTime;
```

File

DBXCommon

Description

This is type DBXCommon.TDBXTime.

55.3.10 DBXCommon.TDBXTraceEvent Type

Tracing information for drivers.

Pascal

```
TDBXTraceEvent = function (TraceInfo: TDBXTraceInfo): CBRType of object;
```

C++

```
(TraceInfo: TDBXTraceInfo): CBRType ( TDBXTraceEvent)();
```

File

DBXCommon

Description

This event provides tracing information for DBX database drivers. TDBXConnection (see page 10398) has a TDBXTraceEvent property called OnTrace. The TDBXTrace delegate driver uses this event to provide DBX driver framework level tracing.

See Also

TDBXConnection (see page 10398)

OnTrace (see page 10412)

55.3.11 DBXCommon.TDBXTraceFlag Type

Pascal

```
TDBXTraceFlag = TInt32;
```

C++

```
TInt32 TDBXTraceFlag;
```

File

DBXCommon

Description

This is type DBXCommon.TDBXTraceFlag.

55.3.12 DBXCommon.TDBXType Type

Type for TDBXDataTypes (see page 10447).

Pascal

```
TDBXType = TInt32;
```

C++

```
TInt32 TDBXType;
```

File

DBXCommon

Description

TDBXType is a type for TDBXDataTypes (see page 10447).

See Also

TDBXDataTypes (see page 10447)

55.3.13 DBXCommon.TDBXValueArray Type

Pascal

```
TDBXValueArray = array of TDBXValue;
```

C++

```
array of TDBXValue TDBXValueArray;
```

File

DBXCommon

Description

This is type DBXCommon.TDBXValueArray.

55.3.14 DBXCommon.TWideStringArray Type

Pascal

```
TWideStringArray = array of WideString;
```

C++

```
array of WideString TWideStringArray;
```

File

DBXCommon

Description

This is type DBXCommon.TWideStringArray.

55.4 Constants

The following table lists constants in this documentation.

Constants

Name	Description
DBXDefaultRowSetSize (see page 10675)	This is constant DBXCommon.DBXDefaultRowSetSize.
DBXVersion25 (see page 10676)	This is constant DBXCommon.DBXVersion25.
DBXVersion30 (see page 10676)	This is constant DBXCommon.DBXVersion30.
DBXVersion40 (see page 10676)	This is constant DBXCommon.DBXVersion40.
SAlreadyPrepared (see page 10677)	This is constant DBXCommon.SAlreadyPrepared.
SConnectionFactoryInitFailed (see page 10677)	This is constant DBXCommon.SConnectionFactoryInitFailed.
SDefaultErrorMessage (see page 10677)	This is constant DBXCommon.SDefaultErrorMessage.
SDllLoadError (see page 10678)	This is constant DBXCommon.SDllLoadError.
SDllProcLoadError (see page 10678)	This is constant DBXCommon.SDllProcLoadError.
SDriverLoadError (see page 10678)	This is constant DBXCommon.SDriverLoadError.
SInvalidArgument (see page 10679)	This is constant DBXCommon.SInvalidArgument.
SInvalidDelegationDepth (see page 10679)	This is constant DBXCommon.SInvalidDelegationDepth.
SInvalidOrdinal (see page 10679)	This is constant DBXCommon.SInvalidOrdinal.
SInvalidTransaction (see page 10680)	This is constant DBXCommon.SInvalidTransaction.
SInvalidTypeAccess (see page 10680)	This is constant DBXCommon.SInvalidTypeAccess.
SNotImplemented (see page 10680)	This is constant DBXCommon.SNotImplemented.
SReaderClosed (see page 10681)	This is constant DBXCommon.SReaderClosed.
SReaderNew (see page 10681)	This is constant DBXCommon.SReaderNew.
SReadOnlyParameter (see page 10681)	This is constant DBXCommon.SReadOnlyParameter.
SReadOnlyType (see page 10682)	This is constant DBXCommon.SReadOnlyType.
SRequiredProperty (see page 10682)	This is constant DBXCommon.SRequiredProperty.
SSetFactoryOnce (see page 10682)	This is constant DBXCommon.SSetFactoryOnce.
SUnknownDriver (see page 10683)	This is constant DBXCommon.SUnknownDriver.
TDBXConnectionFile (see page 10683)	This is constant DBXCommon.TDBXConnectionFile.
TDBXDriverFile (see page 10683)	This is constant DBXCommon.TDBXDriverFile.
TDBXRegistryConnectionValue (see page 10684)	This is constant DBXCommon.TDBXRegistryConnectionValue.
TDBXRegistryDriverValue (see page 10684)	This is constant DBXCommon.TDBXRegistryDriverValue.
TDBXRegistryKey (see page 10684)	This is constant DBXCommon.TDBXRegistryKey.

55.4.1 DBXCommon.DBXDefaultRowSetSize Constant

Pascal

```
DBXDefaultRowSetSize = 20;
```

C++

```
DBXDefaultRowSetSize = 20;
```

File

DBXCommon

Description

This is constant DBXCommon.DBXDefaultRowSetSize.

55.4.2 DBXCommon.DBXVersion25 Constant

Pascal

```
DBXVersion25 = '2.5';
```

C++

```
DBXVersion25 = '2.5';
```

File

DBXCommon

Description

This is constant DBXCommon.DBXVersion25.

55.4.3 DBXCommon.DBXVersion30 Constant

Pascal

```
DBXVersion30 = '3.0';
```

C++

```
DBXVersion30 = '3.0';
```

File

DBXCommon

Description

This is constant DBXCommon.DBXVersion30.

55.4.4 DBXCommon.DBXVersion40 Constant

Pascal

```
DBXVersion40 = '4.0';
```

C++

```
DBXVersion40 = '4.0';
```

File

DBXCommon

Description

This is constant DBXCommon.DBXVersion40.

55.4.5 DBXCommon.SAlreadyPrepared Constant

Pascal

```
SAlreadyPrepared = 'Command can only be prepared once';
```

C++

```
SAlreadyPrepared = 'Command can only be prepared once';
```

File

DBXCommon

Description

This is constant DBXCommon.SAlreadyPrepared.

55.4.6 DBXCommon.SConnectionFactoryInitFailed Constant

Pascal

```
SConnectionFactoryInitFailed = 'Cannot find connection files from application directory (%s)
or the system registry (%s).';
```

C++

```
SConnectionFactoryInitFailed = 'Cannot find connection files from application directory (%s)
or the system registry (%s).';
```

File

DBXCommon

Description

This is constant DBXCommon.SConnectionFactoryInitFailed.

55.4.7 DBXCommon.SDefaultErrorMessage Constant

Pascal

```
SDefaultErrorMessage = 'DBX Error:  %s';
```

C++

```
SDefaultErrorMessage = 'DBX Error:  %s';
```

File

DBXCommon

Description

This is constant DBXCommon.SDefaultErrorMessage.

55.4.8 DBXCommon.SDllLoadError Constant

Pascal

```
SDllLoadError = 'Unable to load %s (ErrorCode %d).  It may be missing from the system path.';
```

C++

```
SDllLoadError = 'Unable to load %s (ErrorCode %d).  It may be missing from the system path.';
```

File

DBXCommon

Description

This is constant DBXCommon.SDllLoadError.

55.4.9 DBXCommon.SDllProcLoadError Constant

Pascal

```
SDllProcLoadError = 'Unable to find procedure %s';
```

C++

```
SDllProcLoadError = 'Unable to find procedure %s';
```

File

DBXCommon

Description

This is constant DBXCommon.SDllProcLoadError.

55.4.10 DBXCommon.SDriverLoadError Constant

Pascal

```
SDriverLoadError = '%s driver cannot be loaded.  Make sure your project either uses the %s
unit or uses packages so the %s package can be loaded dynamically';
```

C++

```
SDriverLoadError = '%s driver cannot be loaded.  Make sure your project either uses the %s
unit or uses packages so the %s package can be loaded dynamically';
```

File

DBXCommon

Description

This is constant DBXCommon.SDriverLoadError.

55.4.11 DBXCommon.SInvalidArgument Constant

Pascal

```
SInvalidArgument = 'Invalid argument:  %s';
```

C++

```
SInvalidArgument = 'Invalid argument:  %s';
```

File

DBXCommon

Description

This is constant DBXCommon.SInvalidArgument.

55.4.12 DBXCommon.SInvalidDelegationDepth Constant

Pascal

```
SInvalidDelegationDepth = 'Cannot delegate a connection more than 16 times:  %s';
```

C++

```
SInvalidDelegationDepth = 'Cannot delegate a connection more than 16 times:  %s';
```

File

DBXCommon

Description

This is constant DBXCommon.SInvalidDelegationDepth.

55.4.13 DBXCommon.SInvalidOrdinal Constant

Pascal

```
SInvalidOrdinal = 'Invalid Ordinal:  %d';
```

C++

```
SInvalidOrdinal = 'Invalid Ordinal:  %d';
```

File

DBXCommon

Description

This is constant DBXCommon.SInvalidOrdinal.

55.4.14 DBXCommon.SInvalidTransaction Constant

Pascal

```
SInvalidTransaction = 'Invalid transaction Object';
```

C++

```
SInvalidTransaction = 'Invalid transaction Object';
```

File

DBXCommon

Description

This is constant DBXCommon.SInvalidTransaction.

55.4.15 DBXCommon.SInvalidTypeAccess Constant

Pascal

```
SInvalidTypeAccess = '%s value type cannot be accessed as %s value type';
```

C++

```
SInvalidTypeAccess = '%s value type cannot be accessed as %s value type';
```

File

DBXCommon

Description

This is constant DBXCommon.SInvalidTypeAccess.

55.4.16 DBXCommon.SNotImplemented Constant

Pascal

```
SNotImplemented = 'Feature not implemented';
```

C++

```
SNotImplemented = 'Feature not implemented';
```

File

DBXCommon

Description

This is constant DBXCommon.SNotImplemented.

55.4.17 DBXCommon.SReaderClosed Constant

Pascal

```
SReaderClosed = 'Reader has no more rows';
```

C++

```
SReaderClosed = 'Reader has no more rows';
```

File

DBXCommon

Description

This is constant DBXCommon.SReaderClosed.

55.4.18 DBXCommon.SReaderNew Constant

Pascal

```
SReaderNew = 'Reader Next method has not been called';
```

C++

```
SReaderNew = 'Reader Next method has not been called';
```

File

DBXCommon

Description

This is constant DBXCommon.SReaderNew.

55.4.19 DBXCommon.SReadOnlyParameter Constant

Pascal

```
SReadOnlyParameter = '%s parameter cannot be modified';
```

C++

```
SReadOnlyParameter = '%s parameter cannot be modified';
```

File

DBXCommon

Description

This is constant DBXCommon.SReadOnlyParameter.

55.4.20 DBXCommon.SReadOnlyType Constant

Pascal

```
SReadOnlyType = '%s type cannot be modified';
```

C++

```
SReadOnlyType = '%s type cannot be modified';
```

File

DBXCommon

Description

This is constant DBXCommon.SReadOnlyType.

55.4.21 DBXCommon.SRequiredProperty Constant

Pascal

```
SRequiredProperty = '%s property not set';
```

C++

```
SRequiredProperty = '%s property not set';
```

File

DBXCommon

Description

This is constant DBXCommon.SRequiredProperty.

55.4.22 DBXCommon.SSetFactoryOnce Constant

Pascal

```
SSetFactoryOnce = 'Cannot set the ConnectionFactory singleton more than once';
```

C++

```
SSetFactoryOnce = 'Cannot set the ConnectionFactory singleton more than once';
```

File

DBXCommon

Description

This is constant DBXCommon.SSetFactoryOnce.

55.4.23 DBXCommon.SUnknownDriver Constant

Pascal

```
SUnknownDriver = 'Unknown driver:  %s';
```

C++

```
SUnknownDriver = 'Unknown driver:  %s';
```

File

DBXCommon

Description

This is constant DBXCommon.SUnknownDriver.

55.4.24 DBXCommon.TDBXConnectionFile Constant

Pascal

```
TDBXConnectionFile = 'dbxconnections.ini';
```

C++

```
TDBXConnectionFile = 'dbxconnections.ini';
```

File

DBXCommon

Description

This is constant DBXCommon.TDBXConnectionFile.

55.4.25 DBXCommon.TDBXDriverFile Constant

Pascal

```
TDBXDriverFile = 'dbxdrivers.ini';
```

C++

```
TDBXDriverFile = 'dbxdrivers.ini';
```

File

DBXCommon

Description

This is constant DBXCommon.TDBXDriverFile.

55.4.26 DBXCommon.TDBXRegistryConnectionValue Constant

Pascal

```
TDBXRegistryConnectionValue = 'Connection Registry File';
```

C++

```
TDBXRegistryConnectionValue = 'Connection Registry File';
```

File

DBXCommon

Description

This is constant DBXCommon.TDBXRegistryConnectionValue.

55.4.27 DBXCommon.TDBXRegistryDriverValue Constant

Pascal

```
TDBXRegistryDriverValue = 'Driver Registry File';
```

C++

```
TDBXRegistryDriverValue = 'Driver Registry File';
```

File

DBXCommon

Description

This is constant DBXCommon.TDBXRegistryDriverValue.

55.4.28 DBXCommon.TDBXRegistryKey Constant

Pascal

```
TDBXRegistryKey = '\Software\Borland\BDS\5.0\dbExpress';
```

C++

```
TDBXRegistryKey = '\Software\Borland\BDS\5.0\dbExpress';
```

File

DBXCommon

Description

This is constant DBXCommon.TDBXRegistryKey.

56 DBXMetaDataNames Namespace

This is namespace DBXMetaDataNames.

Topics

Name	Description
Classes (see page 10687)	The following table lists classes in this documentation.

Classes

	Name	Description
	TDBXCatalogsColumns (see page 10688)	Accesses columns by name in the **Catalogs** metadata.
	TDBXCatalogsIndex (see page 10689)	Accesses columns by ordinal in the **Catalogs** metadata.
	TDBXColumnConstraintsColumns (see page 10690)	Internal use only
	TDBXColumnConstraintsIndex (see page 10692)	Internal use only
	TDBXColumnsColumns (see page 10695)	Accesses columns by name in the **Columns** metadata.
	TDBXColumnsIndex (see page 10701)	Accesses columns by ordinal in the **Columns** metadata.
	TDBXDataTypesColumns (see page 10707)	Accesses columns by name in the **DataTypes** metadata.
	TDBXDataTypesIndex (see page 10716)	Accesses columns by ordinal in the **DataTypes** metadata.
	TDBXForeignKeyColumnsColumns (see page 10725)	Accesses columns by name in the **ForeignKeyColumns** metadata.
	TDBXForeignKeyColumnsIndex (see page 10729)	Accesses columns by ordinal in the **ForeignKeyColumns** metadata.
	TDBXForeignKeysColumns (see page 10734)	Accesses columns by name in the **ForeignKeys** metadata.
	TDBXForeignKeysIndex (see page 10736)	Accesses columns by ordinal in the **ForeignKeys** metadata.
	TDBXIndexColumnsColumns (see page 10738)	Accesses columns by name in the **IndexColumns** metadata.
	TDBXIndexColumnsIndex (see page 10741)	Accesses columns by ordinal in the **IndexColumns** metadata.
	TDBXIndexesColumns (see page 10744)	Accesses columns by name in the **Indexes** metadata.
	TDBXIndexesIndex (see page 10748)	Accesses columns by ordinal in the **Indexes** metadata.
	TDBXMetaDataCollectionIndex (see page 10751)	Represents a collection of metadata accessed by ordinal.
	TDBXMetaDataCollectionName (see page 10758)	Represents a collection of metadata accessed by name.
	TDBXPackageProcedureParametersColumns (see page 10766)	Accesses columns by name in the **PackageProcedureParameters** metadata.
	TDBXPackageProcedureParametersIndex (see page 10772)	Accesses columns by ordinal in the **PackageProcedureParameters** metadata.
	TDBXPackageProceduresColumns (see page 10778)	Accesses columns by name in the **PackageProcedures** metadata.
	TDBXPackageProceduresIndex (see page 10781)	Accesses columns by ordinal in the **PackageProcedures** metadata.
	TDBXPackagesColumns (see page 10783)	Accesses columns by name in the **Packages** metadata.
	TDBXPackagesIndex (see page 10785)	Accesses columns by ordinal in the **Packages** metadata.
	TDBXPackageSourcesColumns (see page 10787)	Accesses columns by name in the **PackageSources** metadata.
	TDBXPackageSourcesIndex (see page 10789)	Accesses columns by ordinal in the **PackageSources** metadata.

	TDBXProcedureParametersColumns (see page 10792)	Accesses columns by name in the **ProcedureParameters** metadata.
	TDBXProcedureParametersIndex (see page 10797)	Accesses columns by ordinal in the **ProcedureParameters** metadata.
	TDBXProceduresColumns (see page 10803)	Accesses columns by name in the **Procedures** metadata.
	TDBXProceduresIndex (see page 10805)	Accesses columns by ordinal in the **Procedures** metadata.
	TDBXProcedureSourcesColumns (see page 10807)	Accesses columns by name in the **ProcedureSources** metadata.
	TDBXProcedureSourcesIndex (see page 10810)	Accesses columns by ordinal in the **ProcedureSources** metadata.
	TDBXReservedWordsColumns (see page 10813)	Accesses columns by name in the **ReservedWords** metadata.
	TDBXReservedWordsIndex (see page 10814)	Accesses columns by ordinal in the **ReservedWords** metadata.
	TDBXRolesColumns (see page 10816)	Accesses columns by name in the **Roles** metadata.
	TDBXRolesIndex (see page 10817)	Accesses columns by ordinal in the **Roles** metadata.
	TDBXSchemasColumns (see page 10818)	Accesses columns by name in the **Schemas** metadata.
	TDBXSchemasIndex (see page 10820)	Accesses columns by ordinal in the **Schemas** metadata.
	TDBXSynonymsColumns (see page 10822)	Accesses columns by name in the **Synonyms** metadata.
	TDBXSynonymsIndex (see page 10824)	Accesses columns by ordinal in the **Synonyms** metadata.
	TDBXTablesColumns (see page 10827)	Accesses columns by name in the **Tables** metadata.
	TDBXTablesIndex (see page 10829)	Accesses columns by ordinal in the **Tables** metadata.
	TDBXUsersColumns (see page 10832)	Accesses columns by name in the **Users** metadata.
	TDBXUsersIndex (see page 10833)	Accesses columns by ordinal in the **Users** metadata.
	TDBXViewsColumns (see page 10834)	Accesses columns by name in the **Views** metadata.
	TDBXViewsIndex (see page 10836)	Accesses columns by ordinal in the **Views** metadata.

56.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TDBXCatalogsColumns (see page 10688)	Accesses columns by name in the **Catalogs** metadata.
	TDBXCatalogsIndex (see page 10689)	Accesses columns by ordinal in the **Catalogs** metadata.
	TDBXColumnConstraintsColumns (see page 10690)	Internal use only
	TDBXColumnConstraintsIndex (see page 10692)	Internal use only
	TDBXColumnsColumns (see page 10695)	Accesses columns by name in the **Columns** metadata.
	TDBXColumnsIndex (see page 10701)	Accesses columns by ordinal in the **Columns** metadata.
	TDBXDataTypesColumns (see page 10707)	Accesses columns by name in the **DataTypes** metadata.
	TDBXDataTypesIndex (see page 10716)	Accesses columns by ordinal in the **DataTypes** metadata.
	TDBXForeignKeyColumnsColumns (see page 10725)	Accesses columns by name in the **ForeignKeyColumns** metadata.
	TDBXForeignKeyColumnsIndex (see page 10729)	Accesses columns by ordinal in the **ForeignKeyColumns** metadata.
	TDBXForeignKeysColumns (see page 10734)	Accesses columns by name in the **ForeignKeys** metadata.
	TDBXForeignKeysIndex (see page 10736)	Accesses columns by ordinal in the **ForeignKeys** metadata.
	TDBXIndexColumnsColumns (see page 10738)	Accesses columns by name in the **IndexColumns** metadata.
	TDBXIndexColumnsIndex (see page 10741)	Accesses columns by ordinal in the **IndexColumns** metadata.
	TDBXIndexesColumns (see page 10744)	Accesses columns by name in the **Indexes** metadata.
	TDBXIndexesIndex (see page 10748)	Accesses columns by ordinal in the **Indexes** metadata.
	TDBXMetaDataCollectionIndex (see page 10751)	Represents a collection of metadata accessed by ordinal.
	TDBXMetaDataCollectionName (see page 10758)	Represents a collection of metadata accessed by name.
	TDBXPackageProcedureParametersColumns (see page 10766)	Accesses columns by name in the **PackageProcedureParameters** metadata.
	TDBXPackageProcedureParametersIndex (see page 10772)	Accesses columns by ordinal in the **PackageProcedureParameters** metadata.
	TDBXPackageProceduresColumns (see page 10778)	Accesses columns by name in the **PackageProcedures** metadata.
	TDBXPackageProceduresIndex (see page 10781)	Accesses columns by ordinal in the **PackageProcedures** metadata.
	TDBXPackagesColumns (see page 10783)	Accesses columns by name in the **Packages** metadata.
	TDBXPackagesIndex (see page 10785)	Accesses columns by ordinal in the **Packages** metadata.
	TDBXPackageSourcesColumns (see page 10787)	Accesses columns by name in the **PackageSources** metadata.
	TDBXPackageSourcesIndex (see page 10789)	Accesses columns by ordinal in the **PackageSources** metadata.
	TDBXProcedureParametersColumns (see page 10792)	Accesses columns by name in the **ProcedureParameters** metadata.
	TDBXProcedureParametersIndex (see page 10797)	Accesses columns by ordinal in the **ProcedureParameters** metadata.
	TDBXProceduresColumns (see page 10803)	Accesses columns by name in the **Procedures** metadata.
	TDBXProceduresIndex (see page 10805)	Accesses columns by ordinal in the **Procedures** metadata.
	TDBXProcedureSourcesColumns (see page 10807)	Accesses columns by name in the **ProcedureSources** metadata.
	TDBXProcedureSourcesIndex (see page 10810)	Accesses columns by ordinal in the **ProcedureSources** metadata.
	TDBXReservedWordsColumns (see page 10813)	Accesses columns by name in the **ReservedWords** metadata.
	TDBXReservedWordsIndex (see page 10814)	Accesses columns by ordinal in the **ReservedWords** metadata.
	TDBXRolesColumns (see page 10816)	Accesses columns by name in the **Roles** metadata.
	TDBXRolesIndex (see page 10817)	Accesses columns by ordinal in the **Roles** metadata.
	TDBXSchemasColumns (see page 10818)	Accesses columns by name in the **Schemas** metadata.
	TDBXSchemasIndex (see page 10820)	Accesses columns by ordinal in the **Schemas** metadata.
	TDBXSynonymsColumns (see page 10822)	Accesses columns by name in the **Synonyms** metadata.
	TDBXSynonymsIndex (see page 10824)	Accesses columns by ordinal in the **Synonyms** metadata.
	TDBXTablesColumns (see page 10827)	Accesses columns by name in the **Tables** metadata.
	TDBXTablesIndex (see page 10829)	Accesses columns by ordinal in the **Tables** metadata.
	TDBXUsersColumns (see page 10832)	Accesses columns by name in the **Users** metadata.

	TDBXUsersIndex (see page 10833)	Accesses columns by ordinal in the **Users** metadata.
	TDBXViewsColumns (see page 10834)	Accesses columns by name in the **Views** metadata.
	TDBXViewsIndex (see page 10836)	Accesses columns by ordinal in the **Views** metadata.

56.1.1 TDBXCatalogsColumns Class

Accesses columns by name in the **Catalogs** metadata.

Class Hierarchy

DBXMetaDataNames.TDBXCatalogsColumns

Pascal

```
TDBXCatalogsColumns = class;
```

C++

```
class TDBXCatalogsColumns;
```

File

DBXMetaDataNames

Description

TDBXCatalogsColumns is used to access columns by name in the **Catalogs** metadata collection. These columns are returned when TDBXCommand.Text' is TDBXMetaDataCommandsEx.GetCatalogs when reading metadata. To retrieve the metadata column, use this constant to index the TDBXReader instance returned by TDBXCommand.ExecuteQuery.

This table describes the column.

Column Name	Data Type of Column Data	Description
CatalogName (see page 10689)	String	Catalog name.

See Also

TDBXCatalogsIndex (see page 10689)

TDBXMetaDataCommandsEx (see page 10531)

56.1.1.1 TDBXCatalogsColumns Members

The following tables list the members exposed by TDBXCatalogsColumns.

Public Constants

	Name	Description
	CatalogName (see page 10689)	This is CatalogName, a member of class TDBXCatalogsColumns.

56.1.1.2 TDBXCatalogsColumns Constants

The constants of the TDBXCatalogsColumns class are listed here.

Public Constants

	Name	Description
	CatalogName (see page 10689)	This is CatalogName, a member of class TDBXCatalogsColumns.

56.1.1.2.1 TDBXCatalogsColumns.CatalogName Constant

Pascal

```
const CatalogName = 'CatalogName';
```

C++

```
CatalogName = 'CatalogName';
```

Description

This is CatalogName, a member of class TDBXCatalogsColumns.

56.1.2 TDBXCatalogsIndex Class

Accesses columns by ordinal in the **Catalogs** metadata.

Class Hierarchy

DBXMetaDataNames.TDBXCatalogsIndex

Pascal

```
TDBXCatalogsIndex = class;
```

C++

```
class TDBXCatalogsIndex;
```

File

DBXMetaDataNames

Description

TDBXCatalogsIndex is used to access columns by ordinal in the **Catalogs** metadata collection. These columns are returned when TDBXCommand.Text' is TDBXMetaDataCommandsEx.GetCatalogs when reading metadata. To retrieve a metadata column, use this constant to index the TDBXReader instance returned by TDBXCommand.ExecuteQuery.

This table describes the column.

Column Ordinal Name	Data Type of Column Data	Description
CatalogName (see page 10690)	String	Catalog name.

See Also

TDBXCatalogsColumns (see page 10688)

TDBXMetaDataCommandsEx (see page 10531)

56.1.2.1 TDBXCatalogsIndex Members

The following tables list the members exposed by TDBXCatalogsIndex.

Public Constants

	Name	Description
	CatalogName (see page 10690)	This is CatalogName, a member of class TDBXCatalogsIndex.
	Last (see page 10690)	This is Last, a member of class TDBXCatalogsIndex.

56.1.2.2 TDBXCatalogsIndex Constants

The constants of the TDBXCatalogsIndex class are listed here.

Public Constants

	Name	Description
	CatalogName (see page 10690)	This is CatalogName, a member of class TDBXCatalogsIndex.
	Last (see page 10690)	This is Last, a member of class TDBXCatalogsIndex.

56.1.2.2.1 TDBXCatalogsIndex.CatalogName Constant

Pascal

```
const CatalogName = 0;
```

C++

```
CatalogName = 0;
```

Description

This is CatalogName, a member of class TDBXCatalogsIndex.

56.1.2.2.2 TDBXCatalogsIndex.Last Constant

Pascal

```
const Last = 0;
```

C++

```
Last = 0;
```

Description

This is Last, a member of class TDBXCatalogsIndex.

56.1.3 TDBXColumnConstraintsColumns Class

Internal use only

Class Hierarchy

Pascal

```
TDBXColumnConstraintsColumns = class;
```

C++

```
class TDBXColumnConstraintsColumns;
```

File

DBXMetaDataNames

Description

This class is used internally.

56.1.3.1 TDBXColumnConstraintsColumns Members

The following tables list the members exposed by TDBXColumnConstraintsColumns.

Public Constants

	Name	Description
	CatalogName (see page 10691)	This is CatalogName, a member of class TDBXColumnConstraintsColumns.
	ColumnName (see page 10691)	This is ColumnName, a member of class TDBXColumnConstraintsColumns.
	ConstraintName (see page 10692)	This is ConstraintName, a member of class TDBXColumnConstraintsColumns.
	SchemaName (see page 10692)	This is SchemaName, a member of class TDBXColumnConstraintsColumns.
	TableName (see page 10692)	This is TableName, a member of class TDBXColumnConstraintsColumns.

56.1.3.2 TDBXColumnConstraintsColumns Constants

The constants of the TDBXColumnConstraintsColumns class are listed here.

Public Constants

	Name	Description
	CatalogName (see page 10691)	This is CatalogName, a member of class TDBXColumnConstraintsColumns.
	ColumnName (see page 10691)	This is ColumnName, a member of class TDBXColumnConstraintsColumns.
	ConstraintName (see page 10692)	This is ConstraintName, a member of class TDBXColumnConstraintsColumns.
	SchemaName (see page 10692)	This is SchemaName, a member of class TDBXColumnConstraintsColumns.
	TableName (see page 10692)	This is TableName, a member of class TDBXColumnConstraintsColumns.

56.1.3.2.1 TDBXColumnConstraintsColumns.CatalogName Constant

Pascal

```
const CatalogName = 'CatalogName';
```

C++

```
CatalogName = 'CatalogName';
```

Description

This is CatalogName, a member of class TDBXColumnConstraintsColumns.

56.1.3.2.2 TDBXColumnConstraintsColumns.ColumnName Constant

Pascal

```
const ColumnName = 'ColumnName';
```

C++

```
ColumnName = 'ColumnName';
```

Description

This is ColumnName, a member of class TDBXColumnConstraintsColumns.

56.1.3.2.3 TDBXColumnConstraintsColumns.ConstraintName Constant

Pascal

```
const ConstraintName = 'ConstraintName';
```

C++

```
ConstraintName = 'ConstraintName';
```

Description

This is ConstraintName, a member of class TDBXColumnConstraintsColumns.

56.1.3.2.4 TDBXColumnConstraintsColumns.SchemaName Constant

Pascal

```
const SchemaName = 'SchemaName';
```

C++

```
SchemaName = 'SchemaName';
```

Description

This is SchemaName, a member of class TDBXColumnConstraintsColumns.

56.1.3.2.5 TDBXColumnConstraintsColumns.TableName Constant

Pascal

```
const TableName = 'TableName';
```

C++

```
TableName = 'TableName';
```

Description

This is TableName, a member of class TDBXColumnConstraintsColumns.

56.1.4 TDBXColumnConstraintsIndex Class

Internal use only

Class Hierarchy

Pascal

```
TDBXColumnConstraintsIndex = class;
```

C++

```
class TDBXColumnConstraintsIndex;
```

File

DBXMetaDataNames

Description

This class is used internally.

56.1.4.1 TDBXColumnConstraintsIndex Members

The following tables list the members exposed by TDBXColumnConstraintsIndex.

Public Constants

	Name	Description
	CatalogName (see page 10693)	This is CatalogName, a member of class TDBXColumnConstraintsIndex.
	ColumnName (see page 10693)	This is ColumnName, a member of class TDBXColumnConstraintsIndex.
	ConstraintName (see page 10694)	This is ConstraintName, a member of class TDBXColumnConstraintsIndex.
	Last (see page 10694)	This is Last, a member of class TDBXColumnConstraintsIndex.
	SchemaName (see page 10694)	This is SchemaName, a member of class TDBXColumnConstraintsIndex.
	TableName (see page 10694)	This is TableName, a member of class TDBXColumnConstraintsIndex.

56.1.4.2 TDBXColumnConstraintsIndex Constants

The constants of the TDBXColumnConstraintsIndex class are listed here.

Public Constants

	Name	Description
	CatalogName (see page 10693)	This is CatalogName, a member of class TDBXColumnConstraintsIndex.
	ColumnName (see page 10693)	This is ColumnName, a member of class TDBXColumnConstraintsIndex.
	ConstraintName (see page 10694)	This is ConstraintName, a member of class TDBXColumnConstraintsIndex.
	Last (see page 10694)	This is Last, a member of class TDBXColumnConstraintsIndex.
	SchemaName (see page 10694)	This is SchemaName, a member of class TDBXColumnConstraintsIndex.
	TableName (see page 10694)	This is TableName, a member of class TDBXColumnConstraintsIndex.

56.1.4.2.1 TDBXColumnConstraintsIndex.CatalogName Constant

Pascal

```
const CatalogName = 0;
```

C++

```
CatalogName = 0;
```

Description

This is CatalogName, a member of class TDBXColumnConstraintsIndex.

56.1.4.2.2 TDBXColumnConstraintsIndex.ColumnName Constant

Pascal

```
const ColumnName = 4;
```

C++

```
ColumnName = 4;
```

Description

This is ColumnName, a member of class TDBXColumnConstraintsIndex.

56.1.4.2.3 TDBXColumnConstraintsIndex.ConstraintName Constant

Pascal

```
const ConstraintName = 3;
```

C++

```
ConstraintName = 3;
```

Description

This is ConstraintName, a member of class TDBXColumnConstraintsIndex.

56.1.4.2.4 TDBXColumnConstraintsIndex.Last Constant

Pascal

```
const Last = 4;
```

C++

```
Last = 4;
```

Description

This is Last, a member of class TDBXColumnConstraintsIndex.

56.1.4.2.5 TDBXColumnConstraintsIndex.SchemaName Constant

Pascal

```
const SchemaName = 1;
```

C++

```
SchemaName = 1;
```

Description

This is SchemaName, a member of class TDBXColumnConstraintsIndex.

56.1.4.2.6 TDBXColumnConstraintsIndex.TableName Constant

Pascal

```
const TableName = 2;
```

C++

```
TableName = 2;
```

Description

This is TableName, a member of class TDBXColumnConstraintsIndex.

56.1.5 TDBXColumnsColumns Class

Accesses columns by name in the **Columns** metadata.

Class Hierarchy

DBXMetaDataNames.TDBXColumnsColumns

Pascal

```
TDBXColumnsColumns = class;
```

C++

```
class TDBXColumnsColumns;
```

File

DBXMetaDataNames

Description

TDBXColumnsColumns is used to access columns by name in the **Columns** metadata collection. These columns are returned when TDBXCommand.Text' is TDBXMetaDataCommands.GetColumns when reading metadata. To retrieve metadata columns, use these constants to index the TDBXReader instance returned by TDBXCommand.ExecuteQuery.

This table describes the columns.

Column Name	Data Type of Column Data	Description
CatalogName (see page 10697)	String	Catalog name.
SchemaName (see page 10700)	String	Schema name.
TableName (see page 10700)	String	Table name.
ColumnName (see page 10697)	String	Column name.
TypeName (see page 10700)	String	Database specific data type name.
Precision (see page 10700)	Int32	Precision (see page 10700) of this type. For a string data type, this is the maximum number of characters. For a decimal types, this is the maximum number digits including digits from the scale.
Scale (see page 10700)	Int32	Scale (see page 10700) of a decimal type.
Ordinal (see page 10699)	Int32	Position in the rows of the table starting with 1.
DefaultValue (see page 10698)	String	Default value.
IsNullable (see page 10698)	Boolean	True if accepts NULL values; false otherwise.

IsAutoIncrement (see page 10698)	Boolean	Is an autoincrement value.
MaxInline (see page 10699)	Int32	The maximal number of bytes to write into row. The rest of the data is handled as a BLOB. (Blackfish SQL only).
DbxDataType (see page 10697)	Int32	dbExpress data type.
IsFixedLength (see page 10698)	Boolean	True if holds fixed length data; false otherwise.
IsUnicode (see page 10699)	Boolean	Can hold Unicode characters.
IsLong (see page 10698)	Boolean	Is a BLOB data type.
IsUnsigned (see page 10699)	Boolean	Is an unsigned numeric type.

56.1.5.1 TDBXColumnsColumns Members

The following tables list the members exposed by TDBXColumnsColumns.

Public Constants

	Name	Description
	CatalogName (see page 10697)	This is CatalogName, a member of class TDBXColumnsColumns.
	ColumnName (see page 10697)	This is ColumnName, a member of class TDBXColumnsColumns.
	DbxDataType (see page 10697)	This is DbxDataType, a member of class TDBXColumnsColumns.
	DefaultValue (see page 10698)	This is DefaultValue, a member of class TDBXColumnsColumns.
	IsAutoIncrement (see page 10698)	This is IsAutoIncrement, a member of class TDBXColumnsColumns.
	IsFixedLength (see page 10698)	This is IsFixedLength, a member of class TDBXColumnsColumns.
	IsLong (see page 10698)	This is IsLong, a member of class TDBXColumnsColumns.
	IsNullable (see page 10698)	This is IsNullable, a member of class TDBXColumnsColumns.
	IsUnicode (see page 10699)	This is IsUnicode, a member of class TDBXColumnsColumns.
	IsUnsigned (see page 10699)	This is IsUnsigned, a member of class TDBXColumnsColumns.
	MaxInline (see page 10699)	This is MaxInline, a member of class TDBXColumnsColumns.
	Ordinal (see page 10699)	This is Ordinal, a member of class TDBXColumnsColumns.
	Precision (see page 10700)	This is Precision, a member of class TDBXColumnsColumns.
	Scale (see page 10700)	This is Scale, a member of class TDBXColumnsColumns.
	SchemaName (see page 10700)	This is SchemaName, a member of class TDBXColumnsColumns.
	TableName (see page 10700)	This is TableName, a member of class TDBXColumnsColumns.
	TypeName (see page 10700)	This is TypeName, a member of class TDBXColumnsColumns.

56.1.5.2 TDBXColumnsColumns Constants

The constants of the TDBXColumnsColumns class are listed here.

Public Constants

	Name	Description
	CatalogName (see page 10697)	This is CatalogName, a member of class TDBXColumnsColumns.
	ColumnName (see page 10697)	This is ColumnName, a member of class TDBXColumnsColumns.
	DbxDataType (see page 10697)	This is DbxDataType, a member of class TDBXColumnsColumns.
	DefaultValue (see page 10698)	This is DefaultValue, a member of class TDBXColumnsColumns.
	IsAutoIncrement (see page 10698)	This is IsAutoIncrement, a member of class TDBXColumnsColumns.
	IsFixedLength (see page 10698)	This is IsFixedLength, a member of class TDBXColumnsColumns.
	IsLong (see page 10698)	This is IsLong, a member of class TDBXColumnsColumns.
	IsNullable (see page 10698)	This is IsNullable, a member of class TDBXColumnsColumns.
	IsUnicode (see page 10699)	This is IsUnicode, a member of class TDBXColumnsColumns.
	IsUnsigned (see page 10699)	This is IsUnsigned, a member of class TDBXColumnsColumns.
	MaxInline (see page 10699)	This is MaxInline, a member of class TDBXColumnsColumns.
	Ordinal (see page 10699)	This is Ordinal, a member of class TDBXColumnsColumns.
	Precision (see page 10700)	This is Precision, a member of class TDBXColumnsColumns.
	Scale (see page 10700)	This is Scale, a member of class TDBXColumnsColumns.
	SchemaName (see page 10700)	This is SchemaName, a member of class TDBXColumnsColumns.
	TableName (see page 10700)	This is TableName, a member of class TDBXColumnsColumns.
	TypeName (see page 10700)	This is TypeName, a member of class TDBXColumnsColumns.

56.1.5.2.1 TDBXColumnsColumns.CatalogName Constant

Pascal

```
const CatalogName = 'CatalogName';
```

C++

```
CatalogName = 'CatalogName';
```

Description

This is CatalogName, a member of class TDBXColumnsColumns.

56.1.5.2.2 TDBXColumnsColumns.ColumnName Constant

Pascal

```
const ColumnName = 'ColumnName';
```

C++

```
ColumnName = 'ColumnName';
```

Description

This is ColumnName, a member of class TDBXColumnsColumns.

56.1.5.2.3 TDBXColumnsColumns.DbxDataType Constant

Pascal

```
const DbxDataType = 'DbxDataType';
```

C++

```
DbxDataType = 'DbxDataType';
```

Description

This is DbxDataType, a member of class TDBXColumnsColumns.

56.1.5.2.4 TDBXColumnsColumns.DefaultValue Constant

Pascal

```
const DefaultValue = 'DefaultValue';
```

C++

```
DefaultValue = 'DefaultValue';
```

Description

This is DefaultValue, a member of class TDBXColumnsColumns.

56.1.5.2.5 TDBXColumnsColumns.IsAutoIncrement Constant

Pascal

```
const IsAutoIncrement = 'IsAutoIncrement';
```

C++

```
IsAutoIncrement = 'IsAutoIncrement';
```

Description

This is IsAutoIncrement, a member of class TDBXColumnsColumns.

56.1.5.2.6 TDBXColumnsColumns.IsFixedLength Constant

Pascal

```
const IsFixedLength = 'IsFixedLength';
```

C++

```
IsFixedLength = 'IsFixedLength';
```

Description

This is IsFixedLength, a member of class TDBXColumnsColumns.

56.1.5.2.7 TDBXColumnsColumns.IsLong Constant

Pascal

```
const IsLong = 'IsLong';
```

C++

```
IsLong = 'IsLong';
```

Description

This is IsLong, a member of class TDBXColumnsColumns.

56.1.5.2.8 TDBXColumnsColumns.IsNullable Constant

Pascal

```
const IsNullable = 'IsNullable';
```

C++

```
IsNullable = 'IsNullable';
```

Description

This is IsNullable, a member of class TDBXColumnsColumns.

56.1.5.2.9 TDBXColumnsColumns.IsUnicode Constant

Pascal

```
const IsUnicode = 'IsUnicode';
```

C++

```
IsUnicode = 'IsUnicode';
```

Description

This is IsUnicode, a member of class TDBXColumnsColumns.

56.1.5.2.10 TDBXColumnsColumns.IsUnsigned Constant

Pascal

```
const IsUnsigned = 'IsUnsigned';
```

C++

```
IsUnsigned = 'IsUnsigned';
```

Description

This is IsUnsigned, a member of class TDBXColumnsColumns.

56.1.5.2.11 TDBXColumnsColumns.MaxInline Constant

Pascal

```
const MaxInline = 'MaxInline';
```

C++

```
MaxInline = 'MaxInline';
```

Description

This is MaxInline, a member of class TDBXColumnsColumns.

56.1.5.2.12 TDBXColumnsColumns.Ordinal Constant

Pascal

```
const Ordinal = 'Ordinal';
```

C++

```
Ordinal = 'Ordinal';
```

Description

This is Ordinal, a member of class TDBXColumnsColumns.

56.1.5.2.13 TDBXColumnsColumns.Precision Constant

Pascal

```
const Precision = 'Precision';
```

C++

```
Precision = 'Precision';
```

Description

This is Precision, a member of class TDBXColumnsColumns.

56.1.5.2.14 TDBXColumnsColumns.Scale Constant

Pascal

```
const Scale = 'Scale';
```

C++

```
Scale = 'Scale';
```

Description

This is Scale, a member of class TDBXColumnsColumns.

56.1.5.2.15 TDBXColumnsColumns.SchemaName Constant

Pascal

```
const SchemaName = 'SchemaName';
```

C++

```
SchemaName = 'SchemaName';
```

Description

This is SchemaName, a member of class TDBXColumnsColumns.

56.1.5.2.16 TDBXColumnsColumns.TableName Constant

Pascal

```
const TableName = 'TableName';
```

C++

```
TableName = 'TableName';
```

Description

This is TableName, a member of class TDBXColumnsColumns.

56.1.5.2.17 TDBXColumnsColumns.TypeName Constant

Pascal

```
const TypeName = 'TypeName';
```

C++

```
TypeName = 'TypeName';
```

Description

This is TypeName, a member of class TDBXColumnsColumns.

56.1.6 TDBXColumnsIndex Class

Accesses columns by ordinal in the **Columns** metadata.

Class Hierarchy

DBXMetaDataNames.TDBXColumnsIndex

Pascal

```
TDBXColumnsIndex = class;
```

C++

```
class TDBXColumnsIndex;
```

File

DBXMetaDataNames

Description

TDBXColumnsIndex is used to access columns by ordinal in the **Columns** metadata collection. These columns are returned when TDBXCommand.Text' is TDBXMetaDataCommands.GetColumns when reading metadata. To retrieve metadata columns, use these constants to index the TDBXReader instance returned by TDBXCommand.ExecuteQuery.

This table describes the columns.

Column Ordinal (see page 10706) Name	Data Type of Column Data	Description
CatalogName (see page 10703)	String	Catalog name.
SchemaName (see page 10706)	String	Schema name.
TableName (see page 10707)	String	Table name.
ColumnName (see page 10703)	String	Column name.
TypeName (see page 10707)	String	Database specific data type name.
Precision (see page 10706)	Int32	Precision (see page 10706) of this type. For a string data type, this is the maximum number of characters. For a decimal types, this is the maximum number digits including digits from the scale.
Scale (see page 10706)	Int32	Scale (see page 10706) of a decimal type.
Ordinal (see page 10706)	Int32	Position in the rows of the table starting with 1.
DefaultValue (see page 10704)	String	Default value.

IsNullable (see page 10705)	Boolean	True if accepts NULL values; false otherwise.
IsAutoIncrement (see page 10704)	Boolean	Is an autoincrement value.
MaxInline (see page 10705)	Int32	The maximal number of bytes to write into row. The rest of the data is handled as a BLOB. (Blackfish SQL only).
DbxDataType (see page 10703)	Int32	dbExpress data type.
IsFixedLength (see page 10704)	Boolean	True if holds fixed length data; false otherwise.
IsUnicode (see page 10705)	Boolean	Can hold Unicode characters.
IsLong (see page 10704)	Boolean	Is a BLOB data type.
IsUnsigned (see page 10705)	Boolean	Is an unsigned numeric type.

56.1.6.1 TDBXColumnsIndex Members

The following tables list the members exposed by TDBXColumnsIndex.

Public Constants

	Name	Description
	CatalogName (see page 10703)	This is CatalogName, a member of class TDBXColumnsIndex.
	ColumnName (see page 10703)	This is ColumnName, a member of class TDBXColumnsIndex.
	DbxDataType (see page 10703)	This is DbxDataType, a member of class TDBXColumnsIndex.
	DefaultValue (see page 10704)	This is DefaultValue, a member of class TDBXColumnsIndex.
	IsAutoIncrement (see page 10704)	This is IsAutoIncrement, a member of class TDBXColumnsIndex.
	IsFixedLength (see page 10704)	This is IsFixedLength, a member of class TDBXColumnsIndex.
	IsLong (see page 10704)	This is IsLong, a member of class TDBXColumnsIndex.
	IsNullable (see page 10705)	This is IsNullable, a member of class TDBXColumnsIndex.
	IsUnicode (see page 10705)	This is IsUnicode, a member of class TDBXColumnsIndex.
	IsUnsigned (see page 10705)	This is IsUnsigned, a member of class TDBXColumnsIndex.
	Last (see page 10705)	This is Last, a member of class TDBXColumnsIndex.
	MaxInline (see page 10705)	This is MaxInline, a member of class TDBXColumnsIndex.
	Ordinal (see page 10706)	This is Ordinal, a member of class TDBXColumnsIndex.
	Precision (see page 10706)	This is Precision, a member of class TDBXColumnsIndex.
	Scale (see page 10706)	This is Scale, a member of class TDBXColumnsIndex.
	SchemaName (see page 10706)	This is SchemaName, a member of class TDBXColumnsIndex.
	TableName (see page 10707)	This is TableName, a member of class TDBXColumnsIndex.
	TypeName (see page 10707)	This is TypeName, a member of class TDBXColumnsIndex.

56.1.6.2 TDBXColumnsIndex Constants

The constants of the TDBXColumnsIndex class are listed here.

Public Constants

	Name	Description
	CatalogName (see page 10703)	This is CatalogName, a member of class TDBXColumnsIndex.
	ColumnName (see page 10703)	This is ColumnName, a member of class TDBXColumnsIndex.
	DbxDataType (see page 10703)	This is DbxDataType, a member of class TDBXColumnsIndex.
	DefaultValue (see page 10704)	This is DefaultValue, a member of class TDBXColumnsIndex.
	IsAutoIncrement (see page 10704)	This is IsAutoIncrement, a member of class TDBXColumnsIndex.
	IsFixedLength (see page 10704)	This is IsFixedLength, a member of class TDBXColumnsIndex.
	IsLong (see page 10704)	This is IsLong, a member of class TDBXColumnsIndex.
	IsNullable (see page 10705)	This is IsNullable, a member of class TDBXColumnsIndex.
	IsUnicode (see page 10705)	This is IsUnicode, a member of class TDBXColumnsIndex.
	IsUnsigned (see page 10705)	This is IsUnsigned, a member of class TDBXColumnsIndex.
	Last (see page 10705)	This is Last, a member of class TDBXColumnsIndex.
	MaxInline (see page 10705)	This is MaxInline, a member of class TDBXColumnsIndex.
	Ordinal (see page 10706)	This is Ordinal, a member of class TDBXColumnsIndex.
	Precision (see page 10706)	This is Precision, a member of class TDBXColumnsIndex.
	Scale (see page 10706)	This is Scale, a member of class TDBXColumnsIndex.
	SchemaName (see page 10706)	This is SchemaName, a member of class TDBXColumnsIndex.
	TableName (see page 10707)	This is TableName, a member of class TDBXColumnsIndex.
	TypeName (see page 10707)	This is TypeName, a member of class TDBXColumnsIndex.

56.1.6.2.1 TDBXColumnsIndex.CatalogName Constant

Pascal

```
const CatalogName = 0;
```

C++

```
CatalogName = 0;
```

Description

This is CatalogName, a member of class TDBXColumnsIndex.

56.1.6.2.2 TDBXColumnsIndex.ColumnName Constant

Pascal

```
const ColumnName = 3;
```

C++

```
ColumnName = 3;
```

Description

This is ColumnName, a member of class TDBXColumnsIndex.

56.1.6.2.3 TDBXColumnsIndex.DbxDataType Constant

Pascal

```
const DbxDataType = 12;
```

C++

```
DbxDataType = 12;
```

Description

This is DbxDataType, a member of class TDBXColumnsIndex.

56.1.6.2.4 TDBXColumnsIndex.DefaultValue Constant

Pascal

```
const DefaultValue = 8;
```

C++

```
DefaultValue = 8;
```

Description

This is DefaultValue, a member of class TDBXColumnsIndex.

56.1.6.2.5 TDBXColumnsIndex.IsAutoIncrement Constant

Pascal

```
const IsAutoIncrement = 10;
```

C++

```
IsAutoIncrement = 10;
```

Description

This is IsAutoIncrement, a member of class TDBXColumnsIndex.

56.1.6.2.6 TDBXColumnsIndex.IsFixedLength Constant

Pascal

```
const IsFixedLength = 13;
```

C++

```
IsFixedLength = 13;
```

Description

This is IsFixedLength, a member of class TDBXColumnsIndex.

56.1.6.2.7 TDBXColumnsIndex.IsLong Constant

Pascal

```
const IsLong = 15;
```

C++

```
IsLong = 15;
```

Description

This is IsLong, a member of class TDBXColumnsIndex.

56.1.6.2.8 TDBXColumnsIndex.IsNullable Constant

Pascal

```
const IsNullable = 9;
```

C++

```
IsNullable = 9;
```

Description

This is IsNullable, a member of class TDBXColumnsIndex.

56.1.6.2.9 TDBXColumnsIndex.IsUnicode Constant

Pascal

```
const IsUnicode = 14;
```

C++

```
IsUnicode = 14;
```

Description

This is IsUnicode, a member of class TDBXColumnsIndex.

56.1.6.2.10 TDBXColumnsIndex.IsUnsigned Constant

Pascal

```
const IsUnsigned = 16;
```

C++

```
IsUnsigned = 16;
```

Description

This is IsUnsigned, a member of class TDBXColumnsIndex.

56.1.6.2.11 TDBXColumnsIndex.Last Constant

Pascal

```
const Last = 16;
```

C++

```
Last = 16;
```

Description

This is Last, a member of class TDBXColumnsIndex.

56.1.6.2.12 TDBXColumnsIndex.MaxInline Constant

Pascal

```
const MaxInline = 11;
```

C++

```
MaxInline = 11;
```

Description

This is MaxInline, a member of class TDBXColumnsIndex.

56.1.6.2.13 TDBXColumnsIndex.Ordinal Constant

Pascal

```
const Ordinal = 7;
```

C++

```
Ordinal = 7;
```

Description

This is Ordinal, a member of class TDBXColumnsIndex.

56.1.6.2.14 TDBXColumnsIndex.Precision Constant

Pascal

```
const Precision = 5;
```

C++

```
Precision = 5;
```

Description

This is Precision, a member of class TDBXColumnsIndex.

56.1.6.2.15 TDBXColumnsIndex.Scale Constant

Pascal

```
const Scale = 6;
```

C++

```
Scale = 6;
```

Description

This is Scale, a member of class TDBXColumnsIndex.

56.1.6.2.16 TDBXColumnsIndex.SchemaName Constant

Pascal

```
const SchemaName = 1;
```

C++

```
SchemaName = 1;
```

Description

This is SchemaName, a member of class TDBXColumnsIndex.

56.1.6.2.17 TDBXColumnsIndex.TableName Constant

Pascal

```
const TableName = 2;
```

C++

```
TableName = 2;
```

Description

This is TableName, a member of class TDBXColumnsIndex.

56.1.6.2.18 TDBXColumnsIndex.TypeName Constant

Pascal

```
const TypeName = 4;
```

C++

```
TypeName = 4;
```

Description

This is TypeName, a member of class TDBXColumnsIndex.

56.1.7 TDBXDataTypesColumns Class

Accesses columns by name in the **DataTypes** metadata.

Class Hierarchy

DBXMetaDataNames.TDBXDataTypesColumns

Pascal

```
TDBXDataTypesColumns = class;
```

C++

```
class TDBXDataTypesColumns;
```

File

DBXMetaDataNames

Description

TDBXDataTypesColumns is used to access columns by name in the **DataTypes** metadata collection. These columns are returned when TDBXCommand.Text' is TDBXMetaDataCommands.GetDataTypes when reading metadata. To retrieve metadata columns, use these constants to index the TDBXReader instance returned by TDBXCommand.ExecuteQuery.

This table describes the columns.

Column Name	Data Type of Column Data	Description
TypeName (see page 10716)	String	Database specific data type name.

DbxDataType (see page 10711)	Int32	dbExpress data type.
ColumnSize (see page 10710)	Int64	Length of this type. For a string data type, this is the maximum number of characters. For a floating point number, this is the number of significant bits in the mantissa. For other numeric types, this is the maximum number of significant digits. For date, time, and timestamp types, this is the length of the string representation.
CreateFormat (see page 10710)	String	Create format as used in CREATE TABLE.
CreateParameters (see page 10711)	String	Parameters for the create format.
DataType (see page 10711)	String	Name of language type representing this data type.
IsAutoIncrementable (see page 10711)	Boolean	Can be used for an autoincrement column.
IsBestMatch (see page 10711)	Boolean	Is best match for language type.
IsCaseSensitive (see page 10712)	Boolean	Is case sensitive.
IsFixedLength (see page 10712)	Boolean	Is fixed length.
IsFixedPrecisionScale (see page 10712)	Boolean	Is an exact numeric.
IsLong (see page 10713)	Boolean	Is a BLOB type.
IsNullable (see page 10713)	Boolean	Can be assigned a value of NULL.
IsSearchable (see page 10713)	Boolean	Can be searched in the SQL database.
IsSearchableWithLike (see page 10713)	Boolean	Can be searched with the SQL LIKE operator.
IsUnsigned (see page 10714)	Boolean	Is an unsigned numeric.
MaximumScale (see page 10715)	Int16	Maximum possible scale value.
MinimumScale (see page 10715)	Int16	Minimum possible scale value.
IsConcurrencyType (see page 10712)	Boolean	Has special update semantics.
MaximumVersion (see page 10715)	String	Last database product version where this type was available.
MinimumVersion (see page 10715)	String	First database product version where this type was available.
IsLiteralSupported (see page 10713)	Boolean	Can be represented as a SQL literal.
LiteralPrefix (see page 10714)	String	Prefix of SQL literal.

LiteralSuffix (see page 10714)	String	Suffix of SQL literal.
IsUnicode (see page 10714)	Boolean	Can hold Unicode character data.
ProviderDbType (see page 10715)	Int32	Same as the DbxDataType (see page 10711) column. Reserved for .NET applications.

56.1.7.1 TDBXDataTypesColumns Members

The following tables list the members exposed by TDBXDataTypesColumns.

Public Constants

	Name	Description
	ColumnSize (see page 10710)	This is ColumnSize, a member of class TDBXDataTypesColumns.
	CreateFormat (see page 10710)	This is CreateFormat, a member of class TDBXDataTypesColumns.
	CreateParameters (see page 10711)	This is CreateParameters, a member of class TDBXDataTypesColumns.
	DataType (see page 10711)	This is DataType, a member of class TDBXDataTypesColumns.
	DbxDataType (see page 10711)	This is DbxDataType, a member of class TDBXDataTypesColumns.
	IsAutoIncrementable (see page 10711)	This is IsAutoIncrementable, a member of class TDBXDataTypesColumns.
	IsBestMatch (see page 10711)	This is IsBestMatch, a member of class TDBXDataTypesColumns.
	IsCaseSensitive (see page 10712)	This is IsCaseSensitive, a member of class TDBXDataTypesColumns.
	IsConcurrencyType (see page 10712)	This is IsConcurrencyType, a member of class TDBXDataTypesColumns.
	IsFixedLength (see page 10712)	This is IsFixedLength, a member of class TDBXDataTypesColumns.
	IsFixedPrecisionScale (see page 10712)	This is IsFixedPrecisionScale, a member of class TDBXDataTypesColumns.
	IsLiteralSupported (see page 10713)	This is IsLiteralSupported, a member of class TDBXDataTypesColumns.
	IsLong (see page 10713)	This is IsLong, a member of class TDBXDataTypesColumns.
	IsNullable (see page 10713)	This is IsNullable, a member of class TDBXDataTypesColumns.
	IsSearchable (see page 10713)	This is IsSearchable, a member of class TDBXDataTypesColumns.
	IsSearchableWithLike (see page 10713)	This is IsSearchableWithLike, a member of class TDBXDataTypesColumns.
	IsUnicode (see page 10714)	This is IsUnicode, a member of class TDBXDataTypesColumns.
	IsUnsigned (see page 10714)	This is IsUnsigned, a member of class TDBXDataTypesColumns.
	LiteralPrefix (see page 10714)	This is LiteralPrefix, a member of class TDBXDataTypesColumns.
	LiteralSuffix (see page 10714)	This is LiteralSuffix, a member of class TDBXDataTypesColumns.
	MaximumScale (see page 10715)	This is MaximumScale, a member of class TDBXDataTypesColumns.
	MaximumVersion (see page 10715)	This is MaximumVersion, a member of class TDBXDataTypesColumns.
	MinimumScale (see page 10715)	This is MinimumScale, a member of class TDBXDataTypesColumns.
	MinimumVersion (see page 10715)	This is MinimumVersion, a member of class TDBXDataTypesColumns.
	ProviderDbType (see page 10715)	This is ProviderDbType, a member of class TDBXDataTypesColumns.
	TypeName (see page 10716)	This is TypeName, a member of class TDBXDataTypesColumns.

56.1.7.2 TDBXDataTypesColumns Constants

The constants of the TDBXDataTypesColumns class are listed here.

Public Constants

	Name	Description
	ColumnSize (see page 10710)	This is ColumnSize, a member of class TDBXDataTypesColumns.
	CreateFormat (see page 10710)	This is CreateFormat, a member of class TDBXDataTypesColumns.
	CreateParameters (see page 10711)	This is CreateParameters, a member of class TDBXDataTypesColumns.
	DataType (see page 10711)	This is DataType, a member of class TDBXDataTypesColumns.
	DbxDataType (see page 10711)	This is DbxDataType, a member of class TDBXDataTypesColumns.
	IsAutoIncrementable (see page 10711)	This is IsAutoIncrementable, a member of class TDBXDataTypesColumns.
	IsBestMatch (see page 10711)	This is IsBestMatch, a member of class TDBXDataTypesColumns.
	IsCaseSensitive (see page 10712)	This is IsCaseSensitive, a member of class TDBXDataTypesColumns.
	IsConcurrencyType (see page 10712)	This is IsConcurrencyType, a member of class TDBXDataTypesColumns.
	IsFixedLength (see page 10712)	This is IsFixedLength, a member of class TDBXDataTypesColumns.
	IsFixedPrecisionScale (see page 10712)	This is IsFixedPrecisionScale, a member of class TDBXDataTypesColumns.
	IsLiteralSupported (see page 10713)	This is IsLiteralSupported, a member of class TDBXDataTypesColumns.
	IsLong (see page 10713)	This is IsLong, a member of class TDBXDataTypesColumns.
	IsNullable (see page 10713)	This is IsNullable, a member of class TDBXDataTypesColumns.
	IsSearchable (see page 10713)	This is IsSearchable, a member of class TDBXDataTypesColumns.
	IsSearchableWithLike (see page 10713)	This is IsSearchableWithLike, a member of class TDBXDataTypesColumns.
	IsUnicode (see page 10714)	This is IsUnicode, a member of class TDBXDataTypesColumns.
	IsUnsigned (see page 10714)	This is IsUnsigned, a member of class TDBXDataTypesColumns.
	LiteralPrefix (see page 10714)	This is LiteralPrefix, a member of class TDBXDataTypesColumns.
	LiteralSuffix (see page 10714)	This is LiteralSuffix, a member of class TDBXDataTypesColumns.
	MaximumScale (see page 10715)	This is MaximumScale, a member of class TDBXDataTypesColumns.
	MaximumVersion (see page 10715)	This is MaximumVersion, a member of class TDBXDataTypesColumns.
	MinimumScale (see page 10715)	This is MinimumScale, a member of class TDBXDataTypesColumns.
	MinimumVersion (see page 10715)	This is MinimumVersion, a member of class TDBXDataTypesColumns.
	ProviderDbType (see page 10715)	This is ProviderDbType, a member of class TDBXDataTypesColumns.
	TypeName (see page 10716)	This is TypeName, a member of class TDBXDataTypesColumns.

56.1.7.2.1 TDBXDataTypesColumns.ColumnSize Constant

Pascal

```
const ColumnSize = 'ColumnSize';
```

C++

```
ColumnSize = 'ColumnSize';
```

Description

This is ColumnSize, a member of class TDBXDataTypesColumns.

56.1.7.2.2 TDBXDataTypesColumns.CreateFormat Constant

Pascal

```
const CreateFormat = 'CreateFormat';
```

C++

```
CreateFormat = 'CreateFormat';
```

Description

This is CreateFormat, a member of class TDBXDataTypesColumns.

56.1.7.2.3 TDBXDataTypesColumns.CreateParameters Constant

Pascal

```
const CreateParameters = 'CreateParameters';
```

C++

```
CreateParameters = 'CreateParameters';
```

Description

This is CreateParameters, a member of class TDBXDataTypesColumns.

56.1.7.2.4 TDBXDataTypesColumns.DataType Constant

Pascal

```
const DataType = 'DataType';
```

C++

```
DataType = 'DataType';
```

Description

This is DataType, a member of class TDBXDataTypesColumns.

56.1.7.2.5 TDBXDataTypesColumns.DbxDataType Constant

Pascal

```
const DbxDataType = 'DbxDataType';
```

C++

```
DbxDataType = 'DbxDataType';
```

Description

This is DbxDataType, a member of class TDBXDataTypesColumns.

56.1.7.2.6 TDBXDataTypesColumns.IsAutoIncrementable Constant

Pascal

```
const IsAutoIncrementable = 'IsAutoIncrementable';
```

C++

```
IsAutoIncrementable = 'IsAutoIncrementable';
```

Description

This is IsAutoIncrementable, a member of class TDBXDataTypesColumns.

56.1.7.2.7 TDBXDataTypesColumns.IsBestMatch Constant

Pascal

```
const IsBestMatch = 'IsBestMatch';
```

C++

```
IsBestMatch = 'IsBestMatch';
```

Description

This is IsBestMatch, a member of class TDBXDataTypesColumns.

56.1.7.2.8 TDBXDataTypesColumns.IsCaseSensitive Constant

Pascal

```
const IsCaseSensitive = 'IsCaseSensitive';
```

C++

```
IsCaseSensitive = 'IsCaseSensitive';
```

Description

This is IsCaseSensitive, a member of class TDBXDataTypesColumns.

56.1.7.2.9 TDBXDataTypesColumns.IsConcurrencyType Constant

Pascal

```
const IsConcurrencyType = 'IsConcurrencyType';
```

C++

```
IsConcurrencyType = 'IsConcurrencyType';
```

Description

This is IsConcurrencyType, a member of class TDBXDataTypesColumns.

56.1.7.2.10 TDBXDataTypesColumns.IsFixedLength Constant

Pascal

```
const IsFixedLength = 'IsFixedLength';
```

C++

```
IsFixedLength = 'IsFixedLength';
```

Description

This is IsFixedLength, a member of class TDBXDataTypesColumns.

56.1.7.2.11 TDBXDataTypesColumns.IsFixedPrecisionScale Constant

Pascal

```
const IsFixedPrecisionScale = 'IsFixedPrecisionScale';
```

C++

```
IsFixedPrecisionScale = 'IsFixedPrecisionScale';
```

Description

This is IsFixedPrecisionScale, a member of class TDBXDataTypesColumns.

56.1.7.2.12 TDBXDataTypesColumns.IsLiteralSupported Constant

Pascal

```
const IsLiteralSupported = 'IsLiteralSupported';
```

C++

```
IsLiteralSupported = 'IsLiteralSupported';
```

Description

This is IsLiteralSupported, a member of class TDBXDataTypesColumns.

56.1.7.2.13 TDBXDataTypesColumns.IsLong Constant

Pascal

```
const IsLong = 'IsLong';
```

C++

```
IsLong = 'IsLong';
```

Description

This is IsLong, a member of class TDBXDataTypesColumns.

56.1.7.2.14 TDBXDataTypesColumns.IsNullable Constant

Pascal

```
const IsNullable = 'IsNullable';
```

C++

```
IsNullable = 'IsNullable';
```

Description

This is IsNullable, a member of class TDBXDataTypesColumns.

56.1.7.2.15 TDBXDataTypesColumns.IsSearchable Constant

Pascal

```
const IsSearchable = 'IsSearchable';
```

C++

```
IsSearchable = 'IsSearchable';
```

Description

This is IsSearchable, a member of class TDBXDataTypesColumns.

56.1.7.2.16 TDBXDataTypesColumns.IsSearchableWithLike Constant

Pascal

```
const IsSearchableWithLike = 'IsSearchableWithLike';
```

C++

```
IsSearchableWithLike = 'IsSearchableWithLike';
```

Description

This is IsSearchableWithLike, a member of class TDBXDataTypesColumns.

56.1.7.2.17 TDBXDataTypesColumns.IsUnicode Constant

Pascal

```
const IsUnicode = 'IsUnicode';
```

C++

```
IsUnicode = 'IsUnicode';
```

Description

This is IsUnicode, a member of class TDBXDataTypesColumns.

56.1.7.2.18 TDBXDataTypesColumns.IsUnsigned Constant

Pascal

```
const IsUnsigned = 'IsUnsigned';
```

C++

```
IsUnsigned = 'IsUnsigned';
```

Description

This is IsUnsigned, a member of class TDBXDataTypesColumns.

56.1.7.2.19 TDBXDataTypesColumns.LiteralPrefix Constant

Pascal

```
const LiteralPrefix = 'LiteralPrefix';
```

C++

```
LiteralPrefix = 'LiteralPrefix';
```

Description

This is LiteralPrefix, a member of class TDBXDataTypesColumns.

56.1.7.2.20 TDBXDataTypesColumns.LiteralSuffix Constant

Pascal

```
const LiteralSuffix = 'LiteralSuffix';
```

C++

```
LiteralSuffix = 'LiteralSuffix';
```

Description

This is LiteralSuffix, a member of class TDBXDataTypesColumns.

56.1.7.2.21 TDBXDataTypesColumns.MaximumScale Constant

Pascal

```
const MaximumScale = 'MaximumScale';
```

C++

```
MaximumScale = 'MaximumScale';
```

Description

This is MaximumScale, a member of class TDBXDataTypesColumns.

56.1.7.2.22 TDBXDataTypesColumns.MaximumVersion Constant

Pascal

```
const MaximumVersion = 'MaximumVersion';
```

C++

```
MaximumVersion = 'MaximumVersion';
```

Description

This is MaximumVersion, a member of class TDBXDataTypesColumns.

56.1.7.2.23 TDBXDataTypesColumns.MinimumScale Constant

Pascal

```
const MinimumScale = 'MinimumScale';
```

C++

```
MinimumScale = 'MinimumScale';
```

Description

This is MinimumScale, a member of class TDBXDataTypesColumns.

56.1.7.2.24 TDBXDataTypesColumns.MinimumVersion Constant

Pascal

```
const MinimumVersion = 'MinimumVersion';
```

C++

```
MinimumVersion = 'MinimumVersion';
```

Description

This is MinimumVersion, a member of class TDBXDataTypesColumns.

56.1.7.2.25 TDBXDataTypesColumns.ProviderDbType Constant

Pascal

```
const ProviderDbType = 'ProviderDbType';
```

C++

```
ProviderDbType = 'ProviderDbType';
```

Description

This is ProviderDbType, a member of class TDBXDataTypesColumns.

56.1.7.2.26 TDBXDataTypesColumns.TypeName Constant

Pascal

```
const TypeName = 'TypeName';
```

C++

```
TypeName = 'TypeName';
```

Description

This is TypeName, a member of class TDBXDataTypesColumns.

56.1.8 TDBXDataTypesIndex Class

Accesses columns by ordinal in the **DataTypes** metadata.

Class Hierarchy

Pascal

```
TDBXDataTypesIndex = class;
```

C++

```
class TDBXDataTypesIndex;
```

File

DBXMetaDataNames

Description

TDBXDataTypesIndex is used to access columns by ordinal in the **DataTypes** metadata collection. These columns are returned when TDBXCommand.Text' is TDBXMetaDataCommands.GetDataTypes when reading metadata. To retrieve metadata columns, use these constants to index the TDBXReader instance returned by TDBXCommand.ExecuteQuery.

This table describes the columns.

Column Ordinal Name	Data Type of Column Data	Description
TypeName (see page 10725)	String	Database specific data type name.
DbxDataType (see page 10720)	Int32	dbExpress data type.
ColumnSize (see page 10719)	Int64	Length of this type. For a string data type, this is the maximum number of characters. For a floating point number, this is the number of significant bits in the mantissa. For other numeric types, this is the maximum number of significant digits. For date, time, and timestamp types, this is the length of the string representation.

CreateFormat (see page 10719)	String	Create format as used in CREATE TABLE.
CreateParameters (see page 10719)	String	Parameters for the create format.
DataType (see page 10720)	String	Name of language type representing this data type.
IsAutoIncrementable (see page 10720)	Boolean	Can be used for an autoincrement column.
IsBestMatch (see page 10720)	Boolean	Is best match for language type.
IsCaseSensitive (see page 10720)	Boolean	Is case sensitive.
IsFixedLength (see page 10721)	Boolean	Is fixed length.
IsFixedPrecisionScale (see page 10721)	Boolean	Is an exact numeric.
IsLong (see page 10722)	Boolean	Is a BLOB type.
IsNullable (see page 10722)	Boolean	Can be assigned a value of NULL.
IsSearchable (see page 10722)	Boolean	Can be searched in the SQL database.
IsSearchableWithLike (see page 10722)	Boolean	Can be searched with the SQL LIKE operator.
IsUnsigned (see page 10723)	Boolean	Is an unsigned numeric.
MaximumScale (see page 10724)	Int16	Maximum possible scale value.
MinimumScale (see page 10724)	Int16	Minimum possible scale value.
IsConcurrencyType (see page 10721)	Boolean	Has special update semantics.
MaximumVersion (see page 10724)	String	Last (see page 10723) database product version where this type was available.
MinimumVersion (see page 10724)	String	First database product version where this type was available.
IsLiteralSupported (see page 10721)	Boolean	Can be represented as a SQL literal.
LiteralPrefix (see page 10723)	String	Prefix of SQL literal.
LiteralSuffix (see page 10723)	String	Suffix of SQL literal.
IsUnicode (see page 10722)	Boolean	Can hold Unicode character data.
ProviderDbType (see page 10724)	Int32	Same as the DbxDataType (see page 10720) column. Reserved for .NET applications.

56.1.8.1 TDBXDataTypesIndex Members

The following tables list the members exposed by TDBXDataTypesIndex.

Public Constants

	Name	Description
	ColumnSize (see page 10719)	This is ColumnSize, a member of class TDBXDataTypesIndex.
	CreateFormat (see page 10719)	This is CreateFormat, a member of class TDBXDataTypesIndex.
	CreateParameters (see page 10719)	This is CreateParameters, a member of class TDBXDataTypesIndex.
	DataType (see page 10720)	This is DataType, a member of class TDBXDataTypesIndex.
	DbxDataType (see page 10720)	This is DbxDataType, a member of class TDBXDataTypesIndex.
	IsAutoIncrementable (see page 10720)	This is IsAutoIncrementable, a member of class TDBXDataTypesIndex.
	IsBestMatch (see page 10720)	This is IsBestMatch, a member of class TDBXDataTypesIndex.
	IsCaseSensitive (see page 10720)	This is IsCaseSensitive, a member of class TDBXDataTypesIndex.
	IsConcurrencyType (see page 10721)	This is IsConcurrencyType, a member of class TDBXDataTypesIndex.
	IsFixedLength (see page 10721)	This is IsFixedLength, a member of class TDBXDataTypesIndex.
	IsFixedPrecisionScale (see page 10721)	This is IsFixedPrecisionScale, a member of class TDBXDataTypesIndex.
	IsLiteralSupported (see page 10721)	This is IsLiteralSupported, a member of class TDBXDataTypesIndex.
	IsLong (see page 10722)	This is IsLong, a member of class TDBXDataTypesIndex.
	IsNullable (see page 10722)	This is IsNullable, a member of class TDBXDataTypesIndex.
	IsSearchable (see page 10722)	This is IsSearchable, a member of class TDBXDataTypesIndex.
	IsSearchableWithLike (see page 10722)	This is IsSearchableWithLike, a member of class TDBXDataTypesIndex.
	IsUnicode (see page 10722)	This is IsUnicode, a member of class TDBXDataTypesIndex.
	IsUnsigned (see page 10723)	This is IsUnsigned, a member of class TDBXDataTypesIndex.
	Last (see page 10723)	This is Last, a member of class TDBXDataTypesIndex.
	LiteralPrefix (see page 10723)	This is LiteralPrefix, a member of class TDBXDataTypesIndex.
	LiteralSuffix (see page 10723)	This is LiteralSuffix, a member of class TDBXDataTypesIndex.
	MaximumScale (see page 10724)	This is MaximumScale, a member of class TDBXDataTypesIndex.
	MaximumVersion (see page 10724)	This is MaximumVersion, a member of class TDBXDataTypesIndex.
	MinimumScale (see page 10724)	This is MinimumScale, a member of class TDBXDataTypesIndex.
	MinimumVersion (see page 10724)	This is MinimumVersion, a member of class TDBXDataTypesIndex.
	ProviderDbType (see page 10724)	This is ProviderDbType, a member of class TDBXDataTypesIndex.
	TypeName (see page 10725)	This is TypeName, a member of class TDBXDataTypesIndex.

56.1.8.2 TDBXDataTypesIndex Constants

The constants of the TDBXDataTypesIndex class are listed here.

Public Constants

	Name	Description
	ColumnSize (see page 10719)	This is ColumnSize, a member of class TDBXDataTypesIndex.
	CreateFormat (see page 10719)	This is CreateFormat, a member of class TDBXDataTypesIndex.
	CreateParameters (see page 10719)	This is CreateParameters, a member of class TDBXDataTypesIndex.
	DataType (see page 10720)	This is DataType, a member of class TDBXDataTypesIndex.
	DbxDataType (see page 10720)	This is DbxDataType, a member of class TDBXDataTypesIndex.
	IsAutoIncrementable (see page 10720)	This is IsAutoIncrementable, a member of class TDBXDataTypesIndex.
	IsBestMatch (see page 10720)	This is IsBestMatch, a member of class TDBXDataTypesIndex.

	IsCaseSensitive (see page 10720)	This is IsCaseSensitive, a member of class TDBXDataTypesIndex.
	IsConcurrencyType (see page 10721)	This is IsConcurrencyType, a member of class TDBXDataTypesIndex.
	IsFixedLength (see page 10721)	This is IsFixedLength, a member of class TDBXDataTypesIndex.
	IsFixedPrecisionScale (see page 10721)	This is IsFixedPrecisionScale, a member of class TDBXDataTypesIndex.
	IsLiteralSupported (see page 10721)	This is IsLiteralSupported, a member of class TDBXDataTypesIndex.
	IsLong (see page 10722)	This is IsLong, a member of class TDBXDataTypesIndex.
	IsNullable (see page 10722)	This is IsNullable, a member of class TDBXDataTypesIndex.
	IsSearchable (see page 10722)	This is IsSearchable, a member of class TDBXDataTypesIndex.
	IsSearchableWithLike (see page 10722)	This is IsSearchableWithLike, a member of class TDBXDataTypesIndex.
	IsUnicode (see page 10722)	This is IsUnicode, a member of class TDBXDataTypesIndex.
	IsUnsigned (see page 10723)	This is IsUnsigned, a member of class TDBXDataTypesIndex.
	Last (see page 10723)	This is Last, a member of class TDBXDataTypesIndex.
	LiteralPrefix (see page 10723)	This is LiteralPrefix, a member of class TDBXDataTypesIndex.
	LiteralSuffix (see page 10723)	This is LiteralSuffix, a member of class TDBXDataTypesIndex.
	MaximumScale (see page 10724)	This is MaximumScale, a member of class TDBXDataTypesIndex.
	MaximumVersion (see page 10724)	This is MaximumVersion, a member of class TDBXDataTypesIndex.
	MinimumScale (see page 10724)	This is MinimumScale, a member of class TDBXDataTypesIndex.
	MinimumVersion (see page 10724)	This is MinimumVersion, a member of class TDBXDataTypesIndex.
	ProviderDbType (see page 10724)	This is ProviderDbType, a member of class TDBXDataTypesIndex.
	TypeName (see page 10725)	This is TypeName, a member of class TDBXDataTypesIndex.

56.1.8.2.1 TDBXDataTypesIndex.ColumnSize Constant

Pascal

```
const ColumnSize = 2;
```

C++

```
ColumnSize = 2;
```

Description

This is ColumnSize, a member of class TDBXDataTypesIndex.

56.1.8.2.2 TDBXDataTypesIndex.CreateFormat Constant

Pascal

```
const CreateFormat = 3;
```

C++

```
CreateFormat = 3;
```

Description

This is CreateFormat, a member of class TDBXDataTypesIndex.

56.1.8.2.3 TDBXDataTypesIndex.CreateParameters Constant

Pascal

```
const CreateParameters = 4;
```

C++

```
CreateParameters = 4;
```

Description

This is CreateParameters, a member of class TDBXDataTypesIndex.

56.1.8.2.4 TDBXDataTypesIndex.DataType Constant

Pascal

```
const DataType = 5;
```

C++

```
DataType = 5;
```

Description

This is DataType, a member of class TDBXDataTypesIndex.

56.1.8.2.5 TDBXDataTypesIndex.DbxDataType Constant

Pascal

```
const DbxDataType = 1;
```

C++

```
DbxDataType = 1;
```

Description

This is DbxDataType, a member of class TDBXDataTypesIndex.

56.1.8.2.6 TDBXDataTypesIndex.IsAutoIncrementable Constant

Pascal

```
const IsAutoIncrementable = 6;
```

C++

```
IsAutoIncrementable = 6;
```

Description

This is IsAutoIncrementable, a member of class TDBXDataTypesIndex.

56.1.8.2.7 TDBXDataTypesIndex.IsBestMatch Constant

Pascal

```
const IsBestMatch = 7;
```

C++

```
IsBestMatch = 7;
```

Description

This is IsBestMatch, a member of class TDBXDataTypesIndex.

56.1.8.2.8 TDBXDataTypesIndex.IsCaseSensitive Constant

Pascal

```
const IsCaseSensitive = 8;
```

C++

```
IsCaseSensitive = 8;
```

Description

This is IsCaseSensitive, a member of class TDBXDataTypesIndex.

56.1.8.2.9 TDBXDataTypesIndex.IsConcurrencyType Constant

Pascal

```
const IsConcurrencyType = 18;
```

C++

```
IsConcurrencyType = 18;
```

Description

This is IsConcurrencyType, a member of class TDBXDataTypesIndex.

56.1.8.2.10 TDBXDataTypesIndex.IsFixedLength Constant

Pascal

```
const IsFixedLength = 9;
```

C++

```
IsFixedLength = 9;
```

Description

This is IsFixedLength, a member of class TDBXDataTypesIndex.

56.1.8.2.11 TDBXDataTypesIndex.IsFixedPrecisionScale Constant

Pascal

```
const IsFixedPrecisionScale = 10;
```

C++

```
IsFixedPrecisionScale = 10;
```

Description

This is IsFixedPrecisionScale, a member of class TDBXDataTypesIndex.

56.1.8.2.12 TDBXDataTypesIndex.IsLiteralSupported Constant

Pascal

```
const IsLiteralSupported = 21;
```

C++

```
IsLiteralSupported = 21;
```

Description

This is IsLiteralSupported, a member of class TDBXDataTypesIndex.

56.1.8.2.13 TDBXDataTypesIndex.IsLong Constant

Pascal

```
const IsLong = 11;
```

C++

```
IsLong = 11;
```

Description

This is IsLong, a member of class TDBXDataTypesIndex.

56.1.8.2.14 TDBXDataTypesIndex.IsNullable Constant

Pascal

```
const IsNullable = 12;
```

C++

```
IsNullable = 12;
```

Description

This is IsNullable, a member of class TDBXDataTypesIndex.

56.1.8.2.15 TDBXDataTypesIndex.IsSearchable Constant

Pascal

```
const IsSearchable = 13;
```

C++

```
IsSearchable = 13;
```

Description

This is IsSearchable, a member of class TDBXDataTypesIndex.

56.1.8.2.16 TDBXDataTypesIndex.IsSearchableWithLike Constant

Pascal

```
const IsSearchableWithLike = 14;
```

C++

```
IsSearchableWithLike = 14;
```

Description

This is IsSearchableWithLike, a member of class TDBXDataTypesIndex.

56.1.8.2.17 TDBXDataTypesIndex.IsUnicode Constant

Pascal

```
const IsUnicode = 24;
```

C++

```
IsUnicode = 24;
```

Description

This is IsUnicode, a member of class TDBXDataTypesIndex.

56.1.8.2.18 TDBXDataTypesIndex.IsUnsigned Constant

Pascal

```
const IsUnsigned = 15;
```

C++

```
IsUnsigned = 15;
```

Description

This is IsUnsigned, a member of class TDBXDataTypesIndex.

56.1.8.2.19 TDBXDataTypesIndex.Last Constant

Pascal

```
const Last = 25;
```

C++

```
Last = 25;
```

Description

This is Last, a member of class TDBXDataTypesIndex.

56.1.8.2.20 TDBXDataTypesIndex.LiteralPrefix Constant

Pascal

```
const LiteralPrefix = 22;
```

C++

```
LiteralPrefix = 22;
```

Description

This is LiteralPrefix, a member of class TDBXDataTypesIndex.

56.1.8.2.21 TDBXDataTypesIndex.LiteralSuffix Constant

Pascal

```
const LiteralSuffix = 23;
```

C++

```
LiteralSuffix = 23;
```

Description

This is LiteralSuffix, a member of class TDBXDataTypesIndex.

56.1.8.2.22 TDBXDataTypesIndex.MaximumScale Constant

Pascal

```
const MaximumScale = 16;
```

C++

```
MaximumScale = 16;
```

Description

This is MaximumScale, a member of class TDBXDataTypesIndex.

56.1.8.2.23 TDBXDataTypesIndex.MaximumVersion Constant

Pascal

```
const MaximumVersion = 19;
```

C++

```
MaximumVersion = 19;
```

Description

This is MaximumVersion, a member of class TDBXDataTypesIndex.

56.1.8.2.24 TDBXDataTypesIndex.MinimumScale Constant

Pascal

```
const MinimumScale = 17;
```

C++

```
MinimumScale = 17;
```

Description

This is MinimumScale, a member of class TDBXDataTypesIndex.

56.1.8.2.25 TDBXDataTypesIndex.MinimumVersion Constant

Pascal

```
const MinimumVersion = 20;
```

C++

```
MinimumVersion = 20;
```

Description

This is MinimumVersion, a member of class TDBXDataTypesIndex.

56.1.8.2.26 TDBXDataTypesIndex.ProviderDbType Constant

Pascal

```
const ProviderDbType = 25;
```

C++

```
ProviderDbType = 25;
```

Description

This is ProviderDbType, a member of class TDBXDataTypesIndex.

56.1.8.2.27 TDBXDataTypesIndex.TypeName Constant

Pascal

```
const TypeName = 0;
```

C++

```
TypeName = 0;
```

Description

This is TypeName, a member of class TDBXDataTypesIndex.

56.1.9 TDBXForeignKeyColumnsColumns Class

Accesses columns by name in the **ForeignKeyColumns** metadata.

Class Hierarchy

DBXMetaDataNames.TDBXForeignKeyColumnsColumns

Pascal

```
TDBXForeignKeyColumnsColumns = class;
```

C++

```
class TDBXForeignKeyColumnsColumns;
```

File

DBXMetaDataNames

Description

TDBXForeignKeyColumnsColumns is used to access columns by name in the **ForeignKeyColumns** metadata collection. These columns are returned when TDBXCommand.Text' is TDBXMetaDataCommands.GetForeignKeyColumns when reading metadata. To retrieve metadata columns, use these constants to index the TDBXReader instance returned by TDBXCommand.ExecuteQuery.

This table describes the columns.

Column Name	Data Type of Column Data	Description
CatalogName (see page 10727)	String	Catalog name of table with foreign key.
SchemaName (see page 10729)	String	Schema name of table with foreign key.
TableName (see page 10729)	String	Table name of table with foreign key.
ForeignKeyName (see page 10727)	String	Foreign key name.

ColumnName (see page 10727)	String	Column that refers to a column in another table.
PrimaryCatalogName (see page 10728)	String	Catalog name of table being referred to.
PrimarySchemaName (see page 10728)	String	Schema name of table being referred to.
PrimaryTableName (see page 10729)	String	Name of table being referred to.
PrimaryKeyName (see page 10728)	String	Name of key being referred to. This is usually the primary key.
PrimaryColumnName (see page 10728)	String	Column being referred to.
Ordinal (see page 10727)	Int32	Position of column reference in foreign key.

See Also

TDBXForeignKeysIndex (see page 10736)

56.1.9.1 TDBXForeignKeyColumnsColumns Members

The following tables list the members exposed by TDBXForeignKeyColumnsColumns.

Public Constants

	Name	Description
	CatalogName (see page 10727)	This is CatalogName, a member of class TDBXForeignKeyColumnsColumns.
	ColumnName (see page 10727)	This is ColumnName, a member of class TDBXForeignKeyColumnsColumns.
	ForeignKeyName (see page 10727)	This is ForeignKeyName, a member of class TDBXForeignKeyColumnsColumns.
	Ordinal (see page 10727)	This is Ordinal, a member of class TDBXForeignKeyColumnsColumns.
	PrimaryCatalogName (see page 10728)	This is PrimaryCatalogName, a member of class TDBXForeignKeyColumnsColumns.
	PrimaryColumnName (see page 10728)	This is PrimaryColumnName, a member of class TDBXForeignKeyColumnsColumns.
	PrimaryKeyName (see page 10728)	This is PrimaryKeyName, a member of class TDBXForeignKeyColumnsColumns.
	PrimarySchemaName (see page 10728)	This is PrimarySchemaName, a member of class TDBXForeignKeyColumnsColumns.
	PrimaryTableName (see page 10729)	This is PrimaryTableName, a member of class TDBXForeignKeyColumnsColumns.
	SchemaName (see page 10729)	This is SchemaName, a member of class TDBXForeignKeyColumnsColumns.
	TableName (see page 10729)	This is TableName, a member of class TDBXForeignKeyColumnsColumns.

56.1.9.2 TDBXForeignKeyColumnsColumns Constants

The constants of the TDBXForeignKeyColumnsColumns class are listed here.

Public Constants

	Name	Description
	CatalogName (see page 10727)	This is CatalogName, a member of class TDBXForeignKeyColumnsColumns.
	ColumnName (see page 10727)	This is ColumnName, a member of class TDBXForeignKeyColumnsColumns.
	ForeignKeyName (see page 10727)	This is ForeignKeyName, a member of class TDBXForeignKeyColumnsColumns.
	Ordinal (see page 10727)	This is Ordinal, a member of class TDBXForeignKeyColumnsColumns.

	PrimaryCatalogName (see page 10728)	This is PrimaryCatalogName, a member of class TDBXForeignKeyColumnsColumns.
	PrimaryColumnName (see page 10728)	This is PrimaryColumnName, a member of class TDBXForeignKeyColumnsColumns.
	PrimaryKeyName (see page 10728)	This is PrimaryKeyName, a member of class TDBXForeignKeyColumnsColumns.
	PrimarySchemaName (see page 10728)	This is PrimarySchemaName, a member of class TDBXForeignKeyColumnsColumns.
	PrimaryTableName (see page 10729)	This is PrimaryTableName, a member of class TDBXForeignKeyColumnsColumns.
	SchemaName (see page 10729)	This is SchemaName, a member of class TDBXForeignKeyColumnsColumns.
	TableName (see page 10729)	This is TableName, a member of class TDBXForeignKeyColumnsColumns.

56.1.9.2.1 TDBXForeignKeyColumnsColumns.CatalogName Constant

Pascal

```
const CatalogName = 'CatalogName';
```

C++

```
CatalogName = 'CatalogName';
```

Description

This is CatalogName, a member of class TDBXForeignKeyColumnsColumns.

56.1.9.2.2 TDBXForeignKeyColumnsColumns.ColumnName Constant

Pascal

```
const ColumnName = 'ColumnName';
```

C++

```
ColumnName = 'ColumnName';
```

Description

This is ColumnName, a member of class TDBXForeignKeyColumnsColumns.

56.1.9.2.3 TDBXForeignKeyColumnsColumns.ForeignKeyName Constant

Pascal

```
const ForeignKeyName = 'ForeignKeyName';
```

C++

```
ForeignKeyName = 'ForeignKeyName';
```

Description

This is ForeignKeyName, a member of class TDBXForeignKeyColumnsColumns.

56.1.9.2.4 TDBXForeignKeyColumnsColumns.Ordinal Constant

Pascal

```
const Ordinal = 'Ordinal';
```

C++

```
Ordinal = 'Ordinal';
```

Description

This is Ordinal, a member of class TDBXForeignKeyColumnsColumns.

56.1.9.2.5 TDBXForeignKeyColumnsColumns.PrimaryCatalogName Constant

Pascal

```
const PrimaryCatalogName = 'PrimaryCatalogName';
```

C++

```
PrimaryCatalogName = 'PrimaryCatalogName';
```

Description

This is PrimaryCatalogName, a member of class TDBXForeignKeyColumnsColumns.

56.1.9.2.6 TDBXForeignKeyColumnsColumns.PrimaryColumnName Constant

Pascal

```
const PrimaryColumnName = 'PrimaryColumnName';
```

C++

```
PrimaryColumnName = 'PrimaryColumnName';
```

Description

This is PrimaryColumnName, a member of class TDBXForeignKeyColumnsColumns.

56.1.9.2.7 TDBXForeignKeyColumnsColumns.PrimaryKeyName Constant

Pascal

```
const PrimaryKeyName = 'PrimaryKeyName';
```

C++

```
PrimaryKeyName = 'PrimaryKeyName';
```

Description

This is PrimaryKeyName, a member of class TDBXForeignKeyColumnsColumns.

56.1.9.2.8 TDBXForeignKeyColumnsColumns.PrimarySchemaName Constant

Pascal

```
const PrimarySchemaName = 'PrimarySchemaName';
```

C++

```
PrimarySchemaName = 'PrimarySchemaName';
```

Description

This is PrimarySchemaName, a member of class TDBXForeignKeyColumnsColumns.

56.1.9.2.9 TDBXForeignKeyColumnsColumns.PrimaryTableName Constant

Pascal

```
const PrimaryTableName = 'PrimaryTableName';
```

C++

```
PrimaryTableName = 'PrimaryTableName';
```

Description

This is PrimaryTableName, a member of class TDBXForeignKeyColumnsColumns.

56.1.9.2.10 TDBXForeignKeyColumnsColumns.SchemaName Constant

Pascal

```
const SchemaName = 'SchemaName';
```

C++

```
SchemaName = 'SchemaName';
```

Description

This is SchemaName, a member of class TDBXForeignKeyColumnsColumns.

56.1.9.2.11 TDBXForeignKeyColumnsColumns.TableName Constant

Pascal

```
const TableName = 'TableName';
```

C++

```
TableName = 'TableName';
```

Description

This is TableName, a member of class TDBXForeignKeyColumnsColumns.

56.1.10 TDBXForeignKeyColumnsIndex Class

Accesses columns by ordinal in the **ForeignKeyColumns** metadata.

Class Hierarchy

Pascal

```
TDBXForeignKeyColumnsIndex = class;
```

C++

```
class TDBXForeignKeyColumnsIndex;
```

File

DBXMetaDataNames

Description

TDBXForeignKeyColumnsIndex is used to access columns by ordinal in the **ForeignKeyColumns** metadata collection. These columns are returned when TDBXCommand.Text' is TDBXMetaDataCommands.GetForeignKeyColumns when reading metadata. To retrieve metadata columns, use these constants to index the TDBXReader instance returned by TDBXCommand.ExecuteQuery.

This table describes the columns.

Column Ordinal (see page 10732) Name	Data Type of Column Data	Description
CatalogName (see page 10731)	String	Catalog name of table with foreign key.
SchemaName (see page 10733)	String	Schema name of table with foreign key.
TableName (see page 10734)	String	Table name of table with foreign key.
ForeignKeyName (see page 10732)	String	Foreign key name.
ColumnName (see page 10731)	String	Column that refers to a column in another table.
PrimaryCatalogName (see page 10732)	String	Catalog name of table being referred to.
PrimarySchemaName (see page 10733)	String	Schema name of table being referred to.
PrimaryTableName (see page 10733)	String	Name of table being referred to.
PrimaryKeyName (see page 10733)	String	Name of key being referred to. This is usually the primary key.
PrimaryColumnName (see page 10732)	String	Column being referred to.
Ordinal (see page 10732)	Int32	Position of column reference in foreign key.

56.1.10.1 TDBXForeignKeyColumnsIndex Members

The following tables list the members exposed by TDBXForeignKeyColumnsIndex.

Public Constants

	Name	Description
	CatalogName (see page 10731)	This is CatalogName, a member of class TDBXForeignKeyColumnsIndex.
	ColumnName (see page 10731)	This is ColumnName, a member of class TDBXForeignKeyColumnsIndex.
	ForeignKeyName (see page 10732)	This is ForeignKeyName, a member of class TDBXForeignKeyColumnsIndex.
	Last (see page 10732)	This is Last, a member of class TDBXForeignKeyColumnsIndex.
	Ordinal (see page 10732)	This is Ordinal, a member of class TDBXForeignKeyColumnsIndex.
	PrimaryCatalogName (see page 10732)	This is PrimaryCatalogName, a member of class TDBXForeignKeyColumnsIndex.

	PrimaryColumnName (see page 10732)	This is PrimaryColumnName, a member of class TDBXForeignKeyColumnsIndex.
	PrimaryKeyName (see page 10733)	This is PrimaryKeyName, a member of class TDBXForeignKeyColumnsIndex.
	PrimarySchemaName (see page 10733)	This is PrimarySchemaName, a member of class TDBXForeignKeyColumnsIndex.
	PrimaryTableName (see page 10733)	This is PrimaryTableName, a member of class TDBXForeignKeyColumnsIndex.
	SchemaName (see page 10733)	This is SchemaName, a member of class TDBXForeignKeyColumnsIndex.
	TableName (see page 10734)	This is TableName, a member of class TDBXForeignKeyColumnsIndex.

56.1.10.2 TDBXForeignKeyColumnsIndex Constants

The constants of the TDBXForeignKeyColumnsIndex class are listed here.

Public Constants

	Name	Description
	CatalogName (see page 10731)	This is CatalogName, a member of class TDBXForeignKeyColumnsIndex.
	ColumnName (see page 10731)	This is ColumnName, a member of class TDBXForeignKeyColumnsIndex.
	ForeignKeyName (see page 10732)	This is ForeignKeyName, a member of class TDBXForeignKeyColumnsIndex.
	Last (see page 10732)	This is Last, a member of class TDBXForeignKeyColumnsIndex.
	Ordinal (see page 10732)	This is Ordinal, a member of class TDBXForeignKeyColumnsIndex.
	PrimaryCatalogName (see page 10732)	This is PrimaryCatalogName, a member of class TDBXForeignKeyColumnsIndex.
	PrimaryColumnName (see page 10732)	This is PrimaryColumnName, a member of class TDBXForeignKeyColumnsIndex.
	PrimaryKeyName (see page 10733)	This is PrimaryKeyName, a member of class TDBXForeignKeyColumnsIndex.
	PrimarySchemaName (see page 10733)	This is PrimarySchemaName, a member of class TDBXForeignKeyColumnsIndex.
	PrimaryTableName (see page 10733)	This is PrimaryTableName, a member of class TDBXForeignKeyColumnsIndex.
	SchemaName (see page 10733)	This is SchemaName, a member of class TDBXForeignKeyColumnsIndex.
	TableName (see page 10734)	This is TableName, a member of class TDBXForeignKeyColumnsIndex.

56.1.10.2.1 TDBXForeignKeyColumnsIndex.CatalogName Constant

Pascal

```
const CatalogName = 0;
```

C++

```
CatalogName = 0;
```

Description

This is CatalogName, a member of class TDBXForeignKeyColumnsIndex.

56.1.10.2.2 TDBXForeignKeyColumnsIndex.ColumnName Constant

Pascal

```
const ColumnName = 4;
```

C++

```
ColumnName = 4;
```

Description

This is ColumnName, a member of class TDBXForeignKeyColumnsIndex.

56.1.10.2.3 TDBXForeignKeyColumnsIndex.ForeignKeyName Constant

Pascal

```
const ForeignKeyName = 3;
```

C++

```
ForeignKeyName = 3;
```

Description

This is ForeignKeyName, a member of class TDBXForeignKeyColumnsIndex.

56.1.10.2.4 TDBXForeignKeyColumnsIndex.Last Constant

Pascal

```
const Last = 10;
```

C++

```
Last = 10;
```

Description

This is Last, a member of class TDBXForeignKeyColumnsIndex.

56.1.10.2.5 TDBXForeignKeyColumnsIndex.Ordinal Constant

Pascal

```
const Ordinal = 10;
```

C++

```
Ordinal = 10;
```

Description

This is Ordinal, a member of class TDBXForeignKeyColumnsIndex.

56.1.10.2.6 TDBXForeignKeyColumnsIndex.PrimaryCatalogName Constant

Pascal

```
const PrimaryCatalogName = 5;
```

C++

```
PrimaryCatalogName = 5;
```

Description

This is PrimaryCatalogName, a member of class TDBXForeignKeyColumnsIndex.

56.1.10.2.7 TDBXForeignKeyColumnsIndex.PrimaryColumnName Constant

Pascal

```
const PrimaryColumnName = 9;
```

C++

```
PrimaryColumnName = 9;
```

Description

This is PrimaryColumnName, a member of class TDBXForeignKeyColumnsIndex.

56.1.10.2.8 TDBXForeignKeyColumnsIndex.PrimaryKeyName Constant

Pascal

```
const PrimaryKeyName = 8;
```

C++

```
PrimaryKeyName = 8;
```

Description

This is PrimaryKeyName, a member of class TDBXForeignKeyColumnsIndex.

56.1.10.2.9 TDBXForeignKeyColumnsIndex.PrimarySchemaName Constant

Pascal

```
const PrimarySchemaName = 6;
```

C++

```
PrimarySchemaName = 6;
```

Description

This is PrimarySchemaName, a member of class TDBXForeignKeyColumnsIndex.

56.1.10.2.10 TDBXForeignKeyColumnsIndex.PrimaryTableName Constant

Pascal

```
const PrimaryTableName = 7;
```

C++

```
PrimaryTableName = 7;
```

Description

This is PrimaryTableName, a member of class TDBXForeignKeyColumnsIndex.

56.1.10.2.11 TDBXForeignKeyColumnsIndex.SchemaName Constant

Pascal

```
const SchemaName = 1;
```

C++

```
SchemaName = 1;
```

Description

This is SchemaName, a member of class TDBXForeignKeyColumnsIndex.

56.1.10.2.12 TDBXForeignKeyColumnsIndex.TableName Constant

Pascal

```
const TableName = 2;
```

C++

```
TableName = 2;
```

Description

This is TableName, a member of class TDBXForeignKeyColumnsIndex.

56.1.11 TDBXForeignKeysColumns Class

Accesses columns by name in the **ForeignKeys** metadata.

Class Hierarchy

DBXMetaDataNames.TDBXForeignKeysColumns

Pascal

```
TDBXForeignKeysColumns = class;
```

C++

```
class TDBXForeignKeysColumns;
```

File

DBXMetaDataNames

Description

TDBXForeignKeysColumns is used to access columns by name in the **ForeignKeys** metadata collection. These columns are returned when TDBXCommand.Text' is TDBXMetaDataCommands.GetForeignKeys when reading metadata. To retrieve metadata columns, use these constants to index the TDBXReader instance returned by TDBXCommand.ExecuteQuery.

This table describes the columns.

Column Name	Data Type of Column Data	Description
CatalogName (see page 10735)	String	Catalog name.
SchemaName (see page 10735)	String	Schema name.
TableName (see page 10736)	String	Table name.
ForeignKeyName (see page 10735)	String	Foreign key name.

See Also

TDBXForeignKeysIndex (see page 10736)

56.1.11.1 TDBXForeignKeysColumns Members

The following tables list the members exposed by TDBXForeignKeysColumns.

Public Constants

	Name	Description
	CatalogName (see page 10735)	This is CatalogName, a member of class TDBXForeignKeysColumns.
	ForeignKeyName (see page 10735)	This is ForeignKeyName, a member of class TDBXForeignKeysColumns.
	SchemaName (see page 10735)	This is SchemaName, a member of class TDBXForeignKeysColumns.
	TableName (see page 10736)	This is TableName, a member of class TDBXForeignKeysColumns.

56.1.11.2 TDBXForeignKeysColumns Constants

The constants of the TDBXForeignKeysColumns class are listed here.

Public Constants

	Name	Description
	CatalogName (see page 10735)	This is CatalogName, a member of class TDBXForeignKeysColumns.
	ForeignKeyName (see page 10735)	This is ForeignKeyName, a member of class TDBXForeignKeysColumns.
	SchemaName (see page 10735)	This is SchemaName, a member of class TDBXForeignKeysColumns.
	TableName (see page 10736)	This is TableName, a member of class TDBXForeignKeysColumns.

56.1.11.2.1 TDBXForeignKeysColumns.CatalogName Constant

Pascal

```
const CatalogName = 'CatalogName';
```

C++

```
CatalogName = 'CatalogName';
```

Description

This is CatalogName, a member of class TDBXForeignKeysColumns.

56.1.11.2.2 TDBXForeignKeysColumns.ForeignKeyName Constant

Pascal

```
const ForeignKeyName = 'ForeignKeyName';
```

C++

```
ForeignKeyName = 'ForeignKeyName';
```

Description

This is ForeignKeyName, a member of class TDBXForeignKeysColumns.

56.1.11.2.3 TDBXForeignKeysColumns.SchemaName Constant

Pascal

```
const SchemaName = 'SchemaName';
```

C++

```
SchemaName = 'SchemaName';
```

Description

This is SchemaName, a member of class TDBXForeignKeysColumns.

56.1.11.2.4 TDBXForeignKeysColumns.TableName Constant

Pascal

```
const TableName = 'TableName';
```

C++

```
TableName = 'TableName';
```

Description

This is TableName, a member of class TDBXForeignKeysColumns.

56.1.12 TDBXForeignKeysIndex Class

Accesses columns by ordinal in the **ForeignKeys** metadata.

Class Hierarchy

Pascal

```
TDBXForeignKeysIndex = class;
```

C++

```
class TDBXForeignKeysIndex;
```

File

DBXMetaDataNames

Description

TDBXForeignKeysIndex is used to access columns by ordinal in the **ForeignKeys** metadata collection. These columns are returned when TDBXCommand.Text' is TDBXMetaDataCommands.GetForeignKeys when reading metadata. To retrieve metadata columns, use these constants to index the TDBXReader instance returned by TDBXCommand.ExecuteQuery.

This table describes the columns.

Column Ordinal Name	Data Type of Column Data	Description
CatalogName (see page 10737)	String	Catalog name.
SchemaName (see page 10738)	String	Schema name.
TableName (see page 10738)	String	Table name.
ForeignKeyName (see page 10737)	String	Foreign key name.

See Also

56.1.12.1 TDBXForeignKeysIndex Members

The following tables list the members exposed by TDBXForeignKeysIndex.

Public Constants

	Name	Description
	CatalogName (see page 10737)	This is CatalogName, a member of class TDBXForeignKeysIndex.
	ForeignKeyName (see page 10737)	This is ForeignKeyName, a member of class TDBXForeignKeysIndex.
	Last (see page 10737)	This is Last, a member of class TDBXForeignKeysIndex.
	SchemaName (see page 10738)	This is SchemaName, a member of class TDBXForeignKeysIndex.
	TableName (see page 10738)	This is TableName, a member of class TDBXForeignKeysIndex.

56.1.12.2 TDBXForeignKeysIndex Constants

The constants of the TDBXForeignKeysIndex class are listed here.

Public Constants

	Name	Description
	CatalogName (see page 10737)	This is CatalogName, a member of class TDBXForeignKeysIndex.
	ForeignKeyName (see page 10737)	This is ForeignKeyName, a member of class TDBXForeignKeysIndex.
	Last (see page 10737)	This is Last, a member of class TDBXForeignKeysIndex.
	SchemaName (see page 10738)	This is SchemaName, a member of class TDBXForeignKeysIndex.
	TableName (see page 10738)	This is TableName, a member of class TDBXForeignKeysIndex.

56.1.12.2.1 TDBXForeignKeysIndex.CatalogName Constant

Pascal

```
const CatalogName = 0;
```

C++

```
CatalogName = 0;
```

Description

This is CatalogName, a member of class TDBXForeignKeysIndex.

56.1.12.2.2 TDBXForeignKeysIndex.ForeignKeyName Constant

Pascal

```
const ForeignKeyName = 3;
```

C++

```
ForeignKeyName = 3;
```

Description

This is ForeignKeyName, a member of class TDBXForeignKeysIndex.

56.1.12.2.3 TDBXForeignKeysIndex.Last Constant

Pascal

```
const Last = 3;
```

C++

```
Last = 3;
```

Description

This is Last, a member of class TDBXForeignKeysIndex.

56.1.12.2.4 TDBXForeignKeysIndex.SchemaName Constant

Pascal

```
const SchemaName = 1;
```

C++

```
SchemaName = 1;
```

Description

This is SchemaName, a member of class TDBXForeignKeysIndex.

56.1.12.2.5 TDBXForeignKeysIndex.TableName Constant

Pascal

```
const TableName = 2;
```

C++

```
TableName = 2;
```

Description

This is TableName, a member of class TDBXForeignKeysIndex.

56.1.13 TDBXIndexColumnsColumns Class

Accesses columns by name in the **IndexColumns** metadata.

Class Hierarchy

Pascal

```
TDBXIndexColumnsColumns = class;
```

C++

```
class TDBXIndexColumnsColumns;
```

File

DBXMetaDataNames

Description

TDBXIndexColumnsColumns is used to access columns by name in the **IndexColumns** metadata collection. These columns are returned when TDBXCommand.Text' is TDBXMetaDataCommands.GetIndexColumns when reading metadata. To retrieve metadata columns, use these constants to index the TDBXReader instance returned by TDBXCommand.ExecuteQuery.

This table describes the columns.

Column Name	Data Type of Column Data	Description
CatalogName (see page 10740)	String	Catalog name.
SchemaName (see page 10741)	String	Schema name.
TableName (see page 10741)	String	Table name.
IndexName (see page 10740)	String	Index name.
ColumnName (see page 10740)	String	Column in index.
Ordinal (see page 10740)	Int32	Position of column in index starting with 1.
IsAscending (see page 10740)	Boolean	Is a descending index column.

56.1.13.1 TDBXIndexColumnsColumns Members

The following tables list the members exposed by TDBXIndexColumnsColumns.

Public Constants

	Name	Description
	CatalogName (see page 10740)	This is CatalogName, a member of class TDBXIndexColumnsColumns.
	ColumnName (see page 10740)	This is ColumnName, a member of class TDBXIndexColumnsColumns.
	IndexName (see page 10740)	This is IndexName, a member of class TDBXIndexColumnsColumns.
	IsAscending (see page 10740)	This is IsAscending, a member of class TDBXIndexColumnsColumns.
	Ordinal (see page 10740)	This is Ordinal, a member of class TDBXIndexColumnsColumns.
	SchemaName (see page 10741)	This is SchemaName, a member of class TDBXIndexColumnsColumns.
	TableName (see page 10741)	This is TableName, a member of class TDBXIndexColumnsColumns.

56.1.13.2 TDBXIndexColumnsColumns Constants

The constants of the TDBXIndexColumnsColumns class are listed here.

Public Constants

	Name	Description
	CatalogName (see page 10740)	This is CatalogName, a member of class TDBXIndexColumnsColumns.
	ColumnName (see page 10740)	This is ColumnName, a member of class TDBXIndexColumnsColumns.
	IndexName (see page 10740)	This is IndexName, a member of class TDBXIndexColumnsColumns.
	IsAscending (see page 10740)	This is IsAscending, a member of class TDBXIndexColumnsColumns.
	Ordinal (see page 10740)	This is Ordinal, a member of class TDBXIndexColumnsColumns.
	SchemaName (see page 10741)	This is SchemaName, a member of class TDBXIndexColumnsColumns.
	TableName (see page 10741)	This is TableName, a member of class TDBXIndexColumnsColumns.

56.1.13.2.1 TDBXIndexColumnsColumns.CatalogName Constant

Pascal

```
const CatalogName = 'CatalogName';
```

C++

```
CatalogName = 'CatalogName';
```

Description

This is CatalogName, a member of class TDBXIndexColumnsColumns.

56.1.13.2.2 TDBXIndexColumnsColumns.ColumnName Constant

Pascal

```
const ColumnName = 'ColumnName';
```

C++

```
ColumnName = 'ColumnName';
```

Description

This is ColumnName, a member of class TDBXIndexColumnsColumns.

56.1.13.2.3 TDBXIndexColumnsColumns.IndexName Constant

Pascal

```
const IndexName = 'IndexName';
```

C++

```
IndexName = 'IndexName';
```

Description

This is IndexName, a member of class TDBXIndexColumnsColumns.

56.1.13.2.4 TDBXIndexColumnsColumns.IsAscending Constant

Pascal

```
const IsAscending = 'IsAscending';
```

C++

```
IsAscending = 'IsAscending';
```

Description

This is IsAscending, a member of class TDBXIndexColumnsColumns.

56.1.13.2.5 TDBXIndexColumnsColumns.Ordinal Constant

Pascal

```
const Ordinal = 'Ordinal';
```

C++

```
Ordinal = 'Ordinal';
```

Description

This is Ordinal, a member of class TDBXIndexColumnsColumns.

56.1.13.2.6 TDBXIndexColumnsColumns.SchemaName Constant

Pascal

```
const SchemaName = 'SchemaName';
```

C++

```
SchemaName = 'SchemaName';
```

Description

This is SchemaName, a member of class TDBXIndexColumnsColumns.

56.1.13.2.7 TDBXIndexColumnsColumns.TableName Constant

Pascal

```
const TableName = 'TableName';
```

C++

```
TableName = 'TableName';
```

Description

This is TableName, a member of class TDBXIndexColumnsColumns.

56.1.14 TDBXIndexColumnsIndex Class

Accesses columns by ordinal in the **IndexColumns** metadata.

Class Hierarchy

Pascal

```
TDBXIndexColumnsIndex = class;
```

C++

```
class TDBXIndexColumnsIndex;
```

File

DBXMetaDataNames

Description

TDBXIndexColumnsIndex is used to access columns by ordinal in the **IndexColumns** metadata collection. These columns are returned when TDBXCommand.Text' is TDBXMetaDataCommands.GetIndexColumns when reading metadata. To retrieve metadata columns, use these constants to index the TDBXReader instance returned by TDBXCommand.ExecuteQuery.

This table describes the columns.

Column Ordinal (see page 10744) Name	Data Type of Column Data	Description
CatalogName (see page 10743)	String	Catalog name.
SchemaName (see page 10744)	String	Schema name.
TableName (see page 10744)	String	Table name.
IndexName (see page 10743)	String	Index name.
ColumnName (see page 10743)	String	Column in index.
Ordinal (see page 10744)	Int32	Position of column in index starting with 1.
IsAscending (see page 10743)	Boolean	Is a descending index column.

See Also

TDBXIndexColumnsColumns (see page 10738)

56.1.14.1 TDBXIndexColumnsIndex Members

The following tables list the members exposed by TDBXIndexColumnsIndex.

Public Constants

	Name	Description
	CatalogName (see page 10743)	This is CatalogName, a member of class TDBXIndexColumnsIndex.
	ColumnName (see page 10743)	This is ColumnName, a member of class TDBXIndexColumnsIndex.
	IndexName (see page 10743)	This is IndexName, a member of class TDBXIndexColumnsIndex.
	IsAscending (see page 10743)	This is IsAscending, a member of class TDBXIndexColumnsIndex.
	Last (see page 10743)	This is Last, a member of class TDBXIndexColumnsIndex.
	Ordinal (see page 10744)	This is Ordinal, a member of class TDBXIndexColumnsIndex.
	SchemaName (see page 10744)	This is SchemaName, a member of class TDBXIndexColumnsIndex.
	TableName (see page 10744)	This is TableName, a member of class TDBXIndexColumnsIndex.

56.1.14.2 TDBXIndexColumnsIndex Constants

The constants of the TDBXIndexColumnsIndex class are listed here.

Public Constants

	Name	Description
	CatalogName (see page 10743)	This is CatalogName, a member of class TDBXIndexColumnsIndex.
	ColumnName (see page 10743)	This is ColumnName, a member of class TDBXIndexColumnsIndex.
	IndexName (see page 10743)	This is IndexName, a member of class TDBXIndexColumnsIndex.
	IsAscending (see page 10743)	This is IsAscending, a member of class TDBXIndexColumnsIndex.
	Last (see page 10743)	This is Last, a member of class TDBXIndexColumnsIndex.
	Ordinal (see page 10744)	This is Ordinal, a member of class TDBXIndexColumnsIndex.
	SchemaName (see page 10744)	This is SchemaName, a member of class TDBXIndexColumnsIndex.
	TableName (see page 10744)	This is TableName, a member of class TDBXIndexColumnsIndex.

56.1.14.2.1 TDBXIndexColumnsIndex.CatalogName Constant

Pascal

```
const CatalogName = 0;
```

C++

```
CatalogName = 0;
```

Description

This is CatalogName, a member of class TDBXIndexColumnsIndex.

56.1.14.2.2 TDBXIndexColumnsIndex.ColumnName Constant

Pascal

```
const ColumnName = 4;
```

C++

```
ColumnName = 4;
```

Description

This is ColumnName, a member of class TDBXIndexColumnsIndex.

56.1.14.2.3 TDBXIndexColumnsIndex.IndexName Constant

Pascal

```
const IndexName = 3;
```

C++

```
IndexName = 3;
```

Description

This is IndexName, a member of class TDBXIndexColumnsIndex.

56.1.14.2.4 TDBXIndexColumnsIndex.IsAscending Constant

Pascal

```
const IsAscending = 6;
```

C++

```
IsAscending = 6;
```

Description

This is IsAscending, a member of class TDBXIndexColumnsIndex.

56.1.14.2.5 TDBXIndexColumnsIndex.Last Constant

Pascal

```
const Last = 6;
```

C++

```
Last = 6;
```

Description

This is Last, a member of class TDBXIndexColumnsIndex.

56.1.14.2.6 TDBXIndexColumnsIndex.Ordinal Constant

Pascal

```
const Ordinal = 5;
```

C++

```
Ordinal = 5;
```

Description

This is Ordinal, a member of class TDBXIndexColumnsIndex.

56.1.14.2.7 TDBXIndexColumnsIndex.SchemaName Constant

Pascal

```
const SchemaName = 1;
```

C++

```
SchemaName = 1;
```

Description

This is SchemaName, a member of class TDBXIndexColumnsIndex.

56.1.14.2.8 TDBXIndexColumnsIndex.TableName Constant

Pascal

```
const TableName = 2;
```

C++

```
TableName = 2;
```

Description

This is TableName, a member of class TDBXIndexColumnsIndex.

56.1.15 TDBXIndexesColumns Class

Accesses columns by name in the **Indexes** metadata.

Class Hierarchy

Pascal

```
TDBXIndexesColumns = class;
```

C++

```
class TDBXIndexesColumns;
```

File

DBXMetaDataNames

Description

TDBXIndexesColumns is used to access columns by name in the **Indexes** metadata collection. These columns are returned when TDBXCommand.Text' is TDBXMetaDataCommands.GetIndexes when reading metadata. To retrieve metadata columns, use these constants to index the TDBXReader instance returned by TDBXCommand.ExecuteQuery.

This table describes the columns.

Column Name	Data Type of Column Data	Description
CatalogName (see page 10746)	String	Catalog name.
SchemaName (see page 10747)	String	Schema name.
TableName (see page 10747)	String	Table name.
IndexName (see page 10746)	String	Index name.
ConstraintName (see page 10746)	String	Constraint name; may be NULL.
IsPrimary (see page 10747)	Boolean	Is primary index of table.
IsUnique (see page 10747)	Boolean	Is unique index of table.
IsAscending (see page 10746)	Boolean	Is a descending index (Interbase only).

56.1.15.1 TDBXIndexesColumns Members

The following tables list the members exposed by TDBXIndexesColumns.

Public Constants

	Name	Description
	CatalogName (see page 10746)	This is CatalogName, a member of class TDBXIndexesColumns.
	ConstraintName (see page 10746)	This is ConstraintName, a member of class TDBXIndexesColumns.
	IndexName (see page 10746)	This is IndexName, a member of class TDBXIndexesColumns.
	IsAscending (see page 10746)	This is IsAscending, a member of class TDBXIndexesColumns.
	IsPrimary (see page 10747)	This is IsPrimary, a member of class TDBXIndexesColumns.
	IsUnique (see page 10747)	This is IsUnique, a member of class TDBXIndexesColumns.
	SchemaName (see page 10747)	This is SchemaName, a member of class TDBXIndexesColumns.
	TableName (see page 10747)	This is TableName, a member of class TDBXIndexesColumns.

56.1.15.2 TDBXIndexesColumns Constants

The constants of the TDBXIndexesColumns class are listed here.

Public Constants

	Name	Description
	CatalogName (see page 10746)	This is CatalogName, a member of class TDBXIndexesColumns.
	ConstraintName (see page 10746)	This is ConstraintName, a member of class TDBXIndexesColumns.
	IndexName (see page 10746)	This is IndexName, a member of class TDBXIndexesColumns.
	IsAscending (see page 10746)	This is IsAscending, a member of class TDBXIndexesColumns.
	IsPrimary (see page 10747)	This is IsPrimary, a member of class TDBXIndexesColumns.
	IsUnique (see page 10747)	This is IsUnique, a member of class TDBXIndexesColumns.
	SchemaName (see page 10747)	This is SchemaName, a member of class TDBXIndexesColumns.
	TableName (see page 10747)	This is TableName, a member of class TDBXIndexesColumns.

56.1.15.2.1 TDBXIndexesColumns.CatalogName Constant

Pascal

```
const CatalogName = 'CatalogName';
```

C++

```
CatalogName = 'CatalogName';
```

Description

This is CatalogName, a member of class TDBXIndexesColumns.

56.1.15.2.2 TDBXIndexesColumns.ConstraintName Constant

Pascal

```
const ConstraintName = 'ConstraintName';
```

C++

```
ConstraintName = 'ConstraintName';
```

Description

This is ConstraintName, a member of class TDBXIndexesColumns.

56.1.15.2.3 TDBXIndexesColumns.IndexName Constant

Pascal

```
const IndexName = 'IndexName';
```

C++

```
IndexName = 'IndexName';
```

Description

This is IndexName, a member of class TDBXIndexesColumns.

56.1.15.2.4 TDBXIndexesColumns.IsAscending Constant

Pascal

```
const IsAscending = 'IsAscending';
```

C++

```
IsAscending = 'IsAscending';
```

Description

This is IsAscending, a member of class TDBXIndexesColumns.

56.1.15.2.5 TDBXIndexesColumns.IsPrimary Constant

Pascal

```
const IsPrimary = 'IsPrimary';
```

C++

```
IsPrimary = 'IsPrimary';
```

Description

This is IsPrimary, a member of class TDBXIndexesColumns.

56.1.15.2.6 TDBXIndexesColumns.IsUnique Constant

Pascal

```
const IsUnique = 'IsUnique';
```

C++

```
IsUnique = 'IsUnique';
```

Description

This is IsUnique, a member of class TDBXIndexesColumns.

56.1.15.2.7 TDBXIndexesColumns.SchemaName Constant

Pascal

```
const SchemaName = 'SchemaName';
```

C++

```
SchemaName = 'SchemaName';
```

Description

This is SchemaName, a member of class TDBXIndexesColumns.

56.1.15.2.8 TDBXIndexesColumns.TableName Constant

Pascal

```
const TableName = 'TableName';
```

C++

```
TableName = 'TableName';
```

Description

This is TableName, a member of class TDBXIndexesColumns.

56.1.16 TDBXIndexesIndex Class

Accesses columns by ordinal in the **Indexes** metadata.

Class Hierarchy

DBXMetaDataNames.TDBXIndexesIndex

Pascal

```
TDBXIndexesIndex = class;
```

C++

```
class TDBXIndexesIndex;
```

File

DBXMetaDataNames

Description

TDBXIndexesIndex is used to access columns by ordinal in the **Indexes** metadata collection. These columns are returned when TDBXCommand.Text' is TDBXMetaDataCommands.GetIndexes when reading metadata. To retrieve metadata columns, use these constants to index the TDBXReader instance returned by TDBXCommand.ExecuteQuery.

This table describes the columns.

Column Ordinal Name	Data Type of Column Data	Description
CatalogName (see page 10749)	String	Catalog name.
SchemaName (see page 10751)	String	Schema name.
TableName (see page 10751)	String	Table name.
IndexName (see page 10749)	String	Index name.
ConstraintName (see page 10749)	String	Constraint name; may be NULL.
IsPrimary (see page 10750)	Boolean	Is primary index of table.
IsUnique (see page 10750)	Boolean	Is unique index of table.
IsAscending (see page 10750)	Boolean	Is a descending index (Interbase only).

56.1.16.1 TDBXIndexesIndex Members

The following tables list the members exposed by TDBXIndexesIndex.

Public Constants

	Name	Description
	CatalogName (see page 10749)	This is CatalogName, a member of class TDBXIndexesIndex.
	ConstraintName (see page 10749)	This is ConstraintName, a member of class TDBXIndexesIndex.

	IndexName (see page 10749)	This is IndexName, a member of class TDBXIndexesIndex.
	IsAscending (see page 10750)	This is IsAscending, a member of class TDBXIndexesIndex.
	IsPrimary (see page 10750)	This is IsPrimary, a member of class TDBXIndexesIndex.
	IsUnique (see page 10750)	This is IsUnique, a member of class TDBXIndexesIndex.
	Last (see page 10750)	This is Last, a member of class TDBXIndexesIndex.
	SchemaName (see page 10751)	This is SchemaName, a member of class TDBXIndexesIndex.
	TableName (see page 10751)	This is TableName, a member of class TDBXIndexesIndex.

56.1.16.2 TDBXIndexesIndex Constants

The constants of the TDBXIndexesIndex class are listed here.

Public Constants

	Name	Description
	CatalogName (see page 10749)	This is CatalogName, a member of class TDBXIndexesIndex.
	ConstraintName (see page 10749)	This is ConstraintName, a member of class TDBXIndexesIndex.
	IndexName (see page 10749)	This is IndexName, a member of class TDBXIndexesIndex.
	IsAscending (see page 10750)	This is IsAscending, a member of class TDBXIndexesIndex.
	IsPrimary (see page 10750)	This is IsPrimary, a member of class TDBXIndexesIndex.
	IsUnique (see page 10750)	This is IsUnique, a member of class TDBXIndexesIndex.
	Last (see page 10750)	This is Last, a member of class TDBXIndexesIndex.
	SchemaName (see page 10751)	This is SchemaName, a member of class TDBXIndexesIndex.
	TableName (see page 10751)	This is TableName, a member of class TDBXIndexesIndex.

56.1.16.2.1 TDBXIndexesIndex.CatalogName Constant

Pascal

```
const CatalogName = 0;
```

C++

```
CatalogName = 0;
```

Description

This is CatalogName, a member of class TDBXIndexesIndex.

56.1.16.2.2 TDBXIndexesIndex.ConstraintName Constant

Pascal

```
const ConstraintName = 4;
```

C++

```
ConstraintName = 4;
```

Description

This is ConstraintName, a member of class TDBXIndexesIndex.

56.1.16.2.3 TDBXIndexesIndex.IndexName Constant

Pascal

```
const IndexName = 3;
```

C++

```
IndexName = 3;
```

Description

This is IndexName, a member of class TDBXIndexesIndex.

56.1.16.2.4 TDBXIndexesIndex.IsAscending Constant

Pascal

```
const IsAscending = 7;
```

C++

```
IsAscending = 7;
```

Description

This is IsAscending, a member of class TDBXIndexesIndex.

56.1.16.2.5 TDBXIndexesIndex.IsPrimary Constant

Pascal

```
const IsPrimary = 5;
```

C++

```
IsPrimary = 5;
```

Description

This is IsPrimary, a member of class TDBXIndexesIndex.

56.1.16.2.6 TDBXIndexesIndex.IsUnique Constant

Pascal

```
const IsUnique = 6;
```

C++

```
IsUnique = 6;
```

Description

This is IsUnique, a member of class TDBXIndexesIndex.

56.1.16.2.7 TDBXIndexesIndex.Last Constant

Pascal

```
const Last = 7;
```

C++

```
Last = 7;
```

Description

This is Last, a member of class TDBXIndexesIndex.

56.1.16.2.8 TDBXIndexesIndex.SchemaName Constant

Pascal

```
const SchemaName = 1;
```

C++

```
SchemaName = 1;
```

Description

This is SchemaName, a member of class TDBXIndexesIndex.

56.1.16.2.9 TDBXIndexesIndex.TableName Constant

Pascal

```
const TableName = 2;
```

C++

```
TableName = 2;
```

Description

This is TableName, a member of class TDBXIndexesIndex.

56.1.17 TDBXMetaDataCollectionIndex Class

Represents a collection of metadata accessed by ordinal.

Class Hierarchy

DBXMetaDataNames.TDBXMetaDataCollectionIndex

Pascal

```
TDBXMetaDataCollectionIndex = class;
```

C++

```
class TDBXMetaDataCollectionIndex;
```

File

DBXMetaDataNames

Description

TDBXMetaDataCollectionIndex represents a collection of metadata accessed by ordinal.

This table describes the metadata collection ordinal names.

Collection Ordinal Name	Description
DataTypes (see page 10754)	Represents the data types supported by a specific database.
Catalogs (see page 10753)	Represents catalogs in a database.
Schemas (see page 10757)	Represents schemas in a database.
Tables (see page 10758)	Represents tables in a database.

Views (see page 10758)	Represents views in a database.
Synonyms (see page 10757)	Represents synonyms in a database.
Columns (see page 10754)	Represents table columns in a database.
ColumnConstraints (see page 10754)	Represents column constraints in a database. This is used only internally.
Indexes (see page 10755)	Represents table indexes in a database.
IndexColumns (see page 10755)	Represents index columns in a database.
ForeignKeys (see page 10755)	Represents foreign keys in a database.
ForeignKeyColumns (see page 10754)	Represents foreign key columns in a database.
Procedures (see page 10756)	Represents procedures in a database.
ProcedureSources (see page 10757)	Represents procedure source code in a database.
ProcedureParameters (see page 10756)	Represents procedure parameters in a database.
Packages (see page 10756)	Represents packages in a database.
PackageProcedures (see page 10755)	Represents package procedures in a database.
PackageProcedureParameters (see page 10755)	Represents package procedure parameters in a database.
PackageSources (see page 10756)	Represents package source code in a database.
Users (see page 10758)	Represents users in a database.
Roles (see page 10757)	Represents roles in a database.
ReservedWords (see page 10757)	Represents reserved words in a database.

TDBXMetaDataCollectionName (see page 10758)

56.1.17.1 TDBXMetaDataCollectionIndex Members

The following tables list the members exposed by TDBXMetaDataCollectionIndex.

Public Constants

	Name	Description
	Catalogs (see page 10753)	This is Catalogs, a member of class TDBXMetaDataCollectionIndex.
	ColumnConstraints (see page 10754)	This is ColumnConstraints, a member of class TDBXMetaDataCollectionIndex.
	Columns (see page 10754)	This is Columns, a member of class TDBXMetaDataCollectionIndex.
	DataTypes (see page 10754)	This is DataTypes, a member of class TDBXMetaDataCollectionIndex.
	ForeignKeyColumns (see page 10754)	This is ForeignKeyColumns, a member of class TDBXMetaDataCollectionIndex.

	ForeignKeys (see page 10755)	This is ForeignKeys, a member of class TDBXMetaDataCollectionIndex.
	IndexColumns (see page 10755)	This is IndexColumns, a member of class TDBXMetaDataCollectionIndex.
	Indexes (see page 10755)	This is Indexes, a member of class TDBXMetaDataCollectionIndex.
	PackageProcedureParameters (see page 10755)	This is PackageProcedureParameters, a member of class TDBXMetaDataCollectionIndex.
	PackageProcedures (see page 10755)	This is PackageProcedures, a member of class TDBXMetaDataCollectionIndex.
	Packages (see page 10756)	This is Packages, a member of class TDBXMetaDataCollectionIndex.
	PackageSources (see page 10756)	This is PackageSources, a member of class TDBXMetaDataCollectionIndex.
	ProcedureParameters (see page 10756)	This is ProcedureParameters, a member of class TDBXMetaDataCollectionIndex.
	Procedures (see page 10756)	This is Procedures, a member of class TDBXMetaDataCollectionIndex.
	ProcedureSources (see page 10757)	This is ProcedureSources, a member of class TDBXMetaDataCollectionIndex.
	ReservedWords (see page 10757)	This is ReservedWords, a member of class TDBXMetaDataCollectionIndex.
	Roles (see page 10757)	This is Roles, a member of class TDBXMetaDataCollectionIndex.
	Schemas (see page 10757)	This is Schemas, a member of class TDBXMetaDataCollectionIndex.
	Synonyms (see page 10757)	This is Synonyms, a member of class TDBXMetaDataCollectionIndex.
	Tables (see page 10758)	This is Tables, a member of class TDBXMetaDataCollectionIndex.
	Users (see page 10758)	This is Users, a member of class TDBXMetaDataCollectionIndex.
	Views (see page 10758)	This is Views, a member of class TDBXMetaDataCollectionIndex.

56.1.17.2 TDBXMetaDataCollectionIndex Constants

The constants of the TDBXMetaDataCollectionIndex class are listed here.

Public Constants

	Name	Description
	Catalogs (see page 10753)	This is Catalogs, a member of class TDBXMetaDataCollectionIndex.
	ColumnConstraints (see page 10754)	This is ColumnConstraints, a member of class TDBXMetaDataCollectionIndex.
	Columns (see page 10754)	This is Columns, a member of class TDBXMetaDataCollectionIndex.
	DataTypes (see page 10754)	This is DataTypes, a member of class TDBXMetaDataCollectionIndex.
	ForeignKeyColumns (see page 10754)	This is ForeignKeyColumns, a member of class TDBXMetaDataCollectionIndex.
	ForeignKeys (see page 10755)	This is ForeignKeys, a member of class TDBXMetaDataCollectionIndex.
	IndexColumns (see page 10755)	This is IndexColumns, a member of class TDBXMetaDataCollectionIndex.
	Indexes (see page 10755)	This is Indexes, a member of class TDBXMetaDataCollectionIndex.
	PackageProcedureParameters (see page 10755)	This is PackageProcedureParameters, a member of class TDBXMetaDataCollectionIndex.
	PackageProcedures (see page 10755)	This is PackageProcedures, a member of class TDBXMetaDataCollectionIndex.
	Packages (see page 10756)	This is Packages, a member of class TDBXMetaDataCollectionIndex.
	PackageSources (see page 10756)	This is PackageSources, a member of class TDBXMetaDataCollectionIndex.
	ProcedureParameters (see page 10756)	This is ProcedureParameters, a member of class TDBXMetaDataCollectionIndex.
	Procedures (see page 10756)	This is Procedures, a member of class TDBXMetaDataCollectionIndex.
	ProcedureSources (see page 10757)	This is ProcedureSources, a member of class TDBXMetaDataCollectionIndex.
	ReservedWords (see page 10757)	This is ReservedWords, a member of class TDBXMetaDataCollectionIndex.
	Roles (see page 10757)	This is Roles, a member of class TDBXMetaDataCollectionIndex.
	Schemas (see page 10757)	This is Schemas, a member of class TDBXMetaDataCollectionIndex.
	Synonyms (see page 10757)	This is Synonyms, a member of class TDBXMetaDataCollectionIndex.
	Tables (see page 10758)	This is Tables, a member of class TDBXMetaDataCollectionIndex.
	Users (see page 10758)	This is Users, a member of class TDBXMetaDataCollectionIndex.
	Views (see page 10758)	This is Views, a member of class TDBXMetaDataCollectionIndex.

56.1.17.2.1 TDBXMetaDataCollectionIndex.Catalogs Constant

Pascal

```
const Catalogs = 2;
```

C++

```
Catalogs = 2;
```

Description

This is Catalogs, a member of class TDBXMetaDataCollectionIndex.

56.1.17.2.2 TDBXMetaDataCollectionIndex.ColumnConstraints Constant

Pascal

```
const ColumnConstraints = 8;
```

C++

```
ColumnConstraints = 8;
```

Description

This is ColumnConstraints, a member of class TDBXMetaDataCollectionIndex.

56.1.17.2.3 TDBXMetaDataCollectionIndex.Columns Constant

Pascal

```
const Columns = 7;
```

C++

```
Columns = 7;
```

Description

This is Columns, a member of class TDBXMetaDataCollectionIndex.

56.1.17.2.4 TDBXMetaDataCollectionIndex.DataTypes Constant

Pascal

```
const DataTypes = 1;
```

C++

```
DataTypes = 1;
```

Description

This is DataTypes, a member of class TDBXMetaDataCollectionIndex.

56.1.17.2.5 TDBXMetaDataCollectionIndex.ForeignKeyColumns Constant

Pascal

```
const ForeignKeyColumns = 12;
```

C++

```
ForeignKeyColumns = 12;
```

Description

This is ForeignKeyColumns, a member of class TDBXMetaDataCollectionIndex.

56.1.17.2.6 TDBXMetaDataCollectionIndex.ForeignKeys Constant

Pascal

```
const ForeignKeys = 11;
```

C++

```
ForeignKeys = 11;
```

Description

This is ForeignKeys, a member of class TDBXMetaDataCollectionIndex.

56.1.17.2.7 TDBXMetaDataCollectionIndex.IndexColumns Constant

Pascal

```
const IndexColumns = 10;
```

C++

```
IndexColumns = 10;
```

Description

This is IndexColumns, a member of class TDBXMetaDataCollectionIndex.

56.1.17.2.8 TDBXMetaDataCollectionIndex.Indexes Constant

Pascal

```
const Indexes = 9;
```

C++

```
Indexes = 9;
```

Description

This is Indexes, a member of class TDBXMetaDataCollectionIndex.

56.1.17.2.9 TDBXMetaDataCollectionIndex.PackageProcedureParameters Constant

Pascal

```
const PackageProcedureParameters = 18;
```

C++

```
PackageProcedureParameters = 18;
```

Description

This is PackageProcedureParameters, a member of class TDBXMetaDataCollectionIndex.

56.1.17.2.10 TDBXMetaDataCollectionIndex.PackageProcedures Constant

Pascal

```
const PackageProcedures = 17;
```

C++

```
PackageProcedures = 17;
```

Description

This is PackageProcedures, a member of class TDBXMetaDataCollectionIndex.

56.1.17.2.11 TDBXMetaDataCollectionIndex.Packages Constant

Pascal

```
const Packages = 16;
```

C++

```
Packages = 16;
```

Description

This is Packages, a member of class TDBXMetaDataCollectionIndex.

56.1.17.2.12 TDBXMetaDataCollectionIndex.PackageSources Constant

Pascal

```
const PackageSources = 19;
```

C++

```
PackageSources = 19;
```

Description

This is PackageSources, a member of class TDBXMetaDataCollectionIndex.

56.1.17.2.13 TDBXMetaDataCollectionIndex.ProcedureParameters Constant

Pascal

```
const ProcedureParameters = 15;
```

C++

```
ProcedureParameters = 15;
```

Description

This is ProcedureParameters, a member of class TDBXMetaDataCollectionIndex.

56.1.17.2.14 TDBXMetaDataCollectionIndex.Procedures Constant

Pascal

```
const Procedures = 13;
```

C++

```
Procedures = 13;
```

Description

This is Procedures, a member of class TDBXMetaDataCollectionIndex.

56.1.17.2.15 TDBXMetaDataCollectionIndex.ProcedureSources Constant

Pascal

```
const ProcedureSources = 14;
```

C++

```
ProcedureSources = 14;
```

Description

This is ProcedureSources, a member of class TDBXMetaDataCollectionIndex.

56.1.17.2.16 TDBXMetaDataCollectionIndex.ReservedWords Constant

Pascal

```
const ReservedWords = 22;
```

C++

```
ReservedWords = 22;
```

Description

This is ReservedWords, a member of class TDBXMetaDataCollectionIndex.

56.1.17.2.17 TDBXMetaDataCollectionIndex.Roles Constant

Pascal

```
const Roles = 21;
```

C++

```
Roles = 21;
```

Description

This is Roles, a member of class TDBXMetaDataCollectionIndex.

56.1.17.2.18 TDBXMetaDataCollectionIndex.Schemas Constant

Pascal

```
const Schemas = 3;
```

C++

```
Schemas = 3;
```

Description

This is Schemas, a member of class TDBXMetaDataCollectionIndex.

56.1.17.2.19 TDBXMetaDataCollectionIndex.Synonyms Constant

Pascal

```
const Synonyms = 6;
```

C++

```
Synonyms = 6;
```

Description

This is Synonyms, a member of class TDBXMetaDataCollectionIndex.

56.1.17.2.20 TDBXMetaDataCollectionIndex.Tables Constant

Pascal

```
const Tables = 4;
```

C++

```
Tables = 4;
```

Description

This is Tables, a member of class TDBXMetaDataCollectionIndex.

56.1.17.2.21 TDBXMetaDataCollectionIndex.Users Constant

Pascal

```
const Users = 20;
```

C++

```
Users = 20;
```

Description

This is Users, a member of class TDBXMetaDataCollectionIndex.

56.1.17.2.22 TDBXMetaDataCollectionIndex.Views Constant

Pascal

```
const Views = 5;
```

C++

```
Views = 5;
```

Description

This is Views, a member of class TDBXMetaDataCollectionIndex.

56.1.18 TDBXMetaDataCollectionName Class

Represents a collection of metadata accessed by name.

Class Hierarchy

Pascal

```
TDBXMetaDataCollectionName = class;
```

C++

```
class TDBXMetaDataCollectionName;
```

File

DBXMetaDataNames

Description

TDBXMetaDataCollectionName represents a collection of metadata accessed by name.

This table describes the metadata collection names.

Collection Name	Description
DataTypes (see page 10762)	Represents the data types supported by a specific database.
Catalogs (see page 10761)	Represents catalogs in a database.
Schemas (see page 10765)	Represents schemas in a database.
Tables (see page 10765)	Represents tables in a database.
Views (see page 10766)	Represents views in a database.
Synonyms (see page 10765)	Represents synonyms in a database.
Columns (see page 10761)	Represents table columns in a database.
ColumnConstraints (see page 10761)	Represents column constraints in a database. This is used only internally.
Indexes (see page 10762)	Represents table indexes in a database.
IndexColumns (see page 10762)	Represents index columns in a database.
ForeignKeys (see page 10762)	Represents foreign keys in a database.
ForeignKeyColumns (see page 10762)	Represents foreign key columns in a database.
Procedures (see page 10764)	Represents procedures in a database.
ProcedureSources (see page 10764)	Represents procedure source code in a database.
ProcedureParameters (see page 10764)	Represents procedure parameters in a database.
Packages (see page 10763)	Represents packages in a database.
PackageProcedures (see page 10763)	Represents package procedures in a database.
PackageProcedureParameters (see page 10763)	Represents package procedure parameters in a database.
PackageSources (see page 10763)	Represents package source code in a database.
Users (see page 10765)	Represents users in a database.
Roles (see page 10764)	Represents roles in a database.

ReservedWords (see page 10764)	Represents reserved words in a database.

TDBXMetaDataCollectionIndex (see page 10751)

56.1.18.1 TDBXMetaDataCollectionName Members

The following tables list the members exposed by TDBXMetaDataCollectionName.

Public Constants

	Name	Description
	Catalogs (see page 10761)	This is Catalogs, a member of class TDBXMetaDataCollectionName.
	ColumnConstraints (see page 10761)	This is ColumnConstraints, a member of class TDBXMetaDataCollectionName.
	Columns (see page 10761)	This is Columns, a member of class TDBXMetaDataCollectionName.
	DataTypes (see page 10762)	This is DataTypes, a member of class TDBXMetaDataCollectionName.
	ForeignKeyColumns (see page 10762)	This is ForeignKeyColumns, a member of class TDBXMetaDataCollectionName.
	ForeignKeys (see page 10762)	This is ForeignKeys, a member of class TDBXMetaDataCollectionName.
	IndexColumns (see page 10762)	This is IndexColumns, a member of class TDBXMetaDataCollectionName.
	Indexes (see page 10762)	This is Indexes, a member of class TDBXMetaDataCollectionName.
	PackageProcedureParameters (see page 10763)	This is PackageProcedureParameters, a member of class TDBXMetaDataCollectionName.
	PackageProcedures (see page 10763)	This is PackageProcedures, a member of class TDBXMetaDataCollectionName.
	Packages (see page 10763)	This is Packages, a member of class TDBXMetaDataCollectionName.
	PackageSources (see page 10763)	This is PackageSources, a member of class TDBXMetaDataCollectionName.
	ProcedureParameters (see page 10764)	This is ProcedureParameters, a member of class TDBXMetaDataCollectionName.
	Procedures (see page 10764)	This is Procedures, a member of class TDBXMetaDataCollectionName.
	ProcedureSources (see page 10764)	This is ProcedureSources, a member of class TDBXMetaDataCollectionName.
	ReservedWords (see page 10764)	This is ReservedWords, a member of class TDBXMetaDataCollectionName.
	Roles (see page 10764)	This is Roles, a member of class TDBXMetaDataCollectionName.
	Schemas (see page 10765)	This is Schemas, a member of class TDBXMetaDataCollectionName.
	Synonyms (see page 10765)	This is Synonyms, a member of class TDBXMetaDataCollectionName.
	Tables (see page 10765)	This is Tables, a member of class TDBXMetaDataCollectionName.
	Users (see page 10765)	This is Users, a member of class TDBXMetaDataCollectionName.
	Views (see page 10766)	This is Views, a member of class TDBXMetaDataCollectionName.

56.1.18.2 TDBXMetaDataCollectionName Constants

The constants of the TDBXMetaDataCollectionName class are listed here.

Public Constants

	Name	Description
	Catalogs (see page 10761)	This is Catalogs, a member of class TDBXMetaDataCollectionName.
	ColumnConstraints (see page 10761)	This is ColumnConstraints, a member of class TDBXMetaDataCollectionName.
	Columns (see page 10761)	This is Columns, a member of class TDBXMetaDataCollectionName.
	DataTypes (see page 10762)	This is DataTypes, a member of class TDBXMetaDataCollectionName.
	ForeignKeyColumns (see page 10762)	This is ForeignKeyColumns, a member of class TDBXMetaDataCollectionName.
	ForeignKeys (see page 10762)	This is ForeignKeys, a member of class TDBXMetaDataCollectionName.
	IndexColumns (see page 10762)	This is IndexColumns, a member of class TDBXMetaDataCollectionName.
	Indexes (see page 10762)	This is Indexes, a member of class TDBXMetaDataCollectionName.

	PackageProcedureParameters (see page 10763)	This is PackageProcedureParameters, a member of class TDBXMetaDataCollectionName.
	PackageProcedures (see page 10763)	This is PackageProcedures, a member of class TDBXMetaDataCollectionName.
	Packages (see page 10763)	This is Packages, a member of class TDBXMetaDataCollectionName.
	PackageSources (see page 10763)	This is PackageSources, a member of class TDBXMetaDataCollectionName.
	ProcedureParameters (see page 10764)	This is ProcedureParameters, a member of class TDBXMetaDataCollectionName.
	Procedures (see page 10764)	This is Procedures, a member of class TDBXMetaDataCollectionName.
	ProcedureSources (see page 10764)	This is ProcedureSources, a member of class TDBXMetaDataCollectionName.
	ReservedWords (see page 10764)	This is ReservedWords, a member of class TDBXMetaDataCollectionName.
	Roles (see page 10764)	This is Roles, a member of class TDBXMetaDataCollectionName.
	Schemas (see page 10765)	This is Schemas, a member of class TDBXMetaDataCollectionName.
	Synonyms (see page 10765)	This is Synonyms, a member of class TDBXMetaDataCollectionName.
	Tables (see page 10765)	This is Tables, a member of class TDBXMetaDataCollectionName.
	Users (see page 10765)	This is Users, a member of class TDBXMetaDataCollectionName.
	Views (see page 10766)	This is Views, a member of class TDBXMetaDataCollectionName.

56.1.18.2.1 TDBXMetaDataCollectionName.Catalogs Constant

Pascal

```
const Catalogs = 'Catalogs';
```

C++

```
Catalogs = 'Catalogs';
```

Description

This is Catalogs, a member of class TDBXMetaDataCollectionName.

56.1.18.2.2 TDBXMetaDataCollectionName.ColumnConstraints Constant

Pascal

```
const ColumnConstraints = 'ColumnConstraints';
```

C++

```
ColumnConstraints = 'ColumnConstraints';
```

Description

This is ColumnConstraints, a member of class TDBXMetaDataCollectionName.

56.1.18.2.3 TDBXMetaDataCollectionName.Columns Constant

Pascal

```
const Columns = 'Columns';
```

C++

```
Columns = 'Columns';
```

Description

This is Columns, a member of class TDBXMetaDataCollectionName.

56.1.18.2.4 TDBXMetaDataCollectionName.DataTypes Constant

Pascal

```
const DataTypes = 'DataTypes';
```

C++

```
DataTypes = 'DataTypes';
```

Description

This is DataTypes, a member of class TDBXMetaDataCollectionName.

56.1.18.2.5 TDBXMetaDataCollectionName.ForeignKeyColumns Constant

Pascal

```
const ForeignKeyColumns = 'ForeignKeyColumns';
```

C++

```
ForeignKeyColumns = 'ForeignKeyColumns';
```

Description

This is ForeignKeyColumns, a member of class TDBXMetaDataCollectionName.

56.1.18.2.6 TDBXMetaDataCollectionName.ForeignKeys Constant

Pascal

```
const ForeignKeys = 'ForeignKeys';
```

C++

```
ForeignKeys = 'ForeignKeys';
```

Description

This is ForeignKeys, a member of class TDBXMetaDataCollectionName.

56.1.18.2.7 TDBXMetaDataCollectionName.IndexColumns Constant

Pascal

```
const IndexColumns = 'IndexColumns';
```

C++

```
IndexColumns = 'IndexColumns';
```

Description

This is IndexColumns, a member of class TDBXMetaDataCollectionName.

56.1.18.2.8 TDBXMetaDataCollectionName.Indexes Constant

Pascal

```
const Indexes = 'Indexes';
```

C++

```
Indexes = 'Indexes';
```

Description

This is Indexes, a member of class TDBXMetaDataCollectionName.

56.1.18.2.9 TDBXMetaDataCollectionName.PackageProcedureParameters Constant

Pascal

```
const PackageProcedureParameters = 'PackageProcedureParameters';
```

C++

```
PackageProcedureParameters = 'PackageProcedureParameters';
```

Description

This is PackageProcedureParameters, a member of class TDBXMetaDataCollectionName.

56.1.18.2.10 TDBXMetaDataCollectionName.PackageProcedures Constant

Pascal

```
const PackageProcedures = 'PackageProcedures';
```

C++

```
PackageProcedures = 'PackageProcedures';
```

Description

This is PackageProcedures, a member of class TDBXMetaDataCollectionName.

56.1.18.2.11 TDBXMetaDataCollectionName.Packages Constant

Pascal

```
const Packages = 'Packages';
```

C++

```
Packages = 'Packages';
```

Description

This is Packages, a member of class TDBXMetaDataCollectionName.

56.1.18.2.12 TDBXMetaDataCollectionName.PackageSources Constant

Pascal

```
const PackageSources = 'PackageSources';
```

C++

```
PackageSources = 'PackageSources';
```

Description

This is PackageSources, a member of class TDBXMetaDataCollectionName.

56.1.18.2.13 TDBXMetaDataCollectionName.ProcedureParameters Constant

Pascal

```
const ProcedureParameters = 'ProcedureParameters';
```

C++

```
ProcedureParameters = 'ProcedureParameters';
```

Description

This is ProcedureParameters, a member of class TDBXMetaDataCollectionName.

56.1.18.2.14 TDBXMetaDataCollectionName.Procedures Constant

Pascal

```
const Procedures = 'Procedures';
```

C++

```
Procedures = 'Procedures';
```

Description

This is Procedures, a member of class TDBXMetaDataCollectionName.

56.1.18.2.15 TDBXMetaDataCollectionName.ProcedureSources Constant

Pascal

```
const ProcedureSources = 'ProcedureSources';
```

C++

```
ProcedureSources = 'ProcedureSources';
```

Description

This is ProcedureSources, a member of class TDBXMetaDataCollectionName.

56.1.18.2.16 TDBXMetaDataCollectionName.ReservedWords Constant

Pascal

```
const ReservedWords = 'ReservedWords';
```

C++

```
ReservedWords = 'ReservedWords';
```

Description

This is ReservedWords, a member of class TDBXMetaDataCollectionName.

56.1.18.2.17 TDBXMetaDataCollectionName.Roles Constant

Pascal

```
const Roles = 'Roles';
```

C++

```
Roles = 'Roles';
```

Description

This is Roles, a member of class TDBXMetaDataCollectionName.

56.1.18.2.18 TDBXMetaDataCollectionName.Schemas Constant

Pascal

```
const Schemas = 'Schemas';
```

C++

```
Schemas = 'Schemas';
```

Description

This is Schemas, a member of class TDBXMetaDataCollectionName.

56.1.18.2.19 TDBXMetaDataCollectionName.Synonyms Constant

Pascal

```
const Synonyms = 'Synonyms';
```

C++

```
Synonyms = 'Synonyms';
```

Description

This is Synonyms, a member of class TDBXMetaDataCollectionName.

56.1.18.2.20 TDBXMetaDataCollectionName.Tables Constant

Pascal

```
const Tables = 'Tables';
```

C++

```
Tables = 'Tables';
```

Description

This is Tables, a member of class TDBXMetaDataCollectionName.

56.1.18.2.21 TDBXMetaDataCollectionName.Users Constant

Pascal

```
const Users = 'Users';
```

C++

```
Users = 'Users';
```

Description

This is Users, a member of class TDBXMetaDataCollectionName.

56.1.18.2.22 TDBXMetaDataCollectionName.Views Constant

Pascal

```
const Views = 'Views';
```

C++

```
Views = 'Views';
```

Description

This is Views, a member of class TDBXMetaDataCollectionName.

56.1.19 TDBXPackageProcedureParametersColumns Class

Accesses columns by name in the **PackageProcedureParameters** metadata.

Class Hierarchy

Pascal

```
TDBXPackageProcedureParametersColumns = class;
```

C++

```
class TDBXPackageProcedureParametersColumns;
```

File

DBXMetaDataNames

Description

TDBXPackageProcedureParametersColumns is used to access columns by name in the **PackageProcedureParameters** metadata collection. These columns are returned when TDBXCommand.Text' is TDBXMetaDataCommandsEx.GetPackageProcedureParameters when reading metadata. To retrieve metadata columns, use these constants to index the TDBXReader instance returned by TDBXCommand.ExecuteQuery.

This table describes the columns.

Column Name	Data Type of Column Data	Description
CatalogName (see page 10768)	String	Catalog name.
SchemaName (see page 10772)	String	Schema name.
PackageName (see page 10770)	String	Package name.
ProcedureName (see page 10771)	String	Procedure name from package.
ParameterName (see page 10771)	String	Parameter name.
ParameterMode (see page 10770)	String	Parameter mode: IN, OUT, INOUT, RESULT.

TypeName (see page 10772)	String	Database specific data type name.
Precision (see page 10771)	Int32	Precision (see page 10771) of this type. For string data type, this is maximum number of characters. For decimal types, this is maximum number of digits, including digits from the scale.
Scale (see page 10771)	Int32	Scale (see page 10771) of a decimal type.
Ordinal (see page 10770)	Int32	Position in rows of table, starting with 1.
IsNullable (see page 10769)	Boolean	Can accept NULL values.
DbxDataType (see page 10769)	Int32	dbExpress data type.
IsFixedLength (see page 10769)	Boolean	Holds fixed length data.
IsUnicode (see page 10770)	Boolean	Can hold Unicode characters.
IsLong (see page 10769)	Boolean	Is BLOB data type.
IsUnsigned (see page 10770)	Boolean	Is unsigned numeric type.

TDBXMetaDataCommandsEx (see page 10531)

TDBXPackageProcedureParametersIndex (see page 10772)

56.1.19.1 TDBXPackageProcedureParametersColumns Members

The following tables list the members exposed by TDBXPackageProcedureParametersColumns.

Public Constants

	Name	Description
	CatalogName (see page 10768)	This is CatalogName, a member of class TDBXPackageProcedureParametersColumns.
	DbxDataType (see page 10769)	This is DbxDataType, a member of class TDBXPackageProcedureParametersColumns.
	IsFixedLength (see page 10769)	This is IsFixedLength, a member of class TDBXPackageProcedureParametersColumns.
	IsLong (see page 10769)	This is IsLong, a member of class TDBXPackageProcedureParametersColumns.
	IsNullable (see page 10769)	This is IsNullable, a member of class TDBXPackageProcedureParametersColumns.
	IsUnicode (see page 10770)	This is IsUnicode, a member of class TDBXPackageProcedureParametersColumns.
	IsUnsigned (see page 10770)	This is IsUnsigned, a member of class TDBXPackageProcedureParametersColumns.
	Ordinal (see page 10770)	This is Ordinal, a member of class TDBXPackageProcedureParametersColumns.
	PackageName (see page 10770)	This is PackageName, a member of class TDBXPackageProcedureParametersColumns.
	ParameterMode (see page 10770)	This is ParameterMode, a member of class TDBXPackageProcedureParametersColumns.

	ParameterName (see page 10771)	This is ParameterName, a member of class TDBXPackageProcedureParametersColumns.
	Precision (see page 10771)	This is Precision, a member of class TDBXPackageProcedureParametersColumns.
	ProcedureName (see page 10771)	This is ProcedureName, a member of class TDBXPackageProcedureParametersColumns.
	Scale (see page 10771)	This is Scale, a member of class TDBXPackageProcedureParametersColumns.
	SchemaName (see page 10772)	This is SchemaName, a member of class TDBXPackageProcedureParametersColumns.
	TypeName (see page 10772)	This is TypeName, a member of class TDBXPackageProcedureParametersColumns.

56.1.19.2 TDBXPackageProcedureParametersColumns Constants

The constants of the TDBXPackageProcedureParametersColumns class are listed here.

Public Constants

	Name	Description
	CatalogName (see page 10768)	This is CatalogName, a member of class TDBXPackageProcedureParametersColumns.
	DbxDataType (see page 10769)	This is DbxDataType, a member of class TDBXPackageProcedureParametersColumns.
	IsFixedLength (see page 10769)	This is IsFixedLength, a member of class TDBXPackageProcedureParametersColumns.
	IsLong (see page 10769)	This is IsLong, a member of class TDBXPackageProcedureParametersColumns.
	IsNullable (see page 10769)	This is IsNullable, a member of class TDBXPackageProcedureParametersColumns.
	IsUnicode (see page 10770)	This is IsUnicode, a member of class TDBXPackageProcedureParametersColumns.
	IsUnsigned (see page 10770)	This is IsUnsigned, a member of class TDBXPackageProcedureParametersColumns.
	Ordinal (see page 10770)	This is Ordinal, a member of class TDBXPackageProcedureParametersColumns.
	PackageName (see page 10770)	This is PackageName, a member of class TDBXPackageProcedureParametersColumns.
	ParameterMode (see page 10770)	This is ParameterMode, a member of class TDBXPackageProcedureParametersColumns.
	ParameterName (see page 10771)	This is ParameterName, a member of class TDBXPackageProcedureParametersColumns.
	Precision (see page 10771)	This is Precision, a member of class TDBXPackageProcedureParametersColumns.
	ProcedureName (see page 10771)	This is ProcedureName, a member of class TDBXPackageProcedureParametersColumns.
	Scale (see page 10771)	This is Scale, a member of class TDBXPackageProcedureParametersColumns.
	SchemaName (see page 10772)	This is SchemaName, a member of class TDBXPackageProcedureParametersColumns.
	TypeName (see page 10772)	This is TypeName, a member of class TDBXPackageProcedureParametersColumns.

56.1.19.2.1 TDBXPackageProcedureParametersColumns.CatalogName Constant

Pascal

```
const CatalogName = 'CatalogName';
```

C++

```
CatalogName = 'CatalogName';
```

Description

This is CatalogName, a member of class TDBXPackageProcedureParametersColumns.

56.1.19.2.2 TDBXPackageProcedureParametersColumns.DbxDataType Constant

Pascal

```
const DbxDataType = 'DbxDataType';
```

C++

```
DbxDataType = 'DbxDataType';
```

Description

This is DbxDataType, a member of class TDBXPackageProcedureParametersColumns.

56.1.19.2.3 TDBXPackageProcedureParametersColumns.IsFixedLength Constant

Pascal

```
const IsFixedLength = 'IsFixedLength';
```

C++

```
IsFixedLength = 'IsFixedLength';
```

Description

This is IsFixedLength, a member of class TDBXPackageProcedureParametersColumns.

56.1.19.2.4 TDBXPackageProcedureParametersColumns.IsLong Constant

Pascal

```
const IsLong = 'IsLong';
```

C++

```
IsLong = 'IsLong';
```

Description

This is IsLong, a member of class TDBXPackageProcedureParametersColumns.

56.1.19.2.5 TDBXPackageProcedureParametersColumns.IsNullable Constant

Pascal

```
const IsNullable = 'IsNullable';
```

C++

```
IsNullable = 'IsNullable';
```

Description

This is IsNullable, a member of class TDBXPackageProcedureParametersColumns.

56.1.19.2.6 TDBXPackageProcedureParametersColumns.IsUnicode Constant

Pascal

```
const IsUnicode = 'IsUnicode';
```

C++

```
IsUnicode = 'IsUnicode';
```

Description

This is IsUnicode, a member of class TDBXPackageProcedureParametersColumns.

56.1.19.2.7 TDBXPackageProcedureParametersColumns.IsUnsigned Constant

Pascal

```
const IsUnsigned = 'IsUnsigned';
```

C++

```
IsUnsigned = 'IsUnsigned';
```

Description

This is IsUnsigned, a member of class TDBXPackageProcedureParametersColumns.

56.1.19.2.8 TDBXPackageProcedureParametersColumns.Ordinal Constant

Pascal

```
const Ordinal = 'Ordinal';
```

C++

```
Ordinal = 'Ordinal';
```

Description

This is Ordinal, a member of class TDBXPackageProcedureParametersColumns.

56.1.19.2.9 TDBXPackageProcedureParametersColumns.PackageName Constant

Pascal

```
const PackageName = 'PackageName';
```

C++

```
PackageName = 'PackageName';
```

Description

This is PackageName, a member of class TDBXPackageProcedureParametersColumns.

56.1.19.2.10 TDBXPackageProcedureParametersColumns.ParameterMode Constant

Pascal

```
const ParameterMode = 'ParameterMode';
```

C++

```
ParameterMode = 'ParameterMode';
```

Description

This is ParameterMode, a member of class TDBXPackageProcedureParametersColumns.

56.1.19.2.11 TDBXPackageProcedureParametersColumns.ParameterName Constant

Pascal

```
const ParameterName = 'ParameterName';
```

C++

```
ParameterName = 'ParameterName';
```

Description

This is ParameterName, a member of class TDBXPackageProcedureParametersColumns.

56.1.19.2.12 TDBXPackageProcedureParametersColumns.Precision Constant

Pascal

```
const Precision = 'Precision';
```

C++

```
Precision = 'Precision';
```

Description

This is Precision, a member of class TDBXPackageProcedureParametersColumns.

56.1.19.2.13 TDBXPackageProcedureParametersColumns.ProcedureName Constant

Pascal

```
const ProcedureName = 'ProcedureName';
```

C++

```
ProcedureName = 'ProcedureName';
```

Description

This is ProcedureName, a member of class TDBXPackageProcedureParametersColumns.

56.1.19.2.14 TDBXPackageProcedureParametersColumns.Scale Constant

Pascal

```
const Scale = 'Scale';
```

C++

```
Scale = 'Scale';
```

Description

This is Scale, a member of class TDBXPackageProcedureParametersColumns.

56.1.19.2.15 TDBXPackageProcedureParametersColumns.SchemaName Constant

Pascal

```
const SchemaName = 'SchemaName';
```

C++

```
SchemaName = 'SchemaName';
```

Description

This is SchemaName, a member of class TDBXPackageProcedureParametersColumns.

56.1.19.2.16 TDBXPackageProcedureParametersColumns.TypeName Constant

Pascal

```
const TypeName = 'TypeName';
```

C++

```
TypeName = 'TypeName';
```

Description

This is TypeName, a member of class TDBXPackageProcedureParametersColumns.

56.1.20 TDBXPackageProcedureParametersIndex Class

Accesses columns by ordinal in the **PackageProcedureParameters** metadata.

Class Hierarchy

DBXMetaDataNames.TDBXPackageProcedureParametersIndex

Pascal

```
TDBXPackageProcedureParametersIndex = class;
```

C++

```
class TDBXPackageProcedureParametersIndex;
```

File

DBXMetaDataNames

Description

TDBXPackageProcedureParametersIndex is used to access columns by ordinal in the **PackageProcedureParameters** metadata collection. These columns are returned when TDBXCommand.Text' is TDBXMetaDataCommandsEx.GetPackageProcedureParameters when reading metadata. To retrieve metadata columns, use these constants to index the TDBXReader instance returned by TDBXCommand.ExecuteQuery.

This table describes the columns.

Column Ordinal (see page 10776) Name	Data Type of Column Data	Description
CatalogName (see page 10775)	String	Catalog name.
SchemaName (see page 10778)	String	Schema name.
PackageName (see page 10777)	String	Package name.
ProcedureName (see page 10778)	String	Procedure name from package.
ParameterName (see page 10777)	String	Parameter name.
ParameterMode (see page 10777)	String	Parameter mode: IN, OUT, INOUT, RESULT.
TypeName (see page 10778)	String	Database specific data type name.
Precision (see page 10777)	Int32	Precision (see page 10777) of this type. For string data type, this is maximum number of characters. For decimal types, this is maximum number of digits, including digits from the scale.
Scale (see page 10778)	Int32	Scale (see page 10778) of a decimal type.
Ordinal (see page 10776)	Int32	Position in rows of table, starting with 1.
IsNullable (see page 10776)	Boolean	Can accept NULL values.
DbxDataType (see page 10775)	Int32	dbExpress data type.
IsFixedLength (see page 10775)	Boolean	Holds fixed length data.
IsUnicode (see page 10776)	Boolean	Can hold Unicode characters.
IsLong (see page 10775)	Boolean	Is BLOB data type.
IsUnsigned (see page 10776)	Boolean	Is unsigned numeric type.

56.1.20.1 TDBXPackageProcedureParametersIndex Members

The following tables list the members exposed by TDBXPackageProcedureParametersIndex.

Public Constants

	Name	Description
	CatalogName (see page 10775)	This is CatalogName, a member of class TDBXPackageProcedureParametersIndex.
	DbxDataType (see page 10775)	This is DbxDataType, a member of class TDBXPackageProcedureParametersIndex.
	IsFixedLength (see page 10775)	This is IsFixedLength, a member of class TDBXPackageProcedureParametersIndex.
	IsLong (see page 10775)	This is IsLong, a member of class TDBXPackageProcedureParametersIndex.
	IsNullable (see page 10776)	This is IsNullable, a member of class TDBXPackageProcedureParametersIndex.
	IsUnicode (see page 10776)	This is IsUnicode, a member of class TDBXPackageProcedureParametersIndex.
	IsUnsigned (see page 10776)	This is IsUnsigned, a member of class TDBXPackageProcedureParametersIndex.
	Last (see page 10776)	This is Last, a member of class TDBXPackageProcedureParametersIndex.
	Ordinal (see page 10776)	This is Ordinal, a member of class TDBXPackageProcedureParametersIndex.
	PackageName (see page 10777)	This is PackageName, a member of class TDBXPackageProcedureParametersIndex.
	ParameterMode (see page 10777)	This is ParameterMode, a member of class TDBXPackageProcedureParametersIndex.
	ParameterName (see page 10777)	This is ParameterName, a member of class TDBXPackageProcedureParametersIndex.
	Precision (see page 10777)	This is Precision, a member of class TDBXPackageProcedureParametersIndex.
	ProcedureName (see page 10778)	This is ProcedureName, a member of class TDBXPackageProcedureParametersIndex.
	Scale (see page 10778)	This is Scale, a member of class TDBXPackageProcedureParametersIndex.
	SchemaName (see page 10778)	This is SchemaName, a member of class TDBXPackageProcedureParametersIndex.
	TypeName (see page 10778)	This is TypeName, a member of class TDBXPackageProcedureParametersIndex.

56.1.20.2 TDBXPackageProcedureParametersIndex Constants

The constants of the TDBXPackageProcedureParametersIndex class are listed here.

Public Constants

	Name	Description
	CatalogName (see page 10775)	This is CatalogName, a member of class TDBXPackageProcedureParametersIndex.
	DbxDataType (see page 10775)	This is DbxDataType, a member of class TDBXPackageProcedureParametersIndex.
	IsFixedLength (see page 10775)	This is IsFixedLength, a member of class TDBXPackageProcedureParametersIndex.
	IsLong (see page 10775)	This is IsLong, a member of class TDBXPackageProcedureParametersIndex.
	IsNullable (see page 10776)	This is IsNullable, a member of class TDBXPackageProcedureParametersIndex.
	IsUnicode (see page 10776)	This is IsUnicode, a member of class TDBXPackageProcedureParametersIndex.
	IsUnsigned (see page 10776)	This is IsUnsigned, a member of class TDBXPackageProcedureParametersIndex.
	Last (see page 10776)	This is Last, a member of class TDBXPackageProcedureParametersIndex.
	Ordinal (see page 10776)	This is Ordinal, a member of class TDBXPackageProcedureParametersIndex.
	PackageName (see page 10777)	This is PackageName, a member of class TDBXPackageProcedureParametersIndex.
	ParameterMode (see page 10777)	This is ParameterMode, a member of class TDBXPackageProcedureParametersIndex.
	ParameterName (see page 10777)	This is ParameterName, a member of class TDBXPackageProcedureParametersIndex.
	Precision (see page 10777)	This is Precision, a member of class TDBXPackageProcedureParametersIndex.
	ProcedureName (see page 10778)	This is ProcedureName, a member of class TDBXPackageProcedureParametersIndex.
	Scale (see page 10778)	This is Scale, a member of class TDBXPackageProcedureParametersIndex.

	SchemaName (see page 10778)	This is SchemaName, a member of class TDBXPackageProcedureParametersIndex.
	TypeName (see page 10778)	This is TypeName, a member of class TDBXPackageProcedureParametersIndex.

56.1.20.2.1 TDBXPackageProcedureParametersIndex.CatalogName Constant

Pascal

```
const CatalogName = 0;
```

C++

```
CatalogName = 0;
```

Description

This is CatalogName, a member of class TDBXPackageProcedureParametersIndex.

56.1.20.2.2 TDBXPackageProcedureParametersIndex.DbxDataType Constant

Pascal

```
const DbxDataType = 11;
```

C++

```
DbxDataType = 11;
```

Description

This is DbxDataType, a member of class TDBXPackageProcedureParametersIndex.

56.1.20.2.3 TDBXPackageProcedureParametersIndex.IsFixedLength Constant

Pascal

```
const IsFixedLength = 12;
```

C++

```
IsFixedLength = 12;
```

Description

This is IsFixedLength, a member of class TDBXPackageProcedureParametersIndex.

56.1.20.2.4 TDBXPackageProcedureParametersIndex.IsLong Constant

Pascal

```
const IsLong = 14;
```

C++

```
IsLong = 14;
```

Description

This is IsLong, a member of class TDBXPackageProcedureParametersIndex.

56.1.20.2.5 TDBXPackageProcedureParametersIndex.IsNullable Constant

Pascal

```
const IsNullable = 10;
```

C++

```
IsNullable = 10;
```

Description

This is IsNullable, a member of class TDBXPackageProcedureParametersIndex.

56.1.20.2.6 TDBXPackageProcedureParametersIndex.IsUnicode Constant

Pascal

```
const IsUnicode = 13;
```

C++

```
IsUnicode = 13;
```

Description

This is IsUnicode, a member of class TDBXPackageProcedureParametersIndex.

56.1.20.2.7 TDBXPackageProcedureParametersIndex.IsUnsigned Constant

Pascal

```
const IsUnsigned = 15;
```

C++

```
IsUnsigned = 15;
```

Description

This is IsUnsigned, a member of class TDBXPackageProcedureParametersIndex.

56.1.20.2.8 TDBXPackageProcedureParametersIndex.Last Constant

Pascal

```
const Last = 15;
```

C++

```
Last = 15;
```

Description

This is Last, a member of class TDBXPackageProcedureParametersIndex.

56.1.20.2.9 TDBXPackageProcedureParametersIndex.Ordinal Constant

Pascal

```
const Ordinal = 9;
```

C++

```
Ordinal = 9;
```

Description

This is Ordinal, a member of class TDBXPackageProcedureParametersIndex.

56.1.20.2.10 TDBXPackageProcedureParametersIndex.PackageName Constant

Pascal

```
const PackageName = 2;
```

C++

```
PackageName = 2;
```

Description

This is PackageName, a member of class TDBXPackageProcedureParametersIndex.

56.1.20.2.11 TDBXPackageProcedureParametersIndex.ParameterMode Constant

Pascal

```
const ParameterMode = 5;
```

C++

```
ParameterMode = 5;
```

Description

This is ParameterMode, a member of class TDBXPackageProcedureParametersIndex.

56.1.20.2.12 TDBXPackageProcedureParametersIndex.ParameterName Constant

Pascal

```
const ParameterName = 4;
```

C++

```
ParameterName = 4;
```

Description

This is ParameterName, a member of class TDBXPackageProcedureParametersIndex.

56.1.20.2.13 TDBXPackageProcedureParametersIndex.Precision Constant

Pascal

```
const Precision = 7;
```

C++

```
Precision = 7;
```

Description

This is Precision, a member of class TDBXPackageProcedureParametersIndex.

56.1.20.2.14 TDBXPackageProcedureParametersIndex.ProcedureName Constant

Pascal

```
const ProcedureName = 3;
```

C++

```
ProcedureName = 3;
```

Description

This is ProcedureName, a member of class TDBXPackageProcedureParametersIndex.

56.1.20.2.15 TDBXPackageProcedureParametersIndex.Scale Constant

Pascal

```
const Scale = 8;
```

C++

```
Scale = 8;
```

Description

This is Scale, a member of class TDBXPackageProcedureParametersIndex.

56.1.20.2.16 TDBXPackageProcedureParametersIndex.SchemaName Constant

Pascal

```
const SchemaName = 1;
```

C++

```
SchemaName = 1;
```

Description

This is SchemaName, a member of class TDBXPackageProcedureParametersIndex.

56.1.20.2.17 TDBXPackageProcedureParametersIndex.TypeName Constant

Pascal

```
const TypeName = 6;
```

C++

```
TypeName = 6;
```

Description

This is TypeName, a member of class TDBXPackageProcedureParametersIndex.

56.1.21 TDBXPackageProceduresColumns Class

Accesses columns by name in the **PackageProcedures** metadata.

Class Hierarchy

DBXMetaDataNames.TDBXPackageProceduresColumns

Pascal

```
TDBXPackageProceduresColumns = class;
```

C++

```
class TDBXPackageProceduresColumns;
```

File

DBXMetaDataNames

Description

TDBXPackageProceduresColumns is used to access columns by name in the **PackageProcedures** metadata collection. These columns are returned when TDBXCommand.Text' is TDBXMetaDataCommandsEx.GetPackageProcedures when reading metadata. To retrieve metadata columns, use these constants to index the TDBXReader instance returned by TDBXCommand.ExecuteQuery.

This table describes the columns.

Column Name	Data Type of Column Data	Description
CatalogName (see page 10780)	String	Catalog name.
SchemaName (see page 10781)	String	Schema name.
PackageName (see page 10780)	String	Package name.
ProcedureName (see page 10780)	String	Procedure name from package.
ProcedureType (see page 10780)	String	Procedure type: FUNCTION, PROCEDURE.

See Also

TDBXMetaDataCommandsEx (see page 10531)

TDBXPackageProceduresIndex (see page 10781)

56.1.21.1 TDBXPackageProceduresColumns Members

The following tables list the members exposed by TDBXPackageProceduresColumns.

Public Constants

	Name	Description
	CatalogName (see page 10780)	This is CatalogName, a member of class TDBXPackageProceduresColumns.
	PackageName (see page 10780)	This is PackageName, a member of class TDBXPackageProceduresColumns.
	ProcedureName (see page 10780)	This is ProcedureName, a member of class TDBXPackageProceduresColumns.
	ProcedureType (see page 10780)	This is ProcedureType, a member of class TDBXPackageProceduresColumns.
	SchemaName (see page 10781)	This is SchemaName, a member of class TDBXPackageProceduresColumns.

56.1.21.2 TDBXPackageProceduresColumns Constants

The constants of the TDBXPackageProceduresColumns class are listed here.

Public Constants

	Name	Description
	CatalogName (see page 10780)	This is CatalogName, a member of class TDBXPackageProceduresColumns.
	PackageName (see page 10780)	This is PackageName, a member of class TDBXPackageProceduresColumns.
	ProcedureName (see page 10780)	This is ProcedureName, a member of class TDBXPackageProceduresColumns.
	ProcedureType (see page 10780)	This is ProcedureType, a member of class TDBXPackageProceduresColumns.
	SchemaName (see page 10781)	This is SchemaName, a member of class TDBXPackageProceduresColumns.

56.1.21.2.1 TDBXPackageProceduresColumns.CatalogName Constant

Pascal

```
const CatalogName = 'CatalogName';
```

C++

```
CatalogName = 'CatalogName';
```

Description

This is CatalogName, a member of class TDBXPackageProceduresColumns.

56.1.21.2.2 TDBXPackageProceduresColumns.PackageName Constant

Pascal

```
const PackageName = 'PackageName';
```

C++

```
PackageName = 'PackageName';
```

Description

This is PackageName, a member of class TDBXPackageProceduresColumns.

56.1.21.2.3 TDBXPackageProceduresColumns.ProcedureName Constant

Pascal

```
const ProcedureName = 'ProcedureName';
```

C++

```
ProcedureName = 'ProcedureName';
```

Description

This is ProcedureName, a member of class TDBXPackageProceduresColumns.

56.1.21.2.4 TDBXPackageProceduresColumns.ProcedureType Constant

Pascal

```
const ProcedureType = 'ProcedureType';
```

C++

```
ProcedureType = 'ProcedureType';
```

Description

This is ProcedureType, a member of class TDBXPackageProceduresColumns.

56.1.21.2.5 TDBXPackageProceduresColumns.SchemaName Constant

Pascal

```
const SchemaName = 'SchemaName';
```

C++

```
SchemaName = 'SchemaName';
```

Description

This is SchemaName, a member of class TDBXPackageProceduresColumns.

56.1.22 TDBXPackageProceduresIndex Class

Accesses columns by ordinal in the **PackageProcedures** metadata.

Class Hierarchy

DBXMetaDataNames.TDBXPackageProceduresIndex

Pascal

```
TDBXPackageProceduresIndex = class;
```

C++

```
class TDBXPackageProceduresIndex;
```

File

DBXMetaDataNames

Description

TDBXPackageProceduresIndex is used to access columns by ordinal in the **PackageProcedures** metadata collection. These columns are returned when TDBXCommand.Text' is TDBXMetaDataCommandsEx.GetPackageProcedures when reading metadata. To retrieve metadata columns, use these constants to index the TDBXReader instance returned by TDBXCommand.ExecuteQuery.

This table describes the columns.

Column Ordinal Name	Data Type of Column Data	Description
CatalogName (see page 10782)	String	Catalog name.
SchemaName (see page 10783)	String	Schema name.
PackageName (see page 10783)	String	Package name.
ProcedureName (see page 10783)	String	Procedure name from package.
ProcedureType (see page 10783)	String	Procedure type: FUNCTION, PROCEDURE.

56.1.22.1 TDBXPackageProceduresIndex Members

The following tables list the members exposed by TDBXPackageProceduresIndex.

Public Constants

	Name	Description
	CatalogName (see page 10782)	This is CatalogName, a member of class TDBXPackageProceduresIndex.
	Last (see page 10782)	This is Last, a member of class TDBXPackageProceduresIndex.
	PackageName (see page 10783)	This is PackageName, a member of class TDBXPackageProceduresIndex.
	ProcedureName (see page 10783)	This is ProcedureName, a member of class TDBXPackageProceduresIndex.
	ProcedureType (see page 10783)	This is ProcedureType, a member of class TDBXPackageProceduresIndex.
	SchemaName (see page 10783)	This is SchemaName, a member of class TDBXPackageProceduresIndex.

56.1.22.2 TDBXPackageProceduresIndex Constants

The constants of the TDBXPackageProceduresIndex class are listed here.

Public Constants

	Name	Description
	CatalogName (see page 10782)	This is CatalogName, a member of class TDBXPackageProceduresIndex.
	Last (see page 10782)	This is Last, a member of class TDBXPackageProceduresIndex.
	PackageName (see page 10783)	This is PackageName, a member of class TDBXPackageProceduresIndex.
	ProcedureName (see page 10783)	This is ProcedureName, a member of class TDBXPackageProceduresIndex.
	ProcedureType (see page 10783)	This is ProcedureType, a member of class TDBXPackageProceduresIndex.
	SchemaName (see page 10783)	This is SchemaName, a member of class TDBXPackageProceduresIndex.

56.1.22.2.1 TDBXPackageProceduresIndex.CatalogName Constant

Pascal

```
const CatalogName = 0;
```

C++

```
CatalogName = 0;
```

Description

This is CatalogName, a member of class TDBXPackageProceduresIndex.

56.1.22.2.2 TDBXPackageProceduresIndex.Last Constant

Pascal

```
const Last = 4;
```

C++

```
Last = 4;
```

Description

This is Last, a member of class TDBXPackageProceduresIndex.

56.1.22.2.3 TDBXPackageProceduresIndex.PackageName Constant

Pascal

```
const PackageName = 2;
```

C++

```
PackageName = 2;
```

Description

This is PackageName, a member of class TDBXPackageProceduresIndex.

56.1.22.2.4 TDBXPackageProceduresIndex.ProcedureName Constant

Pascal

```
const ProcedureName = 3;
```

C++

```
ProcedureName = 3;
```

Description

This is ProcedureName, a member of class TDBXPackageProceduresIndex.

56.1.22.2.5 TDBXPackageProceduresIndex.ProcedureType Constant

Pascal

```
const ProcedureType = 4;
```

C++

```
ProcedureType = 4;
```

Description

This is ProcedureType, a member of class TDBXPackageProceduresIndex.

56.1.22.2.6 TDBXPackageProceduresIndex.SchemaName Constant

Pascal

```
const SchemaName = 1;
```

C++

```
SchemaName = 1;
```

Description

This is SchemaName, a member of class TDBXPackageProceduresIndex.

56.1.23 TDBXPackagesColumns Class

Accesses columns by name in the **Packages** metadata.

Class Hierarchy

DBXMetaDataNames.TDBXPackagesColumns

Pascal

```
TDBXPackagesColumns = class;
```

C++

```
class TDBXPackagesColumns;
```

56.1.23.1 TDBXPackagesColumns Members

The following tables list the members exposed by TDBXPackagesColumns.

Public Constants

	Name	Description
	CatalogName (see page 10785)	This is CatalogName, a member of class TDBXPackagesColumns.
	PackageName (see page 10785)	This is PackageName, a member of class TDBXPackagesColumns.
	SchemaName (see page 10785)	This is SchemaName, a member of class TDBXPackagesColumns.

56.1.23.2 TDBXPackagesColumns Constants

The constants of the TDBXPackagesColumns class are listed here.

Public Constants

	Name	Description
	CatalogName (see page 10785)	This is CatalogName, a member of class TDBXPackagesColumns.
	PackageName (see page 10785)	This is PackageName, a member of class TDBXPackagesColumns.
	SchemaName (see page 10785)	This is SchemaName, a member of class TDBXPackagesColumns.

56.1.23.2.1 TDBXPackagesColumns.CatalogName Constant

Pascal

```
const CatalogName = 'CatalogName';
```

C++

```
CatalogName = 'CatalogName';
```

Description

This is CatalogName, a member of class TDBXPackagesColumns.

56.1.23.2.2 TDBXPackagesColumns.PackageName Constant

Pascal

```
const PackageName = 'PackageName';
```

C++

```
PackageName = 'PackageName';
```

Description

This is PackageName, a member of class TDBXPackagesColumns.

56.1.23.2.3 TDBXPackagesColumns.SchemaName Constant

Pascal

```
const SchemaName = 'SchemaName';
```

C++

```
SchemaName = 'SchemaName';
```

Description

This is SchemaName, a member of class TDBXPackagesColumns.

56.1.24 TDBXPackagesIndex Class

Accesses columns by ordinal in the **Packages** metadata.

Class Hierarchy

Pascal

```
TDBXPackagesIndex = class;

DBXMetaDataNames

Description

TDBXPackagesIndex is used to access columns by ordinal in the **Packages** metadata collection. These columns are returned when TDBXCommand.Text' is TDBXMetaDataCommands.GetPackages when reading metadata. To retrieve metadata columns, use these constants to index the TDBXReader instance returned by TDBXCommand.ExecuteQuery.

This table describes the columns.

Column Ordinal Name	Data Type of Column Data	Description
CatalogName (see page 10786)	String	Catalog name.
SchemaName (see page 10787)	String	Schema name.
PackageName (see page 10787)	String	Package name.

56.1.24.1 TDBXPackagesIndex Members

The following tables list the members exposed by TDBXPackagesIndex.

Public Constants

	Name	Description
	CatalogName (see page 10786)	This is CatalogName, a member of class TDBXPackagesIndex.
	Last (see page 10787)	This is Last, a member of class TDBXPackagesIndex.
	PackageName (see page 10787)	This is PackageName, a member of class TDBXPackagesIndex.
	SchemaName (see page 10787)	This is SchemaName, a member of class TDBXPackagesIndex.

56.1.24.2 TDBXPackagesIndex Constants

The constants of the TDBXPackagesIndex class are listed here.

Public Constants

	Name	Description
	CatalogName (see page 10786)	This is CatalogName, a member of class TDBXPackagesIndex.
	Last (see page 10787)	This is Last, a member of class TDBXPackagesIndex.
	PackageName (see page 10787)	This is PackageName, a member of class TDBXPackagesIndex.
	SchemaName (see page 10787)	This is SchemaName, a member of class TDBXPackagesIndex.

56.1.24.2.1 TDBXPackagesIndex.CatalogName Constant

Pascal

```
const CatalogName = 0;
```

C++

```
CatalogName = 0;
```

Description

This is CatalogName, a member of class TDBXPackagesIndex.

56.1.24.2.2 TDBXPackagesIndex.Last Constant

Pascal

```
const Last = 2;
```

C++

```
Last = 2;
```

Description

This is Last, a member of class TDBXPackagesIndex.

56.1.24.2.3 TDBXPackagesIndex.PackageName Constant

Pascal

```
const PackageName = 2;
```

C++

```
PackageName = 2;
```

Description

This is PackageName, a member of class TDBXPackagesIndex.

56.1.24.2.4 TDBXPackagesIndex.SchemaName Constant

Pascal

```
const SchemaName = 1;
```

C++

```
SchemaName = 1;
```

Description

This is SchemaName, a member of class TDBXPackagesIndex.

56.1.25 TDBXPackageSourcesColumns Class

Accesses columns by name in the **PackageSources** metadata.

Class Hierarchy

Pascal

```
TDBXPackageSourcesColumns = class;
```

C++

```
class TDBXPackageSourcesColumns;
```

File

DBXMetaDataNames

Description

TDBXPackageSourcesColumns is used to access columns by name in the **PackageSources** metadata collection. These columns are returned when TDBXCommand.Text' is TDBXMetaDataCommandsEx.GetPackageSources when reading metadata. To retrieve metadata columns, use these constants to index the TDBXReader instance returned by TDBXCommand.ExecuteQuery.

This table describes the columns.

Column Name	Data Type of Column Data	Description
CatalogName (see page 10788)	String	Catalog name.
SchemaName (see page 10789)	String	Schema name.
PackageName (see page 10789)	String	Package name.
Definition (see page 10789)	String	Package source code.

56.1.25.1 TDBXPackageSourcesColumns Members

The following tables list the members exposed by TDBXPackageSourcesColumns.

Public Constants

	Name	Description
	CatalogName (see page 10788)	This is CatalogName, a member of class TDBXPackageSourcesColumns.
	Definition (see page 10789)	This is Definition, a member of class TDBXPackageSourcesColumns.
	PackageName (see page 10789)	This is PackageName, a member of class TDBXPackageSourcesColumns.
	SchemaName (see page 10789)	This is SchemaName, a member of class TDBXPackageSourcesColumns.

56.1.25.2 TDBXPackageSourcesColumns Constants

The constants of the TDBXPackageSourcesColumns class are listed here.

Public Constants

	Name	Description
	CatalogName (see page 10788)	This is CatalogName, a member of class TDBXPackageSourcesColumns.
	Definition (see page 10789)	This is Definition, a member of class TDBXPackageSourcesColumns.
	PackageName (see page 10789)	This is PackageName, a member of class TDBXPackageSourcesColumns.
	SchemaName (see page 10789)	This is SchemaName, a member of class TDBXPackageSourcesColumns.

56.1.25.2.1 TDBXPackageSourcesColumns.CatalogName Constant

Pascal

```
const CatalogName = 'CatalogName';
```

C++

```
CatalogName = 'CatalogName';
```

Description

This is CatalogName, a member of class TDBXPackageSourcesColumns.

56.1.25.2.2 TDBXPackageSourcesColumns.Definition Constant

Pascal

```
const Definition = 'Definition';
```

C++

```
Definition = 'Definition';
```

Description

This is Definition, a member of class TDBXPackageSourcesColumns.

56.1.25.2.3 TDBXPackageSourcesColumns.PackageName Constant

Pascal

```
const PackageName = 'PackageName';
```

C++

```
PackageName = 'PackageName';
```

Description

This is PackageName, a member of class TDBXPackageSourcesColumns.

56.1.25.2.4 TDBXPackageSourcesColumns.SchemaName Constant

Pascal

```
const SchemaName = 'SchemaName';
```

C++

```
SchemaName = 'SchemaName';
```

Description

This is SchemaName, a member of class TDBXPackageSourcesColumns.

56.1.26 TDBXPackageSourcesIndex Class

Accesses columns by ordinal in the **PackageSources** metadata.

Class Hierarchy

Pascal

```
TDBXPackageSourcesIndex = class;
```

C++

```
class TDBXPackageSourcesIndex;
```

Public Constants

	Name	Description
	CatalogName (see page 10790)	This is CatalogName, a member of class TDBXPackageSourcesIndex.
	Definition (see page 10791)	This is Definition, a member of class TDBXPackageSourcesIndex.
	Last (see page 10791)	This is Last, a member of class TDBXPackageSourcesIndex.
	PackageName (see page 10791)	This is PackageName, a member of class TDBXPackageSourcesIndex.
	SchemaName (see page 10791)	This is SchemaName, a member of class TDBXPackageSourcesIndex.

56.1.26.2 TDBXPackageSourcesIndex Constants

The constants of the TDBXPackageSourcesIndex class are listed here.

Public Constants

	Name	Description
	CatalogName (see page 10790)	This is CatalogName, a member of class TDBXPackageSourcesIndex.
	Definition (see page 10791)	This is Definition, a member of class TDBXPackageSourcesIndex.
	Last (see page 10791)	This is Last, a member of class TDBXPackageSourcesIndex.
	PackageName (see page 10791)	This is PackageName, a member of class TDBXPackageSourcesIndex.
	SchemaName (see page 10791)	This is SchemaName, a member of class TDBXPackageSourcesIndex.

56.1.26.2.1 TDBXPackageSourcesIndex.CatalogName Constant

Pascal

```
const CatalogName = 0;
```

C++

```
CatalogName = 0;
```

Description

This is CatalogName, a member of class TDBXPackageSourcesIndex.

56.1.26.2.2 TDBXPackageSourcesIndex.Definition Constant

Pascal

```
const Definition = 3;
```

C++

```
Definition = 3;
```

Description

This is Definition, a member of class TDBXPackageSourcesIndex.

56.1.26.2.3 TDBXPackageSourcesIndex.Last Constant

Pascal

```
const Last = 3;
```

C++

```
Last = 3;
```

Description

This is Last, a member of class TDBXPackageSourcesIndex.

56.1.26.2.4 TDBXPackageSourcesIndex.PackageName Constant

Pascal

```
const PackageName = 2;
```

C++

```
PackageName = 2;
```

Description

This is PackageName, a member of class TDBXPackageSourcesIndex.

56.1.26.2.5 TDBXPackageSourcesIndex.SchemaName Constant

Pascal

```
const SchemaName = 1;
```

C++

```
SchemaName = 1;
```

Description

This is SchemaName, a member of class TDBXPackageSourcesIndex.

56.1.27 TDBXProcedureParametersColumns Class

Accesses columns by name in the **ProcedureParameters** metadata.

Class Hierarchy

DBXMetaDataNames.TDBXProcedureParametersColumns

Pascal

```
TDBXProcedureParametersColumns = class;
```

C++

```
class TDBXProcedureParametersColumns;
```

DBXMetaDataNames

Description

TDBXProcedureParametersColumns is used to access columns by name in the **ProcedureParameters** metadata collection. These columns are returned when TDBXCommand.Text' is TDBXMetaDataCommands.GetProcedureParameters when reading metadata. To retrieve metadata columns, use these constants to index the TDBXReader instance returned by TDBXCommand.ExecuteQuery.

This table describes the columns.

Column Name	Data Type of Column Data	Description
CatalogName (see page 10794)	String	Catalog name.
SchemaName (see page 10797)	String	Schema name.
ProcedureName (see page 10796)	String	Procedure name.
ParameterName (see page 10796)	String	Parameter name.
ParameterMode (see page 10796)	String	Parameter mode: IN, OUT, INOUT, RESULT.
TypeName (see page 10797)	String	Database specific data type name.
Precision (see page 10796)	Int32	Precision (see page 10796) of this type. For string data type, this is maximum number of characters. For decimal types, this is maximum number of digits, including digits from the scale.
Scale (see page 10796)	Int32	Scale (see page 10796) of a decimal type.
Ordinal (see page 10795)	Int32	Position in rows of table, starting with 1.
IsNullable (see page 10795)	Boolean	Can accept NULL values.

DbxDataType (see page 10794)	Int32	dbExpress data type.
IsFixedLength (see page 10794)	Boolean	Holds fixed length data.
IsUnicode (see page 10795)	Boolean	Can hold Unicode characters.
IsLong (see page 10794)	Boolean	Is BLOB data type.
IsUnsigned (see page 10795)	Boolean	Is unsigned numeric type.

56.1.27.1 TDBXProcedureParametersColumns Members

The following tables list the members exposed by TDBXProcedureParametersColumns.

Public Constants

	Name	Description
	CatalogName (see page 10794)	This is CatalogName, a member of class TDBXProcedureParametersColumns.
	DbxDataType (see page 10794)	This is DbxDataType, a member of class TDBXProcedureParametersColumns.
	IsFixedLength (see page 10794)	This is IsFixedLength, a member of class TDBXProcedureParametersColumns.
	IsLong (see page 10794)	This is IsLong, a member of class TDBXProcedureParametersColumns.
	IsNullable (see page 10795)	This is IsNullable, a member of class TDBXProcedureParametersColumns.
	IsUnicode (see page 10795)	This is IsUnicode, a member of class TDBXProcedureParametersColumns.
	IsUnsigned (see page 10795)	This is IsUnsigned, a member of class TDBXProcedureParametersColumns.
	Ordinal (see page 10795)	This is Ordinal, a member of class TDBXProcedureParametersColumns.
	ParameterMode (see page 10796)	This is ParameterMode, a member of class TDBXProcedureParametersColumns.
	ParameterName (see page 10796)	This is ParameterName, a member of class TDBXProcedureParametersColumns.
	Precision (see page 10796)	This is Precision, a member of class TDBXProcedureParametersColumns.
	ProcedureName (see page 10796)	This is ProcedureName, a member of class TDBXProcedureParametersColumns.
	Scale (see page 10796)	This is Scale, a member of class TDBXProcedureParametersColumns.
	SchemaName (see page 10797)	This is SchemaName, a member of class TDBXProcedureParametersColumns.
	TypeName (see page 10797)	This is TypeName, a member of class TDBXProcedureParametersColumns.

56.1.27.2 TDBXProcedureParametersColumns Constants

The constants of the TDBXProcedureParametersColumns class are listed here.

Public Constants

	Name	Description
	CatalogName (see page 10794)	This is CatalogName, a member of class TDBXProcedureParametersColumns.
	DbxDataType (see page 10794)	This is DbxDataType, a member of class TDBXProcedureParametersColumns.
	IsFixedLength (see page 10794)	This is IsFixedLength, a member of class TDBXProcedureParametersColumns.
	IsLong (see page 10794)	This is IsLong, a member of class TDBXProcedureParametersColumns.
	IsNullable (see page 10795)	This is IsNullable, a member of class TDBXProcedureParametersColumns.
	IsUnicode (see page 10795)	This is IsUnicode, a member of class TDBXProcedureParametersColumns.

	IsUnsigned (see page 10795)	This is IsUnsigned, a member of class TDBXProcedureParametersColumns.
	Ordinal (see page 10795)	This is Ordinal, a member of class TDBXProcedureParametersColumns.
	ParameterMode (see page 10796)	This is ParameterMode, a member of class TDBXProcedureParametersColumns.
	ParameterName (see page 10796)	This is ParameterName, a member of class TDBXProcedureParametersColumns.
	Precision (see page 10796)	This is Precision, a member of class TDBXProcedureParametersColumns.
	ProcedureName (see page 10796)	This is ProcedureName, a member of class TDBXProcedureParametersColumns.
	Scale (see page 10796)	This is Scale, a member of class TDBXProcedureParametersColumns.
	SchemaName (see page 10797)	This is SchemaName, a member of class TDBXProcedureParametersColumns.
	TypeName (see page 10797)	This is TypeName, a member of class TDBXProcedureParametersColumns.

56.1.27.2.1 TDBXProcedureParametersColumns.CatalogName Constant

Pascal

```
const CatalogName = 'CatalogName';
```

C++

```
CatalogName = 'CatalogName';
```

Description

This is CatalogName, a member of class TDBXProcedureParametersColumns.

56.1.27.2.2 TDBXProcedureParametersColumns.DbxDataType Constant

Pascal

```
const DbxDataType = 'DbxDataType';
```

C++

```
DbxDataType = 'DbxDataType';
```

Description

This is DbxDataType, a member of class TDBXProcedureParametersColumns.

56.1.27.2.3 TDBXProcedureParametersColumns.IsFixedLength Constant

Pascal

```
const IsFixedLength = 'IsFixedLength';
```

C++

```
IsFixedLength = 'IsFixedLength';
```

Description

This is IsFixedLength, a member of class TDBXProcedureParametersColumns.

56.1.27.2.4 TDBXProcedureParametersColumns.IsLong Constant

Pascal

```
const IsLong = 'IsLong';
```

C++

```
IsLong = 'IsLong';
```

Description

This is IsLong, a member of class TDBXProcedureParametersColumns.

56.1.27.2.5 TDBXProcedureParametersColumns.IsNullable Constant

Pascal

```
const IsNullable = 'IsNullable';
```

C++

```
IsNullable = 'IsNullable';
```

Description

This is IsNullable, a member of class TDBXProcedureParametersColumns.

56.1.27.2.6 TDBXProcedureParametersColumns.IsUnicode Constant

Pascal

```
const IsUnicode = 'IsUnicode';
```

C++

```
IsUnicode = 'IsUnicode';
```

Description

This is IsUnicode, a member of class TDBXProcedureParametersColumns.

56.1.27.2.7 TDBXProcedureParametersColumns.IsUnsigned Constant

Pascal

```
const IsUnsigned = 'IsUnsigned';
```

C++

```
IsUnsigned = 'IsUnsigned';
```

Description

This is IsUnsigned, a member of class TDBXProcedureParametersColumns.

56.1.27.2.8 TDBXProcedureParametersColumns.Ordinal Constant

Pascal

```
const Ordinal = 'Ordinal';
```

C++

```
Ordinal = 'Ordinal';
```

Description

This is Ordinal, a member of class TDBXProcedureParametersColumns.

56.1.27.2.9 TDBXProcedureParametersColumns.ParameterMode Constant

Pascal

```
const ParameterMode = 'ParameterMode';
```

C++

```
ParameterMode = 'ParameterMode';
```

Description

This is ParameterMode, a member of class TDBXProcedureParametersColumns.

56.1.27.2.10 TDBXProcedureParametersColumns.ParameterName Constant

Pascal

```
const ParameterName = 'ParameterName';
```

C++

```
ParameterName = 'ParameterName';
```

Description

This is ParameterName, a member of class TDBXProcedureParametersColumns.

56.1.27.2.11 TDBXProcedureParametersColumns.Precision Constant

Pascal

```
const Precision = 'Precision';
```

C++

```
Precision = 'Precision';
```

Description

This is Precision, a member of class TDBXProcedureParametersColumns.

56.1.27.2.12 TDBXProcedureParametersColumns.ProcedureName Constant

Pascal

```
const ProcedureName = 'ProcedureName';
```

C++

```
ProcedureName = 'ProcedureName';
```

Description

This is ProcedureName, a member of class TDBXProcedureParametersColumns.

56.1.27.2.13 TDBXProcedureParametersColumns.Scale Constant

Pascal

```
const Scale = 'Scale';
```

C++

```
Scale = 'Scale';
```

Description

This is Scale, a member of class TDBXProcedureParametersColumns.

56.1.27.2.14 TDBXProcedureParametersColumns.SchemaName Constant

Pascal

```
const SchemaName = 'SchemaName';
```

C++

```
SchemaName = 'SchemaName';
```

Description

This is SchemaName, a member of class TDBXProcedureParametersColumns.

56.1.27.2.15 TDBXProcedureParametersColumns.TypeName Constant

Pascal

```
const TypeName = 'TypeName';
```

C++

```
TypeName = 'TypeName';
```

Description

This is TypeName, a member of class TDBXProcedureParametersColumns.

56.1.28 TDBXProcedureParametersIndex Class

Accesses columns by ordinal in the **ProcedureParameters** metadata.

Class Hierarchy

DBXMetaDataNames.TDBXProcedureParametersIndex

Pascal

```
TDBXProcedureParametersIndex = class;
```

C++

```
class TDBXProcedureParametersIndex;
```

DBXMetaDataNames

Description

TDBXProcedureParametersIndex is used to access columns by ordinal in the **ProcedureParameters** metadata collection. These columns are returned when TDBXCommand.Text' is TDBXMetaDataCommands.GetProcedureParameters when reading metadata. To retrieve metadata columns, use these constants to index the TDBXReader instance returned by TDBXCommand.ExecuteQuery.

This table describes the columns.

Column Ordinal (see page 10801) Name	Data Type of Column Data	Description
CatalogName (see page 10799)	String	Catalog name.
SchemaName (see page 10802)	String	Schema name.
ProcedureName (see page 10802)	String	Procedure name.
ParameterName (see page 10802)	String	Parameter name.
ParameterMode (see page 10801)	String	Parameter mode: IN, OUT, INOUT, RESULT.
TypeName (see page 10803)	String	Database specific data type name.
Precision (see page 10802)	Int32	Precision (see page 10802) of this type. For string data type, this is maximum number of characters. For decimal types, this is maximum number of digits, including digits from the scale.
Scale (see page 10802)	Int32	Scale (see page 10802) of a decimal type.
Ordinal (see page 10801)	Int32	Position in rows of table, starting with 1.
IsNullable (see page 10800)	Boolean	Can accept NULL values.
DbxDataType (see page 10800)	Int32	dbExpress data type.
IsFixedLength (see page 10800)	Boolean	Holds fixed length data.
IsUnicode (see page 10800)	Boolean	Can hold Unicode characters.
IsLong (see page 10800)	Boolean	Is BLOB data type.
IsUnsigned (see page 10801)	Boolean	Is unsigned numeric type.

56.1.28.2.1 TDBXProcedureParametersIndex.CatalogName Constant

Pascal

```
const CatalogName = 0;
```

C++

```
CatalogName = 0;
```

Description

This is CatalogName, a member of class TDBXProcedureParametersIndex.

56.1.28.2.2 TDBXProcedureParametersIndex.DbxDataType Constant

Pascal

```
const DbxDataType = 10;
```

C++

```
DbxDataType = 10;
```

Description

This is DbxDataType, a member of class TDBXProcedureParametersIndex.

56.1.28.2.3 TDBXProcedureParametersIndex.IsFixedLength Constant

Pascal

```
const IsFixedLength = 11;
```

C++

```
IsFixedLength = 11;
```

Description

This is IsFixedLength, a member of class TDBXProcedureParametersIndex.

56.1.28.2.4 TDBXProcedureParametersIndex.IsLong Constant

Pascal

```
const IsLong = 13;
```

C++

```
IsLong = 13;
```

Description

This is IsLong, a member of class TDBXProcedureParametersIndex.

56.1.28.2.5 TDBXProcedureParametersIndex.IsNullable Constant

Pascal

```
const IsNullable = 9;
```

C++

```
IsNullable = 9;
```

Description

This is IsNullable, a member of class TDBXProcedureParametersIndex.

56.1.28.2.6 TDBXProcedureParametersIndex.IsUnicode Constant

Pascal

```
const IsUnicode = 12;
```

C++

```
IsUnicode = 12;
```

Description

This is IsUnicode, a member of class TDBXProcedureParametersIndex.

56.1.28.2.7 TDBXProcedureParametersIndex.IsUnsigned Constant

Pascal

```
const IsUnsigned = 14;
```

C++

```
IsUnsigned = 14;
```

Description

This is IsUnsigned, a member of class TDBXProcedureParametersIndex.

56.1.28.2.8 TDBXProcedureParametersIndex.Last Constant

Pascal

```
const Last = 14;
```

C++

```
Last = 14;
```

Description

This is Last, a member of class TDBXProcedureParametersIndex.

56.1.28.2.9 TDBXProcedureParametersIndex.Ordinal Constant

Pascal

```
const Ordinal = 8;
```

C++

```
Ordinal = 8;
```

Description

This is Ordinal, a member of class TDBXProcedureParametersIndex.

56.1.28.2.10 TDBXProcedureParametersIndex.ParameterMode Constant

Pascal

```
const ParameterMode = 4;
```

C++

```
ParameterMode = 4;
```

Description

This is ParameterMode, a member of class TDBXProcedureParametersIndex.

56.1.28.2.11 TDBXProcedureParametersIndex.ParameterName Constant

Pascal

```
const ParameterName = 3;
```

C++

```
ParameterName = 3;
```

Description

This is ParameterName, a member of class TDBXProcedureParametersIndex.

56.1.28.2.12 TDBXProcedureParametersIndex.Precision Constant

Pascal

```
const Precision = 6;
```

C++

```
Precision = 6;
```

Description

This is Precision, a member of class TDBXProcedureParametersIndex.

56.1.28.2.13 TDBXProcedureParametersIndex.ProcedureName Constant

Pascal

```
const ProcedureName = 2;
```

C++

```
ProcedureName = 2;
```

Description

This is ProcedureName, a member of class TDBXProcedureParametersIndex.

56.1.28.2.14 TDBXProcedureParametersIndex.Scale Constant

Pascal

```
const Scale = 7;
```

C++

```
Scale = 7;
```

Description

This is Scale, a member of class TDBXProcedureParametersIndex.

56.1.28.2.15 TDBXProcedureParametersIndex.SchemaName Constant

Pascal

```
const SchemaName = 1;
```

C++

```
SchemaName = 1;
```

Description

This is SchemaName, a member of class TDBXProcedureParametersIndex.

56.1.28.2.16 TDBXProcedureParametersIndex.TypeName Constant

Pascal

```
const TypeName = 5;
```

C++

```
TypeName = 5;
```

Description

This is TypeName, a member of class TDBXProcedureParametersIndex.

56.1.29 TDBXProceduresColumns Class

Accesses columns by name in the **Procedures** metadata.

Class Hierarchy

DBXMetaDataNames.TDBXProceduresColumns

Pascal

```
TDBXProceduresColumns = class;
```

C++

```
class TDBXProceduresColumns;
```

File

DBXMetaDataNames

Description

TDBXProceduresColumns is used to access columns by name in the **Procedures** metadata collection. These columns are returned when TDBXCommand.Text' is TDBXMetaDataCommands.GetProcedures when reading metadata. To retrieve metadata columns, use these constants to index the TDBXReader instance returned by TDBXCommand.ExecuteQuery.

This table describes the columns.

Column Name	Data Type of Column Data	Description
CatalogName (see page 10804)	String	Catalog name.
SchemaName (see page 10805)	String	Schema name.
ProcedureName (see page 10804)	String	Procedure name.
ProcedureType (see page 10804)	String	Procedure type: FUNCTION or PROCEDURE.

See Also

TDBXMetaDataCommands (see page 10525)

TDBXProceduresIndex (see page 10805)

56.1.29.1 TDBXProceduresColumns Members

The following tables list the members exposed by TDBXProceduresColumns.

Public Constants

	Name	Description
	CatalogName (see page 10804)	This is CatalogName, a member of class TDBXProceduresColumns.
	ProcedureName (see page 10804)	This is ProcedureName, a member of class TDBXProceduresColumns.
	ProcedureType (see page 10804)	This is ProcedureType, a member of class TDBXProceduresColumns.
	SchemaName (see page 10805)	This is SchemaName, a member of class TDBXProceduresColumns.

56.1.29.2 TDBXProceduresColumns Constants

The constants of the TDBXProceduresColumns class are listed here.

Public Constants

	Name	Description
	CatalogName (see page 10804)	This is CatalogName, a member of class TDBXProceduresColumns.
	ProcedureName (see page 10804)	This is ProcedureName, a member of class TDBXProceduresColumns.
	ProcedureType (see page 10804)	This is ProcedureType, a member of class TDBXProceduresColumns.
	SchemaName (see page 10805)	This is SchemaName, a member of class TDBXProceduresColumns.

56.1.29.2.1 TDBXProceduresColumns.CatalogName Constant

Pascal

```
const CatalogName = 'CatalogName';
```

C++

```
CatalogName = 'CatalogName';
```

Description

This is CatalogName, a member of class TDBXProceduresColumns.

56.1.29.2.2 TDBXProceduresColumns.ProcedureName Constant

Pascal

```
const ProcedureName = 'ProcedureName';
```

C++

```
ProcedureName = 'ProcedureName';
```

Description

This is ProcedureName, a member of class TDBXProceduresColumns.

56.1.29.2.3 TDBXProceduresColumns.ProcedureType Constant

Pascal

```
const ProcedureType = 'ProcedureType';
```

C++

```
ProcedureType = 'ProcedureType';
```

Description

This is ProcedureType, a member of class TDBXProceduresColumns.

56.1.29.2.4 TDBXProceduresColumns.SchemaName Constant

Pascal

```
const SchemaName = 'SchemaName';
```

C++

```
SchemaName = 'SchemaName';
```

Description

This is SchemaName, a member of class TDBXProceduresColumns.

56.1.30 TDBXProceduresIndex Class

Accesses columns by ordinal in the **Procedures** metadata.

Class Hierarchy

Pascal

```
TDBXProceduresIndex = class;
```

C++

```
class TDBXProceduresIndex;
```

File

DBXMetaDataNames

Description

TDBXProceduresIndex is used to access columns by ordinal in the **Procedures** metadata collection. These columns are returned when TDBXCommand.Text' is TDBXMetaDataCommands.GetProcedures when reading metadata. To retrieve metadata columns, use these constants to index the TDBXReader instance returned by TDBXCommand.ExecuteQuery.

This table describes the columns.

Column Ordinal Name	Data Type of Column Data	Description
CatalogName (see page 10806)	String	Catalog name.
SchemaName (see page 10807)	String	Schema name.
ProcedureName (see page 10807)	String	Procedure name.
ProcedureType (see page 10807)	String	Procedure type: FUNCTION or PROCEDURE.

See Also

TDBXMetaDataCommands (see page 10525)

TDBXProceduresColumns (see page 10803)

56.1.30.1 TDBXProceduresIndex Members

The following tables list the members exposed by TDBXProceduresIndex.

Public Constants

	Name	Description
	CatalogName (see page 10806)	This is CatalogName, a member of class TDBXProceduresIndex.
	Last (see page 10806)	This is Last, a member of class TDBXProceduresIndex.
	ProcedureName (see page 10807)	This is ProcedureName, a member of class TDBXProceduresIndex.
	ProcedureType (see page 10807)	This is ProcedureType, a member of class TDBXProceduresIndex.
	SchemaName (see page 10807)	This is SchemaName, a member of class TDBXProceduresIndex.

56.1.30.2 TDBXProceduresIndex Constants

The constants of the TDBXProceduresIndex class are listed here.

Public Constants

	Name	Description
	CatalogName (see page 10806)	This is CatalogName, a member of class TDBXProceduresIndex.
	Last (see page 10806)	This is Last, a member of class TDBXProceduresIndex.
	ProcedureName (see page 10807)	This is ProcedureName, a member of class TDBXProceduresIndex.
	ProcedureType (see page 10807)	This is ProcedureType, a member of class TDBXProceduresIndex.
	SchemaName (see page 10807)	This is SchemaName, a member of class TDBXProceduresIndex.

56.1.30.2.1 TDBXProceduresIndex.CatalogName Constant

Pascal

```
const CatalogName = 0;
```

C++

```
CatalogName = 0;
```

Description

This is CatalogName, a member of class TDBXProceduresIndex.

56.1.30.2.2 TDBXProceduresIndex.Last Constant

Pascal

```
const Last = 3;
```

C++

```
Last = 3;
```

Description

This is Last, a member of class TDBXProceduresIndex.

56.1.30.2.3 TDBXProceduresIndex.ProcedureName Constant

Pascal

```
const ProcedureName = 2;
```

C++

```
ProcedureName = 2;
```

Description

This is ProcedureName, a member of class TDBXProceduresIndex.

56.1.30.2.4 TDBXProceduresIndex.ProcedureType Constant

Pascal

```
const ProcedureType = 3;
```

C++

```
ProcedureType = 3;
```

Description

This is ProcedureType, a member of class TDBXProceduresIndex.

56.1.30.2.5 TDBXProceduresIndex.SchemaName Constant

Pascal

```
const SchemaName = 1;
```

C++

```
SchemaName = 1;
```

Description

This is SchemaName, a member of class TDBXProceduresIndex.

56.1.31 TDBXProcedureSourcesColumns Class

Accesses columns by name in the **ProcedureSources** metadata.

Class Hierarchy

DBXMetaDataNames.TDBXProcedureSourcesColumns

Pascal

```
TDBXProcedureSourcesColumns = class;
```

C++

```
class TDBXProcedureSourcesColumns;
```

File

DBXMetaDataNames

Description

TDBXProcedureSourcesColumns is used to access columns by name in the **ProcedureSources** metadata collection. These columns are returned when TDBXCommand.Text' is TDBXMetaDataCommandsEx.GetProcedureSources when reading metadata. To retrieve metadata columns, use these constants to index the TDBXReader instance returned by TDBXCommand.ExecuteQuery.

This table describes the columns.

Column Name	Data Type of Column Data	Description
CatalogName (see page 10809)	String	Catalog name.
SchemaName (see page 10810)	String	Schema name.
ProcedureName (see page 10809)	String	Procedure name.
ProcedureType (see page 10809)	String	Procedure type: FUNCTION or PROCEDURE.
Definition (see page 10809)	String	Source of SQL procedure.
ExternalDefinition (see page 10809)	String	Reference to procedure external to database.

See Also

TDBXMetaDataCommandsEx (see page 10531)

TDBXProcedureSourcesIndex (see page 10810)

56.1.31.1 TDBXProcedureSourcesColumns Members

The following tables list the members exposed by TDBXProcedureSourcesColumns.

Public Constants

	Name	Description
	CatalogName (see page 10809)	This is CatalogName, a member of class TDBXProcedureSourcesColumns.
	Definition (see page 10809)	This is Definition, a member of class TDBXProcedureSourcesColumns.
	ExternalDefinition (see page 10809)	This is ExternalDefinition, a member of class TDBXProcedureSourcesColumns.
	ProcedureName (see page 10809)	This is ProcedureName, a member of class TDBXProcedureSourcesColumns.
	ProcedureType (see page 10809)	This is ProcedureType, a member of class TDBXProcedureSourcesColumns.
	SchemaName (see page 10810)	This is SchemaName, a member of class TDBXProcedureSourcesColumns.

56.1.31.2 TDBXProcedureSourcesColumns Constants

The constants of the TDBXProcedureSourcesColumns class are listed here.

Public Constants

	Name	Description
	CatalogName (see page 10809)	This is CatalogName, a member of class TDBXProcedureSourcesColumns.
	Definition (see page 10809)	This is Definition, a member of class TDBXProcedureSourcesColumns.
	ExternalDefinition (see page 10809)	This is ExternalDefinition, a member of class TDBXProcedureSourcesColumns.
	ProcedureName (see page 10809)	This is ProcedureName, a member of class TDBXProcedureSourcesColumns.
	ProcedureType (see page 10809)	This is ProcedureType, a member of class TDBXProcedureSourcesColumns.

	SchemaName (see page 10810)	This is SchemaName, a member of class TDBXProcedureSourcesColumns.

56.1.31.2.1 TDBXProcedureSourcesColumns.CatalogName Constant

Pascal

```
const CatalogName = 'CatalogName';
```

C++

```
CatalogName = 'CatalogName';
```

Description

This is CatalogName, a member of class TDBXProcedureSourcesColumns.

56.1.31.2.2 TDBXProcedureSourcesColumns.Definition Constant

Pascal

```
const Definition = 'Definition';
```

C++

```
Definition = 'Definition';
```

Description

This is Definition, a member of class TDBXProcedureSourcesColumns.

56.1.31.2.3 TDBXProcedureSourcesColumns.ExternalDefinition Constant

Pascal

```
const ExternalDefinition = 'ExternalDefinition';
```

C++

```
ExternalDefinition = 'ExternalDefinition';
```

Description

This is ExternalDefinition, a member of class TDBXProcedureSourcesColumns.

56.1.31.2.4 TDBXProcedureSourcesColumns.ProcedureName Constant

Pascal

```
const ProcedureName = 'ProcedureName';
```

C++

```
ProcedureName = 'ProcedureName';
```

Description

This is ProcedureName, a member of class TDBXProcedureSourcesColumns.

56.1.31.2.5 TDBXProcedureSourcesColumns.ProcedureType Constant

Pascal

```
const ProcedureType = 'ProcedureType';
```

C++

```
ProcedureType = 'ProcedureType';
```

Description

This is ProcedureType, a member of class TDBXProcedureSourcesColumns.

56.1.31.2.6 TDBXProcedureSourcesColumns.SchemaName Constant

Pascal

```
const SchemaName = 'SchemaName';
```

C++

```
SchemaName = 'SchemaName';
```

Description

This is SchemaName, a member of class TDBXProcedureSourcesColumns.

56.1.32 TDBXProcedureSourcesIndex Class

Accesses columns by ordinal in the **ProcedureSources** metadata.

Class Hierarchy

DBXMetaDataNames.TDBXProcedureSourcesIndex

Pascal

```
TDBXProcedureSourcesIndex = class;
```

C++

```
class TDBXProcedureSourcesIndex;
```

File

DBXMetaDataNames

Description

TDBXProcedureSourcesIndex is used to access columns by ordinal in the **ProcedureSources** metadata collection. These columns are returned when TDBXCommand.Text' is TDBXMetaDataCommandsEx.GetProcedureSources when reading metadata. To retrieve metadata columns, use these constants to index the TDBXReader instance returned by TDBXCommand.ExecuteQuery.

This table describes the columns.

Column Ordinal Name	Data Type of Column Data	Description
CatalogName (see page 10811)	String	Catalog name.
SchemaName (see page 10813)	String	Schema name.
ProcedureName (see page 10812)	String	Procedure name.
ProcedureType (see page 10812)	String	Procedure type: FUNCTION or PROCEDURE.
Definition (see page 10812)	String	Source of SQL procedure.

ExternalDefinition (see page 10812)	String	Reference to procedure external to database.

See Also

TDBXMetaDataCommandsEx (see page 10531)

TDBXProcedureSourcesColumns (see page 10807)

56.1.32.1 TDBXProcedureSourcesIndex Members

The following tables list the members exposed by TDBXProcedureSourcesIndex.

Public Constants

	Name	Description
	CatalogName (see page 10811)	This is CatalogName, a member of class TDBXProcedureSourcesIndex.
	Definition (see page 10812)	This is Definition, a member of class TDBXProcedureSourcesIndex.
	ExternalDefinition (see page 10812)	This is ExternalDefinition, a member of class TDBXProcedureSourcesIndex.
	Last (see page 10812)	This is Last, a member of class TDBXProcedureSourcesIndex.
	ProcedureName (see page 10812)	This is ProcedureName, a member of class TDBXProcedureSourcesIndex.
	ProcedureType (see page 10812)	This is ProcedureType, a member of class TDBXProcedureSourcesIndex.
	SchemaName (see page 10813)	This is SchemaName, a member of class TDBXProcedureSourcesIndex.

56.1.32.2 TDBXProcedureSourcesIndex Constants

The constants of the TDBXProcedureSourcesIndex class are listed here.

Public Constants

	Name	Description
	CatalogName (see page 10811)	This is CatalogName, a member of class TDBXProcedureSourcesIndex.
	Definition (see page 10812)	This is Definition, a member of class TDBXProcedureSourcesIndex.
	ExternalDefinition (see page 10812)	This is ExternalDefinition, a member of class TDBXProcedureSourcesIndex.
	Last (see page 10812)	This is Last, a member of class TDBXProcedureSourcesIndex.
	ProcedureName (see page 10812)	This is ProcedureName, a member of class TDBXProcedureSourcesIndex.
	ProcedureType (see page 10812)	This is ProcedureType, a member of class TDBXProcedureSourcesIndex.
	SchemaName (see page 10813)	This is SchemaName, a member of class TDBXProcedureSourcesIndex.

56.1.32.2.1 TDBXProcedureSourcesIndex.CatalogName Constant

Pascal

```
const CatalogName = 0;
```

C++

```
CatalogName = 0;
```

Description

This is CatalogName, a member of class TDBXProcedureSourcesIndex.

56.1.32.2.2 TDBXProcedureSourcesIndex.Definition Constant

Pascal

```
const Definition = 4;
```

C++

```
Definition = 4;
```

Description

This is Definition, a member of class TDBXProcedureSourcesIndex.

56.1.32.2.3 TDBXProcedureSourcesIndex.ExternalDefinition Constant

Pascal

```
const ExternalDefinition = 5;
```

C++

```
ExternalDefinition = 5;
```

Description

This is ExternalDefinition, a member of class TDBXProcedureSourcesIndex.

56.1.32.2.4 TDBXProcedureSourcesIndex.Last Constant

Pascal

```
const Last = 5;
```

C++

```
Last = 5;
```

Description

This is Last, a member of class TDBXProcedureSourcesIndex.

56.1.32.2.5 TDBXProcedureSourcesIndex.ProcedureName Constant

Pascal

```
const ProcedureName = 2;
```

C++

```
ProcedureName = 2;
```

Description

This is ProcedureName, a member of class TDBXProcedureSourcesIndex.

56.1.32.2.6 TDBXProcedureSourcesIndex.ProcedureType Constant

Pascal

```
const ProcedureType = 3;
```

C++

```
ProcedureType = 3;
```

Description

This is ProcedureType, a member of class TDBXProcedureSourcesIndex.

56.1.32.2.7 TDBXProcedureSourcesIndex.SchemaName Constant

Pascal

```
const SchemaName = 1;
```

C++

```
SchemaName = 1;
```

Description

This is SchemaName, a member of class TDBXProcedureSourcesIndex.

56.1.33 TDBXReservedWordsColumns Class

Accesses columns by name in the **ReservedWords** metadata.

Class Hierarchy

DBXMetaDataNames.TDBXReservedWordsColumns

Pascal

```
TDBXReservedWordsColumns = class;
```

C++

```
class TDBXReservedWordsColumns;
```

File

DBXMetaDataNames

Description

TDBXReservedWordsColumns is used to access columns by name in the **ReservedWords** metadata collection. These columns are returned when TDBXCommand.Text' is TDBXMetaDataCommandsEx.GetReservedWords when reading metadata. To retrieve a metadata column, use this constant to index the TDBXReader instance returned by TDBXCommand.ExecuteQuery.

This table describes the column.

Column Name	Data Type of Column Data	Description
ReservedWord (see page 10814)	String	An identifier reserved for SQL syntax. These identifiers should not be used as object names, such as tables and columns. Some databases allows their use if they are quoted.

See Also

TDBXMetaDataCommandsEx (see page 10531)

TDBXReservedWordsIndex (see page 10814)

56.1.33.1 TDBXReservedWordsColumns Members

The following tables list the members exposed by TDBXReservedWordsColumns.

Public Constants

	Name	Description
	ReservedWord (see page 10814)	This is ReservedWord, a member of class TDBXReservedWordsColumns.

56.1.33.2 TDBXReservedWordsColumns Constants

The constants of the TDBXReservedWordsColumns class are listed here.

Public Constants

	Name	Description
	ReservedWord (see page 10814)	This is ReservedWord, a member of class TDBXReservedWordsColumns.

56.1.33.2.1 TDBXReservedWordsColumns.ReservedWord Constant

Pascal

```
const ReservedWord = 'ReservedWord';
```

C++

```
ReservedWord = 'ReservedWord';
```

Description

This is ReservedWord, a member of class TDBXReservedWordsColumns.

56.1.34 TDBXReservedWordsIndex Class

Accesses columns by ordinal in the **ReservedWords** metadata.

Class Hierarchy

Pascal

```
TDBXReservedWordsIndex = class;
```

C++

```
class TDBXReservedWordsIndex;
```

File

DBXMetaDataNames

Description

TDBXReservedWordsIndex is used to access columns by ordinal in the **ReservedWords** metadata collection. These columns are returned when TDBXCommand.Text' is TDBXMetaDataCommandsEx.GetReservedWords when reading metadata. To retrieve a metadata column, use this constant to index the TDBXReader instance returned by TDBXCommand.ExecuteQuery.

This table describes the column.

Column Ordinal Name	Data Type of Column Data	Description
ReservedWord (see page 10815)	String	An identifier reserved for SQL syntax. These identifiers should not be used as object names, such as tables and columns. Some databases allows their use if they are quoted.

See Also

56.1.34.1 TDBXReservedWordsIndex Members

The following tables list the members exposed by TDBXReservedWordsIndex.

Public Constants

	Name	Description
	Last (see page 10815)	This is Last, a member of class TDBXReservedWordsIndex.
	ReservedWord (see page 10815)	This is ReservedWord, a member of class TDBXReservedWordsIndex.

56.1.34.2 TDBXReservedWordsIndex Constants

The constants of the TDBXReservedWordsIndex class are listed here.

Public Constants

	Name	Description
	Last (see page 10815)	This is Last, a member of class TDBXReservedWordsIndex.
	ReservedWord (see page 10815)	This is ReservedWord, a member of class TDBXReservedWordsIndex.

56.1.34.2.1 TDBXReservedWordsIndex.Last Constant

Pascal

```
const Last = 0;
```

C++

```
Last = 0;
```

Description

This is Last, a member of class TDBXReservedWordsIndex.

56.1.34.2.2 TDBXReservedWordsIndex.ReservedWord Constant

Pascal

```
const ReservedWord = 0;
```

C++

```
ReservedWord = 0;
```

Description

This is ReservedWord, a member of class TDBXReservedWordsIndex.

56.1.35 TDBXRolesColumns Class

Accesses columns by name in the **Roles** metadata.

Class Hierarchy

DBXMetaDataNames.TDBXRolesColumns

Pascal

```
TDBXRolesColumns = class;
```

C++

```
class TDBXRolesColumns;
```

File

DBXMetaDataNames

Description

TDBXReservedWordsColumns (see page 10813) is used to access columns by name in the **Roles** metadata collection. These columns are returned when TDBXCommand.Text' is TDBXMetaDataCommandsEx.GetRoles when reading metadata. To retrieve a metadata column, use this constant to index the TDBXReader instance returned by TDBXCommand.ExecuteQuery.

This table describes the column.

Column Name	Data Type of Column Data	Description
RoleName (see page 10817)	String	Role name.

See Also

TDBXMetaDataCommandsEx (see page 10531)

TDBXRolesIndex (see page 10817)

56.1.35.1 TDBXRolesColumns Members

The following tables list the members exposed by TDBXRolesColumns.

Public Constants

	Name	Description
	RoleName (see page 10817)	This is RoleName, a member of class TDBXRolesColumns.

56.1.35.2 TDBXRolesColumns Constants

The constants of the TDBXRolesColumns class are listed here.

Public Constants

	Name	Description
	RoleName (see page 10817)	This is RoleName, a member of class TDBXRolesColumns.

56.1.35.2.1 TDBXRolesColumns.RoleName Constant

Pascal

```
const RoleName = 'RoleName';
```

C++

```
RoleName = 'RoleName';
```

Description

This is RoleName, a member of class TDBXRolesColumns.

56.1.36 TDBXRolesIndex Class

Accesses columns by ordinal in the **Roles** metadata.

Class Hierarchy

DBXMetaDataNames.TDBXRolesIndex

Pascal

```
TDBXRolesIndex = class;
```

C++

```
class TDBXRolesIndex;

DBXMetaDataNames

Description

TDBXSchemasColumns is used to access columns by name in the **Schemas** metadata collection. These columns are returned when TDBXCommand.Text' is TDBXMetaDataCommandsEx.GetSchemas when reading metadata. To retrieve metadata columns, use these constants to index the TDBXReader instance returned by TDBXCommand.ExecuteQuery.

This table describes the columns.

Column Name	Data Type of Column Data	Description
CatalogName (see page 10819)	String	Catalog name.
SchemaName (see page 10820)	String	Schema name.

See Also

TDBXMetaDataCommandsEx (see page 10531)

TDBXSchemasIndex (see page 10820)

56.1.37.1 TDBXSchemasColumns Members

The following tables list the members exposed by TDBXSchemasColumns.

Public Constants

	Name	Description
	CatalogName (see page 10819)	This is CatalogName, a member of class TDBXSchemasColumns.
	SchemaName (see page 10820)	This is SchemaName, a member of class TDBXSchemasColumns.

56.1.37.2 TDBXSchemasColumns Constants

The constants of the TDBXSchemasColumns class are listed here.

Public Constants

	Name	Description
	CatalogName (see page 10819)	This is CatalogName, a member of class TDBXSchemasColumns.
	SchemaName (see page 10820)	This is SchemaName, a member of class TDBXSchemasColumns.

56.1.37.2.1 TDBXSchemasColumns.CatalogName Constant

Pascal

```
const CatalogName = 'CatalogName';
```

C++

```
CatalogName = 'CatalogName';
```

Description

This is CatalogName, a member of class TDBXSchemasColumns.

56.1.37.2.2 TDBXSchemasColumns.SchemaName Constant

Pascal

```
const SchemaName = 'SchemaName';
```

C++

```
SchemaName = 'SchemaName';
```

Description

This is SchemaName, a member of class TDBXSchemasColumns.

56.1.38 TDBXSchemasIndex Class

Accesses columns by ordinal in the **Schemas** metadata.

Class Hierarchy

Pascal

```
TDBXSchemasIndex = class;
```

C++

```
class TDBXSchemasIndex;
```

File

DBXMetaDataNames

Description

TDBXSchemasIndex is used to access columns by ordinal in the **Schemas** metadata collection. These columns are returned when TDBXCommand.Text' is TDBXMetaDataCommandsEx.GetSchemas when reading metadata. To retrieve metadata columns, use these constants to index the TDBXReader instance returned by TDBXCommand.ExecuteQuery.

This table describes the columns.

Column Ordinal Name	Data Type of Column Data	Description
CatalogName (see page 10821)	String	Catalog name.
SchemaName (see page 10821)	String	Schema name.

See Also

TDBXMetaDataCommandsEx (see page 10531)

TDBXSchemasColumns (see page 10818)

56.1.38.1 TDBXSchemasIndex Members

The following tables list the members exposed by TDBXSchemasIndex.

Public Constants

	Name	Description
	CatalogName (see page 10821)	This is CatalogName, a member of class TDBXSchemasIndex.
	Last (see page 10821)	This is Last, a member of class TDBXSchemasIndex.
	SchemaName (see page 10821)	This is SchemaName, a member of class TDBXSchemasIndex.

56.1.38.2 TDBXSchemasIndex Constants

The constants of the TDBXSchemasIndex class are listed here.

Public Constants

	Name	Description
	CatalogName (see page 10821)	This is CatalogName, a member of class TDBXSchemasIndex.
	Last (see page 10821)	This is Last, a member of class TDBXSchemasIndex.
	SchemaName (see page 10821)	This is SchemaName, a member of class TDBXSchemasIndex.

56.1.38.2.1 TDBXSchemasIndex.CatalogName Constant

Pascal

```
const CatalogName = 0;
```

C++

```
CatalogName = 0;
```

Description

This is CatalogName, a member of class TDBXSchemasIndex.

56.1.38.2.2 TDBXSchemasIndex.Last Constant

Pascal

```
const Last = 1;
```

C++

```
Last = 1;
```

Description

This is Last, a member of class TDBXSchemasIndex.

56.1.38.2.3 TDBXSchemasIndex.SchemaName Constant

Pascal

```
const SchemaName = 1;
```

C++

```
SchemaName = 1;
```

Description

This is SchemaName, a member of class TDBXSchemasIndex.

56.1.39 TDBXSynonymsColumns Class

Accesses columns by name in the **Synonyms** metadata.

Class Hierarchy

DBXMetaDataNames.TDBXSynonymsColumns

Pascal

```
TDBXSynonymsColumns = class;
```

C++

```
class TDBXSynonymsColumns;
```

File

DBXMetaDataNames

Description

TDBXSynonymsColumns is used to access columns by name in the **Synonyms** metadata collection. These columns are returned when TDBXCommand.Text' is TDBXMetaDataCommandsEx.GetSynonyms when reading metadata. To retrieve metadata columns, use these constants to index the TDBXReader instance returned by TDBXCommand.ExecuteQuery.

This table describes the columns.

Column Name	Data Type of Column Data	Description
CatalogName (see page 10823)	String	Catalog name.
SchemaName (see page 10823)	String	Schema name.
SynonymName (see page 10823)	String	Synonym name.
TableCatalogName (see page 10824)	String	Catalog name of table this synonym refers to.
TableSchemaName (see page 10824)	String	Schema name of table this synonym refers to.
TableName (see page 10824)	String	Name of table this synonym refers to.

56.1.39.1 TDBXSynonymsColumns Members

The following tables list the members exposed by TDBXSynonymsColumns.

Public Constants

	Name	Description
	CatalogName (see page 10823)	This is CatalogName, a member of class TDBXSynonymsColumns.
	SchemaName (see page 10823)	This is SchemaName, a member of class TDBXSynonymsColumns.
	SynonymName (see page 10823)	This is SynonymName, a member of class TDBXSynonymsColumns.
	TableCatalogName (see page 10824)	This is TableCatalogName, a member of class TDBXSynonymsColumns.
	TableName (see page 10824)	This is TableName, a member of class TDBXSynonymsColumns.
	TableSchemaName (see page 10824)	This is TableSchemaName, a member of class TDBXSynonymsColumns.

56.1.39.2 TDBXSynonymsColumns Constants

The constants of the TDBXSynonymsColumns class are listed here.

Public Constants

	Name	Description
	CatalogName (see page 10823)	This is CatalogName, a member of class TDBXSynonymsColumns.
	SchemaName (see page 10823)	This is SchemaName, a member of class TDBXSynonymsColumns.
	SynonymName (see page 10823)	This is SynonymName, a member of class TDBXSynonymsColumns.
	TableCatalogName (see page 10824)	This is TableCatalogName, a member of class TDBXSynonymsColumns.
	TableName (see page 10824)	This is TableName, a member of class TDBXSynonymsColumns.
	TableSchemaName (see page 10824)	This is TableSchemaName, a member of class TDBXSynonymsColumns.

56.1.39.2.1 TDBXSynonymsColumns.CatalogName Constant

Pascal

```
const CatalogName = 'CatalogName';
```

C++

```
CatalogName = 'CatalogName';
```

Description

This is CatalogName, a member of class TDBXSynonymsColumns.

56.1.39.2.2 TDBXSynonymsColumns.SchemaName Constant

Pascal

```
const SchemaName = 'SchemaName';
```

C++

```
SchemaName = 'SchemaName';
```

Description

This is SchemaName, a member of class TDBXSynonymsColumns.

56.1.39.2.3 TDBXSynonymsColumns.SynonymName Constant

Pascal

```
const SynonymName = 'SynonymName';
```

C++

```
SynonymName = 'SynonymName';
```

Description

This is SynonymName, a member of class TDBXSynonymsColumns.

56.1.39.2.4 TDBXSynonymsColumns.TableCatalogName Constant

Pascal

```
const TableCatalogName = 'TableCatalogName';
```

C++

```
TableCatalogName = 'TableCatalogName';
```

Description

This is TableCatalogName, a member of class TDBXSynonymsColumns.

56.1.39.2.5 TDBXSynonymsColumns.TableName Constant

Pascal

```
const TableName = 'TableName';
```

C++

```
TableName = 'TableName';
```

Description

This is TableName, a member of class TDBXSynonymsColumns.

56.1.39.2.6 TDBXSynonymsColumns.TableSchemaName Constant

Pascal

```
const TableSchemaName = 'TableSchemaName';
```

C++

```
TableSchemaName = 'TableSchemaName';
```

Description

This is TableSchemaName, a member of class TDBXSynonymsColumns.

56.1.40 TDBXSynonymsIndex Class

Accesses columns by ordinal in the **Synonyms** metadata.

Class Hierarchy

Pascal

```
TDBXSynonymsIndex = class;
```

C++

```
class TDBXSynonymsIndex;
```

File

DBXMetaDataNames

Description

TDBXSynonymsIndex is used to access columns by ordinal in the **Synonyms** metadata collection. These columns are returned when TDBXCommand.Text' is TDBXMetaDataCommandsEx.GetSynonyms when reading metadata. To retrieve metadata columns, use these constants to index the TDBXReader instance returned by TDBXCommand.ExecuteQuery.

This table describes the columns.

Column Ordinal Name	Data Type of Column Data	Description
CatalogName (see page 10826)	String	Catalog name.
SchemaName (see page 10826)	String	Schema name.
SynonymName (see page 10826)	String	Synonym name.
TableCatalogName (see page 10827)	String	Catalog name of table this synonym refers to.
TableSchemaName (see page 10827)	String	Schema name of table this synonym refers to.
TableName (see page 10827)	String	Name of table this synonym refers to.

See Also

56.1.40.1 TDBXSynonymsIndex Members

The following tables list the members exposed by TDBXSynonymsIndex.

Public Constants

	Name	Description
	CatalogName (see page 10826)	This is CatalogName, a member of class TDBXSynonymsIndex.
	Last (see page 10826)	This is Last, a member of class TDBXSynonymsIndex.
	SchemaName (see page 10826)	This is SchemaName, a member of class TDBXSynonymsIndex.
	SynonymName (see page 10826)	This is SynonymName, a member of class TDBXSynonymsIndex.
	TableCatalogName (see page 10827)	This is TableCatalogName, a member of class TDBXSynonymsIndex.
	TableName (see page 10827)	This is TableName, a member of class TDBXSynonymsIndex.
	TableSchemaName (see page 10827)	This is TableSchemaName, a member of class TDBXSynonymsIndex.

56.1.40.2 TDBXSynonymsIndex Constants

The constants of the TDBXSynonymsIndex class are listed here.

Public Constants

	Name	Description
	CatalogName (see page 10826)	This is CatalogName, a member of class TDBXSynonymsIndex.
	Last (see page 10826)	This is Last, a member of class TDBXSynonymsIndex.
	SchemaName (see page 10826)	This is SchemaName, a member of class TDBXSynonymsIndex.
	SynonymName (see page 10826)	This is SynonymName, a member of class TDBXSynonymsIndex.
	TableCatalogName (see page 10827)	This is TableCatalogName, a member of class TDBXSynonymsIndex.
	TableName (see page 10827)	This is TableName, a member of class TDBXSynonymsIndex.
	TableSchemaName (see page 10827)	This is TableSchemaName, a member of class TDBXSynonymsIndex.

56.1.40.2.1 TDBXSynonymsIndex.CatalogName Constant

Pascal

```
const CatalogName = 0;
```

C++

```
CatalogName = 0;
```

Description

This is CatalogName, a member of class TDBXSynonymsIndex.

56.1.40.2.2 TDBXSynonymsIndex.Last Constant

Pascal

```
const Last = 5;
```

C++

```
Last = 5;
```

Description

This is Last, a member of class TDBXSynonymsIndex.

56.1.40.2.3 TDBXSynonymsIndex.SchemaName Constant

Pascal

```
const SchemaName = 1;
```

C++

```
SchemaName = 1;
```

Description

This is SchemaName, a member of class TDBXSynonymsIndex.

56.1.40.2.4 TDBXSynonymsIndex.SynonymName Constant

Pascal

```
const SynonymName = 2;
```

C++

```
SynonymName = 2;
```

Description

This is SynonymName, a member of class TDBXSynonymsIndex.

56.1.40.2.5 TDBXSynonymsIndex.TableCatalogName Constant

Pascal

```
const TableCatalogName = 3;
```

C++

```
TableCatalogName = 3;
```

Description

This is TableCatalogName, a member of class TDBXSynonymsIndex.

56.1.40.2.6 TDBXSynonymsIndex.TableName Constant

Pascal

```
const TableName = 5;
```

C++

```
TableName = 5;
```

Description

This is TableName, a member of class TDBXSynonymsIndex.

56.1.40.2.7 TDBXSynonymsIndex.TableSchemaName Constant

Pascal

```
const TableSchemaName = 4;
```

C++

```
TableSchemaName = 4;
```

Description

This is TableSchemaName, a member of class TDBXSynonymsIndex.

56.1.41 TDBXTablesColumns Class

Accesses columns by name in the **Tables** metadata.

Class Hierarchy

Pascal

```
TDBXTablesColumns = class;
```

C++

```
class TDBXTablesColumns;
```

File

DBXMetaDataNames

Description

TDBXTablesColumns is used to access columns by name in the **Tables** metadata collection. These columns are returned when TDBXCommand.Text' is TDBXMetaDataCommands.GetTables when reading metadata. To retrieve metadata columns, use these constants to index the TDBXReader instance returned by TDBXCommand.ExecuteQuery.

This table describes the columns.

Column Name	Data Type of Column Data	Description
CatalogName (see page 10828)	String	Catalog name.
SchemaName (see page 10829)	String	Schema name.
TableName (see page 10829)	String	Table name.
TableType (see page 10829)	String	Table type: TABLE, VIEW, SYNONYM, SYSTEM_TABLE.

See Also

TDBXMetaDataCommands (see page 10525)

56.1.41.1 TDBXTablesColumns Members

The following tables list the members exposed by TDBXTablesColumns.

Public Constants

	Name	Description
	CatalogName (see page 10828)	This is CatalogName, a member of class TDBXTablesColumns.
	SchemaName (see page 10829)	This is SchemaName, a member of class TDBXTablesColumns.
	TableName (see page 10829)	This is TableName, a member of class TDBXTablesColumns.
	TableType (see page 10829)	This is TableType, a member of class TDBXTablesColumns.

56.1.41.2 TDBXTablesColumns Constants

The constants of the TDBXTablesColumns class are listed here.

Public Constants

	Name	Description
	CatalogName (see page 10828)	This is CatalogName, a member of class TDBXTablesColumns.
	SchemaName (see page 10829)	This is SchemaName, a member of class TDBXTablesColumns.
	TableName (see page 10829)	This is TableName, a member of class TDBXTablesColumns.
	TableType (see page 10829)	This is TableType, a member of class TDBXTablesColumns.

56.1.41.2.1 TDBXTablesColumns.CatalogName Constant

Pascal

```
const CatalogName = 'CatalogName';
```

C++

```
CatalogName = 'CatalogName';
```

Description

This is CatalogName, a member of class TDBXTablesColumns.

56.1.41.2.2 TDBXTablesColumns.SchemaName Constant

Pascal

```
const SchemaName = 'SchemaName';
```

C++

```
SchemaName = 'SchemaName';
```

Description

This is SchemaName, a member of class TDBXTablesColumns.

56.1.41.2.3 TDBXTablesColumns.TableName Constant

Pascal

```
const TableName = 'TableName';
```

C++

```
TableName = 'TableName';
```

Description

This is TableName, a member of class TDBXTablesColumns.

56.1.41.2.4 TDBXTablesColumns.TableType Constant

Pascal

```
const TableType = 'TableType';
```

C++

```
TableType = 'TableType';
```

Description

This is TableType, a member of class TDBXTablesColumns.

56.1.42 TDBXTablesIndex Class

Accesses columns by ordinal in the **Tables** metadata.

Class Hierarchy

Pascal

```
TDBXTablesIndex = class;
```

C++

```
class TDBXTablesIndex;
```

File

DBXMetaDataNames

Description

TDBXTablesIndex is used to access columns by ordinal in the **Tables** metadata collection. These columns are returned when TDBXCommand.Text' is TDBXMetaDataCommands.GetTables when reading metadata. To retrieve metadata columns, use these constants to index the TDBXReader instance returned by TDBXCommand.ExecuteQuery.

This table describes the columns.

Column Ordinal Name	Data Type of Column Data	Description
CatalogName (see page 10831)	String	Catalog name.
SchemaName (see page 10831)	String	Schema name.
TableName (see page 10831)	String	Table name.
TableType (see page 10831)	String	Table type: TABLE, VIEW, SYNONYM, SYSTEM_TABLE.

56.1.42.1 TDBXTablesIndex Members

The following tables list the members exposed by TDBXTablesIndex.

Public Constants

	Name	Description
	CatalogName (see page 10831)	This is CatalogName, a member of class TDBXTablesIndex.
	Last (see page 10831)	This is Last, a member of class TDBXTablesIndex.
	SchemaName (see page 10831)	This is SchemaName, a member of class TDBXTablesIndex.
	TableName (see page 10831)	This is TableName, a member of class TDBXTablesIndex.
	TableType (see page 10831)	This is TableType, a member of class TDBXTablesIndex.

56.1.42.2 TDBXTablesIndex Constants

The constants of the TDBXTablesIndex class are listed here.

Public Constants

	Name	Description
	CatalogName (see page 10831)	This is CatalogName, a member of class TDBXTablesIndex.
	Last (see page 10831)	This is Last, a member of class TDBXTablesIndex.
	SchemaName (see page 10831)	This is SchemaName, a member of class TDBXTablesIndex.
	TableName (see page 10831)	This is TableName, a member of class TDBXTablesIndex.
	TableType (see page 10831)	This is TableType, a member of class TDBXTablesIndex.

56.1.42.2.1 TDBXTablesIndex.CatalogName Constant

Pascal

```
const CatalogName = 0;
```

C++

```
CatalogName = 0;
```

Description

This is CatalogName, a member of class TDBXTablesIndex.

56.1.42.2.2 TDBXTablesIndex.Last Constant

Pascal

```
const Last = 3;
```

C++

```
Last = 3;
```

Description

This is Last, a member of class TDBXTablesIndex.

56.1.42.2.3 TDBXTablesIndex.SchemaName Constant

Pascal

```
const SchemaName = 1;
```

C++

```
SchemaName = 1;
```

Description

This is SchemaName, a member of class TDBXTablesIndex.

56.1.42.2.4 TDBXTablesIndex.TableName Constant

Pascal

```
const TableName = 2;
```

C++

```
TableName = 2;
```

Description

This is TableName, a member of class TDBXTablesIndex.

56.1.42.2.5 TDBXTablesIndex.TableType Constant

Pascal

```
const TableType = 3;
```

C++

```
TableType = 3;
```

Description

This is TableType, a member of class TDBXTablesIndex.

56.1.43 TDBXUsersColumns Class

Accesses columns by name in the **Users** metadata.

Class Hierarchy

DBXMetaDataNames.TDBXUsersColumns

Pascal

```
TDBXUsersColumns = class;
```

C++

```
class TDBXUsersColumns;
```

File

DBXMetaDataNames

Description

TDBXUsersColumns is used to access columns by name in the **Users** metadata collection. These columns are returned when TDBXCommand.Text' is TDBXMetaDataCommands.GetUsers when reading metadata. To retrieve a metadata column, use this constant to index the TDBXReader instance returned by TDBXCommand.ExecuteQuery.

This table describes the column.

Column Name	Data Type of Column Data	Description
UserName (see page 10833)	String	User name.

56.1.44.1 TDBXUsersIndex Members

The following tables list the members exposed by TDBXUsersIndex.

Public Constants

	Name	Description
	Last (see page 10834)	This is Last, a member of class TDBXUsersIndex.
	UserName (see page 10834)	This is UserName, a member of class TDBXUsersIndex.

56.1.44.2 TDBXUsersIndex Constants

The constants of the TDBXUsersIndex class are listed here.

Public Constants

	Name	Description
	Last (see page 10834)	This is Last, a member of class TDBXUsersIndex.
	UserName (see page 10834)	This is UserName, a member of class TDBXUsersIndex.

56.1.44.2.1 TDBXUsersIndex.Last Constant

Pascal

```
const Last = 0;
```

C++

```
Last = 0;
```

Description

This is Last, a member of class TDBXUsersIndex.

56.1.44.2.2 TDBXUsersIndex.UserName Constant

Pascal

```
const UserName = 0;
```

C++

```
UserName = 0;
```

Description

This is UserName, a member of class TDBXUsersIndex.

56.1.45 TDBXViewsColumns Class

Accesses columns by name in the **Views** metadata.

Class Hierarchy

DBXMetaDataNames.TDBXViewsColumns

Pascal

```
TDBXViewsColumns = class;
```

56.1.45.1 TDBXViewsColumns Members

The following tables list the members exposed by TDBXViewsColumns.

Public Constants

	Name	Description
	CatalogName (see page 10835)	This is CatalogName, a member of class TDBXViewsColumns.
	Definition (see page 10836)	This is Definition, a member of class TDBXViewsColumns.
	SchemaName (see page 10836)	This is SchemaName, a member of class TDBXViewsColumns.
	ViewName (see page 10836)	This is ViewName, a member of class TDBXViewsColumns.

56.1.45.2 TDBXViewsColumns Constants

The constants of the TDBXViewsColumns class are listed here.

Public Constants

	Name	Description
	CatalogName (see page 10835)	This is CatalogName, a member of class TDBXViewsColumns.
	Definition (see page 10836)	This is Definition, a member of class TDBXViewsColumns.
	SchemaName (see page 10836)	This is SchemaName, a member of class TDBXViewsColumns.
	ViewName (see page 10836)	This is ViewName, a member of class TDBXViewsColumns.

56.1.45.2.1 TDBXViewsColumns.CatalogName Constant

Pascal

```
const CatalogName = 'CatalogName';
```

C++

```
CatalogName = 'CatalogName';
```

Description

This is CatalogName, a member of class TDBXViewsColumns.

56.1.45.2.2 TDBXViewsColumns.Definition Constant

Pascal

```
const Definition = 'Definition';
```

C++

```
Definition = 'Definition';
```

Description

This is Definition, a member of class TDBXViewsColumns.

56.1.45.2.3 TDBXViewsColumns.SchemaName Constant

Pascal

```
const SchemaName = 'SchemaName';
```

C++

```
SchemaName = 'SchemaName';
```

Description

This is SchemaName, a member of class TDBXViewsColumns.

56.1.45.2.4 TDBXViewsColumns.ViewName Constant

Pascal

```
const ViewName = 'ViewName';
```

C++

```
ViewName = 'ViewName';
```

Description

This is ViewName, a member of class TDBXViewsColumns.

56.1.46 TDBXViewsIndex Class

Accesses columns by ordinal in the **Views** metadata.

Class Hierarchy

Pascal

```
TDBXViewsIndex = class;
```

C++

```
class TDBXViewsIndex;
```

File

DBXMetaDataNames

Description

TDBXViewsIndex is used to access columns by ordinal in the **Views** metadata collection. These columns are returned when TDBXCommand.Text' is TDBXMetaDataCommandsEx.GetViews when reading metadata. To retrieve metadata columns, use these constants to index the TDBXReader instance returned by TDBXCommand.ExecuteQuery.

This table describes the columns.

Column Ordinal Name	Data Type of Column Data	Description
CatalogName (see page 10838)	String	Catalog name.
SchemaName (see page 10838)	String	Schema name.
ViewName (see page 10838)	String	View name.
Definition (see page 10838)	String	SQL that was used to create the view.

See Also

TDBXMetaDataCommandsEx (see page 10531)

TDBXViewsColumns (see page 10834)

56.1.46.1 TDBXViewsIndex Members

The following tables list the members exposed by TDBXViewsIndex.

Public Constants

	Name	Description
	CatalogName (see page 10838)	This is CatalogName, a member of class TDBXViewsIndex.
	Definition (see page 10838)	This is Definition, a member of class TDBXViewsIndex.
	Last (see page 10838)	This is Last, a member of class TDBXViewsIndex.
	SchemaName (see page 10838)	This is SchemaName, a member of class TDBXViewsIndex.
	ViewName (see page 10838)	This is ViewName, a member of class TDBXViewsIndex.

56.1.46.2 TDBXViewsIndex Constants

The constants of the TDBXViewsIndex class are listed here.

Public Constants

	Name	Description
	CatalogName (see page 10838)	This is CatalogName, a member of class TDBXViewsIndex.
	Definition (see page 10838)	This is Definition, a member of class TDBXViewsIndex.
	Last (see page 10838)	This is Last, a member of class TDBXViewsIndex.
	SchemaName (see page 10838)	This is SchemaName, a member of class TDBXViewsIndex.
	ViewName (see page 10838)	This is ViewName, a member of class TDBXViewsIndex.

56.1.46.2.1 TDBXViewsIndex.CatalogName Constant

Pascal

```
const CatalogName = 0;
```

C++

```
CatalogName = 0;
```

Description

This is CatalogName, a member of class TDBXViewsIndex.

56.1.46.2.2 TDBXViewsIndex.Definition Constant

Pascal

```
const Definition = 3;
```

C++

```
Definition = 3;
```

Description

This is Definition, a member of class TDBXViewsIndex.

56.1.46.2.3 TDBXViewsIndex.Last Constant

Pascal

```
const Last = 3;
```

C++

```
Last = 3;
```

Description

This is Last, a member of class TDBXViewsIndex.

56.1.46.2.4 TDBXViewsIndex.SchemaName Constant

Pascal

```
const SchemaName = 1;
```

C++

```
SchemaName = 1;
```

Description

This is SchemaName, a member of class TDBXViewsIndex.

56.1.46.2.5 TDBXViewsIndex.ViewName Constant

Pascal

```
const ViewName = 2;
```

C++

```
ViewName = 2;
```

Description

This is ViewName, a member of class TDBXViewsIndex.

57 DBXpressWeb Namespace

This is namespace DBXpressWeb.

Name	Description
Classes (see page 10842)	The following table lists classes in this documentation.

Classes

	Name	Description
	TSQLQueryTableProducer (see page 10842)	TSQLQueryTableProducer assembles a sequence of HTML commands to display the result set of a query in a tabular format.

57.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TSQLQueryTableProducer (see page 10842)	TSQLQueryTableProducer assembles a sequence of HTML commands to display the result set of a query in a tabular format.

57.1.1 TSQLQueryTableProducer Class

TSQLQueryTableProducer assembles a sequence of HTML commands to display the result set of a query in a tabular format.

Class Hierarchy

Pascal

```
TSQLQueryTableProducer = class(TDSTableProducer);
```

C++

```
class TSQLQueryTableProducer : public TDSTableProducer;
```

File

DBXpressWeb

Description

Use TSQLQueryTableProducer to produce an HTML table for the records of a parameterized query. The TSQLQuery object obtains its parameters from an HTTP request message. If the request is a GET message, the parameters for the query are the QueryFields property of the request object. If the request is a POST message, the parameters for the query are the ContentFields property of the request object.

To produce an HTML table for a query that has no parameters, use the TDataSetTableProducer object instead.

See the WebServ demo for an example of how to use TSQLQueryTableProducer.

TDataSet (see page 6894)

TQueryTableProducer (see page 8152)

TWebResponse (see page 15191)

TDataSetPageProducer (see page 11807)

57.1.1.1 TSQLQueryTableProducer Members

The following tables list the members exposed by TSQLQueryTableProducer.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	AcquireLayoutLock (see page 10296)	Calls BeginLayout (see page 10297) when the HTML table is not currently being laid out.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	BeginLayout (see page 10297)	Increments a counter that indicates the number of times the computation of the column order was begun but not completed.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	ColumnHeader (see page 10298)	Returns the string of HTML <TH> tags that define the column headers for the table.
	DefineFieldMap (see page 10298)	Builds the Fields array in DataLink (see page 10309).
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	DoCreateContent (see page 10299)	This is DoCreateContent, a member of class TDSTableProducer.
	DoFormatCell (see page 10299)	Generates an OnFormatCell (see page 10314) event.
	DoGetCaption (see page 10300)	Generates an OnGetCaption event.
	EndLayout (see page 10300)	Decrements a counter that indicates the number of times the computation of the column order has been begun but not completed.
	FormatCell (see page 10301)	Returns an HTML tag of a specified type that reflects a set of specified options.
	GetAppDispatcher (see page 15108)	This is GetAppDispatcher, a member of class TCustomContentProducer.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetDataSet (see page 10847)	Provides the abstract prototype of a method to access the DataSet property.
	GetDataSource (see page 10302)	Returns the value of the DataSource (see page 10309) property.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	LayoutChanged (see page 10303)	Causes the Columns (see page 10308) property to be recomputed when the dataset changes or changes are made to individual column objects.
	LinkActive (see page 10303)	Recomputes the Columns (see page 10308) property when the dataset becomes active.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 10848)	Adjusts the properties of TDSTableProducer when its helper objects are destroyed.

	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	ProduceContent (see page 15108)	Returns the content that the producer creates.
	ProduceContentFromStream (see page 15109)	This is ProduceContentFromStream, a member of class TCustomContentProducer.
	ProduceContentFromString (see page 15109)	This is ProduceContentFromString, a member of class TCustomContentProducer.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	RowHeader (see page 10304)	Returns the HTML <TR> tag that defines each row of the HTML table.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetAppDispatcher (see page 15109)	This is SetAppDispatcher, a member of class TCustomContentProducer.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetColumns (see page 10304)	Sets the Columns (see page 10308) property.
V	SetDataSet (see page 10848)	Provides the abstract prototype of a method to set the DataSet property.
	SetDataSource (see page 10305)	Sets the DataSource (see page 10309) property.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	StoreColumns (see page 10305)	Indicates whether the Columns (see page 10308) property is stored when the TDSTableProducer (see page 10290) is saved.
	TableCaption (see page 10306)	Returns the HTML <Caption (see page 10307)> tag that defines the caption for the HTML table.
	TableHeader (see page 10306)	Returns the HTML <Table> tag for the HTML table.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	DataLink (see page 10309)	Manages the link to the dataset.
	DataSource (see page 10309)	Represents the link to the DataSet (see page 10309) of the TDSTableProducer (see page 10290).
R	InternalDataSource (see page 10311)	Represents the link to the dataset.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	BeginUpdate (see page 10297)	Increments a counter that indicates the number of changes to the contents of the HTML table that have been initiated but not completed.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).

	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Content (see page 10847)	Returns the HTML representation of the records in the dataset.
	ContentFromStream (see page 15107)	Returns the content produced in response to input read from a stream.
	ContentFromString (see page 15107)	Returns the content produced in response to an input string.
	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 10295)	Creates an instance of TDSTableProducer (see page 10290).
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 2766)	Disposes of the component and its owned components.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 10295)	Destroys an instance of TDSTableProducer (see page 10290).
	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	EndUpdate (see page 10301)	Decrements a counter that indicates the number of changes to the contents of the HTML table.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetAppDispatcher (see page 15220)	This is GetAppDispatcher, a member of class IGetAppDispatcher.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	ProduceContent (see page 15224)	Returns the content that the producer creates.
	ProduceContentFromStream (see page 15225)	This is ProduceContentFromStream, a member of class IProduceContentFrom.
	ProduceContentFromString (see page 15226)	This is ProduceContentFromString, a member of class IProduceContentFrom.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.

	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetAppDispatcher (see page 15227)	This is SetAppDispatcher, a member of class ISetAppDispatcher.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DataSet (see page 10309)	Specifies the dataset from which the data in the HTML table is taken.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	Dispatcher (see page 15109)	Provides access to the dispatcher for the Web server application that includes the TCustomContentProducer (see page 15102) object.
R	DispatcherComponent (see page 15110)	Provides access to the dispatcher component.
	Editor (see page 10310)	Writes changes made in the property editor at design time to the TDSTableProducer (see page 10290) object.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Events

	Name	Description
	OnCreateContent (see page 10853)	Occurs in descendants of TDSTableProducer when the Content method needs to generate the HTML table image.
	OnFormatCell (see page 10854)	Occurs when the HTML for a specified cell specified is about to be generated.
	OnGetTableCaption (see page 10854)	Occurs when the HTML table producer is about to generate the HTML for the table caption.

Published Properties

	Name	Description
	Caption (see page 10849)	Specifies the caption string that appears with the HTML table.
	CaptionAlignment (see page 10849)	Specifies where the Caption string should appear relative to the HTML table.
	Columns (see page 10850)	Describes the field bindings and display attributes of the columns in the HTML table.
	Footer (see page 10850)	Specifies a set of HTML commands that appear in the HTML document following the HTML table.
	Header (see page 10851)	Specifies a set of HTML commands that appear in the HTML document preceding the HTML table.
	MaxRows (see page 10851)	Specifies the maximum number of rows that appear in the HTML table.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Query (see page 10852)	Specifies the TSQLQuery object that TSQLQueryTableProducer (see page 10842) runs to obtain its data.
	RowAttributes (see page 10852)	Specifies the display attributes of all the rows in the HTML table.
	TableAttributes (see page 10853)	Specifies the display attributes that pertain to the entire HTML table produced by TDSTableProducer.
	Tag (see page 2808)	Stores an integer value as part of a component.

57.1.1.2 TSQLQueryTableProducer Methods

The methods of the TSQLQueryTableProducer class are listed here.

Protected Methods

	Name	Description
	GetDataSet (see page 10847)	Provides the abstract prototype of a method to access the DataSet property.
	Notification (see page 10848)	Adjusts the properties of TDSTableProducer when its helper objects are destroyed.
	SetDataSet (see page 10848)	Provides the abstract prototype of a method to set the DataSet property.

Public Methods

	Name	Description
	Content (see page 10847)	Returns the HTML representation of the records in the dataset.

57.1.1.2.1 TSQLQueryTableProducer.Content Method

Returns the HTML representation of the records in the dataset.

Pascal

```
function Content: string; override;
```

C++

```
virtual __fastcall AnsiString Content();
```

Description

Call Content to retrieve the HTML representation specified by the properties of the TSQLQueryTableProducer (see page 10842) object. Content calls the OnCreateContent (see page 10853) event handler. If the OnCreateContent (see page 10853) event handler indicates that the Content method should continue, Content returns the Header (see page 10851) property, followed by an HTML table image of the records in the dataset, followed by the Footer (see page 10850) property. If the OnCreateContent (see page 10853) event handler indicates that the Content method should not continue, Content returns an empty string.

The string returned by Content can be used as the Content property of the response to an HTTP request message.

See Also

Footer (see page 10310)

Header (see page 10311)

OnCreateContent (see page 10313)

TWebRequest (see page 15161)

Content (see page 15207)

57.1.1.2.2 TSQLQueryTableProducer.GetDataSet Method

Provides the abstract prototype of a method to access the DataSet property.

Pascal

```
function GetDataSet: TDataSet; override;
```

C++

```
virtual __fastcall TDataSet GetDataSet();
```

Description

Descendants of TDSTableProducer implement the GetDataSet method to access their specific implementation of the DataSet property. Descendants of TDSTableProducer restrict the DataSet property to different classes of TDataSet objects.

See Also

DataSet (see page 10309)

SetDataSet (see page 10305)

57.1.1.2.3 TSQLQueryTableProducer.Notification Method

Adjusts the properties of TDSTableProducer when its helper objects are destroyed.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

Notification overrides the inherited method to respond to messages that the DataSource or one of its field objects is about to be destroyed. Notification sets the DataSource property to nil (Delphi) or NULL (C++), or unbinds the column that references the field component.

See Also

DataSource (see page 10309)

Columns (see page 10308)

57.1.1.2.4 TSQLQueryTableProducer.SetDataSet Method

Provides the abstract prototype of a method to set the DataSet property.

Pascal

```
procedure SetDataSet(ADataSet: TDataSet); override;
```

C++

```
virtual __fastcall SetDataSet(TDataSet ADataSet);
```

Description

Descendants of TDSTableProducer override SetDataSet to ensure that the DataSet property can only be set to an appropriate descendant of TDataSet.

See Also

DataSet (see page 10309)

GetDataSet (see page 10302)

57.1.1.3 TSQLQueryTableProducer Properties

The properties of the TSQLQueryTableProducer class are listed here.

Published Properties

	Name	Description
	Caption (see page 10849)	Specifies the caption string that appears with the HTML table.
	CaptionAlignment (see page 10849)	Specifies where the Caption string should appear relative to the HTML table.
	Columns (see page 10850)	Describes the field bindings and display attributes of the columns in the HTML table.
	Footer (see page 10850)	Specifies a set of HTML commands that appear in the HTML document following the HTML table.
	Header (see page 10851)	Specifies a set of HTML commands that appear in the HTML document preceding the HTML table.
	MaxRows (see page 10851)	Specifies the maximum number of rows that appear in the HTML table.
	Query (see page 10852)	Specifies the TSQLQuery object that TSQLQueryTableProducer (see page 10842) runs to obtain its data.
	RowAttributes (see page 10852)	Specifies the display attributes of all the rows in the HTML table.
	TableAttributes (see page 10853)	Specifies the display attributes that pertain to the entire HTML table produced by TDSTableProducer.

57.1.1.3.1 TSQLQueryTableProducer.Caption Property

Specifies the caption string that appears with the HTML table.

Pascal

```
property Caption: string;
```

C++

```
__property AnsiString Caption;
```

Description

Set Caption to add a caption to the HTML table that represents the dataset. Caption indicates the text that should appear inside the HTML CAPTION tag.

See Also

CaptionAlignment (see page 10308)

OnGetTableCaption (see page 10314)

Embedding Tables in HTML Documents

57.1.1.3.2 TSQLQueryTableProducer.CaptionAlignment Property

Specifies where the Caption string should appear relative to the HTML table.

Pascal

```
property CaptionAlignment: THTMLCaptionAlignment;
```

C++

```
__property THTMLCaptionAlignment CaptionAlignment;
```

Description

Set CaptionAlignment to specify whether the Caption should appear above or below the HTML table.

CaptionAlignment is the value of the ALIGN option on the HTML CAPTION tag.

See Also

Caption (see page 10307)

Embedding Tables in HTML Documents

57.1.1.3.3 TSQLQueryTableProducer.Columns Property

Describes the field bindings and display attributes of the columns in the HTML table.

Pascal

```
property Columns: THTMLTableColumns;
```

C++

```
__property THTMLTableColumns Columns;
```

Description

Use Columns to read or set the field bindings and display attributes of the columns in the HTML table. Each THTMLTableColumn object specifies the display attributes of the corresponding column. Each column object also specifies the name of the field the column represents. The field binding of a column designates a field within the dataset specified by the DataSet property.

Columns can be set at design time through a property editor, or programmatically at runtime.

See Also

DataSet (see page 10309)

DefineFieldMap (see page 10298)

Editor (see page 10310)

RowAttributes (see page 10312)

SetColumns (see page 10304)

StoreColumns (see page 10305)

TableAttributes (see page 10313)

THTMLTableColumn (see page 10318)

THTMLTableColumns (see page 10327)

Specifying the Columns

57.1.1.3.4 TSQLQueryTableProducer.Footer Property

Specifies a set of HTML commands that appear in the HTML document following the HTML table.

Pascal

```
property Footer: TStrings;
```

C++

```
__property TStrings Footer;
```

Description

Set Footer to embed the representation of DataSet in a larger document. The Content method of TDSTableProducer descendants returns any Header commands, followed by the HTML table that represents the DataSet, followed by any Footer commands.

See Also

Content (see page 10282)

Content (see page 10847)

Content (see page 8157)

DataSet (see page 10309)

Header (see page 10311)

Embedding Tables in HTML Documents

57.1.1.3.5 TSQLQueryTableProducer.Header Property

Specifies a set of HTML commands that appear in the HTML document preceding the HTML table.

Pascal

```
property Header: TStrings;
```

C++

```
__property TStrings Header;
```

Description

Set Header to embed the representation of DataSet in a larger document. The Content method of TDSTableProducer descendants returns any Header commands, followed by the HTML table that represents the DataSet, followed by any Footer commands.

See Also

Content (see page 10282)

Content (see page 10847)

Content (see page 8157)

DataSet (see page 10309)

Footer (see page 10310)

Embedding Tables in HTML Documents

57.1.1.3.6 TSQLQueryTableProducer.MaxRows Property

Specifies the maximum number of rows that appear in the HTML table.

Pascal

```
property MaxRows: Integer;
```

C++

```
__property int MaxRows;
```

Description

Set MaxRows to change the upper limit on the size of the HTML table produced to represent the DataSet. MaxRows is initialized to 20.

If DataSet contains more than MaxRows records, only the first MaxRows records appear in the HTML commands produced by Content. If DataSet contains fewer than MaxRows records, the HTML table produced by TDSTableProducer will contain only enough rows to display all the records in DataSet.

See Also

Content (see page 10282)

Content (see page 10847)

Content (see page 8157)

DataSet (see page 10309)

Specifying the Row Attributes

57.1.1.3.7 TSQLQueryTableProducer.Query Property

Specifies the TSQLQuery object that TSQLQueryTableProducer (see page 10842) runs to obtain its data.

Pascal

```
property Query: TSQLQuery;
```

C++

```
__property TSQLQuery Query;
```

Description

Set Query to specify the query to run to obtain the data for the HTML table. Use Query to set the query for the TSQLQueryTableProducer (see page 10842) rather than the DataSource property: TSQLQueryTableProducer (see page 10842) generates its data source internally.

The individual field bindings specified by the THTMLTableColumn objects in the Columns (see page 10850) property refer to fields in DataSet.

Note: Query is identical to the DataSet property, except Query does not use the TDataSet base class of the query object.

See Also

DataSet (see page 10309)

57.1.1.3.8 TSQLQueryTableProducer.RowAttributes Property

Specifies the display attributes of all the rows in the HTML table.

Pascal

```
property RowAttributes: THTMLTableRowAttributes;
```

C++

```
__property THTMLTableRowAttributes RowAttributes;
```

Description

Set RowAttributes to a THTMLTableRowAttributes object that describes the display attributes of the rows in the HTML table. Setting RowAttributes calls the Assign method of the THTMLTableRowAttributes object stored internally by TDSTableProducer. Thus, the memory for any row attributes object assigned to the RowAttributes property is never owned or freed by TDSTableProducer.

Note: Not all the properties of the row attributes object are copied when one row attributes object is assigned to another. To ensure that all the attributes represented by RowAttributes are set appropriately, read RowAttributes and set the individual properties of the THTMLTableRowAttributes object.

See Also

TableAttributes (see page 10313)

Title (see page 10327)

AssignTo (see page 15297)

Specifying the Row Attributes

57.1.1.3.9 TSQLQueryTableProducer.TableAttributes Property

Specifies the display attributes that pertain to the entire HTML table produced by TDSTableProducer.

Pascal

```
property TableAttributes: THTMLTableAttributes;
```

C++

```
__property THTMLTableAttributes TableAttributes;
```

Description

Set TableAttributes to a THTMLTableAttributes object that describes the display attributes for the HTML TABLE tag. Setting TableAttributes calls the Assign method of the THTMLTableAttributes object stored internally by TDSTableProducer. Thus, the memory for any table attributes object assigned to the TableAttributes property is never owned or freed by TDSTableProducer.

Note: Not all the properties of the table attributes object are copied when one table attributes object is assigned to another. To ensure that all the attributes represented by TableAttributes are set appropriately, read TableAttributes and set the individual properties of the THTMLTableAttributes object.

See Also

RowAttributes (see page 10312)

AssignTo (see page 15291)

Title (see page 10327)

Specifying the Table Attributes

57.1.1.4 TSQLQueryTableProducer Events

The events of the TSQLQueryTableProducer class are listed here.

Published Events

	Name	Description
	OnCreateContent (see page 10853)	Occurs in descendants of TDSTableProducer when the Content method needs to generate the HTML table image.
	OnFormatCell (see page 10854)	Occurs when the HTML for a specified cell specified is about to be generated.
	OnGetTableCaption (see page 10854)	Occurs when the HTML table producer is about to generate the HTML for the table caption.

57.1.1.4.1 TSQLQueryTableProducer.OnCreateContent Event

Occurs in descendants of TDSTableProducer when the Content method needs to generate the HTML table image.

Pascal

```
property OnCreateContent: TCreateContentEvent;
```

C++

```
__property TCreateContentEvent OnCreateContent;
```

Description

Write an OnCreateContent event handler to conditionally prevent the Content method from producing any HTML commands. Set the Continue parameter to false to make Content return an empty string.

See Also

Content (see page 10282)

Content (see page 10847)

Content (see page 8157)

docreatecontent (see page 10299)

57.1.1.4.2 TSQLQueryTableProducer.OnFormatCell Event

Occurs when the HTML for a specified cell specified is about to be generated.

Pascal

```
property OnFormatCell: THTMLFormatCellEvent;
```

C++

```
__property THTMLFormatCellEvent OnFormatCell;
```

Description

Write an OnFormatCell event handler to change the appearance or contents of individual cells in the HTML table from the default values produced by TDSTableProducer.

See Also

Columns (see page 10308)

Content (see page 10282)

Content (see page 10847)

Content (see page 8157)

DoFormatCell (see page 10299)

DisplayText (see page 7162)

Align (see page 10324)

BgColor (see page 10325)

Custom (see page 10325)

VAlign (see page 10327)

57.1.1.4.3 TSQLQueryTableProducer.OnGetTableCaption Event

Occurs when the HTML table producer is about to generate the HTML for the table caption.

Pascal

```
property OnGetTableCaption: THTMLGetTableCaptionEvent;
```

C++

```
__property THTMLGetTableCaptionEvent OnGetTableCaption;
```

Description

Write an OnGetTableCaption event handler to change the value or placement of the HTML table caption. The Caption and Alignment parameters are originally set to the values of the Caption and CaptionAlignment properties, respectively. The OnGetTableCaption event handler can change these values to alter the caption for the HTML table returned by the Content

method.

See Also

Caption (see page 10307)

CaptionAlignment (see page 10308)

Content (see page 15106)

58 DdeMan Namespace

This is namespace DdeMan.

Topics

Name	Description
Classes (see page 10858)	The following table lists classes in this documentation.
Functions (see page 10910)	The following table lists functions in this documentation.
Structs, Records, Enums (see page 10911)	The following table lists structs, records, enums in this documentation.
Types (see page 10912)	The following table lists types in this documentation.
Variables (see page 10913)	The following table lists variables in this documentation.

Classes

	Name	Description
	TDdeClientConv (see page 10858)	TDdeClientConv represents a DDE conversation with a DDE server application.
	TDdeClientItem (see page 10878)	TDDEClientItem defines an item in a DDE conversation.
	TDdeMgr (see page 10886)	This is class DdeMan.TDdeMgr.
	TDdeServerConv (see page 10891)	TDdeServerConv represents a DDE topic of conversation with a DDE client.
	TDdeServerItem (see page 10898)	TDdeServerItem defines the item of a DDE conversation.

Functions

	Name	Description
	GetPasteLinkInfo (see page 10910)	This is function DdeMan.GetPasteLinkInfo.

Structs, Records, Enums

	Name	Description
	TDataMode (see page 10911)	TDataMode indicates whether a stage in a DDE conversation happens automatically.

Types

Name	Description
TMacroEvent (see page 10912)	TMacroEvent is the type for event handlers that implement the response of a DDE server to a macro.

Variables

Name	Description
ddeMgr (see page 10913)	This is variable DdeMan.ddeMgr.

58.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TDdeClientConv (see page 10858)	TDdeClientConv represents a DDE conversation with a DDE server application.
	TDdeClientItem (see page 10878)	TDDEClientItem defines an item in a DDE conversation.
	TDdeMgr (see page 10886)	This is class DdeMan.TDdeMgr.
	TDdeServerConv (see page 10891)	TDdeServerConv represents a DDE topic of conversation with a DDE client.
	TDdeServerItem (see page 10898)	TDdeServerItem defines the item of a DDE conversation.

58.1.1 TDdeClientConv Class

TDdeClientConv represents a DDE conversation with a DDE server application.

Class Hierarchy

Pascal

```
TDdeClientConv = class(TComponent);
```

C++

```
class TDdeClientConv : public TComponent;
```

File

DdeMan

Description

Use TDdeClientConv with a TDdeClientItem (see page 10878) object to enable an application to act as a DDE client. TDdeClientConv provides many properties, events, and methods that provide services to

Link to a specified DDE server with a specified DDE topic.

Send data or macro commands to the DDE server after a link has been established.

Specify a format for the data that is sent to the DDE server.

Allow event handlers to respond when the DDE link is opened or closed.

TDdeClientItem (see page 10878) objects are associated with a TDdeClientConv by setting their DdeConv property.

See Also

TDdeClientItem (see page 10878)

TDdeServerConv (see page 10891)

TDdeServerItem (see page 10898)

58.1.1.1 TDdeClientConv Members

The following tables list the members exposed by TDdeClientConv.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeLink (see page 10863)	This is ChangeLink, a member of class TDdeClientConv.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	ClearItems (see page 10864)	This is ClearItems, a member of class TDdeClientConv.
	Close (see page 10864)	This is Close, a member of class TDdeClientConv.
	CreateDdeConv (see page 10864)	This is CreateDdeConv, a member of class TDdeClientConv.
V	DefineProperties (see page 10865)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetCliItemByCtrl (see page 10866)	This is GetCliItemByCtrl, a member of class TDdeClientConv.
	GetCliItemByName (see page 10867)	This is GetCliItemByName, a member of class TDdeClientConv.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 10867)	Initializes the component after the form file has been read into memory.
V	Notification (see page 10867)	Forwards notification messages to all owned components.
	OnAttach (see page 10868)	This is OnAttach, a member of class TDdeClientConv.
	OnDetach (see page 10868)	This is OnDetach, a member of class TDdeClientConv.
	OnSetItem (see page 10868)	This is OnSetItem, a member of class TDdeClientConv.
	Open (see page 10869)	This is Open, a member of class TDdeClientConv.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadLinkInfo (see page 10871)	This is ReadLinkInfo, a member of class TDdeClientConv.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.

	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteLinkInfo (see page 10873)	This is WriteLinkInfo, a member of class TDdeClientConv.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	CloseLink (see page 10864)	Terminates an ongoing DDE conversation.
V	Create (see page 10862)	Creates an instance of TDdeClientConv (see page 10858).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 10862)	Destroys an instance of TDdeClientConv (see page 10858).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	ExecuteMacro (see page 10865)	Sends a macro command string to the DDE server application.
	ExecuteMacroLines (see page 10866)	Sends a list of several macro commands to a DDE server application.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.

	GetParentComponent (see page 2778)	Returns the containing Component.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	OpenLink (see page 10869)	Initiates a new DDE conversation.
	PasteLink (see page 10869)	Opens a DDE conversation with the current Clipboard object.
	PokeData (see page 10870)	Sends data to a DDE server application.
	PokeDataLines (see page 10870)	Sends multiple lines of data to a DDE server application.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
	RequestData (see page 10871)	Requests data from a DDE server.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetLink (see page 10872)	Specifies the service and topic of a DDE conversation and attempts to open the link if ConnectMode (see page 10873) is ddeAutomatic.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	StartAdvise (see page 10872)	Starts an advise loop for all of the TDdeClientItems associated with the current DDE conversation.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
R	Conv (see page 10874)	Indicates the handle for the current DDE conversation.
	DataMode (see page 10874)	Governs whether portions of the DDE conversation execute automatically.
R	DdeFmt (see page 10874)	Represents the clipboard format used for submitting or requesting a data item.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
R	WaitStat (see page 10877)	Indicates whether the server is in the process of servicing a DDE macro that prohibits asynchronous DDE transactions.

Published Events

	Name	Description
	OnClose (see page 10877)	Occurs when the DDE conversation terminates.
	OnOpen (see page 10878)	Occurs immediately after the DDE link to the server has been established.

Published Properties

	Name	Description
	ConnectMode (see page 10873)	Determines whether the link to the DDE server is established automatically when the form is opened.
	DdeService (see page 10875)	Specifies the DDE server application to be linked to a DDE client.
	DdeTopic (see page 10875)	Specifies the topic of a DDE conversation
	FormatChars (see page 10876)	Determines if certain characters are filtered out of text data transferred from a DDE server application.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	ServiceApplication (see page 10876)	Specifies the main executable file name (with path, if necessary) of a DDE server application, without the .EXE extension.
	Tag (see page 2808)	Stores an integer value as part of a component.

58.1.1.2 TDdeClientConv.Create Constructor

Creates an instance of TDdeClientConv (see page 10858).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TDdeClientConv(TComponent * AOwner);
```

Description

Call Create to create an instance of TDdeClientConv (see page 10858). After calling the inherited constructor, Create creates the helper objects used to manage individual DDE client items.

See Also

Create (see page 2766)

TDdeClientItem (see page 10878)

58.1.1.3 TDdeClientConv.Destroy Destructor

Destroys an instance of TDdeClientConv (see page 10858).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TDdeClientConv();
```

Description

Do not call Destroy directly in an application. Instead, call Free. Free verifies that the TDdeClientConv (see page 10858) reference is not nil, and only then calls Destroy.

Destroy closes the link to the server and frees up all helper objects before calling the inherited destructor.

See Also

CloseLink (see page 10864)

Free (see page 22300)

58.1.1.4 TDdeClientConv Methods

The methods of the TDdeClientConv class are listed here.

Protected Methods

	Name	Description
	ChangeLink (see page 10863)	This is ChangeLink, a member of class TDdeClientConv.
	ClearItems (see page 10864)	This is ClearItems, a member of class TDdeClientConv.
	Close (see page 10864)	This is Close, a member of class TDdeClientConv.
	CreateDdeConv (see page 10864)	This is CreateDdeConv, a member of class TDdeClientConv.
V	DefineProperties (see page 10865)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	GetCliItemByCtrl (see page 10866)	This is GetCliItemByCtrl, a member of class TDdeClientConv.
	GetCliItemByName (see page 10867)	This is GetCliItemByName, a member of class TDdeClientConv.
V	Loaded (see page 10867)	Initializes the component after the form file has been read into memory.
V	Notification (see page 10867)	Forwards notification messages to all owned components.
	OnAttach (see page 10868)	This is OnAttach, a member of class TDdeClientConv.
	OnDetach (see page 10868)	This is OnDetach, a member of class TDdeClientConv.
	OnSetItem (see page 10868)	This is OnSetItem, a member of class TDdeClientConv.
	Open (see page 10869)	This is Open, a member of class TDdeClientConv.
	ReadLinkInfo (see page 10871)	This is ReadLinkInfo, a member of class TDdeClientConv.
	WriteLinkInfo (see page 10873)	This is WriteLinkInfo, a member of class TDdeClientConv.

Public Methods

	Name	Description
	CloseLink (see page 10864)	Terminates an ongoing DDE conversation.
	ExecuteMacro (see page 10865)	Sends a macro command string to the DDE server application.
	ExecuteMacroLines (see page 10866)	Sends a list of several macro commands to a DDE server application.
	OpenLink (see page 10869)	Initiates a new DDE conversation.
	PasteLink (see page 10869)	Opens a DDE conversation with the current Clipboard object.
	PokeData (see page 10870)	Sends data to a DDE server application.
	PokeDataLines (see page 10870)	Sends multiple lines of data to a DDE server application.
	RequestData (see page 10871)	Requests data from a DDE server.
	SetLink (see page 10872)	Specifies the service and topic of a DDE conversation and attempts to open the link if ConnectMode (see page 10873) is ddeAutomatic.
	StartAdvise (see page 10872)	Starts an advise loop for all of the TDdeClientItems associated with the current DDE conversation.

58.1.1.4.1 TDdeClientConv.ChangeLink Method

Pascal

```
function ChangeLink(const App: string; const Topic: string; const Item: string): Boolean;
```

C++

```
__fastcall Boolean ChangeLink(const AnsiString App, const AnsiString Topic, const AnsiString
Item);
```

Description

This is ChangeLink, a member of class TDdeClientConv.

58.1.1.4.2 TDdeClientConv.ClearItems Method

Pascal

```
procedure ClearItems;
```

C++

```
__fastcall ClearItems();
```

Description

This is ClearItems, a member of class TDdeClientConv.

58.1.1.4.3 TDdeClientConv.Close Method

Pascal

```
procedure Close; dynamic;
```

C++

```
__fastcall Close();
```

Description

This is Close, a member of class TDdeClientConv.

58.1.1.4.4 TDdeClientConv.CloseLink Method

Terminates an ongoing DDE conversation.

Pascal

```
procedure CloseLink;
```

C++

```
__fastcall CloseLink();
```

Description

Use CloseLink when all communication with the DDE server is finished. After a link is closed, no DDE communication can take place between the DDE client and server until another link is opened.

See Also

OnClose (see page 10877)

OpenLink (see page 10869)

58.1.1.4.5 TDdeClientConv.CreateDdeConv Method

Pascal

```
function CreateDdeConv(FHszApp: HSZ; FHszTopic: HSZ): Boolean;
```

C++

```
__fastcall Boolean CreateDdeConv(HSZ FHszApp, HSZ FHszTopic);
```

Description

This is CreateDdeConv, a member of class TDdeClientConv.

58.1.1.4.6 TDdeClientConv.DefineProperties Method

Designates methods for storing an object's unpublished data on a stream such as a form file.

Pascal

```
procedure DefineProperties(Filer: TFiler); override;
```

C++

```
virtual __fastcall DefineProperties(TFiler Filer);
```

Description

TComponent overrides the DefineProperties method defined in TPersistent to define "fake" Top and Left properties. These are defined so that components that are not controls can be manipulated at design-time. However, the Top and Left properties are hidden, that is, they are not published, because only controls appear at run-time.

DefineProperties is virtual; descendant classes can override it. When overriding DefineProperties, be aware that the Ancestor property of Filer might be set, and that this property can determine whether or not it is appropriate to write properties.

DefineProperties is called automatically as part of the component streaming system; do not call it directly.

See Also

Ancestor (see page 2839)

DefineBinaryProperty (see page 2837)

DefineProperties (see page 2931)

DefineProperty (see page 2838)

58.1.1.4.7 TDdeClientConv.ExecuteMacro Method

Sends a macro command string to the DDE server application.

Pascal

```
function ExecuteMacro(Cmd: PChar; waitFlg: Boolean): Boolean;
```

C++

```
__fastcall Boolean ExecuteMacro(const char * Cmd, Boolean waitFlg);
```

Description

Call ExecuteMacro to send a single macro command to the server application. To send multiple macro commands, use ExecuteMacroLines (see page 10866) instead. ExecuteMacro returns true if the macro was successfully passed to the DDE server application. If ExecuteMacro was unable to send a command string, ExecuteMacro returns false.

Cmd is a null-terminated string that contains the macro to be executed by the DDE server application. The actual value of Cmd depends on the DDE server application. See the documentation of the DDE server application for the command strings it will accept.

WaitFlg determines if this DDE client should wait until the DDE server application finishes executing the macro before allowing another DDE transaction to succeed. If WaitFlg is set to true, subsequent calls to ExecuteMacro, ExecuteMacroLines (see page 10866), PokeData (see page 10870), PokeDataLines (see page 10870), and RequestData (see page 10871) will fail until the DDE server application completes the macro.

Attempting to execute a macro or poke data before a DDE server application completes a currently executing macro may cause the executing macro to fail or to produce unpredictable results. See the documentation of the DDE server application for the results of sending command strings or poking data before macro execution has completed.

Note: ExecuteMacro returns true if the macro command was successfully passed to the DDE server. A true value does not ensure that the macro command will execute successfully once it has been accepted by the server.

See Also

ExecuteMacroLines (see page 10866)

PokeData (see page 10870)

PokeDataLines (see page 10870)

RequestData (see page 10871)

WaitStat (see page 10877)

58.1.1.4.8 TDdeClientConv.ExecuteMacroLines Method

Sends a list of several macro commands to a DDE server application.

Pascal

```
function ExecuteMacroLines(Cmd: TStrings; waitFlg: Boolean): Boolean;
```

C++

```
__fastcall Boolean ExecuteMacroLines(TStrings Cmd, Boolean waitFlg);
```

Description

Call ExecuteMacroLines to send several macro commands to the server application. To send a single macro command, use ExecuteMacro (see page 10865) instead. ExecuteMacroLines returns true if the macro list was successfully passed to the DDE server application. If ExecuteMacroLines is unable to send a list of command strings, it returns false.

Cmd contains the list of macros to be executed by the DDE server application. WaitFlg determines if this DDE client should wait until the DDE server application finishes executing all the macros before allowing another DDE transaction to be sent. If WaitFlg is set to true, subsequent calls to ExecuteMacro (see page 10865), ExecuteMacroLines, PokeData (see page 10870), PokeDataLines (see page 10870), and RequestData (see page 10871) will fail until the DDE server application completes all of the macros.

See Also

ExecuteMacro (see page 10865)

PokeData (see page 10870)

PokeDataLines (see page 10870)

RequestData (see page 10871)

WaitStat (see page 10877)

58.1.1.4.9 TDdeClientConv.GetCliItemByCtrl Method

Pascal

```
function GetCliItemByCtrl(ACtrl: TDdeClientItem): TPersistent;
```

C++

```
__fastcall TPersistent * GetCliItemByCtrl(TDdeClientItem ACtrl);
```

Description

This is GetCliItemByCtrl, a member of class TDdeClientConv.

58.1.1.4.10 TDdeClientConv.GetCliItemByName Method

Pascal

```
function GetCliItemByName(const ItemName: string): TPersistent;
```

C++

```
__fastcall TPersistent * GetCliItemByName(const AnsiString ItemName);
```

Description

This is GetCliItemByName, a member of class TDdeClientConv.

58.1.1.4.11 TDdeClientConv.Loaded Method

Initializes the component after the form file has been read into memory.

Pascal

```
procedure Loaded; override;
```

C++

```
virtual __fastcall Loaded();
```

Description

Do not call the protected Loaded method. The streaming system calls this method after it loads the component's form from a stream.

When the streaming system loads a form or data module from its form file, it first constructs the form component by calling its constructor, then reads its property values from the form file. After reading all the property values for all the components, the streaming system calls the Loaded methods of each component in the order the components were created. This gives the components a chance to initialize any data that depends on the values of other components or other parts of itself.

Note: All references to sibling components are resolved by the time Loaded is called. Loaded is the first place that sibling pointers can be used after being streamed in.

As implemented in TComponent, Loaded clears the csLoading flag in the ComponentState property, indicating that the component is no longer loading.

Warning: Loaded may be called multiple times on inherited forms. It is called every time a level of inheritance is streamed in. Do not allocate memory in an overridden Loaded method without first checking that the memory has not been allocated in a previous call.

See Also

ComponentState (see page 2804)

Create (see page 2766)

TReader (see page 2933)

58.1.1.4.12 TDdeClientConv.Notification Method

Forwards notification messages to all owned components.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

Do not call the Notification method in an application. Notification is called automatically when the component specified by AComponent is about to be inserted or removed, as specified by Operation. By default, components pass along the notification to their owned components, if any.

A component can, if needed, act on the notification that a component is being inserted or removed. For example, if a component has object fields or properties that contain references to other components, it can check the notifications of component removals and invalidate those references as needed.

Note: Notification is not called for components that are freed implicitly (because their Owner is freed).

See Also

FreeNotification (see page 2775)

InsertComponent (see page 2780)

RemoveComponent (see page 2785)

Owner (see page 2807)

58.1.1.4.13 TDdeClientConv.OnAttach Method

Pascal

```
procedure OnAttach(aCtrl: TDdeClientItem);
```

C++

```
__fastcall OnAttach(TDdeClientItem aCtrl);
```

Description

This is OnAttach, a member of class TDdeClientConv.

58.1.1.4.14 TDdeClientConv.OnDetach Method

Pascal

```
procedure OnDetach(aCtrl: TDdeClientItem);
```

C++

```
__fastcall OnDetach(TDdeClientItem aCtrl);
```

Description

This is OnDetach, a member of class TDdeClientConv.

58.1.1.4.15 TDdeClientConv.OnSetItem Method

Pascal

```
function OnSetItem(aCtrl: TDdeClientItem; const S: string): Boolean;
```

C++

```
__fastcall Boolean OnSetItem(TDdeClientItem aCtrl, const AnsiString S);
```

Description

This is OnSetItem, a member of class TDdeClientConv.

58.1.1.4.16 TDdeClientConv.Open Method

Pascal

```
procedure Open; dynamic;
```

C++

```
__fastcall Open();
```

Description

This is Open, a member of class TDdeClientConv.

58.1.1.4.17 TDdeClientConv.OpenLink Method

Initiates a new DDE conversation.

Pascal

```
function OpenLink: Boolean;
```

C++

```
__fastcall Boolean OpenLink();
```

Description

Call OpenLink to establish a new DDE conversation with the DdeService (see page 10875). If the server application is not running, OpenLink will launch the ServiceApplication (see page 10876). If the conversation is successfully opened, an OnOpen (see page 10878) event occurs and OpenLink returns true. If the conversation isn't successfully opened, OpenLink returns false.

Note: If ConnectMode (see page 10873) is ddeAutomatic, OpenLink is called automatically when the DdeTopic (see page 10875) and DdeService (see page 10875) are specified by SetLink (see page 10872).

See Also

ConnectMode (see page 10873)

DdeTopic (see page 10875)

DdeService (see page 10875)

OnOpen (see page 10878)

PasteLink (see page 10869)

ServiceApplication (see page 10876)

SetLink (see page 10872)

58.1.1.4.18 TDdeClientConv.PasteLink Method

Opens a DDE conversation with the current Clipboard object.

Pascal

```
function PasteLink: Boolean;
```

C++

```
__fastcall Boolean PasteLink();
```

Description

Call PasteLink to establish a DDE link to an object on the Clipboard. PasteLink sets the DdeTopic (see page 10875) or DdeService (see page 10875) properties from the Clipboard. PasteLink returns true if the link is successfully established.

See Also

DdeTopic (see page 10875)

DdeService (see page 10875)

OpenLink (see page 10869)

58.1.1.4.19 TDdeClientConv.PokeData Method

Sends data to a DDE server application.

Pascal

```
function PokeData(const Item: string; Data: PChar): Boolean;
```

C++

```
__fastcall Boolean PokeData(const AnsiString Item, const char * Data);
```

Description

Use PokeData to transfer text data to a DDE server that supports poked data. Item specifies the linked item in the DDE server. Data is a null-terminated string that specifies the text data to transfer.

The value of the DDE item depends on the linked DDE server application. Item is typically a selectable portion of text, such as a spreadsheet cell or a database field in an edit box. If the DDE server is a Delphi C++Builder application, Item is the name of the linked DDE server component.

The usual direction of data flow is from the DDE server to the DDE client application. Some DDE server applications won't accept poked data. PokeData returns true if the data was successfully transferred, false if the data was not successfully transferred.

To poke a string list rather than a single string, use the PokeDataLines (see page 10870) method.

Note: If either the ExecuteMacro (see page 10865) or ExecuteMacroLines (see page 10866) method was called with its WaitFlg parameter set to true, PokeData will automatically fail until the server application has completed executing the macro. The WaitStat (see page 10877) property indicates when PokeData will attempt to poke data to the server.

See Also

ExecuteMacro (see page 10865)

ExecuteMacroLines (see page 10866)

PokeDataLines (see page 10870)

WaitStat (see page 10877)

58.1.1.4.20 TDdeClientConv.PokeDataLines Method

Sends multiple lines of data to a DDE server application.

Pascal

```
function PokeDataLines(const Item: string; Data: TStrings): Boolean;
```

C++

```
__fastcall Boolean PokeDataLines(const AnsiString Item, TStrings Data);
```

Description

Use PokeDataLines to transfer multiple lines of text data to a DDE server that supports poked data. Item specifies the linked item in the DDE server. Data is a set of strings that specifies the text data to transfer.

The value of the DDE item depends on the linked DDE server application. Item is typically a selectable portion of text, such as a spreadsheet cell or a database field in an edit box.

The usual direction of data flow is from the DDE server to the DDE client application. Some DDE server applications won't accept poked data. PokeData (see page 10870) returns true if the data was successfully transferred, false if the data was not successfully transferred.

To poke a single string rather than a string list, use the PokeData (see page 10870) method.

Note: If either the ExecuteMacro (see page 10865) or ExecuteMacroLines (see page 10866) method was called with its WaitFlg parameter set to true, PokeData (see page 10870) will automatically fail until the server application has completed executing the macro. The WaitStat (see page 10877) property indicates when PokeData (see page 10870) will attempt to poke data to the server.

See Also

ExecuteMacro (see page 10865)

ExecuteMacroLines (see page 10866)

PokeData (see page 10870)

WaitStat (see page 10877)

58.1.1.4.21 TDdeClientConv.ReadLinkInfo Method

Pascal

```
procedure ReadLinkInfo(Reader: TReader);
```

C++

```
__fastcall ReadLinkInfo(TReader Reader);
```

Description

This is ReadLinkInfo, a member of class TDdeClientConv.

58.1.1.4.22 TDdeClientConv.RequestData Method

Requests data from a DDE server.

Pascal

```
function RequestData(const Item: string): PChar;
```

C++

```
__fastcall const char * RequestData(const AnsiString Item);
```

Description

Call RequestData to send a request to the DDE server for the data named by Item. RequestData returns the value of the named

DDE server item.

Note: RequestData automatically allocates memory to store the returned data, but applications must dispose of this string after processing it. This is done with the StrDispose procedure.

If the DDE server contains DDE items that can be continually updated, data can be received and updated automatically by creating TDdeClientItem (see page 10878) objects for those items.

The value of the DDE item depends on the linked DDE server application. Item is typically a selectable portion of text, such as a spreadsheet cell or a database field in an edit box.

Note: See the documentation for the DDE server application for specific information about specifying a DDE item.

See Also

StrDispose (see page 22947)

TDdeClientItem (see page 10878)

58.1.1.4.23 TDdeClientConv.SetLink Method

Specifies the service and topic of a DDE conversation and attempts to open the link if ConnectMode (see page 10873) is ddeAutomatic.

Pascal

```
function SetLink(const Service: string; const Topic: string): Boolean;
```

C++

```
__fastcall Boolean SetLink(const AnsiString Service, const AnsiString Topic);
```

Description

Call SetLink to fully specify a DDE conversation. If ConnectMode (see page 10873) is ddeManual, calling SetLink is equivalent to setting the DdeTopic (see page 10875) and DdeService (see page 10875) properties, and clearing all data from any associated TDdeClientItem (see page 10878) objects. If ConnectMode (see page 10873) is ddeAutomatic, SetLink opens the link to the DDE server as well.

The Service and Topic parameters specify the values for the DdeTopic (see page 10875) and DdeService (see page 10875) properties, respectively.

See Also

ConnectMode (see page 10873)

DdeService (see page 10875)

DdeTopic (see page 10875)

OpenLink (see page 10869)

58.1.1.4.24 TDdeClientConv.StartAdvise Method

Starts an advise loop for all of the TDdeClientItems associated with the current DDE conversation.

Pascal

```
function StartAdvise: Boolean;
```

C++

```
__fastcall Boolean StartAdvise();
```

Description

Call StartAdvise to start an advise loop for all of the TDdeClientItems associated with the current DDE conversation. StartAdvise returns true if loop startup is successful.

See Also

TDdeClientItem (see page 10878)

58.1.1.4.25 TDdeClientConv.WriteLinkInfo Method

Pascal

```
procedure WriteLinkInfo(Writer: TWriter);
```

C++

```
__fastcall WriteLinkInfo(TWriter Writer);
```

Description

This is WriteLinkInfo, a member of class TDdeClientConv.

58.1.1.5 TDdeClientConv Properties

The properties of the TDdeClientConv class are listed here.

Public Properties

	Name	Description
R	Conv (see page 10874)	Indicates the handle for the current DDE conversation.
	DataMode (see page 10874)	Governs whether portions of the DDE conversation execute automatically.
R	DdeFmt (see page 10874)	Represents the clipboard format used for submitting or requesting a data item.
R	WaitStat (see page 10877)	Indicates whether the server is in the process of servicing a DDE macro that prohibits asynchronous DDE transactions.

Published Properties

	Name	Description
	ConnectMode (see page 10873)	Determines whether the link to the DDE server is established automatically when the form is opened.
	DdeService (see page 10875)	Specifies the DDE server application to be linked to a DDE client.
	DdeTopic (see page 10875)	Specifies the topic of a DDE conversation
	FormatChars (see page 10876)	Determines if certain characters are filtered out of text data transferred from a DDE server application.
	ServiceApplication (see page 10876)	Specifies the main executable file name (with path, if necessary) of a DDE server application, without the .EXE extension.

58.1.1.5.1 TDdeClientConv.ConnectMode Property

Determines whether the link to the DDE server is established automatically when the form is opened.

Pascal

```
property ConnectMode: TDataMode;
```

C++

```
__property TDataMode ConnectMode;
```

Description

Use ConnectMode to change the way a DDE conversation is established. If ConnectMode is ddeAutomatic, the link is

established when it is defined by SetLink (see page 10872). If ConnectMode is ddeManual, the application must call the OpenLink (see page 10869) method or the PasteLink (see page 10869) method to establish the DDE conversation.

See Also

OpenLink (see page 10869)

PasteLink (see page 10869)

SetLink (see page 10872)

58.1.1.5.2 TDdeClientConv.Conv Property

Indicates the handle for the current DDE conversation.

Pascal

```
property Conv: HConv;
```

C++

```
__property HConv Conv;
```

Description

Read Conv to get a handle to the DDE conversation when it is required for a Windows API function call. Conv is available once a DDE conversation has been established by OpenLink (see page 10869) or PasteLink (see page 10869).

See Also

OpenLink (see page 10869)

PasteLink (see page 10869)

58.1.1.5.3 TDdeClientConv.DataMode Property

Governs whether portions of the DDE conversation execute automatically.

Pascal

```
property DataMode: TDataMode;
```

C++

```
__property TDataMode DataMode;
```

Description

DataMode is not implemented for TDdeClientConv (see page 10858). Derived objects can use this property to automatically execute portions of a DDE conversation, such as a RequestData (see page 10871) or PokeData (see page 10870) call.

Note: To determine the way the DDE conversation is established, use ConnectMode (see page 10873) instead.

See Also

ConnectMode (see page 10873)

PokeData (see page 10870)

RequestData (see page 10871)

58.1.1.5.4 TDdeClientConv.DdeFmt Property

Represents the clipboard format used for submitting or requesting a data item.

Pascal

```
property DdeFmt: Integer;
```

C++

```
__property int DdeFmt;
```

Description

Use DdeFmt to specify the format of DDE data items when it has not been specified by the server.

See Also

ServiceApplication (see page 10876)

TDdeClientItem (see page 10878)

58.1.1.5.5 TDdeClientConv.DdeService Property

Specifies the DDE server application to be linked to a DDE client.

Pascal

```
property DdeService: string;
```

C++

```
__property AnsiString DdeService;
```

Description

Use DdeService to specify the server application to link to. Typically, DdeService is the file name (with path, if necessary) of the DDE server application's main executable file without the .EXE extension. If the DDE server is a CLX application, DdeService is the project name without the .DPR or .EXE extension. For example, to link to a TDdeServerConv (see page 10891) component in PROJ1.DPR, set DdeService to PROJ1.

At design time, specify DdeService by typing the DDE server application name in the object inspector or by choosing Paste Link in the DDE Info dialog box. To establish a link at runtime, specify the service and topic with the SetLink (see page 10872) method.

Note: The necessary value for DdeService depends on the individual server application. See the documentation of the DDE server application for specific information about how to specify the server application.

See Also

DdeTopic (see page 10875)

ServiceApplication (see page 10876)

SetLink (see page 10872)

TDdeServerConv (see page 10891)

58.1.1.5.6 TDdeClientConv.DdeTopic Property

Specifies the topic of a DDE conversation

Pascal

```
property DdeTopic: string;
```

C++

```
__property AnsiString DdeTopic;
```

Description

Use DdeTopic to indicate the server-defined topic name of the DDE conversation. Typically, DdeTopic is a file name (with path, if necessary) used by the server application. If the DDE client is linked to a TDdeServerConv (see page 10891) component, DdeTopic is the name of the server conversation component rather than the form caption.

At design time, specify DdeTopic either by typing the DdeTopic name in the object inspector or by choosing Paste Link in the DDE Info dialog box. To establish a link at runtime, specify the service and topic with the SetLink (see page 10872) method.

Note: The server application defines the topic names available for a DDE conversation. See the documentation for the DDE server application for specific information about the names of available topics.

See Also

DdeService (see page 10875)

SetLink (see page 10872)

TDdeServerConv (see page 10891)

58.1.1.5.7 TDdeClientConv.FormatChars Property

Determines if certain characters are filtered out of text data transferred from a DDE server application.

Pascal

```
property FormatChars: Boolean;
```

C++

```
__property Boolean FormatChars;
```

Description

Use FormatChars with DDE server applications that transfer backspaces, linefeeds, carriage returns, and tabs with the text data. These formatting characters can cause incorrect spacing, line breaks, or characters in the DDE client data. To prevent the formatting characters from interfering with the formatting of the client data, set FormatChars to false. To include the formatting characters sent by the DDE server, set FormatChars to true.

See Also

RequestData (see page 10871)

58.1.1.5.8 TDdeClientConv.ServiceApplication Property

Specifies the main executable file name (with path, if necessary) of a DDE server application, without the .EXE extension.

Pascal

```
property ServiceApplication: string;
```

C++

```
__property AnsiString ServiceApplication;
```

Description

Set ServiceApplication to the name of the server application. Typically, this is the same value as the DdeService (see page 10875) property. Sometimes, however, DdeService (see page 10875) is a value other than the DDE server application's executable file name.

If the server application is not running when the TDdeClientConv (see page 10858) tries to establish a DDE conversation, OpenLink (see page 10869) uses the ServiceApplication property to launch the server.

See Also

DdeService (see page 10875)

OpenLink (see page 10869)

58.1.1.5.9 TDdeClientConv.WaitStat Property

Indicates whether the server is in the process of servicing a DDE macro that prohibits asynchronous DDE transactions.

Pascal

```
property WaitStat: Boolean;
```

C++

```
__property Boolean WaitStat;
```

Description

Read WaitStat to learn whether a DDE transaction can be started. When WaitStat is true, the server is processing the last macro, and attempts to execute a macro, request data, or poke data will fail. When WaitStat is false, the server is free to execute the next transaction in the DDE conversation.

See Also

ExecuteMacro (see page 10865)

ExecuteMacroLines (see page 10866)

PokeData (see page 10870)

PokeDataLines (see page 10870)

RequestData (see page 10871)

58.1.1.6 TDdeClientConv Events

The events of the TDdeClientConv class are listed here.

Published Events

	Name	Description
	OnClose (see page 10877)	Occurs when the DDE conversation terminates.
	OnOpen (see page 10878)	Occurs immediately after the DDE link to the server has been established.

58.1.1.6.1 TDdeClientConv.OnClose Event

Occurs when the DDE conversation terminates.

Pascal

```
property OnClose: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnClose;
```

Description

Write an OnClose event handler to take specific action when the DDE conversation ends. The DDE conversation will end if the server terminates the conversation, if the link is closed or changed, or if the TDdeClientConv (see page 10858) object is destroyed.

See Also

CloseLink (see page 10864)

Destroy (see page 10862)

SetLink (see page 10872)

58.1.1.6.2 TDdeClientConv.OnOpen Event

Occurs immediately after the DDE link to the server has been established.

Pascal

```
property OnOpen: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnOpen;
```

Description

Write an OnOpen event handler to take specific action whenever a link is established to the DDE server. The DDE link is established by the OnOpen method or the PasteLink (see page 10869) method. SetLink (see page 10872) will also establish a DDE link if the ConnectMode (see page 10873) is ddeAutomatic. OnOpen will not be called if the link fails, such as when the server application can't be launched.

See Also

ConnectMode (see page 10873)

OpenLink (see page 10869)

PasteLink (see page 10869)

SetLink (see page 10872)

58.1.2 TDdeClientItem Class

TDDEClientItem defines an item in a DDE conversation.

Class Hierarchy

Pascal

```
TDdeClientItem = class(TComponent);
```

C++

```
class TDdeClientItem : public TComponent;
```

File

DdeMan

Description

Use TDDEClientItem with TDDEClientConv to enable an application to act as a DDE client. A DDE client item specifies a single

item supported by a DDE server. A single TDDEClientConv object may be associated with multiple client items. If the DDE client conversation has established a link with a DDE server, the server will automatically and continually update all client items until the conversation is terminated.

See Also

TDdeClientConv (see page 10858)

TDdeServerItem (see page 10898)

58.1.2.1 TDdeClientItem Members

The following tables list the members exposed by TDdeClientItem.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 10882)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.

	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 10881)	Creates an instance of TDDEClientItem.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 10882)	Destroys an instance of TDDEClientItem.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.

	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Events

	Name	Description
	OnChange (see page 10885)	Occurs immediately after the DDE server updates the Lines (see page 10884) property.

Published Properties

	Name	Description
	DdeConv (see page 10883)	Specifies the DDE client conversation to associate with the DDE client item.
	DdeItem (see page 10883)	Specifies the item of a DDE conversation.
	Lines (see page 10884)	Contains the text data to exchange in a DDE conversation.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Text (see page 10884)	Contains the text data to exchange in a DDE conversation.

58.1.2.2 TDdeClientItem.Create Constructor

Creates an instance of TDDEClientItem.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TDdeClientItem(TComponent * AOwner);
```

Description

Call Create to instantiate a TDDEClientItem at runtime. After calling the inherited constructor, Create creates a helper object to manage the Lines (see page 10884) property.

See Also

Lines (see page 10884)

Create (see page 2766)

58.1.2.3 TDdeClientItem.Destroy Destructor

Destroys an instance of TDDEClientItem.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TDdeClientItem();
```

Description

Do not call Destroy directly in an application. Instead, call Free. Free checks that the TDDEClientItem is not nil, and only then calls Destroy.

Destroy frees the memory associated with the Lines (see page 10884) property before calling the inherited destructor.

See Also

Free (see page 22300)

Lines (see page 10884)

58.1.2.4 TDdeClientItem Methods

The methods of the TDdeClientItem class are listed here.

Protected Methods

	Name	Description
	Notification (see page 10882)	Forwards notification messages to all owned components.

58.1.2.4.1 TDdeClientItem.Notification Method

Forwards notification messages to all owned components.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

Do not call the Notification method in an application. Notification is called automatically when the component specified by AComponent is about to be inserted or removed, as specified by Operation. By default, components pass along the notification to their owned components, if any.

A component can, if needed, act on the notification that a component is being inserted or removed. For example, if a component has object fields or properties that contain references to other components, it can check the notifications of component removals and invalidate those references as needed.

Note: Notification is not called for components that are freed implicitly (because their Owner is freed).

See Also

FreeNotification (see page 2775)

InsertComponent (see page 2780)

RemoveComponent (see page 2785)

Owner (see page 2807)

58.1.2.5 TDdeClientItem Properties

The properties of the TDdeClientItem class are listed here.

Published Properties

	Name	Description
	DdeConv (see page 10883)	Specifies the DDE client conversation to associate with the DDE client item.
	DdeItem (see page 10883)	Specifies the item of a DDE conversation.
	Lines (see page 10884)	Contains the text data to exchange in a DDE conversation.
	Text (see page 10884)	Contains the text data to exchange in a DDE conversation.

58.1.2.5.1 TDdeClientItem.DdeConv Property

Specifies the DDE client conversation to associate with the DDE client item.

Pascal

```
property DdeConv: TDdeClientConv;
```

C++

```
__property TDdeClientConv DdeConv;
```

Description

Set DdeConv to associate the DDE client item with a DDE client conversation. The value of DdeConv is the DDE client conversation object that defines the DDE conversation. The DdeConv establishes the link to the server that provides the Text (see page 10884) for the DDE client item.

See Also

Lines (see page 10884)

TDDeClientConv

Text (see page 10884)

58.1.2.5.2 TDdeClientItem.DdeItem Property

Specifies the item of a DDE conversation.

Pascal

```
property DdeItem: string;
```

C++

```
__property AnsiString DdeItem;
```

Description

Set the DdeItem property to the name of a DDE item supported by the DDE server. The value of DdeItem depends on the linked DDE server application. DdeItem is typically a selectable portion of text, such as a spreadsheet cell or a database field in an edit box. If the DDE server is a Delphi C++Builder application, DdeItem is the name of the linked DDE server item.

At design time, specify DdeItem by typing the item string in the object inspector. Alternately, DdeItem can be specified from the DDE conversation by pasting a link using the DDE Info dialog box, which is called by clicking the ellipsis (...) button for DdeService or DdeTopic in the object inspector. After choosing Paste Link in the DDE Info dialog box, choose the item from a list of possible items for DdeItem in the object inspector when link information is on the Clipboard.

Note: See the documentation for the DDE server application for the specific information about specifying DDE items.

See Also

DdeService (see page 10875)

DdeTopic (see page 10875)

TDdeServerItem (see page 10898)

58.1.2.5.3 TDdeClientItem.Lines Property

Contains the text data to exchange in a DDE conversation.

Pascal

```
property Lines: TStrings;
```

C++

```
__property TStrings Lines;
```

Description

Read Lines to get the text that is updated by the DDE server application. Lines is updated automatically by the DDE server. When Lines is changed by the server, an OnChange (see page 10885) event occurs.

Set the Lines property to poke data to the DDE server.

Lines corresponds to the Text (see page 10884) property. Whenever the value of Lines or Text (see page 10884) is updated, the other is also changed so that the first line of Lines is always equal to Text (see page 10884).

Note: Lines of data can also be sent to the DDE server by calling the PokeDataLines method of the DDE client conversation.

See Also

PokeDataLines (see page 10870)

Text (see page 10884)

58.1.2.5.4 TDdeClientItem.Text Property

Contains the text data to exchange in a DDE conversation.

Pascal

```
property Text: string;
```

C++

```
__property AnsiString Text;
```

Description

Read Text to get the text that is updated by the DDE server application. Text is updated automatically by the DDE server. When Text is changed by the server, an OnChange (see page 10885) event occurs.

Set the Text property to poke data to the DDE server.

Text corresponds to the Lines (see page 10884) property. Whenever the value of Lines (see page 10884) or Text is updated, the other is also changed so that the first line of Lines (see page 10884) is always equal to Text.

For text data longer than the 255 character limit of Text, use the Lines (see page 10884) property.

Note: Data can also be sent to the DDE server by calling the PokeData method of the DDE client conversation.

See Also

Lines (see page 10884)

PokeData (see page 10870)

58.1.2.6 TDdeClientItem Events

The events of the TDdeClientItem class are listed here.

Published Events

	Name	Description
	OnChange (see page 10885)	Occurs immediately after the DDE server updates the Lines (see page 10884) property.

58.1.2.6.1 TDdeClientItem.OnChange Event

Occurs immediately after the DDE server updates the Lines (see page 10884) property.

Pascal

```
property OnChange: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnChange;
```

Description

Write an OnChange event handler to take specific action when the DDE server updates the text for this DDE client item. The new value for the DDE client item can be found by reading the Lines (see page 10884) or Text (see page 10884) property.

See Also

Lines (see page 10884)

Text (see page 10884)

58.1.3 TDdeMgr Class

Class Hierarchy

Pascal

```
TDdeMgr = class(TComponent);
```

C++

```
class TDdeMgr : public TComponent;
```

File

DdeMan

Description

This is class DdeMan.TDdeMgr.

58.1.3.1 TDdeMgr Members

The following tables list the members exposed by TDdeMgr.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.

	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 10889)	Allocates memory and constructs a safely initialized instance of a component.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 10889)	Disposes of the component and its owned components.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.

	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetExeName (see page 10890)	This is GetExeName, a member of class TDdeMgr.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
	AppName (see page 10891)	This is AppName, a member of class TDdeMgr.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DdeInstId (see page 10891)	This is DdeInstId, a member of class TDdeMgr.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	LinkClipFmt (see page 10891)	This is LinkClipFmt, a member of class TDdeMgr.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

58.1.3.2 TDdeMgr.Create Constructor

Allocates memory and constructs a safely initialized instance of a component.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TDdeMgr(TComponent * AOwner);
```

Description

All objects have a Create method that constructs the object. TComponent redefines Create so that, for components, Create also:

establishes the relationship of a component and its Owner, as indicated by the AOwner parameter

sets the ComponentStyle property to csInheritable, meaning that the component can be inherited by a descendant form type

It is not necessary to explicitly create components added in the form designer. These components are created automatically when the application is run, and they are destroyed when the application is closed.

For components created programmatically, that is, not created in the form designer, call Create and pass in an owner component as the AOwner parameter. The owner disposes of the component when it is destroyed. If the component is not owned, then use Free when it needs to be destroyed.

Tip: When passing in Self as the Owner parameter, consider what Self references. If a component creates another component in one of its methods, then Self refers to the first component and not the component being created, which is then owned by the first component.

Note: The TComponent constructor is virtual in part to allow polymorphic instantiation of class references. This is critical to the streaming system and to the form designer. Do not forget to use the override directive when declaring a new component's Create constructor.

Destroy (see page 2766)

Free (see page 22300)

Owner (see page 2807)

58.1.3.3 TDdeMgr.Destroy Destructor

Disposes of the component and its owned components.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TDdeMgr();
```

Description

Do not call Destroy directly. Call Free instead. Free verifies that the component is not nil, and only then calls Destroy.

Never explicitly free a component in one of its own event handlers, nor free a component from the event handler of a component that it owns or contains.

To destroy a form, call its Release method. Release waits for all the form's event handlers and the event handlers of the form's components to finish executing before destroying the form.

Note: A form owns all the controls and non-visual components that are placed on it in design mode. When it is freed, all of these components are automatically freed as well. By default, all forms are owned by the global Application object. When an application terminates, it frees the global Application object, which frees all forms. For objects that are not components, and for components created with a nil owner, be sure to call Free after finishing with the object; otherwise the memory allocated for the object will be lost until the application terminates.

58.1.3.4 TDdeMgr Methods

The methods of the TDdeMgr class are listed here.

Public Methods

	Name	Description
	GetExeName (see page 10890)	This is GetExeName, a member of class TDdeMgr.

58.1.3.4.1 TDdeMgr.GetExeName Method

Pascal

```
function GetExeName: string;
```

C++

```
__fastcall AnsiString GetExeName();
```

Description

This is GetExeName, a member of class TDdeMgr.

58.1.3.5 TDdeMgr Properties

The properties of the TDdeMgr class are listed here.

Public Properties

	Name	Description
	AppName (see page 10891)	This is AppName, a member of class TDdeMgr.
	DdeInstId (see page 10891)	This is DdeInstId, a member of class TDdeMgr.
R	LinkClipFmt (see page 10891)	This is LinkClipFmt, a member of class TDdeMgr.

58.1.3.5.1 TDdeMgr.AppName Property

Pascal

```
property AppName: string;
```

C++

```
__property AnsiString AppName;
```

Description

This is AppName, a member of class TDdeMgr.

58.1.3.5.2 TDdeMgr.DdeInstId Property

Pascal

```
property DdeInstId: LongInt;
```

C++

```
__property LongInt DdeInstId;
```

Description

This is DdeInstId, a member of class TDdeMgr.

58.1.3.5.3 TDdeMgr.LinkClipFmt Property

Pascal

```
property LinkClipFmt: Word;
```

C++

```
__property Word LinkClipFmt;
```

Description

This is LinkClipFmt, a member of class TDdeMgr.

58.1.4 TDdeServerConv Class

TDdeServerConv represents a DDE topic of conversation with a DDE client.

Class Hierarchy

Pascal

```
TDdeServerConv = class(TComponent);
```

C++

```
class TDdeServerConv : public TComponent;
```

File

DdeMan

Description

Use TDdeServerConv to establish a DDE topic with a DDE client application. Individual items under the DDE topic are represented by TDdeServerItem (see page 10898) objects. These items are linked to the DDE server conversation by setting their ServerConv property.

Using a TDdeServerConv component is optional. Without a TDdeServerConv object, the client can still enter into a DDE conversation and receive an update directly from a TDdeServerItem (see page 10898) object. However, a DDE server conversation is required to handle any macros that the DDE client may send.

The Name property of the DDE server conversation provides the topic used by DDE clients to establish a link to the DDE server conversation. DDE server items that are not associated with a DDE server conversation use the Caption property of the form for the topic name. Use a TDdeServerConv object when establishing multiple DDE topics in a single form, or when the Caption of the form may not be unique or constant at runtime.

See Also

TDdeClientConv (see page 10858)

TDdeClientItem (see page 10878)

TDdeServerItem (see page 10898)

TForm (see page 13992)

58.1.4.1 TDdeServerConv Members

The following tables list the members exposed by TDdeServerConv.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	Connect (see page 10896)	This is Connect, a member of class TDdeServerConv.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	Disconnect (see page 10896)	This is Disconnect, a member of class TDdeServerConv.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.

	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 10895)	Creates an instance of TDdeServerConv (see page 10891).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 10895)	Destroys an instance of TDdeServerConv (see page 10891).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.

V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	ExecuteMacro (see page 10896)	Responds to macros sent by the DDE client.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Events

	Name	Description
	OnClose (see page 10897)	Occurs when the DDE client terminates the DDE conversation.
	OnExecuteMacro (see page 10897)	Occurs when the DDE client sends a macro to the DDE server conversation.
	OnOpen (see page 10898)	Occurs immediately after the DDE link to the client has been established.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

58.1.4.2 TDdeServerConv.Create Constructor

Creates an instance of TDdeServerConv (see page 10891).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TDdeServerConv(TComponent * AOwner);
```

Description

Call Create to create an instance of TDdeServerConv (see page 10891) at runtime. For TDdeServerConv (see page 10891) objects placed on forms at design time, Create is called automatically.

See Also

Create (see page 2766)

58.1.4.3 TDdeServerConv.Destroy Destructor

Destroys an instance of TDdeServerConv (see page 10891).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TDdeServerConv();
```

Description

Do not call Destroy directly in an application. Instead, call Free. Free verifies that the TDdeServerConv (see page 10891) reference is not nil and only then calls Destroy.

Destroy removes the DDE server conversation topic from the application, but does not terminate any currently open DDE conversations. Instead, the DDE server items that were associated with the DDE server conversation become associated with the form instead, and continue their link to the DDE client.

See Also

Free (see page 22300)

TDdeServerItem (see page 10898)

58.1.4.4 TDdeServerConv Methods

The methods of the TDdeServerConv class are listed here.

Protected Methods

	Name	Description
	Connect (see page 10896)	This is Connect, a member of class TDdeServerConv.
	Disconnect (see page 10896)	This is Disconnect, a member of class TDdeServerConv.

Public Methods

	Name	Description
	ExecuteMacro (see page 10896)	Responds to macros sent by the DDE client.

58.1.4.4.1 TDdeServerConv.Connect Method

Pascal

```
procedure Connect; dynamic;
```

C++

```
__fastcall Connect();
```

Description

This is Connect, a member of class TDdeServerConv.

58.1.4.4.2 TDdeServerConv.Disconnect Method

Pascal

```
procedure Disconnect; dynamic;
```

C++

```
__fastcall Disconnect();
```

Description

This is Disconnect, a member of class TDdeServerConv.

58.1.4.4.3 TDdeServerConv.ExecuteMacro Method

Responds to macros sent by the DDE client.

Pascal

```
function ExecuteMacro(Data: HDdeData): LongInt;
```

C++

```
__fastcall LongInt ExecuteMacro(HDdeData Data);
```

Description

ExecuteMacro provides the only way for a DDE server application to respond to macros sent by DDE clients. ExecuteMacro is called when the DDE client sends a Macro over the DDE link. Data is the handle to the DDE data that contains the macro.

ExecuteMacro retrieves the strings of the macro from Data, and calls the OnExecuteMacro (see page 10897) event handler. If there is no OnExecuteMacro (see page 10897) event handler, the macro is ignored. Whether or not there is an OnExecuteMacro (see page 10897) event handler, the DDE client always receives notification that the macro was successfully

transmitted, unless Data contains no macro.

See Also

OnExecuteMacro (see page 10897)

58.1.4.5 TDdeServerConv Events

The events of the TDdeServerConv class are listed here.

Published Events

	Name	Description
	OnClose (see page 10897)	Occurs when the DDE client terminates the DDE conversation.
	OnExecuteMacro (see page 10897)	Occurs when the DDE client sends a macro to the DDE server conversation.
	OnOpen (see page 10898)	Occurs immediately after the DDE link to the client has been established.

58.1.4.5.1 TDdeServerConv.OnClose Event

Occurs when the DDE client terminates the DDE conversation.

Pascal

```
property OnClose: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnClose;
```

Description

Write an OnClose event handler to take specific action when the DDE conversation ends. The DDE conversation will end if the client terminates the conversation. It does not end if the TDdeServerConv (see page 10891) object is destroyed. In that case, the DDE server items simply remove themselves from the DDE server conversation, and continue the link to the DDE client.

The Sender parameter is the DDE server conversation, not the DDE client.

See Also

Destroy (see page 10895)

OnOpen (see page 10898)

58.1.4.5.2 TDdeServerConv.OnExecuteMacro Event

Occurs when the DDE client sends a macro to the DDE server conversation.

Pascal

```
property OnExecuteMacro: TMacroEvent;
```

C++

```
__property TMacroEvent OnExecuteMacro;
```

Description

Write an OnExecuteMacro event handler to implement a response to macros sent by the DDE client.

See Also

ExecuteMacro (see page 10896)

58.1.4.5.3 TDdeServerConv.OnOpen Event

Occurs immediately after the DDE link to the client has been established.

Pascal

```
property OnOpen: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnOpen;
```

Description

Write an OnOpen event handler to take specific action whenever a link is established to a DDE client. The Sender parameter is the DDE server conversation, not the DDE client.

See Also

OnClose (see page 10897)

58.1.5 TDdeServerItem Class

TDdeServerItem defines the item of a DDE conversation.

Class Hierarchy

Pascal

```
TDdeServerItem = class(TComponent);
```

C++

```
class TDdeServerItem : public TComponent;
```

File

DdeMan

Description

Use TDdeServerItem by itself, or, optionally, with a TDdeServerConv (see page 10891) object to enable an application to function as a DDE server. DDE clients link to an individual DDE server item by referring to the Name property. Once a link to a DDE client is established, the DDE server item can update the client to changes in the item data, or receive data that the DDE client pokes to the item.

See Also

TDdeClientConv (see page 10858)

TDdeClientItem (see page 10878)

TDdeServerConv (see page 10891)

58.1.5.1 TDdeServerItem Members

The following tables list the members exposed by TDdeServerItem.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetText (see page 10904)	This is GetText, a member of class TDdeServerItem.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 10904)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetLines (see page 10905)	This is SetLines, a member of class TDdeServerItem.
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	SetServerConv (see page 10905)	This is SetServerConv, a member of class TDdeServerItem.
	SetText (see page 10905)	This is SetText, a member of class TDdeServerItem.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.

	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	Change (see page 10903)	Generates an OnChange (see page 10908) event.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	CopyToClipboard (see page 10903)	Copies the data specified in the Text (see page 10907) or Lines (see page 10906) property to the Windows Clipboard, along with DDE link information.
	Create (see page 10901)	Creates an instance of TDdeServerItem (see page 10898).
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 10902)	Destroys an instance of TDdeServerItem (see page 10898).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.

	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	PokeData (see page 10904)	Processes data that has been poked to the DDE server item by a DDE client.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	Fmt (see page 10906)	Indicates the clipboard format the DDE client item uses to pass data to the DDE client.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Events

	Name	Description
	OnChange (see page 10908)	Occurs when the Lines (see page 10906) property changes, before the changes have been sent to the DDE client.
	OnPokeData (see page 10908)	Occurs after a DDE client changes the value of the Lines (see page 10906) property.

Published Properties

	Name	Description
	Lines (see page 10906)	Contains the data to exchange in a DDE conversation.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	ServerConv (see page 10907)	Specifies the DDE server conversation to associate with the DDE server item.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Text (see page 10907)	Contains the data to exchange in a DDE conversation.

58.1.5.2 TDdeServerItem.Create Constructor

Creates an instance of TDdeServerItem (see page 10898).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TDdeServerItem(TComponent * AOwner);
```

Description

Call Create to instantiate a DDE server item at runtime. TDdeServerItem (see page 10898) objects placed on forms at design time are created automatically.

After calling the inherited constructor, Create initializes the Fmt (see page 10906) property to CF_TEXT, and creates a helper object to manage the Lines (see page 10906) property.

See Also

Fmt (see page 10906)

Lines (see page 10906)

Create (see page 2766)

58.1.5.3 TDdeServerItem.Destroy Destructor

Destroys an instance of TDdeServerItem (see page 10898).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TDdeServerItem();
```

Description

Do not call Destroy directly in an application. Instead, call Free. Free verifies that the TDdeServerItem (see page 10898) is not nil, and only then calls Destroy.

Destroy frees the memory associated with the Lines (see page 10906) property before calling the inherited destructor.

See Also

Lines (see page 10906)

Free (see page 22300)

58.1.5.4 TDdeServerItem Methods

The methods of the TDdeServerItem class are listed here.

Protected Methods

	Name	Description
	GetText (see page 10904)	This is GetText, a member of class TDdeServerItem.
V	Notification (see page 10904)	Forwards notification messages to all owned components.
	SetLines (see page 10905)	This is SetLines, a member of class TDdeServerItem.
	SetServerConv (see page 10905)	This is SetServerConv, a member of class TDdeServerItem.
	SetText (see page 10905)	This is SetText, a member of class TDdeServerItem.

Public Methods

	Name	Description
	Change (see page 10903)	Generates an OnChange (see page 10908) event.

	CopyToClipboard (see page 10903)	Copies the data specified in the Text (see page 10907) or Lines (see page 10906) property to the Windows Clipboard, along with DDE link information.
	PokeData (see page 10904)	Processes data that has been poked to the DDE server item by a DDE client.

58.1.5.4.1 TDdeServerItem.Change Method

Generates an OnChange (see page 10908) event.

Pascal

```
procedure Change; dynamic;
```

C++

```
__fastcall Change();
```

Description

Call Change to trigger an OnChange (see page 10908) event when not setting the Lines (see page 10906) or Text (see page 10907) property. Use Change in conjunction with the OnChange (see page 10908) event to enable the DDE server item to exchange data that is not compatible with the strings used by the Lines (see page 10906) and Text (see page 10907) properties.

See Also

Lines (see page 10906)

OnChange (see page 10908)

Text (see page 10907)

58.1.5.4.2 TDdeServerItem.CopyToClipboard Method

Copies the data specified in the Text (see page 10907) or Lines (see page 10906) property to the Windows Clipboard, along with DDE link information.

Pascal

```
procedure CopyToClipboard;
```

C++

```
__fastcall CopyToClipboard();
```

Description

Use CopyToClipboard to enable DDE clients to link to the DDE server item by executing an Edit | Paste Link command, or its equivalent in the command structure of the DDE client application.

CopyToClipboard can be used to create a DDE link at runtime only. To create a link at design time, select the TDdeServerItem (see page 10898) object and choose Edit | Copy from the menu. Then, activate the DDE client application and paste the link according to the rules of the DDE client application. See the documentation for the DDE client application for specific information about pasting the link.

See Also

Lines (see page 10906)

PasteLink (see page 10869)

Text (see page 10907)

58.1.5.4.3 TDdeServerItem.GetText Method

Pascal

```
function GetText: string;
```

C++

```
__fastcall AnsiString GetText();
```

Description

This is GetText, a member of class TDdeServerItem.

58.1.5.4.4 TDdeServerItem.Notification Method

Forwards notification messages to all owned components.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

Do not call the Notification method in an application. Notification is called automatically when the component specified by AComponent is about to be inserted or removed, as specified by Operation. By default, components pass along the notification to their owned components, if any.

A component can, if needed, act on the notification that a component is being inserted or removed. For example, if a component has object fields or properties that contain references to other components, it can check the notifications of component removals and invalidate those references as needed.

Note: Notification is not called for components that are freed implicitly (because their Owner is freed).

See Also

FreeNotification (see page 2775)

InsertComponent (see page 2780)

RemoveComponent (see page 2785)

Owner (see page 2807)

58.1.5.4.5 TDdeServerItem.PokeData Method

Processes data that has been poked to the DDE server item by a DDE client.

Pascal

```
function PokeData(Data: HDdeData): LongInt;
```

C++

```
__fastcall LongInt PokeData(HDdeData Data);
```

Description

Call PokeData to inform the DDE server item that the DDE conversation holds data that has been poked from a DDE client. Data is the DDE handle to the poked data.

PokeData does the following:

1Uses the Data handle to obtain the data that was poked.

2Sets the Lines (see page 10906) property to the new data value.

3Triggers an OnChange (see page 10908) event.

4Sends the new value of the data back to the DDE client.

5Triggers an OnPokeData (see page 10908) event.

See Also

Lines (see page 10906)

OnChange (see page 10908)

OnPokeData (see page 10908)

58.1.5.4.6 TDdeServerItem.SetLines Method

Pascal

```
procedure SetLines(Value: TStrings);
```

C++

```
__fastcall SetLines(TStrings Value);
```

Description

This is SetLines, a member of class TDdeServerItem.

58.1.5.4.7 TDdeServerItem.SetServerConv Method

Pascal

```
procedure SetServerConv(SConv: TDdeServerConv);
```

C++

```
__fastcall SetServerConv(TDdeServerConv SConv);
```

Description

This is SetServerConv, a member of class TDdeServerItem.

58.1.5.4.8 TDdeServerItem.SetText Method

Pascal

```
procedure SetText(const Item: string);
```

C++

```
__fastcall SetText(const AnsiString Item);
```

Description

This is SetText, a member of class TDdeServerItem.

58.1.5.5 TDdeServerItem Properties

The properties of the TDdeServerItem class are listed here.

Public Properties

	Name	Description
R	Fmt (see page 10906)	Indicates the clipboard format the DDE client item uses to pass data to the DDE client.

Published Properties

	Name	Description
	Lines (see page 10906)	Contains the data to exchange in a DDE conversation.
	ServerConv (see page 10907)	Specifies the DDE server conversation to associate with the DDE server item.
	Text (see page 10907)	Contains the data to exchange in a DDE conversation.

58.1.5.5.1 TDdeServerItem.Fmt Property

Indicates the clipboard format the DDE client item uses to pass data to the DDE client.

Pascal

```
property Fmt: Integer;
```

C++

```
__property int Fmt;
```

Description

Set Fmt in an OnChange (see page 10908) event handler to specify a clipboard format for the data that is passed to the DDE client if it is not text. The DDE data that is sent to the DDE client includes this format so that clients can correctly interpret the data. Read Fmt when the client pokes data to the DDE server item to determine the clipboard format the client used to format the data.

See Also

Lines (see page 10906)

OnChange (see page 10908)

OnPokeData (see page 10908)

DdeFmt (see page 10874)

Text (see page 10907)

58.1.5.5.2 TDdeServerItem.Lines Property

Contains the data to exchange in a DDE conversation.

Pascal

```
property Lines: TStrings;
```

C++

```
__property TStrings Lines;
```

Description

Set Lines to the data the DDE server item sends to the DDE client. Whenever the Lines property changes, an OnChange (see

page 10908) event occurs and then the new value is sent to the DDE client. If the DDE server item accepts poked data, Lines receives the data whenever the DDE client pokes data to this item. When Lines is changed by a DDE client poking data, an OnPokeData (see page 10908) event occurs after the OnChange (see page 10908) event.

Usually Lines contains text, and setting Lines sets the Fmt (see page 10906) property to CF_TEXT. However, Delphi C++Builder strings can contain non-text data. If Lines does not specify text data, Fmt (see page 10906) must be changed to indicate the format of the data in an OnChange (see page 10908) event handler.

Lines corresponds to the Text (see page 10907) property. Whenever the value of Lines or Text (see page 10907) is changed, the other is updated so that the first line of Lines is always equal to Text (see page 10907).

See Also

Fmt (see page 10906)

OnChange (see page 10908)

OnPokeData (see page 10908)

Text (see page 10907)

58.1.5.5.3 TDdeServerItem.ServerConv Property

Specifies the DDE server conversation to associate with the DDE server item.

Pascal

```
property ServerConv: TDdeServerConv;
```

C++

```
__property TDdeServerConv ServerConv;
```

Description

Set ServerConv to associate the DDE server item with a DDE topic represented by the DDE server conversation. If ServerConv is not set, the DDE topic of the conversation is the value of the Caption property of the form containing the TDdeServerItem (see page 10898) component.

58.1.5.5.4 TDdeServerItem.Text Property

Contains the data to exchange in a DDE conversation.

Pascal

```
property Text: string;
```

C++

```
__property AnsiString Text;
```

Description

Set Text to the data the DDE server item sends to the DDE client. Whenever the Text property changes, an OnChange (see page 10908) event occurs and then the new value is sent to the DDE client. If the DDE server item accepts poked data, Text receives the data whenever the DDE client pokes data to this item. When Text is changed by a DDE client poking data, an OnPokeData (see page 10908) event occurs after the OnChange (see page 10908) event.

Usually Text contains text, and setting Text sets the Fmt (see page 10906) property to CF_TEXT. However, Text can contain non-text data. If Text does not specify text data, Fmt (see page 10906) must be changed to indicate the format of the data in an OnChange (see page 10908) event handler.

Text corresponds to the Lines (see page 10906) property. Whenever the value of Lines (see page 10906) or Text is

changed, the other is updated so that the first line of Lines (see page 10906) is always equal to Text.

See Also

Fmt (see page 10906)

Lines (see page 10906)

OnChange (see page 10908)

OnPokeData (see page 10908)

58.1.5.6 TDdeServerItem Events

The events of the TDdeServerItem class are listed here.

Published Events

	Name	Description
	OnChange (see page 10908)	Occurs when the Lines (see page 10906) property changes, before the changes have been sent to the DDE client.
	OnPokeData (see page 10908)	Occurs after a DDE client changes the value of the Lines (see page 10906) property.

58.1.5.6.1 TDdeServerItem.OnChange Event

Occurs when the Lines (see page 10906) property changes, before the changes have been sent to the DDE client.

Pascal

```
property OnChange: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnChange;
```

Description

Write an OnChange event handler to take specific action when the DDE server item is about to update the DDE client. The new value for the DDE client item can be found by reading the Lines (see page 10906) or Text (see page 10907) property.

If the value of Lines (see page 10906) does not contain text data, an OnChange event handler must be assigned to change the value of Fmt (see page 10906). OnChange is called after Fmt (see page 10906) gets set to CF_TEXT by setting the Lines (see page 10906) property, but before the data gets sent to the client.

See Also

Change (see page 10903)

Fmt (see page 10906)

Lines (see page 10906)

Text (see page 10907)

58.1.5.6.2 TDdeServerItem.OnPokeData Event

Occurs after a DDE client changes the value of the Lines (see page 10906) property.

Pascal

```
property OnPokeData: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnPokeData;
```

Description

Write an OnPokeData event handler to take specific action when the DDE client pokes data to this DDE server item. The new value for the item can be found by reading the Lines (see page 10906) or Text (see page 10907) property.

When a DDE client pokes data to a DDE server items, the PokeData (see page 10904) method is called. PokeData (see page 10904) causes the following events.

1First, the new value is assigned to the Lines (see page 10906) (Text (see page 10907)) property.

2An OnChange (see page 10908) event occurs.

3The new value is sent back to the DDE client.

4An OnPokeData event occurs.

See Also

Lines (see page 10906)

OnChange (see page 10908)

PokeData (see page 10904)

Text (see page 10907)

58.2 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	GetPasteLinkInfo (see page 10910)	This is function DdeMan.GetPasteLinkInfo.

58.2.1 DdeMan.GetPasteLinkInfo Function

Pascal

```
function GetPasteLinkInfo(var Service: string; var Topic: string; var Item: string): Boolean;
```

C++

```
Boolean GetPasteLinkInfo(AnsiString Service, AnsiString Topic, AnsiString Item);
```

File

DdeMan

Description

This is function DdeMan.GetPasteLinkInfo.

58.3 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TDataMode (see page 10911)	TDataMode indicates whether a stage in a DDE conversation happens automatically.

58.3.1 DdeMan.TDataMode Enumeration

TDataMode indicates whether a stage in a DDE conversation happens automatically.

Pascal

```
TDataMode = (
  ddeAutomatic,
  ddeManual
);
```

C++

```
enum TDataMode {
  ddeAutomatic,
  ddeManual
};
```

File

DdeMan

Description

The following table lists the possible values:

Value	Meaning
ddeAutomatic	The stage in the DDE conversation is initiated automatically.
axrIncludeDescendants	The application must call a method to initiate the stage in the DDE converstation.

58.4 Types

The following table lists types in this documentation.

Types

Name	Description
TMacroEvent (see page 10912)	TMacroEvent is the type for event handlers that implement the response of a DDE server to a macro.

58.4.1 DdeMan.TMacroEvent Type

TMacroEvent is the type for event handlers that implement the response of a DDE server to a macro.

Pascal

```
TMacroEvent = procedure (Sender: TObject; Msg: TStrings) of object;
```

C++

```
(Sender: TObject; Msg: TStrings) ( TMacroEvent)();
```

File

DdeMan

Description

Sender parameter is the DDE server conversation.

Msg gives the macro string for the server to execute.

58.5 Variables

The following table lists variables in this documentation.

Variables

Name	Description
ddeMgr (see page 10913)	This is variable DdeMan.ddeMgr.

58.5.1 DdeMan.ddeMgr Variable

Pascal

```
ddeMgr: TDdeMgr;
```

C++

```
TDdeMgr ddeMgr;
```

File

DdeMan

Description

This is variable DdeMan.ddeMgr.

59 DesignEditors Namespace

This is namespace DesignEditors.

Topics

Name	Description
Classes (see page 10917)	The following table lists classes in this documentation.
Interfaces (see page 11088)	The following table lists interfaces in this documentation.
Functions (see page 11090)	The following table lists functions in this documentation.
Structs, Records, Enums (see page 11095)	The following table lists structs, records, enums in this documentation.
Types (see page 11096)	The following table lists types in this documentation.
Variables (see page 11098)	The following table lists variables in this documentation.
Constants (see page 11099)	The following table lists constants in this documentation.

Classes

	Name	Description
	TBoolProperty (see page 10918)	This is class DesignEditors.TBoolProperty.
	TCharProperty (see page 10918)	This is class DesignEditors.TCharProperty.
	TClassProperty (see page 10922)	This is class DesignEditors.TClassProperty.
	TComponentEditor (see page 10927)	TComponentEditor provides the default implementation for the IComponentEditor interface.
	TComponentGuidelines (see page 10935)	This is class DesignEditors.TComponentGuidelines.
	TComponentNameProperty (see page 10939)	This is class DesignEditors.TComponentNameProperty.
	TComponentProperty (see page 10944)	This is class DesignEditors.TComponentProperty.
	TCustomModule (see page 10952)	This is class DesignEditors.TCustomModule.
	TDateProperty (see page 10957)	This is class DesignEditors.TDateProperty.
	TDateTimeProperty (see page 10962)	This is class DesignEditors.TDateTimeProperty.
	TDefaultEditor (see page 10967)	TDefaultEditor is the component editor for components that do not explicitly register a component editor.
	TDesignerOleDropTarget (see page 10970)	This is class DesignEditors.TDesignerOleDropTarget.
	TEditActionSelectionEditor (see page 10973)	This is class DesignEditors.TEditActionSelectionEditor.
	TEnumProperty (see page 10978)	This is class DesignEditors.TEnumProperty.
	TFloatProperty (see page 10983)	This is class DesignEditors.TFloatProperty.
	TInt64Property (see page 10988)	This is class DesignEditors.TInt64Property.
	TIntegerProperty (see page 10993)	This is class DesignEditors.TIntegerProperty.
	TInterfaceProperty (see page 10998)	This is class DesignEditors.TInterfaceProperty.
	TMethodProperty (see page 11004)	This is class DesignEditors.TMethodProperty.

	TNestedProperty (see page 11011)	This is class DesignEditors.TNestedProperty.
	TOrdinalProperty (see page 11015)	This is class DesignEditors.TOrdinalProperty.
	TPropertyEditor (see page 11019)	TPropertyEditor is a base class for property editors that implements the IProperty interface.
	TSelectionEditor (see page 11046)	This is class DesignEditors.TSelectionEditor.
	TSetElementProperty (see page 11049)	This is class DesignEditors.TSetElementProperty.
	TSetProperty (see page 11056)	This is class DesignEditors.TSetProperty.
	TStringProperty (see page 11061)	This is class DesignEditors.TStringProperty.
	TTimeProperty (see page 11066)	This is class DesignEditors.TTimeProperty.
	TVariantProperty (see page 11071)	This is class DesignEditors.TVariantProperty.
	TWideCharProperty (see page 11077)	This is class DesignEditors.TWideCharProperty.
	TWideStringProperty (see page 11082)	This is class DesignEditors.TWideStringProperty.

Constants

Name	Description
sClassNotApplicable (see page 11099)	This is constant DesignEditors.sClassNotApplicable.
sNotAvailable (see page 11099)	This is constant DesignEditors.sNotAvailable.

Functions

	Name	Description
	AncestorNameMatches (see page 11090)	This is function DesignEditors.AncestorNameMatches.
	ClassInheritsFrom (see page 11090)	This is function DesignEditors.ClassInheritsFrom.
	FreeEditorGroup (see page 11091)	This is function DesignEditors.FreeEditorGroup.
	GetComponentEditor (see page 11091)	This is function DesignEditors.GetComponentEditor.
	GetComponentProperties (see page 11091)	This is function DesignEditors.GetComponentProperties.
	GetSelectionEditors (see page 11092)	This is function DesignEditors.GetSelectionEditors.
	GetSelectionEditors (see page 11092)	This is function DesignEditors.GetSelectionEditors.
	GetSelectionEditors (see page 11092)	This is function DesignEditors.GetSelectionEditors.
	GuidelinesFor (see page 11093)	This is function DesignEditors.GuidelinesFor.
	NewEditorGroup (see page 11093)	This is function DesignEditors.NewEditorGroup.
	NotifyGroupChange (see page 11093)	This is function DesignEditors.NotifyGroupChange.
	PossibleStream (see page 11094)	This is function DesignEditors.PossibleStream.
	UnnotifyGroupChange (see page 11094)	This is function DesignEditors.UnnotifyGroupChange.

Interfaces

	Name	Description
	IDesignGroupChange (see page 11088)	This is class DesignEditors.IDesignGroupChange.

Structs, Records, Enums

	Name	Description
	TInstProp (see page 11095)	This is record DesignEditors.TInstProp.

Types

Name	Description
PInstPropList (see page 11096)	This is type DesignEditors.PInstPropList.
TBit (see page 11096)	This is type DesignEditors.TBit.
TGetTopLevelComponentFunc (see page 11097)	This is type DesignEditors.TGetTopLevelComponentFunc.
TGroupChangeProc (see page 11097)	This is type DesignEditors.TGroupChangeProc.
TInstPropList (see page 11097)	This is type DesignEditors.TInstPropList.

Variables

Name	Description
GetTopLevelComponentFunc (see page 11098)	This is variable DesignEditors.GetTopLevelComponentFunc.

59.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TBoolProperty (see page 10918)	This is class DesignEditors.TBoolProperty.
	TCharProperty (see page 10918)	This is class DesignEditors.TCharProperty.
	TClassProperty (see page 10922)	This is class DesignEditors.TClassProperty.
	TComponentEditor (see page 10927)	TComponentEditor provides the default implementation for the IComponentEditor interface.
	TComponentGuidelines (see page 10935)	This is class DesignEditors.TComponentGuidelines.
	TComponentNameProperty (see page 10939)	This is class DesignEditors.TComponentNameProperty.
	TComponentProperty (see page 10944)	This is class DesignEditors.TComponentProperty.
	TCustomModule (see page 10952)	This is class DesignEditors.TCustomModule.
	TDateProperty (see page 10957)	This is class DesignEditors.TDateProperty.
	TDateTimeProperty (see page 10962)	This is class DesignEditors.TDateTimeProperty.
	TDefaultEditor (see page 10967)	TDefaultEditor is the component editor for components that do not explicitly register a component editor.
	TDesignerOleDropTarget (see page 10970)	This is class DesignEditors.TDesignerOleDropTarget.
	TEditActionSelectionEditor (see page 10973)	This is class DesignEditors.TEditActionSelectionEditor.
	TEnumProperty (see page 10978)	This is class DesignEditors.TEnumProperty.
	TFloatProperty (see page 10983)	This is class DesignEditors.TFloatProperty.
	TInt64Property (see page 10988)	This is class DesignEditors.TInt64Property.
	TIntegerProperty (see page 10993)	This is class DesignEditors.TIntegerProperty.
	TInterfaceProperty (see page 10998)	This is class DesignEditors.TInterfaceProperty.
	TMethodProperty (see page 11004)	This is class DesignEditors.TMethodProperty.
	TNestedProperty (see page 11011)	This is class DesignEditors.TNestedProperty.
	TOrdinalProperty (see page 11015)	This is class DesignEditors.TOrdinalProperty.
	TPropertyEditor (see page 11019)	TPropertyEditor is a base class for property editors that implements the IProperty interface.
	TSelectionEditor (see page 11046)	This is class DesignEditors.TSelectionEditor.
	TSetElementProperty (see page 11049)	This is class DesignEditors.TSetElementProperty.
	TSetProperty (see page 11056)	This is class DesignEditors.TSetProperty.
	TStringProperty (see page 11061)	This is class DesignEditors.TStringProperty.
	TTimeProperty (see page 11066)	This is class DesignEditors.TTimeProperty.
	TVariantProperty (see page 11071)	This is class DesignEditors.TVariantProperty.
	TWideCharProperty (see page 11077)	This is class DesignEditors.TWideCharProperty.
	TWideStringProperty (see page 11082)	This is class DesignEditors.TWideStringProperty.

59.1.1 TBoolProperty Class

Class Hierarchy

Pascal

```
TBoolProperty = class(TEnumProperty);
```

C++

```
class TBoolProperty : public TEnumProperty;
```

File

DesignEditors

Description

This is class DesignEditors.TBoolProperty.

59.1.2 TCharProperty Class

Class Hierarchy

Pascal

```
TCharProperty = class(TOrdinalProperty);
```

C++

```
class TCharProperty : public TOrdinalProperty;
```

File

DesignEditors

Description

This is class DesignEditors.TCharProperty.

59.1.2.1 TCharProperty Members

The following tables list the members exposed by TCharProperty.

Protected Data Members

	Name	Description
	FRefCount (see page 22278)	This is FRefCount, a member of class TInterfacedObject.

Protected Methods

	Name	Description
	_AddRef (see page 22278)	Implements the IInterface (see page 22396) System::TInterfacedObject::_AddRef method.
	_Release (see page 22279)	Implements the IInterface (see page 22396) System::TInterfacedObject::_Release method.
	GetEditValue (see page 11027)	This is the overview for the GetEditValue method overload.
	GetFloatValue (see page 11028)	Returns the property value of the first object currently being edited.
	GetFloatValueAt (see page 11028)	Returns the property value of the specified object.
	GetInt64Value (see page 11028)	Returns the property value of the first object currently being edited.
	GetInt64ValueAt (see page 11029)	Returns the property value of the specified object.
	GetIntfValue (see page 11029)	Returns the property value of the first object currently being edited.
	GetIntfValueAt (see page 11030)	Returns the property value of the specified object.
V	GetIsDefault (see page 11030)	This is GetIsDefault, a member of class TPropertyEditor.
	GetMethodValue (see page 11031)	Returns the property value of the first object currently being edited.
	GetMethodValueAt (see page 11031)	Returns the property value of the specified object.
	GetOrdValue (see page 11032)	Returns the property value of the first object currently being edited.
	GetOrdValueAt (see page 11032)	Returns the property value of the specified object.
	GetStrValue (see page 11034)	Returns the property value of the first object currently being edited.
	GetStrValueAt (see page 11034)	Returns the property value of the specified object.
	GetVarValue (see page 11036)	Returns the property value of the first object currently being edited.
	GetVarValueAt (see page 11036)	Returns the property value of the specified object.
	GetWideStrValue (see page 11037)	This is GetWideStrValue, a member of class TPropertyEditor.
	GetWideStrValueAt (see page 11037)	This is GetWideStrValueAt, a member of class TPropertyEditor.
	HasInstance (see page 11038)	Indicates whether a specified object is currently being edited by the property editor.
A	Initialize (see page 11114)	Initializes the property editor after it is created but before it is used.
	Modified (see page 11038)	Informs the designer that the property value has changed.
	QueryInterface (see page 22280)	Implements the IInterface (see page 22396) System::TInterfacedObject::QueryInterface method.
	SetFloatValue (see page 11039)	Changes the property value for every object being edited.
	SetInt64Value (see page 11040)	Changes the property value for every object being edited.
	SetIntfValue (see page 11040)	Changes the property value for every object being edited.
	SetMethodValue (see page 11040)	Changes the property value for every object being edited.
	SetOrdValue (see page 11041)	Changes the property value for every object being edited.
V	SetPropEntry (see page 11041)	Informs the property editor of a particular object whose property is to be edited.
A	SetPropEntry (see page 11115)	Informs the property editor of a particular object whose property is to be edited.
	SetStrValue (see page 11042)	Changes the property value for every object being edited.
	SetVarValue (see page 11043)	Changes the property value for every object being edited.
	SetWideStrValue (see page 11043)	This is SetWideStrValue, a member of class TPropertyEditor.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	Activate (see page 11024)	Responds when the property is selected in the Object Inspector.
	Activate (see page 11199)	Responds when the property is selected in the Object Inspector.
V	AfterConstruction (see page 22279)	Responds after the last constructor executes.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	AllEqual (see page 11018)	Indicates whether all selected components have the same value for the property.
V	AllEqual (see page 11024)	Indicates whether all selected components have the same value for the property.

	AllEqual (see page 11199)	Indicates whether all selected components have the same value for the property.
V	AutoFill (see page 11025)	Returns true to indicate that values can be typed incrementally—and automatically completed—in the Object Inspector.
	AutoFill (see page 11200)	Returns true to indicate that values can be typed incrementally—and automatically completed—in the Object Inspector.
V	BeforeDestruction (see page 22279)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 11022)	Creates a new TPropertyEditor (see page 11019) object.
V	Create (see page 11114)	Creates a new TBasePropertyEditor (see page 11112) object.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 11022)	Destroys an instance of TPropertyEditor (see page 11019).
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
V	Edit (see page 11025)	Responds when the user double-clicks the property in the Object Inspector.
	Edit (see page 11200)	Responds when the user double-clicks the property in the Object Inspector.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
V	GetAttributes (see page 11026)	Describes the property so the Object Inspector provides the appropriate controls.
	GetAttributes (see page 11200)	Describes the property so the Object Inspector provides the appropriate controls.
	GetComponent (see page 11026)	Returns the specified object from the set of all objects currently being edited by the property editor.
V	GetEditLimit (see page 11018)	Returns the maximum length, in characters, of the Value property.
V	GetEditLimit (see page 11027)	Returns the maximum length, in characters, of the Value (see page 11045) property.
	GetEditLimit (see page 11201)	Returns the maximum length, in characters, of the value.
	GetEditValue (see page 11201)	Retrieves a string to represent the property's value, or, if the value is not available, an error message.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIsDefault (see page 11206)	This is GetIsDefault, a member of class IProperty70.
	GetKind (see page 11030)	This is GetKind, a member of class TPropertyEditor.
	GetKind (see page 11212)	This is GetKind, a member of class IPropertyKind.
V	GetName (see page 11032)	Returns the name of the property.
	GetName (see page 11202)	Returns the name of the property.
V	GetProperties (see page 11033)	Provides the subproperties of the property to a callback procedure.
	GetProperties (see page 11202)	Provides the subproperties of the property to a callback procedure.
V	GetPropInfo (see page 11033)	Returns the property information record for the object being edited.
	GetPropInfo (see page 11202)	Returns the property information record for the object being edited.
	GetPropType (see page 11033)	Returns the type information record for the object being edited.
	GetPropType (see page 11203)	Returns the type information record for the object being edited.
V	GetValue (see page 10921)	Returns the property value formatted as a string.
V	GetValues (see page 11035)	Provides the enumerated values of the property to a callback procedure.
	GetValues (see page 11203)	Provides the enumerated values of the property to a callback procedure.

	GetValueW (see page 11036)	This is GetValueW, a member of class TPropertyEditor.
	GetVisualValue (see page 11037)	Returns the property value as it appears in the Object Inspector.
	HasInstance (see page 11204)	Indicates whether a specified object is currently being edited by the property editor.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	Initialize (see page 11038)	Initializes the property editor after it is created but before it is used.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22280)	Allocates memory for each instance of an interfaced object.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	Revert (see page 11039)	Restores all object properties to their original values.
	Revert (see page 11204)	Restores all object properties to their original values.
	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetValue (see page 10922)	Responds when the user changes the value of the property.
	SetValue (see page 11042)	This is the overview for the SetValue method overload.
	ValueAvailable (see page 11044)	Indicates whether all components being edited have a value for the property if their ComponentStyle includes csCheckPropAvail.
	ValueAvailable (see page 11205)	Indicates whether all components being edited have a value for the property if their ComponentStyle includes csCheckPropAvail.

Public Properties

	Name	Description
	Designer (see page 11044)	Provides access to the form designer object in the IDE.
	IsDefault (see page 11206)	This is IsDefault, a member of class IProperty70.
	Kind (see page 11212)	This is Kind, a member of class IPropertyKind.
	PrivateDirectory (see page 11044)	Specifies the location where the property editor can store auxiliary files.
	PropCount (see page 11045)	Indicates the number of components whose properties are being edited.
	RefCount (see page 22281)	Indicates the number of interface pointers currently dependent upon the object.
	Value (see page 11045)	Represents the current value of the property (as returned by GetValue (see page 11035)) as a string.

59.1.2.2 TCharProperty Methods

The methods of the TCharProperty class are listed here.

Public Methods

	Name	Description
	GetValue (see page 10921)	Returns the property value formatted as a string.
	SetValue (see page 10922)	Responds when the user changes the value of the property.

59.1.2.2.1 TCharProperty.GetValue Method

Returns the property value formatted as a string.

Pascal

```
function GetValue: string; override;
```

C++

```
virtual __fastcall AnsiString GetValue();
```

Description

GetValue formats the value of the property, formatted as a string. If the value is not available, GetValue raised an exception.

As implemented in TPropertyEditor, GetValue returns the string "(unknown)". Descendant classes override this method to provide an appropriate value string or raise an exception.

GetValue is the read access method of the Value property.

Note: To obtain an error string when the property value is unavailable rather than raising an exception, you can call the GetEditValue method. GetEditValue is protected, but can be called through the IProperty interface in code that is not a method of a descendant class.

See Also

setvalue (see page 11042)

Value (see page 11045)

GetVisualValue (see page 11037)

GetEditValue (see page 11027)

59.1.2.2.2 TCharProperty.SetValue Method

Responds when the user changes the value of the property.

Pascal

```
procedure SetValue(const Value: string); override;
```

C++

```
virtual __fastcall SetValue(const AnsiString Value);
```

Description

The Object Inspector calls SetValue when the user has finished changing the property value. SetValue applies the value specified by the Value parameter to all components that it is currently editing. If the value can't be set, SetValue raises an exception that describes the problem.

Note: If the property is changed only through a dialog brought up by the Edit method, the Object Inspector does not call SetValue. Rather, the Edit method should handle the setting of the value on all components.

Edit (see page 11200)

59.1.3 TClassProperty Class

Class Hierarchy

Pascal

```
TClassProperty = class(TPropertyEditor);
```

C++

```
class TClassProperty : public TPropertyEditor;
```

File

DesignEditors

Description

This is class DesignEditors.TClassProperty.

59.1.3.1 TClassProperty Members

The following tables list the members exposed by TClassProperty.

Protected Data Members

	Name	Description
	FRefCount (see page 22278)	This is FRefCount, a member of class TInterfacedObject.

Protected Methods

	Name	Description
	_AddRef (see page 22278)	Implements the IInterface (see page 22396) System::TInterfacedObject::_AddRef method.
	_Release (see page 22279)	Implements the IInterface (see page 22396) System::TInterfacedObject::_Release method.
	GetEditValue (see page 11027)	This is the overview for the GetEditValue method overload.
	GetFloatValue (see page 11028)	Returns the property value of the first object currently being edited.
	GetFloatValueAt (see page 11028)	Returns the property value of the specified object.
	GetInt64Value (see page 11028)	Returns the property value of the first object currently being edited.
	GetInt64ValueAt (see page 11029)	Returns the property value of the specified object.
	GetIntfValue (see page 11029)	Returns the property value of the first object currently being edited.
	GetIntfValueAt (see page 11030)	Returns the property value of the specified object.
V	GetIsDefault (see page 11030)	This is GetIsDefault, a member of class TPropertyEditor.
	GetMethodValue (see page 11031)	Returns the property value of the first object currently being edited.
	GetMethodValueAt (see page 11031)	Returns the property value of the specified object.
	GetOrdValue (see page 11032)	Returns the property value of the first object currently being edited.
	GetOrdValueAt (see page 11032)	Returns the property value of the specified object.
	GetStrValue (see page 11034)	Returns the property value of the first object currently being edited.
	GetStrValueAt (see page 11034)	Returns the property value of the specified object.
	GetVarValue (see page 11036)	Returns the property value of the first object currently being edited.
	GetVarValueAt (see page 11036)	Returns the property value of the specified object.
	GetWideStrValue (see page 11037)	This is GetWideStrValue, a member of class TPropertyEditor.
	GetWideStrValueAt (see page 11037)	This is GetWideStrValueAt, a member of class TPropertyEditor.
	HasInstance (see page 11038)	Indicates whether a specified object is currently being edited by the property editor.
A	Initialize (see page 11114)	Initializes the property editor after it is created but before it is used.
	Modified (see page 11038)	Informs the designer that the property value has changed.
	QueryInterface (see page 22280)	Implements the IInterface (see page 22396) System::TInterfacedObject::QueryInterface method.
	SetFloatValue (see page 11039)	Changes the property value for every object being edited.
	SetInt64Value (see page 11040)	Changes the property value for every object being edited.
	SetIntfValue (see page 11040)	Changes the property value for every object being edited.
	SetMethodValue (see page 11040)	Changes the property value for every object being edited.

	SetOrdValue (see page 11041)	Changes the property value for every object being edited.
	SetPropEntry (see page 11041)	Informs the property editor of a particular object whose property is to be edited.
	SetPropEntry (see page 11115)	Informs the property editor of a particular object whose property is to be edited.
	SetStrValue (see page 11042)	Changes the property value for every object being edited.
	SetVarValue (see page 11043)	Changes the property value for every object being edited.
	SetWideStrValue (see page 11043)	This is SetWideStrValue, a member of class TPropertyEditor.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	Activate (see page 11024)	Responds when the property is selected in the Object Inspector.
	Activate (see page 11199)	Responds when the property is selected in the Object Inspector.
	AfterConstruction (see page 22279)	Responds after the last constructor executes.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	AllEqual (see page 11024)	Indicates whether all selected components have the same value for the property.
	AllEqual (see page 11199)	Indicates whether all selected components have the same value for the property.
	AutoFill (see page 11025)	Returns true to indicate that values can be typed incrementally—and automatically completed—in the Object Inspector.
	AutoFill (see page 11200)	Returns true to indicate that values can be typed incrementally—and automatically completed—in the Object Inspector.
	BeforeDestruction (see page 22279)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 11022)	Creates a new TPropertyEditor (see page 11019) object.
	Create (see page 11114)	Creates a new TBasePropertyEditor (see page 11112) object.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 11022)	Destroys an instance of TPropertyEditor (see page 11019).
	Destroy (see page 22287)	Disposes of an object instance.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Edit (see page 11025)	Responds when the user double-clicks the property in the Object Inspector.
	Edit (see page 11200)	Responds when the user double-clicks the property in the Object Inspector.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetAttributes (see page 10926)	Describes the property so the Object Inspector provides the appropriate controls.
	GetComponent (see page 11026)	Returns the specified object from the set of all objects currently being edited by the property editor.
	GetEditLimit (see page 11027)	Returns the maximum length, in characters, of the Value (see page 11045) property.
	GetEditLimit (see page 11201)	Returns the maximum length, in characters, of the value.
	GetEditValue (see page 11201)	Retrieves a string to represent the property's value, or, if the value is not available, an error message.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.

	GetIsDefault (see page 11206)	This is GetIsDefault, a member of class IProperty70.
	GetKind (see page 11030)	This is GetKind, a member of class TPropertyEditor.
	GetKind (see page 11212)	This is GetKind, a member of class IPropertyKind.
V	GetName (see page 11032)	Returns the name of the property.
	GetName (see page 11202)	Returns the name of the property.
V	GetProperties (see page 10926)	Provides the subproperties of the property to a callback procedure.
V	GetPropInfo (see page 11033)	Returns the property information record for the object being edited.
	GetPropInfo (see page 11202)	Returns the property information record for the object being edited.
	GetPropType (see page 11033)	Returns the type information record for the object being edited.
	GetPropType (see page 11203)	Returns the type information record for the object being edited.
V	GetValue (see page 10927)	Returns the property value formatted as a string.
V	GetValues (see page 11035)	Provides the enumerated values of the property to a callback procedure.
	GetValues (see page 11203)	Provides the enumerated values of the property to a callback procedure.
V	GetValueW (see page 11036)	This is GetValueW, a member of class TPropertyEditor.
	GetVisualValue (see page 11037)	Returns the property value as it appears in the Object Inspector.
	HasInstance (see page 11204)	Indicates whether a specified object is currently being edited by the property editor.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
V	Initialize (see page 11038)	Initializes the property editor after it is created but before it is used.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22280)	Allocates memory for each instance of an interfaced object.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	Revert (see page 11039)	Restores all object properties to their original values.
	Revert (see page 11204)	Restores all object properties to their original values.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetValue (see page 11204)	Responds when the user changes the value of the property.
V	SetValue (see page 11042)	This is the overview for the SetValue method overload.
	ValueAvailable (see page 11044)	Indicates whether all components being edited have a value for the property if their ComponentStyle includes csCheckPropAvail.
	ValueAvailable (see page 11205)	Indicates whether all components being edited have a value for the property if their ComponentStyle includes csCheckPropAvail.

Public Properties

	Name	Description
R	Designer (see page 11044)	Provides access to the form designer object in the IDE.
R	IsDefault (see page 11206)	This is IsDefault, a member of class IProperty70.
R	Kind (see page 11212)	This is Kind, a member of class IPropertyKind.
R	PrivateDirectory (see page 11044)	Specifies the location where the property editor can store auxiliary files.
R	PropCount (see page 11045)	Indicates the number of components whose properties are being edited.
R	RefCount (see page 22281)	Indicates the number of interface pointers currently dependent upon the object.
	Value (see page 11045)	Represents the current value of the property (as returned by GetValue (see page 11035)) as a string.

59.1.3.2 TClassProperty Methods

The methods of the TClassProperty class are listed here.

Public Methods

	Name	Description
	GetAttributes (see page 10926)	Describes the property so the Object Inspector provides the appropriate controls.
	GetProperties (see page 10926)	Provides the subproperties of the property to a callback procedure.
	GetValue (see page 10927)	Returns the property value formatted as a string.

59.1.3.2.1 TClassProperty.GetAttributes Method

Describes the property so the Object Inspector provides the appropriate controls.

Pascal

```
function GetAttributes: TPropertyAttributes; override;
```

C++

```
virtual __fastcall TPropertyAttributes GetAttributes();
```

Description

The Object Inspector calls GetAttributes to determine what controls to display for the property and what property editor methods to call. The GetAttributes method of TPropertyEditor returns [paMultiSelect, paRevertable]. Override GetAttributes to return the set of values that corresponds to the attributes of the associated property.

Before the Object Inspector calls the Activate method, GetAttributes does not need to provide accurate information about any attributes other than paSubProperties, paVCL, and paMultiSelect.

See Also

Activate (see page 11024)

Edit (see page 11025)

GetProperties (see page 11033)

GetValues (see page 11035)

setvalue (see page 11042)

Value (see page 11045)

ListDrawValue

ListMeasureHeight

ListMeasureWidth

59.1.3.2.2 TClassProperty.GetProperties Method

Provides the subproperties of the property to a callback procedure.

Pascal

```
procedure GetProperties(Proc: TGetPropProc); override;
```

C++

```
virtual __fastcall GetProperties(TGetPropProc Proc);
```

Description

The Object Inspector calls GetProperties when the property is expanded to show subproperties. The GetProperties method of TPropertyEditor does nothing. Property editors that return paSubProperties from the GetAttributes method should override GetProperties to create an appropriate property editor and pass its IProperty interface to the Proc parameter for every

subproperty (or nested property) of the property.

See Also

GetAttributes (see page 11026)

59.1.3.2.3 TClassProperty.GetValue Method

Returns the property value formatted as a string.

Pascal

```
function GetValue: string; override;
```

C++

```
virtual __fastcall AnsiString GetValue();
```

Description

GetValue formats the value of the property, formatted as a string. If the value is not available, GetValue raised an exception.

As implemented in TPropertyEditor, GetValue returns the string "(unknown)". Descendant classes override this method to provide an appropriate value string or raise an exception.

GetValue is the read access method of the Value property.

Note: To obtain an error string when the property value is unavailable rather than raising an exception, you can call the GetEditValue method. GetEditValue is protected, but can be called through the IProperty interface in code that is not a method of a descendant class.

See Also

setvalue (see page 11042)

Value (see page 11045)

GetVisualValue (see page 11037)

GetEditValue (see page 11027)

59.1.4 TComponentEditor Class

TComponentEditor provides the default implementation for the IComponentEditor interface.

Class Hierarchy

Pascal

```
TComponentEditor = class(TBaseComponentEditor, IComponentEditor);
```

C++

```
class TComponentEditor : public TBaseComponentEditor, public IComponentEditor;
```

File

DesignEditors

Description

Use TComponentEditor or one of its descendants as a base class when defining a design-time editor for working with a new component class. Although you can create component editors that descend directly from TBaseComponentEditor, it is convenient to use TComponentEditor, because this class supplies a default implementation of the IComonentEditor interface.

Create (see page 10929) a new component editor class for a component class to add verbs to its context menu, change its default double-click behavior, or allow the component to use a new clipboard format.

Once the component editor is defined, it can be registered to work with a particular component class. A registered component editor is created for each component of that class when it is selected in the form designer. When the component is double-clicked, the Edit (see page 10930) method of the component editor is called. When the user right-clicks the component, the GetVerbCount (see page 10933) and GetVerb (see page 10932) methods of the editor are called to build context menu. To create the association between a component editor and a component class, call RegisterComponentEditor.

See Also

RegisterComponentEditor

TDefaultEditor (see page 10967)

59.1.4.1 TComponentEditor Members

The following tables list the members exposed by TComponentEditor.

Protected Data Members

	Name	Description
	FRefCount (see page 22278)	This is FRefCount, a member of class TInterfacedObject.

Protected Methods

	Name	Description
	_AddRef (see page 22278)	Implements the IInterface (see page 22396) System::TInterfacedObject::_AddRef method.
	_Release (see page 22279)	Implements the IInterface (see page 22396) System::TInterfacedObject::_Release method.
	QueryInterface (see page 22280)	Implements the IInterface (see page 22396) System::TInterfacedObject::QueryInterface method.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22279)	Responds after the last constructor executes.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 22279)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Copy (see page 10930)	Provides an opportunity to copy the component to the clipboard in custom formats.

V	Create (see page 10929)	Creates a new TBaseComponentEditor object.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
V	Edit (see page 10930)	Responds when the user double-clicks the component in the form designer.
V	ExecuteVerb (see page 10931)	Performs the action of a specified verb.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetComponent (see page 10931)	Returns the value of the Component (see page 10934) property.
	GetDesigner (see page 10932)	Returns the interface for the form designer.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetVerb (see page 10932)	Returns the string that corresponds to a specified position of the component's context menu.
V	GetVerbCount (see page 10933)	Returns the number of menu strings added to the context menu by the component editor.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsInInlined (see page 10933)	Indicates whether the component has the csInline flag set in its ComponentState property.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22280)	Allocates memory for each instance of an interfaced object.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	PrepareItem (see page 10933)	Allows the component editor to modify menu items as they are added to the context menu.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
R	Component (see page 10934)	Provides access to the component in the form designer that uses this component editor.
R	Designer (see page 10935)	Provides access to the form designer in the IDE.
R	RefCount (see page 22281)	Indicates the number of interface pointers currently dependent upon the object.

59.1.4.2 TComponentEditor.Create Constructor

Creates a new TBaseComponentEditor object.

Pascal

```
constructor Create(AComponent: TComponent; ADesigner: IDesigner); override;
```

C++

```
virtual __fastcall TComponentEditor(TComponent * AComponent, IDesigner ADesigner);
```

Description

Do not create instances of a component editor. Registered component editors are created automatically for selected objects in the form designer.

AComponent is the instance of the component for which the editor is created.

ADesigner is an interface that the component editor can use to interact with the forms designer.

59.1.4.3 TComponentEditor Methods

The methods of the TComponentEditor class are listed here.

Public Methods

	Name	Description
	Copy (see page 10930)	Provides an opportunity to copy the component to the clipboard in custom formats.
	Edit (see page 10930)	Responds when the user double-clicks the component in the form designer.
	ExecuteVerb (see page 10931)	Performs the action of a specified verb.
	GetComponent (see page 10931)	Returns the value of the Component (see page 10934) property.
	GetDesigner (see page 10932)	Returns the interface for the form designer.
	GetVerb (see page 10932)	Returns the string that corresponds to a specified position of the component's context menu.
	GetVerbCount (see page 10933)	Returns the number of menu strings added to the context menu by the component editor.
	IsInInlined (see page 10933)	Indicates whether the component has the csInline flag set in its ComponentState property.
	PrepareItem (see page 10933)	Allows the component editor to modify menu items as they are added to the context menu.

59.1.4.3.1 TComponentEditor.Copy Method

Provides an opportunity to copy the component to the clipboard in custom formats.

Pascal

```
procedure Copy; virtual;
```

C++

```
virtual __fastcall Copy();
```

Description

Do not call the Copy method. It is called automatically when the user tries to copy the component to the clipboard. When Copy is called, the component's filed image is already on the Clipboard. Override Copy to copy a different clipboard format, which is ignored by the designer but might be recognized by another application.

See Also

Assign (see page 3331)

SetAsHandle (see page 3343)

SetFormat

AsText (see page 3347)

TClipboard (see page 3328)

59.1.4.3.2 TComponentEditor.Edit Method

Responds when the user double-clicks the component in the form designer.

Pascal

```
procedure Edit; virtual;
```

C++

```
virtual __fastcall Edit();
```

Description

The form designer calls Edit when the user double-clicks the component. Edit executes the first verb supplied by the component editor. That is, if GetVerbCount (see page 10933) returns a value greater than zero, Edit calls

```
ExecuteVerb(0);
```

Override the Edit method to implement another response when the user double-clicks the component. For example, the Edit method can bring up a dialog or design expert.

See Also

GetVerbCount (see page 10933)

ExecuteVerb (see page 10931)

59.1.4.3.3 TComponentEditor.ExecuteVerb Method

Performs the action of a specified verb.

Pascal

```
procedure ExecuteVerb(Index: Integer); virtual;
```

C++

```
virtual __fastcall ExecuteVerb(int Index);
```

Description

The form designer calls ExecuteVerb when the user selects the verb that is returned by GetVerb (see page 10932)(Index). This verb is the string that appears in the corresponding position of the component's context menu.

TComponentEditor (see page 10927) does not supply any verbs for its component. As a result, ExecuteVerb does nothing. Override GetVerb (see page 10932) to provide a set of verbs, or menu strings, that are added to the context menu which appears when the user right-clicks the component. Override ExecuteVerb to implement a response to each of these verbs.

See Also

getverb (see page 10932)

GetVerbCount (see page 10933)

59.1.4.3.4 TComponentEditor.GetComponent Method

Returns the value of the Component (see page 10934) property.

Pascal

```
function GetComponent: TComponent;
```

C++

```
__fastcall TComponent * GetComponent();
```

Description

Use GetComponent to read from and make changes to the component associated with the component editor. Calling GetComponent is equivalent to reading the Component (see page 10934) property, but unlike the Component (see page

10934) property, is available through the IComponentEditor interface.

A component editor is created for each instance of the registered component class when it is selected in the form designer. GetComponent returns the selected instance.

Note: When the component editor makes changes to the component, it must call the Modified method of the form designer that is specified by the Designer (see page 10935) property.

See Also

Component (see page 10934)

Designer (see page 10935)

IComponentEditor (see page 11138)

59.1.4.3.5 TComponentEditor.GetDesigner Method

Returns the interface for the form designer.

Pascal

```
function GetDesigner: IDesigner;
```

C++

```
__fastcall IDesigner GetDesigner();
```

Description

GetDesigner is the read implementation for the Designer (see page 10935) property.

See Also

Designer (see page 10935)

IDesigner (see page 11149)

59.1.4.3.6 TComponentEditor.GetVerb Method

Returns the string that corresponds to a specified position of the component's context menu.

Pascal

```
function GetVerb(Index: Integer): string; virtual;
```

C++

```
virtual __fastcall AnsiString GetVerb(int Index);
```

Description

The form designer calls GetVerb iteratively to build the context menu that appears when the user right-clicks the component.

When implementing GetVerb, add an ampersand (&) to a verb to cause the following character to appear underlined in the context menu and to act as a shortcut key for selecting the menu item. Be sure to add ellipsis (...) to the end of a verb if its corresponding action is to bring up a dialog.

See Also

executeverb (see page 11140)

GetVerbCount (see page 11142)

59.1.4.3.7 TComponentEditor.GetVerbCount Method

Returns the number of menu strings added to the context menu by the component editor.

Pascal

```
function GetVerbCount: Integer; virtual;
```

C++

```
virtual __fastcall int GetVerbCount();
```

Description

The form designer calls GetVerbCount when the user right-clicks the component in order to determine the number of menu items that should be added to the context menu. It then adds the menu items by calling GetVerb (see page 10932) for every value from 0 to GetVerbCount - 1.

TComponentEditor (see page 10927) does not supply any verbs for its component. As a result, GetVerbCount returns 0. Override GetVerbCount when providing a set of verbs, or menu strings, to be added to the context menu. When overriding GetVerbCount, override GetVerb (see page 10932) to return the actual strings, and override ExecuteVerb (see page 10931) to implement a response to each of these verbs. For example, if adding two verbs to the context menu, GetVerbCount should return 2, GetVerb (see page 10932) should return a value for an Index of 0 and for an Index of 1, and ExecuteVerb (see page 10931) should perform the corresponding actions for an Index of 0 and for an Index of 1.

See Also

getverb (see page 10932)

ExecuteVerb (see page 10931)

PrepareItem (see page 10933)

59.1.4.3.8 TComponentEditor.IsInInlined Method

Indicates whether the component has the csInline flag set in its ComponentState property.

Pascal

```
function IsInInlined: Boolean;
```

C++

```
__fastcall Boolean IsInInlined();
```

Description

IsInInlined indicates whether the component being edited is inside a top-level component that can be modified at design time and also embedded in a form.

For instance, when a component is used on a Frame and that Frame is dropped on a Form, IsInInlined returns true for the component when it is embedded in the Frame on the Form, but returns false when the component that is only on the Frame.

See Also

ComponentState (see page 2804)

59.1.4.3.9 TComponentEditor.PrepareItem Method

Allows the component editor to modify menu items as they are added to the context menu.

Pascal

```
procedure PrepareItem(Index: Integer; const AItem: IMenuItem); virtual;
```

C++

```
virtual __fastcall PrepareItem(int Index, const IMenuItem AItem);
```

Description

The form designer calls PrepareItem for each verb when it constructs the context menu. This method lets the component editor make any modifications to the menu item for each verb, including adding subitems or removing the item from the context menu.

Index identifies the current verb that the form designer is adding to the context menu. This is the same index as appears for the command in the GetVerb (see page 10932) and ExecuteVerb (see page 10931) methods.

AItem is an interface to the menu item created by the form designer for the current verb. To add subitems, call the AddItem method of this interface. To disable the item, set the Enabled property to false. To suppress the menu item altogether, set its Visible property to false.

As implemented in TComponentEditor (see page 10927), PrepareItem does nothing. Override this method to customize the context menu before it is displayed.

getverb (see page 10932)

GetVerbCount (see page 10933)

ExecuteVerb (see page 10931)

59.1.4.4 TComponentEditor Properties

The properties of the TComponentEditor class are listed here.

Public Properties

	Name	Description
R	Component (see page 10934)	Provides access to the component in the form designer that uses this component editor.
R	Designer (see page 10935)	Provides access to the form designer in the IDE.

59.1.4.4.1 TComponentEditor.Component Property

Provides access to the component in the form designer that uses this component editor.

Pascal

```
property Component: TComponent;
```

C++

```
__property TComponent * Component;
```

Description

Use Component to read from and make changes to the component associated with the component editor. A component editor is created for each instance of the registered component class when it is selected in the form designer. Component is the selected instance.

Note: When the component editor makes changes to the component, it must call the Modified method of the form designer that is specified by the Designer (see page 10935) property.

See Also

create (see page 10929)

Designer (see page 10935)

Modified

59.1.4.4.2 TComponentEditor.Designer Property

Provides access to the form designer in the IDE.

Pascal

```
property Designer: IDesigner;
```

C++

```
__property IDesigner Designer;
```

Description

Use Designer to read from or make changes to the current form or module in the IDE. The IDesigner interface has methods that can access the components in the current unit and other units linked in by the uses clause (Delphi) or defined in included header files (C++). Other IDesigner methods create or alter the methods in the current unit and so on.

Note: When the component editor makes changes to the component, it must call the Modified method of the IDesigner interface.

59.1.5 TComponentGuidelines Class

Class Hierarchy

Pascal

```
TComponentGuidelines = class(TBaseComponentGuidelines, IComponentGuidelines);
```

C++

```
class TComponentGuidelines : public TBaseComponentGuidelines, public IComponentGuidelines;
```

File

DesignEditors

Description

This is class DesignEditors.TComponentGuidelines.

59.1.5.1 TComponentGuidelines Members

The following tables list the members exposed by TComponentGuidelines.

Protected Data Members

	Name	Description
	FRefCount (see page 22278)	This is FRefCount, a member of class TInterfacedObject.

Protected Methods

	Name	Description
	_AddRef (see page 22278)	Implements the IInterface (see page 22396) System::TInterfacedObject::_AddRef method.
	_Release (see page 22279)	Implements the IInterface (see page 22396) System::TInterfacedObject::_Release method.
V	CalcHorzPos (see page 10937)	This is CalcHorzPos, a member of class TComponentGuidelines.
V	CalcVertPos (see page 10938)	This is CalcVertPos, a member of class TComponentGuidelines.
V	GetCount (see page 10938)	This is GetCount, a member of class TComponentGuidelines.
V	GetDesignerGuideOffset (see page 10938)	This is GetDesignerGuideOffset, a member of class TComponentGuidelines.
V	GetDesignerGuideType (see page 10938)	This is GetDesignerGuideType, a member of class TComponentGuidelines.
	QueryInterface (see page 22280)	Implements the IInterface (see page 22396) System::TInterfacedObject::QueryInterface method.

Protected Properties

	Name	Description
R	Component (see page 10939)	This is Component, a member of class TComponentGuidelines.
R	Container (see page 10939)	This is Container, a member of class TComponentGuidelines.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22279)	Responds after the last constructor executes.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 22279)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 11109)	This is Create, a member of class TBaseComponentGuidelines.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.

	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
V	Initialize (see page 10938)	This is Initialize, a member of class TComponentGuidelines.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22280)	Allocates memory for each instance of an interfaced object.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
R	Count (see page 11145)	This is Count, a member of class IComponentGuidelines.
R	Designer (see page 11110)	This is Designer, a member of class TBaseComponentGuidelines.
R	DesignerGuideOffsets (see page 11145)	This is DesignerGuideOffsets, a member of class IComponentGuidelines.
R	DesignerGuideTypes (see page 11145)	This is DesignerGuideTypes, a member of class IComponentGuidelines.
R	RefCount (see page 22281)	Indicates the number of interface pointers currently dependent upon the object.

59.1.5.2 TComponentGuidelines Methods

The methods of the TComponentGuidelines class are listed here.

Protected Methods

	Name	Description
V	CalcHorzPos (see page 10937)	This is CalcHorzPos, a member of class TComponentGuidelines.
V	CalcVertPos (see page 10938)	This is CalcVertPos, a member of class TComponentGuidelines.
V	GetCount (see page 10938)	This is GetCount, a member of class TComponentGuidelines.
V	GetDesignerGuideOffset (see page 10938)	This is GetDesignerGuideOffset, a member of class TComponentGuidelines.
V	GetDesignerGuideType (see page 10938)	This is GetDesignerGuideType, a member of class TComponentGuidelines.

Public Methods

	Name	Description
V	Initialize (see page 10938)	This is Initialize, a member of class TComponentGuidelines.

59.1.5.2.1 TComponentGuidelines.CalcHorzPos Method

Pascal

```
function CalcHorzPos(APos: Integer): Integer; virtual;
```

C++

```
virtual __fastcall int CalcHorzPos(int APos);
```

Description

This is CalcHorzPos, a member of class TComponentGuidelines.

59.1.5.2.2 TComponentGuidelines.CalcVertPos Method

Pascal

```
function CalcVertPos(APos: Integer): Integer; virtual;
```

C++

```
virtual __fastcall int CalcVertPos(int APos);
```

Description

This is CalcVertPos, a member of class TComponentGuidelines.

59.1.5.2.3 TComponentGuidelines.GetCount Method

Pascal

```
function GetCount: Integer; virtual;
```

C++

```
virtual __fastcall int GetCount();
```

Description

This is GetCount, a member of class TComponentGuidelines.

59.1.5.2.4 TComponentGuidelines.GetDesignerGuideOffset Method

Pascal

```
function GetDesignerGuideOffset(Index: Integer): Integer; virtual;
```

C++

```
virtual __fastcall int GetDesignerGuideOffset(int Index);
```

Description

This is GetDesignerGuideOffset, a member of class TComponentGuidelines.

59.1.5.2.5 TComponentGuidelines.GetDesignerGuideType Method

Pascal

```
function GetDesignerGuideType(Index: Integer): TDesignerGuideType; virtual;
```

C++

```
virtual __fastcall TDesignerGuideType GetDesignerGuideType(int Index);
```

Description

This is GetDesignerGuideType, a member of class TComponentGuidelines.

59.1.5.2.6 TComponentGuidelines.Initialize Method

Pascal

```
procedure Initialize(AComponent: TComponent; AContainer: TComponent); override;
```

C++

```
virtual __fastcall Initialize(TComponent * AComponent, TComponent * AContainer);
```

Description

This is Initialize, a member of class TComponentGuidelines.

59.1.5.3 TComponentGuidelines Properties

The properties of the TComponentGuidelines class are listed here.

Protected Properties

	Name	Description
R	Component (see page 10939)	This is Component, a member of class TComponentGuidelines.
R	Container (see page 10939)	This is Container, a member of class TComponentGuidelines.

59.1.5.3.1 TComponentGuidelines.Component Property

Pascal

```
property Component: TComponent;
```

C++

```
__property TComponent * Component;
```

Description

This is Component, a member of class TComponentGuidelines.

59.1.5.3.2 TComponentGuidelines.Container Property

Pascal

```
property Container: TComponent;
```

C++

```
__property TComponent * Container;
```

Description

This is Container, a member of class TComponentGuidelines.

59.1.6 TComponentNameProperty Class

Class Hierarchy

Pascal

```
TComponentNameProperty = class(TStringProperty);
```

C++

```
class TComponentNameProperty : public TStringProperty;
```

File

DesignEditors

Description

This is class DesignEditors.TComponentNameProperty.

59.1.6.1 TComponentNameProperty Members

The following tables list the members exposed by TComponentNameProperty.

Protected Data Members

	Name	Description
	FRefCount (see page 22278)	This is FRefCount, a member of class TInterfacedObject.

Protected Methods

	Name	Description
	_AddRef (see page 22278)	Implements the IInterface (see page 22396) System::TInterfacedObject::_AddRef method.
	_Release (see page 22279)	Implements the IInterface (see page 22396) System::TInterfacedObject::_Release method.
	GetEditValue (see page 11027)	This is the overview for the GetEditValue method overload.
	GetFloatValue (see page 11028)	Returns the property value of the first object currently being edited.
	GetFloatValueAt (see page 11028)	Returns the property value of the specified object.
	GetInt64Value (see page 11028)	Returns the property value of the first object currently being edited.
	GetInt64ValueAt (see page 11029)	Returns the property value of the specified object.
	GetIntfValue (see page 11029)	Returns the property value of the first object currently being edited.
	GetIntfValueAt (see page 11030)	Returns the property value of the specified object.
V	GetIsDefault (see page 11030)	This is GetIsDefault, a member of class TPropertyEditor.
	GetMethodValue (see page 11031)	Returns the property value of the first object currently being edited.
	GetMethodValueAt (see page 11031)	Returns the property value of the specified object.
	GetOrdValue (see page 11032)	Returns the property value of the first object currently being edited.
	GetOrdValueAt (see page 11032)	Returns the property value of the specified object.
	GetStrValue (see page 11034)	Returns the property value of the first object currently being edited.
	GetStrValueAt (see page 11034)	Returns the property value of the specified object.
	GetVarValue (see page 11036)	Returns the property value of the first object currently being edited.
	GetVarValueAt (see page 11036)	Returns the property value of the specified object.
	GetWideStrValue (see page 11037)	This is GetWideStrValue, a member of class TPropertyEditor.
	GetWideStrValueAt (see page 11037)	This is GetWideStrValueAt, a member of class TPropertyEditor.
	HasInstance (see page 11038)	Indicates whether a specified object is currently being edited by the property editor.
A	Initialize (see page 11114)	Initializes the property editor after it is created but before it is used.
	Modified (see page 11038)	Informs the designer that the property value has changed.
	QueryInterface (see page 22280)	Implements the IInterface (see page 22396) System::TInterfacedObject::QueryInterface method.
	SetFloatValue (see page 11039)	Changes the property value for every object being edited.
	SetInt64Value (see page 11040)	Changes the property value for every object being edited.
	SetIntfValue (see page 11040)	Changes the property value for every object being edited.
	SetMethodValue (see page 11040)	Changes the property value for every object being edited.
	SetOrdValue (see page 11041)	Changes the property value for every object being edited.
V	SetPropEntry (see page 11041)	Informs the property editor of a particular object whose property is to be edited.
A	SetPropEntry (see page 11115)	Informs the property editor of a particular object whose property is to be edited.

	SetStrValue (see page 11042)	Changes the property value for every object being edited.
	SetVarValue (see page 11043)	Changes the property value for every object being edited.
	SetWideStrValue (see page 11043)	This is SetWideStrValue, a member of class TPropertyEditor.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	Activate (see page 11024)	Responds when the property is selected in the Object Inspector.
	Activate (see page 11199)	Responds when the property is selected in the Object Inspector.
V	AfterConstruction (see page 22279)	Responds after the last constructor executes.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	AllEqual (see page 11024)	Indicates whether all selected components have the same value for the property.
V	AllEqual (see page 11065)	Indicates whether all selected components have the same value for the property.
	AllEqual (see page 11199)	Indicates whether all selected components have the same value for the property.
V	AutoFill (see page 11025)	Returns true to indicate that values can be typed incrementally—and automatically completed—in the Object Inspector.
	AutoFill (see page 11200)	Returns true to indicate that values can be typed incrementally—and automatically completed—in the Object Inspector.
V	BeforeDestruction (see page 22279)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 11022)	Creates a new TPropertyEditor (see page 11019) object.
V	Create (see page 11114)	Creates a new TBasePropertyEditor (see page 11112) object.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 11022)	Destroys an instance of TPropertyEditor (see page 11019).
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
V	Edit (see page 11025)	Responds when the user double-clicks the property in the Object Inspector.
	Edit (see page 11200)	Responds when the user double-clicks the property in the Object Inspector.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
V	GetAttributes (see page 10943)	Describes the property so the Object Inspector provides the appropriate controls.
	GetComponent (see page 11026)	Returns the specified object from the set of all objects currently being edited by the property editor.
V	GetEditLimit (see page 10943)	Returns the maximum length, in characters, of the Value property.
	GetEditValue (see page 11201)	Retrieves a string to represent the property's value, or, if the value is not available, an error message.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIsDefault (see page 11206)	This is GetIsDefault, a member of class IProperty70.
	GetKind (see page 11030)	This is GetKind, a member of class TPropertyEditor.
	GetKind (see page 11212)	This is GetKind, a member of class IPropertyKind.

V	GetName (see page 11032)	Returns the name of the property.
	GetName (see page 11202)	Returns the name of the property.
V	GetProperties (see page 11033)	Provides the subproperties of the property to a callback procedure.
	GetProperties (see page 11202)	Provides the subproperties of the property to a callback procedure.
V	GetPropInfo (see page 11033)	Returns the property information record for the object being edited.
	GetPropInfo (see page 11202)	Returns the property information record for the object being edited.
	GetPropType (see page 11033)	Returns the type information record for the object being edited.
	GetPropType (see page 11203)	Returns the type information record for the object being edited.
V	GetValue (see page 11035)	Returns the property value formatted as a string.
V	GetValue (see page 11065)	Returns the property value formatted as a string.
	GetValue (see page 11203)	Returns the property value formatted as a string.
V	GetValues (see page 11035)	Provides the enumerated values of the property to a callback procedure.
	GetValues (see page 11203)	Provides the enumerated values of the property to a callback procedure.
V	GetValueW (see page 11036)	This is GetValueW, a member of class TPropertyEditor.
	GetVisualValue (see page 11037)	Returns the property value as it appears in the Object Inspector.
	HasInstance (see page 11204)	Indicates whether a specified object is currently being edited by the property editor.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
V	Initialize (see page 11038)	Initializes the property editor after it is created but before it is used.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22280)	Allocates memory for each instance of an interfaced object.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	Revert (see page 11039)	Restores all object properties to their original values.
	Revert (see page 11204)	Restores all object properties to their original values.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
V	SetValue (see page 11066)	Responds when the user changes the value of the property.
	SetValue (see page 11204)	Responds when the user changes the value of the property.
V	SetValue (see page 11042)	This is the overview for the SetValue method overload.
	ValueAvailable (see page 11044)	Indicates whether all components being edited have a value for the property if their ComponentStyle includes csCheckPropAvail.
	ValueAvailable (see page 11205)	Indicates whether all components being edited have a value for the property if their ComponentStyle includes csCheckPropAvail.

Public Properties

	Name	Description
R	Designer (see page 11044)	Provides access to the form designer object in the IDE.
R	IsDefault (see page 11206)	This is IsDefault, a member of class IProperty70.
R	Kind (see page 11212)	This is Kind, a member of class IPropertyKind.
R	PrivateDirectory (see page 11044)	Specifies the location where the property editor can store auxiliary files.
R	PropCount (see page 11045)	Indicates the number of components whose properties are being edited.
R	RefCount (see page 22281)	Indicates the number of interface pointers currently dependent upon the object.
	Value (see page 11045)	Represents the current value of the property (as returned by GetValue (see page 11035)) as a string.

59.1.6.2 TComponentNameProperty Methods

The methods of the TComponentNameProperty class are listed here.

Public Methods

	Name	Description
	GetAttributes (see page 10943)	Describes the property so the Object Inspector provides the appropriate controls.
	GetEditLimit (see page 10943)	Returns the maximum length, in characters, of the Value property.

59.1.6.2.1 TComponentNameProperty.GetAttributes Method

Describes the property so the Object Inspector provides the appropriate controls.

Pascal

```
function GetAttributes: TPropertyAttributes; override;
```

C++

```
virtual __fastcall TPropertyAttributes GetAttributes();
```

Description

The Object Inspector calls GetAttributes to determine what controls to display for the property and what property editor methods to call. The GetAttributes method of TPropertyEditor returns [paMultiSelect, paRevertable]. Override GetAttributes to return the set of values that corresponds to the attributes of the associated property.

Before the Object Inspector calls the Activate method, GetAttributes does not need to provide accurate information about any attributes other than paSubProperties, paVCL, and paMultiSelect.

GetValues (see page 11035)

setvalue (see page 11042)

Value (see page 11045)

ListDrawValue

ListMeasureHeight

ListMeasureWidth

59.1.6.2.2 TComponentNameProperty.GetEditLimit Method

Returns the maximum length, in characters, of the Value property.

Pascal

```
function GetEditLimit: Integer; override;
```

C++

```
virtual __fastcall int GetEditLimit();
```

Description

The Object Inspector calls GetEditLimit to determine how many characters the user can type when entering a value for the property. GetEditLimit returns 255. Override this method when the maximum length of the property string is some other value.

DesignEditors

Description

This is class DesignEditors.TComponentProperty.

59.1.7.1 TComponentProperty Members

The following tables list the members exposed by TComponentProperty.

Protected Data Members

	Name	Description
	FRefCount (see page 22278)	This is FRefCount, a member of class TInterfacedObject.

Protected Methods

	Name	Description
	_AddRef (see page 22278)	Implements the IInterface (see page 22396) System::TInterfacedObject::_AddRef method.
	_Release (see page 22279)	Implements the IInterface (see page 22396) System::TInterfacedObject::_Release method.
	FilterFunc (see page 10948)	This is FilterFunc, a member of class TComponentProperty.
V	GetComponentReference (see page 10949)	This is GetComponentReference, a member of class TComponentProperty.
	GetEditValue (see page 11027)	This is the overview for the GetEditValue method overload.
	GetFloatValue (see page 11028)	Returns the property value of the first object currently being edited.
	GetFloatValueAt (see page 11028)	Returns the property value of the specified object.
	GetInt64Value (see page 11028)	Returns the property value of the first object currently being edited.
	GetInt64ValueAt (see page 11029)	Returns the property value of the specified object.
	GetIntfValue (see page 11029)	Returns the property value of the first object currently being edited.

	GetIntfValueAt (see page 11030)	Returns the property value of the specified object.
V	GetIsDefault (see page 11030)	This is GetIsDefault, a member of class TPropertyEditor.
	GetMethodValue (see page 11031)	Returns the property value of the first object currently being edited.
	GetMethodValueAt (see page 11031)	Returns the property value of the specified object.
	GetOrdValue (see page 11032)	Returns the property value of the first object currently being edited.
	GetOrdValueAt (see page 11032)	Returns the property value of the specified object.
V	GetSelections (see page 10950)	This is GetSelections, a member of class TComponentProperty.
	GetStrValue (see page 11034)	Returns the property value of the first object currently being edited.
	GetStrValueAt (see page 11034)	Returns the property value of the specified object.
	GetVarValue (see page 11036)	Returns the property value of the first object currently being edited.
	GetVarValueAt (see page 11036)	Returns the property value of the specified object.
	GetWideStrValue (see page 11037)	This is GetWideStrValue, a member of class TPropertyEditor.
	GetWideStrValueAt (see page 11037)	This is GetWideStrValueAt, a member of class TPropertyEditor.
	HasInstance (see page 11038)	Indicates whether a specified object is currently being edited by the property editor.
A	Initialize (see page 11114)	Initializes the property editor after it is created but before it is used.
	Modified (see page 11038)	Informs the designer that the property value has changed.
	QueryInterface (see page 22280)	Implements the IInterface (see page 22396) System::TInterfacedObject::QueryInterface method.
	SetFloatValue (see page 11039)	Changes the property value for every object being edited.
	SetInt64Value (see page 11040)	Changes the property value for every object being edited.
	SetIntfValue (see page 11040)	Changes the property value for every object being edited.
	SetMethodValue (see page 11040)	Changes the property value for every object being edited.
	SetOrdValue (see page 11041)	Changes the property value for every object being edited.
V	SetPropEntry (see page 11041)	Informs the property editor of a particular object whose property is to be edited.
A	SetPropEntry (see page 11115)	Informs the property editor of a particular object whose property is to be edited.
	SetStrValue (see page 11042)	Changes the property value for every object being edited.
	SetVarValue (see page 11043)	Changes the property value for every object being edited.
	SetWideStrValue (see page 11043)	This is SetWideStrValue, a member of class TPropertyEditor.
V	ShowReferenceProperty (see page 10951)	This is ShowReferenceProperty, a member of class TComponentProperty.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	Activate (see page 11024)	Responds when the property is selected in the Object Inspector.
	Activate (see page 11199)	Responds when the property is selected in the Object Inspector.
V	AfterConstruction (see page 22279)	Responds after the last constructor executes.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	AllEqual (see page 10947)	Indicates whether all selected components have the same value for the property.
V	AutoFill (see page 11025)	Returns true to indicate that values can be typed incrementally—and automatically completed—in the Object Inspector.
	AutoFill (see page 11200)	Returns true to indicate that values can be typed incrementally—and automatically completed—in the Object Inspector.
V	BeforeDestruction (see page 22279)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 11022)	Creates a new TPropertyEditor (see page 11019) object.
V	Create (see page 11114)	Creates a new TBasePropertyEditor (see page 11112) object.

	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 11022)	Destroys an instance of TPropertyEditor (see page 11019).
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
V	Edit (see page 10948)	Responds when the user double-clicks the property in the Object Inspector.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
V	GetAttributes (see page 10948)	Describes the property so the Object Inspector provides the appropriate controls.
	GetComponent (see page 11026)	Returns the specified object from the set of all objects currently being edited by the property editor.
V	GetEditLimit (see page 10949)	Returns the maximum length, in characters, of the Value property.
	GetEditValue (see page 11201)	Retrieves a string to represent the property's value, or, if the value is not available, an error message.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIsDefault (see page 11206)	This is GetIsDefault, a member of class IProperty70.
	GetKind (see page 11030)	This is GetKind, a member of class TPropertyEditor.
	GetKind (see page 11212)	This is GetKind, a member of class IPropertyKind.
V	GetName (see page 11032)	Returns the name of the property.
	GetName (see page 11202)	Returns the name of the property.
V	GetProperties (see page 10949)	Provides the subproperties of the property to a callback procedure.
V	GetPropInfo (see page 11033)	Returns the property information record for the object being edited.
	GetPropInfo (see page 11202)	Returns the property information record for the object being edited.
	GetPropType (see page 11033)	Returns the type information record for the object being edited.
	GetPropType (see page 11203)	Returns the type information record for the object being edited.
V	GetValue (see page 10950)	Returns the property value formatted as a string.
V	GetValues (see page 10951)	Provides the enumerated values of the property to a callback procedure.
V	GetValueW (see page 11036)	This is GetValueW, a member of class TPropertyEditor.
	GetVisualValue (see page 11037)	Returns the property value as it appears in the Object Inspector.
	HasInstance (see page 11204)	Indicates whether a specified object is currently being edited by the property editor.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
V	Initialize (see page 11038)	Initializes the property editor after it is created but before it is used.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22280)	Allocates memory for each instance of an interfaced object.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	Revert (see page 11039)	Restores all object properties to their original values.
	Revert (see page 11204)	Restores all object properties to their original values.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
V	SetValue (see page 10951)	Responds when the user changes the value of the property.
V	SetValue (see page 11042)	This is the overview for the SetValue method overload.
	ValueAvailable (see page 11044)	Indicates whether all components being edited have a value for the property if their ComponentStyle includes csCheckPropAvail.
	ValueAvailable (see page 11205)	Indicates whether all components being edited have a value for the property if their ComponentStyle includes csCheckPropAvail.

Public Properties

	Name	Description
R	Designer (see page 11044)	Provides access to the form designer object in the IDE.
R	IsDefault (see page 11206)	This is IsDefault, a member of class IProperty70.
R	Kind (see page 11212)	This is Kind, a member of class IPropertyKind.
R	PrivateDirectory (see page 11044)	Specifies the location where the property editor can store auxiliary files.
R	PropCount (see page 11045)	Indicates the number of components whose properties are being edited.
R	RefCount (see page 22281)	Indicates the number of interface pointers currently dependent upon the object.
	Value (see page 11045)	Represents the current value of the property (as returned by GetValue (see page 11035)) as a string.

59.1.7.2 TComponentProperty Methods

The methods of the TComponentProperty class are listed here.

Protected Methods

	Name	Description
	FilterFunc (see page 10948)	This is FilterFunc, a member of class TComponentProperty.
V	GetComponentReference (see page 10949)	This is GetComponentReference, a member of class TComponentProperty.
V	GetSelections (see page 10950)	This is GetSelections, a member of class TComponentProperty.
V	ShowReferenceProperty (see page 10951)	This is ShowReferenceProperty, a member of class TComponentProperty.

Public Methods

	Name	Description
V	AllEqual (see page 10947)	Indicates whether all selected components have the same value for the property.
V	Edit (see page 10948)	Responds when the user double-clicks the property in the Object Inspector.
V	GetAttributes (see page 10948)	Describes the property so the Object Inspector provides the appropriate controls.
V	GetEditLimit (see page 10949)	Returns the maximum length, in characters, of the Value property.
V	GetProperties (see page 10949)	Provides the subproperties of the property to a callback procedure.
V	GetValue (see page 10950)	Returns the property value formatted as a string.
V	GetValues (see page 10951)	Provides the enumerated values of the property to a callback procedure.
V	SetValue (see page 10951)	Responds when the user changes the value of the property.

59.1.7.2.1 TComponentProperty.AllEqual Method

Indicates whether all selected components have the same value for the property.

Pascal

```
function AllEqual: Boolean; override;
```

C++

```
virtual __fastcall Boolean AllEqual();
```

Description

The Object Inspector calls AllEqual when there is more than one component selected to determine whether a value should appear for this property. If this method returns true, the Object Inspector displays a value for the property. If this method returns false, the line for the property in the Object Inspector remains blank.

In TPropertyEditor, AllEqual always returns false if more than one selected component has the associated property. Override this method to check the properties of individual components and determine whether a property value can be displayed in the Object Inspector.

Note: AllEqual is called only when the value returned by GetAttributes includes paMultiSelect.

See Also

GetAttributes (see page 11026)

GetComponent (see page 11026)

GetValue (see page 11035)

59.1.7.2.2 TComponentProperty.Edit Method

Responds when the user double-clicks the property in the Object Inspector.

Pascal

```
procedure Edit; override;
```

C++

```
virtual __fastcall Edit();
```

Description

The Object Inspector calls Edit when the ellipsis button (...) is pressed or the property is double-clicked. The Edit method of TPropertyEditor cycles through the possible enumerated values of the property when the GetValues method returns one or more property strings to the callback method.

Override the Edit method to implement a response to the ellipsis button or double-clicking the property. For example, use the Edit method to bring up a dialog for editing the property in some more meaningful fashion than typing a text value in the Object Inspector.

See Also

GetValues (see page 11035)

Value (see page 11045)

59.1.7.2.3 TComponentProperty.FilterFunc Method

Pascal

```
function FilterFunc(const ATestEditor: IProperty): Boolean;
```

C++

```
__fastcall Boolean FilterFunc(const IProperty ATestEditor);
```

Description

This is FilterFunc, a member of class TComponentProperty.

59.1.7.2.4 TComponentProperty.GetAttributes Method

Describes the property so the Object Inspector provides the appropriate controls.

Pascal

```
function GetAttributes: TPropertyAttributes; override;
```

C++

```
virtual __fastcall TPropertyAttributes GetAttributes();
```

Description

The Object Inspector calls GetAttributes to determine what controls to display for the property and what property editor methods

to call. The GetAttributes method of TPropertyEditor returns [paMultiSelect, paRevertable]. Override GetAttributes to return the set of values that corresponds to the attributes of the associated property.

Before the Object Inspector calls the Activate method, GetAttributes does not need to provide accurate information about any attributes other than paSubProperties, paVCL, and paMultiSelect.

See Also

Activate (see page 11024)

Edit (see page 11025)

GetProperties (see page 11033)

GetValues (see page 11035)

setvalue (see page 11042)

Value (see page 11045)

ListDrawValue

ListMeasureHeight

ListMeasureWidth

59.1.7.2.5 TComponentProperty.GetComponentReference Method

Pascal

```
function GetComponentReference: TComponent; virtual;
```

C++

```
virtual __fastcall TComponent * GetComponentReference();
```

Description

This is GetComponentReference, a member of class TComponentProperty.

59.1.7.2.6 TComponentProperty.GetEditLimit Method

Returns the maximum length, in characters, of the Value property.

Pascal

```
function GetEditLimit: Integer; override;
```

C++

```
virtual __fastcall int GetEditLimit();
```

Description

The Object Inspector calls GetEditLimit to determine how many characters the user can type when entering a value for the property. GetEditLimit returns 255. Override this method when the maximum length of the property string is some other value.

See Also

Value (see page 11045)

59.1.7.2.7 TComponentProperty.GetProperties Method

Provides the subproperties of the property to a callback procedure.

Pascal

```
procedure GetProperties(Proc: TGetPropProc); override;
```

C++

```
virtual __fastcall GetProperties(TGetPropProc Proc);
```

Description

The Object Inspector calls GetProperties when the property is expanded to show subproperties. The GetProperties method of TPropertyEditor does nothing. Property editors that return paSubProperties from the GetAttributes method should override GetProperties to create an appropriate property editor and pass its IProperty interface to the Proc parameter for every subproperty (or nested property) of the property.

See Also

GetAttributes (see page 11026)

59.1.7.2.8 TComponentProperty.GetSelections Method

Pascal

```
function GetSelections: IDesignerSelections; virtual;
```

C++

```
virtual __fastcall IDesignerSelections GetSelections();
```

Description

This is GetSelections, a member of class TComponentProperty.

59.1.7.2.9 TComponentProperty.GetValue Method

Returns the property value formatted as a string.

Pascal

```
function GetValue: string; override;
```

C++

```
virtual __fastcall AnsiString GetValue();
```

Description

GetValue formats the value of the property, formatted as a string. If the value is not available, GetValue raised an exception.

As implemented in TPropertyEditor, GetValue returns the string "(unknown)". Descendant classes override this method to provide an appropriate value string or raise an exception.

GetValue is the read access method of the Value property.

Note: To obtain an error string when the property value is unavailable rather than raising an exception, you can call the GetEditValue method. GetEditValue is protected, but can be called through the IProperty interface in code that is not a method of a descendant class.

See Also

setvalue (see page 11042)

Value (see page 11045)

GetVisualValue (see page 11037)

GetEditValue (see page 11027)

59.1.7.2.10 TComponentProperty.GetValues Method

Provides the enumerated values of the property to a callback procedure.

Pascal

```
procedure GetValues(Proc: TGetStrProc); override;
```

C++

```
virtual __fastcall GetValues(TGetStrProc Proc);
```

Description

The Object Inspector calls GetValues when the drop-down button is clicked to show enumerated values. The GetValues method of TPropertyEditor does nothing. Property editors that return paValueList from the GetAttributes method should override GetValues to call the Proc parameter for every string that can represent a valid enumerated value. Even if the GetAttributes method does not return paValueList, property editors for enumerated types should still override GetValues to enumerate all possible values.

See Also

GetAttributes (see page 11026)

Value (see page 11045)

59.1.7.2.11 TComponentProperty.SetValue Method

Responds when the user changes the value of the property.

Pascal

```
procedure SetValue(const Value: string); override;
```

C++

```
virtual __fastcall SetValue(const AnsiString Value);
```

Description

The Object Inspector calls SetValue when the user has finished changing the property value. SetValue applies the value specified by the Value parameter to all components that it is currently editing. If the value can't be set, SetValue raises an exception that describes the problem.

Note: If the property is changed only through a dialog brought up by the Edit method, the Object Inspector does not call SetValue. Rather, the Edit method should handle the setting of the value on all components.

See Also

Edit (see page 11200)

59.1.7.2.12 TComponentProperty.ShowReferenceProperty Method

Pascal

```
function ShowReferenceProperty: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean ShowReferenceProperty();
```

Description

This is ShowReferenceProperty, a member of class TComponentProperty.

59.1.8 TCustomModule Class

Class Hierarchy

Pascal

```
TCustomModule = class(TBaseCustomModule, ICustomModule);
```

C++

```
class TCustomModule : public TBaseCustomModule, public ICustomModule;
```

File

DesignEditors

Description

This is class DesignEditors.TCustomModule.

59.1.8.1 TCustomModule Members

The following tables list the members exposed by TCustomModule.

Protected Data Members

	Name	Description
	FRefCount (see page 22278)	This is FRefCount, a member of class TInterfacedObject.

Protected Methods

	Name	Description
	_AddRef (see page 22278)	Implements the IInterface (see page 22396) System::TInterfacedObject::_AddRef method.
	_Release (see page 22279)	Implements the IInterface (see page 22396) System::TInterfacedObject::_Release method.
	QueryInterface (see page 22280)	Implements the IInterface (see page 22396) System::TInterfacedObject::QueryInterface method.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22279)	Responds after the last constructor executes.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 22279)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.

	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 10953)	This is Create, a member of class TCustomModule.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	DesignClass (see page 11112)	This is DesignClass, a member of class TBaseCustomModule.
V	Destroy (see page 10954)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
V	ExecuteVerb (see page 10955)	This is ExecuteVerb, a member of class TCustomModule.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
V	GetAttributes (see page 10955)	This is GetAttributes, a member of class TCustomModule.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetVerb (see page 10955)	This is GetVerb, a member of class TCustomModule.
V	GetVerbCount (see page 10955)	This is GetVerbCount, a member of class TCustomModule.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	Nestable (see page 10955)	This is Nestable, a member of class TCustomModule.
V	NewInstance (see page 22280)	Allocates memory for each instance of an interfaced object.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	PrepareItem (see page 10956)	This is PrepareItem, a member of class TCustomModule.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
V	Saving (see page 10956)	This is Saving, a member of class TCustomModule.
V	ValidateComponent (see page 10956)	This is ValidateComponent, a member of class TCustomModule.
V	ValidateComponentClass (see page 10956)	This is ValidateComponentClass, a member of class TCustomModule.

Public Properties

	Name	Description
R	Designer (see page 10957)	This is Designer, a member of class TCustomModule.
R	RefCount (see page 22281)	Indicates the number of interface pointers currently dependent upon the object.
R	Root (see page 10957)	This is Root, a member of class TCustomModule.

59.1.8.2 TCustomModule.Create Constructor

Pascal

```
constructor Create(ARoot: TComponent; const ADesigner: IDesigner); override;
```

C++

```
virtual __fastcall TCustomModule(TComponent * ARoot, const IDesigner ADesigner);
```

Description

This is Create, a member of class TCustomModule.

59.1.8.3 TCustomModule.Destroy Destructor

Disposes of an object instance.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TCustomModule();
```

Description

Do not call System::TObject::Destroy directly. Call System::TObject::Free instead. Free verifies that the object reference is not nil before calling System::TObject::Destroy.

The System::TObject::Destroy method defined by System::TObject::TObject deallocates memory. Descendant objects usually define a destructor that is customized for that particular kind of object.

When declaring a System::TObject::Destroy method in a descendant, always add the override directive to the declaration and call the inherited System::TObject::Destroy as the last statement in the overriding method. Since System::TObject::Destroy is a virtual method, overriding it ensures that the proper inherited behavior occurs.

Note: If an exception escapes from the constructor, the destructor is called to destroy the partially constructed object instance that failed to initialize completely. Therefore, destructors should check that allocated resources, such as handles, were actually allocated before trying to release them, since their value might be zero.

System::TObject::Destroy should be implemented so that it calls System::TObject::Free on all subobjects created within the object's constructor (that is, allocated by the constructor). Unlike System::TObject::Destroy, System::TObject::Free provides a safeguard when destroying objects that are nil.

See Also

System::TObject::Free (see page 22300)

59.1.8.4 TCustomModule Methods

The methods of the TCustomModule class are listed here.

Public Methods

	Name	Description
	ExecuteVerb (see page 10955)	This is ExecuteVerb, a member of class TCustomModule.
	GetAttributes (see page 10955)	This is GetAttributes, a member of class TCustomModule.
	GetVerb (see page 10955)	This is GetVerb, a member of class TCustomModule.
	GetVerbCount (see page 10955)	This is GetVerbCount, a member of class TCustomModule.
	Nestable (see page 10955)	This is Nestable, a member of class TCustomModule.
	PrepareItem (see page 10956)	This is PrepareItem, a member of class TCustomModule.
	Saving (see page 10956)	This is Saving, a member of class TCustomModule.
	ValidateComponent (see page 10956)	This is ValidateComponent, a member of class TCustomModule.
	ValidateComponentClass (see page 10956)	This is ValidateComponentClass, a member of class TCustomModule.

59.1.8.4.1 TCustomModule.ExecuteVerb Method

Pascal

```
procedure ExecuteVerb(Index: Integer); virtual;
```

C++

```
virtual __fastcall ExecuteVerb(int Index);
```

Description

This is ExecuteVerb, a member of class TCustomModule.

59.1.8.4.2 TCustomModule.GetAttributes Method

Pascal

```
function GetAttributes: TCustomModuleAttributes; virtual;
```

C++

```
virtual __fastcall TCustomModuleAttributes GetAttributes();
```

Description

This is GetAttributes, a member of class TCustomModule.

59.1.8.4.3 TCustomModule.GetVerb Method

Pascal

```
function GetVerb(Index: Integer): string; virtual;
```

C++

```
virtual __fastcall AnsiString GetVerb(int Index);
```

Description

This is GetVerb, a member of class TCustomModule.

59.1.8.4.4 TCustomModule.GetVerbCount Method

Pascal

```
function GetVerbCount: Integer; virtual;
```

C++

```
virtual __fastcall int GetVerbCount();
```

Description

This is GetVerbCount, a member of class TCustomModule.

59.1.8.4.5 TCustomModule.Nestable Method

Pascal

```
function Nestable: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean Nestable();
```

Description

This is Nestable, a member of class TCustomModule.

59.1.8.4.6 TCustomModule.PrepareItem Method

Pascal

```
procedure PrepareItem(Index: Integer; const AItem: IMenuItem); virtual;
```

C++

```
virtual __fastcall PrepareItem(int Index, const IMenuItem AItem);
```

Description

This is PrepareItem, a member of class TCustomModule.

59.1.8.4.7 TCustomModule.Saving Method

Pascal

```
procedure Saving; virtual;
```

C++

```
virtual __fastcall Saving();
```

Description

This is Saving, a member of class TCustomModule.

59.1.8.4.8 TCustomModule.ValidateComponent Method

Pascal

```
procedure ValidateComponent(Component: TComponent); virtual;
```

C++

```
virtual __fastcall ValidateComponent(TComponent * Component);
```

Description

This is ValidateComponent, a member of class TCustomModule.

59.1.8.4.9 TCustomModule.ValidateComponentClass Method

Pascal

```
function ValidateComponentClass(ComponentClass: TComponentClass): Boolean; virtual;
```

C++

```
virtual __fastcall Boolean ValidateComponentClass(TComponentClass ComponentClass);
```

Description

This is ValidateComponentClass, a member of class TCustomModule.

59.1.8.5 TCustomModule Properties

The properties of the TCustomModule class are listed here.

Public Properties

	Name	Description
R	Designer (see page 10957)	This is Designer, a member of class TCustomModule.
R	Root (see page 10957)	This is Root, a member of class TCustomModule.

59.1.8.5.1 TCustomModule.Designer Property

Pascal

```
property Designer: IDesigner;
```

C++

```
__property IDesigner Designer;
```

Description

This is Designer, a member of class TCustomModule.

59.1.8.5.2 TCustomModule.Root Property

Pascal

```
property Root: TComponent;
```

C++

```
__property TComponent * Root;
```

Description

This is Root, a member of class TCustomModule.

59.1.9 TDateProperty Class

Class Hierarchy

Pascal

```
TDateProperty = class(TPropertyEditor);
```

C++

```
class TDateProperty : public TPropertyEditor;
```

File

DesignEditors

Description

This is class DesignEditors.TDateProperty.

59.1.9.1 TDateProperty Members

The following tables list the members exposed by TDateProperty.

Protected Data Members

	Name	Description
	FRefCount (see page 22278)	This is FRefCount, a member of class TInterfacedObject.

Protected Methods

	Name	Description
	_AddRef (see page 22278)	Implements the IInterface (see page 22396) System::TInterfacedObject::_AddRef method.
	_Release (see page 22279)	Implements the IInterface (see page 22396) System::TInterfacedObject::_Release method.
	GetEditValue (see page 11027)	This is the overview for the GetEditValue method overload.
	GetFloatValue (see page 11028)	Returns the property value of the first object currently being edited.
	GetFloatValueAt (see page 11028)	Returns the property value of the specified object.
	GetInt64Value (see page 11028)	Returns the property value of the first object currently being edited.
	GetInt64ValueAt (see page 11029)	Returns the property value of the specified object.
	GetIntfValue (see page 11029)	Returns the property value of the first object currently being edited.
	GetIntfValueAt (see page 11030)	Returns the property value of the specified object.
V	GetIsDefault (see page 11030)	This is GetIsDefault, a member of class TPropertyEditor.
	GetMethodValue (see page 11031)	Returns the property value of the first object currently being edited.
	GetMethodValueAt (see page 11031)	Returns the property value of the specified object.
	GetOrdValue (see page 11032)	Returns the property value of the first object currently being edited.
	GetOrdValueAt (see page 11032)	Returns the property value of the specified object.
	GetStrValue (see page 11034)	Returns the property value of the first object currently being edited.
	GetStrValueAt (see page 11034)	Returns the property value of the specified object.
	GetVarValue (see page 11036)	Returns the property value of the first object currently being edited.
	GetVarValueAt (see page 11036)	Returns the property value of the specified object.
	GetWideStrValue (see page 11037)	This is GetWideStrValue, a member of class TPropertyEditor.
	GetWideStrValueAt (see page 11037)	This is GetWideStrValueAt, a member of class TPropertyEditor.
	HasInstance (see page 11038)	Indicates whether a specified object is currently being edited by the property editor.
A	Initialize (see page 11114)	Initializes the property editor after it is created but before it is used.
	Modified (see page 11038)	Informs the designer that the property value has changed.
	QueryInterface (see page 22280)	Implements the IInterface (see page 22396) System::TInterfacedObject::QueryInterface method.
	SetFloatValue (see page 11039)	Changes the property value for every object being edited.
	SetInt64Value (see page 11040)	Changes the property value for every object being edited.
	SetIntfValue (see page 11040)	Changes the property value for every object being edited.
	SetMethodValue (see page 11040)	Changes the property value for every object being edited.
	SetOrdValue (see page 11041)	Changes the property value for every object being edited.
V	SetPropEntry (see page 11041)	Informs the property editor of a particular object whose property is to be edited.
A	SetPropEntry (see page 11115)	Informs the property editor of a particular object whose property is to be edited.
	SetStrValue (see page 11042)	Changes the property value for every object being edited.
	SetVarValue (see page 11043)	Changes the property value for every object being edited.
	SetWideStrValue (see page 11043)	This is SetWideStrValue, a member of class TPropertyEditor.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	Activate (see page 11024)	Responds when the property is selected in the Object Inspector.

	Activate (see page 11199)	Responds when the property is selected in the Object Inspector.
	AfterConstruction (see page 22279)	Responds after the last constructor executes.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	AllEqual (see page 11024)	Indicates whether all selected components have the same value for the property.
	AllEqual (see page 11199)	Indicates whether all selected components have the same value for the property.
	AutoFill (see page 11025)	Returns true to indicate that values can be typed incrementally—and automatically completed—in the Object Inspector.
	AutoFill (see page 11200)	Returns true to indicate that values can be typed incrementally—and automatically completed—in the Object Inspector.
	BeforeDestruction (see page 22279)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 11022)	Creates a new TPropertyEditor (see page 11019) object.
	Create (see page 11114)	Creates a new TBasePropertyEditor (see page 11112) object.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 11022)	Destroys an instance of TPropertyEditor (see page 11019).
	Destroy (see page 22287)	Disposes of an object instance.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Edit (see page 11025)	Responds when the user double-clicks the property in the Object Inspector.
	Edit (see page 11200)	Responds when the user double-clicks the property in the Object Inspector.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetAttributes (see page 10960)	Describes the property so the Object Inspector provides the appropriate controls.
	GetComponent (see page 11026)	Returns the specified object from the set of all objects currently being edited by the property editor.
	GetEditLimit (see page 11027)	Returns the maximum length, in characters, of the Value (see page 11045) property.
	GetEditLimit (see page 11201)	Returns the maximum length, in characters, of the value.
	GetEditValue (see page 11201)	Retrieves a string to represent the property's value, or, if the value is not available, an error message.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIsDefault (see page 11206)	This is GetIsDefault, a member of class IProperty70.
	GetKind (see page 11030)	This is GetKind, a member of class TPropertyEditor.
	GetKind (see page 11212)	This is GetKind, a member of class IPropertyKind.
	GetName (see page 11032)	Returns the name of the property.
	GetName (see page 11202)	Returns the name of the property.
	GetProperties (see page 11033)	Provides the subproperties of the property to a callback procedure.
	GetProperties (see page 11202)	Provides the subproperties of the property to a callback procedure.
	GetPropInfo (see page 11033)	Returns the property information record for the object being edited.
	GetPropInfo (see page 11202)	Returns the property information record for the object being edited.
	GetPropType (see page 11033)	Returns the type information record for the object being edited.
	GetPropType (see page 11203)	Returns the type information record for the object being edited.
	GetValue (see page 10961)	Returns the property value formatted as a string.

V	GetValues (see page 11035)	Provides the enumerated values of the property to a callback procedure.
	GetValues (see page 11203)	Provides the enumerated values of the property to a callback procedure.
V	GetValueW (see page 11036)	This is GetValueW, a member of class TPropertyEditor.
	GetVisualValue (see page 11037)	Returns the property value as it appears in the Object Inspector.
	HasInstance (see page 11204)	Indicates whether a specified object is currently being edited by the property editor.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
V	Initialize (see page 11038)	Initializes the property editor after it is created but before it is used.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22280)	Allocates memory for each instance of an interfaced object.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	Revert (see page 11039)	Restores all object properties to their original values.
	Revert (see page 11204)	Restores all object properties to their original values.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
V	SetValue (see page 10962)	Responds when the user changes the value of the property.
V	SetValue (see page 11042)	This is the overview for the SetValue method overload.
	ValueAvailable (see page 11044)	Indicates whether all components being edited have a value for the property if their ComponentStyle includes csCheckPropAvail.
	ValueAvailable (see page 11205)	Indicates whether all components being edited have a value for the property if their ComponentStyle includes csCheckPropAvail.

Public Properties

	Name	Description
R	Designer (see page 11044)	Provides access to the form designer object in the IDE.
R	IsDefault (see page 11206)	This is IsDefault, a member of class IProperty70.
R	Kind (see page 11212)	This is Kind, a member of class IPropertyKind.
R	PrivateDirectory (see page 11044)	Specifies the location where the property editor can store auxiliary files.
R	PropCount (see page 11045)	Indicates the number of components whose properties are being edited.
R	RefCount (see page 22281)	Indicates the number of interface pointers currently dependent upon the object.
	Value (see page 11045)	Represents the current value of the property (as returned by GetValue (see page 11035)) as a string.

59.1.9.2 TDateProperty Methods

The methods of the TDateProperty class are listed here.

Public Methods

	Name	Description
V	GetAttributes (see page 10960)	Describes the property so the Object Inspector provides the appropriate controls.
V	GetValue (see page 10961)	Returns the property value formatted as a string.
V	SetValue (see page 10962)	Responds when the user changes the value of the property.

59.1.9.2.1 TDateProperty.GetAttributes Method

Describes the property so the Object Inspector provides the appropriate controls.

Pascal

```
function GetAttributes: TPropertyAttributes; override;
```

C++

```
virtual __fastcall TPropertyAttributes GetAttributes();
```

Description

The Object Inspector calls GetAttributes to determine what controls to display for the property and what property editor methods to call. The GetAttributes method of TPropertyEditor returns [paMultiSelect, paRevertable]. Override GetAttributes to return the set of values that corresponds to the attributes of the associated property.

Before the Object Inspector calls the Activate method, GetAttributes does not need to provide accurate information about any attributes other than paSubProperties, paVCL, and paMultiSelect.

See Also

Activate (see page 11024)

Edit (see page 11025)

GetProperties (see page 11033)

GetValues (see page 11035)

setvalue (see page 11042)

Value (see page 11045)

ListDrawValue

ListMeasureHeight

ListMeasureWidth

59.1.9.2.2 TDateProperty.GetValue Method

Returns the property value formatted as a string.

Pascal

```
function GetValue: string; override;
```

C++

```
virtual __fastcall AnsiString GetValue();
```

Description

GetValue formats the value of the property, formatted as a string. If the value is not available, GetValue raised an exception.

As implemented in TPropertyEditor, GetValue returns the string "(unknown)". Descendant classes override this method to provide an appropriate value string or raise an exception.

GetValue is the read access method of the Value property.

Note: To obtain an error string when the property value is unavailable rather than raising an exception, you can call the GetEditValue method. GetEditValue is protected, but can be called through the IProperty interface in code that is not a method of a descendant class.

See Also

setvalue (see page 11042)

Value (see page 11045)

GetVisualValue (see page 11037)

GetEditValue (see page 11027)

59.1.9.2.3 TDateProperty.SetValue Method

Responds when the user changes the value of the property.

Pascal

```
procedure SetValue(const Value: string); override;
```

C++

```
virtual __fastcall SetValue(const AnsiString Value);
```

Description

The Object Inspector calls SetValue when the user has finished changing the property value. SetValue applies the value specified by the Value parameter to all components that it is currently editing. If the value can't be set, SetValue raises an exception that describes the problem.

Note: If the property is changed only through a dialog brought up by the Edit method, the Object Inspector does not call SetValue. Rather, the Edit method should handle the setting of the value on all components.

59.1.10 TDateTimeProperty Class

Class Hierarchy

Pascal

```
TDateTimeProperty = class(TPropertyEditor);
```

C++

```
class TDateTimeProperty : public TPropertyEditor;
```

File

DesignEditors

Description

This is class DesignEditors.TDateTimeProperty.

59.1.10.1 TDateTimeProperty Members

The following tables list the members exposed by TDateTimeProperty.

Protected Data Members

	Name	Description
	FRefCount (see page 22278)	This is FRefCount, a member of class TInterfacedObject.

Protected Methods

	Name	Description
	_AddRef (see page 22278)	Implements the IInterface (see page 22396) System::TInterfacedObject::_AddRef method.
	_Release (see page 22279)	Implements the IInterface (see page 22396) System::TInterfacedObject::_Release method.
	GetEditValue (see page 11027)	This is the overview for the GetEditValue method overload.
	GetFloatValue (see page 11028)	Returns the property value of the first object currently being edited.
	GetFloatValueAt (see page 11028)	Returns the property value of the specified object.
	GetInt64Value (see page 11028)	Returns the property value of the first object currently being edited.
	GetInt64ValueAt (see page 11029)	Returns the property value of the specified object.
	GetIntfValue (see page 11029)	Returns the property value of the first object currently being edited.
	GetIntfValueAt (see page 11030)	Returns the property value of the specified object.
V	GetIsDefault (see page 11030)	This is GetIsDefault, a member of class TPropertyEditor.
	GetMethodValue (see page 11031)	Returns the property value of the first object currently being edited.
	GetMethodValueAt (see page 11031)	Returns the property value of the specified object.
	GetOrdValue (see page 11032)	Returns the property value of the first object currently being edited.
	GetOrdValueAt (see page 11032)	Returns the property value of the specified object.
	GetStrValue (see page 11034)	Returns the property value of the first object currently being edited.
	GetStrValueAt (see page 11034)	Returns the property value of the specified object.
	GetVarValue (see page 11036)	Returns the property value of the first object currently being edited.
	GetVarValueAt (see page 11036)	Returns the property value of the specified object.
	GetWideStrValue (see page 11037)	This is GetWideStrValue, a member of class TPropertyEditor.
	GetWideStrValueAt (see page 11037)	This is GetWideStrValueAt, a member of class TPropertyEditor.
	HasInstance (see page 11038)	Indicates whether a specified object is currently being edited by the property editor.
A	Initialize (see page 11114)	Initializes the property editor after it is created but before it is used.
	Modified (see page 11038)	Informs the designer that the property value has changed.
	QueryInterface (see page 22280)	Implements the IInterface (see page 22396) System::TInterfacedObject::QueryInterface method.
	SetFloatValue (see page 11039)	Changes the property value for every object being edited.
	SetInt64Value (see page 11040)	Changes the property value for every object being edited.
	SetIntfValue (see page 11040)	Changes the property value for every object being edited.
	SetMethodValue (see page 11040)	Changes the property value for every object being edited.
	SetOrdValue (see page 11041)	Changes the property value for every object being edited.
V	SetPropEntry (see page 11041)	Informs the property editor of a particular object whose property is to be edited.
A	SetPropEntry (see page 11115)	Informs the property editor of a particular object whose property is to be edited.
	SetStrValue (see page 11042)	Changes the property value for every object being edited.
	SetVarValue (see page 11043)	Changes the property value for every object being edited.
	SetWideStrValue (see page 11043)	This is SetWideStrValue, a member of class TPropertyEditor.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	Activate (see page 11024)	Responds when the property is selected in the Object Inspector.
	Activate (see page 11199)	Responds when the property is selected in the Object Inspector.
V	AfterConstruction (see page 22279)	Responds after the last constructor executes.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	AllEqual (see page 11024)	Indicates whether all selected components have the same value for the property.
	AllEqual (see page 11199)	Indicates whether all selected components have the same value for the property.
V	AutoFill (see page 11025)	Returns true to indicate that values can be typed incrementally—and automatically completed—in the Object Inspector.
	AutoFill (see page 11200)	Returns true to indicate that values can be typed incrementally—and automatically completed—in the Object Inspector.

	BeforeDestruction (see page 22279)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 11022)	Creates a new TPropertyEditor (see page 11019) object.
	Create (see page 11114)	Creates a new TBasePropertyEditor (see page 11112) object.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 11022)	Destroys an instance of TPropertyEditor (see page 11019).
	Destroy (see page 22287)	Disposes of an object instance.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Edit (see page 11025)	Responds when the user double-clicks the property in the Object Inspector.
	Edit (see page 11200)	Responds when the user double-clicks the property in the Object Inspector.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetAttributes (see page 10965)	Describes the property so the Object Inspector provides the appropriate controls.
	GetComponent (see page 11026)	Returns the specified object from the set of all objects currently being edited by the property editor.
	GetEditLimit (see page 11027)	Returns the maximum length, in characters, of the Value (see page 11045) property.
	GetEditLimit (see page 11201)	Returns the maximum length, in characters, of the value.
	GetEditValue (see page 11201)	Retrieves a string to represent the property's value, or, if the value is not available, an error message.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIsDefault (see page 11206)	This is GetIsDefault, a member of class IProperty70.
	GetKind (see page 11030)	This is GetKind, a member of class TPropertyEditor.
	GetKind (see page 11212)	This is GetKind, a member of class IPropertyKind.
	GetName (see page 11032)	Returns the name of the property.
	GetName (see page 11202)	Returns the name of the property.
	GetProperties (see page 11033)	Provides the subproperties of the property to a callback procedure.
	GetProperties (see page 11202)	Provides the subproperties of the property to a callback procedure.
	GetPropInfo (see page 11033)	Returns the property information record for the object being edited.
	GetPropInfo (see page 11202)	Returns the property information record for the object being edited.
	GetPropType (see page 11033)	Returns the type information record for the object being edited.
	GetPropType (see page 11203)	Returns the type information record for the object being edited.
	GetValue (see page 10966)	Returns the property value formatted as a string.
	GetValues (see page 11035)	Provides the enumerated values of the property to a callback procedure.
	GetValues (see page 11203)	Provides the enumerated values of the property to a callback procedure.
	GetValueW (see page 11036)	This is GetValueW, a member of class TPropertyEditor.
	GetVisualValue (see page 11037)	Returns the property value as it appears in the Object Inspector.
	HasInstance (see page 11204)	Indicates whether a specified object is currently being edited by the property editor.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	Initialize (see page 11038)	Initializes the property editor after it is created but before it is used.

	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22280)	Allocates memory for each instance of an interfaced object.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	Revert (see page 11039)	Restores all object properties to their original values.
	Revert (see page 11204)	Restores all object properties to their original values.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
V	SetValue (see page 10966)	Responds when the user changes the value of the property.
V	SetValue (see page 11042)	This is the overview for the SetValue method overload.
	ValueAvailable (see page 11044)	Indicates whether all components being edited have a value for the property if their ComponentStyle includes csCheckPropAvail.
	ValueAvailable (see page 11205)	Indicates whether all components being edited have a value for the property if their ComponentStyle includes csCheckPropAvail.

Public Properties

	Name	Description
R	Designer (see page 11044)	Provides access to the form designer object in the IDE.
R	IsDefault (see page 11206)	This is IsDefault, a member of class IProperty70.
R	Kind (see page 11212)	This is Kind, a member of class IPropertyKind.
R	PrivateDirectory (see page 11044)	Specifies the location where the property editor can store auxiliary files.
R	PropCount (see page 11045)	Indicates the number of components whose properties are being edited.
R	RefCount (see page 22281)	Indicates the number of interface pointers currently dependent upon the object.
	Value (see page 11045)	Represents the current value of the property (as returned by GetValue (see page 11035)) as a string.

59.1.10.2 TDateTimeProperty Methods

The methods of the TDateTimeProperty class are listed here.

Public Methods

	Name	Description
V	GetAttributes (see page 10965)	Describes the property so the Object Inspector provides the appropriate controls.
V	GetValue (see page 10966)	Returns the property value formatted as a string.
V	SetValue (see page 10966)	Responds when the user changes the value of the property.

59.1.10.2.1 TDateTimeProperty.GetAttributes Method

Describes the property so the Object Inspector provides the appropriate controls.

Pascal

```
function GetAttributes: TPropertyAttributes; override;
```

C++

```
virtual __fastcall TPropertyAttributes GetAttributes();
```

Description

The Object Inspector calls GetAttributes to determine what controls to display for the property and what property editor methods to call. The GetAttributes method of TPropertyEditor returns [paMultiSelect, paRevertable]. Override GetAttributes to return the set of values that corresponds to the attributes of the associated property.

Before the Object Inspector calls the Activate method, GetAttributes does not need to provide accurate information about any attributes other than paSubProperties, paVCL, and paMultiSelect.

Activate (see page 11024)

Edit (see page 11025)

GetProperties (see page 11033)

GetValues (see page 11035)

setvalue (see page 11042)

Value (see page 11045)

ListDrawValue

ListMeasureHeight

ListMeasureWidth

59.1.10.2.2 TDateTimeProperty.GetValue Method

Returns the property value formatted as a string.

Pascal

```
function GetValue: string; override;
```

C++

```
virtual __fastcall AnsiString GetValue();
```

Description

GetValue formats the value of the property, formatted as a string. If the value is not available, GetValue raised an exception.

As implemented in TPropertyEditor, GetValue returns the string "(unknown)". Descendant classes override this method to provide an appropriate value string or raise an exception.

GetValue is the read access method of the Value property.

Note: To obtain an error string when the property value is unavailable rather than raising an exception, you can call the GetEditValue method. GetEditValue is protected, but can be called through the IProperty interface in code that is not a method of a descendant class.

See Also

setvalue (see page 11042)

Value (see page 11045)

GetVisualValue (see page 11037)

GetEditValue (see page 11027)

59.1.10.2.3 TDateTimeProperty.SetValue Method

Responds when the user changes the value of the property.

Pascal

```
procedure SetValue(const Value: string); override;
```

C++

```
virtual __fastcall SetValue(const AnsiString Value);
```

Description

The Object Inspector calls SetValue when the user has finished changing the property value. SetValue applies the value specified by the Value parameter to all components that it is currently editing. If the value can't be set, SetValue raises an exception that describes the problem.

Note: If the property is changed only through a dialog brought up by the Edit method, the Object Inspector does not call SetValue. Rather, the Edit method should handle the setting of the value on all components.

Edit (see page 11200)

59.1.11 TDefaultEditor Class

TDefaultEditor is the component editor for components that do not explicitly register a component editor.

Class Hierarchy

Pascal

```
TDefaultEditor = class(TComponentEditor, IDefaultEditor);
```

C++

```
class TDefaultEditor : public TComponentEditor, public IDefaultEditor;
```

File

DesignEditors

Description

When a component class does not have a registered property editor, TDefaultEditor controls its response to right clicks, double clicks, and clipboard commands.

TDefaultEditor does not add any custom menu items to the context menu that appears when the user right-clicks a component in the designer, nor does it add any clipboard formats to the standard component format. However, TDefaultEditor does override the Edit (see page 10969) method to supply a default response when the user double clicks a component.

The Edit (see page 10969) method in TDefaultEditor searches the component for events. If it finds an OnCreate event, it brings up the code editor for the OnCreate event handler. If there is no OnCreate event, it brings up the code editor for the OnChange event handler. If there is no OnChange event, it brings up the code editor for the OnClick event handler. If it finds none of these events, it brings up the code editor for the first event it finds.

Use TDefaultEditor as a base class when creating component editors that bring up the code editor as the default response to a double click.

59.1.11.1 TDefaultEditor Members

The following tables list the members exposed by TDefaultEditor.

Protected Data Members

	Name	Description
	FRefCount (see page 22278)	This is FRefCount, a member of class TInterfacedObject.

Protected Methods

	Name	Description
	_AddRef (see page 22278)	Implements the IInterface (see page 22396) System::TInterfacedObject::_AddRef method.
	_Release (see page 22279)	Implements the IInterface (see page 22396) System::TInterfacedObject::_Release method.
V	EditProperty (see page 10970)	This is EditProperty, a member of class TDefaultEditor.
	QueryInterface (see page 22280)	Implements the IInterface (see page 22396) System::TInterfacedObject::QueryInterface method.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22279)	Responds after the last constructor executes.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 22279)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Copy (see page 10930)	Provides an opportunity to copy the component to the clipboard in custom formats.
	Copy (see page 11140)	Provides an opportunity to copy the component to the clipboard in custom formats.
V	Create (see page 10929)	Creates a new TBaseComponentEditor object.
V	Create (see page 11107)	Creates a new TBaseComponentEditor (see page 11105) object.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
V	Edit (see page 10969)	Responds when the user double-clicks the component in the form designer.
V	ExecuteVerb (see page 10931)	Performs the action of a specified verb.
	ExecuteVerb (see page 11140)	This is ExecuteVerb, a member of class IComponentEditor.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetComponent (see page 10931)	Returns the value of the Component (see page 10934) property.

	GetComponent (see page 11141)	Returns a reference to the component on which the editor operates.
	GetDesigner (see page 10932)	Returns the interface for the form designer.
	GetDesigner (see page 11141)	Returns the interface for the form designer.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetVerb (see page 10932)	Returns the string that corresponds to a specified position of the component's context menu.
	GetVerb (see page 11141)	Returns the string that corresponds to a specified position of the component's context menu.
V	GetVerbCount (see page 10933)	Returns the number of menu strings added to the context menu by the component editor.
	GetVerbCount (see page 11142)	Returns the number of menu strings that the component editor adds to the context menu.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsInInlined (see page 10933)	Indicates whether the component has the csInline flag set in its ComponentState property.
	IsInInlined (see page 11142)	Indicates whether the component has the csInline flag set in its ComponentState property.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22280)	Allocates memory for each instance of an interfaced object.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	PrepareItem (see page 10933)	Allows the component editor to modify menu items as they are added to the context menu.
	PrepareItem (see page 11142)	Allows the component editor to modify menu items as they are added to the context menu.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
R	Component (see page 10934)	Provides access to the component in the form designer that uses this component editor.
R	Designer (see page 10935)	Provides access to the form designer in the IDE.
R	RefCount (see page 22281)	Indicates the number of interface pointers currently dependent upon the object.

59.1.11.2 TDefaultEditor Methods

The methods of the TDefaultEditor class are listed here.

Protected Methods

	Name	Description
V	EditProperty (see page 10970)	This is EditProperty, a member of class TDefaultEditor.

Public Methods

	Name	Description
V	Edit (see page 10969)	Responds when the user double-clicks the component in the form designer.

59.1.11.2.1 TDefaultEditor.Edit Method

Responds when the user double-clicks the component in the form designer.

Pascal

```
procedure Edit; override;
```

C++

```
virtual __fastcall Edit();
```

Description

The Object Inspector calls Edit when the user double-clicks the component. Edit searches the component for events. If it finds an OnCreate event, it brings up the code editor for the OnCreate event handler. If there is no OnCreate event, it brings up the code editor for the OnChange event handler. If there is no OnChange event, it brings up the code editor for the OnClick event handler. If it finds none of these events, it brings up the code editor for the first event it finds.

Note: Do not override Edit to change the event handler that your component editor displays in the code editor. Instead, override the protected EditProperty (see page 10970) method.

59.1.11.2.2 TDefaultEditor.EditProperty Method

Pascal

```
procedure EditProperty(const Prop: IProperty; var Continue: Boolean); virtual;
```

C++

```
virtual __fastcall EditProperty(const IProperty Prop, Boolean Continue);
```

Description

This is EditProperty, a member of class TDefaultEditor.

59.1.12 TDesignerOleDropTarget Class

Class Hierarchy

Pascal

```
TDesignerOleDropTarget = class(TInterfacedObject, IDropTarget);
```

C++

```
class TDesignerOleDropTarget : public TInterfacedObject, public IDropTarget;
```

File

DesignEditors

Description

This is class DesignEditors.TDesignerOleDropTarget.

59.1.12.1 TDesignerOleDropTarget Members

The following tables list the members exposed by TDesignerOleDropTarget.

Protected Data Members

	Name	Description
	FRefCount (see page 22278)	This is FRefCount, a member of class TInterfacedObject.

Protected Methods

	Name	Description
	_AddRef (see page 22278)	Implements the IInterface (see page 22396) System::TInterfacedObject::_AddRef method.
	_Release (see page 22279)	Implements the IInterface (see page 22396) System::TInterfacedObject::_Release method.
	DragEnter (see page 10972)	This is DragEnter, a member of class TDesignerOleDropTarget.
	DragLeave (see page 10972)	This is DragLeave, a member of class TDesignerOleDropTarget.
	DragOver (see page 10973)	This is DragOver, a member of class TDesignerOleDropTarget.
	Drop (see page 10973)	This is Drop, a member of class TDesignerOleDropTarget.
	QueryInterface (see page 22280)	Implements the IInterface (see page 22396) System::TInterfacedObject::QueryInterface method.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22279)	Responds after the last constructor executes.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 22279)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 10972)	This is Create, a member of class TDesignerOleDropTarget.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.

	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22280)	Allocates memory for each instance of an interfaced object.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
R	RefCount (see page 22281)	Indicates the number of interface pointers currently dependent upon the object.

59.1.12.2 TDesignerOleDropTarget.Create Constructor

Pascal

```
constructor Create(const AOldDropTarget: IDropTarget = nil);
```

C++

```
__fastcall TDesignerOleDropTarget(const IDropTarget AOldDropTarget = nil);
```

Description

This is Create, a member of class TDesignerOleDropTarget.

59.1.12.3 TDesignerOleDropTarget Methods

The methods of the TDesignerOleDropTarget class are listed here.

Protected Methods

	Name	Description
	DragEnter (see page 10972)	This is DragEnter, a member of class TDesignerOleDropTarget.
	DragLeave (see page 10972)	This is DragLeave, a member of class TDesignerOleDropTarget.
	DragOver (see page 10973)	This is DragOver, a member of class TDesignerOleDropTarget.
	Drop (see page 10973)	This is Drop, a member of class TDesignerOleDropTarget.

59.1.12.3.1 TDesignerOleDropTarget.DragEnter Method

Pascal

```
function DragEnter(const dataObj: IDataObject; grfKeyState: Longint; pt: TPoint; var dwEffect:
Longint): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT DragEnter(const IDataObject dataObj, Longint grfKeyState, TPoint
pt, Longint dwEffect);
```

Description

This is DragEnter, a member of class TDesignerOleDropTarget.

59.1.12.3.2 TDesignerOleDropTarget.DragLeave Method

Pascal

```
function DragLeave: HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT DragLeave();
```

Description

This is DragLeave, a member of class TDesignerOleDropTarget.

59.1.12.3.3 TDesignerOleDropTarget.DragOver Method

Pascal

```
function DragOver(grfKeyState: Longint; pt: TPoint; var dwEffect: Longint): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT DragOver(Longint grfKeyState, TPoint pt, Longint dwEffect);
```

Description

This is DragOver, a member of class TDesignerOleDropTarget.

59.1.12.3.4 TDesignerOleDropTarget.Drop Method

Pascal

```
function Drop(const dataObj: IDataObject; grfKeyState: Longint; pt: TPoint; var dwEffect:
Longint): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT Drop(const IDataObject dataObj, Longint grfKeyState, TPoint pt,
Longint dwEffect);
```

Description

This is Drop, a member of class TDesignerOleDropTarget.

59.1.13 TEditActionSelectionEditor Class

Class Hierarchy

Pascal

```
TEditActionSelectionEditor = class(TSelectionEditor);
```

C++

```
class TEditActionSelectionEditor : public TSelectionEditor;
```

File

DesignEditors

Description

This is class DesignEditors.TEditActionSelectionEditor.

59.1.13.1 TEditActionSelectionEditor Members

The following tables list the members exposed by TEditActionSelectionEditor.

Protected Data Members

	Name	Description
	FRefCount (see page 22278)	This is FRefCount, a member of class TInterfacedObject.

Protected Methods

	Name	Description
	_AddRef (see page 22278)	Implements the IInterface (see page 22396) System::TInterfacedObject::_AddRef method.
	_Release (see page 22279)	Implements the IInterface (see page 22396) System::TInterfacedObject::_Release method.
	EditAction (see page 10975)	This is EditAction, a member of class TEditActionSelectionEditor.
	GetEditState (see page 10976)	This is GetEditState, a member of class TEditActionSelectionEditor.
	HandleCopy (see page 10976)	This is HandleCopy, a member of class TEditActionSelectionEditor.
	HandleCut (see page 10977)	This is HandleCut, a member of class TEditActionSelectionEditor.
	HandleDelete (see page 10977)	This is HandleDelete, a member of class TEditActionSelectionEditor.
	HandlePaste (see page 10977)	This is HandlePaste, a member of class TEditActionSelectionEditor.
	HandleSelectAll (see page 10977)	This is HandleSelectAll, a member of class TEditActionSelectionEditor.
	HandleUndo (see page 10977)	This is HandleUndo, a member of class TEditActionSelectionEditor.
	QueryInterface (see page 22280)	Implements the IInterface (see page 22396) System::TInterfacedObject::QueryInterface method.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22279)	Responds after the last constructor executes.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 22279)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 11047)	This is Create, a member of class TSelectionEditor.
V	Create (see page 11117)	This is Create, a member of class TBaseSelectionEditor.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
V	ExecuteVerb (see page 11048)	This is ExecuteVerb, a member of class TSelectionEditor.
	ExecuteVerb (see page 11214)	This is ExecuteVerb, a member of class ISelectionEditor.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.

	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetVerb (see page 10976)	This is GetVerb, a member of class TEditActionSelectionEditor.
V	GetVerbCount (see page 10976)	This is GetVerbCount, a member of class TEditActionSelectionEditor.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22280)	Allocates memory for each instance of an interfaced object.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	PrepareItem (see page 10978)	This is PrepareItem, a member of class TEditActionSelectionEditor.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
V	RequiresUnits (see page 11049)	This is RequiresUnits, a member of class TSelectionEditor.
	RequiresUnits (see page 11215)	This is RequiresUnits, a member of class ISelectionEditor.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
R	Designer (see page 11049)	This is Designer, a member of class TSelectionEditor.
R	RefCount (see page 22281)	Indicates the number of interface pointers currently dependent upon the object.

59.1.13.2 TEditActionSelectionEditor Methods

The methods of the TEditActionSelectionEditor class are listed here.

Protected Methods

	Name	Description
	EditAction (see page 10975)	This is EditAction, a member of class TEditActionSelectionEditor.
	GetEditState (see page 10976)	This is GetEditState, a member of class TEditActionSelectionEditor.
	HandleCopy (see page 10976)	This is HandleCopy, a member of class TEditActionSelectionEditor.
	HandleCut (see page 10977)	This is HandleCut, a member of class TEditActionSelectionEditor.
	HandleDelete (see page 10977)	This is HandleDelete, a member of class TEditActionSelectionEditor.
	HandlePaste (see page 10977)	This is HandlePaste, a member of class TEditActionSelectionEditor.
	HandleSelectAll (see page 10977)	This is HandleSelectAll, a member of class TEditActionSelectionEditor.
	HandleUndo (see page 10977)	This is HandleUndo, a member of class TEditActionSelectionEditor.

Public Methods

	Name	Description
V	GetVerb (see page 10976)	This is GetVerb, a member of class TEditActionSelectionEditor.
V	GetVerbCount (see page 10976)	This is GetVerbCount, a member of class TEditActionSelectionEditor.
V	PrepareItem (see page 10978)	This is PrepareItem, a member of class TEditActionSelectionEditor.

59.1.13.2.1 TEditActionSelectionEditor.EditAction Method

Pascal

```
procedure EditAction(Action: TEditAction);
```

C++

```
__fastcall EditAction(TEditAction Action);
```

Description

This is EditAction, a member of class TEditActionSelectionEditor.

59.1.13.2.2 TEditActionSelectionEditor.GetEditState Method

Pascal

```
function GetEditState: TEditState;
```

C++

```
__fastcall TEditState GetEditState();
```

Description

This is GetEditState, a member of class TEditActionSelectionEditor.

59.1.13.2.3 TEditActionSelectionEditor.GetVerb Method

Pascal

```
function GetVerb(Index: Integer): string; override;
```

C++

```
virtual __fastcall AnsiString GetVerb(int Index);
```

Description

This is GetVerb, a member of class TEditActionSelectionEditor.

59.1.13.2.4 TEditActionSelectionEditor.GetVerbCount Method

Pascal

```
function GetVerbCount: Integer; override;
```

C++

```
virtual __fastcall int GetVerbCount();
```

Description

This is GetVerbCount, a member of class TEditActionSelectionEditor.

59.1.13.2.5 TEditActionSelectionEditor.HandleCopy Method

Pascal

```
procedure HandleCopy(Sender: TObject);
```

C++

```
__fastcall HandleCopy(TObject * Sender);
```

Description

This is HandleCopy, a member of class TEditActionSelectionEditor.

59.1.13.2.6 TEditActionSelectionEditor.HandleCut Method

Pascal

```
procedure HandleCut(Sender: TObject);
```

C++

```
__fastcall HandleCut(TObject * Sender);
```

Description

This is HandleCut, a member of class TEditActionSelectionEditor.

59.1.13.2.7 TEditActionSelectionEditor.HandleDelete Method

Pascal

```
procedure HandleDelete(Sender: TObject);
```

C++

```
__fastcall HandleDelete(TObject * Sender);
```

Description

This is HandleDelete, a member of class TEditActionSelectionEditor.

59.1.13.2.8 TEditActionSelectionEditor.HandlePaste Method

Pascal

```
procedure HandlePaste(Sender: TObject);
```

C++

```
__fastcall HandlePaste(TObject * Sender);
```

Description

This is HandlePaste, a member of class TEditActionSelectionEditor.

59.1.13.2.9 TEditActionSelectionEditor.HandleSelectAll Method

Pascal

```
procedure HandleSelectAll(Sender: TObject);
```

C++

```
__fastcall HandleSelectAll(TObject * Sender);
```

Description

This is HandleSelectAll, a member of class TEditActionSelectionEditor.

59.1.13.2.10 TEditActionSelectionEditor.HandleUndo Method

Pascal

```
procedure HandleUndo(Sender: TObject);
```

C++

```
__fastcall HandleUndo(TObject * Sender);
```

Description

This is HandleUndo, a member of class TEditActionSelectionEditor.

59.1.13.2.11 TEditActionSelectionEditor.PrepareItem Method

Pascal

```
procedure PrepareItem(Index: Integer; const AItem: IMenuItem); override;
```

C++

```
virtual __fastcall PrepareItem(int Index, const IMenuItem AItem);
```

Description

This is PrepareItem, a member of class TEditActionSelectionEditor.

59.1.14 TEnumProperty Class

Class Hierarchy

Pascal

```
TEnumProperty = class(TOrdinalProperty);
```

C++

```
class TEnumProperty : public TOrdinalProperty;
```

File

DesignEditors

Description

This is class DesignEditors.TEnumProperty.

59.1.14.1 TEnumProperty Members

The following tables list the members exposed by TEnumProperty.

Protected Data Members

	Name	Description
	FRefCount (see page 22278)	This is FRefCount, a member of class TInterfacedObject.

Protected Methods

	Name	Description
	_AddRef (see page 22278)	Implements the IInterface (see page 22396) System::TInterfacedObject::_AddRef method.

	_Release (see page 22279)	Implements the IInterface (see page 22396) System::TInterfacedObject::_Release method.
	GetEditValue (see page 11027)	This is the overview for the GetEditValue method overload.
	GetFloatValue (see page 11028)	Returns the property value of the first object currently being edited.
	GetFloatValueAt (see page 11028)	Returns the property value of the specified object.
	GetInt64Value (see page 11028)	Returns the property value of the first object currently being edited.
	GetInt64ValueAt (see page 11029)	Returns the property value of the specified object.
	GetIntfValue (see page 11029)	Returns the property value of the first object currently being edited.
	GetIntfValueAt (see page 11030)	Returns the property value of the specified object.
V	GetIsDefault (see page 11030)	This is GetIsDefault, a member of class TPropertyEditor.
	GetMethodValue (see page 11031)	Returns the property value of the first object currently being edited.
	GetMethodValueAt (see page 11031)	Returns the property value of the specified object.
	GetOrdValue (see page 11032)	Returns the property value of the first object currently being edited.
	GetOrdValueAt (see page 11032)	Returns the property value of the specified object.
	GetStrValue (see page 11034)	Returns the property value of the first object currently being edited.
	GetStrValueAt (see page 11034)	Returns the property value of the specified object.
	GetVarValue (see page 11036)	Returns the property value of the first object currently being edited.
	GetVarValueAt (see page 11036)	Returns the property value of the specified object.
	GetWideStrValue (see page 11037)	This is GetWideStrValue, a member of class TPropertyEditor.
	GetWideStrValueAt (see page 11037)	This is GetWideStrValueAt, a member of class TPropertyEditor.
	HasInstance (see page 11038)	Indicates whether a specified object is currently being edited by the property editor.
A	Initialize (see page 11114)	Initializes the property editor after it is created but before it is used.
	Modified (see page 11038)	Informs the designer that the property value has changed.
	QueryInterface (see page 22280)	Implements the IInterface (see page 22396) System::TInterfacedObject::QueryInterface method.
	SetFloatValue (see page 11039)	Changes the property value for every object being edited.
	SetInt64Value (see page 11040)	Changes the property value for every object being edited.
	SetIntfValue (see page 11040)	Changes the property value for every object being edited.
	SetMethodValue (see page 11040)	Changes the property value for every object being edited.
	SetOrdValue (see page 11041)	Changes the property value for every object being edited.
V	SetPropEntry (see page 11041)	Informs the property editor of a particular object whose property is to be edited.
A	SetPropEntry (see page 11115)	Informs the property editor of a particular object whose property is to be edited.
	SetStrValue (see page 11042)	Changes the property value for every object being edited.
	SetVarValue (see page 11043)	Changes the property value for every object being edited.
	SetWideStrValue (see page 11043)	This is SetWideStrValue, a member of class TPropertyEditor.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	Activate (see page 11024)	Responds when the property is selected in the Object Inspector.
	Activate (see page 11199)	Responds when the property is selected in the Object Inspector.
V	AfterConstruction (see page 22279)	Responds after the last constructor executes.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	AllEqual (see page 11018)	Indicates whether all selected components have the same value for the property.
V	AllEqual (see page 11024)	Indicates whether all selected components have the same value for the property.
	AllEqual (see page 11199)	Indicates whether all selected components have the same value for the property.
V	AutoFill (see page 11025)	Returns true to indicate that values can be typed incrementally—and automatically completed—in the Object Inspector.
	AutoFill (see page 11200)	Returns true to indicate that values can be typed incrementally—and automatically completed—in the Object Inspector.
V	BeforeDestruction (see page 22279)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.

	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 11022)	Creates a new TPropertyEditor (see page 11019) object.
V	Create (see page 11114)	Creates a new TBasePropertyEditor (see page 11112) object.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 11022)	Destroys an instance of TPropertyEditor (see page 11019).
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
V	Edit (see page 11025)	Responds when the user double-clicks the property in the Object Inspector.
	Edit (see page 11200)	Responds when the user double-clicks the property in the Object Inspector.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
V	GetAttributes (see page 10981)	Describes the property so the Object Inspector provides the appropriate controls.
	GetComponent (see page 11026)	Returns the specified object from the set of all objects currently being edited by the property editor.
V	GetEditLimit (see page 11018)	Returns the maximum length, in characters, of the Value property.
V	GetEditLimit (see page 11027)	Returns the maximum length, in characters, of the Value (see page 11045) property.
	GetEditLimit (see page 11201)	Returns the maximum length, in characters, of the value.
	GetEditValue (see page 11201)	Retrieves a string to represent the property's value, or, if the value is not available, an error message.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIsDefault (see page 11206)	This is GetIsDefault, a member of class IProperty70.
	GetKind (see page 11030)	This is GetKind, a member of class TPropertyEditor.
	GetKind (see page 11212)	This is GetKind, a member of class IPropertyKind.
V	GetName (see page 11032)	Returns the name of the property.
	GetName (see page 11202)	Returns the name of the property.
V	GetProperties (see page 11033)	Provides the subproperties of the property to a callback procedure.
	GetProperties (see page 11202)	Provides the subproperties of the property to a callback procedure.
V	GetPropInfo (see page 11033)	Returns the property information record for the object being edited.
	GetPropInfo (see page 11202)	Returns the property information record for the object being edited.
	GetPropType (see page 11033)	Returns the type information record for the object being edited.
	GetPropType (see page 11203)	Returns the type information record for the object being edited.
V	GetValue (see page 10982)	Returns the property value formatted as a string.
V	GetValues (see page 10982)	Provides the enumerated values of the property to a callback procedure.
V	GetValueW (see page 11036)	This is GetValueW, a member of class TPropertyEditor.
	GetVisualValue (see page 11037)	Returns the property value as it appears in the Object Inspector.
	HasInstance (see page 11204)	Indicates whether a specified object is currently being edited by the property editor.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
V	Initialize (see page 11038)	Initializes the property editor after it is created but before it is used.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.

	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22280)	Allocates memory for each instance of an interfaced object.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	Revert (see page 11039)	Restores all object properties to their original values.
	Revert (see page 11204)	Restores all object properties to their original values.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
V	SetValue (see page 10983)	Responds when the user changes the value of the property.
V	SetValue (see page 11042)	This is the overview for the SetValue method overload.
	ValueAvailable (see page 11044)	Indicates whether all components being edited have a value for the property if their ComponentStyle includes csCheckPropAvail.
	ValueAvailable (see page 11205)	Indicates whether all components being edited have a value for the property if their ComponentStyle includes csCheckPropAvail.

Public Properties

	Name	Description
R	Designer (see page 11044)	Provides access to the form designer object in the IDE.
R	IsDefault (see page 11206)	This is IsDefault, a member of class IProperty70.
R	Kind (see page 11212)	This is Kind, a member of class IPropertyKind.
R	PrivateDirectory (see page 11044)	Specifies the location where the property editor can store auxiliary files.
R	PropCount (see page 11045)	Indicates the number of components whose properties are being edited.
R	RefCount (see page 22281)	Indicates the number of interface pointers currently dependent upon the object.
	Value (see page 11045)	Represents the current value of the property (as returned by GetValue (see page 11035)) as a string.

59.1.14.2 TEnumProperty Methods

The methods of the TEnumProperty class are listed here.

Public Methods

	Name	Description
V	GetAttributes (see page 10981)	Describes the property so the Object Inspector provides the appropriate controls.
V	GetValue (see page 10982)	Returns the property value formatted as a string.
V	GetValues (see page 10982)	Provides the enumerated values of the property to a callback procedure.
V	SetValue (see page 10983)	Responds when the user changes the value of the property.

59.1.14.2.1 TEnumProperty.GetAttributes Method

Describes the property so the Object Inspector provides the appropriate controls.

Pascal

```
function GetAttributes: TPropertyAttributes; override;
```

C++

```
virtual __fastcall TPropertyAttributes GetAttributes();
```

Description

The Object Inspector calls GetAttributes to determine what controls to display for the property and what property editor methods to call. The GetAttributes method of TPropertyEditor returns [paMultiSelect, paRevertable]. Override GetAttributes to return the set of values that corresponds to the attributes of the associated property.

Before the Object Inspector calls the Activate method, GetAttributes does not need to provide accurate information about any attributes other than paSubProperties, paVCL, and paMultiSelect.

See Also

Activate (see page 11024)

Edit (see page 11025)

GetProperties (see page 11033)

GetValues (see page 11035)

setvalue (see page 11042)

Value (see page 11045)

ListDrawValue

ListMeasureHeight

ListMeasureWidth

59.1.14.2.2 TEnumProperty.GetValue Method

Returns the property value formatted as a string.

Pascal

```
function GetValue: string; override;
```

C++

```
virtual __fastcall AnsiString GetValue();
```

Description

GetValue formats the value of the property, formatted as a string. If the value is not available, GetValue raised an exception.

As implemented in TPropertyEditor, GetValue returns the string "(unknown)". Descendant classes override this method to provide an appropriate value string or raise an exception.

GetValue is the read access method of the Value property.

Note: To obtain an error string when the property value is unavailable rather than raising an exception, you can call the GetEditValue method. GetEditValue is protected, but can be called through the IProperty interface in code that is not a method of a descendant class.

See Also

setvalue (see page 11042)

Value (see page 11045)

GetVisualValue (see page 11037)

GetEditValue (see page 11027)

59.1.14.2.3 TEnumProperty.GetValues Method

Provides the enumerated values of the property to a callback procedure.

Pascal

```
procedure GetValues(Proc: TGetStrProc); override;
```

C++

```
virtual __fastcall GetValues(TGetStrProc Proc);
```

Description

The Object Inspector calls GetValues when the drop-down button is clicked to show enumerated values. The GetValues method of TPropertyEditor does nothing. Property editors that return paValueList from the GetAttributes method should override GetValues to call the Proc parameter for every string that can represent a valid enumerated value. Even if the GetAttributes method does not return paValueList, property editors for enumerated types should still override GetValues to enumerate all possible values.

See Also

GetAttributes (see page 11026)

Value (see page 11045)

59.1.14.2.4 TEnumProperty.SetValue Method

Responds when the user changes the value of the property.

Pascal

```
procedure SetValue(const Value: string); override;
```

C++

```
virtual __fastcall SetValue(const AnsiString Value);
```

Description

The Object Inspector calls SetValue when the user has finished changing the property value. SetValue applies the value specified by the Value parameter to all components that it is currently editing. If the value can't be set, SetValue raises an exception that describes the problem.

Note: If the property is changed only through a dialog brought up by the Edit method, the Object Inspector does not call SetValue. Rather, the Edit method should handle the setting of the value on all components.

Edit (see page 11200)

59.1.15 TFloatProperty Class

Class Hierarchy

Pascal

```
TFloatProperty = class(TPropertyEditor);
```

C++

```
class TFloatProperty : public TPropertyEditor;
```

File

DesignEditors

Description

This is class DesignEditors.TFloatProperty.

59.1.15.1 TFloatProperty Members

The following tables list the members exposed by TFloatProperty.

Protected Data Members

	Name	Description
	FRefCount (see page 22278)	This is FRefCount, a member of class TInterfacedObject.

Protected Methods

	Name	Description
	_AddRef (see page 22278)	Implements the IInterface (see page 22396) System::TInterfacedObject::_AddRef method.
	_Release (see page 22279)	Implements the IInterface (see page 22396) System::TInterfacedObject::_Release method.
	GetEditValue (see page 11027)	This is the overview for the GetEditValue method overload.
	GetFloatValue (see page 11028)	Returns the property value of the first object currently being edited.
	GetFloatValueAt (see page 11028)	Returns the property value of the specified object.
	GetInt64Value (see page 11028)	Returns the property value of the first object currently being edited.
	GetInt64ValueAt (see page 11029)	Returns the property value of the specified object.
	GetIntfValue (see page 11029)	Returns the property value of the first object currently being edited.
	GetIntfValueAt (see page 11030)	Returns the property value of the specified object.
V	GetIsDefault (see page 11030)	This is GetIsDefault, a member of class TPropertyEditor.
	GetMethodValue (see page 11031)	Returns the property value of the first object currently being edited.
	GetMethodValueAt (see page 11031)	Returns the property value of the specified object.
	GetOrdValue (see page 11032)	Returns the property value of the first object currently being edited.
	GetOrdValueAt (see page 11032)	Returns the property value of the specified object.
	GetStrValue (see page 11034)	Returns the property value of the first object currently being edited.
	GetStrValueAt (see page 11034)	Returns the property value of the specified object.
	GetVarValue (see page 11036)	Returns the property value of the first object currently being edited.
	GetVarValueAt (see page 11036)	Returns the property value of the specified object.
	GetWideStrValue (see page 11037)	This is GetWideStrValue, a member of class TPropertyEditor.
	GetWideStrValueAt (see page 11037)	This is GetWideStrValueAt, a member of class TPropertyEditor.
	HasInstance (see page 11038)	Indicates whether a specified object is currently being edited by the property editor.
A	Initialize (see page 11114)	Initializes the property editor after it is created but before it is used.
	Modified (see page 11038)	Informs the designer that the property value has changed.
	QueryInterface (see page 22280)	Implements the IInterface (see page 22396) System::TInterfacedObject::QueryInterface method.
	SetFloatValue (see page 11039)	Changes the property value for every object being edited.
	SetInt64Value (see page 11040)	Changes the property value for every object being edited.
	SetIntfValue (see page 11040)	Changes the property value for every object being edited.
	SetMethodValue (see page 11040)	Changes the property value for every object being edited.
	SetOrdValue (see page 11041)	Changes the property value for every object being edited.
V	SetPropEntry (see page 11041)	Informs the property editor of a particular object whose property is to be edited.
A	SetPropEntry (see page 11115)	Informs the property editor of a particular object whose property is to be edited.
	SetStrValue (see page 11042)	Changes the property value for every object being edited.
	SetVarValue (see page 11043)	Changes the property value for every object being edited.
	SetWideStrValue (see page 11043)	This is SetWideStrValue, a member of class TPropertyEditor.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	Activate (see page 11024)	Responds when the property is selected in the Object Inspector.
	Activate (see page 11199)	Responds when the property is selected in the Object Inspector.
V	AfterConstruction (see page 22279)	Responds after the last constructor executes.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	AllEqual (see page 10987)	Indicates whether all selected components have the same value for the property.
V	AutoFill (see page 11025)	Returns true to indicate that values can be typed incrementally—and automatically completed—in the Object Inspector.
	AutoFill (see page 11200)	Returns true to indicate that values can be typed incrementally—and automatically completed—in the Object Inspector.
V	BeforeDestruction (see page 22279)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 11022)	Creates a new TPropertyEditor (see page 11019) object.
V	Create (see page 11114)	Creates a new TBasePropertyEditor (see page 11112) object.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 11022)	Destroys an instance of TPropertyEditor (see page 11019).
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
V	Edit (see page 11025)	Responds when the user double-clicks the property in the Object Inspector.
	Edit (see page 11200)	Responds when the user double-clicks the property in the Object Inspector.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
V	GetAttributes (see page 11026)	Describes the property so the Object Inspector provides the appropriate controls.
	GetAttributes (see page 11200)	Describes the property so the Object Inspector provides the appropriate controls.
	GetComponent (see page 11026)	Returns the specified object from the set of all objects currently being edited by the property editor.
V	GetEditLimit (see page 11027)	Returns the maximum length, in characters, of the Value (see page 11045) property.
	GetEditLimit (see page 11201)	Returns the maximum length, in characters, of the value.
	GetEditValue (see page 11201)	Retrieves a string to represent the property's value, or, if the value is not available, an error message.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIsDefault (see page 11206)	This is GetIsDefault, a member of class IProperty70.
	GetKind (see page 11030)	This is GetKind, a member of class TPropertyEditor.
	GetKind (see page 11212)	This is GetKind, a member of class IPropertyKind.
V	GetName (see page 11032)	Returns the name of the property.
	GetName (see page 11202)	Returns the name of the property.
V	GetProperties (see page 11033)	Provides the subproperties of the property to a callback procedure.

	GetProperties (see page 11202)	Provides the subproperties of the property to a callback procedure.
V	GetPropInfo (see page 11033)	Returns the property information record for the object being edited.
	GetPropInfo (see page 11202)	Returns the property information record for the object being edited.
	GetPropType (see page 11033)	Returns the type information record for the object being edited.
	GetPropType (see page 11203)	Returns the type information record for the object being edited.
V	GetValue (see page 10987)	Returns the property value formatted as a string.
V	GetValues (see page 11035)	Provides the enumerated values of the property to a callback procedure.
	GetValues (see page 11203)	Provides the enumerated values of the property to a callback procedure.
V	GetValueW (see page 11036)	This is GetValueW, a member of class TPropertyEditor.
	GetVisualValue (see page 11037)	Returns the property value as it appears in the Object Inspector.
	HasInstance (see page 11204)	Indicates whether a specified object is currently being edited by the property editor.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
V	Initialize (see page 11038)	Initializes the property editor after it is created but before it is used.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22280)	Allocates memory for each instance of an interfaced object.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	Revert (see page 11039)	Restores all object properties to their original values.
	Revert (see page 11204)	Restores all object properties to their original values.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
V	SetValue (see page 10988)	Responds when the user changes the value of the property.
V	SetValue (see page 11042)	This is the overview for the SetValue method overload.
	ValueAvailable (see page 11044)	Indicates whether all components being edited have a value for the property if their ComponentStyle includes csCheckPropAvail.
	ValueAvailable (see page 11205)	Indicates whether all components being edited have a value for the property if their ComponentStyle includes csCheckPropAvail.

Public Properties

	Name	Description
R	Designer (see page 11044)	Provides access to the form designer object in the IDE.
R	IsDefault (see page 11206)	This is IsDefault, a member of class IProperty70.
R	Kind (see page 11212)	This is Kind, a member of class IPropertyKind.
R	PrivateDirectory (see page 11044)	Specifies the location where the property editor can store auxiliary files.
R	PropCount (see page 11045)	Indicates the number of components whose properties are being edited.
R	RefCount (see page 22281)	Indicates the number of interface pointers currently dependent upon the object.
	Value (see page 11045)	Represents the current value of the property (as returned by GetValue (see page 11035)) as a string.

59.1.15.2 TFloatProperty Methods

The methods of the TFloatProperty class are listed here.

Public Methods

	Name	Description
V	AllEqual (see page 10987)	Indicates whether all selected components have the same value for the property.
V	GetValue (see page 10987)	Returns the property value formatted as a string.
V	SetValue (see page 10988)	Responds when the user changes the value of the property.

59.1.15.2.1 TFloatProperty.AllEqual Method

Indicates whether all selected components have the same value for the property.

Pascal

```
function AllEqual: Boolean; override;
```

C++

```
virtual __fastcall Boolean AllEqual();
```

Description

The Object Inspector calls AllEqual when there is more than one component selected to determine whether a value should appear for this property. If this method returns true, the Object Inspector displays a value for the property. If this method returns false, the line for the property in the Object Inspector remains blank.

In TPropertyEditor, AllEqual always returns false if more than one selected component has the associated property. Override this method to check the properties of individual components and determine whether a property value can be displayed in the Object Inspector.

Note: AllEqual is called only when the value returned by GetAttributes includes paMultiSelect.

See Also

GetAttributes (see page 11026)

GetComponent (see page 11026)

GetValue (see page 11035)

59.1.15.2.2 TFloatProperty.GetValue Method

Returns the property value formatted as a string.

Pascal

```
function GetValue: string; override;
```

C++

```
virtual __fastcall AnsiString GetValue();
```

Description

GetValue formats the value of the property, formatted as a string. If the value is not available, GetValue raised an exception.

As implemented in TPropertyEditor, GetValue returns the string "(unknown)". Descendant classes override this method to provide an appropriate value string or raise an exception.

GetValue is the read access method of the Value property.

Note: To obtain an error string when the property value is unavailable rather than raising an exception, you can call the GetEditValue method. GetEditValue is protected, but can be called through the IProperty interface in code that is not a method of a descendant class.

See Also

setvalue (see page 11042)

Value (see page 11045)

GetVisualValue (see page 11037)

GetEditValue (see page 11027)

59.1.15.2.3 TFloatProperty.SetValue Method

Responds when the user changes the value of the property.

Pascal

```
procedure SetValue(const Value: string); override;
```

C++

```
virtual __fastcall SetValue(const AnsiString Value);
```

Description

The Object Inspector calls SetValue when the user has finished changing the property value. SetValue applies the value specified by the Value parameter to all components that it is currently editing. If the value can't be set, SetValue raises an exception that describes the problem.

Note: If the property is changed only through a dialog brought up by the Edit method, the Object Inspector does not call SetValue. Rather, the Edit method should handle the setting of the value on all components.

59.1.16 TInt64Property Class

Class Hierarchy

Pascal

```
TInt64Property = class(TPropertyEditor);
```

C++

```
class TInt64Property : public TPropertyEditor;
```

File

DesignEditors

Description

This is class DesignEditors.TInt64Property.

59.1.16.1 TInt64Property Members

The following tables list the members exposed by TInt64Property.

Protected Data Members

	Name	Description
	FRefCount (see page 22278)	This is FRefCount, a member of class TInterfacedObject.

Protected Methods

	Name	Description
	_AddRef (see page 22278)	Implements the IInterface (see page 22396) System::TInterfacedObject::_AddRef method.
	_Release (see page 22279)	Implements the IInterface (see page 22396) System::TInterfacedObject::_Release method.
	GetEditValue (see page 11027)	This is the overview for the GetEditValue method overload.
	GetFloatValue (see page 11028)	Returns the property value of the first object currently being edited.
	GetFloatValueAt (see page 11028)	Returns the property value of the specified object.
	GetInt64Value (see page 11028)	Returns the property value of the first object currently being edited.
	GetInt64ValueAt (see page 11029)	Returns the property value of the specified object.
	GetIntfValue (see page 11029)	Returns the property value of the first object currently being edited.
	GetIntfValueAt (see page 11030)	Returns the property value of the specified object.
V	GetIsDefault (see page 11030)	This is GetIsDefault, a member of class TPropertyEditor.
	GetMethodValue (see page 11031)	Returns the property value of the first object currently being edited.
	GetMethodValueAt (see page 11031)	Returns the property value of the specified object.
	GetOrdValue (see page 11032)	Returns the property value of the first object currently being edited.
	GetOrdValueAt (see page 11032)	Returns the property value of the specified object.
	GetStrValue (see page 11034)	Returns the property value of the first object currently being edited.
	GetStrValueAt (see page 11034)	Returns the property value of the specified object.
	GetVarValue (see page 11036)	Returns the property value of the first object currently being edited.
	GetVarValueAt (see page 11036)	Returns the property value of the specified object.
	GetWideStrValue (see page 11037)	This is GetWideStrValue, a member of class TPropertyEditor.
	GetWideStrValueAt (see page 11037)	This is GetWideStrValueAt, a member of class TPropertyEditor.
	HasInstance (see page 11038)	Indicates whether a specified object is currently being edited by the property editor.
A	Initialize (see page 11114)	Initializes the property editor after it is created but before it is used.
	Modified (see page 11038)	Informs the designer that the property value has changed.
	QueryInterface (see page 22280)	Implements the IInterface (see page 22396) System::TInterfacedObject::QueryInterface method.
	SetFloatValue (see page 11039)	Changes the property value for every object being edited.
	SetInt64Value (see page 11040)	Changes the property value for every object being edited.
	SetIntfValue (see page 11040)	Changes the property value for every object being edited.
	SetMethodValue (see page 11040)	Changes the property value for every object being edited.
	SetOrdValue (see page 11041)	Changes the property value for every object being edited.
V	SetPropEntry (see page 11041)	Informs the property editor of a particular object whose property is to be edited.
A	SetPropEntry (see page 11115)	Informs the property editor of a particular object whose property is to be edited.
	SetStrValue (see page 11042)	Changes the property value for every object being edited.
	SetVarValue (see page 11043)	Changes the property value for every object being edited.
	SetWideStrValue (see page 11043)	This is SetWideStrValue, a member of class TPropertyEditor.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	Activate (see page 11024)	Responds when the property is selected in the Object Inspector.
	Activate (see page 11199)	Responds when the property is selected in the Object Inspector.
V	AfterConstruction (see page 22279)	Responds after the last constructor executes.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	AllEqual (see page 10991)	Indicates whether all selected components have the same value for the property.

	AutoFill (see page 11025)	Returns true to indicate that values can be typed incrementally—and automatically completed—in the Object Inspector.
	AutoFill (see page 11200)	Returns true to indicate that values can be typed incrementally—and automatically completed—in the Object Inspector.
	BeforeDestruction (see page 22279)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 11022)	Creates a new TPropertyEditor (see page 11019) object.
	Create (see page 11114)	Creates a new TBasePropertyEditor (see page 11112) object.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 11022)	Destroys an instance of TPropertyEditor (see page 11019).
	Destroy (see page 22287)	Disposes of an object instance.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Edit (see page 11025)	Responds when the user double-clicks the property in the Object Inspector.
	Edit (see page 11200)	Responds when the user double-clicks the property in the Object Inspector.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetAttributes (see page 11026)	Describes the property so the Object Inspector provides the appropriate controls.
	GetAttributes (see page 11200)	Describes the property so the Object Inspector provides the appropriate controls.
	GetComponent (see page 11026)	Returns the specified object from the set of all objects currently being edited by the property editor.
	GetEditLimit (see page 10992)	Returns the maximum length, in characters, of the Value property.
	GetEditValue (see page 11201)	Retrieves a string to represent the property's value, or, if the value is not available, an error message.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIsDefault (see page 11206)	This is GetIsDefault, a member of class IProperty70.
	GetKind (see page 11030)	This is GetKind, a member of class TPropertyEditor.
	GetKind (see page 11212)	This is GetKind, a member of class IPropertyKind.
	GetName (see page 11032)	Returns the name of the property.
	GetName (see page 11202)	Returns the name of the property.
	GetProperties (see page 11033)	Provides the subproperties of the property to a callback procedure.
	GetProperties (see page 11202)	Provides the subproperties of the property to a callback procedure.
	GetPropInfo (see page 11033)	Returns the property information record for the object being edited.
	GetPropInfo (see page 11202)	Returns the property information record for the object being edited.
	GetPropType (see page 11033)	Returns the type information record for the object being edited.
	GetPropType (see page 11203)	Returns the type information record for the object being edited.
	GetValue (see page 10992)	Returns the property value formatted as a string.
	GetValues (see page 11035)	Provides the enumerated values of the property to a callback procedure.
	GetValues (see page 11203)	Provides the enumerated values of the property to a callback procedure.
	GetValueW (see page 11036)	This is GetValueW, a member of class TPropertyEditor.
	GetVisualValue (see page 11037)	Returns the property value as it appears in the Object Inspector.
	HasInstance (see page 11204)	Indicates whether a specified object is currently being edited by the property editor.

	InheritsFrom (see page 22305)	Determines the relationship of two object types.
V	Initialize (see page 11038)	Initializes the property editor after it is created but before it is used.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22280)	Allocates memory for each instance of an interfaced object.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	Revert (see page 11039)	Restores all object properties to their original values.
	Revert (see page 11204)	Restores all object properties to their original values.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
V	SetValue (see page 10993)	Responds when the user changes the value of the property.
V	SetValue (see page 11042)	This is the overview for the SetValue method overload.
	ValueAvailable (see page 11044)	Indicates whether all components being edited have a value for the property if their ComponentStyle includes csCheckPropAvail.
	ValueAvailable (see page 11205)	Indicates whether all components being edited have a value for the property if their ComponentStyle includes csCheckPropAvail.

Public Properties

	Name	Description
R	Designer (see page 11044)	Provides access to the form designer object in the IDE.
R	IsDefault (see page 11206)	This is IsDefault, a member of class IProperty70.
R	Kind (see page 11212)	This is Kind, a member of class IPropertyKind.
R	PrivateDirectory (see page 11044)	Specifies the location where the property editor can store auxiliary files.
R	PropCount (see page 11045)	Indicates the number of components whose properties are being edited.
R	RefCount (see page 22281)	Indicates the number of interface pointers currently dependent upon the object.
	Value (see page 11045)	Represents the current value of the property (as returned by GetValue (see page 11035)) as a string.

59.1.16.2 TInt64Property Methods

The methods of the TInt64Property class are listed here.

Public Methods

	Name	Description
V	AllEqual (see page 10991)	Indicates whether all selected components have the same value for the property.
V	GetEditLimit (see page 10992)	Returns the maximum length, in characters, of the Value property.
V	GetValue (see page 10992)	Returns the property value formatted as a string.
V	SetValue (see page 10993)	Responds when the user changes the value of the property.

59.1.16.2.1 TInt64Property.AllEqual Method

Indicates whether all selected components have the same value for the property.

Pascal

```
function AllEqual: Boolean; override;
```

C++

```
virtual __fastcall Boolean AllEqual();
```

Description

The Object Inspector calls AllEqual when there is more than one component selected to determine whether a value should

appear for this property. If this method returns true, the Object Inspector displays a value for the property. If this method returns false, the line for the property in the Object Inspector remains blank.

In TPropertyEditor, AllEqual always returns false if more than one selected component has the associated property. Override this method to check the properties of individual components and determine whether a property value can be displayed in the Object Inspector.

Note: AllEqual is called only when the value returned by GetAttributes includes paMultiSelect.

See Also

GetAttributes (see page 11026)

GetComponent (see page 11026)

GetValue (see page 11035)

59.1.16.2.2 TInt64Property.GetEditLimit Method

Returns the maximum length, in characters, of the Value property.

Pascal

```
function GetEditLimit: Integer; override;
```

C++

```
virtual __fastcall int GetEditLimit();
```

Description

The Object Inspector calls GetEditLimit to determine how many characters the user can type when entering a value for the property. GetEditLimit returns 255. Override this method when the maximum length of the property string is some other value.

See Also

Value (see page 11045)

59.1.16.2.3 TInt64Property.GetValue Method

Returns the property value formatted as a string.

Pascal

```
function GetValue: string; override;
```

C++

```
virtual __fastcall AnsiString GetValue();
```

Description

GetValue formats the value of the property, formatted as a string. If the value is not available, GetValue raised an exception.

As implemented in TPropertyEditor, GetValue returns the string "(unknown)". Descendant classes override this method to provide an appropriate value string or raise an exception.

GetValue is the read access method of the Value property.

Note: To obtain an error string when the property value is unavailable rather than raising an exception, you can call the GetEditValue method. GetEditValue is protected, but can be called through the IProperty interface in code that is not a method of a descendant class.

setvalue (see page 11042)

Value (see page 11045)

GetVisualValue (see page 11037)

GetEditValue (see page 11027)

59.1.16.2.4 TInt64Property.SetValue Method

Responds when the user changes the value of the property.

Pascal

```
procedure SetValue(const Value: string); override;
```

C++

```
virtual __fastcall SetValue(const AnsiString Value);
```

Description

The Object Inspector calls SetValue when the user has finished changing the property value. SetValue applies the value specified by the Value parameter to all components that it is currently editing. If the value can't be set, SetValue raises an exception that describes the problem.

Note: If the property is changed only through a dialog brought up by the Edit method, the Object Inspector does not call SetValue. Rather, the Edit method should handle the setting of the value on all components.

59.1.17.1 TIntegerProperty Members

The following tables list the members exposed by TIntegerProperty.

Protected Data Members

	Name	Description
	FRefCount (see page 22278)	This is FRefCount, a member of class TInterfacedObject.

Protected Methods

	Name	Description
	_AddRef (see page 22278)	Implements the IInterface (see page 22396) System::TInterfacedObject::_AddRef method.
	_Release (see page 22279)	Implements the IInterface (see page 22396) System::TInterfacedObject::_Release method.
	GetEditValue (see page 11027)	This is the overview for the GetEditValue method overload.
	GetFloatValue (see page 11028)	Returns the property value of the first object currently being edited.
	GetFloatValueAt (see page 11028)	Returns the property value of the specified object.
	GetInt64Value (see page 11028)	Returns the property value of the first object currently being edited.
	GetInt64ValueAt (see page 11029)	Returns the property value of the specified object.
	GetIntfValue (see page 11029)	Returns the property value of the first object currently being edited.
	GetIntfValueAt (see page 11030)	Returns the property value of the specified object.
V	GetIsDefault (see page 11030)	This is GetIsDefault, a member of class TPropertyEditor.
	GetMethodValue (see page 11031)	Returns the property value of the first object currently being edited.
	GetMethodValueAt (see page 11031)	Returns the property value of the specified object.
	GetOrdValue (see page 11032)	Returns the property value of the first object currently being edited.
	GetOrdValueAt (see page 11032)	Returns the property value of the specified object.
	GetStrValue (see page 11034)	Returns the property value of the first object currently being edited.
	GetStrValueAt (see page 11034)	Returns the property value of the specified object.
	GetVarValue (see page 11036)	Returns the property value of the first object currently being edited.
	GetVarValueAt (see page 11036)	Returns the property value of the specified object.
	GetWideStrValue (see page 11037)	This is GetWideStrValue, a member of class TPropertyEditor.
	GetWideStrValueAt (see page 11037)	This is GetWideStrValueAt, a member of class TPropertyEditor.
	HasInstance (see page 11038)	Indicates whether a specified object is currently being edited by the property editor.
A	Initialize (see page 11114)	Initializes the property editor after it is created but before it is used.
	Modified (see page 11038)	Informs the designer that the property value has changed.
	QueryInterface (see page 22280)	Implements the IInterface (see page 22396) System::TInterfacedObject::QueryInterface method.
	SetFloatValue (see page 11039)	Changes the property value for every object being edited.
	SetInt64Value (see page 11040)	Changes the property value for every object being edited.
	SetIntfValue (see page 11040)	Changes the property value for every object being edited.
	SetMethodValue (see page 11040)	Changes the property value for every object being edited.
	SetOrdValue (see page 11041)	Changes the property value for every object being edited.
V	SetPropEntry (see page 11041)	Informs the property editor of a particular object whose property is to be edited.
A	SetPropEntry (see page 11115)	Informs the property editor of a particular object whose property is to be edited.
	SetStrValue (see page 11042)	Changes the property value for every object being edited.
	SetVarValue (see page 11043)	Changes the property value for every object being edited.
	SetWideStrValue (see page 11043)	This is SetWideStrValue, a member of class TPropertyEditor.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	Activate (see page 11024)	Responds when the property is selected in the Object Inspector.

	Activate (see page 11199)	Responds when the property is selected in the Object Inspector.
	AfterConstruction (see page 22279)	Responds after the last constructor executes.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	AllEqual (see page 11018)	Indicates whether all selected components have the same value for the property.
	AllEqual (see page 11024)	Indicates whether all selected components have the same value for the property.
	AllEqual (see page 11199)	Indicates whether all selected components have the same value for the property.
	AutoFill (see page 11025)	Returns true to indicate that values can be typed incrementally—and automatically completed—in the Object Inspector.
	AutoFill (see page 11200)	Returns true to indicate that values can be typed incrementally—and automatically completed—in the Object Inspector.
	BeforeDestruction (see page 22279)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 11022)	Creates a new TPropertyEditor (see page 11019) object.
	Create (see page 11114)	Creates a new TBasePropertyEditor (see page 11112) object.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 11022)	Destroys an instance of TPropertyEditor (see page 11019).
	Destroy (see page 22287)	Disposes of an object instance.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Edit (see page 11025)	Responds when the user double-clicks the property in the Object Inspector.
	Edit (see page 11200)	Responds when the user double-clicks the property in the Object Inspector.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetAttributes (see page 11026)	Describes the property so the Object Inspector provides the appropriate controls.
	GetAttributes (see page 11200)	Describes the property so the Object Inspector provides the appropriate controls.
	GetComponent (see page 11026)	Returns the specified object from the set of all objects currently being edited by the property editor.
	GetEditLimit (see page 11018)	Returns the maximum length, in characters, of the Value property.
	GetEditLimit (see page 11027)	Returns the maximum length, in characters, of the Value (see page 11045) property.
	GetEditLimit (see page 11201)	Returns the maximum length, in characters, of the value.
	GetEditValue (see page 11201)	Retrieves a string to represent the property's value, or, if the value is not available, an error message.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIsDefault (see page 11206)	This is GetIsDefault, a member of class IProperty70.
	GetKind (see page 11030)	This is GetKind, a member of class TPropertyEditor.
	GetKind (see page 11212)	This is GetKind, a member of class IPropertyKind.
	GetName (see page 11032)	Returns the name of the property.
	GetName (see page 11202)	Returns the name of the property.
	GetProperties (see page 11033)	Provides the subproperties of the property to a callback procedure.
	GetProperties (see page 11202)	Provides the subproperties of the property to a callback procedure.
	GetPropInfo (see page 11033)	Returns the property information record for the object being edited.
	GetPropInfo (see page 11202)	Returns the property information record for the object being edited.

	GetPropType (see page 11033)	Returns the type information record for the object being edited.
	GetPropType (see page 11203)	Returns the type information record for the object being edited.
V	GetValue (see page 10996)	Returns the property value formatted as a string.
V	GetValues (see page 11035)	Provides the enumerated values of the property to a callback procedure.
	GetValues (see page 11203)	Provides the enumerated values of the property to a callback procedure.
V	GetValueW (see page 11036)	This is GetValueW, a member of class TPropertyEditor.
	GetVisualValue (see page 11037)	Returns the property value as it appears in the Object Inspector.
	HasInstance (see page 11204)	Indicates whether a specified object is currently being edited by the property editor.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
V	Initialize (see page 11038)	Initializes the property editor after it is created but before it is used.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22280)	Allocates memory for each instance of an interfaced object.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	Revert (see page 11039)	Restores all object properties to their original values.
	Revert (see page 11204)	Restores all object properties to their original values.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
V	SetValue (see page 10997)	Responds when the user changes the value of the property.
V	SetValue (see page 11042)	This is the overview for the SetValue method overload.
	ValueAvailable (see page 11044)	Indicates whether all components being edited have a value for the property if their ComponentStyle includes csCheckPropAvail.
	ValueAvailable (see page 11205)	Indicates whether all components being edited have a value for the property if their ComponentStyle includes csCheckPropAvail.

Public Properties

	Name	Description
R	Designer (see page 11044)	Provides access to the form designer object in the IDE.
R	IsDefault (see page 11206)	This is IsDefault, a member of class IProperty70.
R	Kind (see page 11212)	This is Kind, a member of class IPropertyKind.
R	PrivateDirectory (see page 11044)	Specifies the location where the property editor can store auxiliary files.
R	PropCount (see page 11045)	Indicates the number of components whose properties are being edited.
R	RefCount (see page 22281)	Indicates the number of interface pointers currently dependent upon the object.
	Value (see page 11045)	Represents the current value of the property (as returned by GetValue (see page 11035)) as a string.

59.1.17.2 TIntegerProperty Methods

The methods of the TIntegerProperty class are listed here.

Public Methods

	Name	Description
V	GetValue (see page 10996)	Returns the property value formatted as a string.
V	SetValue (see page 10997)	Responds when the user changes the value of the property.

59.1.17.2.1 TIntegerProperty.GetValue Method

Returns the property value formatted as a string.

Pascal

```
function GetValue: string; override;
```

C++

```
virtual __fastcall AnsiString GetValue();
```

Description

GetValue formats the value of the property, formatted as a string. If the value is not available, GetValue raised an exception.

As implemented in TPropertyEditor, GetValue returns the string "(unknown)". Descendant classes override this method to provide an appropriate value string or raise an exception.

GetValue is the read access method of the Value property.

Note: To obtain an error string when the property value is unavailable rather than raising an exception, you can call the GetEditValue method. GetEditValue is protected, but can be called through the IProperty interface in code that is not a method of a descendant class.

See Also

setvalue (see page 11042)

Value (see page 11045)

GetVisualValue (see page 11037)

GetEditValue (see page 11027)

59.1.17.2.2 TIntegerProperty.SetValue Method

Responds when the user changes the value of the property.

Pascal

```
procedure SetValue(const Value: string); override;
```

C++

```
virtual __fastcall SetValue(const AnsiString Value);
```

Description

The Object Inspector calls SetValue when the user has finished changing the property value. SetValue applies the value specified by the Value parameter to all components that it is currently editing. If the value can't be set, SetValue raises an exception that describes the problem.

Note: If the property is changed only through a dialog brought up by the Edit method, the Object Inspector does not call SetValue. Rather, the Edit method should handle the setting of the value on all components.

59.1.18 TInterfaceProperty Class

Class Hierarchy

Pascal

```
TInterfaceProperty = class(TComponentProperty);
```

C++

```
class TInterfaceProperty : public TComponentProperty;
```

File

DesignEditors

Description

This is class DesignEditors.TInterfaceProperty.

59.1.18.1 TInterfaceProperty Members

The following tables list the members exposed by TInterfaceProperty.

Protected Data Members

	Name	Description
	FRefCount (see page 22278)	This is FRefCount, a member of class TInterfacedObject.

Protected Methods

	Name	Description
	_AddRef (see page 22278)	Implements the IInterface (see page 22396) System::TInterfacedObject::_AddRef method.
	_Release (see page 22279)	Implements the IInterface (see page 22396) System::TInterfacedObject::_Release method.
	FilterFunc (see page 10948)	This is FilterFunc, a member of class TComponentProperty.
	GetComponent (see page 11002)	This is GetComponent, a member of class TInterfaceProperty.
V	GetComponentReference (see page 11002)	This is GetComponentReference, a member of class TInterfaceProperty.
	GetEditValue (see page 11027)	This is the overview for the GetEditValue method overload.
	GetFloatValue (see page 11028)	Returns the property value of the first object currently being edited.
	GetFloatValueAt (see page 11028)	Returns the property value of the specified object.
	GetInt64Value (see page 11028)	Returns the property value of the first object currently being edited.
	GetInt64ValueAt (see page 11029)	Returns the property value of the specified object.
	GetIntfValue (see page 11029)	Returns the property value of the first object currently being edited.
	GetIntfValueAt (see page 11030)	Returns the property value of the specified object.
V	GetIsDefault (see page 11030)	This is GetIsDefault, a member of class TPropertyEditor.
	GetMethodValue (see page 11031)	Returns the property value of the first object currently being edited.

	GetMethodValueAt (see page 11031)	Returns the property value of the specified object.
	GetOrdValue (see page 11032)	Returns the property value of the first object currently being edited.
	GetOrdValueAt (see page 11032)	Returns the property value of the specified object.
V	GetSelections (see page 11002)	This is GetSelections, a member of class TInterfaceProperty.
	GetStrValue (see page 11034)	Returns the property value of the first object currently being edited.
	GetStrValueAt (see page 11034)	Returns the property value of the specified object.
	GetVarValue (see page 11036)	Returns the property value of the first object currently being edited.
	GetVarValueAt (see page 11036)	Returns the property value of the specified object.
	GetWideStrValue (see page 11037)	This is GetWideStrValue, a member of class TPropertyEditor.
	GetWideStrValueAt (see page 11037)	This is GetWideStrValueAt, a member of class TPropertyEditor.
	HasInstance (see page 11038)	Indicates whether a specified object is currently being edited by the property editor.
A	Initialize (see page 11114)	Initializes the property editor after it is created but before it is used.
	Modified (see page 11038)	Informs the designer that the property value has changed.
	QueryInterface (see page 22280)	Implements the IInterface (see page 22396) System::TInterfacedObject::QueryInterface method.
	ReceiveComponentNames (see page 11003)	This is ReceiveComponentNames, a member of class TInterfaceProperty.
	SetFloatValue (see page 11039)	Changes the property value for every object being edited.
	SetInt64Value (see page 11040)	Changes the property value for every object being edited.
	SetIntfValue (see page 11040)	Changes the property value for every object being edited.
	SetMethodValue (see page 11040)	Changes the property value for every object being edited.
	SetOrdValue (see page 11041)	Changes the property value for every object being edited.
V	SetPropEntry (see page 11041)	Informs the property editor of a particular object whose property is to be edited.
A	SetPropEntry (see page 11115)	Informs the property editor of a particular object whose property is to be edited.
	SetStrValue (see page 11042)	Changes the property value for every object being edited.
	SetVarValue (see page 11043)	Changes the property value for every object being edited.
	SetWideStrValue (see page 11043)	This is SetWideStrValue, a member of class TPropertyEditor.
V	ShowReferenceProperty (see page 10951)	This is ShowReferenceProperty, a member of class TComponentProperty.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	Activate (see page 11024)	Responds when the property is selected in the Object Inspector.
	Activate (see page 11199)	Responds when the property is selected in the Object Inspector.
V	AfterConstruction (see page 22279)	Responds after the last constructor executes.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	AllEqual (see page 11001)	Indicates whether all selected components have the same value for the property.
V	AutoFill (see page 11025)	Returns true to indicate that values can be typed incrementally—and automatically completed—in the Object Inspector.
	AutoFill (see page 11200)	Returns true to indicate that values can be typed incrementally—and automatically completed—in the Object Inspector.
V	BeforeDestruction (see page 22279)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 11022)	Creates a new TPropertyEditor (see page 11019) object.
V	Create (see page 11114)	Creates a new TBasePropertyEditor (see page 11112) object.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.

	Destroy (see page 11022)	Destroys an instance of TPropertyEditor (see page 11019).
	Destroy (see page 22287)	Disposes of an object instance.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Edit (see page 10948)	Responds when the user double-clicks the property in the Object Inspector.
	Edit (see page 11025)	Responds when the user double-clicks the property in the Object Inspector.
	Edit (see page 11200)	Responds when the user double-clicks the property in the Object Inspector.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetAttributes (see page 10948)	Describes the property so the Object Inspector provides the appropriate controls.
	GetAttributes (see page 11026)	Describes the property so the Object Inspector provides the appropriate controls.
	GetAttributes (see page 11200)	Describes the property so the Object Inspector provides the appropriate controls.
	GetEditLimit (see page 10949)	Returns the maximum length, in characters, of the Value property.
	GetEditLimit (see page 11027)	Returns the maximum length, in characters, of the Value (see page 11045) property.
	GetEditLimit (see page 11201)	Returns the maximum length, in characters, of the value.
	GetEditValue (see page 11201)	Retrieves a string to represent the property's value, or, if the value is not available, an error message.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIsDefault (see page 11206)	This is GetIsDefault, a member of class IProperty70.
	GetKind (see page 11030)	This is GetKind, a member of class TPropertyEditor.
	GetKind (see page 11212)	This is GetKind, a member of class IPropertyKind.
	GetName (see page 11032)	Returns the name of the property.
	GetName (see page 11202)	Returns the name of the property.
	GetProperties (see page 10949)	Provides the subproperties of the property to a callback procedure.
	GetProperties (see page 11033)	Provides the subproperties of the property to a callback procedure.
	GetProperties (see page 11202)	Provides the subproperties of the property to a callback procedure.
	GetPropInfo (see page 11033)	Returns the property information record for the object being edited.
	GetPropInfo (see page 11202)	Returns the property information record for the object being edited.
	GetPropType (see page 11033)	Returns the type information record for the object being edited.
	GetPropType (see page 11203)	Returns the type information record for the object being edited.
	GetValue (see page 10950)	Returns the property value formatted as a string.
	GetValue (see page 11035)	Returns the property value formatted as a string.
	GetValue (see page 11203)	Returns the property value formatted as a string.
	GetValues (see page 11002)	Provides the enumerated values of the property to a callback procedure.
	GetValueW (see page 11036)	This is GetValueW, a member of class TPropertyEditor.
	GetVisualValue (see page 11037)	Returns the property value as it appears in the Object Inspector.
	HasInstance (see page 11204)	Indicates whether a specified object is currently being edited by the property editor.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	Initialize (see page 11038)	Initializes the property editor after it is created but before it is used.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22280)	Allocates memory for each instance of an interfaced object.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	Revert (see page 11039)	Restores all object properties to their original values.
	Revert (see page 11204)	Restores all object properties to their original values.

	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetValue (see page 11003)	Responds when the user changes the value of the property.
	SetValue (see page 11042)	This is the overview for the SetValue method overload.
	ShowReferenceProperty (see page 11219)	This is ShowReferenceProperty, a member of class IShowReferenceProperty.
	ValueAvailable (see page 11044)	Indicates whether all components being edited have a value for the property if their ComponentStyle includes csCheckPropAvail.
	ValueAvailable (see page 11205)	Indicates whether all components being edited have a value for the property if their ComponentStyle includes csCheckPropAvail.

Public Properties

	Name	Description
	Designer (see page 11044)	Provides access to the form designer object in the IDE.
	IsDefault (see page 11206)	This is IsDefault, a member of class IProperty70.
	Kind (see page 11212)	This is Kind, a member of class IPropertyKind.
	PrivateDirectory (see page 11044)	Specifies the location where the property editor can store auxiliary files.
	PropCount (see page 11045)	Indicates the number of components whose properties are being edited.
	RefCount (see page 22281)	Indicates the number of interface pointers currently dependent upon the object.
	Value (see page 11045)	Represents the current value of the property (as returned by GetValue (see page 11035)) as a string.

59.1.18.2 TInterfaceProperty Methods

The methods of the TInterfaceProperty class are listed here.

Protected Methods

	Name	Description
	GetComponent (see page 11002)	This is GetComponent, a member of class TInterfaceProperty.
	GetComponentReference (see page 11002)	This is GetComponentReference, a member of class TInterfaceProperty.
	GetSelections (see page 11002)	This is GetSelections, a member of class TInterfaceProperty.
	ReceiveComponentNames (see page 11003)	This is ReceiveComponentNames, a member of class TInterfaceProperty.

Public Methods

	Name	Description
	AllEqual (see page 11001)	Indicates whether all selected components have the same value for the property.
	GetValues (see page 11002)	Provides the enumerated values of the property to a callback procedure.
	SetValue (see page 11003)	Responds when the user changes the value of the property.

59.1.18.2.1 TInterfaceProperty.AllEqual Method

Indicates whether all selected components have the same value for the property.

Pascal

```
function AllEqual: Boolean; override;
```

C++

```
virtual __fastcall Boolean AllEqual();
```

Description

The Object Inspector calls AllEqual when there is more than one component selected to determine whether a value should appear for this property. If this method returns true, the Object Inspector displays a value for the property. If this method returns false, the line for the property in the Object Inspector remains blank.

In TPropertyEditor, AllEqual always returns false if more than one selected component has the associated property. Override this method to check the properties of individual components and determine whether a property value can be displayed in the Object Inspector.

Note: AllEqual is called only when the value returned by GetAttributes includes paMultiSelect.

See Also

GetAttributes (see page 11026)

GetComponent (see page 11026)

GetValue (see page 11035)

59.1.18.2.2 TInterfaceProperty.GetComponent Method

Pascal

```
function GetComponent(const AInterface: IInterface): TComponent;
```

C++

```
__fastcall TComponent * GetComponent(const IInterface AInterface);
```

Description

This is GetComponent, a member of class TInterfaceProperty.

59.1.18.2.3 TInterfaceProperty.GetComponentReference Method

Pascal

```
function GetComponentReference: TComponent; override;
```

C++

```
virtual __fastcall TComponent * GetComponentReference();
```

Description

This is GetComponentReference, a member of class TInterfaceProperty.

59.1.18.2.4 TInterfaceProperty.GetSelections Method

Pascal

```
function GetSelections: IDesignerSelections; override;
```

C++

```
virtual __fastcall IDesignerSelections GetSelections();
```

Description

This is GetSelections, a member of class TInterfaceProperty.

59.1.18.2.5 TInterfaceProperty.GetValues Method

Provides the enumerated values of the property to a callback procedure.

Pascal

```
procedure GetValues(Proc: TGetStrProc); override;
```

C++

```
virtual __fastcall GetValues(TGetStrProc Proc);
```

Description

The Object Inspector calls GetValues when the drop-down button is clicked to show enumerated values. The GetValues method of TPropertyEditor does nothing. Property editors that return paValueList from the GetAttributes method should override GetValues to call the Proc parameter for every string that can represent a valid enumerated value. Even if the GetAttributes method does not return paValueList, property editors for enumerated types should still override GetValues to enumerate all possible values.

See Also

GetAttributes (see page 11026)

Value (see page 11045)

59.1.18.2.6 TInterfaceProperty.ReceiveComponentNames Method

Pascal

```
procedure ReceiveComponentNames(const S: string);
```

C++

```
__fastcall ReceiveComponentNames(const AnsiString S);
```

Description

This is ReceiveComponentNames, a member of class TInterfaceProperty.

59.1.18.2.7 TInterfaceProperty.SetValue Method

Responds when the user changes the value of the property.

Pascal

```
procedure SetValue(const Value: string); override;
```

C++

```
virtual __fastcall SetValue(const AnsiString Value);
```

Description

The Object Inspector calls SetValue when the user has finished changing the property value. SetValue applies the value specified by the Value parameter to all components that it is currently editing. If the value can't be set, SetValue raises an exception that describes the problem.

Note: If the property is changed only through a dialog brought up by the Edit method, the Object Inspector does not call SetValue. Rather, the Edit method should handle the setting of the value on all components.

59.1.19 TMethodProperty Class

Class Hierarchy

Pascal

```
TMethodProperty = class(TPropertyEditor, IMethodProperty);
```

C++

```
class TMethodProperty : public TPropertyEditor, public IMethodProperty;
```

File

DesignEditors

Description

This is class DesignEditors.TMethodProperty.

59.1.19.1 TMethodProperty Members

The following tables list the members exposed by TMethodProperty.

Protected Data Members

	Name	Description
	FRefCount (see page 22278)	This is FRefCount, a member of class TInterfacedObject.

Protected Methods

	Name	Description
	_AddRef (see page 22278)	Implements the IInterface (see page 22396) System::TInterfacedObject::_AddRef method.
	_Release (see page 22279)	Implements the IInterface (see page 22396) System::TInterfacedObject::_Release method.
	GetEditValue (see page 11027)	This is the overview for the GetEditValue method overload.
	GetFloatValue (see page 11028)	Returns the property value of the first object currently being edited.
	GetFloatValueAt (see page 11028)	Returns the property value of the specified object.
	GetInt64Value (see page 11028)	Returns the property value of the first object currently being edited.
	GetInt64ValueAt (see page 11029)	Returns the property value of the specified object.
	GetIntfValue (see page 11029)	Returns the property value of the first object currently being edited.
	GetIntfValueAt (see page 11030)	Returns the property value of the specified object.
V	GetIsDefault (see page 11030)	This is GetIsDefault, a member of class TPropertyEditor.
	GetMethodValue (see page 11031)	Returns the property value of the first object currently being edited.
	GetMethodValueAt (see page 11031)	Returns the property value of the specified object.
	GetOrdValue (see page 11032)	Returns the property value of the first object currently being edited.
	GetOrdValueAt (see page 11032)	Returns the property value of the specified object.
	GetStrValue (see page 11034)	Returns the property value of the first object currently being edited.
	GetStrValueAt (see page 11034)	Returns the property value of the specified object.

	GetVarValue (see page 11036)	Returns the property value of the first object currently being edited.
	GetVarValueAt (see page 11036)	Returns the property value of the specified object.
	GetWideStrValue (see page 11037)	This is GetWideStrValue, a member of class TPropertyEditor.
	GetWideStrValueAt (see page 11037)	This is GetWideStrValueAt, a member of class TPropertyEditor.
	HasInstance (see page 11038)	Indicates whether a specified object is currently being edited by the property editor.
	Initialize (see page 11114)	Initializes the property editor after it is created but before it is used.
	Modified (see page 11038)	Informs the designer that the property value has changed.
	QueryInterface (see page 22280)	Implements the IInterface (see page 22396) System::TInterfacedObject::QueryInterface method.
	SetFloatValue (see page 11039)	Changes the property value for every object being edited.
	SetInt64Value (see page 11040)	Changes the property value for every object being edited.
	SetIntfValue (see page 11040)	Changes the property value for every object being edited.
	SetMethodValue (see page 11040)	Changes the property value for every object being edited.
	SetOrdValue (see page 11041)	Changes the property value for every object being edited.
	SetPropEntry (see page 11041)	Informs the property editor of a particular object whose property is to be edited.
	SetPropEntry (see page 11115)	Informs the property editor of a particular object whose property is to be edited.
	SetStrValue (see page 11042)	Changes the property value for every object being edited.
	SetVarValue (see page 11043)	Changes the property value for every object being edited.
	SetWideStrValue (see page 11043)	This is SetWideStrValue, a member of class TPropertyEditor.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	Activate (see page 11024)	Responds when the property is selected in the Object Inspector.
	Activate (see page 11199)	Responds when the property is selected in the Object Inspector.
	AfterConstruction (see page 22279)	Responds after the last constructor executes.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	AllEqual (see page 11007)	Indicates whether all selected components have the same value for the property.
	AllNamed (see page 11008)	This is AllNamed, a member of class TMethodProperty.
	AutoFill (see page 11025)	Returns true to indicate that values can be typed incrementally—and automatically completed—in the Object Inspector.
	AutoFill (see page 11200)	Returns true to indicate that values can be typed incrementally—and automatically completed—in the Object Inspector.
	BeforeDestruction (see page 22279)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 11022)	Creates a new TPropertyEditor (see page 11019) object.
	Create (see page 11114)	Creates a new TBasePropertyEditor (see page 11112) object.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 11022)	Destroys an instance of TPropertyEditor (see page 11019).
	Destroy (see page 22287)	Disposes of an object instance.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Edit (see page 11008)	Responds when the user double-clicks the property in the Object Inspector.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.

V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
V	GetAttributes (see page 11008)	Describes the property so the Object Inspector provides the appropriate controls.
	GetComponent (see page 11026)	Returns the specified object from the set of all objects currently being edited by the property editor.
V	GetEditLimit (see page 11009)	Returns the maximum length, in characters, of the Value property.
	GetEditValue (see page 11201)	Retrieves a string to represent the property's value, or, if the value is not available, an error message.
V	GetFormMethodName (see page 11009)	This is GetFormMethodName, a member of class TMethodProperty.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIsDefault (see page 11206)	This is GetIsDefault, a member of class IProperty70.
	GetKind (see page 11030)	This is GetKind, a member of class TPropertyEditor.
	GetKind (see page 11212)	This is GetKind, a member of class IPropertyKind.
V	GetName (see page 11032)	Returns the name of the property.
	GetName (see page 11202)	Returns the name of the property.
V	GetProperties (see page 11033)	Provides the subproperties of the property to a callback procedure.
	GetProperties (see page 11202)	Provides the subproperties of the property to a callback procedure.
V	GetPropInfo (see page 11033)	Returns the property information record for the object being edited.
	GetPropInfo (see page 11202)	Returns the property information record for the object being edited.
	GetPropType (see page 11033)	Returns the type information record for the object being edited.
	GetPropType (see page 11203)	Returns the type information record for the object being edited.
	GetTrimmedEventName (see page 11009)	This is GetTrimmedEventName, a member of class TMethodProperty.
V	GetValue (see page 11010)	Returns the property value formatted as a string.
V	GetValues (see page 11010)	Provides the enumerated values of the property to a callback procedure.
V	GetValueW (see page 11036)	This is GetValueW, a member of class TPropertyEditor.
	GetVisualValue (see page 11037)	Returns the property value as it appears in the Object Inspector.
	HasInstance (see page 11204)	Indicates whether a specified object is currently being edited by the property editor.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
V	Initialize (see page 11038)	Initializes the property editor after it is created but before it is used.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22280)	Allocates memory for each instance of an interfaced object.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	Revert (see page 11039)	Restores all object properties to their original values.
	Revert (see page 11204)	Restores all object properties to their original values.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
V	SetValue (see page 11011)	Responds when the user changes the value of the property.
V	SetValue (see page 11042)	This is the overview for the SetValue method overload.
	ValueAvailable (see page 11044)	Indicates whether all components being edited have a value for the property if their ComponentStyle includes csCheckPropAvail.
	ValueAvailable (see page 11205)	Indicates whether all components being edited have a value for the property if their ComponentStyle includes csCheckPropAvail.

Public Properties

	Name	Description
R	Designer (see page 11044)	Provides access to the form designer object in the IDE.
R	IsDefault (see page 11206)	This is IsDefault, a member of class IProperty70.
R	Kind (see page 11212)	This is Kind, a member of class IPropertyKind.

R	PrivateDirectory (see page 11044)	Specifies the location where the property editor can store auxiliary files.
R	PropCount (see page 11045)	Indicates the number of components whose properties are being edited.
R	RefCount (see page 22281)	Indicates the number of interface pointers currently dependent upon the object.
	Value (see page 11045)	Represents the current value of the property (as returned by GetValue (see page 11035)) as a string.

59.1.19.2 TMethodProperty Methods

The methods of the TMethodProperty class are listed here.

Public Methods

	Name	Description
V	AllEqual (see page 11007)	Indicates whether all selected components have the same value for the property.
V	AllNamed (see page 11008)	This is AllNamed, a member of class TMethodProperty.
V	Edit (see page 11008)	Responds when the user double-clicks the property in the Object Inspector.
V	GetAttributes (see page 11008)	Describes the property so the Object Inspector provides the appropriate controls.
V	GetEditLimit (see page 11009)	Returns the maximum length, in characters, of the Value property.
V	GetFormMethodName (see page 11009)	This is GetFormMethodName, a member of class TMethodProperty.
	GetTrimmedEventName (see page 11009)	This is GetTrimmedEventName, a member of class TMethodProperty.
V	GetValue (see page 11010)	Returns the property value formatted as a string.
V	GetValues (see page 11010)	Provides the enumerated values of the property to a callback procedure.
V	SetValue (see page 11011)	Responds when the user changes the value of the property.

59.1.19.2.1 TMethodProperty.AllEqual Method

Indicates whether all selected components have the same value for the property.

Pascal

```
function AllEqual: Boolean; override;
```

C++

```
virtual __fastcall Boolean AllEqual();
```

Description

The Object Inspector calls AllEqual when there is more than one component selected to determine whether a value should appear for this property. If this method returns true, the Object Inspector displays a value for the property. If this method returns false, the line for the property in the Object Inspector remains blank.

In TPropertyEditor, AllEqual always returns false if more than one selected component has the associated property. Override this method to check the properties of individual components and determine whether a property value can be displayed in the Object Inspector.

Note: AllEqual is called only when the value returned by GetAttributes includes paMultiSelect.

See Also

GetAttributes (see page 11026)

GetComponent (see page 11026)

GetValue (see page 11035)

59.1.19.2.2 TMethodProperty.AllNamed Method

Pascal

```
function AllNamed: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean AllNamed();
```

Description

This is AllNamed, a member of class TMethodProperty.

59.1.19.2.3 TMethodProperty.Edit Method

Responds when the user double-clicks the property in the Object Inspector.

Pascal

```
procedure Edit; override;
```

C++

```
virtual __fastcall Edit();
```

Description

The Object Inspector calls Edit when the ellipsis button (...) is pressed or the property is double-clicked. The Edit method of TPropertyEditor cycles through the possible enumerated values of the property when the GetValues method returns one or more property strings to the callback method.

Override the Edit method to implement a response to the ellipsis button or double-clicking the property. For example, use the Edit method to bring up a dialog for editing the property in some more meaningful fashion than typing a text value in the Object Inspector.

See Also

GetValues (see page 11035)

Value (see page 11045)

59.1.19.2.4 TMethodProperty.GetAttributes Method

Describes the property so the Object Inspector provides the appropriate controls.

Pascal

```
function GetAttributes: TPropertyAttributes; override;
```

C++

```
virtual __fastcall TPropertyAttributes GetAttributes();
```

Description

The Object Inspector calls GetAttributes to determine what controls to display for the property and what property editor methods to call. The GetAttributes method of TPropertyEditor returns [paMultiSelect, paRevertable]. Override GetAttributes to return the set of values that corresponds to the attributes of the associated property.

Before the Object Inspector calls the Activate method, GetAttributes does not need to provide accurate information about any attributes other than paSubProperties, paVCL, and paMultiSelect.

See Also

Activate (see page 11024)

Edit (see page 11025)

GetProperties (see page 11033)

GetValues (see page 11035)

setvalue (see page 11042)

Value (see page 11045)

ListDrawValue

ListMeasureHeight

ListMeasureWidth

59.1.19.2.5 TMethodProperty.GetEditLimit Method

Returns the maximum length, in characters, of the Value property.

Pascal

```
function GetEditLimit: Integer; override;
```

C++

```
virtual __fastcall int GetEditLimit();
```

Description

The Object Inspector calls GetEditLimit to determine how many characters the user can type when entering a value for the property. GetEditLimit returns 255. Override this method when the maximum length of the property string is some other value.

See Also

Value (see page 11045)

59.1.19.2.6 TMethodProperty.GetFormMethodName Method

Pascal

```
function GetFormMethodName: string; virtual;
```

C++

```
virtual __fastcall AnsiString GetFormMethodName();
```

Description

This is GetFormMethodName, a member of class TMethodProperty.

59.1.19.2.7 TMethodProperty.GetTrimmedEventName Method

Pascal

```
function GetTrimmedEventName: string;
```

C++

```
__fastcall AnsiString GetTrimmedEventName();
```

Description

This is GetTrimmedEventName, a member of class TMethodProperty.

59.1.19.2.8 TMethodProperty.GetValue Method

Returns the property value formatted as a string.

Pascal

```
function GetValue: string; override;
```

C++

```
virtual __fastcall AnsiString GetValue();
```

Description

GetValue formats the value of the property, formatted as a string. If the value is not available, GetValue raised an exception.

As implemented in TPropertyEditor, GetValue returns the string "(unknown)". Descendant classes override this method to provide an appropriate value string or raise an exception.

GetValue is the read access method of the Value property.

Note: To obtain an error string when the property value is unavailable rather than raising an exception, you can call the GetEditValue method. GetEditValue is protected, but can be called through the IProperty interface in code that is not a method of a descendant class.

See Also

setvalue (see page 11042)

Value (see page 11045)

GetVisualValue (see page 11037)

GetEditValue (see page 11027)

59.1.19.2.9 TMethodProperty.GetValues Method

Provides the enumerated values of the property to a callback procedure.

Pascal

```
procedure GetValues(Proc: TGetStrProc); override;
```

C++

```
virtual __fastcall GetValues(TGetStrProc Proc);
```

Description

The Object Inspector calls GetValues when the drop-down button is clicked to show enumerated values. The GetValues method of TPropertyEditor does nothing. Property editors that return paValueList from the GetAttributes method should override GetValues to call the Proc parameter for every string that can represent a valid enumerated value. Even if the GetAttributes method does not return paValueList, property editors for enumerated types should still override GetValues to enumerate all possible values.

See Also

GetAttributes (see page 11026)

Value (see page 11045)

59.1.19.2.10 TMethodProperty.SetValue Method

Responds when the user changes the value of the property.

Pascal

```
procedure SetValue(const AValue: string); override;
```

C++

```
virtual __fastcall SetValue(const AnsiString AValue);
```

Description

The Object Inspector calls SetValue when the user has finished changing the property value. SetValue applies the value specified by the Value parameter to all components that it is currently editing. If the value can't be set, SetValue raises an exception that describes the problem.

Note: If the property is changed only through a dialog brought up by the Edit method, the Object Inspector does not call SetValue. Rather, the Edit method should handle the setting of the value on all components.

59.1.20 TNestedProperty Class

Class Hierarchy

Pascal

```
TNestedProperty = class(TPropertyEditor);
```

C++

```
class TNestedProperty : public TPropertyEditor;
```

File

DesignEditors

Description

This is class DesignEditors.TNestedProperty.

59.1.20.1 TNestedProperty Members

The following tables list the members exposed by TNestedProperty.

Protected Data Members

	Name	Description
	FRefCount (see page 22278)	This is FRefCount, a member of class TInterfacedObject.

Protected Methods

	Name	Description
	_AddRef (see page 22278)	Implements the IInterface (see page 22396) System::TInterfacedObject::_AddRef method.
	_Release (see page 22279)	Implements the IInterface (see page 22396) System::TInterfacedObject::_Release method.
	GetEditValue (see page 11027)	This is the overview for the GetEditValue method overload.
	GetFloatValue (see page 11028)	Returns the property value of the first object currently being edited.
	GetFloatValueAt (see page 11028)	Returns the property value of the specified object.
	GetInt64Value (see page 11028)	Returns the property value of the first object currently being edited.
	GetInt64ValueAt (see page 11029)	Returns the property value of the specified object.
	GetIntfValue (see page 11029)	Returns the property value of the first object currently being edited.
	GetIntfValueAt (see page 11030)	Returns the property value of the specified object.
V	GetIsDefault (see page 11030)	This is GetIsDefault, a member of class TPropertyEditor.
	GetMethodValue (see page 11031)	Returns the property value of the first object currently being edited.
	GetMethodValueAt (see page 11031)	Returns the property value of the specified object.
	GetOrdValue (see page 11032)	Returns the property value of the first object currently being edited.
	GetOrdValueAt (see page 11032)	Returns the property value of the specified object.
	GetStrValue (see page 11034)	Returns the property value of the first object currently being edited.
	GetStrValueAt (see page 11034)	Returns the property value of the specified object.
	GetVarValue (see page 11036)	Returns the property value of the first object currently being edited.
	GetVarValueAt (see page 11036)	Returns the property value of the specified object.
	GetWideStrValue (see page 11037)	This is GetWideStrValue, a member of class TPropertyEditor.
	GetWideStrValueAt (see page 11037)	This is GetWideStrValueAt, a member of class TPropertyEditor.
	HasInstance (see page 11038)	Indicates whether a specified object is currently being edited by the property editor.
A	Initialize (see page 11114)	Initializes the property editor after it is created but before it is used.
	Modified (see page 11038)	Informs the designer that the property value has changed.
	QueryInterface (see page 22280)	Implements the IInterface (see page 22396) System::TInterfacedObject::QueryInterface method.
	SetFloatValue (see page 11039)	Changes the property value for every object being edited.
	SetInt64Value (see page 11040)	Changes the property value for every object being edited.
	SetIntfValue (see page 11040)	Changes the property value for every object being edited.
	SetMethodValue (see page 11040)	Changes the property value for every object being edited.
	SetOrdValue (see page 11041)	Changes the property value for every object being edited.
V	SetPropEntry (see page 11041)	Informs the property editor of a particular object whose property is to be edited.
A	SetPropEntry (see page 11115)	Informs the property editor of a particular object whose property is to be edited.
	SetStrValue (see page 11042)	Changes the property value for every object being edited.
	SetVarValue (see page 11043)	Changes the property value for every object being edited.
	SetWideStrValue (see page 11043)	This is SetWideStrValue, a member of class TPropertyEditor.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	Activate (see page 11024)	Responds when the property is selected in the Object Inspector.
	Activate (see page 11199)	Responds when the property is selected in the Object Inspector.
V	AfterConstruction (see page 22279)	Responds after the last constructor executes.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	AllEqual (see page 11024)	Indicates whether all selected components have the same value for the property.
	AllEqual (see page 11199)	Indicates whether all selected components have the same value for the property.
V	AutoFill (see page 11025)	Returns true to indicate that values can be typed incrementally—and automatically completed—in the Object Inspector.
	AutoFill (see page 11200)	Returns true to indicate that values can be typed incrementally—and automatically completed—in the Object Inspector.

	BeforeDestruction (see page 22279)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 11014)	This is Create, a member of class TNestedProperty.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 11014)	Destroys an instance of TPropertyEditor.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Edit (see page 11025)	Responds when the user double-clicks the property in the Object Inspector.
	Edit (see page 11200)	Responds when the user double-clicks the property in the Object Inspector.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetAttributes (see page 11026)	Describes the property so the Object Inspector provides the appropriate controls.
	GetAttributes (see page 11200)	Describes the property so the Object Inspector provides the appropriate controls.
	GetComponent (see page 11026)	Returns the specified object from the set of all objects currently being edited by the property editor.
	GetEditLimit (see page 11027)	Returns the maximum length, in characters, of the Value (see page 11045) property.
	GetEditLimit (see page 11201)	Returns the maximum length, in characters, of the value.
	GetEditValue (see page 11201)	Retrieves a string to represent the property's value, or, if the value is not available, an error message.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIsDefault (see page 11206)	This is GetIsDefault, a member of class IProperty70.
	GetKind (see page 11030)	This is GetKind, a member of class TPropertyEditor.
	GetKind (see page 11212)	This is GetKind, a member of class IPropertyKind.
	GetName (see page 11032)	Returns the name of the property.
	GetName (see page 11202)	Returns the name of the property.
	GetProperties (see page 11033)	Provides the subproperties of the property to a callback procedure.
	GetProperties (see page 11202)	Provides the subproperties of the property to a callback procedure.
	GetPropInfo (see page 11033)	Returns the property information record for the object being edited.
	GetPropInfo (see page 11202)	Returns the property information record for the object being edited.
	GetPropType (see page 11033)	Returns the type information record for the object being edited.
	GetPropType (see page 11203)	Returns the type information record for the object being edited.
	GetValue (see page 11035)	Returns the property value formatted as a string.
	GetValue (see page 11203)	Returns the property value formatted as a string.
	GetValues (see page 11035)	Provides the enumerated values of the property to a callback procedure.
	GetValues (see page 11203)	Provides the enumerated values of the property to a callback procedure.
	GetValueW (see page 11036)	This is GetValueW, a member of class TPropertyEditor.
	GetVisualValue (see page 11037)	Returns the property value as it appears in the Object Inspector.
	HasInstance (see page 11204)	Indicates whether a specified object is currently being edited by the property editor.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	Initialize (see page 11038)	Initializes the property editor after it is created but before it is used.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.

	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22280)	Allocates memory for each instance of an interfaced object.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	Revert (see page 11039)	Restores all object properties to their original values.
	Revert (see page 11204)	Restores all object properties to their original values.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetValue (see page 11204)	Responds when the user changes the value of the property.
V	SetValue (see page 11042)	This is the overview for the SetValue method overload.
	ValueAvailable (see page 11044)	Indicates whether all components being edited have a value for the property if their ComponentStyle includes csCheckPropAvail.
	ValueAvailable (see page 11205)	Indicates whether all components being edited have a value for the property if their ComponentStyle includes csCheckPropAvail.

Public Properties

	Name	Description
R	Designer (see page 11044)	Provides access to the form designer object in the IDE.
R	IsDefault (see page 11206)	This is IsDefault, a member of class IProperty70.
R	Kind (see page 11212)	This is Kind, a member of class IPropertyKind.
R	PrivateDirectory (see page 11044)	Specifies the location where the property editor can store auxiliary files.
R	PropCount (see page 11045)	Indicates the number of components whose properties are being edited.
R	RefCount (see page 22281)	Indicates the number of interface pointers currently dependent upon the object.
	Value (see page 11045)	Represents the current value of the property (as returned by GetValue (see page 11035)) as a string.

59.1.20.2 TNestedProperty.Create Constructor

Pascal

```
constructor Create(Parent: TPropertyEditor); reintroduce;
```

C++

```
__fastcall TNestedProperty(TPropertyEditor Parent);
```

Description

This is Create, a member of class TNestedProperty.

59.1.20.3 TNestedProperty.Destroy Destructor

Destroys an instance of TPropertyEditor.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TNestedProperty();
```

Description

Do not call Destroy. The Object Inspector destroys the property editor automatically when it is finished.

Destroy frees the internal objects used to store information about the selected components and their property settings. Override Destroy to free any other internal structures created by the property editor.

59.1.21 TOrdinalProperty Class

Class Hierarchy

Pascal

```
TOrdinalProperty = class(TPropertyEditor);
```

C++

```
class TOrdinalProperty : public TPropertyEditor;
```

File

DesignEditors

Description

This is class DesignEditors.TOrdinalProperty.

59.1.21.1 TOrdinalProperty Members

The following tables list the members exposed by TOrdinalProperty.

Protected Data Members

	Name	Description
	FRefCount (see page 22278)	This is FRefCount, a member of class TInterfacedObject.

Protected Methods

	Name	Description
	_AddRef (see page 22278)	Implements the IInterface (see page 22396) System::TInterfacedObject::_AddRef method.
	_Release (see page 22279)	Implements the IInterface (see page 22396) System::TInterfacedObject::_Release method.
	GetEditValue (see page 11027)	This is the overview for the GetEditValue method overload.
	GetFloatValue (see page 11028)	Returns the property value of the first object currently being edited.
	GetFloatValueAt (see page 11028)	Returns the property value of the specified object.
	GetInt64Value (see page 11028)	Returns the property value of the first object currently being edited.
	GetInt64ValueAt (see page 11029)	Returns the property value of the specified object.
	GetIntfValue (see page 11029)	Returns the property value of the first object currently being edited.
	GetIntfValueAt (see page 11030)	Returns the property value of the specified object.
	GetIsDefault (see page 11030)	This is GetIsDefault, a member of class TPropertyEditor.
	GetMethodValue (see page 11031)	Returns the property value of the first object currently being edited.
	GetMethodValueAt (see page 11031)	Returns the property value of the specified object.
	GetOrdValue (see page 11032)	Returns the property value of the first object currently being edited.

	GetOrdValueAt (see page 11032)	Returns the property value of the specified object.
	GetStrValue (see page 11034)	Returns the property value of the first object currently being edited.
	GetStrValueAt (see page 11034)	Returns the property value of the specified object.
	GetVarValue (see page 11036)	Returns the property value of the first object currently being edited.
	GetVarValueAt (see page 11036)	Returns the property value of the specified object.
	GetWideStrValue (see page 11037)	This is GetWideStrValue, a member of class TPropertyEditor.
	GetWideStrValueAt (see page 11037)	This is GetWideStrValueAt, a member of class TPropertyEditor.
	HasInstance (see page 11038)	Indicates whether a specified object is currently being edited by the property editor.
A	Initialize (see page 11114)	Initializes the property editor after it is created but before it is used.
	Modified (see page 11038)	Informs the designer that the property value has changed.
	QueryInterface (see page 22280)	Implements the IInterface (see page 22396) System::TInterfacedObject::QueryInterface method.
	SetFloatValue (see page 11039)	Changes the property value for every object being edited.
	SetInt64Value (see page 11040)	Changes the property value for every object being edited.
	SetIntfValue (see page 11040)	Changes the property value for every object being edited.
	SetMethodValue (see page 11040)	Changes the property value for every object being edited.
	SetOrdValue (see page 11041)	Changes the property value for every object being edited.
V	SetPropEntry (see page 11041)	Informs the property editor of a particular object whose property is to be edited.
A	SetPropEntry (see page 11115)	Informs the property editor of a particular object whose property is to be edited.
	SetStrValue (see page 11042)	Changes the property value for every object being edited.
	SetVarValue (see page 11043)	Changes the property value for every object being edited.
	SetWideStrValue (see page 11043)	This is SetWideStrValue, a member of class TPropertyEditor.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	Activate (see page 11024)	Responds when the property is selected in the Object Inspector.
	Activate (see page 11199)	Responds when the property is selected in the Object Inspector.
V	AfterConstruction (see page 22279)	Responds after the last constructor executes.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	AllEqual (see page 11018)	Indicates whether all selected components have the same value for the property.
V	AutoFill (see page 11025)	Returns true to indicate that values can be typed incrementally—and automatically completed—in the Object Inspector.
	AutoFill (see page 11200)	Returns true to indicate that values can be typed incrementally—and automatically completed—in the Object Inspector.
V	BeforeDestruction (see page 22279)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 11022)	Creates a new TPropertyEditor (see page 11019) object.
V	Create (see page 11114)	Creates a new TBasePropertyEditor (see page 11112) object.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 11022)	Destroys an instance of TPropertyEditor (see page 11019).
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
V	Edit (see page 11025)	Responds when the user double-clicks the property in the Object Inspector.

	Edit (see page 11200)	Responds when the user double-clicks the property in the Object Inspector.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
V	GetAttributes (see page 11026)	Describes the property so the Object Inspector provides the appropriate controls.
	GetAttributes (see page 11200)	Describes the property so the Object Inspector provides the appropriate controls.
	GetComponent (see page 11026)	Returns the specified object from the set of all objects currently being edited by the property editor.
V	GetEditLimit (see page 11018)	Returns the maximum length, in characters, of the Value property.
	GetEditValue (see page 11201)	Retrieves a string to represent the property's value, or, if the value is not available, an error message.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIsDefault (see page 11206)	This is GetIsDefault, a member of class IProperty70.
	GetKind (see page 11030)	This is GetKind, a member of class TPropertyEditor.
	GetKind (see page 11212)	This is GetKind, a member of class IPropertyKind.
V	GetName (see page 11032)	Returns the name of the property.
	GetName (see page 11202)	Returns the name of the property.
V	GetProperties (see page 11033)	Provides the subproperties of the property to a callback procedure.
	GetProperties (see page 11202)	Provides the subproperties of the property to a callback procedure.
V	GetPropInfo (see page 11033)	Returns the property information record for the object being edited.
	GetPropInfo (see page 11202)	Returns the property information record for the object being edited.
	GetPropType (see page 11033)	Returns the type information record for the object being edited.
	GetPropType (see page 11203)	Returns the type information record for the object being edited.
V	GetValue (see page 11035)	Returns the property value formatted as a string.
	GetValue (see page 11203)	Returns the property value formatted as a string.
V	GetValues (see page 11035)	Provides the enumerated values of the property to a callback procedure.
	GetValues (see page 11203)	Provides the enumerated values of the property to a callback procedure.
V	GetValueW (see page 11036)	This is GetValueW, a member of class TPropertyEditor.
	GetVisualValue (see page 11037)	Returns the property value as it appears in the Object Inspector.
	HasInstance (see page 11204)	Indicates whether a specified object is currently being edited by the property editor.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
V	Initialize (see page 11038)	Initializes the property editor after it is created but before it is used.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22280)	Allocates memory for each instance of an interfaced object.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	Revert (see page 11039)	Restores all object properties to their original values.
	Revert (see page 11204)	Restores all object properties to their original values.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetValue (see page 11204)	Responds when the user changes the value of the property.
V	SetValue (see page 11042)	This is the overview for the SetValue method overload.
	ValueAvailable (see page 11044)	Indicates whether all components being edited have a value for the property if their ComponentStyle includes csCheckPropAvail.
	ValueAvailable (see page 11205)	Indicates whether all components being edited have a value for the property if their ComponentStyle includes csCheckPropAvail.

Public Properties

	Name	Description
R	Designer (see page 11044)	Provides access to the form designer object in the IDE.
R	IsDefault (see page 11206)	This is IsDefault, a member of class IProperty70.
R	Kind (see page 11212)	This is Kind, a member of class IPropertyKind.
R	PrivateDirectory (see page 11044)	Specifies the location where the property editor can store auxiliary files.
R	PropCount (see page 11045)	Indicates the number of components whose properties are being edited.
R	RefCount (see page 22281)	Indicates the number of interface pointers currently dependent upon the object.
	Value (see page 11045)	Represents the current value of the property (as returned by GetValue (see page 11035)) as a string.

59.1.21.2 TOrdinalProperty Methods

The methods of the TOrdinalProperty class are listed here.

Public Methods

	Name	Description
V	AllEqual (see page 11018)	Indicates whether all selected components have the same value for the property.
V	GetEditLimit (see page 11018)	Returns the maximum length, in characters, of the Value property.

59.1.21.2.1 TOrdinalProperty.AllEqual Method

Indicates whether all selected components have the same value for the property.

Pascal

```
function AllEqual: Boolean; override;
```

C++

```
virtual __fastcall Boolean AllEqual();
```

Description

The Object Inspector calls AllEqual when there is more than one component selected to determine whether a value should appear for this property. If this method returns true, the Object Inspector displays a value for the property. If this method returns false, the line for the property in the Object Inspector remains blank.

In TPropertyEditor, AllEqual always returns false if more than one selected component has the associated property. Override this method to check the properties of individual components and determine whether a property value can be displayed in the Object Inspector.

Note: AllEqual is called only when the value returned by GetAttributes includes paMultiSelect.

See Also

GetAttributes (see page 11026)

GetComponent (see page 11026)

GetValue (see page 11035)

59.1.21.2.2 TOrdinalProperty.GetEditLimit Method

Returns the maximum length, in characters, of the Value property.

Pascal

```
function GetEditLimit: Integer; override;
```

C++

```
virtual __fastcall int GetEditLimit();
```

Description

The Object Inspector calls GetEditLimit to determine how many characters the user can type when entering a value for the property. GetEditLimit returns 255. Override this method when the maximum length of the property string is some other value.

See Also

Value (see page 11045)

59.1.22 TPropertyEditor Class

TPropertyEditor is a base class for property editors that implements the IProperty interface.

Class Hierarchy

Pascal

```
TPropertyEditor = class(TBasePropertyEditor, IProperty, IPropertyKind, IProperty70);
```

C++

```
class TPropertyEditor : public TBasePropertyEditor, public IProperty, public IPropertyKind,
public IProperty70;
```

File

DesignEditors

Description

Use TPropertyEditor or one of its descendants as a base class when defining a property editor for a specialized property in a new component class. TPropertyEditor has several descendants that can be used to set the values of properties with simple types. Create (see page 11022) specialized property editors to allow users to set more complicated property values from the Object Inspector.

Unlike its ancestor, TBasePropertyEditor, TPropertyEditor contains no abstract (or, in C++ terminology, pure virtual) methods and provides a default implementation for the IProperty interface that the Object Inspector uses to communicate with property editors.

Individual descendants of TPropertyEditor are displayed based on the type of the property being edited. Individual property editors can be associated with all properties of a specified type, or with a particular property of a particular component class. To create the association between a property editor and a property type, call RegisterPropertyEditor. Once the property editor is registered, it appears when the user attempts to edit an appropriate property using the Object Inspector.

RegisterPropertyEditor

IProperty (see page 11197)

59.1.22.1 TPropertyEditor Members

The following tables list the members exposed by TPropertyEditor.

Protected Data Members

	Name	Description
	FRefCount (see page 22278)	This is FRefCount, a member of class TInterfacedObject.

Protected Methods

	Name	Description
	_AddRef (see page 22278)	Implements the IInterface (see page 22396) System::TInterfacedObject::_AddRef method.
	_Release (see page 22279)	Implements the IInterface (see page 22396) System::TInterfacedObject::_Release method.
	GetEditValue (see page 11027)	This is the overview for the GetEditValue method overload.
	GetFloatValue (see page 11028)	Returns the property value of the first object currently being edited.
	GetFloatValueAt (see page 11028)	Returns the property value of the specified object.
	GetInt64Value (see page 11028)	Returns the property value of the first object currently being edited.
	GetInt64ValueAt (see page 11029)	Returns the property value of the specified object.
	GetIntfValue (see page 11029)	Returns the property value of the first object currently being edited.
	GetIntfValueAt (see page 11030)	Returns the property value of the specified object.
V	GetIsDefault (see page 11030)	This is GetIsDefault, a member of class TPropertyEditor.
	GetMethodValue (see page 11031)	Returns the property value of the first object currently being edited.
	GetMethodValueAt (see page 11031)	Returns the property value of the specified object.
	GetOrdValue (see page 11032)	Returns the property value of the first object currently being edited.
	GetOrdValueAt (see page 11032)	Returns the property value of the specified object.
	GetStrValue (see page 11034)	Returns the property value of the first object currently being edited.
	GetStrValueAt (see page 11034)	Returns the property value of the specified object.
	GetVarValue (see page 11036)	Returns the property value of the first object currently being edited.
	GetVarValueAt (see page 11036)	Returns the property value of the specified object.
	GetWideStrValue (see page 11037)	This is GetWideStrValue, a member of class TPropertyEditor.
	GetWideStrValueAt (see page 11037)	This is GetWideStrValueAt, a member of class TPropertyEditor.
	HasInstance (see page 11038)	Indicates whether a specified object is currently being edited by the property editor.
	Modified (see page 11038)	Informs the designer that the property value has changed.
	QueryInterface (see page 22280)	Implements the IInterface (see page 22396) System::TInterfacedObject::QueryInterface method.
	SetFloatValue (see page 11039)	Changes the property value for every object being edited.
	SetInt64Value (see page 11040)	Changes the property value for every object being edited.
	SetIntfValue (see page 11040)	Changes the property value for every object being edited.
	SetMethodValue (see page 11040)	Changes the property value for every object being edited.
	SetOrdValue (see page 11041)	Changes the property value for every object being edited.
V	SetPropEntry (see page 11041)	Informs the property editor of a particular object whose property is to be edited.
	SetStrValue (see page 11042)	Changes the property value for every object being edited.
	SetVarValue (see page 11043)	Changes the property value for every object being edited.
	SetWideStrValue (see page 11043)	This is SetWideStrValue, a member of class TPropertyEditor.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	Activate (see page 11024)	Responds when the property is selected in the Object Inspector.
V	AfterConstruction (see page 22279)	Responds after the last constructor executes.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.

	AllEqual (see page 11024)	Indicates whether all selected components have the same value for the property.
	AutoFill (see page 11025)	Returns true to indicate that values can be typed incrementally—and automatically completed—in the Object Inspector.
	BeforeDestruction (see page 22279)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 11022)	Creates a new TPropertyEditor (see page 11019) object.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 11022)	Destroys an instance of TPropertyEditor (see page 11019).
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Edit (see page 11025)	Responds when the user double-clicks the property in the Object Inspector.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetAttributes (see page 11026)	Describes the property so the Object Inspector provides the appropriate controls.
	GetComponent (see page 11026)	Returns the specified object from the set of all objects currently being edited by the property editor.
	GetEditLimit (see page 11027)	Returns the maximum length, in characters, of the Value (see page 11045) property.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetKind (see page 11030)	This is GetKind, a member of class TPropertyEditor.
	GetName (see page 11032)	Returns the name of the property.
	GetProperties (see page 11033)	Provides the subproperties of the property to a callback procedure.
	GetPropInfo (see page 11033)	Returns the property information record for the object being edited.
	GetPropType (see page 11033)	Returns the type information record for the object being edited.
	GetValue (see page 11035)	Returns the property value formatted as a string.
	GetValues (see page 11035)	Provides the enumerated values of the property to a callback procedure.
	GetValueW (see page 11036)	This is GetValueW, a member of class TPropertyEditor.
	GetVisualValue (see page 11037)	Returns the property value as it appears in the Object Inspector.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	Initialize (see page 11038)	Initializes the property editor after it is created but before it is used.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22280)	Allocates memory for each instance of an interfaced object.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	Revert (see page 11039)	Restores all object properties to their original values.
	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetValue (see page 11042)	This is the overview for the SetValue method overload.
	ValueAvailable (see page 11044)	Indicates whether all components being edited have a value for the property if their ComponentStyle includes csCheckPropAvail.

Public Properties

	Name	Description
R	Designer (see page 11044)	Provides access to the form designer object in the IDE.
R	IsDefault (see page 11206)	This is IsDefault, a member of class IProperty70.
R	Kind (see page 11212)	This is Kind, a member of class IPropertyKind.
R	PrivateDirectory (see page 11044)	Specifies the location where the property editor can store auxiliary files.
R	PropCount (see page 11045)	Indicates the number of components whose properties are being edited.
R	RefCount (see page 22281)	Indicates the number of interface pointers currently dependent upon the object.
	Value (see page 11045)	Represents the current value of the property (as returned by GetValue (see page 11035)) as a string.

59.1.22.2 TPropertyEditor.Create Constructor

Creates a new TPropertyEditor (see page 11019) object.

Pascal

```
constructor Create(const ADesigner: IDesigner; APropCount: Integer); override;
```

C++

```
virtual __fastcall TPropertyEditor(const IDesigner ADesigner, int APropCount);
```

Description

Do not create instances of a property editor. Registered property editors are created automatically for selected objects in the form designer.

ADesigner is an interface that the property editor can use to interact with the forms designer. It becomes the value of the Designer (see page 11044) property.

APropCount indicates the number of components whose properties are to be edited using the property editor. It becomes the value of the PropCount (see page 11045) property.

See Also

Initialize (see page 11038)

Activate (see page 11024)

Designer (see page 11044)

PropCount (see page 11045)

59.1.22.3 TPropertyEditor.Destroy Destructor

Destroys an instance of TPropertyEditor (see page 11019).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TPropertyEditor();
```

Description

Do not call Destroy. The Object Inspector destroys the property editor automatically when it is finished.

Destroy frees the internal objects used to store information about the selected components and their property settings. Override Destroy to free any other internal structures created by the property editor.

See Also

Free (see page 22300)

59.1.22.4 TPropertyEditor Methods

The methods of the TPropertyEditor class are listed here.

Protected Methods

	Name	Description
	GetEditValue (see page 11027)	This is the overview for the GetEditValue method overload.
	GetFloatValue (see page 11028)	Returns the property value of the first object currently being edited.
	GetFloatValueAt (see page 11028)	Returns the property value of the specified object.
	GetInt64Value (see page 11028)	Returns the property value of the first object currently being edited.
	GetInt64ValueAt (see page 11029)	Returns the property value of the specified object.
	GetIntfValue (see page 11029)	Returns the property value of the first object currently being edited.
	GetIntfValueAt (see page 11030)	Returns the property value of the specified object.
V	GetIsDefault (see page 11030)	This is GetIsDefault, a member of class TPropertyEditor.
	GetMethodValue (see page 11031)	Returns the property value of the first object currently being edited.
	GetMethodValueAt (see page 11031)	Returns the property value of the specified object.
	GetOrdValue (see page 11032)	Returns the property value of the first object currently being edited.
	GetOrdValueAt (see page 11032)	Returns the property value of the specified object.
	GetStrValue (see page 11034)	Returns the property value of the first object currently being edited.
	GetStrValueAt (see page 11034)	Returns the property value of the specified object.
	GetVarValue (see page 11036)	Returns the property value of the first object currently being edited.
	GetVarValueAt (see page 11036)	Returns the property value of the specified object.
	GetWideStrValue (see page 11037)	This is GetWideStrValue, a member of class TPropertyEditor.
	GetWideStrValueAt (see page 11037)	This is GetWideStrValueAt, a member of class TPropertyEditor.
	HasInstance (see page 11038)	Indicates whether a specified object is currently being edited by the property editor.
	Modified (see page 11038)	Informs the designer that the property value has changed.
	SetFloatValue (see page 11039)	Changes the property value for every object being edited.
	SetInt64Value (see page 11040)	Changes the property value for every object being edited.
	SetIntfValue (see page 11040)	Changes the property value for every object being edited.
	SetMethodValue (see page 11040)	Changes the property value for every object being edited.
	SetOrdValue (see page 11041)	Changes the property value for every object being edited.
V	SetPropEntry (see page 11041)	Informs the property editor of a particular object whose property is to be edited.
	SetStrValue (see page 11042)	Changes the property value for every object being edited.
	SetVarValue (see page 11043)	Changes the property value for every object being edited.
	SetWideStrValue (see page 11043)	This is SetWideStrValue, a member of class TPropertyEditor.

Public Methods

	Name	Description
V	Activate (see page 11024)	Responds when the property is selected in the Object Inspector.
V	AllEqual (see page 11024)	Indicates whether all selected components have the same value for the property.
V	AutoFill (see page 11025)	Returns true to indicate that values can be typed incrementally—and automatically completed—in the Object Inspector.
V	Edit (see page 11025)	Responds when the user double-clicks the property in the Object Inspector.
V	GetAttributes (see page 11026)	Describes the property so the Object Inspector provides the appropriate controls.
	GetComponent (see page 11026)	Returns the specified object from the set of all objects currently being edited by the property editor.
V	GetEditLimit (see page 11027)	Returns the maximum length, in characters, of the Value (see page 11045) property.
	GetKind (see page 11030)	This is GetKind, a member of class TPropertyEditor.
V	GetName (see page 11032)	Returns the name of the property.

	GetProperties (see page 11033)	Provides the subproperties of the property to a callback procedure.
	GetPropInfo (see page 11033)	Returns the property information record for the object being edited.
	GetPropType (see page 11033)	Returns the type information record for the object being edited.
	GetValue (see page 11035)	Returns the property value formatted as a string.
	GetValues (see page 11035)	Provides the enumerated values of the property to a callback procedure.
	GetValueW (see page 11036)	This is GetValueW, a member of class TPropertyEditor.
	GetVisualValue (see page 11037)	Returns the property value as it appears in the Object Inspector.
	Initialize (see page 11038)	Initializes the property editor after it is created but before it is used.
	Revert (see page 11039)	Restores all object properties to their original values.
	SetValue (see page 11042)	This is the overview for the SetValue method overload.
	ValueAvailable (see page 11044)	Indicates whether all components being edited have a value for the property if their ComponentStyle includes csCheckPropAvail.

59.1.22.4.1 TPropertyEditor.Activate Method

Responds when the property is selected in the Object Inspector.

Pascal

```
procedure Activate; virtual;
```

C++

```
virtual __fastcall Activate();
```

Description

Do not call the Activate method. It is called automatically when the property is selected. As implemented in TPropertyEditor (see page 11019), Activate does nothing. Override this method to determine attributes of the property dynamically when the property editor is displayed in the Object Inspector.

Before Activate is called, the GetAttributes (see page 11026) method does not need to provide accurate information about any attributes other than paSubProperties, paVCL, and paMultiSelect. Any other attributes can be computed in an override of the Activate method and stored so that subsequent calls to GetAttributes (see page 11026) can provide accurate information.

See Also

GetAttributes (see page 11026)

Initialize (see page 11038)

59.1.22.4.2 TPropertyEditor.AllEqual Method

Indicates whether all selected components have the same value for the property.

Pascal

```
function AllEqual: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean AllEqual();
```

Description

The Object Inspector calls AllEqual when there is more than one component selected to determine whether a value should appear for this property. If this method returns true, the Object Inspector displays a value for the property. If this method returns false, the line for the property in the Object Inspector remains blank.

In TPropertyEditor (see page 11019), AllEqual always returns false if more than one selected component has the associated property. Override this method to check the properties of individual components and determine whether a property value can be displayed in the Object Inspector.

Note: AllEqual is called only when the value returned by GetAttributes (see page 11026) includes paMultiSelect.

See Also

GetAttributes (see page 11026)

GetComponent (see page 11026)

GetValue (see page 11035)

59.1.22.4.3 TPropertyEditor.AutoFill Method

Returns true to indicate that values can be typed incrementally—and automatically completed—in the Object Inspector.

Pascal

```
function AutoFill: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean AutoFill();
```

Description

If GetAttributes returns paValueList, the Object Inspector calls AutoFill to verify that automatic typing completion should be permitted. If AutoFill returns true, the Object Inspector uses the values provided by GetValues to fill in partially typed entries. For example, if the legal values for a property are prSmall and prLarge, the user can type "prS" and the Object Inspector automatically fills in "prSmall."

See Also

GetAttributes (see page 11200)

GetValues (see page 11203)

59.1.22.4.4 TPropertyEditor.Edit Method

Responds when the user double-clicks the property in the Object Inspector.

Pascal

```
procedure Edit; virtual;
```

C++

```
virtual __fastcall Edit();
```

Description

The Object Inspector calls Edit when the ellipsis button (...) is pressed or the property is double-clicked. The Edit method of TPropertyEditor (see page 11019) cycles through the possible enumerated values of the property when the GetValues (see page 11035) method returns one or more property strings to the callback method.

Override the Edit method to implement a response to the ellipsis button or double-clicking the property. For example, use the Edit method to bring up a dialog for editing the property in some more meaningful fashion than typing a text value in the Object Inspector.

See Also

GetValues (see page 11035)

Value (see page 11045)

59.1.22.4.5 TPropertyEditor.GetAttributes Method

Describes the property so the Object Inspector provides the appropriate controls.

Pascal

```
function GetAttributes: TPropertyAttributes; virtual;
```

C++

```
virtual __fastcall TPropertyAttributes GetAttributes();
```

Description

The Object Inspector calls GetAttributes to determine what controls to display for the property and what property editor methods to call. The GetAttributes method of TPropertyEditor (see page 11019) returns [paMultiSelect, paRevertable]. Override GetAttributes to return the set of values that corresponds to the attributes of the associated property.

Before the Object Inspector calls the Activate (see page 11024) method, GetAttributes does not need to provide accurate information about any attributes other than paSubProperties, paVCL, and paMultiSelect.

See Also

Activate (see page 11024)

Edit (see page 11025)

GetProperties (see page 11033)

GetValues (see page 11035)

setvalue (see page 11042)

Value (see page 11045)

ListDrawValue

ListMeasureHeight

ListMeasureWidth

59.1.22.4.6 TPropertyEditor.GetComponent Method

Returns the specified object from the set of all objects currently being edited by the property editor.

Pascal

```
function GetComponent(Index: Integer): TPersistent;
```

C++

```
__fastcall TPersistent * GetComponent(int Index);
```

Description

Call GetComponent to access any of the objects with a property currently being edited by the property editor. The Index parameter is used to specify individual objects in the internal list maintained by the property editor. Index should be a value between 0 and PropCount (see page 11045) - 1, inclusive.

Use GetComponent to iterate over all objects currently being edited.

See Also

PropCount (see page 11045)

HasInstance (see page 11038)

59.1.22.4.7 TPropertyEditor.GetEditLimit Method

Returns the maximum length, in characters, of the Value (see page 11045) property.

Pascal

```
function GetEditLimit: Integer; virtual;
```

C++

```
virtual __fastcall int GetEditLimit();
```

Description

The Object Inspector calls GetEditLimit to determine how many characters the user can type when entering a value for the property. GetEditLimit returns 255. Override this method when the maximum length of the property string is some other value.

See Also

Value (see page 11045)

59.1.22.4.8 GetEditValue Method

This is the overview for the GetEditValue method overload.

Overload List

	Name	Description
	TPropertyEditor.GetEditValue (string) (see page 11027)	Retrieves a string to represent the property's value, or, if the value is not available, an error message.
	TPropertyEditor.GetEditValue (WideString) (see page 11027)	Retrieves a string to represent the property's value, or, if the value is not available, an error message.

59.1.22.4.8.1 TPropertyEditor.GetEditValue Method (WideString)

Retrieves a string to represent the property's value, or, if the value is not available, an error message.

Pascal

```
function GetEditValue(out Value: string): Boolean; overload;
function GetEditValue(out Value: WideString): Boolean; overload;
```

C++

```
__fastcall Boolean GetEditValue(AnsiString Value);
__fastcall Boolean GetEditValue(BSTR Value);
```

Description

The Object Inspector calls GetEditValue (through the IProperty interface) to obtain the string it displays as the property value.

GetValue (see page 11035) formats the string displayed in the Object Inspector to represent the property value and returns it as the Value (see page 11045) parameter. Unlike the GetValue (see page 11035) method, which is the read access method for the Value (see page 11045) property, GetEditValue does not raise an exception when the property value is unavailable. Instead, it assigns an error message to Value (see page 11045) and returns false.

GetValue (see page 11035) returns true if Value (see page 11045) returns a string representation of the property value.

Note: GetEditValue is not a virtual method. To provide a method that supplies the string that appears in the Object Inspector, override the GetValue (see page 11035) method instead. GetEditValue calls GetValue (see page 11035) to fetch this string.

See Also

GetValue (see page 11035)

59.1.22.4.9 TPropertyEditor.GetFloatValue Method

Returns the property value of the first object currently being edited.

Pascal

```
function GetFloatValue: Extended;
```

C++

```
__fastcall Extended GetFloatValue();
```

Description

Call GetFloatValue to obtain the current value of the property for the first object in the internal list of objects being edited. Call GetFloatValue only if the property is a float type.

If more than one object is currently being edited, GetFloatValue returns the value for the object returned by GetComponent (see page 11026)(0). To obtain the current property value for every object currently being edited, use the GetFloatValueAt (see page 11028) method.

See Also

GetComponent (see page 11026)

GetFloatValueAt (see page 11028)

59.1.22.4.10 TPropertyEditor.GetFloatValueAt Method

Returns the property value of the specified object.

Pascal

```
function GetFloatValueAt(Index: Integer): Extended;
```

C++

```
__fastcall Extended GetFloatValueAt(int Index);
```

Description

Call GetFloatValueAt to obtain the current value of the property for an object in the internal list of objects being edited. Call GetFloatValueAt only if the property is a float type. The Index parameter identifies which object's value should be returned. It corresponds to the Index parameter of the GetComponent (see page 11026) method.

Use GetFloatValueAt to iterate over all current values, for example when implementing the AllEqual (see page 11024) method.

See Also

GetComponent (see page 11026)

GetFloatValue (see page 11028)

AllEqual (see page 11024)

59.1.22.4.11 TPropertyEditor.GetInt64Value Method

Returns the property value of the first object currently being edited.

Pascal

```
function GetInt64Value: Int64;
```

C++

```
__fastcall Int64 GetInt64Value();
```

Description

Call GetInt64Value to obtain the current value of the property for the first object in the internal list of objects being edited. Call GetInt64Value only if the property is 64-bit integer type.

If more than one object is currently being edited, GetInt64Value returns the value for the object returned by GetComponent (see page 11026)(0). To obtain the current property value for every object currently being edited, use the GetInt64ValueAt (see page 11029) method.

See Also

GetComponent (see page 11026)

GetInt64ValueAt (see page 11029)

59.1.22.4.12 TPropertyEditor.GetInt64ValueAt Method

Returns the property value of the specified object.

Pascal

```
function GetInt64ValueAt(Index: Integer): Int64;
```

C++

```
__fastcall Int64 GetInt64ValueAt(int Index);
```

Description

Call GetInt64ValueAt to obtain the current value of the property for an object in the internal list of objects being edited. Call GetInt64ValueAt only if the property is a 64-bit integer type. The Index parameter identifies which object's value should be returned. It corresponds to the Index parameter of the GetComponent (see page 11026) method.

Use GetInt64ValueAt to iterate over all current values, for example when implementing the AllEqual (see page 11024) method.

See Also

GetComponent (see page 11026)

GetInt64Value (see page 11028)

AllEqual (see page 11024)

59.1.22.4.13 TPropertyEditor.GetIntfValue Method

Returns the property value of the first object currently being edited.

Pascal

```
function GetIntfValue: IInterface;
```

C++

```
__fastcall IInterface GetIntfValue();
```

Description

Call GetIntfValue to obtain the current value of the property for the first object in the internal list of objects being edited. Call

GetIntfValue only if the property is a component interface type.

If more than one object is currently being edited, GetIntfValue returns the value for the object returned by GetComponent (see page 11026)(0). To obtain the current property value for every object currently being edited, use the GetIntfValueAt (see page 11030) method.

See Also

GetComponent (see page 11026)

GetIntfValueAt (see page 11030)

59.1.22.4.14 TPropertyEditor.GetIntfValueAt Method

Returns the property value of the specified object.

Pascal

```
function GetIntfValueAt(Index: Integer): IInterface;
```

C++

```
__fastcall IInterface GetIntfValueAt(int Index);
```

Description

Call GetIntfValueAt to obtain the current value of the property for an object in the internal list of objects being edited. Call GetIntfValueAt only if the property is a component interface type. The Index parameter identifies which object's value should be returned. It corresponds to the Index parameter of the GetComponent (see page 11026) method.

Use GetIntfValueAt to iterate over all current values, for example when implementing the AllEqual (see page 11024) method.

See Also

GetComponent (see page 11026)

GetIntfValue (see page 11029)

AllEqual (see page 11024)

59.1.22.4.15 TPropertyEditor.GetIsDefault Method

Pascal

```
function GetIsDefault: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean GetIsDefault();
```

Description

This is GetIsDefault, a member of class TPropertyEditor.

59.1.22.4.16 TPropertyEditor.GetKind Method

Pascal

```
function GetKind: TTypeKind;
```

C++

```
__fastcall TTypeKind GetKind();
```

Description

This is GetKind, a member of class TPropertyEditor.

59.1.22.4.17 TPropertyEditor.GetMethodValue Method

Returns the property value of the first object currently being edited.

Pascal

```
function GetMethodValue: TMethod;
```

C++

```
__fastcall TMethod GetMethodValue();
```

Description

Call GetMethodValue to obtain the current value of the property for the first object in the internal list of objects being edited. Call GetMethodValue only if the property is a method, such as the DefWndProc property of TWinControl (Windows) or TWidgetControl (Linux), or an event handler.

If more than one object is currently being edited, GetMethodValue returns the value for the object returned by GetComponent (see page 11026)(0). To obtain the current property value for every object currently being edited, use the GetMethodValueAt (see page 11031) method.

See Also

GetComponent (see page 11026)

GetMethodValueAt (see page 11031)

59.1.22.4.18 TPropertyEditor.GetMethodValueAt Method

Returns the property value of the specified object.

Pascal

```
function GetMethodValueAt(Index: Integer): TMethod;
```

C++

```
__fastcall TMethod GetMethodValueAt(int Index);
```

Description

Call GetMethodValueAt to obtain the current value of the property for an object in the internal list of objects being edited. Call GetMethodValueAt only if the property is a method, such as the DefWndProc property of TWinControl (Windows) or TWidgetControl (Linux), or an event handler. The Index parameter identifies which object's value should be returned. It corresponds to the Index parameter of the GetComponent (see page 11026) method.

Use GetMethodValueAt to iterate over all current values, for example when implementing the AllEqual (see page 11024) method.

See Also

GetComponent (see page 11026)

GetMethodValue (see page 11031)

AllEqual (see page 11024)

59.1.22.4.19 TPropertyEditor.GetName Method

Returns the name of the property.

Pascal

```
function GetName: string; virtual;
```

C++

```
virtual __fastcall AnsiString GetName();
```

Description

The Object Inspector calls GetName to obtain the property name that it displays. GetName returns the name of the property from the property type information with all underbars replaced by spaces. Override this method if the Object Inspector should display a string other than the property name.

See Also

PropDrawName

59.1.22.4.20 TPropertyEditor.GetOrdValue Method

Returns the property value of the first object currently being edited.

Pascal

```
function GetOrdValue: Longint;
```

C++

```
__fastcall Longint GetOrdValue();
```

Description

Call GetOrdValue to obtain the current value of the property for the first object in the internal list of objects being edited. Call GetOrdValue only if the property is an ordinal type.

If more than one object is currently being edited, GetOrdValue returns the value for the object returned by GetComponent (see page 11026)(0). To obtain the current property value for every object currently being edited, use the GetOrdValueAt (see page 11032) method.

See Also

GetComponent (see page 11026)

GetOrdValueAt (see page 11032)

59.1.22.4.21 TPropertyEditor.GetOrdValueAt Method

Returns the property value of the specified object.

Pascal

```
function GetOrdValueAt(Index: Integer): Longint;
```

C++

```
__fastcall Longint GetOrdValueAt(int Index);
```

Description

Call GetOrdValueAt to obtain the current value of the property for an object in the internal list of objects being edited. Call GetOrdValueAt only if the property is an ordinal type. The Index parameter identifies which object's value should be returned. It

corresponds to the Index parameter of the GetComponent (see page 11026) method.

Use GetOrdValueAt to iterate over all current values, for example when implementing the AllEqual (see page 11024) method.

See Also

GetComponent (see page 11026)

GetOrdValue (see page 11032)

AllEqual (see page 11024)

59.1.22.4.22 TPropertyEditor.GetProperties Method

Provides the subproperties of the property to a callback procedure.

Pascal

```
procedure GetProperties(Proc: TGetPropProc); virtual;
```

C++

```
virtual __fastcall GetProperties(TGetPropProc Proc);
```

Description

The Object Inspector calls GetProperties when the property is expanded to show subproperties. The GetProperties method of TPropertyEditor (see page 11019) does nothing. Property editors that return paSubProperties from the GetAttributes (see page 11026) method should override GetProperties to create an appropriate property editor and pass its IProperty interface to the Proc parameter for every subproperty (or nested property) of the property.

See Also

GetAttributes (see page 11026)

59.1.22.4.23 TPropertyEditor.GetPropInfo Method

Returns the property information record for the object being edited.

Pascal

```
function GetPropInfo: PPropInfo; virtual;
```

C++

```
virtual __fastcall PPropInfo GetPropInfo();
```

Description

Call GetPropInfo to access the property information record that describes the property being edited, including its access functions. If more than one object is being edited, GetPropInfo returns the property information record for the object returned by GetComponent (see page 11026)(0).

If only the type information record is desired, use the GetPropType (see page 11033) method instead.

See Also

GetComponent (see page 11026)

GetPropType (see page 11033)

59.1.22.4.24 TPropertyEditor.GetPropType Method

Returns the type information record for the object being edited.

Pascal

```
function GetPropType: PTypeInfo;
```

C++

```
__fastcall PTypeInfo GetPropType();
```

Description

Call GetPropType to obtain access to the type information record that describes the type of the property being edited. If more than one object is being edited, GetPropType returns the type information record for the object returned by GetComponent (see page 11026)(0).

If information about the property access functions and storage details is desired as well, use the GetPropInfo (see page 11033) method instead.

See Also

GetComponent (see page 11026)

GetPropInfo (see page 11033)

59.1.22.4.25 TPropertyEditor.GetStrValue Method

Returns the property value of the first object currently being edited.

Pascal

```
function GetStrValue: string;
```

C++

```
__fastcall AnsiString GetStrValue();
```

Description

Call GetStrValue to obtain the current value of the property for the first object in the internal list of objects being edited. Only call GetStrValue if the property is a string type.

If more than one object is currently being edited, GetStrValue returns the value for the object returned by GetComponent (see page 11026)(0); To obtain the current property value for every object currently being edited, use the GetStrValueAt (see page 11034) method.

See Also

GetComponent (see page 11026)

GetStrValueAt (see page 11034)

59.1.22.4.26 TPropertyEditor.GetStrValueAt Method

Returns the property value of the specified object.

Pascal

```
function GetStrValueAt(Index: Integer): string;
```

C++

```
__fastcall AnsiString GetStrValueAt(int Index);
```

Description

Call GetStrValueAt to obtain the current value of the property for an object in the internal list of objects being edited. Call GetStrValueAt only if the property is an ordinal type. The Index parameter identifies which object's value should be returned. It

corresponds to the Index parameter of the GetComponent (see page 11026) method.

Use GetStrValueAt to iterate over all current values, for example when implementing the AllEqual (see page 11024) method.

See Also

GetComponent (see page 11026)

GetStrValue (see page 11034)

AllEqual (see page 11024)

59.1.22.4.27 TPropertyEditor.GetValue Method

Returns the property value formatted as a string.

Pascal

```
function GetValue: string; virtual;
```

C++

```
virtual __fastcall AnsiString GetValue();
```

Description

GetValue formats the value of the property, formatted as a string. If the value is not available, GetValue raised an exception.

As implemented in TPropertyEditor (see page 11019), GetValue returns the string "(unknown)". Descendant classes override this method to provide an appropriate value string or raise an exception.

GetValue is the read access method of the Value (see page 11045) property.

Note: To obtain an error string when the property value is unavailable rather than raising an exception, you can call the GetEditValue (see page 11027) method. GetEditValue (see page 11027) is protected, but can be called through the IProperty interface in code that is not a method of a descendant class.

See Also

setvalue (see page 11042)

Value (see page 11045)

GetVisualValue (see page 11037)

GetEditValue (see page 11027)

59.1.22.4.28 TPropertyEditor.GetValues Method

Provides the enumerated values of the property to a callback procedure.

Pascal

```
procedure GetValues(Proc: TGetStrProc); virtual;
```

C++

```
virtual __fastcall GetValues(TGetStrProc Proc);
```

Description

The Object Inspector calls GetValues when the drop-down button is clicked to show enumerated values. The GetValues method of TPropertyEditor (see page 11019) does nothing. Property editors that return paValueList from the GetAttributes (see page 11026) method should override GetValues to call the Proc parameter for every string that can represent a valid enumerated value. Even if the GetAttributes (see page 11026) method does not return paValueList, property editors for enumerated types

should still override GetValues to enumerate all possible values.

See Also

GetAttributes (see page 11026)

Value (see page 11045)

59.1.22.4.29 TPropertyEditor.GetValueW Method

Pascal

```
function GetValueW: WideString; virtual;
```

C++

```
virtual __fastcall BSTR GetValueW();
```

Description

This is GetValueW, a member of class TPropertyEditor.

59.1.22.4.30 TPropertyEditor.GetVarValue Method

Returns the property value of the first object currently being edited.

Pascal

```
function GetVarValue: Variant;
```

C++

```
__fastcall Variant GetVarValue();
```

Description

Call GetVarValue to obtain the current value of the property for the first object in the internal list of objects being edited. Call GetVarValue only if the property value can be represented by a variant.

If more than one object is currently being edited, GetVarValue returns the value for the object returned by GetComponent (see page 11026)(0); To obtain the current property value for every object currently being edited, use the GetVarValueAt (see page 11036) method.

See Also

GetComponent (see page 11026)

GetVarValueAt (see page 11036)

59.1.22.4.31 TPropertyEditor.GetVarValueAt Method

Returns the property value of the specified object.

Pascal

```
function GetVarValueAt(Index: Integer): Variant;
```

C++

```
__fastcall Variant GetVarValueAt(int Index);
```

Description

Call GetVarValueAt to obtain the current value of the property for an object in the internal list of objects being edited. Call GetVarValueAt only if the property value can be represented as a variant. The Index parameter identifies which object's value

should be returned. It corresponds to the Index parameter of the GetComponent (see page 11026) method.

Use GetVarValueAt to iterate over all current values, for example when implementing the AllEqual (see page 11024) method.

See Also

GetComponent (see page 11026)

GetVarValue (see page 11036)

AllEqual (see page 11024)

59.1.22.4.32 TPropertyEditor.GetVisualValue Method

Returns the property value as it appears in the Object Inspector.

Pascal

```
function GetVisualValue: string;
```

C++

```
__fastcall AnsiString GetVisualValue();
```

Description

GetVisualValue returns the string that the Object Inspector displays to represent the property value. If only one item is selected or all multi-selected items have the same value, GetVisualValue returns the string formatted by GetValue (see page 11035). Otherwise, GetVisualValue returns an empty string.

See Also

GetValue (see page 11035)

GetEditValue (see page 11027)

59.1.22.4.33 TPropertyEditor.GetWideStrValue Method

Pascal

```
function GetWideStrValue: WideString;
```

C++

```
__fastcall BSTR GetWideStrValue();
```

Description

This is GetWideStrValue, a member of class TPropertyEditor.

59.1.22.4.34 TPropertyEditor.GetWideStrValueAt Method

Pascal

```
function GetWideStrValueAt(Index: Integer): WideString;
```

C++

```
__fastcall BSTR GetWideStrValueAt(int Index);
```

Description

This is GetWideStrValueAt, a member of class TPropertyEditor.

59.1.22.4.35 TPropertyEditor.HasInstance Method

Indicates whether a specified object is currently being edited by the property editor.

Pascal

```
function HasInstance(Instance: TPersistent): Boolean;
```

C++

```
__fastcall Boolean HasInstance(TPersistent * Instance);
```

Description

HasInstance returns true if the Instance parameter references one of the objects that the GetComponent (see page 11026) method returns, false otherwise.

See Also

GetComponent (see page 11026)

59.1.22.4.36 TPropertyEditor.Initialize Method

Initializes the property editor after it is created but before it is used.

Pascal

```
procedure Initialize; override;
```

C++

```
virtual __fastcall Initialize();
```

Description

Do not call the Initialize method. It is called automatically by the Object Inspector to allow property editors to perform any necessary initialization before they are used. The Initialize method of TPropertyEditor (see page 11019) does nothing. Override the Initialize method to perform any special initialization, such as the creation of helper objects.

Property editors are often created and discarded without being used because they do not represent a common property across all selected components. Since Initialize is called only after it is determined that the property editor will be used, it is more efficient to initialize property values and create helper objects in the Initialize method rather than the constructor.

See Also

Activate (see page 11024)

Create (see page 22287)

59.1.22.4.37 TPropertyEditor.Modified Method

Informs the designer that the property value has changed.

Pascal

```
procedure Modified;
```

C++

```
__fastcall Modified();
```

Description

Call Modified after changing the property value so that the designer is aware that something has changed.

It is not necessary to call Modified if changes are made using the SetFloatValue (see page 11039), SetMethodValue (see page 11040), SetOrdValue (see page 11041), SetStrValue (see page 11042), or SetVarValue (see page 11043) methods. These methods automatically call Modified.

See Also

Designer (see page 11044)

SetFloatValue (see page 11039)

SetMethodValue (see page 11040)

SetOrdValue (see page 11041)

SetVarValue (see page 11043)

Value (see page 11045)

59.1.22.4.38 TPropertyEditor.Revert Method

Restores all object properties to their original values.

Pascal

```
procedure Revert;
```

C++

```
__fastcall Revert();
```

Description

Call Revert to restore the original property values that each of the edited objects had before the user began making modification with the Object Inspector. Revert will not work if GetAttributes (see page 11026) returns paAutoUpdate.

See Also

GetAttributes (see page 11026)

59.1.22.4.39 TPropertyEditor.SetFloatValue Method

Changes the property value for every object being edited.

Pascal

```
procedure SetFloatValue(Value: Extended);
```

C++

```
__fastcall SetFloatValue(Extended Value);
```

Description

Call SetFloatValue to change the property setting for every object that can be returned by the GetComponent (see page 11026) method. Do not call SetFloatValue unless the property editor represents a float value. After changing a property value using SetFloatValue, it is not necessary to call Modified (see page 11038).

See Also

GetComponent (see page 11026)

Modified (see page 11038)

setvalue (see page 11042)

59.1.22.4.40 TPropertyEditor.SetInt64Value Method

Changes the property value for every object being edited.

Pascal

```
procedure SetInt64Value(Value: Int64);
```

C++

```
__fastcall SetInt64Value(Int64 Value);
```

Description

Call SetInt64Value to change the property setting for every object that can be returned by the GetComponent (see page 11026) method. Do not call SetInt64Value unless the property editor represents a 64-bit integer value. After changing a property value using SetInt64Value, it is not necessary to call Modified (see page 11038).

See Also

GetComponent (see page 11026)

Modified (see page 11038)

setvalue (see page 11042)

59.1.22.4.41 TPropertyEditor.SetIntfValue Method

Changes the property value for every object being edited.

Pascal

```
procedure SetIntfValue(const Value: IInterface);
```

C++

```
__fastcall SetIntfValue(const IInterface Value);
```

Description

Call SetIntfValue to change the property setting for every object that can be returned by the GetComponent (see page 11026) method. Do not call SetIntfValue unless the property editor represents a component interface value. After changing a property value using SetIntfValue, it is not necessary to call Modified (see page 11038).

See Also

GetComponent (see page 11026)

Modified (see page 11038)

setvalue (see page 11042)

59.1.22.4.42 TPropertyEditor.SetMethodValue Method

Changes the property value for every object being edited.

Pascal

```
procedure SetMethodValue(const Value: TMethod);
```

C++

```
__fastcall SetMethodValue(const TMethod Value);
```

Description

Call SetMethodValue to change the property setting for every object that can be returned by the GetComponent (see page 11026) method. Do not call SetMethodValue unless the property represents a method. After changing a property value using SetMethodValue, it is not necessary to call Modified (see page 11038).

See Also

GetComponent (see page 11026)

Modified (see page 11038)

setvalue (see page 11042)

59.1.22.4.43 TPropertyEditor.SetOrdValue Method

Changes the property value for every object being edited.

Pascal

```
procedure SetOrdValue(Value: Longint);
```

C++

```
__fastcall SetOrdValue(Longint Value);
```

Description

Call SetOrdValue to change the property setting for every object that can be returned by the GetComponent (see page 11026) method. Do not call SetOrdValue unless the property represents an ordinal value. After changing a property value using SetOrdValue, it is not necessary to call Modified (see page 11038).

See Also

GetComponent (see page 11026)

Modified (see page 11038)

setvalue (see page 11042)

59.1.22.4.44 TPropertyEditor.SetPropEntry Method

Informs the property editor of a particular object whose property is to be edited.

Pascal

```
procedure SetPropEntry(Index: Integer; AInstance: TPersistent; APropInfo: PPropInfo); override;
```

C++

```
virtual __fastcall SetPropEntry(int Index, TPersistent * AInstance, PPropInfo APropInfo);
```

Description

The Object Inspector calls SetPropEntry for each object that has a property that the property editor is editing. This allows the property editor to store information about the objects being edited so that it can get and set property values.

Index is the index of the object being edited. This value can range from 0 to one less than the value of the PropCount (see page 11045) property.

AInstance is a reference to the object being edited. This is later used to supply the value that the GetComponent (see page 11026) method returns.

APropInfo is a pointer to the property information record for the property on AInstance. This is later used to supply the value that the GetPropInfo (see page 11033) method returns.

See Also

GetComponent (see page 11026)

GetPropInfo (see page 11033)

PropCount (see page 11045)

59.1.22.4.45 TPropertyEditor.SetStrValue Method

Changes the property value for every object being edited.

Pascal

```
procedure SetStrValue(const Value: string);
```

C++

```
__fastcall SetStrValue(const AnsiString Value);
```

Description

Call SetStrValue to change the property setting for every object that can be returned by the GetComponent (see page 11026) method. Do not call SetStrValue unless the property represents a string value. After changing a property value using SetStrValue, it is not necessary to call Modified (see page 11038).

See Also

GetComponent (see page 11026)

Modified (see page 11038)

setvalue (see page 11042)

59.1.22.4.46 SetValue Method

This is the overview for the SetValue method overload.

Overload List

	Name	Description
	TPropertyEditor.SetValue (string) (see page 11043)	Responds when the user changes the value of the property.
	TPropertyEditor.SetValue (WideString) (see page 11042)	This is SetValue, a member of class TPropertyEditor.

59.1.22.4.46.1 TPropertyEditor.SetValue Method (WideString)

Pascal

```
procedure SetValue(const Value: WideString); virtual; overload;
```

C++

```
virtual __fastcall SetValue(const BSTR Value);
```

Description

This is SetValue, a member of class TPropertyEditor.

59.1.22.4.46.2 TPropertyEditor.SetValue Method (string)

Responds when the user changes the value of the property.

Pascal

```
procedure SetValue(const Value: string); virtual; overload;
```

C++

```
virtual __fastcall SetValue(const AnsiString Value);
```

Description

The Object Inspector calls SetValue when the user has finished changing the property value. SetValue applies the value specified by the Value parameter to all components that it is currently editing. If the value can't be set, SetValue raises an exception that describes the problem.

Note: If the property is changed only through a dialog brought up by the Edit method, the Object Inspector does not call SetValue. Rather, the Edit method should handle the setting of the value on all components.

See Also

Edit (see page 11200)

59.1.22.4.47 TPropertyEditor.SetVarValue Method

Changes the property value for every object being edited.

Pascal

```
procedure SetVarValue(const Value: Variant);
```

C++

```
__fastcall SetVarValue(const Variant Value);
```

Description

Call SetVarValue to change the property setting for every object that can be returned by the GetComponent (see page 11026) method. Do not call SetVarValue unless the property can be represented by a variant value. After changing a property value using SetVarValue, it is not necessary to call Modified (see page 11038).

See Also

GetComponent (see page 11026)

Modified (see page 11038)

setvalue (see page 11042)

59.1.22.4.48 TPropertyEditor.SetWideStrValue Method

Pascal

```
procedure SetWideStrValue(const Value: WideString);
```

C++

```
__fastcall SetWideStrValue(const BSTR Value);
```

Description

This is SetWideStrValue, a member of class TPropertyEditor.

59.1.22.4.49 TPropertyEditor.ValueAvailable Method

Indicates whether all components being edited have a value for the property if their ComponentStyle includes csCheckPropAvail.

Pascal

```
function ValueAvailable: Boolean;
```

C++

```
__fastcall Boolean ValueAvailable();
```

Description

The Object Inspector calls ValueAvailable to determine which components can be edited for a particular property or which properties can be displayed for a particular component.

See Also

ComponentStyle (see page 2805)

59.1.22.5 TPropertyEditor Properties

The properties of the TPropertyEditor class are listed here.

Public Properties

	Name	Description
R	Designer (see page 11044)	Provides access to the form designer object in the IDE.
R	PrivateDirectory (see page 11044)	Specifies the location where the property editor can store auxiliary files.
R	PropCount (see page 11045)	Indicates the number of components whose properties are being edited.
	Value (see page 11045)	Represents the current value of the property (as returned by GetValue (see page 11035)) as a string.

59.1.22.5.1 TPropertyEditor.Designer Property

Provides access to the form designer object in the IDE.

Pascal

```
property Designer: IDesigner;
```

C++

```
__property IDesigner Designer;
```

Description

Use Designer to read from or make changes to the current form or module in the IDE. The IDesigner interface has methods that can access the components in the current unit and other units linked in by the uses clause (Delphi) or included headers (C++), create or alter the methods in the current unit, and so on.

59.1.22.5.2 TPropertyEditor.PrivateDirectory Property

Specifies the location where the property editor can store auxiliary files.

Pascal

```
property PrivateDirectory: string;
```

C++

```
__property AnsiString PrivateDirectory;
```

Description

Use PrivateDirectory to store executables used by the property editor or auxiliary files that store state information, examples, templates, and so on.

Note: On Windows, PrivateDirectory is the location specified in the registry under the key

Note: HKEY_CURRENT_USER\Software\Borland (see page 1761)\Delphi\x.0\Globals\PrivateDir

Note: HKEY_CURRENT_USER\Software\Borland (see page 1761)\CBuilder\x.0\Globals\PrivateDir

The property editor can use the directory to read files, write files, or store DLLs (Windows) or shared objects (Linux) and executables.

59.1.22.5.3 TPropertyEditor.PropCount Property

Indicates the number of components whose properties are being edited.

Pascal

```
property PropCount: Integer;
```

C++

```
__property int PropCount;
```

Description

Use PropCount to determine the valid range of indexes to use when calling the GetComponent (see page 11026) method. This value corresponds to the number of components selected when the property editor is created. Typically, it is not necessary to access individual components because the Getxxx and Setxxx methods propagate values appropriately.

See Also

GetComponent (see page 11026)

setvalue (see page 11042)

59.1.22.5.4 TPropertyEditor.Value Property

Represents the current value of the property (as returned by GetValue (see page 11035)) as a string.

Pascal

```
property Value: string;
```

C++

```
__property AnsiString Value;
```

Description

Read Value to determine the current property setting as it is displayed in the Object Inspector. Set Value to apply a value to all selected components for which the property is appropriate.

The Value property is implemented using the GetValue (see page 11035) and SetValue (see page 11042) methods. Descendants of TPropertyEditor (see page 11019) must override these methods to implement the Value property.

See Also

GetValue (see page 11035)

setvalue (see page 11042)

59.1.23 TSelectionEditor Class

Class Hierarchy

Pascal

```
TSelectionEditor = class(TBaseSelectionEditor, ISelectionEditor);
```

C++

```
class TSelectionEditor : public TBaseSelectionEditor, public ISelectionEditor;
```

File

DesignEditors

Description

This is class DesignEditors.TSelectionEditor.

59.1.23.1 TSelectionEditor Members

The following tables list the members exposed by TSelectionEditor.

Protected Data Members

	Name	Description
	FRefCount (see page 22278)	This is FRefCount, a member of class TInterfacedObject.

Protected Methods

	Name	Description
	_AddRef (see page 22278)	Implements the IInterface (see page 22396) System::TInterfacedObject::_AddRef method.
	_Release (see page 22279)	Implements the IInterface (see page 22396) System::TInterfacedObject::_Release method.
	QueryInterface (see page 22280)	Implements the IInterface (see page 22396) System::TInterfacedObject::QueryInterface method.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22279)	Responds after the last constructor executes.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 22279)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.

	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 11047)	This is Create, a member of class TSelectionEditor.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
V	ExecuteVerb (see page 11048)	This is ExecuteVerb, a member of class TSelectionEditor.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetVerb (see page 11048)	This is GetVerb, a member of class TSelectionEditor.
V	GetVerbCount (see page 11048)	This is GetVerbCount, a member of class TSelectionEditor.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22280)	Allocates memory for each instance of an interfaced object.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	PrepareItem (see page 11048)	This is PrepareItem, a member of class TSelectionEditor.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
V	RequiresUnits (see page 11049)	This is RequiresUnits, a member of class TSelectionEditor.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
R	Designer (see page 11049)	This is Designer, a member of class TSelectionEditor.
R	RefCount (see page 22281)	Indicates the number of interface pointers currently dependent upon the object.

59.1.23.2 TSelectionEditor.Create Constructor

Pascal

```
constructor Create(const ADesigner: IDesigner); override;
```

C++

```
virtual __fastcall TSelectionEditor(const IDesigner ADesigner);
```

Description

This is Create, a member of class TSelectionEditor.

59.1.23.3 TSelectionEditor Methods

The methods of the TSelectionEditor class are listed here.

Public Methods

	Name	Description
	ExecuteVerb (see page 11048)	This is ExecuteVerb, a member of class TSelectionEditor.
	GetVerb (see page 11048)	This is GetVerb, a member of class TSelectionEditor.
	GetVerbCount (see page 11048)	This is GetVerbCount, a member of class TSelectionEditor.
	PrepareItem (see page 11048)	This is PrepareItem, a member of class TSelectionEditor.
	RequiresUnits (see page 11049)	This is RequiresUnits, a member of class TSelectionEditor.

59.1.23.3.1 TSelectionEditor.ExecuteVerb Method

Pascal

```
procedure ExecuteVerb(Index: Integer; const List: IDesignerSelections); virtual;
```

C++

```
virtual __fastcall ExecuteVerb(int Index, const IDesignerSelections List);
```

Description

This is ExecuteVerb, a member of class TSelectionEditor.

59.1.23.3.2 TSelectionEditor.GetVerb Method

Pascal

```
function GetVerb(Index: Integer): string; virtual;
```

C++

```
virtual __fastcall AnsiString GetVerb(int Index);
```

Description

This is GetVerb, a member of class TSelectionEditor.

59.1.23.3.3 TSelectionEditor.GetVerbCount Method

Pascal

```
function GetVerbCount: Integer; virtual;
```

C++

```
virtual __fastcall int GetVerbCount();
```

Description

This is GetVerbCount, a member of class TSelectionEditor.

59.1.23.3.4 TSelectionEditor.PrepareItem Method

Pascal

```
procedure PrepareItem(Index: Integer; const AItem: IMenuItem); virtual;
```

C++

```
virtual __fastcall PrepareItem(int Index, const IMenuItem AItem);
```

Description

This is PrepareItem, a member of class TSelectionEditor.

59.1.23.3.5 TSelectionEditor.RequiresUnits Method

Pascal

```
procedure RequiresUnits(Proc: TGetStrProc); virtual;
```

C++

```
virtual __fastcall RequiresUnits(TGetStrProc Proc);
```

Description

This is RequiresUnits, a member of class TSelectionEditor.

59.1.23.4 TSelectionEditor Properties

The properties of the TSelectionEditor class are listed here.

Public Properties

	Name	Description
	Designer (see page 11049)	This is Designer, a member of class TSelectionEditor.

59.1.23.4.1 TSelectionEditor.Designer Property

Pascal

```
property Designer: IDesigner;
```

C++

```
__property IDesigner Designer;
```

Description

This is Designer, a member of class TSelectionEditor.

59.1.24 TSetElementProperty Class

Class Hierarchy

Pascal

```
TSetElementProperty = class(TNestedProperty);
```

C++

```
class TSetElementProperty : public TNestedProperty;
```

File

DesignEditors

Description

This is class DesignEditors.TSetElementProperty.

59.1.24.1 TSetElementProperty Members

The following tables list the members exposed by TSetElementProperty.

Protected Data Members

	Name	Description
	FRefCount (see page 22278)	This is FRefCount, a member of class TInterfacedObject.

Protected Methods

	Name	Description
	_AddRef (see page 22278)	Implements the IInterface (see page 22396) System::TInterfacedObject::_AddRef method.
	_Release (see page 22279)	Implements the IInterface (see page 22396) System::TInterfacedObject::_Release method.
	Create (see page 11052)	This is Create, a member of class TSetElementProperty.
	GetEditValue (see page 11027)	This is the overview for the GetEditValue method overload.
	GetFloatValue (see page 11028)	Returns the property value of the first object currently being edited.
	GetFloatValueAt (see page 11028)	Returns the property value of the specified object.
	GetInt64Value (see page 11028)	Returns the property value of the first object currently being edited.
	GetInt64ValueAt (see page 11029)	Returns the property value of the specified object.
	GetIntfValue (see page 11029)	Returns the property value of the first object currently being edited.
	GetIntfValueAt (see page 11030)	Returns the property value of the specified object.
V	GetIsDefault (see page 11054)	This is GetIsDefault, a member of class TSetElementProperty.
	GetMethodValue (see page 11031)	Returns the property value of the first object currently being edited.
	GetMethodValueAt (see page 11031)	Returns the property value of the specified object.
	GetOrdValue (see page 11032)	Returns the property value of the first object currently being edited.
	GetOrdValueAt (see page 11032)	Returns the property value of the specified object.
	GetStrValue (see page 11034)	Returns the property value of the first object currently being edited.
	GetStrValueAt (see page 11034)	Returns the property value of the specified object.
	GetVarValue (see page 11036)	Returns the property value of the first object currently being edited.
	GetVarValueAt (see page 11036)	Returns the property value of the specified object.
	GetWideStrValue (see page 11037)	This is GetWideStrValue, a member of class TPropertyEditor.
	GetWideStrValueAt (see page 11037)	This is GetWideStrValueAt, a member of class TPropertyEditor.
	HasInstance (see page 11038)	Indicates whether a specified object is currently being edited by the property editor.
A	Initialize (see page 11114)	Initializes the property editor after it is created but before it is used.
	Modified (see page 11038)	Informs the designer that the property value has changed.
	QueryInterface (see page 22280)	Implements the IInterface (see page 22396) System::TInterfacedObject::QueryInterface method.
	SetFloatValue (see page 11039)	Changes the property value for every object being edited.
	SetInt64Value (see page 11040)	Changes the property value for every object being edited.
	SetIntfValue (see page 11040)	Changes the property value for every object being edited.
	SetMethodValue (see page 11040)	Changes the property value for every object being edited.
	SetOrdValue (see page 11041)	Changes the property value for every object being edited.
V	SetPropEntry (see page 11041)	Informs the property editor of a particular object whose property is to be edited.

	SetPropEntry (see page 11115)	Informs the property editor of a particular object whose property is to be edited.
	SetStrValue (see page 11042)	Changes the property value for every object being edited.
	SetVarValue (see page 11043)	Changes the property value for every object being edited.
	SetWideStrValue (see page 11043)	This is SetWideStrValue, a member of class TPropertyEditor.

Protected Properties

	Name	Description
	Element (see page 11056)	This is Element, a member of class TSetElementProperty.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	Activate (see page 11024)	Responds when the property is selected in the Object Inspector.
	Activate (see page 11199)	Responds when the property is selected in the Object Inspector.
	AfterConstruction (see page 22279)	Responds after the last constructor executes.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	AllEqual (see page 11053)	Indicates whether all selected components have the same value for the property.
	AutoFill (see page 11025)	Returns true to indicate that values can be typed incrementally—and automatically completed—in the Object Inspector.
	AutoFill (see page 11200)	Returns true to indicate that values can be typed incrementally—and automatically completed—in the Object Inspector.
	BeforeDestruction (see page 22279)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 11014)	Destroys an instance of TPropertyEditor.
	Destroy (see page 11022)	Destroys an instance of TPropertyEditor (see page 11019).
	Destroy (see page 22287)	Disposes of an object instance.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Edit (see page 11025)	Responds when the user double-clicks the property in the Object Inspector.
	Edit (see page 11200)	Responds when the user double-clicks the property in the Object Inspector.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetAttributes (see page 11053)	Describes the property so the Object Inspector provides the appropriate controls.
	GetComponent (see page 11026)	Returns the specified object from the set of all objects currently being edited by the property editor.
	GetEditLimit (see page 11027)	Returns the maximum length, in characters, of the Value (see page 11045) property.
	GetEditLimit (see page 11201)	Returns the maximum length, in characters, of the value.
	GetEditValue (see page 11201)	Retrieves a string to represent the property's value, or, if the value is not available, an error message.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetKind (see page 11030)	This is GetKind, a member of class TPropertyEditor.

	GetKind (see page 11212)	This is GetKind, a member of class IPropertyKind.
V	GetName (see page 11054)	Returns the name of the property.
V	GetProperties (see page 11033)	Provides the subproperties of the property to a callback procedure.
	GetProperties (see page 11202)	Provides the subproperties of the property to a callback procedure.
V	GetPropInfo (see page 11033)	Returns the property information record for the object being edited.
	GetPropInfo (see page 11202)	Returns the property information record for the object being edited.
	GetPropType (see page 11033)	Returns the type information record for the object being edited.
	GetPropType (see page 11203)	Returns the type information record for the object being edited.
V	GetValue (see page 11055)	Returns the property value formatted as a string.
V	GetValues (see page 11055)	Provides the enumerated values of the property to a callback procedure.
V	GetValueW (see page 11036)	This is GetValueW, a member of class TPropertyEditor.
	GetVisualValue (see page 11037)	Returns the property value as it appears in the Object Inspector.
	HasInstance (see page 11204)	Indicates whether a specified object is currently being edited by the property editor.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
V	Initialize (see page 11038)	Initializes the property editor after it is created but before it is used.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22280)	Allocates memory for each instance of an interfaced object.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	Revert (see page 11039)	Restores all object properties to their original values.
	Revert (see page 11204)	Restores all object properties to their original values.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
V	SetValue (see page 11056)	Responds when the user changes the value of the property.
V	SetValue (see page 11042)	This is the overview for the SetValue method overload.
	ValueAvailable (see page 11044)	Indicates whether all components being edited have a value for the property if their ComponentStyle includes csCheckPropAvail.
	ValueAvailable (see page 11205)	Indicates whether all components being edited have a value for the property if their ComponentStyle includes csCheckPropAvail.

Public Properties

	Name	Description
R	Designer (see page 11044)	Provides access to the form designer object in the IDE.
R	IsDefault (see page 11206)	This is IsDefault, a member of class IProperty70.
R	Kind (see page 11212)	This is Kind, a member of class IPropertyKind.
R	PrivateDirectory (see page 11044)	Specifies the location where the property editor can store auxiliary files.
R	PropCount (see page 11045)	Indicates the number of components whose properties are being edited.
R	RefCount (see page 22281)	Indicates the number of interface pointers currently dependent upon the object.
	Value (see page 11045)	Represents the current value of the property (as returned by GetValue (see page 11035)) as a string.

59.1.24.2 TSetElementProperty.Create Constructor

Pascal

```
constructor Create(Parent: TPropertyEditor; AElement: Integer); reintroduce;
```

C++

```
__fastcall TSetElementProperty(TPropertyEditor Parent, int AElement);
```

Description

This is Create, a member of class TSetElementProperty.

59.1.24.3 TSetElementProperty Methods

The methods of the TSetElementProperty class are listed here.

Protected Methods

	Name	Description
	GetIsDefault (see page 11054)	This is GetIsDefault, a member of class TSetElementProperty.

Public Methods

	Name	Description
	AllEqual (see page 11053)	Indicates whether all selected components have the same value for the property.
	GetAttributes (see page 11053)	Describes the property so the Object Inspector provides the appropriate controls.
	GetName (see page 11054)	Returns the name of the property.
	GetValue (see page 11055)	Returns the property value formatted as a string.
	GetValues (see page 11055)	Provides the enumerated values of the property to a callback procedure.
	SetValue (see page 11056)	Responds when the user changes the value of the property.

59.1.24.3.1 TSetElementProperty.AllEqual Method

Indicates whether all selected components have the same value for the property.

Pascal

```
function AllEqual: Boolean; override;
```

C++

```
virtual __fastcall Boolean AllEqual();
```

Description

The Object Inspector calls AllEqual when there is more than one component selected to determine whether a value should appear for this property. If this method returns true, the Object Inspector displays a value for the property. If this method returns false, the line for the property in the Object Inspector remains blank.

In TPropertyEditor, AllEqual always returns false if more than one selected component has the associated property. Override this method to check the properties of individual components and determine whether a property value can be displayed in the Object Inspector.

Note: AllEqual is called only when the value returned by GetAttributes includes paMultiSelect.

See Also

GetAttributes (see page 11026)

GetComponent (see page 11026)

GetValue (see page 11035)

59.1.24.3.2 TSetElementProperty.GetAttributes Method

Describes the property so the Object Inspector provides the appropriate controls.

Pascal

```
function GetAttributes: TPropertyAttributes; override;
```

C++

```
virtual __fastcall TPropertyAttributes GetAttributes();
```

Description

The Object Inspector calls GetAttributes to determine what controls to display for the property and what property editor methods to call. The GetAttributes method of TPropertyEditor returns [paMultiSelect, paRevertable]. Override GetAttributes to return the set of values that corresponds to the attributes of the associated property.

Before the Object Inspector calls the Activate method, GetAttributes does not need to provide accurate information about any attributes other than paSubProperties, paVCL, and paMultiSelect.

Activate (see page 11024)

Edit (see page 11025)

GetProperties (see page 11033)

GetValues (see page 11035)

setvalue (see page 11042)

Value (see page 11045)

ListDrawValue

ListMeasureHeight

ListMeasureWidth

59.1.24.3.3 TSetElementProperty.GetIsDefault Method

Pascal

```
function GetIsDefault: Boolean; override;
```

C++

```
virtual __fastcall Boolean GetIsDefault();
```

Description

This is GetIsDefault, a member of class TSetElementProperty.

59.1.24.3.4 TSetElementProperty.GetName Method

Returns the name of the property.

Pascal

```
function GetName: string; override;
```

C++

```
virtual __fastcall AnsiString GetName();
```

Description

The Object Inspector calls GetName to obtain the property name that it displays. GetName returns the name of the property from the property type information with all underbars replaced by spaces. Override this method if the Object Inspector should display

a string other than the property name.

See Also

PropDrawName

59.1.24.3.5 TSetElementProperty.GetValue Method

Returns the property value formatted as a string.

Pascal

```
function GetValue: string; override;
```

C++

```
virtual __fastcall AnsiString GetValue();
```

Description

GetValue formats the value of the property, formatted as a string. If the value is not available, GetValue raised an exception.

As implemented in TPropertyEditor, GetValue returns the string "(unknown)". Descendant classes override this method to provide an appropriate value string or raise an exception.

GetValue is the read access method of the Value property.

Note: To obtain an error string when the property value is unavailable rather than raising an exception, you can call the GetEditValue method. GetEditValue is protected, but can be called through the IProperty interface in code that is not a method of a descendant class.

See Also

setvalue (see page 11042)

Value (see page 11045)

GetVisualValue (see page 11037)

GetEditValue (see page 11027)

59.1.24.3.6 TSetElementProperty.GetValues Method

Provides the enumerated values of the property to a callback procedure.

Pascal

```
procedure GetValues(Proc: TGetStrProc); override;
```

C++

```
virtual __fastcall GetValues(TGetStrProc Proc);
```

Description

The Object Inspector calls GetValues when the drop-down button is clicked to show enumerated values. The GetValues method of TPropertyEditor does nothing. Property editors that return paValueList from the GetAttributes method should override GetValues to call the Proc parameter for every string that can represent a valid enumerated value. Even if the GetAttributes method does not return paValueList, property editors for enumerated types should still override GetValues to enumerate all possible values.

See Also

GetAttributes (see page 11026)

Value (see page 11045)

59.1.24.3.7 TSetElementProperty.SetValue Method

Responds when the user changes the value of the property.

Pascal

```
procedure SetValue(const Value: string); override;
```

C++

```
virtual __fastcall SetValue(const AnsiString Value);
```

Description

The Object Inspector calls SetValue when the user has finished changing the property value. SetValue applies the value specified by the Value parameter to all components that it is currently editing. If the value can't be set, SetValue raises an exception that describes the problem.

Note: If the property is changed only through a dialog brought up by the Edit method, the Object Inspector does not call SetValue. Rather, the Edit method should handle the setting of the value on all components.

See Also

Edit (see page 11200)

59.1.24.4 TSetElementProperty Properties

The properties of the TSetElementProperty class are listed here.

Protected Properties

	Name	Description
	Element (see page 11056)	This is Element, a member of class TSetElementProperty.

59.1.24.4.1 TSetElementProperty.Element Property

Pascal

```
property Element: Integer;
```

C++

```
__property int Element;
```

Description

This is Element, a member of class TSetElementProperty.

59.1.25 TSetProperty Class

Class Hierarchy

Pascal

```
TSetProperty = class(TOrdinalProperty);
```

C++

```
class TSetProperty : public TOrdinalProperty;
```

File

DesignEditors

Description

This is class DesignEditors.TSetProperty.

59.1.25.1 TSetProperty Members

The following tables list the members exposed by TSetProperty.

Protected Data Members

	Name	Description
	FRefCount (see page 22278)	This is FRefCount, a member of class TInterfacedObject.

Protected Methods

	Name	Description
	_AddRef (see page 22278)	Implements the IInterface (see page 22396) System::TInterfacedObject::_AddRef method.
	_Release (see page 22279)	Implements the IInterface (see page 22396) System::TInterfacedObject::_Release method.
	GetEditValue (see page 11027)	This is the overview for the GetEditValue method overload.
	GetFloatValue (see page 11028)	Returns the property value of the first object currently being edited.
	GetFloatValueAt (see page 11028)	Returns the property value of the specified object.
	GetInt64Value (see page 11028)	Returns the property value of the first object currently being edited.
	GetInt64ValueAt (see page 11029)	Returns the property value of the specified object.
	GetIntfValue (see page 11029)	Returns the property value of the first object currently being edited.
	GetIntfValueAt (see page 11030)	Returns the property value of the specified object.
V	GetIsDefault (see page 11030)	This is GetIsDefault, a member of class TPropertyEditor.
	GetMethodValue (see page 11031)	Returns the property value of the first object currently being edited.
	GetMethodValueAt (see page 11031)	Returns the property value of the specified object.
	GetOrdValue (see page 11032)	Returns the property value of the first object currently being edited.
	GetOrdValueAt (see page 11032)	Returns the property value of the specified object.
	GetStrValue (see page 11034)	Returns the property value of the first object currently being edited.
	GetStrValueAt (see page 11034)	Returns the property value of the specified object.
	GetVarValue (see page 11036)	Returns the property value of the first object currently being edited.
	GetVarValueAt (see page 11036)	Returns the property value of the specified object.
	GetWideStrValue (see page 11037)	This is GetWideStrValue, a member of class TPropertyEditor.
	GetWideStrValueAt (see page 11037)	This is GetWideStrValueAt, a member of class TPropertyEditor.
	HasInstance (see page 11038)	Indicates whether a specified object is currently being edited by the property editor.
A	Initialize (see page 11114)	Initializes the property editor after it is created but before it is used.
	Modified (see page 11038)	Informs the designer that the property value has changed.
	QueryInterface (see page 22280)	Implements the IInterface (see page 22396) System::TInterfacedObject::QueryInterface method.
	SetFloatValue (see page 11039)	Changes the property value for every object being edited.
	SetInt64Value (see page 11040)	Changes the property value for every object being edited.
	SetIntfValue (see page 11040)	Changes the property value for every object being edited.
	SetMethodValue (see page 11040)	Changes the property value for every object being edited.

	SetOrdValue (see page 11041)	Changes the property value for every object being edited.
	SetPropEntry (see page 11041)	Informs the property editor of a particular object whose property is to be edited.
	SetPropEntry (see page 11115)	Informs the property editor of a particular object whose property is to be edited.
	SetStrValue (see page 11042)	Changes the property value for every object being edited.
	SetVarValue (see page 11043)	Changes the property value for every object being edited.
	SetWideStrValue (see page 11043)	This is SetWideStrValue, a member of class TPropertyEditor.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	Activate (see page 11024)	Responds when the property is selected in the Object Inspector.
	Activate (see page 11199)	Responds when the property is selected in the Object Inspector.
	AfterConstruction (see page 22279)	Responds after the last constructor executes.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	AllEqual (see page 11018)	Indicates whether all selected components have the same value for the property.
	AllEqual (see page 11024)	Indicates whether all selected components have the same value for the property.
	AllEqual (see page 11199)	Indicates whether all selected components have the same value for the property.
	AutoFill (see page 11025)	Returns true to indicate that values can be typed incrementally—and automatically completed—in the Object Inspector.
	AutoFill (see page 11200)	Returns true to indicate that values can be typed incrementally—and automatically completed—in the Object Inspector.
	BeforeDestruction (see page 22279)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 11022)	Creates a new TPropertyEditor (see page 11019) object.
	Create (see page 11114)	Creates a new TBasePropertyEditor (see page 11112) object.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 11022)	Destroys an instance of TPropertyEditor (see page 11019).
	Destroy (see page 22287)	Disposes of an object instance.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Edit (see page 11025)	Responds when the user double-clicks the property in the Object Inspector.
	Edit (see page 11200)	Responds when the user double-clicks the property in the Object Inspector.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetAttributes (see page 11060)	Describes the property so the Object Inspector provides the appropriate controls.
	GetComponent (see page 11026)	Returns the specified object from the set of all objects currently being edited by the property editor.
	GetEditLimit (see page 11018)	Returns the maximum length, in characters, of the Value property.
	GetEditLimit (see page 11027)	Returns the maximum length, in characters, of the Value (see page 11045) property.
	GetEditLimit (see page 11201)	Returns the maximum length, in characters, of the value.
	GetEditValue (see page 11201)	Retrieves a string to represent the property's value, or, if the value is not available, an error message.
	GetInterface (see page 22303)	Retrieves a specified interface.

	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIsDefault (see page 11206)	This is GetIsDefault, a member of class IProperty70.
	GetKind (see page 11030)	This is GetKind, a member of class TPropertyEditor.
	GetKind (see page 11212)	This is GetKind, a member of class IPropertyKind.
V	GetName (see page 11032)	Returns the name of the property.
	GetName (see page 11202)	Returns the name of the property.
V	GetProperties (see page 11060)	Provides the subproperties of the property to a callback procedure.
V	GetPropInfo (see page 11033)	Returns the property information record for the object being edited.
	GetPropInfo (see page 11202)	Returns the property information record for the object being edited.
	GetPropType (see page 11033)	Returns the type information record for the object being edited.
	GetPropType (see page 11203)	Returns the type information record for the object being edited.
V	GetValue (see page 11061)	Returns the property value formatted as a string.
V	GetValues (see page 11035)	Provides the enumerated values of the property to a callback procedure.
	GetValues (see page 11203)	Provides the enumerated values of the property to a callback procedure.
V	GetValueW (see page 11036)	This is GetValueW, a member of class TPropertyEditor.
	GetVisualValue (see page 11037)	Returns the property value as it appears in the Object Inspector.
	HasInstance (see page 11204)	Indicates whether a specified object is currently being edited by the property editor.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
V	Initialize (see page 11038)	Initializes the property editor after it is created but before it is used.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22280)	Allocates memory for each instance of an interfaced object.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	Revert (see page 11039)	Restores all object properties to their original values.
	Revert (see page 11204)	Restores all object properties to their original values.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetValue (see page 11204)	Responds when the user changes the value of the property.
V	SetValue (see page 11042)	This is the overview for the SetValue method overload.
	ValueAvailable (see page 11044)	Indicates whether all components being edited have a value for the property if their ComponentStyle includes csCheckPropAvail.
	ValueAvailable (see page 11205)	Indicates whether all components being edited have a value for the property if their ComponentStyle includes csCheckPropAvail.

Public Properties

	Name	Description
R	Designer (see page 11044)	Provides access to the form designer object in the IDE.
R	IsDefault (see page 11206)	This is IsDefault, a member of class IProperty70.
R	Kind (see page 11212)	This is Kind, a member of class IPropertyKind.
R	PrivateDirectory (see page 11044)	Specifies the location where the property editor can store auxiliary files.
R	PropCount (see page 11045)	Indicates the number of components whose properties are being edited.
R	RefCount (see page 22281)	Indicates the number of interface pointers currently dependent upon the object.
	Value (see page 11045)	Represents the current value of the property (as returned by GetValue (see page 11035)) as a string.

59.1.25.2 TSetProperty Methods

The methods of the TSetProperty class are listed here.

Public Methods

	Name	Description
	GetAttributes (see page 11060)	Describes the property so the Object Inspector provides the appropriate controls.
	GetProperties (see page 11060)	Provides the subproperties of the property to a callback procedure.
	GetValue (see page 11061)	Returns the property value formatted as a string.

59.1.25.2.1 TSetProperty.GetAttributes Method

Describes the property so the Object Inspector provides the appropriate controls.

Pascal

```
function GetAttributes: TPropertyAttributes; override;
```

C++

```
virtual __fastcall TPropertyAttributes GetAttributes();
```

Description

The Object Inspector calls GetAttributes to determine what controls to display for the property and what property editor methods to call. The GetAttributes method of TPropertyEditor returns [paMultiSelect, paRevertable]. Override GetAttributes to return the set of values that corresponds to the attributes of the associated property.

Before the Object Inspector calls the Activate method, GetAttributes does not need to provide accurate information about any attributes other than paSubProperties, paVCL, and paMultiSelect.

See Also

Activate (see page 11024)

Edit (see page 11025)

GetProperties (see page 11033)

GetValues (see page 11035)

setvalue (see page 11042)

Value (see page 11045)

ListDrawValue

ListMeasureHeight

ListMeasureWidth

59.1.25.2.2 TSetProperty.GetProperties Method

Provides the subproperties of the property to a callback procedure.

Pascal

```
procedure GetProperties(Proc: TGetPropProc); override;
```

C++

```
virtual __fastcall GetProperties(TGetPropProc Proc);
```

Description

The Object Inspector calls GetProperties when the property is expanded to show subproperties. The GetProperties method of TPropertyEditor does nothing. Property editors that return paSubProperties from the GetAttributes method should override GetProperties to create an appropriate property editor and pass its IProperty interface to the Proc parameter for every

subproperty (or nested property) of the property.

See Also

GetAttributes (see page 11026)

59.1.25.2.3 TSetProperty.GetValue Method

Returns the property value formatted as a string.

Pascal

```
function GetValue: string; override;
```

C++

```
virtual __fastcall AnsiString GetValue();
```

Description

GetValue formats the value of the property, formatted as a string. If the value is not available, GetValue raised an exception.

As implemented in TPropertyEditor, GetValue returns the string "(unknown)". Descendant classes override this method to provide an appropriate value string or raise an exception.

GetValue is the read access method of the Value property.

Note: To obtain an error string when the property value is unavailable rather than raising an exception, you can call the GetEditValue method. GetEditValue is protected, but can be called through the IProperty interface in code that is not a method of a descendant class.

59.1.26 TStringProperty Class

Class Hierarchy

Pascal

```
TStringProperty = class(TPropertyEditor);
```

C++

```
class TStringProperty : public TPropertyEditor;
```

File

DesignEditors

Description

This is class DesignEditors.TStringProperty.

59.1.26.1 TStringProperty Members

The following tables list the members exposed by TStringProperty.

Protected Data Members

	Name	Description
	FRefCount (see page 22278)	This is FRefCount, a member of class TInterfacedObject.

Protected Methods

	Name	Description
	_AddRef (see page 22278)	Implements the IInterface (see page 22396) System::TInterfacedObject::_AddRef method.
	_Release (see page 22279)	Implements the IInterface (see page 22396) System::TInterfacedObject::_Release method.
	GetEditValue (see page 11027)	This is the overview for the GetEditValue method overload.
	GetFloatValue (see page 11028)	Returns the property value of the first object currently being edited.
	GetFloatValueAt (see page 11028)	Returns the property value of the specified object.
	GetInt64Value (see page 11028)	Returns the property value of the first object currently being edited.
	GetInt64ValueAt (see page 11029)	Returns the property value of the specified object.
	GetIntfValue (see page 11029)	Returns the property value of the first object currently being edited.
	GetIntfValueAt (see page 11030)	Returns the property value of the specified object.
V	GetIsDefault (see page 11030)	This is GetIsDefault, a member of class TPropertyEditor.
	GetMethodValue (see page 11031)	Returns the property value of the first object currently being edited.
	GetMethodValueAt (see page 11031)	Returns the property value of the specified object.
	GetOrdValue (see page 11032)	Returns the property value of the first object currently being edited.
	GetOrdValueAt (see page 11032)	Returns the property value of the specified object.
	GetStrValue (see page 11034)	Returns the property value of the first object currently being edited.
	GetStrValueAt (see page 11034)	Returns the property value of the specified object.
	GetVarValue (see page 11036)	Returns the property value of the first object currently being edited.
	GetVarValueAt (see page 11036)	Returns the property value of the specified object.
	GetWideStrValue (see page 11037)	This is GetWideStrValue, a member of class TPropertyEditor.
	GetWideStrValueAt (see page 11037)	This is GetWideStrValueAt, a member of class TPropertyEditor.
	HasInstance (see page 11038)	Indicates whether a specified object is currently being edited by the property editor.
A	Initialize (see page 11114)	Initializes the property editor after it is created but before it is used.
	Modified (see page 11038)	Informs the designer that the property value has changed.
	QueryInterface (see page 22280)	Implements the IInterface (see page 22396) System::TInterfacedObject::QueryInterface method.
	SetFloatValue (see page 11039)	Changes the property value for every object being edited.
	SetInt64Value (see page 11040)	Changes the property value for every object being edited.
	SetIntfValue (see page 11040)	Changes the property value for every object being edited.
	SetMethodValue (see page 11040)	Changes the property value for every object being edited.
	SetOrdValue (see page 11041)	Changes the property value for every object being edited.
V	SetPropEntry (see page 11041)	Informs the property editor of a particular object whose property is to be edited.
A	SetPropEntry (see page 11115)	Informs the property editor of a particular object whose property is to be edited.
	SetStrValue (see page 11042)	Changes the property value for every object being edited.
	SetVarValue (see page 11043)	Changes the property value for every object being edited.
	SetWideStrValue (see page 11043)	This is SetWideStrValue, a member of class TPropertyEditor.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	Activate (see page 11024)	Responds when the property is selected in the Object Inspector.
	Activate (see page 11199)	Responds when the property is selected in the Object Inspector.
V	AfterConstruction (see page 22279)	Responds after the last constructor executes.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	AllEqual (see page 11065)	Indicates whether all selected components have the same value for the property.
V	AutoFill (see page 11025)	Returns true to indicate that values can be typed incrementally—and automatically completed—in the Object Inspector.
	AutoFill (see page 11200)	Returns true to indicate that values can be typed incrementally—and automatically completed—in the Object Inspector.
V	BeforeDestruction (see page 22279)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 11022)	Creates a new TPropertyEditor (see page 11019) object.
V	Create (see page 11114)	Creates a new TBasePropertyEditor (see page 11112) object.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 11022)	Destroys an instance of TPropertyEditor (see page 11019).
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
V	Edit (see page 11025)	Responds when the user double-clicks the property in the Object Inspector.
	Edit (see page 11200)	Responds when the user double-clicks the property in the Object Inspector.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
V	GetAttributes (see page 11026)	Describes the property so the Object Inspector provides the appropriate controls.
	GetAttributes (see page 11200)	Describes the property so the Object Inspector provides the appropriate controls.
	GetComponent (see page 11026)	Returns the specified object from the set of all objects currently being edited by the property editor.
V	GetEditLimit (see page 11065)	Returns the maximum length, in characters, of the Value property.
	GetEditValue (see page 11201)	Retrieves a string to represent the property's value, or, if the value is not available, an error message.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIsDefault (see page 11206)	This is GetIsDefault, a member of class IProperty70.
	GetKind (see page 11030)	This is GetKind, a member of class TPropertyEditor.
	GetKind (see page 11212)	This is GetKind, a member of class IPropertyKind.
V	GetName (see page 11032)	Returns the name of the property.
	GetName (see page 11202)	Returns the name of the property.
V	GetProperties (see page 11033)	Provides the subproperties of the property to a callback procedure.
	GetProperties (see page 11202)	Provides the subproperties of the property to a callback procedure.
V	GetPropInfo (see page 11033)	Returns the property information record for the object being edited.

	GetPropInfo (see page 11202)	Returns the property information record for the object being edited.
	GetPropType (see page 11033)	Returns the type information record for the object being edited.
	GetPropType (see page 11203)	Returns the type information record for the object being edited.
V	GetValue (see page 11065)	Returns the property value formatted as a string.
V	GetValues (see page 11035)	Provides the enumerated values of the property to a callback procedure.
	GetValues (see page 11203)	Provides the enumerated values of the property to a callback procedure.
V	GetValueW (see page 11036)	This is GetValueW, a member of class TPropertyEditor.
	GetVisualValue (see page 11037)	Returns the property value as it appears in the Object Inspector.
	HasInstance (see page 11204)	Indicates whether a specified object is currently being edited by the property editor.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
V	Initialize (see page 11038)	Initializes the property editor after it is created but before it is used.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22280)	Allocates memory for each instance of an interfaced object.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	Revert (see page 11039)	Restores all object properties to their original values.
	Revert (see page 11204)	Restores all object properties to their original values.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
V	SetValue (see page 11066)	Responds when the user changes the value of the property.
V	SetValue (see page 11042)	This is the overview for the SetValue method overload.
	ValueAvailable (see page 11044)	Indicates whether all components being edited have a value for the property if their ComponentStyle includes csCheckPropAvail.
	ValueAvailable (see page 11205)	Indicates whether all components being edited have a value for the property if their ComponentStyle includes csCheckPropAvail.

Public Properties

	Name	Description
R	Designer (see page 11044)	Provides access to the form designer object in the IDE.
R	IsDefault (see page 11206)	This is IsDefault, a member of class IProperty70.
R	Kind (see page 11212)	This is Kind, a member of class IPropertyKind.
R	PrivateDirectory (see page 11044)	Specifies the location where the property editor can store auxiliary files.
R	PropCount (see page 11045)	Indicates the number of components whose properties are being edited.
R	RefCount (see page 22281)	Indicates the number of interface pointers currently dependent upon the object.
	Value (see page 11045)	Represents the current value of the property (as returned by GetValue (see page 11035)) as a string.

59.1.26.2 TStringProperty Methods

The methods of the TStringProperty class are listed here.

Public Methods

	Name	Description
V	AllEqual (see page 11065)	Indicates whether all selected components have the same value for the property.
V	GetEditLimit (see page 11065)	Returns the maximum length, in characters, of the Value property.
V	GetValue (see page 11065)	Returns the property value formatted as a string.
V	SetValue (see page 11066)	Responds when the user changes the value of the property.

59.1.26.2.1 TStringProperty.AllEqual Method

Indicates whether all selected components have the same value for the property.

Pascal

```
function AllEqual: Boolean; override;
```

C++

```
virtual __fastcall Boolean AllEqual();
```

Description

The Object Inspector calls AllEqual when there is more than one component selected to determine whether a value should appear for this property. If this method returns true, the Object Inspector displays a value for the property. If this method returns false, the line for the property in the Object Inspector remains blank.

In TPropertyEditor, AllEqual always returns false if more than one selected component has the associated property. Override this method to check the properties of individual components and determine whether a property value can be displayed in the Object Inspector.

Note: AllEqual is called only when the value returned by GetAttributes includes paMultiSelect.

See Also

GetAttributes (see page 11026)

GetComponent (see page 11026)

GetValue (see page 11035)

59.1.26.2.2 TStringProperty.GetEditLimit Method

Returns the maximum length, in characters, of the Value property.

Pascal

```
function GetEditLimit: Integer; override;
```

C++

```
virtual __fastcall int GetEditLimit();
```

Description

The Object Inspector calls GetEditLimit to determine how many characters the user can type when entering a value for the property. GetEditLimit returns 255. Override this method when the maximum length of the property string is some other value.

See Also

Value (see page 11045)

59.1.26.2.3 TStringProperty.GetValue Method

Returns the property value formatted as a string.

Pascal

```
function GetValue: string; override;
```

C++

```
virtual __fastcall AnsiString GetValue();
```

Description

GetValue formats the value of the property, formatted as a string. If the value is not available, GetValue raised an exception.

As implemented in TPropertyEditor, GetValue returns the string "(unknown)". Descendant classes override this method to provide an appropriate value string or raise an exception.

GetValue is the read access method of the Value property.

Note: To obtain an error string when the property value is unavailable rather than raising an exception, you can call the GetEditValue method. GetEditValue is protected, but can be called through the IProperty interface in code that is not a method of a descendant class.

See Also

setvalue (see page 11042)

Value (see page 11045)

GetVisualValue (see page 11037)

GetEditValue (see page 11027)

59.1.26.2.4 TStringProperty.SetValue Method

Responds when the user changes the value of the property.

Pascal

```
procedure SetValue(const Value: string); override;
```

C++

```
virtual __fastcall SetValue(const AnsiString Value);
```

Description

The Object Inspector calls SetValue when the user has finished changing the property value. SetValue applies the value specified by the Value parameter to all components that it is currently editing. If the value can't be set, SetValue raises an exception that describes the problem.

Note: If the property is changed only through a dialog brought up by the Edit method, the Object Inspector does not call SetValue. Rather, the Edit method should handle the setting of the value on all components.

59.1.27 TTimeProperty Class

Class Hierarchy

Pascal

```
TTimeProperty = class(TPropertyEditor);
```

C++

```
class TTimeProperty : public TPropertyEditor;
```

File

DesignEditors

Description

This is class DesignEditors.TTimeProperty.

59.1.27.1 TTimeProperty Members

The following tables list the members exposed by TTimeProperty.

Protected Data Members

	Name	Description
	FRefCount (see page 22278)	This is FRefCount, a member of class TInterfacedObject.

Protected Methods

	Name	Description
	_AddRef (see page 22278)	Implements the IInterface (see page 22396) System::TInterfacedObject::_AddRef method.
	_Release (see page 22279)	Implements the IInterface (see page 22396) System::TInterfacedObject::_Release method.
	GetEditValue (see page 11027)	This is the overview for the GetEditValue method overload.
	GetFloatValue (see page 11028)	Returns the property value of the first object currently being edited.
	GetFloatValueAt (see page 11028)	Returns the property value of the specified object.
	GetInt64Value (see page 11028)	Returns the property value of the first object currently being edited.
	GetInt64ValueAt (see page 11029)	Returns the property value of the specified object.
	GetIntfValue (see page 11029)	Returns the property value of the first object currently being edited.
	GetIntfValueAt (see page 11030)	Returns the property value of the specified object.
V	GetIsDefault (see page 11030)	This is GetIsDefault, a member of class TPropertyEditor.
	GetMethodValue (see page 11031)	Returns the property value of the first object currently being edited.
	GetMethodValueAt (see page 11031)	Returns the property value of the specified object.
	GetOrdValue (see page 11032)	Returns the property value of the first object currently being edited.
	GetOrdValueAt (see page 11032)	Returns the property value of the specified object.
	GetStrValue (see page 11034)	Returns the property value of the first object currently being edited.
	GetStrValueAt (see page 11034)	Returns the property value of the specified object.
	GetVarValue (see page 11036)	Returns the property value of the first object currently being edited.
	GetVarValueAt (see page 11036)	Returns the property value of the specified object.
	GetWideStrValue (see page 11037)	This is GetWideStrValue, a member of class TPropertyEditor.
	GetWideStrValueAt (see page 11037)	This is GetWideStrValueAt, a member of class TPropertyEditor.
	HasInstance (see page 11038)	Indicates whether a specified object is currently being edited by the property editor.
A	Initialize (see page 11114)	Initializes the property editor after it is created but before it is used.
	Modified (see page 11038)	Informs the designer that the property value has changed.
	QueryInterface (see page 22280)	Implements the IInterface (see page 22396) System::TInterfacedObject::QueryInterface method.
	SetFloatValue (see page 11039)	Changes the property value for every object being edited.
	SetInt64Value (see page 11040)	Changes the property value for every object being edited.
	SetIntfValue (see page 11040)	Changes the property value for every object being edited.
	SetMethodValue (see page 11040)	Changes the property value for every object being edited.

	SetOrdValue (see page 11041)	Changes the property value for every object being edited.
	SetPropEntry (see page 11041)	Informs the property editor of a particular object whose property is to be edited.
	SetPropEntry (see page 11115)	Informs the property editor of a particular object whose property is to be edited.
	SetStrValue (see page 11042)	Changes the property value for every object being edited.
	SetVarValue (see page 11043)	Changes the property value for every object being edited.
	SetWideStrValue (see page 11043)	This is SetWideStrValue, a member of class TPropertyEditor.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	Activate (see page 11024)	Responds when the property is selected in the Object Inspector.
	Activate (see page 11199)	Responds when the property is selected in the Object Inspector.
	AfterConstruction (see page 22279)	Responds after the last constructor executes.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	AllEqual (see page 11024)	Indicates whether all selected components have the same value for the property.
	AllEqual (see page 11199)	Indicates whether all selected components have the same value for the property.
	AutoFill (see page 11025)	Returns true to indicate that values can be typed incrementally—and automatically completed—in the Object Inspector.
	AutoFill (see page 11200)	Returns true to indicate that values can be typed incrementally—and automatically completed—in the Object Inspector.
	BeforeDestruction (see page 22279)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 11022)	Creates a new TPropertyEditor (see page 11019) object.
	Create (see page 11114)	Creates a new TBasePropertyEditor (see page 11112) object.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 11022)	Destroys an instance of TPropertyEditor (see page 11019).
	Destroy (see page 22287)	Disposes of an object instance.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Edit (see page 11025)	Responds when the user double-clicks the property in the Object Inspector.
	Edit (see page 11200)	Responds when the user double-clicks the property in the Object Inspector.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetAttributes (see page 11070)	Describes the property so the Object Inspector provides the appropriate controls.
	GetComponent (see page 11026)	Returns the specified object from the set of all objects currently being edited by the property editor.
	GetEditLimit (see page 11027)	Returns the maximum length, in characters, of the Value (see page 11045) property.
	GetEditLimit (see page 11201)	Returns the maximum length, in characters, of the value.
	GetEditValue (see page 11201)	Retrieves a string to represent the property's value, or, if the value is not available, an error message.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.

	GetIsDefault (see page 11206)	This is GetIsDefault, a member of class IProperty70.
	GetKind (see page 11030)	This is GetKind, a member of class TPropertyEditor.
	GetKind (see page 11212)	This is GetKind, a member of class IPropertyKind.
V	GetName (see page 11032)	Returns the name of the property.
	GetName (see page 11202)	Returns the name of the property.
V	GetProperties (see page 11033)	Provides the subproperties of the property to a callback procedure.
	GetProperties (see page 11202)	Provides the subproperties of the property to a callback procedure.
V	GetPropInfo (see page 11033)	Returns the property information record for the object being edited.
	GetPropInfo (see page 11202)	Returns the property information record for the object being edited.
	GetPropType (see page 11033)	Returns the type information record for the object being edited.
	GetPropType (see page 11203)	Returns the type information record for the object being edited.
V	GetValue (see page 11070)	Returns the property value formatted as a string.
V	GetValues (see page 11035)	Provides the enumerated values of the property to a callback procedure.
	GetValues (see page 11203)	Provides the enumerated values of the property to a callback procedure.
V	GetValueW (see page 11036)	This is GetValueW, a member of class TPropertyEditor.
	GetVisualValue (see page 11037)	Returns the property value as it appears in the Object Inspector.
	HasInstance (see page 11204)	Indicates whether a specified object is currently being edited by the property editor.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
V	Initialize (see page 11038)	Initializes the property editor after it is created but before it is used.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22280)	Allocates memory for each instance of an interfaced object.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	Revert (see page 11039)	Restores all object properties to their original values.
	Revert (see page 11204)	Restores all object properties to their original values.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
V	SetValue (see page 11071)	Responds when the user changes the value of the property.
V	SetValue (see page 11042)	This is the overview for the SetValue method overload.
	ValueAvailable (see page 11044)	Indicates whether all components being edited have a value for the property if their ComponentStyle includes csCheckPropAvail.
	ValueAvailable (see page 11205)	Indicates whether all components being edited have a value for the property if their ComponentStyle includes csCheckPropAvail.

Public Properties

	Name	Description
R	Designer (see page 11044)	Provides access to the form designer object in the IDE.
R	IsDefault (see page 11206)	This is IsDefault, a member of class IProperty70.
R	Kind (see page 11212)	This is Kind, a member of class IPropertyKind.
R	PrivateDirectory (see page 11044)	Specifies the location where the property editor can store auxiliary files.
R	PropCount (see page 11045)	Indicates the number of components whose properties are being edited.
R	RefCount (see page 22281)	Indicates the number of interface pointers currently dependent upon the object.
	Value (see page 11045)	Represents the current value of the property (as returned by GetValue (see page 11035)) as a string.

59.1.27.2 TTimeProperty Methods

The methods of the TTimeProperty class are listed here.

Public Methods

	Name	Description
	GetAttributes (see page 11070)	Describes the property so the Object Inspector provides the appropriate controls.
	GetValue (see page 11070)	Returns the property value formatted as a string.
	SetValue (see page 11071)	Responds when the user changes the value of the property.

59.1.27.2.1 TTimeProperty.GetAttributes Method

Describes the property so the Object Inspector provides the appropriate controls.

Pascal

```
function GetAttributes: TPropertyAttributes; override;
```

C++

```
virtual __fastcall TPropertyAttributes GetAttributes();
```

Description

The Object Inspector calls GetAttributes to determine what controls to display for the property and what property editor methods to call. The GetAttributes method of TPropertyEditor returns [paMultiSelect, paRevertable]. Override GetAttributes to return the set of values that corresponds to the attributes of the associated property.

Before the Object Inspector calls the Activate method, GetAttributes does not need to provide accurate information about any attributes other than paSubProperties, paVCL, and paMultiSelect.

GetValues (see page 11035)

setvalue (see page 11042)

Value (see page 11045)

ListDrawValue

ListMeasureHeight

ListMeasureWidth

59.1.27.2.2 TTimeProperty.GetValue Method

Returns the property value formatted as a string.

Pascal

```
function GetValue: string; override;
```

C++

```
virtual __fastcall AnsiString GetValue();
```

Description

GetValue formats the value of the property, formatted as a string. If the value is not available, GetValue raised an exception.

As implemented in TPropertyEditor, GetValue returns the string "(unknown)". Descendant classes override this method to

provide an appropriate value string or raise an exception.

GetValue is the read access method of the Value property.

Note: To obtain an error string when the property value is unavailable rather than raising an exception, you can call the GetEditValue method. GetEditValue is protected, but can be called through the IProperty interface in code that is not a method of a descendant class.

See Also

setvalue (see page 11042)

Value (see page 11045)

GetVisualValue (see page 11037)

GetEditValue (see page 11027)

59.1.27.2.3 TTimeProperty.SetValue Method

Responds when the user changes the value of the property.

Pascal

```
procedure SetValue(const Value: string); override;
```

C++

```
virtual __fastcall SetValue(const AnsiString Value);
```

Description

The Object Inspector calls SetValue when the user has finished changing the property value. SetValue applies the value specified by the Value parameter to all components that it is currently editing. If the value can't be set, SetValue raises an exception that describes the problem.

Note: If the property is changed only through a dialog brought up by the Edit method, the Object Inspector does not call SetValue. Rather, the Edit method should handle the setting of the value on all components.

59.1.28 TVariantProperty Class

Class Hierarchy

Pascal

```
TVariantProperty = class(TPropertyEditor);
```

C++

```
class TVariantProperty : public TPropertyEditor;
```

File

DesignEditors

Description

This is class DesignEditors.TVariantProperty.

59.1.28.1 TVariantProperty Members

The following tables list the members exposed by TVariantProperty.

Protected Data Members

	Name	Description
	FRefCount (see page 22278)	This is FRefCount, a member of class TInterfacedObject.

Protected Methods

	Name	Description
	_AddRef (see page 22278)	Implements the IInterface (see page 22396) System::TInterfacedObject::_AddRef method.
	_Release (see page 22279)	Implements the IInterface (see page 22396) System::TInterfacedObject::_Release method.
	GetEditValue (see page 11027)	This is the overview for the GetEditValue method overload.
	GetFloatValue (see page 11028)	Returns the property value of the first object currently being edited.
	GetFloatValueAt (see page 11028)	Returns the property value of the specified object.
	GetInt64Value (see page 11028)	Returns the property value of the first object currently being edited.
	GetInt64ValueAt (see page 11029)	Returns the property value of the specified object.
	GetIntfValue (see page 11029)	Returns the property value of the first object currently being edited.
	GetIntfValueAt (see page 11030)	Returns the property value of the specified object.
V	GetIsDefault (see page 11030)	This is GetIsDefault, a member of class TPropertyEditor.
	GetMethodValue (see page 11031)	Returns the property value of the first object currently being edited.
	GetMethodValueAt (see page 11031)	Returns the property value of the specified object.
	GetOrdValue (see page 11032)	Returns the property value of the first object currently being edited.
	GetOrdValueAt (see page 11032)	Returns the property value of the specified object.
	GetStrValue (see page 11034)	Returns the property value of the first object currently being edited.
	GetStrValueAt (see page 11034)	Returns the property value of the specified object.
	GetVarValue (see page 11036)	Returns the property value of the first object currently being edited.
	GetVarValueAt (see page 11036)	Returns the property value of the specified object.
	GetWideStrValue (see page 11037)	This is GetWideStrValue, a member of class TPropertyEditor.
	GetWideStrValueAt (see page 11037)	This is GetWideStrValueAt, a member of class TPropertyEditor.
	HasInstance (see page 11038)	Indicates whether a specified object is currently being edited by the property editor.
A	Initialize (see page 11114)	Initializes the property editor after it is created but before it is used.
	Modified (see page 11038)	Informs the designer that the property value has changed.
	QueryInterface (see page 22280)	Implements the IInterface (see page 22396) System::TInterfacedObject::QueryInterface method.
	SetFloatValue (see page 11039)	Changes the property value for every object being edited.
	SetInt64Value (see page 11040)	Changes the property value for every object being edited.
	SetIntfValue (see page 11040)	Changes the property value for every object being edited.
	SetMethodValue (see page 11040)	Changes the property value for every object being edited.
	SetOrdValue (see page 11041)	Changes the property value for every object being edited.
V	SetPropEntry (see page 11041)	Informs the property editor of a particular object whose property is to be edited.
A	SetPropEntry (see page 11115)	Informs the property editor of a particular object whose property is to be edited.
	SetStrValue (see page 11042)	Changes the property value for every object being edited.
	SetVarValue (see page 11043)	Changes the property value for every object being edited.

	SetWideStrValue (see page 11043)	This is SetWideStrValue, a member of class TPropertyEditor.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	Activate (see page 11024)	Responds when the property is selected in the Object Inspector.
	Activate (see page 11199)	Responds when the property is selected in the Object Inspector.
V	AfterConstruction (see page 22279)	Responds after the last constructor executes.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	AllEqual (see page 11024)	Indicates whether all selected components have the same value for the property.
	AllEqual (see page 11199)	Indicates whether all selected components have the same value for the property.
V	AutoFill (see page 11025)	Returns true to indicate that values can be typed incrementally—and automatically completed—in the Object Inspector.
	AutoFill (see page 11200)	Returns true to indicate that values can be typed incrementally—and automatically completed—in the Object Inspector.
V	BeforeDestruction (see page 22279)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 11022)	Creates a new TPropertyEditor (see page 11019) object.
V	Create (see page 11114)	Creates a new TBasePropertyEditor (see page 11112) object.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 11022)	Destroys an instance of TPropertyEditor (see page 11019).
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
V	Edit (see page 11025)	Responds when the user double-clicks the property in the Object Inspector.
	Edit (see page 11200)	Responds when the user double-clicks the property in the Object Inspector.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
V	GetAttributes (see page 11075)	Describes the property so the Object Inspector provides the appropriate controls.
	GetComponent (see page 11026)	Returns the specified object from the set of all objects currently being edited by the property editor.
V	GetEditLimit (see page 11027)	Returns the maximum length, in characters, of the Value (see page 11045) property.
	GetEditLimit (see page 11201)	Returns the maximum length, in characters, of the value.
	GetEditValue (see page 11201)	Retrieves a string to represent the property's value, or, if the value is not available, an error message.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIsDefault (see page 11206)	This is GetIsDefault, a member of class IProperty70.
	GetKind (see page 11030)	This is GetKind, a member of class TPropertyEditor.
	GetKind (see page 11212)	This is GetKind, a member of class IPropertyKind.
V	GetName (see page 11032)	Returns the name of the property.
	GetName (see page 11202)	Returns the name of the property.

V	GetProperties (see page 11075)	Provides the subproperties of the property to a callback procedure.
V	GetPropInfo (see page 11033)	Returns the property information record for the object being edited.
	GetPropInfo (see page 11202)	Returns the property information record for the object being edited.
	GetPropType (see page 11033)	Returns the type information record for the object being edited.
	GetPropType (see page 11203)	Returns the type information record for the object being edited.
V	GetValue (see page 11076)	Returns the property value formatted as a string.
V	GetValues (see page 11035)	Provides the enumerated values of the property to a callback procedure.
	GetValues (see page 11203)	Provides the enumerated values of the property to a callback procedure.
V	GetValueW (see page 11036)	This is GetValueW, a member of class TPropertyEditor.
	GetVisualValue (see page 11037)	Returns the property value as it appears in the Object Inspector.
	HasInstance (see page 11204)	Indicates whether a specified object is currently being edited by the property editor.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
V	Initialize (see page 11038)	Initializes the property editor after it is created but before it is used.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22280)	Allocates memory for each instance of an interfaced object.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	Revert (see page 11039)	Restores all object properties to their original values.
	Revert (see page 11204)	Restores all object properties to their original values.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
V	SetValue (see page 11076)	Responds when the user changes the value of the property.
V	SetValue (see page 11042)	This is the overview for the SetValue method overload.
	ValueAvailable (see page 11044)	Indicates whether all components being edited have a value for the property if their ComponentStyle includes csCheckPropAvail.
	ValueAvailable (see page 11205)	Indicates whether all components being edited have a value for the property if their ComponentStyle includes csCheckPropAvail.

Public Properties

	Name	Description
R	Designer (see page 11044)	Provides access to the form designer object in the IDE.
R	IsDefault (see page 11206)	This is IsDefault, a member of class IProperty70.
R	Kind (see page 11212)	This is Kind, a member of class IPropertyKind.
R	PrivateDirectory (see page 11044)	Specifies the location where the property editor can store auxiliary files.
R	PropCount (see page 11045)	Indicates the number of components whose properties are being edited.
R	RefCount (see page 22281)	Indicates the number of interface pointers currently dependent upon the object.
	Value (see page 11045)	Represents the current value of the property (as returned by GetValue (see page 11035)) as a string.

59.1.28.2 TVariantProperty Methods

The methods of the TVariantProperty class are listed here.

Public Methods

	Name	Description
V	GetAttributes (see page 11075)	Describes the property so the Object Inspector provides the appropriate controls.
V	GetProperties (see page 11075)	Provides the subproperties of the property to a callback procedure.
V	GetValue (see page 11076)	Returns the property value formatted as a string.
V	SetValue (see page 11076)	Responds when the user changes the value of the property.

59.1.28.2.1 TVariantProperty.GetAttributes Method

Describes the property so the Object Inspector provides the appropriate controls.

Pascal

```
function GetAttributes: TPropertyAttributes; override;
```

C++

```
virtual __fastcall TPropertyAttributes GetAttributes();
```

Description

The Object Inspector calls GetAttributes to determine what controls to display for the property and what property editor methods to call. The GetAttributes method of TPropertyEditor returns [paMultiSelect, paRevertable]. Override GetAttributes to return the set of values that corresponds to the attributes of the associated property.

Before the Object Inspector calls the Activate method, GetAttributes does not need to provide accurate information about any attributes other than paSubProperties, paVCL, and paMultiSelect.

See Also

Activate (see page 11024)

Edit (see page 11025)

GetProperties (see page 11033)

GetValues (see page 11035)

setvalue (see page 11042)

Value (see page 11045)

ListDrawValue

ListMeasureHeight

ListMeasureWidth

59.1.28.2.2 TVariantProperty.GetProperties Method

Provides the subproperties of the property to a callback procedure.

Pascal

```
procedure GetProperties(Proc: TGetPropProc); override;
```

C++

```
virtual __fastcall GetProperties(TGetPropProc Proc);
```

Description

The Object Inspector calls GetProperties when the property is expanded to show subproperties. The GetProperties method of TPropertyEditor does nothing. Property editors that return paSubProperties from the GetAttributes method should override GetProperties to create an appropriate property editor and pass its IProperty interface to the Proc parameter for every subproperty (or nested property) of the property.

See Also

GetAttributes (see page 11026)

59.1.28.2.3 TVariantProperty.GetValue Method

Returns the property value formatted as a string.

Pascal

```
function GetValue: string; override;
```

C++

```
virtual __fastcall AnsiString GetValue();
```

Description

GetValue formats the value of the property, formatted as a string. If the value is not available, GetValue raised an exception.

As implemented in TPropertyEditor, GetValue returns the string "(unknown)". Descendant classes override this method to provide an appropriate value string or raise an exception.

GetValue is the read access method of the Value property.

Note: To obtain an error string when the property value is unavailable rather than raising an exception, you can call the GetEditValue method. GetEditValue is protected, but can be called through the IProperty interface in code that is not a method of a descendant class.

See Also

setvalue (see page 11042)

Value (see page 11045)

GetVisualValue (see page 11037)

GetEditValue (see page 11027)

59.1.28.2.4 TVariantProperty.SetValue Method

Responds when the user changes the value of the property.

Pascal

```
procedure SetValue(const Value: string); override;
```

C++

```
virtual __fastcall SetValue(const AnsiString Value);
```

Description

The Object Inspector calls SetValue when the user has finished changing the property value. SetValue applies the value specified by the Value parameter to all components that it is currently editing. If the value can't be set, SetValue raises an exception that describes the problem.

Note: If the property is changed only through a dialog brought up by the Edit method, the Object Inspector does not call SetValue. Rather, the Edit method should handle the setting of the value on all components.

DesignEditors

Description

This is class DesignEditors.TWideCharProperty.

59.1.29.1 TWideCharProperty Members

The following tables list the members exposed by TWideCharProperty.

Protected Data Members

	Name	Description
	FRefCount (see page 22278)	This is FRefCount, a member of class TInterfacedObject.

Protected Methods

	Name	Description
	_AddRef (see page 22278)	Implements the IInterface (see page 22396) System::TInterfacedObject::_AddRef method.
	_Release (see page 22279)	Implements the IInterface (see page 22396) System::TInterfacedObject::_Release method.
	GetEditValue (see page 11027)	This is the overview for the GetEditValue method overload.
	GetFloatValue (see page 11028)	Returns the property value of the first object currently being edited.
	GetFloatValueAt (see page 11028)	Returns the property value of the specified object.
	GetInt64Value (see page 11028)	Returns the property value of the first object currently being edited.
	GetInt64ValueAt (see page 11029)	Returns the property value of the specified object.
	GetIntfValue (see page 11029)	Returns the property value of the first object currently being edited.
	GetIntfValueAt (see page 11030)	Returns the property value of the specified object.
V	GetIsDefault (see page 11030)	This is GetIsDefault, a member of class TPropertyEditor.
	GetMethodValue (see page 11031)	Returns the property value of the first object currently being edited.
	GetMethodValueAt (see page 11031)	Returns the property value of the specified object.
	GetOrdValue (see page 11032)	Returns the property value of the first object currently being edited.
	GetOrdValueAt (see page 11032)	Returns the property value of the specified object.
	GetStrValue (see page 11034)	Returns the property value of the first object currently being edited.

	GetStrValueAt (see page 11034)	Returns the property value of the specified object.
	GetVarValue (see page 11036)	Returns the property value of the first object currently being edited.
	GetVarValueAt (see page 11036)	Returns the property value of the specified object.
	GetWideStrValue (see page 11037)	This is GetWideStrValue, a member of class TPropertyEditor.
	GetWideStrValueAt (see page 11037)	This is GetWideStrValueAt, a member of class TPropertyEditor.
	HasInstance (see page 11038)	Indicates whether a specified object is currently being edited by the property editor.
A	Initialize (see page 11114)	Initializes the property editor after it is created but before it is used.
	Modified (see page 11038)	Informs the designer that the property value has changed.
	QueryInterface (see page 22280)	Implements the IInterface (see page 22396) System::TInterfacedObject::QueryInterface method.
	SetFloatValue (see page 11039)	Changes the property value for every object being edited.
	SetInt64Value (see page 11040)	Changes the property value for every object being edited.
	SetIntfValue (see page 11040)	Changes the property value for every object being edited.
	SetMethodValue (see page 11040)	Changes the property value for every object being edited.
	SetOrdValue (see page 11041)	Changes the property value for every object being edited.
V	SetPropEntry (see page 11041)	Informs the property editor of a particular object whose property is to be edited.
A	SetPropEntry (see page 11115)	Informs the property editor of a particular object whose property is to be edited.
	SetStrValue (see page 11042)	Changes the property value for every object being edited.
	SetVarValue (see page 11043)	Changes the property value for every object being edited.
	SetWideStrValue (see page 11043)	This is SetWideStrValue, a member of class TPropertyEditor.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	Activate (see page 11024)	Responds when the property is selected in the Object Inspector.
	Activate (see page 11199)	Responds when the property is selected in the Object Inspector.
V	AfterConstruction (see page 22279)	Responds after the last constructor executes.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	AllEqual (see page 11018)	Indicates whether all selected components have the same value for the property.
V	AllEqual (see page 11024)	Indicates whether all selected components have the same value for the property.
	AllEqual (see page 11199)	Indicates whether all selected components have the same value for the property.
V	AutoFill (see page 11025)	Returns true to indicate that values can be typed incrementally—and automatically completed—in the Object Inspector.
	AutoFill (see page 11200)	Returns true to indicate that values can be typed incrementally—and automatically completed—in the Object Inspector.
V	BeforeDestruction (see page 22279)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 11022)	Creates a new TPropertyEditor (see page 11019) object.
V	Create (see page 11114)	Creates a new TBasePropertyEditor (see page 11112) object.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 11022)	Destroys an instance of TPropertyEditor (see page 11019).
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
V	Edit (see page 11025)	Responds when the user double-clicks the property in the Object Inspector.

	Edit (see page 11200)	Responds when the user double-clicks the property in the Object Inspector.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
V	GetAttributes (see page 11026)	Describes the property so the Object Inspector provides the appropriate controls.
	GetAttributes (see page 11200)	Describes the property so the Object Inspector provides the appropriate controls.
	GetComponent (see page 11026)	Returns the specified object from the set of all objects currently being edited by the property editor.
V	GetEditLimit (see page 11018)	Returns the maximum length, in characters, of the Value property.
V	GetEditLimit (see page 11027)	Returns the maximum length, in characters, of the Value (see page 11045) property.
	GetEditLimit (see page 11201)	Returns the maximum length, in characters, of the value.
	GetEditValue (see page 11201)	Retrieves a string to represent the property's value, or, if the value is not available, an error message.
	GetEditValue (see page 11220)	This is GetEditValue, a member of class IWideProperty.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIsDefault (see page 11206)	This is GetIsDefault, a member of class IProperty70.
	GetKind (see page 11030)	This is GetKind, a member of class TPropertyEditor.
	GetKind (see page 11212)	This is GetKind, a member of class IPropertyKind.
V	GetName (see page 11032)	Returns the name of the property.
	GetName (see page 11202)	Returns the name of the property.
V	GetProperties (see page 11033)	Provides the subproperties of the property to a callback procedure.
	GetProperties (see page 11202)	Provides the subproperties of the property to a callback procedure.
V	GetPropInfo (see page 11033)	Returns the property information record for the object being edited.
	GetPropInfo (see page 11202)	Returns the property information record for the object being edited.
	GetPropType (see page 11033)	Returns the type information record for the object being edited.
	GetPropType (see page 11203)	Returns the type information record for the object being edited.
V	GetValue (see page 11080)	Returns the property value formatted as a string.
V	GetValues (see page 11035)	Provides the enumerated values of the property to a callback procedure.
	GetValues (see page 11203)	Provides the enumerated values of the property to a callback procedure.
V	GetValueW (see page 11081)	This is GetValueW, a member of class TWideCharProperty.
	GetVisualValue (see page 11037)	Returns the property value as it appears in the Object Inspector.
	HasInstance (see page 11204)	Indicates whether a specified object is currently being edited by the property editor.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
V	Initialize (see page 11038)	Initializes the property editor after it is created but before it is used.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22280)	Allocates memory for each instance of an interfaced object.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	Revert (see page 11039)	Restores all object properties to their original values.
	Revert (see page 11204)	Restores all object properties to their original values.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
V	SetValue (see page 11042)	This is the overview for the SetValue method overload.
V	SetValue (see page 11081)	This is the overview for the SetValue method overload.
	ValueAvailable (see page 11044)	Indicates whether all components being edited have a value for the property if their ComponentStyle includes csCheckPropAvail.

	ValueAvailable (see page 11205)	Indicates whether all components being edited have a value for the property if their ComponentStyle includes csCheckPropAvail.

Public Properties

	Name	Description
R	Designer (see page 11044)	Provides access to the form designer object in the IDE.
R	IsDefault (see page 11206)	This is IsDefault, a member of class IProperty70.
R	Kind (see page 11212)	This is Kind, a member of class IPropertyKind.
R	PrivateDirectory (see page 11044)	Specifies the location where the property editor can store auxiliary files.
R	PropCount (see page 11045)	Indicates the number of components whose properties are being edited.
R	RefCount (see page 22281)	Indicates the number of interface pointers currently dependent upon the object.
	Value (see page 11045)	Represents the current value of the property (as returned by GetValue (see page 11035)) as a string.

59.1.29.2 TWideCharProperty Methods

The methods of the TWideCharProperty class are listed here.

Public Methods

	Name	Description
V	GetValue (see page 11080)	Returns the property value formatted as a string.
V	GetValueW (see page 11081)	This is GetValueW, a member of class TWideCharProperty.
V	SetValue (see page 11081)	This is the overview for the SetValue method overload.

59.1.29.2.1 TWideCharProperty.GetValue Method

Returns the property value formatted as a string.

Pascal

```
function GetValue: string; override;
```

C++

```
virtual __fastcall AnsiString GetValue();
```

Description

GetValue formats the value of the property, formatted as a string. If the value is not available, GetValue raised an exception.

As implemented in TPropertyEditor, GetValue returns the string "(unknown)". Descendant classes override this method to provide an appropriate value string or raise an exception.

GetValue is the read access method of the Value property.

Note: To obtain an error string when the property value is unavailable rather than raising an exception, you can call the GetEditValue method. GetEditValue is protected, but can be called through the IProperty interface in code that is not a method of a descendant class.

See Also

setvalue (see page 11042)

GetVisualValue (see page 11037)

GetEditValue (see page 11027)

59.1.29.2.2 TWideCharProperty.GetValueW Method

Pascal

```
function GetValueW: WideString; override;
```

C++

```
virtual __fastcall BSTR GetValueW();
```

Description

This is GetValueW, a member of class TWideCharProperty.

59.1.29.2.3 SetValue Method

This is the overview for the SetValue method overload.

Overload List

	Name	Description
	TWideCharProperty.SetValue (string) (see page 11081)	Responds when the user changes the value of the property.
	TWideCharProperty.SetValue (WideString) (see page 11081)	This is SetValue, a member of class TWideCharProperty.

59.1.29.2.3.1 TWideCharProperty.SetValue Method (WideString)

Pascal

```
procedure SetValue(const Value: WideString); override;
```

C++

```
virtual __fastcall SetValue(const BSTR Value);
```

Description

This is SetValue, a member of class TWideCharProperty.

59.1.29.2.3.2 TWideCharProperty.SetValue Method (string)

Responds when the user changes the value of the property.

Pascal

```
procedure SetValue(const Value: string); override;
```

C++

```
virtual __fastcall SetValue(const AnsiString Value);
```

Description

The Object Inspector calls SetValue when the user has finished changing the property value. SetValue applies the value specified by the Value parameter to all components that it is currently editing. If the value can't be set, SetValue raises an exception that describes the problem.

Note: If the property is changed only through a dialog brought up by the Edit method, the Object Inspector does not call SetValue. Rather, the Edit method should handle the setting of the value on all components.

59.1.30 TWideStringProperty Class

Class Hierarchy

Pascal

```
TWideStringProperty = class(TPropertyEditor, IWideProperty, IWideProperty10);
```

C++

```
class TWideStringProperty : public TPropertyEditor, public IWideProperty, public
IWideProperty10;
```

File

DesignEditors

Description

This is class DesignEditors.TWideStringProperty.

59.1.30.1 TWideStringProperty Members

The following tables list the members exposed by TWideStringProperty.

Protected Data Members

	Name	Description
	FRefCount (see page 22278)	This is FRefCount, a member of class TInterfacedObject.

Protected Methods

	Name	Description
	_AddRef (see page 22278)	Implements the IInterface (see page 22396) System::TInterfacedObject::_AddRef method.
	_Release (see page 22279)	Implements the IInterface (see page 22396) System::TInterfacedObject::_Release method.
	GetEditValue (see page 11027)	This is the overview for the GetEditValue method overload.
	GetFloatValue (see page 11028)	Returns the property value of the first object currently being edited.
	GetFloatValueAt (see page 11028)	Returns the property value of the specified object.
	GetInt64Value (see page 11028)	Returns the property value of the first object currently being edited.
	GetInt64ValueAt (see page 11029)	Returns the property value of the specified object.
	GetIntfValue (see page 11029)	Returns the property value of the first object currently being edited.
	GetIntfValueAt (see page 11030)	Returns the property value of the specified object.
V	GetIsDefault (see page 11030)	This is GetIsDefault, a member of class TPropertyEditor.

	GetMethodValue (see page 11031)	Returns the property value of the first object currently being edited.
	GetMethodValueAt (see page 11031)	Returns the property value of the specified object.
	GetOrdValue (see page 11032)	Returns the property value of the first object currently being edited.
	GetOrdValueAt (see page 11032)	Returns the property value of the specified object.
	GetStrValue (see page 11034)	Returns the property value of the first object currently being edited.
	GetStrValueAt (see page 11034)	Returns the property value of the specified object.
	GetVarValue (see page 11036)	Returns the property value of the first object currently being edited.
	GetVarValueAt (see page 11036)	Returns the property value of the specified object.
	GetWideStrValue (see page 11037)	This is GetWideStrValue, a member of class TPropertyEditor.
	GetWideStrValueAt (see page 11037)	This is GetWideStrValueAt, a member of class TPropertyEditor.
	HasInstance (see page 11038)	Indicates whether a specified object is currently being edited by the property editor.
A	Initialize (see page 11114)	Initializes the property editor after it is created but before it is used.
	Modified (see page 11038)	Informs the designer that the property value has changed.
	QueryInterface (see page 22280)	Implements the IInterface (see page 22396) System::TInterfacedObject::QueryInterface method.
	SetFloatValue (see page 11039)	Changes the property value for every object being edited.
	SetInt64Value (see page 11040)	Changes the property value for every object being edited.
	SetIntfValue (see page 11040)	Changes the property value for every object being edited.
	SetMethodValue (see page 11040)	Changes the property value for every object being edited.
	SetOrdValue (see page 11041)	Changes the property value for every object being edited.
V	SetPropEntry (see page 11041)	Informs the property editor of a particular object whose property is to be edited.
A	SetPropEntry (see page 11115)	Informs the property editor of a particular object whose property is to be edited.
	SetStrValue (see page 11042)	Changes the property value for every object being edited.
	SetVarValue (see page 11043)	Changes the property value for every object being edited.
	SetWideStrValue (see page 11043)	This is SetWideStrValue, a member of class TPropertyEditor.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	Activate (see page 11024)	Responds when the property is selected in the Object Inspector.
	Activate (see page 11199)	Responds when the property is selected in the Object Inspector.
V	AfterConstruction (see page 22279)	Responds after the last constructor executes.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	AllEqual (see page 11085)	Indicates whether all selected components have the same value for the property.
V	AutoFill (see page 11025)	Returns true to indicate that values can be typed incrementally—and automatically completed—in the Object Inspector.
	AutoFill (see page 11200)	Returns true to indicate that values can be typed incrementally—and automatically completed—in the Object Inspector.
V	BeforeDestruction (see page 22279)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 11022)	Creates a new TPropertyEditor (see page 11019) object.
V	Create (see page 11114)	Creates a new TBasePropertyEditor (see page 11112) object.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 11022)	Destroys an instance of TPropertyEditor (see page 11019).
V	Destroy (see page 22287)	Disposes of an object instance.

	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Edit (see page 11025)	Responds when the user double-clicks the property in the Object Inspector.
	Edit (see page 11200)	Responds when the user double-clicks the property in the Object Inspector.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetAttributes (see page 11026)	Describes the property so the Object Inspector provides the appropriate controls.
	GetAttributes (see page 11200)	Describes the property so the Object Inspector provides the appropriate controls.
	GetComponent (see page 11026)	Returns the specified object from the set of all objects currently being edited by the property editor.
	GetEditLimit (see page 11027)	Returns the maximum length, in characters, of the Value (see page 11045) property.
	GetEditLimit (see page 11201)	Returns the maximum length, in characters, of the value.
	GetEditValue (see page 11201)	Retrieves a string to represent the property's value, or, if the value is not available, an error message.
	GetEditValue (see page 11220)	This is GetEditValue, a member of class IWideProperty.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIsDefault (see page 11206)	This is GetIsDefault, a member of class IProperty70.
	GetKind (see page 11030)	This is GetKind, a member of class TPropertyEditor.
	GetKind (see page 11212)	This is GetKind, a member of class IPropertyKind.
	GetName (see page 11032)	Returns the name of the property.
	GetName (see page 11202)	Returns the name of the property.
	GetName (see page 11221)	This is GetName, a member of class IWideProperty10.
	GetNameW (see page 11086)	This is GetNameW, a member of class TWideStringProperty.
	GetProperties (see page 11033)	Provides the subproperties of the property to a callback procedure.
	GetProperties (see page 11202)	Provides the subproperties of the property to a callback procedure.
	GetPropInfo (see page 11033)	Returns the property information record for the object being edited.
	GetPropInfo (see page 11202)	Returns the property information record for the object being edited.
	GetPropType (see page 11033)	Returns the type information record for the object being edited.
	GetPropType (see page 11203)	Returns the type information record for the object being edited.
	GetValue (see page 11086)	Returns the property value formatted as a string.
	GetValues (see page 11086)	This is GetValues, a member of class TWideStringProperty.
	GetValueW (see page 11087)	This is GetValueW, a member of class TWideStringProperty.
	GetVisualValue (see page 11037)	Returns the property value as it appears in the Object Inspector.
	HasInstance (see page 11204)	Indicates whether a specified object is currently being edited by the property editor.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	Initialize (see page 11038)	Initializes the property editor after it is created but before it is used.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22280)	Allocates memory for each instance of an interfaced object.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	Revert (see page 11039)	Restores all object properties to their original values.
	Revert (see page 11204)	Restores all object properties to their original values.
	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetValue (see page 11087)	This is SetValue, a member of class TWideStringProperty.
	SetValue (see page 11042)	This is the overview for the SetValue method overload.

	ValueAvailable (see page 11044)	Indicates whether all components being edited have a value for the property if their ComponentStyle includes csCheckPropAvail.
	ValueAvailable (see page 11205)	Indicates whether all components being edited have a value for the property if their ComponentStyle includes csCheckPropAvail.

Public Properties

	Name	Description
R	Designer (see page 11044)	Provides access to the form designer object in the IDE.
R	IsDefault (see page 11206)	This is IsDefault, a member of class IProperty70.
R	Kind (see page 11212)	This is Kind, a member of class IPropertyKind.
R	PrivateDirectory (see page 11044)	Specifies the location where the property editor can store auxiliary files.
R	PropCount (see page 11045)	Indicates the number of components whose properties are being edited.
R	RefCount (see page 22281)	Indicates the number of interface pointers currently dependent upon the object.
	Value (see page 11045)	Represents the current value of the property (as returned by GetValue (see page 11035)) as a string.

59.1.30.2 TWideStringProperty Methods

The methods of the TWideStringProperty class are listed here.

Public Methods

	Name	Description
V	AllEqual (see page 11085)	Indicates whether all selected components have the same value for the property.
	GetNameW (see page 11086)	This is GetNameW, a member of class TWideStringProperty.
V	GetValue (see page 11086)	Returns the property value formatted as a string.
V	GetValues (see page 11086)	This is GetValues, a member of class TWideStringProperty.
V	GetValueW (see page 11087)	This is GetValueW, a member of class TWideStringProperty.
V	SetValue (see page 11087)	This is SetValue, a member of class TWideStringProperty.

59.1.30.2.1 TWideStringProperty.AllEqual Method

Indicates whether all selected components have the same value for the property.

Pascal

```
function AllEqual: Boolean; override;
```

C++

```
virtual __fastcall Boolean AllEqual();
```

Description

The Object Inspector calls AllEqual when there is more than one component selected to determine whether a value should appear for this property. If this method returns true, the Object Inspector displays a value for the property. If this method returns false, the line for the property in the Object Inspector remains blank.

In TPropertyEditor, AllEqual always returns false if more than one selected component has the associated property. Override this method to check the properties of individual components and determine whether a property value can be displayed in the Object Inspector.

Note: AllEqual is called only when the value returned by GetAttributes includes paMultiSelect.

See Also

GetAttributes (see page 11026)

GetComponent (see page 11026)

GetValue (see page 11035)

59.1.30.2.2 TWideStringProperty.GetNameW Method

Pascal

```
function GetNameW: WideString;
```

C++

```
__fastcall BSTR GetNameW();
```

Description

This is GetNameW, a member of class TWideStringProperty.

59.1.30.2.3 TWideStringProperty.GetValue Method

Returns the property value formatted as a string.

Pascal

```
function GetValue: string; override;
```

C++

```
virtual __fastcall AnsiString GetValue();
```

Description

GetValue formats the value of the property, formatted as a string. If the value is not available, GetValue raised an exception.

As implemented in TPropertyEditor, GetValue returns the string "(unknown)". Descendant classes override this method to provide an appropriate value string or raise an exception.

GetValue is the read access method of the Value property.

Note: To obtain an error string when the property value is unavailable rather than raising an exception, you can call the GetEditValue method. GetEditValue is protected, but can be called through the IProperty interface in code that is not a method of a descendant class.

See Also

setvalue (see page 11042)

Value (see page 11045)

GetVisualValue (see page 11037)

GetEditValue (see page 11027)

59.1.30.2.4 TWideStringProperty.GetValues Method

Pascal

```
procedure GetValues(Proc: TGetWideStrProc); virtual;
```

C++

```
virtual __fastcall GetValues(TGetWideStrProc Proc);
```

Description

This is GetValues, a member of class TWideStringProperty.

59.1.30.2.5 TWideStringProperty.GetValueW Method

Pascal

```
function GetValueW: WideString; override;
```

C++

```
virtual __fastcall BSTR GetValueW();
```

Description

This is GetValueW, a member of class TWideStringProperty.

59.1.30.2.6 TWideStringProperty.SetValue Method

Pascal

```
procedure SetValue(const Value: WideString); virtual;
```

C++

```
virtual __fastcall SetValue(const BSTR Value);
```

Description

This is SetValue, a member of class TWideStringProperty.

59.2 Interfaces

The following table lists interfaces in this documentation.

Interfaces

	Name	Description
	IDesignGroupChange (see page 11088)	This is class DesignEditors.IDesignGroupChange.

59.2.1 IDesignGroupChange Interface

Class Hierarchy

DesignEditors.IDesignGroupChange

Pascal

```
IDesignGroupChange = interface;
```

C++

```
__interface IDesignGroupChange;
```

File

DesignEditors

Description

This is class DesignEditors.IDesignGroupChange.

59.2.1.1 IDesignGroupChange Members

The following tables list the members exposed by IDesignGroupChange.

Public Methods

	Name	Description
	FreeEditorGroup (see page 11089)	This is FreeEditorGroup, a member of class IDesignGroupChange.

59.2.1.2 IDesignGroupChange Methods

The methods of the IDesignGroupChange class are listed here.

Public Methods

	Name	Description
	FreeEditorGroup (see page 11089)	This is FreeEditorGroup, a member of class IDesignGroupChange.

59.2.1.2.1 IDesignGroupChange.FreeEditorGroup Method

Pascal

```
procedure FreeEditorGroup(Group: Integer);
```

C++

```
__fastcall FreeEditorGroup(int Group);
```

Description

This is FreeEditorGroup, a member of class IDesignGroupChange.

59.3 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	AncestorNameMatches (see page 11090)	This is function DesignEditors.AncestorNameMatches.
	ClassInheritsFrom (see page 11090)	This is function DesignEditors.ClassInheritsFrom.
	FreeEditorGroup (see page 11091)	This is function DesignEditors.FreeEditorGroup.
	GetComponentEditor (see page 11091)	This is function DesignEditors.GetComponentEditor.
	GetComponentProperties (see page 11091)	This is function DesignEditors.GetComponentProperties.
	GetSelectionEditors (see page 11092)	This is function DesignEditors.GetSelectionEditors.
	GetSelectionEditors (see page 11092)	This is function DesignEditors.GetSelectionEditors.
	GetSelectionEditors (see page 11092)	This is function DesignEditors.GetSelectionEditors.
	GuidelinesFor (see page 11093)	This is function DesignEditors.GuidelinesFor.
	NewEditorGroup (see page 11093)	This is function DesignEditors.NewEditorGroup.
	NotifyGroupChange (see page 11093)	This is function DesignEditors.NotifyGroupChange.
	PossibleStream (see page 11094)	This is function DesignEditors.PossibleStream.
	UnnotifyGroupChange (see page 11094)	This is function DesignEditors.UnnotifyGroupChange.

59.3.1 DesignEditors.AncestorNameMatches Function

Pascal

```
function AncestorNameMatches(ClassType: TClass; AncestorClass: TClass): Boolean;
```

C++

```
Boolean AncestorNameMatches(TClass ClassType, TClass AncestorClass);
```

File

DesignEditors

Description

This is function DesignEditors.AncestorNameMatches.

59.3.2 DesignEditors.ClassInheritsFrom Function

Pascal

```
function ClassInheritsFrom(ClassType: TClass; const ClassName: string): Boolean;
```

C++

```
Boolean ClassInheritsFrom(TClass ClassType, const AnsiString ClassName);
```

File

DesignEditors

Description

This is function DesignEditors.ClassInheritsFrom.

59.3.3 DesignEditors.FreeEditorGroup Function

Pascal

```
procedure FreeEditorGroup(Group: Integer);
```

C++

```
FreeEditorGroup(int Group);
```

File

DesignEditors

Description

This is function DesignEditors.FreeEditorGroup.

59.3.4 DesignEditors.GetComponentEditor Function

Pascal

```
function GetComponentEditor(Component: TComponent; const Designer: IDesigner):
IComponentEditor;
```

C++

```
IComponentEditor GetComponentEditor(TComponent * Component, const IDesigner Designer);
```

File

DesignEditors

Description

This is function DesignEditors.GetComponentEditor.

59.3.5 DesignEditors.GetComponentProperties Function

Pascal

```
procedure GetComponentProperties(const Components: IDesignerSelections; Filter: TTypeKinds;
const Designer: IDesigner; Proc: TGetPropProc; EditorFilterFunc: TPropertyEditorFilterFunc =
nil);
```

C++

```
GetComponentProperties(const IDesignerSelections Components, TTypeKinds Filter, const
IDesigner Designer, TGetPropProc Proc, TPropertyEditorFilterFunc EditorFilterFunc = nil);
```

File

DesignEditors

Description

This is function DesignEditors.GetComponentProperties.

59.3.6 DesignEditors.GetSelectionEditors Function

Pascal

```
function GetSelectionEditors(const Designer: IDesigner): ISelectionEditorList; overload;
```

C++

```
ISelectionEditorList GetSelectionEditors(const IDesigner Designer);
```

File

DesignEditors

Description

This is function DesignEditors.GetSelectionEditors.

59.3.7 DesignEditors.GetSelectionEditors Function

Pascal

```
function GetSelectionEditors(const Designer: IDesigner; const Selections:
IDesignerSelections): ISelectionEditorList; overload;
```

C++

```
ISelectionEditorList GetSelectionEditors(const IDesigner Designer, const IDesignerSelections
Selections);
```

File

DesignEditors

Description

This is function DesignEditors.GetSelectionEditors.

59.3.8 DesignEditors.GetSelectionEditors Function

Pascal

```
function GetSelectionEditors(const Designer: IDesigner; Component: TComponent):
ISelectionEditorList; overload;
```

C++

```
ISelectionEditorList GetSelectionEditors(const IDesigner Designer, TComponent * Component);
```

File

DesignEditors

Description

This is function DesignEditors.GetSelectionEditors.

59.3.9 DesignEditors.GuidelinesFor Function

Pascal

```
function GuidelinesFor(const ADesigner: IDesigner; AComponent: TComponent; AContainer:
TComponent): IComponentGuidelines;
```

C++

```
IComponentGuidelines GuidelinesFor(const IDesigner ADesigner, TComponent * AComponent,
TComponent * AContainer);
```

File

DesignEditors

Description

This is function DesignEditors.GuidelinesFor.

59.3.10 DesignEditors.NewEditorGroup Function

Pascal

```
function NewEditorGroup: Integer;
```

C++

```
int NewEditorGroup();
```

File

DesignEditors

Description

This is function DesignEditors.NewEditorGroup.

59.3.11 DesignEditors.NotifyGroupChange Function

Pascal

```
procedure NotifyGroupChange(AProc: TGroupChangeProc);
```

C++

```
NotifyGroupChange(TGroupChangeProc AProc);
```

File

DesignEditors

Description

This is function DesignEditors.NotifyGroupChange.

59.3.12 DesignEditors.PossibleStream Function

Pascal

```
function PossibleStream(const S: string): Boolean;
```

C++

```
Boolean PossibleStream(const AnsiString S);
```

File

DesignEditors

Description

This is function DesignEditors.PossibleStream.

59.3.13 DesignEditors.UnnotifyGroupChange Function

Pascal

```
procedure UnnotifyGroupChange(AProc: TGroupChangeProc);
```

C++

```
UnnotifyGroupChange(TGroupChangeProc AProc);
```

File

DesignEditors

Description

This is function DesignEditors.UnnotifyGroupChange.

59.4 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Records

	Name	Description
	TInstProp (see page 11095)	This is record DesignEditors.TInstProp.

59.4.1 DesignEditors.TInstProp Record

Pascal

```
TInstProp = record
  Instance: TPersistent;
  PropInfo: PPropInfo;
end;
```

C++

```
struct TInstProp {
  TPersistent * Instance;
  PPropInfo PropInfo;
};
```

File

DesignEditors

Description

This is record DesignEditors.TInstProp.

59.5 Types

The following table lists types in this documentation.

Types

Name	Description
PInstPropList (see page 11096)	This is type DesignEditors.PInstPropList.
TBit (see page 11096)	This is type DesignEditors.TBit.
TGetTopLevelComponentFunc (see page 11097)	This is type DesignEditors.TGetTopLevelComponentFunc.
TGroupChangeProc (see page 11097)	This is type DesignEditors.TGroupChangeProc.
TInstPropList (see page 11097)	This is type DesignEditors.TInstPropList.

59.5.1 DesignEditors.PInstPropList Type

Pascal

```
PInstPropList = ^TInstPropList;
```

C++

```
^TInstPropList PInstPropList;
```

File

DesignEditors

Description

This is type DesignEditors.PInstPropList.

59.5.2 DesignEditors.TBit Type

Pascal

```
TBit = 0..31;
```

C++

```
0..31 TBit;
```

File

DesignEditors

Description

This is type DesignEditors.TBit.

59.5.3 DesignEditors.TGetTopLevelComponentFunc Type

Pascal

```
TGetTopLevelComponentFunc = function (Ignoring: TComponent = nil): TComponent;
```

C++

```
(Ignoring: TComponent = nil): TComponent ( TGetTopLevelComponentFunc)();
```

File

DesignEditors

Description

This is type DesignEditors.TGetTopLevelComponentFunc.

59.5.4 DesignEditors.TGroupChangeProc Type

Pascal

```
TGroupChangeProc = procedure (AGroup: Integer);
```

C++

```
(AGroup: Integer) ( TGroupChangeProc)();
```

File

DesignEditors

Description

This is type DesignEditors.TGroupChangeProc.

59.5.5 DesignEditors.TInstPropList Type

Pascal

```
TInstPropList = array[0..1023] of TInstProp;
```

C++

```
array[0..1023] of TInstProp TInstPropList;
```

File

DesignEditors

Description

This is type DesignEditors.TInstPropList.

59.6 Variables

The following table lists variables in this documentation.

Variables

Name	Description
GetTopLevelComponentFunc (see page 11098)	This is variable DesignEditors.GetTopLevelComponentFunc.

59.6.1 DesignEditors.GetTopLevelComponentFunc Variable

Pascal

```
GetTopLevelComponentFunc: TGetTopLevelComponentFunc;
```

C++

```
TGetTopLevelComponentFunc GetTopLevelComponentFunc;
```

File

DesignEditors

Description

This is variable DesignEditors.GetTopLevelComponentFunc.

59.7 Constants

The following table lists constants in this documentation.

Constants

Name	Description
sClassNotApplicable (see page 11099)	This is constant DesignEditors.sClassNotApplicable.
sNotAvailable (see page 11099)	This is constant DesignEditors.sNotAvailable.

59.7.1 DesignEditors.sClassNotApplicable Constant

Pascal

```
sClassNotApplicable = 'Class %s is not applicable to this module';
```

C++

```
sClassNotApplicable = 'Class %s is not applicable to this module';
```

File

DesignEditors

Description

This is constant DesignEditors.sClassNotApplicable.

59.7.2 DesignEditors.sNotAvailable Constant

Pascal

```
sNotAvailable = '(Not available)';
```

C++

```
sNotAvailable = '(Not available)';
```

File

DesignEditors

Description

This is constant DesignEditors.sNotAvailable.

60 DesignIntf Namespace

This is namespace DesignIntf.

Topics

Name	Description
Classes (see page 11105)	The following table lists classes in this documentation.
Interfaces (see page 11134)	The following table lists interfaces in this documentation.
Functions (see page 11224)	The following table lists functions in this documentation.
Structs, Records, Enums (see page 11233)	The following table lists structs, records, enums in this documentation.
Types (see page 11238)	The following table lists types in this documentation.
Variables (see page 11249)	The following table lists variables in this documentation.
Constants (see page 11255)	The following table lists constants in this documentation.

Classes

	Name	Description
	TBaseComponentEditor (see page 11105)	TBaseComponentEditor is the base class for all component editors.
	TBaseComponentGuidelines (see page 11107)	This is class DesignIntf.TBaseComponentGuidelines.
	TBaseCustomModule (see page 11110)	This is class DesignIntf.TBaseCustomModule.
	TBasePropertyEditor (see page 11112)	TBasePropertyEditor is the base class for all property editors.
	TBaseSelectionEditor (see page 11116)	This is class DesignIntf.TBaseSelectionEditor.
	TClassWrapper (see page 11117)	This is class DesignIntf.TClassWrapper.
	TDesignerSelections (see page 11121)	TDesignerSelections maintains a list of persistent objects.
	TDragTarget (see page 11127)	This is class DesignIntf.TDragTarget.
	TEventInfo (see page 11129)	This is class DesignIntf.TEventInfo.

Constants

Name	Description
MaxIdentLength (see page 11255)	This is constant DesignIntf.MaxIdentLength.
sActionCategoryName (see page 11256)	This is constant DesignIntf.sActionCategoryName.
sAppearanceCategoryName (see page 11256)	This is constant DesignIntf.sAppearanceCategoryName.
sBehaviorCategoryName (see page 11256)	This is constant DesignIntf.sBehaviorCategoryName.
sDatabaseCategoryName (see page 11257)	This is constant DesignIntf.sDatabaseCategoryName.
sDataCategoryName (see page 11257)	This is constant DesignIntf.sDataCategoryName.
sDesignCategoryName (see page 11257)	This is constant DesignIntf.sDesignCategoryName.
sDragNDropCategoryName (see page 11258)	This is constant DesignIntf.sDragNDropCategoryName.
sFocusCategoryName (see page 11258)	This is constant DesignIntf.sFocusCategoryName.

sHelpCategoryName (see page 11258)	This is constant DesignIntf.sHelpCategoryName.
sInputCategoryName (see page 11259)	This is constant DesignIntf.sInputCategoryName.
sInvalidFilter (see page 11259)	This is constant DesignIntf.sInvalidFilter.
sKeyCategoryName (see page 11259)	This is constant DesignIntf.sKeyCategoryName.
sLayoutCategoryName (see page 11260)	This is constant DesignIntf.sLayoutCategoryName.
sLegacyCategoryName (see page 11260)	This is constant DesignIntf.sLegacyCategoryName.
sLinkageCategoryName (see page 11260)	This is constant DesignIntf.sLinkageCategoryName.
sLocaleCategoryName (see page 11261)	This is constant DesignIntf.sLocaleCategoryName.
sLocalizableCategoryName (see page 11261)	This is constant DesignIntf.sLocalizableCategoryName.
sMiscellaneousCategoryName (see page 11261)	This is constant DesignIntf.sMiscellaneousCategoryName.
sMouseCategoryName (see page 11262)	This is constant DesignIntf.sMouseCategoryName.
sPropertyChangeCategoryName (see page 11262)	This is constant DesignIntf.sPropertyChangeCategoryName.
sVisualCategoryName (see page 11262)	This is constant DesignIntf.sVisualCategoryName.
sWindowStyleName (see page 11263)	This is constant DesignIntf.sWindowStyleName.

Functions

	Name	Description
	CreateSelectionList (see page 11224)	This is function DesignIntf.CreateSelectionList.
	EnableDemandLoadReport (see page 11225)	This is function DesignIntf.EnableDemandLoadReport.
	ForceDemandLoadState (see page 11225)	This is function DesignIntf.ForceDemandLoadState.
	PersistentToDesignObject (see page 11225)	This is function DesignIntf.PersistentToDesignObject.
	RegisterComponentEditor (see page 11226)	This is function DesignIntf.RegisterComponentEditor.
	RegisterComponentGuidelines (see page 11226)	This is function DesignIntf.RegisterComponentGuidelines.
	RegisterCustomModule (see page 11226)	This is function DesignIntf.RegisterCustomModule.
	RegisterDesignDragObject (see page 11227)	This is function DesignIntf.RegisterDesignDragObject.
	RegisterDesignNotification (see page 11227)	This is function DesignIntf.RegisterDesignNotification.
	RegisterDragTarget (see page 11227)	This is function DesignIntf.RegisterDragTarget.
	RegisterIDropTarget (see page 11228)	This is function DesignIntf.RegisterIDropTarget.
	RegisterPropertiesInCategory (see page 11228)	This is function DesignIntf.RegisterPropertiesInCategory.
	RegisterPropertiesInCategory (see page 11228)	This is function DesignIntf.RegisterPropertiesInCategory.
	RegisterPropertiesInCategory (see page 11229)	This is function DesignIntf.RegisterPropertiesInCategory.
	RegisterPropertyEditor (see page 11229)	This is function DesignIntf.RegisterPropertyEditor.
	RegisterPropertyInCategory (see page 11229)	This is function DesignIntf.RegisterPropertyInCategory.
	RegisterPropertyInCategory (see page 11230)	This is function DesignIntf.RegisterPropertyInCategory.
	RegisterPropertyInCategory (see page 11230)	This is function DesignIntf.RegisterPropertyInCategory.
	RegisterPropertyInCategory (see page 11230)	This is function DesignIntf.RegisterPropertyInCategory.
	RegisterPropertyMapper (see page 11231)	This is function DesignIntf.RegisterPropertyMapper.
	RegisterSelectionEditor (see page 11231)	This is function DesignIntf.RegisterSelectionEditor.
	SetPropertyEditorGroup (see page 11231)	This is function DesignIntf.SetPropertyEditorGroup.
	UnlistPublishedProperty (see page 11232)	This is function DesignIntf.UnlistPublishedProperty.
	UnregisterDesignNotification (see page 11232)	This is function DesignIntf.UnregisterDesignNotification.

Interfaces

	Name	Description
	IActivatable (see page 11134)	This is class DesignIntf.IActivatable.
	IClass (see page 11135)	This is class DesignIntf.IClass.
	IComponentEditor (see page 11138)	IComponentEditor is the interface that the form designer uses to communicate with component editors.
	IComponentGuidelines (see page 11143)	This is class DesignIntf.IComponentGuidelines.
	ICustomModule (see page 11145)	This is class DesignIntf.ICustomModule.
	IDefaultEditor (see page 11148)	This is class DesignIntf.IDefaultEditor.
	IDesigner (see page 11149)	IDesigner is an interface to the form designer in the IDE.
	IDesigner60 (see page 11151)	This is class DesignIntf.IDesigner60.
	IDesigner70 (see page 11167)	This is class DesignIntf.IDesigner70.
	IDesigner80 (see page 11169)	This is class DesignIntf.IDesigner80.

	IDesignerSelections (see page 11172)	IDesignerSelections represents a list of persistent objects.
	IDesignNotification (see page 11176)	This is class DesignIntf.IDesignNotification.
	IDesignObject (see page 11178)	This is class DesignIntf.IDesignObject.
	IDesignPersistent (see page 11183)	This is class DesignIntf.IDesignPersistent.
	IDesignWindow (see page 11184)	This is class DesignIntf.IDesignWindow.
	IEditHandler (see page 11186)	This is class DesignIntf.IEditHandler.
	IEventInfo (see page 11187)	This is class DesignIntf.IEventInfo.
	IHostForm (see page 11189)	This is class DesignIntf.IHostForm.
	IImplementation (see page 11196)	This is class DesignIntf.IImplementation.
	IMethodProperty (see page 11197)	This is class DesignIntf.IMethodProperty.
	IProperty (see page 11197)	IProperty is the interface that the Object Inspector uses to communicate with property editors.
	IProperty70 (see page 11205)	This is class DesignIntf.IProperty70.
	IProperty80 (see page 11207)	This is class DesignIntf.IProperty80.
	IPropertyControl (see page 11208)	This is class DesignIntf.IPropertyControl.
	IPropertyDescription (see page 11209)	This is class DesignIntf.IPropertyDescription.
	IPropertyHost (see page 11210)	This is class DesignIntf.IPropertyHost.
	IPropertyKind (see page 11211)	This is class DesignIntf.IPropertyKind.
	IReferenceProperty (see page 11212)	This is class DesignIntf.IReferenceProperty.
	ISelectionEditor (see page 11213)	This is class DesignIntf.ISelectionEditor.
	ISelectionEditorList (see page 11215)	This is class DesignIntf.ISelectionEditorList.
	ISelectionPropertyFilter (see page 11217)	This is class DesignIntf.ISelectionPropertyFilter.
	IShowReferenceProperty (see page 11218)	This is class DesignIntf.IShowReferenceProperty.
	IWideProperty (see page 11219)	This is class DesignIntf.IWideProperty.
	IWideProperty10 (see page 11221)	This is class DesignIntf.IWideProperty10.
	IWidePropertyDescription (see page 11222)	This is class DesignIntf.IWidePropertyDescription.

Structs, Records, Enums

	Name	Description
	TCustomModuleAttribute (see page 11233)	This is record DesignIntf.TCustomModuleAttribute.
	TDemandLoadState (see page 11233)	This is record DesignIntf.TDemandLoadState.
	TDesignerGuideType (see page 11234)	This is record DesignIntf.TDesignerGuideType.
	TEditAction (see page 11234)	This is record DesignIntf.TEditAction.
	TEditStates (see page 11235)	This is record DesignIntf.TEditStates.
	TPropertyAttribute (see page 11236)	This is record DesignIntf.TPropertyAttribute.
	TPropKind (see page 11237)	This is record DesignIntf.TPropKind.

Types

Name	Description
IDesignEditQuery (see page 11238)	This is type DesignIntf.IDesignEditQuery.
TComponentEditorClass (see page 11239)	This is type DesignIntf.TComponentEditorClass.
TComponentGuidelinesClass (see page 11239)	This is type DesignIntf.TComponentGuidelinesClass.
TCustomModuleAttributes (see page 11239)	This is type DesignIntf.TCustomModuleAttributes.
TCustomModuleClass (see page 11240)	This is type DesignIntf.TCustomModuleClass.
TDragTargetClass (see page 11240)	This is type DesignIntf.TDragTargetClass.
TEditState (see page 11240)	This is type DesignIntf.TEditState.
TEnableDemandLoadReportProc (see page 11241)	This is type DesignIntf.TEnableDemandLoadReportProc.
TForceDemandLoadStateProc (see page 11241)	This is type DesignIntf.TForceDemandLoadStateProc.
TGetDesignerEvent (see page 11241)	This is type DesignIntf.TGetDesignerEvent.
TGetPropProc (see page 11242)	This is type DesignIntf.TGetPropProc.
TGetWideStrProc (see page 11242)	This is type DesignIntf.TGetWideStrProc.
TPropertyAttributes (see page 11242)	This is type DesignIntf.TPropertyAttributes.
TPropertyEditorClass (see page 11243)	This is type DesignIntf.TPropertyEditorClass.
TPropertyEditorFilterFunc (see page 11243)	This is type DesignIntf.TPropertyEditorFilterFunc.
TPropertyMapperFunc (see page 11243)	This is type DesignIntf.TPropertyMapperFunc.

TRegisterComponentEditorProc (see page 11244)	This is type DesignIntf.TRegisterComponentEditorProc.
TRegisterComponentGuidelines (see page 11244)	This is type DesignIntf.TRegisterComponentGuidelines.
TRegisterCustomModuleProc (see page 11244)	This is type DesignIntf.TRegisterCustomModuleProc.
TRegisterDesignDragObject (see page 11245)	This is type DesignIntf.TRegisterDesignDragObject.
TRegisterDesignNotification (see page 11245)	This is type DesignIntf.TRegisterDesignNotification.
TRegisterDragTargetProc (see page 11245)	This is type DesignIntf.TRegisterDragTargetProc.
TRegisterIDropTarget (see page 11246)	This is type DesignIntf.TRegisterIDropTarget.
TRegisterPropertyEditorProc (see page 11246)	This is type DesignIntf.TRegisterPropertyEditorProc.
TRegisterPropertyInCategoryProc (see page 11246)	This is type DesignIntf.TRegisterPropertyInCategoryProc.
TRegisterPropertyMapperProc (see page 11247)	This is type DesignIntf.TRegisterPropertyMapperProc.
TRegisterSelectionEditorProc (see page 11247)	This is type DesignIntf.TRegisterSelectionEditorProc.
TSelectionEditorClass (see page 11247)	This is type DesignIntf.TSelectionEditorClass.
TSetPropertyEditorGroupProc (see page 11248)	This is type DesignIntf.TSetPropertyEditorGroupProc.

Variables

Name	Description
EnableDemandLoadReportProc (see page 11249)	This is variable DesignIntf.EnableDemandLoadReportProc.
ForceDemandLoadStateProc (see page 11249)	This is variable DesignIntf.ForceDemandLoadStateProc.
GReferenceExpandable (see page 11250)	This is variable DesignIntf.GReferenceExpandable.
GShowReadOnlyProps (see page 11250)	This is variable DesignIntf.GShowReadOnlyProps.
RegisterComponentEditorProc (see page 11250)	This is variable DesignIntf.RegisterComponentEditorProc.
RegisterComponentGuidelinesProc (see page 11251)	This is variable DesignIntf.RegisterComponentGuidelinesProc.
RegisterCustomModuleProc (see page 11251)	This is variable DesignIntf.RegisterCustomModuleProc.
RegisterDesignDragObjectProc (see page 11251)	This is variable DesignIntf.RegisterDesignDragObjectProc.
RegisterDesignNotificationProc (see page 11252)	This is variable DesignIntf.RegisterDesignNotificationProc.
RegisterDragTargetProc (see page 11252)	This is variable DesignIntf.RegisterDragTargetProc.
RegisterIDropTargetProc (see page 11252)	This is variable DesignIntf.RegisterIDropTargetProc.
RegisterPropertyEditorProc (see page 11253)	This is variable DesignIntf.RegisterPropertyEditorProc.
RegisterPropertyInCategoryProc (see page 11253)	This is variable DesignIntf.RegisterPropertyInCategoryProc.
RegisterPropertyMapperProc (see page 11253)	This is variable DesignIntf.RegisterPropertyMapperProc.
RegisterSelectionEditorProc (see page 11254)	This is variable DesignIntf.RegisterSelectionEditorProc.
SetPropertyEditorGroupProc (see page 11254)	This is variable DesignIntf.SetPropertyEditorGroupProc.
UnregisterDesignNotificationProc (see page 11254)	This is variable DesignIntf.UnregisterDesignNotificationProc.

60.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TBaseComponentEditor (see page 11105)	TBaseComponentEditor is the base class for all component editors.
	TBaseComponentGuidelines (see page 11107)	This is class DesignIntf.TBaseComponentGuidelines.
	TBaseCustomModule (see page 11110)	This is class DesignIntf.TBaseCustomModule.
	TBasePropertyEditor (see page 11112)	TBasePropertyEditor is the base class for all property editors.
	TBaseSelectionEditor (see page 11116)	This is class DesignIntf.TBaseSelectionEditor.
	TClassWrapper (see page 11117)	This is class DesignIntf.TClassWrapper.
	TDesignerSelections (see page 11121)	TDesignerSelections maintains a list of persistent objects.
	TDragTarget (see page 11127)	This is class DesignIntf.TDragTarget.
	TEventInfo (see page 11129)	This is class DesignIntf.TEventInfo.

60.1.1 TBaseComponentEditor Class

TBaseComponentEditor is the base class for all component editors.

Class Hierarchy

Pascal

```
TBaseComponentEditor = class(TInterfacedObject);
```

C++

```
class TBaseComponentEditor : public TInterfacedObject;
```

File

DesignIntf

Description

Use TBaseComponentEditor or one of its descendants as a base class when defining a design-time editor for working with a new component class. All component editors must descend from TBaseComponentEditor and, in addition, they must support the IComponentEditor (see page 11138) interface.

Create (see page 11107) a new component editor class for a component class to add verbs to its context menu, change its default double-click behavior, or allow the component to use a new clipboard format.

TBaseComponentEditor does not implement any support for the IComponentEditor (see page 11138) interface. This support must be supplied by descendant classes. For example, TBaseComponentEditor has an immediate descendant, TComponentEditor, which supplies a default implementation of the IComponentEditor (see page 11138) interface. Typically, component writers use TComponentEditor or TDefaultEditor as a base class when defining new component editors. However, you can derive a component editor directly from TBaseComponentEditor if you want to provide your own implementation of IComponentEditor (see page 11138)..

Once the component editor is defined, it can be registered to work with a particular component class. A registered component editor is created for each component of that class when it is selected in the form designer. To create the association between a component editor and a component class, call RegisterComponentEditor (see page 11226).

See Also

RegisterComponentEditor (see page 11226)

IComponentEditor (see page 11138)

TComponentEditor (see page 10927)

60.1.1.1 TBaseComponentEditor Members

The following tables list the members exposed by TBaseComponentEditor.

Protected Data Members

	Name	Description
	FRefCount (see page 22278)	This is FRefCount, a member of class TInterfacedObject.

Protected Methods

	Name	Description
	_AddRef (see page 22278)	Implements the IInterface (see page 22396) System::TInterfacedObject::_AddRef method.
	_Release (see page 22279)	Implements the IInterface (see page 22396) System::TInterfacedObject::_Release method.
	QueryInterface (see page 22280)	Implements the IInterface (see page 22396) System::TInterfacedObject::QueryInterface method.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22279)	Responds after the last constructor executes.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 22279)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 11107)	Creates a new TBaseComponentEditor (see page 11105) object.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.

	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22280)	Allocates memory for each instance of an interfaced object.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
R	RefCount (see page 22281)	Indicates the number of interface pointers currently dependent upon the object.

60.1.1.2 TBaseComponentEditor.Create Constructor

Creates a new TBaseComponentEditor (see page 11105) object.

Pascal

```
constructor Create(AComponent: TComponent; ADesigner: IDesigner); virtual;
```

C++

```
virtual __fastcall TBaseComponentEditor(TComponent * AComponent, IDesigner ADesigner);
```

Description

Do not create instances of a component editor. Registered component editors are created automatically for selected objects in the form designer.

AComponent is the instance of the component for which the editor is created.

ADesigner is an interface that the component editor can use to interact with the forms designer.

60.1.2 TBaseComponentGuidelines Class

Class Hierarchy

Pascal

```
TBaseComponentGuidelines = class(TInterfacedObject);
```

C++

```
class TBaseComponentGuidelines : public TInterfacedObject;
```

File

DesignIntf

Description

This is class DesignIntf.TBaseComponentGuidelines.

60.1.2.1 TBaseComponentGuidelines Members

The following tables list the members exposed by TBaseComponentGuidelines.

Protected Data Members

	Name	Description
	FRefCount (see page 22278)	This is FRefCount, a member of class TInterfacedObject.

Protected Methods

	Name	Description
	_AddRef (see page 22278)	Implements the IInterface (see page 22396) System::TInterfacedObject::_AddRef method.
	_Release (see page 22279)	Implements the IInterface (see page 22396) System::TInterfacedObject::_Release method.
	QueryInterface (see page 22280)	Implements the IInterface (see page 22396) System::TInterfacedObject::QueryInterface method.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22279)	Responds after the last constructor executes.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 22279)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 11109)	This is Create, a member of class TBaseComponentGuidelines.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
A	Initialize (see page 11109)	This is Initialize, a member of class TBaseComponentGuidelines.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.

	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22280)	Allocates memory for each instance of an interfaced object.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
R	Designer (see page 11110)	This is Designer, a member of class TBaseComponentGuidelines.
R	RefCount (see page 22281)	Indicates the number of interface pointers currently dependent upon the object.

60.1.2.2 TBaseComponentGuidelines.Create Constructor

Pascal

```
constructor Create(const ADesigner: IDesigner); virtual;
```

C++

```
virtual __fastcall TBaseComponentGuidelines(const IDesigner ADesigner);
```

Description

This is Create, a member of class TBaseComponentGuidelines.

60.1.2.3 TBaseComponentGuidelines Methods

The methods of the TBaseComponentGuidelines class are listed here.

Public Methods

	Name	Description
A	Initialize (see page 11109)	This is Initialize, a member of class TBaseComponentGuidelines.

60.1.2.3.1 TBaseComponentGuidelines.Initialize Method

Pascal

```
procedure Initialize(AComponent: TComponent; AContainer: TComponent); virtual; abstract;
```

C++

```
virtual __fastcall Initialize(TComponent * AComponent, TComponent * AContainer) = 0;
```

Description

This is Initialize, a member of class TBaseComponentGuidelines.

60.1.2.4 TBaseComponentGuidelines Properties

The properties of the TBaseComponentGuidelines class are listed here.

Public Properties

	Name	Description
R	Designer (see page 11110)	This is Designer, a member of class TBaseComponentGuidelines.

60.1.2.4.1 TBaseComponentGuidelines.Designer Property

Pascal

```
property Designer: IDesigner;
```

C++

```
__property IDesigner Designer;
```

Description

This is Designer, a member of class TBaseComponentGuidelines.

60.1.3 TBaseCustomModule Class

Class Hierarchy

Pascal

```
TBaseCustomModule = class(TInterfacedObject);
```

C++

```
class TBaseCustomModule : public TInterfacedObject;
```

File

DesignIntf

Description

This is class DesignIntf.TBaseCustomModule.

60.1.3.1 TBaseCustomModule Members

The following tables list the members exposed by TBaseCustomModule.

Protected Data Members

	Name	Description
	FRefCount (see page 22278)	This is FRefCount, a member of class TInterfacedObject.

Protected Methods

	Name	Description
	_AddRef (see page 22278)	Implements the IInterface (see page 22396) System::TInterfacedObject::_AddRef method.
	_Release (see page 22279)	Implements the IInterface (see page 22396) System::TInterfacedObject::_Release method.
	QueryInterface (see page 22280)	Implements the IInterface (see page 22396) System::TInterfacedObject::QueryInterface method.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.

V	AfterConstruction (see page 22279)	Responds after the last constructor executes.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 22279)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 11111)	This is Create, a member of class TBaseCustomModule.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	DesignClass (see page 11112)	This is DesignClass, a member of class TBaseCustomModule.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22280)	Allocates memory for each instance of an interfaced object.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
R	RefCount (see page 22281)	Indicates the number of interface pointers currently dependent upon the object.

60.1.3.2 TBaseCustomModule.Create Constructor

Pascal

```
constructor Create(ARoot: TComponent; const Designer: IDesigner); virtual;
```

C++

```
virtual __fastcall TBaseCustomModule(TComponent * ARoot, const IDesigner Designer);
```

Description

This is Create, a member of class TBaseCustomModule.

60.1.3.3 TBaseCustomModule Methods

The methods of the TBaseCustomModule class are listed here.

Public Methods

	Name	Description
	DesignClass (see page 11112)	This is DesignClass, a member of class TBaseCustomModule.

60.1.3.3.1 TBaseCustomModule.DesignClass Method

Pascal

```
class function DesignClass: TComponentClass; virtual;
```

C++

```
virtual __fastcall TComponentClass DesignClass();
```

Description

This is DesignClass, a member of class TBaseCustomModule.

60.1.4 TBasePropertyEditor Class

TBasePropertyEditor is the base class for all property editors.

Class Hierarchy

Pascal

```
TBasePropertyEditor = class(TInterfacedObject);
```

C++

```
class TBasePropertyEditor : public TInterfacedObject;
```

File

DesignIntf

Description

Use TBasePropertyEditor or one of its descendants as a base class when defining a property editor for a specialized property in a new component class. All property editors must descend from TBasePropertyEditor and, in addition, they must support the IProperty (see page 11197) interface.

TBasePropertyEditor defines two abstract (pure virtual) protected methods that the Object Inspector calls to inform the property editor of information it may find useful. It does not implement any support for the IProperty (see page 11197) interface. This support must be supplied by descendant classes. For example, TBasePropertyEditor has an immediate descendant, TPropertyEditor, which supplies a default implementation of the IProperty (see page 11197) interface as well as support for fetching property values of different types. Typically, component writers use TPropertyEditor as a base class when defining new property editors. However, you can derive a property editor directly from TBasePropertyEditor, and avoid the overhead of all methods that handle types that are not needed for your particular property.

Property editors can be associated with all properties of a specified type, or with a particular property of a particular component

class. To create the association between a property editor and a property type, call RegisterPropertyEditor (see page 11229). Once the property editor is registered, it appears when the user attempts to edit an appropriate property using the Object Inspector.

TPropertyEditor (see page 11019)

60.1.4.1 TBasePropertyEditor Members

The following tables list the members exposed by TBasePropertyEditor.

Protected Data Members

	Name	Description
	FRefCount (see page 22278)	This is FRefCount, a member of class TInterfacedObject.

Protected Methods

	Name	Description
	_AddRef (see page 22278)	Implements the IInterface (see page 22396) System::TInterfacedObject::_AddRef method.
	_Release (see page 22279)	Implements the IInterface (see page 22396) System::TInterfacedObject::_Release method.
A	Initialize (see page 11114)	Initializes the property editor after it is created but before it is used.
	QueryInterface (see page 22280)	Implements the IInterface (see page 22396) System::TInterfacedObject::QueryInterface method.
A	SetPropEntry (see page 11115)	Informs the property editor of a particular object whose property is to be edited.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22279)	Responds after the last constructor executes.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 22279)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 11114)	Creates a new TBasePropertyEditor (see page 11112) object.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.

	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22280)	Allocates memory for each instance of an interfaced object.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
R	RefCount (see page 22281)	Indicates the number of interface pointers currently dependent upon the object.

60.1.4.2 TBasePropertyEditor.Create Constructor

Creates a new TBasePropertyEditor (see page 11112) object.

Pascal

```
constructor Create(const ADesigner: IDesigner; APropCount: Integer); virtual;
```

C++

```
virtual __fastcall TBasePropertyEditor(const IDesigner ADesigner, int APropCount);
```

Description

Do not create instances of a property editor. Registered property editors are created automatically for selected objects in the form designer.

ADesigner is an interface that the property editor can use to interact with the forms designer.

APropCount indicates the number of components whose properties are to be edited using the property editor.

See Also

Initialize (see page 11114)

60.1.4.3 TBasePropertyEditor Methods

The methods of the TBasePropertyEditor class are listed here.

Protected Methods

	Name	Description
A	Initialize (see page 11114)	Initializes the property editor after it is created but before it is used.
A	SetPropEntry (see page 11115)	Informs the property editor of a particular object whose property is to be edited.

60.1.4.3.1 TBasePropertyEditor.Initialize Method

Initializes the property editor after it is created but before it is used.

Pascal

```
procedure Initialize; virtual; abstract;
```

C++

```
virtual __fastcall Initialize() = 0;
```

Description

Do not call the Initialize method. It is called automatically by the Object Inspector to allow property editors to perform any necessary initialization before they are used.

In TBasePropertyEditor (see page 11112), Initialize is abstract (pure virtual). Descendant classes must override the Initialize method to provide an implementation. This method can be used to perform any special initialization, such as the creation of helper objects.

Property editors are often created and discarded without being used because they do not represent a common property across all selected components. Since Initialize is called only after it is determined that the property editor will be used, it is more efficient to initialize property values and create helper objects in the Initialize method rather than the constructor.

See Also

Create (see page 11114)

60.1.4.3.2 TBasePropertyEditor.SetPropEntry Method

Informs the property editor of a particular object whose property is to be edited.

Pascal

```
procedure SetPropEntry(Index: Integer; AInstance: TPersistent; APropInfo: PPropInfo); virtual;
abstract;
```

C++

```
virtual __fastcall SetPropEntry(int Index, TPersistent * AInstance, PPropInfo APropInfo) = 0;
```

Description

The Object Inspector calls SetPropEntry for each object that has a property that the property editor is editing. This allows the property editor to store information about the objects being edited so that it can get and set property values.

Index is the index of the object being edited. This value can range from 0 to one less than the APropCount parameter that is passed to the constructor.

AInstance is a reference to the object being edited.

APropInfo is a pointer to the property information record for the property on AInstance. This can be used to access the methods that get or set the property value.

In TBasePropertyEditor (see page 11112), SetPropEntry is abstract (pure virtual). Descendant classes must override this method to provide an implementation.

Create (see page 11114)

60.1.5 TBaseSelectionEditor Class

Class Hierarchy

Pascal

```
TBaseSelectionEditor = class(TInterfacedObject);
```

C++

```
class TBaseSelectionEditor : public TInterfacedObject;
```

File

DesignIntf

Description

This is class DesignIntf.TBaseSelectionEditor.

60.1.5.1 TBaseSelectionEditor Members

The following tables list the members exposed by TBaseSelectionEditor.

Protected Data Members

	Name	Description
	FRefCount (see page 22278)	This is FRefCount, a member of class TInterfacedObject.

Protected Methods

	Name	Description
	_AddRef (see page 22278)	Implements the IInterface (see page 22396) System::TInterfacedObject::_AddRef method.
	_Release (see page 22279)	Implements the IInterface (see page 22396) System::TInterfacedObject::_Release method.
	QueryInterface (see page 22280)	Implements the IInterface (see page 22396) System::TInterfacedObject::QueryInterface method.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22279)	Responds after the last constructor executes.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 22279)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.

	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 11117)	This is Create, a member of class TBaseSelectionEditor.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22280)	Allocates memory for each instance of an interfaced object.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
R	RefCount (see page 22281)	Indicates the number of interface pointers currently dependent upon the object.

60.1.5.2 TBaseSelectionEditor.Create Constructor

Pascal

```
constructor Create(const ADesigner: IDesigner); virtual;
```

C++

```
virtual __fastcall TBaseSelectionEditor(const IDesigner ADesigner);
```

Description

This is Create, a member of class TBaseSelectionEditor.

60.1.6 TClassWrapper Class

Class Hierarchy

Pascal

```
TClassWrapper = class(TInterfacedObject, IClass);
```

C++

```
class TClassWrapper : public TInterfacedObject, public IClass;
```

File

DesignIntf

Description

This is class DesignIntf.TClassWrapper.

60.1.6.1 TClassWrapper Members

The following tables list the members exposed by TClassWrapper.

Protected Data Members

	Name	Description
	FRefCount (see page 22278)	This is FRefCount, a member of class TInterfacedObject.

Protected Methods

	Name	Description
	_AddRef (see page 22278)	Implements the IInterface (see page 22396) System::TInterfacedObject::_AddRef method.
	_Release (see page 22279)	Implements the IInterface (see page 22396) System::TInterfacedObject::_Release method.
	ClassNameIs (see page 11119)	Determines whether an object is of a specific type.
	GetClassName (see page 11120)	This is GetClassName, a member of class TClassWrapper.
	GetClassParent (see page 11120)	This is GetClassParent, a member of class TClassWrapper.
	GetUnitName (see page 11120)	This is GetUnitName, a member of class TClassWrapper.
	QueryInterface (see page 22280)	Implements the IInterface (see page 22396) System::TInterfacedObject::QueryInterface method.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22279)	Responds after the last constructor executes.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 22279)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 11119)	This is Create, a member of class TClassWrapper.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.

	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22280)	Allocates memory for each instance of an interfaced object.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
R	ClassName (see page 11137)	This is ClassName, a member of class IClass.
R	ClassParent (see page 11138)	This is ClassParent, a member of class IClass.
R	RefCount (see page 22281)	Indicates the number of interface pointers currently dependent upon the object.
R	UnitName (see page 11138)	This is UnitName, a member of class IClass.

60.1.6.2 TClassWrapper.Create Constructor

Pascal

```
constructor Create(AClass: TClass);
```

C++

```
__fastcall TClassWrapper(TClass AClass);
```

Description

This is Create, a member of class TClassWrapper.

60.1.6.3 TClassWrapper Methods

The methods of the TClassWrapper class are listed here.

Protected Methods

	Name	Description
	ClassNameIs (see page 11119)	Determines whether an object is of a specific type.
	GetClassName (see page 11120)	This is GetClassName, a member of class TClassWrapper.
	GetClassParent (see page 11120)	This is GetClassParent, a member of class TClassWrapper.
	GetUnitName (see page 11120)	This is GetUnitName, a member of class TClassWrapper.

60.1.6.3.1 TClassWrapper.ClassNameIs Method

Determines whether an object is of a specific type.

Pascal

```
function ClassNameIs(const AClassName: string): Boolean;
```

C++

```
__fastcall Boolean ClassNameIs(const AnsiString AClassName);
```

Description

System::TObject::ClassNameIs determines whether an object instance or class reference has a class name that matches a specified string. This is useful to query objects across modules or shared libraries.

Note: In C++ code, call System::TObject::ClassNameIs as a method to compare an object's class name. Use the global static function to compare the class name from a metaclass object.

See Also

System::TObject::ClassName (see page 22290)

System::TObject::InheritsFrom (see page 22305)

60.1.6.3.2 TClassWrapper.GetClassName Method

Pascal

```
function GetClassName: string;
```

C++

```
__fastcall AnsiString GetClassName();
```

Description

This is GetClassName, a member of class TClassWrapper.

60.1.6.3.3 TClassWrapper.GetClassParent Method

Pascal

```
function GetClassParent: IClass;
```

C++

```
__fastcall IClass GetClassParent();
```

Description

This is GetClassParent, a member of class TClassWrapper.

60.1.6.3.4 TClassWrapper.GetUnitName Method

Pascal

```
function GetUnitName: string;
```

C++

```
__fastcall AnsiString GetUnitName();
```

Description

This is GetUnitName, a member of class TClassWrapper.

60.1.7 TDesignerSelections Class

TDesignerSelections maintains a list of persistent objects.

Class Hierarchy

Pascal

```
TDesignerSelections = class(TInterfacedObject, IDesignerSelections);
```

C++

```
class TDesignerSelections : public TInterfacedObject, public IDesignerSelections;
```

File

DesignIntf

Description

The form designer and its property editors and component editors use TDesignerSelections to manage lists of persistent objects in the IDE. For example, the form designer uses a TDesignerSelections to represent the set of components currently selected in the form designer.

TDesignerSelections implements the IDesignerSelections (see page 11172) interface. TDesignerSelections introduces properties and methods to

Add (see page 11124) objects to the list.

Compare two lists of objects.

Access individual objects in the list.

Note: TDesignerSelections does not allow objects to be rearranged or deleted from the list once they are added. To maintain a list of objects that allows the objects to be rearranged or deleted, use the TList object, or the Objects property of a descendant of TStrings.

See Also

TList (see page 2868)

TStrings (see page 3029)

TPersistent (see page 2928)

IDesignerSelections (see page 11172)

TInterfaceList (see page 2855)

60.1.7.1 TDesignerSelections Members

The following tables list the members exposed by TDesignerSelections.

Protected Data Members

	Name	Description
	FRefCount (see page 22278)	This is FRefCount, a member of class TInterfacedObject.

Protected Methods

	Name	Description
	_AddRef (see page 22278)	Implements the IInterface (see page 22396) System::TInterfacedObject::_AddRef method.
	_Release (see page 22279)	Implements the IInterface (see page 22396) System::TInterfacedObject::_Release method.
	Add (see page 11124)	Adds a new object to the end of the list.
	Equals (see page 11125)	Indicates whether the selections list is identical to another selections list.
	Get (see page 11125)	Returns a specified item from the list.
	GetCount (see page 11125)	Returns the value of the Count (see page 11126) property.
	GetDesignObject (see page 11126)	This is GetDesignObject, a member of class TDesignerSelections.
	QueryInterface (see page 22280)	Implements the IInterface (see page 22396) System::TInterfacedObject::QueryInterface method.

Protected Properties

	Name	Description
R	Count (see page 11126)	Indicates the number of entries in the list.
R	Items (see page 11126)	Provides indexed access to the objects in the list.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22279)	Responds after the last constructor executes.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 22279)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Copy (see page 11123)	Creates an instance of TDesignerSelections (see page 11121) that is a copy of another list.
V	Create (see page 11123)	Creates an instance of TDesignerSelections (see page 11121).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 11124)	Destroys an instance of TDesignerSelections (see page 11121).
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.

	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22280)	Allocates memory for each instance of an interfaced object.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
R	DesignObjects (see page 11175)	This is DesignObjects, a member of class IDesignerSelections.
R	RefCount (see page 22281)	Indicates the number of interface pointers currently dependent upon the object.

60.1.7.2 TDesignerSelections.Copy Constructor

Creates an instance of TDesignerSelections (see page 11121) that is a copy of another list.

Pascal

```
constructor Copy(const Selections: IDesignerSelections);
```

C++

```
__fastcall TDesignerSelections(const IDesignerSelections Selections);
```

Description

Call Copy to create a TDesignerSelections (see page 11121) object that represents the same list of selected objects as those in the Selections parameter.

See Also

Create (see page 11123)

60.1.7.3 TDesignerSelections.Create Constructor

Creates an instance of TDesignerSelections (see page 11121).

Pascal

```
constructor Create; virtual;
```

C++

```
virtual __fastcall TDesignerSelections();
```

Description

Call Create to create an empty component list. After creating the list, use the Add (see page 11124) method (via the IDesignerSelections (see page 11172) interface) to add objects to the list.

See Also

Add (see page 11124)

60.1.7.4 TDesignerSelections.Destroy Destructor

Destroys an instance of TDesignerSelections (see page 11121).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TDesignerSelections();
```

Description

Do not call Destroy directly in an application. Instead, call Free. Free checks that the TDesignerSelections (see page 11121) reference is not nil, and only then calls Destroy.

See Also

Free (see page 22300)

60.1.7.5 TDesignerSelections Methods

The methods of the TDesignerSelections class are listed here.

Protected Methods

	Name	Description
	Add (see page 11124)	Adds a new object to the end of the list.
	Equals (see page 11125)	Indicates whether the selections list is identical to another selections list.
	Get (see page 11125)	Returns a specified item from the list.
	GetCount (see page 11125)	Returns the value of the Count (see page 11126) property.
	GetDesignObject (see page 11126)	This is GetDesignObject, a member of class TDesignerSelections.

60.1.7.5.1 TDesignerSelections.Add Method

Adds a new object to the end of the list.

Pascal

```
function Add(const Item: TPersistent): Integer;
```

C++

```
__fastcall int Add(const TPersistent * Item);
```

Description

Call Add to insert a new object at the end of the Items (see page 11126) array. Add returns the index of the new item, where the first item in the list has an index of 0. Add increases the value of Count (see page 11126) to reflect the addition of a new object.

Note: Add is a protected method. To call this method you must use the IDesignerSelections (see page 11172) interface.

See Also

Count (see page 11126)

Items (see page 11126)

60.1.7.5.2 TDesignerSelections.Equals Method

Indicates whether the selections list is identical to another selections list.

Pascal

```
function Equals(const List: IDesignerSelections): Boolean;
```

C++

```
__fastcall Boolean Equals(const IDesignerSelections List);
```

Description

Call Equals to determine whether the list specified by the List parameter contains exactly the same objects in the same order as this list. Equals returns false if the other list

Contains objects not in the Items (see page 11126) array.

Contains a subset of the objects in the Items (see page 11126) array.

Contains the same objects but in a different order.

See Also

Items (see page 11126)

60.1.7.5.3 TDesignerSelections.Get Method

Returns a specified item from the list.

Pascal

```
function Get(Index: Integer): TPersistent;
```

C++

```
__fastcall TPersistent * Get(int Index);
```

Description

Get is the protected read access method for the Items (see page 11126) property.

Index identifies the desired object by its position in the list, where 0 identifies the first position. Get returns the specified object.

See Also

Items (see page 11126)

60.1.7.5.4 TDesignerSelections.GetCount Method

Returns the value of the Count (see page 11126) property.

Pascal

```
function GetCount: Integer;
```

C++

```
__fastcall int GetCount();
```

Description

GetCount is the protected read access method for the Count (see page 11126) property.

See Also

Count (see page 11126)

60.1.7.5.5 TDesignerSelections.GetDesignObject Method

Pascal

```
function GetDesignObject(Index: Integer): IDesignObject;
```

C++

```
__fastcall IDesignObject GetDesignObject(int Index);
```

Description

This is GetDesignObject, a member of class TDesignerSelections.

60.1.7.6 TDesignerSelections Properties

The properties of the TDesignerSelections class are listed here.

Protected Properties

	Name	Description
R	Count (see page 11126)	Indicates the number of entries in the list.
R	Items (see page 11126)	Provides indexed access to the objects in the list.

60.1.7.6.1 TDesignerSelections.Count Property

Indicates the number of entries in the list.

Pascal

```
property Count: Integer;
```

C++

```
__property int Count;
```

Description

Read Count to determine the number of entries in the Items (see page 11126) array. Use Count as an upper limit when iterating over all the objects in the list.

Count is a read-only property. To increase the number of objects in the list, use the Add (see page 11124) method. Objects can not be removed from the list once they have been added.

Note: Count is a protected property. To access this property you must use the IDesignerSelections (see page 11172) interface.

See Also

Items (see page 11126)

Add (see page 11124)

60.1.7.6.2 TDesignerSelections.Items Property

Provides indexed access to the objects in the list.

Pascal

```
property Items [Index: Integer]: TPersistent;
```

C++

```
__property TPersistent * Items[int Index];
```

Description

Use Items to access a specific object in the array. The Index parameter indicates the index of the object, where 0 is the index of the first object, 1 is the index of the second object, and so on. Use Items with the Count (see page 11126) property to iterate through all of the objects in the list.

To add objects to the Items array, use the Add (see page 11124) method. Once objects have been added, they can't be deleted or rearranged.

Note: Items is a protected property. To access this property you must use the IDesignerSelections (see page 11172) interface.

See Also

Count (see page 11126)

Add (see page 11124)

60.1.8 TDragTarget Class

Class Hierarchy

DesignIntf.TDragTarget

Pascal

```
TDragTarget = class;
```

C++

```
class TDragTarget;
```

File

DesignIntf

Description

This is class DesignIntf.TDragTarget.

60.1.8.1 TDragTarget Members

The following tables list the members exposed by TDragTarget.

Public Methods

	Name	Description
V	Create (see page 11128)	This is Create, a member of class TDragTarget.
A	DragDrop (see page 11128)	This is DragDrop, a member of class TDragTarget.
A	DragOver (see page 11128)	This is DragOver, a member of class TDragTarget.

Public Properties

	Name	Description
	Designer (see page 11129)	This is Designer, a member of class TDragTarget.

60.1.8.2 TDragTarget.Create Constructor

Pascal

```
constructor Create(const ADesigner: IDesigner); virtual;
```

C++

```
virtual __fastcall TDragTarget(const IDesigner ADesigner);
```

Description

This is Create, a member of class TDragTarget.

60.1.8.3 TDragTarget Methods

The methods of the TDragTarget class are listed here.

Public Methods

	Name	Description
	DragDrop (see page 11128)	This is DragDrop, a member of class TDragTarget.
	DragOver (see page 11128)	This is DragOver, a member of class TDragTarget.

60.1.8.3.1 TDragTarget.DragDrop Method

Pascal

```
procedure DragDrop(Target: TObject; Source: TObject; X: Integer; Y: Integer); virtual;
abstract;
```

C++

```
virtual __fastcall DragDrop(TObject * Target, TObject * Source, int X, int Y) = 0;
```

Description

This is DragDrop, a member of class TDragTarget.

60.1.8.3.2 TDragTarget.DragOver Method

Pascal

```
function DragOver(Target: TObject; Source: TObject; X: Integer; Y: Integer; State:
TDragState): Boolean; virtual; abstract;
```

C++

```
virtual __fastcall Boolean DragOver(TObject * Target, TObject * Source, int X, int Y,
TDragState State) = 0;
```

Description

This is DragOver, a member of class TDragTarget.

60.1.8.4 TDragTarget Properties

The properties of the TDragTarget class are listed here.

Public Properties

	Name	Description
	Designer (see page 11129)	This is Designer, a member of class TDragTarget.

60.1.8.4.1 TDragTarget.Designer Property

Pascal

```
property Designer: IDesigner;
```

C++

```
__property IDesigner Designer;
```

Description

This is Designer, a member of class TDragTarget.

60.1.9 TEventInfo Class

Class Hierarchy

Pascal

```
TEventInfo = class(TInterfacedObject, IEventInfo);
```

C++

```
class TEventInfo : public TInterfacedObject, public IEventInfo;
```

File

DesignIntf

Description

This is class DesignIntf.TEventInfo.

60.1.9.1 TEventInfo Members

The following tables list the members exposed by TEventInfo.

Protected Data Members

	Name	Description
	FRefCount (see page 22278)	This is FRefCount, a member of class TInterfacedObject.

Protected Methods

	Name	Description
	_AddRef (see page 22278)	Implements the IInterface (see page 22396) System::TInterfacedObject::_AddRef method.
	_Release (see page 22279)	Implements the IInterface (see page 22396) System::TInterfacedObject::_Release method.
	GetMethodKind (see page 11132)	This is GetMethodKind, a member of class TEventInfo.
	GetParamCount (see page 11132)	This is GetParamCount, a member of class TEventInfo.
	GetParamFlags (see page 11132)	This is GetParamFlags, a member of class TEventInfo.
	GetParamName (see page 11132)	This is GetParamName, a member of class TEventInfo.
	GetParamType (see page 11132)	This is GetParamType, a member of class TEventInfo.
	GetResultType (see page 11133)	This is GetResultType, a member of class TEventInfo.
	QueryInterface (see page 22280)	Implements the IInterface (see page 22396) System::TInterfacedObject::QueryInterface method.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22279)	Responds after the last constructor executes.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 22279)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 11131)	This is the overview for the Create constructor overload.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22280)	Allocates memory for each instance of an interfaced object.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
	RefCount (see page 22281)	Indicates the number of interface pointers currently dependent upon the object.

60.1.9.2 Create Constructor

This is the overview for the Create constructor overload.

Overload List

	Name	Description
	TEventInfo.Create (PPropInfo) (see page 11131)	This is Create, a member of class TEventInfo.
	TEventInfo.Create (PTypeData) (see page 11131)	This is Create, a member of class TEventInfo.

60.1.9.2.1 TEventInfo.Create Constructor (PPropInfo)

Pascal

```
constructor Create(APropInfo: PPropInfo); overload;
```

C++

```
__fastcall TEventInfo(PPropInfo APropInfo);
```

Description

This is Create, a member of class TEventInfo.

60.1.9.2.2 TEventInfo.Create Constructor (PTypeData)

Pascal

```
constructor Create(ATypeData: PTypeData); overload;
```

C++

```
__fastcall TEventInfo(PTypeData ATypeData);
```

Description

This is Create, a member of class TEventInfo.

60.1.9.3 TEventInfo Methods

The methods of the TEventInfo class are listed here.

Protected Methods

	Name	Description
	GetMethodKind (see page 11132)	This is GetMethodKind, a member of class TEventInfo.
	GetParamCount (see page 11132)	This is GetParamCount, a member of class TEventInfo.
	GetParamFlags (see page 11132)	This is GetParamFlags, a member of class TEventInfo.
	GetParamName (see page 11132)	This is GetParamName, a member of class TEventInfo.
	GetParamType (see page 11132)	This is GetParamType, a member of class TEventInfo.

	GetResultType (see page 11133)	This is GetResultType, a member of class TEventInfo.

60.1.9.3.1 TEventInfo.GetMethodKind Method

Pascal

```
function GetMethodKind: TMethodKind;
```

C++

```
__fastcall TMethodKind GetMethodKind();
```

Description

This is GetMethodKind, a member of class TEventInfo.

60.1.9.3.2 TEventInfo.GetParamCount Method

Pascal

```
function GetParamCount: Integer;
```

C++

```
__fastcall int GetParamCount();
```

Description

This is GetParamCount, a member of class TEventInfo.

60.1.9.3.3 TEventInfo.GetParamFlags Method

Pascal

```
function GetParamFlags(Index: Integer): TParamFlags;
```

C++

```
__fastcall TParamFlags GetParamFlags(int Index);
```

Description

This is GetParamFlags, a member of class TEventInfo.

60.1.9.3.4 TEventInfo.GetParamName Method

Pascal

```
function GetParamName(Index: Integer): string;
```

C++

```
__fastcall AnsiString GetParamName(int Index);
```

Description

This is GetParamName, a member of class TEventInfo.

60.1.9.3.5 TEventInfo.GetParamType Method

Pascal

```
function GetParamType(Index: Integer): string;
```

C++

```
__fastcall AnsiString GetParamType(int Index);
```

Description

This is GetParamType, a member of class TEventInfo.

60.1.9.3.6 TEventInfo.GetResultType Method

Pascal

```
function GetResultType: string;
```

C++

```
__fastcall AnsiString GetResultType();
```

Description

This is GetResultType, a member of class TEventInfo.

60.2 Interfaces

The following table lists interfaces in this documentation.

Interfaces

	Name	Description
	IActivatable (see page 11134)	This is class DesignIntf.IActivatable.
	IClass (see page 11135)	This is class DesignIntf.IClass.
	IComponentEditor (see page 11138)	IComponentEditor is the interface that the form designer uses to communicate with component editors.
	IComponentGuidelines (see page 11143)	This is class DesignIntf.IComponentGuidelines.
	ICustomModule (see page 11145)	This is class DesignIntf.ICustomModule.
	IDefaultEditor (see page 11148)	This is class DesignIntf.IDefaultEditor.
	IDesigner (see page 11149)	IDesigner is an interface to the form designer in the IDE.
	IDesigner60 (see page 11151)	This is class DesignIntf.IDesigner60.
	IDesigner70 (see page 11167)	This is class DesignIntf.IDesigner70.
	IDesigner80 (see page 11169)	This is class DesignIntf.IDesigner80.
	IDesignerSelections (see page 11172)	IDesignerSelections represents a list of persistent objects.
	IDesignNotification (see page 11176)	This is class DesignIntf.IDesignNotification.
	IDesignObject (see page 11178)	This is class DesignIntf.IDesignObject.
	IDesignPersistent (see page 11183)	This is class DesignIntf.IDesignPersistent.
	IDesignWindow (see page 11184)	This is class DesignIntf.IDesignWindow.
	IEditHandler (see page 11186)	This is class DesignIntf.IEditHandler.
	IEventInfo (see page 11187)	This is class DesignIntf.IEventInfo.
	IHostForm (see page 11189)	This is class DesignIntf.IHostForm.
	IImplementation (see page 11196)	This is class DesignIntf.IImplementation.
	IMethodProperty (see page 11197)	This is class DesignIntf.IMethodProperty.
	IProperty (see page 11197)	IProperty is the interface that the Object Inspector uses to communicate with property editors.
	IProperty70 (see page 11205)	This is class DesignIntf.IProperty70.
	IProperty80 (see page 11207)	This is class DesignIntf.IProperty80.
	IPropertyControl (see page 11208)	This is class DesignIntf.IPropertyControl.
	IPropertyDescription (see page 11209)	This is class DesignIntf.IPropertyDescription.
	IPropertyHost (see page 11210)	This is class DesignIntf.IPropertyHost.
	IPropertyKind (see page 11211)	This is class DesignIntf.IPropertyKind.
	IReferenceProperty (see page 11212)	This is class DesignIntf.IReferenceProperty.
	ISelectionEditor (see page 11213)	This is class DesignIntf.ISelectionEditor.
	ISelectionEditorList (see page 11215)	This is class DesignIntf.ISelectionEditorList.
	ISelectionPropertyFilter (see page 11217)	This is class DesignIntf.ISelectionPropertyFilter.
	IShowReferenceProperty (see page 11218)	This is class DesignIntf.IShowReferenceProperty.
	IWideProperty (see page 11219)	This is class DesignIntf.IWideProperty.
	IWideProperty10 (see page 11221)	This is class DesignIntf.IWideProperty10.
	IWidePropertyDescription (see page 11222)	This is class DesignIntf.IWidePropertyDescription.

60.2.1 IActivatable Interface

Class Hierarchy

DesignIntf.IActivatable

Pascal

```
IActivatable = interface;
```

C++

```
__interface IActivatable;
```

File

DesignIntf

Description

This is class DesignIntf.IActivatable.

60.2.1.1 IActivatable Members

The following tables list the members exposed by IActivatable.

Public Methods

	Name	Description
	Activate (see page 11135)	This is Activate, a member of class IActivatable.

60.2.1.2 IActivatable Methods

The methods of the IActivatable class are listed here.

Public Methods

	Name	Description
	Activate (see page 11135)	This is Activate, a member of class IActivatable.

60.2.1.2.1 IActivatable.Activate Method

Pascal

```
procedure Activate;
```

C++

```
__fastcall Activate();
```

Description

This is Activate, a member of class IActivatable.

60.2.2 IClass Interface

Class Hierarchy

DesignIntf.IClass

Pascal

```
IClass = interface;
```

C++

```
__interface IClass;
```

File

DesignIntf

Description

This is class DesignIntf.IClass.

60.2.2.1 IClass Members

The following tables list the members exposed by IClass.

Public Methods

	Name	Description
	ClassNameIs (see page 11136)	This is ClassNameIs, a member of class IClass.
	GetClassName (see page 11137)	This is GetClassName, a member of class IClass.
	GetClassParent (see page 11137)	This is GetClassParent, a member of class IClass.
	GetUnitName (see page 11137)	This is GetUnitName, a member of class IClass.

Public Properties

	Name	Description
R	ClassName (see page 11137)	This is ClassName, a member of class IClass.
R	ClassParent (see page 11138)	This is ClassParent, a member of class IClass.
R	UnitName (see page 11138)	This is UnitName, a member of class IClass.

60.2.2.2 IClass Methods

The methods of the IClass class are listed here.

Public Methods

	Name	Description
	ClassNameIs (see page 11136)	This is ClassNameIs, a member of class IClass.
	GetClassName (see page 11137)	This is GetClassName, a member of class IClass.
	GetClassParent (see page 11137)	This is GetClassParent, a member of class IClass.
	GetUnitName (see page 11137)	This is GetUnitName, a member of class IClass.

60.2.2.2.1 IClass.ClassNameIs Method

Pascal

```
function ClassNameIs(const AClassName: string): Boolean;
```

C++

```
__fastcall Boolean ClassNameIs(const AnsiString AClassName);
```

Description

This is ClassNameIs, a member of class IClass.

60.2.2.2.2 IClass.GetClassName Method

Pascal

```
function GetClassName: string;
```

C++

```
__fastcall AnsiString GetClassName();
```

Description

This is GetClassName, a member of class IClass.

60.2.2.2.3 IClass.GetClassParent Method

Pascal

```
function GetClassParent: IClass;
```

C++

```
__fastcall IClass GetClassParent();
```

Description

This is GetClassParent, a member of class IClass.

60.2.2.2.4 IClass.GetUnitName Method

Pascal

```
function GetUnitName: string;
```

C++

```
__fastcall AnsiString GetUnitName();
```

Description

This is GetUnitName, a member of class IClass.

60.2.2.3 IClass Properties

The properties of the IClass class are listed here.

Public Properties

	Name	Description
R	ClassName (see page 11137)	This is ClassName, a member of class IClass.
R	ClassParent (see page 11138)	This is ClassParent, a member of class IClass.
R	UnitName (see page 11138)	This is UnitName, a member of class IClass.

60.2.2.3.1 IClass.ClassName Property

Pascal

```
property ClassName: string;
```

C++

```
__property AnsiString ClassName;
```

Description

This is ClassName, a member of class IClass.

60.2.2.3.2 IClass.ClassParent Property

Pascal

```
property ClassParent: IClass;
```

C++

```
__property IClass ClassParent;
```

Description

This is ClassParent, a member of class IClass.

60.2.2.3.3 IClass.UnitName Property

Pascal

```
property UnitName: string;
```

C++

```
__property AnsiString UnitName;
```

Description

This is UnitName, a member of class IClass.

60.2.3 IComponentEditor Interface

IComponentEditor is the interface that the form designer uses to communicate with component editors.

Class Hierarchy

Pascal

```
IComponentEditor = interface;
```

C++

```
__interface IComponentEditor;
```

File

DesignIntf

Description

When you create your own component editors, they must meet two criteria:

They must be descendants of TBaseComponentEditor (see page 11105).

They must implement the IComponentEditor interface.

The forms designer uses the methods on the IComponentEditor interface to interact with component editors.

Typically, component editors are derived from TComponentEditor, which supplies a default implementation for

IComponentEditor, or TDefaultEditor, which also supplies a default implementation of the edit method to bring up an event handler in the edit window.

Note: C++ method declarations that use IComponentEditor use the _di_IComponentEditor type instead. This type is a DelphiInterface wrapper around the IComponentEditor interface:

```
typedef System::DelphiInterfaceDelphiInterface_object< IComponentEditor >
_di_IComponentEditor;
```

See Also

TDefaultEditor (see page 10967)

TBaseComponentEditor (see page 11105)

TComponentEditor (see page 10927)

60.2.3.1 IComponentEditor Members

The following tables list the members exposed by IComponentEditor.

Public Methods

	Name	Description
	Copy (see page 11140)	Provides an opportunity to copy the component to the clipboard in custom formats.
	Edit (see page 11140)	Responds when the user double-clicks the component in the form designer.
	ExecuteVerb (see page 11140)	This is ExecuteVerb, a member of class IComponentEditor.
	GetComponent (see page 11141)	Returns a reference to the component on which the editor operates.
	GetDesigner (see page 11141)	Returns the interface for the form designer.
	GetVerb (see page 11141)	Returns the string that corresponds to a specified position of the component's context menu.
	GetVerbCount (see page 11142)	Returns the number of menu strings that the component editor adds to the context menu.
	IsInInlined (see page 11142)	Indicates whether the component has the csInline flag set in its ComponentState property.
	PrepareItem (see page 11142)	Allows the component editor to modify menu items as they are added to the context menu.

60.2.3.2 IComponentEditor Methods

The methods of the IComponentEditor class are listed here.

Public Methods

	Name	Description
	Copy (see page 11140)	Provides an opportunity to copy the component to the clipboard in custom formats.
	Edit (see page 11140)	Responds when the user double-clicks the component in the form designer.
	ExecuteVerb (see page 11140)	This is ExecuteVerb, a member of class IComponentEditor.
	GetComponent (see page 11141)	Returns a reference to the component on which the editor operates.
	GetDesigner (see page 11141)	Returns the interface for the form designer.
	GetVerb (see page 11141)	Returns the string that corresponds to a specified position of the component's context menu.
	GetVerbCount (see page 11142)	Returns the number of menu strings that the component editor adds to the context menu.
	IsInInlined (see page 11142)	Indicates whether the component has the csInline flag set in its ComponentState property.

	PrepareItem (see page 11142)	Allows the component editor to modify menu items as they are added to the context menu.

60.2.3.2.1 IComponentEditor.Copy Method

Provides an opportunity to copy the component to the clipboard in custom formats.

Pascal

```
procedure Copy;
```

C++

```
__fastcall Copy();
```

Description

The forms designer calls Copy when the user tries to copy the component to the clipboard. When Copy is called, the component's filed image is already on the Clipboard.

Implement Copy to copy a different clipboard format, which is ignored by the designer but might be recognized by another application.

See Also

Assign (see page 3331)

SetAsHandleTClipboard_SetFormat

AsText (see page 3347)

TClipboard (see page 3328)

60.2.3.2.2 IComponentEditor.Edit Method

Responds when the user double-clicks the component in the form designer.

Pascal

```
procedure Edit;
```

C++

```
__fastcall Edit();
```

Description

The form designer calls Edit when the user double-clicks the component.

Implement the Edit method to provide a response when the user double-clicks the component. For example, the Edit method can bring up a dialog or design expert.

See Also

GetVerbCount (see page 11142)

executeverb (see page 11140)

60.2.3.2.3 IComponentEditor.ExecuteVerb Method

Pascal

```
procedure ExecuteVerb(Index: Integer);
```

C++

```
__fastcall ExecuteVerb(int Index);
```

Description

This is ExecuteVerb, a member of class IComponentEditor.

60.2.3.2.4 IComponentEditor.GetComponent Method

Returns a reference to the component on which the editor operates.

Pascal

```
function GetComponent: TComponent;
```

C++

```
__fastcall TComponent * GetComponent();
```

Description

A component editor is created for each instance of the registered component class when it is selected in the form designer. GetComponent returns the selected instance. This component is associated with a component editor through its constructor.

See Also

Create (see page 11107)

60.2.3.2.5 IComponentEditor.GetDesigner Method

Returns the interface for the form designer.

Pascal

```
function GetDesigner: IDesigner;
```

C++

```
__fastcall IDesigner GetDesigner();
```

Description

GetDesigner returns the interface of the form designer. This interface is supplied to a component editor as a parameter to the constructor.

See Also

Create (see page 11107)

60.2.3.2.6 IComponentEditor.GetVerb Method

Returns the string that corresponds to a specified position of the component's context menu.

Pascal

```
function GetVerb(Index: Integer): string;
```

C++

```
__fastcall AnsiString GetVerb(int Index);
```

Description

The form designer calls GetVerb iteratively to build the context menu that appears when the user right-clicks the component.

When implementing GetVerb, add an ampersand (&) to a verb to cause the following character to appear underlined in the

context menu and to act as a shortcut key for selecting the menu item. Be sure to add ellipsis (...) to the end of a verb if its corresponding action is to bring up a dialog.

See Also

executeverb (see page 11140)

GetVerbCount (see page 11142)

60.2.3.2.7 IComponentEditor.GetVerbCount Method

Returns the number of menu strings that the component editor adds to the context menu.

Pascal

```
function GetVerbCount: Integer;
```

C++

```
__fastcall int GetVerbCount();
```

Description

The form designer calls GetVerbCount when the user right-clicks the component in order to determine the number of menu items that should be added to the context menu. It then adds the menu items by calling GetVerb (see page 11141) for every value from 0 to GetVerbCount - 1.

See Also

GetVerb (see page 11141)

executeverb (see page 11140)

60.2.3.2.8 IComponentEditor.IsInInlined Method

Indicates whether the component has the csInline flag set in its ComponentState property.

Pascal

```
function IsInInlined: Boolean;
```

C++

```
__fastcall Boolean IsInInlined();
```

Description

IsInInlined indicates whether the component being edited is inside a top-level component that can be modified at design time and also embedded in a form.

For instance, when a component is used on a Frame and that Frame is dropped on a Form, IsInInlined returns true for the component when it is embedded in the Frame on the Form, but returns false when the component that is only on the Frame.

See Also

ComponentState (see page 2804)

60.2.3.2.9 IComponentEditor.PrepareItem Method

Allows the component editor to modify menu items as they are added to the context menu.

Pascal

```
procedure PrepareItem(Index: Integer; const AItem: IMenuItem);
```

C++

```
__fastcall PrepareItem(int Index, const IMenuItem AItem);
```

Description

The form designer calls PrepareItem for each verb when it constructs the context menu. This method lets the component editor make any modifications to the menu item for each verb, including adding subitems or removing the item from the context menu.

Index identifies the current verb that the form designer is adding to the context menu. This is the same index as appears for the command in the GetVerb (see page 11141) and ExecuteVerb (see page 11140) methods.

AItem is an interface to the menu item created by the form designer for the current verb. To add subitems, call the AddItem method of this interface. To disable the item, set the Enabled property to false. To suppress the menu item altogether, set its Visible property to false.

60.2.4 IComponentGuidelines Interface

Class Hierarchy

DesignIntf.IComponentGuidelines

Pascal

```
IComponentGuidelines = interface;
```

C++

```
__interface IComponentGuidelines;
```

File

DesignIntf

Description

This is class DesignIntf.IComponentGuidelines.

60.2.4.1 IComponentGuidelines Members

The following tables list the members exposed by IComponentGuidelines.

Public Methods

	Name	Description
	GetCount (see page 11144)	This is GetCount, a member of class IComponentGuidelines.
	GetDesignerGuideOffset (see page 11144)	This is GetDesignerGuideOffset, a member of class IComponentGuidelines.
	GetDesignerGuideType (see page 11144)	This is GetDesignerGuideType, a member of class IComponentGuidelines.

Public Properties

	Name	Description
R	Count (see page 11145)	This is Count, a member of class IComponentGuidelines.

	DesignerGuideOffsets (see page 11145)	This is DesignerGuideOffsets, a member of class IComponentGuidelines.
	DesignerGuideTypes (see page 11145)	This is DesignerGuideTypes, a member of class IComponentGuidelines.

60.2.4.2 IComponentGuidelines Methods

The methods of the IComponentGuidelines class are listed here.

Public Methods

	Name	Description
	GetCount (see page 11144)	This is GetCount, a member of class IComponentGuidelines.
	GetDesignerGuideOffset (see page 11144)	This is GetDesignerGuideOffset, a member of class IComponentGuidelines.
	GetDesignerGuideType (see page 11144)	This is GetDesignerGuideType, a member of class IComponentGuidelines.

60.2.4.2.1 IComponentGuidelines.GetCount Method

Pascal

```
function GetCount: Integer;
```

C++

```
__fastcall int GetCount();
```

Description

This is GetCount, a member of class IComponentGuidelines.

60.2.4.2.2 IComponentGuidelines.GetDesignerGuideOffset Method

Pascal

```
function GetDesignerGuideOffset(Index: Integer): Integer;
```

C++

```
__fastcall int GetDesignerGuideOffset(int Index);
```

Description

This is GetDesignerGuideOffset, a member of class IComponentGuidelines.

60.2.4.2.3 IComponentGuidelines.GetDesignerGuideType Method

Pascal

```
function GetDesignerGuideType(Index: Integer): TDesignerGuideType;
```

C++

```
__fastcall TDesignerGuideType GetDesignerGuideType(int Index);
```

Description

This is GetDesignerGuideType, a member of class IComponentGuidelines.

60.2.4.3 IComponentGuidelines Properties

The properties of the IComponentGuidelines class are listed here.

Public Properties

	Name	Description
R	Count (see page 11145)	This is Count, a member of class IComponentGuidelines.
R	DesignerGuideOffsets (see page 11145)	This is DesignerGuideOffsets, a member of class IComponentGuidelines.
R	DesignerGuideTypes (see page 11145)	This is DesignerGuideTypes, a member of class IComponentGuidelines.

60.2.4.3.1 IComponentGuidelines.Count Property

Pascal

```
property Count: Integer;
```

C++

```
__property int Count;
```

Description

This is Count, a member of class IComponentGuidelines.

60.2.4.3.2 IComponentGuidelines.DesignerGuideOffsets Property

Pascal

```
property DesignerGuideOffsets [Index: Integer]: Integer;
```

C++

```
__property int DesignerGuideOffsets[int Index];
```

Description

This is DesignerGuideOffsets, a member of class IComponentGuidelines.

60.2.4.3.3 IComponentGuidelines.DesignerGuideTypes Property

Pascal

```
property DesignerGuideTypes [Index: Integer]: TDesignerGuideType;
```

C++

```
__property TDesignerGuideType DesignerGuideTypes[int Index];
```

Description

This is DesignerGuideTypes, a member of class IComponentGuidelines.

60.2.5 ICustomModule Interface

Class Hierarchy

DesignIntf.ICustomModule

Pascal

```
ICustomModule = interface;
```

C++

```
__interface ICustomModule;
```

File

DesignIntf

Description

This is class DesignIntf.ICustomModule.

60.2.5.1 ICustomModule Members

The following tables list the members exposed by ICustomModule.

Public Methods

	Name	Description
	ExecuteVerb (see page 11146)	This is ExecuteVerb, a member of class ICustomModule.
	GetAttributes (see page 11147)	This is GetAttributes, a member of class ICustomModule.
	GetVerb (see page 11147)	This is GetVerb, a member of class ICustomModule.
	GetVerbCount (see page 11147)	This is GetVerbCount, a member of class ICustomModule.
	Nestable (see page 11147)	This is Nestable, a member of class ICustomModule.
	PrepareItem (see page 11147)	This is PrepareItem, a member of class ICustomModule.
	Saving (see page 11148)	This is Saving, a member of class ICustomModule.
	ValidateComponent (see page 11148)	This is ValidateComponent, a member of class ICustomModule.
	ValidateComponentClass (see page 11148)	This is ValidateComponentClass, a member of class ICustomModule.

60.2.5.2 ICustomModule Methods

The methods of the ICustomModule class are listed here.

Public Methods

	Name	Description
	ExecuteVerb (see page 11146)	This is ExecuteVerb, a member of class ICustomModule.
	GetAttributes (see page 11147)	This is GetAttributes, a member of class ICustomModule.
	GetVerb (see page 11147)	This is GetVerb, a member of class ICustomModule.
	GetVerbCount (see page 11147)	This is GetVerbCount, a member of class ICustomModule.
	Nestable (see page 11147)	This is Nestable, a member of class ICustomModule.
	PrepareItem (see page 11147)	This is PrepareItem, a member of class ICustomModule.
	Saving (see page 11148)	This is Saving, a member of class ICustomModule.
	ValidateComponent (see page 11148)	This is ValidateComponent, a member of class ICustomModule.
	ValidateComponentClass (see page 11148)	This is ValidateComponentClass, a member of class ICustomModule.

60.2.5.2.1 ICustomModule.ExecuteVerb Method

Pascal

```
procedure ExecuteVerb(Index: Integer);
```

C++

```
__fastcall ExecuteVerb(int Index);
```

Description

This is ExecuteVerb, a member of class ICustomModule.

60.2.5.2.2 ICustomModule.GetAttributes Method

Pascal

```
function GetAttributes: TCustomModuleAttributes;
```

C++

```
__fastcall TCustomModuleAttributes GetAttributes();
```

Description

This is GetAttributes, a member of class ICustomModule.

60.2.5.2.3 ICustomModule.GetVerb Method

Pascal

```
function GetVerb(Index: Integer): string;
```

C++

```
__fastcall AnsiString GetVerb(int Index);
```

Description

This is GetVerb, a member of class ICustomModule.

60.2.5.2.4 ICustomModule.GetVerbCount Method

Pascal

```
function GetVerbCount: Integer;
```

C++

```
__fastcall int GetVerbCount();
```

Description

This is GetVerbCount, a member of class ICustomModule.

60.2.5.2.5 ICustomModule.Nestable Method

Pascal

```
function Nestable: Boolean;
```

C++

```
__fastcall Boolean Nestable();
```

Description

This is Nestable, a member of class ICustomModule.

60.2.5.2.6 ICustomModule.PrepareItem Method

Pascal

```
procedure PrepareItem(Index: Integer; const AItem: IMenuItem);
```

C++

```
__fastcall PrepareItem(int Index, const IMenuItem AItem);
```

Description

This is PrepareItem, a member of class ICustomModule.

60.2.5.2.7 ICustomModule.Saving Method

Pascal

```
procedure Saving;
```

C++

```
__fastcall Saving();
```

Description

This is Saving, a member of class ICustomModule.

60.2.5.2.8 ICustomModule.ValidateComponent Method

Pascal

```
procedure ValidateComponent(Component: TComponent);
```

C++

```
__fastcall ValidateComponent(TComponent * Component);
```

Description

This is ValidateComponent, a member of class ICustomModule.

60.2.5.2.9 ICustomModule.ValidateComponentClass Method

Pascal

```
function ValidateComponentClass(ComponentClass: TComponentClass): Boolean;
```

C++

```
__fastcall Boolean ValidateComponentClass(TComponentClass ComponentClass);
```

Description

This is ValidateComponentClass, a member of class ICustomModule.

60.2.6 IDefaultEditor Interface

Class Hierarchy

Pascal

```
IDefaultEditor = interface(IComponentEditor);
```

C++

```
__interface IDefaultEditor : public IComponentEditor;
```

File

DesignIntf

Description

This is class DesignIntf.IDefaultEditor.

60.2.7 IDesigner Interface

IDesigner is an interface to the form designer in the IDE.

Class Hierarchy

Pascal

```
IDesigner = interface(IDesigner80);
```

C++

```
__interface IDesigner : public IDesigner80;
```

File

DesignIntf

Description

Use IDesigner to interact with the current unit when implementing a property editor or component editor. Access IDesigner through the Designer property of the property editor or component editor. IDesigner introduces several methods that are useful for managing standard menu items and for creating and manipulating components and methods such as event handlers.

Note: C++ method declarations that use IDesigner use the _di_IDesigner type instead. This is a DelphiInterface wrapper around the IDesigner interface:

```
typedef System::DelphiInterfaceDelphiInterface_object< IDesigner > _di_IDesigner;
```

See Also

TComponentEditor (see page 10927)

TPropertyEditor (see page 11019)

60.2.7.1 IDesigner Members

The following tables list the members exposed by IDesigner.

Public Methods

	Name	Description
	Activate (see page 11154)	This is Activate, a member of class IDesigner60.
	CanPaste (see page 11154)	This is CanPaste, a member of class IDesigner60.
	ChainCall (see page 11154)	This is the overview for the ChainCall method overload.
	ClearSelection (see page 11155)	This is ClearSelection, a member of class IDesigner60.
	CopySelection (see page 11155)	This is CopySelection, a member of class IDesigner60.
	CreateComponent (see page 11156)	This is CreateComponent, a member of class IDesigner60.
	CreateCurrentComponent (see page 11156)	This is CreateCurrentComponent, a member of class IDesigner60.
	CreateMethod (see page 11156)	This is CreateMethod, a member of class IDesigner60.
	CreateMethod (see page 11171)	This is CreateMethod, a member of class IDesigner80.

	CutSelection (see page 11156)	This is CutSelection, a member of class IDesigner60.
	DeleteSelection (see page 11157)	This is DeleteSelection, a member of class IDesigner60.
	Edit (see page 11157)	This is Edit, a member of class IDesigner60.
	FindRootAncestor (see page 11168)	This is FindRootAncestor, a member of class IDesigner70.
	GetActiveClassGroup (see page 11169)	This is GetActiveClassGroup, a member of class IDesigner70.
	GetAncestorDesigner (see page 11157)	This is GetAncestorDesigner, a member of class IDesigner60.
	GetBaseRegKey (see page 11157)	This is GetBaseRegKey, a member of class IDesigner60.
	GetComponent (see page 11157)	This is GetComponent, a member of class IDesigner60.
	GetComponentName (see page 11158)	This is GetComponentName, a member of class IDesigner60.
	GetComponentNames (see page 11158)	This is GetComponentNames, a member of class IDesigner60.
	GetDesignerExtension (see page 11151)	This is GetDesignerExtension, a member of class IDesigner.
	GetIDEOptions (see page 11158)	This is GetIDEOptions, a member of class IDesigner60.
	GetIsDormant (see page 11158)	This is GetIsDormant, a member of class IDesigner60.
	GetMethodName (see page 11159)	This is GetMethodName, a member of class IDesigner60.
	GetMethods (see page 11159)	This is GetMethods, a member of class IDesigner60.
	GetMethods (see page 11171)	This is GetMethods, a member of class IDesigner80.
	GetObject (see page 11159)	This is GetObject, a member of class IDesigner60.
	GetObjectName (see page 11159)	This is GetObjectName, a member of class IDesigner60.
	GetObjectNames (see page 11159)	This is GetObjectNames, a member of class IDesigner60.
	GetPathAndBaseExeName (see page 11160)	This is GetPathAndBaseExeName, a member of class IDesigner60.
	GetPrivateDirectory (see page 11160)	This is GetPrivateDirectory, a member of class IDesigner60.
	GetProjectModules (see page 11160)	This is GetProjectModules, a member of class IDesigner60.
	GetRoot (see page 11160)	This is GetRoot, a member of class IDesigner60.
	GetRootClassName (see page 11161)	This is GetRootClassName, a member of class IDesigner60.
	GetScrollRanges (see page 11161)	This is GetScrollRanges, a member of class IDesigner60.
	GetSelections (see page 11161)	This is GetSelections, a member of class IDesigner60.
	GetShiftState (see page 11161)	This is GetShiftState, a member of class IDesigner60.
	IsComponentHidden (see page 11161)	This is IsComponentHidden, a member of class IDesigner60.
	IsComponentLinkable (see page 11162)	This is IsComponentLinkable, a member of class IDesigner60.
	IsSourceReadOnly (see page 11162)	This is IsSourceReadOnly, a member of class IDesigner60.
	MakeComponentLinkable (see page 11162)	This is MakeComponentLinkable, a member of class IDesigner60.
	MethodExists (see page 11162)	This is MethodExists, a member of class IDesigner60.
	MethodFromAncestor (see page 11163)	This is MethodFromAncestor, a member of class IDesigner60.
	ModalEdit (see page 11163)	This is ModalEdit, a member of class IDesigner60.
	Modified (see page 11163)	This is Modified, a member of class IDesigner60.
	ModuleFileNames (see page 11163)	This is ModuleFileNames, a member of class IDesigner60.
	NoSelection (see page 11163)	This is NoSelection, a member of class IDesigner60.
	PasteSelection (see page 11164)	This is PasteSelection, a member of class IDesigner60.
	RenameMethod (see page 11164)	This is RenameMethod, a member of class IDesigner60.
	Resurrect (see page 11164)	This is Resurrect, a member of class IDesigner60.
	Revert (see page 11164)	This is Revert, a member of class IDesigner60.
	SelectComponent (see page 11165)	This is SelectComponent, a member of class IDesigner60.
	SelectComponent (see page 11171)	This is SelectComponent, a member of class IDesigner80.
	SelectItemName (see page 11165)	This is SelectItemName, a member of class IDesigner60.
	SetSelections (see page 11165)	This is SetSelections, a member of class IDesigner60.
	ShowMethod (see page 11165)	This is ShowMethod, a member of class IDesigner60.
	UniqueName (see page 11165)	This is UniqueName, a member of class IDesigner60.

Public Properties

	Name	Description
R	ActiveClassGroup (see page 11169)	This is ActiveClassGroup, a member of class IDesigner70.
R	AncestorDesigner (see page 11166)	This is AncestorDesigner, a member of class IDesigner60.
R	DesignerExtention (see page 11151)	This is DesignerExtention, a member of class IDesigner.
R	IsDormant (see page 11166)	This is IsDormant, a member of class IDesigner60.

	Root (see page 11166)	This is Root, a member of class IDesigner60.

60.2.7.2 IDesigner Methods

The methods of the IDesigner class are listed here.

Public Methods

	Name	Description
	GetDesignerExtension (see page 11151)	This is GetDesignerExtension, a member of class IDesigner.

60.2.7.2.1 IDesigner.GetDesignerExtension Method

Pascal

```
function GetDesignerExtension: string;
```

C++

```
__fastcall AnsiString GetDesignerExtension();
```

Description

This is GetDesignerExtension, a member of class IDesigner.

60.2.7.3 IDesigner Properties

The properties of the IDesigner class are listed here.

Public Properties

	Name	Description
	DesignerExtention (see page 11151)	This is DesignerExtention, a member of class IDesigner.

60.2.7.3.1 IDesigner.DesignerExtention Property

Pascal

```
property DesignerExtention: string;
```

C++

```
__property AnsiString DesignerExtention;
```

Description

This is DesignerExtention, a member of class IDesigner.

60.2.8 IDesigner60 Interface

Class Hierarchy

DesignIntf.IDesigner60

Pascal

```
IDesigner60 = interface;
```

C++

```
__interface IDesigner60;
```

File

DesignIntf

Description

This is class DesignIntf.IDesigner60.

60.2.8.1 IDesigner60 Members

The following tables list the members exposed by IDesigner60.

Public Methods

	Name	Description
	Activate (see page 11154)	This is Activate, a member of class IDesigner60.
	CanPaste (see page 11154)	This is CanPaste, a member of class IDesigner60.
	ChainCall (see page 11154)	This is the overview for the ChainCall method overload.
	ClearSelection (see page 11155)	This is ClearSelection, a member of class IDesigner60.
	CopySelection (see page 11155)	This is CopySelection, a member of class IDesigner60.
	CreateComponent (see page 11156)	This is CreateComponent, a member of class IDesigner60.
	CreateCurrentComponent (see page 11156)	This is CreateCurrentComponent, a member of class IDesigner60.
	CreateMethod (see page 11156)	This is CreateMethod, a member of class IDesigner60.
	CutSelection (see page 11156)	This is CutSelection, a member of class IDesigner60.
	DeleteSelection (see page 11157)	This is DeleteSelection, a member of class IDesigner60.
	Edit (see page 11157)	This is Edit, a member of class IDesigner60.
	GetAncestorDesigner (see page 11157)	This is GetAncestorDesigner, a member of class IDesigner60.
	GetBaseRegKey (see page 11157)	This is GetBaseRegKey, a member of class IDesigner60.
	GetComponent (see page 11157)	This is GetComponent, a member of class IDesigner60.
	GetComponentName (see page 11158)	This is GetComponentName, a member of class IDesigner60.
	GetComponentNames (see page 11158)	This is GetComponentNames, a member of class IDesigner60.
	GetIDEOptions (see page 11158)	This is GetIDEOptions, a member of class IDesigner60.
	GetIsDormant (see page 11158)	This is GetIsDormant, a member of class IDesigner60.
	GetMethodName (see page 11159)	This is GetMethodName, a member of class IDesigner60.
	GetMethods (see page 11159)	This is GetMethods, a member of class IDesigner60.
	GetObject (see page 11159)	This is GetObject, a member of class IDesigner60.
	GetObjectName (see page 11159)	This is GetObjectName, a member of class IDesigner60.
	GetObjectNames (see page 11159)	This is GetObjectNames, a member of class IDesigner60.
	GetPathAndBaseExeName (see page 11160)	This is GetPathAndBaseExeName, a member of class IDesigner60.
	GetPrivateDirectory (see page 11160)	This is GetPrivateDirectory, a member of class IDesigner60.
	GetProjectModules (see page 11160)	This is GetProjectModules, a member of class IDesigner60.
	GetRoot (see page 11160)	This is GetRoot, a member of class IDesigner60.
	GetRootClassName (see page 11161)	This is GetRootClassName, a member of class IDesigner60.
	GetScrollRanges (see page 11161)	This is GetScrollRanges, a member of class IDesigner60.
	GetSelections (see page 11161)	This is GetSelections, a member of class IDesigner60.
	GetShiftState (see page 11161)	This is GetShiftState, a member of class IDesigner60.
	IsComponentHidden (see page 11161)	This is IsComponentHidden, a member of class IDesigner60.
	IsComponentLinkable (see page 11162)	This is IsComponentLinkable, a member of class IDesigner60.
	IsSourceReadOnly (see page 11162)	This is IsSourceReadOnly, a member of class IDesigner60.
	MakeComponentLinkable (see page 11162)	This is MakeComponentLinkable, a member of class IDesigner60.
	MethodExists (see page 11162)	This is MethodExists, a member of class IDesigner60.
	MethodFromAncestor (see page 11163)	This is MethodFromAncestor, a member of class IDesigner60.
	ModalEdit (see page 11163)	This is ModalEdit, a member of class IDesigner60.

	Modified (see page 11163)	This is Modified, a member of class IDesigner60.
	ModuleFileNames (see page 11163)	This is ModuleFileNames, a member of class IDesigner60.
	NoSelection (see page 11163)	This is NoSelection, a member of class IDesigner60.
	PasteSelection (see page 11164)	This is PasteSelection, a member of class IDesigner60.
	RenameMethod (see page 11164)	This is RenameMethod, a member of class IDesigner60.
	Resurrect (see page 11164)	This is Resurrect, a member of class IDesigner60.
	Revert (see page 11164)	This is Revert, a member of class IDesigner60.
	SelectComponent (see page 11165)	This is SelectComponent, a member of class IDesigner60.
	SelectItemName (see page 11165)	This is SelectItemName, a member of class IDesigner60.
	SetSelections (see page 11165)	This is SetSelections, a member of class IDesigner60.
	ShowMethod (see page 11165)	This is ShowMethod, a member of class IDesigner60.
	UniqueName (see page 11165)	This is UniqueName, a member of class IDesigner60.

Public Properties

	Name	Description
R	AncestorDesigner (see page 11166)	This is AncestorDesigner, a member of class IDesigner60.
R	IsDormant (see page 11166)	This is IsDormant, a member of class IDesigner60.
R	Root (see page 11166)	This is Root, a member of class IDesigner60.

60.2.8.2 IDesigner60 Methods

The methods of the IDesigner60 class are listed here.

Public Methods

	Name	Description
	Activate (see page 11154)	This is Activate, a member of class IDesigner60.
	CanPaste (see page 11154)	This is CanPaste, a member of class IDesigner60.
	ChainCall (see page 11154)	This is the overview for the ChainCall method overload.
	ClearSelection (see page 11155)	This is ClearSelection, a member of class IDesigner60.
	CopySelection (see page 11155)	This is CopySelection, a member of class IDesigner60.
	CreateComponent (see page 11156)	This is CreateComponent, a member of class IDesigner60.
	CreateCurrentComponent (see page 11156)	This is CreateCurrentComponent, a member of class IDesigner60.
	CreateMethod (see page 11156)	This is CreateMethod, a member of class IDesigner60.
	CutSelection (see page 11156)	This is CutSelection, a member of class IDesigner60.
	DeleteSelection (see page 11157)	This is DeleteSelection, a member of class IDesigner60.
	Edit (see page 11157)	This is Edit, a member of class IDesigner60.
	GetAncestorDesigner (see page 11157)	This is GetAncestorDesigner, a member of class IDesigner60.
	GetBaseRegKey (see page 11157)	This is GetBaseRegKey, a member of class IDesigner60.
	GetComponent (see page 11157)	This is GetComponent, a member of class IDesigner60.
	GetComponentName (see page 11158)	This is GetComponentName, a member of class IDesigner60.
	GetComponentNames (see page 11158)	This is GetComponentNames, a member of class IDesigner60.
	GetIDEOptions (see page 11158)	This is GetIDEOptions, a member of class IDesigner60.
	GetIsDormant (see page 11158)	This is GetIsDormant, a member of class IDesigner60.
	GetMethodName (see page 11159)	This is GetMethodName, a member of class IDesigner60.
	GetMethods (see page 11159)	This is GetMethods, a member of class IDesigner60.
	GetObject (see page 11159)	This is GetObject, a member of class IDesigner60.
	GetObjectName (see page 11159)	This is GetObjectName, a member of class IDesigner60.
	GetObjectNames (see page 11159)	This is GetObjectNames, a member of class IDesigner60.
	GetPathAndBaseExeName (see page 11160)	This is GetPathAndBaseExeName, a member of class IDesigner60.
	GetPrivateDirectory (see page 11160)	This is GetPrivateDirectory, a member of class IDesigner60.
	GetProjectModules (see page 11160)	This is GetProjectModules, a member of class IDesigner60.
	GetRoot (see page 11160)	This is GetRoot, a member of class IDesigner60.
	GetRootClassName (see page 11161)	This is GetRootClassName, a member of class IDesigner60.

	GetScrollRanges (see page 11161)	This is GetScrollRanges, a member of class IDesigner60.
	GetSelections (see page 11161)	This is GetSelections, a member of class IDesigner60.
	GetShiftState (see page 11161)	This is GetShiftState, a member of class IDesigner60.
	IsComponentHidden (see page 11161)	This is IsComponentHidden, a member of class IDesigner60.
	IsComponentLinkable (see page 11162)	This is IsComponentLinkable, a member of class IDesigner60.
	IsSourceReadOnly (see page 11162)	This is IsSourceReadOnly, a member of class IDesigner60.
	MakeComponentLinkable (see page 11162)	This is MakeComponentLinkable, a member of class IDesigner60.
	MethodExists (see page 11162)	This is MethodExists, a member of class IDesigner60.
	MethodFromAncestor (see page 11163)	This is MethodFromAncestor, a member of class IDesigner60.
	ModalEdit (see page 11163)	This is ModalEdit, a member of class IDesigner60.
	Modified (see page 11163)	This is Modified, a member of class IDesigner60.
	ModuleFileNames (see page 11163)	This is ModuleFileNames, a member of class IDesigner60.
	NoSelection (see page 11163)	This is NoSelection, a member of class IDesigner60.
	PasteSelection (see page 11164)	This is PasteSelection, a member of class IDesigner60.
	RenameMethod (see page 11164)	This is RenameMethod, a member of class IDesigner60.
	Resurrect (see page 11164)	This is Resurrect, a member of class IDesigner60.
	Revert (see page 11164)	This is Revert, a member of class IDesigner60.
	SelectComponent (see page 11165)	This is SelectComponent, a member of class IDesigner60.
	SelectItemName (see page 11165)	This is SelectItemName, a member of class IDesigner60.
	SetSelections (see page 11165)	This is SetSelections, a member of class IDesigner60.
	ShowMethod (see page 11165)	This is ShowMethod, a member of class IDesigner60.
	UniqueName (see page 11165)	This is UniqueName, a member of class IDesigner60.

60.2.8.2.1 IDesigner60.Activate Method

Pascal

```
procedure Activate;
```

C++

```
__fastcall Activate();
```

Description

This is Activate, a member of class IDesigner60.

60.2.8.2.2 IDesigner60.CanPaste Method

Pascal

```
function CanPaste: Boolean;
```

C++

```
__fastcall Boolean CanPaste();
```

Description

This is CanPaste, a member of class IDesigner60.

60.2.8.2.3 ChainCall Method

This is the overview for the ChainCall method overload.

Overload List

	Name	Description
	IDesigner60.ChainCall (string, string, string, IEventInfo) (see page 11155)	This is ChainCall, a member of class IDesigner60.
	IDesigner60.ChainCall (string, string, string, PTypeData) (see page 11155)	This is ChainCall, a member of class IDesigner60.

60.2.8.2.3.1 IDesigner60.ChainCall Method (string, string, string, IEventInfo)

Pascal

```
procedure ChainCall(const MethodName: string; const InstanceName: string; const
InstanceMethod: string; const AEventInfo: IEventInfo); overload;
```

C++

```
__fastcall ChainCall(const AnsiString MethodName, const AnsiString InstanceName, const
AnsiString InstanceMethod, const IEventInfo AEventInfo);
```

Description

This is ChainCall, a member of class IDesigner60.

60.2.8.2.3.2 IDesigner60.ChainCall Method (string, string, string, PTypeData)

Pascal

```
procedure ChainCall(const MethodName: string; const InstanceName: string; const
InstanceMethod: string; TypeData: PTypeData); overload;
```

C++

```
__fastcall ChainCall(const AnsiString MethodName, const AnsiString InstanceName, const
AnsiString InstanceMethod, PTypeData TypeData);
```

Description

This is ChainCall, a member of class IDesigner60.

60.2.8.2.4 IDesigner60.ClearSelection Method

Pascal

```
procedure ClearSelection;
```

C++

```
__fastcall ClearSelection();
```

Description

This is ClearSelection, a member of class IDesigner60.

60.2.8.2.5 IDesigner60.CopySelection Method

Pascal

```
procedure CopySelection;
```

C++

```
__fastcall CopySelection();
```

Description

This is CopySelection, a member of class IDesigner60.

60.2.8.2.6 IDesigner60.CreateComponent Method

Pascal

```
function CreateComponent(ComponentClass: TComponentClass; Parent: TComponent; Left: Integer;
Top: Integer; Width: Integer; Height: Integer): TComponent;
```

C++

```
__fastcall TComponent * CreateComponent(TComponentClass ComponentClass, TComponent * Parent,
int Left, int Top, int Width, int Height);
```

Description

This is CreateComponent, a member of class IDesigner60.

60.2.8.2.7 IDesigner60.CreateCurrentComponent Method

Pascal

```
function CreateCurrentComponent(Parent: TComponent; const Rect: TRect): TComponent;
```

C++

```
__fastcall TComponent * CreateCurrentComponent(TComponent * Parent, const TRect Rect);
```

Description

This is CreateCurrentComponent, a member of class IDesigner60.

60.2.8.2.8 IDesigner60.CreateMethod Method

Pascal

```
function CreateMethod(const Name: string; TypeData: PTypeData): TMethod; overload;
```

C++

```
__fastcall TMethod CreateMethod(const AnsiString Name, PTypeData TypeData);
```

Description

This is CreateMethod, a member of class IDesigner60.

60.2.8.2.9 IDesigner60.CutSelection Method

Pascal

```
procedure CutSelection;
```

C++

```
__fastcall CutSelection();
```

Description

This is CutSelection, a member of class IDesigner60.

60.2.8.2.10 IDesigner60.DeleteSelection Method

Pascal

```
procedure DeleteSelection(ADoAll: Boolean = False);
```

C++

```
__fastcall DeleteSelection(Boolean ADoAll = False);
```

Description

This is DeleteSelection, a member of class IDesigner60.

60.2.8.2.11 IDesigner60.Edit Method

Pascal

```
procedure Edit(const Component: TComponent);
```

C++

```
__fastcall Edit(const TComponent * Component);
```

Description

This is Edit, a member of class IDesigner60.

60.2.8.2.12 IDesigner60.GetAncestorDesigner Method

Pascal

```
function GetAncestorDesigner: IDesigner;
```

C++

```
__fastcall IDesigner GetAncestorDesigner();
```

Description

This is GetAncestorDesigner, a member of class IDesigner60.

60.2.8.2.13 IDesigner60.GetBaseRegKey Method

Pascal

```
function GetBaseRegKey: string;
```

C++

```
__fastcall AnsiString GetBaseRegKey();
```

Description

This is GetBaseRegKey, a member of class IDesigner60.

60.2.8.2.14 IDesigner60.GetComponent Method

Pascal

```
function GetComponent(const Name: string): TComponent;
```

C++

```
__fastcall TComponent * GetComponent(const AnsiString Name);
```

Description

This is GetComponent, a member of class IDesigner60.

60.2.8.2.15 IDesigner60.GetComponentName Method

Pascal

```
function GetComponentName(Component: TComponent): string;
```

C++

```
__fastcall AnsiString GetComponentName(TComponent * Component);
```

Description

This is GetComponentName, a member of class IDesigner60.

60.2.8.2.16 IDesigner60.GetComponentNames Method

Pascal

```
procedure GetComponentNames(TypeData: PTypeData; Proc: TGetStrProc);
```

C++

```
__fastcall GetComponentNames(PTypeData TypeData, TGetStrProc Proc);
```

Description

This is GetComponentNames, a member of class IDesigner60.

60.2.8.2.17 IDesigner60.GetIDEOptions Method

Pascal

```
function GetIDEOptions: TCustomIniFile;
```

C++

```
__fastcall TCustomIniFile GetIDEOptions();
```

Description

This is GetIDEOptions, a member of class IDesigner60.

60.2.8.2.18 IDesigner60.GetIsDormant Method

Pascal

```
function GetIsDormant: Boolean;
```

C++

```
__fastcall Boolean GetIsDormant();
```

Description

This is GetIsDormant, a member of class IDesigner60.

60.2.8.2.19 IDesigner60.GetMethodName Method

Pascal

```
function GetMethodName(const Method: TMethod): string;
```

C++

```
__fastcall AnsiString GetMethodName(const TMethod Method);
```

Description

This is GetMethodName, a member of class IDesigner60.

60.2.8.2.20 IDesigner60.GetMethods Method

Pascal

```
procedure GetMethods(TypeData: PTypeData; Proc: TGetStrProc); overload;
```

C++

```
__fastcall GetMethods(PTypeData TypeData, TGetStrProc Proc);
```

Description

This is GetMethods, a member of class IDesigner60.

60.2.8.2.21 IDesigner60.GetObject Method

Pascal

```
function GetObject(const Name: string): TPersistent;
```

C++

```
__fastcall TPersistent * GetObject(const AnsiString Name);
```

Description

This is GetObject, a member of class IDesigner60.

60.2.8.2.22 IDesigner60.GetObjectName Method

Pascal

```
function GetObjectName(Instance: TPersistent): string;
```

C++

```
__fastcall AnsiString GetObjectName(TPersistent * Instance);
```

Description

This is GetObjectName, a member of class IDesigner60.

60.2.8.2.23 IDesigner60.GetObjectNames Method

Pascal

```
procedure GetObjectNames(TypeData: PTypeData; Proc: TGetStrProc);
```

C++

```
__fastcall GetObjectNames(PTypeData TypeData, TGetStrProc Proc);
```

Description

This is GetObjectNames, a member of class IDesigner60.

60.2.8.2.24 IDesigner60.GetPathAndBaseExeName Method

Pascal

```
function GetPathAndBaseExeName: string;
```

C++

```
__fastcall AnsiString GetPathAndBaseExeName();
```

Description

This is GetPathAndBaseExeName, a member of class IDesigner60.

60.2.8.2.25 IDesigner60.GetPrivateDirectory Method

Pascal

```
function GetPrivateDirectory: string;
```

C++

```
__fastcall AnsiString GetPrivateDirectory();
```

Description

This is GetPrivateDirectory, a member of class IDesigner60.

60.2.8.2.26 IDesigner60.GetProjectModules Method

Pascal

```
procedure GetProjectModules(Proc: TGetModuleProc);
```

C++

```
__fastcall GetProjectModules(TGetModuleProc Proc);
```

Description

This is GetProjectModules, a member of class IDesigner60.

60.2.8.2.27 IDesigner60.GetRoot Method

Pascal

```
function GetRoot: TComponent;
```

C++

```
__fastcall TComponent * GetRoot();
```

Description

This is GetRoot, a member of class IDesigner60.

60.2.8.2.28 IDesigner60.GetRootClassName Method

Pascal

```
function GetRootClassName: string;
```

C++

```
__fastcall AnsiString GetRootClassName();
```

Description

This is GetRootClassName, a member of class IDesigner60.

60.2.8.2.29 IDesigner60.GetScrollRanges Method

Pascal

```
function GetScrollRanges(const ScrollPosition: TPoint): TPoint;
```

C++

```
__fastcall TPoint GetScrollRanges(const TPoint ScrollPosition);
```

Description

This is GetScrollRanges, a member of class IDesigner60.

60.2.8.2.30 IDesigner60.GetSelections Method

Pascal

```
procedure GetSelections(const List: IDesignerSelections);
```

C++

```
__fastcall GetSelections(const IDesignerSelections List);
```

Description

This is GetSelections, a member of class IDesigner60.

60.2.8.2.31 IDesigner60.GetShiftState Method

Pascal

```
function GetShiftState: TShiftState;
```

C++

```
__fastcall TShiftState GetShiftState();
```

Description

This is GetShiftState, a member of class IDesigner60.

60.2.8.2.32 IDesigner60.IsComponentHidden Method

Pascal

```
function IsComponentHidden(Component: TComponent): Boolean;
```

C++

```
__fastcall Boolean IsComponentHidden(TComponent * Component);
```

Description

This is IsComponentHidden, a member of class IDesigner60.

60.2.8.2.33 IDesigner60.IsComponentLinkable Method

Pascal

```
function IsComponentLinkable(Component: TComponent): Boolean;
```

C++

```
__fastcall Boolean IsComponentLinkable(TComponent * Component);
```

Description

This is IsComponentLinkable, a member of class IDesigner60.

60.2.8.2.34 IDesigner60.IsSourceReadOnly Method

Pascal

```
function IsSourceReadOnly: Boolean;
```

C++

```
__fastcall Boolean IsSourceReadOnly();
```

Description

This is IsSourceReadOnly, a member of class IDesigner60.

60.2.8.2.35 IDesigner60.MakeComponentLinkable Method

Pascal

```
procedure MakeComponentLinkable(Component: TComponent);
```

C++

```
__fastcall MakeComponentLinkable(TComponent * Component);
```

Description

This is MakeComponentLinkable, a member of class IDesigner60.

60.2.8.2.36 IDesigner60.MethodExists Method

Pascal

```
function MethodExists(const Name: string): Boolean;
```

C++

```
__fastcall Boolean MethodExists(const AnsiString Name);
```

Description

This is MethodExists, a member of class IDesigner60.

60.2.8.2.37 IDesigner60.MethodFromAncestor Method

Pascal

```
function MethodFromAncestor(const Method: TMethod): Boolean;
```

C++

```
__fastcall Boolean MethodFromAncestor(const TMethod Method);
```

Description

This is MethodFromAncestor, a member of class IDesigner60.

60.2.8.2.38 IDesigner60.ModalEdit Method

Pascal

```
procedure ModalEdit(EditKey: Char; const ReturnWindow: IActivatable);
```

C++

```
__fastcall ModalEdit(Char EditKey, const IActivatable ReturnWindow);
```

Description

This is ModalEdit, a member of class IDesigner60.

60.2.8.2.39 IDesigner60.Modified Method

Pascal

```
procedure Modified;
```

C++

```
__fastcall Modified();
```

Description

This is Modified, a member of class IDesigner60.

60.2.8.2.40 IDesigner60.ModuleFileNames Method

Pascal

```
procedure ModuleFileNames(var ImplFileName: string; var IntfFileName: string; var
FormFileName: string);
```

C++

```
__fastcall ModuleFileNames(AnsiString ImplFileName, AnsiString IntfFileName, AnsiString
FormFileName);
```

Description

This is ModuleFileNames, a member of class IDesigner60.

60.2.8.2.41 IDesigner60.NoSelection Method

Pascal

```
procedure NoSelection;
```

C++

```
__fastcall NoSelection();
```

Description

This is NoSelection, a member of class IDesigner60.

60.2.8.2.42 IDesigner60.PasteSelection Method

Pascal

```
procedure PasteSelection;
```

C++

```
__fastcall PasteSelection();
```

Description

This is PasteSelection, a member of class IDesigner60.

60.2.8.2.43 IDesigner60.RenameMethod Method

Pascal

```
procedure RenameMethod(const CurName: string; const NewName: string);
```

C++

```
__fastcall RenameMethod(const AnsiString CurName, const AnsiString NewName);
```

Description

This is RenameMethod, a member of class IDesigner60.

60.2.8.2.44 IDesigner60.Resurrect Method

Pascal

```
procedure Resurrect;
```

C++

```
__fastcall Resurrect();
```

Description

This is Resurrect, a member of class IDesigner60.

60.2.8.2.45 IDesigner60.Revert Method

Pascal

```
procedure Revert(Instance: TPersistent; PropInfo: PPropInfo);
```

C++

```
__fastcall Revert(TPersistent * Instance, PPropInfo PropInfo);
```

Description

This is Revert, a member of class IDesigner60.

60.2.8.2.46 IDesigner60.SelectComponent Method

Pascal

```
procedure SelectComponent(Instance: TPersistent); overload;
```

C++

```
__fastcall SelectComponent(TPersistent * Instance);
```

Description

This is SelectComponent, a member of class IDesigner60.

60.2.8.2.47 IDesigner60.SelectItemName Method

Pascal

```
procedure SelectItemName(const PropertyName: string);
```

C++

```
__fastcall SelectItemName(const AnsiString PropertyName);
```

Description

This is SelectItemName, a member of class IDesigner60.

60.2.8.2.48 IDesigner60.SetSelections Method

Pascal

```
procedure SetSelections(const List: IDesignerSelections);
```

C++

```
__fastcall SetSelections(const IDesignerSelections List);
```

Description

This is SetSelections, a member of class IDesigner60.

60.2.8.2.49 IDesigner60.ShowMethod Method

Pascal

```
procedure ShowMethod(const Name: string);
```

C++

```
__fastcall ShowMethod(const AnsiString Name);
```

Description

This is ShowMethod, a member of class IDesigner60.

60.2.8.2.50 IDesigner60.UniqueName Method

Pascal

```
function UniqueName(const BaseName: string): string;
```

C++

```
__fastcall AnsiString UniqueName(const AnsiString BaseName);
```

Description

This is UniqueName, a member of class IDesigner60.

60.2.8.3 IDesigner60 Properties

The properties of the IDesigner60 class are listed here.

Public Properties

	Name	Description
R	AncestorDesigner (see page 11166)	This is AncestorDesigner, a member of class IDesigner60.
R	IsDormant (see page 11166)	This is IsDormant, a member of class IDesigner60.
R	Root (see page 11166)	This is Root, a member of class IDesigner60.

60.2.8.3.1 IDesigner60.AncestorDesigner Property

Pascal

```
property AncestorDesigner: IDesigner;
```

C++

```
__property IDesigner AncestorDesigner;
```

Description

This is AncestorDesigner, a member of class IDesigner60.

60.2.8.3.2 IDesigner60.IsDormant Property

Pascal

```
property IsDormant: Boolean;
```

C++

```
__property Boolean IsDormant;
```

Description

This is IsDormant, a member of class IDesigner60.

60.2.8.3.3 IDesigner60.Root Property

Pascal

```
property Root: TComponent;
```

C++

```
__property TComponent * Root;
```

Description

This is Root, a member of class IDesigner60.

60.2.9 IDesigner70 Interface

Class Hierarchy

Pascal

```
IDesigner70 = interface(IDesigner60);
```

C++

```
__interface IDesigner70 : public IDesigner60;
```

File

DesignIntf

Description

This is class DesignIntf.IDesigner70.

60.2.9.1 IDesigner70 Members

The following tables list the members exposed by IDesigner70.

Public Methods

	Name	Description
	Activate (see page 11154)	This is Activate, a member of class IDesigner60.
	CanPaste (see page 11154)	This is CanPaste, a member of class IDesigner60.
	ChainCall (see page 11154)	This is the overview for the ChainCall method overload.
	ClearSelection (see page 11155)	This is ClearSelection, a member of class IDesigner60.
	CopySelection (see page 11155)	This is CopySelection, a member of class IDesigner60.
	CreateComponent (see page 11156)	This is CreateComponent, a member of class IDesigner60.
	CreateCurrentComponent (see page 11156)	This is CreateCurrentComponent, a member of class IDesigner60.
	CreateMethod (see page 11156)	This is CreateMethod, a member of class IDesigner60.
	CutSelection (see page 11156)	This is CutSelection, a member of class IDesigner60.
	DeleteSelection (see page 11157)	This is DeleteSelection, a member of class IDesigner60.
	Edit (see page 11157)	This is Edit, a member of class IDesigner60.
	FindRootAncestor (see page 11168)	This is FindRootAncestor, a member of class IDesigner70.
	GetActiveClassGroup (see page 11169)	This is GetActiveClassGroup, a member of class IDesigner70.
	GetAncestorDesigner (see page 11157)	This is GetAncestorDesigner, a member of class IDesigner60.
	GetBaseRegKey (see page 11157)	This is GetBaseRegKey, a member of class IDesigner60.
	GetComponent (see page 11157)	This is GetComponent, a member of class IDesigner60.
	GetComponentName (see page 11158)	This is GetComponentName, a member of class IDesigner60.
	GetComponentNames (see page 11158)	This is GetComponentNames, a member of class IDesigner60.
	GetIDEOptions (see page 11158)	This is GetIDEOptions, a member of class IDesigner60.
	GetIsDormant (see page 11158)	This is GetIsDormant, a member of class IDesigner60.
	GetMethodName (see page 11159)	This is GetMethodName, a member of class IDesigner60.
	GetMethods (see page 11159)	This is GetMethods, a member of class IDesigner60.
	GetObject (see page 11159)	This is GetObject, a member of class IDesigner60.
	GetObjectName (see page 11159)	This is GetObjectName, a member of class IDesigner60.
	GetObjectNames (see page 11159)	This is GetObjectNames, a member of class IDesigner60.
	GetPathAndBaseExeName (see page 11160)	This is GetPathAndBaseExeName, a member of class IDesigner60.
	GetPrivateDirectory (see page 11160)	This is GetPrivateDirectory, a member of class IDesigner60.

	GetProjectModules (see page 11160)	This is GetProjectModules, a member of class IDesigner60.
	GetRoot (see page 11160)	This is GetRoot, a member of class IDesigner60.
	GetRootClassName (see page 11161)	This is GetRootClassName, a member of class IDesigner60.
	GetScrollRanges (see page 11161)	This is GetScrollRanges, a member of class IDesigner60.
	GetSelections (see page 11161)	This is GetSelections, a member of class IDesigner60.
	GetShiftState (see page 11161)	This is GetShiftState, a member of class IDesigner60.
	IsComponentHidden (see page 11161)	This is IsComponentHidden, a member of class IDesigner60.
	IsComponentLinkable (see page 11162)	This is IsComponentLinkable, a member of class IDesigner60.
	IsSourceReadOnly (see page 11162)	This is IsSourceReadOnly, a member of class IDesigner60.
	MakeComponentLinkable (see page 11162)	This is MakeComponentLinkable, a member of class IDesigner60.
	MethodExists (see page 11162)	This is MethodExists, a member of class IDesigner60.
	MethodFromAncestor (see page 11163)	This is MethodFromAncestor, a member of class IDesigner60.
	ModalEdit (see page 11163)	This is ModalEdit, a member of class IDesigner60.
	Modified (see page 11163)	This is Modified, a member of class IDesigner60.
	ModuleFileNames (see page 11163)	This is ModuleFileNames, a member of class IDesigner60.
	NoSelection (see page 11163)	This is NoSelection, a member of class IDesigner60.
	PasteSelection (see page 11164)	This is PasteSelection, a member of class IDesigner60.
	RenameMethod (see page 11164)	This is RenameMethod, a member of class IDesigner60.
	Resurrect (see page 11164)	This is Resurrect, a member of class IDesigner60.
	Revert (see page 11164)	This is Revert, a member of class IDesigner60.
	SelectComponent (see page 11165)	This is SelectComponent, a member of class IDesigner60.
	SelectItemName (see page 11165)	This is SelectItemName, a member of class IDesigner60.
	SetSelections (see page 11165)	This is SetSelections, a member of class IDesigner60.
	ShowMethod (see page 11165)	This is ShowMethod, a member of class IDesigner60.
	UniqueName (see page 11165)	This is UniqueName, a member of class IDesigner60.

Public Properties

	Name	Description
R	ActiveClassGroup (see page 11169)	This is ActiveClassGroup, a member of class IDesigner70.
R	AncestorDesigner (see page 11166)	This is AncestorDesigner, a member of class IDesigner60.
R	IsDormant (see page 11166)	This is IsDormant, a member of class IDesigner60.
R	Root (see page 11166)	This is Root, a member of class IDesigner60.

60.2.9.2 IDesigner70 Methods

The methods of the IDesigner70 class are listed here.

Public Methods

	Name	Description
	FindRootAncestor (see page 11168)	This is FindRootAncestor, a member of class IDesigner70.
	GetActiveClassGroup (see page 11169)	This is GetActiveClassGroup, a member of class IDesigner70.

60.2.9.2.1 IDesigner70.FindRootAncestor Method

Pascal

```
function FindRootAncestor(const AClassName: string): TComponent;
```

C++

```
__fastcall TComponent * FindRootAncestor(const AnsiString AClassName);
```

Description

This is FindRootAncestor, a member of class IDesigner70.

60.2.9.2.2 IDesigner70.GetActiveClassGroup Method

Pascal

```
function GetActiveClassGroup: TPersistentClass;
```

C++

```
__fastcall TPersistentClass GetActiveClassGroup();
```

Description

This is GetActiveClassGroup, a member of class IDesigner70.

60.2.9.3 IDesigner70 Properties

The properties of the IDesigner70 class are listed here.

Public Properties

	Name	Description
	ActiveClassGroup (see page 11169)	This is ActiveClassGroup, a member of class IDesigner70.

60.2.9.3.1 IDesigner70.ActiveClassGroup Property

Pascal

```
property ActiveClassGroup: TPersistentClass;
```

C++

```
__property TPersistentClass ActiveClassGroup;
```

Description

This is ActiveClassGroup, a member of class IDesigner70.

60.2.10 IDesigner80 Interface

Class Hierarchy

Pascal

```
IDesigner80 = interface(IDesigner70);
```

C++

```
__interface IDesigner80 : public IDesigner70;
```

File

DesignIntf

Description

This is class DesignIntf.IDesigner80.

60.2.10.1 IDesigner80 Members

The following tables list the members exposed by IDesigner80.

Public Methods

	Name	Description
	Activate (see page 11154)	This is Activate, a member of class IDesigner60.
	CanPaste (see page 11154)	This is CanPaste, a member of class IDesigner60.
	ChainCall (see page 11154)	This is the overview for the ChainCall method overload.
	ClearSelection (see page 11155)	This is ClearSelection, a member of class IDesigner60.
	CopySelection (see page 11155)	This is CopySelection, a member of class IDesigner60.
	CreateComponent (see page 11156)	This is CreateComponent, a member of class IDesigner60.
	CreateCurrentComponent (see page 11156)	This is CreateCurrentComponent, a member of class IDesigner60.
	CreateMethod (see page 11171)	This is CreateMethod, a member of class IDesigner80.
	CutSelection (see page 11156)	This is CutSelection, a member of class IDesigner60.
	DeleteSelection (see page 11157)	This is DeleteSelection, a member of class IDesigner60.
	Edit (see page 11157)	This is Edit, a member of class IDesigner60.
	FindRootAncestor (see page 11168)	This is FindRootAncestor, a member of class IDesigner70.
	GetActiveClassGroup (see page 11169)	This is GetActiveClassGroup, a member of class IDesigner70.
	GetAncestorDesigner (see page 11157)	This is GetAncestorDesigner, a member of class IDesigner60.
	GetBaseRegKey (see page 11157)	This is GetBaseRegKey, a member of class IDesigner60.
	GetComponent (see page 11157)	This is GetComponent, a member of class IDesigner60.
	GetComponentName (see page 11158)	This is GetComponentName, a member of class IDesigner60.
	GetComponentNames (see page 11158)	This is GetComponentNames, a member of class IDesigner60.
	GetIDEOptions (see page 11158)	This is GetIDEOptions, a member of class IDesigner60.
	GetIsDormant (see page 11158)	This is GetIsDormant, a member of class IDesigner60.
	GetMethodName (see page 11159)	This is GetMethodName, a member of class IDesigner60.
	GetMethods (see page 11171)	This is GetMethods, a member of class IDesigner80.
	GetObject (see page 11159)	This is GetObject, a member of class IDesigner60.
	GetObjectName (see page 11159)	This is GetObjectName, a member of class IDesigner60.
	GetObjectNames (see page 11159)	This is GetObjectNames, a member of class IDesigner60.
	GetPathAndBaseExeName (see page 11160)	This is GetPathAndBaseExeName, a member of class IDesigner60.
	GetPrivateDirectory (see page 11160)	This is GetPrivateDirectory, a member of class IDesigner60.
	GetProjectModules (see page 11160)	This is GetProjectModules, a member of class IDesigner60.
	GetRoot (see page 11160)	This is GetRoot, a member of class IDesigner60.
	GetRootClassName (see page 11161)	This is GetRootClassName, a member of class IDesigner60.
	GetScrollRanges (see page 11161)	This is GetScrollRanges, a member of class IDesigner60.
	GetSelections (see page 11161)	This is GetSelections, a member of class IDesigner60.
	GetShiftState (see page 11161)	This is GetShiftState, a member of class IDesigner60.
	IsComponentHidden (see page 11161)	This is IsComponentHidden, a member of class IDesigner60.
	IsComponentLinkable (see page 11162)	This is IsComponentLinkable, a member of class IDesigner60.
	IsSourceReadOnly (see page 11162)	This is IsSourceReadOnly, a member of class IDesigner60.
	MakeComponentLinkable (see page 11162)	This is MakeComponentLinkable, a member of class IDesigner60.
	MethodExists (see page 11162)	This is MethodExists, a member of class IDesigner60.
	MethodFromAncestor (see page 11163)	This is MethodFromAncestor, a member of class IDesigner60.
	ModalEdit (see page 11163)	This is ModalEdit, a member of class IDesigner60.
	Modified (see page 11163)	This is Modified, a member of class IDesigner60.
	ModuleFileNames (see page 11163)	This is ModuleFileNames, a member of class IDesigner60.
	NoSelection (see page 11163)	This is NoSelection, a member of class IDesigner60.
	PasteSelection (see page 11164)	This is PasteSelection, a member of class IDesigner60.
	RenameMethod (see page 11164)	This is RenameMethod, a member of class IDesigner60.
	Resurrect (see page 11164)	This is Resurrect, a member of class IDesigner60.
	Revert (see page 11164)	This is Revert, a member of class IDesigner60.

	SelectComponent (see page 11171)	This is SelectComponent, a member of class IDesigner80.
	SelectItemName (see page 11165)	This is SelectItemName, a member of class IDesigner60.
	SetSelections (see page 11165)	This is SetSelections, a member of class IDesigner60.
	ShowMethod (see page 11165)	This is ShowMethod, a member of class IDesigner60.
	UniqueName (see page 11165)	This is UniqueName, a member of class IDesigner60.

Public Properties

	Name	Description
R	ActiveClassGroup (see page 11169)	This is ActiveClassGroup, a member of class IDesigner70.
R	AncestorDesigner (see page 11166)	This is AncestorDesigner, a member of class IDesigner60.
R	IsDormant (see page 11166)	This is IsDormant, a member of class IDesigner60.
R	Root (see page 11166)	This is Root, a member of class IDesigner60.

60.2.10.2 IDesigner80 Methods

The methods of the IDesigner80 class are listed here.

Public Methods

	Name	Description
	CreateMethod (see page 11171)	This is CreateMethod, a member of class IDesigner80.
	GetMethods (see page 11171)	This is GetMethods, a member of class IDesigner80.
	SelectComponent (see page 11171)	This is SelectComponent, a member of class IDesigner80.

60.2.10.2.1 IDesigner80.CreateMethod Method

Pascal

```
function CreateMethod(const Name: string; const AEventInfo: IEventInfo): TMethod; overload;
```

C++

```
__fastcall TMethod CreateMethod(const AnsiString Name, const IEventInfo AEventInfo);
```

Description

This is CreateMethod, a member of class IDesigner80.

60.2.10.2.2 IDesigner80.GetMethods Method

Pascal

```
procedure GetMethods(const AEventInfo: IEventInfo; Proc: TGetStrProc); overload;
```

C++

```
__fastcall GetMethods(const IEventInfo AEventInfo, TGetStrProc Proc);
```

Description

This is GetMethods, a member of class IDesigner80.

60.2.10.2.3 IDesigner80.SelectComponent Method

Pascal

```
procedure SelectComponent(const ADesignObject: IDesignObject); overload;
```

C++

```
__fastcall SelectComponent(const IDesignObject ADesignObject);
```

Description

This is SelectComponent, a member of class IDesigner80.

60.2.11 IDesignerSelections Interface

IDesignerSelections represents a list of persistent objects.

Class Hierarchy

DesignIntf.IDesignerSelections

Pascal

```
IDesignerSelections = interface;
```

C++

```
__interface IDesignerSelections;
```

File

DesignIntf

Description

The form designer uses IDesignerSelections to get or set a list of those objects that are selected.

IDesignerSelections provides properties and methods to

Add (see page 11173) objects to the list.

Compare two lists of objects.

Access individual objects in the list.

Note: C++ method declarations that use IDesignerSelections use the _di_IDesignerSelections type instead. This is a DelphiInterface wrapper around the IDesignerSelections interface:

```
typedef System::DelphiInterfaceDelphiInterface_object< IDesignerSelections >
_di_IDesignerSelections;
```

See Also

TDesignerSelections (see page 11121)

60.2.11.1 IDesignerSelections Members

The following tables list the members exposed by IDesignerSelections.

Public Methods

	Name	Description
	Add (see page 11173)	Adds a new object to the end of the list.
	Equals (see page 11173)	Indicates whether the selections list is identical to another selections list.
	Get (see page 11174)	Returns a specified item from the list.
	GetCount (see page 11174)	Returns the value of the Count (see page 11175) property.
	GetDesignObject (see page 11174)	This is GetDesignObject, a member of class IDesignerSelections.

Public Properties

	Name	Description
R	Count (see page 11175)	Indicates the number of entries in the list.
R	DesignObjects (see page 11175)	This is DesignObjects, a member of class IDesignerSelections.
R	Items (see page 11175)	Provides indexed access to the objects in the list.

60.2.11.2 IDesignerSelections Methods

The methods of the IDesignerSelections class are listed here.

Public Methods

	Name	Description
	Add (see page 11173)	Adds a new object to the end of the list.
	Equals (see page 11173)	Indicates whether the selections list is identical to another selections list.
	Get (see page 11174)	Returns a specified item from the list.
	GetCount (see page 11174)	Returns the value of the Count (see page 11175) property.
	GetDesignObject (see page 11174)	This is GetDesignObject, a member of class IDesignerSelections.

60.2.11.2.1 IDesignerSelections.Add Method

Adds a new object to the end of the list.

Pascal

```
function Add(const Item: TPersistent): Integer;
```

C++

```
__fastcall int Add(const TPersistent * Item);
```

Description

Call Add to insert a new object at the end of the Items (see page 11175) array. Add returns the index of the new item, where the first item in the list has an index of 0. Add increases the value of Count (see page 11175) to reflect the addition of a new object.

See Also

Count (see page 11175)

Items (see page 11175)

60.2.11.2.2 IDesignerSelections.Equals Method

Indicates whether the selections list is identical to another selections list.

Pascal

```
function Equals(const List: IDesignerSelections): Boolean;
```

C++

```
__fastcall Boolean Equals(const IDesignerSelections List);
```

Description

Call Equals to determine whether the list specified by the List parameter contains exactly the same objects in the same order as this list. Equals returns false if the other list

Contains objects not in the Items (see page 11175) array.

Contains a subset of the objects in the Items (see page 11175) array.

Contains the same objects but in a different order.

See Also

Items (see page 11175)

60.2.11.2.3 IDesignerSelections.Get Method

Returns a specified item from the list.

Pascal

```
function Get(Index: Integer): TPersistent;
```

C++

```
__fastcall TPersistent * Get(int Index);
```

Description

Get is the protected read access method for the Items (see page 11175) property.

Index identifies the desired object by its position in the list, where 0 identifies the first position. Get returns the specified object.

See Also

Items (see page 11175)

60.2.11.2.4 IDesignerSelections.GetCount Method

Returns the value of the Count (see page 11175) property.

Pascal

```
function GetCount: Integer;
```

C++

```
__fastcall int GetCount();
```

Description

GetCount is the protected read access method for the Count (see page 11175) property.

See Also

Count (see page 11175)

60.2.11.2.5 IDesignerSelections.GetDesignObject Method

Pascal

```
function GetDesignObject(Index: Integer): IDesignObject;
```

C++

```
__fastcall IDesignObject GetDesignObject(int Index);
```

Description

This is GetDesignObject, a member of class IDesignerSelections.

60.2.11.3 IDesignerSelections Properties

The properties of the IDesignerSelections class are listed here.

Public Properties

	Name	Description
R	Count (see page 11175)	Indicates the number of entries in the list.
R	DesignObjects (see page 11175)	This is DesignObjects, a member of class IDesignerSelections.
R	Items (see page 11175)	Provides indexed access to the objects in the list.

60.2.11.3.1 IDesignerSelections.Count Property

Indicates the number of entries in the list.

Pascal

```
property Count: Integer;
```

C++

```
__property int Count;
```

Description

Read Count to determine the number of entries in the Items (see page 11175) array. Use Count as an upper limit when iterating over all the objects in the list.

Count is a read-only property. To increase the number of objects in the list, use the Add (see page 11173) method. Objects can not be removed from the list once they have been added.

See Also

Items (see page 11175)

Add (see page 11173)

60.2.11.3.2 IDesignerSelections.DesignObjects Property

Pascal

```
property DesignObjects [Index: Integer]: IDesignObject;
```

C++

```
__property IDesignObject DesignObjects[int Index];
```

Description

This is DesignObjects, a member of class IDesignerSelections.

60.2.11.3.3 IDesignerSelections.Items Property

Provides indexed access to the objects in the list.

Pascal

```
property Items [Index: Integer]: TPersistent;
```

C++

```
__property TPersistent * Items[int Index];
```

Description

Use Items to access a specific object in the list. The Index parameter indicates the index of the object, where 0 is the index of the first object, 1 is the index of the second object, and so on. Use Items with the Count (see page 11175) property to iterate through all of the objects in the list.

To add objects to the Items array, use the Add (see page 11173) method. Once objects have been added, they can't be deleted or rearranged.

See Also

Count (see page 11175)

Add (see page 11173)

60.2.12 IDesignNotification Interface

Class Hierarchy

DesignIntf.IDesignNotification

Pascal

```
IDesignNotification = interface;
```

C++

```
__interface IDesignNotification;
```

File

DesignIntf

Description

This is class DesignIntf.IDesignNotification.

60.2.12.1 IDesignNotification Members

The following tables list the members exposed by IDesignNotification.

Public Methods

	Name	Description
	DesignerClosed (see page 11177)	This is DesignerClosed, a member of class IDesignNotification.
	DesignerOpened (see page 11177)	This is DesignerOpened, a member of class IDesignNotification.
	ItemDeleted (see page 11177)	This is ItemDeleted, a member of class IDesignNotification.
	ItemInserted (see page 11177)	This is ItemInserted, a member of class IDesignNotification.
	ItemsModified (see page 11178)	This is ItemsModified, a member of class IDesignNotification.
	SelectionChanged (see page 11178)	This is SelectionChanged, a member of class IDesignNotification.

60.2.12.2 IDesignNotification Methods

The methods of the IDesignNotification class are listed here.

Public Methods

	Name	Description
	DesignerClosed (see page 11177)	This is DesignerClosed, a member of class IDesignNotification.
	DesignerOpened (see page 11177)	This is DesignerOpened, a member of class IDesignNotification.
	ItemDeleted (see page 11177)	This is ItemDeleted, a member of class IDesignNotification.
	ItemInserted (see page 11177)	This is ItemInserted, a member of class IDesignNotification.
	ItemsModified (see page 11178)	This is ItemsModified, a member of class IDesignNotification.
	SelectionChanged (see page 11178)	This is SelectionChanged, a member of class IDesignNotification.

60.2.12.2.1 IDesignNotification.DesignerClosed Method

Pascal

```
procedure DesignerClosed(const ADesigner: IDesigner; AGoingDormant: Boolean);
```

C++

```
__fastcall DesignerClosed(const IDesigner ADesigner, Boolean AGoingDormant);
```

Description

This is DesignerClosed, a member of class IDesignNotification.

60.2.12.2.2 IDesignNotification.DesignerOpened Method

Pascal

```
procedure DesignerOpened(const ADesigner: IDesigner; AResurrecting: Boolean);
```

C++

```
__fastcall DesignerOpened(const IDesigner ADesigner, Boolean AResurrecting);
```

Description

This is DesignerOpened, a member of class IDesignNotification.

60.2.12.2.3 IDesignNotification.ItemDeleted Method

Pascal

```
procedure ItemDeleted(const ADesigner: IDesigner; AItem: TPersistent);
```

C++

```
__fastcall ItemDeleted(const IDesigner ADesigner, TPersistent * AItem);
```

Description

This is ItemDeleted, a member of class IDesignNotification.

60.2.12.2.4 IDesignNotification.ItemInserted Method

Pascal

```
procedure ItemInserted(const ADesigner: IDesigner; AItem: TPersistent);
```

C++

```
__fastcall ItemInserted(const IDesigner ADesigner, TPersistent * AItem);
```

Description

This is ItemInserted, a member of class IDesignNotification.

60.2.12.2.5 IDesignNotification.ItemsModified Method

Pascal

```
procedure ItemsModified(const ADesigner: IDesigner);
```

C++

```
__fastcall ItemsModified(const IDesigner ADesigner);
```

Description

This is ItemsModified, a member of class IDesignNotification.

60.2.12.2.6 IDesignNotification.SelectionChanged Method

Pascal

```
procedure SelectionChanged(const ADesigner: IDesigner; const ASelection: IDesignerSelections);
```

C++

```
__fastcall SelectionChanged(const IDesigner ADesigner, const IDesignerSelections ASelection);
```

Description

This is SelectionChanged, a member of class IDesignNotification.

60.2.13 IDesignObject Interface

Class Hierarchy

Pascal

```
IDesignObject = interface;
```

C++

```
__interface IDesignObject;
```

File

DesignIntf

Description

This is class DesignIntf.IDesignObject.

60.2.13.1 IDesignObject Members

The following tables list the members exposed by IDesignObject.

Public Methods

	Name	Description
	Equals (see page 11179)	This is the overview for the Equals method overload.
	GetClassName (see page 11180)	This is GetClassName, a member of class IDesignObject.
	GetClassType (see page 11180)	This is GetClassType, a member of class IDesignObject.
	GetComponentIndex (see page 11180)	This is GetComponentIndex, a member of class IDesignObject.
	GetComponentName (see page 11180)	This is GetComponentName, a member of class IDesignObject.
	GetIsComponent (see page 11181)	This is GetIsComponent, a member of class IDesignObject.
	GetNamePath (see page 11181)	This is GetNamePath, a member of class IDesignObject.

Public Properties

	Name	Description
R	ClassName (see page 11181)	This is ClassName, a member of class IDesignObject.
R	ClassType (see page 11182)	This is ClassType, a member of class IDesignObject.
R	ComponentIndex (see page 11182)	This is ComponentIndex, a member of class IDesignObject.
R	ComponentName (see page 11182)	This is ComponentName, a member of class IDesignObject.
R	IsComponent (see page 11182)	This is IsComponent, a member of class IDesignObject.
R	NamePath (see page 11182)	This is NamePath, a member of class IDesignObject.

60.2.13.2 IDesignObject Methods

The methods of the IDesignObject class are listed here.

Public Methods

	Name	Description
	Equals (see page 11179)	This is the overview for the Equals method overload.
	GetClassName (see page 11180)	This is GetClassName, a member of class IDesignObject.
	GetClassType (see page 11180)	This is GetClassType, a member of class IDesignObject.
	GetComponentIndex (see page 11180)	This is GetComponentIndex, a member of class IDesignObject.
	GetComponentName (see page 11180)	This is GetComponentName, a member of class IDesignObject.
	GetIsComponent (see page 11181)	This is GetIsComponent, a member of class IDesignObject.
	GetNamePath (see page 11181)	This is GetNamePath, a member of class IDesignObject.

60.2.13.2.1 Equals Method

This is the overview for the Equals method overload.

Overload List

	Name	Description
	IDesignObject.Equals (IDesignObject) (see page 11179)	This is Equals, a member of class IDesignObject.
	IDesignObject.Equals (TObject) (see page 11180)	This is Equals, a member of class IDesignObject.

60.2.13.2.1.1 IDesignObject.Equals Method (IDesignObject)

Pascal

```
function Equals(const ADesignObject: IDesignObject): Boolean; overload;
```

C++

```
__fastcall Boolean Equals(const IDesignObject ADesignObject);
```

Description

This is Equals, a member of class IDesignObject.

60.2.13.2.1.2 IDesignObject.Equals Method (TObject)

Pascal

```
function Equals(Obj: TObject): Boolean; overload;
```

C++

```
__fastcall Boolean Equals(TObject * Obj);
```

Description

This is Equals, a member of class IDesignObject.

60.2.13.2.2 IDesignObject.GetClassName Method

Pascal

```
function GetClassName: string;
```

C++

```
__fastcall AnsiString GetClassName();
```

Description

This is GetClassName, a member of class IDesignObject.

60.2.13.2.3 IDesignObject.GetClassType Method

Pascal

```
function GetClassType: IClass;
```

C++

```
__fastcall IClass GetClassType();
```

Description

This is GetClassType, a member of class IDesignObject.

60.2.13.2.4 IDesignObject.GetComponentIndex Method

Pascal

```
function GetComponentIndex: Integer;
```

C++

```
__fastcall int GetComponentIndex();
```

Description

This is GetComponentIndex, a member of class IDesignObject.

60.2.13.2.5 IDesignObject.GetComponentName Method

Pascal

```
function GetComponentName: string;
```

C++

```
__fastcall AnsiString GetComponentName();
```

Description

This is GetComponentName, a member of class IDesignObject.

60.2.13.2.6 IDesignObject.GetIsComponent Method

Pascal

```
function GetIsComponent: Boolean;
```

C++

```
__fastcall Boolean GetIsComponent();
```

Description

This is GetIsComponent, a member of class IDesignObject.

60.2.13.2.7 IDesignObject.GetNamePath Method

Pascal

```
function GetNamePath: string;
```

C++

```
__fastcall AnsiString GetNamePath();
```

Description

This is GetNamePath, a member of class IDesignObject.

60.2.13.3 IDesignObject Properties

The properties of the IDesignObject class are listed here.

Public Properties

	Name	Description
R	ClassName (see page 11181)	This is ClassName, a member of class IDesignObject.
R	ClassType (see page 11182)	This is ClassType, a member of class IDesignObject.
R	ComponentIndex (see page 11182)	This is ComponentIndex, a member of class IDesignObject.
R	ComponentName (see page 11182)	This is ComponentName, a member of class IDesignObject.
R	IsComponent (see page 11182)	This is IsComponent, a member of class IDesignObject.
R	NamePath (see page 11182)	This is NamePath, a member of class IDesignObject.

60.2.13.3.1 IDesignObject.ClassName Property

Pascal

```
property ClassName: string;
```

C++

```
__property AnsiString ClassName;
```

Description

This is ClassName, a member of class IDesignObject.

60.2.13.3.2 IDesignObject.ClassType Property

Pascal

```
property ClassType: IClass;
```

C++

```
__property IClass ClassType;
```

Description

This is ClassType, a member of class IDesignObject.

60.2.13.3.3 IDesignObject.ComponentIndex Property

Pascal

```
property ComponentIndex: Integer;
```

C++

```
__property int ComponentIndex;
```

Description

This is ComponentIndex, a member of class IDesignObject.

60.2.13.3.4 IDesignObject.ComponentName Property

Pascal

```
property ComponentName: string;
```

C++

```
__property AnsiString ComponentName;
```

Description

This is ComponentName, a member of class IDesignObject.

60.2.13.3.5 IDesignObject.IsComponent Property

Pascal

```
property IsComponent: Boolean;
```

C++

```
__property Boolean IsComponent;
```

Description

This is IsComponent, a member of class IDesignObject.

60.2.13.3.6 IDesignObject.NamePath Property

Pascal

```
property NamePath: string;
```

C++

```
__property AnsiString NamePath;
```

Description

This is NamePath, a member of class IDesignObject.

60.2.14 IDesignPersistent Interface

Class Hierarchy

Pascal

```
IDesignPersistent = interface(IDesignObject);
```

C++

```
__interface IDesignPersistent : public IDesignObject;
```

File

DesignIntf

Description

This is class DesignIntf.IDesignPersistent.

60.2.14.1 IDesignPersistent Members

The following tables list the members exposed by IDesignPersistent.

Public Methods

	Name	Description
	Equals (see page 11179)	This is the overview for the Equals method overload.
	GetClassName (see page 11180)	This is GetClassName, a member of class IDesignObject.
	GetClassType (see page 11180)	This is GetClassType, a member of class IDesignObject.
	GetComponentIndex (see page 11180)	This is GetComponentIndex, a member of class IDesignObject.
	GetComponentName (see page 11180)	This is GetComponentName, a member of class IDesignObject.
	GetIsComponent (see page 11181)	This is GetIsComponent, a member of class IDesignObject.
	GetNamePath (see page 11181)	This is GetNamePath, a member of class IDesignObject.
	GetPersistent (see page 11184)	This is GetPersistent, a member of class IDesignPersistent.

Public Properties

	Name	Description
R	ClassName (see page 11181)	This is ClassName, a member of class IDesignObject.
R	ClassType (see page 11182)	This is ClassType, a member of class IDesignObject.
R	ComponentIndex (see page 11182)	This is ComponentIndex, a member of class IDesignObject.
R	ComponentName (see page 11182)	This is ComponentName, a member of class IDesignObject.
R	IsComponent (see page 11182)	This is IsComponent, a member of class IDesignObject.
R	NamePath (see page 11182)	This is NamePath, a member of class IDesignObject.
R	Persistent (see page 11184)	This is Persistent, a member of class IDesignPersistent.

60.2.14.2 IDesignPersistent Methods

The methods of the IDesignPersistent class are listed here.

Public Methods

	Name	Description
	GetPersistent (see page 11184)	This is GetPersistent, a member of class IDesignPersistent.

60.2.14.2.1 IDesignPersistent.GetPersistent Method

Pascal

```
function GetPersistent: TPersistent;
```

C++

```
__fastcall TPersistent * GetPersistent();
```

Description

This is GetPersistent, a member of class IDesignPersistent.

60.2.14.3 IDesignPersistent Properties

The properties of the IDesignPersistent class are listed here.

Public Properties

	Name	Description
R	Persistent (see page 11184)	This is Persistent, a member of class IDesignPersistent.

60.2.14.3.1 IDesignPersistent.Persistent Property

Pascal

```
property Persistent: TPersistent;
```

C++

```
__property TPersistent * Persistent;
```

Description

This is Persistent, a member of class IDesignPersistent.

60.2.15 IDesignWindow Interface

Class Hierarchy

Pascal

```
IDesignWindow = interface(IDesignNotification);
```

C++

```
__interface IDesignWindow : public IDesignNotification;
```

File

DesignIntf

Description

This is class DesignIntf.IDesignWindow.

60.2.15.1 IDesignWindow Members

The following tables list the members exposed by IDesignWindow.

Public Methods

	Name	Description
	DesignerClosed (see page 11177)	This is DesignerClosed, a member of class IDesignNotification.
	DesignerOpened (see page 11177)	This is DesignerOpened, a member of class IDesignNotification.
	ItemDeleted (see page 11177)	This is ItemDeleted, a member of class IDesignNotification.
	ItemInserted (see page 11177)	This is ItemInserted, a member of class IDesignNotification.
	ItemsModified (see page 11178)	This is ItemsModified, a member of class IDesignNotification.
	SelectionChanged (see page 11178)	This is SelectionChanged, a member of class IDesignNotification.
	WindowHide (see page 11185)	This is WindowHide, a member of class IDesignWindow.
	WindowShow (see page 11185)	This is WindowShow, a member of class IDesignWindow.

60.2.15.2 IDesignWindow Methods

The methods of the IDesignWindow class are listed here.

Public Methods

	Name	Description
	WindowHide (see page 11185)	This is WindowHide, a member of class IDesignWindow.
	WindowShow (see page 11185)	This is WindowShow, a member of class IDesignWindow.

60.2.15.2.1 IDesignWindow.WindowHide Method

Pascal

```
procedure WindowHide;
```

C++

```
__fastcall WindowHide();
```

Description

This is WindowHide, a member of class IDesignWindow.

60.2.15.2.2 IDesignWindow.WindowShow Method

Pascal

```
procedure WindowShow;
```

C++

```
__fastcall WindowShow();
```

Description

This is WindowShow, a member of class IDesignWindow.

60.2.16 IEditHandler Interface

Class Hierarchy

DesignIntf.IEditHandler

Pascal

```
IEditHandler = interface;
```

C++

```
__interface IEditHandler;
```

File

DesignIntf

Description

This is class DesignIntf.IEditHandler.

60.2.16.1 IEditHandler Members

The following tables list the members exposed by IEditHandler.

Public Methods

	Name	Description
	EditAction (see page 11186)	This is EditAction, a member of class IEditHandler.
	GetEditState (see page 11187)	This is GetEditState, a member of class IEditHandler.

60.2.16.2 IEditHandler Methods

The methods of the IEditHandler class are listed here.

Public Methods

	Name	Description
	EditAction (see page 11186)	This is EditAction, a member of class IEditHandler.
	GetEditState (see page 11187)	This is GetEditState, a member of class IEditHandler.

60.2.16.2.1 IEditHandler.EditAction Method

Pascal

```
function EditAction(Action: TEditAction): Boolean;
```

C++

```
__fastcall Boolean EditAction(TEditAction Action);
```

Description

This is EditAction, a member of class IEditHandler.

60.2.16.2.2 IEditHandler.GetEditState Method

Pascal

```
function GetEditState: TEditState;
```

C++

```
__fastcall TEditState GetEditState();
```

Description

This is GetEditState, a member of class IEditHandler.

60.2.17 IEventInfo Interface

Class Hierarchy

DesignIntf.IEventInfo

Pascal

```
IEventInfo = interface;
```

C++

```
__interface IEventInfo;
```

File

DesignIntf

Description

This is class DesignIntf.IEventInfo.

60.2.17.1 IEventInfo Members

The following tables list the members exposed by IEventInfo.

Public Methods

	Name	Description
	GetMethodKind (see page 11188)	This is GetMethodKind, a member of class IEventInfo.
	GetParamCount (see page 11188)	This is GetParamCount, a member of class IEventInfo.
	GetParamFlags (see page 11188)	This is GetParamFlags, a member of class IEventInfo.
	GetParamName (see page 11188)	This is GetParamName, a member of class IEventInfo.
	GetParamType (see page 11189)	This is GetParamType, a member of class IEventInfo.
	GetResultType (see page 11189)	This is GetResultType, a member of class IEventInfo.

60.2.17.2 IEventInfo Methods

The methods of the IEventInfo class are listed here.

Public Methods

	Name	Description
	GetMethodKind (see page 11188)	This is GetMethodKind, a member of class IEventInfo.

	GetParamCount (see page 11188)	This is GetParamCount, a member of class IEventInfo.
	GetParamFlags (see page 11188)	This is GetParamFlags, a member of class IEventInfo.
	GetParamName (see page 11188)	This is GetParamName, a member of class IEventInfo.
	GetParamType (see page 11189)	This is GetParamType, a member of class IEventInfo.
	GetResultType (see page 11189)	This is GetResultType, a member of class IEventInfo.

60.2.17.2.1 IEventInfo.GetMethodKind Method

Pascal

```
function GetMethodKind: TMethodKind;
```

C++

```
__fastcall TMethodKind GetMethodKind();
```

Description

This is GetMethodKind, a member of class IEventInfo.

60.2.17.2.2 IEventInfo.GetParamCount Method

Pascal

```
function GetParamCount: Integer;
```

C++

```
__fastcall int GetParamCount();
```

Description

This is GetParamCount, a member of class IEventInfo.

60.2.17.2.3 IEventInfo.GetParamFlags Method

Pascal

```
function GetParamFlags(Index: Integer): TParamFlags;
```

C++

```
__fastcall TParamFlags GetParamFlags(int Index);
```

Description

This is GetParamFlags, a member of class IEventInfo.

60.2.17.2.4 IEventInfo.GetParamName Method

Pascal

```
function GetParamName(Index: Integer): string;
```

C++

```
__fastcall AnsiString GetParamName(int Index);
```

Description

This is GetParamName, a member of class IEventInfo.

60.2.17.2.5 IEventInfo.GetParamType Method

Pascal

```
function GetParamType(Index: Integer): string;
```

C++

```
__fastcall AnsiString GetParamType(int Index);
```

Description

This is GetParamType, a member of class IEventInfo.

60.2.17.2.6 IEventInfo.GetResultType Method

Pascal

```
function GetResultType: string;
```

C++

```
__fastcall AnsiString GetResultType();
```

Description

This is GetResultType, a member of class IEventInfo.

60.2.18 IHostForm Interface

Class Hierarchy

DesignIntf.IHostForm

Pascal

```
IHostForm = interface;
```

C++

```
__interface IHostForm;
```

File

DesignIntf

Description

This is class DesignIntf.IHostForm.

60.2.18.1 IHostForm Members

The following tables list the members exposed by IHostForm.

Public Methods

	Name	Description
	BringToFront (see page 11191)	This is BringToFront, a member of class IHostForm.
	CheckPosChanged (see page 11191)	This is CheckPosChanged, a member of class IHostForm.
	DeinitializeDesigner (see page 11191)	This is DeinitializeDesigner, a member of class IHostForm.

	GetCanPrint (see page 11191)	This is GetCanPrint, a member of class IHostForm.
	GetCaption (see page 11191)	This is GetCaption, a member of class IHostForm.
	GetDesignerState (see page 11192)	This is GetDesignerState, a member of class IHostForm.
	GetFont (see page 11192)	This is GetFont, a member of class IHostForm.
	GetForm (see page 11192)	This is GetForm, a member of class IHostForm.
	GetFormImage (see page 11192)	This is GetFormImage, a member of class IHostForm.
	GetScrollPos (see page 11193)	This is GetScrollPos, a member of class IHostForm.
	GetVisible (see page 11193)	This is GetVisible, a member of class IHostForm.
	GetWindowState (see page 11193)	This is GetWindowState, a member of class IHostForm.
	HideWindow (see page 11193)	This is HideWindow, a member of class IHostForm.
	IsMenuKey (see page 11193)	This is IsMenuKey, a member of class IHostForm.
	SetCaption (see page 11194)	This is SetCaption, a member of class IHostForm.
	SetDesigner (see page 11194)	This is SetDesigner, a member of class IHostForm.
	SetDesigning (see page 11194)	This is SetDesigning, a member of class IHostForm.
	SetFormDefaults (see page 11194)	This is SetFormDefaults, a member of class IHostForm.
	Show (see page 11195)	This is Show, a member of class IHostForm.
	ShowWindow (see page 11195)	This is ShowWindow, a member of class IHostForm.
	Unmodify (see page 11195)	This is Unmodify, a member of class IHostForm.

Public Properties

	Name	Description
	Caption (see page 11195)	This is Caption, a member of class IHostForm.
R	Visible (see page 11196)	This is Visible, a member of class IHostForm.

60.2.18.2 IHostForm Methods

The methods of the IHostForm class are listed here.

Public Methods

	Name	Description
	BringToFront (see page 11191)	This is BringToFront, a member of class IHostForm.
	CheckPosChanged (see page 11191)	This is CheckPosChanged, a member of class IHostForm.
	DeinitializeDesigner (see page 11191)	This is DeinitializeDesigner, a member of class IHostForm.
	GetCanPrint (see page 11191)	This is GetCanPrint, a member of class IHostForm.
	GetCaption (see page 11191)	This is GetCaption, a member of class IHostForm.
	GetDesignerState (see page 11192)	This is GetDesignerState, a member of class IHostForm.
	GetFont (see page 11192)	This is GetFont, a member of class IHostForm.
	GetForm (see page 11192)	This is GetForm, a member of class IHostForm.
	GetFormImage (see page 11192)	This is GetFormImage, a member of class IHostForm.
	GetScrollPos (see page 11193)	This is GetScrollPos, a member of class IHostForm.
	GetVisible (see page 11193)	This is GetVisible, a member of class IHostForm.
	GetWindowState (see page 11193)	This is GetWindowState, a member of class IHostForm.
	HideWindow (see page 11193)	This is HideWindow, a member of class IHostForm.
	IsMenuKey (see page 11193)	This is IsMenuKey, a member of class IHostForm.
	SetCaption (see page 11194)	This is SetCaption, a member of class IHostForm.
	SetDesigner (see page 11194)	This is SetDesigner, a member of class IHostForm.
	SetDesigning (see page 11194)	This is SetDesigning, a member of class IHostForm.
	SetFormDefaults (see page 11194)	This is SetFormDefaults, a member of class IHostForm.
	Show (see page 11195)	This is Show, a member of class IHostForm.
	ShowWindow (see page 11195)	This is ShowWindow, a member of class IHostForm.
	Unmodify (see page 11195)	This is Unmodify, a member of class IHostForm.

60.2.18.2.1 IHostForm.BringToFront Method

Pascal

```
procedure BringToFront;
```

C++

```
__fastcall BringToFront();
```

Description

This is BringToFront, a member of class IHostForm.

60.2.18.2.2 IHostForm.CheckPosChanged Method

Pascal

```
procedure CheckPosChanged;
```

C++

```
__fastcall CheckPosChanged();
```

Description

This is CheckPosChanged, a member of class IHostForm.

60.2.18.2.3 IHostForm.DeinitializeDesigner Method

Pascal

```
procedure DeinitializeDesigner(ARoot: TComponent);
```

C++

```
__fastcall DeinitializeDesigner(TComponent * ARoot);
```

Description

This is DeinitializeDesigner, a member of class IHostForm.

60.2.18.2.4 IHostForm.GetCanPrint Method

Pascal

```
function GetCanPrint: Boolean;
```

C++

```
__fastcall Boolean GetCanPrint();
```

Description

This is GetCanPrint, a member of class IHostForm.

60.2.18.2.5 IHostForm.GetCaption Method

Pascal

```
function GetCaption: string;
```

C++

```
__fastcall AnsiString GetCaption();
```

Description

This is GetCaption, a member of class IHostForm.

60.2.18.2.6 IHostForm.GetDesignerState Method

Pascal

```
function GetDesignerState: TDesignerState;
```

C++

```
__fastcall TDesignerState GetDesignerState();
```

Description

This is GetDesignerState, a member of class IHostForm.

60.2.18.2.7 IHostForm.GetFont Method

Pascal

```
function GetFont: TPersistent;
```

C++

```
__fastcall TPersistent * GetFont();
```

Description

This is GetFont, a member of class IHostForm.

60.2.18.2.8 IHostForm.GetForm Method

Pascal

```
function GetForm: TComponent;
```

C++

```
__fastcall TComponent * GetForm();
```

Description

This is GetForm, a member of class IHostForm.

60.2.18.2.9 IHostForm.GetFormImage Method

Pascal

```
function GetFormImage: TObject;
```

C++

```
__fastcall TObject * GetFormImage();
```

Description

This is GetFormImage, a member of class IHostForm.

60.2.18.2.10 IHostForm.GetScrollPos Method

Pascal

```
function GetScrollPos(Horiz: Boolean): Integer;
```

C++

```
__fastcall int GetScrollPos(Boolean Horiz);
```

Description

This is GetScrollPos, a member of class IHostForm.

60.2.18.2.11 IHostForm.GetVisible Method

Pascal

```
function GetVisible: Boolean;
```

C++

```
__fastcall Boolean GetVisible();
```

Description

This is GetVisible, a member of class IHostForm.

60.2.18.2.12 IHostForm.GetWindowState Method

Pascal

```
function GetWindowState: TShowState;
```

C++

```
__fastcall TShowState GetWindowState();
```

Description

This is GetWindowState, a member of class IHostForm.

60.2.18.2.13 IHostForm.HideWindow Method

Pascal

```
procedure HideWindow;
```

C++

```
__fastcall HideWindow();
```

Description

This is HideWindow, a member of class IHostForm.

60.2.18.2.14 IHostForm.IsMenuKey Method

Pascal

```
function IsMenuKey(var Message: TWMKey): Boolean;
```

C++

```
__fastcall Boolean IsMenuKey(TWMKey Message);
```

Description

This is IsMenuKey, a member of class IHostForm.

60.2.18.2.15 IHostForm.SetCaption Method

Pascal

```
procedure SetCaption(const ACaption: string);
```

C++

```
__fastcall SetCaption(const AnsiString ACaption);
```

Description

This is SetCaption, a member of class IHostForm.

60.2.18.2.16 IHostForm.SetDesigner Method

Pascal

```
procedure SetDesigner(const ADesigner: IInterface);
```

C++

```
__fastcall SetDesigner(const IInterface ADesigner);
```

Description

This is SetDesigner, a member of class IHostForm.

60.2.18.2.17 IHostForm.SetDesigning Method

Pascal

```
procedure SetDesigning(DesignMode: Boolean);
```

C++

```
__fastcall SetDesigning(Boolean DesignMode);
```

Description

This is SetDesigning, a member of class IHostForm.

60.2.18.2.18 IHostForm.SetFormDefaults Method

Pascal

```
procedure SetFormDefaults(ARoot: TComponent; const ARootName: string; X: Integer; Y: Integer;
Scale: Boolean);
```

C++

```
__fastcall SetFormDefaults(TComponent * ARoot, const AnsiString ARootName, int X, int Y,
Boolean Scale);
```

Description

This is SetFormDefaults, a member of class IHostForm.

60.2.18.2.19 IHostForm.Show Method

Pascal

```
procedure Show;
```

C++

```
__fastcall Show();
```

Description

This is Show, a member of class IHostForm.

60.2.18.2.20 IHostForm.ShowWindow Method

Pascal

```
procedure ShowWindow(AShowState: TShowState);
```

C++

```
__fastcall ShowWindow(TShowState AShowState);
```

Description

This is ShowWindow, a member of class IHostForm.

60.2.18.2.21 IHostForm.Unmodify Method

Pascal

```
procedure Unmodify;
```

C++

```
__fastcall Unmodify();
```

Description

This is Unmodify, a member of class IHostForm.

60.2.18.3 IHostForm Properties

The properties of the IHostForm class are listed here.

Public Properties

	Name	Description
	Caption (see page 11195)	This is Caption, a member of class IHostForm.
R	Visible (see page 11196)	This is Visible, a member of class IHostForm.

60.2.18.3.1 IHostForm.Caption Property

Pascal

```
property Caption: string;
```

C++

```
__property AnsiString Caption;
```

Description

This is Caption, a member of class IHostForm.

60.2.18.3.2 IHostForm.Visible Property

Pascal

```
property Visible: Boolean;
```

C++

```
__property Boolean Visible;
```

Description

This is Visible, a member of class IHostForm.

60.2.19 IImplementation Interface

Class Hierarchy

DesignIntf.IImplementation

Pascal

```
IImplementation = interface;
```

C++

```
__interface IImplementation;
```

File

DesignIntf

Description

This is class DesignIntf.IImplementation.

60.2.19.1 IImplementation Members

The following tables list the members exposed by IImplementation.

Public Methods

	Name	Description
	GetInstance (see page 11197)	This is GetInstance, a member of class IImplementation.

60.2.19.2 IImplementation Methods

The methods of the IImplementation class are listed here.

Public Methods

	Name	Description
	GetInstance (see page 11197)	This is GetInstance, a member of class IImplementation.

60.2.19.2.1 IImplementation.GetInstance Method

Pascal

```
function GetInstance: TObject;
```

C++

```
__fastcall TObject * GetInstance();
```

Description

This is GetInstance, a member of class IImplementation.

60.2.20 IMethodProperty Interface

Class Hierarchy

DesignIntf.IMethodProperty

Pascal

```
IMethodProperty = interface;
```

C++

```
__interface IMethodProperty;
```

File

DesignIntf

Description

This is class DesignIntf.IMethodProperty.

60.2.21 IProperty Interface

IProperty is the interface that the Object Inspector uses to communicate with property editors.

Class Hierarchy

DesignIntf.IProperty

Pascal

```
IProperty = interface;
```

C++

```
__interface IProperty;
```

File

DesignIntf

Description

When you create your own property editors, they must meet two criteria:

They must be descendants of TBasePropertyEditor (see page 11112).

They must implement the IProperty interface.

The Object Inspector uses the methods on the IProperty interface to interact with property editors.

Typically, property editors are derived from TPropertyEditor, which supplies a default implementation for IProperty.

Note: C++ method declarations that use IPropertyServer use the _di_IPropertyServer type instead. This type is a DelphiInterface wrapper around the IProperty interface:

```
typedef System::DelphiInterfaceDelphiInterface_object< IProperty >  _di_IProperty;
```

RegisterPropertyEditor (see page 11229)

TBasePropertyEditor (see page 11112)

TPropertyEditor (see page 11019)

60.2.21.1 IProperty Members

The following tables list the members exposed by IProperty.

Public Methods

	Name	Description
	Activate (see page 11199)	Responds when the property is selected in the Object Inspector.
	AllEqual (see page 11199)	Indicates whether all selected components have the same value for the property.
	AutoFill (see page 11200)	Returns true to indicate that values can be typed incrementally—and automatically completed—in the Object Inspector.
	Edit (see page 11200)	Responds when the user double-clicks the property in the Object Inspector.
	GetAttributes (see page 11200)	Describes the property so the Object Inspector provides the appropriate controls.
	GetEditLimit (see page 11201)	Returns the maximum length, in characters, of the value.
	GetEditValue (see page 11201)	Retrieves a string to represent the property's value, or, if the value is not available, an error message.
	GetName (see page 11202)	Returns the name of the property.
	GetProperties (see page 11202)	Provides the subproperties of the property to a callback procedure.
	GetPropInfo (see page 11202)	Returns the property information record for the object being edited.
	GetPropType (see page 11203)	Returns the type information record for the object being edited.
	GetValue (see page 11203)	Returns the property value formatted as a string.
	GetValues (see page 11203)	Provides the enumerated values of the property to a callback procedure.
	HasInstance (see page 11204)	Indicates whether a specified object is currently being edited by the property editor.
	Revert (see page 11204)	Restores all object properties to their original values.
	SetValue (see page 11204)	Responds when the user changes the value of the property.
	ValueAvailable (see page 11205)	Indicates whether all components being edited have a value for the property if their ComponentStyle includes csCheckPropAvail.

60.2.21.2 IProperty Methods

The methods of the IProperty class are listed here.

Public Methods

	Name	Description
	Activate (see page 11199)	Responds when the property is selected in the Object Inspector.
	AllEqual (see page 11199)	Indicates whether all selected components have the same value for the property.

	AutoFill (see page 11200)	Returns true to indicate that values can be typed incrementally—and automatically completed—in the Object Inspector.
	Edit (see page 11200)	Responds when the user double-clicks the property in the Object Inspector.
	GetAttributes (see page 11200)	Describes the property so the Object Inspector provides the appropriate controls.
	GetEditLimit (see page 11201)	Returns the maximum length, in characters, of the value.
	GetEditValue (see page 11201)	Retrieves a string to represent the property's value, or, if the value is not available, an error message.
	GetName (see page 11202)	Returns the name of the property.
	GetProperties (see page 11202)	Provides the subproperties of the property to a callback procedure.
	GetPropInfo (see page 11202)	Returns the property information record for the object being edited.
	GetPropType (see page 11203)	Returns the type information record for the object being edited.
	GetValue (see page 11203)	Returns the property value formatted as a string.
	GetValues (see page 11203)	Provides the enumerated values of the property to a callback procedure.
	HasInstance (see page 11204)	Indicates whether a specified object is currently being edited by the property editor.
	Revert (see page 11204)	Restores all object properties to their original values.
	SetValue (see page 11204)	Responds when the user changes the value of the property.
	ValueAvailable (see page 11205)	Indicates whether all components being edited have a value for the property if their ComponentStyle includes csCheckPropAvail.

60.2.21.2.1 IProperty.Activate Method

Responds when the property is selected in the Object Inspector.

Pascal

```
procedure Activate;
```

C++

```
__fastcall Activate();
```

Description

The Object Inspector calls Activate when the property is selected. This method lets a property editor determine attributes of the property dynamically when it is displayed in the Object Inspector.

Before Activate is called, the GetAttributes (see page 11200) method does not need to provide accurate information about any attributes other than paSubProperties, paVCL, and paMultiSelect. Any other attributes can be computed in the Activate method and stored so that subsequent calls to GetAttributes (see page 11200) can provide accurate information.

See Also

GetAttributes (see page 11200)

60.2.21.2.2 IProperty.AllEqual Method

Indicates whether all selected components have the same value for the property.

Pascal

```
function AllEqual: Boolean;
```

C++

```
__fastcall Boolean AllEqual();
```

Description

The Object Inspector calls AllEqual when there is more than one component selected to determine whether a value should appear for this property. If this method returns true, the Object Inspector displays a value for the property. If this method returns false, the line for the property in the Object Inspector remains blank.

Note: AllEqual is called only when the value returned by GetAttributes (see page 11200) includes paMultiSelect.

See Also

GetAttributes (see page 11200)

GetValue (see page 11203)

60.2.21.2.3 IProperty.AutoFill Method

Returns true to indicate that values can be typed incrementally—and automatically completed—in the Object Inspector.

Pascal

```
function AutoFill: Boolean;
```

C++

```
__fastcall Boolean AutoFill();
```

Description

If GetAttributes (see page 11200) returns paValueList, the Object Inspector calls AutoFill to verify that automatic typing completion should be permitted. If AutoFill returns true, the Object Inspector uses the values provided by GetValues (see page 11203) to fill in partially typed entries. For example, if the legal values for a property are prSmall and prLarge, the user can type "prS" and the Object Inspector automatically fills in "prSmall."

See Also

GetAttributes (see page 11200)

GetValues (see page 11203)

60.2.21.2.4 IProperty.Edit Method

Responds when the user double-clicks the property in the Object Inspector.

Pascal

```
procedure Edit; overload;
```

C++

```
__fastcall Edit();
```

Description

The Object Inspector calls Edit when the ellipsis button (...) is pressed or the property is double-clicked. Property editors implement this method to respond. For example, the Edit method can bring up a dialog for editing the property or it can change the value to some default.

See Also

GetValues (see page 11203)

GetValue (see page 11203)

60.2.21.2.5 IProperty.GetAttributes Method

Describes the property so the Object Inspector provides the appropriate controls.

Pascal

```
function GetAttributes: TPropertyAttributes;
```

C++

```
__fastcall TPropertyAttributes GetAttributes();
```

Description

The Object Inspector calls GetAttributes to determine what controls to display for the property and what property editor methods to call. GetAttributes returns a set of flags that provide this information.

Before the Object Inspector calls the Activate (see page 11199) method, GetAttributes does not need to provide accurate information about any attributes other than paSubProperties, paVCL, and paMultiSelect.

See Also

Activate (see page 11199)

Edit (see page 11200)

GetProperties (see page 11202)

GetValues (see page 11203)

SetValue (see page 11204)

60.2.21.2.6 IProperty.GetEditLimit Method

Returns the maximum length, in characters, of the value.

Pascal

```
function GetEditLimit: Integer;
```

C++

```
__fastcall int GetEditLimit();
```

Description

The Object Inspector calls GetEditLimit to determine how many characters the user can type when entering a value for the property.

60.2.21.2.7 IProperty.GetEditValue Method

Retrieves a string to represent the property's value, or, if the value is not available, an error message.

Pascal

```
function GetEditValue(out Value: string): Boolean;
```

C++

```
__fastcall Boolean GetEditValue(AnsiString Value);
```

Description

The Object Inspector calls GetEditValue to obtain the string it displays as the property value.

GetValue (see page 11203) formats the string displayed in the Object Inspector to represent the property value and returns it as the Value parameter. Unlike the GetValue (see page 11203) method, GetEditValue does not raise an exception when the property value is unavailable. Instead, it assigns an error message to Value and returns false.

GetValue (see page 11203) returns true if Value returns a string representation of the property value.

See Also

GetValue (see page 11203)

60.2.21.2.8 IProperty.GetName Method

Returns the name of the property.

Pascal

```
function GetName: string;
```

C++

```
__fastcall AnsiString GetName();
```

Description

The Object Inspector calls GetName to obtain the property name that it displays in the left column.

60.2.21.2.9 IProperty.GetProperties Method

Provides the subproperties of the property to a callback procedure.

Pascal

```
procedure GetProperties(Proc: TGetPropProc);
```

C++

```
__fastcall GetProperties(TGetPropProc Proc);
```

Description

The Object Inspector calls GetProperties when the property is expanded to show subproperties. Property editors that return paSubProperties from the GetAttributes (see page 11200) method should implement GetProperties to create an appropriate property editor and pass its IProperty (see page 11197) interface to the Proc parameter for every subproperty (or nested property) of the property.

See Also

GetAttributes (see page 11200)

60.2.21.2.10 IProperty.GetPropInfo Method

Returns the property information record for the object being edited.

Pascal

```
function GetPropInfo: PPropInfo;
```

C++

```
__fastcall PPropInfo GetPropInfo();
```

Description

Call GetPropInfo to access the property information record that describes the property being edited, including its access functions. If more than one object is being edited, GetPropInfo returns the property information record for a representative component.

See Also

GetPropType (see page 11203)

60.2.21.2.11 IProperty.GetPropType Method

Returns the type information record for the object being edited.

Pascal

```
function GetPropType: PTypeInfo;
```

C++

```
__fastcall PTypeInfo GetPropType();
```

Description

Call GetPropType to obtain access to the type information record that describes the type of the property being edited. If more than one object is being edited, GetPropType returns the type information record for a representative component.

See Also

GetPropInfo (see page 11202)

60.2.21.2.12 IProperty.GetValue Method

Returns the property value formatted as a string.

Pascal

```
function GetValue: string;
```

C++

```
__fastcall AnsiString GetValue();
```

Description

GetValue formats the value of the property, formatted as a string. If the value is not available, GetValue raises an exception.

See Also

SetValue (see page 11204)

GetEditValue (see page 11201)

60.2.21.2.13 IProperty.GetValues Method

Provides the enumerated values of the property to a callback procedure.

Pascal

```
procedure GetValues(Proc: TGetStrProc);
```

C++

```
__fastcall GetValues(TGetStrProc Proc);
```

Description

The Object Inspector calls GetValues when the drop-down button is clicked to show enumerated values. Property editors that return paValueList from the GetAttributes (see page 11200) method implement GetValues to call the Proc parameter for every string that can represent a valid enumerated value. Even if the GetAttributes (see page 11200) method does not return paValueList, property editors for enumerated types should still implement GetValues to enumerate all possible values.

See Also

GetAttributes (see page 11200)

GetValue (see page 11203)

60.2.21.2.14 IProperty.HasInstance Method

Indicates whether a specified object is currently being edited by the property editor.

Pascal

```
function HasInstance(Instance: TPersistent): Boolean;
```

C++

```
__fastcall Boolean HasInstance(TPersistent * Instance);
```

Description

HasInstance returns true if the Instance parameter references one of the objects that the property editor is currently editing, false otherwise.

60.2.21.2.15 IProperty.Revert Method

Restores all object properties to their original values.

Pascal

```
procedure Revert;
```

C++

```
__fastcall Revert();
```

Description

Call Revert to restore the original property values that each of the edited objects had before the user began making modification with the Object Inspector. Revert may not work if GetAttributes (see page 11200) returns paAutoUpdate.

See Also

GetAttributes (see page 11200)

60.2.21.2.16 IProperty.SetValue Method

Responds when the user changes the value of the property.

Pascal

```
procedure SetValue(const Value: string);
```

C++

```
__fastcall SetValue(const AnsiString Value);
```

Description

The Object Inspector calls SetValue when the user has finished changing the property value. SetValue applies the value specified by the Value parameter to all components that it is currently editing. If the value can't be set, SetValue raises an exception that describes the problem.

Note: If the property is changed only through a dialog brought up by the Edit (see page 11200) method, the Object Inspector does not call SetValue. Rather, the Edit (see page 11200) method should handle the setting of the value on all components.

See Also

Edit (see page 11200)

60.2.21.2.17 IProperty.ValueAvailable Method

Indicates whether all components being edited have a value for the property if their ComponentStyle includes csCheckPropAvail.

Pascal

```
function ValueAvailable: Boolean;
```

C++

```
__fastcall Boolean ValueAvailable();
```

Description

The Object Inspector calls ValueAvailable to determine which components can be edited for a particular property or which properties can be displayed for a particular component.

See Also

ComponentStyle (see page 2805)

60.2.22 IProperty70 Interface

Class Hierarchy

Pascal

```
IProperty70 = interface(IProperty);
```

C++

```
__interface IProperty70 : public IProperty;
```

File

DesignIntf

Description

This is class DesignIntf.IProperty70.

60.2.22.1 IProperty70 Members

The following tables list the members exposed by IProperty70.

Public Methods

	Name	Description
	Activate (see page 11199)	Responds when the property is selected in the Object Inspector.
	AllEqual (see page 11199)	Indicates whether all selected components have the same value for the property.
	AutoFill (see page 11200)	Returns true to indicate that values can be typed incrementally—and automatically completed—in the Object Inspector.
	Edit (see page 11200)	Responds when the user double-clicks the property in the Object Inspector.
	GetAttributes (see page 11200)	Describes the property so the Object Inspector provides the appropriate controls.
	GetEditLimit (see page 11201)	Returns the maximum length, in characters, of the value.
	GetEditValue (see page 11201)	Retrieves a string to represent the property's value, or, if the value is not available, an error message.
	GetIsDefault (see page 11206)	This is GetIsDefault, a member of class IProperty70.

	GetName (see page 11202)	Returns the name of the property.
	GetProperties (see page 11202)	Provides the subproperties of the property to a callback procedure.
	GetPropInfo (see page 11202)	Returns the property information record for the object being edited.
	GetPropType (see page 11203)	Returns the type information record for the object being edited.
	GetValue (see page 11203)	Returns the property value formatted as a string.
	GetValues (see page 11203)	Provides the enumerated values of the property to a callback procedure.
	HasInstance (see page 11204)	Indicates whether a specified object is currently being edited by the property editor.
	Revert (see page 11204)	Restores all object properties to their original values.
	SetValue (see page 11204)	Responds when the user changes the value of the property.
	ValueAvailable (see page 11205)	Indicates whether all components being edited have a value for the property if their ComponentStyle includes csCheckPropAvail.

Public Properties

	Name	Description
R	IsDefault (see page 11206)	This is IsDefault, a member of class IProperty70.

60.2.22.2 IProperty70 Methods

The methods of the IProperty70 class are listed here.

Public Methods

	Name	Description
	GetIsDefault (see page 11206)	This is GetIsDefault, a member of class IProperty70.

60.2.22.2.1 IProperty70.GetIsDefault Method

Pascal

```
function GetIsDefault: Boolean;
```

C++

```
__fastcall Boolean GetIsDefault();
```

Description

This is GetIsDefault, a member of class IProperty70.

60.2.22.3 IProperty70 Properties

The properties of the IProperty70 class are listed here.

Public Properties

	Name	Description
R	IsDefault (see page 11206)	This is IsDefault, a member of class IProperty70.

60.2.22.3.1 IProperty70.IsDefault Property

Pascal

```
property IsDefault: Boolean;
```

C++

```
__property Boolean IsDefault;
```

Description

This is IsDefault, a member of class IProperty70.

60.2.23 IProperty80 Interface

Class Hierarchy

Pascal

```
IProperty80 = interface(IProperty);
```

C++

```
__interface IProperty80 : public IProperty;
```

File

DesignIntf

Description

This is class DesignIntf.IProperty80.

60.2.23.1 IProperty80 Members

The following tables list the members exposed by IProperty80.

Public Methods

	Name	Description
	Activate (see page 11199)	Responds when the property is selected in the Object Inspector.
	AllEqual (see page 11199)	Indicates whether all selected components have the same value for the property.
	AutoFill (see page 11200)	Returns true to indicate that values can be typed incrementally—and automatically completed—in the Object Inspector.
	Edit (see page 11208)	This is Edit, a member of class IProperty80.
	GetAttributes (see page 11200)	Describes the property so the Object Inspector provides the appropriate controls.
	GetEditLimit (see page 11201)	Returns the maximum length, in characters, of the value.
	GetEditValue (see page 11201)	Retrieves a string to represent the property's value, or, if the value is not available, an error message.
	GetName (see page 11202)	Returns the name of the property.
	GetProperties (see page 11202)	Provides the subproperties of the property to a callback procedure.
	GetPropInfo (see page 11202)	Returns the property information record for the object being edited.
	GetPropType (see page 11203)	Returns the type information record for the object being edited.
	GetValue (see page 11203)	Returns the property value formatted as a string.
	GetValues (see page 11203)	Provides the enumerated values of the property to a callback procedure.
	HasInstance (see page 11204)	Indicates whether a specified object is currently being edited by the property editor.
	Revert (see page 11204)	Restores all object properties to their original values.
	SetValue (see page 11204)	Responds when the user changes the value of the property.
	ValueAvailable (see page 11205)	Indicates whether all components being edited have a value for the property if their ComponentStyle includes csCheckPropAvail.

60.2.23.2 IProperty80 Methods

The methods of the IProperty80 class are listed here.

Public Methods

	Name	Description
	Edit (see page 11208)	This is Edit, a member of class IProperty80.

60.2.23.2.1 IProperty80.Edit Method

Pascal

```
procedure Edit(const Host: IPropertyHost; DblClick: Boolean);
```

C++

```
__fastcall Edit(const IPropertyHost Host, Boolean DblClick);
```

Description

This is Edit, a member of class IProperty80.

60.2.24 IPropertyControl Interface

Class Hierarchy

DesignIntf.IPropertyControl

Pascal

```
IPropertyControl = interface;
```

C++

```
__interface IPropertyControl;
```

File

DesignIntf

Description

This is class DesignIntf.IPropertyControl.

60.2.24.1 IPropertyControl Members

The following tables list the members exposed by IPropertyControl.

Public Methods

	Name	Description
	ClearCache (see page 11209)	This is ClearCache, a member of class IPropertyControl.

60.2.24.2 IPropertyControl Methods

The methods of the IPropertyControl class are listed here.

Public Methods

	Name	Description
	ClearCache (see page 11209)	This is ClearCache, a member of class IPropertyControl.

60.2.24.2.1 IPropertyControl.ClearCache Method

Pascal

```
procedure ClearCache;
```

C++

```
__fastcall ClearCache();
```

Description

This is ClearCache, a member of class IPropertyControl.

60.2.25 IPropertyDescription Interface

Class Hierarchy

DesignIntf.IPropertyDescription

Pascal

```
IPropertyDescription = interface;
```

C++

```
__interface IPropertyDescription;
```

File

DesignIntf

Description

This is class DesignIntf.IPropertyDescription.

60.2.25.1 IPropertyDescription Members

The following tables list the members exposed by IPropertyDescription.

Public Methods

	Name	Description
	GetDescription (see page 11210)	This is GetDescription, a member of class IPropertyDescription.

60.2.25.2 IPropertyDescription Methods

The methods of the IPropertyDescription class are listed here.

Public Methods

	Name	Description
	GetDescription (see page 11210)	This is GetDescription, a member of class IPropertyDescription.

60.2.25.2.1 IPropertyDescription.GetDescription Method

Pascal

```
function GetDescription: string;
```

C++

```
__fastcall AnsiString GetDescription();
```

Description

This is GetDescription, a member of class IPropertyDescription.

60.2.26 IPropertyHost Interface

Class Hierarchy

DesignIntf.IPropertyHost

Pascal

```
IPropertyHost = interface;
```

C++

```
__interface IPropertyHost;
```

File

DesignIntf

Description

This is class DesignIntf.IPropertyHost.

60.2.26.1 IPropertyHost Members

The following tables list the members exposed by IPropertyHost.

Public Methods

	Name	Description
	CloseDropDown (see page 11211)	This is CloseDropDown, a member of class IPropertyHost.
	DropDownControl (see page 11211)	This is DropDownControl, a member of class IPropertyHost.

60.2.26.2 IPropertyHost Methods

The methods of the IPropertyHost class are listed here.

Public Methods

	Name	Description
	CloseDropDown (see page 11211)	This is CloseDropDown, a member of class IPropertyHost.
	DropDownControl (see page 11211)	This is DropDownControl, a member of class IPropertyHost.

60.2.26.2.1 IPropertyHost.CloseDropDown Method

Pascal

```
procedure CloseDropDown;
```

C++

```
__fastcall CloseDropDown();
```

Description

This is CloseDropDown, a member of class IPropertyHost.

60.2.26.2.2 IPropertyHost.DropDownControl Method

Pascal

```
procedure DropDownControl(Control: TPersistent);
```

C++

```
__fastcall DropDownControl(TPersistent * Control);
```

Description

This is DropDownControl, a member of class IPropertyHost.

60.2.27 IPropertyKind Interface

Class Hierarchy

DesignIntf.IPropertyKind

Pascal

```
IPropertyKind = interface;
```

C++

```
__interface IPropertyKind;
```

File

DesignIntf

Description

This is class DesignIntf.IPropertyKind.

60.2.27.1 IPropertyKind Members

The following tables list the members exposed by IPropertyKind.

Public Methods

	Name	Description
	GetKind (see page 11212)	This is GetKind, a member of class IPropertyKind.

Public Properties

	Name	Description
	Kind (see page 11212)	This is Kind, a member of class IPropertyKind.

60.2.27.2 IPropertyKind Methods

The methods of the IPropertyKind class are listed here.

Public Methods

	Name	Description
	GetKind (see page 11212)	This is GetKind, a member of class IPropertyKind.

60.2.27.2.1 IPropertyKind.GetKind Method

Pascal

```
function GetKind: TTypeKind;
```

C++

```
__fastcall TTypeKind GetKind();
```

Description

This is GetKind, a member of class IPropertyKind.

60.2.27.3 IPropertyKind Properties

The properties of the IPropertyKind class are listed here.

Public Properties

	Name	Description
	Kind (see page 11212)	This is Kind, a member of class IPropertyKind.

60.2.27.3.1 IPropertyKind.Kind Property

Pascal

```
property Kind: TTypeKind;
```

C++

```
__property TTypeKind Kind;
```

Description

This is Kind, a member of class IPropertyKind.

60.2.28 IReferenceProperty Interface

Class Hierarchy

DesignIntf.IReferenceProperty

Pascal

```
IReferenceProperty = interface;
```

C++

```
__interface IReferenceProperty;
```

File

DesignIntf

Description

This is class DesignIntf.IReferenceProperty.

60.2.28.1 IReferenceProperty Members

The following tables list the members exposed by IReferenceProperty.

Public Methods

	Name	Description
	GetComponentReference (see page 11213)	This is GetComponentReference, a member of class IReferenceProperty.

60.2.28.2 IReferenceProperty Methods

The methods of the IReferenceProperty class are listed here.

Public Methods

	Name	Description
	GetComponentReference (see page 11213)	This is GetComponentReference, a member of class IReferenceProperty.

60.2.28.2.1 IReferenceProperty.GetComponentReference Method

Pascal

```
function GetComponentReference: TComponent;
```

C++

```
__fastcall TComponent * GetComponentReference();
```

Description

This is GetComponentReference, a member of class IReferenceProperty.

60.2.29 ISelectionEditor Interface

Class Hierarchy

DesignIntf.ISelectionEditor

Pascal

```
ISelectionEditor = interface;
```

C++

```
__interface ISelectionEditor;
```

File

DesignIntf

Description

This is class DesignIntf.ISelectionEditor.

60.2.29.1 ISelectionEditor Members

The following tables list the members exposed by ISelectionEditor.

Public Methods

	Name	Description
	ExecuteVerb (see page 11214)	This is ExecuteVerb, a member of class ISelectionEditor.
	GetVerb (see page 11214)	This is GetVerb, a member of class ISelectionEditor.
	GetVerbCount (see page 11215)	This is GetVerbCount, a member of class ISelectionEditor.
	PrepareItem (see page 11215)	This is PrepareItem, a member of class ISelectionEditor.
	RequiresUnits (see page 11215)	This is RequiresUnits, a member of class ISelectionEditor.

60.2.29.2 ISelectionEditor Methods

The methods of the ISelectionEditor class are listed here.

Public Methods

	Name	Description
	ExecuteVerb (see page 11214)	This is ExecuteVerb, a member of class ISelectionEditor.
	GetVerb (see page 11214)	This is GetVerb, a member of class ISelectionEditor.
	GetVerbCount (see page 11215)	This is GetVerbCount, a member of class ISelectionEditor.
	PrepareItem (see page 11215)	This is PrepareItem, a member of class ISelectionEditor.
	RequiresUnits (see page 11215)	This is RequiresUnits, a member of class ISelectionEditor.

60.2.29.2.1 ISelectionEditor.ExecuteVerb Method

Pascal

```
procedure ExecuteVerb(Index: Integer; const List: IDesignerSelections);
```

C++

```
__fastcall ExecuteVerb(int Index, const IDesignerSelections List);
```

Description

This is ExecuteVerb, a member of class ISelectionEditor.

60.2.29.2.2 ISelectionEditor.GetVerb Method

Pascal

```
function GetVerb(Index: Integer): string;
```

C++

```
__fastcall AnsiString GetVerb(int Index);
```

Description

This is GetVerb, a member of class ISelectionEditor.

60.2.29.2.3 ISelectionEditor.GetVerbCount Method

Pascal

```
function GetVerbCount: Integer;
```

C++

```
__fastcall int GetVerbCount();
```

Description

This is GetVerbCount, a member of class ISelectionEditor.

60.2.29.2.4 ISelectionEditor.PrepareItem Method

Pascal

```
procedure PrepareItem(Index: Integer; const AItem: IMenuItem);
```

C++

```
__fastcall PrepareItem(int Index, const IMenuItem AItem);
```

Description

This is PrepareItem, a member of class ISelectionEditor.

60.2.29.2.5 ISelectionEditor.RequiresUnits Method

Pascal

```
procedure RequiresUnits(Proc: TGetStrProc);
```

C++

```
__fastcall RequiresUnits(TGetStrProc Proc);
```

Description

This is RequiresUnits, a member of class ISelectionEditor.

60.2.30 ISelectionEditorList Interface

Class Hierarchy

DesignIntf.ISelectionEditorList

Pascal

```
ISelectionEditorList = interface;
```

C++

```
__interface ISelectionEditorList;
```

File

DesignIntf

Description

This is class DesignIntf.ISelectionEditorList.

60.2.30.1 ISelectionEditorList Members

The following tables list the members exposed by ISelectionEditorList.

Public Methods

	Name	Description
	Get (see page 11216)	This is Get, a member of class ISelectionEditorList.
	GetCount (see page 11216)	This is GetCount, a member of class ISelectionEditorList.

Public Properties

	Name	Description
R	Count (see page 11217)	This is Count, a member of class ISelectionEditorList.
R	Items (see page 11217)	This is Items, a member of class ISelectionEditorList.

60.2.30.2 ISelectionEditorList Methods

The methods of the ISelectionEditorList class are listed here.

Public Methods

	Name	Description
	Get (see page 11216)	This is Get, a member of class ISelectionEditorList.
	GetCount (see page 11216)	This is GetCount, a member of class ISelectionEditorList.

60.2.30.2.1 ISelectionEditorList.Get Method

Pascal

```
function Get(Index: Integer): ISelectionEditor;
```

C++

```
__fastcall ISelectionEditor Get(int Index);
```

Description

This is Get, a member of class ISelectionEditorList.

60.2.30.2.2 ISelectionEditorList.GetCount Method

Pascal

```
function GetCount: Integer;
```

C++

```
__fastcall int GetCount();
```

Description

This is GetCount, a member of class ISelectionEditorList.

60.2.30.3 ISelectionEditorList Properties

The properties of the ISelectionEditorList class are listed here.

Public Properties

	Name	Description
R	Count (see page 11217)	This is Count, a member of class ISelectionEditorList.
R	Items (see page 11217)	This is Items, a member of class ISelectionEditorList.

60.2.30.3.1 ISelectionEditorList.Count Property

Pascal

```
property Count: Integer;
```

C++

```
__property int Count;
```

Description

This is Count, a member of class ISelectionEditorList.

60.2.30.3.2 ISelectionEditorList.Items Property

Pascal

```
property Items [Index: Integer]: ISelectionEditor;
```

C++

```
__property ISelectionEditor Items[int Index];
```

Description

This is Items, a member of class ISelectionEditorList.

60.2.31 ISelectionPropertyFilter Interface

Class Hierarchy

DesignIntf.ISelectionPropertyFilter

Pascal

```
ISelectionPropertyFilter = interface;
```

C++

```
__interface ISelectionPropertyFilter;
```

File

DesignIntf

Description

This is class DesignIntf.ISelectionPropertyFilter.

60.2.31.1 ISelectionPropertyFilter Members

The following tables list the members exposed by ISelectionPropertyFilter.

Public Methods

	Name	Description
	FilterProperties (see page 11218)	This is FilterProperties, a member of class ISelectionPropertyFilter.

60.2.31.2 ISelectionPropertyFilter Methods

The methods of the ISelectionPropertyFilter class are listed here.

Public Methods

	Name	Description
	FilterProperties (see page 11218)	This is FilterProperties, a member of class ISelectionPropertyFilter.

60.2.31.2.1 ISelectionPropertyFilter.FilterProperties Method

Pascal

```
procedure FilterProperties(const ASelection: IDesignerSelections; const ASelectionProperties:
IInterfaceList);
```

C++

```
__fastcall FilterProperties(const IDesignerSelections ASelection, const IInterfaceList
ASelectionProperties);
```

Description

This is FilterProperties, a member of class ISelectionPropertyFilter.

60.2.32 IShowReferenceProperty Interface

Class Hierarchy

DesignIntf.IShowReferenceProperty

Pascal

```
IShowReferenceProperty = interface;
```

C++

```
__interface IShowReferenceProperty;
```

File

DesignIntf

Description

This is class DesignIntf.IShowReferenceProperty.

60.2.32.1 IShowReferenceProperty Members

The following tables list the members exposed by IShowReferenceProperty.

Public Methods

	Name	Description
	ShowReferenceProperty (see page 11219)	This is ShowReferenceProperty, a member of class IShowReferenceProperty.

60.2.32.2 IShowReferenceProperty Methods

The methods of the IShowReferenceProperty class are listed here.

Public Methods

	Name	Description
	ShowReferenceProperty (see page 11219)	This is ShowReferenceProperty, a member of class IShowReferenceProperty.

60.2.32.2.1 IShowReferenceProperty.ShowReferenceProperty Method

Pascal

```
function ShowReferenceProperty: Boolean;
```

C++

```
__fastcall Boolean ShowReferenceProperty();
```

Description

This is ShowReferenceProperty, a member of class IShowReferenceProperty.

60.2.33 IWideProperty Interface

Class Hierarchy

DesignIntf.IWideProperty

Pascal

```
IWideProperty = interface;
```

C++

```
__interface IWideProperty;
```

File

DesignIntf

Description

This is class DesignIntf.IWideProperty.

60.2.33.1 IWideProperty Members

The following tables list the members exposed by IWideProperty.

Public Methods

	Name	Description
	GetEditValue (see page 11220)	This is GetEditValue, a member of class IWideProperty.
	GetValue (see page 11220)	This is GetValue, a member of class IWideProperty.
	SetValue (see page 11220)	This is SetValue, a member of class IWideProperty.

60.2.33.2 IWideProperty Methods

The methods of the IWideProperty class are listed here.

Public Methods

	Name	Description
	GetEditValue (see page 11220)	This is GetEditValue, a member of class IWideProperty.
	GetValue (see page 11220)	This is GetValue, a member of class IWideProperty.
	SetValue (see page 11220)	This is SetValue, a member of class IWideProperty.

60.2.33.2.1 IWideProperty.GetEditValue Method

Pascal

```
function GetEditValue(out Value: widestring): Boolean;
```

C++

```
__fastcall Boolean GetEditValue(BSTR Value);
```

Description

This is GetEditValue, a member of class IWideProperty.

60.2.33.2.2 IWideProperty.GetValue Method

Pascal

```
function GetValue: WideString;
```

C++

```
__fastcall BSTR GetValue();
```

Description

This is GetValue, a member of class IWideProperty.

60.2.33.2.3 IWideProperty.SetValue Method

Pascal

```
procedure SetValue(const Value: WideString);
```

C++

```
__fastcall SetValue(const BSTR Value);
```

Description

This is SetValue, a member of class IWideProperty.

60.2.34 IWideProperty10 Interface

Class Hierarchy

DesignIntf.IWideProperty10

Pascal

```
IWideProperty10 = interface;
```

C++

```
__interface IWideProperty10;
```

File

DesignIntf

Description

This is class DesignIntf.IWideProperty10.

60.2.34.1 IWideProperty10 Members

The following tables list the members exposed by IWideProperty10.

Public Methods

	Name	Description
	GetName (see page 11221)	This is GetName, a member of class IWideProperty10.
	GetValues (see page 11222)	This is GetValues, a member of class IWideProperty10.

60.2.34.2 IWideProperty10 Methods

The methods of the IWideProperty10 class are listed here.

Public Methods

	Name	Description
	GetName (see page 11221)	This is GetName, a member of class IWideProperty10.
	GetValues (see page 11222)	This is GetValues, a member of class IWideProperty10.

60.2.34.2.1 IWideProperty10.GetName Method

Pascal

```
function GetName: WideString;
```

C++

```
__fastcall BSTR GetName();
```

Description

This is GetName, a member of class IWideProperty10.

60.2.34.2.2 IWideProperty10.GetValues Method

Pascal

```
procedure GetValues(Proc: TGetWideStrProc);
```

C++

```
__fastcall GetValues(TGetWideStrProc Proc);
```

Description

This is GetValues, a member of class IWideProperty10.

60.2.35 IWidePropertyDescription Interface

Class Hierarchy

DesignIntf.IWidePropertyDescription

Pascal

```
IWidePropertyDescription = interface;
```

C++

```
__interface IWidePropertyDescription;
```

File

DesignIntf

Description

This is class DesignIntf.IWidePropertyDescription.

60.2.35.1 IWidePropertyDescription Members

The following tables list the members exposed by IWidePropertyDescription.

Public Methods

	Name	Description
	GetDescription (see page 11223)	This is GetDescription, a member of class IWidePropertyDescription.

60.2.35.2 IWidePropertyDescription Methods

The methods of the IWidePropertyDescription class are listed here.

Public Methods

	Name	Description
	GetDescription (see page 11223)	This is GetDescription, a member of class IWidePropertyDescription.

60.2.35.2.1 IWidePropertyDescription.GetDescription Method

Pascal

```
function GetDescription: WideString;
```

C++

```
__fastcall BSTR GetDescription();
```

Description

This is GetDescription, a member of class IWidePropertyDescription.

60.3 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	CreateSelectionList (see page 11224)	This is function DesignIntf.CreateSelectionList.
	EnableDemandLoadReport (see page 11225)	This is function DesignIntf.EnableDemandLoadReport.
	ForceDemandLoadState (see page 11225)	This is function DesignIntf.ForceDemandLoadState.
	PersistentToDesignObject (see page 11225)	This is function DesignIntf.PersistentToDesignObject.
	RegisterComponentEditor (see page 11226)	This is function DesignIntf.RegisterComponentEditor.
	RegisterComponentGuidelines (see page 11226)	This is function DesignIntf.RegisterComponentGuidelines.
	RegisterCustomModule (see page 11226)	This is function DesignIntf.RegisterCustomModule.
	RegisterDesignDragObject (see page 11227)	This is function DesignIntf.RegisterDesignDragObject.
	RegisterDesignNotification (see page 11227)	This is function DesignIntf.RegisterDesignNotification.
	RegisterDragTarget (see page 11227)	This is function DesignIntf.RegisterDragTarget.
	RegisterIDropTarget (see page 11228)	This is function DesignIntf.RegisterIDropTarget.
	RegisterPropertiesInCategory (see page 11228)	This is function DesignIntf.RegisterPropertiesInCategory.
	RegisterPropertiesInCategory (see page 11228)	This is function DesignIntf.RegisterPropertiesInCategory.
	RegisterPropertiesInCategory (see page 11229)	This is function DesignIntf.RegisterPropertiesInCategory.
	RegisterPropertyEditor (see page 11229)	This is function DesignIntf.RegisterPropertyEditor.
	RegisterPropertyInCategory (see page 11229)	This is function DesignIntf.RegisterPropertyInCategory.
	RegisterPropertyInCategory (see page 11230)	This is function DesignIntf.RegisterPropertyInCategory.
	RegisterPropertyInCategory (see page 11230)	This is function DesignIntf.RegisterPropertyInCategory.
	RegisterPropertyInCategory (see page 11230)	This is function DesignIntf.RegisterPropertyInCategory.
	RegisterPropertyMapper (see page 11231)	This is function DesignIntf.RegisterPropertyMapper.
	RegisterSelectionEditor (see page 11231)	This is function DesignIntf.RegisterSelectionEditor.
	SetPropertyEditorGroup (see page 11231)	This is function DesignIntf.SetPropertyEditorGroup.
	UnlistPublishedProperty (see page 11232)	This is function DesignIntf.UnlistPublishedProperty.
	UnregisterDesignNotification (see page 11232)	This is function DesignIntf.UnregisterDesignNotification.

60.3.1 DesignIntf.CreateSelectionList Function

Pascal

```
function CreateSelectionList: IDesignerSelections;
```

C++

```
IDesignerSelections CreateSelectionList();
```

File

DesignIntf

Description

This is function DesignIntf.CreateSelectionList.

60.3.2 DesignIntf.EnableDemandLoadReport Function

Pascal

```
procedure EnableDemandLoadReport(Detailed: Boolean);
```

C++

```
EnableDemandLoadReport(Boolean Detailed);
```

File

DesignIntf

Description

This is function DesignIntf.EnableDemandLoadReport.

60.3.3 DesignIntf.ForceDemandLoadState Function

Pascal

```
procedure ForceDemandLoadState(DemandLoadState: TDemandLoadState);
```

C++

```
ForceDemandLoadState(TDemandLoadState DemandLoadState);
```

File

DesignIntf

Description

This is function DesignIntf.ForceDemandLoadState.

60.3.4 DesignIntf.PersistentToDesignObject Function

Pascal

```
function PersistentToDesignObject(APersistent: TPersistent): IDesignObject;
```

C++

```
IDesignObject PersistentToDesignObject(TPersistent * APersistent);
```

File

DesignIntf

Description

This is function DesignIntf.PersistentToDesignObject.

60.3.5 DesignIntf.RegisterComponentEditor Function

Pascal

```
procedure RegisterComponentEditor(ComponentClass: TComponentClass; ComponentEditor:
TComponentEditorClass);
```

C++

```
RegisterComponentEditor(TComponentClass ComponentClass, TComponentEditorClass ComponentEditor);
```

File

DesignIntf

Description

This is function DesignIntf.RegisterComponentEditor.

60.3.6 DesignIntf.RegisterComponentGuidelines Function

Pascal

```
procedure RegisterComponentGuidelines(AComponentClass: TComponentClass;
AComponentGuidelinesClass: TComponentGuidelinesClass);
```

C++

```
RegisterComponentGuidelines(TComponentClass AComponentClass, TComponentGuidelinesClass
AComponentGuidelinesClass);
```

File

DesignIntf

Description

This is function DesignIntf.RegisterComponentGuidelines.

60.3.7 DesignIntf.RegisterCustomModule Function

Pascal

```
procedure RegisterCustomModule(ComponentBaseClass: TComponentClass; CustomModuleClass:
TCustomModuleClass);
```

C++

```
RegisterCustomModule(TComponentClass ComponentBaseClass, TCustomModuleClass CustomModuleClass);
```

File

DesignIntf

Description

This is function DesignIntf.RegisterCustomModule.

60.3.8 DesignIntf.RegisterDesignDragObject Function

Pascal

```
procedure RegisterDesignDragObject(DragObjectClass: TDragObjectClass);
```

C++

```
RegisterDesignDragObject(TDragObjectClass DragObjectClass);
```

File

DesignIntf

Description

This is function DesignIntf.RegisterDesignDragObject.

60.3.9 DesignIntf.RegisterDesignNotification Function

Pascal

```
procedure RegisterDesignNotification(const DesignNotification: IDesignNotification);
```

C++

```
RegisterDesignNotification(const IDesignNotification DesignNotification);
```

File

DesignIntf

Description

This is function DesignIntf.RegisterDesignNotification.

60.3.10 DesignIntf.RegisterDragTarget Function

Pascal

```
procedure RegisterDragTarget(const SourceName: string; TargetClass: TDragTargetClass);
```

C++

```
RegisterDragTarget(const AnsiString SourceName, TDragTargetClass TargetClass);
```

File

DesignIntf

Description

This is function DesignIntf.RegisterDragTarget.

60.3.11 DesignIntf.RegisterIDropTarget Function

Pascal

```
procedure RegisterIDropTarget(const ADropTarget: IDropTarget);
```

C++

```
RegisterIDropTarget(const IDropTarget ADropTarget);
```

File

DesignIntf

Description

This is function DesignIntf.RegisterIDropTarget.

60.3.12 DesignIntf.RegisterPropertiesInCategory Function

Pascal

```
procedure RegisterPropertiesInCategory(const CategoryName: string; PropertyType: PTypeInfo;
const Filters: array of string); overload;
```

C++

```
RegisterPropertiesInCategory(const AnsiString CategoryName, PTypeInfo PropertyType, const
array of string Filters);
```

File

DesignIntf

Description

This is function DesignIntf.RegisterPropertiesInCategory.

60.3.13 DesignIntf.RegisterPropertiesInCategory Function

Pascal

```
procedure RegisterPropertiesInCategory(const CategoryName: string; ComponentClass: TClass;
const Filters: array of string); overload;
```

C++

```
RegisterPropertiesInCategory(const AnsiString CategoryName, TClass ComponentClass, const array
of string Filters);
```

File

DesignIntf

Description

This is function DesignIntf.RegisterPropertiesInCategory.

60.3.14 DesignIntf.RegisterPropertiesInCategory Function

Pascal

```
procedure RegisterPropertiesInCategory(const CategoryName: string; const Filters: array of
const); overload;
```

C++

```
RegisterPropertiesInCategory(const AnsiString CategoryName, const array of const Filters);
```

File

DesignIntf

Description

This is function DesignIntf.RegisterPropertiesInCategory.

60.3.15 DesignIntf.RegisterPropertyEditor Function

Pascal

```
procedure RegisterPropertyEditor(PropertyType: PTypeInfo; ComponentClass: TClass; const
PropertyName: string; EditorClass: TPropertyEditorClass);
```

C++

```
RegisterPropertyEditor(PTypeInfo PropertyType, TClass ComponentClass, const AnsiString
PropertyName, TPropertyEditorClass EditorClass);
```

File

DesignIntf

Description

This is function DesignIntf.RegisterPropertyEditor.

60.3.16 DesignIntf.RegisterPropertyInCategory Function

Pascal

```
procedure RegisterPropertyInCategory(const CategoryName: string; PropertyType: PTypeInfo);
overload;
```

C++

```
RegisterPropertyInCategory(const AnsiString CategoryName, PTypeInfo PropertyType);
```

File

DesignIntf

Description

This is function DesignIntf.RegisterPropertyInCategory.

60.3.17 DesignIntf.RegisterPropertyInCategory Function

Pascal

```
procedure RegisterPropertyInCategory(const CategoryName: string; PropertyType: PTypeInfo;
const PropertyName: string); overload;
```

C++

```
RegisterPropertyInCategory(const AnsiString CategoryName, PTypeInfo PropertyType, const
AnsiString PropertyName);
```

File

DesignIntf

Description

This is function DesignIntf.RegisterPropertyInCategory.

60.3.18 DesignIntf.RegisterPropertyInCategory Function

Pascal

```
procedure RegisterPropertyInCategory(const CategoryName: string; ComponentClass: TClass; const
PropertyName: string); overload;
```

C++

```
RegisterPropertyInCategory(const AnsiString CategoryName, TClass ComponentClass, const
AnsiString PropertyName);
```

File

DesignIntf

Description

This is function DesignIntf.RegisterPropertyInCategory.

60.3.19 DesignIntf.RegisterPropertyInCategory Function

Pascal

```
procedure RegisterPropertyInCategory(const CategoryName: string; const PropertyName: string);
overload;
```

C++

```
RegisterPropertyInCategory(const AnsiString CategoryName, const AnsiString PropertyName);
```

File

DesignIntf

Description

This is function DesignIntf.RegisterPropertyInCategory.

60.3.20 DesignIntf.RegisterPropertyMapper Function

Pascal

```
procedure RegisterPropertyMapper(Mapper: TPropertyMapperFunc);
```

C++

```
RegisterPropertyMapper(TPropertyMapperFunc Mapper);
```

File

DesignIntf

Description

This is function DesignIntf.RegisterPropertyMapper.

60.3.21 DesignIntf.RegisterSelectionEditor Function

Pascal

```
procedure RegisterSelectionEditor(AClass: TClass; AEditor: TSelectionEditorClass);
```

C++

```
RegisterSelectionEditor(TClass AClass, TSelectionEditorClass AEditor);
```

File

DesignIntf

Description

This is function DesignIntf.RegisterSelectionEditor.

60.3.22 DesignIntf.SetPropertyEditorGroup Function

Pascal

```
procedure SetPropertyEditorGroup(EditorClass: TPropertyEditorClass; GroupClass:
TPersistentClass);
```

C++

```
SetPropertyEditorGroup(TPropertyEditorClass EditorClass, TPersistentClass GroupClass);
```

File

DesignIntf

Description

This is function DesignIntf.SetPropertyEditorGroup.

60.3.23 DesignIntf.UnlistPublishedProperty Function

Pascal

```
procedure UnlistPublishedProperty(ComponentClass: TClass; const PropertyName: string);
```

C++

```
UnlistPublishedProperty(TClass ComponentClass, const AnsiString PropertyName);
```

File

DesignIntf

Description

This is function DesignIntf.UnlistPublishedProperty.

60.3.24 DesignIntf.UnregisterDesignNotification Function

Pascal

```
procedure UnregisterDesignNotification(const DesignNotification: IDesignNotification);
```

C++

```
UnregisterDesignNotification(const IDesignNotification DesignNotification);
```

File

DesignIntf

Description

This is function DesignIntf.UnregisterDesignNotification.

60.4 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TCustomModuleAttribute (see page 11233)	This is record DesignIntf.TCustomModuleAttribute.
	TDemandLoadState (see page 11233)	This is record DesignIntf.TDemandLoadState.
	TDesignerGuideType (see page 11234)	This is record DesignIntf.TDesignerGuideType.
	TEditAction (see page 11234)	This is record DesignIntf.TEditAction.
	TEditStates (see page 11235)	This is record DesignIntf.TEditStates.
	TPropertyAttribute (see page 11236)	This is record DesignIntf.TPropertyAttribute.
	TPropKind (see page 11237)	This is record DesignIntf.TPropKind.

60.4.1 DesignIntf.TCustomModuleAttribute Enumeration

Pascal

```
TCustomModuleAttribute = (
  cmaVirtualSize
);
```

C++

```
enum TCustomModuleAttribute {
  cmaVirtualSize
};
```

File

DesignIntf

Description

This is record DesignIntf.TCustomModuleAttribute.

60.4.2 DesignIntf.TDemandLoadState Enumeration

Pascal

```
TDemandLoadState = (
  dlDefault,
  dlDisable,
  dlEnable
);
```

C++

```
enum TDemandLoadState {
  dlDefault,
  dlDisable,
  dlEnable
};
```

File

DesignIntf

Description

This is record DesignIntf.TDemandLoadState.

60.4.3 DesignIntf.TDesignerGuideType Enumeration

Pascal

```
TDesignerGuideType = (
  gtAlignLeft,
  gtAlignTop,
  gtAlignRight,
  gtAlignBottom,
  gtMarginLeft,
  gtMarginTop,
  gtMarginRight,
  gtMarginBottom,
  gtPaddingLeft,
  gtPaddingTop,
  gtPaddingRight,
  gtPaddingBottom,
  gtBaseline
);
```

C++

```
enum TDesignerGuideType {
  gtAlignLeft,
  gtAlignTop,
  gtAlignRight,
  gtAlignBottom,
  gtMarginLeft,
  gtMarginTop,
  gtMarginRight,
  gtMarginBottom,
  gtPaddingLeft,
  gtPaddingTop,
  gtPaddingRight,
  gtPaddingBottom,
  gtBaseline
};
```

File

DesignIntf

Description

This is record DesignIntf.TDesignerGuideType.

60.4.4 DesignIntf.TEditAction Enumeration

Pascal

```
TEditAction = (
  eaUndo,
```

```
    eaRedo,
    eaCut,
    eaCopy,
    eaPaste,
    eaDelete,
    eaSelectAll,
    eaPrint,
    eaElide
  );
```

C++

```
  enum TEditAction {
    eaUndo,
    eaRedo,
    eaCut,
    eaCopy,
    eaPaste,
    eaDelete,
    eaSelectAll,
    eaPrint,
    eaElide
  };
```

File

DesignIntf

Description

This is record DesignIntf.TEditAction.

60.4.5 DesignIntf.TEditStates Enumeration

Pascal

```
  TEditStates = (
    esCanUndo,
    esCanRedo,
    esCanCut,
    esCanCopy,
    esCanPaste,
    esCanDelete,
    esCanEditOle,
    esCanPrint,
    esCanSelectAll,
    esCanCreateTemplate,
    esCanElide
  );
```

C++

```
  enum TEditStates {
    esCanUndo,
    esCanRedo,
    esCanCut,
    esCanCopy,
    esCanPaste,
    esCanDelete,
    esCanEditOle,
    esCanPrint,
    esCanSelectAll,
    esCanCreateTemplate,
    esCanElide
  };
```

File

DesignIntf

Description

This is record DesignIntf.TEditStates.

60.4.6 DesignIntf.TPropertyAttribute Enumeration

Pascal

```
TPropertyAttribute = (
  paValueList,
  paSubProperties,
  paDialog,
  paMultiSelect,
  paAutoUpdate,
  paSortList,
  paReadOnly,
  paRevertable,
  paFullWidthName,
  paVolatileSubProperties,
  paVCL,
  paNotNestable,
  paDisplayReadOnly,
  paCustomDropDown,
  paValueEditable
);
```

C++

```
enum TPropertyAttribute {
  paValueList,
  paSubProperties,
  paDialog,
  paMultiSelect,
  paAutoUpdate,
  paSortList,
  paReadOnly,
  paRevertable,
  paFullWidthName,
  paVolatileSubProperties,
  paVCL,
  paNotNestable,
  paDisplayReadOnly,
  paCustomDropDown,
  paValueEditable
};
```

File

DesignIntf

Description

This is record DesignIntf.TPropertyAttribute.

60.4.7 DesignIntf.TPropKind Enumeration

Pascal

```
TPropKind = (
  pkProperties,
  pkEvents
);
```

C++

```
enum TPropKind {
  pkProperties,
  pkEvents
};
```

File

DesignIntf

Description

This is record DesignIntf.TPropKind.

60.5 Types

The following table lists types in this documentation.

Types

Name	Description
IDesignEditQuery (see page 11238)	This is type DesignIntf.IDesignEditQuery.
TComponentEditorClass (see page 11239)	This is type DesignIntf.TComponentEditorClass.
TComponentGuidelinesClass (see page 11239)	This is type DesignIntf.TComponentGuidelinesClass.
TCustomModuleAttributes (see page 11239)	This is type DesignIntf.TCustomModuleAttributes.
TCustomModuleClass (see page 11240)	This is type DesignIntf.TCustomModuleClass.
TDragTargetClass (see page 11240)	This is type DesignIntf.TDragTargetClass.
TEditState (see page 11240)	This is type DesignIntf.TEditState.
TEnableDemandLoadReportProc (see page 11241)	This is type DesignIntf.TEnableDemandLoadReportProc.
TForceDemandLoadStateProc (see page 11241)	This is type DesignIntf.TForceDemandLoadStateProc.
TGetDesignerEvent (see page 11241)	This is type DesignIntf.TGetDesignerEvent.
TGetPropProc (see page 11242)	This is type DesignIntf.TGetPropProc.
TGetWideStrProc (see page 11242)	This is type DesignIntf.TGetWideStrProc.
TPropertyAttributes (see page 11242)	This is type DesignIntf.TPropertyAttributes.
TPropertyEditorClass (see page 11243)	This is type DesignIntf.TPropertyEditorClass.
TPropertyEditorFilterFunc (see page 11243)	This is type DesignIntf.TPropertyEditorFilterFunc.
TPropertyMapperFunc (see page 11243)	This is type DesignIntf.TPropertyMapperFunc.
TRegisterComponentEditorProc (see page 11244)	This is type DesignIntf.TRegisterComponentEditorProc.
TRegisterComponentGuidelines (see page 11244)	This is type DesignIntf.TRegisterComponentGuidelines.
TRegisterCustomModuleProc (see page 11244)	This is type DesignIntf.TRegisterCustomModuleProc.
TRegisterDesignDragObject (see page 11245)	This is type DesignIntf.TRegisterDesignDragObject.
TRegisterDesignNotification (see page 11245)	This is type DesignIntf.TRegisterDesignNotification.
TRegisterDragTargetProc (see page 11245)	This is type DesignIntf.TRegisterDragTargetProc.
TRegisterIDropTarget (see page 11246)	This is type DesignIntf.TRegisterIDropTarget.
TRegisterPropertyEditorProc (see page 11246)	This is type DesignIntf.TRegisterPropertyEditorProc.
TRegisterPropertyInCategoryProc (see page 11246)	This is type DesignIntf.TRegisterPropertyInCategoryProc.
TRegisterPropertyMapperProc (see page 11247)	This is type DesignIntf.TRegisterPropertyMapperProc.
TRegisterSelectionEditorProc (see page 11247)	This is type DesignIntf.TRegisterSelectionEditorProc.
TSelectionEditorClass (see page 11247)	This is type DesignIntf.TSelectionEditorClass.
TSetPropertyEditorGroupProc (see page 11248)	This is type DesignIntf.TSetPropertyEditorGroupProc.

60.5.1 DesignIntf.IDesignEditQuery Type

Pascal

```
IDesignEditQuery = IEditHandler;
```

C++

```
IEditHandler IDesignEditQuery;
```

File

DesignIntf

Description

This is type DesignIntf.IDesignEditQuery.

60.5.2 DesignIntf.TComponentEditorClass Type

Pascal

```
TComponentEditorClass = class of TBaseComponentEditor;
```

C++

```
TBaseComponentEditor TComponentEditorClass;
```

File

DesignIntf

Description

This is type DesignIntf.TComponentEditorClass.

60.5.3 DesignIntf.TComponentGuidelinesClass Type

Pascal

```
TComponentGuidelinesClass = class of TBaseComponentGuidelines;
```

C++

```
TBaseComponentGuidelines TComponentGuidelinesClass;
```

File

DesignIntf

Description

This is type DesignIntf.TComponentGuidelinesClass.

60.5.4 DesignIntf.TCustomModuleAttributes Type

Pascal

```
TCustomModuleAttributes = set of TCustomModuleAttribute;
```

C++

```
TCustomModuleAttribute TCustomModuleAttributes;
```

File

DesignIntf

Description

This is type DesignIntf.TCustomModuleAttributes.

60.5.5 DesignIntf.TCustomModuleClass Type

Pascal

```
TCustomModuleClass = class of TBaseCustomModule;
```

C++

```
TBaseCustomModule TCustomModuleClass;
```

File

DesignIntf

Description

This is type DesignIntf.TCustomModuleClass.

60.5.6 DesignIntf.TDragTargetClass Type

Pascal

```
TDragTargetClass = class of TDragTarget;
```

C++

```
TDragTarget TDragTargetClass;
```

File

DesignIntf

Description

This is type DesignIntf.TDragTargetClass.

60.5.7 DesignIntf.TEditState Type

Pascal

```
TEditState = set of TEditStates;
```

C++

```
TEditStates TEditState;
```

File

DesignIntf

Description

This is type DesignIntf.TEditState.

60.5.8 DesignIntf.TEnableDemandLoadReportProc Type

Pascal

```
TEnableDemandLoadReportProc = procedure (Detailed: Boolean);
```

C++

```
(Detailed: Boolean) ( TEnableDemandLoadReportProc)();
```

File

DesignIntf

Description

This is type DesignIntf.TEnableDemandLoadReportProc.

60.5.9 DesignIntf.TForceDemandLoadStateProc Type

Pascal

```
TForceDemandLoadStateProc = procedure (DemandLoadState: TDemandLoadState);
```

C++

```
(DemandLoadState: TDemandLoadState) ( TForceDemandLoadStateProc)();
```

File

DesignIntf

Description

This is type DesignIntf.TForceDemandLoadStateProc.

60.5.10 DesignIntf.TGetDesignerEvent Type

Pascal

```
TGetDesignerEvent = procedure (Sender: TObject; out ADesigner: IDesigner) of object;
```

C++

```
(Sender: TObject; out ADesigner: IDesigner) ( TGetDesignerEvent)();
```

File

DesignIntf

Description

This is type DesignIntf.TGetDesignerEvent.

60.5.11 DesignIntf.TGetPropProc Type

Pascal

```
TGetPropProc = procedure (const Prop: IProperty) of object;
```

C++

```
(const Prop: IProperty) ( TGetPropProc)();
```

File

DesignIntf

Description

This is type DesignIntf.TGetPropProc.

60.5.12 DesignIntf.TGetWideStrProc Type

Pascal

```
TGetWideStrProc = procedure (const S: WideString) of object;
```

C++

```
(const S: WideString) ( TGetWideStrProc)();
```

File

DesignIntf

Description

This is type DesignIntf.TGetWideStrProc.

60.5.13 DesignIntf.TPropertyAttributes Type

Pascal

```
TPropertyAttributes = set of TPropertyAttribute;
```

C++

```
TPropertyAttribute TPropertyAttributes;
```

File

DesignIntf

Description

This is type DesignIntf.TPropertyAttributes.

60.5.14 DesignIntf.TPropertyEditorClass Type

Pascal

```
TPropertyEditorClass = class of TBasePropertyEditor;
```

C++

```
TBasePropertyEditor TPropertyEditorClass;
```

File

DesignIntf

Description

This is type DesignIntf.TPropertyEditorClass.

60.5.15 DesignIntf.TPropertyEditorFilterFunc Type

Pascal

```
TPropertyEditorFilterFunc = function (const ATestEditor: IProperty): Boolean of object;
```

C++

```
(const ATestEditor: IProperty): Boolean ( TPropertyEditorFilterFunc)();
```

File

DesignIntf

Description

This is type DesignIntf.TPropertyEditorFilterFunc.

60.5.16 DesignIntf.TPropertyMapperFunc Type

Pascal

```
TPropertyMapperFunc = function (Obj: TPersistent; PropInfo: PPropInfo): TPropertyEditorClass;
```

C++

```
(Obj: TPersistent; PropInfo: PPropInfo): TPropertyEditorClass ( TPropertyMapperFunc)();
```

File

DesignIntf

Description

This is type DesignIntf.TPropertyMapperFunc.

60.5.17 DesignIntf.TRegisterComponentEditorProc Type

Pascal

```
TRegisterComponentEditorProc = procedure (ComponentClass: TComponentClass; ComponentEditor:
TComponentEditorClass);
```

C++

```
(ComponentClass: TComponentClass; ComponentEditor: TComponentEditorClass) (
TRegisterComponentEditorProc)();
```

File

DesignIntf

Description

This is type DesignIntf.TRegisterComponentEditorProc.

60.5.18 DesignIntf.TRegisterComponentGuidelines Type

Pascal

```
TRegisterComponentGuidelines = procedure (AComponentClass: TComponentClass;
AComponentGuidelineClass: TComponentGuidelinesClass);
```

C++

```
(AComponentClass: TComponentClass; AComponentGuidelineClass: TComponentGuidelinesClass) (
TRegisterComponentGuidelines)();
```

File

DesignIntf

Description

This is type DesignIntf.TRegisterComponentGuidelines.

60.5.19 DesignIntf.TRegisterCustomModuleProc Type

Pascal

```
TRegisterCustomModuleProc = procedure (Group: Integer; ComponentBaseClass: TComponentClass;
CustomModuleClass: TCustomModuleClass);
```

C++

```
(Group: Integer; ComponentBaseClass: TComponentClass; CustomModuleClass: TCustomModuleClass) (
TRegisterCustomModuleProc)();
```

File

DesignIntf

Description

This is type DesignIntf.TRegisterCustomModuleProc.

60.5.20 DesignIntf.TRegisterDesignDragObject Type

Pascal

```
TRegisterDesignDragObject = procedure (DragObjectClass: TDragObjectClass);
```

C++

```
(DragObjectClass: TDragObjectClass) ( TRegisterDesignDragObject)();
```

File

DesignIntf

Description

This is type DesignIntf.TRegisterDesignDragObject.

60.5.21 DesignIntf.TRegisterDesignNotification Type

Pascal

```
TRegisterDesignNotification = procedure (const DesignNotification: IDesignNotification);
```

C++

```
(const DesignNotification: IDesignNotification) ( TRegisterDesignNotification)();
```

File

DesignIntf

Description

This is type DesignIntf.TRegisterDesignNotification.

60.5.22 DesignIntf.TRegisterDragTargetProc Type

Pascal

```
TRegisterDragTargetProc = procedure (const SourceName: string; TargetClass: TDragTargetClass);
```

C++

```
(const SourceName: string; TargetClass: TDragTargetClass) ( TRegisterDragTargetProc)();
```

File

DesignIntf

Description

This is type DesignIntf.TRegisterDragTargetProc.

60.5.23 DesignIntf.TRegisterIDropTarget Type

Pascal

```
TRegisterIDropTarget = procedure (const ADropTarget: IDropTarget);
```

C++

```
(const ADropTarget: IDropTarget) ( TRegisterIDropTarget)();
```

File

DesignIntf

Description

This is type DesignIntf.TRegisterIDropTarget.

60.5.24 DesignIntf.TRegisterPropertyEditorProc Type

Pascal

```
TRegisterPropertyEditorProc = procedure (PropertyType: PTypeInfo; ComponentClass: TClass;
const PropertyName: string; EditorClass: TPropertyEditorClass);
```

C++

```
(PropertyType: PTypeInfo; ComponentClass: TClass; const PropertyName: string; EditorClass:
TPropertyEditorClass) ( TRegisterPropertyEditorProc)();
```

File

DesignIntf

Description

This is type DesignIntf.TRegisterPropertyEditorProc.

60.5.25 DesignIntf.TRegisterPropertyInCategoryProc Type

Pascal

```
TRegisterPropertyInCategoryProc = procedure (const CategoryName: string; ComponentClass:
TClass; PropertyType: PTypeInfo; const PropertyName: string);
```

C++

```
(const CategoryName: string; ComponentClass: TClass; PropertyType: PTypeInfo; const
PropertyName: string) ( TRegisterPropertyInCategoryProc)();
```

File

DesignIntf

Description

This is type DesignIntf.TRegisterPropertyInCategoryProc.

60.5.26 DesignIntf.TRegisterPropertyMapperProc Type

Pascal

```
TRegisterPropertyMapperProc = procedure (Mapper: TPropertyMapperFunc);
```

C++

```
(Mapper: TPropertyMapperFunc) ( TRegisterPropertyMapperProc)();
```

File

DesignIntf

Description

This is type DesignIntf.TRegisterPropertyMapperProc.

60.5.27 DesignIntf.TRegisterSelectionEditorProc Type

Pascal

```
TRegisterSelectionEditorProc = procedure (AClass: TClass; AEditor: TSelectionEditorClass);
```

C++

```
(AClass: TClass; AEditor: TSelectionEditorClass) ( TRegisterSelectionEditorProc)();
```

File

DesignIntf

Description

This is type DesignIntf.TRegisterSelectionEditorProc.

60.5.28 DesignIntf.TSelectionEditorClass Type

Pascal

```
TSelectionEditorClass = class of TBaseSelectionEditor;
```

C++

```
TBaseSelectionEditor TSelectionEditorClass;
```

File

DesignIntf

Description

This is type DesignIntf.TSelectionEditorClass.

60.5.29 DesignIntf.TSetPropertyEditorGroupProc Type

Pascal

```
TSetPropertyEditorGroupProc = procedure (EditorClass: TPropertyEditorClass; GroupClass:
TPersistentClass);
```

C++

```
(EditorClass: TPropertyEditorClass; GroupClass: TPersistentClass) (
TSetPropertyEditorGroupProc)();
```

File

DesignIntf

Description

This is type DesignIntf.TSetPropertyEditorGroupProc.

60.6 Variables

The following table lists variables in this documentation.

Variables

Name	Description
EnableDemandLoadReportProc (see page 11249)	This is variable DesignIntf.EnableDemandLoadReportProc.
ForceDemandLoadStateProc (see page 11249)	This is variable DesignIntf.ForceDemandLoadStateProc.
GReferenceExpandable (see page 11250)	This is variable DesignIntf.GReferenceExpandable.
GShowReadOnlyProps (see page 11250)	This is variable DesignIntf.GShowReadOnlyProps.
RegisterComponentEditorProc (see page 11250)	This is variable DesignIntf.RegisterComponentEditorProc.
RegisterComponentGuidelinesProc (see page 11251)	This is variable DesignIntf.RegisterComponentGuidelinesProc.
RegisterCustomModuleProc (see page 11251)	This is variable DesignIntf.RegisterCustomModuleProc.
RegisterDesignDragObjectProc (see page 11251)	This is variable DesignIntf.RegisterDesignDragObjectProc.
RegisterDesignNotificationProc (see page 11252)	This is variable DesignIntf.RegisterDesignNotificationProc.
RegisterDragTargetProc (see page 11252)	This is variable DesignIntf.RegisterDragTargetProc.
RegisterIDropTargetProc (see page 11252)	This is variable DesignIntf.RegisterIDropTargetProc.
RegisterPropertyEditorProc (see page 11253)	This is variable DesignIntf.RegisterPropertyEditorProc.
RegisterPropertyInCategoryProc (see page 11253)	This is variable DesignIntf.RegisterPropertyInCategoryProc.
RegisterPropertyMapperProc (see page 11253)	This is variable DesignIntf.RegisterPropertyMapperProc.
RegisterSelectionEditorProc (see page 11254)	This is variable DesignIntf.RegisterSelectionEditorProc.
SetPropertyEditorGroupProc (see page 11254)	This is variable DesignIntf.SetPropertyEditorGroupProc.
UnregisterDesignNotificationProc (see page 11254)	This is variable DesignIntf.UnregisterDesignNotificationProc.

60.6.1 DesignIntf.EnableDemandLoadReportProc Variable

Pascal

```
EnableDemandLoadReportProc: TEnableDemandLoadReportProc;
```

C++

```
TEnableDemandLoadReportProc EnableDemandLoadReportProc;
```

File

DesignIntf

Description

This is variable DesignIntf.EnableDemandLoadReportProc.

60.6.2 DesignIntf.ForceDemandLoadStateProc Variable

Pascal

```
ForceDemandLoadStateProc: TForceDemandLoadStateProc;
```

C++

```
TForceDemandLoadStateProc ForceDemandLoadStateProc;
```

File

DesignIntf

Description

This is variable DesignIntf.ForceDemandLoadStateProc.

60.6.3 DesignIntf.GReferenceExpandable Variable

Pascal

```
GReferenceExpandable: Boolean = True;
```

C++

```
Boolean GReferenceExpandable = True;
```

File

DesignIntf

Description

This is variable DesignIntf.GReferenceExpandable.

60.6.4 DesignIntf.GShowReadOnlyProps Variable

Pascal

```
GShowReadOnlyProps: Boolean = True;
```

C++

```
Boolean GShowReadOnlyProps = True;
```

File

DesignIntf

Description

This is variable DesignIntf.GShowReadOnlyProps.

60.6.5 DesignIntf.RegisterComponentEditorProc Variable

Pascal

```
RegisterComponentEditorProc: TRegisterComponentEditorProc;
```

C++

```
TRegisterComponentEditorProc RegisterComponentEditorProc;
```

File

DesignIntf

Description

This is variable DesignIntf.RegisterComponentEditorProc.

60.6.6 DesignIntf.RegisterComponentGuidelinesProc Variable

Pascal

```
RegisterComponentGuidelinesProc: TRegisterComponentGuidelines;
```

C++

```
TRegisterComponentGuidelines RegisterComponentGuidelinesProc;
```

File

DesignIntf

Description

This is variable DesignIntf.RegisterComponentGuidelinesProc.

60.6.7 DesignIntf.RegisterCustomModuleProc Variable

Pascal

```
RegisterCustomModuleProc: TRegisterCustomModuleProc;
```

C++

```
TRegisterCustomModuleProc RegisterCustomModuleProc;
```

File

DesignIntf

Description

This is variable DesignIntf.RegisterCustomModuleProc.

60.6.8 DesignIntf.RegisterDesignDragObjectProc Variable

Pascal

```
RegisterDesignDragObjectProc: TRegisterDesignDragObject;
```

C++

```
TRegisterDesignDragObject RegisterDesignDragObjectProc;
```

File

DesignIntf

Description

This is variable DesignIntf.RegisterDesignDragObjectProc.

60.6.9 DesignIntf.RegisterDesignNotificationProc Variable

Pascal

```
RegisterDesignNotificationProc: TRegisterDesignNotification;
```

C++

```
TRegisterDesignNotification RegisterDesignNotificationProc;
```

File

DesignIntf

Description

This is variable DesignIntf.RegisterDesignNotificationProc.

60.6.10 DesignIntf.RegisterDragTargetProc Variable

Pascal

```
RegisterDragTargetProc: TRegisterDragTargetProc;
```

C++

```
TRegisterDragTargetProc RegisterDragTargetProc;
```

File

DesignIntf

Description

This is variable DesignIntf.RegisterDragTargetProc.

60.6.11 DesignIntf.RegisterIDropTargetProc Variable

Pascal

```
RegisterIDropTargetProc: TRegisterIDropTarget;
```

C++

```
TRegisterIDropTarget RegisterIDropTargetProc;
```

File

DesignIntf

Description

This is variable DesignIntf.RegisterIDropTargetProc.

60.6.12 DesignIntf.RegisterPropertyEditorProc Variable

Pascal

```
RegisterPropertyEditorProc: TRegisterPropertyEditorProc;
```

C++

```
TRegisterPropertyEditorProc RegisterPropertyEditorProc;
```

File

DesignIntf

Description

This is variable DesignIntf.RegisterPropertyEditorProc.

60.6.13 DesignIntf.RegisterPropertyInCategoryProc Variable

Pascal

```
RegisterPropertyInCategoryProc: TRegisterPropertyInCategoryProc;
```

C++

```
TRegisterPropertyInCategoryProc RegisterPropertyInCategoryProc;
```

File

DesignIntf

Description

This is variable DesignIntf.RegisterPropertyInCategoryProc.

60.6.14 DesignIntf.RegisterPropertyMapperProc Variable

Pascal

```
RegisterPropertyMapperProc: TRegisterPropertyMapperProc;
```

C++

```
TRegisterPropertyMapperProc RegisterPropertyMapperProc;
```

File

DesignIntf

Description

This is variable DesignIntf.RegisterPropertyMapperProc.

60.6.15 DesignIntf.RegisterSelectionEditorProc Variable

Pascal

```
RegisterSelectionEditorProc: TRegisterSelectionEditorProc;
```

C++

```
TRegisterSelectionEditorProc RegisterSelectionEditorProc;
```

File

DesignIntf

Description

This is variable DesignIntf.RegisterSelectionEditorProc.

60.6.16 DesignIntf.SetPropertyEditorGroupProc Variable

Pascal

```
SetPropertyEditorGroupProc: TSetPropertyEditorGroupProc;
```

C++

```
TSetPropertyEditorGroupProc SetPropertyEditorGroupProc;
```

File

DesignIntf

Description

This is variable DesignIntf.SetPropertyEditorGroupProc.

60.6.17 DesignIntf.UnregisterDesignNotificationProc Variable

Pascal

```
UnregisterDesignNotificationProc: TRegisterDesignNotification;
```

C++

```
TRegisterDesignNotification UnregisterDesignNotificationProc;
```

File

DesignIntf

Description

This is variable DesignIntf.UnregisterDesignNotificationProc.

60.7 Constants

The following table lists constants in this documentation.

Constants

Name	Description
MaxIdentLength (see page 11255)	This is constant DesignIntf.MaxIdentLength.
sActionCategoryName (see page 11256)	This is constant DesignIntf.sActionCategoryName.
sAppearanceCategoryName (see page 11256)	This is constant DesignIntf.sAppearanceCategoryName.
sBehaviorCategoryName (see page 11256)	This is constant DesignIntf.sBehaviorCategoryName.
sDatabaseCategoryName (see page 11257)	This is constant DesignIntf.sDatabaseCategoryName.
sDataCategoryName (see page 11257)	This is constant DesignIntf.sDataCategoryName.
sDesignCategoryName (see page 11257)	This is constant DesignIntf.sDesignCategoryName.
sDragNDropCategoryName (see page 11258)	This is constant DesignIntf.sDragNDropCategoryName.
sFocusCategoryName (see page 11258)	This is constant DesignIntf.sFocusCategoryName.
sHelpCategoryName (see page 11258)	This is constant DesignIntf.sHelpCategoryName.
sInputCategoryName (see page 11259)	This is constant DesignIntf.sInputCategoryName.
sInvalidFilter (see page 11259)	This is constant DesignIntf.sInvalidFilter.
sKeyCategoryName (see page 11259)	This is constant DesignIntf.sKeyCategoryName.
sLayoutCategoryName (see page 11260)	This is constant DesignIntf.sLayoutCategoryName.
sLegacyCategoryName (see page 11260)	This is constant DesignIntf.sLegacyCategoryName.
sLinkageCategoryName (see page 11260)	This is constant DesignIntf.sLinkageCategoryName.
sLocaleCategoryName (see page 11261)	This is constant DesignIntf.sLocaleCategoryName.
sLocalizableCategoryName (see page 11261)	This is constant DesignIntf.sLocalizableCategoryName.
sMiscellaneousCategoryName (see page 11261)	This is constant DesignIntf.sMiscellaneousCategoryName.
sMouseCategoryName (see page 11262)	This is constant DesignIntf.sMouseCategoryName.
sPropertyChangeCategoryName (see page 11262)	This is constant DesignIntf.sPropertyChangeCategoryName.
sVisualCategoryName (see page 11262)	This is constant DesignIntf.sVisualCategoryName.
sWindowStyleName (see page 11263)	This is constant DesignIntf.sWindowStyleName.

60.7.1 DesignIntf.MaxIdentLength Constant

Pascal

```
MaxIdentLength = 63;
```

C++

```
MaxIdentLength = 63;
```

File

DesignIntf

Description

This is constant DesignIntf.MaxIdentLength.

60.7.2 DesignIntf.sActionCategoryName Constant

Pascal

```
sActionCategoryName = 'Action';
```

C++

```
sActionCategoryName = 'Action';
```

File

DesignIntf

Description

This is constant DesignIntf.sActionCategoryName.

60.7.3 DesignIntf.sAppearanceCategoryName Constant

Pascal

```
sAppearanceCategoryName = 'Appearance';
```

C++

```
sAppearanceCategoryName = 'Appearance';
```

File

DesignIntf

Description

This is constant DesignIntf.sAppearanceCategoryName.

60.7.4 DesignIntf.sBehaviorCategoryName Constant

Pascal

```
sBehaviorCategoryName = 'Behavior';
```

C++

```
sBehaviorCategoryName = 'Behavior';
```

File

DesignIntf

Description

This is constant DesignIntf.sBehaviorCategoryName.

60.7.5 DesignIntf.sDatabaseCategoryName Constant

Pascal

```
sDatabaseCategoryName = 'Database';
```

C++

```
sDatabaseCategoryName = 'Database';
```

File

DesignIntf

Description

This is constant DesignIntf.sDatabaseCategoryName.

60.7.6 DesignIntf.sDataCategoryName Constant

Pascal

```
sDataCategoryName = 'Data';
```

C++

```
sDataCategoryName = 'Data';
```

File

DesignIntf

Description

This is constant DesignIntf.sDataCategoryName.

60.7.7 DesignIntf.sDesignCategoryName Constant

Pascal

```
sDesignCategoryName = 'Design';
```

C++

```
sDesignCategoryName = 'Design';
```

File

DesignIntf

Description

This is constant DesignIntf.sDesignCategoryName.

60.7.8 DesignIntf.sDragNDropCategoryName Constant

Pascal

```
sDragNDropCategoryName = 'Drag Drop/Docking';
```

C++

```
sDragNDropCategoryName = 'Drag Drop/Docking';
```

File

DesignIntf

Description

This is constant DesignIntf.sDragNDropCategoryName.

60.7.9 DesignIntf.sFocusCategoryName Constant

Pascal

```
sFocusCategoryName = 'Focus';
```

C++

```
sFocusCategoryName = 'Focus';
```

File

DesignIntf

Description

This is constant DesignIntf.sFocusCategoryName.

60.7.10 DesignIntf.sHelpCategoryName Constant

Pascal

```
sHelpCategoryName = 'Help and Hints';
```

C++

```
sHelpCategoryName = 'Help and Hints';
```

File

DesignIntf

Description

This is constant DesignIntf.sHelpCategoryName.

60.7.11 DesignIntf.sInputCategoryName Constant

Pascal

```
sInputCategoryName = 'Input';
```

C++

```
sInputCategoryName = 'Input';
```

File

DesignIntf

Description

This is constant DesignIntf.sInputCategoryName.

60.7.12 DesignIntf.sInvalidFilter Constant

Pascal

```
sInvalidFilter = 'Property filters may only be name, class or type based (%d:%d)';
```

C++

```
sInvalidFilter = 'Property filters may only be name, class or type based (%d:%d)';
```

File

DesignIntf

Description

This is constant DesignIntf.sInvalidFilter.

60.7.13 DesignIntf.sKeyCategoryName Constant

Pascal

```
sKeyCategoryName = 'Key';
```

C++

```
sKeyCategoryName = 'Key';
```

File

DesignIntf

Description

This is constant DesignIntf.sKeyCategoryName.

60.7.14 DesignIntf.sLayoutCategoryName Constant

Pascal

```
sLayoutCategoryName = 'Layout';
```

C++

```
sLayoutCategoryName = 'Layout';
```

File

DesignIntf

Description

This is constant DesignIntf.sLayoutCategoryName.

60.7.15 DesignIntf.sLegacyCategoryName Constant

Pascal

```
sLegacyCategoryName = 'Legacy';
```

C++

```
sLegacyCategoryName = 'Legacy';
```

File

DesignIntf

Description

This is constant DesignIntf.sLegacyCategoryName.

60.7.16 DesignIntf.sLinkageCategoryName Constant

Pascal

```
sLinkageCategoryName = 'Linkage';
```

C++

```
sLinkageCategoryName = 'Linkage';
```

File

DesignIntf

Description

This is constant DesignIntf.sLinkageCategoryName.

60.7.17 DesignIntf.sLocaleCategoryName Constant

Pascal

```
sLocaleCategoryName = 'Locale';
```

C++

```
sLocaleCategoryName = 'Locale';
```

File

DesignIntf

Description

This is constant DesignIntf.sLocaleCategoryName.

60.7.18 DesignIntf.sLocalizableCategoryName Constant

Pascal

```
sLocalizableCategoryName = 'Localizable';
```

C++

```
sLocalizableCategoryName = 'Localizable';
```

File

DesignIntf

Description

This is constant DesignIntf.sLocalizableCategoryName.

60.7.19 DesignIntf.sMiscellaneousCategoryName Constant

Pascal

```
sMiscellaneousCategoryName = 'Miscellaneous';
```

C++

```
sMiscellaneousCategoryName = 'Miscellaneous';
```

File

DesignIntf

Description

This is constant DesignIntf.sMiscellaneousCategoryName.

60.7.20 DesignIntf.sMouseCategoryName Constant

Pascal

```
sMouseCategoryName = 'Mouse';
```

C++

```
sMouseCategoryName = 'Mouse';
```

File

DesignIntf

Description

This is constant DesignIntf.sMouseCategoryName.

60.7.21 DesignIntf.sPropertyChangeCategoryName Constant

Pascal

```
sPropertyChangeCategoryName = 'Property Changed';
```

C++

```
sPropertyChangeCategoryName = 'Property Changed';
```

File

DesignIntf

Description

This is constant DesignIntf.sPropertyChangeCategoryName.

60.7.22 DesignIntf.sVisualCategoryName Constant

Pascal

```
sVisualCategoryName = 'Visual';
```

C++

```
sVisualCategoryName = 'Visual';
```

File

DesignIntf

Description

This is constant DesignIntf.sVisualCategoryName.

60.7.23 DesignIntf.sWindowStyleName Constant

Pascal

```
sWindowStyleName = 'Window Style';
```

C++

```
sWindowStyleName = 'Window Style';
```

File

DesignIntf

Description

This is constant DesignIntf.sWindowStyleName.

61 Dialogs Namespace

This is namespace Dialogs.

Topics

Name	Description
Classes (see page 11269)	The following table lists classes in this documentation.
Functions (see page 11531)	The following table lists functions in this documentation.
Structs, Records, Enums (see page 11548)	The following table lists structs, records, enums in this documentation.
Types (see page 11568)	The following table lists types in this documentation.
Variables (see page 11585)	The following table lists variables in this documentation.
Constants (see page 11586)	The following table lists constants in this documentation.

Classes

	Name	Description
	EPlatformVersionException (see page 11269)	This is class Dialogs.EPlatformVersionException.
	TColorDialog (see page 11270)	TColorDialog displays a modal color-selection dialog.
	TCommonDialog (see page 11277)	TCommonDialog is the ancestor of all components that represent Windows common dialog boxes.
	TCustomFileDialog (see page 11288)	Abstract base class for Vista style file dialogs.
	TCustomFileOpenDialog (see page 11308)	Base class for Vista style file open dialogs.
	TCustomFileSaveDialog (see page 11314)	Base class for Vista style file save dialogs.
	TCustomTaskDialog (see page 11318)	Base class for Task Dialogs.
	TFavoriteLinkItem (see page 11337)	Item in a list of favorite links.
	TFavoriteLinkItems (see page 11340)	List of favorite links.
	TFavoriteLinkItemsEnumerator (see page 11343)	Enumerator for list of favorite items.
	TFileOpenDialog (see page 11346)	Class for Vista style file open dialogs.
	TFileSaveDialog (see page 11357)	Class for Vista style file save dialogs.
	TFileTypeItem (see page 11368)	File type specification.
	TFileTypeItems (see page 11372)	Collection of file type specifications.
	TFindDialog (see page 11376)	TFindDialog displays a Find (see page 11383) dialog that allows users to search for text in a file.
	TFontDialog (see page 11394)	TFontDialog displays a font-selection dialog.
	TOpenDialog (see page 11407)	TOpenDialog displays a file-selection dialog.
	TPageSetupDialog (see page 11441)	TPageSetupDialog displays a page setup dialog.
	TPrintDialog (see page 11458)	TPrintDialog displays a Print dialog.
	TPrinterSetupDialog (see page 11478)	TPrinterSetupDialog displays a print-setup dialog for configuring printers.

	TReplaceDialog (see page 11482)	TReplaceDialog displays a search-and-replace dialog.
	TSaveDialog (see page 11489)	TSaveDialog displays a "Save As" dialog for saving files.
	TTaskDialog (see page 11494)	Class for Task Dialog properties.
	TTaskDialogBaseButtonItem (see page 11507)	Base button class for Task Dialogs.
	TTaskDialogButtonItem (see page 11513)	A single Task Dialog button item.
	TTaskDialogButtons (see page 11517)	A collection of buttons appearing on a Task Dialog.
	TTaskDialogButtonsEnumerator (see page 11521)	Enumerates the button collection for a Task Dialog.
	TTaskDialogProgressBar (see page 11523)	Progress bar class for Task Dialogs. in one, concise sentence.
	TTaskDialogRadioButtonItem (see page 11527)	A single radio button item for Task Dialogs..

Constants

Name	Description
MaxCustomColors (see page 11586)	The number of custom colors on a Color Dialog.
mbAbortIgnore (see page 11586)	Used to define a dialog with Abort and Ignore buttons.
mbAbortRetryIgnore (see page 11587)	Used to define a dialog with Abort, Retry and Ignore buttons.
mbOKCancel (see page 11588)	Used to define a dialog with OK and Cancel buttons.
mbYesAllNoAllCancel (see page 11588)	This is constant Dialogs.mbYesAllNoAllCancel.
mbYesNo (see page 11589)	Used to define a dialog with Yes and No buttons.
mbYesNoCancel (see page 11589)	Used to define a dialog with Yes, No and Cancel buttons.
tdiError (see page 11590)	This is constant Dialogs.tdiError.
tdiInformation (see page 11590)	This is constant Dialogs.tdiInformation.
tdiNone (see page 11591)	This is constant Dialogs.tdiNone.
tdiShield (see page 11591)	This is constant Dialogs.tdiShield.
tdiWarning (see page 11591)	This is constant Dialogs.tdiWarning.

Functions

	Name	Description
	CreateMessageDialog (see page 11531)	Creates a specified message dialog.
	CreateMessageDialog (see page 11531)	Creates a specified message dialog.
	InputBox (see page 11532)	Displays an input dialog box that lets the user enter a string, double, or integer.
	InputQuery (see page 11533)	Displays an input dialog box that lets the user enter a string, double, or integer.
	MessageDlg (see page 11535)	Displays a message dialog box in the center of the screen.
	MessageDlg (see page 11535)	Displays a message dialog box in the center of the screen.
	MessageDlgPos (see page 11537)	Displays a message dialog box at the specified screen coordinates.
	MessageDlgPos (see page 11537)	Displays a message dialog box at the specified screen coordinates.
	MessageDlgPosHelp (see page 11539)	Displays a message dialog box whose help is supplied in a named help file.
	MessageDlgPosHelp (see page 11539)	Displays a message dialog box whose help is supplied in a named help file.
	PromptForFileName (see page 11540)	Displays an open or save dialog, where the user can specify a file name.
	ShowMessage (see page 11541)	Displays a message box with an OK button.
	ShowMessageFmt (see page 11542)	Displays a message box with a formatted message.
	ShowMessagePos (see page 11543)	Displays a message box at a specified location.
	TaskMessageDlg (see page 11543)	Displays a message task dialog box in the center of the screen.
	TaskMessageDlg (see page 11543)	Displays a message task dialog box in the center of the screen.
	TaskMessageDlgPos (see page 11545)	Displays a message task dialog box at the specified screen coordinates.
	TaskMessageDlgPos (see page 11545)	Displays a message task dialog box at the specified screen coordinates.
	TaskMessageDlgPosHelp (see page 11546)	Displays a message task dialog box whose help is supplied in a named help file.
	TaskMessageDlgPosHelp (see page 11546)	Displays a message task dialog box whose help is supplied in a named help file.

Structs, Records, Enums

	Name	Description
	TColorDialogOption (see page 11548)	TColorDialogOption and TColorDialogOptions (see page 11568) specify options for a TColorDialog (see page 11270) component.
	TFileDialogOption (see page 11549)	The settings in TFileDialogOption determine the behavior of a TCustomFileDialog (see page 11288) file dialog. TFileDialogOptions (see page 11571) is a set of TFileDialogOption. These options are the same as the options for the Microsoft IFileDialog::GetOptions and IFileDialog::SetOptions functions.

	TFileDialogOverwriteResponse (see page 11551)	TFileDialogOverwriteResponse indicates the application's response to an overwrite request during a save operation for a TCustomFileSaveDialog (see page 11314) dialog. These are the same values as in the FDE_OVERWRITE_RESPONSE enumerated type used in the Microsoft IFileDialogEvents::OnOverwrite method.
	TFileDialogShareViolationResponse (see page 11552)	TFileDialogShareViolationResponse indicates the application's response to a sharing violation during a file open or save for a TCustomFileDialog (see page 11288) dialog. These are the same values as in the FDE_SHAREVIOLATION_RESPONSE enumerated type used in the Microsoft IFileDialogEvents::OnShareViolation method.
	TFileEditStyle (see page 11552)	TFileEditStyle indicates the type of control that appears in a file selection dialog for the file name.
	TFindOption (see page 11553)	TFindOption and TFindOptions (see page 11573) determine the controls that appear in a find dialog.
	TFontDialogDevice (see page 11554)	TFontDialogDevice indicates the source from which a TFontDialog (see page 11394) instance obtains its list of fonts.
	TFontDialogOption (see page 11555)	TFontDialogOption and TFontDialogOptions (see page 11574) are flags that influence the appearance and behavior of a font dialog.
	TMsgDlgBtn (see page 11556)	TMsgDlgBtn defines a set of values used by MessageDlg (see page 11535) and MessageDlgPos (see page 11537) functions.
	TMsgDlgType (see page 11558)	TMsgDlgType defines values describing the type of message box.
	TOpenOption (see page 11559)	TOpenOption and TOpenOptions (see page 11576) determine the behavior of a file selection dialog.
	TOpenOptionEx (see page 11561)	TOpenOptionEx and TOpenOptionsEx (see page 11578) determine the behavior of a file selection dialog.
	TPageMeasureUnits (see page 11561)	Specifies page setup measure unit types.
	TPageSetupDialogOption (see page 11562)	This is record Dialogs.TPageSetupDialogOption.
	TPageType (see page 11562)	TPageType indicates the type of page being configured for printing.
	TPrintDialogOption (see page 11563)	TPrintDialogOption and TPrintDialogOptions (see page 11580) specify options for a TPrintDialog (see page 11458) component.
	TPrinterKind (see page 11564)	This is record Dialogs.TPrinterKind.
	TPrintRange (see page 11564)	TPrintRange indicates how the user specified the set of pages to print.
	TProgressBarState (see page 11565)	TProgressBarState defines a set of values used by the State property.
	TTaskDialogCommonButton (see page 11565)	Buttons (see page 2289) for Task Dialogs.
	TTaskDialogFlag (see page 11566)	Flags for Task Dialogs.

Types

Name	Description
TColorDialogOptions (see page 11568)	TColorDialogOption (see page 11548) and TColorDialogOptions specify options for a TColorDialog (see page 11270) component.
TCustomColors (see page 11569)	TCustomColors is an array that holds the color values for your custom colors.
TFDApplyEvent (see page 11569)	TFDApplyEvent is the type for event handlers that respond when the user clicks the Apply button in a nonmodal font dialog.
TFileDialogCloseEvent (see page 11570)	Event for user clicking OK.
TFileDialogFolderChangingEvent (see page 11570)	Event before a directory is opened or closed from the dialog.
TFileDialogOptions (see page 11571)	The settings in TFileDialogOptions determine the behavior of a TCustomFileDialog (see page 11288) file dialog. TFileDialogOptions is a set of TFileDialogOptions. These options are the same as the options for the Microsoft IFileDialog::GetOptions and IFileDialog::SetOptions functions.
TFileDialogOverwriteEvent (see page 11572)	Event just before a file would be overwritten.
TFileDialogShareViolationEvent (see page 11572)	Event when sharing violations arise from open or save operations.
TFindOptions (see page 11573)	TFindOption (see page 11553) and TFindOptions determine the controls that appear in a find dialog.
TFindReplaceFunc (see page 11574)	This is type Dialogs.TFindReplaceFunc.
TFontDialogOptions (see page 11574)	TFontDialogOption (see page 11555) and TFontDialogOptions are flags that influence the appearance and behavior of a font dialog.
TIncludeItemEvent (see page 11575)	This is type Dialogs.TIncludeItemEvent.
TMsgDlgButtons (see page 11575)	TMsgDlgButtons defines a set of values used by MessageDlg (see page 11535) and MessageDlgPos (see page 11537).
TOFNotifyEx (see page 11576)	This is type Dialogs.TOFNotifyEx.
TOpenOptions (see page 11576)	TOpenOption (see page 11559) and TOpenOptions determine the behavior of a file selection dialog.

TOpenOptionsEx (see page 11578)	TOpenOptionEx (see page 11561) and TOpenOptionsEx determine the behavior of a file selection dialog.
TPageSetupBeforePaintEvent (see page 11578)	TPageSetupBeforePaintEvent defines the class method called by the BeforePaint event.
TPageSetupDialogOptions (see page 11579)	Specifies page setup dialog options.
TPaintPageEvent (see page 11579)	TPageSetupBeforePaintEvent (see page 11578) defines the class method called by various TPageSetupDialog (see page 11441) events.
TPrintDialogOptions (see page 11580)	TPrintDialogOption (see page 11563) and TPrintDialogOptions specify options for a TPrintDialog (see page 11458) component.
TPrinterOrientation (see page 11581)	TPrinterOrientation indicates the orientation of pages when printing.
TTaskDialogButtonList (see page 11581)	This is type Dialogs.TTaskDialogButtonList.
TTaskDialogCommonButtons (see page 11582)	An array of Buttons (see page 2289) for Task Dialogs.
TTaskDialogFlags (see page 11582)	Flags for Task Dialogs.
TTaskDialogIcon (see page 11583)	This is type Dialogs.TTaskDialogIcon.
TTaskDlgClickEvent (see page 11583)	Event for a button click in a Task Dialog.
TTaskDlgTimerEvent (see page 11584)	Event for the Task Dialog timer.

Variables

Name	Description
ForceCurrentDirectory (see page 11585)	Indicates whether open and save dialogs should display the current directory if no initial directory is assigned.
UseLatestCommonDialogs (see page 11585)	This is variable Dialogs.UseLatestCommonDialogs.

61.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	EPlatformVersionException (see page 11269)	This is class Dialogs.EPlatformVersionException.
	TColorDialog (see page 11270)	TColorDialog displays a modal color-selection dialog.
	TCommonDialog (see page 11277)	TCommonDialog is the ancestor of all components that represent Windows common dialog boxes.
	TCustomFileDialog (see page 11288)	Abstract base class for Vista style file dialogs.
	TCustomFileOpenDialog (see page 11308)	Base class for Vista style file open dialogs.
	TCustomFileSaveDialog (see page 11314)	Base class for Vista style file save dialogs.
	TCustomTaskDialog (see page 11318)	Base class for Task Dialogs (see page 11265).
	TFavoriteLinkItem (see page 11337)	Item in a list of favorite links.
	TFavoriteLinkItems (see page 11340)	List of favorite links.
	TFavoriteLinkItemsEnumerator (see page 11343)	Enumerator for list of favorite items.
	TFileOpenDialog (see page 11346)	Class for Vista style file open dialogs.
	TFileSaveDialog (see page 11357)	Class for Vista style file save dialogs.
	TFileTypeItem (see page 11368)	File type specification.
	TFileTypeItems (see page 11372)	Collection of file type specifications.
	TFindDialog (see page 11376)	TFindDialog displays a Find (see page 11383) dialog that allows users to search for text in a file.
	TFontDialog (see page 11394)	TFontDialog displays a font-selection dialog.
	TOpenDialog (see page 11407)	TOpenDialog displays a file-selection dialog.
	TPageSetupDialog (see page 11441)	TPageSetupDialog displays a page setup dialog.
	TPrintDialog (see page 11458)	TPrintDialog displays a Print dialog.
	TPrinterSetupDialog (see page 11478)	TPrinterSetupDialog displays a print-setup dialog for configuring printers.
	TReplaceDialog (see page 11482)	TReplaceDialog displays a search-and-replace dialog.
	TSaveDialog (see page 11489)	TSaveDialog displays a "Save As" dialog for saving files.
	TTaskDialog (see page 11494)	Class for Task Dialog properties.
	TTaskDialogBaseButtonItem (see page 11507)	Base button class for Task Dialogs (see page 11265).
	TTaskDialogButtonItem (see page 11513)	A single Task Dialog button item.
	TTaskDialogButtons (see page 11517)	A collection of buttons appearing on a Task Dialog.
	TTaskDialogButtonsEnumerator (see page 11521)	Enumerates the button collection for a Task Dialog.
	TTaskDialogProgressBar (see page 11523)	Progress bar class for Task Dialogs (see page 11265). in one, concise sentence.
	TTaskDialogRadioButtonItem (see page 11527)	A single radio button item for Task Dialogs (see page 11265)..

61.1.1 EPlatformVersionException Class

Class Hierarchy

Pascal

```
EPlatformVersionException = class(Exception);
```

C++

```
class EPlatformVersionException : public Exception;
```

File

Dialogs

Description

This is class Dialogs.EPlatformVersionException.

61.1.2 TColorDialog Class

TColorDialog displays a modal color-selection dialog.

Class Hierarchy

Pascal

```
TColorDialog = class(TCommonDialog);
```

C++

```
class TColorDialog : public TCommonDialog;
```

File

Dialogs

Description

The TColorDialog component displays a Windows dialog box for selecting colors. The dialog does not appear at runtime until it is activated by a call to the Execute (see page 11274) method. When the user selects a color and clicks OK, the dialog closes and the selected color is stored in the Color (see page 11275) property.

61.1.2.1 TColorDialog Members

The following tables list the members exposed by TColorDialog.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.

	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	DoClose (see page 11282)	Generates an OnClose (see page 11287) event.
	DoShow (see page 11283)	Generates an OnShow (see page 11288) event.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	MessageHook (see page 11284)	Provides special Windows message processing for the dialog.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	TaskModalDialog (see page 11284)	Ensures that Windows messages are properly routed when the dialog executes.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WndProc (see page 11285)	Responds to Windows messages sent to the dialog.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	Template (see page 11287)	Points to a custom template for the dialog.
	TemplateModule (see page 11287)	This is TemplateModule, a member of class TCommonDialog.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.

	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 11273)	Creates and initializes a color-selection dialog.
	DefaultHandler (see page 11282)	Sends unhandled messages to Windows for processing.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 11274)	Destroys the color-selection dialog and frees its memory.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Execute (see page 11274)	Displays the color-selection dialog.
	Execute (see page 11283)	This is the overview for the Execute method overload.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	Handle (see page 11286)	Specifies the window handle of the dialog.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Events

	Name	Description
	OnClose (see page 11287)	Occurs when the dialog closes.
	OnShow (see page 11288)	Occurs when the dialog opens.

Published Properties

	Name	Description
	Color (see page 11275)	Returns the selected color.
	Ctl3D (see page 11276)	Determines whether the dialog has a three-dimensional look.
	CustomColors (see page 11276)	Determines which custom colors are available in the dialog box.
	HelpContext (see page 11286)	Specifies the context number for online Help.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Options (see page 11277)	Specifies options and default appearance for the dialog.
	Tag (see page 2808)	Stores an integer value as part of a component.

61.1.2.2 TColorDialog.Create Constructor

Creates and initializes a color-selection dialog.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TColorDialog(TComponent * AOwner);
```

Description

Create generates a TColorDialog (see page 11270) instance.

AOwner is the component, typically a form or data module, that is responsible for freeing the TColorDialog (see page 11270) instance. It becomes the value of the Owner property.

Note: Creating a TColorDialog (see page 11270) instance does not cause the dialog to appear to the user. To display the color dialog, use the Execute (see page 11274) method.

See Also

Execute (see page 11274)

Owner (see page 2807)

61.1.2.3 TColorDialog.Destroy Destructor

Destroys the color-selection dialog and frees its memory.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TColorDialog();
```

Description

Do not call Destroy directly in an application. Call Free instead. Free verifies that the color-selection dialog is not nil before calling Destroy.

See Also

Create (see page 11273)

Free (see page 22300)

61.1.2.4 TColorDialog Methods

The methods of the TColorDialog class are listed here.

Public Methods

	Name	Description
	Execute (see page 11274)	Displays the color-selection dialog.

61.1.2.4.1 TColorDialog.Execute Method

Displays the color-selection dialog.

Pascal

```
function Execute(ParentWnd: HWND): Boolean; override;
```

C++

```
virtual __fastcall Boolean Execute(HWND ParentWnd);
```

Description

Execute opens the color-selection dialog, returning true when the user selects a color and clicks OK, or false when the user cancels.

```
if ColorDialog1.Execute then
  Shape1.Brush.Color := ColorDialog1.Color
else
  Shape1.Brush.Color := clGray;
if (ColorDialog1->Execute())
  Shape1->Brush->Color = ColorDialog1->Color;
else
  Shape1->Brush->Color = clGray;
```

C++ Examples:

```
/*
The following code changes the color of a shape control
```

```
using the Color dialog box. The example displays the Color
dialog box when the Button1 button is clicked, allowing the
user to select a color with the dialog box. When a color
value is selected with the dialog box, it is assigned to
the shape control.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  if (ColorDialog1->Execute())
    Shape1->Brush->Color = ColorDialog1->Color;
}
```

Delphi Examples:

```
{
The following code changes the color of a shape control
using the Color dialog box. The example displays the Color
dialog box when the Button1 button is clicked, allowing the
user to select a color with the dialog box. When a color
value is selected with the dialog box, it is assigned to
the shape control.
}
procedure TForm1.Button1Click(Sender: TObject);
begin
  if ColorDialog1.Execute then
    Shape1.Brush.Color := ColorDialog1.Color;
end;
```

See Also

Color (see page 11275)

61.1.2.5 TColorDialog Properties

The properties of the TColorDialog class are listed here.

Published Properties

	Name	Description
	Color (see page 11275)	Returns the selected color.
	Ctl3D (see page 11276)	Determines whether the dialog has a three-dimensional look.
	CustomColors (see page 11276)	Determines which custom colors are available in the dialog box.
	Options (see page 11277)	Specifies options and default appearance for the dialog.

61.1.2.5.1 TColorDialog.Color Property

Returns the selected color.

Pascal

```
property Color: TColor;
```

C++

```
__property TColor Color;
```

Description

When the user selects a color in the dialog box and clicks OK, the selected color becomes the value of the Color property. To make a default color of choice appear in the dialog when it opens, assign a value to Color in the Object Inspector or in program code, otherwise the default is clBlack.

C++ Examples:

```
/*
The following code changes the color of a shape control
using the Color dialog box. The example displays the Color
dialog box when the Button1 button is clicked, allowing the
user to select a color with the dialog box. When a color
value is selected with the dialog box, it is assigned to
the shape control.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  if (ColorDialog1->Execute())
    Shape1->Brush->Color = ColorDialog1->Color;
}
```

Delphi Examples:

```
{
The following code changes the color of a shape control
using the Color dialog box. The example displays the Color
dialog box when the Button1 button is clicked, allowing the
user to select a color with the dialog box. When a color
value is selected with the dialog box, it is assigned to
the shape control.
}
procedure TForm1.Button1Click(Sender: TObject);
begin
  if ColorDialog1.Execute then
    Shape1.Brush.Color := ColorDialog1.Color;
end;
```

See Also

CustomColors (see page 11276)

61.1.2.5.2 TColorDialog.Ctl3D Property

Determines whether the dialog has a three-dimensional look.

Pascal

```
property Ctl3D: Boolean;
```

C++

```
__property Boolean Ctl3D;
```

Description

Ctl3D is provided for backward compatibility. It has no effect on 32-bit versions of Windows and on NT 4.0 and later.

Ctl3D determined whether controls in the dialog had a flat or beveled look. It required CTL3D32.DLL to be installed in the System32 directory.

See Also

Ctl3D (see page 6198)

61.1.2.5.3 TColorDialog.CustomColors Property

Determines which custom colors are available in the dialog box.

Pascal

```
property CustomColors: TStrings;
```

C++

```
__property TStrings CustomColors;
```

Description

Each custom color is represented as a string of the form ColorX=HexValue. For example, the following string sets the first custom color.

```
ColorA=808022
```

Up to 16 custom colors (ColorA through ColorP) can be set.

See Also

Color (see page 11275)

61.1.2.5.4 TColorDialog.Options Property

Specifies options and default appearance for the dialog.

Pascal

```
property Options: TColorDialogOptions;
```

C++

```
__property TColorDialogOptions Options;
```

Description

Use the Options property to customize the appearance and functionality of the dialog. By default, all options are off.

61.1.3 TCommonDialog Class

TCommonDialog is the ancestor of all components that represent Windows common dialog boxes.

Class Hierarchy

Pascal

```
TCommonDialog = class(TComponent);
```

C++

```
class TCommonDialog : public TComponent;
```

File

Dialogs

Description

TCommonDialog is an abstract class that represents Windows common dialog boxes. Its descendants handle such tasks as finding and opening files, setting fonts and colors, and printing. The dialogs do not appear at runtime until activated by a call to the Execute (see page 11283) method. Except for TFindDialog (see page 11376) and TReplaceDialog (see page 11482), these dialogs are all modal.

The TCommonDialog descendants are nonvisual components that generate a single function call to COMMDLG.DLL, and are

therefore less easily modified than other components. New components that encapsulate common-dialog functions should descend from TCommonDialog. Most other dialog boxes should descend from TForm.

See Also

TColorDialog (see page 11270)

TFindDialog (see page 11376)

TFontDialog (see page 11394)

TForm (see page 13992)

TOpenDialog (see page 11407)

TOpenPictureDialog (see page 13282)

TPrintDialog (see page 11458)

TPrinterSetupDialog (see page 11478)

TReplaceDialog (see page 11482)

TSaveDialog (see page 11489)

TSavePictureDialog (see page 13300)

61.1.3.1 TCommonDialog Members

The following tables list the members exposed by TCommonDialog.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	DoClose (see page 11282)	Generates an OnClose (see page 11287) event.
	DoShow (see page 11283)	Generates an OnShow (see page 11288) event.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).

	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	MessageHook (see page 11284)	Provides special Windows message processing for the dialog.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	TaskModalDialog (see page 11284)	Ensures that Windows messages are properly routed when the dialog executes.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WndProc (see page 11285)	Responds to Windows messages sent to the dialog.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	Template (see page 11287)	Points to a custom template for the dialog.
	TemplateModule (see page 11287)	This is TemplateModule, a member of class TCommonDialog.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 11281)	Creates and initializes a TCommonDialog (see page 11277) instance.
V	DefaultHandler (see page 11282)	Sends unhandled messages to Windows for processing.
V	Destroy (see page 11281)	Destroys the TCommonDialog (see page 11277) instance and frees its memory.
	DestroyComponents (see page 2771)	Destroys all owned components.

	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
V	Execute (see page 11283)	This is the overview for the Execute method overload.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	Handle (see page 11286)	Specifies the window handle of the dialog.

R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Events

	Name	Description
	OnClose (see page 11287)	Occurs when the dialog closes.
	OnShow (see page 11288)	Occurs when the dialog opens.

Published Properties

	Name	Description
	Ctl3D (see page 11285)	Determines whether the dialog has a three-dimensional look.
	HelpContext (see page 11286)	Specifies the context number for online Help.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

61.1.3.2 TCommonDialog.Create Constructor

Creates and initializes a TCommonDialog (see page 11277) instance.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCommonDialog(TComponent * AOwner);
```

Description

Call Create to instantiate a common dialog component at runtime. Dialogs (see page 11265) added to forms or data modules at design time are created automatically.

After calling the inherited constructor, Create performs the following actions:

Placeholder #1.

See Also

Ctl3D (see page 11285)

Destroy (see page 11281)

Create (see page 2766)

61.1.3.3 TCommonDialog.Destroy Destructor

Destroys the TCommonDialog (see page 11277) instance and frees its memory.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TCommonDialog();
```

Description

Do not call Destroy directly in an application. Call Free instead. Free verifies that the dialog reference is not nil before calling Destroy.

See Also

Free (see page 22300)

Create (see page 11281)

61.1.3.4 TCommonDialog Methods

The methods of the TCommonDialog class are listed here.

Protected Methods

	Name	Description
	DoClose (see page 11282)	Generates an OnClose (see page 11287) event.
	DoShow (see page 11283)	Generates an OnShow (see page 11288) event.
V	MessageHook (see page 11284)	Provides special Windows message processing for the dialog.
V	TaskModalDialog (see page 11284)	Ensures that Windows messages are properly routed when the dialog executes.
V	WndProc (see page 11285)	Responds to Windows messages sent to the dialog.

Public Methods

	Name	Description
V	DefaultHandler (see page 11282)	Sends unhandled messages to Windows for processing.
V	Execute (see page 11283)	This is the overview for the Execute method overload.

61.1.3.4.1 TCommonDialog.DefaultHandler Method

Sends unhandled messages to Windows for processing.

Pascal

```
procedure DefaultHandler(var Message); override;
```

C++

```
virtual __fastcall DefaultHandler( Message);
```

Description

DefaultHandler is called by Dispatch when it cannot find a method for a particular message. DefaultHandler sends these messages to the dialog's window procedure, where they are handled by Windows.

See Also

WndProc (see page 11285)

Dispatch

MessageHook (see page 11284)

61.1.3.4.2 TCommonDialog.DoClose Method

Generates an OnClose (see page 11287) event.

Pascal

```
procedure DoClose; dynamic;
```

C++

```
__fastcall DoClose();
```

Description

DoClose is called automatically when the user closes the dialog. Override this method to provide additional processing other than calling the OnClose (see page 11287) event handler. For example, to perform shutdown operations that use protected methods of the dialog class, override DoClose rather than writing an OnClose (see page 11287) event handler (which can access only public methods).

See Also

OnClose (see page 11287)

61.1.3.4.3 TCommonDialog.DoShow Method

Generates an OnShow (see page 11288) event.

Pascal

```
procedure DoShow; dynamic;
```

C++

```
__fastcall DoShow();
```

Description

DoShow is called automatically when the dialog is first displayed. Override this method to provide additional processing other than calling the OnShow (see page 11288) event handler. For example, to perform initializations that use protected methods of the dialog class, override DoShow rather than writing an OnShow (see page 11288) event handler (which can access only public methods).

See Also

OnShow (see page 11288)

61.1.3.4.4 Execute Method

This is the overview for the Execute method overload.

Overload List

	Name	Description
V	TCommonDialog.Execute () (see page 11283)	Displays the dialog box.
A	TCommonDialog.Execute (HWND) (see page 11283)	Displays the dialog box.

61.1.3.4.4.1 TCommonDialog.Execute Method ()

Displays the dialog box.

Pascal

```
function Execute: Boolean; virtual; overload;
function Execute(ParentWnd: HWND): Boolean; virtual; abstract; overload;
```

C++

```
virtual __fastcall Boolean Execute();
virtual __fastcall Boolean Execute(HWND ParentWnd) = 0;
```

Description

TCommonDialog (see page 11277) introduces the abstract Execute method, which descendant classes use to open the dialog instance at runtime. Generally, Execute returns true when the user makes a selection and clicks OK, and returns false when the user closes the dialog without making a selection.

See Also

TaskModalDialog (see page 11284)

61.1.3.4.5 TCommonDialog.MessageHook Method

Provides special Windows message processing for the dialog.

Pascal

```
function MessageHook(var Msg: TMessage): Boolean; virtual;
```

C++

```
virtual __fastcall Boolean MessageHook(TMessage Msg);
```

Description

MessageHook intercepts messages sent to the dialog window before the dialog's window procedure gets them. When MessageHook handles a message, it returns true to indicate that the message should not be sent on for further processing. If the window procedure should handle the message, MessageHook returns false.

Override MessageHook to provide extra message processing. For example, if the Template (see page 11287) property substitutes a dialog template with additional controls, use MessageHook to handle messages from those dialog controls.

In TCommonDialog (see page 11277), MessageHook handles Help messages by calling the application's HelpContext (see page 11286) method if the HelpContext (see page 11286) property is defined. Descendants of TCommonDialog (see page 11277) override MessageHook to add additional message processing.

See Also

Template (see page 11287)

HelpContext (see page 13679)

HelpContext (see page 11286)

61.1.3.4.6 TCommonDialog.TaskModalDialog Method

Ensures that Windows messages are properly routed when the dialog executes.

Pascal

```
function TaskModalDialog(DialogFunc: Pointer; var DialogData): Bool; virtual;
```

C++

```
virtual __fastcall Bool TaskModalDialog(void * DialogFunc,  DialogData);
```

Description

Descendants of TCommonDialog (see page 11277) call TaskModalDialog from their Execute (see page 11283) methods.

TaskModalDialog

Disables other windows while the dialog is displayed.

Ensures that application windows are activated and deactivated appropriately.

Ensures that the MessageHook (see page 11284) receives Windows messages before the dialog's window procedure.

Calls the dialog function specified as DialogFunc, passing in the dialog-specific data provided by DialogData.

See Also

Execute (see page 11283)

61.1.3.4.7 TCommonDialog.WndProc Method

Responds to Windows messages sent to the dialog.

Pascal

```
procedure WndProc(var Message: TMessage); virtual;
```

C++

```
virtual __fastcall WndProc(TMessage Message);
```

Description

WndProc is the main window procedure for the dialog. As implemented in TCommonDialog (see page 11277), it simply calls the Dispatch method, where any message handlers respond to messages before the DefaultHandler (see page 11282) method sends them on to the Windows message handler.

Override WndProc to subclass the dialog's window procedure. To add additional message processing without interfering with the existing message handling of the dialog, override MessageHook (see page 11284) instead.

See Also

DefaultHandler (see page 11282)

Dispatch

MessageHook (see page 11284)

61.1.3.5 TCommonDialog Properties

The properties of the TCommonDialog class are listed here.

Protected Properties

	Name	Description
	Template (see page 11287)	Points to a custom template for the dialog.
	TemplateModule (see page 11287)	This is TemplateModule, a member of class TCommonDialog.

Public Properties

	Name	Description
R	Handle (see page 11286)	Specifies the window handle of the dialog.

Published Properties

	Name	Description
	Ctl3D (see page 11285)	Determines whether the dialog has a three-dimensional look.
	HelpContext (see page 11286)	Specifies the context number for online Help.

61.1.3.5.1 TCommonDialog.Ctl3D Property

Determines whether the dialog has a three-dimensional look.

Pascal

```
property Ctl3D: Boolean;
```

C++

```
__property Boolean Ctl3D;
```

Description

Ctl3D is provided for backward compatibility. It has no effect on 32-bit versions of Windows and on NT 4.0 and later.

Ctl3D determined whether controls in the dialog had a flat or beveled look. It required CTL3D32.DLL to be installed in the System32 directory.

See Also

Ctl3D (see page 6198)

61.1.3.5.2 TCommonDialog.Handle Property

Specifies the window handle of the dialog.

Pascal

```
property Handle: HWnd;
```

C++

```
__property HWnd Handle;
```

Description

The Handle property, which provides access to the dialog's window handle after a call to Execute (see page 11283), can be used in OnShow (see page 11288) and OnClose (see page 11287) event handlers. Handle is reset to 0 after the dialog closes.

See Also

Execute (see page 11283)

OnClose (see page 11287)

OnShow (see page 11288)

61.1.3.5.3 TCommonDialog.HelpContext Property

Specifies the context number for online Help.

Pascal

```
property HelpContext: THelpContext;
```

C++

```
__property THelpContext HelpContext;
```

Description

The HelpContext property is an integer value that determines which Help screen appears when the user requests context-sensitive online Help. If HelpContext is set to the default value of 0, the dialog inherits the Help context of its parent.

See Also

HelpContext (see page 5826)

61.1.3.5.4 TCommonDialog.Template Property

Points to a custom template for the dialog.

Pascal

```
property Template: PChar;
```

C++

```
__property const char * Template;
```

Description

Template points to a resource identifier (a null-terminated string or an integer created with MAKEINTRESOURCE) that identifies a Windows dialog resource in the current HInstance module. The Execute (see page 11283) method uses this resource to customize the appearance of the dialog.

See Also

Execute (see page 11283)

Hinstance

TOpenDialog (see page 11407)

TPrintDialog (see page 11458)

MessageHook (see page 11284)

61.1.3.5.5 TCommonDialog.TemplateModule Property

Pascal

```
property TemplateModule: HINST;
```

C++

```
__property HINST TemplateModule;
```

Description

This is TemplateModule, a member of class TCommonDialog.

61.1.3.6 TCommonDialog Events

The events of the TCommonDialog class are listed here.

Published Events

	Name	Description
	OnClose (see page 11287)	Occurs when the dialog closes.
	OnShow (see page 11288)	Occurs when the dialog opens.

61.1.3.6.1 TCommonDialog.OnClose Event

Occurs when the dialog closes.

Pascal

```
property OnClose: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnClose;
```

Description

Write an OnClose event handler to perform special processing when the dialog closes.

See Also

Handle (see page 11286)

61.1.3.6.2 TCommonDialog.OnShow Event

Occurs when the dialog opens.

Pascal

```
property OnShow: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnShow;
```

Description

Write an OnShow event handler to perform special processing when the dialog is displayed.

See Also

Handle (see page 11286)

Execute (see page 11283)

61.1.4 TCustomFileDialog Class

Abstract base class for Vista style file dialogs.

Class Hierarchy

Pascal

```
TCustomFileDialog = class(TComponent);
```

C++

```
class TCustomFileDialog : public TComponent;
```

File

Dialogs

Description

File dialogs, such as open and save, extend this abstract base class for Microsoft Windows Vista style file dialogs. This is a wrapper class for the Windows Vista common item dialog and implements the IFileDialog interface.

See Also

TCustomFileOpenDialog (see page 11308)

TCustomFileSaveDialog (see page 11314)

61.1.4.1 TCustomFileDialog Members

The following tables list the members exposed by TCustomFileDialog.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	FileOkClick (see page 11297)	This is FileOkClick, a member of class TCustomFileDialog.
	FolderChange (see page 11297)	This is FolderChange, a member of class TCustomFileDialog.
	FolderChanging (see page 11297)	This is FolderChanging, a member of class TCustomFileDialog.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	Overwrite (see page 11298)	This is Overwrite, a member of class TCustomFileDialog.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SelectionChange (see page 11298)	This is SelectionChange, a member of class TCustomFileDialog.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	ShareViolation (see page 11299)	This is ShareViolation, a member of class TCustomFileDialog.
	TypeChange (see page 11299)	This is TypeChange, a member of class TCustomFileDialog.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.

	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Public Events

	Name	Description
	OnExecute (see page 11305)	Occurs when a file dialog gets executed.
	OnFileOkClick (see page 11306)	Occurs when the user clicks the OK button.
	OnFolderChange (see page 11306)	Occurs when a directory is opened or closed from the dialog.
	OnFolderChanging (see page 11307)	Occurs before a directory is opened or closed from the dialog.
	OnOverwrite (see page 11307)	Occurs just before a file would be overwritten.
	OnSelectionChange (see page 11307)	Occurs when the user changes the selection in the dialog.
	OnShareViolation (see page 11308)	Occurs when sharing violations arise from open or save operations.
	OnTypeChange (see page 11308)	Occurs when the user changes the file type selection in the dialog.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 11292)	Creates and initializes an instance.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 11292)	Destroys an instance and frees the associated resources.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Execute (see page 11296)	This is the overview for the Execute method overload.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.

	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
	ClientGuid (see page 11299)	GUID associated with a dialog's persisted state.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DefaultExtension (see page 11300)	Default extension to be added to file names.
	DefaultFolder (see page 11300)	Default folder if no recently used folder.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	Dialog (see page 11300)	Pointer to dialog.
	FavoriteLinks (see page 11301)	List of places available for the user to open or save items.
	FileName (see page 11301)	Text in dialog's File name edit box.
	FileNameLabel (see page 11301)	Text of label next to file name edit box.
R	Files (see page 11302)	List of selected file names.
	FileTypeIndex (see page 11302)	Determines which filter is selected by default when the dialog opens.
	FileTypes (see page 11303)	Determines the file type masks (filters) available in the dialog.
R	Handle (see page 11303)	Specifies the window handle of the dialog.
	OkButtonLabel (see page 11303)	Text of the Open or Save button.
	Options (see page 11304)	List of options controlling dialog.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.

R	ShellItem (see page 11304)	Current shell item.
R	ShellItems (see page 11304)	Array of current shell items.
	Title (see page 11305)	Dialog (see page 11300) title.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

Strict protected Methods

	Name	Description
A	CreateFileDialog (see page 11293)	Create (see page 11292) a file dialog.
	DoOnExecute (see page 11294)	Call OnExecute (see page 11305) event method if defined.
	DoOnFileOkClick (see page 11294)	Call OnFileOkClick (see page 11306) event method if defined.
	DoOnFolderChange (see page 11294)	Call OnFolderChange (see page 11306) event method if defined.
	DoOnFolderChanging (see page 11295)	Call OnFolderChanging (see page 11307) event method if defined.
	DoOnOverwrite (see page 11295)	Call OnOverwrite (see page 11307) event method if defined.
	DoOnSelectionChange (see page 11295)	Call OnSelectionChange (see page 11307) event method if defined.
	DoOnShareViolation (see page 11296)	Call OnShareViolation (see page 11308) event method if defined.
	DoOnTypeChange (see page 11296)	Call OnTypeChange (see page 11308) event method if defined.
	GetFileNames (see page 11298)	This is GetFileNames, a member of class TCustomFileDialog.
	GetItemName (see page 11298)	This is GetItemName, a member of class TCustomFileDialog.
V	GetResults (see page 11298)	This is GetResults, a member of class TCustomFileDialog.

61.1.4.2 TCustomFileDialog.Create Constructor

Creates and initializes an instance.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomFileDialog(TComponent * AOwner);
```

Description

This method creates and initializes an instance of TCustomFileDialog (see page 11288).

See Also

Destroy (see page 11292)

61.1.4.3 TCustomFileDialog.Destroy Destructor

Destroys an instance and frees the associated resources.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TCustomFileDialog();
```

Description

This method destroys an instance of TCustomFileDialog (see page 11288) and frees the associated resources.

See Also

Create (see page 11292)

61.1.4.4 TCustomFileDialog Methods

The methods of the TCustomFileDialog class are listed here.

Protected Methods

	Name	Description
	FileOkClick (see page 11297)	This is FileOkClick, a member of class TCustomFileDialog.
	FolderChange (see page 11297)	This is FolderChange, a member of class TCustomFileDialog.
	FolderChanging (see page 11297)	This is FolderChanging, a member of class TCustomFileDialog.
	Overwrite (see page 11298)	This is Overwrite, a member of class TCustomFileDialog.
	SelectionChange (see page 11298)	This is SelectionChange, a member of class TCustomFileDialog.
	ShareViolation (see page 11299)	This is ShareViolation, a member of class TCustomFileDialog.
	TypeChange (see page 11299)	This is TypeChange, a member of class TCustomFileDialog.

Public Methods

	Name	Description
V	Execute (see page 11296)	This is the overview for the Execute method overload.

Strict protected Methods

	Name	Description
A	CreateFileDialog (see page 11293)	Create (see page 11292) a file dialog.
	DoOnExecute (see page 11294)	Call OnExecute (see page 11305) event method if defined.
	DoOnFileOkClick (see page 11294)	Call OnFileOkClick (see page 11306) event method if defined.
	DoOnFolderChange (see page 11294)	Call OnFolderChange (see page 11306) event method if defined.
	DoOnFolderChanging (see page 11295)	Call OnFolderChanging (see page 11307) event method if defined.
	DoOnOverwrite (see page 11295)	Call OnOverwrite (see page 11307) event method if defined.
	DoOnSelectionChange (see page 11295)	Call OnSelectionChange (see page 11307) event method if defined.
	DoOnShareViolation (see page 11296)	Call OnShareViolation (see page 11308) event method if defined.
	DoOnTypeChange (see page 11296)	Call OnTypeChange (see page 11308) event method if defined.
	GetFileNames (see page 11298)	This is GetFileNames, a member of class TCustomFileDialog.
	GetItemName (see page 11298)	This is GetItemName, a member of class TCustomFileDialog.
V	GetResults (see page 11298)	This is GetResults, a member of class TCustomFileDialog.

61.1.4.4.1 TCustomFileDialog.CreateFileDialog Method

Create (see page 11292) a file dialog.

Pascal

```
function CreateFileDialog: IFileDialog; virtual; abstract;
```

C++

```
virtual __fastcall IFileDialog CreateFileDialog() = 0;
```

Description

This method creates a file dialog. Since it is an abstract method that is not implemented, it must be overridden and implemented by any class extending TCustomFileDialog (see page 11288). The implementation should create a Windows common item dialog, usually using the Windows function CoCreateInstance.

61.1.4.4.2 TCustomFileDialog.DoOnExecute Method

Call OnExecute (see page 11305) event method if defined.

Pascal

```
procedure DoOnExecute; dynamic;
```

C++

```
__fastcall DoOnExecute();
```

Description

DoOnExecute calls the OnExecute (see page 11305) event, if the event is defined. DoOnExecute is called by the Execute (see page 11296) method, so this event occurs whenever an instance of TCustomFileDialog (see page 11288) gets executed. Execute (see page 11296) causes the dialog to be displayed.

See Also

Execute (see page 11296)

OnExecute (see page 11305)

61.1.4.4.3 TCustomFileDialog.DoOnFileOkClick Method

Call OnFileOkClick (see page 11306) event method if defined.

Pascal

```
function DoOnFileOkClick: Boolean; dynamic;
```

C++

```
__fastcall Boolean DoOnFileOkClick();
```

Description

DoOnFileOkClick calls the OnFileOkClick (see page 11306) event, if the event is defined. DoOnFileOkClick is called whenever the user clicks the OK button. The event occurs just before the dialog returns with a result.

See Also

OnFileOkClick (see page 11306)

61.1.4.4.4 TCustomFileDialog.DoOnFolderChange Method

Call OnFolderChange (see page 11306) event method if defined.

Pascal

```
procedure DoOnFolderChange; dynamic;
```

C++

```
__fastcall DoOnFolderChange();
```

Description

DoOnFolderChange calls the OnFolderChange (see page 11306) event, if the event is defined. DoOnFolderChange is called before a directory is opened or closed from the dialog. Such changes happen when the user double-clicks on a directory, clicks the Up arrow, or uses the list box at the top of the dialog to navigate through the directory structure. The event occurs before the change.

See Also

OnFolderChange (see page 11306)

61.1.4.4.5 TCustomFileDialog.DoOnFolderChanging Method

Call OnFolderChanging (see page 11307) event method if defined.

Pascal

```
function DoOnFolderChanging: Boolean; dynamic;
```

C++

```
__fastcall Boolean DoOnFolderChanging();
```

Description

DoOnFolderChanging calls the OnFolderChanging (see page 11307) event, if the event is defined. DoOnFolderChanging is called when a directory is opened or closed from the dialog. This can happen when the user double-clicks on a directory, clicks the Up arrow, or uses the list box at the top of the dialog to navigate through the directory structure. The event occurs after the change.

See Also

OnFolderChanging (see page 11307)

61.1.4.4.6 TCustomFileDialog.DoOnOverwrite Method

Call OnOverwrite (see page 11307) event method if defined.

Pascal

```
procedure DoOnOverwrite(var Response: TFileDialogOverwriteResponse); dynamic;
```

C++

```
__fastcall DoOnOverwrite(TFileDialogOverwriteResponse Response);
```

Description

DoOnOverwrite calls the OnOverwrite (see page 11307) event, if the event is defined. DoOnOverwrite is called just before a file would be overwritten, so this applies only to save dialogs.

See Also

OnOverwrite (see page 11307)

61.1.4.4.7 TCustomFileDialog.DoOnSelectionChange Method

Call OnSelectionChange (see page 11307) event method if defined.

Pascal

```
procedure DoOnSelectionChange; dynamic;
```

C++

```
__fastcall DoOnSelectionChange();
```

Description

DoOnSelectionChange calls the OnSelectionChange (see page 11307) event, if the event is defined. DoOnSelectionChange is called when the user changes the selection in the dialog.

See Also

OnSelectionChange (see page 11307)

61.1.4.4.8 TCustomFileDialog.DoOnShareViolation Method

Call OnShareViolation (see page 11308) event method if defined.

Pascal

```
procedure DoOnShareViolation(var Response: TFileDialogShareViolationResponse); dynamic;
```

C++

```
__fastcall DoOnShareViolation(TFileDialogShareViolationResponse Response);
```

Description

DoOnShareViolation calls the OnShareViolation (see page 11308) event, if the event is defined. DoOnShareViolation is called when sharing violations that arise from Open or Save operations occur.

See Also

OnShareViolation (see page 11308)

61.1.4.4.9 TCustomFileDialog.DoOnTypeChange Method

Call OnTypeChange (see page 11308) event method if defined.

Pascal

```
procedure DoOnTypeChange; dynamic;
```

C++

```
__fastcall DoOnTypeChange();
```

Description

DoOnTypeChange calls the OnTypeChange (see page 11308) event, if the event is defined. DoOnTypeChange is called when the user changes the file type selection in the dialog.

See Also

OnTypeChange (see page 11308)

61.1.4.4.10 Execute Method

This is the overview for the Execute method overload.

Overload List

	Name	Description
	TCustomFileDialog.Execute () (see page 11296)	Displays the dialog box.
	TCustomFileDialog.Execute (HWND) (see page 11296)	Displays the dialog box.

61.1.4.4.10.1 TCustomFileDialog.Execute Method ()

Displays the dialog box.

Pascal

```
function Execute: Boolean; virtual; overload;
function Execute(ParentWnd: HWND): Boolean; virtual; overload;
```

C++

```
virtual __fastcall Boolean Execute();
virtual __fastcall Boolean Execute(HWND ParentWnd);
```

Description

Execute opens the dialog instance at runtime. Generally, Execute returns true when the user makes a selection and clicks OK, and returns false when the user closes the dialog without making a selection.

If the window handle parameter is not supplied, the parent window of the application is used as the parent window of the dialog. Execute calls DoOnExecute (see page 11294), which triggers the OnExecute (see page 11305) event.

See Also

DoOnExecute (see page 11294)

OnExecute (see page 11305)

61.1.4.4.11 TCustomFileDialog.FileOkClick Method

Pascal

```
function FileOkClick: HResult; dynamic;
```

C++

```
__fastcall HRESULT FileOkClick();
```

Description

This is FileOkClick, a member of class TCustomFileDialog.

61.1.4.4.12 TCustomFileDialog.FolderChange Method

Pascal

```
function FolderChange: HResult; dynamic;
```

C++

```
__fastcall HRESULT FolderChange();
```

Description

This is FolderChange, a member of class TCustomFileDialog.

61.1.4.4.13 TCustomFileDialog.FolderChanging Method

Pascal

```
function FolderChanging(psiFolder: IShellItem): HResult; dynamic;
```

C++

```
__fastcall HRESULT FolderChanging(IShellItem psiFolder);
```

Description

This is FolderChanging, a member of class TCustomFileDialog.

61.1.4.4.14 TCustomFileDialog.GetFileNames Method

Pascal

```
function GetFileNames(Items: IShellItemArray): HResult; dynamic;
```

C++

```
__fastcall HRESULT GetFileNames(IShellItemArray Items);
```

Description

This is GetFileNames, a member of class TCustomFileDialog.

61.1.4.4.15 TCustomFileDialog.GetItemName Method

Pascal

```
function GetItemName(Item: IShellItem; var ItemName: TFileName): HResult; dynamic;
```

C++

```
__fastcall HRESULT GetItemName(IShellItem Item, TFileName ItemName);
```

Description

This is GetItemName, a member of class TCustomFileDialog.

61.1.4.4.16 TCustomFileDialog.GetResults Method

Pascal

```
function GetResults: HResult; virtual;
```

C++

```
virtual __fastcall HRESULT GetResults();
```

Description

This is GetResults, a member of class TCustomFileDialog.

61.1.4.4.17 TCustomFileDialog.Overwrite Method

Pascal

```
function Overwrite(psiFile: IShellItem; var Response: Cardinal): HResult; dynamic;
```

C++

```
__fastcall HRESULT Overwrite(IShellItem psiFile, unsigned Response);
```

Description

This is Overwrite, a member of class TCustomFileDialog.

61.1.4.4.18 TCustomFileDialog.SelectionChange Method

Pascal

```
function SelectionChange: HResult; dynamic;
```

C++

```
__fastcall HRESULT SelectionChange();
```

Description

This is SelectionChange, a member of class TCustomFileDialog.

61.1.4.4.19 TCustomFileDialog.ShareViolation Method

Pascal

```
function ShareViolation(psiFile: IShellItem; var Response: Cardinal): HResult; dynamic;
```

C++

```
__fastcall HRESULT ShareViolation(IShellItem psiFile, unsigned Response);
```

Description

This is ShareViolation, a member of class TCustomFileDialog.

61.1.4.4.20 TCustomFileDialog.TypeChange Method

Pascal

```
function TypeChange: HResult; dynamic;
```

C++

```
__fastcall HRESULT TypeChange();
```

Description

This is TypeChange, a member of class TCustomFileDialog.

61.1.4.5 TCustomFileDialog Properties

The properties of the TCustomFileDialog class are listed here.

Public Properties

	Name	Description
	ClientGuid (see page 11299)	GUID associated with a dialog's persisted state.
	DefaultExtension (see page 11300)	Default extension to be added to file names.
	DefaultFolder (see page 11300)	Default folder if no recently used folder.
R	Dialog (see page 11300)	Pointer to dialog.
	FavoriteLinks (see page 11301)	List of places available for the user to open or save items.
	FileName (see page 11301)	Text in dialog's File name edit box.
	FileNameLabel (see page 11301)	Text of label next to file name edit box.
R	Files (see page 11302)	List of selected file names.
	FileTypeIndex (see page 11302)	Determines which filter is selected by default when the dialog opens.
	FileTypes (see page 11303)	Determines the file type masks (filters) available in the dialog.
R	Handle (see page 11303)	Specifies the window handle of the dialog.
	OkButtonLabel (see page 11303)	Text of the Open or Save button.
	Options (see page 11304)	List of options controlling dialog.
R	ShellItem (see page 11304)	Current shell item.
R	ShellItems (see page 11304)	Array of current shell items.
	Title (see page 11305)	Dialog (see page 11300) title.

61.1.4.5.1 TCustomFileDialog.ClientGuid Property

GUID associated with a dialog's persisted state.

Pascal

```
property ClientGuid: string;
```

C++

```
__property AnsiString ClientGuid;
```

Description

ClientGuid holds a GUID associated with a dialog's persisted state. Persisted states for a dialog can include such things as its position and size. Having a GUID allows an application to remember these persisted states for different versions of the dialog.

61.1.4.5.2 TCustomFileDialog.DefaultExtension Property

Default extension to be added to file names.

Pascal

```
property DefaultExtension: string;
```

C++

```
__property AnsiString DefaultExtension;
```

Description

DefaultExtension contains the default extension to add to file names.

See Also

DefaultFolder (see page 11300)

FileName (see page 11301)

Files (see page 11302)

FileTypes (see page 11303)

61.1.4.5.3 TCustomFileDialog.DefaultFolder Property

Default folder if no recently used folder.

Pascal

```
property DefaultFolder: string;
```

C++

```
__property AnsiString DefaultFolder;
```

Description

DefaultFolder contains the name of the default folder if there is no recently used folder.

See Also

DefaultExtension (see page 11300)

61.1.4.5.4 TCustomFileDialog.Dialog Property

Pointer to dialog.

Pascal

```
property Dialog: IFileDialog;
```

C++

```
__property IFileDialog Dialog;
```

Description

Dialog contains a pointer to the dialog itself.

See Also

Handle (see page 11303)

61.1.4.5.5 TCustomFileDialog.FavoriteLinks Property

List of places available for the user to open or save items.

Pascal

```
property FavoriteLinks: TFavoriteLinkItems;
```

C++

```
__property TFavoriteLinkItems FavoriteLinks;
```

Description

FavoriteLinks contains a list of places available for the user to open or save items. This is an instance of TFavoriteLinkItems (see page 11340).

See Also

TFavoriteLinkItems (see page 11340)

61.1.4.5.6 TCustomFileDialog.FileName Property

Text in dialog's File name edit box.

Pascal

```
property FileName: TFileName;
```

C++

```
__property TFileName FileName;
```

Description

FileName contains the text currently entered in the dialog's File name edit box.

See Also

FileNameLabel (see page 11301)

FileTypes (see page 11303)

ShellItem (see page 11304)

61.1.4.5.7 TCustomFileDialog.FileNameLabel Property

Text of label next to file name edit box.

Pascal

```
property FileNameLabel: string;
```

C++

```
__property AnsiString FileNameLabel;
```

Description

FileNameLabel holds the text of the label next to the file name edit box in the dialog.

See Also

FileName (see page 11301)

FileTypes (see page 11303)

OkButtonLabel (see page 11303)

61.1.4.5.8 TCustomFileDialog.Files Property

List of selected file names.

Pascal

```
property Files: TStrings;
```

C++

```
__property TStrings Files;
```

Description

Files is a string list that contains each selected file name with its full directory path. (To let users select multiple file names, set the fdoAllowMultiSelect flag in Options (see page 11304).) Use properties and methods for string lists to traverse this list of files and read individual items.

The example below assigns the list of files in Files to the Items property of a TListBox component.

```
ListBox1.Items.Assign(OpenDialog1.Files);
ListBox1->Items->Assign(OpenDialog1->Files);
```

See Also

FileName (see page 11301)

ShellItems (see page 11304)

61.1.4.5.9 TCustomFileDialog.FileTypeIndex Property

Determines which filter is selected by default when the dialog opens.

Pascal

```
property FileTypeIndex: Cardinal;
```

C++

```
__property unsigned FileTypeIndex;
```

Description

FileTypeIndex determines which of the file types in FileTypes (see page 11303) is selected by default when the dialog opens. Set FileTypeIndex to 1 to choose the first file type in the list as the default, or set FileTypeIndex to 2 to choose the second file type as the default, and so forth. If the value of FileTypeIndex is out or range, the first file type listed in FileTypes (see page 11303) is the default.

See Also

FileTypes (see page 11303)

61.1.4.5.10 TCustomFileDialog.FileTypes Property

Determines the file type masks (filters) available in the dialog.

Pascal

```
property FileTypes: TFileTypeItems;
```

C++

```
__property TFileTypeItems FileTypes;
```

Description

FileTypes is an instance of TFileTypeItems (see page 11372) containing a list of file types, each of which is an instance of TFileTypeItem (see page 11368).

To add file types to a dialog, get the TFileTypeItems (see page 11372) instance from FileTypes and use the TFileTypeItems.Add method as in this sample:

```
with FileOpenDialog1.FileTypes.Add do
begin
  DisplayName := 'All Files';
  FileMask := '*.*';
end;
```

See Also

TFileTypeItem (see page 11368)

TFileTypeItems (see page 11372)

FileTypeIndex (see page 11302)

61.1.4.5.11 TCustomFileDialog.Handle Property

Specifies the window handle of the dialog.

Pascal

```
property Handle: HWnd;
```

C++

```
__property HWnd Handle;
```

Description

The Handle property contains the dialog's window handle after a call to Execute (see page 11296).

See Also

Dialog (see page 11300)

Execute (see page 11296)

61.1.4.5.12 TCustomFileDialog.OkButtonLabel Property

Text of the Open or Save button.

Pascal

```
property OkButtonLabel: string;
```

C++

```
__property AnsiString OkButtonLabel;
```

Description

OkButtonLabel contains text of the Open or Save button.

See Also

FileNameLabel (see page 11301)

61.1.4.5.13 TCustomFileDialog.Options Property

List of options controlling dialog.

Pascal

```
property Options: TFileDialogOptions;
```

C++

```
__property TFileDialogOptions Options;
```

Description

Options is a set of TFileDialogOption (see page 11549) options controlling the dialog's behavior.

See Also

TFileDialogOption

61.1.4.5.14 TCustomFileDialog.ShellItem Property

Current shell item.

Pascal

```
property ShellItem: IShellItem;
```

C++

```
__property IShellItem ShellItem;
```

Description

ShellItem holds the most recently accessed shell item in the dialog from a user's action, such as selecting a file or folder. Shell items are container-like objects in Windows, such as folders. See the Microsoft SDK for information on shell items.

During an event, ShellItem contains the shell item pertinent to the event, such as a file a user selected; after the event is processed, ShellItem is `nil`. After the user clicks OK, ShellItem contains the shell item result from the dialog.

See Also

FileName (see page 11301)

ShellItems (see page 11304)

61.1.4.5.15 TCustomFileDialog.ShellItems Property

Array of current shell items.

Pascal

```
property ShellItems: IShellItemArray;
```

C++

```
__property IShellItemArray ShellItems;
```

Description

ShellItems holds the most recently accessed shell items in the dialog from a user's action, such as selecting files. Shell items are container-like objects in Windows, such as folders. See the Microsoft SDK for information on shell items. The fdoAllowMultiSelect option must be set in Options (see page 11304) so that multiple items can be selected for ShellItems to be used.

During an event, ShellItems contains the shell items pertinent to the event, such as an array of files a user selected; after the event is processed, ShellItems is `nil`. After the user clicks OK, ShellItems contains the shell items result from the dialog.

See Also

Files (see page 11302)

ShellItem (see page 11304)

61.1.4.5.16 TCustomFileDialog.Title Property

Dialog (see page 11300) title.

Pascal

```
property Title: string;
```

C++

```
__property AnsiString Title;
```

Description

Title contains the dialog's title.

See Also

FileNameLabel (see page 11301)

OkButtonLabel (see page 11303)

61.1.4.6 TCustomFileDialog Events

The events of the TCustomFileDialog class are listed here.

Public Events

	Name	Description
	OnExecute (see page 11305)	Occurs when a file dialog gets executed.
	OnFileOkClick (see page 11306)	Occurs when the user clicks the OK button.
	OnFolderChange (see page 11306)	Occurs when a directory is opened or closed from the dialog.
	OnFolderChanging (see page 11307)	Occurs before a directory is opened or closed from the dialog.
	OnOverwrite (see page 11307)	Occurs just before a file would be overwritten.
	OnSelectionChange (see page 11307)	Occurs when the user changes the selection in the dialog.
	OnShareViolation (see page 11308)	Occurs when sharing violations arise from open or save operations.
	OnTypeChange (see page 11308)	Occurs when the user changes the file type selection in the dialog.

61.1.4.6.1 TCustomFileDialog.OnExecute Event

Occurs when a file dialog gets executed.

Pascal

```
property OnExecute: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnExecute;
```

Description

OnExecute occurs when an instance of TCustomFileDialog (see page 11288) gets executed by the Execute (see page 11296) method. Execute (see page 11296) causes the dialog to be displayed. The DoOnExecute (see page 11294) method triggers this event.

See Also

DoOnExecute (see page 11294)

Execute (see page 11296)

61.1.4.6.2 TCustomFileDialog.OnFileOkClick Event

Occurs when the user clicks the OK button.

Pascal

```
property OnFileOkClick: TFileDialogCloseEvent;
```

C++

```
__property TFileDialogCloseEvent OnFileOkClick;
```

Description

OnFileOkClick occurs when the user clicks the OK button. The event occurs just before the dialog returns with a result. If an event handler is defined, the property contains a pointer to a TFileDialogCloseEvent (see page 11570). The DoOnFileOkClick (see page 11294) method triggers this event.

See Also

DoOnFileOkClick (see page 11294)

TFileDialogCloseEvent

61.1.4.6.3 TCustomFileDialog.OnFolderChange Event

Occurs when a directory is opened or closed from the dialog.

Pascal

```
property OnFolderChange: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnFolderChange;
```

Description

The OnFolderChange event occurs when the user changes the directory whose contents are displayed in the dialog. This can happen when the user double-clicks on a directory, clicks the Up arrow, or uses the list box at the top of the dialog to navigate through the directory structure. The event occurs after the folder changes. The DoOnFolderChange (see page 11294) method triggers this event.

See Also

DoOnFolderChange (see page 11294)

61.1.4.6.4 TCustomFileDialog.OnFolderChanging Event

Occurs before a directory is opened or closed from the dialog.

Pascal

```
property OnFolderChanging: TFileDialogFolderChangingEvent;
```

C++

```
__property TFileDialogFolderChangingEvent OnFolderChanging;
```

Description

OnFileOkClick (see page 11306) occurs before a directory is opened or closed from the dialog. This can happen when the user double-clicks on a directory, clicks the Up arrow, or uses the list box at the top of the dialog to navigate through the directory structure. If an event handler is defined, the property contains a pointer to a TFileDialogFolderChangingEvent (see page 11570). The DoOnFolderChanging (see page 11295) method triggers this event.

See Also

DoOnFolderChanging (see page 11295)

TFileDialogFolderChangingEvent

61.1.4.6.5 TCustomFileDialog.OnOverwrite Event

Occurs just before a file would be overwritten.

Pascal

```
property OnOverwrite: TFileDialogOverwriteEvent;
```

C++

```
__property TFileDialogOverwriteEvent OnOverwrite;
```

Description

OnOverwrite occurs just before a file would be overwritten, so this applies only to save dialogs. If an event handler is defined, the property contains a pointer to a TFileDialogOverwriteEvent (see page 11572). The DoOnOverwrite (see page 11295) method triggers this event.

See Also

DoOnOverwrite (see page 11295)

TFileDialogOverwriteEvent

61.1.4.6.6 TCustomFileDialog.OnSelectionChange Event

Occurs when the user changes the selection in the dialog.

Pascal

```
property OnSelectionChange: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnSelectionChange;
```

Description

OnSelectionChange occurs when the user changes the selection in the dialog. The DoOnSelectionChange (see page 11295) method triggers this event.

See Also

DoOnSelectionChange (see page 11295)

61.1.4.6.7 TCustomFileDialog.OnShareViolation Event

Occurs when sharing violations arise from open or save operations.

Pascal

```
property OnShareViolation: TFileDialogShareViolationEvent;
```

C++

```
__property TFileDialogShareViolationEvent OnShareViolation;
```

Description

OnShareViolation occurs when sharing violations arise from open or save operations. If an event handler is defined, the property contains a pointer to a TFileDialogShareViolationEvent (see page 11572). The DoOnShareViolation (see page 11296) method triggers this event.

See Also

DoOnShareViolation (see page 11296)

TFileDialogShareViolationEvent

61.1.4.6.8 TCustomFileDialog.OnTypeChange Event

Occurs when the user changes the file type selection in the dialog.

Pascal

```
property OnTypeChange: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnTypeChange;
```

Description

OnTypeChange occurs when the user changes the file type selection in the dialog. The DoOnTypeChange (see page 11296) method triggers this event.

See Also

DoOnTypeChange (see page 11296)

61.1.5 TCustomFileOpenDialog Class

Base class for Vista style file open dialogs.

Class Hierarchy

Pascal

```
TCustomFileOpenDialog = class(TCustomFileDialog);
```

C++

```
class TCustomFileOpenDialog : public TCustomFileDialog;
```

File

Dialogs

Description

This class extends TCustomFileDialog (see page 11288). File open dialogs extend this base class for Microsoft Windows Vista style file open dialogs. This is a wrapper class for the Windows Vista CLSID_FileOpenDialog and implements the IFileOpenDialog interface.

See Also

TCustomFileDialog (see page 11288)

61.1.5.1 TCustomFileOpenDialog Members

The following tables list the members exposed by TCustomFileOpenDialog.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	CreateFileDialog (see page 11313)	Create (see page 11292) an open file dialog.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	FileOkClick (see page 11297)	This is FileOkClick, a member of class TCustomFileDialog.
	FolderChange (see page 11297)	This is FolderChange, a member of class TCustomFileDialog.
	FolderChanging (see page 11297)	This is FolderChanging, a member of class TCustomFileDialog.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
V	GetResults (see page 11313)	Get user's choices in dialog.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.

	Notification (see page 2783)	Forwards notification messages to all owned components.
	Overwrite (see page 11298)	This is Overwrite, a member of class TCustomFileDialog.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SelectionChange (see page 11313)	Respond to a selection change.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	ShareViolation (see page 11299)	This is ShareViolation, a member of class TCustomFileDialog.
	TypeChange (see page 11299)	This is TypeChange, a member of class TCustomFileDialog.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Public Events

	Name	Description
	OnExecute (see page 11305)	Occurs when a file dialog gets executed.
	OnFileOkClick (see page 11306)	Occurs when the user clicks the OK button.
	OnFolderChange (see page 11306)	Occurs when a directory is opened or closed from the dialog.
	OnFolderChanging (see page 11307)	Occurs before a directory is opened or closed from the dialog.
	OnOverwrite (see page 11307)	Occurs just before a file would be overwritten.
	OnSelectionChange (see page 11307)	Occurs when the user changes the selection in the dialog.
	OnShareViolation (see page 11308)	Occurs when sharing violations arise from open or save operations.
	OnTypeChange (see page 11308)	Occurs when the user changes the file type selection in the dialog.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.

	Create (see page 11292)	Creates and initializes an instance.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 2766)	Disposes of the component and its owned components.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 11292)	Destroys an instance and frees the associated resources.
	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Execute (see page 11296)	This is the overview for the Execute method overload.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
	ClientGuid (see page 11299)	GUID associated with a dialog's persisted state.

R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DefaultExtension (see page 11300)	Default extension to be added to file names.
	DefaultFolder (see page 11300)	Default folder if no recently used folder.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	Dialog (see page 11300)	Pointer to dialog.
	FavoriteLinks (see page 11301)	List of places available for the user to open or save items.
	FileName (see page 11301)	Text in dialog's File name edit box.
	FileNameLabel (see page 11301)	Text of label next to file name edit box.
R	Files (see page 11302)	List of selected file names.
	FileTypeIndex (see page 11302)	Determines which filter is selected by default when the dialog opens.
	FileTypes (see page 11303)	Determines the file type masks (filters) available in the dialog.
R	Handle (see page 11303)	Specifies the window handle of the dialog.
	OkButtonLabel (see page 11303)	Text of the Open or Save button.
	Options (see page 11304)	List of options controlling dialog.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
R	ShellItem (see page 11304)	Current shell item.
R	ShellItems (see page 11304)	Array of current shell items.
	Title (see page 11305)	Dialog (see page 11300) title.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

Strict protected Methods

	Name	Description
	DoOnExecute (see page 11294)	Call OnExecute (see page 11305) event method if defined.
	DoOnFileOkClick (see page 11294)	Call OnFileOkClick (see page 11306) event method if defined.
	DoOnFolderChange (see page 11294)	Call OnFolderChange (see page 11306) event method if defined.
	DoOnFolderChanging (see page 11295)	Call OnFolderChanging (see page 11307) event method if defined.
	DoOnOverwrite (see page 11295)	Call OnOverwrite (see page 11307) event method if defined.
	DoOnSelectionChange (see page 11295)	Call OnSelectionChange (see page 11307) event method if defined.
	DoOnShareViolation (see page 11296)	Call OnShareViolation (see page 11308) event method if defined.
	DoOnTypeChange (see page 11296)	Call OnTypeChange (see page 11308) event method if defined.
	GetFileNames (see page 11298)	This is GetFileNames, a member of class TCustomFileDialog.
	GetItemName (see page 11298)	This is GetItemName, a member of class TCustomFileDialog.

61.1.5.2 TCustomFileOpenDialog Methods

The methods of the TCustomFileOpenDialog class are listed here.

Protected Methods

	Name	Description
V	CreateFileDialog (see page 11313)	Create (see page 11292) an open file dialog.
V	GetResults (see page 11313)	Get user's choices in dialog.

	SelectionChange (see page 11313)	Respond to a selection change.

61.1.5.2.1 TCustomFileOpenDialog.CreateFileDialog Method

Create (see page 11292) an open file dialog.

Pascal

```
function CreateFileDialog: IFileDialog; override;
```

C++

```
virtual __fastcall IFileDialog CreateFileDialog();
```

Description

This method creates a Windows CLSID_FileOpenDialog using the Windows function CoCreateInstance.

See Also

TCustomFileDialog (see page 11288)

CreateFileDialog (see page 11293)

61.1.5.2.2 TCustomFileOpenDialog.GetResults Method

Get user's choices in dialog.

Pascal

```
function GetResults: HResult; override;
```

C++

```
virtual __fastcall HRESULT GetResults();
```

Description

GetResults obtains the user's choices in a dialog. The fdoAllowMultiSelect option must be set in Options (see page 11304) to allow multiple items to be selected. This returns S_OK if successful or an error value otherwise.

See Also

Options (see page 11304)

61.1.5.2.3 TCustomFileOpenDialog.SelectionChange Method

Respond to a selection change.

Pascal

```
function SelectionChange: HResult; override;
```

C++

```
virtual __fastcall HRESULT SelectionChange();
```

Description

SelectionChange performs the appropriate processing for a change to the selection in the dialog. TCustomFileDialog.DoOnSelectionChange (see page 11295) is called. The ShellItem (see page 11304) and ShellItems (see page 11304) properties are updated.

See Also

TCustomFileDialog (see page 11288)

ShellItem (see page 11304)

ShellItems (see page 11304)

DoOnSelectionChange (see page 11295)

61.1.6 TCustomFileSaveDialog Class

Base class for Vista style file save dialogs.

Class Hierarchy

Pascal

```
TCustomFileSaveDialog = class(TCustomFileDialog);
```

C++

```
class TCustomFileSaveDialog : public TCustomFileDialog;
```

File

Dialogs

Description

This class extends TCustomFileDialog (see page 11288). File save dialogs extend this base class for Microsoft Windows Vista style file save dialogs. This is a wrapper class for the Windows Vista CLSID_FileSaveDialog and implements the IFileSaveDialog interface.

See Also

TCustomFileDialog (see page 11288)

61.1.6.1 TCustomFileSaveDialog Members

The following tables list the members exposed by TCustomFileSaveDialog.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	CreateFileDialog (see page 11318)	Create (see page 11292) an save file dialog.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.

	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	FileOkClick (see page 11297)	This is FileOkClick, a member of class TCustomFileDialog.
	FolderChange (see page 11297)	This is FolderChange, a member of class TCustomFileDialog.
	FolderChanging (see page 11297)	This is FolderChanging, a member of class TCustomFileDialog.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	Overwrite (see page 11298)	This is Overwrite, a member of class TCustomFileDialog.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SelectionChange (see page 11298)	This is SelectionChange, a member of class TCustomFileDialog.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	ShareViolation (see page 11299)	This is ShareViolation, a member of class TCustomFileDialog.
	TypeChange (see page 11299)	This is TypeChange, a member of class TCustomFileDialog.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Public Events

	Name	Description
	OnExecute (see page 11305)	Occurs when a file dialog gets executed.
	OnFileOkClick (see page 11306)	Occurs when the user clicks the OK button.
	OnFolderChange (see page 11306)	Occurs when a directory is opened or closed from the dialog.
	OnFolderChanging (see page 11307)	Occurs before a directory is opened or closed from the dialog.
	OnOverwrite (see page 11307)	Occurs just before a file would be overwritten.
	OnSelectionChange (see page 11307)	Occurs when the user changes the selection in the dialog.
	OnShareViolation (see page 11308)	Occurs when sharing violations arise from open or save operations.
	OnTypeChange (see page 11308)	Occurs when the user changes the file type selection in the dialog.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
V	Create (see page 11292)	Creates and initializes an instance.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 11292)	Destroys an instance and frees the associated resources.
V	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
V	Execute (see page 11296)	This is the overview for the Execute method overload.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.

	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
	ClientGuid (see page 11299)	GUID associated with a dialog's persisted state.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DefaultExtension (see page 11300)	Default extension to be added to file names.
	DefaultFolder (see page 11300)	Default folder if no recently used folder.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	Dialog (see page 11300)	Pointer to dialog.
	FavoriteLinks (see page 11301)	List of places available for the user to open or save items.
	FileName (see page 11301)	Text in dialog's File name edit box.
	FileNameLabel (see page 11301)	Text of label next to file name edit box.
R	Files (see page 11302)	List of selected file names.
	FileTypeIndex (see page 11302)	Determines which filter is selected by default when the dialog opens.
	FileTypes (see page 11303)	Determines the file type masks (filters) available in the dialog.
R	Handle (see page 11303)	Specifies the window handle of the dialog.
	OkButtonLabel (see page 11303)	Text of the Open or Save button.
	Options (see page 11304)	List of options controlling dialog.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
R	ShellItem (see page 11304)	Current shell item.
R	ShellItems (see page 11304)	Array of current shell items.
	Title (see page 11305)	Dialog (see page 11300) title.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

Strict protected Methods

	Name	Description
	DoOnExecute (see page 11294)	Call OnExecute (see page 11305) event method if defined.
	DoOnFileOkClick (see page 11294)	Call OnFileOkClick (see page 11306) event method if defined.
	DoOnFolderChange (see page 11294)	Call OnFolderChange (see page 11306) event method if defined.
	DoOnFolderChanging (see page 11295)	Call OnFolderChanging (see page 11307) event method if defined.

	DoOnOverwrite (see page 11295)	Call OnOverwrite (see page 11307) event method if defined.
	DoOnSelectionChange (see page 11295)	Call OnSelectionChange (see page 11307) event method if defined.
	DoOnShareViolation (see page 11296)	Call OnShareViolation (see page 11308) event method if defined.
	DoOnTypeChange (see page 11296)	Call OnTypeChange (see page 11308) event method if defined.
	GetFileNames (see page 11298)	This is GetFileNames, a member of class TCustomFileDialog.
	GetItemName (see page 11298)	This is GetItemName, a member of class TCustomFileDialog.
V	GetResults (see page 11298)	This is GetResults, a member of class TCustomFileDialog.

61.1.6.2 TCustomFileSaveDialog Methods

The methods of the TCustomFileSaveDialog class are listed here.

Protected Methods

	Name	Description
V	CreateFileDialog (see page 11318)	Create (see page 11292) an save file dialog.

61.1.6.2.1 TCustomFileSaveDialog.CreateFileDialog Method

Create (see page 11292) an save file dialog.

Pascal

```
function CreateFileDialog: IFileDialog; override;
```

C++

```
virtual __fastcall IFileDialog CreateFileDialog();
```

Description

This method creates a Windows CLSID_FileSaveDialog using the Windows function CoCreateInstance.

See Also

TCustomFileDialog (see page 11288)

CreateFileDialog (see page 11293)

61.1.7 TCustomTaskDialog Class

Base class for Task Dialogs (see page 11265).

Class Hierarchy

Pascal

```
TCustomTaskDialog = class(TComponent);
```

C++

```
class TCustomTaskDialog : public TComponent;
```

File

Dialogs

Description

TCustomTaskDialog provides the base class for Task Dialogs (see page 11265). Derived classes should inherit from TTaskDialog (see page 11494) instead of TCustomTaskDialog.

61.1.7.1 TCustomTaskDialog Members

The following tables list the members exposed by TCustomTaskDialog.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	CallbackProc (see page 11323)	An application-defined function used with Task Dialogs (see page 11265).
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.

	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Public Events

	Name	Description
	OnButtonClicked (see page 11334)	Button (see page 11328) click event.
	OnDialogConstructed (see page 11335)	Dialog constructed event.
	OnDialogCreated (see page 11335)	Task Dialog creation event.
	OnDialogDestroyed (see page 11335)	Task dialog destruction event..
	OnExpanded (see page 11335)	Task dialog expanded event.
	OnHyperlinkClicked (see page 11336)	Task dialog hyperlink clicked event.
	OnNavigated (see page 11336)	Task Dialog navigation event.
	OnRadioButtonClicked (see page 11336)	Task Dialog radio button click event.
	OnTimer (see page 11336)	Task dialog timer event.
	OnVerificationClicked (see page 11337)	Task Dialog verification check box event.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 11322)	Creates a custom Task Dialog instance.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 11322)	Destroys an instance of a custom Task Dialog.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Execute (see page 11326)	This is the overview for the Execute method overload.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.

	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
	Button (see page 11328)	Selected button.
	Buttons (see page 11328)	The collection of all buttons on the Task Dialog.
	Caption (see page 11328)	Caption for the Task Dialog.
	CommonButtons (see page 11328)	Specifies the push buttons displayed in the Task Dialog.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	CustomFooterIcon (see page 11329)	Indicates the custom footer icon, if any, for the Task Dialog.
	CustomMainIcon (see page 11329)	Indicates the custom main icon, if any, for the Task Dialog.
	DefaultButton (see page 11329)	The default button for this Task Dialog.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	ExpandButtonCaption (see page 11329)	Additional information for this button.
R	Expanded (see page 11330)	Indicates whether the Task Dialog is expanded.
	ExpandedText (see page 11330)	Text (see page 11333) to display when the Task Dialog is expanded.
	Flags (see page 11330)	Flags for this Task Dialog.
	FooterIcon (see page 11331)	Indicates which standard footer icon to display.
	FooterText (see page 11331)	String to be used in the footer area of the Task Dialog.
R	Handle (see page 11331)	Handle to the parent window.
	HelpContext (see page 11332)	Help context for the Task Dialog.
	MainIcon (see page 11332)	Indicates which standard main icon to display.

	ModalResult (see page 11332)	Modal result.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	ProgressBar (see page 11332)	Progress bar for this Task Dialog.
R	RadioButton (see page 11333)	Selected radio button.
	RadioButtons (see page 11333)	Collection of all radio buttons on this Task Dialog.
	Text (see page 11333)	The main text on this Task Dialog..
	Title (see page 11333)	The title of this Task Dialog.
R	URL (see page 11334)	URL for the Task Dialog.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	VerificationText (see page 11334)	Text (see page 11333) used to label the verification check box.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

Strict protected Methods

	Name	Description
	DoExecute (see page 11323)	Executes the Task Dialog.
	DoOnButtonClicked (see page 11324)	Performs the click function of the Task Dialog.
	DoOnDialogContructed (see page 11324)	Performs the on-construction actions of the Task Dialog.
	DoOnDialogCreated (see page 11324)	Performs the on-creation actrions of a Task Dialog.
	DoOnDialogDestroyed (see page 11324)	Performs the on-destruction actions of a Task Dialog.
	DoOnExpandButtonClicked (see page 11325)	Performs the expansion action of a Task Dialog when the **Expand** button is pushed.
	DoOnHelp (see page 11325)	Performs the help function for a Task Dialog.
	DoOnHyperlinkClicked (see page 11325)	Performs the hyperlink click action of a Task Dialog.
	DoOnNavigated (see page 11325)	Performs the navigation action of a Task Dialog.
	DoOnRadioButtonClicked (see page 11326)	Performs the radio button click action of a Task Dialog.
	DoOnTimer (see page 11326)	Performs the timer action of a Task Dialog.
	DoOnVerificationClicked (see page 11326)	Performs the verification check action of a Task Dialog.

61.1.7.2 TCustomTaskDialog.Create Constructor

Creates a custom Task Dialog instance.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomTaskDialog(TComponent * AOwner);
```

Description

Use Create to create an instance of TCustomTaskDialog (see page 11318). Derived classes should inherit from the TTaskDialog (see page 11494) instead of this one.

61.1.7.3 TCustomTaskDialog.Destroy Destructor

Destroys an instance of a custom Task Dialog.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TCustomTaskDialog();
```

Description

Use Destroy to destroy an instance of TCustomTaskDialog (see page 11318).

61.1.7.4 TCustomTaskDialog Methods

The methods of the TCustomTaskDialog class are listed here.

Protected Methods

	Name	Description
	CallbackProc (see page 11323)	An application-defined function used with Task Dialogs (see page 11265).

Public Methods

	Name	Description
	Execute (see page 11326)	This is the overview for the Execute method overload.

Strict protected Methods

	Name	Description
	DoExecute (see page 11323)	Executes the Task Dialog.
	DoOnButtonClicked (see page 11324)	Performs the click function of the Task Dialog.
	DoOnDialogContructed (see page 11324)	Performs the on-construction actions of the Task Dialog.
	DoOnDialogCreated (see page 11324)	Performs the on-creation actrions of a Task Dialog.
	DoOnDialogDestroyed (see page 11324)	Performs the on-destruction actions of a Task Dialog.
	DoOnExpandButtonClicked (see page 11325)	Performs the expansion action of a Task Dialog when the **Expand** button is pushed.
	DoOnHelp (see page 11325)	Performs the help function for a Task Dialog.
	DoOnHyperlinkClicked (see page 11325)	Performs the hyperlink click action of a Task Dialog.
	DoOnNavigated (see page 11325)	Performs the navigation action of a Task Dialog.
	DoOnRadioButtonClicked (see page 11326)	Performs the radio button click action of a Task Dialog.
	DoOnTimer (see page 11326)	Performs the timer action of a Task Dialog.
	DoOnVerificationClicked (see page 11326)	Performs the verification check action of a Task Dialog.

61.1.7.4.1 TCustomTaskDialog.CallbackProc Method

An application-defined function used with Task Dialogs (see page 11265).

Pascal

```
function CallbackProc(hwnd: HWND; msg: UINT; wParam: WPARAM; lParam: LPARAM; lpRefData:
LONG_PTR): HResult; dynamic;
```

C++

```
__fastcall HRESULT CallbackProc(HWND hwnd, UINT msg, WPARAM wParam, LPARAM lParam, LONG_PTR
lpRefData);
```

Description

Use CallbackProc as an application-defined function used with the TaskDialogIndirect function. It receives messages from the Task Dialog when various events occur. An application must register this callback function. .

61.1.7.4.2 TCustomTaskDialog.DoExecute Method

Executes the Task Dialog.

Pascal

```
function DoExecute(ParentWnd: HWND): Boolean; dynamic;
```

C++

```
__fastcall Boolean DoExecute(HWND ParentWnd);
```

Description

Use DoExecute to perform the execution of the Task Dialog.

61.1.7.4.3 TCustomTaskDialog.DoOnButtonClicked Method

Performs the click function of the Task Dialog.

Pascal

```
procedure DoOnButtonClicked(AModalResult: Integer; var CanClose: Boolean); dynamic;
```

C++

```
__fastcall DoOnButtonClicked(int AModalResult, Boolean CanClose);
```

Description

Use DoOnButtonClicked to perform the click action of the Task Dialog.

61.1.7.4.4 TCustomTaskDialog.DoOnDialogContructed Method

Performs the on-construction actions of the Task Dialog.

Pascal

```
procedure DoOnDialogContructed; dynamic;
```

C++

```
__fastcall DoOnDialogContructed();
```

Description

Use DoOnDialogContructed to perform the on-construction actions of the Task Dialog.

61.1.7.4.5 TCustomTaskDialog.DoOnDialogCreated Method

Performs the on-creation actrions of a Task Dialog.

Pascal

```
procedure DoOnDialogCreated; dynamic;
```

C++

```
__fastcall DoOnDialogCreated();
```

Description

Use DoOnDialogCreated to perform the on-creation actions of the Task Dialog.

61.1.7.4.6 TCustomTaskDialog.DoOnDialogDestroyed Method

Performs the on-destruction actions of a Task Dialog.

Pascal

```
procedure DoOnDialogDestroyed; dynamic;
```

C++

```
__fastcall DoOnDialogDestroyed();
```

Description

Use DoOnDialogDestroyed to perform the on-destruction actions of a Task Dialog.

61.1.7.4.7 TCustomTaskDialog.DoOnExpandButtonClicked Method

Performs the expansion action of a Task Dialog when the **Expand** button is pushed.

Pascal

```
procedure DoOnExpandButtonClicked(Expanded: Boolean); dynamic;
```

C++

```
__fastcall DoOnExpandButtonClicked(Boolean Expanded);
```

Description

Use DoOnExpandButtonClicked to perform the expansion action of a Task Dialog.

61.1.7.4.8 TCustomTaskDialog.DoOnHelp Method

Performs the help function for a Task Dialog.

Pascal

```
procedure DoOnHelp; dynamic;
```

C++

```
__fastcall DoOnHelp();
```

Description

Use DoOnHelp to perform the help function for a Task Dialog.

61.1.7.4.9 TCustomTaskDialog.DoOnHyperlinkClicked Method

Performs the hyperlink click action of a Task Dialog.

Pascal

```
procedure DoOnHyperlinkClicked(const AURL: string); dynamic;
```

C++

```
__fastcall DoOnHyperlinkClicked(const AnsiString AURL);
```

Description

Use DoOnHyperlinkClicked to perform the hyperlink click action of a Task Dialog.

61.1.7.4.10 TCustomTaskDialog.DoOnNavigated Method

Performs the navigation action of a Task Dialog.

Pascal

```
procedure DoOnNavigated; dynamic;
```

C++

```
__fastcall DoOnNavigated();
```

Description

Use DoOnNavigated to perform the navigation action of a Task Dialog.

61.1.7.4.11 TCustomTaskDialog.DoOnRadioButtonClicked Method

Performs the radio button click action of a Task Dialog.

Pascal

```
procedure DoOnRadioButtonClicked(ButtonID: Integer); dynamic;
```

C++

```
__fastcall DoOnRadioButtonClicked(int ButtonID);
```

Description

Use DoOnRadioButtonClicked to perform the radion button click action of a Task Dialog.

61.1.7.4.12 TCustomTaskDialog.DoOnTimer Method

Performs the timer action of a Task Dialog.

Pascal

```
procedure DoOnTimer(TickCount: Cardinal; var Reset: Boolean); dynamic;
```

C++

```
__fastcall DoOnTimer(unsigned TickCount, Boolean Reset);
```

Description

Use DoOnTimer to perform the timer action of the Task Dialog.

61.1.7.4.13 TCustomTaskDialog.DoOnVerificationClicked Method

Performs the verification check action of a Task Dialog.

Pascal

```
procedure DoOnVerificationClicked(Checked: Boolean); dynamic;
```

C++

```
__fastcall DoOnVerificationClicked(Boolean Checked);
```

Description

Use DoOnVerificationClicked to perform the verification check action of a Task Dialog.

61.1.7.4.14 Execute Method

This is the overview for the Execute method overload.

Overload List

	Name	Description
	TCustomTaskDialog.Execute () (see page 11327)	Displays the Task Dialog.
	TCustomTaskDialog.Execute (HWND) (see page 11327)	Displays the Task Dialog.

61.1.7.4.14.1 TCustomTaskDialog.Execute Method ()

Displays the Task Dialog.

Pascal

```
function Execute: Boolean; overload;
function Execute(ParentWnd: HWND): Boolean; overload;
```

C++

```
__fastcall Boolean Execute();
__fastcall Boolean Execute(HWND ParentWnd);
```

Description

Use Execute to display the Task Dialog.

61.1.7.5 TCustomTaskDialog Properties

The properties of the TCustomTaskDialog class are listed here.

Public Properties

	Name	Description
	Button (see page 11328)	Selected button.
	Buttons (see page 11328)	The collection of all buttons on the Task Dialog.
	Caption (see page 11328)	Caption for the Task Dialog.
	CommonButtons (see page 11328)	Specifies the push buttons displayed in the Task Dialog.
	CustomFooterIcon (see page 11329)	Indicates the custom footer icon, if any, for the Task Dialog.
	CustomMainIcon (see page 11329)	Indicates the custom main icon, if any, for the Task Dialog.
	DefaultButton (see page 11329)	The default button for this Task Dialog.
	ExpandButtonCaption (see page 11329)	Additional information for this button.
R	Expanded (see page 11330)	Indicates whether the Task Dialog is expanded.
	ExpandedText (see page 11330)	Text (see page 11333) to display when the Task Dialog is expanded.
	Flags (see page 11330)	Flags for this Task Dialog.
	FooterIcon (see page 11331)	Indicates which standard footer icon to display.
	FooterText (see page 11331)	String to be used in the footer area of the Task Dialog.
R	Handle (see page 11331)	Handle to the parent window.
	HelpContext (see page 11332)	Help context for the Task Dialog.
	MainIcon (see page 11332)	Indicates which standard main icon to display.
	ModalResult (see page 11332)	Modal result.
	ProgressBar (see page 11332)	Progress bar for this Task Dialog.
R	RadioButton (see page 11333)	Selected radio button.
	RadioButtons (see page 11333)	Collection of all radio buttons on this Task Dialog.
	Text (see page 11333)	The main text on this Task Dialog..
	Title (see page 11333)	The title of this Task Dialog.
R	URL (see page 11334)	URL for the Task Dialog.

	VerificationText (see page 11334)	Text (see page 11333) used to label the verification check box.

61.1.7.5.1 TCustomTaskDialog.Button Property

Selected button.

Pascal

```
property Button: TTaskDialogButtonItem;
```

C++

```
__property TTaskDialogButtonItem Button;
```

Description

Button is the selected button on the Task Dialog.

61.1.7.5.2 TCustomTaskDialog.Buttons Property

The collection of all buttons on the Task Dialog.

Pascal

```
property Buttons: TTaskDialogButtons;
```

C++

```
__property TTaskDialogButtons Buttons;
```

Description

Buttons contains all of the buttons for the Task Dialog.

61.1.7.5.3 TCustomTaskDialog.Caption Property

Caption for the Task Dialog.

Pascal

```
property Caption: string;
```

C++

```
__property AnsiString Caption;
```

Description

Caption contains the caption for the Task Dialog.

61.1.7.5.4 TCustomTaskDialog.CommonButtons Property

Specifies the push buttons displayed in the Task Dialog.

Pascal

```
property CommonButtons: TTaskDialogCommonButtons;
```

C++

```
__property TTaskDialogCommonButtons CommonButtons;
```

Description

CommonButtons specifies the common push buttons for the Task Dialog. If no buttons are specified, the **OK** button is displayed.

61.1.7.5.5 TCustomTaskDialog.CustomFooterIcon Property

Indicates the custom footer icon, if any, for the Task Dialog.

Pascal

```
property CustomFooterIcon: TIcon;
```

C++

```
__property TIcon CustomFooterIcon;
```

Description

CustomFooterIcon points to the custom footer icon for this Task Dialog. If **tfUseHiconFooter** is set in Flags (see page 11330).

61.1.7.5.6 TCustomTaskDialog.CustomMainIcon Property

Indicates the custom main icon, if any, for the Task Dialog.

Pascal

```
property CustomMainIcon: TIcon;
```

C++

```
__property TIcon CustomMainIcon;
```

Description

CustomMainIcon points to the custom main icon for this Task Dialog. If **tfUseHiconMain** is set in Flags (see page 11330).

61.1.7.5.7 TCustomTaskDialog.DefaultButton Property

The default button for this Task Dialog.

Pascal

```
property DefaultButton: TTaskDialogCommonButton;
```

C++

```
__property TTaskDialogCommonButton DefaultButton;
```

Description

DefaultButton indicates the default button for this Task Dialog.

61.1.7.5.8 TCustomTaskDialog.ExpandButtonCaption Property

Additional information for this button.

Pascal

```
property ExpandButtonCaption: string;
```

C++

```
__property AnsiString ExpandButtonCaption;
```

Description

ExpandButtonCaption contains additional text to be displayed when the caption is expanded.

61.1.7.5.9 TCustomTaskDialog.Expanded Property

Indicates whether the Task Dialog is expanded.

Pascal

```
property Expanded: Boolean;
```

C++

```
__property Boolean Expanded;
```

Description

Expanded is **True** when the Task Dialog is expanded.

61.1.7.5.10 TCustomTaskDialog.ExpandedText Property

Text (see page 11333) to display when the Task Dialog is expanded.

Pascal

```
property ExpandedText: string;
```

C++

```
__property AnsiString ExpandedText;
```

Description

ExpandedText contains additional information to display when the Task Dialog is expanded.

61.1.7.5.11 TCustomTaskDialog.Flags Property

Flags for this Task Dialog.

Pascal

```
property Flags: TTaskDialogFlags;
```

C++

```
__property TTaskDialogFlags Flags;
```

Description

Flags provides flags for TCustomTaskDialog (see page 11318).

Flag	Description
tfEnableHyperlinks	If set, content, footer, and expanded text can include hyperlinks.
tfUseHiconMain	if set, use the custom main icon.
tfUseHiconFooter	If set, use the custom footer icon.
tfAllowDialogCancellation	If set, permits Task Dialog to be closed in the absence of a **Cancel** button.
tfUseCommandLinks	If set, buttons are displayed as command links using a standard dialog glyph.
tfUseCommandLinksNoIcon	If set, buttons are displayed as command links without a glyph.
tfExpandFooterArea	If set, display expanded text in the footer.
tfExpandedByDefault	If set, expanded text is displayed when the Task Dialog opens.

tfVerificationFlagChecked	If set, the verification check box is initially checked.
tfShowProgressBar	If set, display the progress bar.
tfShowMarqueeProgressBar	If set, display marquee progress bar.
tfCallbackTimer	If set, dialogs callback will be called every 200 milliseconds.
tfPositionRelativeToWindow	If set, Task Dialog is centered with respect to parent window.
tfRtlLayout	If set, text reads right-to-left.
tfNoDefaultRadioButton	If set, there is no default radio button.
tfCanBeMinimized	If set, the Task Dialog can be minimized.

61.1.7.5.12 TCustomTaskDialog.FooterIcon Property

Indicates which standard footer icon to display.

Pascal

```
property FooterIcon: TTaskDialogIcon;
```

C++

```
__property TTaskDialogIcon FooterIcon;
```

Description

FooterIcon indicates which standard footer icon to display in the Task Dialog. Legal values include **tdiNone (see page 11591)**, **tdiWarning (see page 11591)**, **tdiError (see page 11590)**, **tdiInformation (see page 11590)**, and **tdiShield (see page 11591)**.

61.1.7.5.13 TCustomTaskDialog.FooterText Property

String to be used in the footer area of the Task Dialog.

Pascal

```
property FooterText: string;
```

C++

```
__property AnsiString FooterText;
```

Description

FooterText provides a string to be used in the footer area of the Task Dialog.

61.1.7.5.14 TCustomTaskDialog.Handle Property

Handle to the parent window.

Pascal

```
property Handle: HWND;
```

C++

```
__property HWND Handle;
```

Description

Handle provides a handle to the parent window. This field can be null.

61.1.7.5.15 TCustomTaskDialog.HelpContext Property

Help context for the Task Dialog.

Pascal

```
property HelpContext: Integer;
```

C++

```
__property int HelpContext;
```

Description

HelpContext provides the help context for the Task Dialog

61.1.7.5.16 TCustomTaskDialog.MainIcon Property

Indicates which standard main icon to display.

Pascal

```
property MainIcon: TTaskDialogIcon;
```

C++

```
__property TTaskDialogIcon MainIcon;
```

Description

MainIcon indicates which standard main icon to display in the Task Dialog. Legal values include **tdiNone (see page 11591)**, **tdiWarning (see page 11591)**, **tdiError (see page 11590)**, **tdiInformation (see page 11590)**, and **tdiShield (see page 11591)**.

61.1.7.5.17 TCustomTaskDialog.ModalResult Property

Modal result.

Pascal

```
property ModalResult: TModalResult;
```

C++

```
__property TModalResult ModalResult;
```

Description

ModalResult contains the modal result of the Task Dialog: mrYes, mrNo, mrOk, mrCancel mrAbort, mrRetry, mrIgnore, mrAll, mrNoToAll, mrYesToAll.

61.1.7.5.18 TCustomTaskDialog.ProgressBar Property

Progress bar for this Task Dialog.

Pascal

```
property ProgressBar: TTaskDialogProgressBar;
```

C++

```
__property TTaskDialogProgressBar ProgressBar;
```

Description

ProgressBar is the TTaskDialogProgressBar (see page 11523) for this Task Dialog.

61.1.7.5.19 TCustomTaskDialog.RadioButton Property

Selected radio button.

Pascal

```
property RadioButton: TTaskDialogRadioButtonItem;
```

C++

```
__property TTaskDialogRadioButtonItem RadioButton;
```

Description

RadioButton is the selected radio button on this Task Dialog.

61.1.7.5.20 TCustomTaskDialog.RadioButtons Property

Collection of all radio buttons on this Task Dialog.

Pascal

```
property RadioButtons: TTaskDialogButtons;
```

C++

```
__property TTaskDialogButtons RadioButtons;
```

Description

RadioButtons is the collection of radio buttons for this class dialog.

61.1.7.5.21 TCustomTaskDialog.Text Property

The main text on this Task Dialog..

Pascal

```
property Text: string;
```

C++

```
__property AnsiString Text;
```

Description

Text contains the main text to be displayed in this Task Dialog.

61.1.7.5.22 TCustomTaskDialog.Title Property

The title of this Task Dialog.

Pascal

```
property Title: string;
```

C++

```
__property AnsiString Title;
```

Description

Title contains the title of this Task Dialog.

61.1.7.5.23 TCustomTaskDialog.URL Property

URL for the Task Dialog.

Pascal

```
property URL: string;
```

C++

```
__property AnsiString URL;
```

Description

URL contains the URL for the Task Dialog.

61.1.7.5.24 TCustomTaskDialog.VerificationText Property

Text (see page 11333) used to label the verification check box.

Pascal

```
property VerificationText: string;
```

C++

```
__property AnsiString VerificationText;
```

Description

VerificationText contains text use to label the verification check box.

61.1.7.6 TCustomTaskDialog Events

The events of the TCustomTaskDialog class are listed here.

Public Events

	Name	Description
	OnButtonClicked (see page 11334)	Button (see page 11328) click event.
	OnDialogConstructed (see page 11335)	Dialog constructed event.
	OnDialogCreated (see page 11335)	Task Dialog creation event.
	OnDialogDestroyed (see page 11335)	Task dialog destruction event..
	OnExpanded (see page 11335)	Task dialog expanded event.
	OnHyperlinkClicked (see page 11336)	Task dialog hyperlink clicked event.
	OnNavigated (see page 11336)	Task Dialog navigation event.
	OnRadioButtonClicked (see page 11336)	Task Dialog radio button click event.
	OnTimer (see page 11336)	Task dialog timer event.
	OnVerificationClicked (see page 11337)	Task Dialog verification check box event.

61.1.7.6.1 TCustomTaskDialog.OnButtonClicked Event

Button (see page 11328) click event.

Pascal

```
property OnButtonClicked: TTaskDlgClickEvent;
```

C++

```
__property TTaskDlgClickEvent OnButtonClicked;
```

Description

OnButtonClicked is the button click event for Task Dialog.

61.1.7.6.2 TCustomTaskDialog.OnDialogConstructed Event

Dialog constructed event.

Pascal

```
property OnDialogConstructed: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnDialogConstructed;
```

Description

OnDialogConstructed is the dialog constructed event.

61.1.7.6.3 TCustomTaskDialog.OnDialogCreated Event

Task Dialog creation event.

Pascal

```
property OnDialogCreated: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnDialogCreated;
```

Description

OnDialogCreated is the Task Dialog creation event.

61.1.7.6.4 TCustomTaskDialog.OnDialogDestroyed Event

Task dialog destruction event..

Pascal

```
property OnDialogDestroyed: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnDialogDestroyed;
```

Description

OnDialogDestroyed is the Task Dialog destroy event.

61.1.7.6.5 TCustomTaskDialog.OnExpanded Event

Task dialog expanded event.

Pascal

```
property OnExpanded: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnExpanded;
```

Description

OnExpanded is the Task Dialog expanded event.

61.1.7.6.6 TCustomTaskDialog.OnHyperlinkClicked Event

Task dialog hyperlink clicked event.

Pascal

```
property OnHyperlinkClicked: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnHyperlinkClicked;
```

Description

OnHyperlinkClicked is the Task Dialog hyperlink clicked event.

61.1.7.6.7 TCustomTaskDialog.OnNavigated Event

Task Dialog navigation event.

Pascal

```
property OnNavigated: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnNavigated;
```

Description

OnNavigated is the Task Dialog navigation event.

61.1.7.6.8 TCustomTaskDialog.OnRadioButtonClicked Event

Task Dialog radio button click event.

Pascal

```
property OnRadioButtonClicked: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnRadioButtonClicked;
```

Description

OnRadioButtonClicked

61.1.7.6.9 TCustomTaskDialog.OnTimer Event

Task dialog timer event.

Pascal

```
property OnTimer: TTaskDlgTimerEvent;
```

C++

```
__property TTaskDlgTimerEvent OnTimer;
```

Description

OnTimer is the Task Dialog timer event.

61.1.7.6.10 TCustomTaskDialog.OnVerificationClicked Event

Task Dialog verification check box event.

Pascal

```
property OnVerificationClicked: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnVerificationClicked;
```

Description

OnVerificationClicked is the Task Dialog verification check box event.

61.1.8 TFavoriteLinkItem Class

Item in a list of favorite links.

Class Hierarchy

Pascal

```
TFavoriteLinkItem = class(TCollectionItem);
```

C++

```
class TFavoriteLinkItem : public TCollectionItem;
```

File

Dialogs

Description

This class represents Items in a list of favorite links.

See Also

TCollectionItem (see page 2755)

TFavoriteLinkItem

FavoriteLinks (see page 11301)

61.1.8.1 TFavoriteLinkItem Members

The following tables list the members exposed by TFavoriteLinkItem.

Protected Methods

	Name	Description
	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	Changed (see page 2758)	Updates the collection to reflect changes to the collection item.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetDisplayName (see page 11339)	Get displayed name for item.
	GetOwner (see page 2759)	Returns the collection to which this item belongs.
	GetOwner (see page 2932)	Returns the owner of an object.
	SetCollection (see page 2759)	Sets the value of the Collection (see page 2761) property.
	SetDisplayName (see page 2760)	Sets the name of the collection item as it appears in the collection editor.
	SetIndex (see page 2760)	Moves the collection item to a specified position in the parent collection.

Public Methods

	Name	Description
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 2757)	Creates and initializes a TCollectionItem (see page 2755) instance.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 2757)	Destroys the TCollectionItem (see page 2755) instance and frees its memory.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 22287)	Disposes of an object instance.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2759)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
	Collection (see page 2761)	Specifies the TCollection (see page 2731) instance to which the TCollectionItem (see page 2755) belongs.
	DisplayName (see page 2761)	The name displayed in the Collection (see page 2761) editor.
R	ID (see page 2761)	A unique, permanent index for the item.
	Index (see page 2762)	Returns the item's position in the Items array of TCollection (see page 2731).

Published Properties

	Name	Description
	Location (see page 11339)	Displayed name for item.

61.1.8.2 TFavoriteLinkItem Methods

The methods of the TFavoriteLinkItem class are listed here.

Protected Methods

	Name	Description
V	GetDisplayName (see page 11339)	Get displayed name for item.

61.1.8.2.1 TFavoriteLinkItem.GetDisplayName Method

Get displayed name for item.

Pascal

```
function GetDisplayName: string; override;
```

C++

```
virtual __fastcall AnsiString GetDisplayName();
```

Description

GetDisplayName obtains the name that appears in the file dialog for a favorite item.

See Also

TFavoriteLinkItem (see page 11337)

61.1.8.3 TFavoriteLinkItem Properties

The properties of the TFavoriteLinkItem class are listed here.

Published Properties

	Name	Description
	Location (see page 11339)	Displayed name for item.

61.1.8.3.1 TFavoriteLinkItem.Location Property

Displayed name for item.

Pascal

```
property Location: string;
```

C++

```
__property AnsiString Location;
```

Description

Location contains the name that appears in the file dialog for a favorite item.

See Also

TFavoriteLinkItem (see page 11337)

GetDisplayName (see page 11339)

61.1.9 TFavoriteLinkItems Class

List of favorite links.

Class Hierarchy

Pascal

```
TFavoriteLinkItems = class(TCollection);
```

C++

```
class TFavoriteLinkItems : public TCollection;
```

File

Dialogs

Description

This class represents a list of favorite links.

See Also

TCollection (see page 2731)

TFavoriteLinkItem (see page 11337)

FavoriteLinks (see page 11301)

61.1.9.1 TFavoriteLinkItems Members

The following tables list the members exposed by TFavoriteLinkItems.

Protected Methods

	Name	Description
V	Added (see page 2736)	Responds when items are added to the collection.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	Changed (see page 2740)	Responds when the collection or any of its items changes.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	Deleting (see page 2741)	Responds when items are deleted from the collection.
	GetAttr (see page 2743)	Returns the name of a custom attribute that can be retrieved using the GetItemAttr (see page 2745) method.
	GetAttrCount (see page 2744)	Returns the number of custom attributes associated with items in the collection.

	GetItem (see page 2744)	Returns a specified item in the collection.
	GetItemAttr (see page 2745)	Returns the value of a custom attribute assigned to one of the collection's items.
	GetOwner (see page 2932)	Returns the owner of an object.
V	Notify (see page 2746)	Responds when items are added to or removed from the collection.
	SetItem (see page 2747)	Copies the properties of another item to a specified item in the collection.
V	SetItemName (see page 2747)	Initializes the name of a newly inserted collection item.
V	Update (see page 2747)	Updates the collection to reflect changes to its items.

Protected Properties

	Name	Description
R	NextID (see page 2752)	Specifies a unique ID that can be assigned to the next added collection item.
	PropName (see page 2752)	Specifies the name of the property that the collection implements.
R	UpdateCount (see page 2753)	Counts the number of times BeginUpdate (see page 2739) was called without a corresponding call to EndUpdate (see page 2742).

Public Methods

	Name	Description
	Add (see page 11342)	Add item to list of favorite links.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2736)	Copies the contents of another collection to the object where the method is executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
V	BeginUpdate (see page 2739)	Suspends screen repainting.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Clear (see page 2741)	Deletes all items from the collection.
	Create (see page 2734)	Creates and initializes a collection.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Delete (see page 2741)	Deletes a single item from the collection.
V	Destroy (see page 2735)	Destroys the collection and each item in it.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
V	EndUpdate (see page 2742)	Re-enables screen repainting.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindItemID (see page 2743)	Returns the item with the specified ID.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetEnumerator (see page 11342)	Get an enumerator for favorite items list.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2745)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.

	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	Insert (see page 2746)	Creates a new TCollectionItem (see page 2755) instance and adds it to the Items (see page 2751) array.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	Owner (see page 2746)	Returns the Owner of the collection.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
	Capacity (see page 2748)	Provides access to the internal TList (see page 2868) Capacity property.
R	Count (see page 2749)	Returns the number of items in the collection.
R	ItemClass (see page 2751)	Indicates the class to which the collection's items belong.
	Items (see page 11343)	List of favorite items.

61.1.9.2 TFavoriteLinkItems Methods

The methods of the TFavoriteLinkItems class are listed here.

Public Methods

	Name	Description
	Add (see page 11342)	Add item to list of favorite links.
	GetEnumerator (see page 11342)	Get an enumerator for favorite items list.

61.1.9.2.1 TFavoriteLinkItems.Add Method

Add item to list of favorite links.

Pascal

```
function Add: TFavoriteLinkItem;
```

C++

```
__fastcall TFavoriteLinkItem Add();
```

Description

Add adds an item to the list of favorite links.

61.1.9.2.2 TFavoriteLinkItems.GetEnumerator Method

Get an enumerator for favorite items list.

Pascal

```
function GetEnumerator: TFavoriteLinkItemsEnumerator;
```

C++

```
__fastcall TFavoriteLinkItemsEnumerator GetEnumerator();
```

Description

GetEnumerator obtains a TFavoriteLinkItemsEnumerator (see page 11343) instance to enumerate the favorite items list.

See Also

TFavoriteLinkItemsEnumerator (see page 11343)

61.1.9.3 TFavoriteLinkItems Properties

The properties of the TFavoriteLinkItems class are listed here.

Public Properties

	Name	Description
	Items (see page 11343)	List of favorite items.

61.1.9.3.1 TFavoriteLinkItems.Items Property

List of favorite items.

Pascal

```
property Items [Index: Integer]: TFavoriteLinkItem;
```

C++

```
__property TFavoriteLinkItem Items[int Index];
```

Description

Items contains the list of favorite items and can be indexed by item number.

See Also

TFavoriteLinkItem (see page 11337)

61.1.10 TFavoriteLinkItemsEnumerator Class

Enumerator for list of favorite items.

Class Hierarchy

Dialogs.TFavoriteLinkItemsEnumerator

Pascal

```
TFavoriteLinkItemsEnumerator = class;
```

C++

```
class TFavoriteLinkItemsEnumerator;
```

File

Dialogs

Description

This class allows you to enumerate the list of favorite items.

See Also

TFavoriteLinkItem (see page 11337)

TFavoriteLinkItems (see page 11340)

61.1.10.1 TFavoriteLinkItemsEnumerator Members

The following tables list the members exposed by TFavoriteLinkItemsEnumerator.

Public Methods

	Name	Description
	Create (see page 11344)	Create a favorite items enumerator.
	GetCurrent (see page 11344)	Returns current enumerated favorite item.
	MoveNext (see page 11345)	Move to next item in favorite items enumeration.

Public Properties

	Name	Description
R	Current (see page 11345)	Current enumerated favorite item.

61.1.10.2 TFavoriteLinkItemsEnumerator.Create Constructor

Create a favorite items enumerator.

Pascal

```
constructor Create(ACollection: TFavoriteLinkItems);
```

C++

```
__fastcall TFavoriteLinkItemsEnumerator(TFavoriteLinkItems ACollection);
```

Description

Create creates and initializes a favorite items enumerator instance for the supplied TFavoriteLinkItems (see page 11340) list.

See Also

TFavoriteLinkItems (see page 11340)

61.1.10.3 TFavoriteLinkItemsEnumerator Methods

The methods of the TFavoriteLinkItemsEnumerator class are listed here.

Public Methods

	Name	Description
	GetCurrent (see page 11344)	Returns current enumerated favorite item.
	MoveNext (see page 11345)	Move to next item in favorite items enumeration.

61.1.10.3.1 TFavoriteLinkItemsEnumerator.GetCurrent Method

Returns current enumerated favorite item.

Pascal

```
function GetCurrent: TFavoriteLinkItem;
```

C++

```
__fastcall TFavoriteLinkItem GetCurrent();
```

Description

GetCurrent obtains the current enumerated favorite item.

See Also

TFavoriteLinkItem (see page 11337)

Current

MoveNext (see page 11345)

61.1.10.3.2 TFavoriteLinkItemsEnumerator.MoveNext Method

Move to next item in favorite items enumeration.

Pascal

```
function MoveNext: Boolean;
```

C++

```
__fastcall Boolean MoveNext();
```

Description

MoveNext goes to the next item in the favorite items enumeration.

See Also

TFavoriteLinkItem (see page 11337)

Current

GetCurrent (see page 11344)

61.1.10.4 TFavoriteLinkItemsEnumerator Properties

The properties of the TFavoriteLinkItemsEnumerator class are listed here.

Public Properties

	Name	Description
R	Current (see page 11345)	Current enumerated favorite item.

61.1.10.4.1 TFavoriteLinkItemsEnumerator.Current Property

Current enumerated favorite item.

Pascal

```
property Current: TFavoriteLinkItem;
```

C++

```
__property TFavoriteLinkItem Current;
```

Description

Current allows you to obtain the current enumerated favorite item.

See Also

TFavoriteLinkItem (see page 11337)

MoveNext (see page 11345)

61.1.11 TFileOpenDialog Class

Class for Vista style file open dialogs.

Class Hierarchy

Pascal

```
TFileOpenDialog = class(TCustomFileOpenDialog);
```

C++

```
class TFileOpenDialog : public TCustomFileOpenDialog;
```

File

Dialogs

Description

This class extends TCustomFileOpenDialog (see page 11308). It allows creating Microsoft Windows Vista style file open dialogs CLSID_FileOpenDialog and implements the IFileOpenDialog interface.

See Also

TCustomFileOpenDialog (see page 11308)

61.1.11.1 TFileOpenDialog Members

The following tables list the members exposed by TFileOpenDialog.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	CreateFileDialog (see page 11313)	Create (see page 11292) an open file dialog.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	FileOkClick (see page 11297)	This is FileOkClick, a member of class TCustomFileDialog.
	FolderChange (see page 11297)	This is FolderChange, a member of class TCustomFileDialog.
	FolderChanging (see page 11297)	This is FolderChanging, a member of class TCustomFileDialog.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.

	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
V	GetResults (see page 11313)	Get user's choices in dialog.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
	Overwrite (see page 11298)	This is Overwrite, a member of class TCustomFileDialog.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SelectionChange (see page 11298)	This is SelectionChange, a member of class TCustomFileDialog.
V	SelectionChange (see page 11313)	Respond to a selection change.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	ShareViolation (see page 11299)	This is ShareViolation, a member of class TCustomFileDialog.
	TypeChange (see page 11299)	This is TypeChange, a member of class TCustomFileDialog.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Public Events

	Name	Description
	OnOverwrite (see page 11307)	Occurs just before a file would be overwritten.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).

	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
V	Create (see page 11292)	Creates and initializes an instance.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 11292)	Destroys an instance and frees the associated resources.
V	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
V	Execute (see page 11296)	This is the overview for the Execute method overload.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.

	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	Dialog (see page 11300)	Pointer to dialog.
R	Files (see page 11302)	List of selected file names.
R	Handle (see page 11303)	Specifies the window handle of the dialog.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
R	ShellItem (see page 11304)	Current shell item.
R	ShellItems (see page 11304)	Array of current shell items.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Events

	Name	Description
	OnExecute (see page 11354)	Occurs when a file dialog gets executed.
	OnFileOkClick (see page 11355)	Occurs when the user clicks the OK button.
	OnFolderChange (see page 11355)	Occurs when a directory is opened or closed from the dialog.
	OnFolderChanging (see page 11355)	Occurs before a directory is opened or closed from the dialog.
	OnSelectionChange (see page 11356)	Occurs when the user changes the selection in the dialog.
	OnShareViolation (see page 11356)	Occurs when sharing violations arise from Open or Save operations.
	OnTypeChange (see page 11356)	Occurs when the user changes the file type selection in the dialog.

Published Properties

	Name	Description
	ClientGuid (see page 11350)	GUID associated with a dialog's persisted state.
	DefaultExtension (see page 11350)	Default extension to be added to file names.
	DefaultFolder (see page 11351)	Default folder if no recently used folder.
	FavoriteLinks (see page 11351)	List of places available for the user to open or save items.
	FileName (see page 11351)	Text in dialog's File name edit box.
	FileNameLabel (see page 11352)	Text of label next to file name edit box.
	FileTypeIndex (see page 11352)	Determines which filter is selected by default when the dialog opens.
	FileTypes (see page 11352)	Determines the file type masks (filters) available in the dialog.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	OkButtonLabel (see page 11353)	Text of the Open or Save button.
	Options (see page 11353)	List of options controlling dialog.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Title (see page 11354)	Dialog (see page 11300) title.

Strict protected Methods

	Name	Description
A	CreateFileDialog (see page 11293)	Create (see page 11292) a file dialog.
	DoOnExecute (see page 11294)	Call OnExecute (see page 11305) event method if defined.
	DoOnFileOkClick (see page 11294)	Call OnFileOkClick (see page 11306) event method if defined.
	DoOnFolderChange (see page 11294)	Call OnFolderChange (see page 11306) event method if defined.
	DoOnFolderChanging (see page 11295)	Call OnFolderChanging (see page 11307) event method if defined.
	DoOnOverwrite (see page 11295)	Call OnOverwrite (see page 11307) event method if defined.

	DoOnSelectionChange (see page 11295)	Call OnSelectionChange (see page 11307) event method if defined.
	DoOnShareViolation (see page 11296)	Call OnShareViolation (see page 11308) event method if defined.
	DoOnTypeChange (see page 11296)	Call OnTypeChange (see page 11308) event method if defined.
	GetFileNames (see page 11298)	This is GetFileNames, a member of class TCustomFileDialog.
	GetItemName (see page 11298)	This is GetItemName, a member of class TCustomFileDialog.
	GetResults (see page 11298)	This is GetResults, a member of class TCustomFileDialog.

61.1.11.2 TFileOpenDialog Properties

The properties of the TFileOpenDialog class are listed here.

Published Properties

	Name	Description
	ClientGuid (see page 11350)	GUID associated with a dialog's persisted state.
	DefaultExtension (see page 11350)	Default extension to be added to file names.
	DefaultFolder (see page 11351)	Default folder if no recently used folder.
	FavoriteLinks (see page 11351)	List of places available for the user to open or save items.
	FileName (see page 11351)	Text in dialog's File name edit box.
	FileNameLabel (see page 11352)	Text of label next to file name edit box.
	FileTypeIndex (see page 11352)	Determines which filter is selected by default when the dialog opens.
	FileTypes (see page 11352)	Determines the file type masks (filters) available in the dialog.
	OkButtonLabel (see page 11353)	Text of the Open or Save button.
	Options (see page 11353)	List of options controlling dialog.
	Title (see page 11354)	Dialog (see page 11300) title.

61.1.11.2.1 TFileOpenDialog.ClientGuid Property

GUID associated with a dialog's persisted state.

Pascal

```
property ClientGuid: string;
```

C++

```
__property AnsiString ClientGuid;
```

Description

ClientGuid holds a GUID associated with a dialog's persisted state. Persisted states for a dialog can include such things as its position and size. Having a GUID allows an application to remember these persisted states for different versions of the dialog.

61.1.11.2.2 TFileOpenDialog.DefaultExtension Property

Default extension to be added to file names.

Pascal

```
property DefaultExtension: string;
```

C++

```
__property AnsiString DefaultExtension;
```

Description

DefaultExtension contains the default extension to add to file names.

See Also

DefaultFolder (see page 11351)

FileName (see page 11351)

Files

FileTypes (see page 11352)

61.1.11.2.3 TFileOpenDialog.DefaultFolder Property

Default folder if no recently used folder.

Pascal

```
property DefaultFolder: string;
```

C++

```
__property AnsiString DefaultFolder;
```

Description

DefaultFolder contains the name of the default folder if there is no recently used folder.

See Also

DefaultExtension (see page 11350)

61.1.11.2.4 TFileOpenDialog.FavoriteLinks Property

List of places available for the user to open or save items.

Pascal

```
property FavoriteLinks: TFavoriteLinkItems;
```

C++

```
__property TFavoriteLinkItems FavoriteLinks;
```

Description

FavoriteLinks contains a list of places available for the user to open or save items. This is an instance of TFavoriteLinkItems (see page 11340).

See Also

TFavoriteLinkItems (see page 11340)

61.1.11.2.5 TFileOpenDialog.FileName Property

Text in dialog's File name edit box.

Pascal

```
property FileName: TFileName;
```

C++

```
__property TFileName FileName;
```

Description

FileName contains the text currently entered in the dialog's File name edit box.

See Also

FileNameLabel (see page 11352)

FileTypes (see page 11352)

ShellItem

61.1.11.2.6 TFileOpenDialog.FileNameLabel Property

Text of label next to file name edit box.

Pascal

```
property FileNameLabel: string;
```

C++

```
__property AnsiString FileNameLabel;
```

Description

FileNameLabel holds the text of the label next to the file name edit box in the dialog.

See Also

FileName (see page 11351)

FileTypes (see page 11352)

OkButtonLabel (see page 11353)

61.1.11.2.7 TFileOpenDialog.FileTypeIndex Property

Determines which filter is selected by default when the dialog opens.

Pascal

```
property FileTypeIndex: Cardinal;
```

C++

```
__property unsigned FileTypeIndex;
```

Description

FileTypeIndex determines which of the file types in FileTypes (see page 11352) is selected by default when the dialog opens. Set FileTypeIndex to 1 to choose the first file type in the list as the default, or set FileTypeIndex to 2 to choose the second file type as the default, and so forth. If the value of FileTypeIndex is out or range, the first file type listed in FileTypes (see page 11352) is the default.

See Also

FileTypes (see page 11352)

61.1.11.2.8 TFileOpenDialog.FileTypes Property

Determines the file type masks (filters) available in the dialog.

Pascal

```
property FileTypes: TFileTypeItems;
```

C++

```
__property TFileTypeItems FileTypes;
```

Description

FileTypes is an instance of TFileTypeItems (see page 11372) containing a list of file types, each of which is an instance of TFileTypeItem (see page 11368).

To add file types to a dialog, get the TFileTypeItems (see page 11372) instance from FileTypes and use the TFileTypeItems.Add method as in this sample:

```
with FileOpenDialog1.FileTypes.Add do
begin
  DisplayName := 'All Files';
  FileMask := '*.*';
end;
```

See Also

TFileTypeItem (see page 11368)

TFileTypeItems (see page 11372)

FileTypeIndex (see page 11352)

61.1.11.2.9 TFileOpenDialog.OkButtonLabel Property

Text of the Open or Save button.

Pascal

```
property OkButtonLabel: string;
```

C++

```
__property AnsiString OkButtonLabel;
```

Description

OkButtonLabel contains text of the Open or Save button.

See Also

FileNameLabel (see page 11352)

61.1.11.2.10 TFileOpenDialog.Options Property

List of options controlling dialog.

Pascal

```
property Options: TFileDialogOptions;
```

C++

```
__property TFileDialogOptions Options;
```

Description

Options is a set of TFileDialogOption (see page 11549) options controlling the dialog's behavior.

See Also

TFileDialogOption

61.1.11.2.11 TFileOpenDialog.Title Property

Dialog (see page 11300) title.

Pascal

```
property Title: string;
```

C++

```
__property AnsiString Title;
```

Description

Title contains the dialog's title.

See Also

FileNameLabel (see page 11352)

OkButtonLabel (see page 11353)

61.1.11.3 TFileOpenDialog Events

The events of the TFileOpenDialog class are listed here.

Published Events

	Name	Description
	OnExecute (see page 11354)	Occurs when a file dialog gets executed.
	OnFileOkClick (see page 11355)	Occurs when the user clicks the OK button.
	OnFolderChange (see page 11355)	Occurs when a directory is opened or closed from the dialog.
	OnFolderChanging (see page 11355)	Occurs before a directory is opened or closed from the dialog.
	OnSelectionChange (see page 11356)	Occurs when the user changes the selection in the dialog.
	OnShareViolation (see page 11356)	Occurs when sharing violations arise from Open or Save operations.
	OnTypeChange (see page 11356)	Occurs when the user changes the file type selection in the dialog.

61.1.11.3.1 TFileOpenDialog.OnExecute Event

Occurs when a file dialog gets executed.

Pascal

```
property OnExecute: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnExecute;
```

Description

OnExecute occurs when an instance of TFileOpenDialog (see page 11346) gets executed by the Execute (see page 11296) method. Execute (see page 11296) causes the dialog to be displayed. The DoOnExecute (see page 11294) method triggers this event.

See Also

DoOnExecute (see page 11294)

Execute (see page 11296)

61.1.11.3.2 TFileOpenDialog.OnFileOkClick Event

Occurs when the user clicks the OK button.

Pascal

```
property OnFileOkClick: TFileDialogCloseEvent;
```

C++

```
__property TFileDialogCloseEvent OnFileOkClick;
```

Description

OnFileOkClick occurs when whenever the user clicks the OK button. The event occurs just before the dialog returns with a result. The DoOnFileOkClick (see page 11294) method triggers this event.

See Also

DoOnFileOkClick (see page 11294)

61.1.11.3.3 TFileOpenDialog.OnFolderChange Event

Occurs when a directory is opened or closed from the dialog.

Pascal

```
property OnFolderChange: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnFolderChange;
```

Description

The OnFolderChange event occurs when the user changes the directory whose contents are displayed in the dialog. This can happen when the user double-clicks on a directory, clicks the Up arrow, or uses the list box at the top of the dialog to navigate through the directory structure. The event occurs after the folder changes. The DoOnFolderChange (see page 11294) method triggers this event.

See Also

DoOnFolderChange (see page 11294)

61.1.11.3.4 TFileOpenDialog.OnFolderChanging Event

Occurs before a directory is opened or closed from the dialog.

Pascal

```
property OnFolderChanging: TFileDialogFolderChangingEvent;
```

C++

```
__property TFileDialogFolderChangingEvent OnFolderChanging;
```

Description

OnFileOkClick (see page 11355) occurs before a directory is opened or closed from the dialog. This can happen when the user double-clicks on a directory, clicks the Up arrow, or uses the list box at the top of the dialog to navigate through the directory structure. The DoOnFolderChanging (see page 11295) method triggers this event.

See Also

DoOnFolderChanging (see page 11295)

61.1.11.3.5 TFileOpenDialog.OnSelectionChange Event

Occurs when the user changes the selection in the dialog.

Pascal

```
property OnSelectionChange: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnSelectionChange;
```

Description

OnSelectionChange occurs when the user changes the selection in the dialog. The DoOnSelectionChange (see page 11295) method triggers this event.

See Also

DoOnSelectionChange (see page 11295)

61.1.11.3.6 TFileOpenDialog.OnShareViolation Event

Occurs when sharing violations arise from Open or Save operations.

Pascal

```
property OnShareViolation: TFileDialogShareViolationEvent;
```

C++

```
__property TFileDialogShareViolationEvent OnShareViolation;
```

Description

OnShareViolation occurs when sharing violations arise from Open or Save operations. The DoOnShareViolation (see page 11296) method triggers this event.

See Also

DoOnShareViolation (see page 11296)

61.1.11.3.7 TFileOpenDialog.OnTypeChange Event

Occurs when the user changes the file type selection in the dialog.

Pascal

```
property OnTypeChange: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnTypeChange;
```

Description

OnTypeChange occurs when the user changes the file type selection in the dialog. The DoOnTypeChange (see page 11296) method triggers this event.

See Also

DoOnTypeChange (see page 11296)

61.1.12 TFileSaveDialog Class

Class for Vista style file save dialogs.

Class Hierarchy

Pascal

```
TFileSaveDialog = class(TCustomFileSaveDialog);
```

C++

```
class TFileSaveDialog : public TCustomFileSaveDialog;
```

File

Dialogs

Description

This class extends TCustomFileSaveDialog (see page 11314). It allows creating Microsoft Windows Vista style file save dialogs CLSID_FileSaveDialog and implements the IFileSaveDialog interface.

See Also

TCustomFileSaveDialog (see page 11314)

61.1.12.1 TFileSaveDialog Members

The following tables list the members exposed by TFileSaveDialog.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	CreateFileDialog (see page 11318)	Create (see page 11292) an save file dialog.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	FileOkClick (see page 11297)	This is FileOkClick, a member of class TCustomFileDialog.
	FolderChange (see page 11297)	This is FolderChange, a member of class TCustomFileDialog.
	FolderChanging (see page 11297)	This is FolderChanging, a member of class TCustomFileDialog.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.

	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
	Overwrite (see page 11298)	This is Overwrite, a member of class TCustomFileDialog.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SelectionChange (see page 11298)	This is SelectionChange, a member of class TCustomFileDialog.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	ShareViolation (see page 11299)	This is ShareViolation, a member of class TCustomFileDialog.
	TypeChange (see page 11299)	This is TypeChange, a member of class TCustomFileDialog.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
V	Create (see page 11292)	Creates and initializes an instance.

	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 11292)	Destroys an instance and frees the associated resources.
V	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
V	Execute (see page 11296)	This is the overview for the Execute method overload.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.

	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	Dialog (see page 11300)	Pointer to dialog.
R	Files (see page 11302)	List of selected file names.
R	Handle (see page 11303)	Specifies the window handle of the dialog.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
R	ShellItem (see page 11304)	Current shell item.
R	ShellItems (see page 11304)	Array of current shell items.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Events

	Name	Description
	OnExecute (see page 11365)	Occurs when a file dialog gets executed.
	OnFileOkClick (see page 11365)	Occurs when the user clicks the OK button.
	OnFolderChange (see page 11366)	Occurs when a directory is opened or closed from the dialog.
	OnFolderChanging (see page 11366)	Occurs before a directory is opened or closed from the dialog.
	OnOverwrite (see page 11366)	Occurs just before a file would be overwritten.
	OnSelectionChange (see page 11367)	Occurs when the user changes the selection in the dialog.
	OnShareViolation (see page 11367)	Occurs when sharing violations arise from Open or Save operations.
	OnTypeChange (see page 11367)	Occurs when the user changes the file type selection in the dialog.

Published Properties

	Name	Description
	ClientGuid (see page 11361)	GUID associated with a dialog's persisted state.
	DefaultExtension (see page 11361)	Default extension to be added to file names.
	DefaultFolder (see page 11362)	Default folder if no recently used folder.
	FavoriteLinks (see page 11362)	List of places available for the user to open or save items.
	FileName (see page 11362)	Text in dialog's File name edit box.
	FileNameLabel (see page 11363)	Text of label next to file name edit box.
	FileTypeIndex (see page 11363)	Determines which filter is selected by default when the dialog opens.
	FileTypes (see page 11363)	Determines the file type masks (filters) available in the dialog.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	OkButtonLabel (see page 11364)	Text of the Open or Save button.
	Options (see page 11364)	List of options controlling dialog.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Title (see page 11364)	Dialog (see page 11300) title.

Strict protected Methods

	Name	Description
A	CreateFileDialog (see page 11293)	Create (see page 11292) a file dialog.
	DoOnExecute (see page 11294)	Call OnExecute (see page 11305) event method if defined.
	DoOnFileOkClick (see page 11294)	Call OnFileOkClick (see page 11306) event method if defined.
	DoOnFolderChange (see page 11294)	Call OnFolderChange (see page 11306) event method if defined.
	DoOnFolderChanging (see page 11295)	Call OnFolderChanging (see page 11307) event method if defined.
	DoOnOverwrite (see page 11295)	Call OnOverwrite (see page 11307) event method if defined.
	DoOnSelectionChange (see page 11295)	Call OnSelectionChange (see page 11307) event method if defined.
	DoOnShareViolation (see page 11296)	Call OnShareViolation (see page 11308) event method if defined.
	DoOnTypeChange (see page 11296)	Call OnTypeChange (see page 11308) event method if defined.
	GetFileNames (see page 11298)	This is GetFileNames, a member of class TCustomFileDialog.

	GetItemName (see page 11298)	This is GetItemName, a member of class TCustomFileDialog.
	GetResults (see page 11298)	This is GetResults, a member of class TCustomFileDialog.

61.1.12.2 TFileSaveDialog Properties

The properties of the TFileSaveDialog class are listed here.

Published Properties

	Name	Description
	ClientGuid (see page 11361)	GUID associated with a dialog's persisted state.
	DefaultExtension (see page 11361)	Default extension to be added to file names.
	DefaultFolder (see page 11362)	Default folder if no recently used folder.
	FavoriteLinks (see page 11362)	List of places available for the user to open or save items.
	FileName (see page 11362)	Text in dialog's File name edit box.
	FileNameLabel (see page 11363)	Text of label next to file name edit box.
	FileTypeIndex (see page 11363)	Determines which filter is selected by default when the dialog opens.
	FileTypes (see page 11363)	Determines the file type masks (filters) available in the dialog.
	OkButtonLabel (see page 11364)	Text of the Open or Save button.
	Options (see page 11364)	List of options controlling dialog.
	Title (see page 11364)	Dialog (see page 11300) title.

61.1.12.2.1 TFileSaveDialog.ClientGuid Property

GUID associated with a dialog's persisted state.

Pascal

```
property ClientGuid: string;
```

C++

```
__property AnsiString ClientGuid;
```

Description

ClientGuid holds a GUID associated with a dialog's persisted state. Persisted states for a dialog can include such things as its position and size. Having a GUID allows an application to remember these persisted states for different versions of the dialog.

61.1.12.2.2 TFileSaveDialog.DefaultExtension Property

Default extension to be added to file names.

Pascal

```
property DefaultExtension: string;
```

C++

```
__property AnsiString DefaultExtension;
```

Description

DefaultExtension contains the default extension to add to file names.

See Also

DefaultFolder (see page 11362)

FileName (see page 11362)

Files

FileTypes (see page 11363)

61.1.12.2.3 TFileSaveDialog.DefaultFolder Property

Default folder if no recently used folder.

Pascal

```
property DefaultFolder: string;
```

C++

```
__property AnsiString DefaultFolder;
```

Description

DefaultFolder contains the name of the default folder if there is no recently used folder.

See Also

DefaultExtension (see page 11361)

61.1.12.2.4 TFileSaveDialog.FavoriteLinks Property

List of places available for the user to open or save items.

Pascal

```
property FavoriteLinks: TFavoriteLinkItems;
```

C++

```
__property TFavoriteLinkItems FavoriteLinks;
```

Description

FavoriteLinks contains a list of places available for the user to open or save items. This is an instance of TFavoriteLinkItems (see page 11340).

See Also

TFavoriteLinkItems (see page 11340)

61.1.12.2.5 TFileSaveDialog.FileName Property

Text in dialog's File name edit box.

Pascal

```
property FileName: TFileName;
```

C++

```
__property TFileName FileName;
```

Description

FileName contains the text currently entered in the dialog's File name edit box.

See Also

FileNameLabel (see page 11363)

FileTypes (see page 11363)

ShellItem

61.1.12.2.6 TFileSaveDialog.FileNameLabel Property

Text of label next to file name edit box.

Pascal

```
property FileNameLabel: string;
```

C++

```
__property AnsiString FileNameLabel;
```

Description

FileNameLabel holds the text of the label next to the file name edit box in the dialog.

See Also

FileName (see page 11362)

FileTypes (see page 11363)

OkButtonLabel (see page 11364)

61.1.12.2.7 TFileSaveDialog.FileTypeIndex Property

Determines which filter is selected by default when the dialog opens.

Pascal

```
property FileTypeIndex: Cardinal;
```

C++

```
__property unsigned FileTypeIndex;
```

Description

FileTypeIndex determines which of the file types in FileTypes (see page 11363) is selected by default when the dialog opens. Set FileTypeIndex to 1 to choose the first file type in the list as the default, or set FileTypeIndex to 2 to choose the second file type as the default, and so forth. If the value of FileTypeIndex is out or range, the first file type listed in FileTypes (see page 11363) is the default.

See Also

FileTypes (see page 11363)

61.1.12.2.8 TFileSaveDialog.FileTypes Property

Determines the file type masks (filters) available in the dialog.

Pascal

```
property FileTypes: TFileTypeItems;
```

C++

```
__property TFileTypeItems FileTypes;
```

Description

FileTypes is an instance of TFileTypeItems (see page 11372) containing a list of file types, each of which is an instance of TFileTypeItem (see page 11368).

To add file types to a dialog, get the TFileTypeItems (see page 11372) instance from FileTypes and use the

TFileTypeItems.Add method as in this sample:

```
with FileOpenDialog1.FileTypes.Add do
begin
  DisplayName := 'All Files';
  FileMask := '*.*';
end;
```

See Also

TFileTypeItem (see page 11368)

TFileTypeItems (see page 11372)

FileTypeIndex (see page 11363)

61.1.12.2.9 TFileSaveDialog.OkButtonLabel Property

Text of the Open or Save button.

Pascal

```
property OkButtonLabel: string;
```

C++

```
__property AnsiString OkButtonLabel;
```

Description

OkButtonLabel contains text of the Open or Save button.

See Also

FileNameLabel (see page 11363)

61.1.12.2.10 TFileSaveDialog.Options Property

List of options controlling dialog.

Pascal

```
property Options: TFileDialogOptions;
```

C++

```
__property TFileDialogOptions Options;
```

Description

Options is a set of TFileDialogOption (see page 11549) options controlling the dialog's behavior.

See Also

TFileDialogOption

61.1.12.2.11 TFileSaveDialog.Title Property

Dialog (see page 11300) title.

Pascal

```
property Title: string;
```

C++

```
__property AnsiString Title;
```

Description

Title contains the dialog's title.

See Also

FileNameLabel (see page 11363)

OkButtonLabel (see page 11364)

61.1.12.3 TFileSaveDialog Events

The events of the TFileSaveDialog class are listed here.

Published Events

	Name	Description
	OnExecute (see page 11365)	Occurs when a file dialog gets executed.
	OnFileOkClick (see page 11365)	Occurs when the user clicks the OK button.
	OnFolderChange (see page 11366)	Occurs when a directory is opened or closed from the dialog.
	OnFolderChanging (see page 11366)	Occurs before a directory is opened or closed from the dialog.
	OnOverwrite (see page 11366)	Occurs just before a file would be overwritten.
	OnSelectionChange (see page 11367)	Occurs when the user changes the selection in the dialog.
	OnShareViolation (see page 11367)	Occurs when sharing violations arise from Open or Save operations.
	OnTypeChange (see page 11367)	Occurs when the user changes the file type selection in the dialog.

61.1.12.3.1 TFileSaveDialog.OnExecute Event

Occurs when a file dialog gets executed.

Pascal

```
property OnExecute: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnExecute;
```

Description

OnExecute occurs when an instance of TFileSaveDialog (see page 11357) gets executed by the Execute (see page 11296) method. Execute (see page 11296) causes the dialog to be displayed. The DoOnExecute (see page 11294) method triggers this event.

See Also

DoOnExecute (see page 11294)

Execute (see page 11296)

61.1.12.3.2 TFileSaveDialog.OnFileOkClick Event

Occurs when the user clicks the OK button.

Pascal

```
property OnFileOkClick: TFileDialogCloseEvent;
```

C++

```
__property TFileDialogCloseEvent OnFileOkClick;
```

Description

OnFileOkClick occurs when whenever the user clicks the OK button. The event occurs just before the dialog returns with a result. The DoOnFileOkClick (see page 11294) method triggers this event.

See Also

DoOnFileOkClick (see page 11294)

61.1.12.3.3 TFileSaveDialog.OnFolderChange Event

Occurs when a directory is opened or closed from the dialog.

Pascal

```
property OnFolderChange: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnFolderChange;
```

Description

The OnFolderChange event occurs when the user changes the directory whose contents are displayed in the dialog. This can happen when the user double-clicks on a directory, clicks the Up arrow, or uses the list box at the top of the dialog to navigate through the directory structure. The event occurs after the folder changes. The DoOnFolderChange (see page 11294) method triggers this event.

See Also

DoOnFolderChange (see page 11294)

61.1.12.3.4 TFileSaveDialog.OnFolderChanging Event

Occurs before a directory is opened or closed from the dialog.

Pascal

```
property OnFolderChanging: TFileDialogFolderChangingEvent;
```

C++

```
__property TFileDialogFolderChangingEvent OnFolderChanging;
```

Description

OnFileOkClick (see page 11365) occurs before a directory is opened or closed from the dialog. This can happen when the user double-clicks on a directory, clicks the Up arrow, or uses the list box at the top of the dialog to navigate through the directory structure. The DoOnFolderChanging (see page 11295) method triggers this event.

See Also

DoOnFolderChanging (see page 11295)

61.1.12.3.5 TFileSaveDialog.OnOverwrite Event

Occurs just before a file would be overwritten.

Pascal

```
property OnOverwrite: TFileDialogOverwriteEvent;
```

C++

```
__property TFileDialogOverwriteEvent OnOverwrite;
```

Description

OnOverwrite occurs just before a file would be overwritten, so this applies only to save dialogs. The DoOnOverwrite (see page 11295) method triggers this event.

See Also

DoOnOverwrite (see page 11295)

61.1.12.3.6 TFileSaveDialog.OnSelectionChange Event

Occurs when the user changes the selection in the dialog.

Pascal

```
property OnSelectionChange: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnSelectionChange;
```

Description

OnSelectionChange occurs when the user changes the selection in the dialog. The DoOnSelectionChange (see page 11295) method triggers this event.

See Also

DoOnSelectionChange (see page 11295)

61.1.12.3.7 TFileSaveDialog.OnShareViolation Event

Occurs when sharing violations arise from Open or Save operations.

Pascal

```
property OnShareViolation: TFileDialogShareViolationEvent;
```

C++

```
__property TFileDialogShareViolationEvent OnShareViolation;
```

Description

OnShareViolation occurs when sharing violations arise from Open or Save operations. The DoOnShareViolation (see page 11296) method triggers this event.

See Also

DoOnShareViolation (see page 11296)

61.1.12.3.8 TFileSaveDialog.OnTypeChange Event

Occurs when the user changes the file type selection in the dialog.

Pascal

```
property OnTypeChange: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnTypeChange;
```

Description

OnTypeChange occurs when the user changes the file type selection in the dialog. The DoOnTypeChange (see page 11296) method triggers this event.

See Also

DoOnTypeChange (see page 11296)

61.1.13 TFileTypeItem Class

File type specification.

Class Hierarchy

Pascal

```
TFileTypeItem = class(TCollectionItem);
```

C++

```
class TFileTypeItem : public TCollectionItem;
```

File

Dialogs

Description

The class TFileTypeItem represents a type of file that a dialog handles.

A file type includes both a name describing the type of file (DisplayName (see page 11371) property) and a mask typically describing the file's extension (FileMask (see page 11372) property). For instance, a name might be “PDF files” and the filter “*.pdf”.

The property TCustomFileDialog.FileTypes is an instance of TFileTypeItems (see page 11372) containing a list of file types, each of which is an instance of TFileTypeItem

See Also

TCustomFileDialog (see page 11288)

TFileTypeItems (see page 11372)

FileTypes (see page 11303)

FileTypeIndex (see page 11302)

61.1.13.1 TFileTypeItem Members

The following tables list the members exposed by TFileTypeItem.

Protected Methods

	Name	Description
	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	Changed (see page 2758)	Updates the collection to reflect changes to the collection item.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.

	GetDisplayName (see page 11370)	Get display name for file type.
	GetOwner (see page 2759)	Returns the collection to which this item belongs.
	GetOwner (see page 2932)	Returns the owner of an object.
	SetCollection (see page 2759)	Sets the value of the Collection (see page 2761) property.
	SetDisplayName (see page 2760)	Sets the name of the collection item as it appears in the collection editor.
	SetIndex (see page 2760)	Moves the collection item to a specified position in the parent collection.

Public Methods

	Name	Description
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 11370)	Creates and initializes an instance.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 11370)	Destroys an instance and frees the associated resources.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2759)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
	Collection (see page 2761)	Specifies the TCollection (see page 2731) instance to which the TCollectionItem (see page 2755) belongs.
R	DisplayNameWStr (see page 11371)	Display name in Unicode for file type.
R	FileMaskWStr (see page 11372)	Mask (see page 15797) in Unicode for file type.
R	ID (see page 2761)	A unique, permanent index for the item.
	Index (see page 2762)	Returns the item's position in the Items array of TCollection (see page 2731).

Published Properties

	Name	Description
	DisplayName (see page 11371)	Display name for file type.

	FileMask (see page 11372)	Mask (see page 15797) for file type.

61.1.13.2 TFileTypeItem.Create Constructor

Creates and initializes an instance.

Pascal

```
constructor Create(Collection: TCollection); override;
```

C++

```
virtual __fastcall TFileTypeItem(TCollection Collection);
```

Description

This method creates and initializes an instance of TFileTypeItem (see page 11368).

See Also

Destroy (see page 11370)

61.1.13.3 TFileTypeItem.Destroy Destructor

Destroys an instance and frees the associated resources.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TFileTypeItem();
```

Description

This method destroys an instance of TFileTypeItem (see page 11368) and frees the associated resources.

See Also

Create (see page 11370)

61.1.13.4 TFileTypeItem Methods

The methods of the TFileTypeItem class are listed here.

Protected Methods

	Name	Description
	GetDisplayName (see page 11370)	Get display name for file type.

61.1.13.4.1 TFileTypeItem.GetDisplayName Method

Get display name for file type.

Pascal

```
function GetDisplayName: string; override;
```

C++

```
virtual __fastcall AnsiString GetDisplayName();
```

Description

GetDisplayName returns the name that appears in the file types list for the file type.

See Also

DisplayName (see page 11371)

DisplayNameWStr (see page 11371)

61.1.13.5 TFileTypeItem Properties

The properties of the TFileTypeItem class are listed here.

Public Properties

	Name	Description
R	DisplayNameWStr (see page 11371)	Display name in Unicode for file type.
R	FileMaskWStr (see page 11372)	Mask (see page 15797) in Unicode for file type.

Published Properties

	Name	Description
	DisplayName (see page 11371)	Display name for file type.
	FileMask (see page 11372)	Mask (see page 15797) for file type.

61.1.13.5.1 TFileTypeItem.DisplayName Property

Display name for file type.

Pascal

```
property DisplayName: string;
```

C++

```
__property AnsiString DisplayName;
```

Description

DisplayName contains the name that appears in the file types list for the file type. For instance, a name could be “Text files”.

See Also

DisplayNameWStr (see page 11371)

61.1.13.5.2 TFileTypeItem.DisplayNameWStr Property

Display name in Unicode for file type.

Pascal

```
property DisplayNameWStr: LPCWSTR;
```

C++

```
__property LPCWSTR DisplayNameWStr;
```

Description

DisplayName (see page 11371) contains the file type's name that appears in the file types list in Unicode. For instance, a name could be “Text files”.

See Also

DisplayName (see page 11371)

61.1.13.5.3 TFileTypeItem.FileMask Property

Mask (see page 15797) for file type.

Pascal

```
property FileMask: string;
```

C++

```
__property AnsiString FileMask;
```

Description

FileMask contains the mask for the file type. For instance, a mask for text files could be “*.txt”.

See Also

FileMaskWStr (see page 11372)

61.1.13.5.4 TFileTypeItem.FileMaskWStr Property

Mask (see page 15797) in Unicode for file type.

Pascal

```
property FileMaskWStr: LPCWSTR;
```

C++

```
__property LPCWSTR FileMaskWStr;
```

Description

FileMask (see page 11372) contains the file type's mask in Unicode. For instance, a mask for text files could be “*.txt”.

See Also

FileMask (see page 11372)

61.1.14 TFileTypeItems Class

Collection of file type specifications.

Class Hierarchy

Pascal

```
TFileTypeItems = class(TCollection);
```

C++

```
class TFileTypeItems : public TCollection;
```

File

Dialogs

Description

The class TFileTypeItems represents a collection of file types for a dialog. A file type includes both a name describing the type of file and a mask typically describing the file's extension. For instance, a name might be “PDF files” and the filter “*.pdf”.

The property TCustomFileDialog.FileTypes is an instance of TFileTypeItems containing a list of file types, each of which is an instance of TFileTypeItem (see page 11368)

To add file types to a dialog, get the TFileTypeItems instance from TCustomFileDialog.FileTypes and use the TFileTypeItems.Add (see page 11375) method as in this sample:

```
with FileOpenDialog1.FileTypes.Add do
begin
  DisplayName := ‘All Files’;
  FileMask := ‘*.*’;
end;
```

See Also

TCustomFileDialog (see page 11288)

TFileTypeItem (see page 11368)

DisplayName (see page 11371)

FileMask (see page 11372)

FileTypes (see page 11303)

FileTypeIndex (see page 11302)

61.1.14.1 TFileTypeItems Members

The following tables list the members exposed by TFileTypeItems.

Protected Methods

	Name	Description
V	Added (see page 2736)	Responds when items are added to the collection.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	Changed (see page 2740)	Responds when the collection or any of its items changes.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	Deleting (see page 2741)	Responds when items are deleted from the collection.
	GetAttr (see page 2743)	Returns the name of a custom attribute that can be retrieved using the GetItemAttr (see page 2745) method.
	GetAttrCount (see page 2744)	Returns the number of custom attributes associated with items in the collection.
	GetItem (see page 2744)	Returns a specified item in the collection.
	GetItemAttr (see page 2745)	Returns the value of a custom attribute assigned to one of the collection's items.
	GetOwner (see page 2932)	Returns the owner of an object.
V	Notify (see page 2746)	Responds when items are added to or removed from the collection.
	SetItem (see page 2747)	Copies the properties of another item to a specified item in the collection.
V	SetItemName (see page 2747)	Initializes the name of a newly inserted collection item.
V	Update (see page 2747)	Updates the collection to reflect changes to its items.

Protected Properties

	Name	Description
R	NextID (see page 2752)	Specifies a unique ID that can be assigned to the next added collection item.
	PropName (see page 2752)	Specifies the name of the property that the collection implements.

R	UpdateCount (see page 2753)	Counts the number of times BeginUpdate (see page 2739) was called without a corresponding call to EndUpdate (see page 2742).

Public Methods

	Name	Description
	Add (see page 11375)	Add a file type to the collection.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2736)	Copies the contents of another collection to the object where the method is executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
V	BeginUpdate (see page 2739)	Suspends screen repainting.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Clear (see page 2741)	Deletes all items from the collection.
	Create (see page 2734)	Creates and initializes a collection.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Delete (see page 2741)	Deletes a single item from the collection.
V	Destroy (see page 2735)	Destroys the collection and each item in it.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
V	EndUpdate (see page 2742)	Re-enables screen repainting.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FilterSpecArray (see page 11375)	Get an array of file types.
	FindItemID (see page 2743)	Returns the item with the specified ID.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetEnumerator (see page 2744)	Returns a TCollection (see page 2731) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2745)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	Insert (see page 2746)	Creates a new TCollectionItem (see page 2755) instance and adds it to the Items (see page 2751) array.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	Owner (see page 2746)	Returns the Owner of the collection.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
	Capacity (see page 2748)	Provides access to the internal TList (see page 2868) Capacity property.
R	Count (see page 2749)	Returns the number of items in the collection.
R	ItemClass (see page 2751)	Indicates the class to which the collection's items belong.
	Items (see page 11376)	List of file types.

61.1.14.2 TFileTypeItems Methods

The methods of the TFileTypeItems class are listed here.

Public Methods

	Name	Description
	Add (see page 11375)	Add a file type to the collection.
	FilterSpecArray (see page 11375)	Get an array of file types.

61.1.14.2.1 TFileTypeItems.Add Method

Add a file type to the collection.

Pascal

```
function Add: TFileTypeItem;
```

C++

```
__fastcall TFileTypeItem Add();
```

Description

Add adds a file type to the file types collection. After you add the file type, you need to set its properties as in this sample:

```
with FileOpenDialog1.FileTypes.Add do
begin
  DisplayName := 'All Files';
  FileMask := '*.*';
end;
```

See Also

TFileTypeItem (see page 11368)

DisplayName (see page 11371)

FileMask (see page 11372)

61.1.14.2.2 TFileTypeItems.FilterSpecArray Method

Get an array of file types.

Pascal

```
function FilterSpecArray: TComdlgFilterSpecArray;
```

C++

```
__fastcall TComdlgFilterSpecArray FilterSpecArray();
```

Description

FilterSpecArray returns a TComdlgFilterSpecArray record with file type information. TComdlgFilterSpecArray is the same as the COMDLG_FILTERSPEC struct in the Microsoft IFileDialog interface for common item dialogs.

61.1.14.3 TFileTypeItems Properties

The properties of the TFileTypeItems class are listed here.

Public Properties

	Name	Description
	Items (see page 11376)	List of file types.

61.1.14.3.1 TFileTypeItems.Items Property

List of file types.

Pascal

```
property Items [Index: Integer]: TFileTypeItem;
```

C++

```
__property TFileTypeItem Items[int Index];
```

Description

Items contains a list of the dialog's file types and can be indexed by a cardinal integer.

61.1.15 TFindDialog Class

TFindDialog displays a Find (see page 11383) dialog that allows users to search for text in a file.

Class Hierarchy

Pascal

```
TFindDialog = class(TCommonDialog);
```

C++

```
class TFindDialog : public TCommonDialog;
```

File

Dialogs

Description

The TFindDialog component displays a modeless Windows dialog box that prompts the user for a search string. The dialog does not appear at runtime until it is activated by a call to the Execute (see page 11381) method.

See Also

TReplaceDialog (see page 11482)

61.1.15.1 TFindDialog Members

The following tables list the members exposed by TFindDialog.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	DoClose (see page 11282)	Generates an OnClose (see page 11287) event.
	DoShow (see page 11283)	Generates an OnShow (see page 11288) event.
	Find (see page 11383)	This is Find, a member of class TFindDialog.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	MessageHook (see page 11383)	Provides special Windows message processing for the dialog.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	Replace (see page 11384)	This is Replace, a member of class TFindDialog.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	TaskModalDialog (see page 11284)	Ensures that Windows messages are properly routed when the dialog executes.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.

	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WndProc (see page 11285)	Responds to Windows messages sent to the dialog.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	Template (see page 11287)	Points to a custom template for the dialog.
	TemplateModule (see page 11287)	This is TemplateModule, a member of class TCommonDialog.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	CloseDialog (see page 11381)	Closes the Find (see page 11383) dialog box.
V	Create (see page 11380)	Creates and initializes a TFindDialog (see page 11376) instance.
V	DefaultHandler (see page 11282)	Sends unhandled messages to Windows for processing.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 11380)	Destroys the TFindDialog (see page 11376) and frees its memory.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
V	Execute (see page 11381)	Displays the Find (see page 11383) dialog.
V	Execute (see page 11283)	This is the overview for the Execute method overload.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.

V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	Handle (see page 11286)	Specifies the window handle of the dialog.
	Left (see page 11386)	Determines the X coordinate (horizontal position) of the Find (see page 11383) dialog's upper left corner.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Position (see page 11390)	Determines the position of the Find (see page 11383) dialog on the screen.
	Top (see page 11392)	Determines the Y coordinate (vertical position) of the Find (see page 11383) dialog's upper left corner.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Events

	Name	Description
	OnClose (see page 11287)	Occurs when the dialog closes.
	OnFind (see page 11392)	Occurs when the user clicks the Find (see page 11383) Next button.
	OnShow (see page 11288)	Occurs when the dialog opens.

Published Properties

	Name	Description
	Ctl3D (see page 11285)	Determines whether the dialog has a three-dimensional look.
	FindText (see page 11384)	Contains the search string.
	HelpContext (see page 11286)	Specifies the context number for online Help.

	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Options (see page 11386)	Determines the appearance and behavior of the Find (see page 11383) dialog.
	Tag (see page 2808)	Stores an integer value as part of a component.

61.1.15.2 TFindDialog.Create Constructor

Creates and initializes a TFindDialog (see page 11376) instance.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TFindDialog(TComponent * AOwner);
```

Description

The Create method generates a TFindDialog (see page 11376) instance, but the new dialog does not appear on the form at runtime until the Execute (see page 11381) method is called.

AOwner is the component that is responsible for freeing the dialog. It becomes the value of the Owner property.

See Also

Owner (see page 2807)

Execute (see page 11381)

Destroy (see page 11380)

61.1.15.3 TFindDialog.Destroy Destructor

Destroys the TFindDialog (see page 11376) and frees its memory.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TFindDialog();
```

Description

Do not call Destroy directly in an application. Call Free instead. Free checks that the Find (see page 11383) dialog reference is not nil before calling Destroy.

See Also

Free (see page 22300)

Create (see page 11380)

61.1.15.4 TFindDialog Methods

The methods of the TFindDialog class are listed here.

Protected Methods

	Name	Description
	Find (see page 11383)	This is Find, a member of class TFindDialog.

	MessageHook (see page 11383)	Provides special Windows message processing for the dialog.
	Replace (see page 11384)	This is Replace, a member of class TFindDialog.

Public Methods

	Name	Description
	CloseDialog (see page 11381)	Closes the Find (see page 11383) dialog box.
	Execute (see page 11381)	Displays the Find (see page 11383) dialog.

61.1.15.4.1 TFindDialog.CloseDialog Method

Closes the Find (see page 11383) dialog box.

Pascal

```
procedure CloseDialog;
```

C++

```
__fastcall CloseDialog();
```

Description

CloseDialog closes the dialog box and frees its window handle, but leaves most properties of the TFindDialog (see page 11376) (including FindText (see page 11384)) unchanged.

61.1.15.4.2 TFindDialog.Execute Method

Displays the Find (see page 11383) dialog.

Pascal

```
function Execute(ParentWnd: HWND): Boolean; override;
```

C++

```
virtual __fastcall Boolean Execute(HWND ParentWnd);
```

Description

Execute opens the Find (see page 11383) dialog, returning true when a window handle is successfully allocated. If the dialog is already open when Execute is called, Execute brings the dialog to the top, activates its parent form, and returns true.

C++ Examples:

```
/*
This example requires a TRichEdit, a TButton, and a
TFindDialog.  Clicking the button click will display a Find
Dialog to the right of the edit control.  Filling in the
"Find what" text and pressing the Find Next button will
select the first matching string in the Rich Edit control
that follows the previous selection.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  FindDialog1->Position = Point(RichEdit1->Left + RichEdit1->Width, RichEdit1->Top);
  FindDialog1->Execute();
}

void __fastcall TForm1::FindDialog1Find(TObject *Sender)
{
  int FoundAt, StartPos, ToEnd;
  TSearchTypes mySearchTypes;
  // begin the search after the current selection
  // if there is one
  // otherwise, begin at the start of the text
```

```
  if (FindDialog1->Options.Contains(frMatchCase))
    mySearchTypes << stMatchCase;
  if (FindDialog1->Options.Contains(frWholeWord))
    mySearchTypes << stWholeWord;
  if (RichEdit1->SelLength)
    StartPos = RichEdit1->SelStart + RichEdit1->SelLength;
  else
    StartPos = 0;
  // ToEnd is the length from StartPos
  // to the end of the text in the rich edit control
  ToEnd = RichEdit1->Text.Length() - StartPos;
  FoundAt = RichEdit1->FindText(FindDialog1->FindText, StartPos, ToEnd, mySearchTypes);
  if (FoundAt != -1)
  {
    RichEdit1->SetFocus();
    RichEdit1->SelStart = FoundAt;
    RichEdit1->SelLength = FindDialog1->FindText.Length();
  }
  else Beep();
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  RichEdit1->PlainText = False;
  RichEdit1->Lines->LoadFromFile("../Overview.RTF");  // starts in Debug
  RichEdit1->ScrollBars = ssVertical;
}
```

Delphi Examples:

```
{
This example requires a TRichEdit, a TButton, and a
TFindDialog.  Clicking the button click will display a Find
Dialog to the right of the edit control.  Filling in the
"Find what" text and pressing the Find Next button will
select the first matching string in the Rich Edit control
that follows the previous selection.
}
procedure TForm1.Button1Click(Sender: TObject);
begin
  FindDialog1.Position :=
    Point(RichEdit1.Left + RichEdit1.Width, RichEdit1.Top);
  FindDialog1.Execute;
end;

procedure TForm1.FindDialog1Find(Sender: TObject);
var
  FoundAt: LongInt;
  StartPos, ToEnd: Integer;
  mySearchTypes : TSearchTypes;
  myFindOptions : TFindOptions;
begin
  with RichEdit1 do
  begin
    if frMatchCase in FindDialog1.Options then
       mySearchTypes := mySearchTypes + [stMatchCase];
    if frWholeWord in FindDialog1.Options then
       mySearchTypes := mySearchTypes + [stWholeWord];
    { begin the search after the current selection if there is one }
    { otherwise, begin at the start of the text }
    if SelLength <> 0 then
      StartPos := SelStart + SelLength
    else
      StartPos := 0;
    { ToEnd is the length from StartPos to the end of the
      text in the rich edit control }
    ToEnd := Length(Text) - StartPos;
```

```
      FoundAt :=
        FindText(FindDialog1.FindText, StartPos, ToEnd, mySearchTypes);
      if FoundAt <> -1 then
      begin
        SetFocus;
        SelStart := FoundAt;
        SelLength := Length(FindDialog1.FindText);
      end
      else Beep;
    end;
  end;

  procedure TForm1.FormCreate(Sender: TObject);
  const Path = 'OverView.RTF';
  begin
    RichEdit1.PlainText := False;
    RichEdit1.Lines.LoadFromFile(Path);
    RichEdit1.ScrollBars := ssVertical;
  end;
```

61.1.15.4.3 TFindDialog.Find Method

Pascal

```
procedure Find; dynamic;
```

C++

```
__fastcall Find();
```

Description

This is Find, a member of class TFindDialog.

61.1.15.4.4 TFindDialog.MessageHook Method

Provides special Windows message processing for the dialog.

Pascal

```
function MessageHook(var Msg: TMessage): Boolean; override;
```

C++

```
virtual __fastcall Boolean MessageHook(TMessage Msg);
```

Description

MessageHook intercepts messages sent to the dialog window before the dialog's window procedure gets them. When MessageHook handles a message, it returns true to indicate that the message should not be sent on for further processing. If the window procedure should handle the message, MessageHook returns false.

Override MessageHook to provide extra message processing. For example, if the Template property substitutes a dialog template with additional controls, use MessageHook to handle messages from those dialog controls.

In TCommonDialog, MessageHook handles Help messages by calling the application's HelpContext method if the HelpContext property is defined. Descendants of TCommonDialog override MessageHook to add additional message processing.

See Also

Template (see page 11287)

HelpContext (see page 13679)

HelpContext (see page 11286)

61.1.15.4.5 TFindDialog.Replace Method

Pascal

```
procedure Replace; dynamic;
```

C++

```
__fastcall Replace();
```

Description

This is Replace, a member of class TFindDialog.

61.1.15.5 TFindDialog Properties

The properties of the TFindDialog class are listed here.

Public Properties

	Name	Description
	Left (see page 11386)	Determines the X coordinate (horizontal position) of the Find (see page 11383) dialog's upper left corner.
	Position (see page 11390)	Determines the position of the Find (see page 11383) dialog on the screen.
	Top (see page 11392)	Determines the Y coordinate (vertical position) of the Find (see page 11383) dialog's upper left corner.

Published Properties

	Name	Description
	FindText (see page 11384)	Contains the search string.
	Options (see page 11386)	Determines the appearance and behavior of the Find (see page 11383) dialog.

61.1.15.5.1 TFindDialog.FindText Property

Contains the search string.

Pascal

```
property FindText: string;
```

C++

```
__property AnsiString FindText;
```

Description

FindText contains the text string that the user wants to search for. When the user clicks the Find (see page 11383) Next button, the text in the dialog's edit box is automatically assigned to FindText. To make a default text string appear in the edit box when the dialog opens, assign a value to FindText in the Object Inspector or in program code.

C++ Examples:

```
/*
This example requires a TRichEdit, a TButton, and a
TFindDialog.  Clicking the button click will display a Find
Dialog to the right of the edit control.  Filling in the
"Find what" text and pressing the Find Next button will
select the first matching string in the Rich Edit control
that follows the previous selection.
```

```
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  FindDialog1->Position = Point(RichEdit1->Left + RichEdit1->Width, RichEdit1->Top);
  FindDialog1->Execute();
}

void __fastcall TForm1::FindDialog1Find(TObject *Sender)
{
  int FoundAt, StartPos, ToEnd;
  TSearchTypes mySearchTypes;
  // begin the search after the current selection
  // if there is one
  // otherwise, begin at the start of the text
  if (FindDialog1->Options.Contains(frMatchCase))
    mySearchTypes << stMatchCase;
  if (FindDialog1->Options.Contains(frWholeWord))
    mySearchTypes << stWholeWord;
  if (RichEdit1->SelLength)
    StartPos = RichEdit1->SelStart + RichEdit1->SelLength;
  else
    StartPos = 0;
  // ToEnd is the length from StartPos
  // to the end of the text in the rich edit control
  ToEnd = RichEdit1->Text.Length() - StartPos;
  FoundAt = RichEdit1->FindText(FindDialog1->FindText, StartPos, ToEnd, mySearchTypes);
  if (FoundAt != -1)
  {
    RichEdit1->SetFocus();
    RichEdit1->SelStart = FoundAt;
    RichEdit1->SelLength = FindDialog1->FindText.Length();
  }
  else Beep();
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  RichEdit1->PlainText = False;
  RichEdit1->Lines->LoadFromFile("../Overview.RTF");  // starts in Debug
  RichEdit1->ScrollBars = ssVertical;
}
```

Delphi Examples:

```
{
This example requires a TRichEdit, a TButton, and a
TFindDialog.  Clicking the button click will display a Find
Dialog to the right of the edit control.  Filling in the
"Find what" text and pressing the Find Next button will
select the first matching string in the Rich Edit control
that follows the previous selection.
}
procedure TForm1.Button1Click(Sender: TObject);
begin
  FindDialog1.Position :=
    Point(RichEdit1.Left + RichEdit1.Width, RichEdit1.Top);
  FindDialog1.Execute;
end;

procedure TForm1.FindDialog1Find(Sender: TObject);
var
  FoundAt: LongInt;
  StartPos, ToEnd: Integer;
  mySearchTypes : TSearchTypes;
  myFindOptions : TFindOptions;
begin
  with RichEdit1 do
```

```
    begin
      if frMatchCase in FindDialog1.Options then
         mySearchTypes := mySearchTypes + [stMatchCase];
      if frWholeWord in FindDialog1.Options then
         mySearchTypes := mySearchTypes + [stWholeWord];
      { begin the search after the current selection if there is one }
      { otherwise, begin at the start of the text }
      if SelLength <> 0 then
        StartPos := SelStart + SelLength
      else
        StartPos := 0;
      { ToEnd is the length from StartPos to the end of the
        text in the rich edit control }
      ToEnd := Length(Text) - StartPos;
      FoundAt :=
        FindText(FindDialog1.FindText, StartPos, ToEnd, mySearchTypes);
      if FoundAt <> -1 then
      begin
        SetFocus;
        SelStart := FoundAt;
        SelLength := Length(FindDialog1.FindText);
      end
      else Beep;
    end;
  end;

  procedure TForm1.FormCreate(Sender: TObject);
  const Path = 'OverView.RTF';
  begin
    RichEdit1.PlainText := False;
    RichEdit1.Lines.LoadFromFile(Path);
    RichEdit1.ScrollBars := ssVertical;
  end;
```

61.1.15.5.2 TFindDialog.Left Property

Determines the X coordinate (horizontal position) of the Find (see page 11383) dialog's upper left corner.

Pascal

```
property Left: Integer;
```

C++

```
__property int Left;
```

Description

Left holds the same value as the first integer in Position (see page 11390). This property is maintained for compatibility with older applications.

See Also

Position (see page 11390)

Top (see page 11392)

61.1.15.5.3 TFindDialog.Options Property

Determines the appearance and behavior of the Find (see page 11383) dialog.

Pascal

```
property Options: TFindOptions;
```

C++

```
__property TFindOptions Options;
```

Description

Use Options to

Determine which controls in the dialog are disabled (grayed).

Determine which controls do not appear in the dialog.

Specify settings for the search direction, case-sensitivity, and "whole word" attributes of the search.

By default, all options except frDown are off.

C++ Examples:

```
/*
This example requires a TRichEdit, a TButton, and a
TFindDialog.  Clicking the button click will display a Find
Dialog to the right of the edit control.  Filling in the
"Find what" text and pressing the Find Next button will
select the first matching string in the Rich Edit control
that follows the previous selection.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  FindDialog1->Position = Point(RichEdit1->Left + RichEdit1->Width, RichEdit1->Top);
  FindDialog1->Execute();
}

void __fastcall TForm1::FindDialog1Find(TObject *Sender)
{
  int FoundAt, StartPos, ToEnd;
  TSearchTypes mySearchTypes;
  // begin the search after the current selection
  // if there is one
  // otherwise, begin at the start of the text

61.1.15.5.4 TFindDialog.Position Property

Determines the position of the Find (see page 11383) dialog on the screen.

Pascal

```
property Position: TPoint;
```

C++

```
__property TPoint Position;
```

Description

Position gives the pixel coordinates of the dialog's upper left corner.

C++ Examples:

```
/*
This example requires a TRichEdit, a TButton, and a
TFindDialog.  Clicking the button click will display a Find
Dialog to the right of the edit control.  Filling in the
"Find what" text and pressing the Find Next button will
select the first matching string in the Rich Edit control
that follows the previous selection.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  FindDialog1->Position = Point(RichEdit1->Left + RichEdit1->Width, RichEdit1->Top);
  FindDialog1->Execute();
}

void __fastcall TForm1::FindDialog1Find(TObject *Sender)
{
  int FoundAt, StartPos, ToEnd;
  TSearchTypes mySearchTypes;
  // begin the search after the current selection
  // if there is one
  // otherwise, begin at the start of the text
  if (FindDialog1->Options.Contains(frMatchCase))
    mySearchTypes << stMatchCase;
  if (FindDialog1->Options.Contains(frWholeWord))
    mySearchTypes << stWholeWord;
  if (RichEdit1->SelLength)
    StartPos = RichEdit1->SelStart + RichEdit1->SelLength;
  else
    StartPos = 0;
  // ToEnd is the length from StartPos
  // to the end of the text in the rich edit control
  ToEnd = RichEdit1->Text.Length() - StartPos;
  FoundAt = RichEdit1->FindText(FindDialog1->FindText, StartPos, ToEnd, mySearchTypes);
  if (FoundAt != -1)
  {
    RichEdit1->SetFocus();
    RichEdit1->SelStart = FoundAt;
    RichEdit1->SelLength = FindDialog1->FindText.Length();
  }
  else Beep();
}

void __fastcall TForm1::FormCreate(TObject *Sender)
```

```
{
  RichEdit1->PlainText = False;
  RichEdit1->Lines->LoadFromFile("../Overview.RTF");  // starts in Debug
  RichEdit1->ScrollBars = ssVertical;
}
```

Delphi Examples:

```
{
This example requires a TRichEdit, a TButton, and a
TFindDialog.  Clicking the button click will display a Find
Dialog to the right of the edit control.  Filling in the
"Find what" text and pressing the Find Next button will
select the first matching string in the Rich Edit control
that follows the previous selection.
}
procedure TForm1.Button1Click(Sender: TObject);

Top (see page 11392)

61.1.15.5.5 TFindDialog.Top Property

Determines the Y coordinate (vertical position) of the Find (see page 11383) dialog's upper left corner.

Pascal

```
property Top: Integer;
```

C++

```
__property int Top;
```

Description

Top holds the same value as the second integer in Position (see page 11390). This property is maintained for compatibility with older applications.

61.1.15.6 TFindDialog Events

The events of the TFindDialog class are listed here.

Published Events

	Name	Description
	OnFind (see page 11392)	Occurs when the user clicks the Find (see page 11383) Next button.

61.1.15.6.1 TFindDialog.OnFind Event

Occurs when the user clicks the Find (see page 11383) Next button.

Pascal

```
property OnFind: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnFind;
```

Description

Write an OnFind event handler to perform the requested search when the user clicks Find (see page 11383) Next in the dialog. Use the Options (see page 11386) flags to determine how the search is conducted.

C++ Examples:

```
/*
This example requires a TRichEdit, a TButton, and a
TFindDialog.  Clicking the button click will display a Find
Dialog to the right of the edit control.  Filling in the
"Find what" text and pressing the Find Next button will
select the first matching string in the Rich Edit control
that follows the previous selection.
```

```
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  FindDialog1->Position = Point(RichEdit1->Left + RichEdit1->Width, RichEdit1->Top);
  FindDialog1->Execute();
}

void __fastcall TForm1::FindDialog1Find(TObject *Sender)
{
  int FoundAt, StartPos, ToEnd;
  TSearchTypes mySearchTypes;
  // begin the search after the current selection
  // if there is one
  // otherwise, begin at the start of the text

61.1.16 TFontDialog Class

TFontDialog displays a font-selection dialog.

Class Hierarchy

Pascal

```
TFontDialog = class(TCommonDialog);
```

C++

```
class TFontDialog : public TCommonDialog;
```

File

Dialogs

Description

TFontDialog displays a modal Windows dialog box for selecting fonts. The dialog does not appear at runtime until it is activated by a call to the Execute (see page 11399) method. When the user selects a font and clicks OK, the dialog closes and the selected font is stored in the Font (see page 11401) property.

61.1.16.1 TFontDialog Members

The following tables list the members exposed by TFontDialog.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	Apply (see page 11399)	This is Apply, a member of class TFontDialog.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	DoClose (see page 11282)	Generates an OnClose (see page 11287) event.
	DoShow (see page 11283)	Generates an OnShow (see page 11288) event.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	MessageHook (see page 11284)	Provides special Windows message processing for the dialog.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	TaskModalDialog (see page 11284)	Ensures that Windows messages are properly routed when the dialog executes.

	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WndProc (see page 11400)	Responds to Windows messages sent to the dialog.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	Template (see page 11287)	Points to a custom template for the dialog.
	TemplateModule (see page 11287)	This is TemplateModule, a member of class TCommonDialog.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 11398)	Creates and initializes a TFontDialog (see page 11394) instance.
	DefaultHandler (see page 11282)	Sends unhandled messages to Windows for processing.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 11398)	Destroys the TFontDialog (see page 11394) and frees its memory.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Execute (see page 11399)	Displays the Font (see page 11401) dialog.
	Execute (see page 11283)	This is the overview for the Execute method overload.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.

	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	Handle (see page 11286)	Specifies the window handle of the dialog.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Events

	Name	Description
	OnApply (see page 11406)	Occurs when the user clicks the Apply (see page 11399) button.
	OnClose (see page 11287)	Occurs when the dialog closes.
	OnShow (see page 11288)	Occurs when the dialog opens.

Published Properties

	Name	Description
	Ctl3D (see page 11285)	Determines whether the dialog has a three-dimensional look.
	Device (see page 11401)	Specifies the device from which to retrieve the list of available fonts.
	Font (see page 11401)	Indicates the selected font.
	HelpContext (see page 11286)	Specifies the context number for online Help.

	MaxFontSize (see page 11403)	Determines the largest font size available in the Font (see page 11401) dialog.
	MinFontSize (see page 11404)	Determines the smallest font size available in the Font (see page 11401) dialog.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Options (see page 11405)	Determines the appearance and behavior of the Font (see page 11401) dialog.
	Tag (see page 2808)	Stores an integer value as part of a component.

61.1.16.2 TFontDialog.Create Constructor

Creates and initializes a TFontDialog (see page 11394) instance.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TFontDialog(TComponent * AOwner);
```

Description

The Create method generates a TFontDialog (see page 11394) instance, but the new dialog does not appear on the form at runtime until the Execute (see page 11399) method is called.

AOwner is the component, typically a form or data module, that is responsible for freeing the TFontDialog (see page 11394) instance. It becomes the value of the Owner property.

See Also

Owner (see page 2807)

Execute (see page 11399)

Destroy (see page 11398)

61.1.16.3 TFontDialog.Destroy Destructor

Destroys the TFontDialog (see page 11394) and frees its memory.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TFontDialog();
```

Description

Do not call Destroy directly in an application. Call Free instead. Free verifies that the TFontDialog (see page 11394) reference is not nil before calling Destroy.

See Also

Free (see page 22300)

Create (see page 11398)

61.1.16.4 TFontDialog Methods

The methods of the TFontDialog class are listed here.

Protected Methods

	Name	Description
	Apply (see page 11399)	This is Apply, a member of class TFontDialog.
V	WndProc (see page 11400)	Responds to Windows messages sent to the dialog.

Public Methods

	Name	Description
V	Execute (see page 11399)	Displays the Font (see page 11401) dialog.

61.1.16.4.1 TFontDialog.Apply Method

Pascal

```
procedure Apply(Wnd: HWND); dynamic;
```

C++

```
__fastcall Apply(HWND Wnd);
```

Description

This is Apply, a member of class TFontDialog.

61.1.16.4.2 TFontDialog.Execute Method

Displays the Font (see page 11401) dialog.

Pascal

```
function Execute(ParentWnd: HWND): Boolean; override;
```

C++

```
virtual __fastcall Boolean Execute(HWND ParentWnd);
```

Description

Execute opens the Font (see page 11401) dialog, returning true when the user selects a font and clicks OK.

```
FontDialog1.Font := Form1.Font;
if FontDialog1.Execute then
for i := 0 to (Form1.ControlCount - 1) do
if (Form1.Controls[i] is TButton) then
      (Form1.Controls[i] as TButton).Font :=
        FontDialog1.Font
FontDialog1->Font = Form1->Font;
if (FontDialog1->Execute())
  Button1->Font = FontDialog1->Font;
```

C++ Examples:

```
/*
This example takes an edit control, a button, and a rich
edit control on a form.  When the user presses the button, a
Font dialog appears.  When the user clicks the Apply (not OK)
button in the Font dialog, the currently selected font is
applied to the active control. Clicking the button sets the
ActiveControl to the button.  That is why we need to save
the ActiveControl in a shared OnEnter procedure.  In the rich
edit, only the text selected converts.
*/
TWinControl *myActiveControl;

void __fastcall TForm1::Button1Click(TObject *Sender)
{
```

```
  FontDialog1->Options << fdApplyButton;
  FontDialog1->Execute();
}

    ((TRichEdit *)myActiveControl)->SelAttributes->Assign(FontDialog1->Font);
  else
    MessageBeep(0);
}

void __fastcall TForm1::Edit1Enter(TObject *Sender)
{
  myActiveControl = ActiveControl;
}
```

Delphi Examples:

```
{
This example takes an edit control, a button, and a rich
edit control on a form.  When the user presses the button, a
Font dialog appears.  When the user clicks the Apply (not OK)
button in the Font dialog, the currently selected font is
applied to the active control. Clicking the button sets the
ActiveControl to the button.  That is why we need to save
the ActiveControl in a shared OnEnter procedure.  In the rich
edit, only the text selected converts.
}
procedure TForm1.Button1Click(Sender: TObject);
begin
   FontDialog1.Options := FontDialog1.Options + [fdApplyButton];
   FontDialog1.Execute;
end;

procedure TForm1.Edit1Enter(Sender: TObject);
begin
  myActiveControl := ActiveControl;
end;

procedure TForm1.FontDialog1Apply(Sender: TObject; Wnd: HWND);
begin
  if myActiveControl is TEdit then
    with myActiveControl as TEdit do
       Font.Assign(TFontDialog(Sender).Font)
  else if myActiveControl is TRichEdit then
    with myActiveControl as TRichEdit do
      SelAttributes.Assign(TFontDialog(Sender).Font)
  else
    Beep;
end;
```

61.1.16.4.3 TFontDialog.WndProc Method

Responds to Windows messages sent to the dialog.

Pascal

```
procedure WndProc(var Message: TMessage); override;
```

C++

```
virtual __fastcall WndProc(TMessage Message);
```

Description

WndProc is the main window procedure for the dialog. As implemented in TCommonDialog, it simply calls the Dispatch method, where any message handlers respond to messages before the DefaultHandler method sends them on to the Windows message handler.

Override WndProc to subclass the dialog's window procedure. To add additional message processing without interfering with the existing message handling of the dialog, override MessageHook instead.

DefaultHandler (see page 11282)

Dispatch

MessageHook (see page 11284)

61.1.16.5 TFontDialog Properties

The properties of the TFontDialog class are listed here.

Published Properties

	Name	Description
	Device (see page 11401)	Specifies the device from which to retrieve the list of available fonts.
	Font (see page 11401)	Indicates the selected font.
	MaxFontSize (see page 11403)	Determines the largest font size available in the Font (see page 11401) dialog.
	MinFontSize (see page 11404)	Determines the smallest font size available in the Font (see page 11401) dialog.
	Options (see page 11405)	Determines the appearance and behavior of the Font (see page 11401) dialog.

61.1.16.5.1 TFontDialog.Device Property

Specifies the device from which to retrieve the list of available fonts.

Pascal

```
property Device: TFontDialogDevice;
```

C++

```
__property TFontDialogDevice Device;
```

Description

Use Device to specify whether you want the dialog to list screen fonts (fdScreen), printer fonts (fdPrinter), or both screen and printer fonts (fdBoth).

61.1.16.5.2 TFontDialog.Font Property

Indicates the selected font.

Pascal

```
property Font: TFont;
```

C++

```
__property TFont Font;
```

Description

When the user selects a font in the dialog box and clicks OK, the selected font becomes the value of the Font property. To make a default font appear in the dialog when it opens, assign a value to Font in the Object Inspector or in program code.

```
FontDialog1.Font := Form1.Font;
if FontDialog1.Execute then
for i := 0 to (Form1.ControlCount - 1) do
if (Form1.Controls[i] is TButton) then
      (Form1.Controls[i] as TButton).Font :=
        FontDialog1.Font
FontDialog1->Font = Form1->Font;
if (FontDialog1->Execute())
  Button1->Font = FontDialog1->Font;
```

C++ Examples:

```
/*
This example takes an edit control, a button, and a rich
edit control on a form.  When the user presses the button, a
Font dialog appears.  When the user clicks the Apply (not OK)
button in the Font dialog, the currently selected font is
applied to the active control. Clicking the button sets the
ActiveControl to the button.  That is why we need to save
the ActiveControl in a shared OnEnter procedure.  In the rich
edit, only the text selected converts.
*/
TWinControl *myActiveControl;

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  FontDialog1->Options << fdApplyButton;
  FontDialog1->Execute();
}

void __fastcall TForm1::FontDialog1Apply(TObject *Sender, HWND Wnd)
{
  if (myActiveControl->ClassNameIs("TEdit"))
   ((TEdit *)myActiveControl)->Font->Assign(FontDialog1->Font);
  else if (myActiveControl->ClassNameIs("TRichEdit"))
    ((TRichEdit *)myActiveControl)->SelAttributes->Assign(FontDialog1->Font);
  else
    MessageBeep(0);
}

void __fastcall TForm1::Edit1Enter(TObject *Sender)
{
  myActiveControl = ActiveControl;
}
```

Delphi Examples:

```
{
This example takes an edit control, a button, and a rich
edit control on a form.  When the user presses the button, a
Font dialog appears.  When the user clicks the Apply (not OK)
button in the Font dialog, the currently selected font is
applied to the active control. Clicking the button sets the
ActiveControl to the button.  That is why we need to save
the ActiveControl in a shared OnEnter procedure.  In the rich
edit, only the text selected converts.
}
procedure TForm1.Button1Click(Sender: TObject);
begin
   FontDialog1.Options := FontDialog1.Options + [fdApplyButton];
   FontDialog1.Execute;
end;
```

```
procedure TForm1.Edit1Enter(Sender: TObject);
begin
  myActiveControl := ActiveControl;
end;

procedure TForm1.FontDialog1Apply(Sender: TObject; Wnd: HWND);
begin
  if myActiveControl is TEdit then
    with myActiveControl as TEdit do
       Font.Assign(TFontDialog(Sender).Font)
  else if myActiveControl is TRichEdit then
    with myActiveControl as TRichEdit do
      SelAttributes.Assign(TFontDialog(Sender).Font)
  else
    Beep;
end;
```

See Also

TFont (see page 14497)

61.1.16.5.3 TFontDialog.MaxFontSize Property

Determines the largest font size available in the Font (see page 11401) dialog.

Pascal

```
property MaxFontSize: Integer;
```

C++

```
__property int MaxFontSize;
```

Description

Assign a value to MaxFontSize to limit the font sizes available in the dialog.

MaxFontSize is inoperative unless the fdLimitSize flag is set in Options (see page 11405).

C++ Examples:

```
/*
This example uses a Font dialog box, a button, and a label
on a form. When the user clicks the button, the Font dialog
box appears. The font sizes available are within the range
of 8 to 14. When the user chooses OK, the selected font is
applied to the caption of the label.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  FontDialog1->Options.Clear();
  FontDialog1->Options << fdLimitSize;
  FontDialog1->MaxFontSize = 14;
  FontDialog1->MinFontSize = 8;
  if (FontDialog1->Execute())
    Label1->Font = FontDialog1->Font;
}
```

Delphi Examples:

```
{
This example uses a Font dialog box, a button, and a label
on a form. When the user clicks the button, the Font dialog
box appears. The font sizes available are within the range
of 8 to 14. When the user chooses OK, the selected font is
applied to the caption of the label.
}
```

```
procedure TForm1.Button1Click(Sender: TObject);
begin
  FontDialog1.Options := [fdLimitSize];
  FontDialog1.MaxFontSize := 14;
  FontDialog1.MinFontSize := 8;
  if FontDialog1.Execute then
    Label1.Font := FontDialog1.Font;
end;
```

See Also

MinFontSize (see page 11404)

Options (see page 11405)

61.1.16.5.4 TFontDialog.MinFontSize Property

Determines the smallest font size available in the Font (see page 11401) dialog.

Pascal

```
property MinFontSize: Integer;
```

C++

```
__property int MinFontSize;
```

Description

Assign a value to MinFontSize to limit the font sizes available in the dialog.

MinFontSize is inoperative unless the fdLimitSize flag is set in Options (see page 11405).

C++ Examples:

```
/*
This example uses a Font dialog box, a button, and a label
on a form. When the user clicks the button, the Font dialog
box appears. The font sizes available are within the range
of 8 to 14. When the user chooses OK, the selected font is
applied to the caption of the label.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  FontDialog1->Options.Clear();
  FontDialog1->Options << fdLimitSize;
  FontDialog1->MaxFontSize = 14;
  FontDialog1->MinFontSize = 8;
  if (FontDialog1->Execute())
    Label1->Font = FontDialog1->Font;
}
```

Delphi Examples:

```
{
This example uses a Font dialog box, a button, and a label
on a form. When the user clicks the button, the Font dialog
box appears. The font sizes available are within the range
of 8 to 14. When the user chooses OK, the selected font is
applied to the caption of the label.
}
procedure TForm1.Button1Click(Sender: TObject);
begin
  FontDialog1.Options := [fdLimitSize];
  FontDialog1.MaxFontSize := 14;
  FontDialog1.MinFontSize := 8;
  if FontDialog1.Execute then
    Label1.Font := FontDialog1.Font;
```

```
end;
```

See Also

MaxFontSize (see page 11403)

Options (see page 11405)

61.1.16.5.5 TFontDialog.Options Property

Determines the appearance and behavior of the Font (see page 11401) dialog.

Pascal

```
property Options: TFontDialogOptions;
```

C++

```
__property TFontDialogOptions Options;
```

Description

Use the Options property to customize the appearance and functionality of the dialog. Use these flags to indicate which fonts should appear and what controls appear in the dialog.

By default, all options except fdEffects are off.

C++ Examples:

```
/*
This example uses a Font dialog box, a button, and a label
on a form. When the user clicks the button, the Font dialog
box appears. The font sizes available are within the range
of 8 to 14. When the user chooses OK, the selected font is
applied to the caption of the label.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  FontDialog1->Options.Clear();
  FontDialog1->Options << fdLimitSize;
  FontDialog1->MaxFontSize = 14;
  FontDialog1->MinFontSize = 8;
  if (FontDialog1->Execute())
    Label1->Font = FontDialog1->Font;
}
```

Delphi Examples:

```
{
This example uses a Font dialog box, a button, and a label
on a form. When the user clicks the button, the Font dialog
box appears. The font sizes available are within the range
of 8 to 14. When the user chooses OK, the selected font is
applied to the caption of the label.
}
procedure TForm1.Button1Click(Sender: TObject);
begin
  FontDialog1.Options := [fdLimitSize];
  FontDialog1.MaxFontSize := 14;
  FontDialog1.MinFontSize := 8;
  if FontDialog1.Execute then
    Label1.Font := FontDialog1.Font;
end;
```

61.1.16.6 TFontDialog Events

The events of the TFontDialog class are listed here.

Published Events

	Name	Description
	OnApply (see page 11406)	Occurs when the user clicks the Apply (see page 11399) button.

61.1.16.6.1 TFontDialog.OnApply Event

Occurs when the user clicks the Apply (see page 11399) button.

Pascal

```
property OnApply: TFDApplyEvent;
```

C++

```
__property TFDApplyEvent OnApply;
```

Description

The Apply (see page 11399) button appears in the dialog if an event handler is assigned to OnApply or if the fdApplyButton flag is set in Options (see page 11405). Use an OnApply event handler to apply the selected font without closing the Font (see page 11401) dialog box.

C++ Examples:

```
/*
This example takes an edit control, a button, and a rich
edit control on a form.  When the user presses the button, a
Font dialog appears.  When the user clicks the Apply (not OK)
button in the Font dialog, the currently selected font is
applied to the active control. Clicking the button sets the
ActiveControl to the button.  That is why we need to save
the ActiveControl in a shared OnEnter procedure.  In the rich
edit, only the text selected converts.
*/

61.1.17 TOpenDialog Class

TOpenDialog displays a file-selection dialog.

Class Hierarchy

Pascal

```
TOpenDialog = class(TCommonDialog);
```

C++

```
class TOpenDialog : public TCommonDialog;
```

File

Dialogs

Description

TOpenDialog displays a modal Windows dialog box for selecting and opening files. The dialog does not appear at runtime until it is activated by a call to the Execute (see page 11415) method. When the user clicks Open, the dialog closes and the selected file or files are stored in the Files (see page 11429) property.

See Also

TOpenPictureDialog (see page 13282)

TSaveDialog (see page 11489)

TSavePictureDialog (see page 13300)

61.1.17.1 TOpenDialog Members

The following tables list the members exposed by TOpenDialog.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	CanClose (see page 11413)	This is CanClose, a member of class TOpenDialog.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 11413)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	DoCanClose (see page 11413)	This is DoCanClose, a member of class TOpenDialog.
	DoClose (see page 11282)	Generates an OnClose (see page 11287) event.
	DoExecute (see page 11413)	This is the overview for the DoExecute method overload.
	DoFolderChange (see page 11414)	This is DoFolderChange, a member of class TOpenDialog.
	DoIncludeItem (see page 11414)	This is DoIncludeItem, a member of class TOpenDialog.
	DoSelectionChange (see page 11415)	This is DoSelectionChange, a member of class TOpenDialog.
	DoShow (see page 11283)	Generates an OnShow (see page 11288) event.
	DoTypeChange (see page 11415)	This is DoTypeChange, a member of class TOpenDialog.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetFileNames (see page 11417)	This is GetFileNames, a member of class TOpenDialog.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
V	GetStaticRect (see page 11417)	Returns the coordinates of the reserved area of the dialog box.

	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	MessageHook (see page 11284)	Provides special Windows message processing for the dialog.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	TaskModalDialog (see page 11284)	Ensures that Windows messages are properly routed when the dialog executes.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WndProc (see page 11420)	Responds to Windows messages sent to the dialog.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	Template (see page 11287)	Points to a custom template for the dialog.
	TemplateModule (see page 11287)	This is TemplateModule, a member of class TCommonDialog.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 11411)	Creates and initializes a TOpenDialog (see page 11407) instance.
V	DefaultHandler (see page 11282)	Sends unhandled messages to Windows for processing.

	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 11412)	Destroys the TOpenDialog (see page 11407) and frees its memory.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Execute (see page 11415)	Displays the file-selection dialog.
	Execute (see page 11283)	This is the overview for the Execute method overload.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.

R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	FileEditStyle (see page 11423)	Determines the style of the file-selection dialog. (Obsolete.)
R	Files (see page 11429)	List of selected file names.
R	Handle (see page 11286)	Specifies the window handle of the dialog.
	HistoryList (see page 11436)	Maintains a list of previously selected files. (Obsolete.)
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Events

	Name	Description
	OnCanClose (see page 11439)	Occurs when the user tries to close the dialog without canceling.
	OnClose (see page 11287)	Occurs when the dialog closes.
	OnFolderChange (see page 11440)	Occurs when a directory is opened or closed from the dialog.
	OnIncludeItem (see page 11440)	Occurs before the dialog adds a file to the file list box.
	OnSelectionChange (see page 11441)	Occurs when file names displayed in the dialog are changed.
	OnShow (see page 11288)	Occurs when the dialog opens.
	OnTypeChange (see page 11441)	Occurs when the file types displayed in the dialog are changed.

Published Properties

	Name	Description
	Ctl3D (see page 11285)	Determines whether the dialog has a three-dimensional look.
	DefaultExt (see page 11421)	Specifies a default file extension.
	FileName (see page 11424)	Indicates the name and directory path of the last file selected.
	Filter (see page 11431)	Determines the file masks (filters) available in the dialog.
	FilterIndex (see page 11434)	Determines which filter is selected by default when the dialog opens.
	HelpContext (see page 11286)	Specifies the context number for online Help.
	InitialDir (see page 11436)	Determines the current directory when the dialog opens.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Options (see page 11436)	Determines the appearance and behavior of the file-selection dialog.
	OptionsEx (see page 11438)	Augments the Options (see page 11436) property with additional flags that determine the appearance and behavior of the file-selection dialog.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Title (see page 11438)	Specifies the text in the dialog's title bar.

61.1.17.2 TOpenDialog.Create Constructor

Creates and initializes a TOpenDialog (see page 11407) instance.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TOpenDialog(TComponent * AOwner);
```

Description

Create generates a TOpenDialog (see page 11407) instance, but the new dialog does not appear on the form at runtime until the Execute (see page 11415) method is called.

AOwner is the component that is responsible for freeing the TOpenDialog (see page 11407) instance. It becomes the value of the Owner property.

See Also

Execute (see page 11415)

Owner (see page 2807)

Destroy (see page 11412)

61.1.17.3 TOpenDialog.Destroy Destructor

Destroys the TOpenDialog (see page 11407) and frees its memory.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TOpenDialog();
```

Description

Do not call Destroy directly in an application. Call Free instead. Free verifies that the TOpenDialog (see page 11407) reference is not nil before calling Destroy.

See Also

Free (see page 22300)

Create (see page 11411)

61.1.17.4 TOpenDialog Methods

The methods of the TOpenDialog class are listed here.

Protected Methods

	Name	Description
	CanClose (see page 11413)	This is CanClose, a member of class TOpenDialog.
V	DefineProperties (see page 11413)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	DoCanClose (see page 11413)	This is DoCanClose, a member of class TOpenDialog.
	DoExecute (see page 11413)	This is the overview for the DoExecute method overload.
	DoFolderChange (see page 11414)	This is DoFolderChange, a member of class TOpenDialog.
	DoIncludeItem (see page 11414)	This is DoIncludeItem, a member of class TOpenDialog.
	DoSelectionChange (see page 11415)	This is DoSelectionChange, a member of class TOpenDialog.
	DoTypeChange (see page 11415)	This is DoTypeChange, a member of class TOpenDialog.
	GetFileNames (see page 11417)	This is GetFileNames, a member of class TOpenDialog.
V	GetStaticRect (see page 11417)	Returns the coordinates of the reserved area of the dialog box.
V	WndProc (see page 11420)	Responds to Windows messages sent to the dialog.

Public Methods

	Name	Description
V	Execute (see page 11415)	Displays the file-selection dialog.

61.1.17.4.1 TOpenDialog.CanClose Method

Pascal

```
function CanClose(var OpenFileName: TOpenFileName): Boolean;
```

C++

```
__fastcall Boolean CanClose(TOpenFileName OpenFileName);
```

Description

This is CanClose, a member of class TOpenDialog.

61.1.17.4.2 TOpenDialog.DefineProperties Method

Designates methods for storing an object's unpublished data on a stream such as a form file.

Pascal

```
procedure DefineProperties(Filer: TFiler); override;
```

C++

```
virtual __fastcall DefineProperties(TFiler Filer);
```

Description

TComponent overrides the DefineProperties method defined in TPersistent to define "fake" Top and Left properties. These are defined so that components that are not controls can be manipulated at design-time. However, the Top and Left properties are hidden, that is, they are not published, because only controls appear at run-time.

DefineProperties is virtual; descendant classes can override it. When overriding DefineProperties, be aware that the Ancestor property of Filer might be set, and that this property can determine whether or not it is appropriate to write properties.

DefineProperties is called automatically as part of the component streaming system; do not call it directly.

See Also

Ancestor (see page 2839)

DefineBinaryProperty (see page 2837)

DefineProperties (see page 2931)

DefineProperty (see page 2838)

61.1.17.4.3 TOpenDialog.DoCanClose Method

Pascal

```
function DoCanClose: Boolean; dynamic;
```

C++

```
__fastcall Boolean DoCanClose();
```

Description

This is DoCanClose, a member of class TOpenDialog.

61.1.17.4.4 DoExecute Method

This is the overview for the DoExecute method overload.

Overload List

	Name	Description
	TOpenDialog.DoExecute (Pointer) (see page 11414)	This is DoExecute, a member of class TOpenDialog.
	TOpenDialog.DoExecute (Pointer, HWND) (see page 11414)	This is DoExecute, a member of class TOpenDialog.

61.1.17.4.4.1 TOpenDialog.DoExecute Method (Pointer)

Pascal

```
function DoExecute(Func: Pointer): Bool; overload;
```

C++

```
__fastcall Bool DoExecute(void * Func);
```

Description

This is DoExecute, a member of class TOpenDialog.

61.1.17.4.4.2 TOpenDialog.DoExecute Method (Pointer, HWND)

Pascal

```
function DoExecute(Func: Pointer; ParentWnd: HWND): Bool; overload;
```

C++

```
__fastcall Bool DoExecute(void * Func, HWND ParentWnd);
```

Description

This is DoExecute, a member of class TOpenDialog.

61.1.17.4.5 TOpenDialog.DoFolderChange Method

Pascal

```
procedure DoFolderChange; dynamic;
```

C++

```
__fastcall DoFolderChange();
```

Description

This is DoFolderChange, a member of class TOpenDialog.

61.1.17.4.6 TOpenDialog.DoIncludeItem Method

Pascal

```
procedure DoIncludeItem(const OFN: TOFNotifyEx; var Include: Boolean); dynamic;
```

C++

```
__fastcall DoIncludeItem(const TOFNotifyEx OFN, Boolean Include);
```

Description

This is DoIncludeItem, a member of class TOpenDialog.

61.1.17.4.7 TOpenDialog.DoSelectionChange Method

Pascal

```
procedure DoSelectionChange; dynamic;
```

C++

```
__fastcall DoSelectionChange();
```

Description

This is DoSelectionChange, a member of class TOpenDialog.

61.1.17.4.8 TOpenDialog.DoTypeChange Method

Pascal

```
procedure DoTypeChange; dynamic;
```

C++

```
__fastcall DoTypeChange();
```

Description

This is DoTypeChange, a member of class TOpenDialog.

61.1.17.4.9 TOpenDialog.Execute Method

Displays the file-selection dialog.

Pascal

```
function Execute(ParentWnd: HWND): Boolean; override;
```

C++

```
virtual __fastcall Boolean Execute(HWND ParentWnd);
```

Description

Execute opens the file-selection dialog, returning true when the user selects a file and clicks Open. If the user clicks Cancel, Execute returns false.

```
if OpenDialog1.Execute then
  Memo1.Lines.LoadFromFile(OpenDialog1.FileName)
else
  Memo1.Lines.Clear;
if (OpenDialog1->Execute())
  Memo1->Lines->LoadFromFile(OpenDialog1->FileName);
else
  Memo1->Clear();
```

C++ Examples:

```
/*
The following code allows the user to use a dialog box to
redefine the icon for the application at run time. When the
user clicks Button1, OpenDialog1 executes and the user
specifies an icon filename. The Icon is then assigned to the
application.  At runtime, click Button1 to select the icon,
then minimize the application to see the icon.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
```

```
  OpenPictureDialog1->DefaultExt = GraphicExtension(__classid(TIcon));
  OpenPictureDialog1->FileName = GraphicFileMask(__classid(TIcon));
  OpenPictureDialog1->Filter = GraphicFilter(__classid(TIcon));
  OpenPictureDialog1->Options.Clear();
  OpenPictureDialog1->Options << ofFileMustExist << ofHideReadOnly << ofNoChangeDir;
  while (true)
  {
    if (OpenPictureDialog1->Execute())
    {
      if (!OpenPictureDialog1->Options.Contains(ofExtensionDifferent))
      {
        Application->Icon->LoadFromFile(OpenPictureDialog1->FileName);
        break;
      }
      else // reset Options to remove ofExtensionDifferent
      {
        OpenPictureDialog1->Options.Clear();
        OpenPictureDialog1->Options << ofFileMustExist << ofHideReadOnly << ofNoChangeDir;
      }
    }
    else // user cancelled
      break;
  }
}
```

Delphi Examples:

```
{
The following code allows the user to use a dialog box to
redefine the icon for the application at run time. When the
user clicks Button1, OpenDialog1 executes and the user
specifies an icon filename. The Icon is then assigned to the
application.  At runtime, click Button1 to select the icon,
then minimize the application to see the icon.
}
procedure TForm1.Button1Click(Sender: TObject);
var
Done: Boolean;
filenamestring : String;
begin
  OpenPictureDialog1.DefaultExt := GraphicExtension(TIcon);
  filenamestring := GraphicFileMask(TIcon);
  OpenPictureDialog1.FileName := filenamestring;
  OpenPictureDialog1.Filter := GraphicFilter(TIcon);
  OpenPictureDialog1.Options := [ ofFileMustExist, ofHideReadOnly, ofNoChangeDir ];
  Done := False;
  while not Done do
  begin
  if OpenPictureDialog1.Execute then
    begin
    if not (ofExtensionDifferent in OpenPictureDialog1.Options) then
      begin
      Application.Icon.LoadFromFile(OpenPictureDialog1.FileName);
      Done := True;
      end
    else
//      OpenPictureDialog1.Options := OpenPictureDialog1.Options - ofExtensionDifferent;
    end
  else { User cancelled }
    Done := True;
  end;
end;
{
Use a TOpenDialog to select a file.  Place the first line of
the file into a TEdit.
}
procedure TForm1.Edit1Click(Sender: TObject);
```

```
var
  F: TextFile;
  S: string;
begin
  if OpenDialog1.Execute then            { Display Open dialog box }
  begin
    AssignFile(F, OpenDialog1.FileName); { File selected in dialog }
    Reset(F);
    Readln(F, S);                        { Read first line of file }
    Edit1.Text := S;                     { Put string in a TEdit control }
    CloseFile(F);
  end;
end;
```

See Also

Files (see page 11429)

FileName (see page 11424)

61.1.17.4.10 TOpenDialog.GetFileNames Method

Pascal

```
procedure GetFileNames(var OpenFileName: TOpenFileName);
```

C++

```
__fastcall GetFileNames(TOpenFileName OpenFileName);
```

Description

This is GetFileNames, a member of class TOpenDialog.

61.1.17.4.11 TOpenDialog.GetStaticRect Method

Returns the coordinates of the reserved area of the dialog box.

Pascal

```
function GetStaticRect: TRect; virtual;
```

C++

```
virtual __fastcall TRect GetStaticRect();
```

Description

GetStaticRect is provided for components that descend from TOpenDialog (see page 11407) and require the placement of new controls alongside the standard ones inherited from the parent class. For Explorer-style dialogs, GetStaticRect returns the size and location of the standard controls within the dialog. For older versions of Windows, or if ofOldStyleDialog is enabled in Options (see page 11436), GetStaticRect returns the client dimensions of the entire dialog box.

C++ Examples:

```
/*
The following example is taken from TOpenPictureDialog. It
calculates the preview rectangle based on the difference
between the client area of the dialog and the static area of
the standard controls.
*/

#include <ExtDlgs.hpp>

class MyOpenPictureDialog : public TOpenPictureDialog
{
```

```
private:    // User declarations
    TPanel *FPicturePanel;  // can't use the private versions in TOpenPictureDialog
    TLabel *FPictureLabel;
    TSpeedButton *FPreviewButton;
    TPanel *FPaintPanel;
    TImage *FImageCtrl;
    AnsiString FSavedFilename;
protected:  // User declarations
    DYNAMIC void __fastcall DoShow(void);
public:     // User declarations
    __fastcall MyOpenPictureDialog(TComponent* Owner);
    virtual bool __fastcall  Execute(HWND ParentWnd){ return TOpenDialog::Execute(ParentWnd); }
};

__fastcall MyOpenPictureDialog::MyOpenPictureDialog(TComponent* Owner)
    : TOpenPictureDialog(Owner)
{
}

void __fastcall MyOpenPictureDialog::DoShow(void)
{
  RECT *PreviewRect = new RECT();
  TRect StaticRect;
  FPicturePanel = new TPanel(this);
  FPictureLabel = new TLabel(this);
  FPreviewButton = new TSpeedButton(this);
  FPaintPanel = new TPanel(this);
  FImageCtrl = new TImage(this);
  // Set preview area to entire dialog
  GetClientRect(Handle, PreviewRect);
  StaticRect = GetStaticRect();
  // Move preview area to right of static area
  PreviewRect->left = StaticRect.Left + (StaticRect.Right - StaticRect.Left);
  PreviewRect->top += 4;
  FPicturePanel->BoundsRect.Left = PreviewRect->left;
  FPicturePanel->BoundsRect.Right = PreviewRect->right;
  FPicturePanel->BoundsRect.Top = PreviewRect->top;
  FPicturePanel->BoundsRect.Bottom = PreviewRect->bottom;

  FPreviewButton->Left = FPaintPanel->BoundsRect.Right - FPreviewButton->Width - 2;
  FImageCtrl->Picture = NULL;
  FSavedFilename = "";
  FPaintPanel->Caption = "";
  FPicturePanel->ParentWindow = Handle;
  delete PreviewRect;
  delete FPicturePanel;
  delete FPreviewButton;
  delete FPaintPanel;
  delete FImageCtrl;
//  TOpenDialog::DoShow();   // the above code is equivalent to the inherited version
}

TForm1 *Form1;
MyOpenPictureDialog *OpenPictureDialog1;

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  if (OpenPictureDialog1->Execute(GetParentHandle()))
      Image1->Picture->LoadFromFile(OpenPictureDialog1->FileName);
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  OpenPictureDialog1 =  new MyOpenPictureDialog(Form1);
}
```

Delphi Examples:

```
{
The following example is overrides the
TOpenPictureDialog.DoShow method and implements it here.
DoShow calculates the preview rectangle based on the
difference between the client area of the dialog and the
static area of the standard controls.
}
type
  TForm1 = class(TForm)

TOpenPictureDialog (see page 13282)

61.1.17.4.12 TOpenDialog.WndProc Method

Responds to Windows messages sent to the dialog.

Pascal

```
procedure WndProc(var Message: TMessage); override;
```

C++

```
virtual __fastcall WndProc(TMessage Message);
```

Description

WndProc is the main window procedure for the dialog. As implemented in TCommonDialog, it simply calls the Dispatch method, where any message handlers respond to messages before the DefaultHandler method sends them on to the Windows message handler.

Override WndProc to subclass the dialog's window procedure. To add additional message processing without interfering with the existing message handling of the dialog, override MessageHook instead.

See Also

DefaultHandler (see page 11282)

Dispatch

MessageHook (see page 11284)

61.1.17.5 TOpenDialog Properties

The properties of the TOpenDialog class are listed here.

Public Properties

	Name	Description
	FileEditStyle (see page 11423)	Determines the style of the file-selection dialog. (Obsolete.)
R	Files (see page 11429)	List of selected file names.
	HistoryList (see page 11436)	Maintains a list of previously selected files. (Obsolete.)

Published Properties

	Name	Description
	DefaultExt (see page 11421)	Specifies a default file extension.
	FileName (see page 11424)	Indicates the name and directory path of the last file selected.

	Filter (see page 11431)	Determines the file masks (filters) available in the dialog.
	FilterIndex (see page 11434)	Determines which filter is selected by default when the dialog opens.
	InitialDir (see page 11436)	Determines the current directory when the dialog opens.
	Options (see page 11436)	Determines the appearance and behavior of the file-selection dialog.
	OptionsEx (see page 11438)	Augments the Options (see page 11436) property with additional flags that determine the appearance and behavior of the file-selection dialog.
	Title (see page 11438)	Specifies the text in the dialog's title bar.

61.1.17.5.1 TOpenDialog.DefaultExt Property

Specifies a default file extension.

Pascal

```
property DefaultExt: string;
```

C++

```
__property AnsiString DefaultExt;
```

Description

DefaultExt specifies a file extension that is appended automatically to the selected file name, unless the selected file name already includes a registered extension. If the user selects a file name with an extension that is unregistered, DefaultExt is appended to the unregistered extension.

Extensions longer than three characters are not supported. Do not include the period (.) that divides the file name and its extension.

C++ Examples:

```
/*
This code displays a Save Picture dialog box with the
TBitmap default extension that is added automatically to
files that are given no extension. Confirm that the
bitmap file has been saved under the filename and path
specified.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  AnsiString NewFileName, OldFileName;
  TFileStream *NewFile, *OldFile;
  SavePictureDialog1->DefaultExt = GraphicExtension(__classid(Graphics::TBitmap));
  SavePictureDialog1->Filter = GraphicFilter(__classid(Graphics::TBitmap));
  OldFileName = "factory.bmp";
  if (SavePictureDialog1->Execute())
  {
    NewFileName = SavePictureDialog1->FileName;
    OldFile = new TFileStream(OldFileName, (fmOpenRead | fmShareDenyWrite));
    try
    {
      NewFile = new TFileStream(NewFileName, (fmCreate | fmShareDenyRead));
      try
      {
        NewFile->CopyFrom(OldFile, OldFile->Size);
      }
      __finally
      {
        FreeAndNil(&NewFile);
      };
    }
    __finally
    {
      FreeAndNil(&OldFile);
    };
```

```
  };
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  Image1->Picture->LoadFromFile("../factory.bmp");
}
/*
The following code allows the user to use a dialog box to
redefine the icon for the application at run time. When the
user clicks Button1, OpenDialog1 executes and the user
specifies an icon filename. The Icon is then assigned to the
application.  At runtime, click Button1 to select the icon,
then minimize the application to see the icon.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  OpenPictureDialog1->DefaultExt = GraphicExtension(__classid(TIcon));
  OpenPictureDialog1->FileName = GraphicFileMask(__classid(TIcon));
  OpenPictureDialog1->Filter = GraphicFilter(__classid(TIcon));
  OpenPictureDialog1->Options.Clear();
  OpenPictureDialog1->Options << ofFileMustExist << ofHideReadOnly << ofNoChangeDir;
  while (true)
  {
    if (OpenPictureDialog1->Execute())
    {
      if (!OpenPictureDialog1->Options.Contains(ofExtensionDifferent))
      {
        Application->Icon->LoadFromFile(OpenPictureDialog1->FileName);
        break;
      }
      else // reset Options to remove ofExtensionDifferent
      {
        OpenPictureDialog1->Options.Clear();
        OpenPictureDialog1->Options << ofFileMustExist << ofHideReadOnly << ofNoChangeDir;
      }
    }
    else // user cancelled
      break;
  }
}
```

Delphi Examples:

```
{
This code displays a Save Picture dialog box with the
TBitmap default extension that is added automatically to
files that are given no extension. Confirm that the
bitmap file has been saved under the filename and path
specified.
}
procedure TForm1.Button1Click(Sender: TObject);
var NewFileName, OldFileName: string;
    NewFile, OldFile: TFileStream;
begin
  SavePictureDialog1.DefaultExt := GraphicExtension(TBitmap);
  SavePictureDialog1.Filter := GraphicFilter(TBitmap);
  OldFileName := 'factory.bmp';
  if SavePictureDialog1.Execute then
  begin
    NewFileName := SavePictureDialog1.FileName;
    OldFile := TFileStream.Create(
      OldFileName, fmOpenRead or fmShareDenyWrite);
    try
      NewFile := TFileStream.Create(
        NewFileName, fmCreate or fmShareDenyRead);
      try
```

```
        NewFile.CopyFrom(OldFile, OldFile.Size);
      finally
        FreeAndNil(NewFile);
      end;
    finally
      FreeAndNil(OldFile);
    end;
  end;
end;

```

61.1.17.5.2 TOpenDialog.FileEditStyle Property

Determines the style of the file-selection dialog. (Obsolete.)

Pascal

```
property FileEditStyle: TFileEditStyle;
```

C++

```
__property TFileEditStyle FileEditStyle;
```

Description

FileEditStyle is maintained for compatibility with older versions of the VCL. It has no effect.

61.1.17.5.3 TOpenDialog.FileName Property

Indicates the name and directory path of the last file selected.

Pascal

```
property FileName: TFileName;
```

C++

```
__property TFileName FileName;
```

Description

The FileName property returns the name and complete directory path of the most recently selected file. The value of FileName is the same as the first item in the Files (see page 11429) property.

To make a file name appear by default in the dialog's edit box, assign a value to FileName in the Object Inspector or in program code. Programmatic changes to FileName have no effect while the dialog is active.

```
if OpenDialog1.Execute then
  Memo1.Lines.LoadFromFile(OpenDialog1.FileName)
else
  Memo1.Lines.Clear;
if (OpenDialog1->Execute())
  Memo1->Lines->LoadFromFile(OpenDialog1->FileName);
else
  Memo1->Clear();
```

C++ Examples:

```
/*
This code displays a Save Picture dialog box with the
TBitmap default extension that is added automatically to
files that are given no extension. Confirm that the
bitmap file has been saved under the filename and path
specified.
*/

61.1.17.5.4 TOpenDialog.Files Property

List of selected file names.

Pascal

```
property Files: TStrings;
```

C++

```
__property TStrings Files;
```

Description

Files is a string list that contains each selected file name with its full directory path. (To let users select multiple file names, set the ofAllowMultiSelect flag in Options (see page 11436).) Use properties and methods for string lists to traverse this list of files and read individual items.

The example below assigns the list of files in Files to the Items property of a TListBox component.

```
ListBox1.Items.Assign(OpenDialog1.Files);
ListBox1->Items->Assign(OpenDialog1->Files);
```

C++ Examples:

```
/*
This example uses an Open dialog box, a memo, and a button
on a form. When the user clicks the button, the Open dialog
box appears. When the user selects files in the dialog box
and chooses the OK button, the first line from each of the
files is added to the memo. Choose multiple files using the
CNTL key or the SHIFT key.

61.1.17.5.5 TOpenDialog.Filter Property

Determines the file masks (filters) available in the dialog.

Pascal

```
property Filter: string;
```

C++

```
__property AnsiString Filter;
```

Description

The file-selection dialog includes a drop-down list of file types under the edit box. When the user picks a file type from the list, only files of the selected type are displayed in the dialog.

To configure file masks at design time, click on the ellipsis marks (...) to the right of the Filter property in the Object Inspector. This opens the Filter editor. In the left column of the Filter editor, under Filter Name, type a brief description of each file type that will be available at runtime. In the right column, under Filter, type the file mask corresponding to each description. For example, the description "Text files" might appear to the left of the mask "*.txt", and the description "Pascal source files" might appear to the left of the mask "*.pas". Since the description appears in the drop-down list at runtime, it is often helpful to show the mask explicitly in the description (for example, "Text files (*.txt)").

To create file masks in program code, assign a value to the Filter property that consists of a description and a mask separated by a vertical bar (pipe) character. Do not include spaces around the vertical bar. For example,

```
OpenDialog1.Filter := 'Text files (*.txt)|*.TXT';
OpenDialog1->Filter = "Text files (*.txt)|*.TXT";
```

Multiple filters should be separated by vertical bars. For example,

```
OpenDialog1.Filter := 'Text files (*.txt)|*.TXT|Pascal files (*.pas)|*.PAS';
OpenDialog1->Filter = "Text files (*.txt)|*.TXT|Pascal files (*.pas)|*.PAS";
```

To include multiple masks in a single filter, separate the masks with semicolons. This works both in the Object Inspector and in program code. For example,

```
OpenDialog1.Filter := 'Pascal files|*.PAS;*.DPK;*.DPR';
OpenDialog1->Filter = "Pascal files|*.PAS;*.DPK;*.DPR";
```

If no value is assigned to Filter, the dialog displays all file types.

C++ Examples:

```
/*

    begin
    if not (ofExtensionDifferent in OpenPictureDialog1.Options) then
      begin
      Application.Icon.LoadFromFile(OpenPictureDialog1.FileName);
      Done := True;
      end
    else
//      OpenPictureDialog1.Options := OpenPictureDialog1.Options - ofExtensionDifferent;
    end
  else { User cancelled }
    Done := True;
  end;
end;
```

See Also

FilterIndex (see page 11434)

GraphicFilter (see page 14624)

61.1.17.5.6 TOpenDialog.FilterIndex Property

Determines which filter is selected by default when the dialog opens.

Pascal

```
property FilterIndex: Integer;
```

C++

```
__property int FilterIndex;
```

Description

FilterIndex determines which of the file types in Filter (see page 11431) is selected by default when the dialog opens. Set FilterIndex to 1 to choose the first file type in the list as the default, or set FilterIndex to 2 to choose the second file type as the default, and so forth. If the value of FilterIndex is out or range, the first file type listed in Filter (see page 11431) is the default.

C++ Examples:

```
/*
This example uses an Open dialog box, a memo, and a button
on a form. When the user clicks the button, the Open dialog
box appears. When the user selects files in the dialog box
and chooses the OK button, the first line from each of the
files is added to the memo. Choose multiple files using the
CNTL key or the SHIFT key.
*/

#include <stdio.h>     // for FILE

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  FILE *stream;
  char FirstLine[512];

  OpenDialog1->Options.Clear();
  OpenDialog1->Options << ofAllowMultiSelect << ofFileMustExist;
  OpenDialog1->Filter = "Text files (*.txt)|*.txt|All files (*.*)|*.*";
  OpenDialog1->FilterIndex = 2; // start the dialog showing all files
  if (OpenDialog1->Execute())
  {
    for (int I = 0; I < OpenDialog1->Files->Count; I ++)
    {
      stream = fopen(OpenDialog1->Files->Strings[I].c_str(), "r");
      if (stream)
      {
        // read the first line from the file
        fgets(FirstLine, sizeof(FirstLine), stream);
        Memo1->Lines->Append(FirstLine);
        fclose(stream);
      }
    }
  }
}
```

Delphi Examples:

```
{
This example uses an Open dialog box, a memo, and a button
on a form. When the user clicks the button, the Open dialog
box appears. When the user selects files in the dialog box
and chooses the OK button, the first line from each of the
files is added to the memo. Choose multiple files using the
CNTL key or the SHIFT key.
}
procedure TForm1.Button1Click(Sender: TObject);
var
  I: integer;
  F: TextFile;
  FirstLine: string;
begin
  OpenDialog1.Options := [ofAllowMultiSelect, ofFileMustExist];
  OpenDialog1.Filter := 'Text files (*.txt)|*.txt|All files (*.*)|*.*';
  OpenDialog1.FilterIndex := 2; { start the dialog showing all files }
```

```
    if OpenDialog1.Execute then
      with OpenDialog1.Files do
        for I := 0 to Count - 1 do
        begin
          AssignFile(F, Strings[I]);  { next file in Files property }
          Reset(F);
          Readln(F, FirstLine);  { Read the first line out of the file }
          Memo1.Lines.Append(FirstLine);  { Add the line to the memo }
          CloseFile(F);
        end;
  end;
```

See Also

Filter (see page 11431)

61.1.17.5.7 TOpenDialog.HistoryList Property

Maintains a list of previously selected files. (Obsolete.)

Pascal

```
property HistoryList: TStrings;
```

C++

```
__property TStrings HistoryList;
```

Description

HistoryList is maintained for compatibility with older versions of TOpenDialog (see page 11407). It is not used.

61.1.17.5.8 TOpenDialog.InitialDir Property

Determines the current directory when the dialog opens.

Pascal

```
property InitialDir: string;
```

C++

```
__property AnsiString InitialDir;
```

Description

InitialDir determines the default directory displayed in the file-selection dialog when it opens. For example, to point the dialog at the WINDOWS\SYSTEM directory, set the value of InitialDir to C:\WINDOWS\SYSTEM.

If no value is assigned to InitialDir, or if the specified directory does not exist, the initial directory is controlled by the global ForceCurrentDirectory (see page 11585) variable. If ForceCurrentDirectory (see page 11585) is true, the dialog opens with the current working directory displayed. Otherwise, the dialog opens with either the current working directory or the My Documents directory, depending on the version of Windows.

See Also

ForceCurrentDirectory (see page 11585)

61.1.17.5.9 TOpenDialog.Options Property

Determines the appearance and behavior of the file-selection dialog.

Pascal

```
property Options: TOpenOptions;
```

C++

```
__property TOpenOptions Options;
```

Description

Use the Options property to customize the appearance and functionality of the dialog.

C++ Examples:

```
/*
The following code allows the user to use a dialog box to
redefine the icon for the application at run time. When the
user clicks Button1, OpenDialog1 executes and the user
specifies an icon filename. The Icon is then assigned to the
application.  At runtime, click Button1 to select the icon,
then minimize the application to see the icon.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  OpenPictureDialog1->DefaultExt = GraphicExtension(__classid(TIcon));
  OpenPictureDialog1->FileName = GraphicFileMask(__classid(TIcon));
  OpenPictureDialog1->Filter = GraphicFilter(__classid(TIcon));
  OpenPictureDialog1->Options.Clear();
  OpenPictureDialog1->Options << ofFileMustExist << ofHideReadOnly << ofNoChangeDir;
  while (true)
  {
    if (OpenPictureDialog1->Execute())
    {
      if (!OpenPictureDialog1->Options.Contains(ofExtensionDifferent))
      {
        Application->Icon->LoadFromFile(OpenPictureDialog1->FileName);
        break;
      }
      else // reset Options to remove ofExtensionDifferent
      {
        OpenPictureDialog1->Options.Clear();
        OpenPictureDialog1->Options << ofFileMustExist << ofHideReadOnly << ofNoChangeDir;
      }
    }
    else // user cancelled
      break;
  }
}
```

Delphi Examples:

```
{
The following code allows the user to use a dialog box to
redefine the icon for the application at run time. When the
user clicks Button1, OpenDialog1 executes and the user
specifies an icon filename. The Icon is then assigned to the
application.  At runtime, click Button1 to select the icon,
then minimize the application to see the icon.
}
procedure TForm1.Button1Click(Sender: TObject);
var
Done: Boolean;
filenamestring : String;
begin
  OpenPictureDialog1.DefaultExt := GraphicExtension(TIcon);
  filenamestring := GraphicFileMask(TIcon);
  OpenPictureDialog1.FileName := filenamestring;
  OpenPictureDialog1.Filter := GraphicFilter(TIcon);
  OpenPictureDialog1.Options := [ ofFileMustExist, ofHideReadOnly, ofNoChangeDir ];
  Done := False;
  while not Done do
```

```
    begin
    if OpenPictureDialog1.Execute then
      begin
      if not (ofExtensionDifferent in OpenPictureDialog1.Options) then
        begin
        Application.Icon.LoadFromFile(OpenPictureDialog1.FileName);
        Done := True;
        end
      else
//      OpenPictureDialog1.Options := OpenPictureDialog1.Options - ofExtensionDifferent;
      end
    else { User cancelled }
      Done := True;
    end;
  end;
```

DefaultExt (see page 11421)

FileName (see page 11424)

TSaveDialog (see page 11489)

TSavePictureDialog (see page 13300)

61.1.17.5.10 TOpenDialog.OptionsEx Property

Augments the Options (see page 11436) property with additional flags that determine the appearance and behavior of the file-selection dialog.

Pascal

```
property OptionsEx: TOpenOptionsEx;
```

C++

```
__property TOpenOptionsEx OptionsEx;
```

Description

Use the OptionsEx property to further customize the file open dialog beyond the options covered by the Options (see page 11436) property.

See Also

Options (see page 11436)

61.1.17.5.11 TOpenDialog.Title Property

Specifies the text in the dialog's title bar.

Pascal

```
property Title: string;
```

C++

```
__property AnsiString Title;
```

Description

Use Title to specify the text that appears in the file-selection dialog's title bar. If no value is assigned to Title, the dialog has the title "Open".

C++ Examples:

```
/*
Click the button to open a TOpenDialog, then select a file
to delete.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  OpenDialog1->Title = "Delete File";
  if (OpenDialog1->Execute())
  {
    if (FileExists(OpenDialog1->FileName))
      DeleteFile(OpenDialog1->FileName);
  }
}
```

Delphi Examples:

```
{
Click the button to open a TOpenDialog, then select a file
to delete.
}

procedure TForm1.Button1Click(Sender: TObject);
var
  F: Textfile;
begin
  OpenDialog1.Title := 'Delete File';
  if OpenDialog1.Execute then
  begin
    AssignFile(F, OpenDialog1.FileName);
    try
      Reset(F);
      if MessageDlg('Erase ' + OpenDialog1.FileName + '?',
        mtConfirmation, [mbYes, mbNo], 0) = mrYes then
      begin
        CloseFile(F);
        Erase(F);
      end;
    except
      on EInOutError do
        MessageDlg('File I/O error.', mtError, [mbOk], 0);
    end;
  end;
end;
```

61.1.17.6 TOpenDialog Events

The events of the TOpenDialog class are listed here.

Published Events

	Name	Description
	OnCanClose (see page 11439)	Occurs when the user tries to close the dialog without canceling.
	OnFolderChange (see page 11440)	Occurs when a directory is opened or closed from the dialog.
	OnIncludeItem (see page 11440)	Occurs before the dialog adds a file to the file list box.
	OnSelectionChange (see page 11441)	Occurs when file names displayed in the dialog are changed.
	OnTypeChange (see page 11441)	Occurs when the file types displayed in the dialog are changed.

61.1.17.6.1 TOpenDialog.OnCanClose Event

Occurs when the user tries to close the dialog without canceling.

Pascal

```
property OnCanClose: TCloseQueryEvent;
```

C++

```
__property TCloseQueryEvent OnCanClose;
```

Description

Write an OnCanClose event handler to provide custom validation of the value of FileName (see page 11424). File selection dialogs provide a number of built-in validations, such as checking for invalid characters, prompting for confirmation before overwriting, checking whether a file or path exists, and so on. These validations can be specified using the Options (see page 11436) property. However, applications can provide additional validation of file names in an OnCanClose event handler.

Set the CanClose (see page 11413) parameter to false to prevent the dialog from closing. The OnCanClose event handler is responsible for telling the user why the dialog doesn't close.

Note: OnCanClose does not occur under Windows NT 3.51 unless the new shell is installed.

See Also

FileName (see page 11424)

OnClose (see page 11287)

Options (see page 11436)

61.1.17.6.2 TOpenDialog.OnFolderChange Event

Occurs when a directory is opened or closed from the dialog.

Pascal

```
property OnFolderChange: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnFolderChange;
```

Description

The OnFolderChange event occurs when the user changes the directory whose contents are displayed in the dialog. This can happen when the user double-clicks on a directory, clicks the Up arrow, or uses the list box at the top of the dialog to navigate through the directory structure.

61.1.17.6.3 TOpenDialog.OnIncludeItem Event

Occurs before the dialog adds a file to the file list box.

Pascal

```
property OnIncludeItem: TIncludeItemEvent;
```

C++

```
__property TIncludeItemEvent OnIncludeItem;
```

Description

Write an OnIncludeItem event handler to programmatically filter the items that appear in the shell folder's item list.

This event does not occur unless the Options (see page 11436) property includes ofEnableIncludeNotify.

See Also

Options (see page 11436)

61.1.17.6.4 TOpenDialog.OnSelectionChange Event

Occurs when file names displayed in the dialog are changed.

Pascal

```
property OnSelectionChange: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnSelectionChange;
```

Description

The OnSelectionChange event occurs when the user does something to change the list displayed in the dialog. This can include opening the file-selection dialog, highlighting a file or directory, selecting a new filter, selecting a new directory, or creating a new folder.

See Also

FileName (see page 11424)

61.1.17.6.5 TOpenDialog.OnTypeChange Event

Occurs when the file types displayed in the dialog are changed.

Pascal

```
property OnTypeChange: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnTypeChange;
```

Description

The OnTypeChange event occurs when the user selects a new filter from the Files (see page 11429) of Type list box at the bottom of the dialog.

See Also

Filter (see page 11431)

61.1.18 TPageSetupDialog Class

TPageSetupDialog displays a page setup dialog.

Class Hierarchy

Pascal

```
TPageSetupDialog = class(TCommonDialog);
```

C++

```
class TPageSetupDialog : public TCommonDialog;
```

File

Dialogs

Description

TPageSetupDialog displays a modal Windows dialog box for setting up the print page. The dialog does not appear at runtime until it is activated by a call to the Execute (see page 11446) method. When the user selects a font and clicks OK, the dialog closes and the selected font is stored in the Font property.

The page setup dialog includes a sample page that is drawn when the dialog first appears and again as the user reconfigures the page setup. Each time the sample page is drawn, the following events occur. Defining handlers for these events allows you to customize the way the sample page is drawn. Events are listed in the order they occur:

Event	Occurs
BeforePaint (see page 11455)	Before drawing begins. Use to initialize values for other event handlers.
OnDrawFullPage (see page 11456)	Before drawing full page.
OnDrawMinMargin (see page 11457)	Before drawing minimum margins.
OnDrawMargin (see page 11457)	Before drawing margins.
OnDrawGreekText (see page 11456)	Before drawing "Greek" text.
OnDrawEnvStamp (see page 11455)	Before drawing stamp (envelope paper types only).
OnDrawRetAddress (see page 11458)	Before drawing return address (envelope paper types only).

Most of the event handlers can prevent some or all following event handlers from being called. Refer to individual event handler topics for more information.

61.1.18.1 TPageSetupDialog Members

The following tables list the members exposed by TPageSetupDialog.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.

	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	DoClose (see page 11282)	Generates an OnClose (see page 11287) event.
	DoShow (see page 11283)	Generates an OnShow (see page 11288) event.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	MessageHook (see page 11284)	Provides special Windows message processing for the dialog.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	TaskModalDialog (see page 11284)	Ensures that Windows messages are properly routed when the dialog executes.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WndProc (see page 11285)	Responds to Windows messages sent to the dialog.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	Template (see page 11287)	Points to a custom template for the dialog.
	TemplateModule (see page 11287)	This is TemplateModule, a member of class TCommonDialog.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.

	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 11446)	Creates and initializes a TPageSetupDialog (see page 11441) instance.
	DefaultHandler (see page 11282)	Sends unhandled messages to Windows for processing.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 2766)	Disposes of the component and its owned components.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 11281)	Destroys the TCommonDialog (see page 11277) instance and frees its memory.
	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Execute (see page 11446)	Displays the page setup dialog.
	Execute (see page 11283)	This is the overview for the Execute method overload.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetDefaults (see page 11446)	Displays the page setup dialog.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.

	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	Handle (see page 11286)	Specifies the window handle of the dialog.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
R	PageSetupDlgRec (see page 11454)	Contain setup data structure.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Events

	Name	Description
	BeforePaint (see page 11455)	Occurs before dialog draws sample page.
	OnClose (see page 11287)	Occurs when the dialog closes.
	OnDrawEnvStamp (see page 11455)	Occurs before dialog draws stamp.
	OnDrawFullPage (see page 11456)	Occurs before any page drawing.
	OnDrawGreekText (see page 11456)	Occurs before drawing "Greek" text.
	OnDrawMargin (see page 11457)	Occurs before drawing margins.
	OnDrawMinMargin (see page 11457)	Occurs before drawing minimum margins.
	OnDrawRetAddress (see page 11458)	Occurs before dialog draws return address.
	OnShow (see page 11288)	Occurs when the dialog opens.

Published Properties

	Name	Description
	Ctl3D (see page 11285)	Determines whether the dialog has a three-dimensional look.
	HelpContext (see page 11286)	Specifies the context number for online Help.
	MarginBottom (see page 11447)	Specifies bottom margin.
	MarginLeft (see page 11448)	Specifies left margin
	MarginRight (see page 11448)	Specifies right margin.
	MarginTop (see page 11449)	Specifies top margin.
	MinMarginBottom (see page 11450)	Specifies minimum bottom margin.
	MinMarginLeft (see page 11450)	Specifies minimum left margin.
	MinMarginRight (see page 11451)	Specifies minimum right margin.
	MinMarginTop (see page 11452)	Specifies minimum top margin.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Options (see page 11452)	Specifies dialog options.
	PageHeight (see page 11453)	Specifies page height.
	PageWidth (see page 11454)	Specifies page height.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Units (see page 11454)	Specifies units used by user.

61.1.18.2 TPageSetupDialog.Create Constructor

Creates and initializes a TPageSetupDialog (see page 11441) instance.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TPageSetupDialog(TComponent * AOwner);
```

Description

The Create method generates a TPageSetupDialog (see page 11441) instance, but the new dialog does not appear on the form at runtime until the Execute (see page 11446) method is called.

AOwner is the component, typically a form or data module, that is responsible for freeing the TPageSetupDialog (see page 11441) instance. It becomes the value of the Owner property.

See Also

Owner (see page 2807)

Execute (see page 11446)

61.1.18.3 TPageSetupDialog Methods

The methods of the TPageSetupDialog class are listed here.

Public Methods

	Name	Description
	Execute (see page 11446)	Displays the page setup dialog.
	GetDefaults (see page 11446)	Displays the page setup dialog.

61.1.18.3.1 TPageSetupDialog.Execute Method

Displays the page setup dialog.

Pascal

```
function Execute(ParentWnd: HWND): Boolean; override;
```

C++

```
virtual __fastcall Boolean Execute(HWND ParentWnd);
```

Description

Execute opens the page setup dialog. Execute returns true if the user completed the page setup operation, or false if the user canceled it.

61.1.18.3.2 TPageSetupDialog.GetDefaults Method

Displays the page setup dialog.

Pascal

```
function GetDefaults: Boolean;
```

C++

```
__fastcall Boolean GetDefaults();
```

Description

GetDefaults obtains the default settings for the current printer, initializes the printer, and sets the page margin options accordingly. GetDefaults returns true if this operation succeeds, false otherwise.

61.1.18.4 TPageSetupDialog Properties

The properties of the TPageSetupDialog class are listed here.

Public Properties

	Name	Description
R	PageSetupDlgRec (see page 11454)	Contain setup data structure.

Published Properties

	Name	Description
	MarginBottom (see page 11447)	Specifies bottom margin.
	MarginLeft (see page 11448)	Specifies left margin
	MarginRight (see page 11448)	Specifies right margin.
	MarginTop (see page 11449)	Specifies top margin.
	MinMarginBottom (see page 11450)	Specifies minimum bottom margin.
	MinMarginLeft (see page 11450)	Specifies minimum left margin.
	MinMarginRight (see page 11451)	Specifies minimum right margin.
	MinMarginTop (see page 11452)	Specifies minimum top margin.
	Options (see page 11452)	Specifies dialog options.
	PageHeight (see page 11453)	Specifies page height.
	PageWidth (see page 11454)	Specifies page height.
	Units (see page 11454)	Specifies units used by user.

61.1.18.4.1 TPageSetupDialog.MarginBottom Property

Specifies bottom margin.

Pascal

```
property MarginBottom: Integer;
```

C++

```
__property int MarginBottom;
```

Description

If Options (see page 11452) includes psoMargins, MarginBottom is the initial value presented to the user as the bottom margin. If the user clicks the OK button (indicated by Execute (see page 11446) returning true), MarginBottom is assigned the bottom margin value specified by the user.

If the user is entering values in inches, MarginBottom expresses the margin in thousandths of an inch. If the user is entering values in millimeters, MarginBottom expresses the margin in hundredths of a millimeter.

See Also

MarginLeft (see page 11448)

MarginRight (see page 11448)

MarginTop (see page 11449)

MinMarginLeft (see page 11450)

MinMarginRight (see page 11451)

MinMarginBottom (see page 11450)

MinMarginTop (see page 11452)

Execute (see page 11446)

Options (see page 11452)

Units (see page 11454)

61.1.18.4.2 TPageSetupDialog.MarginLeft Property

Specifies left margin

Pascal

```
property MarginLeft: Integer;
```

C++

```
__property int MarginLeft;
```

Description

If Options (see page 11452) includes psoMargins, MarginLeft is the initial value presented to the user as the left margin. If the user clicks the OK button (indicated by Execute (see page 11446) returning true), MarginLeft is assigned the left margin value specified by the user.

If the user is entering values in inches, MarginLeft expresses the margin in thousandths of an inch. If the user is entering values in millimeters, MarginLeft expresses the margin in hundredths of a millimeter.

See Also

MarginBottom (see page 11447)

MarginRight (see page 11448)

MarginTop (see page 11449)

MinMarginLeft (see page 11450)

MinMarginRight (see page 11451)

MinMarginLeft (see page 11450)

MinMarginTop (see page 11452)

Execute (see page 11446)

Options (see page 11452)

Units (see page 11454)

61.1.18.4.3 TPageSetupDialog.MarginRight Property

Specifies right margin.

Pascal

```
property MarginRight: Integer;
```

C++

```
__property int MarginRight;
```

Description

If Options (see page 11452) includes psoMargins, MarginRight is the initial value presented to the user as the right margin. If the user clicks the OK button (indicated by Execute (see page 11446) returning true), MarginRight is assigned the right margin value specified by the user.

If the user is entering values in inches, MarginRight expresses the margin in thousandths of an inch. If the user is entering values in millimeters, MarginRight expresses the margin in hundredths of a millimeter.

See Also

MarginLeft (see page 11448)

MarginBottom (see page 11447)

MarginTop (see page 11449)

MinMarginLeft (see page 11450)

MinMarginRight (see page 11451)

MinMarginRight (see page 11451)

MinMarginTop (see page 11452)

Execute (see page 11446)

Options (see page 11452)

Units (see page 11454)

61.1.18.4.4 TPageSetupDialog.MarginTop Property

Specifies top margin.

Pascal

```
property MarginTop: Integer;
```

C++

```
__property int MarginTop;
```

Description

If Options (see page 11452) includes psoMargins, MarginTop is the initial value presented to the user as the top margin. If the user clicks the OK button (indicated by Execute (see page 11446) returning true), MarginTop is assigned the top margin value specified by the user.

If the user is entering values in inches, MarginTop expresses the margin in thousandths of an inch. If the user is entering values in millimeters, MarginTop expresses the margin in hundredths of a millimeter.

See Also

MarginLeft (see page 11448)

MarginRight (see page 11448)

MarginBottom (see page 11447)

MinMarginLeft (see page 11450)

MinMarginRight (see page 11451)

MinMarginTop (see page 11452)

MinMarginTop (see page 11452)

Execute (see page 11446)

Options (see page 11452)

Units (see page 11454)

61.1.18.4.5 TPageSetupDialog.MinMarginBottom Property

Specifies minimum bottom margin.

Pascal

```
property MinMarginBottom: Integer;
```

C++

```
__property int MinMarginBottom;
```

Description

If Options (see page 11452) includes psoMinMargins, MinMarginBottom is the minimum value the user can enter for the bottom margin.

If the user is entering values in inches, MinMarginBottom expresses the minimum margin in thousandths of an inch. If the user is entering values in millimeters, MinMarginBottom expresses the minimum margin in hundredths of a millimeter.

See Also

MarginLeft (see page 11448)

MarginRight (see page 11448)

MarginTop (see page 11449)

MinMarginLeft (see page 11450)

MinMarginRight (see page 11451)

MarginBottom (see page 11447)

MinMarginTop (see page 11452)

Execute (see page 11446)

Options (see page 11452)

Units (see page 11454)

61.1.18.4.6 TPageSetupDialog.MinMarginLeft Property

Specifies minimum left margin.

Pascal

```
property MinMarginLeft: Integer;
```

C++

```
__property int MinMarginLeft;
```

Description

If Options (see page 11452) includes psoMinMargins, MinMarginLeft is the minimum value the user can enter for the left

margin.

If the user is entering values in inches, MinMarginLeft expresses the minimum margin in thousandths of an inch. If the user is entering values in millimeters, MinMarginLeft expresses the minimum margin in hundredths of a millimeter.

See Also

MarginLeft (see page 11448)

MarginRight (see page 11448)

MarginTop (see page 11449)

MinMarginBottom (see page 11450)

MinMarginRight (see page 11451)

MarginBottom (see page 11447)

MinMarginTop (see page 11452)

Execute (see page 11446)

Options (see page 11452)

Units (see page 11454)

61.1.18.4.7 TPageSetupDialog.MinMarginRight Property

Specifies minimum right margin.

Pascal

```
property MinMarginRight: Integer;
```

C++

```
__property int MinMarginRight;
```

Description

If Options (see page 11452) includes psoMinMargins, MinMarginRight is the minimum value the user can enter for the right margin.

If the user is entering values in inches, MinMarginRight expresses the minimum margin in thousandths of an inch. If the user is entering values in millimeters, MinMarginRight expresses the minimum margin in hundredths of a millimeter.

See Also

MarginLeft (see page 11448)

MarginRight (see page 11448)

MarginTop (see page 11449)

MinMarginLeft (see page 11450)

MinMarginBottom (see page 11450)

MarginBottom (see page 11447)

MinMarginTop (see page 11452)

Execute (see page 11446)

Options (see page 11452)

Units (see page 11454)

61.1.18.4.8 TPageSetupDialog.MinMarginTop Property

Specifies minimum top margin.

Pascal

```
property MinMarginTop: Integer;
```

C++

```
__property int MinMarginTop;
```

Description

If Options (see page 11452) includes psoMinMargins, MinMarginTop is the minimum value the user can enter for the top margin.

If the user is entering values in inches, MinMarginTop expresses the minimum margin in thousandths of an inch. If the user is entering values in millimeters, MinMarginTop expresses the minimum margin in hundredths of a millimeter.

See Also

MarginLeft (see page 11448)

MarginRight (see page 11448)

MarginTop (see page 11449)

MinMarginLeft (see page 11450)

MinMarginRight (see page 11451)

MarginBottom (see page 11447)

MinMarginBottom (see page 11450)

Execute (see page 11446)

Options (see page 11452)

Units (see page 11454)

61.1.18.4.9 TPageSetupDialog.Options Property

Specifies dialog options.

Pascal

```
property Options: TPageSetupDialogOptions;
```

C++

```
__property TPageSetupDialogOptions Options;
```

Description

Options specifies the display options for the printer dialog. These are:

Option	Meaning
psoDefaultMinMargins	Sets the minimum values that the user can specify for the page margins to be the minimum margins allowed by the printer.
psoDisableMargins	Disables the margin controls, preventing the user from setting the margins.
psoDisableOrientation	Disables the orientation controls, preventing the user from setting the page orientation.

psoDisablePagePainting	Prevents default sample page drawing. Does not disable event calls.
psoDisablePaper	Disables the paper controls, preventing the user from setting page parameters such as the paper size and source.
psoDisablePrinter	Disables the Printer button, preventing the user from invoking a dialog box that contains additional printer setup information.
psoMargins	Sets the initial margins from MarginLeft (see page 11448), MarginRight (see page 11448), MarginBottom (see page 11447), and MarginTop (see page 11449) properties. Otherwise, initial margins are one inch each.
psoMinMargins	Sets the minimum margins from MinMarginLeft (see page 11450), MinMarginRight (see page 11451), MinMarginBottom (see page 11450), and MinMarginTop (see page 11452). Otherwise, minimum margins are determined by the printer driver.
psoShowHelp	Displays Help button and Help title bar button.
psoWarning	Prevents display of warning when there is no default printer.
psoNoNetworkButton	Hides and disables Network button.

See Also

MarginLeft (see page 11448)

MarginRight (see page 11448)

MarginBottom (see page 11447)

MarginTop (see page 11449)

MinMarginLeft (see page 11450)

MinMarginRight (see page 11451)

MinMarginBottom (see page 11450)

MinMarginTop (see page 11452)

61.1.18.4.10 TPageSetupDialog.PageHeight Property

Specifies page height.

Pascal

```
property PageHeight: Integer;
```

C++

```
__property int PageHeight;
```

Description

PageHeight contains the height of the page type selected by the user.

If the user is entering values in inches, PageHeight expresses the page height in thousandths of an inch. If the user is entering values in millimeters, PageHeight expresses the page height in hundredths of a millimeter.

See Also

PageWidth (see page 11454)

61.1.18.4.11 TPageSetupDialog.PageSetupDlgRec Property

Contain setup data structure.

Pascal

```
property PageSetupDlgRec: TPageSetupDlg;
```

C++

```
__property TPageSetupDlg PageSetupDlgRec;
```

Description

PageSetupDlgRec contains the Windows page setup data structure.

61.1.18.4.12 TPageSetupDialog.PageWidth Property

Specifies page height.

Pascal

```
property PageWidth: Integer;
```

C++

```
__property int PageWidth;
```

Description

PageWidth contains the width of the page type selected by the user.

If the user is entering values in inches, PageWidth expresses the page width in thousandths of an inch. If the user is entering values in millimeters, PageWidth expresses the page width in hundredths of a millimeter.

See Also

PageHeight (see page 11453)

61.1.18.4.13 TPageSetupDialog.Units Property

Specifies units used by user.

Pascal

```
property Units: TPageMeasureUnits;
```

C++

```
__property TPageMeasureUnits Units;
```

Description

Units determines the measurement units used by the user. Possible settings:

Constant	Meaning
pmDefault	User must specify values in units determined by locale settings.
pmMillimeters	User must specify values in millimeters.
pmInches	User must specify values in inches.

61.1.18.5 TPageSetupDialog Events

The events of the TPageSetupDialog class are listed here.

Published Events

	Name	Description
	BeforePaint (see page 11455)	Occurs before dialog draws sample page.
	OnDrawEnvStamp (see page 11455)	Occurs before dialog draws stamp.
	OnDrawFullPage (see page 11456)	Occurs before any page drawing.
	OnDrawGreekText (see page 11456)	Occurs before drawing "Greek" text.
	OnDrawMargin (see page 11457)	Occurs before drawing margins.
	OnDrawMinMargin (see page 11457)	Occurs before drawing minimum margins.
	OnDrawRetAddress (see page 11458)	Occurs before dialog draws return address.

61.1.18.5.1 TPageSetupDialog.BeforePaint Event

Occurs before dialog draws sample page.

Pascal

```
property BeforePaint: TPageSetupBeforePaintEvent;
```

C++

```
__property TPageSetupBeforePaintEvent BeforePaint;
```

Description

Write an BeforePaint event handler to initialize data used by the other event handlers.

PaperSize indicates a standard Windows paper size. See Paper size constants.

Orientation indicates the paper orientation currently selected.

PageType indicates the kind of paper currently selected.

Set DoneDrawing to true to disable further painting. This results in a blank sample page, with none of the other event handlers being called.

61.1.18.5.2 TPageSetupDialog.OnDrawEnvStamp Event

Occurs before dialog draws stamp.

Pascal

```
property OnDrawEnvStamp: TPaintPageEvent;
```

C++

```
__property TPaintPageEvent OnDrawEnvStamp;
```

Description

Write an OnDrawEnvStamp event handler to customize the way the page setup dialog draws the stamp. The PageRect parameter indicates the boundaries of the stamp.

If the handler sets the DoneDrawing parameter to true, default stamp drawing is suppressed.

OnDrawEnvStamp only occurs for envelope paper types.

61.1.18.5.3 TPageSetupDialog.OnDrawFullPage Event

Occurs before any page drawing.

Pascal

```
property OnDrawFullPage: TPaintPageEvent;
```

C++

```
__property TPaintPageEvent OnDrawFullPage;
```

Description

Write an OnDrawFullPage event handler to customize the way the entire page is drawn. The PageRect parameter indicates the boundaries of the page.

If the handler sets the DoneDrawing parameter to true, all default page drawing is suppressed and none of the subsequent event handlers (OnDrawMinMargin (see page 11457), OnDrawMargin (see page 11457), OnDrawGreekText (see page 11456), OnDrawEnvStamp (see page 11455), and OnDrawRetAddress (see page 11458)) are called. All drawing of the sample page is done by the OnDrawFullPage event handler.

See Also

OnDrawMinMargin (see page 11457)

OnDrawMargin (see page 11457)

OnDrawGreekText (see page 11456)

OnDrawEnvStamp (see page 11455)

OnDrawRetAddress (see page 11458)

61.1.18.5.4 TPageSetupDialog.OnDrawGreekText Event

Occurs before drawing "Greek" text.

Pascal

```
property OnDrawGreekText: TPaintPageEvent;
```

C++

```
__property TPaintPageEvent OnDrawGreekText;
```

Description

Write an OnDrawGreekText event handler to customize the way "Greek" text is drawn. The PageRect parameter indicates the current margins of the page.

If the handler sets the DoneDrawing parameter to true, default drawing for the margins and "Greek" text is suppressed. This does not suppress special drawing features for envelope paper types: drawing the return address or stamp, and calling the OnDrawEnvStamp (see page 11455), and OnDrawRetAddress (see page 11458) event handlers.

See Also

OnDrawEnvStamp (see page 11455)

OnDrawRetAddress (see page 11458)

61.1.18.5.5 TPageSetupDialog.OnDrawMargin Event

Occurs before drawing margins.

Pascal

```
property OnDrawMargin: TPaintPageEvent;
```

C++

```
__property TPaintPageEvent OnDrawMargin;
```

Description

Write an OnDrawMargin event handler to customize the way the margins are drawn. The PageRect parameter indicates the current margins of the page.

If the handler sets the DoneDrawing parameter to true, default drawing for the margins and "Greek" text is suppressed and the OnDrawGreekText (see page 11456) event handler is not called. However, this does not suppress special drawing features for envelope paper types: drawing the return address or stamp, and calling the OnDrawEnvStamp (see page 11455), and OnDrawRetAddress (see page 11458) event handlers.

See Also

OnDrawGreekText (see page 11456)

OnDrawEnvStamp (see page 11455)

OnDrawRetAddress (see page 11458)

61.1.18.5.6 TPageSetupDialog.OnDrawMinMargin Event

Occurs before drawing minimum margins.

Pascal

```
property OnDrawMinMargin: TPaintPageEvent;
```

C++

```
__property TPaintPageEvent OnDrawMinMargin;
```

Description

Write an OnDrawMinMargin event handler to customize the way the minimum margins are drawn. The PageRect parameter indicates the minimum margins of the page.

If the handler sets the DoneDrawing parameter to true, default drawing for the minimum margins, margins, and "Greek" text is suppressed and the OnDrawMargin (see page 11457) and OnDrawGreekText (see page 11456) event handlers are not called. However, this does not suppress special drawing features for envelope paper types: drawing the return address or stamp, and calling the OnDrawEnvStamp (see page 11455), and OnDrawRetAddress (see page 11458) event handlers.

See Also

OnDrawMargin (see page 11457)

OnDrawGreekText (see page 11456)

OnDrawEnvStamp (see page 11455)

OnDrawRetAddress (see page 11458)

61.1.18.5.7 TPageSetupDialog.OnDrawRetAddress Event

Occurs before dialog draws return address.

Pascal

```
property OnDrawRetAddress: TPaintPageEvent;
```

C++

```
__property TPaintPageEvent OnDrawRetAddress;
```

Description

Write an OnDrawRetAddress event handler to customize the way the page setup dialog draws the return address. The PageRect parameter indicates the boundaries of the return address

If the handler sets the DoneDrawing parameter to true, default return address drawing is suppressed.

OnDrawRetAddress only occurs for envelope paper types.

61.1.19 TPrintDialog Class

TPrintDialog displays a Print dialog.

Class Hierarchy

Pascal

```
TPrintDialog = class(TCommonDialog);
```

C++

```
class TPrintDialog : public TCommonDialog;
```

File

Dialogs

Description

The TPrintDialog component displays a standard Windows dialog box for sending jobs to a printer. The dialog is modal and does not appear at runtime until it is activated by a call to the Execute (see page 11462) method.

See Also

TPrinterSetupDialog (see page 11478)

61.1.19.1 TPrintDialog Members

The following tables list the members exposed by TPrintDialog.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	DoClose (see page 11282)	Generates an OnClose (see page 11287) event.
	DoShow (see page 11283)	Generates an OnShow (see page 11288) event.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	MessageHook (see page 11284)	Provides special Windows message processing for the dialog.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	TaskModalDialog (see page 11284)	Ensures that Windows messages are properly routed when the dialog executes.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WndProc (see page 11285)	Responds to Windows messages sent to the dialog.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	Template (see page 11287)	Points to a custom template for the dialog.

	TemplateModule (see page 11287)	This is TemplateModule, a member of class TCommonDialog.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
V	Create (see page 11281)	Creates and initializes a TCommonDialog (see page 11277) instance.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	DefaultHandler (see page 11282)	Sends unhandled messages to Windows for processing.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 11281)	Destroys the TCommonDialog (see page 11277) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
V	Execute (see page 11462)	Displays the Print dialog box.
V	Execute (see page 11283)	This is the overview for the Execute method overload.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.

	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	Handle (see page 11286)	Specifies the window handle of the dialog.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Events

	Name	Description
	OnClose (see page 11287)	Occurs when the dialog closes.
	OnShow (see page 11288)	Occurs when the dialog opens.

Published Properties

	Name	Description
	Collate (see page 11464)	Indicates whether the Collate check box is selected.
	Copies (see page 11464)	Indicates the number copies selected in the Print dialog.
	Ctl3D (see page 11285)	Determines whether the dialog has a three-dimensional look.
	FromPage (see page 11465)	Indicates the page on which the print job is to begin.
	HelpContext (see page 11286)	Specifies the context number for online Help.
	MaxPage (see page 11467)	Determines the greatest page number the user can enter when specifying pages to print.
	MinPage (see page 11469)	Determines the smallest page number the user can enter when specifying pages to print.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Options (see page 11471)	Determines the appearance and behavior of the Print dialog.
	PrintRange (see page 11473)	Indicates the type of print range selected in the dialog.
	PrintToFile (see page 11475)	Indicates whether the Print To File check box is selected.
	Tag (see page 2808)	Stores an integer value as part of a component.
	ToPage (see page 11476)	Indicates the page on which the print job is to end.

61.1.19.2 TPrintDialog Methods

The methods of the TPrintDialog class are listed here.

Public Methods

	Name	Description
	Execute (see page 11462)	Displays the Print dialog box.

61.1.19.2.1 TPrintDialog.Execute Method

Displays the Print dialog box.

Pascal

```
function Execute(ParentWnd: HWND): Boolean; override;
```

C++

```
virtual __fastcall Boolean Execute(HWND ParentWnd);
```

Description

Execute opens the Print dialog, returning true when the user clicks Print and false when the user clicks Cancel.

C++ Examples:

```
{
This example uses a button, a Page Control, and a Print
dialog box on a form. When the user clicks the button, the
print dialog is displayed.  The user can select any subset
of the pages in the page control for printing.  The selected
pages are then printed.  To run this example successfully,
you must add the Printers unit to the uses clause of your
unit.  Right click on the PageControl to add at least one
page to the PageControl.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  PrintDialog1->Options.Clear();
  PrintDialog1->Options << poPageNums << poSelection;
  PrintDialog1->FromPage = 1;
  PrintDialog1->MinPage = 1;
  PrintDialog1->ToPage = PageControl1->PageCount;
  PrintDialog1->MaxPage = PageControl1->PageCount;
  if (PrintDialog1->Execute())
  {
    int Start, Stop;
    // determine the range the user wants to print
    switch (PrintDialog1->PrintRange)
    {
      case prSelection:
        Start = PageControl1->ActivePage->PageIndex;
        Stop = Start;
        break;
      case prPageNums:
        Start = PrintDialog1->FromPage - 1;
        Stop =  PrintDialog1->ToPage - 1;
        break;
      default:  // prAllPages
        Start = PrintDialog1->MinPage - 1;
        Stop = PrintDialog1->MaxPage - 1;
        break;
    }
```

```
    // now, print the pages
    Printer()->BeginDoc();
    for (int i = Start; i <= Stop; i++)
    {
      PageControl1->Pages[i]->PaintTo(Printer()->Handle, 10, 10);
      if (i != Stop)
        Printer()->NewPage();
    }
    Printer()->EndDoc();
  }
}
```

Delphi Examples:

```
{
This example uses a button, a Page Control, and a Print
dialog box on a form. When the user clicks the button, the
print dialog is displayed.  The user can select any subset
of the pages in the page control for printing.  The selected
pages are then printed.  To run this example successfully,
you must add the Printers unit to the uses clause of your
unit.  Right click on the PageControl to add at least one
page to the PageControl.
}
procedure TForm1.Button1Click(Sender:TObject);
var
  I, Start, Stop: Integer;
begin
PrintDialog1.Options := [poPageNums, poSelection];
PrintDialog1.FromPage := 1;
PrintDialog1.MinPage := 1;
PrintDialog1.ToPage := PageControl1.PageCount;
PrintDialog1.MaxPage := PageControl1.PageCount;

if PrintDialog1.Execute() then
  begin
    { determine the range the user wants to print }
    with PrintDialog1 do
    begin
      if PrintRange = prAllPages then
        begin
        Start := MinPage - 1;
        Stop := MaxPage - 1;
      end
      else if PrintRange = prSelection then
      begin
        Start := PageControl1.ActivePage.PageIndex;
        Stop := Start;
        end
      else  { PrintRange = prPageNums }
      begin
        Start := FromPage - 1;
        Stop := ToPage - 1;
      end;
    end;
    { now, print the pages }
    with Printer do
    begin
      BeginDoc;
      for I := Start to Stop do
      begin
        PageControl1.Pages[I].PaintTo(Handle, 10, 10);
        if I <> Stop then
          NewPage;
      end;
      EndDoc;
    end;
```

```
  end;
end;
```

61.1.19.3 TPrintDialog Properties

The properties of the TPrintDialog class are listed here.

Published Properties

	Name	Description
	Collate (see page 11464)	Indicates whether the Collate check box is selected.
	Copies (see page 11464)	Indicates the number copies selected in the Print dialog.
	FromPage (see page 11465)	Indicates the page on which the print job is to begin.
	MaxPage (see page 11467)	Determines the greatest page number the user can enter when specifying pages to print.
	MinPage (see page 11469)	Determines the smallest page number the user can enter when specifying pages to print.
	Options (see page 11471)	Determines the appearance and behavior of the Print dialog.
	PrintRange (see page 11473)	Indicates the type of print range selected in the dialog.
	PrintToFile (see page 11475)	Indicates whether the Print To File check box is selected.
	ToPage (see page 11476)	Indicates the page on which the print job is to end.

61.1.19.3.1 TPrintDialog.Collate Property

Indicates whether the Collate check box is selected.

Pascal

```
property Collate: Boolean;
```

C++

```
__property Boolean Collate;
```

Description

Collate is true whenever the Collate check box is selected in the Print dialog. To make the dialog open with the check box selected, set Collate to true in the Object Inspector or in program code.

See Also

Copies (see page 11464)

61.1.19.3.2 TPrintDialog.Copies Property

Indicates the number copies selected in the Print dialog.

Pascal

```
property Copies: Integer;
```

C++

```
__property int Copies;
```

Description

If Copies is 0 or 1, the dialog will have 1 in the Number of Copies field. To make the dialog open with 2 or more copies selected, set the value of Copies in the Object Inspector or in program code.

See Also

Collate (see page 11464)

61.1.19.3.3 TPrintDialog.FromPage Property

Indicates the page on which the print job is to begin.

Pascal

```
property FromPage: Integer;
```

C++

```
__property int FromPage;
```

Description

The FromPage property corresponds to the From field in the Print dialog.

C++ Examples:

```
{
This example uses a button, a Page Control, and a Print
dialog box on a form. When the user clicks the button, the
print dialog is displayed.  The user can select any subset
of the pages in the page control for printing.  The selected
pages are then printed.  To run this example successfully,
you must add the Printers unit to the uses clause of your
unit.  Right click on the PageControl to add at least one
page to the PageControl.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  PrintDialog1->Options.Clear();
  PrintDialog1->Options << poPageNums << poSelection;
  PrintDialog1->FromPage = 1;
  PrintDialog1->MinPage = 1;
  PrintDialog1->ToPage = PageControl1->PageCount;
  PrintDialog1->MaxPage = PageControl1->PageCount;
  if (PrintDialog1->Execute())
  {
    int Start, Stop;
    // determine the range the user wants to print
    switch (PrintDialog1->PrintRange)
    {
      case prSelection:
        Start = PageControl1->ActivePage->PageIndex;
        Stop = Start;
        break;
      case prPageNums:
        Start = PrintDialog1->FromPage - 1;
        Stop =  PrintDialog1->ToPage - 1;
        break;
      default:  // prAllPages
        Start = PrintDialog1->MinPage - 1;
        Stop = PrintDialog1->MaxPage - 1;
        break;
    }
    // now, print the pages
    Printer()->BeginDoc();
    for (int i = Start; i <= Stop; i++)
    {
      PageControl1->Pages[i]->PaintTo(Printer()->Handle, 10, 10);
      if (i != Stop)
        Printer()->NewPage();
    }
    Printer()->EndDoc();
  }
}
```

Delphi Examples:

```
{
This example uses a button, a Page Control, and a Print
dialog box on a form. When the user clicks the button, the
print dialog is displayed.  The user can select any subset
of the pages in the page control for printing.  The selected
pages are then printed.  To run this example successfully,
you must add the Printers unit to the uses clause of your
unit.  Right click on the PageControl to add at least one
page to the PageControl.
}
procedure TForm1.Button1Click(Sender:TObject);
var

  end;
end;
```

See Also

MaxPage (see page 11467)

MinPage (see page 11469)

Options (see page 11471)

PrintRange (see page 11473)

ToPage (see page 11476)

61.1.19.3.4 TPrintDialog.MaxPage Property

Determines the greatest page number the user can enter when specifying pages to print.

Pascal

```
property MaxPage: Integer;
```

C++

```
__property int MaxPage;
```

Description

If the user tries to enter a number greater than MaxPage, an error message appears.

Note: The user can specify page numbers only if the poPageNums flag is set in Options (see page 11471). If poPageNums is on, MaxPage must be set to a value greater than MinPage (see page 11469) or the Print dialog will not open.

C++ Examples:

```
{
This example uses a button, a Page Control, and a Print
dialog box on a form. When the user clicks the button, the
print dialog is displayed.  The user can select any subset
of the pages in the page control for printing.  The selected
pages are then printed.  To run this example successfully,
you must add the Printers unit to the uses clause of your
unit.  Right click on the PageControl to add at least one
page to the PageControl.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  PrintDialog1->Options.Clear();
  PrintDialog1->Options << poPageNums << poSelection;
  PrintDialog1->FromPage = 1;
  PrintDialog1->MinPage = 1;
  PrintDialog1->ToPage = PageControl1->PageCount;
  PrintDialog1->MaxPage = PageControl1->PageCount;
  if (PrintDialog1->Execute())
  {
    int Start, Stop;
    // determine the range the user wants to print

FromPage (see page 11465)

MinPage (see page 11469)

Options (see page 11471)

ToPage (see page 11476)

61.1.19.3.5 TPrintDialog.MinPage Property

Determines the smallest page number the user can enter when specifying pages to print.

Pascal

```
property MinPage: Integer;
```

C++

```
__property int MinPage;
```

Description

If the user tries to enter a number smaller than MinPage, a error message appears.

Note: The user can specify page numbers only if the poPageNums flag is set in Options (see page 11471). If poPageNums is on, MaxPage (see page 11467) must be set to a value greater than MinPage or the Print dialog will not open.

C++ Examples:

```
{
This example uses a button, a Page Control, and a Print
