61.1.19.3.7 TPrintDialog.PrintRange Property

Indicates the type of print range selected in the dialog.

Pascal

```
property PrintRange: TPrintRange;
```

C++

```
__property TPrintRange PrintRange;
```

Description

The value of PrintRange corresponds the All, Selection, and Pages (From/To) radio buttons in the Print dialog. To determine which radio button is selected by default when the dialog opens, set the value of PrintRange in the Object Inspector or in program code.

To enable the Pages radio button, set the poPageNums flag in Options (see page 11471). To enable the Selection radio button, set the poSelection flag in Options (see page 11471) and set MaxPage (see page 11467) to a greater value than MinPage (see page 11469).

C++ Examples:

```
{
This example uses a button, a Page Control, and a Print
dialog box on a form. When the user clicks the button, the
print dialog is displayed.  The user can select any subset
of the pages in the page control for printing.  The selected
pages are then printed.  To run this example successfully,
you must add the Printers unit to the uses clause of your
unit.  Right click on the PageControl to add at least one
page to the PageControl.

61.1.19.3.8 TPrintDialog.PrintToFile Property

Indicates whether the Print To File check box is selected.

Pascal

```
property PrintToFile: Boolean;
```

C++

```
__property Boolean PrintToFile;
```

Description

PrintToFile is true whenever the Print To File check box is selected in the dialog. To make the dialog open with the check box selected, set PrintToFile to true in the Object Inspector or in program code.

To make the Print To File check box appear in the dialog, set the poPrintToFile flag in Options (see page 11471). To disable (gray) the Print To File check box, set the poDisablePrintToFile flag.

C++ Examples:

```
/*
This example displays a print dialog box with a Print to
File check box, and then prints the contents of a rich edit
control to the indicated destination:
Verify that the file is saved by the SaveDialog.
*/
void __fastcall TForm1::BitBtn1Click(TObject *Sender)
{
  PrintDialog1->Options << poPrintToFile;
  PrintDialog1->PrintToFile = true;
  if (PrintDialog1->Execute())
  {
    if (PrintDialog1->PrintToFile)
    {
      SaveDialog1->Title = "Print to File:";
      if (SaveDialog1->Execute())
        RichEdit1->Lines->SaveToFile(SaveDialog1->FileName);
      else
        RichEdit1->Print("");
    }
```

```
  }
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
// you may need to change this path to suit your environment
  char const *Path = "..\\overview.rtf";
  RichEdit1->PlainText = false;
  RichEdit1->Lines->LoadFromFile(Path);
  RichEdit1->ScrollBars = ssVertical;
}
```

Delphi Examples:

```
{
This example displays a print dialog box with a Print to
File check box, and then prints the contents of a rich edit
control to the indicated destination:
Verify that the file is saved by the SaveDialog.
}
procedure TForm1.BitBtn1Click(Sender: TObject);
begin
with PrintDialog1 do
  begin
  Options := [poPrintToFile];
  PrintToFile := True;
  if Execute then
    begin
    if PrintToFile then
      begin
      SaveDialog1.Title := 'Print to File: ';
      if SaveDialog1.Execute then
        RichEdit1.Lines.SaveToFile(SaveDialog1.FileName);
      end
    else
      RichEdit1.Print('');
    end;
  end;
end;

procedure TForm1.FormCreate(Sender: TObject);
const
  // you may need to change this path to suit your environment
  Path = 'OverView.RTF';
begin
  RichEdit1.PlainText := False;
  RichEdit1.Lines.LoadFromFile(Path);
  RichEdit1.ScrollBars := ssVertical;
end;
```

61.1.19.3.9 TPrintDialog.ToPage Property

Indicates the page on which the print job is to end.

Pascal

```
property ToPage: Integer;
```

C++

```
__property int ToPage;
```

Description

The ToPage property corresponds to the To field in the Print dialog.

C++ Examples:

```
{
This example uses a button, a Page Control, and a Print
dialog box on a form. When the user clicks the button, the
print dialog is displayed.  The user can select any subset
of the pages in the page control for printing.  The selected
pages are then printed.  To run this example successfully,
you must add the Printers unit to the uses clause of your
unit.  Right click on the PageControl to add at least one
page to the PageControl.
*/

61.1.20 TPrinterSetupDialog Class

TPrinterSetupDialog displays a print-setup dialog for configuring printers.

Class Hierarchy

Pascal

```
TPrinterSetupDialog = class(TCommonDialog);
```

C++

```
class TPrinterSetupDialog : public TCommonDialog;
```

File

Dialogs

Description

TPrinterSetupDialog displays a modal Windows dialog box for configuring printers. The contents of the dialog vary depending on the printer driver selected.

The dialog does not appear at runtime until it is activated by a call to the Execute (see page 11482) method.

See Also

TPrintDialog (see page 11458)

61.1.20.1 TPrinterSetupDialog Members

The following tables list the members exposed by TPrinterSetupDialog.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	DoClose (see page 11282)	Generates an OnClose (see page 11287) event.
	DoShow (see page 11283)	Generates an OnShow (see page 11288) event.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.

	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	MessageHook (see page 11284)	Provides special Windows message processing for the dialog.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	TaskModalDialog (see page 11284)	Ensures that Windows messages are properly routed when the dialog executes.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WndProc (see page 11285)	Responds to Windows messages sent to the dialog.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	Template (see page 11287)	Points to a custom template for the dialog.
	TemplateModule (see page 11287)	This is TemplateModule, a member of class TCommonDialog.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
V	Create (see page 11281)	Creates and initializes a TCommonDialog (see page 11277) instance.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.

	DefaultHandler (see page 11282)	Sends unhandled messages to Windows for processing.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 2766)	Disposes of the component and its owned components.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 11281)	Destroys the TCommonDialog (see page 11277) instance and frees its memory.
	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Execute (see page 11482)	Displays the printer configuration dialog box.
	Execute (see page 11283)	This is the overview for the Execute method overload.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.

R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	Handle (see page 11286)	Specifies the window handle of the dialog.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Events

	Name	Description
	OnClose (see page 11287)	Occurs when the dialog closes.
	OnShow (see page 11288)	Occurs when the dialog opens.

Published Properties

	Name	Description
	Ctl3D (see page 11285)	Determines whether the dialog has a three-dimensional look.
	HelpContext (see page 11286)	Specifies the context number for online Help.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

61.1.20.2 TPrinterSetupDialog Methods

The methods of the TPrinterSetupDialog class are listed here.

Public Methods

	Name	Description
V	Execute (see page 11482)	Displays the printer configuration dialog box.

61.1.20.2.1 TPrinterSetupDialog.Execute Method

Displays the printer configuration dialog box.

Pascal

```
function Execute(ParentWnd: HWND): Boolean; override;
```

C++

```
virtual __fastcall Boolean Execute(HWND ParentWnd);
```

Description

Execute opens the print-setup dialog. If the user clicks OK, Execute configures the printers as specified in the dialog and returns true. If the user clicks Cancel, Execute returns false.

61.1.21 TReplaceDialog Class

TReplaceDialog displays a search-and-replace dialog.

Class Hierarchy

Pascal

```
TReplaceDialog = class(TFindDialog);
```

C++

```
class TReplaceDialog : public TFindDialog;
```

File

Dialogs

Description

TReplaceDialog is a special version of TFindDialog (see page 11376) that prompts the user for both a search string and a replace string. Like the Find (see page 11383) dialog, the Replace (see page 11384) dialog is modeless and does not appear at runtime until activated by a call to the Execute (see page 11381) method.

See Also

TFindDialog (see page 11376)

61.1.21.1 TReplaceDialog Members

The following tables list the members exposed by TReplaceDialog.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	DoClose (see page 11282)	Generates an OnClose (see page 11287) event.
	DoShow (see page 11283)	Generates an OnShow (see page 11288) event.
	Find (see page 11383)	This is Find, a member of class TFindDialog.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.

	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	MessageHook (see page 11284)	Provides special Windows message processing for the dialog.
V	MessageHook (see page 11383)	Provides special Windows message processing for the dialog.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	Replace (see page 11384)	This is Replace, a member of class TFindDialog.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	TaskModalDialog (see page 11284)	Ensures that Windows messages are properly routed when the dialog executes.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WndProc (see page 11285)	Responds to Windows messages sent to the dialog.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	Template (see page 11287)	Points to a custom template for the dialog.
	TemplateModule (see page 11287)	This is TemplateModule, a member of class TCommonDialog.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.

	CloseDialog (see page 11381)	Closes the Find (see page 11383) dialog box.
V	Create (see page 11486)	Creates and initializes a TReplaceDialog (see page 11482) instance.
V	DefaultHandler (see page 11282)	Sends unhandled messages to Windows for processing.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 11281)	Destroys the TCommonDialog (see page 11277) instance and frees its memory.
V	Destroy (see page 11380)	Destroys the TFindDialog (see page 11376) and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
V	Execute (see page 11381)	Displays the Find (see page 11383) dialog.
V	Execute (see page 11283)	This is the overview for the Execute method overload.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	Handle (see page 11286)	Specifies the window handle of the dialog.
	Left (see page 11386)	Determines the X coordinate (horizontal position) of the Find (see page 11383) dialog's upper left corner.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Position (see page 11390)	Determines the position of the Find (see page 11383) dialog on the screen.
	Top (see page 11392)	Determines the Y coordinate (vertical position) of the Find (see page 11383) dialog's upper left corner.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Events

	Name	Description
	OnClose (see page 11287)	Occurs when the dialog closes.
	OnFind (see page 11392)	Occurs when the user clicks the Find (see page 11383) Next button.
	OnReplace (see page 11488)	Occurs when the user clicks the Replace (see page 11384) or Replace (see page 11384) All button.
	OnShow (see page 11288)	Occurs when the dialog opens.

Published Properties

	Name	Description
	Ctl3D (see page 11285)	Determines whether the dialog has a three-dimensional look.
	FindText (see page 11384)	Contains the search string.
	HelpContext (see page 11286)	Specifies the context number for online Help.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Options (see page 11386)	Determines the appearance and behavior of the Find (see page 11383) dialog.
	ReplaceText (see page 11487)	Contains the text that should replace FindText (see page 11384).
	Tag (see page 2808)	Stores an integer value as part of a component.

61.1.21.2 TReplaceDialog.Create Constructor

Creates and initializes a TReplaceDialog (see page 11482) instance.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TReplaceDialog(TComponent * AOwner);
```

Description

The Create method generates a TReplaceDialog (see page 11482) instance, but the new dialog does not appear on the form at runtime until the Execute (see page 11381) method is called.

AOwner is the component responsible for freeing the TReplaceDialog (see page 11482) instance. It becomes the value of the Owner property.

See Also

Execute (see page 11381)

Owner (see page 2807)

61.1.21.3 TReplaceDialog Properties

The properties of the TReplaceDialog class are listed here.

Published Properties

	Name	Description
	ReplaceText (see page 11487)	Contains the text that should replace FindText (see page 11384).

61.1.21.3.1 TReplaceDialog.ReplaceText Property

Contains the text that should replace FindText (see page 11384).

Pascal

```
property ReplaceText;
```

C++

```
__property ReplaceText;
```

Description

FindText (see page 11384), taken from the Find (see page 11383) What edit box, contains the text string that the user wants to search for. ReplaceText, taken from the Replace (see page 11384) With edit box, contains the text string that will replace FindText (see page 11384). To make a default text string appear in the Replace (see page 11384) With edit box when the dialog opens, assign a value to ReplaceText in the Object Inspector or in program code.

C++ Examples:

```
/*
The following event handler searches a TMemo object called
Memo1 and replaces FindText with ReplaceText. It uses
TMemo's SelStart, SelLength, and SelText properties.
*/
void __fastcall TForm1::ReplaceDialog1Replace(TObject *Sender)
{
  TReplaceDialog *dlg = (TReplaceDialog *)Sender;
  /* perform a global case-sensitive search for FindText in Memo1 */
  int SelPos = Memo1->Lines->Text.Pos(dlg->FindText);
  if (SelPos > 0)
  {
    Memo1->SelStart = SelPos - 1;
    Memo1->SelLength = dlg->FindText.Length();
    // Replace selected text with ReplaceText
    Memo1->SelText = dlg->ReplaceText;
  }
  else
    MessageBeep(0);
}
```

Delphi Examples:

```
{
The following event handler searches a TMemo object called
Memo1 and replaces FindText with ReplaceText. It uses
TMemo's SelStart, SelLength, and SelText properties.
}
```

```
procedure TForm1.ReplaceDialog1Replace(Sender: TObject);
var
  SelPos: Integer;
begin
  with TReplaceDialog(Sender) do
  begin
  { Perform a global case-sensitive search for FindText in Memo1 }
    SelPos := Pos(FindText, Memo1.Lines.Text);
    if SelPos > 0 then
    begin
      Memo1.SelStart := SelPos - 1;
      Memo1.SelLength := Length(FindText);
      { Replace selected text with ReplaceText }
      Memo1.SelText := ReplaceText;
    end
    else MessageDlg(Concat('Could not find "', FindText, '" in Memo1.'), mtError, [mbOk], 0);
  end;
end;
```

See Also

FindText (see page 11384)

61.1.21.4 TReplaceDialog Events

The events of the TReplaceDialog class are listed here.

Published Events

	Name	Description
	OnReplace (see page 11488)	Occurs when the user clicks the Replace (see page 11384) or Replace (see page 11384) All button.

61.1.21.4.1 TReplaceDialog.OnReplace Event

Occurs when the user clicks the Replace (see page 11384) or Replace (see page 11384) All button.

Pascal

```
property OnReplace;
```

C++

```
__property OnReplace;
```

Description

OnReplace occurs whenever the user clicks Replace (see page 11384) or Replace (see page 11384) All. In addition, when the user clicks Replace (see page 11384), the frReplace flag is set (and the frReplaceAll flag is turned off) in Options (see page 11386). When the user clicks ReplaceAll, the frReplaceAll flag is set (and the frReplace flag is turned off) in Options (see page 11386).

Write an OnReplace event handler that searches for the text specified in FindText (see page 11384) and replaces it with the text in ReplaceText (see page 11487). Use the Options (see page 11386) flags to determine how the search is conducted.

C++ Examples:

```
/*
The following event handler searches a TMemo object called
Memo1 and replaces FindText with ReplaceText. It uses
TMemo's SelStart, SelLength, and SelText properties.
*/
void __fastcall TForm1::ReplaceDialog1Replace(TObject *Sender)
{
```

```
  TReplaceDialog *dlg = (TReplaceDialog *)Sender;
  /* perform a global case-sensitive search for FindText in Memo1 */
  int SelPos = Memo1->Lines->Text.Pos(dlg->FindText);
  if (SelPos > 0)
  {
    Memo1->SelStart = SelPos - 1;
    Memo1->SelLength = dlg->FindText.Length();
    // Replace selected text with ReplaceText
    Memo1->SelText = dlg->ReplaceText;
  }
  else
    MessageBeep(0);
}
```

Delphi Examples:

```
{
The following event handler searches a TMemo object called
Memo1 and replaces FindText with ReplaceText. It uses
TMemo's SelStart, SelLength, and SelText properties.
}
procedure TForm1.ReplaceDialog1Replace(Sender: TObject);
var
  SelPos: Integer;
begin
  with TReplaceDialog(Sender) do
  begin
  { Perform a global case-sensitive search for FindText in Memo1 }
    SelPos := Pos(FindText, Memo1.Lines.Text);
    if SelPos > 0 then
    begin
      Memo1.SelStart := SelPos - 1;
      Memo1.SelLength := Length(FindText);
      { Replace selected text with ReplaceText }
      Memo1.SelText := ReplaceText;
    end
    else MessageDlg(Concat('Could not find "', FindText, '" in Memo1.'), mtError, [mbOk], 0);
  end;
end;
```

61.1.22 TSaveDialog Class

TSaveDialog displays a "Save As" dialog for saving files.

Class Hierarchy

Pascal

```
TSaveDialog = class(TOpenDialog);
```

C++

```
class TSaveDialog : public TOpenDialog;
```

File

Dialogs

Description

TSaveDialog displays a modal Windows dialog box for selecting file names and saving files. The dialog does not appear at runtime until it is activated by a call to the Execute (see page 11494) method. When the user clicks Save, the dialog closes and the selected file name is stored in the FileName (see page 11424) property.

Delphi Examples:

```
{
This example reads an entire file into a buffer with one
command and then writes it into a saved file.
}
procedure TForm1.Button1Click(Sender: TObject);
var
  FromF, ToF: file;
  NumRead, NumWritten: Integer;
  Buf: array[1..2048] of Char;
begin
  if OpenDialog1.Execute then     { Display Open dialog box }
  begin
    AssignFile(FromF, OpenDialog1.FileName);
    Reset(FromF, 1);    { Record size = 1 }
    if SaveDialog1.Execute then      { Display Save dialog box}
    begin
      AssignFile(ToF, SaveDialog1.FileName);    { Open output file }
      Rewrite(ToF, 1);  { Record size = 1 }
      Canvas.TextOut(10, 10, 'Copying ' + IntToStr(FileSize(FromF))
        + ' bytes...');
      repeat
        System.BlockRead(FromF, Buf, SizeOf(Buf), NumRead);
        BlockWrite(ToF, Buf, NumRead, NumWritten);
      until (NumRead = 0) or (NumWritten <> NumRead);
      CloseFile(FromF);
      CloseFile(ToF);
    end;
  end;
end;
```

61.1.22.1 TSaveDialog Members

The following tables list the members exposed by TSaveDialog.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.

	_Release (see page 2769)	Called when an application releases a component interface.
	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	CanClose (see page 11413)	This is CanClose, a member of class TOpenDialog.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	DefineProperties (see page 11413)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	DoCanClose (see page 11413)	This is DoCanClose, a member of class TOpenDialog.
	DoClose (see page 11282)	Generates an OnClose (see page 11287) event.
	DoExecute (see page 11413)	This is the overview for the DoExecute method overload.
	DoFolderChange (see page 11414)	This is DoFolderChange, a member of class TOpenDialog.
	DoIncludeItem (see page 11414)	This is DoIncludeItem, a member of class TOpenDialog.
	DoSelectionChange (see page 11415)	This is DoSelectionChange, a member of class TOpenDialog.
	DoShow (see page 11283)	Generates an OnShow (see page 11288) event.
	DoTypeChange (see page 11415)	This is DoTypeChange, a member of class TOpenDialog.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetFileNames (see page 11417)	This is GetFileNames, a member of class TOpenDialog.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetStaticRect (see page 11417)	Returns the coordinates of the reserved area of the dialog box.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	MessageHook (see page 11284)	Provides special Windows message processing for the dialog.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	TaskModalDialog (see page 11284)	Ensures that Windows messages are properly routed when the dialog executes.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.

	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WndProc (see page 11285)	Responds to Windows messages sent to the dialog.
	WndProc (see page 11420)	Responds to Windows messages sent to the dialog.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	Template (see page 11287)	Points to a custom template for the dialog.
	TemplateModule (see page 11287)	This is TemplateModule, a member of class TCommonDialog.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 11281)	Creates and initializes a TCommonDialog (see page 11277) instance.
	Create (see page 11411)	Creates and initializes a TOpenDialog (see page 11407) instance.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	DefaultHandler (see page 11282)	Sends unhandled messages to Windows for processing.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 2766)	Disposes of the component and its owned components.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 11281)	Destroys the TCommonDialog (see page 11277) instance and frees its memory.
	Destroy (see page 11412)	Destroys the TOpenDialog (see page 11407) and frees its memory.
	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Execute (see page 11494)	Displays the Save As dialog box.
	Execute (see page 11283)	This is the overview for the Execute method overload.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.

	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	FileEditStyle (see page 11423)	Determines the style of the file-selection dialog. (Obsolete.)
R	Files (see page 11429)	List of selected file names.
R	Handle (see page 11286)	Specifies the window handle of the dialog.
	HistoryList (see page 11436)	Maintains a list of previously selected files. (Obsolete.)
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Events

	Name	Description
	OnCanClose (see page 11439)	Occurs when the user tries to close the dialog without canceling.
	OnClose (see page 11287)	Occurs when the dialog closes.
	OnFolderChange (see page 11440)	Occurs when a directory is opened or closed from the dialog.
	OnIncludeItem (see page 11440)	Occurs before the dialog adds a file to the file list box.
	OnSelectionChange (see page 11441)	Occurs when file names displayed in the dialog are changed.
	OnShow (see page 11288)	Occurs when the dialog opens.
	OnTypeChange (see page 11441)	Occurs when the file types displayed in the dialog are changed.

Published Properties

	Name	Description
	Ctl3D (see page 11285)	Determines whether the dialog has a three-dimensional look.
	DefaultExt (see page 11421)	Specifies a default file extension.
	FileName (see page 11424)	Indicates the name and directory path of the last file selected.
	Filter (see page 11431)	Determines the file masks (filters) available in the dialog.
	FilterIndex (see page 11434)	Determines which filter is selected by default when the dialog opens.
	HelpContext (see page 11286)	Specifies the context number for online Help.
	InitialDir (see page 11436)	Determines the current directory when the dialog opens.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Options (see page 11436)	Determines the appearance and behavior of the file-selection dialog.
	OptionsEx (see page 11438)	Augments the Options (see page 11436) property with additional flags that determine the appearance and behavior of the file-selection dialog.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Title (see page 11438)	Specifies the text in the dialog's title bar.

61.1.22.2 TSaveDialog Methods

The methods of the TSaveDialog class are listed here.

Public Methods

	Name	Description
	Execute (see page 11494)	Displays the Save As dialog box.

61.1.22.2.1 TSaveDialog.Execute Method

Displays the Save As dialog box.

Pascal

```
function Execute(ParentWnd: HWND): Boolean; override;
```

C++

```
virtual __fastcall Boolean Execute(HWND ParentWnd);
```

Description

Execute opens the Save As dialog, returning true when the user selects a file name and clicks Save. If the user cancels the save operation, Execute returns a false value.

```
if SaveDialog1.Execute then
  Memo1.Lines.SaveToFile(SaveDialog1.FileName);
if (SaveDialog1->Execute())
  Memo1->Lines->SaveToFile(SaveDialog1->FileName);
```

61.1.23 TTaskDialog Class

Class for Task Dialog properties.

Class Hierarchy

Pascal

```
TTaskDialog = class(TCustomTaskDialog);
```

C++

```
class TTaskDialog : public TCustomTaskDialog;
```

File

Dialogs

Description

TTaskDialog is a class for Task Dialogs (see page 11265).

Note: Task Dialogs (see page 11265) require Vista.

61.1.23.1 TTaskDialog Members

The following tables list the members exposed by TTaskDialog.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	CallbackProc (see page 11323)	An application-defined function used with Task Dialogs (see page 11265).
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.

	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
V	Create (see page 11322)	Creates a custom Task Dialog instance.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 11322)	Destroys an instance of a custom Task Dialog.
V	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Execute (see page 11326)	This is the overview for the Execute method overload.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.

	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
	Button (see page 11328)	Selected button.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	Expanded (see page 11330)	Indicates whether the Task Dialog is expanded.
R	Handle (see page 11331)	Handle to the parent window.
	ModalResult (see page 11332)	Modal result.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
R	RadioButton (see page 11333)	Selected radio button.
R	URL (see page 11334)	URL for the Task Dialog.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Events

	Name	Description
	OnButtonClicked (see page 11504)	Button (see page 11328) click event.
	OnDialogConstructed (see page 11504)	Dialog constructed event.
	OnDialogCreated (see page 11505)	Task Dialog creation event.

	OnDialogDestroyed (see page 11505)	Task dialog destruction event..
	OnExpanded (see page 11505)	Task dialog expanded event.
	OnHyperlinkClicked (see page 11505)	Task dialog hyperlink clicked event.
	OnNavigated (see page 11506)	Task Dialog navigation event.
	OnRadioButtonClicked (see page 11506)	Task Dialog radio button click event.
	OnTimer (see page 11506)	Task dialog timer event.
	OnVerificationClicked (see page 11506)	Task Dialog verification check box event.

Published Properties

	Name	Description
	Buttons (see page 11499)	The collection of all buttons on the Task Dialog.
	Caption (see page 11499)	Caption for the Task Dialog.
	CommonButtons (see page 11499)	Specifies the push buttons displayed in the Task Dialog.
	CustomFooterIcon (see page 11500)	Indicates the custom footer icon, if any, for the Task Dialog.
	CustomMainIcon (see page 11500)	Indicates the custom main icon, if any, for the Task Dialog.
	DefaultButton (see page 11500)	The default button for this Task Dialog.
	ExpandButtonCaption (see page 11500)	Additional information for this button.
	ExpandedText (see page 11501)	Text (see page 11503) to display when the Task Dialog is expanded.
	Flags (see page 11501)	Flags for this Task Dialog.
	FooterIcon (see page 11502)	Indicates which standard footer icon to display.
	FooterText (see page 11502)	String to be used in the footer area of the Task Dialog.
	HelpContext (see page 11502)	Help context for the Task Dialog.
	MainIcon (see page 11502)	Indicates which standard main icon to display.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	ProgressBar (see page 11503)	Progress bar for this Task Dialog.
	RadioButtons (see page 11503)	Collection of all radio buttons on this Task Dialog.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Text (see page 11503)	The main text on this Task Dialog..
	Title (see page 11503)	The title of this Task Dialog.
	VerificationText (see page 11504)	Text (see page 11503) used to label the verification check box.

Strict protected Methods

	Name	Description
	DoExecute (see page 11323)	Executes the Task Dialog.
	DoOnButtonClicked (see page 11324)	Performs the click function of the Task Dialog.
	DoOnDialogContructed (see page 11324)	Performs the on-construction actions of the Task Dialog.
	DoOnDialogCreated (see page 11324)	Performs the on-creation actrions of a Task Dialog.
	DoOnDialogDestroyed (see page 11324)	Performs the on-destruction actions of a Task Dialog.
	DoOnExpandButtonClicked (see page 11325)	Performs the expansion action of a Task Dialog when the **Expand** button is pushed.
	DoOnHelp (see page 11325)	Performs the help function for a Task Dialog.
	DoOnHyperlinkClicked (see page 11325)	Performs the hyperlink click action of a Task Dialog.
	DoOnNavigated (see page 11325)	Performs the navigation action of a Task Dialog.
	DoOnRadioButtonClicked (see page 11326)	Performs the radio button click action of a Task Dialog.
	DoOnTimer (see page 11326)	Performs the timer action of a Task Dialog.
	DoOnVerificationClicked (see page 11326)	Performs the verification check action of a Task Dialog.

61.1.23.2 TTaskDialog Properties

The properties of the TTaskDialog class are listed here.

Published Properties

	Name	Description
	Buttons (see page 11499)	The collection of all buttons on the Task Dialog.

	Caption (see page 11499)	Caption for the Task Dialog.
	CommonButtons (see page 11499)	Specifies the push buttons displayed in the Task Dialog.
	CustomFooterIcon (see page 11500)	Indicates the custom footer icon, if any, for the Task Dialog.
	CustomMainIcon (see page 11500)	Indicates the custom main icon, if any, for the Task Dialog.
	DefaultButton (see page 11500)	The default button for this Task Dialog.
	ExpandButtonCaption (see page 11500)	Additional information for this button.
	ExpandedText (see page 11501)	Text (see page 11503) to display when the Task Dialog is expanded.
	Flags (see page 11501)	Flags for this Task Dialog.
	FooterIcon (see page 11502)	Indicates which standard footer icon to display.
	FooterText (see page 11502)	String to be used in the footer area of the Task Dialog.
	HelpContext (see page 11502)	Help context for the Task Dialog.
	MainIcon (see page 11502)	Indicates which standard main icon to display.
	ProgressBar (see page 11503)	Progress bar for this Task Dialog.
	RadioButtons (see page 11503)	Collection of all radio buttons on this Task Dialog.
	Text (see page 11503)	The main text on this Task Dialog..
	Title (see page 11503)	The title of this Task Dialog.
	VerificationText (see page 11504)	Text (see page 11503) used to label the verification check box.

61.1.23.2.1 TTaskDialog.Buttons Property

The collection of all buttons on the Task Dialog.

Pascal

```
property Buttons: TTaskDialogButtons;
```

C++

```
__property TTaskDialogButtons Buttons;
```

Description

Buttons contains all of the buttons for the Task Dialog.

61.1.23.2.2 TTaskDialog.Caption Property

Caption for the Task Dialog.

Pascal

```
property Caption: string;
```

C++

```
__property AnsiString Caption;
```

Description

Caption contains the caption for the Task Dialog.

61.1.23.2.3 TTaskDialog.CommonButtons Property

Specifies the push buttons displayed in the Task Dialog.

Pascal

```
property CommonButtons: TTaskDialogCommonButtons;
```

C++

```
__property TTaskDialogCommonButtons CommonButtons;
```

Description

CommonButtons specifies the common push buttons for the Task Dialog. If no buttons are specified, the **OK** button is displayed.

61.1.23.2.4 TTaskDialog.CustomFooterIcon Property

Indicates the custom footer icon, if any, for the Task Dialog.

Pascal

```
property CustomFooterIcon: TIcon;
```

C++

```
__property TIcon CustomFooterIcon;
```

Description

CustomFooterIcon points to the custom footer icon for this Task Dialog. If **tfUseHiconFooter** is set in Flags (see page 11501).

61.1.23.2.5 TTaskDialog.CustomMainIcon Property

Indicates the custom main icon, if any, for the Task Dialog.

Pascal

```
property CustomMainIcon: TIcon;
```

C++

```
__property TIcon CustomMainIcon;
```

Description

CustomMainIcon points to the custom main icon for this Task Dialog. If **tfUseHiconMain** is set in Flags (see page 11501).

61.1.23.2.6 TTaskDialog.DefaultButton Property

The default button for this Task Dialog.

Pascal

```
property DefaultButton: TTaskDialogCommonButton;
```

C++

```
__property TTaskDialogCommonButton DefaultButton;
```

Description

DefaultButton indicates the default button for this Task Dialog.

61.1.23.2.7 TTaskDialog.ExpandButtonCaption Property

Additional information for this button.

Pascal

```
property ExpandButtonCaption: string;
```

C++

```
__property AnsiString ExpandButtonCaption;
```

Description

ExpandButtonCaption contains additional text to be displayed when the caption is expanded.

61.1.23.2.8 TTaskDialog.ExpandedText Property

Text (see page 11503) to display when the Task Dialog is expanded.

Pascal

```
property ExpandedText: string;
```

C++

```
__property AnsiString ExpandedText;
```

Description

ExpandedText contains additional information to display when the Task Dialog is expanded.

61.1.23.2.9 TTaskDialog.Flags Property

Flags for this Task Dialog.

Pascal

```
property Flags: TTaskDialogFlags;
```

C++

```
__property TTaskDialogFlags Flags;
```

Description

Flags provides flags for TTaskDialog (see page 11494).

Flag	Description
tfEnableHyperlinks	If set, content, footer, and expanded text can include hyperlinks.
tfUseHiconMain	if set, use the custom main icon.
tfUseHiconFooter	If set, use the custom footer icon.
tfAllowDialogCancellation	If set, permits Task Dialog to be closed in the absence of a **Cancel** button.
tfUseCommandLinks	If set, buttons are displayed as command links using a standard dialog glyph.
tfUseCommandLinksNoIcon	If set, buttons are displayed as command links without a glyph.
tfExpandFooterArea	If set, display expanded text in the footer.
tfExpandedByDefault	If set, expanded text is displayed when the Task Dialog opens.
tfVerificationFlagChecked	If set, the verification check box is initially checked.
tfShowProgressBar	If set, display the progress bar.
tfShowMarqueeProgressBar	If set, display marquee progress bar.
tfCallbackTimer	If set, dialogs callback will be called every 200 milliseconds.
tfPositionRelativeToWindow	If set, Task Dialog is centered with respect to parent window.
tfRtlLayout	If set, text reads right-to-left.
tfNoDefaultRadioButton	If set, there is no default radio button.

tfCanBeMinimized	If set, the Task Dialog can be minimized.

61.1.23.2.10 TTaskDialog.FooterIcon Property

Indicates which standard footer icon to display.

Pascal

```
property FooterIcon: TTaskDialogIcon;
```

C++

```
__property TTaskDialogIcon FooterIcon;
```

Description

FooterIcon indicates which standard footer icon to display in the Task Dialog. Legal values include **tdiNone (see page 11591)**, **tdiWarning (see page 11591)**, **tdiError (see page 11590)**, **tdiInformation (see page 11590)**, and **tdiShield (see page 11591)**.

61.1.23.2.11 TTaskDialog.FooterText Property

String to be used in the footer area of the Task Dialog.

Pascal

```
property FooterText: string;
```

C++

```
__property AnsiString FooterText;
```

Description

FooterText provides a string to be used in the footer area of the Task Dialog.

61.1.23.2.12 TTaskDialog.HelpContext Property

Help context for the Task Dialog.

Pascal

```
property HelpContext: Integer;
```

C++

```
__property int HelpContext;
```

Description

HelpContext provides the help context for the Task Dialog

61.1.23.2.13 TTaskDialog.MainIcon Property

Indicates which standard main icon to display.

Pascal

```
property MainIcon: TTaskDialogIcon;
```

C++

```
__property TTaskDialogIcon MainIcon;
```

Description

MainIcon indicates which standard main icon to display in the Task Dialog. Legal values include **tdiNone (see page 11591)**, **tdiWarning (see page 11591)**, **tdiError (see page 11590)**, **tdiInformation (see page 11590)**, and **tdiShield (see page 11591)**.

61.1.23.2.14 TTaskDialog.ProgressBar Property

Progress bar for this Task Dialog.

Pascal

```
property ProgressBar: TTaskDialogProgressBar;
```

C++

```
__property TTaskDialogProgressBar ProgressBar;
```

Description

ProgressBar is the TTaskDialogProgressBar (see page 11523) for this Task Dialog.

61.1.23.2.15 TTaskDialog.RadioButtons Property

Collection of all radio buttons on this Task Dialog.

Pascal

```
property RadioButtons: TTaskDialogButtons;
```

C++

```
__property TTaskDialogButtons RadioButtons;
```

Description

RadioButtons is the collection of radio buttons for this class dialog.

61.1.23.2.16 TTaskDialog.Text Property

The main text on this Task Dialog..

Pascal

```
property Text: string;
```

C++

```
__property AnsiString Text;
```

Description

Text contains the main text to be displayed in this Task Dialog.

61.1.23.2.17 TTaskDialog.Title Property

The title of this Task Dialog.

Pascal

```
property Title: string;
```

C++

```
__property AnsiString Title;
```

Description

Title contains the title of this Task Dialog.

61.1.23.2.18 TTaskDialog.VerificationText Property

Text (see page 11503) used to label the verification check box.

Pascal

```
property VerificationText: string;
```

C++

```
__property AnsiString VerificationText;
```

Description

VerificationText contains text use to label the verification check box.

61.1.23.3 TTaskDialog Events

The events of the TTaskDialog class are listed here.

Published Events

	Name	Description
	OnButtonClicked (see page 11504)	Button (see page 11328) click event.
	OnDialogConstructed (see page 11504)	Dialog constructed event.
	OnDialogCreated (see page 11505)	Task Dialog creation event.
	OnDialogDestroyed (see page 11505)	Task dialog destruction event..
	OnExpanded (see page 11505)	Task dialog expanded event.
	OnHyperlinkClicked (see page 11505)	Task dialog hyperlink clicked event.
	OnNavigated (see page 11506)	Task Dialog navigation event.
	OnRadioButtonClicked (see page 11506)	Task Dialog radio button click event.
	OnTimer (see page 11506)	Task dialog timer event.
	OnVerificationClicked (see page 11506)	Task Dialog verification check box event.

61.1.23.3.1 TTaskDialog.OnButtonClicked Event

Button (see page 11328) click event.

Pascal

```
property OnButtonClicked: TTaskDlgClickEvent;
```

C++

```
__property TTaskDlgClickEvent OnButtonClicked;
```

Description

OnButtonClicked is the button click event for Task Dialog.

61.1.23.3.2 TTaskDialog.OnDialogConstructed Event

Dialog constructed event.

Pascal

```
property OnDialogConstructed: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnDialogConstructed;
```

Description

OnDialogConstructed is the dialog constructed event.

61.1.23.3.3 TTaskDialog.OnDialogCreated Event

Task Dialog creation event.

Pascal

```
property OnDialogCreated: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnDialogCreated;
```

Description

OnDialogCreated is the Task Dialog creation event.

61.1.23.3.4 TTaskDialog.OnDialogDestroyed Event

Task dialog destruction event..

Pascal

```
property OnDialogDestroyed: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnDialogDestroyed;
```

Description

OnDialogDestroyed is the Task Dialog destroy event.

61.1.23.3.5 TTaskDialog.OnExpanded Event

Task dialog expanded event.

Pascal

```
property OnExpanded: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnExpanded;
```

Description

OnExpanded is the Task Dialog expanded event.

61.1.23.3.6 TTaskDialog.OnHyperlinkClicked Event

Task dialog hyperlink clicked event.

Pascal

```
property OnHyperlinkClicked: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnHyperlinkClicked;
```

Description

OnHyperlinkClicked is the Task Dialog hyperlink clicked event.

61.1.23.3.7 TTaskDialog.OnNavigated Event

Task Dialog navigation event.

Pascal

```
property OnNavigated: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnNavigated;
```

Description

OnNavigated is the Task Dialog navigation event.

61.1.23.3.8 TTaskDialog.OnRadioButtonClicked Event

Task Dialog radio button click event.

Pascal

```
property OnRadioButtonClicked: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnRadioButtonClicked;
```

Description

OnRadioButtonClicked

61.1.23.3.9 TTaskDialog.OnTimer Event

Task dialog timer event.

Pascal

```
property OnTimer: TTaskDlgTimerEvent;
```

C++

```
__property TTaskDlgTimerEvent OnTimer;
```

Description

OnTimer is the Task Dialog timer event.

61.1.23.3.10 TTaskDialog.OnVerificationClicked Event

Task Dialog verification check box event.

Pascal

```
property OnVerificationClicked: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnVerificationClicked;
```

Description

OnVerificationClicked is the Task Dialog verification check box event.

61.1.24 TTaskDialogBaseButtonItem Class

Base button class for Task Dialogs (see page 11265).

Class Hierarchy

Pascal

```
TTaskDialogBaseButtonItem = class(TCollectionItem);
```

C++

```
class TTaskDialogBaseButtonItem : public TCollectionItem;
```

File

Dialogs

Description

TTaskDialogBaseButtonItem is the base button class for Task Dialog buttons. This class implements the basic button functions for all Task dialog button classes

61.1.24.1 TTaskDialogBaseButtonItem Members

The following tables list the members exposed by TTaskDialogBaseButtonItem.

Protected Methods

	Name	Description
	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	Changed (see page 2758)	Updates the collection to reflect changes to the collection item.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetOwner (see page 2759)	Returns the collection to which this item belongs.
	GetOwner (see page 2932)	Returns the owner of an object.
	SetCollection (see page 2759)	Sets the value of the Collection (see page 2761) property.
	SetDisplayName (see page 2760)	Sets the name of the collection item as it appears in the collection editor.
	SetIndex (see page 2760)	Moves the collection item to a specified position in the parent collection.

Public Methods

	Name	Description
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.

	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Click (see page 11509)	Clicks the button.
V	Create (see page 11509)	Creates a button instance.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 11509)	Destroys a button.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2759)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
V	SetInitialState (see page 11511)	Set the initial state of the button.

Public Properties

	Name	Description
	Collection (see page 2761)	Specifies the TCollection (see page 2731) instance to which the TCollectionItem (see page 2755) belongs.
	DisplayName (see page 2761)	The name displayed in the Collection (see page 2761) editor.
R	ID (see page 2761)	A unique, permanent index for the item.
	Index (see page 2762)	Returns the item's position in the Items array of TCollection (see page 2731).
	ModalResult (see page 11512)	Modal result of pushing this button.
R	TextWStr (see page 11513)	Descriptive button text.

Published Properties

	Name	Description
	Caption (see page 11511)	The caption for the button.
	Default (see page 11512)	Indicates whether this button is the default.
	Enabled (see page 11512)	Indicates whether this button is enabled.

Strict protected Methods

	Name	Description
V	DoButtonClick (see page 11510)	Click (see page 11509) the button.
V	DoSetEnabled (see page 11510)	Enables or disables the button..
V	GetButtonText (see page 11510)	Fetch the button text.
V	GetDisplayName (see page 11510)	Get display name..

Strict protected Properties

	Name	Description
R	Client (see page 11512)	Client area of the button.

61.1.24.2 TTaskDialogBaseButtonItem.Create Constructor

Creates a button instance.

Pascal

```
constructor Create(Collection: TCollection); override;
```

C++

```
virtual __fastcall TTaskDialogBaseButtonItem(TCollection Collection);
```

Description

Use Create to create an instance of TTaskDialogBaseButtonItem (see page 11507).

61.1.24.3 TTaskDialogBaseButtonItem.Destroy Destructor

Destroys a button.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TTaskDialogBaseButtonItem();
```

Description

Use Destroy to destroy an instance of TTaskDialogBaseButtonItem (see page 11507).

61.1.24.4 TTaskDialogBaseButtonItem Methods

The methods of the TTaskDialogBaseButtonItem class are listed here.

Public Methods

	Name	Description
	Click (see page 11509)	Clicks the button.
V	SetInitialState (see page 11511)	Set the initial state of the button.

Strict protected Methods

	Name	Description
V	DoButtonClick (see page 11510)	Click (see page 11509) the button.
V	DoSetEnabled (see page 11510)	Enables or disables the button..
V	GetButtonText (see page 11510)	Fetch the button text.
V	GetDisplayName (see page 11510)	Get display name..

61.1.24.4.1 TTaskDialogBaseButtonItem.Click Method

Clicks the button.

Pascal

```
procedure Click;
```

C++

```
__fastcall Click();
```

Description

Use Click to perform the action of clicking the button.

61.1.24.4.2 TTaskDialogBaseButtonItem.DoButtonClick Method

Click (see page 11509) the button.

Pascal

```
procedure DoButtonClick; virtual;
```

C++

```
virtual __fastcall DoButtonClick();
```

Description

DoButtonClick performs the basic operation of clicking a button. In general, use the public method Click (see page 11509) to perform this action.

61.1.24.4.3 TTaskDialogBaseButtonItem.DoSetEnabled Method

Enables or disables the button..

Pascal

```
procedure DoSetEnabled; virtual;
```

C++

```
virtual __fastcall DoSetEnabled();
```

Description

Use DoSetEnabled to enable or disable the button.

61.1.24.4.4 TTaskDialogBaseButtonItem.GetButtonText Method

Fetch the button text.

Pascal

```
function GetButtonText: string; virtual;
```

C++

```
virtual __fastcall AnsiString GetButtonText();
```

Description

Use GetButtonText to get the button text.

61.1.24.4.5 TTaskDialogBaseButtonItem.GetDisplayName Method

Get display name..

Pascal

```
function GetDisplayName: string; override;
```

C++

```
virtual __fastcall AnsiString GetDisplayName();
```

Description

Use GetDisplayName to fetch the display name for the button.

61.1.24.4.6 TTaskDialogBaseButtonItem.SetInitialState Method

Set the initial state of the button.

Pascal

```
procedure SetInitialState; virtual;
```

C++

```
virtual __fastcall SetInitialState();
```

Description

Use SetInitialState to set the initial state of the button.

61.1.24.5 TTaskDialogBaseButtonItem Properties

The properties of the TTaskDialogBaseButtonItem class are listed here.

Public Properties

	Name	Description
	ModalResult (see page 11512)	Modal result of pushing this button.
R	TextWStr (see page 11513)	Descriptive button text.

Published Properties

	Name	Description
	Caption (see page 11511)	The caption for the button.
	Default (see page 11512)	Indicates whether this button is the default.
	Enabled (see page 11512)	Indicates whether this button is enabled.

Strict protected Properties

	Name	Description
R	Client (see page 11512)	Client area of the button.

61.1.24.5.1 TTaskDialogBaseButtonItem.Caption Property

The caption for the button.

Pascal

```
property Caption: string;
```

C++

```
__property AnsiString Caption;
```

Description

This property contains the caption for the button.

61.1.24.5.2 TTaskDialogBaseButtonItem.Client Property

Client area of the button.

Pascal

```
property Client: TCustomTaskDialog;
```

C++

```
__property TCustomTaskDialog Client;
```

Description

Client describes the client area of the button

61.1.24.5.3 TTaskDialogBaseButtonItem.Default Property

Indicates whether this button is the default.

Pascal

```
property Default: Boolean;
```

C++

```
__property Boolean Default;
```

Description

Default is **True** if this is the default button in the Task Dialog window.

61.1.24.5.4 TTaskDialogBaseButtonItem.Enabled Property

Indicates whether this button is enabled.

Pascal

```
property Enabled: Boolean;
```

C++

```
__property Boolean Enabled;
```

Description

Enabled is **True** if this button is enabled.

61.1.24.5.5 TTaskDialogBaseButtonItem.ModalResult Property

Modal result of pushing this button.

Pascal

```
property ModalResult: TModalResult;
```

C++

```
__property TModalResult ModalResult;
```

Description

ModalResult defines the modal result of pushing this button: mrYes, mrNo, mrOk, mrCancel mrAbort, mrRetry, mrIgnore, mrAll, mrNoToAll, mrYesToAll.

61.1.24.5.6 TTaskDialogBaseButtonItem.TextWStr Property

Descriptive button text.

Pascal

```
property TextWStr: LPCWSTR;
```

C++

```
__property LPCWSTR TextWStr;
```

Description

TextWStr contains the descriptive text for this button.

61.1.25 TTaskDialogButtonItem Class

A single Task Dialog button item.

Class Hierarchy

Pascal

```
TTaskDialogButtonItem = class(TTaskDialogBaseButtonItem);
```

C++

```
class TTaskDialogButtonItem : public TTaskDialogBaseButtonItem;
```

File

Dialogs

Description

An instance of the TTaskDialogButtonItem class contains information about a single Task Dialog button..

61.1.25.1 TTaskDialogButtonItem Members

The following tables list the members exposed by TTaskDialogButtonItem.

Protected Methods

	Name	Description
	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	Changed (see page 2758)	Updates the collection to reflect changes to the collection item.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetDisplayName (see page 2758)	Returns the name of the collection item as it appears in the collection editor.
	GetOwner (see page 2759)	Returns the collection to which this item belongs.
	GetOwner (see page 2932)	Returns the owner of an object.
	SetCollection (see page 2759)	Sets the value of the Collection (see page 2761) property.
	SetDisplayName (see page 2760)	Sets the name of the collection item as it appears in the collection editor.
	SetIndex (see page 2760)	Moves the collection item to a specified position in the parent collection.

Public Methods

	Name	Description
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Click (see page 11509)	Clicks the button.
V	Create (see page 11515)	Creates a button instance.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2757)	Destroys the TCollectionItem (see page 2755) instance and frees its memory.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 11509)	Destroys a button.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2759)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
V	SetInitialState (see page 11516)	Set the initial state of the button.

Public Properties

	Name	Description
	Collection (see page 2761)	Specifies the TCollection (see page 2731) instance to which the TCollectionItem (see page 2755) belongs.
	DisplayName (see page 2761)	The name displayed in the Collection (see page 2761) editor.
R	ID (see page 2761)	A unique, permanent index for the item.
	Index (see page 2762)	Returns the item's position in the Items array of TCollection (see page 2731).
R	TextWStr (see page 11513)	Descriptive button text.

Published Properties

	Name	Description
	Caption (see page 11511)	The caption for the button.
	CommandLinkHint (see page 11516)	Command link hint.

	Default (see page 11512)	Indicates whether this button is the default.
	ElevationRequired (see page 11516)	Elevation required.
	Enabled (see page 11512)	Indicates whether this button is enabled.
	ModalResult (see page 11517)	Modal result of pushing this button.

Strict protected Methods

	Name	Description
V	DoButtonClick (see page 11510)	Click (see page 11509) the button.
V	DoSetEnabled (see page 11510)	Enables or disables the button..
V	GetButtonText (see page 11515)	Fetch the button text.
V	GetDisplayName (see page 11510)	Get display name..

Strict protected Properties

	Name	Description
R	Client (see page 11512)	Client area of the button.

61.1.25.2 TTaskDialogButtonItem.Create Constructor

Creates a button instance.

Pascal

```
constructor Create(Collection: TCollection); override;
```

C++

```
virtual __fastcall TTaskDialogButtonItem(TCollection Collection);
```

Description

Use Create to create an instance of TTaskDialogButtonItem (see page 11513).

61.1.25.3 TTaskDialogButtonItem Methods

The methods of the TTaskDialogButtonItem class are listed here.

Public Methods

	Name	Description
V	SetInitialState (see page 11516)	Set the initial state of the button.

Strict protected Methods

	Name	Description
V	GetButtonText (see page 11515)	Fetch the button text.

61.1.25.3.1 TTaskDialogButtonItem.GetButtonText Method

Fetch the button text.

Pascal

```
function GetButtonText: string; override;
```

C++

```
virtual __fastcall AnsiString GetButtonText();
```

Description

Use GetButtonText to get the button text.

61.1.25.3.2 TTaskDialogButtonItem.SetInitialState Method

Set the initial state of the button.

Pascal

```
procedure SetInitialState; override;
```

C++

```
virtual __fastcall SetInitialState();
```

Description

Use SetInitialState to set the initial state of the button.

61.1.25.4 TTaskDialogButtonItem Properties

The properties of the TTaskDialogButtonItem class are listed here.

Published Properties

	Name	Description
	CommandLinkHint (see page 11516)	Command link hint.
	ElevationRequired (see page 11516)	Elevation required.
	ModalResult (see page 11517)	Modal result of pushing this button.

61.1.25.4.1 TTaskDialogButtonItem.CommandLinkHint Property

Command link hint.

Pascal

```
property CommandLinkHint: string;
```

C++

```
__property AnsiString CommandLinkHint;
```

Description

A hint for this button.

61.1.25.4.2 TTaskDialogButtonItem.ElevationRequired Property

Elevation required.

Pascal

```
property ElevationRequired: Boolean;
```

C++

```
__property Boolean ElevationRequired;
```

Description

ElevationRequired is **True** if security elevation is required in the process following a button click. Setting this property indicates that this button should display a User Account Control (UAC) shield icon.

61.1.25.4.3 TTaskDialogButtonItem.ModalResult Property

Modal result of pushing this button.

Pascal

```
property ModalResult: TModalResult;
```

C++

```
__property TModalResult ModalResult;
```

Description

ModalResult defines the modal result of pushing this button: mrYes, mrNo, mrOk, mrCancel mrAbort, mrRetry, mrIgnore, mrAll, mrNoToAll, mrYesToAll.

61.1.26 TTaskDialogButtons Class

A collection of buttons appearing on a Task Dialog.

Class Hierarchy

Pascal

```
TTaskDialogButtons = class(TOwnedCollection);
```

C++

```
class TTaskDialogButtons : public TOwnedCollection;
```

File

Dialogs

Description

TTaskDialogButtons represents the collection of buttons appearing on a Task Dialog.

61.1.26.1 TTaskDialogButtons Members

The following tables list the members exposed by TTaskDialogButtons.

Protected Methods

	Name	Description
	Added (see page 2736)	Responds when items are added to the collection.
	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	Changed (see page 2740)	Responds when the collection or any of its items changes.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	Deleting (see page 2741)	Responds when items are deleted from the collection.
	GetAttr (see page 2743)	Returns the name of a custom attribute that can be retrieved using the GetItemAttr (see page 2745) method.
	GetAttrCount (see page 2744)	Returns the number of custom attributes associated with items in the collection.
	GetItem (see page 2744)	Returns a specified item in the collection.
	GetItemAttr (see page 2745)	Returns the value of a custom attribute assigned to one of the collection's items.

V	GetOwner (see page 2915)	Returns the owner of an object.
	GetOwner (see page 2932)	Returns the owner of an object.
V	Notify (see page 2746)	Responds when items are added to or removed from the collection.
	SetItem (see page 2747)	Copies the properties of another item to a specified item in the collection.
V	SetItemName (see page 2747)	Initializes the name of a newly inserted collection item.
V	Update (see page 2747)	Updates the collection to reflect changes to its items.

Protected Properties

	Name	Description
R	NextID (see page 2752)	Specifies a unique ID that can be assigned to the next added collection item.
	PropName (see page 2752)	Specifies the name of the property that the collection implements.
R	UpdateCount (see page 2753)	Counts the number of times BeginUpdate (see page 2739) was called without a corresponding call to EndUpdate (see page 2742).

Public Methods

	Name	Description
	Add (see page 11519)	Add a button to the collection.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2736)	Copies the contents of another collection to the object where the method is executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
V	BeginUpdate (see page 2739)	Suspends screen repainting.
	Buttons (see page 11519)	Returns an array of the buttons defined for this Task Dialog.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Clear (see page 2741)	Deletes all items from the collection.
	Create (see page 2734)	Creates and initializes a collection.
	Create (see page 2914)	Creates and initializes a TOwnedCollection (see page 2912) instance.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Delete (see page 2741)	Deletes a single item from the collection.
V	Destroy (see page 2735)	Destroys the collection and each item in it.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
V	EndUpdate (see page 2742)	Re-enables screen repainting.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindButton (see page 11520)	Find a button by modal result.
	FindItemID (see page 2743)	Returns the item with the specified ID.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetEnumerator (see page 11520)	Get an enumerator for the Task Dialog button collection.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2745)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.

	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	Insert (see page 2746)	Creates a new TCollectionItem (see page 2755) instance and adds it to the Items (see page 2751) array.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	Owner (see page 2746)	Returns the Owner of the collection.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetInitialState (see page 11520)	Sets the initial state for a collection of Task Dialog buttons.

Public Properties

	Name	Description
	Capacity (see page 2748)	Provides access to the internal TList (see page 2868) Capacity property.
R	Count (see page 2749)	Returns the number of items in the collection.
	DefaultButton (see page 11521)	The default button for the Task Dialog.
R	ItemClass (see page 2751)	Indicates the class to which the collection's items belong.
	Items (see page 11521)	An array of buttons for the Task Dialog

61.1.26.2 TTaskDialogButtons Methods

The methods of the TTaskDialogButtons class are listed here.

Public Methods

	Name	Description
	Add (see page 11519)	Add a button to the collection.
	Buttons (see page 11519)	Returns an array of the buttons defined for this Task Dialog.
	FindButton (see page 11520)	Find a button by modal result.
	GetEnumerator (see page 11520)	Get an enumerator for the Task Dialog button collection.
	SetInitialState (see page 11520)	Sets the initial state for a collection of Task Dialog buttons.

61.1.26.2.1 TTaskDialogButtons.Add Method

Add a button to the collection.

Pascal

```
function Add: TTaskDialogBaseButtonItem;
```

C++

```
__fastcall TTaskDialogBaseButtonItem Add();
```

Description

Use Add to add a button to Items (see page 11521).

61.1.26.2.2 TTaskDialogButtons.Buttons Method

Returns an array of the buttons defined for this Task Dialog.

Pascal

```
function Buttons: PTaskDialogButton;
```

C++

```
__fastcall PTaskDialogButton Buttons();
```

Description

Use Buttons to retrieve an array of the modal results and text strings of the buttons defined for this Task Dialog.

61.1.26.2.3 TTaskDialogButtons.FindButton Method

Find a button by modal result.

Pascal

```
function FindButton(AModalResult: TModalResult): TTaskDialogBaseButtonItem;
```

C++

```
__fastcall TTaskDialogBaseButtonItem FindButton(TModalResult AModalResult);
```

Description

Use FindButton to find the button in this Task Dialog that corresponds to a particular modal result value.

61.1.26.2.4 TTaskDialogButtons.GetEnumerator Method

Get an enumerator for the Task Dialog button collection.

Pascal

```
function GetEnumerator: TTaskDialogButtonsEnumerator;
```

C++

```
__fastcall TTaskDialogButtonsEnumerator GetEnumerator();
```

Description

Use GetEnumerator to fetch an enumerator for TTaskDialogButtons (see page 11517).

61.1.26.2.5 TTaskDialogButtons.SetInitialState Method

Sets the initial state for a collection of Task Dialog buttons.

Pascal

```
procedure SetInitialState; dynamic;
```

C++

```
__fastcall SetInitialState();
```

Description

Use SetInitialState to set the initial state for TTaskDialogButtons (see page 11517)

61.1.26.3 TTaskDialogButtons Properties

The properties of the TTaskDialogButtons class are listed here.

Public Properties

	Name	Description
	DefaultButton (see page 11521)	The default button for the Task Dialog.

	Items (see page 11521)	An array of buttons for the Task Dialog

61.1.26.3.1 TTaskDialogButtons.DefaultButton Property

The default button for the Task Dialog.

Pascal

```
property DefaultButton: TTaskDialogBaseButtonItem;
```

C++

```
__property TTaskDialogBaseButtonItem DefaultButton;
```

Description

DefaultButton represents the default button for the Task Dialog.

61.1.26.3.2 TTaskDialogButtons.Items Property

An array of buttons for the Task Dialog

Pascal

```
property Items [Index: Integer]: TTaskDialogBaseButtonItem;
```

C++

```
__property TTaskDialogBaseButtonItem Items[int Index];
```

Description

Itemsis an array of all the TTaskDialogBaseButton used in this Task Dialog.

61.1.27 TTaskDialogButtonsEnumerator Class

Enumerates the button collection for a Task Dialog.

Class Hierarchy

Pascal

```
TTaskDialogButtonsEnumerator = class;
```

C++

```
class TTaskDialogButtonsEnumerator;
```

File

Dialogs

Description

TTaskDialogButtonsEnumerator provides an enumerator for the collection TTaskDialogButtons (see page 11517)

61.1.27.1 TTaskDialogButtonsEnumerator Members

The following tables list the members exposed by TTaskDialogButtonsEnumerator.

Public Methods

	Name	Description
	Create (see page 11522)	Creates a Task Dialog buttons enumerator.
	GetCurrent (see page 11522)	Gets the current button.
	MoveNext (see page 11522)	Moves the enumerator to the next button in the collection.

Public Properties

	Name	Description
R	Current (see page 11523)	The current button.

61.1.27.2 TTaskDialogButtonsEnumerator.Create Constructor

Creates a Task Dialog buttons enumerator.

Pascal

```
constructor Create(ACollection: TTaskDialogButtons);
```

C++

```
__fastcall TTaskDialogButtonsEnumerator(TTaskDialogButtons ACollection);
```

Description

Creates an instance of TTaskDialogButtonsEnumerator (see page 11521).

61.1.27.3 TTaskDialogButtonsEnumerator Methods

The methods of the TTaskDialogButtonsEnumerator class are listed here.

Public Methods

	Name	Description
	GetCurrent (see page 11522)	Gets the current button.
	MoveNext (see page 11522)	Moves the enumerator to the next button in the collection.

61.1.27.3.1 TTaskDialogButtonsEnumerator.GetCurrent Method

Gets the current button.

Pascal

```
function GetCurrent: TTaskDialogBaseButtonItem;
```

C++

```
__fastcall TTaskDialogBaseButtonItem GetCurrent();
```

Description

Use GetCurrent to get the current button in TTaskDialogButtons (see page 11517).

61.1.27.3.2 TTaskDialogButtonsEnumerator.MoveNext Method

Moves the enumerator to the next button in the collection.

Pascal

```
function MoveNext: Boolean;
```

C++

```
__fastcall Boolean MoveNext();
```

Description

Use MoveNext to move the TTaskDialogButtonsEnumerator (see page 11521) to the next button in TTaskDialogButtons (see page 11517).

61.1.27.4 TTaskDialogButtonsEnumerator Properties

The properties of the TTaskDialogButtonsEnumerator class are listed here.

Public Properties

	Name	Description
R	Current (see page 11523)	The current button.

61.1.27.4.1 TTaskDialogButtonsEnumerator.Current Property

The current button.

Pascal

```
property Current: TTaskDialogBaseButtonItem;
```

C++

```
__property TTaskDialogBaseButtonItem Current;
```

Description

Current contains the TTaskDialogButtonsEnumerator (see page 11521) current button in the TTaskDialogButtons (see page 11517) collection.

61.1.28 TTaskDialogProgressBar Class

Progress bar class for Task Dialogs (see page 11265). in one, concise sentence.

Class Hierarchy

Pascal

```
TTaskDialogProgressBar = class(TPersistent);
```

C++

```
class TTaskDialogProgressBar : public TPersistent;
```

File

Dialogs

Description

TTaskDialogProgressBar provides properties and methods to manage progress bars for Task Dialogs (see page 11265).

61.1.28.1 TTaskDialogProgressBar Members

The following tables list the members exposed by TTaskDialogProgressBar.

Protected Methods

	Name	Description
	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetOwner (see page 2932)	Returns the owner of an object.

Public Methods

	Name	Description
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 11525)	Creates an instance of a class dialog progress bar.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 22287)	Disposes of an object instance.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	Initialize (see page 11525)	Initialize an instance of a task dialog progress bar.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Published Properties

	Name	Description
	MarqueeSpeed (see page 11526)	Controls (see page 5711) the marquee speed of an indeterminate progress bar.
	Max (see page 11526)	Specifies the upper limit of the value of the progress bar.
	Min (see page 11526)	Specifies the minimum value of the progress bar.

	Position (see page 11526)	Specifies the current position of the progress bar.
	State (see page 11527)	The state of the progress bar.

61.1.28.2 TTaskDialogProgressBar.Create Constructor

Creates an instance of a class dialog progress bar.

Pascal

```
constructor Create(AClient: TCustomTaskDialog);
```

C++

```
__fastcall TTaskDialogProgressBar(TCustomTaskDialog AClient);
```

Description

Use Create to create an instance of TTaskDialogProgressBar (see page 11523).

61.1.28.3 TTaskDialogProgressBar Methods

The methods of the TTaskDialogProgressBar class are listed here.

Public Methods

	Name	Description
	Initialize (see page 11525)	Initialize an instance of a task dialog progress bar.

61.1.28.3.1 TTaskDialogProgressBar.Initialize Method

Initialize an instance of a task dialog progress bar.

Pascal

```
procedure Initialize;
```

C++

```
__fastcall Initialize();
```

Description

Use Initialize to initialize an instance of TTaskDialogProgressBar (see page 11523).

61.1.28.4 TTaskDialogProgressBar Properties

The properties of the TTaskDialogProgressBar class are listed here.

Published Properties

	Name	Description
	MarqueeSpeed (see page 11526)	Controls (see page 5711) the marquee speed of an indeterminate progress bar.
	Max (see page 11526)	Specifies the upper limit of the value of the progress bar.
	Min (see page 11526)	Specifies the minimum value of the progress bar.
	Position (see page 11526)	Specifies the current position of the progress bar.
	State (see page 11527)	The state of the progress bar.

61.1.28.4.1 TTaskDialogProgressBar.MarqueeSpeed Property

Controls (see page 5711) the marquee speed of an indeterminate progress bar.

Pascal

```
property MarqueeSpeed: Cardinal;
```

C++

```
__property unsigned MarqueeSpeed;
```

Description

MarqueeSpeed controls the time it takes for the progress block to scroll across the progress bar in milliseconds..

61.1.28.4.2 TTaskDialogProgressBar.Max Property

Specifies the upper limit of the value of the progress bar.

Pascal

```
property Max: Integer;
```

C++

```
__property int Max;
```

Description

Max controls the maximum value of the progress bar.

61.1.28.4.3 TTaskDialogProgressBar.Min Property

Specifies the minimum value of the progress bar.

Pascal

```
property Min: Integer;
```

C++

```
__property int Min;
```

Description

Min controls the minimum value of the progress bar.

61.1.28.4.4 TTaskDialogProgressBar.Position Property

Specifies the current position of the progress bar.

Pascal

```
property Position: Integer;
```

C++

```
__property int Position;
```

Description

Position describes the current position of the progress bar.

61.1.28.4.5 TTaskDialogProgressBar.State Property

The state of the progress bar.

Pascal

```
property State: TProgressBarState;
```

C++

```
__property TProgressBarState State;
```

Description

State describes the state of the progress bar: pbsNormal, pbsError, or pbsPaused.

61.1.29 TTaskDialogRadioButtonItem Class

A single radio button item for Task Dialogs (see page 11265)..

Class Hierarchy

Pascal

```
TTaskDialogRadioButtonItem = class(TTaskDialogBaseButtonItem);
```

C++

```
class TTaskDialogRadioButtonItem : public TTaskDialogBaseButtonItem;
```

File

Dialogs

Description

An instance of TTaskDialogRadioButtonItem represents a single radio button for a Task Dialog.

61.1.29.1 TTaskDialogRadioButtonItem Members

The following tables list the members exposed by TTaskDialogRadioButtonItem.

Protected Methods

	Name	Description
	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	Changed (see page 2758)	Updates the collection to reflect changes to the collection item.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetDisplayName (see page 2758)	Returns the name of the collection item as it appears in the collection editor.
	GetOwner (see page 2759)	Returns the collection to which this item belongs.
	GetOwner (see page 2932)	Returns the owner of an object.
	SetCollection (see page 2759)	Sets the value of the Collection (see page 2761) property.
	SetDisplayName (see page 2760)	Sets the name of the collection item as it appears in the collection editor.
	SetIndex (see page 2760)	Moves the collection item to a specified position in the parent collection.

Public Methods

	Name	Description
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Click (see page 11509)	Clicks the button.
V	Create (see page 11529)	Creates a single Task dialog radio button.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2757)	Destroys the TCollectionItem (see page 2755) instance and frees its memory.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 11509)	Destroys a button.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2759)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
V	SetInitialState (see page 11511)	Set the initial state of the button.

Public Properties

	Name	Description
	Collection (see page 2761)	Specifies the TCollection (see page 2731) instance to which the TCollectionItem (see page 2755) belongs.
	DisplayName (see page 2761)	The name displayed in the Collection (see page 2761) editor.
R	ID (see page 2761)	A unique, permanent index for the item.
	Index (see page 2762)	Returns the item's position in the Items array of TCollection (see page 2731).
	ModalResult (see page 11512)	Modal result of pushing this button.
R	TextWStr (see page 11513)	Descriptive button text.

Published Properties

	Name	Description
	Caption (see page 11511)	The caption for the button.

	Default (see page 11512)	Indicates whether this button is the default.
	Enabled (see page 11512)	Indicates whether this button is enabled.

Strict protected Methods

	Name	Description
V	DoButtonClick (see page 11529)	Performs the click actions for the radio button.
V	DoSetEnabled (see page 11529)	Enable or disable the radio button.
V	GetButtonText (see page 11510)	Fetch the button text.
V	GetDisplayName (see page 11510)	Get display name..

Strict protected Properties

	Name	Description
R	Client (see page 11512)	Client area of the button.

61.1.29.2 TTaskDialogRadioButtonItem.Create Constructor

Creates a single Task dialog radio button.

Pascal

```
constructor Create(Collection: TCollection); override;
```

C++

```
virtual __fastcall TTaskDialogRadioButtonItem(TCollection Collection);
```

Description

Use Create to create a single instance of the TTaskDialogRadioButtonItem (see page 11527) class.

61.1.29.3 TTaskDialogRadioButtonItem Methods

The methods of the TTaskDialogRadioButtonItem class are listed here.

Strict protected Methods

	Name	Description
V	DoButtonClick (see page 11529)	Performs the click actions for the radio button.
V	DoSetEnabled (see page 11529)	Enable or disable the radio button.

61.1.29.3.1 TTaskDialogRadioButtonItem.DoButtonClick Method

Performs the click actions for the radio button.

Pascal

```
procedure DoButtonClick; override;
```

C++

```
virtual __fastcall DoButtonClick();
```

Description

Use DoButtonClick to perform the actions specified on the click of the radio button.

61.1.29.3.2 TTaskDialogRadioButtonItem.DoSetEnabled Method

Enable or disable the radio button.

Pascal

```
procedure DoSetEnabled; override;
```

C++

```
virtual __fastcall DoSetEnabled();
```

Description

Use DoSetEnabled to enable or disable the radio button.

61.2 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	CreateMessageDialog (see page 11531)	Creates a specified message dialog.
	CreateMessageDialog (see page 11531)	Creates a specified message dialog.
	InputBox (see page 11532)	Displays an input dialog box that lets the user enter a string, double, or integer.
	InputQuery (see page 11533)	Displays an input dialog box that lets the user enter a string, double, or integer.
	MessageDlg (see page 11535)	Displays a message dialog box in the center of the screen.
	MessageDlg (see page 11535)	Displays a message dialog box in the center of the screen.
	MessageDlgPos (see page 11537)	Displays a message dialog box at the specified screen coordinates.
	MessageDlgPos (see page 11537)	Displays a message dialog box at the specified screen coordinates.
	MessageDlgPosHelp (see page 11539)	Displays a message dialog box whose help is supplied in a named help file.
	MessageDlgPosHelp (see page 11539)	Displays a message dialog box whose help is supplied in a named help file.
	PromptForFileName (see page 11540)	Displays an open or save dialog, where the user can specify a file name.
	ShowMessage (see page 11541)	Displays a message box with an OK button.
	ShowMessageFmt (see page 11542)	Displays a message box with a formatted message.
	ShowMessagePos (see page 11543)	Displays a message box at a specified location.
	TaskMessageDlg (see page 11543)	Displays a message task dialog box in the center of the screen.
	TaskMessageDlg (see page 11543)	Displays a message task dialog box in the center of the screen.
	TaskMessageDlgPos (see page 11545)	Displays a message task dialog box at the specified screen coordinates.
	TaskMessageDlgPos (see page 11545)	Displays a message task dialog box at the specified screen coordinates.
	TaskMessageDlgPosHelp (see page 11546)	Displays a message task dialog box whose help is supplied in a named help file.
	TaskMessageDlgPosHelp (see page 11546)	Displays a message task dialog box whose help is supplied in a named help file.

61.2.1 Dialogs.CreateMessageDialog Function

Creates a specified message dialog.

Pascal

```
function CreateMessageDialog(const Msg: string; DlgType: TMsgDlgType; Buttons:
TMsgDlgButtons): TForm; overload;
function CreateMessageDialog(const Msg: string; DlgType: TMsgDlgType; Buttons: TMsgDlgButtons;
DefaultButton: TMsgDlgBtn): TForm; overload;
```

C++

```
TForm * CreateMessageDialog(const AnsiString Msg, TMsgDlgType DlgType, TMsgDlgButtons Buttons);
TForm * CreateMessageDialog(const AnsiString Msg, TMsgDlgType DlgType, TMsgDlgButtons Buttons,
TMsgDlgBtn DefaultButton);
```

File

Dialogs

Description

Call CreateMessageDialog to create a message dialog that will be used several times in an application. CreateMessageDialog returns a dialog of the type specified by the DlgType parameter and with the buttons indicated by the Buttons (see page 2289) parameter. Users can copy messages created using CreateMessageDialog to the clipboard by pressing Ctrl+C.

Note: CreateMessageDialog does not display the dialog form. The application must display this form when it is needed by calling its ShowModal method.

See Also

MessageDlg (see page 11535)

MessageDlgPos (see page 11537)

MessageDlgPosHelp (see page 11539)

ShowMessage (see page 11541)

ShowMessageFmt (see page 11542)

TCustomForm

TCustomForm

61.2.2 Dialogs.InputBox Function

Displays an input dialog box that lets the user enter a string, double, or integer.

Pascal

```
function InputBox(const ACaption: string; const APrompt: string; const ADefault: string):
string;
```

C++

```
AnsiString InputBox(const AnsiString ACaption, const AnsiString APrompt, const AnsiString
ADefault);
```

File

Dialogs

Description

Call InputBox to bring up an input dialog box ready for the user to enter a string, double, or integer in its edit box.

ACaption is the caption of the dialog box.

APrompt is the text that prompts the user to enter input in the edit box.

ADefault is the value that appears in the edit box when the dialog box first appears.

AMin is the minimum value the user can enter into the edit box.

AMax is the maximum value the user can enter into the edit box.

Decimals does nothing.

Increment controls the amount by which the value in the spin control changes when the user clicks the up or down arrow. (It has no effect on values that the user types).

If the user chooses the Cancel button, InputBox returns the default value. If the user chooses the OK button, InputBox returns the value in the edit box.

Use the InputBox function when there is a default value that should be used when the user chooses the Cancel button (or presses Esc) to exit the dialog. If the application needs to know whether the user chooses OK or Cancel, use the InputQuery (see page 11533) function instead.

C++ Examples:

```
/*
This example displays an input dialog box when the user
clicks a button on the form. The input dialog box includes a
prompt string and a default string. The string the user enters
in the dialog box is stored in the InputString variable and
the text edit.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  AnsiString InputString = InputBox("Input Box", "Prompt", "Default string");
  Edit1->Text = InputString;
}
```

Delphi Examples:

```
{
This example displays an input dialog box when the user
clicks a button on the form. The input dialog box includes a
prompt string and a default string. The string the user enters
in the dialog box is stored in the InputString variable and
the text edit.
}

procedure TForm1.Button1Click(Sender: TObject);
var
  InputString: string;
begin
  InputString:= Dialogs.InputBox('Input Box', 'Prompt', 'Default string');
  Edit1.Text:= InputString;
end;
```

See Also

InputQuery (see page 11533)

MessageDlg (see page 11535)

MessageDlgPos (see page 11537)

61.2.3 Dialogs.InputQuery Function

Displays an input dialog box that lets the user enter a string, double, or integer.

Pascal

```
function InputQuery(const ACaption: string; const APrompt: string; var Value: string): Boolean;
```

C++

```
Boolean InputQuery(const AnsiString ACaption, const AnsiString APrompt, AnsiString Value);
```

File

Dialogs

Description

Call InputQuery to bring up an input dialog box ready for the user to enter a string, double, or integer in its edit box.

ACaption is the caption of the dialog box.

APrompt is the text that prompts the user to enter input in the edit box.

Value is the value that appears in the edit box when the dialog box first appears and which returns the value that the user enters.

AMin is the minimum value the user can enter into the edit box.

AMax is the maximum value the user can enter into the edit box.

Decimals does nothing.

Increment controls the amount by which the value in the spin control changes when the user clicks the up or down arrow. (It has no effect on values that the user types).

InputQuery returns true if the user chooses OK, and false if the user chooses Cancel or presses the Esc key.

If a default value should be used when the user cancels out of the dialog, use InputBox (see page 11532) instead.

C++ Examples:

```
/*
This example uses a button and a label on the form. When the
user clicks the button, the input box displays. If the user
chooses OK, the string that appears in the edit box of the
dialog box displays as the caption of the label on the form.
If the user chooses Cancel, the dialog box closes and the
caption of the label remains unchanged.
*/
#include <dialogs.hpp>
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  AnsiString NewString = "Default String";
  Label1->Caption = NewString;
  if (InputQuery("Input Box", "Prompt", NewString))
    // NewString has been changed by the user, who clicked ok
    Label1->Caption = NewString;
}
```

Delphi Examples:

```
{
This example uses a button and a label on the form. When the
user clicks the button, the input box displays. If the user
chooses OK, the string that appears in the edit box of the
dialog box displays as the caption of the label on the form.
If the user chooses Cancel, the dialog box closes and the
caption of the label remains unchanged.
}
procedure TForm1.Button1Click(Sender: TObject);
var
  NewString: string;
  ClickedOK: Boolean;
begin
  NewString := 'Default String';
  Label1.Caption := NewString;
  ClickedOK := Dialogs.InputQuery('Input Box', 'Prompt', NewString);
  if ClickedOK then            { NewString contains new input string }
    Label1.Caption := 'The new string is ''' + NewString + '''';
end;
```

See Also

InputBox (see page 11532)

MessageDlg (see page 11535)

MessageDlgPos (see page 11537)

61.2.4 Dialogs.MessageDlg Function

Displays a message dialog box in the center of the screen.

Pascal

```
function MessageDlg(const Msg: string; DlgType: TMsgDlgType; Buttons: TMsgDlgButtons; HelpCtx:
Longint): Integer; overload;
function MessageDlg(const Msg: string; DlgType: TMsgDlgType; Buttons: TMsgDlgButtons; HelpCtx:
Longint; DefaultButton: TMsgDlgBtn): Integer; overload;
```

C++

```
int MessageDlg(const AnsiString Msg, TMsgDlgType DlgType, TMsgDlgButtons Buttons, Longint
HelpCtx);
int MessageDlg(const AnsiString Msg, TMsgDlgType DlgType, TMsgDlgButtons Buttons, Longint
HelpCtx, TMsgDlgBtn DefaultButton);
```

File

Dialogs

Description

Call MessageDlg to bring up a message box and obtain the user's response.

Msg is the content of the message that appears.

DlgType indicates the purpose of the dialog.

Buttons (see page 2289) indicates what buttons should appear in the message box. For a three button message box, use the syntax containing Button1, Button2, and Button3.

Button1, **Button2**, and **Button3** indicate what types of buttons to use for a three button message box. The resulting buttons appear in order.

HelpCtx specifies the context ID for the help topic that should appear when the user clicks the help button or presses F1 while the dialog is displayed.

DefaultBtn specifies which button from among those specified by Buttons (see page 2289) (or Button1, Button2, and Button3) is the default button for the dialog. If DefaultBtn is mbNone, there is no default button.

MessageDlg returns the value of the button the user selected. The following table lists the TMsgDlgBtn (see page 11556) values for each type of button that can appear in the message box, and the corresponding value that is returned if the user selects that button:

TMsgDlgBtn (see page 11556) Value	Corresponding return value
mbOK	mrOK
mbCancel	mrCancel
mbYes	mrYes
mbNo	mrNo
mbAbort	mrAbort
mbRetry	mrRetry
mbIgnore	mrIgnore
mbAll	mrAll
mbNoToAll	mrNoToAll

mbYesToAll	mrYesToAll

Note: If the user types Ctrl+C in the message box, the text of the message is copied to the clipboard.

C++ Examples:

```
/*
The following code adds a new object to a list in a list
object and then removes it:
*/
class TMyClass : public TComponent
{
__published:    // IDE-managed Components
private:    // User declarations
public:     // User declarations
  AnsiString MyString;
    __fastcall TMyClass(TComponent* Owner, AnsiString mystr);
};

__fastcall TMyClass::TMyClass(TComponent* Owner, AnsiString mystr)
    : TComponent(Owner)
{
  MyString = mystr;
}

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  TList *list = new TList();
  TMyClass *TheObject = new TMyClass(Form1, "This is an object.");
  try
  {
    list->Add(TheObject); // add AnsiString instance to list
    MessageDlg("The list has " + IntToStr(list->Count) + " objects",
               mtInformation, TMsgDlgButtons() << mbOK, 0);
    list->Remove(TheObject);
    MessageDlg("The list has " + IntToStr(list->Count) + " objects",
               mtInformation, TMsgDlgButtons() << mbOK, 0);
  }
  __finally
  {
    delete list;
  }
}
```

Delphi Examples:

```
{
This example uses a button on a form. When the user clicks
the button, a message box appears, asking if the user wants
to exit the application. If the user chooses Yes, another
dialog box appears informing the user the application is
about to end. When user chooses OK, the application ends.
}
procedure TForm1.Button1Click(Sender: TObject);
begin
  if Dialogs.MessageDlg('Welcome to my Delphi application.  Exit now?',
    mtConfirmation, [mbYes, mbNo], 0, mbYes) = mrYes then
  begin
    Dialogs.MessageDlg('Exiting the Delphi application.', mtInformation,
      [mbOk], 0, mbOk);
    Close;
  end;
end;
```

61.2.5 Dialogs.MessageDlgPos Function

Displays a message dialog box at the specified screen coordinates.

Pascal

```
function MessageDlgPos(const Msg: string; DlgType: TMsgDlgType; Buttons: TMsgDlgButtons;
HelpCtx: Longint; X: Integer; Y: Integer): Integer; overload;
function MessageDlgPos(const Msg: string; DlgType: TMsgDlgType; Buttons: TMsgDlgButtons;
HelpCtx: Longint; X: Integer; Y: Integer; DefaultButton: TMsgDlgBtn): Integer; overload;
```

C++

```
int MessageDlgPos(const AnsiString Msg, TMsgDlgType DlgType, TMsgDlgButtons Buttons, Longint
HelpCtx, int X, int Y);
int MessageDlgPos(const AnsiString Msg, TMsgDlgType DlgType, TMsgDlgButtons Buttons, Longint
HelpCtx, int X, int Y, TMsgDlgBtn DefaultButton);
```

File

Dialogs

Description

Call MessageDlgPos to bring up a message box at a particular location when you do not need to specify a caption. (If you need to specify the caption as well, use the MessageDlg (see page 11535) function).

Msg is the content of the message that appears.

DlgType indicates the purpose of the dialog.

Buttons (see page 2289) indicates what buttons should appear in the message box.

HelpCtx specifies the context ID for the help topic that should appear when the user clicks the help button or presses F1 while the dialog is displayed.

X and **Y** specify the screen coordinates where the dialog should appear. A value of –1 means that the message box can appear anywhere in the specified dimension.

DefaultBtn specifies which button from among those specified by Buttons (see page 2289) is the default button for the dialog. If DefaultBtn is mbNone, there is no default button.

MessageDlgPos returns the value of the button the user selected. The following table lists the TMsgDlgBtn (see page 11556) values for each type of button that can appear in the message box, and the corresponding value that is returned if the user selects that button:

TMsgDlgBtn (see page 11556) Value	Corresponding return value
mbOK	mrOK
mbCancel	mrCancel
mbYes	mrYes
mbNo	mrNo
mbAbort	mrAbort
mbRetry	mrRetry
mbIgnore	mrIgnore
mbAll	mrAll
mbNoToAll	mrNoToAll
mbYesToAll	mrYesToAll

Note: If the user types Ctrl+C in the message box, the text of the message is copied to the clipboard.

C++ Examples:

```
/*
This example uses a button on a form. When the user clicks
the button, a message box appears with a Yes, No, and Cancel
button on it:
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  // can't do TMsgDlgButtons() << mbYesNoCancel
  MessageDlgPos("Are you there?", mtConfirmation, mbYesNoCancel, 0, 200, 200, mbYes);
}
```

Delphi Examples:

```
{
This example uses a button on a form. When the user clicks
the button, a message box appears with a Yes, No, and Cancel
button on it:
}

procedure TForm1.Button1Click(Sender: TObject);

begin
  // can't do TMsgDlgButtons() << mbYesNoCancel
  Dialogs.MessageDlgPos('Are you there?', mtConfirmation, mbYesNoCancel, 0, 200, 200, mbYes);
end;
```

ShowMessageFmt (see page 11542)

CreateMessageDialog (see page 11531)

61.2.6 Dialogs.MessageDlgPosHelp Function

Displays a message dialog box whose help is supplied in a named help file.

Pascal

```
function MessageDlgPosHelp(const Msg: string; DlgType: TMsgDlgType; Buttons: TMsgDlgButtons;
HelpCtx: Longint; X: Integer; Y: Integer; const HelpFileName: string): Integer; overload;
function MessageDlgPosHelp(const Msg: string; DlgType: TMsgDlgType; Buttons: TMsgDlgButtons;
HelpCtx: Longint; X: Integer; Y: Integer; const HelpFileName: string; DefaultButton:
TMsgDlgBtn): Integer; overload;
```

C++

```
int MessageDlgPosHelp(const AnsiString Msg, TMsgDlgType DlgType, TMsgDlgButtons Buttons,
Longint HelpCtx, int X, int Y, const AnsiString HelpFileName);
int MessageDlgPosHelp(const AnsiString Msg, TMsgDlgType DlgType, TMsgDlgButtons Buttons,
Longint HelpCtx, int X, int Y, const AnsiString HelpFileName, TMsgDlgBtn DefaultButton);
```

File

Dialogs

Description

Call MessageDlgPosHelp to bring up a message box when the associated help comes from a help file other than the default help file.

Msg is the content of the message that appears.

DlgType indicates the purpose of the dialog.

Buttons (see page 2289) indicates what buttons should appear in the message box.

HelpCtx specifies the context ID for the help topic in the file specified by HelpFileName. This topic appears when the user clicks the help button or presses F1 while the dialog is displayed.

X and Y specify the screen coordinates where the dialog should appear.

HelpFileName specifies the help file that contains the help topic for this message box.

MessageDlgPosHelp returns the value of the button the user selected. The following table lists the TMsgDlgBtn (see page 11556) values for each type of button that can appear in the message box, and the corresponding value that is returned if the user selects that button:

TMsgDlgBtn (see page 11556) Value	Corresponding return value
mbOK	mrOk
mbCancel	mrCancel
mbYes	mrYes
mbNo	mrNo
mbAbort	mrAbort
mbRetry	mrRetry
mbIgnore	mrIgnore
mbAll	mrAll
mbNoToAll	mrNoToAll
mbYesToAll	mrYesToAll

Note: If the user types Ctrl+C in the message box, the text of the message is copied to the clipboard.

See Also

MessageDlg (see page 11535)

ShowMessage (see page 11541)

ShowMessageFmt (see page 11542)

61.2.7 Dialogs.PromptForFileName Function

Displays an open or save dialog, where the user can specify a file name.

Pascal

```
function PromptForFileName(var AFileName: string; const AFilter: string = ''; const
ADefaultExt: string = ''; const ATitle: string = ''; const AInitialDir: string = '';
SaveDialog: Boolean = False): Boolean;
```

C++

```
Boolean PromptForFileName(AnsiString AFileName, const AnsiString AFilter = '', const
AnsiString ADefaultExt = '', const AnsiString ATitle = '', const AnsiString AInitialDir = '',
Boolean SaveDialog = False);
```

File

Dialogs

Description

Call PromptForFileName to display an open or save dialog.

AFilename is the name of the file. The value supplied by the caller is used to initialize the file name in the dialog. On exit, AFileName contains the name specified in the dialog.

AFilter determines the file masks (filters) available in the dialog. If AFilter is set to an empty string, the dialog uses the string 'All files (*.*)', which causes the dialog to display all files in the current directory. For information on filter strings, see Filter.

ADefaultExt specifies a file extension that is appended automatically to the specified file name, unless the selected file name already includes a registered extension. If the user specifies a file name with an extension that is unregistered, ADefaultExt is appended to the unregistered extension.

ATitle specifies the title for the dialog. If ATitle is set to an empty string, the dialog uses 'Open' or 'Save As', depending on the value of the SaveDialog parameter.

AInitialDir specifies the directory displayed in the dialog when it opens. If AInitialDir is an empty string, or if the specified directory does not exist, the initial directory is the current working directory.

SaveDialog specifies whether the file selection should be a Save As dialog (true) or an Open dialog (false).

Options specifies file dialog options.

PromptForFileName returns true if the user selected a file name, false if the user exited by clicking the cancel button.

SelectDirectory

61.2.8 Dialogs.ShowMessage Function

Displays a message box with an OK button.

Pascal

```
procedure ShowMessage(const Msg: string);
```

C++

```
ShowMessage(const AnsiString Msg);
```

File

Dialogs

Description

Call ShowMessage to display a simple message box with an OK button. The name of the application's executable file appears as the caption of the message box.

Msg parameter is the message string that appears in the message box.

Params lists the values to insert into Msg if the Msg string includes formatting specifiers. For more information about how messages are formatted, see Format Strings.

Params_size is the index of the last value in Params (one less than the number of elements).

Note: To display a message in a message box with other buttons, or with an icon, use the MessageDlg (see page 11535) function.

Note: If the user types Ctrl+C in the message box, the text of the message is copied to the clipboard.

C++ Examples:

```
/*
The following example uses an edit control and a button on a
form. When the button is clicked, the current directory is
searched for the filename specified in the edit control. A
message box indicates whether the file is found.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  AnsiString asFileName = FileSearch(Edit1->Text, GetCurrentDir());
  if (asFileName.IsEmpty())
    ShowMessage(AnsiString("Couldn't find ") + Edit1->Text + ".");
  else
    ShowMessage(AnsiString("Found ") + asFileName + ".");
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  Label2->Caption = GetCurrentDir();
}
```

Delphi Examples:

```
{
```

```
The following example uses an edit control and a button on a
form. When the button is clicked, the current directory is
searched for the filename specified in the edit control. A
message box indicates whether the file is found.
}
procedure TForm1.Button1Click(Sender: TObject);
var
  FileToFind: string;
begin
  FileToFind := SysUtils.FileSearch(Edit1.Text, GetCurrentDir);
  if FileToFind = '' then
    ShowMessage('Couldn''t find ' + Edit1.Text + '.')
  else
    ShowMessage('Found ' + FileToFind + '.');
end;

procedure TForm1.FormCreate(Sender: TObject);
begin
  Label2.Caption := GetCurrentDir;
end;
```

ShowMessagePos (see page 11543)

61.2.9 Dialogs.ShowMessageFmt Function

Displays a message box with a formatted message.

Pascal

```
procedure ShowMessageFmt(const Msg: string; Params: array of const);
```

C++

```
ShowMessageFmt(const AnsiString Msg, array of const Params);
```

File

Dialogs

Description

Call ShowMessageFmt to display a simple message box with an OK button. The name of the application's executable file appears as the caption of the message box.

The Msg parameter is a format string for the message that appears in the message box. The Params parameter provides the parameters that are assembled into the message. The Params_Size parameter gives the index of the element of the Params array (one less than the number of parameters).

For more information about how messages are formatted, see Format Strings.

To display a message in a message box with other buttons, or with an icon, use the MessageDlg (see page 11535) function.

Note: If the user types Ctrl+C in the message box, the text of the message is copied to the clipboard.

See Also

MessageDlg (see page 11535)

61.2.10 Dialogs.ShowMessagePos Function

Displays a message box at a specified location.

Pascal

```
procedure ShowMessagePos(const Msg: string; X: Integer; Y: Integer);
```

C++

```
ShowMessagePos(const AnsiString Msg, int X, int Y);
```

File

Dialogs

Description

Call ShowMessagePos to display a simple message box with an OK button at a specified location. The name of the application's executable file appears as the caption of the message box.

The Msg parameter is the message that appears in the message box.

X and Y specify the screen coordinates where the message box should appear. A value of –1 means that the message box can appear anywhere in the specified dimension.

To display a message in a message box with other buttons, or with an icon, use the MessageDlg (see page 11535) function.

Note: If the user types Ctrl+C in the message box, the text of the message is copied to the clipboard.

ShowMessageFmt (see page 11542)

61.2.11 Dialogs.TaskMessageDlg Function

Displays a message task dialog box in the center of the screen.

Pascal

```
function TaskMessageDlg(const Title: string; const Msg: string; DlgType: TMsgDlgType; Buttons:
TMsgDlgButtons; HelpCtx: Longint): Integer; overload;
function TaskMessageDlg(const Title: string; const Msg: string; DlgType: TMsgDlgType; Buttons:
```

```
TMsgDlgButtons; HelpCtx: Longint; DefaultButton: TMsgDlgBtn): Integer; overload;
```

C++

```
int TaskMessageDlg(const AnsiString Title, const AnsiString Msg, TMsgDlgType DlgType,
TMsgDlgButtons Buttons, Longint HelpCtx);
int TaskMessageDlg(const AnsiString Title, const AnsiString Msg, TMsgDlgType DlgType,
TMsgDlgButtons Buttons, Longint HelpCtx, TMsgDlgBtn DefaultButton);
```

File

Dialogs

Description

Call TaskMessageDlg to bring up a message box and obtain the user's response.

Caption specifies the caption for the message box when DlgType is mtCustom. If this parameter is not used, the caption for custom message boxes is the title of the application.

Msg is the content of the message that appears.

DlgType indicates the purpose of the dialog.

Buttons (see page 2289) indicates what buttons should appear in the message box. For a three button message box, use the syntax containing Button1, Button2, and Button3.

Button1, Button2, and Button3 indicate what types of buttons to use for a three button message box. The resulting buttons appear in order.

HelpCtx specifies the context ID for the help topic that should appear when the user clicks the help button or presses F1 while the dialog is displayed.

X and Y specify the screen coordinates where the dialog should appear. A value of –1 means that the message box can appear anywhere in the specified dimension.

DefaultBtn specifies which button from among those specified by Buttons (see page 2289) (or Button1, Button2, and Button3) is the default button for the dialog. If DefaultBtn is mbNone, there is no default button.

Bitmap is an image that appears on the face of the message dialog. If Bitmap is nil (Delphi) or NULL (C++), there is no image unless DlgType is mtConfirmation.

MessageDlg (see page 11535) returns the value of the button the user selected. The following table lists the TMsgDlgBtn (see page 11556) values for each type of button that can appear in the message box, and the corresponding value that is returned if the user selects that button:

TMsgDlgBtn (see page 11556) Value	Corresponding return value
mbOk	mrOk
mbOK	mrOk
mbCancel	mrCancel
mbYes	mrYes
mbNo	mrNo
mbAbort	mrAbort
mbRetry	mrRetry
mbIgnore	mrIgnore
mbAll	mrAll
mbNoToAll	mrNoToAll
mbYesToAll	mrYesToAll

Note: If the user types Ctrl+C in the message box, the text of the message is copied to the clipboard.

61.2.12 Dialogs.TaskMessageDlgPos Function

Displays a message task dialog box at the specified screen coordinates.

Pascal

```
function TaskMessageDlgPos(const Title: string; const Msg: string; DlgType: TMsgDlgType;
Buttons: TMsgDlgButtons; HelpCtx: Longint; X: Integer; Y: Integer): Integer; overload;
function TaskMessageDlgPos(const Title: string; const Msg: string; DlgType: TMsgDlgType;
Buttons: TMsgDlgButtons; HelpCtx: Longint; X: Integer; Y: Integer; DefaultButton: TMsgDlgBtn):
Integer; overload;
```

C++

```
int TaskMessageDlgPos(const AnsiString Title, const AnsiString Msg, TMsgDlgType DlgType,
TMsgDlgButtons Buttons, Longint HelpCtx, int X, int Y);
int TaskMessageDlgPos(const AnsiString Title, const AnsiString Msg, TMsgDlgType DlgType,
TMsgDlgButtons Buttons, Longint HelpCtx, int X, int Y, TMsgDlgBtn DefaultButton);
```

File

Dialogs

Description

Call TaskMessageDlgPos to bring up a message box at a particular location when you do not need to specify a caption. (If you need to specify the caption as well, use the MessageDlg (see page 11535) function).

Msg is the content of the message that appears.

DlgType indicates the purpose of the dialog.

Buttons (see page 2289) indicates what buttons should appear in the message box.

HelpCtx specifies the context ID for the help topic that should appear when the user clicks the help button or presses F1 while the dialog is displayed.

X and Y specify the screen coordinates where the dialog should appear. A value of –1 means that the message box can appear anywhere in the specified dimension.

DefaultBtn specifies which button from among those specified by Buttons (see page 2289) is the default button for the dialog. If DefaultBtn is mbNone, there is no default button.

Bitmap is an image that appears on the face of the message dialog. If Bitmap is nil (Delphi) or NULL (C++), there is no image unless DlgType is mtConfirmation.

MessageDlgPos (see page 11537) returns the value of the button the user selected. The following table lists the TMsgDlgBtn (see page 11556) values for each type of button that can appear in the message box, and the corresponding value that is returned if the user selects that button:

TMsgDlgBtn (see page 11556) Value	Corresponding return value
mbOk	mrOk
mbOK	mrOk
mbCancel	mrCancel
mbYes	mrYes

mbNo	mrNo
mbAbort	mrAbort
mbRetry	mrRetry
mbIgnore	mrIgnore
mbAll	mrAll
mbNoToAll	mrNoToAll
mbYesToAll	mrYesToAll

Note: If the user types Ctrl+C in the message box, the text of the message is copied to the clipboard.

61.2.13 Dialogs.TaskMessageDlgPosHelp Function

Displays a message task dialog box whose help is supplied in a named help file.

Pascal

```
function TaskMessageDlgPosHelp(const Title: string; const Msg: string; DlgType: TMsgDlgType;
Buttons: TMsgDlgButtons; HelpCtx: Longint; X: Integer; Y: Integer; const HelpFileName:
string): Integer; overload;
function TaskMessageDlgPosHelp(const Title: string; const Msg: string; DlgType: TMsgDlgType;
Buttons: TMsgDlgButtons; HelpCtx: Longint; X: Integer; Y: Integer; const HelpFileName: string;
DefaultButton: TMsgDlgBtn): Integer; overload;
```

C++

```
int TaskMessageDlgPosHelp(const AnsiString Title, const AnsiString Msg, TMsgDlgType DlgType,
TMsgDlgButtons Buttons, Longint HelpCtx, int X, int Y, const AnsiString HelpFileName);
int TaskMessageDlgPosHelp(const AnsiString Title, const AnsiString Msg, TMsgDlgType DlgType,
TMsgDlgButtons Buttons, Longint HelpCtx, int X, int Y, const AnsiString HelpFileName,
TMsgDlgBtn DefaultButton);
```

File

Dialogs

Description

Call TaskMessageDlgPosHelp to bring up a message box when the associated help comes from a help file other than the default help file.

Msg is the content of the message that appears.

DlgType indicates the purpose of the dialog.

Buttons (see page 2289) indicates what buttons should appear in the message box.

HelpCtx specifies the context ID for the help topic in the file specified by HelpFileName. This topic appears when the user clicks the help button or presses F1 while the dialog is displayed.

X and Y specify the screen coordinates where the dialog should appear.

HelpFileName specifies the help file that contains the help topic for this message box.

MessageDlgPosHelp (see page 11539) returns the value of the button the user selected. The following table lists the TMsgDlgBtn (see page 11556) values for each type of button that can appear in the message box, and the corresponding value that is returned if the user selects that button:

TMsgDlgBtn (see page 11556) Value	Corresponding return value
mbOK	mrOk
mbCancel	mrCancel
mbYes	mrYes
mbNo	mrNo
mbAbort	mrAbort
mbRetry	mrRetry
mbIgnore	mrIgnore
mbAll	mrAll
mbNoToAll	mrNoToAll
mbYesToAll	mrYesToAll

Note: If the user types Ctrl+C in the message box, the text of the message is copied to the clipboard.

61.3 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TColorDialogOption (see page 11548)	TColorDialogOption and TColorDialogOptions (see page 11568) specify options for a TColorDialog (see page 11270) component.
	TFileDialogOption (see page 11549)	The settings in TFileDialogOption determine the behavior of a TCustomFileDialog (see page 11288) file dialog. TFileDialogOptions (see page 11571) is a set of TFileDialogOption. These options are the same as the options for the Microsoft IFileDialog::GetOptions and IFileDialog::SetOptions functions.
	TFileDialogOverwriteResponse (see page 11551)	TFileDialogOverwriteResponse indicates the application's response to an overwrite request during a save operation for a TCustomFileSaveDialog (see page 11314) dialog. These are the same values as in the FDE_OVERWRITE_RESPONSE enumerated type used in the Microsoft IFileDialogEvents::OnOverwrite method.
	TFileDialogShareViolationResponse (see page 11552)	TFileDialogShareViolationResponse indicates the application's response to a sharing violation during a file open or save for a TCustomFileDialog (see page 11288) dialog. These are the same values as in the FDE_SHAREVIOLATION_RESPONSE enumerated type used in the Microsoft IFileDialogEvents::OnShareViolation method.
	TFileEditStyle (see page 11552)	TFileEditStyle indicates the type of control that appears in a file selection dialog for the file name.
	TFindOption (see page 11553)	TFindOption and TFindOptions (see page 11573) determine the controls that appear in a find dialog.
	TFontDialogDevice (see page 11554)	TFontDialogDevice indicates the source from which a TFontDialog (see page 11394) instance obtains its list of fonts.
	TFontDialogOption (see page 11555)	TFontDialogOption and TFontDialogOptions (see page 11574) are flags that influence the appearance and behavior of a font dialog.
	TMsgDlgBtn (see page 11556)	TMsgDlgBtn defines a set of values used by MessageDlg (see page 11535) and MessageDlgPos (see page 11537) functions.
	TMsgDlgType (see page 11558)	TMsgDlgType defines values describing the type of message box.
	TOpenOption (see page 11559)	TOpenOption and TOpenOptions (see page 11576) determine the behavior of a file selection dialog.
	TOpenOptionEx (see page 11561)	TOpenOptionEx and TOpenOptionsEx (see page 11578) determine the behavior of a file selection dialog.
	TPageMeasureUnits (see page 11561)	Specifies page setup measure unit types.
	TPageSetupDialogOption (see page 11562)	This is record Dialogs.TPageSetupDialogOption.
	TPageType (see page 11562)	TPageType indicates the type of page being configured for printing.
	TPrintDialogOption (see page 11563)	TPrintDialogOption and TPrintDialogOptions (see page 11580) specify options for a TPrintDialog (see page 11458) component.
	TPrinterKind (see page 11564)	This is record Dialogs.TPrinterKind.
	TPrintRange (see page 11564)	TPrintRange indicates how the user specified the set of pages to print.
	TProgressBarState (see page 11565)	TProgressBarState defines a set of values used by the State property.
	TTaskDialogCommonButton (see page 11565)	Buttons (see page 2289) for Task Dialogs (see page 11265).
	TTaskDialogFlag (see page 11566)	Flags for Task Dialogs (see page 11265).

61.3.1 Dialogs.TColorDialogOption Enumeration

TColorDialogOption and TColorDialogOptions (see page 11568) specify options for a TColorDialog (see page 11270) component.

Pascal

```
TColorDialogOption = (
  cdFullOpen,
  cdPreventFullOpen,
  cdShowHelp,
  cdSolidColor,
  cdAnyColor
);
```

C++

```
enum TColorDialogOption {
  cdFullOpen,
  cdPreventFullOpen,
  cdShowHelp,
  cdSolidColor,
  cdAnyColor
};
```

File

Dialogs

Description

TColorDialogOptions (see page 11568) is a set of TColorDialogOption values. The possible values of TColorDialogOption are

Value	Meaning
cdFullOpen	Display custom color options when the dialog opens.
cdPreventFullOpen	Disable the Define Custom Colors button in the dialog, so that the user cannot define new colors.
cdShowHelp	Add a Help button to the color dialog.
cdSolidColor	Direct Windows to use the nearest solid color to the color chosen.
cdAnyColor	Allow the user to select non-solid colors (which may have to be approximated by dithering).

61.3.2 Dialogs.TFileDialogOption Enumeration

The settings in TFileDialogOption determine the behavior of a TCustomFileDialog (see page 11288) file dialog. TFileDialogOptions (see page 11571) is a set of TFileDialogOption. These options are the same as the options for the Microsoft IFileDialog::GetOptions and IFileDialog::SetOptions functions.

Pascal

```
TFileDialogOption = (
  fdoOverWritePrompt,
  fdoStrictFileTypes,
  fdoNoChangeDir,
  fdoPickFolders,
  fdoForceFileSystem,
  fdoAllNonStorageItems,
  fdoNoValidate,
  fdoAllowMultiSelect,
  fdoPathMustExist,
  fdoFileMustExist,
  fdoCreatePrompt,
  fdoShareAware,
  fdoNoReadOnlyReturn,
  fdoNoTestFileCreate,
  fdoHideMRUPlaces,
```

```
    fdoHidePinnedPlaces,
    fdoNoDereferenceLinks,
    fdoDontAddToRecent,
    fdoForceShowHidden,
    fdoDefaultNoMiniMode,
    fdoForcePreviewPaneOn
  );
```

C++

```
  enum TFileDialogOption {
    fdoOverWritePrompt,
    fdoStrictFileTypes,
    fdoNoChangeDir,
    fdoPickFolders,
    fdoForceFileSystem,
    fdoAllNonStorageItems,
    fdoNoValidate,
    fdoAllowMultiSelect,
    fdoPathMustExist,
    fdoFileMustExist,
    fdoCreatePrompt,
    fdoShareAware,
    fdoNoReadOnlyReturn,
    fdoNoTestFileCreate,
    fdoHideMRUPlaces,
    fdoHidePinnedPlaces,
    fdoNoDereferenceLinks,
    fdoDontAddToRecent,
    fdoForceShowHidden,
    fdoDefaultNoMiniMode,
    fdoForcePreviewPaneOn
  };
```

File

Dialogs

Description

The following table lists the possible values:

Value	Meaning
fdoOverWritePrompt	Prompt before overwriting an existing file of the same name when saving a file. This is a default for save dialogs.
fdoStrictFileTypes	The file extension of a saved file being must match the selected file type.
fdoNoChangeDir	Unused.
fdoPickFolders	Choose folders rather than files.
fdoForceFileSystem	Returned items must be file system items.
fdoAllNonStorageItems	Allow users to choose any item in the Shell namespace. This flag cannot be combined with fdoForceFileSystem.
fdoNoValidate	Do not check for situations preventing applications from opening selected files, such as sharing violations or access denied errors.
fdoAllowMultiSelect	Allow selecting multiple items in an open dialog.
fdoPathMustExist	Items returned must be in an existing folder. This is a default.
fdoFileMustExist	Items returned must exist. This is a default value for open dialogs.
fdoCreatePrompt	Prompt for creation if returned item in save dialog does not exist. This does not create the item.
fdoShareAware	For a sharing violation opening a file, call the application back for guidance. This flag is overridden by fdoNoValidate.

fdoNoReadOnlyReturn	Do not return read-only items.
fdoNoTestFileCreate	Do not test creation of returned item from save dialogs. If not set, the calling application must handle errors discovered in the creation test.
fdoHideMRUPlaces	Hide places of recently opened or saved items.
fdoHidePinnedPlaces	Hide pinned places from which users can choose.
fdoNoDereferenceLinks	Shortcuts are not treated as their target items, allowing applications to open .lnk files.
fdoDontAddToRecent	Do not add the item being opened or saved to the list of recent places.
fdoForceShowHidden	Show hidden items.
fdoDefaultNoMiniMode	Open save dialog box in expanded mode in which users can browse folders. Expanded mode is set and unset by clicking the button in the lower-left corner of a save dialog box.
fdoForcePreviewPaneOn	Display the preview pane.

61.3.3 Dialogs.TFileDialogOverwriteResponse Enumeration

TFileDialogOverwriteResponse indicates the application's response to an overwrite request during a save operation for a TCustomFileSaveDialog (see page 11314) dialog. These are the same values as in the FDE_OVERWRITE_RESPONSE enumerated type used in the Microsoft IFileDialogEvents::OnOverwrite method.

Pascal

```
TFileDialogOverwriteResponse = (
  forDefault = FDEOR_DEFAULT,
  forAccept = FDEOR_ACCEPT,
  forRefuse = FDEOR_REFUSE
);
```

C++

```
enum TFileDialogOverwriteResponse {
  forDefault = FDEOR_DEFAULT,
  forAccept = FDEOR_ACCEPT,
  forRefuse = FDEOR_REFUSE
};
```

File

Dialogs

Description

The following table lists the possible values:

Value	Meaning
forDefault	The application displays a dialog asking the user whether or not to overwrite.
forAccept	The application returns the file name, allowing the overwrite.
forRefuse	The application does not return the file name, refusing the overwrite.

61.3.4 Dialogs.TFileDialogShareViolationResponse Enumeration

TFileDialogShareViolationResponse indicates the application's response to a sharing violation during a file open or save for a TCustomFileDialog (see page 11288) dialog. These are the same values as in the FDE_SHAREVIOLATION_RESPONSE enumerated type used in the Microsoft IFileDialogEvents::OnShareViolation method.

Pascal

```
TFileDialogShareViolationResponse = (
  fsrDefault = FDESVR_DEFAULT,
  fsrAccept = FDESVR_ACCEPT,
  fsrRefuse = FDESVR_REFUSE
);
```

C++

```
enum TFileDialogShareViolationResponse {
  fsrDefault = FDESVR_DEFAULT,
  fsrAccept = FDESVR_ACCEPT,
  fsrRefuse = FDESVR_REFUSE
};
```

File

Dialogs

Description

The following table lists the possible values:

Value	Meaning
fsrDefault	The application displays a dialog telling the user the file is in use allowing selection of another file.
fsrAccept	The application returns the file name.
fsrRefuse	The application does not return the file name.

61.3.5 Dialogs.TFileEditStyle Enumeration

TFileEditStyle indicates the type of control that appears in a file selection dialog for the file name.

Pascal

```
TFileEditStyle = (
  fsEdit,
  fsComboBox
);
```

C++

```
enum TFileEditStyle {
  fsEdit,
  fsComboBox
};
```

File

Dialogs

Description

TFileEditStyle can have one of the following values:

Value	Meaning
fsEdit	The control for entering the file name is an edit control.
fsComboBox	The control for entering the file name is a combo box.

61.3.6 Dialogs.TFindOption Enumeration

TFindOption and TFindOptions (see page 11573) determine the controls that appear in a find dialog.

Pascal

```
TFindOption = (
  frDown,
  frFindNext,
  frHideMatchCase,
  frHideWholeWord,
  frHideUpDown,
  frMatchCase,
  frDisableMatchCase,
  frDisableUpDown,
  frDisableWholeWord,
  frReplace,
  frReplaceAll,
  frWholeWord,
  frShowHelp
);
```

C++

```
enum TFindOption {
  frDown,
  frFindNext,
  frHideMatchCase,
  frHideWholeWord,
  frHideUpDown,
  frMatchCase,
  frDisableMatchCase,
  frDisableUpDown,
  frDisableWholeWord,
  frReplace,
  frReplaceAll,
  frWholeWord,
  frShowHelp
};
```

File

Dialogs

Description

TFindOption values determine which controls are enabled in a TFindDialog (see page 11376) instance, and how the controls are initialized.

TFindOptions (see page 11573) is a set of TFindOption values.

The following table lists the possible values:

Value	Meaning
frDisableMatchCase	Disables (grays) the Match Case check box in a find dialog.
frDisableUpDown	Disables (grays) the Up and Down buttons, which determine the direction of the search.
frDisableWholeWord	Disables (grays) the Match Whole Word check box of find dialog.
frDown	Selects the Down button by default when the dialog opens. If the frDown flags is off, Up is selected when the dialog opens. (By default, frDown is on.)
frFindNext	This flag is turned on when the user clicks the Find Next button and turned off when the dialog closes.
frHideMatchCase	Removes the Match Case check box from the dialog.
frHideWholeWord	Removes the Match Whole Word check box from the dialog.
frHideUpDown	Removes the Up and Down buttons from the dialog.
frMatchCase	This flag is turned on (off) when the user selects (deselects) the Match Case check box. To select the check box by default when the dialog opens, set frMatchCase at design time.
frReplace	Applies to TReplaceDialog (see page 11482) only. This flag is set by the system to indicate that the application should replace the current occurrence (and only the current occurrence) of the FindText string with the ReplaceText string. Not used in search routines.
frReplaceAll	Applies to TReplaceDialog (see page 11482) only. This flag is set by the system to indicate that the application should replace all occurrences of the FindText string with the ReplaceText string.
frShowHelp	Displays a Help button in the dialog.
frWholeWord	This flag is turned on (off) when the user selects (deselects) the Match Whole Word check box. To select the check box by default when the dialog opens, set frWholeWord at design time.

61.3.7 Dialogs.TFontDialogDevice Enumeration

TFontDialogDevice indicates the source from which a TFontDialog (see page 11394) instance obtains its list of fonts.

Pascal

```
TFontDialogDevice = (
  fdScreen,
  fdPrinter,
  fdBoth
);
```

C++

```
enum TFontDialogDevice {
  fdScreen,
  fdPrinter,
  fdBoth
};
```

File

Dialogs

Description

These are the possible values of TFondDialogDevice:

Value	Meaning
fdScreen	Retrieve fonts from the screen.
fdPrinter	Retrieve fonts from the printer.
fdBoth	Retrieve fonts from both the screen and the printer.

61.3.8 Dialogs.TFontDialogOption Enumeration

TFontDialogOption and TFontDialogOptions (see page 11574) are flags that influence the appearance and behavior of a font dialog.

Pascal

```
TFontDialogOption = (
  fdAnsiOnly,
  fdTrueTypeOnly,
  fdEffects,
  fdFixedPitchOnly,
  fdForceFontExist,
  fdNoFaceSel,
  fdNoOEMFonts,
  fdNoSimulations,
  fdNoSizeSel,
  fdNoStyleSel,
  fdNoVectorFonts,
  fdShowHelp,
  fdWysiwyg,
  fdLimitSize,
  fdScalableOnly,
  fdApplyButton
);
```

C++

```
enum TFontDialogOption {
  fdAnsiOnly,
  fdTrueTypeOnly,
  fdEffects,
  fdFixedPitchOnly,
  fdForceFontExist,
  fdNoFaceSel,
  fdNoOEMFonts,
  fdNoSimulations,
  fdNoSizeSel,
  fdNoStyleSel,
  fdNoVectorFonts,
  fdShowHelp,
  fdWysiwyg,
  fdLimitSize,
  fdScalableOnly,
  fdApplyButton
};
```

File

Dialogs

Description

TFontDialogOptions (see page 11574) is a set of TFontDialogOption values. These are the possible values of TFontDialogOption:

Value	Meaning
fdAnsiOnly	Displays only fonts that use the Windows character set. Symbol fonts are not listed in the dialog.
fdApplyButton	Displays an Apply button in the dialog, whether or not there is an OnApply event handler.
fdEffects	Displays the Effects check boxes (Strikeout and Underline) and the Color list box in the dialog.
fdFixedPitchOnly	Displays only monospaced fonts in the dialog. Proportionally spaced fonts are not listed, nor are TrueType fonts that do not have the fixed-pitch flag set in the style header.
fdForceFontExist	Allows the user to enter only fonts that are displayed in the dialog (that is, listed in the Font combo box). If the user tries to enter another font name, an error message appears.
fdLimitSize	Enables the MaxFontSize and MinFontSize properties, limiting the range of font sizes that appear in the dialog if these properties have values.
fdNoFaceSel	Causes the dialog to open without a preselected font name in the Font combo box.
fdNoOEMFonts	Removes OEM fonts from the dialog's combo box. Lists only non-OEM fonts.
fdScalableOnly	Displays only scalable fonts in the dialog. Non-scalable (bitmap) fonts are removed from the list.
fdNoSimulations	Displays only fonts and font styles that are directly supported by the font definition file. GDI-synthesized bold and italic styles (for bitmap fonts) are not listed.
fdNoSizeSel	Causes the dialog to open without a preselected size in the Size combo box.
fdNoStyleSel	Causes the dialog to open without a preselected style in the Font Style combo box.
fdNoVectorFonts	Removes vector fonts from the dialog's combo box; lists only non-vector fonts. (Vector fonts are Windows 1.0 fonts, such as Roman or Script, which resemble pen-plotter output.)
fdShowHelp	Displays a Help button in the dialog.
fdTrueTypeOnly	Displays only TrueType fonts in the dialog. Other fonts are not listed.
fdWysiwyg	Displays only fonts that are available to both the printer and the screen. Device-specific fonts are not listed in the dialog.

61.3.9 Dialogs.TMsgDlgBtn Enumeration

TMsgDlgBtn defines a set of values used by MessageDlg (see page 11535) and MessageDlgPos (see page 11537) functions.

Pascal

```
TMsgDlgBtn = (
  mbYes,
  mbNo,
  mbOK,
  mbCancel,
  mbAbort,
  mbRetry,
  mbIgnore,
  mbAll,
  mbNoToAll,
  mbYesToAll,
  mbHelp
);
```

C++

```
enum TMsgDlgBtn {
  mbYes,
```

```
    mbNo,
    mbOK,
    mbCancel,
    mbAbort,
    mbRetry,
    mbIgnore,
    mbAll,
    mbNoToAll,
    mbYesToAll,
    mbHelp
  };
```

File

Dialogs

Description

The TMsgDlgBtn enumeration defines the set of values a button in a message box can have. The TMsgDlgBtn values are used by the MessageDlg (see page 11535) and MessageDlgPos (see page 11537) functions.

The following tables lists the possible values:

Value	Meaning
mbYes	A button with 'Yes' on its face.
mbNo	A button the text 'No' on its face.
mbOK	A button the text 'OK' on its face.
mbCancel	A button with the text 'Cancel' on its face.
mbAbort	A button with the text 'Abort' on its face
mbRetry	A button with the text 'Retry' on its face
mbIgnore	A button the text 'Ignore' on its face
mbAll	A button with the text 'All' on its face
mbNoToAll	A button with the text 'No to All' on its face
mbYesToAll	A button with the text 'Yes to All' on its face
mbHelp	A button with the text 'Help' on its face
mbYesNoCancel (see page 11589)	mbYes, mbNo, and mbCancel
mbYesNoAllCancel	mbYes, mbYesToAll, mbNo, mbNoToAll, and mbCancel
mbOKCancel (see page 11588)	mbOK and mbCancel
mbAbortRetryIgnore (see page 11587)	mbAbort, mbRetry, and mbIgnore
mbAbortIgnore (see page 11586)	mbAbort, mbIgnore

In addition, the Dialogs (see page 11265) unit defines the following constants for commonly used TMsgDlgButton values:

Constant	Meaning
mbYesNoCancel (see page 11589)	mbYes, mbNo, and mbCancel
mbYesNoAllCancel	mbYes, mbYesToAll, mbNo, mbNoToAll, and mbCancel
mbOKCancel (see page 11588)	mbOK and mbCancel

mbAbortRetryIgnore (see page 11587)	mbAbort, mbRetry, and mbIgnore
mbAbortIgnore (see page 11586)	mbAbort, mbIgnore

See Also

MessageDlg (see page 11535)

MessageDlgPos (see page 11537)

TMsgDlgButtons (see page 11575)

61.3.10 Dialogs.TMsgDlgType Enumeration

TMsgDlgType defines values describing the type of message box.

Pascal

```
TMsgDlgType = (
  mtWarning,
  mtError,
  mtInformation,
  mtConfirmation,
  mtCustom
);
```

C++

```
enum TMsgDlgType {
  mtWarning,
  mtError,
  mtInformation,
  mtConfirmation,
  mtCustom
};
```

File

Dialogs

Description

The TMsgDlgType type defines the values describing the type of a message box. The TMsgDlgType is used by the MessageDlg (see page 11535) and MessageDlgPos (see page 11537) functions. The following table lists the possible values:

Value	Meaning
mtWarning	A message box containing a yellow exclamation point symbol.
mtError	A message box containing a red stop sign.
mtInformation	A message box containing a blue "i".
mtConfirmation	A message box containing a green question mark.
mtCustom	A message box containing no bitmap. The caption of the message box is the name of the application's executable file.

61.3.11 Dialogs.TOpenOption Enumeration

TOpenOption and TOpenOptions (see page 11576) determine the behavior of a file selection dialog.

Pascal

```
TOpenOption = (
  ofReadOnly,
  ofOverwritePrompt,
  ofHideReadOnly,
  ofNoChangeDir,
  ofShowHelp,
  ofNoValidate,
  ofAllowMultiSelect,
  ofExtensionDifferent,
  ofPathMustExist,
  ofFileMustExist,
  ofCreatePrompt,
  ofShareAware,
  ofNoReadOnlyReturn,
  ofNoTestFileCreate,
  ofNoNetworkButton,
  ofNoLongNames,
  ofOldStyleDialog,
  ofNoDereferenceLinks,
  ofEnableIncludeNotify,
  ofEnableSizing,
  ofDontAddToRecent,
  ofForceShowHidden
);
```

C++

```
enum TOpenOption {
  ofReadOnly,
  ofOverwritePrompt,
  ofHideReadOnly,
  ofNoChangeDir,
  ofShowHelp,
  ofNoValidate,
  ofAllowMultiSelect,
  ofExtensionDifferent,
  ofPathMustExist,
  ofFileMustExist,
  ofCreatePrompt,
  ofShareAware,
  ofNoReadOnlyReturn,
  ofNoTestFileCreate,
  ofNoNetworkButton,
  ofNoLongNames,
  ofOldStyleDialog,
  ofNoDereferenceLinks,
  ofEnableIncludeNotify,
  ofEnableSizing,
  ofDontAddToRecent,
  ofForceShowHidden
};
```

File

Dialogs

Description

TOpenOption values determine the appearance and behavior of a file selection dialog. TOpenOptions (see page 11576) is a set of TOpenOption values.

The following table lists the possible values:

Value	Meaning
ofReadOnly	Selects the Open As Read Only check box by default when the dialog opens.
ofOverwritePrompt	Generates a warning message if the user tries to select a file name that is already in use, asking whether to overwrite the existing file. (Use with save dialogs.)
ofHideReadOnly	Removes the Open As Read Only check box from the dialog.
ofNoChangeDir	After the user clicks OK, resets the current directory to whatever it was before the file-selection dialog opened.
ofShowHelp	Displays a Help button in the dialog.
ofNoValidate	Disables checking for invalid characters in file names. Allows selection of file names with invalid characters.
ofAllowMultiSelect	Allows users to select more than one file in the dialog.
ofExtensionDifferent	This flag is turned on at runtime whenever the selected filename has an extension that differs from DefaultExt. If you use this flag in an application, remember to reset it.
ofPathMustExist	Generates an error message if the user tries to select a file name with a nonexistent directory path.
ofFileMustExist	Generates an error message if the user tries to select a nonexistent file. (only applies to Open dialogs).
ofCreatePrompt	Generates a warning message if the user tries to select a nonexistent file, asking whether to create a new file with the specified name.
ofShareAware	Ignores sharing errors and allows files to be selected even when sharing violations occur.
ofNoReadOnlyReturn	Generates an error message if the user tries to select a read-only file.
ofNoTestFileCreate	Disables checking for network file protection and inaccessibility of disk drives. Applies only when the user tries to save a file in a create-no-modify shared network directory.
ofNoNetworkButton	Removes the Network button (which opens a Map Network Drive dialog) from the file-selection dialog. Applies only if the ofOldStyleDialog flag is on.
ofNoLongNames	Displays 8.3-character file names only. This option is only valid if Options also includes ofOldStyleDialog.
ofOldStyleDialog	Creates the older style of file-selection dialog.
ofNoDereferenceLinks	Disables dereferencing of Windows shortcuts. If the user selects a shortcut, assigns to FileName the path and file name of the shortcut itself (the .LNK file), rather than the file linked to the shortcut.
ofEnableIncludeNotify	(Windows 2000 and later.) Sends CDN_INCLUDEITEM notification messages to the dialog when the user opens a folder. A notification is sent for each item in the newly opened folder. You can use these messages to control which items appear in the folder's item list.
ofEnableSizing	(Windows 98 and later) Lets the Explorer-style dialog be resized with the mouse or keyboard. By default, the dialog allows this resizing regardless of the value of this option. It is only required if you provide a hook procedure or custom template. (Old style dialogs never permit resizing.)
ofDontAddToRecent	Prevents the file from being added to the list of recently opened files.
ofForceShowHidden	Ensures that hidden files are visible in the dialog.

61.3.12 Dialogs.TOpenOptionEx Enumeration

TOpenOptionEx and TOpenOptionsEx (see page 11578) determine the behavior of a file selection dialog.

Pascal

```
TOpenOptionEx = (
  ofExNoPlacesBar
);
```

C++

```
enum TOpenOptionEx {
  ofExNoPlacesBar
};
```

File

Dialogs

Description

TOpenOptionEx values determine the appearance and behavior of a file selection dialog. TOpenOptionsEx (see page 11578) is a set of TOpenOptionEx values.

61.3.13 Dialogs.TPageMeasureUnits Enumeration

Specifies page setup measure unit types.

Pascal

```
TPageMeasureUnits = (
  pmDefault,
  pmMillimeters,
  pmInches
);
```

C++

```
enum TPageMeasureUnits {
  pmDefault,
  pmMillimeters,
  pmInches
};
```

File

Dialogs

Description

Units determines the measurement units used by the user. TPageMeasureUnits enumerates the possible unit types :

Constant	Meaning
pmDefault	User must specify values in units determined by locale settings.
pmMillimeters	User must specify values in millimeters.
pmInches	User must specify values in inches.

See Also

Units (see page 11454)

61.3.14 Dialogs.TPageSetupDialogOption Enumeration

Pascal

```
TPageSetupDialogOption = (
  psoDefaultMinMargins,
  psoDisableMargins,
  psoDisableOrientation,
  psoDisablePagePainting,
  psoDisablePaper,
  psoDisablePrinter,
  psoMargins,
  psoMinMargins,
  psoShowHelp,
  psoWarning,
  psoNoNetworkButton
);
```

C++

```
enum TPageSetupDialogOption {
  psoDefaultMinMargins,
  psoDisableMargins,
  psoDisableOrientation,
  psoDisablePagePainting,
  psoDisablePaper,
  psoDisablePrinter,
  psoMargins,
  psoMinMargins,
  psoShowHelp,
  psoWarning,
  psoNoNetworkButton
};
```

File

Dialogs

Description

This is record Dialogs.TPageSetupDialogOption.

61.3.15 Dialogs.TPageType Enumeration

TPageType indicates the type of page being configured for printing.

Pascal

```
TPageType = (
  ptEnvelope,
  ptPaper
);
```

C++

```
enum TPageType {
```

```
  ptEnvelope,
  ptPaper
};
```

File

Dialogs

Description

TPageType has one of the following values:

Value	Meaning
ptEnvelope	Page is an envelope.
ptPaper	Page is a sheet of paper.

61.3.16 Dialogs.TPrintDialogOption Enumeration

TPrintDialogOption and TPrintDialogOptions (see page 11580) specify options for a TPrintDialog (see page 11458) component.

Pascal

```
TPrintDialogOption = (
  poPrintToFile,
  poPageNums,
  poSelection,
  poWarning,
  poHelp,
  poDisablePrintToFile
);
```

C++

```
enum TPrintDialogOption {
  poPrintToFile,
  poPageNums,
  poSelection,
  poWarning,
  poHelp,
  poDisablePrintToFile
};
```

File

Dialogs

Description

TPrintDialogOptions (see page 11580) is a set of TPrintDialogOption values. The possible values of TPrintDialogOption are

Value	Meaning
poDisablePrintToFile	Disables (grays) the Print To File Check box. (Applicable only if the poPrintToFile flag is set.)
poHelp	Displays a Help button in the dialog. May not work in some versions of Windows 95.
poPageNums	Enables the Pages radio button, allowing the user to specify a page range.
poPrintToFile	Displays a Print To File check box in the dialog.
poSelection	Enables the Selection radio button, allowing the user to print selected (highlighted) text.
poWarning	Generates a warning message if the user tries to send a job to an uninstalled printer.

61.3.17 Dialogs.TPrinterKind Enumeration

Pascal

```
TPrinterKind = (
  pkDotMatrix,
  pkHPPCL
);
```

C++

```
enum TPrinterKind {
  pkDotMatrix,
  pkHPPCL
};
```

File

Dialogs

Description

This is record Dialogs.TPrinterKind.

61.3.18 Dialogs.TPrintRange Enumeration

TPrintRange indicates how the user specified the set of pages to print.

Pascal

```
TPrintRange = (
  prAllPages,
  prSelection,
  prPageNums
);
```

C++

```
enum TPrintRange {
  prAllPages,
  prSelection,
  prPageNums
};
```

File

Dialogs

Description

The possible values of TPrintRange are

Value	Meaning
prAllPages	The All radio button is selected.
prSelection	The Selection radio button is selected.
prPageNums	The Pages radio button is selected.

61.3.19 Dialogs.TProgressBarState Enumeration

TProgressBarState defines a set of values used by the State property.

Pascal

```
TProgressBarState = (
  pbsNormal,
  pbsError,
  pbsPaused
);
```

C++

```
enum TProgressBarState {
  pbsNormal,
  pbsError,
  pbsPaused
};
```

File

Dialogs

Description

The State property defines the state of a dialog task bar. The TProgressBarState enumeration defines the set of state values :

Value	Meaning
pbsNormal	The dialog is still in process.
pbsError	An error has occured in the dialog.
pbsPaused	The dialog process has been paused.

See Also

State (see page 11527)

61.3.20 Dialogs.TTaskDialogCommonButton Enumeration

Buttons (see page 2289) for Task Dialogs (see page 11265).

Pascal

```
TTaskDialogCommonButton = (
  tcbOk,
  tcbYes,
  tcbNo,
  tcbCancel,
  tcbRetry,
  tcbClose
);
```

C++

```
enum TTaskDialogCommonButton {
  tcbOk,
  tcbYes,
  tcbNo,
```

```
    tcbCancel,
    tcbRetry,
    tcbClose
  };
```

File

Dialogs

Description

The following predefined buttons can appear on Task Dialogs (see page 11265):

Button	Description
tcbOk	OK button.
tcbYes	Yes button.
tcbNo	No button.
tcbCancel	Cancel button.
tcbRetry	Retry button.
tcbClose	Close button.

61.3.21 Dialogs.TTaskDialogFlag Enumeration

Flags for Task Dialogs (see page 11265).

Pascal

```
  TTaskDialogFlag = (
    tfEnableHyperlinks,
    tfUseHiconMain,
    tfUseHiconFooter,
    tfAllowDialogCancellation,
    tfUseCommandLinks,
    tfUseCommandLinksNoIcon,
    tfExpandFooterArea,
    tfExpandedByDefault,
    tfVerificationFlagChecked,
    tfShowProgressBar,
    tfShowMarqueeProgressBar,
    tfCallbackTimer,
    tfPositionRelativeToWindow,
    tfRtlLayout,
    tfNoDefaultRadioButton,
    tfCanBeMinimized
  );
```

C++

```
  enum TTaskDialogFlag {
    tfEnableHyperlinks,
    tfUseHiconMain,
    tfUseHiconFooter,
    tfAllowDialogCancellation,
    tfUseCommandLinks,
    tfUseCommandLinksNoIcon,
    tfExpandFooterArea,
    tfExpandedByDefault,
    tfVerificationFlagChecked,
    tfShowProgressBar,
```

```
    tfShowMarqueeProgressBar,
    tfCallbackTimer,
    tfPositionRelativeToWindow,
    tfRtlLayout,
    tfNoDefaultRadioButton,
    tfCanBeMinimized
  };
```

File

Dialogs

Description

The following flags specify options for Task Dialogs (see page 11265):

Flag	Description
tfEnableHyperlinks	If set, content, footer, and expanded text can include hyperlinks.
tfUseHiconMain	if set, use the custom main icon.
tfUseHiconFooter	If set, use the custom footer icon.
tfAllowDialogCancellation	If set, permits Task Dialog to be closed in the absence of a **Cancel** button.
tfUseCommandLinks	If set, buttons are displayed as command links using a standard dialog glyph.
tfUseCommandLinksNoIcon	If set, buttons are displayed as command links without a glyph.
tfExpandFooterArea	If set, display expanded text in the footer.
tfExpandedByDefault	If set, expanded text is displayed when the Task Dialog opens.
tfVerificationFlagChecked	If set, the verification check box is initially checked.
tfShowProgressBar	If set, display the progress bar.
tfShowMarqueeProgressBar	If set, display marquee progress bar.
tfCallbackTimer	If set, dialogs callback will be called every 200 milliseconds.
tfPositionRelativeToWindow	If set, Task Dialog is centered with respect to parent window.
tfRtlLayout	If set, text reads right-to-left.
tfNoDefaultRadioButton	If set, there is no default radio button.
tfCanBeMinimized	If set, the Task Dialog can be minimized.

61.4 Types

The following table lists types in this documentation.

Types

Name	Description
TColorDialogOptions (see page 11568)	TColorDialogOption (see page 11548) and TColorDialogOptions specify options for a TColorDialog (see page 11270) component.
TCustomColors (see page 11569)	TCustomColors is an array that holds the color values for your custom colors.
TFDApplyEvent (see page 11569)	TFDApplyEvent is the type for event handlers that respond when the user clicks the Apply button in a nonmodal font dialog.
TFileDialogCloseEvent (see page 11570)	Event for user clicking OK.
TFileDialogFolderChangingEvent (see page 11570)	Event before a directory is opened or closed from the dialog.
TFileDialogOptions (see page 11571)	The settings in TFileDialogOptions determine the behavior of a TCustomFileDialog (see page 11288) file dialog. TFileDialogOptions is a set of TFileDialogOptions. These options are the same as the options for the Microsoft IFileDialog::GetOptions and IFileDialog::SetOptions functions.
TFileDialogOverwriteEvent (see page 11572)	Event just before a file would be overwritten.
TFileDialogShareViolationEvent (see page 11572)	Event when sharing violations arise from open or save operations.
TFindOptions (see page 11573)	TFindOption (see page 11553) and TFindOptions determine the controls that appear in a find dialog.
TFindReplaceFunc (see page 11574)	This is type Dialogs.TFindReplaceFunc.
TFontDialogOptions (see page 11574)	TFontDialogOption (see page 11555) and TFontDialogOptions are flags that influence the appearance and behavior of a font dialog.
TIncludeItemEvent (see page 11575)	This is type Dialogs.TIncludeItemEvent.
TMsgDlgButtons (see page 11575)	TMsgDlgButtons defines a set of values used by MessageDlg (see page 11535) and MessageDlgPos (see page 11537).
TOFNotifyEx (see page 11576)	This is type Dialogs.TOFNotifyEx.
TOpenOptions (see page 11576)	TOpenOption (see page 11559) and TOpenOptions determine the behavior of a file selection dialog.
TOpenOptionsEx (see page 11578)	TOpenOptionEx (see page 11561) and TOpenOptionsEx determine the behavior of a file selection dialog.
TPageSetupBeforePaintEvent (see page 11578)	TPageSetupBeforePaintEvent defines the class method called by the BeforePaint event.
TPageSetupDialogOptions (see page 11579)	Specifies page setup dialog options.
TPaintPageEvent (see page 11579)	TPageSetupBeforePaintEvent (see page 11578) defines the class method called by various TPageSetupDialog (see page 11441) events.
TPrintDialogOptions (see page 11580)	TPrintDialogOption (see page 11563) and TPrintDialogOptions specify options for a TPrintDialog (see page 11458) component.
TPrinterOrientation (see page 11581)	TPrinterOrientation indicates the orientation of pages when printing.
TTaskDialogButtonList (see page 11581)	This is type Dialogs.TTaskDialogButtonList.
TTaskDialogCommonButtons (see page 11582)	An array of Buttons (see page 2289) for Task Dialogs (see page 11265).
TTaskDialogFlags (see page 11582)	Flags for Task Dialogs (see page 11265).
TTaskDialogIcon (see page 11583)	This is type Dialogs.TTaskDialogIcon.
TTaskDlgClickEvent (see page 11583)	Event for a button click in a Task Dialog.
TTaskDlgTimerEvent (see page 11584)	Event for the Task Dialog timer.

61.4.1 Dialogs.TColorDialogOptions Type

TColorDialogOption (see page 11548) and TColorDialogOptions specify options for a TColorDialog (see page 11270) component.

Pascal

```
TColorDialogOptions = set of TColorDialogOption;
```

C++

```
TColorDialogOption TColorDialogOptions;
```

File

Dialogs

Description

TColorDialogOptions is a set of TColorDialogOption (see page 11548) values. The possible values of TColorDialogOption (see page 11548) are

Value	Meaning
cdFullOpen	Display custom color options when the dialog opens.
cdPreventFullOpen	Disable the Define Custom Colors button in the dialog, so that the user cannot define new colors.
cdShowHelp	Add a Help button to the color dialog.
cdSolidColor	Direct Windows to use the nearest solid color to the color chosen.
cdAnyColor	Allow the user to select non-solid colors (which may have to be approximated by dithering).

61.4.2 Dialogs.TCustomColors Type

TCustomColors is an array that holds the color values for your custom colors.

Pascal

```
TCustomColors = array[0..MaxCustomColors - 1] of Longint;
```

C++

```
array[0..MaxCustomColors - 1] of Longint TCustomColors;
```

File

Dialogs

Description

TCustomColors is an array that holds the color values for the custom colors you create using TColorDialog (see page 11270). As many as 16 custom colors (ColorA through ColorP) can be set.

61.4.3 Dialogs.TFDApplyEvent Type

TFDApplyEvent is the type for event handlers that respond when the user clicks the Apply button in a nonmodal font dialog.

Pascal

```
TFDApplyEvent = procedure (Sender: TObject; Wnd: HWND) of object;
```

C++

```
(Sender: TObject; Wnd: HWND) ( TFDApplyEvent)();
```

File

Dialogs

Description

Sender is the TFontDialog (see page 11394) component that displays the dialog.

Wnd is the Font dialog's window handle. Wnd has the same value as the Handle property of Sender.

61.4.4 Dialogs.TFileDialogCloseEvent Type

Event for user clicking OK.

Pascal

```
TFileDialogCloseEvent = procedure (Sender: TObject; var CanClose: Boolean) of object;
```

C++

```
(Sender: TObject; var CanClose: Boolean) ( TFileDialogCloseEvent)();
```

File

Dialogs

Description

TFileDialogCloseEvent is the event for the user clicking OK. If defined, the OnFileOkClick property contains a pointer to this event.

See Also

TCustomFileDialog (see page 11288)

OnFileOkClick (see page 11306)

61.4.5 Dialogs.TFileDialogFolderChangingEvent Type

Event before a directory is opened or closed from the dialog.

Pascal

```
TFileDialogFolderChangingEvent = procedure (Sender: TObject; var CanChange: Boolean) of object;
```

C++

```
(Sender: TObject; var CanChange: Boolean) ( TFileDialogFolderChangingEvent)();
```

File

Dialogs

Description

TFileDialogFolderChangingEvent is the event that occurs just before a directory is opened or closed from the dialog. If defined, the OnFolderChanging property contains a pointer to this event.

See Also

TCustomFileDialog (see page 11288)

OnFolderChanging (see page 11307)

61.4.6 Dialogs.TFileDialogOptions Type

The settings in TFileDialogOptions determine the behavior of a TCustomFileDialog (see page 11288) file dialog. TFileDialogOptions is a set of TFileDialogOptions. These options are the same as the options for the Microsoft IFileDialog::GetOptions and IFileDialog::SetOptions functions.

Pascal

```
TFileDialogOptions = set of TFileDialogOption;
```

C++

```
TFileDialogOption TFileDialogOptions;
```

File

Dialogs

Description

The following table lists the possible values:

Value	Meaning
fdoOverWritePrompt	Prompt before overwriting an existing file of the same name when saving a file. This is a default for save dialogs.
fdoStrictFileTypes	The file extension of a saved file being must match the selected file type.
fdoNoChangeDir	Unused.
fdoPickFolders	Choose folders rather than files.
fdoForceFileSystem	Returned items must be file system items.
fdoAllNonStorageItems	Allow users to choose any item in the Shell namespace. This flag cannot be combined with fdoForceFileSystem.
fdoNoValidate	Do not check for situations preventing applications from opening selected files, such as sharing violations or access denied errors.
fdoAllowMultiSelect	Allow selecting multiple items in an open dialog.
fdoPathMustExist	Items returned must be in an existing folder. This is a default.
fdoFileMustExist	Items returned must exist. This is a default value for open dialogs.
fdoCreatePrompt	Prompt for creation if returned item in save dialog does not exist. This does not create the item.
fdoShareAware	For a sharing violation opening a file, call the application back for guidance. This flag is overridden by fdoNoValidate.
fdoNoReadOnlyReturn	Do not return read-only items.
fdoNoTestFileCreate	Do not test creation of returned item from save dialogs. If not set, the calling application must handle errors discovered in the creation test.
fdoHideMRUPlaces	Hide places of recently opened or saved items.
fdoHidePinnedPlaces	Hide pinned places from which users can choose.
fdoNoDereferenceLinks	Shortcuts are not treated as their target items, allowing applications to open .lnk files.
fdoDontAddToRecent	Do not add the item being opened or saved to the list of recent places.
fdoForceShowHidden	Show hidden items.

fdoDefaultNoMiniMode	Open save dialog box in expanded mode in which users can browse folders. Expanded mode is set and unset by clicking the button in the lower-left corner of a save dialog box.
fdoForcePreviewPaneOn	Display the preview pane.

61.4.7 Dialogs.TFileDialogOverwriteEvent Type

Event just before a file would be overwritten.

Pascal

```
TFileDialogOverwriteEvent = procedure (Sender: TObject; var Response:
TFileDialogOverwriteResponse) of object;
```

C++

```
(Sender: TObject; var Response: TFileDialogOverwriteResponse) ( TFileDialogOverwriteEvent)();
```

File

Dialogs

Description

TFileDialogOverwriteEvent is the event just before a file would be overwritten from a save operation. If defined, the OnOverwrite property contains a pointer to this event.

See Also

TCustomFileDialog (see page 11288)

OnOverwrite (see page 11307)

61.4.8 Dialogs.TFileDialogShareViolationEvent Type

Event when sharing violations arise from open or save operations.

Pascal

```
TFileDialogShareViolationEvent = procedure (Sender: TObject; var Response:
TFileDialogShareViolationResponse) of object;
```

C++

```
(Sender: TObject; var Response: TFileDialogShareViolationResponse) (
TFileDialogShareViolationEvent)();
```

File

Dialogs

Description

TFileDialogShareViolationEvent is the event for sharing violations that arise from open or save operations. If defined, the OnShareViolation property contains a pointer to this event.

See Also

TCustomFileDialog (see page 11288)

OnShareViolation (see page 11308)

61.4.9 Dialogs.TFindOptions Type

TFindOption (see page 11553) and TFindOptions determine the controls that appear in a find dialog.

Pascal

```
TFindOptions = set of TFindOption;
```

C++

```
TFindOption TFindOptions;
```

File

Dialogs

Description

TFindOption (see page 11553) values determine which controls are enabled in a TFindDialog (see page 11376) instance, and how the controls are initialized.

TFindOptions is a set of TFindOption (see page 11553) values.

The following table lists the possible values:

Value	Meaning
frDisableMatchCase	Disables (grays) the Match Case check box in a find dialog.
frDisableUpDown	Disables (grays) the Up and Down buttons, which determine the direction of the search.
frDisableWholeWord	Disables (grays) the Match Whole Word check box of find dialog.
frDown	Selects the Down button by default when the dialog opens. If the frDown flags is off, Up is selected when the dialog opens. (By default, frDown is on.)
frFindNext	This flag is turned on when the user clicks the Find Next button and turned off when the dialog closes.
frHideMatchCase	Removes the Match Case check box from the dialog.
frHideWholeWord	Removes the Match Whole Word check box from the dialog.
frHideUpDown	Removes the Up and Down buttons from the dialog.
frMatchCase	This flag is turned on (off) when the user selects (deselects) the Match Case check box. To select the check box by default when the dialog opens, set frMatchCase at design time.
frReplace	Applies to TReplaceDialog (see page 11482) only. This flag is set by the system to indicate that the application should replace the current occurrence (and only the current occurrence) of the FindText string with the ReplaceText string. Not used in search routines.
frReplaceAll	Applies to TReplaceDialog (see page 11482) only. This flag is set by the system to indicate that the application should replace all occurrences of the FindText string with the ReplaceText string.
frShowHelp	Displays a Help button in the dialog.
frWholeWord	This flag is turned on (off) when the user selects (deselects) the Match Whole Word check box. To select the check box by default when the dialog opens, set frWholeWord at design time.

61.4.10 Dialogs.TFindReplaceFunc Type

Pascal

```
TFindReplaceFunc = function (var FindReplace: TFindReplace): HWnd stdcall;
```

C++

```
(var FindReplace: TFindReplace): HWnd stdcall ( TFindReplaceFunc)();
```

File

Dialogs

Description

This is type Dialogs.TFindReplaceFunc.

61.4.11 Dialogs.TFontDialogOptions Type

TFontDialogOption (see page 11555) and TFontDialogOptions are flags that influence the appearance and behavior of a font dialog.

Pascal

```
TFontDialogOptions = set of TFontDialogOption;
```

C++

```
TFontDialogOption TFontDialogOptions;
```

File

Dialogs

Description

TFontDialogOptions is a set of TFontDialogOption (see page 11555) values. These are the possible values of TFontDialogOption (see page 11555):

Value	Meaning
fdAnsiOnly	Displays only fonts that use the Windows character set. Symbol fonts are not listed in the dialog.
fdApplyButton	Displays an Apply button in the dialog, whether or not there is an OnApply event handler.
fdEffects	Displays the Effects check boxes (Strikeout and Underline) and the Color list box in the dialog.
fdFixedPitchOnly	Displays only monospaced fonts in the dialog. Proportionally spaced fonts are not listed, nor are TrueType fonts that do not have the fixed-pitch flag set in the style header.
fdForceFontExist	Allows the user to enter only fonts that are displayed in the dialog (that is, listed in the Font combo box). If the user tries to enter another font name, an error message appears.
fdLimitSize	Enables the MaxFontSize and MinFontSize properties, limiting the range of font sizes that appear in the dialog if these properties have values.
fdNoFaceSel	Causes the dialog to open without a preselected font name in the Font combo box.
fdNoOEMFonts	Removes OEM fonts from the dialog's combo box. Lists only non-OEM fonts.
fdScalableOnly	Displays only scalable fonts in the dialog. Non-scalable (bitmap) fonts are removed from the list.

fdNoSimulations	Displays only fonts and font styles that are directly supported by the font definition file. GDI-synthesized bold and italic styles (for bitmap fonts) are not listed.
fdNoSizeSel	Causes the dialog to open without a preselected size in the Size combo box.
fdNoStyleSel	Causes the dialog to open without a preselected style in the Font Style combo box.
fdNoVectorFonts	Removes vector fonts from the dialog's combo box; lists only non-vector fonts. (Vector fonts are Windows 1.0 fonts, such as Roman or Script, which resemble pen-plotter output.)
fdShowHelp	Displays a Help button in the dialog.
fdTrueTypeOnly	Displays only TrueType fonts in the dialog. Other fonts are not listed.
fdWysiwyg	Displays only fonts that are available to both the printer and the screen. Device-specific fonts are not listed in the dialog.

61.4.12 Dialogs.TIncludeItemEvent Type

Pascal

```
TIncludeItemEvent = procedure (const OFN: TOFNotifyEx; var Include: Boolean) of object;
```

C++

```
(const OFN: TOFNotifyEx; var Include: Boolean) ( TIncludeItemEvent)();
```

File

Dialogs

Description

This is type Dialogs.TIncludeItemEvent.

61.4.13 Dialogs.TMsgDlgButtons Type

TMsgDlgButtons defines a set of values used by MessageDlg (see page 11535) and MessageDlgPos (see page 11537).

Pascal

```
TMsgDlgButtons = set of TMsgDlgBtn;
```

C++

```
TMsgDlgBtn TMsgDlgButtons;
```

File

Dialogs

Description

The TMsgDlgButtons type defines the set of values a button in a message box can have. The TMsgDlgButtons type is used by the MessageDlg (see page 11535) and MessageDlgPos (see page 11537) functions. The following tables lists the possible values:

Value	Meaning
mbYes	A button with 'Yes' on its face.

mbNo	A button the text 'No' on its face.
mbOK	A button the text 'OK' on its face.
mbCancel	A button with the text 'Cancel' on its face.
mbAbort	A button with the text 'Abort' on its face
mbRetry	A button with the text 'Retry' on its face
mbIgnore	A button the text 'Ignore' on its face
mbAll	A button with the text 'All' on its face
mbNoToAll	A button with the text 'No to All' on its face
mbYesToAll	A button with the text 'Yes to All' on its face
mbHelp	A button with the text 'Help' on its face

In addition, the Dialogs (see page 11265) unit defines the following constants for commonly used TMsgDlgButtons values:

Constant	Meaning
mbYesNoCancel (see page 11589)	mbYes, mbNo, and mbCancel
mbYesNoAllCancel	mbYes, mbYesToAll, mbNo, mbNoToAll, and mbCancel
mbOKCancel (see page 11588)	mbOK and mbCancel
mbAbortRetryIgnore (see page 11587)	mbAbort, mbRetry, and mbIgnore
mbAbortIgnore (see page 11586)	mbAbort, mbIgnore

61.4.14 Dialogs.TOFNotifyEx Type

Pascal

```
TOFNotifyEx = type CommDlg.TOFNotifyEx;
```

C++

```
type CommDlg.TOFNotifyEx TOFNotifyEx;
```

File

Dialogs

Description

This is type Dialogs.TOFNotifyEx.

61.4.15 Dialogs.TOpenOptions Type

TOpenOption (see page 11559) and TOpenOptions determine the behavior of a file selection dialog.

Pascal

```
TOpenOptions = set of TOpenOption;
```

C++

```
TOpenOption TOpenOptions;
```

File

Dialogs

Description

TOpenOption (see page 11559) values determine the appearance and behavior of a file selection dialog. TOpenOptions is a set of TOpenOption (see page 11559) values.

The following table lists the possible values:

Value	Meaning
ofReadOnly	Selects the Open As Read Only check box by default when the dialog opens.
ofOverwritePrompt	Generates a warning message if the user tries to select a file name that is already in use, asking whether to overwrite the existing file. (Use with save dialogs.)
ofHideReadOnly	Removes the Open As Read Only check box from the dialog.
ofNoChangeDir	After the user clicks OK, resets the current directory to whatever it was before the file-selection dialog opened.
ofShowHelp	Displays a Help button in the dialog.
ofNoValidate	Disables checking for invalid characters in file names. Allows selection of file names with invalid characters.
ofAllowMultiSelect	Allows users to select more than one file in the dialog.
ofExtensionDifferent	This flag is turned on at runtime whenever the selected filename has an extension that differs from DefaultExt. If you use this flag in an application, remember to reset it.
ofPathMustExist	Generates an error message if the user tries to select a file name with a nonexistent directory path.
ofFileMustExist	Generates an error message if the user tries to select a nonexistent file. (only applies to Open dialogs).
ofCreatePrompt	Generates a warning message if the user tries to select a nonexistent file, asking whether to create a new file with the specified name.
ofShareAware	Ignores sharing errors and allows files to be selected even when sharing violations occur.
ofNoReadOnlyReturn	Generates an error message if the user tries to select a read-only file.
ofNoTestFileCreate	Disables checking for network file protection and inaccessibility of disk drives. Applies only when the user tries to save a file in a create-no-modify shared network directory.
ofNoNetworkButton	Removes the Network button (which opens a Map Network Drive dialog) from the file-selection dialog. Applies only if the ofOldStyleDialog flag is on.
ofNoLongNames	Displays 8.3-character file names only. This option is only valid if Options also includes ofOldStyleDialog.
ofOldStyleDialog	Creates the older style of file-selection dialog.
ofNoDereferenceLinks	Disables dereferencing of Windows shortcuts. If the user selects a shortcut, assigns to FileName the path and file name of the shortcut itself (the .LNK file), rather than the file linked to the shortcut.
ofEnableIncludeNotify	(Windows 2000 and later.) Sends CDN_INCLUDEITEM notification messages to the dialog when the user opens a folder. A notification is sent for each item in the newly opened folder. You can use these messages to control which items appear in the folder's item list.
ofEnableSizing	(Windows 98 and later) Lets the Explorer-style dialog be resized with the mouse or keyboard. By default, the dialog allows this resizing regardless of the value of this option. It is only required if you provide a hook procedure or custom template. (Old style dialogs never permit resizing.)
ofDontAddToRecent	Prevents the file from being added to the list of recently opened files.

ofForceShowHidden	Ensures that hidden files are visible in the dialog.

61.4.16 Dialogs.TOpenOptionsEx Type

TOpenOptionEx (see page 11561) and TOpenOptionsEx determine the behavior of a file selection dialog.

Pascal

```
TOpenOptionsEx = set of TOpenOptionEx;
```

C++

```
TOpenOptionEx TOpenOptionsEx;
```

File

Dialogs

Description

TOpenOptionEx (see page 11561) values determine the appearance and behavior of a file selection dialog. TOpenOptionsEx is a set of TOpenOptionEx (see page 11561) values.

61.4.17 Dialogs.TPageSetupBeforePaintEvent Type

TPageSetupBeforePaintEvent defines the class method called by the BeforePaint event.

Pascal

```
TPageSetupBeforePaintEvent = procedure (Sender: TObject; const PaperSize: SmallInt; const
Orientation: TPrinterOrientation; const PageType: TPageType; var DoneDrawing: Boolean) of
object;
```

C++

```
(Sender: TObject; const PaperSize: SmallInt; const Orientation: TPrinterOrientation; const
PageType: TPageType; var DoneDrawing: Boolean) ( TPageSetupBeforePaintEvent)();
```

File

Dialogs

Description

The BeforePaint event occurs before dialog draws sample page. Write a BeforePaint event handler to initialize data used by the other event handlers.

PaperSize indicates a standard Windows paper size. See Paper size constants.

Orientation indicates the paper orientation currently selected.

PageType indicates the kind of paper currently selected.

Set **DoneDrawing** to true to disable further painting. This results in a blank sample page, with none of the other event handlers being called.

See Also

BeforePaint (see page 11455)

TPageSetupDialog (see page 11441)

61.4.18 Dialogs.TPageSetupDialogOptions Type

Specifies page setup dialog options.

Pascal

```
TPageSetupDialogOptions = set of TPageSetupDialogOption;
```

C++

```
TPageSetupDialogOption TPageSetupDialogOptions;
```

File

Dialogs

Description

Options specifies the options for the page setup dialog. TPageSetupDialogOptions enumerates the possible unit types :

Option	Meaning
psoDefaultMinMargins	Sets the minimum values that the user can specify for the page margins to be the minimum margins allowed by the printer.
psoDisableMargins	Disables the margin controls, preventing the user from setting the margins.
psoDisableOrientation	Disables the orientation controls, preventing the user from setting the page orientation.
psoDisablePagePainting	Prevents default sample page drawing. Does not disable event calls.
psoDisablePaper	Disables the paper controls, preventing the user from setting page parameters such as the paper size and source.
psoDisablePrinter	Disables the Printer button, preventing the user from invoking a dialog box that contains additional printer setup information.
psoMargins	Sets the initial margins from MarginLeft, MarginRight, MarginBottom, and MarginTop properties. Otherwise, initial margins are one inch each.
psoMinMargins	Sets the minimum margins from MinMarginLeft, MinMarginRight, MinMarginBottom, and MinMarginTop. Otherwise, minimum margins are determined by the printer driver.
psoShowHelp	Displays Help button and Help title bar button.
psoWarning	Prevents display of warning when there is no default printer.
psoNoNetworkButton	Hides and disables Network button.

See Also

Options (see page 11452)

61.4.19 Dialogs.TPaintPageEvent Type

TPageSetupBeforePaintEvent (see page 11578) defines the class method called by various TPageSetupDialog (see page 11441) events.

Pascal

```
TPaintPageEvent = procedure (Sender: TObject; Canvas: TCanvas; PageRect: TRect; var
DoneDrawing: Boolean) of object;
```

C++

```
(Sender: TObject; Canvas: TCanvas; PageRect: TRect; var DoneDrawing: Boolean) (
TPaintPageEvent)();
```

File

Dialogs

Description

The TPaintPageEvent class method is called by a number of events that are involved in the painting of the Page Setup Dialog illustrative page image.

Sender is a reference to the calling TPageSetupDialog (see page 11441) instance.

Canvas is a reference to the Page Setup Dialog canvas.

PageRect gives the bounds of the item being drawn that resulted in the event.

Set **DoneDrawing** to true to disable further painting. This results in a blank sample page, with none of the other event handlers being called.

See Also

OnDrawFullPage (see page 11456)

OnDrawMinMargin (see page 11457)

OnDrawMargin (see page 11457)

OnDrawGreekText (see page 11456)

OnDrawEnvStamp (see page 11455)

OnDrawRetAddress (see page 11458)

TPageSetupDialog (see page 11441)

61.4.20 Dialogs.TPrintDialogOptions Type

TPrintDialogOption (see page 11563) and TPrintDialogOptions specify options for a TPrintDialog (see page 11458) component.

Pascal

```
TPrintDialogOptions = set of TPrintDialogOption;
```

C++

```
TPrintDialogOption TPrintDialogOptions;
```

File

Dialogs

Description

TPrintDialogOptions is a set of TPrintDialogOption (see page 11563) values. The possible values of TPrintDialogOption (see page 11563) are

Value	Meaning
poDisablePrintToFile	Disables (grays) the Print To File Check box. (Applicable only if the poPrintToFile flag is set.)
poHelp	Displays a Help button in the dialog. May not work in some versions of Windows 95.
poPageNums	Enables the Pages radio button, allowing the user to specify a page range.
poPrintToFile	Displays a Print To File check box in the dialog.
poSelection	Enables the Selection radio button, allowing the user to print selected (highlighted) text.
poWarning	Generates a warning message if the user tries to send a job to an uninstalled printer.

61.4.21 Dialogs.TPrinterOrientation Type

TPrinterOrientation indicates the orientation of pages when printing.

Pascal

```
TPrinterOrientation = Printers.TPrinterOrientation;
```

C++

```
Printers.TPrinterOrientation TPrinterOrientation;
```

File

Dialogs

Description

These are the possible values for TPrinterOrientation:

Value	Meaning
poPortrait	The job prints vertically on the page.
poLandscape	The job prints horizontally on the page.

61.4.22 Dialogs.TTaskDialogButtonList Type

Pascal

```
TTaskDialogButtonList = array of TTaskDialogButton;
```

C++

```
array of TTaskDialogButton TTaskDialogButtonList;
```

File

Dialogs

Description

This is type Dialogs.TTaskDialogButtonList.

61.4.23 Dialogs.TTaskDialogCommonButtons Type

An array of Buttons (see page 2289) for Task Dialogs (see page 11265).

Pascal

```
TTaskDialogCommonButtons = set of TTaskDialogCommonButton;
```

C++

```
TTaskDialogCommonButton TTaskDialogCommonButtons;
```

File

Dialogs

Description

The following predefined buttons can appear on Task Dialogs (see page 11265):

Button	Description
tcbOk	OK button.
tcbYes	Yes button.
tcbNo	No button.
tcbCancel	Cancel button.
tcbRetry	Retry button.
tcbClose	Close button.

61.4.24 Dialogs.TTaskDialogFlags Type

Flags for Task Dialogs (see page 11265).

Pascal

```
TTaskDialogFlags = set of TTaskDialogFlag;
```

C++

```
TTaskDialogFlag TTaskDialogFlags;
```

File

Dialogs

Description

The following flags specify options for Task Dialogs (see page 11265):

Flag	Description
tfEnableHyperlinks	If set, content, footer, and expanded text can include hyperlinks.
tfUseHiconMain	if set, use the custom main icon.
tfUseHiconFooter	If set, use the custom footer icon.

tfAllowDialogCancellation	If set, permits Task Dialog to be closed in the absence of a **Cancel** button.
tfUseCommandLinks	If set, buttons are displayed as command links using a standard dialog glyph.
tfUseCommandLinksNoIcon	If set, buttons are displayed as command links without a glyph.
tfExpandFooterArea	If set, display expanded text in the footer.
tfExpandedByDefault	If set, expanded text is displayed when the Task Dialog opens.
tfVerificationFlagChecked	If set, the verification check box is initially checked.
tfShowProgressBar	If set, display the progress bar.
tfShowMarqueeProgressBar	If set, display marquee progress bar.
tfCallbackTimer	If set, dialogs callback will be called every 200 milliseconds.
tfPositionRelativeToWindow	If set, Task Dialog is centered with respect to parent window.
tfRtlLayout	If set, text reads right-to-left.
tfNoDefaultRadioButton	If set, there is no default radio button.
tfCanBeMinimized	If set, the Task Dialog can be minimized.

61.4.25 Dialogs.TTaskDialogIcon Type

Pascal

```
TTaskDialogIcon = Low(Integer)..High(Integer);
```

C++

```
Low(Integer)..High(Integer) TTaskDialogIcon;
```

File

Dialogs

Description

This is type Dialogs.TTaskDialogIcon.

61.4.26 Dialogs.TTaskDlgClickEvent Type

Event for a button click in a Task Dialog.

Pascal

```
TTaskDlgClickEvent = procedure (Sender: TObject; ModalResult: TModalResult; var CanClose:
Boolean) of object;
```

C++

```
(Sender: TObject; ModalResult: TModalResult; var CanClose: Boolean) ( TTaskDlgClickEvent)();
```

File

Dialogs

Description

OnButtonClicked is the event for a button click in a Task Dialog.

61.4.27 Dialogs.TTaskDlgTimerEvent Type

Event for the Task Dialog timer.

Pascal

```
TTaskDlgTimerEvent = procedure (Sender: TObject; TickCount: Cardinal; var Reset: Boolean) of
object;
```

C++

```
(Sender: TObject; TickCount: Cardinal; var Reset: Boolean) ( TTaskDlgTimerEvent)();
```

File

Dialogs

Description

OnTimer is the timer event for a Task Dialog.

61.5 Variables

The following table lists variables in this documentation.

Variables

Name	Description
ForceCurrentDirectory (see page 11585)	Indicates whether open and save dialogs should display the current directory if no initial directory is assigned.
UseLatestCommonDialogs (see page 11585)	This is variable Dialogs.UseLatestCommonDialogs.

61.5.1 Dialogs.ForceCurrentDirectory Variable

Indicates whether open and save dialogs should display the current directory if no initial directory is assigned.

Pascal

```
ForceCurrentDirectory: Boolean = False;
```

C++

```
Boolean ForceCurrentDirectory = False;
```

File

Dialogs

Description

ForceCurrentDirectory indicates how open and save dialogs should initialize the directory if the InitialDir property is not set to a valid directory. When ForceCurrentDirectory is **True**, the dialog opens with the current directory assigned. When ForceCurrentDirectory is **False**, the initial directory is either the current directory or the My Documents directory, depending on the version of Windows.

TOpenDialog (see page 11407)

61.5.2 Dialogs.UseLatestCommonDialogs Variable

Pascal

```
UseLatestCommonDialogs: Boolean = False;
```

C++

```
Boolean UseLatestCommonDialogs = False;
```

File

Dialogs

Description

This is variable Dialogs.UseLatestCommonDialogs.

61.6 Constants

The following table lists constants in this documentation.

Constants

Name	Description
MaxCustomColors (see page 11586)	The number of custom colors on a Color Dialog.
mbAbortIgnore (see page 11586)	Used to define a dialog with Abort and Ignore buttons.
mbAbortRetryIgnore (see page 11587)	Used to define a dialog with Abort, Retry and Ignore buttons.
mbOKCancel (see page 11588)	Used to define a dialog with OK and Cancel buttons.
mbYesAllNoAllCancel (see page 11588)	This is constant Dialogs.mbYesAllNoAllCancel.
mbYesNo (see page 11589)	Used to define a dialog with Yes and No buttons.
mbYesNoCancel (see page 11589)	Used to define a dialog with Yes, No and Cancel buttons.
tdiError (see page 11590)	This is constant Dialogs.tdiError.
tdiInformation (see page 11590)	This is constant Dialogs.tdiInformation.
tdiNone (see page 11591)	This is constant Dialogs.tdiNone.
tdiShield (see page 11591)	This is constant Dialogs.tdiShield.
tdiWarning (see page 11591)	This is constant Dialogs.tdiWarning.

61.6.1 Dialogs.MaxCustomColors Constant

The number of custom colors on a Color Dialog.

Pascal

```
MaxCustomColors = 16;
```

C++

```
MaxCustomColors = 16;
```

File

Dialogs

Description

The CustomColors property is used to define colors to be displayed in some or all of the 16 custom color boxes on a TColorDialog (see page 11270). This limit of 16 is defined by MaxCustomColors.

See Also

CustomColors (see page 11276)

TColorDialog (see page 11270)

61.6.2 Dialogs.mbAbortIgnore Constant

Used to define a dialog with Abort and Ignore buttons.

Pascal

```
mbAbortIgnore = [mbAbort, mbIgnore];
```

C++

```
mbAbortIgnore = [mbAbort, mbIgnore];
```

File

Dialogs

Description

The TMsgDlgButtons (see page 11575) type defines the set of values a button in a message box can have. mbAbortIgnore value defines a dialog with Abort and Ignore buttons.

See Also

mbAbortRetryIgnore (see page 11587)

mbOKCancel (see page 11588)

mbYesNoAllCancel

mbYesNo (see page 11589)

mbYesNoCancel (see page 11589)

MessageDlg (see page 11535)

MessageDlgPos (see page 11537)

MessageDlgPosHelp (see page 11539)

TMsgDlgButtons (see page 11575)

61.6.3 Dialogs.mbAbortRetryIgnore Constant

Used to define a dialog with Abort, Retry and Ignore buttons.

Pascal

```
mbAbortRetryIgnore = [mbAbort, mbRetry, mbIgnore];
```

C++

```
mbAbortRetryIgnore = [mbAbort, mbRetry, mbIgnore];
```

File

Dialogs

Description

The TMsgDlgButtons (see page 11575) type defines the set of values a button in a message box can have. mbAbortRetryIgnore value defines a dialog with Abort, Retry and Ignore buttons.

See Also

mbAbortIgnore (see page 11586)

mbOKCancel (see page 11588)

mbYesNoAllCancel

mbYesNo (see page 11589)

mbYesNoCancel (see page 11589)

MessageDlg (see page 11535)

MessageDlgPos (see page 11537)

MessageDlgPosHelp (see page 11539)

TMsgDlgButtons (see page 11575)

61.6.4 Dialogs.mbOKCancel Constant

Used to define a dialog with OK and Cancel buttons.

Pascal

```
mbOKCancel = [mbOK, mbCancel];
```

C++

```
mbOKCancel = [mbOK, mbCancel];
```

File

Dialogs

Description

The TMsgDlgButtons (see page 11575) type defines the set of values a button in a message box can have. mbOKCancel value defines a dialog with OK and Cancel buttons.

See Also

mbAbortIgnore (see page 11586)

mbAbortRetryIgnore (see page 11587)

mbYesNoAllCancel

mbYesNo (see page 11589)

mbYesNoCancel (see page 11589)

MessageDlg (see page 11535)

MessageDlgPos (see page 11537)

MessageDlgPosHelp (see page 11539)

TMsgDlgButtons (see page 11575)

61.6.5 Dialogs.mbYesAllNoAllCancel Constant

Pascal

```
mbYesAllNoAllCancel = [mbYes, mbYesToAll, mbNo, mbNoToAll, mbCancel];
```

C++

```
mbYesAllNoAllCancel = [mbYes, mbYesToAll, mbNo, mbNoToAll, mbCancel];
```

File

Dialogs

Description

This is constant Dialogs.mbYesAllNoAllCancel.

61.6.6 Dialogs.mbYesNo Constant

Used to define a dialog with Yes and No buttons.

Pascal

```
mbYesNo = [mbYes, mbNo];
```

C++

```
mbYesNo = [mbYes, mbNo];
```

File

Dialogs

Description

The TMsgDlgButtons (see page 11575) type defines the set of values a button in a message box can have. mbYesNo value defines a dialog with Yes and No buttons.

See Also

mbAbortIgnore (see page 11586)

mbAbortRetryIgnore (see page 11587)

mbOKCancel (see page 11588)

mbYesNoAllCancel

mbYesNoCancel (see page 11589)

MessageDlg (see page 11535)

MessageDlgPos (see page 11537)

MessageDlgPosHelp (see page 11539)

TMsgDlgButtons (see page 11575)

61.6.7 Dialogs.mbYesNoCancel Constant

Used to define a dialog with Yes, No and Cancel buttons.

Pascal

```
mbYesNoCancel = [mbYes, mbNo, mbCancel];
```

C++

```
mbYesNoCancel = [mbYes, mbNo, mbCancel];
```

File

Dialogs

Description

The TMsgDlgButtons (see page 11575) type defines the set of values a button in a message box can have. mbYesNoCancel value defines a dialog with Yes, No and Cancel buttons.

See Also

mbAbortIgnore (see page 11586)

mbAbortRetryIgnore (see page 11587)

mbOKCancel (see page 11588)

mbYesNo (see page 11589)

mbYesNoAllCancel

MessageDlg (see page 11535)

MessageDlgPos (see page 11537)

MessageDlgPosHelp (see page 11539)

TMsgDlgButtons (see page 11575)

61.6.8 Dialogs.tdiError Constant

Pascal

```
tdiError = 2;
```

C++

```
tdiError = 2;
```

File

Dialogs

Description

This is constant Dialogs.tdiError.

61.6.9 Dialogs.tdiInformation Constant

Pascal

```
tdiInformation = 3;
```

C++

```
tdiInformation = 3;
```

File

Dialogs

Description

This is constant Dialogs.tdiInformation.

61.6.10 Dialogs.tdiNone Constant

Pascal

```
tdiNone = 0;
```

C++

```
tdiNone = 0;
```

File

Dialogs

Description

This is constant Dialogs.tdiNone.

61.6.11 Dialogs.tdiShield Constant

Pascal

```
tdiShield = 4;
```

C++

```
tdiShield = 4;
```

File

Dialogs

Description

This is constant Dialogs.tdiShield.

61.6.12 Dialogs.tdiWarning Constant

Pascal

```
tdiWarning = 1;
```

C++

```
tdiWarning = 1;
```

File

Dialogs

Description

This is constant Dialogs.tdiWarning.

62 DockTabSet Namespace

This is namespace DockTabSet.

Topics

Name	Description
Classes (see page 11594)	The following table lists classes in this documentation.
Interfaces (see page 11643)	The following table lists interfaces in this documentation.

Classes

	Name	Description
	ETabDockException (see page 11594)	The exception class for docktab control.
	TCaptionedTabDockTree (see page 11594)	Defines the captioned tab dock tree that can be instantiated to create a new docktab control.
	TDockClientInfo (see page 11598)	Provides the properties describing the dock client.
	TDockTabSet (see page 11604)	A docking tab set that has the appearance of notebook dividers.
	TTabDockPanel (see page 11625)	The panel for the TTabDock object.

Interfaces

	Name	Description
	IAlternateDockHost (see page 11643)	Implement this interface to allow items to be redocked from one area to another, such as when using a pin control.

62.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	ETabDockException (see page 11594)	The exception class for docktab control.
	TCaptionedTabDockTree (see page 11594)	Defines the captioned tab dock tree that can be instantiated to create a new docktab control.
	TDockClientInfo (see page 11598)	Provides the properties describing the dock client.
	TDockTabSet (see page 11604)	A docking tab set that has the appearance of notebook dividers.
	TTabDockPanel (see page 11625)	The panel for the TTabDock object.

62.1.1 ETabDockException Class

The exception class for docktab control.

Class Hierarchy

Pascal

```
ETabDockException = class(Exception);
```

C++

```
class ETabDockException : public Exception;
```

File

DockTabSet

62.1.2 TCaptionedTabDockTree Class

Defines the captioned tab dock tree that can be instantiated to create a new docktab control.

Class Hierarchy

Pascal

```
TCaptionedTabDockTree = class(TCaptionedDockTree, IAlternateDockHost);
```

C++

```
class TCaptionedTabDockTree : public TCaptionedDockTree, public IAlternateDockHost;
```

File

DockTabSet

62.1.2.1 TCaptionedTabDockTree Members

The following tables list the members exposed by TCaptionedTabDockTree.

Protected Data Members

	Name	Description
	FRefCount (see page 22278)	This is FRefCount, a member of class TInterfacedObject.

Protected Methods

	Name	Description
	_AddRef (see page 22278)	Implements the IInterface (see page 22396) System::TInterfacedObject::_AddRef method.
	_Release (see page 22279)	Implements the IInterface (see page 22396) System::TInterfacedObject::_Release method.
V	AdjustCaptionRect (see page 2402)	This is AdjustCaptionRect, a member of class TCaptionedDockTree.
V	AdjustDockRect (see page 2402)	Adjusts the boundaries of the docking zone where a specified control is docked.
V	AdjustDockRect (see page 5987)	Adjusts the boundaries of the docking zone where a specified control is docked.
V	AdjustFrameRect (see page 5988)	This is AdjustFrameRect, a member of class TDockTree.
	BeginUpdate (see page 5988)	Responds when the docked controls are about to change.
	EndUpdate (see page 5988)	Responds when the docked controls have finished changing.
	FindControlAtPos (see page 5989)	This is FindControlAtPos, a member of class TDockTree.
	GetControlBounds (see page 5989)	Returns the dimensions allotted to a control that is already docked.
V	HitTest (see page 5990)	Indicates which docked control is at a specified mouse position.
V	InsertControl (see page 5990)	Handles the docking of a control into the associated DockSite (see page 5996).
	InternalCaptionHitTest (see page 2403)	This is InternalCaptionHitTest, a member of class TCaptionedDockTree.
V	LoadFromStream (see page 5991)	Creates docking zones for a set of docked controls read from a stream.
V	MouseDown (see page 5991)	This is MouseDown, a member of class TDockTree.
V	MouseMove (see page 5991)	This is MouseMove, a member of class TDockTree.
V	MouseUp (see page 11597)	This is MouseUp, a member of class TCaptionedTabDockTree.
V	PaintDockFrame (see page 2404)	Paints the elements of a docking zone that surround a docked control.
V	PaintDockFrame (see page 5992)	Paints the elements of a docking zone that surround a docked control.
V	PositionDockRect (see page 5993)	Computes the dimensions of a new docking zone.
	QueryInterface (see page 22280)	Implements the IInterface (see page 22396) System::TInterfacedObject::QueryInterface method.
V	ReferenceFromOrient (see page 5993)	This is ReferenceFromOrient, a member of class TDockTree.
V	RemoveControl (see page 5993)	Handles the undocking of a control from the associated DockSite (see page 5996).
V	ResetBounds (see page 5994)	Recomputes the layout of docked controls.
V	SaveToStream (see page 5994)	Saves a list of the set of docked controls and their positions to a stream.
	SetReplacingControl (see page 5995)	Prepares the dock tree for replacing one docked control with another.
V	ShowHint (see page 5995)	This is ShowHint, a member of class TDockTree.
	UpdateAll (see page 5995)	Makes any internal adjustments to reflect the current state of the docked controls.
V	WndProc (see page 2404)	This is WndProc, a member of class TCaptionedDockTree.
V	WndProc (see page 5996)	This is WndProc, a member of class TDockTree.
V	ZoneCaptionHitTest (see page 2404)	This is ZoneCaptionHitTest, a member of class TCaptionedDockTree.
V	ZoneCaptionHitTest (see page 5996)	This is ZoneCaptionHitTest, a member of class TDockTree.

Protected Properties

	Name	Description
R	DockCaptionDrawer (see page 2405)	This is DockCaptionDrawer, a member of class TCaptionedDockTree.
R	DockCaptionOrientation (see page 2405)	This is DockCaptionOrientation, a member of class TCaptionedDockTree.

	DockSite (see page 5996)	Specifies the windowed control that uses this dock tree to manage docking operations.
	RelativeSizes (see page 5997)	This is RelativeSizes, a member of class TDockTree.
R	TopZone (see page 5997)	This is TopZone, a member of class TDockTree.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22279)	Responds after the last constructor executes.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 22279)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	BeginUpdate (see page 6239)	Responds when the docked controls are about to change.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 5985)	Creates and initializes a TDockTree (see page 5983) object.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	Create (see page 2400)	This is the overview for the Create constructor overload.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2401)	Frees the memory associated with the TDockTree object.
V	Destroy (see page 5986)	Frees the memory associated with the TDockTree (see page 5983) object.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	EndUpdate (see page 6240)	Responds when the docked controls have finished changing.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetControlBounds (see page 6240)	Returns the dimensions allotted to a control that is already docked.
V	GetDockCaptionDrawer (see page 2403)	This is GetDockCaptionDrawer, a member of class TCaptionedDockTree.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetParentFormState (see page 2403)	Returns the state of the form that contains the control.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertControl (see page 6240)	Handles the docking of a control into the associated container control.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	LoadFromStream (see page 6241)	Lays out a set of docked controls read from a stream.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22280)	Allocates memory for each instance of an interfaced object.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	PaintSite (see page 6241)	Paints the elements that surround all docked controls.
V	PaintSite (see page 5992)	Paints the elements that surround all docked controls.

	PositionDockRect (see page 6242)	Computes the dimensions of a new docking zone.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	RemoveControl (see page 6242)	Handles the undocking of a control from the associated container control.
	ResetBounds (see page 6243)	Recomputes the layout of docked controls.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SaveToStream (see page 6245)	Saves a list of the set of docked controls and their positions to a stream.
	SetAlternateDockHost (see page 11597)	Sets an item to dock on an alternate host, assuming that an alternate host is defined.
	SetReplacingControl (see page 6245)	This is SetReplacingControl, a member of class IDockManager.

Public Properties

	Name	Description
R	RefCount (see page 22281)	Indicates the number of interface pointers currently dependent upon the object.

62.1.2.2 TCaptionedTabDockTree Methods

The methods of the TCaptionedTabDockTree class are listed here.

Protected Methods

	Name	Description
V	MouseUp (see page 11597)	This is MouseUp, a member of class TCaptionedTabDockTree.

Public Methods

	Name	Description
	SetAlternateDockHost (see page 11597)	Sets an item to dock on an alternate host, assuming that an alternate host is defined.

62.1.2.2.1 TCaptionedTabDockTree.MouseUp Method

Pascal

```
procedure MouseUp(Button: TMouseButton; Shift: TShiftState; X: Integer; Y: Integer; var
Handled: Boolean); override;
```

C++

```
virtual __fastcall MouseUp(TMouseButton Button, TShiftState Shift, int X, int Y, Boolean
Handled);
```

Description

This is MouseUp, a member of class TCaptionedTabDockTree.

62.1.2.2.2 TCaptionedTabDockTree.SetAlternateDockHost Method

Sets an item to dock on an alternate host, assuming that an alternate host is defined.

Pascal

```
procedure SetAlternateDockHost(const DockHost: TWinControl);
```

C++

```
__fastcall SetAlternateDockHost(const TWinControl * DockHost);
```

62.1.3 TDockClientInfo Class

Provides the properties describing the dock client.

Class Hierarchy

Pascal

```
TDockClientInfo = class(TComponent);
```

C++

```
class TDockClientInfo : public TComponent;
```

File

DockTabSet

62.1.3.1 TDockClientInfo Members

The following tables list the members exposed by TDockClientInfo.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 11602)	Forwards notification messages to all owned components.

	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 11601)	This is Create, a member of class TDockClientInfo.
	CreateTab (see page 11602)	This is CreateTab, a member of class TDockClientInfo.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 11601)	Disposes of the component and its owned components.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.

	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	DockClient (see page 11603)	Controls (see page 5711) how child controls are docked
R	DockTabSet (see page 11603)	Specifies the name of the current DockTabSet.
	ImageIndex (see page 11603)	Specifies an image's index number in the Images list.
R	ListIndex (see page 11603)	Lists the index of the tab in the collection of tabs that are part of the TDockTabSet (see page 11604).
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
R	ParentPanel (see page 11604)	Specifies the parent TDockTabSet (see page 11604) that is returned in the TDockClientInfo (see page 11598) class.
	TabIndex (see page 11604)	This is TabIndex, a member of class TDockClientInfo.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.

	Tag (see page 2808)	Stores an integer value as part of a component.

62.1.3.2 TDockClientInfo.Create Constructor

Pascal

```
constructor Create(const ADockTabSet: TDockTabSet; const ADockClient: TWinControl);
reintroduce;
```

C++

```
__fastcall TDockClientInfo(const TDockTabSet ADockTabSet, const TWinControl * ADockClient);
```

Description

This is Create, a member of class TDockClientInfo.

62.1.3.3 TDockClientInfo.Destroy Destructor

Disposes of the component and its owned components.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TDockClientInfo();
```

Description

Do not call Destroy directly. Call Free instead. Free verifies that the component is not nil, and only then calls Destroy.

Never explicitly free a component in one of its own event handlers, nor free a component from the event handler of a component that it owns or contains.

To destroy a form, call its Release method. Release waits for all the form's event handlers and the event handlers of the form's components to finish executing before destroying the form.

Note: A form owns all the controls and non-visual components that are placed on it in design mode. When it is freed, all of these components are automatically freed as well. By default, all forms are owned by the global Application object. When an application terminates, it frees the global Application object, which frees all forms. For objects that are not components, and for components created with a nil owner, be sure to call Free after finishing with the object; otherwise the memory allocated for the object will be lost until the application terminates.

62.1.3.4 TDockClientInfo Methods

The methods of the TDockClientInfo class are listed here.

Protected Methods

	Name	Description
	Notification (see page 11602)	Forwards notification messages to all owned components.

Public Methods

	Name	Description
	CreateTab (see page 11602)	This is CreateTab, a member of class TDockClientInfo.

62.1.3.4.1 TDockClientInfo.CreateTab Method

Pascal

```
procedure CreateTab(AlwaysCreate: Boolean = False);
```

C++

```
__fastcall CreateTab(Boolean AlwaysCreate = False);
```

Description

This is CreateTab, a member of class TDockClientInfo.

62.1.3.4.2 TDockClientInfo.Notification Method

Forwards notification messages to all owned components.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

Do not call the Notification method in an application. Notification is called automatically when the component specified by AComponent is about to be inserted or removed, as specified by Operation. By default, components pass along the notification to their owned components, if any.

A component can, if needed, act on the notification that a component is being inserted or removed. For example, if a component has object fields or properties that contain references to other components, it can check the notifications of component removals and invalidate those references as needed.

Note: Notification is not called for components that are freed implicitly (because their Owner is freed).

FreeNotification (see page 2775)

InsertComponent (see page 2780)

RemoveComponent (see page 2785)

Owner (see page 2807)

62.1.3.5 TDockClientInfo Properties

The properties of the TDockClientInfo class are listed here.

Public Properties

	Name	Description
R	DockClient (see page 11603)	Controls (see page 5711) how child controls are docked
R	DockTabSet (see page 11603)	Specifies the name of the current DockTabSet.
	ImageIndex (see page 11603)	Specifies an image's index number in the Images list.
R	ListIndex (see page 11603)	Lists the index of the tab in the collection of tabs that are part of the TDockTabSet (see page 11604).
R	ParentPanel (see page 11604)	Specifies the parent TDockTabSet (see page 11604) that is returned in the TDockClientInfo (see page 11598) class.
	TabIndex (see page 11604)	This is TabIndex, a member of class TDockClientInfo.

62.1.3.5.1 TDockClientInfo.DockClient Property

Controls (see page 5711) how child controls are docked

Pascal

```
property DockClient: TWinControl;
```

C++

```
__property TWinControl * DockClient;
```

62.1.3.5.2 TDockClientInfo.DockTabSet Property

Specifies the name of the current DockTabSet.

Pascal

```
property DockTabSet: TDockTabSet;
```

C++

```
__property TDockTabSet DockTabSet;
```

62.1.3.5.3 TDockClientInfo.ImageIndex Property

Specifies an image's index number in the Images list.

Pascal

```
property ImageIndex: Integer;
```

C++

```
__property int ImageIndex;
```

62.1.3.5.4 TDockClientInfo.ListIndex Property

Lists the index of the tab in the collection of tabs that are part of the TDockTabSet (see page 11604).

Pascal

```
property ListIndex: Integer;
```

C++

```
__property int ListIndex;
```

62.1.3.5.5 TDockClientInfo.ParentPanel Property

Specifies the parent TDockTabSet (see page 11604) that is returned in the TDockClientInfo (see page 11598) class.

Pascal

```
property ParentPanel: TTabDockPanel;
```

C++

```
__property TTabDockPanel ParentPanel;
```

62.1.3.5.6 TDockClientInfo.TabIndex Property

Pascal

```
property TabIndex: Integer;
```

C++

```
__property int TabIndex;
```

Description

This is TabIndex, a member of class TDockClientInfo.

62.1.4 TDockTabSet Class

A docking tab set that has the appearance of notebook dividers.

Class Hierarchy

Pascal

```
TDockTabSet = class(TTabSet);
```

C++

```
class TDockTabSet : public TTabSet;
```

File

DockTabSet

Description

Inherits from TTabSet. Use TDockTabSet to add a control with multiple tab settings to a form. Unlike a page control, TDockTabSet is not made up of several pages that contain different controls. Instead, TDockTabSet is a single object. When the current tab changes, the tab control must directly update its contents to reflect the change in an OnChange event handler. Disabling a TDockTabSet object disables all tabs because it is one control.

62.1.4.1 TDockTabSet Members

The following tables list the members exposed by TDockTabSet.

Protected Events

	Name	Description
	OnAlignInsertBefore (see page 6213)	Occurs when an object with custom alignment is aligned.
	OnAlignPosition (see page 6214)	Occurs when an object with custom alignment is aligned.
	OnCanResize (see page 5851)	Occurs when an attempt is made to resize the control.
	OnClick (see page 5851)	Occurs when the user clicks the control.
	OnConstrainedResize (see page 5853)	Adjust resize constraints.
	OnContextPopup (see page 5854)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnDblClick (see page 5854)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDragDrop (see page 5855)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 5857)	Occurs when the user drags an object over a control.
	OnEndDock (see page 5859)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 5860)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnEnter (see page 6219)	Occurs when a control receives the input focus.
	OnExit (see page 6221)	Occurs when the input focus shifts away from one control to another.
	OnGetImageIndex (see page 11624)	This is OnGetImageIndex, a member of class TDockTabSet.
	OnKeyDown (see page 6225)	Occurs when a user presses any key while the control has focus.
	OnKeyPress (see page 6227)	Occurs when a key is pressed.
	OnKeyUp (see page 6228)	Occurs when the user releases a key that has been pressed.
	OnMouseActivate (see page 5861)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 5862)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseEnter (see page 5864)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 5864)	Occurs when the user moves the mouse outside of a control.
	OnMouseMove (see page 5865)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 5867)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnMouseWheel (see page 5869)	Occurs when the mouse wheel is rotated.
	OnMouseWheelDown (see page 5869)	Occurs when the mouse wheel is rotated downward.
	OnMouseWheelUp (see page 5870)	Occurs when the mouse wheel is rotated upward.
	OnResize (see page 5870)	Occurs immediately after the control is resized.
	OnStartDrag (see page 5871)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.

Protected Fields

	Name	Description
	FAnchorMove (see page 5733)	This is FAnchorMove, a member of class TControl.
	FAnchorOrigin (see page 5734)	This is FAnchorOrigin, a member of class TControl.
	FAnchorRules (see page 5734)	This is FAnchorRules, a member of class TControl.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FDesignSize (see page 6124)	This is FDesignSize, a member of class TWinControl.
	FDoubleBuffered (see page 6124)	This is FDoubleBuffered, a member of class TWinControl.
	FExplicitHeight (see page 5734)	This is FExplicitHeight, a member of class TControl.
	FExplicitLeft (see page 5734)	This is FExplicitLeft, a member of class TControl.
	FExplicitTop (see page 5734)	This is FExplicitTop, a member of class TControl.
	FExplicitWidth (see page 5735)	This is FExplicitWidth, a member of class TControl.
	FInImeComposition (see page 6125)	This is FInImeComposition, a member of class TWinControl.
	FOriginalParentSize (see page 5735)	This is FOriginalParentSize, a member of class TControl.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	ActionChange (see page 5737)	Responds when the action associated with the control changes.
V	ActionChange (see page 6127)	Updates the control to reflect changes in its associated action.
	AddBiDiModeExStyle (see page 6128)	Sets control's window style according to its bi-directional support.
V	AdjustClientRect (see page 6128)	Provides the interface that adjusts the ClientRect (see page 5810) property for idiosyncrasies of the window.
	AdjustSize (see page 5738)	Sets the size of the control as determined by the AutoSize (see page 5803) property.
V	AdjustSize (see page 6129)	Adjusts the control's size according to its contents and constraints.
V	AlignControls (see page 6129)	Aligns any controls for which the control is the parent within a specified area of the control.
	ArrangeControl (see page 6130)	This is ArrangeControl, a member of class TWinControl.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	AssignTo (see page 5739)	Overrides the inherited AssignTo function to enable assignments to TAction objects.
V	AssignTo (see page 6130)	Copies the properties of the windowed control to another object.
	BeginAutoDrag (see page 5739)	Begin Automatic Drag.
	CalcCursorPos (see page 5741)	This is CalcCursorPos, a member of class TControl.
V	CanAutoSize (see page 5741)	Indicates whether the control can resize itself automatically to accommodate its contents.
V	CanAutoSize (see page 6131)	Indicates how the control can be resized.
	CanChange (see page 23171)	This is CanChange, a member of class TTabSet.
V	CanResize (see page 5742)	OnCanResize (see page 5851) event dispatcher.
V	CanResize (see page 6132)	Indicates how the control can respond to a resize attempt.
	Changed (see page 5742)	Sends a CM_CHANGED (see page 6330) message to the control.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	ChangeScale (see page 5743)	Rescaling event dispatcher.
V	ChangeScale (see page 6132)	Resize (see page 5780) and reposition children and self.
	Click (see page 5743)	Respond to user click.
	CMHintShow (see page 23171)	This is CMHintShow, a member of class TTabSet.
V	ConstrainedResize (see page 5746)	Notify control of resize with constraints.
V	ConstrainedResize (see page 6133)	Generates an OnConstrainedResize (see page 5853) event.
	ControlsAligned (see page 6134)	This is ControlsAligned, a member of class TWinControl.
	CreateDockManager (see page 6134)	Creates the dock manager for the control.
V	CreateHandle (see page 6135)	Creates underlying screen object.
V	CreateParams (see page 6135)	Initializes a window-creation parameter data structure.
V	CreateParams (see page 23172)	Initializes a window-creation parameter data structure.
	CreateSubClass (see page 6136)	Creates a windowed control derived from an existing Windows window class.
V	CreateWindowHandle (see page 6137)	Creates a Windows control to represent the control.
V	CreateWnd (see page 6137)	Creates the underlying window.
V	CustomAlignInsertBefore (see page 6137)	Returns placement order of custom-aligned child control.
V	CustomAlignPosition (see page 6138)	Returns aligned position of custom-aligned child control.
	DblClick (see page 5747)	OnDblClick (see page 5854) event dispatcher.
	DefaultDockImage (see page 5747)	Handles the painting and erasing of a dock image.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DefineProperties (see page 5748)	Provides methods to read and write the IsControl (see page 5829) property to a stream such as a form file.
V	DefineProperties (see page 6139)	Provides methods to read and write the IsControl property to a stream such as a form file.
	DesignWndProc (see page 5749)	This is DesignWndProc, a member of class TControl.

	DestroyHandle (see page 6140)	Destroys the control's window without destroying the control.
	DestroyWindowHandle (see page 6140)	Destroys the window created in the CreateWindowHandle (see page 6137) method.
	DestroyWnd (see page 6141)	Destroys the control's window.
	DoAddDockClient (see page 11617)	Performs actions when a control is docked to the windowed control.
	DockOver (see page 11618)	Responds when a docking client is dragged over the windowed control.
	DockReplaceDockClient (see page 11619)	This is DockReplaceDockClient, a member of class TDockTabSet.
	DockTrackNoTarget (see page 5749)	Handles dragging of the control over an invalid docking target.
	DoContextPopup (see page 5750)	OnContextPopup (see page 5854) event dispatcher.
	DoDock (see page 5750)	Docking event dispatcher.
	DoDockOver (see page 6143)	Generates an OnDockOver (see page 6216) event.
	DoEndDock (see page 5750)	OnEndDock (see page 5859) event dispatcher.
	DoEndDrag (see page 5751)	OnEndDrag (see page 5860) event dispatcher.
	DoEnter (see page 6144)	Respond to receiving input focus.
	DoExit (see page 6144)	Respond to losing input focus
	DoFlipChildren (see page 6145)	Flips the control's children.
	DoKeyDown (see page 6145)	Performs some preprocessing before generating an OnKeyDown (see page 6225) event.
	DoKeyPress (see page 6146)	Performs some preprocessing before generating an OnKeyPress (see page 6227) event.
	DoKeyUp (see page 6146)	Performs some preprocessing before generating an OnKeyUp (see page 6228) event.
	DoMouseWheel (see page 5751)	Processes mouse wheel motion.
	DoMouseWheelDown (see page 5752)	OnMouseWheelDown (see page 5869) event dispatcher.
	DoMouseWheelUp (see page 5752)	OnMouseWheelUp (see page 5870) event dispatcher.
	DoRemoveDockClient (see page 11619)	Responds when a control is undocked from the windowed control.
	DoStartDock (see page 5753)	OnStartDock (see page 5871) event dispatcher.
	DoStartDrag (see page 5753)	OnStartDrag (see page 5871) event dispatcher.
	DoUnDock (see page 6147)	Undocks a control that is currently docked to the windowed control.
	DragCanceled (see page 5754)	Provides the interface for a method that responds to the cancellation of a drag.
	DragOver (see page 5755)	OnDragOver (see page 5857) event dispatcher.
	DrawDragDockImage (see page 5755)	Draws the dock image for the control.
	DrawTab (see page 23172)	This is DrawTab, a member of class TTabSet.
	EraseDragDockImage (see page 5757)	Erases the dock image for the control.
	FindDockClientInfo (see page 11619)	This is FindDockClientInfo, a member of class TDockTabSet.
	FindNextControl (see page 6149)	Returns the control's next child in the tab order after the specified control.
	FixupTabList (see page 6149)	Sorts the child controls by their tab order.
	GetAction (see page 5758)	This is GetAction, a member of class TControl.
	GetActionLinkClass (see page 5758)	Returns the appropriate action link class that is associated with the control class.
	GetActionLinkClass (see page 6152)	Returns the associated action link class.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetChildren (see page 6153)	Calls a specified method for each child of the control.
	GetChildren (see page 23172)	Calls a specified method for each child of the control.
	GetClientOrigin (see page 5758)	Returns the screen coordinates of the top-left corner of the control's client area.
	GetClientOrigin (see page 6153)	Returns the value of the ClientOrigin (see page 5809) property.
	GetClientRect (see page 5759)	Returns a rectangle defining the client area of the control.
	GetClientRect (see page 6154)	Returns the value of the ClientRect (see page 5810) property.
	GetControlExtents (see page 6154)	Returns the smallest rectangle in which all the control's children fit.
	GetDeviceContext (see page 5760)	Returns a device context for the control.
	GetDeviceContext (see page 6155)	Provides access to a device context for the control.
	GetDockEdge (see page 5763)	Returns the edge on which another control should be docked when it is dragged over the control.

	GetDragImages (see page 5763)	Returns the control's image list containing the image to be displayed while dragging.
	GetEnabled (see page 5763)	Returns the value of the Enabled (see page 5821) property.
	GetFloating (see page 5764)	Returns the value of the Floating (see page 5823) property.
	GetFloatingDockSiteClass (see page 5764)	Returns the class used for the control when it is floating.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetImageIndex (see page 11620)	This is GetImageIndex, a member of class TDockTabSet.
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetPalette (see page 5765)	Returns the handle to a palette for use by the control.
	GetParentHandle (see page 6157)	Returns the window handle for the window of the control's parent.
	GetPopupMenu (see page 5765)	Returns the pop-up menu associated with the control.
	GetSiteInfo (see page 6158)	Generates an OnGetSiteInfo (see page 6223) event
	GetTabName (see page 11620)	This is GetTabName, a member of class TDockTabSet.
	GetTopParentHandle (see page 6159)	Returns the window handle of the first window not associated with a VCL control that contains the windowed control.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	InvalidateDockHostSite (see page 6162)	This is InvalidateDockHostSite, a member of class TWinControl.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsControlActivateMsg (see page 6162)	This is IsControlActivateMsg, a member of class TWinControl.
	IsControlMouseMsg (see page 6162)	Indicates whether a specified mouse message is directed to one of the windowed control's child controls.
	IsQualifyingSite (see page 6163)	This is IsQualifyingSite, a member of class TWinControl.
	KeyDown (see page 6163)	Respond to key press events.
	KeyPress (see page 6163)	Respond to keyboard input.
	KeyUp (see page 6164)	Respond to released key.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Loaded (see page 5771)	Initializes the control after it is loaded from a stream.
	MainWndProc (see page 6165)	Receives Windows messages for the control.
	MeasureTab (see page 23174)	This is MeasureTab, a member of class TTabSet.
	MouseActivate (see page 5773)	This is MouseActivate, a member of class TControl.
	MouseDown (see page 5773)	OnMouseDown (see page 5862) event dispatcher.
	MouseDown (see page 23175)	OnMouseDown event dispatcher.
	MouseMove (see page 11620)	Respond to mouse moving over control area..
	MouseUp (see page 5774)	OnMouseUp (see page 5867) event dispatcher.
	Notification (see page 11621)	Responds to notifications that components are being created or destroyed.
	NotifyControls (see page 6165)	Sends a message to all the child controls.
	Paint (see page 5920)	Renders the image of a custom control.
	Paint (see page 23176)	Renders the image of a custom control.
	PaintControls (see page 6166)	Paints each of the child controls in a windowed control using the specified device context.
	PaintHandler (see page 6166)	Responds to WM_PAINT messages.
	PaintWindow (see page 5920)	Renders the image of the control on a specified device context.
	PaintWindow (see page 6169)	Renders the image of a windowed control.
	PaletteChanged (see page 5775)	Responds to changes in the system's palette by realizing the control's palette.
	PaletteChanged (see page 6170)	Responds to changes in the system's palette by realizing the control's palette and the palette for each child control.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	PositionDockRect (see page 5777)	Positions the docking rectangle according to the current drag-and-dock state.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	ReadState (see page 5778)	Prepares the control for having its properties assigned values read from a stream.
	ReadState (see page 6171)	Prepares the control for having its properties assigned values from a stream.

	RecreateWnd (see page 6171)	Recreate underlying Windows screen object.
	ReloadDockedControl (see page 6172)	Reloads a docked control.
	RemoveWindowProps (see page 6174)	This is RemoveWindowProps, a member of class TWinControl.
V	RequestAlign (see page 5780)	Instructs the parent of a control to reposition the control, enforcing its Align (see page 5798) property.
	ResetIme (see page 6174)	Restores the input method editor (IME) that was active when the application started.
	ResetImeComposition (see page 6175)	Directs the composition window of the input method editor (IME) to perform a specific action.
	Resize (see page 5780)	Respond to control resize.
	ScaleConstraints (see page 5781)	This is ScaleConstraints, a member of class TControl.
	ScaleControls (see page 6176)	Rescale child controls only.
	SelectFirst (see page 6177)	Locates first selectable child control.
	SelectNext (see page 6177)	Moves the input focus from the current child control to the next one in the tab order.
	SendCancelMode (see page 5781)	Cancels the modal state of the control.
	SendDockNotification (see page 5782)	Sends a Windows message to the control's host dock site.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
V	SetAutoSize (see page 5783)	This is SetAutoSize, a member of class TControl.
V	SetBiDiMode (see page 5783)	Sets the control's bi-directional mode.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
V	SetChildOrder (see page 6178)	Changes the order in which the child component appears in the list of child components returned by the GetChildren (see page 6153) method.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
V	SetDragMode (see page 5785)	Sets the drag mode for the control.
V	SetEnabled (see page 5785)	Sets the value of the Enabled (see page 5821) property.
	SetIme (see page 6181)	Activates an input method editor (IME) using the values specified by the ImeMode (see page 6207) and ImeName (see page 6208) properties.
	SetImeCompositionWindow (see page 6181)	Sets the position and font of the composition window.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
V	SetName (see page 5785)	Sets the name of the control.
V	SetParent (see page 5786)	Sets the parent of the control.
V	SetParent (see page 6182)	Sets the parent of the control.
V	SetParentBackground (see page 6182)	This is SetParentBackground, a member of class TWinControl.
V	SetParentBiDiMode (see page 5786)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 5787)	Sets the parent for the control.
V	SetTabIndex (see page 11621)	This is SetTabIndex, a member of class TDockTabSet.
	SetZOrder (see page 5788)	Repositions the control in its parent's control list, thereby changing position onscreen.
V	SetZOrder (see page 6182)	Moves the control to the top or bottom of the parent control's (or screen's) list of TWinControl (see page 6112) controls.
V	ShouldAutoHide (see page 11622)	This is ShouldAutoHide, a member of class TDockTabSet.
V	ShowControl (see page 6183)	Ensures that a specified child control is visible.
V	ShowDockClientInfo (see page 11622)	This is ShowDockClientInfo, a member of class TDockTabSet.
	UpdateBounds (see page 6185)	This is UpdateBounds, a member of class TWinControl.
	UpdateBoundsRect (see page 5789)	Changes the Top (see page 5844), Left (see page 5830), Width (see page 5849), and Height (see page 5825) properties of the control, but doesn't update its screen image and bypasses all resize events.
V	UpdateControlOriginalParentSize (see page 6186)	This is UpdateControlOriginalParentSize, a member of class TWinControl.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateExplicitBounds (see page 5789)	This is UpdateExplicitBounds, a member of class TControl.
	UpdateRecreatingFlag (see page 6186)	This is UpdateRecreatingFlag, a member of class TWinControl.

V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	UpdateUIState (see page 6186)	Updates form User Interface State as needed
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	VisibleChanging (see page 5791)	Provides the interface for a method that responds to changes in the control's visibility.
V	WndProc (see page 5791)	Provides specific message responses for the control.
V	WndProc (see page 6187)	Provides specific message responses for the control.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	ActionLink (see page 5798)	Contains the action link object associated with the control.
	AutoSize (see page 5803)	Specifies whether the control sizes itself automatically to accommodate its contents.
	BevelEdges (see page 6192)	Specifies which edges of the control are beveled.
	BevelInner (see page 6193)	Specifies the cut of the inner bevel.
	BevelKind (see page 6193)	Specifies the control's bevel style.
	BevelOuter (see page 6194)	Specifies the cut of the outer bevel.
	BevelWidth (see page 6194)	Specifies the width of the inner and outer bevels.
	BorderWidth (see page 6195)	Specifies the width of the control's border.
R	Canvas (see page 5921)	Specifies the TCanvas object that presents a drawing surface for the control.
	Caption (see page 5806)	Specifies a text string that identifies the control to the user.
	Color (see page 5812)	Specifies the background color of the control.
	Ctl3D (see page 6198)	Determines whether a control has a three-dimensional (3-D) or two-dimensional look.
	DefWndProc (see page 6199)	Specifies the default window procedure for the windowed control.
	DesktopFont (see page 5818)	Specifies whether the control uses the Windows icon font when writing text.
	DragCursor (see page 5818)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 5819)	Specifies whether the control is being dragged normally or for docking.
	DragMode (see page 5819)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	Font (see page 5823)	Controls (see page 5711) the attributes of text written on or in the control.
	Images (see page 11623)	This is Images, a member of class TDockTabSet.
	ImeMode (see page 6207)	Determines the behavior of the input method editor (IME).
	ImeName (see page 6208)	Specifies the input method editor (IME) to use for converting keyboard input to Asian language characters.
	IsControl (see page 5829)	Determines whether a form stores its form-specific properties to a stream.
	MouseCapture (see page 5831)	Indicates whether the control has "captured" mouse events.
	ParentBackground (see page 6209)	Determines whether control uses parent's theme background.
	ParentBiDiMode (see page 5833)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	ParentColor (see page 5834)	Determines where a control looks for its color information.
	ParentCtl3D (see page 6209)	Determines where a component looks to determine if it should appear three dimensional.
	ParentFont (see page 5834)	Determines where a control looks for its font information.
	ParentShowHint (see page 5835)	Determines where a control looks to find out if its Help Hint (see page 5827) should be shown.
	PopupMenu (see page 5835)	Identifies the pop-up menu associated with the control.
	ScalingFlags (see page 5840)	Reflects which attributes of the control have been scaled.
R	Scroller (see page 23196)	This is Scroller, a member of class TTabSet.
	Text (see page 5842)	Contains a text string associated with the control.
	WheelAccumulator (see page 5849)	Accumulates mouse wheel rotations.

	WindowHandle (see page 6212)	Provides access to a window handle for the control.
	WindowText (see page 5850)	Contains the text string of the control.

Public Events

	Name	Description
	WindowProc (see page 5872)	Points to the window procedure that responds to messages sent to the control.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	BeginDrag (see page 5740)	Starts the dragging of a control.
	BringToFront (see page 5740)	Puts the control in front of all other controls in its parent control.
	Broadcast (see page 6130)	Sends a message to each of the child controls.
	CanFocus (see page 6131)	Indicates whether a control can receive focus.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	ClientToParent (see page 5744)	Translates client coordinates to parent coordinates.
	ClientToScreen (see page 5744)	Translates a given point from client area coordinates to global screen coordinates.
	ContainsControl (see page 6133)	Indicates whether a specified control exists within the control.
	ControlAtPos (see page 6133)	Returns the child control located at a specified position within the control.
	Create (see page 11616)	Constructs a tab set control.
	CreateParented (see page 6123)	Creates and initializes a control as the child of a specified non-VCL container.
	CreateParentedControl (see page 6136)	Creates and initializes a control as the child of a specified non-VCL window.
	DefaultHandler (see page 5748)	Provides message handling for all messages that do not have specific handlers.
	DefaultHandler (see page 6139)	Provides message handling for all messages that the control does not fully process itself.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 11617)	Frees the memory associated with the TTabSet object.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	DisableAlign (see page 6141)	Disables the realignment of child controls.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Dock (see page 5749)	Used internally to dock the control.
	DockDrop (see page 6142)	Generates an OnDockDrop (see page 6214) event.
	DragDrop (see page 5754)	OnDragDrop (see page 5855) event dispatcher.
	Dragging (see page 5754)	Indicates whether a control is being dragged.
	DrawTextBiDiModeFlags (see page 5756)	Returns the text flags that reflect the current setting of the BiDiMode (see page 5803) property.
	DrawTextBiDiModeFlagsReadingOnly (see page 5756)	Returns the text flag to add that indicates whether the control's text should read from right to left.
	EnableAlign (see page 6148)	Decrements the reference count incremented by the DisableAlign (see page 6141) method, eventually realigning the child controls.
	EndDrag (see page 5757)	Stops a control from being dragged any further.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.

	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindChildControl (see page 6148)	Returns a child control given its name.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FlipChildren (see page 6150)	Reverses the positions of child controls.
	Focused (see page 6150)	Determines whether the control has input focus.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetControlsAlignment (see page 5759)	Indicates how text is aligned within the control.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 5765)	Returns the parent of the control.
	GetTabOrderList (see page 6158)	Builds a list of controls in tab order.
	GetTextBuf (see page 5766)	Retrieves the control's text, copies it into a buffer, and returns the number of characters copied.
	GetTextLen (see page 5767)	Returns the length of the control's text.
	HandleAllocated (see page 6159)	Reports whether a screen object handle exists for the control.
	HandleNeeded (see page 6160)	Creates a screen object for the control if it doesn't already exist.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 5768)	Indicates whether the control has a parent.
	Hide (see page 5769)	Makes the control invisible.
	HideCurrentDockClient (see page 11620)	Makes the control invisible.
	IndexOfDockClient (see page 11620)	Specifies the index of the client in a collection.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
V	InitiateAction (see page 5769)	Calls the action link's Update (see page 5789) method if the control is associated with an action link.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InsertControl (see page 6160)	Inserts a control into the Controls (see page 6197) array property.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
V	Invalidate (see page 5770)	Completely repaint control.
V	Invalidate (see page 6161)	Schedules a control repaint.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	IsRightToLeft (see page 5770)	Indicates whether the control should be reversed right to left.
	ItemAtPos (see page 23173)	Returns the index of the tab indicated by the coordinates of a point on the control.
	ItemRect (see page 23173)	Returns the rectangle that surrounds the item specified in the Item parameter.
	ItemWidth (see page 23174)	Returns the width, in pixels, of a specified tab in the set.
	ManualDock (see page 5771)	Docks the control.
	ManualFloat (see page 5772)	Undocks the control.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	MinClientRect (see page 23174)	This is the overview for the MinClientRect method overload.
	MouseWheelHandler (see page 5774)	Dispatches messages received from a mouse wheel.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.

	PaintTo (see page 6167)	This is the overview for the PaintTo method overload.
	ParentToClient (see page 5776)	Translate parent coordinates to client coordinates.
	Perform (see page 5776)	Responds as if the control received a specified Windows message.
	PreProcessMessage (see page 6170)	This is PreProcessMessage, a member of class TWinControl.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	Realign (see page 6171)	Forces the control to realign children.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	Refresh (see page 5779)	Repaints the control on the screen.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveControl (see page 6172)	Removes a specified control from the Controls (see page 6197) array.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	Repaint (see page 5779)	Forces the control to repaint its image on the screen.
V	Repaint (see page 6174)	Repaints the entire control.
	ReplaceDockedControl (see page 5779)	Docks the control in the place where another control is already docked.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	ScaleBy (see page 6175)	Rescale control and its children.
	ScreenToClient (see page 5781)	Converts the screen coordinates of a specified point on the screen to client coordinates.
	ScrollBy (see page 6176)	Scroll control contents.
	SelectNext (see page 23177)	Selects the next tab in a tab set control, scrolling if necessary to bring the selected tab into view.
	SendToBack (see page 5782)	Puts a windowed control behind all other windowed controls, or puts a non-windowed control behind all other non-windowed controls.
V	SetBounds (see page 5783)	Sets the Left (see page 5830), Top (see page 5844), Width (see page 5849), and Height (see page 5825) properties all at once.
V	SetBounds (see page 6178)	Sets the windowed control's boundary properties all at once.
	SetDesignVisible (see page 5784)	Makes a control visible at design time.
V	SetDesignVisible (see page 6178)	Makes a control visible at design time.
V	SetFocus (see page 6179)	Gives the input focus to the control.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	SetTextBuf (see page 5787)	Sets the text of the control.
	Show (see page 5788)	Makes a control visible.
	ShowDockClient (see page 11622)	Makes the control visible
V	Update (see page 5789)	Processes any pending paint messages immediately.
V	Update (see page 6183)	Forces the control to update.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	UpdateControlState (see page 6186)	Respond to state change.
	UseRightToLeftAlignment (see page 5790)	Specifies whether the control's alignment should be reversed right-to-left.
	UseRightToLeftReading (see page 5790)	Specifies whether the control is using a right-to-left reading order.
	UseRightToLeftScrollBar (see page 5791)	Specifies whether the vertical scroll bar appears on the left side of the control.

Public Properties

	Name	Description
	Action (see page 5797)	Designates the action associated with the control.
	Align (see page 5798)	Determines how the control aligns within its container (parent control).
R	AlignDisabled (see page 6192)	Indicates child control realignment disabled.
	Anchors (see page 5802)	Specifies how the control is anchored to its parent.
	BiDiMode (see page 5803)	Specifies the bi-directional mode for the control.
	BoundsRect (see page 5803)	Specifies the bounding rectangle of the control, expressed in the coordinate system of the parent control.
R	Brush (see page 6195)	Determines the color and pattern used for painting the background of the control.
	Canvas (see page 23183)	Specifies the TCanvas object that presents a drawing surface for the control.
	ClientHeight (see page 5808)	Specifies the height of the control's client area in pixels.

R	ClientOrigin (see page 5809)	Specifies the screen coordinates (in pixels) of the top left corner of a control's client area.
R	ClientRect (see page 5810)	Specifies the size (in pixels) of a control's client area.
	ClientWidth (see page 5811)	Specifies the horizontal size of the control's client area in pixels.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Constraints (see page 5812)	Specifies the size constraints for the control.
R	ControlCount (see page 6195)	Returns the number of child controls.
R	Controls (see page 6197)	Lists all child controls.
	ControlState (see page 5813)	Indicates the current state of a control at runtime.
	ControlStyle (see page 5814)	Determines style characteristics of the control.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	DockClientCount (see page 6199)	Specifies the number of controls that are docked on the windowed control.
R	DockClients (see page 6201)	Lists the controls that are docked to the windowed control.
	DockManager (see page 6202)	Specifies the control's docking manager interface.
	DockOrientation (see page 5818)	Specifies how the control is docked relative to other controls docked in the same parent.
	DoubleBuffered (see page 6205)	Determines whether the control's image is rendered directly to the window or painted to an in-memory bitmap first.
	Enabled (see page 5821)	Controls (see page 5711) whether the control responds to mouse, keyboard, and timer events.
R	ExplicitHeight (see page 5821)	Specifies the explicit vertical size of the control in pixels.
R	ExplicitLeft (see page 5822)	Specifies the explicit horizontal pixel coordinate of the left edge of a component relative to its parent.
R	ExplicitTop (see page 5822)	Specifies the explicit vertical pixel coordinate of the top edge of a component relative to its parent.
R	ExplicitWidth (see page 5822)	Specifies the explicit horizontal size of the control in pixels.
	FirstIndex (see page 23189)	Specifies the tab that appears in the leftmost visible position in the tab set control.
R	Floating (see page 5823)	Indicates whether the control is floating.
	FloatingDockSiteClass (see page 5823)	Specifies the class of the temporary control that hosts the control when it is floating.
R	Handle (see page 6207)	Provides access to the underlying Windows screen object for the control.
	HostDockSite (see page 5829)	Specifies the control in which the control is docked.
	LRDockWidth (see page 5831)	Specifies the width of the control when it is docked horizontally.
R	MouseInClient (see page 6209)	This is MouseInClient, a member of class TWinControl.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Padding (see page 6209)	Specifies the padding of a control.
	Parent (see page 5832)	Indicates the parent of the control.
	ParentWindow (see page 6210)	Reference to parent's underlying control.
	ShowHint (see page 5840)	Determines whether the control displays a Help Hint (see page 5827) when the mouse pointer rests momentarily on the control.
R	Showing (see page 6210)	Indicates whether the control is showing on the screen.
	TabOrder (see page 6211)	Indicates the position of the control in its parent's tab order.
	TabStop (see page 6211)	Determines if the user can tab to a control.
	TBDockHeight (see page 5842)	Specifies the height of the control when it is docked vertically.
	UndockHeight (see page 5845)	Specifies the height of the control when it is floating.
	UndockWidth (see page 5846)	Specifies the width of the control when it is floating.
	UseDockManager (see page 6212)	Specifies whether the docking manager is used in drag-and-dock operations.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	Visible (see page 5847)	Determines whether the component appears onscreen.
R	VisibleDockClientCount (see page 6212)	Specifies the number of visible controls that are docked on the windowed control.

Published Events

	Name	Description
	OnAlignInsertBefore (see page 23204)	Occurs when an object with custom alignment is aligned.
	OnAlignPosition (see page 23204)	Occurs when an object with custom alignment is aligned.
	OnChange (see page 23205)	Occurs just before a new tab is selected.
	OnClick (see page 23205)	Occurs when the user clicks the control.
	OnDockDrop (see page 11624)	Occurs when the control is released from the mouse control and dropped onto the client.
	OnDockOver (see page 11624)	Occurs when the tabbed control is hovering over the dock site.
	OnDragDrop (see page 23207)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 23210)	Occurs when the user drags an object over a control.
	OnDrawTab (see page 23212)	Occurs when a tab in an owner-drawn tab set control needs to redisplay.
	OnEndDock (see page 23213)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 23213)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnEnter (see page 23214)	Occurs when a control receives the input focus.
	OnExit (see page 23216)	Occurs when the input focus shifts away from one control to another.
	OnGetSiteInfo (see page 11625)	Returns information about the site or client control on which the tab control is docked.
	OnMeasureTab (see page 23218)	Occurs when an application needs to redisplay a tab in an owner-draw tab set.
	OnMouseActivate (see page 23219)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 23220)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseEnter (see page 23222)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 23222)	Occurs when the user moves the mouse outside of a control.
	OnMouseMove (see page 23222)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 23225)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnStartDock (see page 11625)	Occurs when the user begins to drag a control to a docked position.
	OnStartDrag (see page 23228)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.
	OnTabAdded (see page 11625)	Occurs when a tab is added to the tab control.
	OnTabRemoved (see page 11625)	Occurs when a tab is removed from the tab control.
	OnUnDock (see page 11625)	Occurs when the application tries to undock a control that is docked to the windowed control.

Published Properties

	Name	Description
	Align (see page 23178)	Determines how the control aligns within its container (parent control).
	AlignWithMargins (see page 5802)	Indicates whether a control should be constrained by margins.
	Anchors (see page 23182)	Specifies how the control is anchored to its parent.
	AutoScroll (see page 23182)	Determines if scroll buttons automatically appear in a tab set control if there isn't room in the control to display all the tabs.
	AutoSelect (see page 11622)	Determines whether the control is automatically selected when it gets focus.
	BackgroundColor (see page 23183)	Determines the background color of the tab set control.
	Constraints (see page 23185)	Specifies the size constraints for the control.
	Cursor (see page 5815)	Specifies the image used to represent the mouse pointer when it passes into the region covered by the control.
	DestinationDockSite (see page 11623)	Specifies the docking destination of the control.
	DitherBackground (see page 23186)	Determines whether the background color set with the BackgroundColor (see page 23183) property is dithered.
	DockSite (see page 11623)	Specifies the windowed control that uses this dock tree to manage docking operations.
	DragCursor (see page 23186)	Indicates the image used to represent the mouse pointer when the control is being dragged.

	DragKind (see page 23186)	Specifies whether the control is being dragged normally or for docking.
	DragMode (see page 23187)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	Enabled (see page 23188)	Controls whether the control responds to mouse, keyboard, and timer events.
	EndMargin (see page 23189)	Determines how far, in pixels, the rightmost tab appears from the right edge of the tab set control.
	Font (see page 23190)	Controls the attributes of text written on or in the control.
	Height (see page 5825)	Specifies the vertical size of the control in pixels.
	HelpContext (see page 5826)	Numeric ID for control's context-sensitive help topic
	HelpKeyword (see page 5826)	Keyword for control's context-sensitive help topic
	HelpType (see page 5827)	Indicates whether the control's context sensitive help topic is identified by context ID or by keyword.
	Hint (see page 5827)	Contains the text string that can appear when the user moves the mouse over the control.
	Left (see page 5830)	Specifies the horizontal coordinate of the left edge of a component relative to its parent.
	Margins (see page 5831)	Specifies the margins for the control.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	ParentBackground (see page 23191)	Determines whether control uses parent's theme background.
	ParentShowHint (see page 23191)	Determines where a control looks to find out if its Help Hint should be shown.
	PopupMenu (see page 23192)	Identifies the pop-up menu associated with the control.
	SelectedColor (see page 23197)	Determines the color of the selected tab in the tab set control.
	ShowHint (see page 23197)	Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.
	ShrinkToFit (see page 23198)	This is ShrinkToFit, a member of class TTabSet.
	SoftTop (see page 23199)	Specifies whether a line appears at the edge of the tab set, setting off the non-current tabs.
	StartMargin (see page 23199)	Determines how far, in pixels, the first tab appears from the left edge of the tab set control.
	Style (see page 23199)	Determines whether the tab set is owner-drawn.
	TabHeight (see page 23200)	Determines the height of the tabs in an owner-drawn tab set control.
	TabIndex (see page 23200)	Determines which tab of a tab set control is currently selected.
	TabPosition (see page 23201)	This is TabPosition, a member of class TTabSet.
	Tabs (see page 23201)	Contains the list of text strings that appear on the tabs.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Top (see page 5844)	Specifies the Y coordinate of the top left corner of a control, relative to its parent or containing control in pixels.
	UnselectedColor (see page 23201)	Determines the color of the tabs that aren't currently selected in the tab set control.
	Visible (see page 23201)	Determines whether the component appears onscreen.
R	VisibleTabs (see page 23203)	Contains the number of tabs currently visible in the tab set control.
	Width (see page 5849)	Specifies the horizontal size of the control or form in pixels.

62.1.4.2 TDockTabSet.Create Constructor

Constructs a tab set control.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TDockTabSet(TComponent * AOwner);
```

Description

Create sets the initial values of the control, including creating a TTabList object that holds the list of tabs for the control. The AOwner parameter specifies the component (usually a form) that is responsible for freeing the tab set.

See Also

Destroy (see page 23170)

62.1.4.3 TDockTabSet.Destroy Destructor

Frees the memory associated with the TTabSet object.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TDockTabSet();
```

Description

Do not call Destroy directly. Instead, use the Free method, which checks that the tab set is not nil before calling Destroy. Destroy frees the TTabList object that holds the list of tabs.

See Also

Create (see page 23170)

Free (see page 22300)

62.1.4.4 TDockTabSet Methods

The methods of the TDockTabSet class are listed here.

Protected Methods

	Name	Description
	DoAddDockClient (see page 11617)	Performs actions when a control is docked to the windowed control.
	DockOver (see page 11618)	Responds when a docking client is dragged over the windowed control.
	DockReplaceDockClient (see page 11619)	This is DockReplaceDockClient, a member of class TDockTabSet.
	DoRemoveDockClient (see page 11619)	Responds when a control is undocked from the windowed control.
	FindDockClientInfo (see page 11619)	This is FindDockClientInfo, a member of class TDockTabSet.
	GetImageIndex (see page 11620)	This is GetImageIndex, a member of class TDockTabSet.
	GetTabName (see page 11620)	This is GetTabName, a member of class TDockTabSet.
	MouseMove (see page 11620)	Respond to mouse moving over control area..
	Notification (see page 11621)	Responds to notifications that components are being created or destroyed.
	SetTabIndex (see page 11621)	This is SetTabIndex, a member of class TDockTabSet.
	ShouldAutoHide (see page 11622)	This is ShouldAutoHide, a member of class TDockTabSet.
	ShowDockClientInfo (see page 11622)	This is ShowDockClientInfo, a member of class TDockTabSet.

Public Methods

	Name	Description
	HideCurrentDockClient (see page 11620)	Makes the control invisible.
	IndexOfDockClient (see page 11620)	Specifies the index of the client in a collection.
	ShowDockClient (see page 11622)	Makes the control visible

62.1.4.4.1 TDockTabSet.DoAddDockClient Method

Performs actions when a control is docked to the windowed control.

Pascal

```
procedure DoAddDockClient(Client: TControl; const ARect: TRect); override;
```

C++

```
virtual __fastcall DoAddDockClient(TControl * Client, const TRect ARect);
```

Description

DoAddDockClient is called automatically when a client control is docked to the windowed control. As implemented in TWinControl, DoAddDockClient sets the client's Parent property to the control.

Client is the control that has been docked.

ARect describes the boundaries of the region where Client has been docked.

Override DoAddDockClient to perform actions when a control is docked to the windowed control.

Note: DoAddDockClient is called in response to a message sent by the DockDrop method, before the OnDockDrop event.

See Also

Parent (see page 5832)

DockClients (see page 6201)

ManualDock (see page 5771)

DoRemoveDockClient (see page 6147)

DockDrop (see page 6142)

OnDockDrop (see page 6214)

62.1.4.4.2 TDockTabSet.DockOver Method

Responds when a docking client is dragged over the windowed control.

Pascal

```
procedure DockOver(Source: TDragDockObject; X: Integer; Y: Integer; State: TDragState; var
Accept: Boolean); override;
```

C++

```
virtual __fastcall DockOver(TDragDockObject Source, int X, int Y, TDragState State, Boolean
Accept);
```

Description

DockOver is called automatically for dock sites when a dockable object is dragged over them. As implemented in TWinControl, DockOver positions the docking rectangle and then calls DoDockOver to generate an OnDockOver event.

Override DockOver to perform additional actions when another control is dragged over the control.

DockOver is called only if DockSite is true.

See Also

OnDockOver (see page 6216)

DockSite (see page 6204)

DoDockOver (see page 6143)

62.1.4.4.3 TDockTabSet.DockReplaceDockClient Method

Pascal

```
function DockReplaceDockClient(Client: TControl; NewDockSite: TWinControl; DropControl:
TControl; ControlSide: TAlign; ReplacementClient: TControl): Boolean; override;
```

C++

```
virtual __fastcall Boolean DockReplaceDockClient(TControl * Client, TWinControl * NewDockSite,
TControl * DropControl, TAlign ControlSide, TControl * ReplacementClient);
```

Description

This is DockReplaceDockClient, a member of class TDockTabSet.

62.1.4.4.4 TDockTabSet.DoRemoveDockClient Method

Responds when a control is undocked from the windowed control.

Pascal

```
procedure DoRemoveDockClient(Client: TControl); override;
```

C++

```
virtual __fastcall DoRemoveDockClient(TControl * Client);
```

Description

DoRemoveDockClient is called automatically when a client control is undocked from the windowed control. As implemented in TWinControl, DoRemoveDockClient does nothing.

Client is the control that has been undocked.

Override DoRemoveDockClient to perform any necessary adjustments when a control is undocked from the windowed control.

Note: DoRemoveDockClient occurs at the end of the undocking process. To make changes when undocking starts, override the DoUnDock method instead.

See Also

DockClients (see page 6201)

ManualDock (see page 5771)

DoAddDockClient (see page 6142)

DoUnDock (see page 6147)

62.1.4.4.5 TDockTabSet.FindDockClientInfo Method

Pascal

```
function FindDockClientInfo(const Client: TControl): TDockClientInfo;
```

C++

```
__fastcall TDockClientInfo FindDockClientInfo(const TControl * Client);
```

Description

This is FindDockClientInfo, a member of class TDockTabSet.

62.1.4.4.6 TDockTabSet.GetImageIndex Method

Pascal

```
function GetImageIndex(TabIndex: Integer): Integer; override;
```

C++

```
virtual __fastcall int GetImageIndex(int TabIndex);
```

Description

This is GetImageIndex, a member of class TDockTabSet.

62.1.4.4.7 TDockTabSet.GetTabName Method

Pascal

```
function GetTabName(const Client: TControl): string; virtual;
```

C++

```
virtual __fastcall AnsiString GetTabName(const TControl * Client);
```

Description

This is GetTabName, a member of class TDockTabSet.

62.1.4.4.8 TDockTabSet.HideCurrentDockClient Method

Makes the control invisible.

Pascal

```
procedure HideCurrentDockClient(const AnimateSpeed: Integer = 200);
```

C++

```
__fastcall HideCurrentDockClient(const int AnimateSpeed = 200);
```

62.1.4.4.9 TDockTabSet.IndexOfDockClient Method

Specifies the index of the client in a collection.

Pascal

```
function IndexOfDockClient(const Client: TControl): Integer;
```

C++

```
__fastcall int IndexOfDockClient(const TControl * Client);
```

62.1.4.4.10 TDockTabSet.MouseMove Method

Respond to mouse moving over control area..

Pascal

```
procedure MouseMove(Shift: TShiftState; X: Integer; Y: Integer); override;
```

C++

```
virtual __fastcall MouseMove(TShiftState Shift, int X, int Y);
```

Description

Override the protected MouseMove method to provide other responses in addition to calling the OnMouseMove event handler when the user moves the mouse.

A control calls MouseMove in response to any of the Windows mouse-move messages (WM_MOUSEMOVE), decoding the message parameters into the shift-key state and position, which it passes in the Shift, X, and Y parameters, respectively.

As the mouse cursor moves across a control, this method is called repeatedly. Each time it is called, it is with the new coordinates that reflect the continuous path of the mouse cursor across the screen real estate covered by the control's visual representation.

See Also

MouseDown (see page 5773)

MouseUp (see page 5774)

OnMouseMove (see page 5865)

62.1.4.4.11 TDockTabSet.Notification Method

Responds to notifications that components are being created or destroyed.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

Notification allows TControl to update its PopupMenu property when the pop-up menu it refers to is destroyed.

Override the Notification method to respond to notifications that other components are about to be destroyed or have just been created. Use the Notification method to update controls that rely on other objects. Remove references to objects that are going away so that the control does not refer to objects that have been destroyed. For example, data-aware objects override the Notification method to update themselves when their data source is removed. Some objects respond to notifications that other objects of a specific type are being created. For example, the session component sets the Session property of new data-aware controls to itself when the AutoSessionName property is true.

By default, components pass along the notification to their owned components, if any.

See Also

PopupMenu (see page 5835)

Notification (see page 2783)

62.1.4.4.12 TDockTabSet.SetTabIndex Method

Pascal

```
procedure SetTabIndex(Value: Integer); override;
```

C++

```
virtual __fastcall SetTabIndex(int Value);
```

Description

This is SetTabIndex, a member of class TDockTabSet.

62.1.4.4.13 TDockTabSet.ShouldAutoHide Method

Pascal

```
function ShouldAutoHide(const Client: TWinControl): Boolean; virtual;
```

C++

```
virtual __fastcall Boolean ShouldAutoHide(const TWinControl * Client);
```

Description

This is ShouldAutoHide, a member of class TDockTabSet.

62.1.4.4.14 TDockTabSet.ShowDockClient Method

Makes the control visible

Pascal

```
procedure ShowDockClient(const Client: TControl);
```

C++

```
__fastcall ShowDockClient(const TControl * Client);
```

62.1.4.4.15 TDockTabSet.ShowDockClientInfo Method

Pascal

```
procedure ShowDockClientInfo(const DockClientInfo: TDockClientInfo); virtual;
```

C++

```
virtual __fastcall ShowDockClientInfo(const TDockClientInfo DockClientInfo);
```

Description

This is ShowDockClientInfo, a member of class TDockTabSet.

62.1.4.5 TDockTabSet Properties

The properties of the TDockTabSet class are listed here.

Protected Properties

	Name	Description
	Images (see page 11623)	This is Images, a member of class TDockTabSet.

Published Properties

	Name	Description
	AutoSelect (see page 11622)	Determines whether the control is automatically selected when it gets focus.
	DestinationDockSite (see page 11623)	Specifies the docking destination of the control.
	DockSite (see page 11623)	Specifies the windowed control that uses this dock tree to manage docking operations.

62.1.4.5.1 TDockTabSet.AutoSelect Property

Determines whether the control is automatically selected when it gets focus.

Pascal

```
property AutoSelect: Boolean;
```

C++

```
__property Boolean AutoSelect;
```

Description

When this property is set to **True** the runtime behavior is that a tab on the control gets focus and is selected when the user moves the mouse pointer over the tab. If you want to test this, create a simple form application, drop a TDockTabSet (see page 11604) control onto the form, set the TStrings of the Tabs (see page 23133) property to `foo` and `bar`, set AutoSelect to **True**, then add the following code to a OnClick event:

```
procedure TForm1.DockTabSet1Click(Sender: TObject);
 var whichTab: string;
begin

  if DockTabSet1.TabIndex = 1 then
     whichTab := 'bar'
  else
     whichTab := 'foo';
     ShowMessage('Clicked '+ whichTab);
end;
```

62.1.4.5.2 TDockTabSet.DestinationDockSite Property

Specifies the docking destination of the control.

Pascal

```
property DestinationDockSite: TWinControl;
```

C++

```
__property TWinControl * DestinationDockSite;
```

Description

For example, the destination dock site of a tabbed control might be an instance of a form.

62.1.4.5.3 TDockTabSet.DockSite Property

Specifies the windowed control that uses this dock tree to manage docking operations.

Pascal

```
property DockSite: Boolean;
```

C++

```
__property Boolean DockSite;
```

62.1.4.5.4 TDockTabSet.Images Property

Pascal

```
property Images: TCustomImageList;
```

C++

```
__property TCustomImageList Images;
```

Description

This is Images, a member of class TDockTabSet.

62.1.4.6 TDockTabSet Events

The events of the TDockTabSet class are listed here.

Protected Events

	Name	Description
	OnGetImageIndex (see page 11624)	This is OnGetImageIndex, a member of class TDockTabSet.

Published Events

	Name	Description
	OnDockDrop (see page 11624)	Occurs when the control is released from the mouse control and dropped onto the client.
	OnDockOver (see page 11624)	Occurs when the tabbed control is hovering over the dock site.
	OnGetSiteInfo (see page 11625)	Returns information about the site or client control on which the tab control is docked.
	OnStartDock (see page 11625)	Occurs when the user begins to drag a control to a docked position.
	OnTabAdded (see page 11625)	Occurs when a tab is added to the tab control.
	OnTabRemoved (see page 11625)	Occurs when a tab is removed from the tab control.
	OnUnDock (see page 11625)	Occurs when the application tries to undock a control that is docked to the windowed control.

62.1.4.6.1 TDockTabSet.OnDockDrop Event

Occurs when the control is released from the mouse control and dropped onto the client.

Pascal

```
property OnDockDrop: TDockDropEvent;
```

C++

```
__property TDockDropEvent OnDockDrop;
```

62.1.4.6.2 TDockTabSet.OnDockOver Event

Occurs when the tabbed control is hovering over the dock site.

Pascal

```
property OnDockOver: TDockOverEvent;
```

C++

```
__property TDockOverEvent OnDockOver;
```

62.1.4.6.3 TDockTabSet.OnGetImageIndex Event

Pascal

```
property OnGetImageIndex: TTabGetImageEvent;
```

C++

```
__property TTabGetImageEvent OnGetImageIndex;
```

Description

This is OnGetImageIndex, a member of class TDockTabSet.

62.1.4.6.4 TDockTabSet.OnGetSiteInfo Event

Returns information about the site or client control on which the tab control is docked.

Pascal

```
property OnGetSiteInfo: TGetSiteInfoEvent;
```

C++

```
__property TGetSiteInfoEvent OnGetSiteInfo;
```

62.1.4.6.5 TDockTabSet.OnStartDock Event

Occurs when the user begins to drag a control to a docked position.

Pascal

```
property OnStartDock: TStartDockEvent;
```

C++

```
__property TStartDockEvent OnStartDock;
```

62.1.4.6.6 TDockTabSet.OnTabAdded Event

Occurs when a tab is added to the tab control.

Pascal

```
property OnTabAdded: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnTabAdded;
```

62.1.4.6.7 TDockTabSet.OnTabRemoved Event

Occurs when a tab is removed from the tab control.

Pascal

```
property OnTabRemoved: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnTabRemoved;
```

62.1.4.6.8 TDockTabSet.OnUnDock Event

Occurs when the application tries to undock a control that is docked to the windowed control.

Pascal

```
property OnUnDock: TUnDockEvent;
```

C++

```
__property TUnDockEvent OnUnDock;
```

62.1.5 TTabDockPanel Class

The panel for the TTabDock object.

Class Hierarchy

Pascal

```
TTabDockPanel = class(TPanel);
```

C++

```
class TTabDockPanel : public TPanel;
```

File

DockTabSet

Description

Use TDockTabSet (see page 11604) instead of TTabDock, when possible.

62.1.5.1 TTabDockPanel Members

The following tables list the members exposed by TTabDockPanel.

Protected Events

	Name	Description
	OnAlignInsertBefore (see page 6213)	Occurs when an object with custom alignment is aligned.
	OnAlignPosition (see page 6214)	Occurs when an object with custom alignment is aligned.
	OnCanResize (see page 5851)	Occurs when an attempt is made to resize the control.
	OnClick (see page 5851)	Occurs when the user clicks the control.
	OnConstrainedResize (see page 5853)	Adjust resize constraints.
	OnContextPopup (see page 5854)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnDblClick (see page 5854)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDockDrop (see page 6214)	Occurs when another control is docked to the control.
	OnDockOver (see page 6216)	Occurs when another control is dragged over the control.
	OnDragDrop (see page 5855)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 5857)	Occurs when the user drags an object over a control.
	OnEndDock (see page 5859)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 5860)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnEnter (see page 6219)	Occurs when a control receives the input focus.
	OnExit (see page 6221)	Occurs when the input focus shifts away from one control to another.
	OnGetSiteInfo (see page 6223)	Returns the control's docking information.
	OnKeyDown (see page 6225)	Occurs when a user presses any key while the control has focus.
	OnKeyPress (see page 6227)	Occurs when a key is pressed.
	OnKeyUp (see page 6228)	Occurs when the user releases a key that has been pressed.
	OnMouseActivate (see page 5861)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 5862)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseEnter (see page 5864)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 5864)	Occurs when the user moves the mouse outside of a control.
	OnMouseMove (see page 5865)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.

	OnMouseUp (see page 5867)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnMouseWheel (see page 5869)	Occurs when the mouse wheel is rotated.
	OnMouseWheelDown (see page 5869)	Occurs when the mouse wheel is rotated downward.
	OnMouseWheelUp (see page 5870)	Occurs when the mouse wheel is rotated upward.
	OnResize (see page 5870)	Occurs immediately after the control is resized.
	OnStartDock (see page 5871)	Occurs when the user begins to drag a control with a DragKind (see page 5819) of dkDock.
	OnStartDrag (see page 5871)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.
	OnUnDock (see page 6230)	Occurs when the application tries to undock a control that is docked to the windowed control.

Protected Fields

	Name	Description
	FAnchorMove (see page 5733)	This is FAnchorMove, a member of class TControl.
	FAnchorOrigin (see page 5734)	This is FAnchorOrigin, a member of class TControl.
	FAnchorRules (see page 5734)	This is FAnchorRules, a member of class TControl.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FDesignSize (see page 6124)	This is FDesignSize, a member of class TWinControl.
	FDoubleBuffered (see page 6124)	This is FDoubleBuffered, a member of class TWinControl.
	FExplicitHeight (see page 5734)	This is FExplicitHeight, a member of class TControl.
	FExplicitLeft (see page 5734)	This is FExplicitLeft, a member of class TControl.
	FExplicitTop (see page 5734)	This is FExplicitTop, a member of class TControl.
	FExplicitWidth (see page 5735)	This is FExplicitWidth, a member of class TControl.
	FInImeComposition (see page 6125)	This is FInImeComposition, a member of class TWinControl.
	FOriginalParentSize (see page 5735)	This is FOriginalParentSize, a member of class TControl.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	ActionChange (see page 5737)	Responds when the action associated with the control changes.
V	ActionChange (see page 6127)	Updates the control to reflect changes in its associated action.
	AddBiDiModeExStyle (see page 6128)	Sets control's window style according to its bi-directional support.
V	AdjustClientRect (see page 6128)	Provides the interface that adjusts the ClientRect (see page 5810) property for idiosyncrasies of the window.
V	AdjustClientRect (see page 12537)	Adjusts the ClientRect property for the idiosyncrasies of the window.
	AdjustSize (see page 5738)	Sets the size of the control as determined by the AutoSize (see page 5803) property.
V	AdjustSize (see page 6129)	Adjusts the control's size according to its contents and constraints.
V	AlignControls (see page 6129)	Aligns any controls for which the control is the parent within a specified area of the control.
	ArrangeControl (see page 6130)	This is ArrangeControl, a member of class TWinControl.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	AssignTo (see page 5739)	Overrides the inherited AssignTo function to enable assignments to TAction objects.
V	AssignTo (see page 6130)	Copies the properties of the windowed control to another object.
	BeginAnimation (see page 11639)	This is BeginAnimation, a member of class TTabDockPanel.
	BeginAutoDrag (see page 5739)	Begin Automatic Drag.
	CalcCursorPos (see page 5741)	This is CalcCursorPos, a member of class TControl.
V	CanAutoSize (see page 5741)	Indicates whether the control can resize itself automatically to accommodate its contents.
V	CanAutoSize (see page 6131)	Indicates how the control can be resized.
V	CanAutoSize (see page 12537)	Adjusts the way the panel responds to resize attempts.
V	CanResize (see page 5742)	OnCanResize (see page 5851) event dispatcher.
V	CanResize (see page 6132)	Indicates how the control can respond to a resize attempt.

	Changed (see page 5742)	Sends a CM_CHANGED (see page 6330) message to the control.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	ChangeScale (see page 5743)	Rescaling event dispatcher.
V	ChangeScale (see page 6132)	Resize (see page 5780) and reposition children and self.
	Click (see page 5743)	Respond to user click.
	CMShowingChanged (see page 11640)	This is CMShowingChanged, a member of class TTabDockPanel.
V	ConstrainedResize (see page 5746)	Notify control of resize with constraints.
V	ConstrainedResize (see page 6133)	Generates an OnConstrainedResize (see page 5853) event.
	ControlsAligned (see page 6134)	This is ControlsAligned, a member of class TWinControl.
	CreateDockManager (see page 6134)	Creates the dock manager for the control.
V	CreateHandle (see page 6135)	Creates underlying screen object.
V	CreateParams (see page 6135)	Initializes a window-creation parameter data structure.
V	CreateParams (see page 12537)	Initializes a window-creation parameter record passed in the Params parameter.
	CreateSubClass (see page 6136)	Creates a windowed control derived from an existing Windows window class.
V	CreateWindowHandle (see page 6137)	Creates a Windows control to represent the control.
V	CreateWnd (see page 6137)	Creates the underlying window.
V	CustomAlignInsertBefore (see page 6137)	Returns placement order of custom-aligned child control.
V	CustomAlignPosition (see page 6138)	Returns aligned position of custom-aligned child control.
	DblClick (see page 5747)	OnDblClick (see page 5854) event dispatcher.
	DefaultDockImage (see page 5747)	Handles the painting and erasing of a dock image.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DefineProperties (see page 5748)	Provides methods to read and write the IsControl (see page 5829) property to a stream such as a form file.
V	DefineProperties (see page 6139)	Provides methods to read and write the IsControl property to a stream such as a form file.
	DesignWndProc (see page 5749)	This is DesignWndProc, a member of class TControl.
V	DestroyHandle (see page 6140)	Destroys the control's window without destroying the control.
V	DestroyWindowHandle (see page 6140)	Destroys the window created in the CreateWindowHandle (see page 6137) method.
V	DestroyWnd (see page 6141)	Destroys the control's window.
	DoAddDockClient (see page 6142)	Performs actions when a control is docked to the windowed control.
	DockOver (see page 6143)	Responds when a docking client is dragged over the windowed control.
V	DockReplaceDockClient (see page 6143)	This is DockReplaceDockClient, a member of class TWinControl.
	DockTrackNoTarget (see page 5749)	Handles dragging of the control over an invalid docking target.
	DoContextPopup (see page 5750)	OnContextPopup (see page 5854) event dispatcher.
	DoDock (see page 5750)	Docking event dispatcher.
	DoDockOver (see page 6143)	Generates an OnDockOver (see page 6216) event.
	DoEndDock (see page 5750)	OnEndDock (see page 5859) event dispatcher.
	DoEndDrag (see page 5751)	OnEndDrag (see page 5860) event dispatcher.
	DoEnter (see page 6144)	Respond to receiving input focus.
	DoExit (see page 6144)	Respond to losing input focus
	DoFlipChildren (see page 6145)	Flips the control's children.
	DoKeyDown (see page 6145)	Performs some preprocessing before generating an OnKeyDown (see page 6225) event.
	DoKeyPress (see page 6146)	Performs some preprocessing before generating an OnKeyPress (see page 6227) event.
	DoKeyUp (see page 6146)	Performs some preprocessing before generating an OnKeyUp (see page 6228) event.
	DoMouseWheel (see page 5751)	Processes mouse wheel motion.
	DoMouseWheelDown (see page 5752)	OnMouseWheelDown (see page 5869) event dispatcher.
	DoMouseWheelUp (see page 5752)	OnMouseWheelUp (see page 5870) event dispatcher.
	DoRemoveDockClient (see page 6147)	Responds when a control is undocked from the windowed control.
	DoStartDock (see page 5753)	OnStartDock (see page 5871) event dispatcher.

	DoStartDrag (see page 5753)	OnStartDrag (see page 5871) event dispatcher.
	DoUnDock (see page 6147)	Undocks a control that is currently docked to the windowed control.
	DragCanceled (see page 5754)	Provides the interface for a method that responds to the cancellation of a drag.
	DragOver (see page 5755)	OnDragOver (see page 5857) event dispatcher.
	DrawDragDockImage (see page 5755)	Draws the dock image for the control.
	EndAnimation (see page 11640)	This is EndAnimation, a member of class TTabDockPanel.
	EraseDragDockImage (see page 5757)	Erases the dock image for the control.
	FindNextControl (see page 6149)	Returns the control's next child in the tab order after the specified control.
	FixupTabList (see page 6149)	Sorts the child controls by their tab order.
V	GetAction (see page 5758)	This is GetAction, a member of class TControl.
	GetActionLinkClass (see page 5758)	Returns the appropriate action link class that is associated with the control class.
V	GetActionLinkClass (see page 6152)	Returns the associated action link class.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetChildren (see page 6153)	Calls a specified method for each child of the control.
V	GetClientOrigin (see page 5758)	Returns the screen coordinates of the top-left corner of the control's client area.
V	GetClientOrigin (see page 6153)	Returns the value of the ClientOrigin (see page 5809) property.
V	GetClientRect (see page 5759)	Returns a rectangle defining the client area of the control.
V	GetClientRect (see page 6154)	Returns the value of the ClientRect (see page 5810) property.
V	GetControlExtents (see page 6154)	Returns the smallest rectangle in which all the control's children fit.
V	GetDeviceContext (see page 5760)	Returns a device context for the control.
V	GetDeviceContext (see page 6155)	Provides access to a device context for the control.
	GetDockEdge (see page 5763)	Returns the edge on which another control should be docked when it is dragged over the control.
V	GetDragImages (see page 5763)	Returns the control's image list containing the image to be displayed while dragging.
V	GetEnabled (see page 5763)	Returns the value of the Enabled (see page 5821) property.
V	GetFloating (see page 5764)	Returns the value of the Floating (see page 5823) property.
V	GetFloatingDockSiteClass (see page 5764)	Returns the class used for the control when it is floating.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetPalette (see page 5765)	Returns the handle to a palette for use by the control.
	GetParentHandle (see page 6157)	Returns the window handle for the window of the control's parent.
	GetPopupMenu (see page 5765)	Returns the pop-up menu associated with the control.
	GetSiteInfo (see page 6158)	Generates an OnGetSiteInfo (see page 6223) event
	GetTopParentHandle (see page 6159)	Returns the window handle of the first window not associated with a VCL control that contains the windowed control.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	InvalidateDockHostSite (see page 6162)	This is InvalidateDockHostSite, a member of class TWinControl.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsControlActivateMsg (see page 6162)	This is IsControlActivateMsg, a member of class TWinControl.
	IsControlMouseMsg (see page 6162)	Indicates whether a specified mouse message is directed to one of the windowed control's child controls.
	IsQualifyingSite (see page 6163)	This is IsQualifyingSite, a member of class TWinControl.
	KeyDown (see page 6163)	Respond to key press events.
	KeyPress (see page 6163)	Respond to keyboard input.
	KeyUp (see page 6164)	Respond to released key.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Loaded (see page 5771)	Initializes the control after it is loaded from a stream.
	MainWndProc (see page 6165)	Receives Windows messages for the control.

	MouseActivate (see page 5773)	This is MouseActivate, a member of class TControl.
	MouseDown (see page 5773)	OnMouseDown (see page 5862) event dispatcher.
	MouseMove (see page 5773)	Respond to mouse moving over control area..
	MouseUp (see page 5774)	OnMouseUp (see page 5867) event dispatcher.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	Notification (see page 5775)	Responds to notifications that components are being created or destroyed.
V	Notification (see page 6165)	Responds to notifications that components are being created or destroyed.
	NotifyControls (see page 6165)	Sends a message to all the child controls.
V	Paint (see page 5920)	Renders the image of a custom control.
V	Paint (see page 12538)	Renders the image of the panel.
	PaintControls (see page 6166)	Paints each of the child controls in a windowed control using the specified device context.
	PaintHandler (see page 6166)	Responds to WM_PAINT messages.
V	PaintWindow (see page 5920)	Renders the image of the control on a specified device context.
V	PaintWindow (see page 6169)	Renders the image of a windowed control.
	PaletteChanged (see page 5775)	Responds to changes in the system's palette by realizing the control's palette.
V	PaletteChanged (see page 6170)	Responds to changes in the system's palette by realizing the control's palette and the palette for each child control.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	PositionDockRect (see page 5777)	Positions the docking rectangle according to the current drag-and-dock state.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 5778)	Prepares the control for having its properties assigned values read from a stream.
V	ReadState (see page 6171)	Prepares the control for having its properties assigned values from a stream.
	RecreateWnd (see page 6171)	Recreate underlying Windows screen object.
	ReloadDockedControl (see page 6172)	Reloads a docked control.
	RemoveWindowProps (see page 6174)	This is RemoveWindowProps, a member of class TWinControl.
V	RequestAlign (see page 5780)	Instructs the parent of a control to reposition the control, enforcing its Align (see page 5798) property.
	ResetIme (see page 6174)	Restores the input method editor (IME) that was active when the application started.
	ResetImeComposition (see page 6175)	Directs the composition window of the input method editor (IME) to perform a specific action.
	Resize (see page 5780)	Respond to control resize.
	ScaleConstraints (see page 5781)	This is ScaleConstraints, a member of class TControl.
	ScaleControls (see page 6176)	Rescale child controls only.
	SelectFirst (see page 6177)	Locates first selectable child control.
	SelectNext (see page 6177)	Moves the input focus from the current child control to the next one in the tab order.
	SendCancelMode (see page 5781)	Cancels the modal state of the control.
	SendDockNotification (see page 5782)	Sends a Windows message to the control's host dock site.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
V	SetAutoSize (see page 5783)	This is SetAutoSize, a member of class TControl.
V	SetBiDiMode (see page 5783)	Sets the control's bi-directional mode.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
V	SetChildOrder (see page 6178)	Changes the order in which the child component appears in the list of child components returned by the GetChildren (see page 6153) method.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
V	SetDragMode (see page 5785)	Sets the drag mode for the control.
V	SetEnabled (see page 5785)	Sets the value of the Enabled (see page 5821) property.
	SetIme (see page 6181)	Activates an input method editor (IME) using the values specified by the ImeMode (see page 6207) and ImeName (see page 6208) properties.
	SetImeCompositionWindow (see page 6181)	Sets the position and font of the composition window.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.

	SetName (see page 5785)	Sets the name of the control.
	SetParent (see page 5786)	Sets the parent of the control.
	SetParent (see page 6182)	Sets the parent of the control.
	SetParentBackground (see page 6182)	This is SetParentBackground, a member of class TWinControl.
	SetParentBackground (see page 12539)	This is SetParentBackground, a member of class TCustomPanel.
	SetParentBiDiMode (see page 5786)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	SetParentComponent (see page 5787)	Sets the parent for the control.
	SetZOrder (see page 5788)	Repositions the control in its parent's control list, thereby changing position onscreen.
	SetZOrder (see page 6182)	Moves the control to the top or bottom of the parent control's (or screen's) list of TWinControl (see page 6112) controls.
	ShouldAutoHide (see page 11640)	This is ShouldAutoHide, a member of class TTabDockPanel.
	ShowControl (see page 6183)	Ensures that a specified child control is visible.
	UpdateBounds (see page 6185)	This is UpdateBounds, a member of class TWinControl.
	UpdateBoundsRect (see page 5789)	Changes the Top (see page 5844), Left (see page 5830), Width (see page 5849), and Height (see page 5825) properties of the control, but doesn't update its screen image and bypasses all resize events.
	UpdateControlOriginalParentSize (see page 6186)	This is UpdateControlOriginalParentSize, a member of class TWinControl.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateExplicitBounds (see page 5789)	This is UpdateExplicitBounds, a member of class TControl.
	UpdateRecreatingFlag (see page 6186)	This is UpdateRecreatingFlag, a member of class TWinControl.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	UpdateUIState (see page 6186)	Updates form User Interface State as needed
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	VisibleChanging (see page 5791)	Provides the interface for a method that responds to changes in the control's visibility.
	WMEraseBkgnd (see page 11640)	This is WMEraseBkgnd, a member of class TTabDockPanel.
	WMNCPaint (see page 11641)	This is WMNCPaint, a member of class TTabDockPanel.
	WMPaint (see page 11641)	This is WMPaint, a member of class TTabDockPanel.
	WMPrint (see page 11641)	This is WMPrint, a member of class TTabDockPanel.
	WMPrintClient (see page 11641)	This is WMPrintClient, a member of class TTabDockPanel.
	WndProc (see page 5791)	Provides specific message responses for the control.
	WndProc (see page 6187)	Provides specific message responses for the control.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	ActionLink (see page 5798)	Contains the action link object associated with the control.
	Alignment (see page 12539)	Determines how the caption is aligned within the panel.
	AutoSize (see page 5803)	Specifies whether the control sizes itself automatically to accommodate its contents.
	BevelEdges (see page 6192)	Specifies which edges of the control are beveled.
	BevelInner (see page 6193)	Specifies the cut of the inner bevel.
	BevelInner (see page 12540)	Determines the style of the inner bevel of a panel.
	BevelKind (see page 6193)	Specifies the control's bevel style.
	BevelOuter (see page 6194)	Specifies the cut of the outer bevel.
	BevelOuter (see page 12541)	Determines the style of the outer bevel of a panel.
	BevelWidth (see page 6194)	Specifies the width of the inner and outer bevels.
	BevelWidth (see page 12542)	Determines the width, in pixels, of both the inner and outer bevels of a panel.

	BorderStyle (see page 12543)	Determines the style of the line drawn around the perimeter of the panel control.
	BorderWidth (see page 6195)	Specifies the width of the control's border.
	BorderWidth (see page 12543)	Specifies the distance, in pixels, between the outer and inner bevels.
R	Canvas (see page 5921)	Specifies the TCanvas object that presents a drawing surface for the control.
	Caption (see page 5806)	Specifies a text string that identifies the control to the user.
	Color (see page 5812)	Specifies the background color of the control.
	Color (see page 12544)	Specifies the background color of the control.
	Ctl3D (see page 6198)	Determines whether a control has a three-dimensional (3-D) or two-dimensional look.
	DefWndProc (see page 6199)	Specifies the default window procedure for the windowed control.
	DesktopFont (see page 5818)	Specifies whether the control uses the Windows icon font when writing text.
R	DockClientInfo (see page 11642)	This is DockClientInfo, a member of class TTabDockPanel.
	DragCursor (see page 5818)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 5819)	Specifies whether the control is being dragged normally or for docking.
	DragMode (see page 5819)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	Font (see page 5823)	Controls (see page 5711) the attributes of text written on or in the control.
	FullRepaint (see page 12545)	Determines how the panel repaints itself when it is resized.
	ImeMode (see page 6207)	Determines the behavior of the input method editor (IME).
	ImeName (see page 6208)	Specifies the input method editor (IME) to use for converting keyboard input to Asian language characters.
	IsControl (see page 5829)	Determines whether a form stores its form-specific properties to a stream.
	Locked (see page 12545)	Determines whether a panel that is used as a toolbar is replaced by a toolbar supplied by an OLE server.
	MouseCapture (see page 5831)	Indicates whether the control has "captured" mouse events.
	ParentBackground (see page 6209)	Determines whether control uses parent's theme background.
	ParentBiDiMode (see page 5833)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	ParentColor (see page 5834)	Determines where a control looks for its color information.
	ParentColor (see page 12546)	Determines where a control looks for its color information.
	ParentCtl3D (see page 6209)	Determines where a component looks to determine if it should appear three dimensional.
	ParentFont (see page 5834)	Determines where a control looks for its font information.
	ParentShowHint (see page 5835)	Determines where a control looks to find out if its Help Hint (see page 5827) should be shown.
	PopupMenu (see page 5835)	Identifies the pop-up menu associated with the control.
	ScalingFlags (see page 5840)	Reflects which attributes of the control have been scaled.
R	SplitterPanel (see page 11642)	This is SplitterPanel, a member of class TTabDockPanel.
	SplitterWidth (see page 11642)	This is SplitterWidth, a member of class TTabDockPanel.
	Text (see page 5842)	Contains a text string associated with the control.
	VerticalAlignment (see page 12547)	Sets the vertical position of the caption.
	WheelAccumulator (see page 5849)	Accumulates mouse wheel rotations.
	WindowHandle (see page 6212)	Provides access to a window handle for the control.
	WindowText (see page 5850)	Contains the text string of the control.

Public Events

	Name	Description
	WindowProc (see page 5872)	Points to the window procedure that responds to messages sent to the control.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.

	BeginDrag (see page 5740)	Starts the dragging of a control.
	BringToFront (see page 5740)	Puts the control in front of all other controls in its parent control.
	Broadcast (see page 6130)	Sends a message to each of the child controls.
	CanFocus (see page 6131)	Indicates whether a control can receive focus.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	ClientToParent (see page 5744)	Translates client coordinates to parent coordinates.
	ClientToScreen (see page 5744)	Translates a given point from client area coordinates to global screen coordinates.
	ContainsControl (see page 6133)	Indicates whether a specified control exists within the control.
	ControlAtPos (see page 6133)	Returns the child control located at a specified position within the control.
	Create (see page 11638)	This is Create, a member of class TTabDockPanel.
	CreateParented (see page 6123)	Creates and initializes a control as the child of a specified non-VCL container.
	CreateParentedControl (see page 6136)	Creates and initializes a control as the child of a specified non-VCL window.
V	DefaultHandler (see page 5748)	Provides message handling for all messages that do not have specific handlers.
V	DefaultHandler (see page 6139)	Provides message handling for all messages that the control does not fully process itself.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 11638)	Destroys an instance of TCustomControl.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	DisableAlign (see page 6141)	Disables the realignment of child controls.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Dock (see page 5749)	Used internally to dock the control.
	DockDrop (see page 6142)	Generates an OnDockDrop (see page 6214) event.
	DragDrop (see page 5754)	OnDragDrop (see page 5855) event dispatcher.
	Dragging (see page 5754)	Indicates whether a control is being dragged.
	DrawTextBiDiModeFlags (see page 5756)	Returns the text flags that reflect the current setting of the BiDiMode (see page 5803) property.
	DrawTextBiDiModeFlagsReadingOnly (see page 5756)	Returns the text flag to add that indicates whether the control's text should read from right to left.
	EnableAlign (see page 6148)	Decrements the reference count incremented by the DisableAlign (see page 6141) method, eventually realigning the child controls.
	EndDrag (see page 5757)	Stops a control from being dragged any further.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindChildControl (see page 6148)	Returns a child control given its name.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FlipChildren (see page 6150)	Reverses the positions of child controls.
	Focused (see page 6150)	Determines whether the control has input focus.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetControlsAlignment (see page 5759)	Indicates how text is aligned within the control.
V	GetControlsAlignment (see page 12538)	Returns the alignment of text in the panel.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.

	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 5765)	Returns the parent of the control.
	GetTabOrderList (see page 6158)	Builds a list of controls in tab order.
	GetTextBuf (see page 5766)	Retrieves the control's text, copies it into a buffer, and returns the number of characters copied.
	GetTextLen (see page 5767)	Returns the length of the control's text.
	HandleAllocated (see page 6159)	Reports whether a screen object handle exists for the control.
	HandleNeeded (see page 6160)	Creates a screen object for the control if it doesn't already exist.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 5768)	Indicates whether the control has a parent.
	Hide (see page 5769)	Makes the control invisible.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
V	InitiateAction (see page 5769)	Calls the action link's Update (see page 5789) method if the control is associated with an action link.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InsertControl (see page 6160)	Inserts a control into the Controls (see page 6197) array property.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
V	Invalidate (see page 5770)	Completely repaint control.
V	Invalidate (see page 6161)	Schedules a control repaint.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	IsRightToLeft (see page 5770)	Indicates whether the control should be reversed right to left.
	ManualDock (see page 5771)	Docks the control.
	ManualFloat (see page 5772)	Undocks the control.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	MouseWheelHandler (see page 5774)	Dispatches messages received from a mouse wheel.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	PaintTo (see page 6167)	This is the overview for the PaintTo method overload.
	ParentToClient (see page 5776)	Translate parent coordinates to client coordinates.
	Perform (see page 5776)	Responds as if the control received a specified Windows message.
	PreProcessMessage (see page 6170)	This is PreProcessMessage, a member of class TWinControl.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	Realign (see page 6171)	Forces the control to realign children.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	Refresh (see page 5779)	Repaints the control on the screen.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveControl (see page 6172)	Removes a specified control from the Controls (see page 6197) array.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	Repaint (see page 5779)	Forces the control to repaint its image on the screen.
V	Repaint (see page 6174)	Repaints the entire control.
	ReplaceDockedControl (see page 5779)	Docks the control in the place where another control is already docked.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	ScaleBy (see page 6175)	Rescale control and its children.

	ScreenToClient (see page 5781)	Converts the screen coordinates of a specified point on the screen to client coordinates.
	ScrollBy (see page 6176)	Scroll control contents.
	SendToBack (see page 5782)	Puts a windowed control behind all other windowed controls, or puts a non-windowed control behind all other non-windowed controls.
V	SetBounds (see page 5783)	Sets the Left (see page 5830), Top (see page 5844), Width (see page 5849), and Height (see page 5825) properties all at once.
V	SetBounds (see page 6178)	Sets the windowed control's boundary properties all at once.
	SetDesignVisible (see page 5784)	Makes a control visible at design time.
V	SetDesignVisible (see page 6178)	Makes a control visible at design time.
V	SetFocus (see page 6179)	Gives the input focus to the control.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	SetTextBuf (see page 5787)	Sets the text of the control.
	Show (see page 5788)	Makes a control visible.
V	Update (see page 5789)	Processes any pending paint messages immediately.
V	Update (see page 6183)	Forces the control to update.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	UpdateControlState (see page 6186)	Respond to state change.
	UpdateDockCaptionPin (see page 11640)	Updates the pin state for the DockCaption of the TTabDockPanel (see page 11625).
	UseRightToLeftAlignment (see page 5790)	Specifies whether the control's alignment should be reversed right-to-left.
	UseRightToLeftReading (see page 5790)	Specifies whether the control is using a right-to-left reading order.
	UseRightToLeftScrollBar (see page 5791)	Specifies whether the vertical scroll bar appears on the left side of the control.

Public Properties

	Name	Description
	Action (see page 5797)	Designates the action associated with the control.
	Align (see page 5798)	Determines how the control aligns within its container (parent control).
R	AlignDisabled (see page 6192)	Indicates child control realignment disabled.
	Anchors (see page 5802)	Specifies how the control is anchored to its parent.
	AnimateSpeed (see page 11642)	Sets the animation speed on the panel and pin.
	BiDiMode (see page 5803)	Specifies the bi-directional mode for the control.
	BoundsRect (see page 5803)	Specifies the bounding rectangle of the control, expressed in the coordinate system of the parent control.
R	Brush (see page 6195)	Determines the color and pattern used for painting the background of the control.
	ClientHeight (see page 5808)	Specifies the height of the control's client area in pixels.
R	ClientOrigin (see page 5809)	Specifies the screen coordinates (in pixels) of the top left corner of a control's client area.
R	ClientRect (see page 5810)	Specifies the size (in pixels) of a control's client area.
	ClientWidth (see page 5811)	Specifies the horizontal size of the control's client area in pixels.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Constraints (see page 5812)	Specifies the size constraints for the control.
R	ControlCount (see page 6195)	Returns the number of child controls.
R	Controls (see page 6197)	Lists all child controls.
	ControlState (see page 5813)	Indicates the current state of a control at runtime.
	ControlStyle (see page 5814)	Determines style characteristics of the control.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	DockClientCount (see page 6199)	Specifies the number of controls that are docked on the windowed control.
R	DockClients (see page 6201)	Lists the controls that are docked to the windowed control.
	DockManager (see page 6202)	Specifies the control's docking manager interface.

	DockManager (see page 13060)	Specifies the control's docking manager interface.
	DockOrientation (see page 5818)	Specifies how the control is docked relative to other controls docked in the same parent.
	DockSite (see page 6204)	Specifies whether the control can be the target of drag-and-dock operations.
	DoubleBuffered (see page 6205)	Determines whether the control's image is rendered directly to the window or painted to an in-memory bitmap first.
	Enabled (see page 5821)	Controls (see page 5711) whether the control responds to mouse, keyboard, and timer events.
R	ExplicitHeight (see page 5821)	Specifies the explicit vertical size of the control in pixels.
R	ExplicitLeft (see page 5822)	Specifies the explicit horizontal pixel coordinate of the left edge of a component relative to its parent.
R	ExplicitTop (see page 5822)	Specifies the explicit vertical pixel coordinate of the top edge of a component relative to its parent.
R	ExplicitWidth (see page 5822)	Specifies the explicit horizontal size of the control in pixels.
R	Floating (see page 5823)	Indicates whether the control is floating.
	FloatingDockSiteClass (see page 5823)	Specifies the class of the temporary control that hosts the control when it is floating.
R	Handle (see page 6207)	Provides access to the underlying Windows screen object for the control.
	HostDockSite (see page 5829)	Specifies the control in which the control is docked.
	LRDockWidth (see page 5831)	Specifies the width of the control when it is docked horizontally.
R	MouseInClient (see page 6209)	This is MouseInClient, a member of class TWinControl.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Padding (see page 6209)	Specifies the padding of a control.
	Parent (see page 5832)	Indicates the parent of the control.
	ParentBackground (see page 12546)	Determines whether control uses parent's theme background.
	ParentWindow (see page 6210)	Reference to parent's underlying control.
	ShowHint (see page 5840)	Determines whether the control displays a Help Hint (see page 5827) when the mouse pointer rests momentarily on the control.
R	Showing (see page 6210)	Indicates whether the control is showing on the screen.
	TabOrder (see page 6211)	Indicates the position of the control in its parent's tab order.
	TabStop (see page 6211)	Determines if the user can tab to a control.
	TBDockHeight (see page 5842)	Specifies the height of the control when it is docked vertically.
	UndockHeight (see page 5845)	Specifies the height of the control when it is floating.
	UndockWidth (see page 5846)	Specifies the width of the control when it is floating.
	UseDockManager (see page 6212)	Specifies whether the docking manager is used in drag-and-dock operations.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	Visible (see page 5847)	Determines whether the component appears onscreen.
R	VisibleDockClientCount (see page 6212)	Specifies the number of visible controls that are docked on the windowed control.

Published Events

	Name	Description
	OnAlignInsertBefore (see page 13080)	Occurs when an object with custom alignment is aligned.
	OnAlignPosition (see page 13081)	Occurs when an object with custom alignment is aligned.
	OnCanResize (see page 13082)	Occurs when an attempt is made to resize the control.
	OnClick (see page 13082)	Occurs when the user clicks the control.
	OnConstrainedResize (see page 13084)	Adjust resize constraints.
	OnContextPopup (see page 13084)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnDblClick (see page 13085)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDockDrop (see page 13085)	Occurs when another control is docked to the control.
	OnDockOver (see page 13087)	Occurs when another control is dragged over the control.
	OnDragDrop (see page 13090)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 13092)	Occurs when the user drags an object over a control.
	OnEndDock (see page 13094)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.

	OnEndDrag (see page 13095)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnEnter (see page 13096)	Occurs when a control receives the input focus.
	OnExit (see page 13098)	Occurs when the input focus shifts away from one control to another.
	OnGetSiteInfo (see page 13100)	Returns the control's docking information.
	OnMouseActivate (see page 13102)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 13103)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseEnter (see page 13105)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 13105)	Occurs when the user moves the mouse outside of a control.
	OnMouseMove (see page 13105)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 13108)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnResize (see page 13110)	Occurs immediately after the control is resized.
	OnStartDock (see page 13111)	Occurs when the user begins to drag a control with a DragKind of dkDock.
	OnStartDrag (see page 13111)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.
	OnUnDock (see page 13112)	Occurs when the application tries to undock a control that is docked to the windowed control.

Published Properties

	Name	Description
	Align (see page 13044)	Determines how the control aligns within its container (parent control).
	Alignment (see page 13048)	Determines how the caption is aligned within the panel.
	AlignWithMargins (see page 5802)	Indicates whether a control should be constrained by margins.
	Anchors (see page 13048)	Specifies how the control is anchored to its parent.
	AutoSize (see page 13049)	Specifies whether the control sizes itself automatically to accommodate its contents.
	BevelEdges (see page 13049)	Specifies which edges of the control are beveled.
	BevelInner (see page 13050)	Determines the style of the inner bevel of a panel.
	BevelKind (see page 13051)	Specifies the control's bevel style.
	BevelOuter (see page 13051)	Determines the style of the outer bevel of a panel.
	BevelWidth (see page 13052)	Determines the width, in pixels, of both the inner and outer bevels of a panel.
	BiDiMode (see page 13053)	Specifies the bi-directional mode for the control.
	BorderStyle (see page 13054)	Determines the style of the line drawn around the perimeter of the panel control.
	BorderWidth (see page 13054)	Specifies the distance, in pixels, between the outer and inner bevels.
	Caption (see page 13055)	Specifies a text string that identifies the control to the user.
	Color (see page 13058)	Specifies the background color of the control.
	Constraints (see page 13059)	Specifies the size constraints for the control.
	Ctl3D (see page 13059)	Determines whether a control has a three-dimensional (3-D) or two-dimensional look.
	Cursor (see page 5815)	Specifies the image used to represent the mouse pointer when it passes into the region covered by the control.
	DockSite (see page 13062)	Specifies whether the control can be the target of drag-and-dock operations.
	DragCursor (see page 13063)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 13063)	Specifies whether the control is being dragged normally or for docking.
	DragMode (see page 13063)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	Enabled (see page 13065)	Controls whether the control responds to mouse, keyboard, and timer events.
	Font (see page 13066)	Controls the attributes of text written on or in the control.
	FullRepaint (see page 13067)	Determines how the panel repaints itself when it is resized.
	Height (see page 5825)	Specifies the vertical size of the control in pixels.
	HelpContext (see page 5826)	Numeric ID for control's context-sensitive help topic
	HelpKeyword (see page 5826)	Keyword for control's context-sensitive help topic
	HelpType (see page 5827)	Indicates whether the control's context sensitive help topic is identified by context ID or by keyword.

	Hint (see page 5827)	Contains the text string that can appear when the user moves the mouse over the control.
	Left (see page 5830)	Specifies the horizontal coordinate of the left edge of a component relative to its parent.
	Locked (see page 13067)	Determines whether a panel that is used as a toolbar is replaced by a toolbar supplied by an OLE server.
	Margins (see page 5831)	Specifies the margins for the control.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Padding (see page 13067)	Specifies the padding of a control.
	ParentBackground (see page 13068)	Determines whether control uses parent's theme background.
	ParentBiDiMode (see page 13068)	Specifies whether the control uses its parent's BiDiMode.
	ParentColor (see page 13068)	Determines where a control looks for its color information.
	ParentCtl3D (see page 13069)	Determines where a component looks to determine if it should appear three dimensional.
	ParentFont (see page 13069)	Determines where a control looks for its font information.
	ParentShowHint (see page 13070)	Determines where a control looks to find out if its Help Hint should be shown.
	PopupMenu (see page 13070)	Identifies the pop-up menu associated with the control.
	ShowHint (see page 13075)	Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.
	TabOrder (see page 13076)	Indicates the position of the control in its parent's tab order.
	TabStop (see page 13077)	Determines if the user can tab to a control.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Top (see page 5844)	Specifies the Y coordinate of the top left corner of a control, relative to its parent or containing control in pixels.
	UseDockManager (see page 13077)	Specifies whether the docking manager is used in drag-and-dock operations.
	VerticalAlignment (see page 13078)	Sets the vertical position of the caption.
	Visible (see page 13078)	Determines whether the component appears onscreen.
	Width (see page 5849)	Specifies the horizontal size of the control or form in pixels.

62.1.5.2 TTabDockPanel.Create Constructor

Pascal

```
constructor Create(AOwner: TComponent; DockClientInfo: TDockClientInfo); reintroduce;
```

C++

```
__fastcall TTabDockPanel(TComponent * AOwner, TDockClientInfo DockClientInfo);
```

Description

This is Create, a member of class TTabDockPanel.

62.1.5.3 TTabDockPanel.Destroy Destructor

Destroys an instance of TCustomControl.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TTabDockPanel();
```

Description

Do not call Destroy directly in an application. Instead, call Free. Free verifies that the control is not nil, and only then calls Destroy.

Applications should only free controls explicitly when the constructor was called without assigning an owner to the control.

As the control is destroyed, it:

Destroys the TCanvas object in its Canvas property.

Override Destroy to free any memory or resources allocated in the Create method. When declaring a Destroy method in a descendant control type, always add the override directive to the declaration and call the inherited Destroy as the last statement in the redeclared method.

When a control is created, Delphi automatically provides exception handling around the constructor call. The destructor is called if an exception escapes from the constructor. This means that the destructor code must be prepared to clean up a partially constructed instance. Check all data fields for zero before disposing of their contents.

62.1.5.4 TTabDockPanel Methods

The methods of the TTabDockPanel class are listed here.

Protected Methods

	Name	Description
	BeginAnimation (see page 11639)	This is BeginAnimation, a member of class TTabDockPanel.
	CMShowingChanged (see page 11640)	This is CMShowingChanged, a member of class TTabDockPanel.
	EndAnimation (see page 11640)	This is EndAnimation, a member of class TTabDockPanel.
	ShouldAutoHide (see page 11640)	This is ShouldAutoHide, a member of class TTabDockPanel.
	WMEraseBkgnd (see page 11640)	This is WMEraseBkgnd, a member of class TTabDockPanel.
	WMNCPaint (see page 11641)	This is WMNCPaint, a member of class TTabDockPanel.
	WMPaint (see page 11641)	This is WMPaint, a member of class TTabDockPanel.
	WMPrint (see page 11641)	This is WMPrint, a member of class TTabDockPanel.
	WMPrintClient (see page 11641)	This is WMPrintClient, a member of class TTabDockPanel.

Public Methods

	Name	Description
	UpdateDockCaptionPin (see page 11640)	Updates the pin state for the DockCaption of the TTabDockPanel (see page 11625).

62.1.5.4.1 TTabDockPanel.BeginAnimation Method

Pascal

```
procedure BeginAnimation;
```

C++

```
__fastcall BeginAnimation();
```

Description

This is BeginAnimation, a member of class TTabDockPanel.

62.1.5.4.2 TTabDockPanel.CMShowingChanged Method

Pascal

```
procedure CMShowingChanged(var Message: TMessage); message CM_SHOWINGCHANGED;
```

C++

```
__fastcall CMShowingChanged(TMessage Message);
```

Description

This is CMShowingChanged, a member of class TTabDockPanel.

62.1.5.4.3 TTabDockPanel.EndAnimation Method

Pascal

```
procedure EndAnimation;
```

C++

```
__fastcall EndAnimation();
```

Description

This is EndAnimation, a member of class TTabDockPanel.

62.1.5.4.4 TTabDockPanel.ShouldAutoHide Method

Pascal

```
function ShouldAutoHide: Boolean;
```

C++

```
__fastcall Boolean ShouldAutoHide();
```

Description

This is ShouldAutoHide, a member of class TTabDockPanel.

62.1.5.4.5 TTabDockPanel.UpdateDockCaptionPin Method

Updates the pin state for the DockCaption of the TTabDockPanel (see page 11625).

Pascal

```
procedure UpdateDockCaptionPin;
```

C++

```
__fastcall UpdateDockCaptionPin();
```

62.1.5.4.6 TTabDockPanel.WMEraseBkgnd Method

Pascal

```
procedure WMEraseBkgnd(var Message: TWMEraseBkgnd); message WM_ERASEBKGND;
```

C++

```
__fastcall WMEraseBkgnd(TWMEraseBkgnd Message);
```

Description

This is WMEraseBkgnd, a member of class TTabDockPanel.

62.1.5.4.7 TTabDockPanel.WMNCPaint Method

Pascal

```
procedure WMNCPaint(var Message: TWMNCPaint); message WM_NCPAINT;
```

C++

```
__fastcall WMNCPaint(TWMNCPaint Message);
```

Description

This is WMNCPaint, a member of class TTabDockPanel.

62.1.5.4.8 TTabDockPanel.WMPaint Method

Pascal

```
procedure WMPaint(var Message: TWMPaint); message WM_PAINT;
```

C++

```
__fastcall WMPaint(TWMPaint Message);
```

Description

This is WMPaint, a member of class TTabDockPanel.

62.1.5.4.9 TTabDockPanel.WMPrint Method

Pascal

```
procedure WMPrint(var Message: TWMPrint); message WM_PRINT;
```

C++

```
__fastcall WMPrint(TWMPrint Message);
```

Description

This is WMPrint, a member of class TTabDockPanel.

62.1.5.4.10 TTabDockPanel.WMPrintClient Method

Pascal

```
procedure WMPrintClient(var Message: TWMPrintClient); message WM_PRINTCLIENT;
```

C++

```
__fastcall WMPrintClient(TWMPrintClient Message);
```

Description

This is WMPrintClient, a member of class TTabDockPanel.

62.1.5.5 TTabDockPanel Properties

The properties of the TTabDockPanel class are listed here.

Protected Properties

	Name	Description
R	DockClientInfo (see page 11642)	This is DockClientInfo, a member of class TTabDockPanel.
R	SplitterPanel (see page 11642)	This is SplitterPanel, a member of class TTabDockPanel.
	SplitterWidth (see page 11642)	This is SplitterWidth, a member of class TTabDockPanel.

Public Properties

	Name	Description
	AnimateSpeed (see page 11642)	Sets the animation speed on the panel and pin.

62.1.5.5.1 TTabDockPanel.AnimateSpeed Property

Sets the animation speed on the panel and pin.

Pascal

```
property AnimateSpeed: Integer;
```

C++

```
__property int AnimateSpeed;
```

62.1.5.5.2 TTabDockPanel.DockClientInfo Property

Pascal

```
property DockClientInfo: TDockClientInfo;
```

C++

```
__property TDockClientInfo DockClientInfo;
```

Description

This is DockClientInfo, a member of class TTabDockPanel.

62.1.5.5.3 TTabDockPanel.SplitterPanel Property

Pascal

```
property SplitterPanel: TPanel;
```

C++

```
__property TPanel SplitterPanel;
```

Description

This is SplitterPanel, a member of class TTabDockPanel.

62.1.5.5.4 TTabDockPanel.SplitterWidth Property

Pascal

```
property SplitterWidth: Integer;
```

C++

```
__property int SplitterWidth;
```

Description

This is SplitterWidth, a member of class TTabDockPanel.

62.2 Interfaces

The following table lists interfaces in this documentation.

Interfaces

	Name	Description
	IAlternateDockHost (see page 11643)	Implement this interface to allow items to be redocked from one area to another, such as when using a pin control.

62.2.1 IAlternateDockHost Interface

Implement this interface to allow items to be redocked from one area to another, such as when using a pin control.

Class Hierarchy

Pascal

```
IAlternateDockHost = interface(IInterface);
```

C++

```
__interface IAlternateDockHost : public IInterface;
```

File

DockTabSet

62.2.1.1 IAlternateDockHost Members

The following tables list the members exposed by IAlternateDockHost.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	SetAlternateDockHost (see page 11644)	Sets an item to dock on an alternate host, assuming that an alternate host is defined.

62.2.1.2 IAlternateDockHost Methods

The methods of the IAlternateDockHost class are listed here.

Public Methods

	Name	Description
	SetAlternateDockHost (see page 11644)	Sets an item to dock on an alternate host, assuming that an alternate host is defined.

62.2.1.2.1 IAlternateDockHost.SetAlternateDockHost Method

Sets an item to dock on an alternate host, assuming that an alternate host is defined.

Pascal

```
procedure SetAlternateDockHost(const DockHost: TWinControl);
```

C++

```
__fastcall SetAlternateDockHost(const TWinControl * DockHost);
```

63 DRIntf Namespace

This is namespace DRIntf.

Topics

Name	Description
Functions (see page 11647)	The following table lists functions in this documentation.
Structs, Records, Enums (see page 11661)	The following table lists structs, records, enums in this documentation.
Types (see page 11662)	The following table lists types in this documentation.
Constants (see page 11664)	The following table lists constants in this documentation.

Constants

Name	Description
NullAttrID (see page 11664)	This is constant DRIntf.NullAttrID.
NullDatabaseID (see page 11664)	This is constant DRIntf.NullDatabaseID.
NullFieldID (see page 11665)	This is constant DRIntf.NullFieldID.
NullID (see page 11665)	This is constant DRIntf.NullID.
NullTableID (see page 11665)	This is constant DRIntf.NullTableID.

Functions

	Name	Description
	AssociateAttr (see page 11647)	Sets up an association between an attribute ID and a field ID.
	CreateField (see page 11648)	Creates a new field from information stored in the Data Dictionary.
	CurrentDictionary (see page 11649)	This is function DRIntf.CurrentDictionary.
	DictionaryActive (see page 11649)	Indicates whether there is an active Data Dictionary.
	DictionaryDeactivate (see page 11649)	Deactivates the Data Dictionary.
	FindAttrID (see page 11650)	Returns the ID of a specified attribute set.
	FindDatabaseID (see page 11650)	Returns the ID of a specified database.
	FindFieldID (see page 11651)	Returns the ID of a specified field.
	FindTableID (see page 11652)	Returns the ID of a specified table.
	GetAttrID (see page 11652)	Returns the ID of the attribute set associated with a field.
	GetAttrName (see page 11653)	Returns the name of an attribute set given its ID.
	GetAttrNames (see page 11653)	Executes a callback for every attribute set name.
	GetControlClass (see page 11654)	Returns the class associated with an attribute set.
	HasConstraints (see page 11654)	Indicates whether there are any data constraints for a dataset stored in the Data Dictionary.
	IsNullID (see page 11655)	Indicates whether a Data Dictionary Identifier is null.

	NewAttr (see page 11656)	Creates an attribute set based on the properties of a field component.
	QualifyTableName (see page 11656)	Returns the fully qualified name of a table in the Data Dictionary.
	QualifyTableNameByName (see page 11657)	Returns the fully qualified name of a table in the Data Dictionary.
	UnassociateAttr (see page 11657)	Removes the association between an attribute ID and a field ID.
	UpdateAttr (see page 11658)	Updates an attribute set to match the properties of a field component.
	UpdateConstraints (see page 11659)	Replaces all imported constraints for a dataset with the current constraints in the Data Dictionary.
	UpdateDataset (see page 11659)	Updates a dataset and all its field components to match the Data Dictionary.
	UpdateField (see page 11660)	Updates a field component to match the associated attribute set in the Data Dictionary.

Structs, Records, Enums

	Name	Description
	TID (see page 11661)	This is record DRIntf.TID.

Types

Name	Description
TAttrID (see page 11662)	This is type DRIntf.TAttrID.
TDatabaseID (see page 11662)	This is type DRIntf.TDatabaseID.
TFieldID (see page 11663)	This is type DRIntf.TFieldID.
TTableID (see page 11663)	This is type DRIntf.TTableID.

63.1 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	AssociateAttr (see page 11647)	Sets up an association between an attribute ID and a field ID.
	CreateField (see page 11648)	Creates a new field from information stored in the Data Dictionary.
	CurrentDictionary (see page 11649)	This is function DRIntf.CurrentDictionary.
	DictionaryActive (see page 11649)	Indicates whether there is an active Data Dictionary.
	DictionaryDeactivate (see page 11649)	Deactivates the Data Dictionary.
	FindAttrID (see page 11650)	Returns the ID of a specified attribute set.
	FindDatabaseID (see page 11650)	Returns the ID of a specified database.
	FindFieldID (see page 11651)	Returns the ID of a specified field.
	FindTableID (see page 11652)	Returns the ID of a specified table.
	GetAttrID (see page 11652)	Returns the ID of the attribute set associated with a field.
	GetAttrName (see page 11653)	Returns the name of an attribute set given its ID.
	GetAttrNames (see page 11653)	Executes a callback for every attribute set name.
	GetControlClass (see page 11654)	Returns the class associated with an attribute set.
	HasConstraints (see page 11654)	Indicates whether there are any data constraints for a dataset stored in the Data Dictionary.
	IsNullID (see page 11655)	Indicates whether a Data Dictionary Identifier is null.
	NewAttr (see page 11656)	Creates an attribute set based on the properties of a field component.
	QualifyTableName (see page 11656)	Returns the fully qualified name of a table in the Data Dictionary.
	QualifyTableNameByName (see page 11657)	Returns the fully qualified name of a table in the Data Dictionary.
	UnassociateAttr (see page 11657)	Removes the association between an attribute ID and a field ID.
	UpdateAttr (see page 11658)	Updates an attribute set to match the properties of a field component.
	UpdateConstraints (see page 11659)	Replaces all imported constraints for a dataset with the current constraints in the Data Dictionary.
	UpdateDataset (see page 11659)	Updates a dataset and all its field components to match the Data Dictionary.
	UpdateField (see page 11660)	Updates a field component to match the associated attribute set in the Data Dictionary.

63.1.1 DRIntf.AssociateAttr Function

Sets up an association between an attribute ID and a field ID.

Pascal

```
procedure AssociateAttr(const AttrID: TAttrID; const FieldID: TFieldID);
```

C++

```
AssociateAttr(const TAttrID AttrID, const TFieldID FieldID);
```

File

DRIntf

Description

Call AssociateAttr to associate an attribute set in the Data Dictionary with a field in the field dictionary.

See Also

UnassociateAttr (see page 11657)

FindFieldID (see page 11651)

FindAttrID (see page 11650)

GetAttrID (see page 11652)

NewAttr (see page 11656)

The Data Dictionary

63.1.2 DRIntf.CreateField Function

Creates a new field from information stored in the Data Dictionary.

Pascal

```
function CreateField(Owner: TComponent; Dataset: TDataset; const FullName: string; const
Origin: string; const FieldID: TFieldID; const AttrID: TAttrID): TField;
```

C++

```
TField CreateField(TComponent * Owner, TDataset Dataset, const AnsiString FullName, const
AnsiString Origin, const TFieldID FieldID, const TAttrID AttrID);
```

File

DRIntf

Description

Call CreateField to create a field component based on the information in the Data Dictionary.

The Owner parameter specifies the component responsible for freeing the field.

The Dataset parameter specifies the dataset that includes the field component.

The FullName and Origin parameters specify the values of the field component's properties of the same names. Origin can be an empty string.

The FieldID and AttrID parameters specify the field in the field dictionary and an attribute set to use when creating the field. Both can be 0. If FieldID is specified and AttrID is not, the attribute set associated with FieldID is used.

GetControlclass

The Data Dictionary

63.1.3 DRIntf.CurrentDictionary Function

Pascal

```
function CurrentDictionary: HDBIDR;
```

C++

```
HDBIDR CurrentDictionary();
```

File

DRIntf

Description

This is function DRIntf.CurrentDictionary.

63.1.4 DRIntf.DictionaryActive Function

Indicates whether there is an active Data Dictionary.

Pascal

```
function DictionaryActive: Boolean;
```

C++

```
Boolean DictionaryActive();
```

File

DRIntf

Description

Call DictionaryActive to check whether the Data Dictionary is active. If the dictionary is not active, applications can't store or retrieve attribute sets.

DictionaryActive returns true if the dictionary is active, false otherwise.

See Also

DictionaryDeactivate (see page 11649)

The Data Dictionary

63.1.5 DRIntf.DictionaryDeactivate Function

Deactivates the Data Dictionary.

Pascal

```
procedure DictionaryDeactivate;
```

C++

```
DictionaryDeactivate();
```

File

DRIntf

Description

Call DictionaryDeactivate to disable the Data Dictionary.

See Also

DictionaryActive (see page 11649)

The Data Dictionary

63.1.6 DRIntf.FindAttrID Function

Returns the ID of a specified attribute set.

Pascal

```
function FindAttrID(const AttrName: string): TAttrID;
```

C++

```
TAttrID FindAttrID(const AnsiString AttrName);
```

File

DRIntf

Description

Call FindAttrID to get the attribute ID for an attribute set that is stored in the Data Dictionary. AttrName is the name of the attribute set. If the Data Dictionary does not contain an attribute set with the specified name, FindAttrID returns a null ID.

See Also

NewAttr (see page 11656)

GetAttrID (see page 11652)

GetAttrName (see page 11653)

GetAttrNames (see page 11653)

IsNullID (see page 11655)

The Data Dictionary

63.1.7 DRIntf.FindDatabaseID Function

Returns the ID of a specified database.

Pascal

```
function FindDatabaseID(const Database: string): TDatabaseID;
```

C++

```
TDatabaseID FindDatabaseID(const AnsiString Database);
```

File

DRIntf

Description

Call FindDatabaseID to get the database ID for the database specified by the Database parameter. This ID can be used for locating the database's tables in the Data Dictionary.

If the named database is not in the Data Dictionary, FindDatabaseID returns a null ID.

See Also

FindTableID (see page 11652)

IsNullID (see page 11655)

The Data Dictionary

63.1.8 DRIntf.FindFieldID Function

Returns the ID of a specified field.

Pascal

```
function FindFieldID(const Table: TTableID; const Field: string): TFieldID;
```

C++

```
TFieldID FindFieldID(const TTableID Table, const AnsiString Field);
```

File

DRIntf

Description

Call FindFieldID to get the ID for a field that is stored in the field dictionary. Use this field ID to get or set an associated attribute set or to use as a basis when creating a new field component.

The Table parameter specifies the ID of the table that contains the field. The Field parameter specifies the name of the field.

If the Data Dictionary does not contain an entry for the specified field, FindFieldID returns a null ID.

See Also

GetAttrID (see page 11652)

FindTableID (see page 11652)

IsNullID (see page 11655)

UpdateAttr (see page 11658)

createField

UpdateField (see page 11660)

UnassociateAttr (see page 11657)

AssociateAttr (see page 11647)

The Data Dictionary

63.1.9 DRIntf.FindTableID Function

Returns the ID of a specified table.

Pascal

```
function FindTableID(const Database: TDatabaseID; const Table: string): TTableID;
```

C++

```
TTableID FindTableID(const TDatabaseID Database, const AnsiString Table);
```

File

DRIntf

Description

Call FindTableID to get the ID for a table in the database specified by the Database parameter. This ID can be used for locating the database's fields in the Data Dictionary.

The Database parameter specifies the database in which to locate the table. This ID can be obtained by calling FindDatabaseID (see page 11650).

The Table parameter is the name of table.

If the database ID is invalid or the named table is not in the Data Dictionary, FindTableID returns a null ID.

See Also

FindDatabaseID (see page 11650)

FindFieldID (see page 11651)

IsNullID (see page 11655)

QualifyTablename

The Data Dictionary

63.1.10 DRIntf.GetAttrID Function

Returns the ID of the attribute set associated with a field.

Pascal

```
function GetAttrID(const FieldID: TFieldID): TAttrID;
```

C++

```
TAttrID GetAttrID(const TFieldID FieldID);
```

File

DRIntf

Description

Call GetAttrID to get the ID for the attribute set associated with a field. The FieldID parameter is the Data Dictionary ID for the field whose attribute set is desired.

If the FieldID is not valid or the field does not have an associated attribute set, GetAttrID returns a null ID.

See Also

FindAttrID (see page 11650)

AssociateAttr (see page 11647)

FindFieldID (see page 11651)

IsNullID (see page 11655)

The Data Dictionary

63.1.11 DRIntf.GetAttrName Function

Returns the name of an attribute set given its ID.

Pascal

```
function GetAttrName(const AttrID: TAttrID): string;
```

C++

```
AnsiString GetAttrName(const TAttrID AttrID);
```

File

DRIntf

Description

Call GetAttrName to get the name of an attribute set from its ID.

See Also

FindAttrID (see page 11650)

NewAttr (see page 11656)

GetAttrNames (see page 11653)

GetAttrID (see page 11652)

The Data Dictionary

63.1.12 DRIntf.GetAttrNames Function

Executes a callback for every attribute set name.

Pascal

```
procedure GetAttrNames(Proc: TGetStrProc);
```

C++

```
GetAttrNames(TGetStrProc Proc);
```

File

DRIntf

Description

Call GetAttrNames to perform a callback for every attribute set in the Data Dictionary. The Proc parameter is called for every attribute set with its parameter set to the name of the attribute set.

The callback can obtain an attribute ID from the attribute set's name by calling FindAttrID (see page 11650).

See Also

NewAttr (see page 11656)

GetAttrName (see page 11653)

FindAttrID (see page 11650)

The Data Dictionary

63.1.13 DRIntf.GetControlClass Function

Returns the class associated with an attribute set.

Pascal

```
function GetControlClass(const AttrID: TAttrID): string;
```

C++

```
AnsiString GetControlClass(const TAttrID AttrID);
```

File

DRIntf

Description

Call GetControlClass to get name of the control class (a TField descendant) associated with an attribute set. If no class is associated with the attribute set, GetControlClass returns an empty string.

Note: To obtain a class reference from the class name, use the GetClass (Delphi) or __classid (C++) function.

63.1.14 DRIntf.HasConstraints Function

Indicates whether there are any data constraints for a dataset stored in the Data Dictionary.

Pascal

```
function HasConstraints(Dataset: TDBDataset): Boolean;
```

C++

```
Boolean HasConstraints(TDBDataset Dataset);
```

File

DRIntf

Description

Call HasConstraints to determine whether the Data Dictionary has any constraints recorded for the specified dataset.

See Also

UpdateConstraints (see page 11659)

TDataSet

TField

UpdateDataset (see page 11659)

The Data Dictionary

63.1.15 DRIntf.IsNullID Function

Indicates whether a Data Dictionary Identifier is null.

Pascal

```
function IsNullID(const ID): Boolean;
```

C++

```
Boolean IsNullID(const  ID);
```

File

DRIntf

Description

Call IsNullID to determine whether the ID for an entity in the Data Dictionary is null. IsNullID returns true if the ID is null, false otherwise.

Use IsNullID to test the return value of functions that look up items in the Data Dictionary.

See Also

FindDatabaseID (see page 11650)

FindFieldID (see page 11651)

FindTableID (see page 11652)

FindAttrID (see page 11650)

GetAttrID (see page 11652)

TAttrID (see page 11662)

The Data Dictionary

63.1.16 DRIntf.NewAttr Function

Creates an attribute set based on the properties of a field component.

Pascal

```
function NewAttr(Field: TField; const FieldID: TFieldID; const AttrName: string; const Parent:
TAttrID): TAttrID;
```

C++

```
TAttrID NewAttr(TField Field, const TFieldID FieldID, const AnsiString AttrName, const TAttrID
Parent);
```

File

DRIntf

Description

Call NewAttr create an attribute set in the data dictionary.

The attributes in the attribute set reflect the current properties of the field component specified by the Field parameter.

If a FieldID is provided, the attribute set is associated with Field ID. To create an attribute set without associating it with a field in the Data Dictionary, set the FieldID parameter to NullFieldID (see page 11665).

The AttrName parameter specifies the name under which the attribute set is stored.

The Parent parameter specifies a parent attribute set from which the new attribute set inherits values. Only field properties that differ from the values in the parent attribute set are saved with the new attribute set. If Parent is NullAttrID (see page 11664), all field properties are saved in the new attribute set.

NewAttr returns the attribute ID for the new attribute set.

The Data Dictionary

63.1.17 DRIntf.QualifyTableName Function

Returns the fully qualified name of a table in the Data Dictionary.

Pascal

```
function QualifyTableName(Database: TDatabase; const TableName: string): string;
```

C++

```
AnsiString QualifyTableName(TDatabase Database, const AnsiString TableName);
```

File

DRIntf

Description

Call QualifyTableName to add user name information to a database table name. Specify the database that contains the table using the Database parameter. Specify the name of a table within that database using the TableName parameter. QualifyTableName returns the fully qualified name of the database table if the table is stored in the Data Dictionary qualified by user name.

See Also

QualifyTableNameByName (see page 11657)

The Data Dictionary

63.1.18 DRIntf.QualifyTableNameByName Function

Returns the fully qualified name of a table in the Data Dictionary.

Pascal

```
function QualifyTableNameByName(const SessionName: string; const DatabaseName: string; const
TableName: string): string;
```

C++

```
AnsiString QualifyTableNameByName(const AnsiString SessionName, const AnsiString DatabaseName,
const AnsiString TableName);
```

File

DRIntf

Description

Call QualifyTableNameByName to add user name information to a database table name. Specify the BDE session that manages the database connection with the Session Name parameter. Specify the database that contains the table using the Database parameter. Specify the name of a table within that database using the TableName parameter. QualifyTableNameByName returns the fully qualified name of the database table if the table is stored in the Data Dictionary qualified by user name.

QualifyTablename

TSession

TDatabase

The Data Dictionary

63.1.19 DRIntf.UnassociateAttr Function

Removes the association between an attribute ID and a field ID.

Pascal

```
procedure UnassociateAttr(const FieldID: TFieldID);
```

C++

```
UnassociateAttr(const TFieldID FieldID);
```

File

DRIntf

Description

Call UnassociateAttr to end the association between the field specified by FieldID and its current attribute set in the Data Dictionary.

See Also

AssociateAttr (see page 11647)

FindFieldID (see page 11651)

The Data Dictionary

63.1.20 DRIntf.UpdateAttr Function

Updates an attribute set to match the properties of a field component.

Pascal

```
procedure UpdateAttr(Field: TField; const FieldID: TFieldID; const AttrID: TAttrID);
```

C++

```
UpdateAttr(TField Field, const TFieldID FieldID, const TAttrID AttrID);
```

File

DRIntf

Description

Call UpdateAttr to update an attribute set so that it matches the properties of the field component specified by the Field parameter. If the field is in the field dictionary, only those attributes that differ from the field identified by FieldID are saved in the attribute set.

The AttrID parameter identifies the attribute set to update. If AttrID is NULL, the attribute set associated with the FieldID parameter is updated.

See Also

FindFieldID (see page 11651)

GetAttrID (see page 11652)

FindAttrID (see page 11650)

NewAttr (see page 11656)

UpdateField (see page 11660)

AssociateAttr (see page 11647)

The Data Dictionary

63.1.21 DRIntf.UpdateConstraints Function

Replaces all imported constraints for a dataset with the current constraints in the Data Dictionary.

Pascal

```
procedure UpdateConstraints(Dataset: TDBDataset; Constraints: TCheckConstraints);
```

C++

```
UpdateConstraints(TDBDataset Dataset, TCheckConstraints Constraints);
```

File

DRIntf

Description

Call UpdateConstraints to ensure that the constraints for a dataset match the current values stored in the Data Dictionary. Specify the dataset to which the constraints apply as the DataSet parameter. Specify the TCheckConstraints object that represents that dataset's constraints as the Constraints parameter.

UpdateConstraints removes all constraints with a non-empty ImportedConstraint property and replaces them with new constraints that match the values in the Data Dictionary.

UpdateConstraints is equivalent to calling "Read From Dictionary" in the Constraints property editor.

See Also

HasConstraints (see page 11654)

UpdateDataset (see page 11659)

TDataSet

TCheckConstraint

The Data Dictionary

63.1.22 DRIntf.UpdateDataset Function

Updates a dataset and all its field components to match the Data Dictionary.

Pascal

```
procedure UpdateDataset(Dataset: TDBDataset);
```

C++

```
UpdateDataset(TDBDataset Dataset);
```

File

DRIntf

Description

Call UpdateDataset to ensure that a dataset reflects the current settings in the data dictionary. Specify the dataset to update as the Dataset parameter.

If Dataset is a TTable, UpdateDataset updates the Constraints property so that all imported constraints match the Data

Dictionary and updates all the field components to match the associated attribute sets.

If Dataset is a TQuery or TStoredProc, UpdateDataset updates the field components to match the associated attribute sets and parses the query to obtain any field constraints included in the constituent tables.

Calling UpdateDataset is equivalent to using "Retrieve attributes" for all fields in the fields editor followed by "Read From Dictionary" in the Constraints property editor.

See Also

UpdateConstraints (see page 11659)

UpdateField (see page 11660)

TDataset

TDataset

The Data Dictionary

63.1.23 DRIntf.UpdateField Function

Updates a field component to match the associated attribute set in the Data Dictionary.

Pascal

```
procedure UpdateField(Field: TField; const FieldID: TFieldID; const AttrID: TAttrID);
```

C++

```
UpdateField(TField Field, const TFieldID FieldID, const TAttrID AttrID);
```

File

DRIntf

Description

Call UpdateField to change the properties of a field component so that they match the associated attribute set in the Data Dictionary.

Specify the field to update as the Field parameter.

Specify the ID of the corresponding field in the Data Dictionary using the FieldID parameter. This value can be obtained using FindFieldID (see page 11651).

Specify the attribute set that acts as a source using the AttrID parameter.

The Data Dictionary

63.2 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Records

	Name	Description
	TID (see page 11661)	This is record DRIntf.TID.

63.2.1 DRIntf.TID Record

Pascal

```
TID = packed record
  Reserved: array[1..6] of Byte;
end;
```

C++

```
struct TID {
  array[1..6] of Byte Reserved;
};
```

File

DRIntf

Description

This is record DRIntf.TID.

63.3 Types

The following table lists types in this documentation.

Types

Name	Description
TAttrID (see page 11662)	This is type DRIntf.TAttrID.
TDatabaseID (see page 11662)	This is type DRIntf.TDatabaseID.
TFieldID (see page 11663)	This is type DRIntf.TFieldID.
TTableID (see page 11663)	This is type DRIntf.TTableID.

63.3.1 DRIntf.TAttrID Type

Pascal

```
TAttrID = type TID;
```

C++

```
type TID TAttrID;
```

File

DRIntf

Description

This is type DRIntf.TAttrID.

63.3.2 DRIntf.TDatabaseID Type

Pascal

```
TDatabaseID = type TID;
```

C++

```
type TID TDatabaseID;
```

File

DRIntf

Description

This is type DRIntf.TDatabaseID.

63.3.3 DRIntf.TFieldID Type

Pascal

```
TFieldID = type TID;
```

C++

```
type TID TFieldID;
```

File

DRIntf

Description

This is type DRIntf.TFieldID.

63.3.4 DRIntf.TTableID Type

Pascal

```
TTableID = type TID;
```

C++

```
type TID TTableID;
```

File

DRIntf

Description

This is type DRIntf.TTableID.

63.4 Constants

The following table lists constants in this documentation.

Constants

Name	Description
NullAttrID (see page 11664)	This is constant DRIntf.NullAttrID.
NullDatabaseID (see page 11664)	This is constant DRIntf.NullDatabaseID.
NullFieldID (see page 11665)	This is constant DRIntf.NullFieldID.
NullID (see page 11665)	This is constant DRIntf.NullID.
NullTableID (see page 11665)	This is constant DRIntf.NullTableID.

63.4.1 DRIntf.NullAttrID Constant

Pascal

```
NullAttrID: TAttrID = ();
```

C++

```
TAttrID NullAttrID = ();
```

File

DRIntf

Description

This is constant DRIntf.NullAttrID.

63.4.2 DRIntf.NullDatabaseID Constant

Pascal

```
NullDatabaseID: TDatabaseID = ();
```

C++

```
TDatabaseID NullDatabaseID = ();
```

File

DRIntf

Description

This is constant DRIntf.NullDatabaseID.

63.4.3 DRIntf.NullFieldID Constant

Pascal

```
NullFieldID: TFieldID = ();
```

C++

```
TFieldID NullFieldID = ();
```

File

DRIntf

Description

This is constant DRIntf.NullFieldID.

63.4.4 DRIntf.NullID Constant

Pascal

```
NullID: TID = ();
```

C++

```
TID NullID = ();
```

File

DRIntf

Description

This is constant DRIntf.NullID.

63.4.5 DRIntf.NullTableID Constant

Pascal

```
NullTableID: TTableID = ();
```

C++

```
TTableID NullTableID = ();
```

File

DRIntf

Description

This is constant DRIntf.NullTableID.

64 DSIntf Namespace

This is namespace DSIntf.

Topics

Name	Description
Interfaces (see page 11673)	The following table lists interfaces in this documentation.
Functions (see page 11702)	The following table lists functions in this documentation.
Structs, Records, Enums (see page 11705)	The following table lists structs, records, enums in this documentation.
Types (see page 11713)	The following table lists types in this documentation.
Constants (see page 11723)	The following table lists constants in this documentation.

Constants

Name	Description
BLANK_NOTCHANGED (see page 11727)	This is constant DSIntf.BLANK_NOTCHANGED.
BLANK_NULL (see page 11727)	This is constant DSIntf.BLANK_NULL.
BlobTypeMap (see page 11727)	This is constant DSIntf.BlobTypeMap.
CLSID_DSBase (see page 11728)	This is constant DSIntf.CLSID_DSBase.
CLSID_DSCursor (see page 11728)	This is constant DSIntf.CLSID_DSCursor.
CLSID_DSWriter (see page 11728)	This is constant DSIntf.CLSID_DSWriter.
DataTypeMap (see page 11729)	This is constant DSIntf.DataTypeMap.
DBERR_ABORTED (see page 11729)	This is constant DSIntf.DBERR_ABORTED.
DBERR_BLOBNOTFETCHED (see page 11729)	This is constant DSIntf.DBERR_BLOBNOTFETCHED.
DBERR_BOF (see page 11730)	This is constant DSIntf.DBERR_BOF.
DBERR_CANCELLED (see page 11730)	This is constant DSIntf.DBERR_CANCELLED.
DBERR_CANNOTAPPEND (see page 11730)	This is constant DSIntf.DBERR_CANNOTAPPEND.
DBERR_DATAPACKETMISMATCH (see page 11731)	This is constant DSIntf.DBERR_DATAPACKETMISMATCH.
DBERR_DELTAISEMPTY (see page 11731)	This is constant DSIntf.DBERR_DELTAISEMPTY.
DBERR_DETAILSNOTFETCHED (see page 11731)	This is constant DSIntf.DBERR_DETAILSNOTFETCHED.
DBERR_EOF (see page 11732)	This is constant DSIntf.DBERR_EOF.
DBERR_FLYAWAY_WRONGORDER (see page 11732)	This is constant DSIntf.DBERR_FLYAWAY_WRONGORDER.
DBERR_LINKFIELDSNOTUNIQUE (see page 11732)	This is constant DSIntf.DBERR_LINKFIELDSNOTUNIQUE.
DBERR_NEWERVERSIONREQ (see page 11733)	This is constant DSIntf.DBERR_NEWERVERSIONREQ.
DBERR_NOCASCADEDUPDATES (see page 11733)	This is constant DSIntf.DBERR_NOCASCADEDUPDATES.
DBERR_NOMASTERRECORD (see page 11733)	This is constant DSIntf.DBERR_NOMASTERRECORD.
DBERR_NOMETADATA (see page 11734)	This is constant DSIntf.DBERR_NOMETADATA.
DBERR_NONE (see page 11734)	This is constant DSIntf.DBERR_NONE.

DBERR_NOSUCHINDEX (see page 11734)	This is constant DSIntf.DBERR_NOSUCHINDEX.
DBERR_NOTHINGTOUNDO (see page 11735)	This is constant DSIntf.DBERR_NOTHINGTOUNDO.
dsArrayFldType (see page 11735)	This is constant DSIntf.dsArrayFldType.
dsCASCADEDELETES (see page 11735)	This is constant DSIntf.dsCASCADEDELETES.
dsCASCADEUPDATES (see page 11736)	This is constant DSIntf.dsCASCADEUPDATES.
dscbrABORT (see page 11736)	This is constant DSIntf.dscbrABORT.
dscbrAPPLY (see page 11736)	This is constant DSIntf.dscbrAPPLY.
dscbrCANCEL (see page 11737)	This is constant DSIntf.dscbrCANCEL.
dscbrCORRECT (see page 11737)	This is constant DSIntf.dscbrCORRECT.
dscbrIGNORE (see page 11737)	This is constant DSIntf.dscbrIGNORE.
dscbrMERGE (see page 11738)	This is constant DSIntf.dscbrMERGE.
dscbrREFRESH (see page 11738)	This is constant DSIntf.dscbrREFRESH.
dscbrSKIP (see page 11738)	This is constant DSIntf.dscbrSKIP.
dsCompArrayFldType (see page 11739)	This is constant DSIntf.dsCompArrayFldType.
dsDELAYEDBIT (see page 11739)	This is constant DSIntf.dsDELAYEDBIT.
dsDetUpd (see page 11739)	This is constant DSIntf.dsDetUpd.
dsEmbeddedFldType (see page 11740)	This is constant DSIntf.dsEmbeddedFldType.
dsfldADT (see page 11740)	This is constant DSIntf.dsfldADT.
dsfldARRAY (see page 11740)	This is constant DSIntf.dsfldARRAY.
dsfldBCD (see page 11741)	This is constant DSIntf.dsfldBCD.
dsfldBOOL (see page 11741)	This is constant DSIntf.dsfldBOOL.
dsfldBYTES (see page 11741)	This is constant DSIntf.dsfldBYTES.
dsfldDATE (see page 11742)	This is constant DSIntf.dsfldDATE.
dsfldDATETIME (see page 11742)	This is constant DSIntf.dsfldDATETIME.
dsfldEMBEDDEDTBL (see page 11742)	This is constant DSIntf.dsfldEMBEDDEDTBL.
dsfldFLOATIEEE (see page 11743)	This is constant DSIntf.dsfldFLOATIEEE.
dsfldFMTBCD (see page 11743)	This is constant DSIntf.dsfldFMTBCD.
dsfldINT (see page 11743)	This is constant DSIntf.dsfldINT.
dsfldREF (see page 11744)	This is constant DSIntf.dsfldREF.
dsfldTIME (see page 11744)	This is constant DSIntf.dsfldTIME.
dsfldTIMESTAMP (see page 11744)	This is constant DSIntf.dsfldTIMESTAMP.
dsfldUINT (see page 11745)	This is constant DSIntf.dsfldUINT.
dsfldUNICODE (see page 11745)	This is constant DSIntf.dsfldUNICODE.
dsfldUNKNOWN (see page 11745)	This is constant DSIntf.dsfldUNKNOWN.
dsfldZSTRING (see page 11746)	This is constant DSIntf.dsfldZSTRING.
dsIncInDelta (see page 11746)	This is constant DSIntf.dsIncInDelta.
dsIsNotVisible (see page 11746)	This is constant DSIntf.dsIsNotVisible.
dsIsVisible (see page 11747)	This is constant DSIntf.dsIsVisible.
dskeyCASEINSENSITIVE (see page 11747)	This is constant DSIntf.dskeyCASEINSENSITIVE.
dskeyDESCENDING (see page 11747)	This is constant DSIntf.dskeyDESCENDING.
dsPseudoFldType (see page 11748)	This is constant DSIntf.dsPseudoFldType.
dsRecDeleted (see page 11748)	This is constant DSIntf.dsRecDeleted.
dsRecModified (see page 11748)	This is constant DSIntf.dsRecModified.
dsRecNew (see page 11749)	This is constant DSIntf.dsRecNew.
dsRecOrg (see page 11749)	This is constant DSIntf.dsRecOrg.
dsRecUnmodified (see page 11749)	This is constant DSIntf.dsRecUnmodified.
dsSizeBitsLen (see page 11750)	This is constant DSIntf.dsSizeBitsLen.
dsSizeBitsMask (see page 11750)	This is constant DSIntf.dsSizeBitsMask.
dsTypeBitsMask (see page 11750)	This is constant DSIntf.dsTypeBitsMask.
dsUnused (see page 11751)	This is constant DSIntf.dsUnused.
dsVaryingFldType (see page 11751)	This is constant DSIntf.dsVaryingFldType.
ERRBASE_ALC (see page 11751)	This is constant DSIntf.ERRBASE_ALC.
ERRCAT_ALC (see page 11752)	This is constant DSIntf.ERRCAT_ALC.
ERRCODE_ABORTED (see page 11752)	This is constant DSIntf.ERRCODE_ABORTED.

ERRCODE_BLOBNOTFETCHED (see page 11752)	This is constant DSIntf.ERRCODE_BLOBNOTFETCHED.
ERRCODE_CANCELLED (see page 11753)	This is constant DSIntf.ERRCODE_CANCELLED.
ERRCODE_CANNOTAPPEND (see page 11753)	This is constant DSIntf.ERRCODE_CANNOTAPPEND.
ERRCODE_DATAPACKETMISMATCH (see page 11753)	This is constant DSIntf.ERRCODE_DATAPACKETMISMATCH.
ERRCODE_DELTAISEMPTY (see page 11754)	This is constant DSIntf.ERRCODE_DELTAISEMPTY.
ERRCODE_DETAILSNOTFETCHED (see page 11754)	This is constant DSIntf.ERRCODE_DETAILSNOTFETCHED.
ERRCODE_FLYAWAY_WRONGORDER (see page 11754)	This is constant DSIntf.ERRCODE_FLYAWAY_WRONGORDER.
ERRCODE_LINKFIELDSNOTUNIQUE (see page 11755)	This is constant DSIntf.ERRCODE_LINKFIELDSNOTUNIQUE.
ERRCODE_NEWERVERSIONREQ (see page 11755)	This is constant DSIntf.ERRCODE_NEWERVERSIONREQ.
ERRCODE_NOCASCADEDUPDATES (see page 11755)	This is constant DSIntf.ERRCODE_NOCASCADEDUPDATES.
ERRCODE_NOMASTERRECORD (see page 11756)	This is constant DSIntf.ERRCODE_NOMASTERRECORD.
ERRCODE_NOMETADATA (see page 11756)	This is constant DSIntf.ERRCODE_NOMETADATA.
ERRCODE_NOTHINGTOUNDO (see page 11756)	This is constant DSIntf.ERRCODE_NOTHINGTOUNDO.
FieldTypeMap (see page 11757)	This is constant DSIntf.FieldTypeMap.
fldADT (see page 11757)	This is constant DSIntf.fldADT.
fldARRAY (see page 11757)	This is constant DSIntf.fldARRAY.
fldAttrHIDDEN (see page 11758)	This is constant DSIntf.fldAttrHIDDEN.
fldAttrLINK (see page 11758)	This is constant DSIntf.fldAttrLINK.
fldAttrREADONLY (see page 11758)	This is constant DSIntf.fldAttrREADONLY.
fldAttrREQUIRED (see page 11759)	This is constant DSIntf.fldAttrREQUIRED.
fldBCD (see page 11759)	This is constant DSIntf.fldBCD.
fldBLOB (see page 11759)	This is constant DSIntf.fldBLOB.
fldBOOL (see page 11760)	This is constant DSIntf.fldBOOL.
fldBYTES (see page 11760)	This is constant DSIntf.fldBYTES.
fldCURSOR (see page 11760)	This is constant DSIntf.fldCURSOR.
fldDATE (see page 11761)	This is constant DSIntf.fldDATE.
fldDATETIME (see page 11761)	This is constant DSIntf.fldDATETIME.
fldFLOAT (see page 11761)	This is constant DSIntf.fldFLOAT.
fldFLOATIEEE (see page 11762)	This is constant DSIntf.fldFLOATIEEE.
fldFMTBCD (see page 11762)	This is constant DSIntf.fldFMTBCD.
fldINT16 (see page 11762)	This is constant DSIntf.fldINT16.
fldINT32 (see page 11763)	This is constant DSIntf.fldINT32.
fldINT64 (see page 11763)	This is constant DSIntf.fldINT64.
fldLOCKINFO (see page 11763)	This is constant DSIntf.fldLOCKINFO.
fldREF (see page 11764)	This is constant DSIntf.fldREF.
fldstACCOLEOBJ (see page 11764)	This is constant DSIntf.fldstACCOLEOBJ.
fldstAUTOINC (see page 11764)	This is constant DSIntf.fldstAUTOINC.
fldstBFILE (see page 11765)	This is constant DSIntf.fldstBFILE.
fldstBINARY (see page 11765)	This is constant DSIntf.fldstBINARY.
fldstDBSOLEOBJ (see page 11765)	This is constant DSIntf.fldstDBSOLEOBJ.
fldstFIXED (see page 11766)	This is constant DSIntf.fldstFIXED.
fldstFMTMEMO (see page 11766)	This is constant DSIntf.fldstFMTMEMO.
fldstGRAPHIC (see page 11766)	This is constant DSIntf.fldstGRAPHIC.
fldstGUID (see page 11767)	This is constant DSIntf.fldstGUID.
fldstHBINARY (see page 11767)	This is constant DSIntf.fldstHBINARY.
fldstHMEMO (see page 11767)	This is constant DSIntf.fldstHMEMO.
fldstMEMO (see page 11768)	This is constant DSIntf.fldstMEMO.
fldstMONEY (see page 11768)	This is constant DSIntf.fldstMONEY.
fldstOLEOBJ (see page 11768)	This is constant DSIntf.fldstOLEOBJ.
fldstORAINTERVAL (see page 11769)	This is constant DSIntf.fldstORAINTERVAL.
fldstORATIMESTAMP (see page 11769)	This is constant DSIntf.fldstORATIMESTAMP.
fldstPASSWORD (see page 11769)	This is constant DSIntf.fldstPASSWORD.
fldstReference (see page 11770)	This is constant DSIntf.fldstReference.
fldstTYPEDBINARY (see page 11770)	This is constant DSIntf.fldstTYPEDBINARY.

fldstWIDEMEMO (see page 11770)	This is constant DSIntf.fldstWIDEMEMO.
FldSubTypeMap (see page 11771)	This is constant DSIntf.FldSubTypeMap.
fldTABLE (see page 11771)	This is constant DSIntf.fldTABLE.
fldTIME (see page 11771)	This is constant DSIntf.fldTIME.
fldTIMESTAMP (see page 11772)	This is constant DSIntf.fldTIMESTAMP.
fldUINT16 (see page 11772)	This is constant DSIntf.fldUINT16.
fldUINT32 (see page 11772)	This is constant DSIntf.fldUINT32.
fldUINT64 (see page 11773)	This is constant DSIntf.fldUINT64.
fldUNICODE (see page 11773)	This is constant DSIntf.fldUNICODE.
fldUNKNOWN (see page 11773)	This is constant DSIntf.fldUNKNOWN.
fldVARBYTES (see page 11774)	This is constant DSIntf.fldVARBYTES.
fldWIDESTRING (see page 11774)	This is constant DSIntf.fldWIDESTRING.
fldZSTRING (see page 11774)	This is constant DSIntf.fldZSTRING.
MAXKEYFIELDS (see page 11775)	This is constant DSIntf.MAXKEYFIELDS.
MAXLOGFLDTYPES (see page 11775)	This is constant DSIntf.MAXLOGFLDTYPES.
mdALLOWLINKCHANGE (see page 11775)	This is constant DSIntf.mdALLOWLINKCHANGE.
mdCASCADEDEL (see page 11776)	This is constant DSIntf.mdCASCADEDEL.
mdCASCADEMOD (see page 11776)	This is constant DSIntf.mdCASCADEMOD.
PACKETVERSION_1 (see page 11776)	This is constant DSIntf.PACKETVERSION_1.
PACKETVERSION_2 (see page 11777)	This is constant DSIntf.PACKETVERSION_2.
PACKETVERSION_3 (see page 11777)	This is constant DSIntf.PACKETVERSION_3.
szAUTOINCVALUE (see page 11777)	This is constant DSIntf.szAUTOINCVALUE.
szBDEDEFCL (see page 11778)	This is constant DSIntf.szBDEDEFCL.
szBDEDEFX (see page 11778)	This is constant DSIntf.szBDEDEFX.
szBDEDOMCL (see page 11778)	This is constant DSIntf.szBDEDOMCL.
szBDEDOMX (see page 11779)	This is constant DSIntf.szBDEDOMX.
szBDERECCL (see page 11779)	This is constant DSIntf.szBDERECCL.
szBDERECX (see page 11779)	This is constant DSIntf.szBDERECX.
szCHANGE_LOG (see page 11780)	This is constant DSIntf.szCHANGE_LOG.
szCHANGEINDEX (see page 11780)	This is constant DSIntf.szCHANGEINDEX.
szCONSTRAINTS (see page 11780)	This is constant DSIntf.szCONSTRAINTS.
szDATASET_CONTEXT (see page 11781)	This is constant DSIntf.szDATASET_CONTEXT.
szDATASET_DELTA (see page 11781)	This is constant DSIntf.szDATASET_DELTA.
szDECIMALS (see page 11781)	This is constant DSIntf.szDECIMALS.
szDEFAULT_ORDER (see page 11782)	This is constant DSIntf.szDEFAULT_ORDER.
szDISABLE_DELETES (see page 11782)	This is constant DSIntf.szDISABLE_DELETES.
szDISABLE_EDITS (see page 11782)	This is constant DSIntf.szDISABLE_EDITS.
szDISABLE_INSERTS (see page 11783)	This is constant DSIntf.szDISABLE_INSERTS.
szELEMENTS (see page 11783)	This is constant DSIntf.szELEMENTS.
szFIELDNAME (see page 11783)	This is constant DSIntf.szFIELDNAME.
szFIELDPROPS (see page 11784)	This is constant DSIntf.szFIELDPROPS.
szLCID (see page 11784)	This is constant DSIntf.szLCID.
szMAXVALUE (see page 11784)	This is constant DSIntf.szMAXVALUE.
szMD_FIELDLINKS (see page 11785)	This is constant DSIntf.szMD_FIELDLINKS.
szMD_SEMANTICS (see page 11785)	This is constant DSIntf.szMD_SEMANTICS.
szMINVALUE (see page 11785)	This is constant DSIntf.szMINVALUE.
szNO_RESET_CALL (see page 11786)	This is constant DSIntf.szNO_RESET_CALL.
szORIGIN (see page 11786)	This is constant DSIntf.szORIGIN.
szPRIMARY_KEY (see page 11786)	This is constant DSIntf.szPRIMARY_KEY.
szPROVFLAGS (see page 11787)	This is constant DSIntf.szPROVFLAGS.
szREADONLY (see page 11787)	This is constant DSIntf.szREADONLY.
szSERVER_COL (see page 11787)	This is constant DSIntf.szSERVER_COL.
szSERVERCALC (see page 11788)	This is constant DSIntf.szSERVERCALC.
szstACCOLEOBJ (see page 11788)	This is constant DSIntf.szstACCOLEOBJ.

szstADTNESTEDTABLE (see page 11788)	This is constant DSIntf.szstADTNESTEDTABLE.
szstAUTOINC (see page 11789)	This is constant DSIntf.szstAUTOINC.
szstBINARY (see page 11789)	This is constant DSIntf.szstBINARY.
szstDBSOLEOBJ (see page 11789)	This is constant DSIntf.szstDBSOLEOBJ.
szstFIXEDCHAR (see page 11790)	This is constant DSIntf.szstFIXEDCHAR.
szstFMTMEMO (see page 11790)	This is constant DSIntf.szstFMTMEMO.
szstGRAPHIC (see page 11790)	This is constant DSIntf.szstGRAPHIC.
szstGUID (see page 11791)	This is constant DSIntf.szstGUID.
szstHBINARY (see page 11791)	This is constant DSIntf.szstHBINARY.
szstHMEMO (see page 11791)	This is constant DSIntf.szstHMEMO.
szstMEMO (see page 11792)	This is constant DSIntf.szstMEMO.
szstMONEY (see page 11792)	This is constant DSIntf.szstMONEY.
szstOLEOBJ (see page 11792)	This is constant DSIntf.szstOLEOBJ.
szstREFNESTEDTABLE (see page 11793)	This is constant DSIntf.szstREFNESTEDTABLE.
szstTYPEDBINARY (see page 11793)	This is constant DSIntf.szstTYPEDBINARY.
szstWideMEMO (see page 11793)	This is constant DSIntf.szstWideMEMO.
szSUBTYPE (see page 11794)	This is constant DSIntf.szSUBTYPE.
szTABLE_NAME (see page 11794)	This is constant DSIntf.szTABLE_NAME.
szTYPENAME (see page 11794)	This is constant DSIntf.szTYPENAME.
szUNIQUE_KEY (see page 11795)	This is constant DSIntf.szUNIQUE_KEY.
szUPDATEMODE (see page 11795)	This is constant DSIntf.szUPDATEMODE.
szWIDTH (see page 11795)	This is constant DSIntf.szWIDTH.
xmlOFF (see page 11796)	This is constant DSIntf.xmlOFF.
xmlON (see page 11796)	This is constant DSIntf.xmlON.
xmlUNTYPED (see page 11796)	This is constant DSIntf.xmlUNTYPED.
xmlUTF8 (see page 11797)	This is constant DSIntf.xmlUTF8.
xmlXMLDATATYPED (see page 11797)	This is constant DSIntf.xmlXMLDATATYPED.
xmlXMLSCHEMA (see page 11797)	This is constant DSIntf.xmlXMLSCHEMA.
xmlXMLUTF8 (see page 11798)	This is constant DSIntf.xmlXMLUTF8.

Functions

	Name	Description
	CreateDbClientObject (see page 11702)	This is function DSIntf.CreateDbClientObject.
	DataPacketSize (see page 11702)	This is function DSIntf.DataPacketSize.
	DataPacketToVariant (see page 11703)	This is function DSIntf.DataPacketToVariant.
	FreeDataPacket (see page 11703)	This is function DSIntf.FreeDataPacket.
	RegisterMidasLib (see page 11703)	This is function DSIntf.RegisterMidasLib.
	StringToVariantArray (see page 11704)	This is function DSIntf.StringToVariantArray.
	VariantArrayToString (see page 11704)	This is function DSIntf.VariantArrayToString.
	VarToDataPacket (see page 11704)	This is function DSIntf.VarToDataPacket.

Interfaces

	Name	Description
	IDSBase (see page 11673)	This is class DSIntf.IDSBase.
	IDSCursor (see page 11682)	This is class DSIntf.IDSCursor.
	IDSWriter (see page 11697)	This is class DSIntf.IDSWriter.

Structs, Records, Enums

	Name	Description
	AGGSTATE (see page 11705)	This is record DSIntf.AGGSTATE.
	AGGVALUE (see page 11706)	This is record DSIntf.AGGVALUE.
	CURProp (see page 11706)	This is record DSIntf.CURProp.
	DBSearchCond (see page 11707)	This is record DSIntf.DBSearchCond.
	DSBOOKMRK (see page 11707)	This is record DSIntf.DSBOOKMRK.
	DSFLDDesc (see page 11708)	This is record DSIntf.DSFLDDesc.

	DSIDXDesc (see page 11708)	This is record DSIntf.DSIDXDesc.
	DSProp (see page 11709)	This is record DSIntf.DSProp.
	DSProps (see page 11710)	This is record DSIntf.DSProps.
	GROUPSTATE (see page 11711)	This is record DSIntf.GROUPSTATE.
	TDSDataPacketFldDesc (see page 11711)	This is record DSIntf.TDSDataPacketFldDesc.
	TPcktAttrArea (see page 11712)	This is record DSIntf.TPcktAttrArea.
	TPcktFldStatus (see page 11712)	This is record DSIntf.TPcktFldStatus.

Types

Name	Description
DBResult (see page 11713)	This is type DSIntf.DBResult.
DSAttr (see page 11714)	This is type DSIntf.DSAttr.
dsCBRType (see page 11714)	This is type DSIntf.dsCBRType.
DSKEY (see page 11714)	This is type DSIntf.DSKEY.
DSKEYBOOL (see page 11715)	This is type DSIntf.DSKEYBOOL.
hDSAggregate (see page 11715)	This is type DSIntf.hDSAggregate.
hDSFilter (see page 11715)	This is type DSIntf.hDSFilter.
MIDASNAME (see page 11716)	This is type DSIntf.MIDASNAME.
MIDASPATH (see page 11716)	This is type DSIntf.MIDASPATH.
pDSAttr (see page 11716)	This is type DSIntf.pDSAttr.
pDSBOOKMRK (see page 11717)	This is type DSIntf.pDSBOOKMRK.
pdsCBRType (see page 11717)	This is type DSIntf.pdsCBRType.
PDSDataPacketFldDesc (see page 11717)	This is type DSIntf.PDSDataPacketFldDesc.
pDSFLDDesc (see page 11718)	This is type DSIntf.pDSFLDDesc.
pDSIDXDesc (see page 11718)	This is type DSIntf.pDSIDXDesc.
pDSProps (see page 11718)	This is type DSIntf.pDSProps.
pfCHANGECallBack (see page 11719)	This is type DSIntf.pfCHANGECallBack.
pfDSCalcField (see page 11719)	This is type DSIntf.pfDSCalcField.
pfDSFilter (see page 11719)	This is type DSIntf.pfDSFilter.
pfDSReconcile (see page 11720)	This is type DSIntf.pfDSReconcile.
pfDSReconcile_MD (see page 11720)	This is type DSIntf.pfDSReconcile_MD.
pfFLDComp (see page 11720)	This is type DSIntf.pfFLDComp.
phDSAggregate (see page 11721)	This is type DSIntf.phDSAggregate.
phDSFilter (see page 11721)	This is type DSIntf.phDSFilter.
PLongBool (see page 11721)	This is type DSIntf.PLongBool.
pSAVEPOINT (see page 11722)	This is type DSIntf.pSAVEPOINT.
SAVEPOINT (see page 11722)	This is type DSIntf.SAVEPOINT.
TDataPacket (see page 11722)	This is type DSIntf.TDataPacket.

64.1 Interfaces

The following table lists interfaces in this documentation.

Interfaces

	Name	Description
	IDSBase (see page 11673)	This is class DSIntf.IDSBase.
	IDSCursor (see page 11682)	This is class DSIntf.IDSCursor.
	IDSWriter (see page 11697)	This is class DSIntf.IDSWriter.

64.1.1 IDSBase Interface

Class Hierarchy

Pascal

```
IDSBase = interface(IUnknown);
```

C++

```
__interface IDSBase : public IUnknown;
```

File

DSIntf

Description

This is class DSIntf.IDSBase.

64.1.1.1 IDSBase Members

The following tables list the members exposed by IDSBase.

Public Methods

	Name	Description
	AcceptChanges (see page 11675)	This is AcceptChanges, a member of class IDSBase.
	AddField (see page 11675)	This is AddField, a member of class IDSBase.
	AddOptParameter (see page 11675)	This is AddOptParameter, a member of class IDSBase.
	AppendData (see page 11675)	This is AppendData, a member of class IDSBase.
	Clone (see page 11676)	This is Clone, a member of class IDSBase.
	Create (see page 11676)	This is Create, a member of class IDSBase.
	CreateIndex (see page 11676)	This is CreateIndex, a member of class IDSBase.
	DropOptParameter (see page 11676)	This is DropOptParameter, a member of class IDSBase.
	FldCmp (see page 11677)	This is FldCmp, a member of class IDSBase.
	GetDelta (see page 11677)	This is GetDelta, a member of class IDSBase.
	GetEmbeddedDS (see page 11677)	This is GetEmbeddedDS, a member of class IDSBase.
	GetErrorString (see page 11677)	This is GetErrorString, a member of class IDSBase.
	GetFieldDescs (see page 11677)	This is GetFieldDescs, a member of class IDSBase.

	GetIndexDescs (see page 11678)	This is GetIndexDescs, a member of class IDSBase.
	GetOptParameter (see page 11678)	This is GetOptParameter, a member of class IDSBase.
	GetProp (see page 11678)	This is GetProp, a member of class IDSBase.
	GetProps (see page 11678)	This is GetProps, a member of class IDSBase.
	MakeEmbedded (see page 11679)	This is MakeEmbedded, a member of class IDSBase.
	PutBlank (see page 11679)	This is PutBlank, a member of class IDSBase.
	Reconcile (see page 11679)	This is Reconcile, a member of class IDSBase.
	Reconcile_MD (see page 11679)	This is Reconcile_MD, a member of class IDSBase.
	Refresh (see page 11680)	This is Refresh, a member of class IDSBase.
	RefreshRecords (see page 11680)	This is RefreshRecords, a member of class IDSBase.
	ReleaseBlobs (see page 11680)	This is ReleaseBlobs, a member of class IDSBase.
	RemoveIndex (see page 11680)	This is RemoveIndex, a member of class IDSBase.
	Reserved1 (see page 11681)	This is Reserved1, a member of class IDSBase.
	Reserved2 (see page 11681)	This is Reserved2, a member of class IDSBase.
	Reserved3 (see page 11681)	This is Reserved3, a member of class IDSBase.
	Reset (see page 11681)	This is Reset, a member of class IDSBase.
	RollBack (see page 11681)	This is RollBack, a member of class IDSBase.
	SetFieldCalculation (see page 11682)	This is SetFieldCalculation, a member of class IDSBase.
	SetProp (see page 11682)	This is SetProp, a member of class IDSBase.
	StreamDS (see page 11682)	This is StreamDS, a member of class IDSBase.

64.1.1.2 IDSBase Methods

The methods of the IDSBase class are listed here.

Public Methods

	Name	Description
	AcceptChanges (see page 11675)	This is AcceptChanges, a member of class IDSBase.
	AddField (see page 11675)	This is AddField, a member of class IDSBase.
	AddOptParameter (see page 11675)	This is AddOptParameter, a member of class IDSBase.
	AppendData (see page 11675)	This is AppendData, a member of class IDSBase.
	Clone (see page 11676)	This is Clone, a member of class IDSBase.
	Create (see page 11676)	This is Create, a member of class IDSBase.
	CreateIndex (see page 11676)	This is CreateIndex, a member of class IDSBase.
	DropOptParameter (see page 11676)	This is DropOptParameter, a member of class IDSBase.
	FldCmp (see page 11677)	This is FldCmp, a member of class IDSBase.
	GetDelta (see page 11677)	This is GetDelta, a member of class IDSBase.
	GetEmbeddedDS (see page 11677)	This is GetEmbeddedDS, a member of class IDSBase.
	GetErrorString (see page 11677)	This is GetErrorString, a member of class IDSBase.
	GetFieldDescs (see page 11677)	This is GetFieldDescs, a member of class IDSBase.
	GetIndexDescs (see page 11678)	This is GetIndexDescs, a member of class IDSBase.
	GetOptParameter (see page 11678)	This is GetOptParameter, a member of class IDSBase.
	GetProp (see page 11678)	This is GetProp, a member of class IDSBase.
	GetProps (see page 11678)	This is GetProps, a member of class IDSBase.
	MakeEmbedded (see page 11679)	This is MakeEmbedded, a member of class IDSBase.
	PutBlank (see page 11679)	This is PutBlank, a member of class IDSBase.
	Reconcile (see page 11679)	This is Reconcile, a member of class IDSBase.
	Reconcile_MD (see page 11679)	This is Reconcile_MD, a member of class IDSBase.
	Refresh (see page 11680)	This is Refresh, a member of class IDSBase.
	RefreshRecords (see page 11680)	This is RefreshRecords, a member of class IDSBase.
	ReleaseBlobs (see page 11680)	This is ReleaseBlobs, a member of class IDSBase.
	RemoveIndex (see page 11680)	This is RemoveIndex, a member of class IDSBase.
	Reserved1 (see page 11681)	This is Reserved1, a member of class IDSBase.

	Reserved2 (see page 11681)	This is Reserved2, a member of class IDSBase.
	Reserved3 (see page 11681)	This is Reserved3, a member of class IDSBase.
	Reset (see page 11681)	This is Reset, a member of class IDSBase.
	RollBack (see page 11681)	This is RollBack, a member of class IDSBase.
	SetFieldCalculation (see page 11682)	This is SetFieldCalculation, a member of class IDSBase.
	SetProp (see page 11682)	This is SetProp, a member of class IDSBase.
	StreamDS (see page 11682)	This is StreamDS, a member of class IDSBase.

64.1.1.2.1 IDSBase.AcceptChanges Method

Pascal

```
function AcceptChanges: DBResult; stdcall;
```

C++

```
__fastcall __stdcall DBResult AcceptChanges();
```

Description

This is AcceptChanges, a member of class IDSBase.

64.1.1.2.2 IDSBase.AddField Method

Pascal

```
function AddField(pFldDes: pDSFLDDesc): DBResult; stdcall;
```

C++

```
__fastcall __stdcall DBResult AddField(pDSFLDDesc pFldDes);
```

Description

This is AddField, a member of class IDSBase.

64.1.1.2.3 IDSBase.AddOptParameter Method

Pascal

```
function AddOptParameter(iFldNo: LongWord; pszAttr: PChar; iType: LongWord; iLen: LongWord;
pValue: Pointer): DBResult; stdcall;
```

C++

```
__fastcall __stdcall DBResult AddOptParameter(LongWord iFldNo, const char * pszAttr, LongWord
iType, LongWord iLen, void * pValue);
```

Description

This is AddOptParameter, a member of class IDSBase.

64.1.1.2.4 IDSBase.AppendData Method

Pascal

```
function AppendData(Packet: PSafeArray; bEof: LongBool): DBResult; stdcall;
```

C++

```
__fastcall __stdcall DBResult AppendData(PSafeArray Packet, LongBool bEof);
```

Description

This is AppendData, a member of class IDSBase.

64.1.1.2.5 IDSBase.Clone Method

Pascal

```
function Clone(iPType: LongWord; bRecurse: LongBool; bCloneOptParams: LongBool; var DataSet:
IDSBase): DBResult; stdcall;
```

C++

```
__fastcall __stdcall DBResult Clone(LongWord iPType, LongBool bRecurse, LongBool
bCloneOptParams, IDSBase DataSet);
```

Description

This is Clone, a member of class IDSBase.

64.1.1.2.6 IDSBase.Create Method

Pascal

```
function Create(iFields: LongWord; pFldDes: pDSFLDDesc; pszName: PChar): DBResult; stdcall;
```

C++

```
__fastcall __stdcall DBResult Create(LongWord iFields, pDSFLDDesc pFldDes, const char *
pszName);
```

Description

This is Create, a member of class IDSBase.

64.1.1.2.7 IDSBase.CreateIndex Method

Pascal

```
function CreateIndex(const IdxDesc: DSIDXDesc): DBResult; stdcall;
```

C++

```
__fastcall __stdcall DBResult CreateIndex(const DSIDXDesc IdxDesc);
```

Description

This is CreateIndex, a member of class IDSBase.

64.1.1.2.8 IDSBase.DropOptParameter Method

Pascal

```
function DropOptParameter(iFldNo: LongWord; pName: PChar): DBResult; stdcall;
```

C++

```
__fastcall __stdcall DBResult DropOptParameter(LongWord iFldNo, const char * pName);
```

Description

This is DropOptParameter, a member of class IDSBase.

64.1.1.2.9 IDSBase.FldCmp Method

Pascal

```
function FldCmp(iFldType: LongWord; pFld1: Pointer; pFld2: Pointer; iUnits1: LongWord;
iUnits2: LongWord): Integer; stdcall;
```

C++

```
__fastcall __stdcall int FldCmp(LongWord iFldType, void * pFld1, void * pFld2, LongWord
iUnits1, LongWord iUnits2);
```

Description

This is FldCmp, a member of class IDSBase.

64.1.1.2.10 IDSBase.GetDelta Method

Pascal

```
function GetDelta(out DsDelta: IDSBase): DBResult; stdcall;
```

C++

```
__fastcall __stdcall DBResult GetDelta(IDSBase DsDelta);
```

Description

This is GetDelta, a member of class IDSBase.

64.1.1.2.11 IDSBase.GetEmbeddedDS Method

Pascal

```
function GetEmbeddedDS(iFieldID: LongWord; out DsDet: IDSBase): DBResult; stdcall;
```

C++

```
__fastcall __stdcall DBResult GetEmbeddedDS(LongWord iFieldID, IDSBase DsDet);
```

Description

This is GetEmbeddedDS, a member of class IDSBase.

64.1.1.2.12 IDSBase.GetErrorString Method

Pascal

```
function GetErrorString(iErrCode: DBResult; pString: PChar): DBResult; stdcall;
```

C++

```
__fastcall __stdcall DBResult GetErrorString(DBResult iErrCode, const char * pString);
```

Description

This is GetErrorString, a member of class IDSBase.

64.1.1.2.13 IDSBase.GetFieldDescs Method

Pascal

```
function GetFieldDescs(Fields: pDSFLDDesc): DBResult; stdcall;
```

C++

```
__fastcall __stdcall DBResult GetFieldDescs(pDSFLDDesc Fields);
```

Description

This is GetFieldDescs, a member of class IDSBase.

64.1.1.2.14 IDSBase.GetIndexDescs Method

Pascal

```
function GetIndexDescs(p1: PDSIDXDesc): DBResult; stdcall;
```

C++

```
__fastcall __stdcall DBResult GetIndexDescs(PDSIDXDesc p1);
```

Description

This is GetIndexDescs, a member of class IDSBase.

64.1.1.2.15 IDSBase.GetOptParameter Method

Pascal

```
function GetOptParameter(iNo: LongWord; iFldNo: LongWord; var ppName: Pointer; var piType:
LongWord; var piLen: LongWord; var ppValue: Pointer): DBResult; stdcall;
```

C++

```
__fastcall __stdcall DBResult GetOptParameter(LongWord iNo, LongWord iFldNo, void * ppName,
LongWord piType, LongWord piLen, void * ppValue);
```

Description

This is GetOptParameter, a member of class IDSBase.

64.1.1.2.16 IDSBase.GetProp Method

Pascal

```
function GetProp(eProp: DSProp; piPropValue: Pointer): DBResult; stdcall;
```

C++

```
__fastcall __stdcall DBResult GetProp(DSProp eProp, void * piPropValue);
```

Description

This is GetProp, a member of class IDSBase.

64.1.1.2.17 IDSBase.GetProps Method

Pascal

```
function GetProps(var Prop: DSProps): DBResult; stdcall;
```

C++

```
__fastcall __stdcall DBResult GetProps(DSProps Prop);
```

Description

This is GetProps, a member of class IDSBase.

64.1.1.2.18 IDSBase.MakeEmbedded Method

Pascal

```
function MakeEmbedded(DsDet: IDSBase; iFieldsLink: LongWord; piFieldsM: PLongWord; piFieldsD:
PLongWord; pMasterFieldName: PChar; pDetailFieldName: PChar): DBResult; stdcall;
```

C++

```
__fastcall __stdcall DBResult MakeEmbedded(IDSBase DsDet, LongWord iFieldsLink, PLongWord
piFieldsM, PLongWord piFieldsD, const char * pMasterFieldName, const char * pDetailFieldName);
```

Description

This is MakeEmbedded, a member of class IDSBase.

64.1.1.2.19 IDSBase.PutBlank Method

Pascal

```
function PutBlank(pRecBuf: Pointer; iRecNo: LongWord; iFldNo: LongWord; iBlankValue:
LongWord): DBResult; stdcall;
```

C++

```
__fastcall __stdcall DBResult PutBlank(void * pRecBuf, LongWord iRecNo, LongWord iFldNo,
LongWord iBlankValue);
```

Description

This is PutBlank, a member of class IDSBase.

64.1.1.2.20 IDSBase.Reconcile Method

Pascal

```
function Reconcile(DeltaPacket: PSafeArray; ErrorPacket: PSafeArray; iClientData: LongWord;
pfReconcile: pfDSReconcile): DBResult; stdcall;
```

C++

```
__fastcall __stdcall DBResult Reconcile(PSafeArray DeltaPacket, PSafeArray ErrorPacket,
LongWord iClientData, pfDSReconcile pfReconcile);
```

Description

This is Reconcile, a member of class IDSBase.

64.1.1.2.21 IDSBase.Reconcile_MD Method

Pascal

```
function Reconcile_MD(pDsRec: IDSBase; pDeltaPacket: PSafeArray; pErrorPacket: PSafeArray;
iClientData: LongWord; pfReconcile_MD: pfDSReconcile_MD): DBResult; stdcall;
```

C++

```
__fastcall __stdcall DBResult Reconcile_MD(IDSBase pDsRec, PSafeArray pDeltaPacket, PSafeArray
pErrorPacket, LongWord iClientData, pfDSReconcile_MD pfReconcile_MD);
```

Description

This is Reconcile_MD, a member of class IDSBase.

64.1.1.2.22 IDSBase.Refresh Method

Pascal

```
function Refresh(NewPacket: PSafeArray; iClientData: LongWord; pfReconcile: pfDSReconcile):
DBResult; stdcall;
```

C++

```
__fastcall __stdcall DBResult Refresh(PSafeArray NewPacket, LongWord iClientData,
pfDSReconcile pfReconcile);
```

Description

This is Refresh, a member of class IDSBase.

64.1.1.2.23 IDSBase.RefreshRecords Method

Pascal

```
function RefreshRecords(NewDataPacket: PSafeArray; iRecNo: LongWord; iClientData: LongWord;
pfReconcile: pfDSReconcile): DBResult; stdcall;
```

C++

```
__fastcall __stdcall DBResult RefreshRecords(PSafeArray NewDataPacket, LongWord iRecNo,
LongWord iClientData, pfDSReconcile pfReconcile);
```

Description

This is RefreshRecords, a member of class IDSBase.

64.1.1.2.24 IDSBase.ReleaseBlobs Method

Pascal

```
function ReleaseBlobs(iBlobId: LongWord): DBResult; stdcall;
```

C++

```
__fastcall __stdcall DBResult ReleaseBlobs(LongWord iBlobId);
```

Description

This is ReleaseBlobs, a member of class IDSBase.

64.1.1.2.25 IDSBase.RemoveIndex Method

Pascal

```
function RemoveIndex(pszName: PChar): DBResult; stdcall;
```

C++

```
__fastcall __stdcall DBResult RemoveIndex(const char * pszName);
```

Description

This is RemoveIndex, a member of class IDSBase.

64.1.1.2.26 IDSBase.Reserved1 Method

Pascal

```
function Reserved1(Input: Pointer): DBResult; stdcall;
```

C++

```
__fastcall __stdcall DBResult Reserved1(void * Input);
```

Description

This is Reserved1, a member of class IDSBase.

64.1.1.2.27 IDSBase.Reserved2 Method

Pascal

```
function Reserved2(Input: Pointer): DBResult; stdcall;
```

C++

```
__fastcall __stdcall DBResult Reserved2(void * Input);
```

Description

This is Reserved2, a member of class IDSBase.

64.1.1.2.28 IDSBase.Reserved3 Method

Pascal

```
function Reserved3(Input: Pointer): DBResult; stdcall;
```

C++

```
__fastcall __stdcall DBResult Reserved3(void * Input);
```

Description

This is Reserved3, a member of class IDSBase.

64.1.1.2.29 IDSBase.Reset Method

Pascal

```
function Reset: DBResult; stdcall;
```

C++

```
__fastcall __stdcall DBResult Reset();
```

Description

This is Reset, a member of class IDSBase.

64.1.1.2.30 IDSBase.RollBack Method

Pascal

```
function RollBack(iSavePoint: SAVEPOINT): DBResult; stdcall;
```

C++

```
__fastcall __stdcall DBResult RollBack(SAVEPOINT iSavePoint);
```

Description

This is RollBack, a member of class IDSBase.

64.1.1.2.31 IDSBase.SetFieldCalculation Method

Pascal

```
function SetFieldCalculation(iClientData: LongWord; pfCalc: pfDSCalcField): DBResult; stdcall;
```

C++

```
__fastcall __stdcall DBResult SetFieldCalculation(LongWord iClientData, pfDSCalcField pfCalc);
```

Description

This is SetFieldCalculation, a member of class IDSBase.

64.1.1.2.32 IDSBase.SetProp Method

Pascal

```
function SetProp(eProp: DSProp; iPropValue: LongWord): DBResult; stdcall;
```

C++

```
__fastcall __stdcall DBResult SetProp(DSProp eProp, LongWord iPropValue);
```

Description

This is SetProp, a member of class IDSBase.

64.1.1.2.33 IDSBase.StreamDS Method

Pascal

```
function StreamDS(out Packet: PSafeArray): DBResult; stdcall;
```

C++

```
__fastcall __stdcall DBResult StreamDS(PSafeArray Packet);
```

Description

This is StreamDS, a member of class IDSBase.

64.1.2 IDSCursor Interface

Class Hierarchy

Pascal

```
IDSCursor = interface(IUnknown);
```

C++

```
__interface IDSCursor : public IUnknown;
```

File

DSIntf

Description

This is class DSIntf.IDSCursor.

64.1.2.1 IDSCursor Members

The following tables list the members exposed by IDSCursor.

Public Methods

	Name	Description
	AddAggregate (see page 11685)	This is AddAggregate, a member of class IDSCursor.
	AddFilter (see page 11685)	This is AddFilter, a member of class IDSCursor.
	AddFilterCallBack (see page 11685)	This is AddFilterCallBack, a member of class IDSCursor.
	CloneCursor (see page 11686)	This is CloneCursor, a member of class IDSCursor.
	CompareBookMarks (see page 11686)	This is CompareBookMarks, a member of class IDSCursor.
	DeleteRecord (see page 11686)	This is DeleteRecord, a member of class IDSCursor.
	DropAggregate (see page 11686)	This is DropAggregate, a member of class IDSCursor.
	DropFilter (see page 11687)	This is DropFilter, a member of class IDSCursor.
	DropRange (see page 11687)	This is DropRange, a member of class IDSCursor.
	ExtractKey (see page 11687)	This is ExtractKey, a member of class IDSCursor.
	GetAggregateDesc (see page 11687)	This is GetAggregateDesc, a member of class IDSCursor.
	GetAggregateValue (see page 11687)	This is GetAggregateValue, a member of class IDSCursor.
	GetBlob (see page 11688)	This is GetBlob, a member of class IDSCursor.
	GetBlobLen (see page 11688)	This is GetBlobLen, a member of class IDSCursor.
	GetCurrentBookMark (see page 11688)	This is GetCurrentBookMark, a member of class IDSCursor.
	GetCurrentRecord (see page 11688)	This is GetCurrentRecord, a member of class IDSCursor.
	GetCursorProps (see page 11689)	This is GetCursorProps, a member of class IDSCursor.
	GetField (see page 11689)	This is GetField, a member of class IDSCursor.
	GetFieldDescs (see page 11689)	This is GetFieldDescs, a member of class IDSCursor.
	GetIndexDescs (see page 11689)	This is GetIndexDescs, a member of class IDSCursor.
	GetProp (see page 11690)	This is GetProp, a member of class IDSCursor.
	GetRecordAttribute (see page 11690)	This is GetRecordAttribute, a member of class IDSCursor.
	GetRecordBlock (see page 11690)	This is GetRecordBlock, a member of class IDSCursor.
	GetRecordCount (see page 11690)	This is GetRecordCount, a member of class IDSCursor.
	GetRecordForKey (see page 11690)	This is GetRecordForKey, a member of class IDSCursor.
	GetRecordNumber (see page 11691)	This is GetRecordNumber, a member of class IDSCursor.
	GetRowRequestPacket (see page 11691)	This is GetRowRequestPacket, a member of class IDSCursor.
	GetSequenceNumber (see page 11691)	This is GetSequenceNumber, a member of class IDSCursor.
	GetSubGroupState (see page 11691)	This is GetSubGroupState, a member of class IDSCursor.
	InitCursor (see page 11692)	This is InitCursor, a member of class IDSCursor.
	InitRecord (see page 11692)	This is InitRecord, a member of class IDSCursor.
	InsertRecord (see page 11692)	This is InsertRecord, a member of class IDSCursor.
	LinkCursors (see page 11692)	This is LinkCursors, a member of class IDSCursor.
	LocateWithFilter (see page 11693)	This is LocateWithFilter, a member of class IDSCursor.
	ModifyRecord (see page 11693)	This is ModifyRecord, a member of class IDSCursor.
	MoveRelative (see page 11693)	This is MoveRelative, a member of class IDSCursor.
	MoveToBOF (see page 11693)	This is MoveToBOF, a member of class IDSCursor.
	MoveToBookMark (see page 11693)	This is MoveToBookMark, a member of class IDSCursor.
	MoveToEOF (see page 11694)	This is MoveToEOF, a member of class IDSCursor.
	MoveToKey (see page 11694)	This is MoveToKey, a member of class IDSCursor.
	MoveToNextSubGroup (see page 11694)	This is MoveToNextSubGroup, a member of class IDSCursor.
	MoveToSeqNo (see page 11694)	This is MoveToSeqNo, a member of class IDSCursor.
	PutBlob (see page 11695)	This is PutBlob, a member of class IDSCursor.

	PutField (see page 11695)	This is PutField, a member of class IDSCursor.
	RefreshRecord (see page 11695)	This is RefreshRecord, a member of class IDSCursor.
	ResyncWithMaster (see page 11695)	This is ResyncWithMaster, a member of class IDSCursor.
	RevertRecord (see page 11695)	This is RevertRecord, a member of class IDSCursor.
	SetNotifyCallBack (see page 11696)	This is SetNotifyCallBack, a member of class IDSCursor.
	SetProp (see page 11696)	This is SetProp, a member of class IDSCursor.
	SetRange (see page 11696)	This is SetRange, a member of class IDSCursor.
	SortOnFields (see page 11696)	This is SortOnFields, a member of class IDSCursor.
	UndoLastChange (see page 11697)	This is UndoLastChange, a member of class IDSCursor.
	UseIndexOrder (see page 11697)	This is UseIndexOrder, a member of class IDSCursor.
	VerifyField (see page 11697)	This is VerifyField, a member of class IDSCursor.

64.1.2.2 IDSCursor Methods

The methods of the IDSCursor class are listed here.

Public Methods

	Name	Description
	AddAggregate (see page 11685)	This is AddAggregate, a member of class IDSCursor.
	AddFilter (see page 11685)	This is AddFilter, a member of class IDSCursor.
	AddFilterCallBack (see page 11685)	This is AddFilterCallBack, a member of class IDSCursor.
	CloneCursor (see page 11686)	This is CloneCursor, a member of class IDSCursor.
	CompareBookMarks (see page 11686)	This is CompareBookMarks, a member of class IDSCursor.
	DeleteRecord (see page 11686)	This is DeleteRecord, a member of class IDSCursor.
	DropAggregate (see page 11686)	This is DropAggregate, a member of class IDSCursor.
	DropFilter (see page 11687)	This is DropFilter, a member of class IDSCursor.
	DropRange (see page 11687)	This is DropRange, a member of class IDSCursor.
	ExtractKey (see page 11687)	This is ExtractKey, a member of class IDSCursor.
	GetAggregateDesc (see page 11687)	This is GetAggregateDesc, a member of class IDSCursor.
	GetAggregateValue (see page 11687)	This is GetAggregateValue, a member of class IDSCursor.
	GetBlob (see page 11688)	This is GetBlob, a member of class IDSCursor.
	GetBlobLen (see page 11688)	This is GetBlobLen, a member of class IDSCursor.
	GetCurrentBookMark (see page 11688)	This is GetCurrentBookMark, a member of class IDSCursor.
	GetCurrentRecord (see page 11688)	This is GetCurrentRecord, a member of class IDSCursor.
	GetCursorProps (see page 11689)	This is GetCursorProps, a member of class IDSCursor.
	GetField (see page 11689)	This is GetField, a member of class IDSCursor.
	GetFieldDescs (see page 11689)	This is GetFieldDescs, a member of class IDSCursor.
	GetIndexDescs (see page 11689)	This is GetIndexDescs, a member of class IDSCursor.
	GetProp (see page 11690)	This is GetProp, a member of class IDSCursor.
	GetRecordAttribute (see page 11690)	This is GetRecordAttribute, a member of class IDSCursor.
	GetRecordBlock (see page 11690)	This is GetRecordBlock, a member of class IDSCursor.
	GetRecordCount (see page 11690)	This is GetRecordCount, a member of class IDSCursor.
	GetRecordForKey (see page 11690)	This is GetRecordForKey, a member of class IDSCursor.
	GetRecordNumber (see page 11691)	This is GetRecordNumber, a member of class IDSCursor.
	GetRowRequestPacket (see page 11691)	This is GetRowRequestPacket, a member of class IDSCursor.
	GetSequenceNumber (see page 11691)	This is GetSequenceNumber, a member of class IDSCursor.
	GetSubGroupState (see page 11691)	This is GetSubGroupState, a member of class IDSCursor.
	InitCursor (see page 11692)	This is InitCursor, a member of class IDSCursor.
	InitRecord (see page 11692)	This is InitRecord, a member of class IDSCursor.
	InsertRecord (see page 11692)	This is InsertRecord, a member of class IDSCursor.
	LinkCursors (see page 11692)	This is LinkCursors, a member of class IDSCursor.
	LocateWithFilter (see page 11693)	This is LocateWithFilter, a member of class IDSCursor.
	ModifyRecord (see page 11693)	This is ModifyRecord, a member of class IDSCursor.

	MoveRelative (see page 11693)	This is MoveRelative, a member of class IDSCursor.
	MoveToBOF (see page 11693)	This is MoveToBOF, a member of class IDSCursor.
	MoveToBookMark (see page 11693)	This is MoveToBookMark, a member of class IDSCursor.
	MoveToEOF (see page 11694)	This is MoveToEOF, a member of class IDSCursor.
	MoveToKey (see page 11694)	This is MoveToKey, a member of class IDSCursor.
	MoveToNextSubGroup (see page 11694)	This is MoveToNextSubGroup, a member of class IDSCursor.
	MoveToSeqNo (see page 11694)	This is MoveToSeqNo, a member of class IDSCursor.
	PutBlob (see page 11695)	This is PutBlob, a member of class IDSCursor.
	PutField (see page 11695)	This is PutField, a member of class IDSCursor.
	RefreshRecord (see page 11695)	This is RefreshRecord, a member of class IDSCursor.
	ResyncWithMaster (see page 11695)	This is ResyncWithMaster, a member of class IDSCursor.
	RevertRecord (see page 11695)	This is RevertRecord, a member of class IDSCursor.
	SetNotifyCallBack (see page 11696)	This is SetNotifyCallBack, a member of class IDSCursor.
	SetProp (see page 11696)	This is SetProp, a member of class IDSCursor.
	SetRange (see page 11696)	This is SetRange, a member of class IDSCursor.
	SortOnFields (see page 11696)	This is SortOnFields, a member of class IDSCursor.
	UndoLastChange (see page 11697)	This is UndoLastChange, a member of class IDSCursor.
	UseIndexOrder (see page 11697)	This is UseIndexOrder, a member of class IDSCursor.
	VerifyField (see page 11697)	This is VerifyField, a member of class IDSCursor.

64.1.2.2.1 IDSCursor.AddAggregate Method

Pascal

```
function AddAggregate(iFlds: LongWord; iCanLen: LongWord; pCanExpr: Pointer; var hAgg:
hDSAggregate): DBResult; stdcall;
```

C++

```
__fastcall __stdcall DBResult AddAggregate(LongWord iFlds, LongWord iCanLen, void * pCanExpr,
hDSAggregate hAgg);
```

Description

This is AddAggregate, a member of class IDSCursor.

64.1.2.2.2 IDSCursor.AddFilter Method

Pascal

```
function AddFilter(pcanExpr: Pointer; iLen: LongWord; var hFilter: hDSFilter): DBResult;
stdcall;
```

C++

```
__fastcall __stdcall DBResult AddFilter(void * pcanExpr, LongWord iLen, hDSFilter hFilter);
```

Description

This is AddFilter, a member of class IDSCursor.

64.1.2.2.3 IDSCursor.AddFilterCallBack Method

Pascal

```
function AddFilterCallBack(iClientData: LongWord; pfFilter: pfDSFilter; var hFilter:
hDSFilter): DBResult; stdcall;
```

C++

```
__fastcall __stdcall DBResult AddFilterCallBack(LongWord iClientData, pfDSFilter pfFilter,
hDSFilter hFilter);
```

Description

This is AddFilterCallBack, a member of class IDSCursor.

64.1.2.2.4 IDSCursor.CloneCursor Method

Pascal

```
function CloneCursor(Cursor: IDSCursor): DBResult; stdcall;
```

C++

```
__fastcall __stdcall DBResult CloneCursor(IDSCursor Cursor);
```

Description

This is CloneCursor, a member of class IDSCursor.

64.1.2.2.5 IDSCursor.CompareBookMarks Method

Pascal

```
function CompareBookMarks(pBookMark1: Pointer; pBookMark2: Pointer; var iCmp: Integer):
DBResult; stdcall;
```

C++

```
__fastcall __stdcall DBResult CompareBookMarks(void * pBookMark1, void * pBookMark2, int iCmp);
```

Description

This is CompareBookMarks, a member of class IDSCursor.

64.1.2.2.6 IDSCursor.DeleteRecord Method

Pascal

```
function DeleteRecord: DBResult; stdcall;
```

C++

```
__fastcall __stdcall DBResult DeleteRecord();
```

Description

This is DeleteRecord, a member of class IDSCursor.

64.1.2.2.7 IDSCursor.DropAggregate Method

Pascal

```
function DropAggregate(hAgg: hDSAggregate): DBResult; stdcall;
```

C++

```
__fastcall __stdcall DBResult DropAggregate(hDSAggregate hAgg);
```

Description

This is DropAggregate, a member of class IDSCursor.

64.1.2.2.8 IDSCursor.DropFilter Method

Pascal

```
function DropFilter(hFilter: hDSFilter): DBResult; stdcall;
```

C++

```
__fastcall __stdcall DBResult DropFilter(hDSFilter hFilter);
```

Description

This is DropFilter, a member of class IDSCursor.

64.1.2.2.9 IDSCursor.DropRange Method

Pascal

```
function DropRange: DBResult; stdcall;
```

C++

```
__fastcall __stdcall DBResult DropRange();
```

Description

This is DropRange, a member of class IDSCursor.

64.1.2.2.10 IDSCursor.ExtractKey Method

Pascal

```
function ExtractKey(pRecBuf: Pointer; pKeyBuf: Pointer): DBResult; stdcall;
```

C++

```
__fastcall __stdcall DBResult ExtractKey(void * pRecBuf, void * pKeyBuf);
```

Description

This is ExtractKey, a member of class IDSCursor.

64.1.2.2.11 IDSCursor.GetAggregateDesc Method

Pascal

```
function GetAggregateDesc(hAgg: hDSAggregate; var Desc: DSFLDDesc): DBResult; stdcall;
```

C++

```
__fastcall __stdcall DBResult GetAggregateDesc(hDSAggregate hAgg, DSFLDDesc Desc);
```

Description

This is GetAggregateDesc, a member of class IDSCursor.

64.1.2.2.12 IDSCursor.GetAggregateValue Method

Pascal

```
function GetAggregateValue(hAgg: hDSAggregate; pValue: Pointer; var bBlank: LongBool):
DBResult; stdcall;
```

C++

```
__fastcall __stdcall DBResult GetAggregateValue(hDSAggregate hAgg, void * pValue, LongBool
bBlank);
```

Description

This is GetAggregateValue, a member of class IDSCursor.

64.1.2.2.13 IDSCursor.GetBlob Method

Pascal

```
function GetBlob(pRecBuf: Pointer; iFieldNo: LongWord; iOffSet: LongWord; pBuf: Pointer; var
iLength: LongWord): DBResult; stdcall;
```

C++

```
__fastcall __stdcall DBResult GetBlob(void * pRecBuf, LongWord iFieldNo, LongWord iOffSet,
void * pBuf, LongWord iLength);
```

Description

This is GetBlob, a member of class IDSCursor.

64.1.2.2.14 IDSCursor.GetBlobLen Method

Pascal

```
function GetBlobLen(pRecBuf: Pointer; iFieldNo: LongWord; var iLength: LongWord): DBResult;
stdcall;
```

C++

```
__fastcall __stdcall DBResult GetBlobLen(void * pRecBuf, LongWord iFieldNo, LongWord iLength);
```

Description

This is GetBlobLen, a member of class IDSCursor.

64.1.2.2.15 IDSCursor.GetCurrentBookMark Method

Pascal

```
function GetCurrentBookMark(pBookMark: Pointer): DBResult; stdcall;
```

C++

```
__fastcall __stdcall DBResult GetCurrentBookMark(void * pBookMark);
```

Description

This is GetCurrentBookMark, a member of class IDSCursor.

64.1.2.2.16 IDSCursor.GetCurrentRecord Method

Pascal

```
function GetCurrentRecord(pRecBuf: Pointer): DBResult; stdcall;
```

C++

```
__fastcall __stdcall DBResult GetCurrentRecord(void * pRecBuf);
```

Description

This is GetCurrentRecord, a member of class IDSCursor.

64.1.2.2.17 IDSCursor.GetCursorProps Method

Pascal

```
function GetCursorProps(var p1: DSProps): DBResult; stdcall;
```

C++

```
__fastcall __stdcall DBResult GetCursorProps(DSProps p1);
```

Description

This is GetCursorProps, a member of class IDSCursor.

64.1.2.2.18 IDSCursor.GetField Method

Pascal

```
function GetField(pRecBuf: Pointer; iFieldNo: LongWord; pFldBuf: Pointer; var bBlank:
LongBool): DBResult; stdcall;
```

C++

```
__fastcall __stdcall DBResult GetField(void * pRecBuf, LongWord iFieldNo, void * pFldBuf,
LongBool bBlank);
```

Description

This is GetField, a member of class IDSCursor.

64.1.2.2.19 IDSCursor.GetFieldDescs Method

Pascal

```
function GetFieldDescs(p1: pDSFLDDesc): DBResult; stdcall;
```

C++

```
__fastcall __stdcall DBResult GetFieldDescs(pDSFLDDesc p1);
```

Description

This is GetFieldDescs, a member of class IDSCursor.

64.1.2.2.20 IDSCursor.GetIndexDescs Method

Pascal

```
function GetIndexDescs(bCurrentOnly: LongBool; var IdxDesc: DSIDXDesc): DBResult; stdcall;
```

C++

```
__fastcall __stdcall DBResult GetIndexDescs(LongBool bCurrentOnly, DSIDXDesc IdxDesc);
```

Description

This is GetIndexDescs, a member of class IDSCursor.

64.1.2.2.21 IDSCursor.GetProp Method

Pascal

```
function GetProp(eProp: CURProp; piPropValue: Pointer): DBResult; stdcall;
```

C++

```
__fastcall __stdcall DBResult GetProp(CURProp eProp, void * piPropValue);
```

Description

This is GetProp, a member of class IDSCursor.

64.1.2.2.22 IDSCursor.GetRecordAttribute Method

Pascal

```
function GetRecordAttribute(var Attr: DSAttr): DBResult; stdcall;
```

C++

```
__fastcall __stdcall DBResult GetRecordAttribute(DSAttr Attr);
```

Description

This is GetRecordAttribute, a member of class IDSCursor.

64.1.2.2.23 IDSCursor.GetRecordBlock Method

Pascal

```
function GetRecordBlock(piRecs: PLongWord; pRecBuf: Pointer): DBResult; stdcall;
```

C++

```
__fastcall __stdcall DBResult GetRecordBlock(PLongWord piRecs, void * pRecBuf);
```

Description

This is GetRecordBlock, a member of class IDSCursor.

64.1.2.2.24 IDSCursor.GetRecordCount Method

Pascal

```
function GetRecordCount(var iRecs: Integer): DBResult; stdcall;
```

C++

```
__fastcall __stdcall DBResult GetRecordCount(int iRecs);
```

Description

This is GetRecordCount, a member of class IDSCursor.

64.1.2.2.25 IDSCursor.GetRecordForKey Method

Pascal

```
function GetRecordForKey(iFields: LongWord; iPartLen: LongWord; pKey: Pointer; pRecBuf:
Pointer): DBResult; stdcall;
```

C++

```
__fastcall __stdcall DBResult GetRecordForKey(LongWord iFields, LongWord iPartLen, void *
pKey, void * pRecBuf);
```

Description

This is GetRecordForKey, a member of class IDSCursor.

64.1.2.2.26 IDSCursor.GetRecordNumber Method

Pascal

```
function GetRecordNumber(var iRecNo: LongWord): DBResult; stdcall;
```

C++

```
__fastcall __stdcall DBResult GetRecordNumber(LongWord iRecNo);
```

Description

This is GetRecordNumber, a member of class IDSCursor.

64.1.2.2.27 IDSCursor.GetRowRequestPacket Method

Pascal

```
function GetRowRequestPacket(bKeysOnly: LongBool; bFetchAllBlobs: LongBool; bFetchAllDetails:
LongBool; bInclMetaData: LongBool; out Packet: PSafeArray): DBResult; stdcall;
```

C++

```
__fastcall __stdcall DBResult GetRowRequestPacket(LongBool bKeysOnly, LongBool bFetchAllBlobs,
LongBool bFetchAllDetails, LongBool bInclMetaData, PSafeArray Packet);
```

Description

This is GetRowRequestPacket, a member of class IDSCursor.

64.1.2.2.28 IDSCursor.GetSequenceNumber Method

Pascal

```
function GetSequenceNumber(var iSeq: LongWord): DBResult; stdcall;
```

C++

```
__fastcall __stdcall DBResult GetSequenceNumber(LongWord iSeq);
```

Description

This is GetSequenceNumber, a member of class IDSCursor.

64.1.2.2.29 IDSCursor.GetSubGroupState Method

Pascal

```
function GetSubGroupState(iFields: LongWord; var iSubGroupState: GROUPSTATE): DBResult;
stdcall;
```

C++

```
__fastcall __stdcall DBResult GetSubGroupState(LongWord iFields, GROUPSTATE iSubGroupState);
```

Description

This is GetSubGroupState, a member of class IDSCursor.

64.1.2.2.30 IDSCursor.InitCursor Method

Pascal

```
function InitCursor(DataSet: IDSBase): DBResult; stdcall;
```

C++

```
__fastcall __stdcall DBResult InitCursor(IDSBase DataSet);
```

Description

This is InitCursor, a member of class IDSCursor.

64.1.2.2.31 IDSCursor.InitRecord Method

Pascal

```
function InitRecord(pRecBuf: Pointer): DBResult; stdcall;
```

C++

```
__fastcall __stdcall DBResult InitRecord(void * pRecBuf);
```

Description

This is InitRecord, a member of class IDSCursor.

64.1.2.2.32 IDSCursor.InsertRecord Method

Pascal

```
function InsertRecord(pRecBuf: Pointer): DBResult; stdcall;
```

C++

```
__fastcall __stdcall DBResult InsertRecord(void * pRecBuf);
```

Description

This is InsertRecord, a member of class IDSCursor.

64.1.2.2.33 IDSCursor.LinkCursors Method

Pascal

```
function LinkCursors(iFieldsM: LongWord; piFieldsM: PLongWord; piFieldsD: PLongWord; hCurDet:
IDSCursor): DBResult; stdcall;
```

C++

```
__fastcall __stdcall DBResult LinkCursors(LongWord iFieldsM, PLongWord piFieldsM, PLongWord
piFieldsD, IDSCursor hCurDet);
```

Description

This is LinkCursors, a member of class IDSCursor.

64.1.2.2.34 IDSCursor.LocateWithFilter Method

Pascal

```
function LocateWithFilter(pCanExpr: Pointer; iLen: LongWord): DBResult; stdcall;
```

C++

```
__fastcall __stdcall DBResult LocateWithFilter(void * pCanExpr, LongWord iLen);
```

Description

This is LocateWithFilter, a member of class IDSCursor.

64.1.2.2.35 IDSCursor.ModifyRecord Method

Pascal

```
function ModifyRecord(pRecBuf: Pointer): DBResult; stdcall;
```

C++

```
__fastcall __stdcall DBResult ModifyRecord(void * pRecBuf);
```

Description

This is ModifyRecord, a member of class IDSCursor.

64.1.2.2.36 IDSCursor.MoveRelative Method

Pascal

```
function MoveRelative(i: Integer): DBResult; stdcall;
```

C++

```
__fastcall __stdcall DBResult MoveRelative(int i);
```

Description

This is MoveRelative, a member of class IDSCursor.

64.1.2.2.37 IDSCursor.MoveToBOF Method

Pascal

```
function MoveToBOF: DBResult; stdcall;
```

C++

```
__fastcall __stdcall DBResult MoveToBOF();
```

Description

This is MoveToBOF, a member of class IDSCursor.

64.1.2.2.38 IDSCursor.MoveToBookMark Method

Pascal

```
function MoveToBookMark(pBookMark: Pointer): DBResult; stdcall;
```

C++

```
__fastcall __stdcall DBResult MoveToBookMark(void * pBookMark);
```

Description

This is MoveToBookMark, a member of class IDSCursor.

64.1.2.2.39 IDSCursor.MoveToEOF Method

Pascal

```
function MoveToEOF: DBResult; stdcall;
```

C++

```
__fastcall __stdcall DBResult MoveToEOF();
```

Description

This is MoveToEOF, a member of class IDSCursor.

64.1.2.2.40 IDSCursor.MoveToKey Method

Pascal

```
function MoveToKey(SearchCond: DBSearchCond; iFields: LongWord; iPartLen: LongWord; pRecBuf:
Pointer): DBResult; stdcall;
```

C++

```
__fastcall __stdcall DBResult MoveToKey(DBSearchCond SearchCond, LongWord iFields, LongWord
iPartLen, void * pRecBuf);
```

Description

This is MoveToKey, a member of class IDSCursor.

64.1.2.2.41 IDSCursor.MoveToNextSubGroup Method

Pascal

```
function MoveToNextSubGroup(iFields: LongWord): DBResult; stdcall;
```

C++

```
__fastcall __stdcall DBResult MoveToNextSubGroup(LongWord iFields);
```

Description

This is MoveToNextSubGroup, a member of class IDSCursor.

64.1.2.2.42 IDSCursor.MoveToSeqNo Method

Pascal

```
function MoveToSeqNo(i: LongWord): DBResult; stdcall;
```

C++

```
__fastcall __stdcall DBResult MoveToSeqNo(LongWord i);
```

Description

This is MoveToSeqNo, a member of class IDSCursor.

64.1.2.2.43 IDSCursor.PutBlob Method

Pascal

```
function PutBlob(pRecBuf: Pointer; iFieldNo: LongWord; iOffSet: LongWord; pBuf: Pointer;
iLength: LongWord): DBResult; stdcall;
```

C++

```
__fastcall __stdcall DBResult PutBlob(void * pRecBuf, LongWord iFieldNo, LongWord iOffSet,
void * pBuf, LongWord iLength);
```

Description

This is PutBlob, a member of class IDSCursor.

64.1.2.2.44 IDSCursor.PutField Method

Pascal

```
function PutField(pRecBuf: Pointer; iFieldNo: LongWord; pFldBuf: Pointer): DBResult; stdcall;
```

C++

```
__fastcall __stdcall DBResult PutField(void * pRecBuf, LongWord iFieldNo, void * pFldBuf);
```

Description

This is PutField, a member of class IDSCursor.

64.1.2.2.45 IDSCursor.RefreshRecord Method

Pascal

```
function RefreshRecord(Packet: PSafeArray): DBResult; stdcall;
```

C++

```
__fastcall __stdcall DBResult RefreshRecord(PSafeArray Packet);
```

Description

This is RefreshRecord, a member of class IDSCursor.

64.1.2.2.46 IDSCursor.ResyncWithMaster Method

Pascal

```
function ResyncWithMaster: DBResult; stdcall;
```

C++

```
__fastcall __stdcall DBResult ResyncWithMaster();
```

Description

This is ResyncWithMaster, a member of class IDSCursor.

64.1.2.2.47 IDSCursor.RevertRecord Method

Pascal

```
function RevertRecord: DBResult; stdcall;
```

C++

```
__fastcall __stdcall DBResult RevertRecord();
```

Description

This is RevertRecord, a member of class IDSCursor.

64.1.2.2.48 IDSCursor.SetNotifyCallBack Method

Pascal

```
function SetNotifyCallBack(iClientData: LongWord; pfCallBack: pfCHANGECallBack): DBResult;
stdcall;
```

C++

```
__fastcall __stdcall DBResult SetNotifyCallBack(LongWord iClientData, pfCHANGECallBack
pfCallBack);
```

Description

This is SetNotifyCallBack, a member of class IDSCursor.

64.1.2.2.49 IDSCursor.SetProp Method

Pascal

```
function SetProp(eProp: CURProp; iPropValue: LongWord): DBResult; stdcall;
```

C++

```
__fastcall __stdcall DBResult SetProp(CURProp eProp, LongWord iPropValue);
```

Description

This is SetProp, a member of class IDSCursor.

64.1.2.2.50 IDSCursor.SetRange Method

Pascal

```
function SetRange(iFields: LongWord; pKey1: Pointer; bKey1Incl: LongBool; pKey2: Pointer;
bKey2Incl: LongBool): DBResult; stdcall;
```

C++

```
__fastcall __stdcall DBResult SetRange(LongWord iFields, void * pKey1, LongBool bKey1Incl,
void * pKey2, LongBool bKey2Incl);
```

Description

This is SetRange, a member of class IDSCursor.

64.1.2.2.51 IDSCursor.SortOnFields Method

Pascal

```
function SortOnFields(iFields: LongWord; piFields: PLongWord; pDescending: PLongBool;
pCaseInsensitive: PLongBool): DBResult; stdcall;
```

C++

```
__fastcall __stdcall DBResult SortOnFields(LongWord iFields, PLongWord piFields, PLongBool
pDescending, PLongBool pCaseInsensitive);
```

Description

This is SortOnFields, a member of class IDSCursor.

64.1.2.2.52 IDSCursor.UndoLastChange Method

Pascal

```
function UndoLastChange(bFollowChange: LongBool): DBResult; stdcall;
```

C++

```
__fastcall __stdcall DBResult UndoLastChange(LongBool bFollowChange);
```

Description

This is UndoLastChange, a member of class IDSCursor.

64.1.2.2.53 IDSCursor.UseIndexOrder Method

Pascal

```
function UseIndexOrder(pszName: PChar): DBResult; stdcall;
```

C++

```
__fastcall __stdcall DBResult UseIndexOrder(const char * pszName);
```

Description

This is UseIndexOrder, a member of class IDSCursor.

64.1.2.2.54 IDSCursor.VerifyField Method

Pascal

```
function VerifyField(iFieldNo: LongWord; pFldBuf: Pointer): DBResult; stdcall;
```

C++

```
__fastcall __stdcall DBResult VerifyField(LongWord iFieldNo, void * pFldBuf);
```

Description

This is VerifyField, a member of class IDSCursor.

64.1.3 IDSWriter Interface

Class Hierarchy

Pascal

```
IDSWriter = interface(IUnknown);
```

C++

```
__interface IDSWriter : public IUnknown;
```

File

DSIntf

Description

This is class DSIntf.IDSWriter.

64.1.3.1 IDSWriter Members

The following tables list the members exposed by IDSWriter.

Public Methods

	Name	Description
	AddAttribute (see page 11698)	This is AddAttribute, a member of class IDSWriter.
	AddColumnDesc (see page 11699)	This is AddColumnDesc, a member of class IDSWriter.
	EndOfNestedRows (see page 11699)	This is EndOfNestedRows, a member of class IDSWriter.
	GetColumnCount (see page 11699)	This is GetColumnCount, a member of class IDSWriter.
	GetColumnDescs (see page 11699)	This is GetColumnDescs, a member of class IDSWriter.
	GetDataPacket (see page 11700)	This is GetDataPacket, a member of class IDSWriter.
	GetErrorString (see page 11700)	This is GetErrorString, a member of class IDSWriter.
	GetSize (see page 11700)	This is GetSize, a member of class IDSWriter.
	GetXMLMode (see page 11700)	This is GetXMLMode, a member of class IDSWriter.
	Init (see page 11700)	This is Init, a member of class IDSWriter.
	Init_Sequential (see page 11701)	This is Init_Sequential, a member of class IDSWriter.
	PutField (see page 11701)	This is PutField, a member of class IDSWriter.
	Reset (see page 11701)	This is Reset, a member of class IDSWriter.
	SetXMLMode (see page 11701)	This is SetXMLMode, a member of class IDSWriter.

64.1.3.2 IDSWriter Methods

The methods of the IDSWriter class are listed here.

Public Methods

	Name	Description
	AddAttribute (see page 11698)	This is AddAttribute, a member of class IDSWriter.
	AddColumnDesc (see page 11699)	This is AddColumnDesc, a member of class IDSWriter.
	EndOfNestedRows (see page 11699)	This is EndOfNestedRows, a member of class IDSWriter.
	GetColumnCount (see page 11699)	This is GetColumnCount, a member of class IDSWriter.
	GetColumnDescs (see page 11699)	This is GetColumnDescs, a member of class IDSWriter.
	GetDataPacket (see page 11700)	This is GetDataPacket, a member of class IDSWriter.
	GetErrorString (see page 11700)	This is GetErrorString, a member of class IDSWriter.
	GetSize (see page 11700)	This is GetSize, a member of class IDSWriter.
	GetXMLMode (see page 11700)	This is GetXMLMode, a member of class IDSWriter.
	Init (see page 11700)	This is Init, a member of class IDSWriter.
	Init_Sequential (see page 11701)	This is Init_Sequential, a member of class IDSWriter.
	PutField (see page 11701)	This is PutField, a member of class IDSWriter.
	Reset (see page 11701)	This is Reset, a member of class IDSWriter.
	SetXMLMode (see page 11701)	This is SetXMLMode, a member of class IDSWriter.

64.1.3.2.1 IDSWriter.AddAttribute Method

Pascal

```
function AddAttribute(AttrArea: TPcktAttrArea; Attr: PChar; AttrType: LongWord; Len: LongWord;
Value: Pointer): DBResult; stdcall;
```

C++

```
__fastcall __stdcall DBResult AddAttribute(TPcktAttrArea AttrArea, const char * Attr, LongWord
AttrType, LongWord Len, void * Value);
```

Description

This is AddAttribute, a member of class IDSWriter.

64.1.3.2.2 IDSWriter.AddColumnDesc Method

Pascal

```
function AddColumnDesc(const FldDes: TDSDataPacketFldDesc): DBResult; stdcall;
```

C++

```
__fastcall __stdcall DBResult AddColumnDesc(const TDSDataPacketFldDesc FldDes);
```

Description

This is AddColumnDesc, a member of class IDSWriter.

64.1.3.2.3 IDSWriter.EndOfNestedRows Method

Pascal

```
function EndOfNestedRows: DBResult; stdcall;
```

C++

```
__fastcall __stdcall DBResult EndOfNestedRows();
```

Description

This is EndOfNestedRows, a member of class IDSWriter.

64.1.3.2.4 IDSWriter.GetColumnCount Method

Pascal

```
function GetColumnCount(var Count: LongWord): DBResult; stdcall;
```

C++

```
__fastcall __stdcall DBResult GetColumnCount(LongWord Count);
```

Description

This is GetColumnCount, a member of class IDSWriter.

64.1.3.2.5 IDSWriter.GetColumnDescs Method

Pascal

```
function GetColumnDescs(FieldDes: PDSDataPacketFldDesc): DBResult; stdcall;
```

C++

```
__fastcall __stdcall DBResult GetColumnDescs(PDSDataPacketFldDesc FieldDes);
```

Description

This is GetColumnDescs, a member of class IDSWriter.

64.1.3.2.6 IDSWriter.GetDataPacket Method

Pascal

```
function GetDataPacket(var SA: PSafeArray): DBResult; stdcall;
```

C++

```
__fastcall __stdcall DBResult GetDataPacket(PSafeArray SA);
```

Description

This is GetDataPacket, a member of class IDSWriter.

64.1.3.2.7 IDSWriter.GetErrorString Method

Pascal

```
function GetErrorString(iErrCode: DBResult; pString: PChar): DBResult; stdcall;
```

C++

```
__fastcall __stdcall DBResult GetErrorString(DBResult iErrCode, const char * pString);
```

Description

This is GetErrorString, a member of class IDSWriter.

64.1.3.2.8 IDSWriter.GetSize Method

Pascal

```
function GetSize(var DataPacketSize: LongWord): DBResult; stdcall;
```

C++

```
__fastcall __stdcall DBResult GetSize(LongWord DataPacketSize);
```

Description

This is GetSize, a member of class IDSWriter.

64.1.3.2.9 IDSWriter.GetXMLMode Method

Pascal

```
function GetXMLMode: LongWord; stdcall;
```

C++

```
__fastcall __stdcall LongWord GetXMLMode();
```

Description

This is GetXMLMode, a member of class IDSWriter.

64.1.3.2.10 IDSWriter.Init Method

Pascal

```
function Init(Version: LongWord; Columns: Word; FieldDesc: PDSDataPacketFldDesc): DBResult;
stdcall;
```

C++

```
__fastcall __stdcall DBResult Init(LongWord Version, Word Columns, PDSDataPacketFldDesc
FieldDesc);
```

Description

This is Init, a member of class IDSWriter.

64.1.3.2.11 IDSWriter.Init_Sequential Method

Pascal

```
function Init_Sequential(Version: LongWord; Columns: Word): DBResult; stdcall;
```

C++

```
__fastcall __stdcall DBResult Init_Sequential(LongWord Version, Word Columns);
```

Description

This is Init_Sequential, a member of class IDSWriter.

64.1.3.2.12 IDSWriter.PutField Method

Pascal

```
function PutField(FldStatus: TPcktFldStatus; Len: LongWord; Src: Pointer): DBResult; stdcall;
```

C++

```
__fastcall __stdcall DBResult PutField(TPcktFldStatus FldStatus, LongWord Len, void * Src);
```

Description

This is PutField, a member of class IDSWriter.

64.1.3.2.13 IDSWriter.Reset Method

Pascal

```
function Reset: DBResult; stdcall;
```

C++

```
__fastcall __stdcall DBResult Reset();
```

Description

This is Reset, a member of class IDSWriter.

64.1.3.2.14 IDSWriter.SetXMLMode Method

Pascal

```
function SetXMLMode(iMode: Integer): DBResult; stdcall;
```

C++

```
__fastcall __stdcall DBResult SetXMLMode(int iMode);
```

Description

This is SetXMLMode, a member of class IDSWriter.

64.2 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	CreateDbClientObject (see page 11702)	This is function DSIntf.CreateDbClientObject.
	DataPacketSize (see page 11702)	This is function DSIntf.DataPacketSize.
	DataPacketToVariant (see page 11703)	This is function DSIntf.DataPacketToVariant.
	FreeDataPacket (see page 11703)	This is function DSIntf.FreeDataPacket.
	RegisterMidasLib (see page 11703)	This is function DSIntf.RegisterMidasLib.
	StringToVariantArray (see page 11704)	This is function DSIntf.StringToVariantArray.
	VariantArrayToString (see page 11704)	This is function DSIntf.VariantArrayToString.
	VarToDataPacket (see page 11704)	This is function DSIntf.VarToDataPacket.

64.2.1 DSIntf.CreateDbClientObject Function

Pascal

```
procedure CreateDbClientObject(const CLSID: TGUID; const IID: TGUID; out Obj);
```

C++

```
CreateDbClientObject(const TGUID CLSID, const TGUID IID,  Obj);
```

File

DSIntf

Description

This is function DSIntf.CreateDbClientObject.

64.2.2 DSIntf.DataPacketSize Function

Pascal

```
function DataPacketSize(const DataPacket: TDataPacket): Integer;
```

C++

```
int DataPacketSize(const TDataPacket DataPacket);
```

File

DSIntf

Description

This is function DSIntf.DataPacketSize.

64.2.3 DSIntf.DataPacketToVariant Function

Pascal

```
procedure DataPacketToVariant(const DataPacket: TDataPacket; var V: OleVariant);
```

C++

```
DataPacketToVariant(const TDataPacket DataPacket, OleVariant V);
```

File

DSIntf

Description

This is function DSIntf.DataPacketToVariant.

64.2.4 DSIntf.FreeDataPacket Function

Pascal

```
procedure FreeDataPacket(var DataPacket: TDataPacket);
```

C++

```
FreeDataPacket(TDataPacket DataPacket);
```

File

DSIntf

Description

This is function DSIntf.FreeDataPacket.

64.2.5 DSIntf.RegisterMidasLib Function

Pascal

```
procedure RegisterMidasLib(GetClassProc: Pointer);
```

C++

```
RegisterMidasLib(void * GetClassProc);
```

File

DSIntf

Description

This is function DSIntf.RegisterMidasLib.

64.2.6 DSIntf.StringToVariantArray Function

Pascal

```
function StringToVariantArray(const S: string): OleVariant;
```

C++

```
OleVariant StringToVariantArray(const AnsiString S);
```

File

DSIntf

Description

This is function DSIntf.StringToVariantArray.

64.2.7 DSIntf.VariantArrayToString Function

Pascal

```
function VariantArrayToString(const V: OleVariant): string;
```

C++

```
AnsiString VariantArrayToString(const OleVariant V);
```

File

DSIntf

Description

This is function DSIntf.VariantArrayToString.

64.2.8 DSIntf.VarToDataPacket Function

Pascal

```
function VarToDataPacket(const V: OleVariant): TDataPacket;
```

C++

```
TDataPacket VarToDataPacket(const OleVariant V);
```

File

DSIntf

Description

This is function DSIntf.VarToDataPacket.

64.3 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	AGGSTATE (see page 11705)	This is record DSIntf.AGGSTATE.
	CURProp (see page 11706)	This is record DSIntf.CURProp.
	DBSearchCond (see page 11707)	This is record DSIntf.DBSearchCond.
	DSProp (see page 11709)	This is record DSIntf.DSProp.
	GROUPSTATE (see page 11711)	This is record DSIntf.GROUPSTATE.
	TPcktAttrArea (see page 11712)	This is record DSIntf.TPcktAttrArea.
	TPcktFldStatus (see page 11712)	This is record DSIntf.TPcktFldStatus.

Records

	Name	Description
	AGGVALUE (see page 11706)	This is record DSIntf.AGGVALUE.
	DSBOOKMRK (see page 11707)	This is record DSIntf.DSBOOKMRK.
	DSFLDDesc (see page 11708)	This is record DSIntf.DSFLDDesc.
	DSIDXDesc (see page 11708)	This is record DSIntf.DSIDXDesc.
	DSProps (see page 11710)	This is record DSIntf.DSProps.
	TDSDataPacketFldDesc (see page 11711)	This is record DSIntf.TDSDataPacketFldDesc.

64.3.1 DSIntf.AGGSTATE Enumeration

Pascal

```
AGGSTATE = (
  aggSTATEUNDEF,
  aggSTATEOK,
  aggSTATEBLANK,
  aggSTATEERROR
);
```

C++

```
enum AGGSTATE {
  aggSTATEUNDEF,
  aggSTATEOK,
  aggSTATEBLANK,
  aggSTATEERROR
};
```

File

DSIntf

Description

This is record DSIntf.AGGSTATE.

64.3.2 DSIntf.AGGVALUE Record

Pascal

```
AGGVALUE = packed record
  iCnt: Integer;
  eAggState: AGGSTATE;
  Value: record;
end;
```

C++

```
struct AGGVALUE {
  int iCnt;
  AGGSTATE eAggState;
  record Value;
};
```

File

DSIntf

Description

This is record DSIntf.AGGVALUE.

64.3.3 DSIntf.CURProp Enumeration

Pascal

```
CURProp = (
  curpropCONSTRAINT_ERROR_MESSAGE,
  curpropDSBASE,
  curpropSETCRACK,
  curpropGETORG_RECBUF
);
```

C++

```
enum CURProp {
  curpropCONSTRAINT_ERROR_MESSAGE,
  curpropDSBASE,
  curpropSETCRACK,
  curpropGETORG_RECBUF
};
```

File

DSIntf

Description

This is record DSIntf.CURProp.

64.3.4 DSIntf.DBSearchCond Enumeration

Pascal

```
DBSearchCond = (
  keySEARCHEQ,
  keySEARCHGT,
  keySEARCHGEQ
);
```

C++

```
enum DBSearchCond {
  keySEARCHEQ,
  keySEARCHGT,
  keySEARCHGEQ
};
```

File

DSIntf

Description

This is record DSIntf.DBSearchCond.

64.3.5 DSIntf.DSBOOKMRK Record

Pascal

```
DSBOOKMRK = packed record
  iPos: Integer;
  iState: Integer;
  iRecNo: Integer;
  iSeqNo: Integer;
  iOrderID: Integer;
end;
```

C++

```
struct DSBOOKMRK {
  int iPos;
  int iState;
  int iRecNo;
  int iSeqNo;
  int iOrderID;
};
```

File

DSIntf

Description

This is record DSIntf.DSBOOKMRK.

64.3.6 DSIntf.DSFLDDesc Record

Pascal

```
DSFLDDesc = packed record
  szName: MIDASNAME;
  iFldType: Integer;
  iFldSubType: Integer;
  iUnits1: Integer;
  iUnits2: Integer;
  iFldLen: Integer;
  iFldOffsInRec: Integer;
  iNullOffsInRec: Integer;
  iFieldID: Word;
  iFieldIDParent: Word;
  bCalculated: LongBool;
  iFldAttr: Integer;
  iOptParameters: Integer;
end;
```

C++

```
struct DSFLDDesc {
  MIDASNAME szName;
  int iFldType;
  int iFldSubType;
  int iUnits1;
  int iUnits2;
  int iFldLen;
  int iFldOffsInRec;
  int iNullOffsInRec;
  Word iFieldID;
  Word iFieldIDParent;
  LongBool bCalculated;
  int iFldAttr;
  int iOptParameters;
};
```

File

DSIntf

Description

This is record DSIntf.DSFLDDesc.

64.3.7 DSIntf.DSIDXDesc Record

Pascal

```
DSIDXDesc = packed record
  szName: MIDASNAME;
  iFields: Integer;
  iKeyFields: DSKEY;
  iKeyLen: Integer;
  bUnique: LongBool;
  bDescending: DSKEYBOOL;
  bCaseInsensitive: DSKEYBOOL;
end;
```

C++

```
struct DSIDXDesc {
  MIDASNAME szName;
  int iFields;
  DSKEY iKeyFields;
  int iKeyLen;
  LongBool bUnique;
  DSKEYBOOL bDescending;
  DSKEYBOOL bCaseInsensitive;
};
```

File

DSIntf

Description

This is record DSIntf.DSIDXDesc.

64.3.8 DSIntf.DSProp Enumeration

Pascal

```
DSProp = (
  dspropLOGCHANGES,
  dspropREADONLY,
  dspropNOOFCHANGES,
  dspropCONSTRAINTS_DISABLED,
  dspropDSISPARTIAL,
  dspropRECORDSINDS,
  dspropAUTOINC_DISABLED,
  dspropISDELTA,
  dspropDONTINCLMETADATA,
  dspropINCLBLOBSINDELTA,
  dspropGETSAVEPOINT,
  dspropCOMPRESSARRAYS,
  dspropMD_SEMANTICS,
  dspropFIELD_FULLNAME,
  dspropFIELDID_FORNAME,
  dspropFIELDID_FORPARENT,
  dspropCHANGEINDEX_VIEW,
  dspropGETUNIQUEINDEX,
  dspropREMOTE_UPDATEMODE,
  dspropXML_STREAMMODE,
  dspropDISABLEDELETES,
  dspropDISABLEINSERTS,
  dspropDISABLEEDITS,
  dspropDISABLESTRINGTRIM,
  dspropDATAHASCHANGED
);
```

C++

```
enum DSProp {
  dspropLOGCHANGES,
  dspropREADONLY,
  dspropNOOFCHANGES,
  dspropCONSTRAINTS_DISABLED,
  dspropDSISPARTIAL,
  dspropRECORDSINDS,
  dspropAUTOINC_DISABLED,
  dspropISDELTA,
  dspropDONTINCLMETADATA,
```

```
    dspropINCLBLOBSINDELTA,
    dspropGETSAVEPOINT,
    dspropCOMPRESSARRAYS,
    dspropMD_SEMANTICS,
    dspropFIELD_FULLNAME,
    dspropFIELDID_FORNAME,
    dspropFIELDID_FORPARENT,
    dspropCHANGEINDEX_VIEW,
    dspropGETUNIQUEINDEX,
    dspropREMOTE_UPDATEMODE,
    dspropXML_STREAMMODE,
    dspropDISABLEDELETES,
    dspropDISABLEINSERTS,
    dspropDISABLEEDITS,
    dspropDISABLESTRINGTRIM,
    dspropDATAHASCHANGED
  };
```

File

DSIntf

Description

This is record DSIntf.DSProp.

64.3.9 DSIntf.DSProps Record

Pascal

```
  DSProps = packed record
    szName: MIDASPATH;
    iFields: Integer;
    iRecBufSize: Integer;
    iBookMarkSize: Integer;
    bReadOnly: LongBool;
    iIndexes: Integer;
    iOptParams: Integer;
    bDelta: LongBool;
    iLCID: Integer;
    iUnused: packed array[0..7] of Integer;
  end;
```

C++

```
  struct DSProps {
    MIDASPATH szName;
    int iFields;
    int iRecBufSize;
    int iBookMarkSize;
    LongBool bReadOnly;
    int iIndexes;
    int iOptParams;
    LongBool bDelta;
    int iLCID;
    packed array[0..7] of Integer iUnused;
  };
```

File

DSIntf

Description

This is record DSIntf.DSProps.

64.3.10 DSIntf.GROUPSTATE Enumeration

Pascal

```
GROUPSTATE = (
  grSTATEMIDDLE,
  grSTATEFIRST,
  grSTATELAST,
  grSTATEFIRSTLAST
);
```

C++

```
enum GROUPSTATE {
  grSTATEMIDDLE,
  grSTATEFIRST,
  grSTATELAST,
  grSTATEFIRSTLAST
};
```

File

DSIntf

Description

This is record DSIntf.GROUPSTATE.

64.3.11 DSIntf.TDSDataPacketFldDesc Record

Pascal

```
TDSDataPacketFldDesc = packed record
  szFieldName: MIDASNAME;
  iFieldType: Integer;
  iAttributes: Word;
end;
```

C++

```
struct TDSDataPacketFldDesc {
  MIDASNAME szFieldName;
  int iFieldType;
  Word iAttributes;
};
```

File

DSIntf

Description

This is record DSIntf.TDSDataPacketFldDesc.

64.3.12 DSIntf.TPcktAttrArea Enumeration

Pascal

```
TPcktAttrArea = (
  fldAttrArea,
  pcktAttrArea
);
```

C++

```
enum TPcktAttrArea {
  fldAttrArea,
  pcktAttrArea
};
```

File

DSIntf

Description

This is record DSIntf.TPcktAttrArea.

64.3.13 DSIntf.TPcktFldStatus Enumeration

Pascal

```
TPcktFldStatus = (
  fldIsChanged,
  fldIsNull,
  fldIsUnChanged
);
```

C++

```
enum TPcktFldStatus {
  fldIsChanged,
  fldIsNull,
  fldIsUnChanged
};
```

File

DSIntf

Description

This is record DSIntf.TPcktFldStatus.

64.4 Types

The following table lists types in this documentation.

Types

Name	Description
DBResult (see page 11713)	This is type DSIntf.DBResult.
DSAttr (see page 11714)	This is type DSIntf.DSAttr.
dsCBRType (see page 11714)	This is type DSIntf.dsCBRType.
DSKEY (see page 11714)	This is type DSIntf.DSKEY.
DSKEYBOOL (see page 11715)	This is type DSIntf.DSKEYBOOL.
hDSAggregate (see page 11715)	This is type DSIntf.hDSAggregate.
hDSFilter (see page 11715)	This is type DSIntf.hDSFilter.
MIDASNAME (see page 11716)	This is type DSIntf.MIDASNAME.
MIDASPATH (see page 11716)	This is type DSIntf.MIDASPATH.
pDSAttr (see page 11716)	This is type DSIntf.pDSAttr.
pDSBOOKMRK (see page 11717)	This is type DSIntf.pDSBOOKMRK.
pdsCBRType (see page 11717)	This is type DSIntf.pdsCBRType.
PDSDataPacketFldDesc (see page 11717)	This is type DSIntf.PDSDataPacketFldDesc.
pDSFLDDesc (see page 11718)	This is type DSIntf.pDSFLDDesc.
pDSIDXDesc (see page 11718)	This is type DSIntf.pDSIDXDesc.
pDSProps (see page 11718)	This is type DSIntf.pDSProps.
pfCHANGECallBack (see page 11719)	This is type DSIntf.pfCHANGECallBack.
pfDSCalcField (see page 11719)	This is type DSIntf.pfDSCalcField.
pfDSFilter (see page 11719)	This is type DSIntf.pfDSFilter.
pfDSReconcile (see page 11720)	This is type DSIntf.pfDSReconcile.
pfDSReconcile_MD (see page 11720)	This is type DSIntf.pfDSReconcile_MD.
pfFLDComp (see page 11720)	This is type DSIntf.pfFLDComp.
phDSAggregate (see page 11721)	This is type DSIntf.phDSAggregate.
phDSFilter (see page 11721)	This is type DSIntf.phDSFilter.
PLongBool (see page 11721)	This is type DSIntf.PLongBool.
pSAVEPOINT (see page 11722)	This is type DSIntf.pSAVEPOINT.
SAVEPOINT (see page 11722)	This is type DSIntf.SAVEPOINT.
TDataPacket (see page 11722)	This is type DSIntf.TDataPacket.

64.4.1 DSIntf.DBResult Type

Pascal

```
DBResult = Word;
```

C++

```
Word DBResult;
```

File

DSIntf

Description

This is type DSIntf.DBResult.

64.4.2 DSIntf.DSAttr Type

Pascal

```
DSAttr = type Byte;
```

C++

```
type Byte DSAttr;
```

File

DSIntf

Description

This is type DSIntf.DSAttr.

64.4.3 DSIntf.dsCBRType Type

Pascal

```
dsCBRType = Integer;
```

C++

```
int dsCBRType;
```

File

DSIntf

Description

This is type DSIntf.dsCBRType.

64.4.4 DSIntf.DSKEY Type

Pascal

```
DSKEY = array[0..MAXKEYFIELDS-1] of Integer;
```

C++

```
array[0..MAXKEYFIELDS-1] of Integer DSKEY;
```

File

DSIntf

Description

This is type DSIntf.DSKEY.

64.4.5 DSIntf.DSKEYBOOL Type

Pascal

```
DSKEYBOOL = array[0..MAXKEYFIELDS-1] of LongBool;
```

C++

```
array[0..MAXKEYFIELDS-1] of LongBool DSKEYBOOL;
```

File

DSIntf

Description

This is type DSIntf.DSKEYBOOL.

64.4.6 DSIntf.hDSAggregate Type

Pascal

```
hDSAggregate = type Integer;
```

C++

```
type Integer hDSAggregate;
```

File

DSIntf

Description

This is type DSIntf.hDSAggregate.

64.4.7 DSIntf.hDSFilter Type

Pascal

```
hDSFilter = type Pointer;
```

C++

```
type Pointer hDSFilter;
```

File

DSIntf

Description

This is type DSIntf.hDSFilter.

64.4.8 DSIntf.MIDASNAME Type

Pascal

```
MIDASNAME = array [0..31] of Char;
```

C++

```
array [0..31] of Char MIDASNAME;
```

File

DSIntf

Description

This is type DSIntf.MIDASNAME.

64.4.9 DSIntf.MIDASPATH Type

Pascal

```
MIDASPATH = array [0..260] of Char;
```

C++

```
array [0..260] of Char MIDASPATH;
```

File

DSIntf

Description

This is type DSIntf.MIDASPATH.

64.4.10 DSIntf.pDSAttr Type

Pascal

```
pDSAttr = ^DSAttr;
```

C++

```
^DSAttr pDSAttr;
```

File

DSIntf

Description

This is type DSIntf.pDSAttr.

64.4.11 DSIntf.pDSBOOKMRK Type

Pascal

```
pDSBOOKMRK = ^DSBOOKMRK;
```

C++

```
^DSBOOKMRK pDSBOOKMRK;
```

File

DSIntf

Description

This is type DSIntf.pDSBOOKMRK.

64.4.12 DSIntf.pdsCBRType Type

Pascal

```
pdsCBRType = ^dsCBRType;
```

C++

```
^dsCBRType pdsCBRType;
```

File

DSIntf

Description

This is type DSIntf.pdsCBRType.

64.4.13 DSIntf.PDSDataPacketFldDesc Type

Pascal

```
PDSDataPacketFldDesc = ^TDSDataPacketFldDesc;
```

C++

```
^TDSDataPacketFldDesc PDSDataPacketFldDesc;
```

File

DSIntf

Description

This is type DSIntf.PDSDataPacketFldDesc.

64.4.14 DSIntf.pDSFLDDesc Type

Pascal

```
pDSFLDDesc = ^DSFLDDesc;
```

C++

```
^DSFLDDesc pDSFLDDesc;
```

File

DSIntf

Description

This is type DSIntf.pDSFLDDesc.

64.4.15 DSIntf.pDSIDXDesc Type

Pascal

```
pDSIDXDesc = ^DSIDXDesc;
```

C++

```
^DSIDXDesc pDSIDXDesc;
```

File

DSIntf

Description

This is type DSIntf.pDSIDXDesc.

64.4.16 DSIntf.pDSProps Type

Pascal

```
pDSProps = ^DSProps;
```

C++

```
^DSProps pDSProps;
```

File

DSIntf

Description

This is type DSIntf.pDSProps.

64.4.17 DSIntf.pfCHANGECallBack Type

Pascal

```
pfCHANGECallBack = procedure ( iClientData : Integer );
```

C++

```
( iClientData : Integer ) ( pfCHANGECallBack)();
```

File

DSIntf

Description

This is type DSIntf.pfCHANGECallBack.

64.4.18 DSIntf.pfDSCalcField Type

Pascal

```
pfDSCalcField = function ( iClientData : Integer; pRecBuf : Pointer ): DBResult;
```

C++

```
( iClientData : Integer; pRecBuf : Pointer ): DBResult ( pfDSCalcField)();
```

File

DSIntf

Description

This is type DSIntf.pfDSCalcField.

64.4.19 DSIntf.pfDSFilter Type

Pascal

```
pfDSFilter = function ( iClientData : Integer; pRecBuf : Pointer ): LongBool;
```

C++

```
( iClientData : Integer; pRecBuf : Pointer ): LongBool ( pfDSFilter)();
```

File

DSIntf

Description

This is type DSIntf.pfDSFilter.

64.4.20 DSIntf.pfDSReconcile Type

Pascal

```
pfDSReconcile = function ( iClientData : Integer; iRslt : Integer; iAction : DSAttr; iResponse
: dsCBRType; iErrCode : Integer; pErrMessage : PChar; pErrContext : PChar; pRecUpd : Pointer;
pRecOrg : Pointer; pRecConflict : Pointer ): dsCBRType;
```

C++

```
( iClientData : Integer; iRslt : Integer; iAction : DSAttr; iResponse : dsCBRType; iErrCode :
Integer; pErrMessage : PChar; pErrContext : PChar; pRecUpd : Pointer; pRecOrg : Pointer;
pRecConflict : Pointer ): dsCBRType ( pfDSReconcile)();
```

File

DSIntf

Description

This is type DSIntf.pfDSReconcile.

64.4.21 DSIntf.pfDSReconcile_MD Type

Pascal

```
pfDSReconcile_MD = function ( iClientData : Integer; iRslt : Integer; iAction : DSAttr;
iErrResponse : dsCBRType; iErrCode : Integer; pErrMessage : PChar; pErrContext : PChar;
pRecUpd : PByte; pRecOrg : PByte; pRecConflict : PByte; iLevels : Integer; piFieldIDs :
PInteger ): dsCBRType;
```

C++

```
( iClientData : Integer; iRslt : Integer; iAction : DSAttr; iErrResponse : dsCBRType; iErrCode
: Integer; pErrMessage : PChar; pErrContext : PChar; pRecUpd : PByte; pRecOrg : PByte;
pRecConflict : PByte; iLevels : Integer; piFieldIDs : PInteger ): dsCBRType (
pfDSReconcile_MD)();
```

File

DSIntf

Description

This is type DSIntf.pfDSReconcile_MD.

64.4.22 DSIntf.pfFLDComp Type

Pascal

```
pfFLDComp = function ( iClientData : Integer; pVal1 : Pointer; pVal2 : Pointer ): Integer;
```

C++

```
( iClientData : Integer; pVal1 : Pointer; pVal2 : Pointer ): Integer ( pfFLDComp)();
```

File

DSIntf

Description

This is type DSIntf.pfFLDComp.

64.4.23 DSIntf.phDSAggregate Type

Pascal

```
phDSAggregate = ^hDSAggregate;
```

C++

```
^hDSAggregate phDSAggregate;
```

File

DSIntf

Description

This is type DSIntf.phDSAggregate.

64.4.24 DSIntf.phDSFilter Type

Pascal

```
phDSFilter = ^hDSFilter;
```

C++

```
^hDSFilter phDSFilter;
```

File

DSIntf

Description

This is type DSIntf.phDSFilter.

64.4.25 DSIntf.PLongBool Type

Pascal

```
PLongBool = ^LongBool;
```

C++

```
^LongBool PLongBool;
```

File

DSIntf

Description

This is type DSIntf.PLongBool.

64.4.26 DSIntf.pSAVEPOINT Type

Pascal

```
pSAVEPOINT = ^SAVEPOINT;
```

C++

```
^SAVEPOINT pSAVEPOINT;
```

File

DSIntf

Description

This is type DSIntf.pSAVEPOINT.

64.4.27 DSIntf.SAVEPOINT Type

Pascal

```
SAVEPOINT = type Integer;
```

C++

```
type Integer SAVEPOINT;
```

File

DSIntf

Description

This is type DSIntf.SAVEPOINT.

64.4.28 DSIntf.TDataPacket Type

Pascal

```
TDataPacket = PSafeArray;
```

C++

```
PSafeArray TDataPacket;
```

File

DSIntf

Description

This is type DSIntf.TDataPacket.

64.5 Constants

The following table lists constants in this documentation.

Constants

Name	Description
BLANK_NOTCHANGED (see page 11727)	This is constant DSIntf.BLANK_NOTCHANGED.
BLANK_NULL (see page 11727)	This is constant DSIntf.BLANK_NULL.
BlobTypeMap (see page 11727)	This is constant DSIntf.BlobTypeMap.
CLSID_DSBase (see page 11728)	This is constant DSIntf.CLSID_DSBase.
CLSID_DSCursor (see page 11728)	This is constant DSIntf.CLSID_DSCursor.
CLSID_DSWriter (see page 11728)	This is constant DSIntf.CLSID_DSWriter.
DataTypeMap (see page 11729)	This is constant DSIntf.DataTypeMap.
DBERR_ABORTED (see page 11729)	This is constant DSIntf.DBERR_ABORTED.
DBERR_BLOBNOTFETCHED (see page 11729)	This is constant DSIntf.DBERR_BLOBNOTFETCHED.
DBERR_BOF (see page 11730)	This is constant DSIntf.DBERR_BOF.
DBERR_CANCELLED (see page 11730)	This is constant DSIntf.DBERR_CANCELLED.
DBERR_CANNOTAPPEND (see page 11730)	This is constant DSIntf.DBERR_CANNOTAPPEND.
DBERR_DATAPACKETMISMATCH (see page 11731)	This is constant DSIntf.DBERR_DATAPACKETMISMATCH.
DBERR_DELTAISEMPTY (see page 11731)	This is constant DSIntf.DBERR_DELTAISEMPTY.
DBERR_DETAILSNOTFETCHED (see page 11731)	This is constant DSIntf.DBERR_DETAILSNOTFETCHED.
DBERR_EOF (see page 11732)	This is constant DSIntf.DBERR_EOF.
DBERR_FLYAWAY_WRONGORDER (see page 11732)	This is constant DSIntf.DBERR_FLYAWAY_WRONGORDER.
DBERR_LINKFIELDSNOTUNIQUE (see page 11732)	This is constant DSIntf.DBERR_LINKFIELDSNOTUNIQUE.
DBERR_NEWERVERSIONREQ (see page 11733)	This is constant DSIntf.DBERR_NEWERVERSIONREQ.
DBERR_NOCASCADEDUPDATES (see page 11733)	This is constant DSIntf.DBERR_NOCASCADEDUPDATES.
DBERR_NOMASTERRECORD (see page 11733)	This is constant DSIntf.DBERR_NOMASTERRECORD.
DBERR_NOMETADATA (see page 11734)	This is constant DSIntf.DBERR_NOMETADATA.
DBERR_NONE (see page 11734)	This is constant DSIntf.DBERR_NONE.
DBERR_NOSUCHINDEX (see page 11734)	This is constant DSIntf.DBERR_NOSUCHINDEX.
DBERR_NOTHINGTOUNDO (see page 11735)	This is constant DSIntf.DBERR_NOTHINGTOUNDO.
dsArrayFldType (see page 11735)	This is constant DSIntf.dsArrayFldType.
dsCASCADEDELETES (see page 11735)	This is constant DSIntf.dsCASCADEDELETES.
dsCASCADEUPDATES (see page 11736)	This is constant DSIntf.dsCASCADEUPDATES.
dscbrABORT (see page 11736)	This is constant DSIntf.dscbrABORT.
dscbrAPPLY (see page 11736)	This is constant DSIntf.dscbrAPPLY.
dscbrCANCEL (see page 11737)	This is constant DSIntf.dscbrCANCEL.
dscbrCORRECT (see page 11737)	This is constant DSIntf.dscbrCORRECT.
dscbrIGNORE (see page 11737)	This is constant DSIntf.dscbrIGNORE.
dscbrMERGE (see page 11738)	This is constant DSIntf.dscbrMERGE.
dscbrREFRESH (see page 11738)	This is constant DSIntf.dscbrREFRESH.
dscbrSKIP (see page 11738)	This is constant DSIntf.dscbrSKIP.
dsCompArrayFldType (see page 11739)	This is constant DSIntf.dsCompArrayFldType.
dsDELAYEDBIT (see page 11739)	This is constant DSIntf.dsDELAYEDBIT.
dsDetUpd (see page 11739)	This is constant DSIntf.dsDetUpd.
dsEmbeddedFldType (see page 11740)	This is constant DSIntf.dsEmbeddedFldType.
dsfldADT (see page 11740)	This is constant DSIntf.dsfldADT.
dsfldARRAY (see page 11740)	This is constant DSIntf.dsfldARRAY.
dsfldBCD (see page 11741)	This is constant DSIntf.dsfldBCD.
dsfldBOOL (see page 11741)	This is constant DSIntf.dsfldBOOL.

dsfldBYTES (see page 11741)	This is constant DSIntf.dsfldBYTES.
dsfldDATE (see page 11742)	This is constant DSIntf.dsfldDATE.
dsfldDATETIME (see page 11742)	This is constant DSIntf.dsfldDATETIME.
dsfldEMBEDDEDTBL (see page 11742)	This is constant DSIntf.dsfldEMBEDDEDTBL.
dsfldFLOATIEEE (see page 11743)	This is constant DSIntf.dsfldFLOATIEEE.
dsfldFMTBCD (see page 11743)	This is constant DSIntf.dsfldFMTBCD.
dsfldINT (see page 11743)	This is constant DSIntf.dsfldINT.
dsfldREF (see page 11744)	This is constant DSIntf.dsfldREF.
dsfldTIME (see page 11744)	This is constant DSIntf.dsfldTIME.
dsfldTIMESTAMP (see page 11744)	This is constant DSIntf.dsfldTIMESTAMP.
dsfldUINT (see page 11745)	This is constant DSIntf.dsfldUINT.
dsfldUNICODE (see page 11745)	This is constant DSIntf.dsfldUNICODE.
dsfldUNKNOWN (see page 11745)	This is constant DSIntf.dsfldUNKNOWN.
dsfldZSTRING (see page 11746)	This is constant DSIntf.dsfldZSTRING.
dsIncInDelta (see page 11746)	This is constant DSIntf.dsIncInDelta.
dsIsNotVisible (see page 11746)	This is constant DSIntf.dsIsNotVisible.
dsIsVisible (see page 11747)	This is constant DSIntf.dsIsVisible.
dskeyCASEINSENSITIVE (see page 11747)	This is constant DSIntf.dskeyCASEINSENSITIVE.
dskeyDESCENDING (see page 11747)	This is constant DSIntf.dskeyDESCENDING.
dsPseudoFldType (see page 11748)	This is constant DSIntf.dsPseudoFldType.
dsRecDeleted (see page 11748)	This is constant DSIntf.dsRecDeleted.
dsRecModified (see page 11748)	This is constant DSIntf.dsRecModified.
dsRecNew (see page 11749)	This is constant DSIntf.dsRecNew.
dsRecOrg (see page 11749)	This is constant DSIntf.dsRecOrg.
dsRecUnmodified (see page 11749)	This is constant DSIntf.dsRecUnmodified.
dsSizeBitsLen (see page 11750)	This is constant DSIntf.dsSizeBitsLen.
dsSizeBitsMask (see page 11750)	This is constant DSIntf.dsSizeBitsMask.
dsTypeBitsMask (see page 11750)	This is constant DSIntf.dsTypeBitsMask.
dsUnused (see page 11751)	This is constant DSIntf.dsUnused.
dsVaryingFldType (see page 11751)	This is constant DSIntf.dsVaryingFldType.
ERRBASE_ALC (see page 11751)	This is constant DSIntf.ERRBASE_ALC.
ERRCAT_ALC (see page 11752)	This is constant DSIntf.ERRCAT_ALC.
ERRCODE_ABORTED (see page 11752)	This is constant DSIntf.ERRCODE_ABORTED.
ERRCODE_BLOBNOTFETCHED (see page 11752)	This is constant DSIntf.ERRCODE_BLOBNOTFETCHED.
ERRCODE_CANCELLED (see page 11753)	This is constant DSIntf.ERRCODE_CANCELLED.
ERRCODE_CANNOTAPPEND (see page 11753)	This is constant DSIntf.ERRCODE_CANNOTAPPEND.
ERRCODE_DATAPACKETMISMATCH (see page 11753)	This is constant DSIntf.ERRCODE_DATAPACKETMISMATCH.
ERRCODE_DELTAISEMPTY (see page 11754)	This is constant DSIntf.ERRCODE_DELTAISEMPTY.
ERRCODE_DETAILSNOTFETCHED (see page 11754)	This is constant DSIntf.ERRCODE_DETAILSNOTFETCHED.
ERRCODE_FLYAWAY_WRONGORDER (see page 11754)	This is constant DSIntf.ERRCODE_FLYAWAY_WRONGORDER.
ERRCODE_LINKFIELDSNOTUNIQUE (see page 11755)	This is constant DSIntf.ERRCODE_LINKFIELDSNOTUNIQUE.
ERRCODE_NEWERVERSIONREQ (see page 11755)	This is constant DSIntf.ERRCODE_NEWERVERSIONREQ.
ERRCODE_NOCASCADEDUPDATES (see page 11755)	This is constant DSIntf.ERRCODE_NOCASCADEDUPDATES.
ERRCODE_NOMASTERRECORD (see page 11756)	This is constant DSIntf.ERRCODE_NOMASTERRECORD.
ERRCODE_NOMETADATA (see page 11756)	This is constant DSIntf.ERRCODE_NOMETADATA.
ERRCODE_NOTHINGTOUNDO (see page 11756)	This is constant DSIntf.ERRCODE_NOTHINGTOUNDO.
FieldTypeMap (see page 11757)	This is constant DSIntf.FieldTypeMap.
fldADT (see page 11757)	This is constant DSIntf.fldADT.
fldARRAY (see page 11757)	This is constant DSIntf.fldARRAY.
fldAttrHIDDEN (see page 11758)	This is constant DSIntf.fldAttrHIDDEN.
fldAttrLINK (see page 11758)	This is constant DSIntf.fldAttrLINK.
fldAttrREADONLY (see page 11758)	This is constant DSIntf.fldAttrREADONLY.
fldAttrREQUIRED (see page 11759)	This is constant DSIntf.fldAttrREQUIRED.
fldBCD (see page 11759)	This is constant DSIntf.fldBCD.

fldBLOB (see page 11759)	This is constant DSIntf.fldBLOB.
fldBOOL (see page 11760)	This is constant DSIntf.fldBOOL.
fldBYTES (see page 11760)	This is constant DSIntf.fldBYTES.
fldCURSOR (see page 11760)	This is constant DSIntf.fldCURSOR.
fldDATE (see page 11761)	This is constant DSIntf.fldDATE.
fldDATETIME (see page 11761)	This is constant DSIntf.fldDATETIME.
fldFLOAT (see page 11761)	This is constant DSIntf.fldFLOAT.
fldFLOATIEEE (see page 11762)	This is constant DSIntf.fldFLOATIEEE.
fldFMTBCD (see page 11762)	This is constant DSIntf.fldFMTBCD.
fldINT16 (see page 11762)	This is constant DSIntf.fldINT16.
fldINT32 (see page 11763)	This is constant DSIntf.fldINT32.
fldINT64 (see page 11763)	This is constant DSIntf.fldINT64.
fldLOCKINFO (see page 11763)	This is constant DSIntf.fldLOCKINFO.
fldREF (see page 11764)	This is constant DSIntf.fldREF.
fldstACCOLEOBJ (see page 11764)	This is constant DSIntf.fldstACCOLEOBJ.
fldstAUTOINC (see page 11764)	This is constant DSIntf.fldstAUTOINC.
fldstBFILE (see page 11765)	This is constant DSIntf.fldstBFILE.
fldstBINARY (see page 11765)	This is constant DSIntf.fldstBINARY.
fldstDBSOLEOBJ (see page 11765)	This is constant DSIntf.fldstDBSOLEOBJ.
fldstFIXED (see page 11766)	This is constant DSIntf.fldstFIXED.
fldstFMTMEMO (see page 11766)	This is constant DSIntf.fldstFMTMEMO.
fldstGRAPHIC (see page 11766)	This is constant DSIntf.fldstGRAPHIC.
fldstGUID (see page 11767)	This is constant DSIntf.fldstGUID.
fldstHBINARY (see page 11767)	This is constant DSIntf.fldstHBINARY.
fldstHMEMO (see page 11767)	This is constant DSIntf.fldstHMEMO.
fldstMEMO (see page 11768)	This is constant DSIntf.fldstMEMO.
fldstMONEY (see page 11768)	This is constant DSIntf.fldstMONEY.
fldstOLEOBJ (see page 11768)	This is constant DSIntf.fldstOLEOBJ.
fldstORAINTERVAL (see page 11769)	This is constant DSIntf.fldstORAINTERVAL.
fldstORATIMESTAMP (see page 11769)	This is constant DSIntf.fldstORATIMESTAMP.
fldstPASSWORD (see page 11769)	This is constant DSIntf.fldstPASSWORD.
fldstReference (see page 11770)	This is constant DSIntf.fldstReference.
fldstTYPEDBINARY (see page 11770)	This is constant DSIntf.fldstTYPEDBINARY.
fldstWIDEMEMO (see page 11770)	This is constant DSIntf.fldstWIDEMEMO.
FldSubTypeMap (see page 11771)	This is constant DSIntf.FldSubTypeMap.
fldTABLE (see page 11771)	This is constant DSIntf.fldTABLE.
fldTIME (see page 11771)	This is constant DSIntf.fldTIME.
fldTIMESTAMP (see page 11772)	This is constant DSIntf.fldTIMESTAMP.
fldUINT16 (see page 11772)	This is constant DSIntf.fldUINT16.
fldUINT32 (see page 11772)	This is constant DSIntf.fldUINT32.
fldUINT64 (see page 11773)	This is constant DSIntf.fldUINT64.
fldUNICODE (see page 11773)	This is constant DSIntf.fldUNICODE.
fldUNKNOWN (see page 11773)	This is constant DSIntf.fldUNKNOWN.
fldVARBYTES (see page 11774)	This is constant DSIntf.fldVARBYTES.
fldWIDESTRING (see page 11774)	This is constant DSIntf.fldWIDESTRING.
fldZSTRING (see page 11774)	This is constant DSIntf.fldZSTRING.
MAXKEYFIELDS (see page 11775)	This is constant DSIntf.MAXKEYFIELDS.
MAXLOGFLDTYPES (see page 11775)	This is constant DSIntf.MAXLOGFLDTYPES.
mdALLOWLINKCHANGE (see page 11775)	This is constant DSIntf.mdALLOWLINKCHANGE.
mdCASCADEDEL (see page 11776)	This is constant DSIntf.mdCASCADEDEL.
mdCASCADEMOD (see page 11776)	This is constant DSIntf.mdCASCADEMOD.
PACKETVERSION_1 (see page 11776)	This is constant DSIntf.PACKETVERSION_1.
PACKETVERSION_2 (see page 11777)	This is constant DSIntf.PACKETVERSION_2.
PACKETVERSION_3 (see page 11777)	This is constant DSIntf.PACKETVERSION_3.

szAUTOINCVALUE (see page 11777)	This is constant DSIntf.szAUTOINCVALUE.
szBDEDEFCL (see page 11778)	This is constant DSIntf.szBDEDEFCL.
szBDEDEFX (see page 11778)	This is constant DSIntf.szBDEDEFX.
szBDEDOMCL (see page 11778)	This is constant DSIntf.szBDEDOMCL.
szBDEDOMX (see page 11779)	This is constant DSIntf.szBDEDOMX.
szBDERECCL (see page 11779)	This is constant DSIntf.szBDERECCL.
szBDERECX (see page 11779)	This is constant DSIntf.szBDERECX.
szCHANGE_LOG (see page 11780)	This is constant DSIntf.szCHANGE_LOG.
szCHANGEINDEX (see page 11780)	This is constant DSIntf.szCHANGEINDEX.
szCONSTRAINTS (see page 11780)	This is constant DSIntf.szCONSTRAINTS.
szDATASET_CONTEXT (see page 11781)	This is constant DSIntf.szDATASET_CONTEXT.
szDATASET_DELTA (see page 11781)	This is constant DSIntf.szDATASET_DELTA.
szDECIMALS (see page 11781)	This is constant DSIntf.szDECIMALS.
szDEFAULT_ORDER (see page 11782)	This is constant DSIntf.szDEFAULT_ORDER.
szDISABLE_DELETES (see page 11782)	This is constant DSIntf.szDISABLE_DELETES.
szDISABLE_EDITS (see page 11782)	This is constant DSIntf.szDISABLE_EDITS.
szDISABLE_INSERTS (see page 11783)	This is constant DSIntf.szDISABLE_INSERTS.
szELEMENTS (see page 11783)	This is constant DSIntf.szELEMENTS.
szFIELDNAME (see page 11783)	This is constant DSIntf.szFIELDNAME.
szFIELDPROPS (see page 11784)	This is constant DSIntf.szFIELDPROPS.
szLCID (see page 11784)	This is constant DSIntf.szLCID.
szMAXVALUE (see page 11784)	This is constant DSIntf.szMAXVALUE.
szMD_FIELDLINKS (see page 11785)	This is constant DSIntf.szMD_FIELDLINKS.
szMD_SEMANTICS (see page 11785)	This is constant DSIntf.szMD_SEMANTICS.
szMINVALUE (see page 11785)	This is constant DSIntf.szMINVALUE.
szNO_RESET_CALL (see page 11786)	This is constant DSIntf.szNO_RESET_CALL.
szORIGIN (see page 11786)	This is constant DSIntf.szORIGIN.
szPRIMARY_KEY (see page 11786)	This is constant DSIntf.szPRIMARY_KEY.
szPROVFLAGS (see page 11787)	This is constant DSIntf.szPROVFLAGS.
szREADONLY (see page 11787)	This is constant DSIntf.szREADONLY.
szSERVER_COL (see page 11787)	This is constant DSIntf.szSERVER_COL.
szSERVERCALC (see page 11788)	This is constant DSIntf.szSERVERCALC.
szstACCOLEOBJ (see page 11788)	This is constant DSIntf.szstACCOLEOBJ.
szstADTNESTEDTABLE (see page 11788)	This is constant DSIntf.szstADTNESTEDTABLE.
szstAUTOINC (see page 11789)	This is constant DSIntf.szstAUTOINC.
szstBINARY (see page 11789)	This is constant DSIntf.szstBINARY.
szstDBSOLEOBJ (see page 11789)	This is constant DSIntf.szstDBSOLEOBJ.
szstFIXEDCHAR (see page 11790)	This is constant DSIntf.szstFIXEDCHAR.
szstFMTMEMO (see page 11790)	This is constant DSIntf.szstFMTMEMO.
szstGRAPHIC (see page 11790)	This is constant DSIntf.szstGRAPHIC.
szstGUID (see page 11791)	This is constant DSIntf.szstGUID.
szstHBINARY (see page 11791)	This is constant DSIntf.szstHBINARY.
szstHMEMO (see page 11791)	This is constant DSIntf.szstHMEMO.
szstMEMO (see page 11792)	This is constant DSIntf.szstMEMO.
szstMONEY (see page 11792)	This is constant DSIntf.szstMONEY.
szstOLEOBJ (see page 11792)	This is constant DSIntf.szstOLEOBJ.
szstREFNESTEDTABLE (see page 11793)	This is constant DSIntf.szstREFNESTEDTABLE.
szstTYPEDBINARY (see page 11793)	This is constant DSIntf.szstTYPEDBINARY.
szstWideMEMO (see page 11793)	This is constant DSIntf.szstWideMEMO.
szSUBTYPE (see page 11794)	This is constant DSIntf.szSUBTYPE.
szTABLE_NAME (see page 11794)	This is constant DSIntf.szTABLE_NAME.
szTYPENAME (see page 11794)	This is constant DSIntf.szTYPENAME.
szUNIQUE_KEY (see page 11795)	This is constant DSIntf.szUNIQUE_KEY.
szUPDATEMODE (see page 11795)	This is constant DSIntf.szUPDATEMODE.

szWIDTH (see page 11795)	This is constant DSIntf.szWIDTH.
xmlOFF (see page 11796)	This is constant DSIntf.xmlOFF.
xmlON (see page 11796)	This is constant DSIntf.xmlON.
xmlUNTYPED (see page 11796)	This is constant DSIntf.xmlUNTYPED.
xmlUTF8 (see page 11797)	This is constant DSIntf.xmlUTF8.
xmlXMLDATATYPED (see page 11797)	This is constant DSIntf.xmlXMLDATATYPED.
xmlXMLSCHEMA (see page 11797)	This is constant DSIntf.xmlXMLSCHEMA.
xmlXMLUTF8 (see page 11798)	This is constant DSIntf.xmlXMLUTF8.

64.5.1 DSIntf.BLANK_NOTCHANGED Constant

Pascal

```
BLANK_NOTCHANGED = 2;
```

C++

```
BLANK_NOTCHANGED = 2;
```

File

DSIntf

Description

This is constant DSIntf.BLANK_NOTCHANGED.

64.5.2 DSIntf.BLANK_NULL Constant

Pascal

```
BLANK_NULL = 1;
```

C++

```
BLANK_NULL = 1;
```

File

DSIntf

Description

This is constant DSIntf.BLANK_NULL.

64.5.3 DSIntf.BlobTypeMap Constant

Pascal

```
BlobTypeMap: array[fldstMEMO..fldstBFILE] of TFieldType = ( ftMemo, ftBlob, ftFmtMemo,
ftParadoxOle, ftGraphic, ftDBaseOle, ftTypedBinary, ftBlob, ftBlob, ftBlob, ftWideMemo,
ftOraClob, ftOraBlob, ftBlob, ftBlob);
```

C++

```
array[fldstMEMO..fldstBFILE] of TFieldType BlobTypeMap = ( ftMemo, ftBlob, ftFmtMemo,
ftParadoxOle, ftGraphic, ftDBaseOle, ftTypedBinary, ftBlob, ftBlob, ftBlob, ftWideMemo,
```

```
ftOraClob, ftOraBlob, ftBlob, ftBlob);
```

File

DSIntf

Description

This is constant DSIntf.BlobTypeMap.

64.5.4 DSIntf.CLSID_DSBase Constant

Pascal

```
CLSID_DSBase: TGUID = '{9E8D2FA1-591C-11D0-BF52-0020AF32BD64}';
```

C++

```
TGUID CLSID_DSBase = '{9E8D2FA1-591C-11D0-BF52-0020AF32BD64}';
```

File

DSIntf

Description

This is constant DSIntf.CLSID_DSBase.

64.5.5 DSIntf.CLSID_DSCursor Constant

Pascal

```
CLSID_DSCursor: TGUID = '{9E8D2FA3-591C-11D0-BF52-0020AF32BD64}';
```

C++

```
TGUID CLSID_DSCursor = '{9E8D2FA3-591C-11D0-BF52-0020AF32BD64}';
```

File

DSIntf

Description

This is constant DSIntf.CLSID_DSCursor.

64.5.6 DSIntf.CLSID_DSWriter Constant

Pascal

```
CLSID_DSWriter: TGUID = '{9E8D2FA5-591C-11D0-BF52-0020AF32BD64}';
```

C++

```
TGUID CLSID_DSWriter = '{9E8D2FA5-591C-11D0-BF52-0020AF32BD64}';
```

File

DSIntf

Description

This is constant DSIntf.CLSID_DSWriter.

64.5.7 DSIntf.DataTypeMap Constant

Pascal

```
DataTypeMap: array[0..MAXLOGFLDTYPES - 1] of TFieldType = ( ftUnknown, ftString, ftDate,
ftBlob, ftBoolean, ftSmallint, ftInteger, ftFloat, ftBCD, ftBytes, ftTime, ftDateTime, ftWord,
ftInteger, ftUnknown, ftVarBytes, ftUnknown, ftUnknown, ftLargeInt, ftLargeInt, ftADT,
ftArray, ftReference, ftDataSet, ftTimeStamp, ftFMTBcd, ftWideString);
```

C++

```
array[0..MAXLOGFLDTYPES - 1] of TFieldType DataTypeMap = ( ftUnknown, ftString, ftDate,
ftBlob, ftBoolean, ftSmallint, ftInteger, ftFloat, ftBCD, ftBytes, ftTime, ftDateTime, ftWord,
ftInteger, ftUnknown, ftVarBytes, ftUnknown, ftUnknown, ftLargeInt, ftLargeInt, ftADT,
ftArray, ftReference, ftDataSet, ftTimeStamp, ftFMTBcd, ftWideString);
```

File

DSIntf

Description

This is constant DSIntf.DataTypeMap.

64.5.8 DSIntf.DBERR_ABORTED Constant

Pascal

```
DBERR_ABORTED = ERRBASE_ALC + ERRCODE_ABORTED;
```

C++

```
DBERR_ABORTED = ERRBASE_ALC + ERRCODE_ABORTED;
```

File

DSIntf

Description

This is constant DSIntf.DBERR_ABORTED.

64.5.9 DSIntf.DBERR_BLOBNOTFETCHED Constant

Pascal

```
DBERR_BLOBNOTFETCHED = ERRBASE_ALC + ERRCODE_BLOBNOTFETCHED;
```

C++

```
DBERR_BLOBNOTFETCHED = ERRBASE_ALC + ERRCODE_BLOBNOTFETCHED;
```

File

DSIntf

Description

This is constant DSIntf.DBERR_BLOBNOTFETCHED.

64.5.10 DSIntf.DBERR_BOF Constant

Pascal

```
DBERR_BOF = $2201;
```

C++

```
DBERR_BOF = 0x2201;
```

File

DSIntf

Description

This is constant DSIntf.DBERR_BOF.

64.5.11 DSIntf.DBERR_CANCELLED Constant

Pascal

```
DBERR_CANCELLED = ERRBASE_ALC + ERRCODE_CANCELLED;
```

C++

```
DBERR_CANCELLED = ERRBASE_ALC + ERRCODE_CANCELLED;
```

File

DSIntf

Description

This is constant DSIntf.DBERR_CANCELLED.

64.5.12 DSIntf.DBERR_CANNOTAPPEND Constant

Pascal

```
DBERR_CANNOTAPPEND = ERRBASE_ALC + ERRCODE_CANNOTAPPEND;
```

C++

```
DBERR_CANNOTAPPEND = ERRBASE_ALC + ERRCODE_CANNOTAPPEND;
```

File

DSIntf

Description

This is constant DSIntf.DBERR_CANNOTAPPEND.

64.5.13 DSIntf.DBERR_DATAPACKETMISMATCH Constant

Pascal

```
DBERR_DATAPACKETMISMATCH = ERRBASE_ALC + ERRCODE_DATAPACKETMISMATCH;
```

C++

```
DBERR_DATAPACKETMISMATCH = ERRBASE_ALC + ERRCODE_DATAPACKETMISMATCH;
```

File

DSIntf

Description

This is constant DSIntf.DBERR_DATAPACKETMISMATCH.

64.5.14 DSIntf.DBERR_DELTAISEMPTY Constant

Pascal

```
DBERR_DELTAISEMPTY = ERRBASE_ALC + ERRCODE_DELTAISEMPTY;
```

C++

```
DBERR_DELTAISEMPTY = ERRBASE_ALC + ERRCODE_DELTAISEMPTY;
```

File

DSIntf

Description

This is constant DSIntf.DBERR_DELTAISEMPTY.

64.5.15 DSIntf.DBERR_DETAILSNOTFETCHED Constant

Pascal

```
DBERR_DETAILSNOTFETCHED = ERRBASE_ALC + ERRCODE_DETAILSNOTFETCHED;
```

C++

```
DBERR_DETAILSNOTFETCHED = ERRBASE_ALC + ERRCODE_DETAILSNOTFETCHED;
```

File

DSIntf

Description

This is constant DSIntf.DBERR_DETAILSNOTFETCHED.

64.5.16 DSIntf.DBERR_EOF Constant

Pascal

```
DBERR_EOF = $2202;
```

C++

```
DBERR_EOF = 0x2202;
```

File

DSIntf

Description

This is constant DSIntf.DBERR_EOF.

64.5.17 DSIntf.DBERR_FLYAWAY_WRONGORDER Constant

Pascal

```
DBERR_FLYAWAY_WRONGORDER = ERRBASE_ALC + ERRCODE_FLYAWAY_WRONGORDER;
```

C++

```
DBERR_FLYAWAY_WRONGORDER = ERRBASE_ALC + ERRCODE_FLYAWAY_WRONGORDER;
```

File

DSIntf

Description

This is constant DSIntf.DBERR_FLYAWAY_WRONGORDER.

64.5.18 DSIntf.DBERR_LINKFIELDSNOTUNIQUE Constant

Pascal

```
DBERR_LINKFIELDSNOTUNIQUE = ERRBASE_ALC + ERRCODE_LINKFIELDSNOTUNIQUE;
```

C++

```
DBERR_LINKFIELDSNOTUNIQUE = ERRBASE_ALC + ERRCODE_LINKFIELDSNOTUNIQUE;
```

File

DSIntf

Description

This is constant DSIntf.DBERR_LINKFIELDSNOTUNIQUE.

64.5.19 DSIntf.DBERR_NEWERVERSIONREQ Constant

Pascal

```
DBERR_NEWERVERSIONREQ = ERRBASE_ALC + ERRCODE_NEWERVERSIONREQ;
```

C++

```
DBERR_NEWERVERSIONREQ = ERRBASE_ALC + ERRCODE_NEWERVERSIONREQ;
```

File

DSIntf

Description

This is constant DSIntf.DBERR_NEWERVERSIONREQ.

64.5.20 DSIntf.DBERR_NOCASCADEDUPDATES Constant

Pascal

```
DBERR_NOCASCADEDUPDATES = ERRBASE_ALC + ERRCODE_NOCASCADEDUPDATES;
```

C++

```
DBERR_NOCASCADEDUPDATES = ERRBASE_ALC + ERRCODE_NOCASCADEDUPDATES;
```

File

DSIntf

Description

This is constant DSIntf.DBERR_NOCASCADEDUPDATES.

64.5.21 DSIntf.DBERR_NOMASTERRECORD Constant

Pascal

```
DBERR_NOMASTERRECORD = ERRBASE_ALC + ERRCODE_NOMASTERRECORD;
```

C++

```
DBERR_NOMASTERRECORD = ERRBASE_ALC + ERRCODE_NOMASTERRECORD;
```

File

DSIntf

Description

This is constant DSIntf.DBERR_NOMASTERRECORD.

64.5.22 DSIntf.DBERR_NOMETADATA Constant

Pascal

```
DBERR_NOMETADATA = ERRBASE_ALC + ERRCODE_NOMETADATA;
```

C++

```
DBERR_NOMETADATA = ERRBASE_ALC + ERRCODE_NOMETADATA;
```

File

DSIntf

Description

This is constant DSIntf.DBERR_NOMETADATA.

64.5.23 DSIntf.DBERR_NONE Constant

Pascal

```
DBERR_NONE = 0;
```

C++

```
DBERR_NONE = 0;
```

File

DSIntf

Description

This is constant DSIntf.DBERR_NONE.

64.5.24 DSIntf.DBERR_NOSUCHINDEX Constant

Pascal

```
DBERR_NOSUCHINDEX = $270D;
```

C++

```
DBERR_NOSUCHINDEX = 0x270D;
```

File

DSIntf

Description

This is constant DSIntf.DBERR_NOSUCHINDEX.

64.5.25 DSIntf.DBERR_NOTHINGTOUNDO Constant

Pascal

```
DBERR_NOTHINGTOUNDO = ERRBASE_ALC + ERRCODE_NOTHINGTOUNDO;
```

C++

```
DBERR_NOTHINGTOUNDO = ERRBASE_ALC + ERRCODE_NOTHINGTOUNDO;
```

File

DSIntf

Description

This is constant DSIntf.DBERR_NOTHINGTOUNDO.

64.5.26 DSIntf.dsArrayFldType Constant

Pascal

```
dsArrayFldType = $00800000;
```

C++

```
dsArrayFldType = 0x00800000;
```

File

DSIntf

Description

This is constant DSIntf.dsArrayFldType.

64.5.27 DSIntf.dsCASCADEDELETES Constant

Pascal

```
dsCASCADEDELETES = 1;
```

C++

```
dsCASCADEDELETES = 1;
```

File

DSIntf

Description

This is constant DSIntf.dsCASCADEDELETES.

64.5.28 DSIntf.dsCASCADEUPDATES Constant

Pascal

```
dsCASCADEUPDATES = 2;
```

C++

```
dsCASCADEUPDATES = 2;
```

File

DSIntf

Description

This is constant DSIntf.dsCASCADEUPDATES.

64.5.29 DSIntf.dscbrABORT Constant

Pascal

```
dscbrABORT = 2;
```

C++

```
dscbrABORT = 2;
```

File

DSIntf

Description

This is constant DSIntf.dscbrABORT.

64.5.30 DSIntf.dscbrAPPLY Constant

Pascal

```
dscbrAPPLY = 4;
```

C++

```
dscbrAPPLY = 4;
```

File

DSIntf

Description

This is constant DSIntf.dscbrAPPLY.

64.5.31 DSIntf.dscbrCANCEL Constant

Pascal

```
dscbrCANCEL = 5;
```

C++

```
dscbrCANCEL = 5;
```

File

DSIntf

Description

This is constant DSIntf.dscbrCANCEL.

64.5.32 DSIntf.dscbrCORRECT Constant

Pascal

```
dscbrCORRECT = 4;
```

C++

```
dscbrCORRECT = 4;
```

File

DSIntf

Description

This is constant DSIntf.dscbrCORRECT.

64.5.33 DSIntf.dscbrIGNORE Constant

Pascal

```
dscbrIGNORE = 5;
```

C++

```
dscbrIGNORE = 5;
```

File

DSIntf

Description

This is constant DSIntf.dscbrIGNORE.

64.5.34 DSIntf.dscbrMERGE Constant

Pascal

```
dscbrMERGE = 3;
```

C++

```
dscbrMERGE = 3;
```

File

DSIntf

Description

This is constant DSIntf.dscbrMERGE.

64.5.35 DSIntf.dscbrREFRESH Constant

Pascal

```
dscbrREFRESH = 6;
```

C++

```
dscbrREFRESH = 6;
```

File

DSIntf

Description

This is constant DSIntf.dscbrREFRESH.

64.5.36 DSIntf.dscbrSKIP Constant

Pascal

```
dscbrSKIP = 1;
```

C++

```
dscbrSKIP = 1;
```

File

DSIntf

Description

This is constant DSIntf.dscbrSKIP.

64.5.37 DSIntf.dsCompArrayFldType Constant

Pascal

```
dsCompArrayFldType = $02000000;
```

C++

```
dsCompArrayFldType = 0x02000000;
```

File

DSIntf

Description

This is constant DSIntf.dsCompArrayFldType.

64.5.38 DSIntf.dsDELAYEDBIT Constant

Pascal

```
dsDELAYEDBIT = $80000000;
```

C++

```
dsDELAYEDBIT = 0x80000000;
```

File

DSIntf

Description

This is constant DSIntf.dsDELAYEDBIT.

64.5.39 DSIntf.dsDetUpd Constant

Pascal

```
dsDetUpd = $0040;
```

C++

```
dsDetUpd = 0x0040;
```

File

DSIntf

Description

This is constant DSIntf.dsDetUpd.

64.5.40 DSIntf.dsEmbeddedFldType Constant

Pascal

```
dsEmbeddedFldType = $04000000;
```

C++

```
dsEmbeddedFldType = 0x04000000;
```

File

DSIntf

Description

This is constant DSIntf.dsEmbeddedFldType.

64.5.41 DSIntf.dsfldADT Constant

Pascal

```
dsfldADT = 12;
```

C++

```
dsfldADT = 12;
```

File

DSIntf

Description

This is constant DSIntf.dsfldADT.

64.5.42 DSIntf.dsfldARRAY Constant

Pascal

```
dsfldARRAY = 13;
```

C++

```
dsfldARRAY = 13;
```

File

DSIntf

Description

This is constant DSIntf.dsfldARRAY.

64.5.43 DSIntf.dsfldBCD Constant

Pascal

```
dsfldBCD = 5;
```

C++

```
dsfldBCD = 5;
```

File

DSIntf

Description

This is constant DSIntf.dsfldBCD.

64.5.44 DSIntf.dsfldBOOL Constant

Pascal

```
dsfldBOOL = 3;
```

C++

```
dsfldBOOL = 3;
```

File

DSIntf

Description

This is constant DSIntf.dsfldBOOL.

64.5.45 DSIntf.dsfldBYTES Constant

Pascal

```
dsfldBYTES = 11;
```

C++

```
dsfldBYTES = 11;
```

File

DSIntf

Description

This is constant DSIntf.dsfldBYTES.

64.5.46 DSIntf.dsfldDATE Constant

Pascal

```
dsfldDATE = 6;
```

C++

```
dsfldDATE = 6;
```

File

DSIntf

Description

This is constant DSIntf.dsfldDATE.

64.5.47 DSIntf.dsfldDATETIME Constant

Pascal

```
dsfldDATETIME = 17;
```

C++

```
dsfldDATETIME = 17;
```

File

DSIntf

Description

This is constant DSIntf.dsfldDATETIME.

64.5.48 DSIntf.dsfldEMBEDDEDTBL Constant

Pascal

```
dsfldEMBEDDEDTBL = 14;
```

C++

```
dsfldEMBEDDEDTBL = 14;
```

File

DSIntf

Description

This is constant DSIntf.dsfldEMBEDDEDTBL.

64.5.49 DSIntf.dsfldFLOATIEEE Constant

Pascal

```
dsfldFLOATIEEE = 4;
```

C++

```
dsfldFLOATIEEE = 4;
```

File

DSIntf

Description

This is constant DSIntf.dsfldFLOATIEEE.

64.5.50 DSIntf.dsfldFMTBCD Constant

Pascal

```
dsfldFMTBCD = 18;
```

C++

```
dsfldFMTBCD = 18;
```

File

DSIntf

Description

This is constant DSIntf.dsfldFMTBCD.

64.5.51 DSIntf.dsfldINT Constant

Pascal

```
dsfldINT = 1;
```

C++

```
dsfldINT = 1;
```

File

DSIntf

Description

This is constant DSIntf.dsfldINT.

64.5.52 DSIntf.dsfldREF Constant

Pascal

```
dsfldREF = 15;
```

C++

```
dsfldREF = 15;
```

File

DSIntf

Description

This is constant DSIntf.dsfldREF.

64.5.53 DSIntf.dsfldTIME Constant

Pascal

```
dsfldTIME = 7;
```

C++

```
dsfldTIME = 7;
```

File

DSIntf

Description

This is constant DSIntf.dsfldTIME.

64.5.54 DSIntf.dsfldTIMESTAMP Constant

Pascal

```
dsfldTIMESTAMP = 8;
```

C++

```
dsfldTIMESTAMP = 8;
```

File

DSIntf

Description

This is constant DSIntf.dsfldTIMESTAMP.

64.5.55 DSIntf.dsfldUINT Constant

Pascal

```
dsfldUINT = 2;
```

C++

```
dsfldUINT = 2;
```

File

DSIntf

Description

This is constant DSIntf.dsfldUINT.

64.5.56 DSIntf.dsfldUNICODE Constant

Pascal

```
dsfldUNICODE = 10;
```

C++

```
dsfldUNICODE = 10;
```

File

DSIntf

Description

This is constant DSIntf.dsfldUNICODE.

64.5.57 DSIntf.dsfldUNKNOWN Constant

Pascal

```
dsfldUNKNOWN = 0;
```

C++

```
dsfldUNKNOWN = 0;
```

File

DSIntf

Description

This is constant DSIntf.dsfldUNKNOWN.

64.5.58 DSIntf.dsfldZSTRING Constant

Pascal

```
dsfldZSTRING = 9;
```

C++

```
dsfldZSTRING = 9;
```

File

DSIntf

Description

This is constant DSIntf.dsfldZSTRING.

64.5.59 DSIntf.dsIncInDelta Constant

Pascal

```
dsIncInDelta = $80000000;
```

C++

```
dsIncInDelta = 0x80000000;
```

File

DSIntf

Description

This is constant DSIntf.dsIncInDelta.

64.5.60 DSIntf.dsIsNotVisible Constant

Pascal

```
dsIsNotVisible = dsRecDeleted or dsRecOrg or dsUnused;
```

C++

```
dsIsNotVisible = dsRecDeleted or dsRecOrg or dsUnused;
```

File

DSIntf

Description

This is constant DSIntf.dsIsNotVisible.

64.5.61 DSIntf.dsIsVisible Constant

Pascal

```
dsIsVisible = not (dsRecDeleted or dsRecOrg or dsUnused);
```

C++

```
dsIsVisible = not (dsRecDeleted or dsRecOrg or dsUnused);
```

File

DSIntf

Description

This is constant DSIntf.dsIsVisible.

64.5.62 DSIntf.dskeyCASEINSENSITIVE Constant

Pascal

```
dskeyCASEINSENSITIVE = $4000;
```

C++

```
dskeyCASEINSENSITIVE = 0x4000;
```

File

DSIntf

Description

This is constant DSIntf.dskeyCASEINSENSITIVE.

64.5.63 DSIntf.dskeyDESCENDING Constant

Pascal

```
dskeyDESCENDING = $8000;
```

C++

```
dskeyDESCENDING = 0x8000;
```

File

DSIntf

Description

This is constant DSIntf.dskeyDESCENDING.

64.5.64 DSIntf.dsPseudoFldType Constant

Pascal

```
dsPseudoFldType = $01000000;
```

C++

```
dsPseudoFldType = 0x01000000;
```

File

DSIntf

Description

This is constant DSIntf.dsPseudoFldType.

64.5.65 DSIntf.dsRecDeleted Constant

Pascal

```
dsRecDeleted = $0002;
```

C++

```
dsRecDeleted = 0x0002;
```

File

DSIntf

Description

This is constant DSIntf.dsRecDeleted.

64.5.66 DSIntf.dsRecModified Constant

Pascal

```
dsRecModified = $0008;
```

C++

```
dsRecModified = 0x0008;
```

File

DSIntf

Description

This is constant DSIntf.dsRecModified.

64.5.67 DSIntf.dsRecNew Constant

Pascal

```
dsRecNew = $0004;
```

C++

```
dsRecNew = 0x0004;
```

File

DSIntf

Description

This is constant DSIntf.dsRecNew.

64.5.68 DSIntf.dsRecOrg Constant

Pascal

```
dsRecOrg = $0001;
```

C++

```
dsRecOrg = 0x0001;
```

File

DSIntf

Description

This is constant DSIntf.dsRecOrg.

64.5.69 DSIntf.dsRecUnmodified Constant

Pascal

```
dsRecUnmodified = $0000;
```

C++

```
dsRecUnmodified = 0x0000;
```

File

DSIntf

Description

This is constant DSIntf.dsRecUnmodified.

64.5.70 DSIntf.dsSizeBitsLen Constant

Pascal

```
dsSizeBitsLen = 16;
```

C++

```
dsSizeBitsLen = 16;
```

File

DSIntf

Description

This is constant DSIntf.dsSizeBitsLen.

64.5.71 DSIntf.dsSizeBitsMask Constant

Pascal

```
dsSizeBitsMask = $0000FFFF;
```

C++

```
dsSizeBitsMask = 0x0000FFFF;
```

File

DSIntf

Description

This is constant DSIntf.dsSizeBitsMask.

64.5.72 DSIntf.dsTypeBitsMask Constant

Pascal

```
dsTypeBitsMask = $003F0000;
```

C++

```
dsTypeBitsMask = 0x003F0000;
```

File

DSIntf

Description

This is constant DSIntf.dsTypeBitsMask.

64.5.73 DSIntf.dsUnused Constant

Pascal

```
dsUnused = $0020;
```

C++

```
dsUnused = 0x0020;
```

File

DSIntf

Description

This is constant DSIntf.dsUnused.

64.5.74 DSIntf.dsVaryingFldType Constant

Pascal

```
dsVaryingFldType = $00400000;
```

C++

```
dsVaryingFldType = 0x00400000;
```

File

DSIntf

Description

This is constant DSIntf.dsVaryingFldType.

64.5.75 DSIntf.ERRBASE_ALC Constant

Pascal

```
ERRBASE_ALC = $4000;
```

C++

```
ERRBASE_ALC = 0x4000;
```

File

DSIntf

Description

This is constant DSIntf.ERRBASE_ALC.

64.5.76 DSIntf.ERRCAT_ALC Constant

Pascal

```
ERRCAT_ALC = $40;
```

C++

```
ERRCAT_ALC = 0x40;
```

File

DSIntf

Description

This is constant DSIntf.ERRCAT_ALC.

64.5.77 DSIntf.ERRCODE_ABORTED Constant

Pascal

```
ERRCODE_ABORTED = 6;
```

C++

```
ERRCODE_ABORTED = 6;
```

File

DSIntf

Description

This is constant DSIntf.ERRCODE_ABORTED.

64.5.78 DSIntf.ERRCODE_BLOBNOTFETCHED Constant

Pascal

```
ERRCODE_BLOBNOTFETCHED = 9;
```

C++

```
ERRCODE_BLOBNOTFETCHED = 9;
```

File

DSIntf

Description

This is constant DSIntf.ERRCODE_BLOBNOTFETCHED.

64.5.79 DSIntf.ERRCODE_CANCELLED Constant

Pascal

```
ERRCODE_CANCELLED = 7;
```

C++

```
ERRCODE_CANCELLED = 7;
```

File

DSIntf

Description

This is constant DSIntf.ERRCODE_CANCELLED.

64.5.80 DSIntf.ERRCODE_CANNOTAPPEND Constant

Pascal

```
ERRCODE_CANNOTAPPEND = 4;
```

C++

```
ERRCODE_CANNOTAPPEND = 4;
```

File

DSIntf

Description

This is constant DSIntf.ERRCODE_CANNOTAPPEND.

64.5.81 DSIntf.ERRCODE_DATAPACKETMISMATCH Constant

Pascal

```
ERRCODE_DATAPACKETMISMATCH = 5;
```

C++

```
ERRCODE_DATAPACKETMISMATCH = 5;
```

File

DSIntf

Description

This is constant DSIntf.ERRCODE_DATAPACKETMISMATCH.

64.5.82 DSIntf.ERRCODE_DELTAISEMPTY Constant

Pascal

```
ERRCODE_DELTAISEMPTY = 1;
```

C++

```
ERRCODE_DELTAISEMPTY = 1;
```

File

DSIntf

Description

This is constant DSIntf.ERRCODE_DELTAISEMPTY.

64.5.83 DSIntf.ERRCODE_DETAILSNOTFETCHED Constant

Pascal

```
ERRCODE_DETAILSNOTFETCHED = 10;
```

C++

```
ERRCODE_DETAILSNOTFETCHED = 10;
```

File

DSIntf

Description

This is constant DSIntf.ERRCODE_DETAILSNOTFETCHED.

64.5.84 DSIntf.ERRCODE_FLYAWAY_WRONGORDER Constant

Pascal

```
ERRCODE_FLYAWAY_WRONGORDER = 13;
```

C++

```
ERRCODE_FLYAWAY_WRONGORDER = 13;
```

File

DSIntf

Description

This is constant DSIntf.ERRCODE_FLYAWAY_WRONGORDER.

64.5.85 DSIntf.ERRCODE_LINKFIELDSNOTUNIQUE Constant

Pascal

```
ERRCODE_LINKFIELDSNOTUNIQUE = 12;
```

C++

```
ERRCODE_LINKFIELDSNOTUNIQUE = 12;
```

File

DSIntf

Description

This is constant DSIntf.ERRCODE_LINKFIELDSNOTUNIQUE.

64.5.86 DSIntf.ERRCODE_NEWERVERSIONREQ Constant

Pascal

```
ERRCODE_NEWERVERSIONREQ = 8;
```

C++

```
ERRCODE_NEWERVERSIONREQ = 8;
```

File

DSIntf

Description

This is constant DSIntf.ERRCODE_NEWERVERSIONREQ.

64.5.87 DSIntf.ERRCODE_NOCASCADEDUPDATES Constant

Pascal

```
ERRCODE_NOCASCADEDUPDATES = 14;
```

C++

```
ERRCODE_NOCASCADEDUPDATES = 14;
```

File

DSIntf

Description

This is constant DSIntf.ERRCODE_NOCASCADEDUPDATES.

64.5.88 DSIntf.ERRCODE_NOMASTERRECORD Constant

Pascal

```
ERRCODE_NOMASTERRECORD = 11;
```

C++

```
ERRCODE_NOMASTERRECORD = 11;
```

File

DSIntf

Description

This is constant DSIntf.ERRCODE_NOMASTERRECORD.

64.5.89 DSIntf.ERRCODE_NOMETADATA Constant

Pascal

```
ERRCODE_NOMETADATA = 3;
```

C++

```
ERRCODE_NOMETADATA = 3;
```

File

DSIntf

Description

This is constant DSIntf.ERRCODE_NOMETADATA.

64.5.90 DSIntf.ERRCODE_NOTHINGTOUNDO Constant

Pascal

```
ERRCODE_NOTHINGTOUNDO = 2;
```

C++

```
ERRCODE_NOTHINGTOUNDO = 2;
```

File

DSIntf

Description

This is constant DSIntf.ERRCODE_NOTHINGTOUNDO.

64.5.91 DSIntf.FieldTypeMap Constant

Pascal

```
FieldTypeMap: TFieldMap = ( fldUNKNOWN, fldZSTRING, fldINT16, fldINT32, fldUINT16, fldBOOL,
fldFLOAT, fldFLOAT, fldBCD, fldDATE, fldTIME, fldTIMESTAMP, fldBYTES, fldVARBYTES, fldINT32,
fldBLOB, fldBLOB, fldBLOB, fldBLOB, fldBLOB, fldBLOB, fldBLOB, fldCURSOR, fldZSTRING,
fldWIDESTRING, fldINT64, fldADT, fldArray, fldREF, fldTABLE, fldBLOB, fldBLOB, fldUNKNOWN,
fldUNKNOWN, fldUNKNOWN, fldZSTRING, fldDATETIME, fldFMTBCD, fldWIDESTRING, fldBLOB,
fldDATETIME, fldZSTRING);
```

C++

```
TFieldMap FieldTypeMap = ( fldUNKNOWN, fldZSTRING, fldINT16, fldINT32, fldUINT16, fldBOOL,
fldFLOAT, fldFLOAT, fldBCD, fldDATE, fldTIME, fldTIMESTAMP, fldBYTES, fldVARBYTES, fldINT32,
fldBLOB, fldBLOB, fldBLOB, fldBLOB, fldBLOB, fldBLOB, fldBLOB, fldCURSOR, fldZSTRING,
fldWIDESTRING, fldINT64, fldADT, fldArray, fldREF, fldTABLE, fldBLOB, fldBLOB, fldUNKNOWN,
fldUNKNOWN, fldUNKNOWN, fldZSTRING, fldDATETIME, fldFMTBCD, fldWIDESTRING, fldBLOB,
fldDATETIME, fldZSTRING);
```

File

DSIntf

Description

This is constant DSIntf.FieldTypeMap.

64.5.92 DSIntf.fldADT Constant

Pascal

```
fldADT = 20;
```

C++

```
fldADT = 20;
```

File

DSIntf

Description

This is constant DSIntf.fldADT.

64.5.93 DSIntf.fldARRAY Constant

Pascal

```
fldARRAY = 21;
```

C++

```
fldARRAY = 21;
```

File

DSIntf

Description

This is constant DSIntf.fldARRAY.

64.5.94 DSIntf.fldAttrHIDDEN Constant

Pascal

```
fldAttrHIDDEN = $0001;
```

C++

```
fldAttrHIDDEN = 0x0001;
```

File

DSIntf

Description

This is constant DSIntf.fldAttrHIDDEN.

64.5.95 DSIntf.fldAttrLINK Constant

Pascal

```
fldAttrLINK = $0008;
```

C++

```
fldAttrLINK = 0x0008;
```

File

DSIntf

Description

This is constant DSIntf.fldAttrLINK.

64.5.96 DSIntf.fldAttrREADONLY Constant

Pascal

```
fldAttrREADONLY = $0002;
```

C++

```
fldAttrREADONLY = 0x0002;
```

File

DSIntf

Description

This is constant DSIntf.fldAttrREADONLY.

64.5.97 DSIntf.fldAttrREQUIRED Constant

Pascal

```
fldAttrREQUIRED = $0004;
```

C++

```
fldAttrREQUIRED = 0x0004;
```

File

DSIntf

Description

This is constant DSIntf.fldAttrREQUIRED.

64.5.98 DSIntf.fldBCD Constant

Pascal

```
fldBCD = 8;
```

C++

```
fldBCD = 8;
```

File

DSIntf

Description

This is constant DSIntf.fldBCD.

64.5.99 DSIntf.fldBLOB Constant

Pascal

```
fldBLOB = 3;
```

C++

```
fldBLOB = 3;
```

File

DSIntf

Description

This is constant DSIntf.fldBLOB.

64.5.100 DSIntf.fldBOOL Constant

Pascal

```
fldBOOL = 4;
```

C++

```
fldBOOL = 4;
```

File

DSIntf

Description

This is constant DSIntf.fldBOOL.

64.5.101 DSIntf.fldBYTES Constant

Pascal

```
fldBYTES = 9;
```

C++

```
fldBYTES = 9;
```

File

DSIntf

Description

This is constant DSIntf.fldBYTES.

64.5.102 DSIntf.fldCURSOR Constant

Pascal

```
fldCURSOR = 17;
```

C++

```
fldCURSOR = 17;
```

File

DSIntf

Description

This is constant DSIntf.fldCURSOR.

64.5.103 DSIntf.fldDATE Constant

Pascal

```
fldDATE = 2;
```

C++

```
fldDATE = 2;
```

File

DSIntf

Description

This is constant DSIntf.fldDATE.

64.5.104 DSIntf.fldDATETIME Constant

Pascal

```
fldDATETIME = 24;
```

C++

```
fldDATETIME = 24;
```

File

DSIntf

Description

This is constant DSIntf.fldDATETIME.

64.5.105 DSIntf.fldFLOAT Constant

Pascal

```
fldFLOAT = 7;
```

C++

```
fldFLOAT = 7;
```

File

DSIntf

Description

This is constant DSIntf.fldFLOAT.

64.5.106 DSIntf.fldFLOATIEEE Constant

Pascal

```
fldFLOATIEEE = 14;
```

C++

```
fldFLOATIEEE = 14;
```

File

DSIntf

Description

This is constant DSIntf.fldFLOATIEEE.

64.5.107 DSIntf.fldFMTBCD Constant

Pascal

```
fldFMTBCD = 25;
```

C++

```
fldFMTBCD = 25;
```

File

DSIntf

Description

This is constant DSIntf.fldFMTBCD.

64.5.108 DSIntf.fldINT16 Constant

Pascal

```
fldINT16 = 5;
```

C++

```
fldINT16 = 5;
```

File

DSIntf

Description

This is constant DSIntf.fldINT16.

64.5.109 DSIntf.fldINT32 Constant

Pascal

```
fldINT32 = 6;
```

C++

```
fldINT32 = 6;
```

File

DSIntf

Description

This is constant DSIntf.fldINT32.

64.5.110 DSIntf.fldINT64 Constant

Pascal

```
fldINT64 = 18;
```

C++

```
fldINT64 = 18;
```

File

DSIntf

Description

This is constant DSIntf.fldINT64.

64.5.111 DSIntf.fldLOCKINFO Constant

Pascal

```
fldLOCKINFO = 16;
```

C++

```
fldLOCKINFO = 16;
```

File

DSIntf

Description

This is constant DSIntf.fldLOCKINFO.

64.5.112 DSIntf.fldREF Constant

Pascal

```
fldREF = 22;
```

C++

```
fldREF = 22;
```

File

DSIntf

Description

This is constant DSIntf.fldREF.

64.5.113 DSIntf.fldstACCOLEOBJ Constant

Pascal

```
fldstACCOLEOBJ = 30;
```

C++

```
fldstACCOLEOBJ = 30;
```

File

DSIntf

Description

This is constant DSIntf.fldstACCOLEOBJ.

64.5.114 DSIntf.fldstAUTOINC Constant

Pascal

```
fldstAUTOINC = 29;
```

C++

```
fldstAUTOINC = 29;
```

File

DSIntf

Description

This is constant DSIntf.fldstAUTOINC.

64.5.115 DSIntf.fldstBFILE Constant

Pascal

```
fldstBFILE = 36;
```

C++

```
fldstBFILE = 36;
```

File

DSIntf

Description

This is constant DSIntf.fldstBFILE.

64.5.116 DSIntf.fldstBINARY Constant

Pascal

```
fldstBINARY = 23;
```

C++

```
fldstBINARY = 23;
```

File

DSIntf

Description

This is constant DSIntf.fldstBINARY.

64.5.117 DSIntf.fldstDBSOLEOBJ Constant

Pascal

```
fldstDBSOLEOBJ = 27;
```

C++

```
fldstDBSOLEOBJ = 27;
```

File

DSIntf

Description

This is constant DSIntf.fldstDBSOLEOBJ.

64.5.118 DSIntf.fldstFIXED Constant

Pascal

```
fldstFIXED = 31;
```

C++

```
fldstFIXED = 31;
```

File

DSIntf

Description

This is constant DSIntf.fldstFIXED.

64.5.119 DSIntf.fldstFMTMEMO Constant

Pascal

```
fldstFMTMEMO = 24;
```

C++

```
fldstFMTMEMO = 24;
```

File

DSIntf

Description

This is constant DSIntf.fldstFMTMEMO.

64.5.120 DSIntf.fldstGRAPHIC Constant

Pascal

```
fldstGRAPHIC = 26;
```

C++

```
fldstGRAPHIC = 26;
```

File

DSIntf

Description

This is constant DSIntf.fldstGRAPHIC.

64.5.121 DSIntf.fldstGUID Constant

Pascal

```
fldstGUID = 38;
```

C++

```
fldstGUID = 38;
```

File

DSIntf

Description

This is constant DSIntf.fldstGUID.

64.5.122 DSIntf.fldstHBINARY Constant

Pascal

```
fldstHBINARY = 34;
```

C++

```
fldstHBINARY = 34;
```

File

DSIntf

Description

This is constant DSIntf.fldstHBINARY.

64.5.123 DSIntf.fldstHMEMO Constant

Pascal

```
fldstHMEMO = 33;
```

C++

```
fldstHMEMO = 33;
```

File

DSIntf

Description

This is constant DSIntf.fldstHMEMO.

64.5.124 DSIntf.fldstMEMO Constant

Pascal

```
fldstMEMO = 22;
```

C++

```
fldstMEMO = 22;
```

File

DSIntf

Description

This is constant DSIntf.fldstMEMO.

64.5.125 DSIntf.fldstMONEY Constant

Pascal

```
fldstMONEY = 21;
```

C++

```
fldstMONEY = 21;
```

File

DSIntf

Description

This is constant DSIntf.fldstMONEY.

64.5.126 DSIntf.fldstOLEOBJ Constant

Pascal

```
fldstOLEOBJ = 25;
```

C++

```
fldstOLEOBJ = 25;
```

File

DSIntf

Description

This is constant DSIntf.fldstOLEOBJ.

64.5.127 DSIntf.fldstORAINTERVAL Constant

Pascal

```
fldstORAINTERVAL = 40;
```

C++

```
fldstORAINTERVAL = 40;
```

File

DSIntf

Description

This is constant DSIntf.fldstORAINTERVAL.

64.5.128 DSIntf.fldstORATIMESTAMP Constant

Pascal

```
fldstORATIMESTAMP = 39;
```

C++

```
fldstORATIMESTAMP = 39;
```

File

DSIntf

Description

This is constant DSIntf.fldstORATIMESTAMP.

64.5.129 DSIntf.fldstPASSWORD Constant

Pascal

```
fldstPASSWORD = 1;
```

C++

```
fldstPASSWORD = 1;
```

File

DSIntf

Description

This is constant DSIntf.fldstPASSWORD.

64.5.130 DSIntf.fldstReference Constant

Pascal

```
fldstReference = 70;
```

C++

```
fldstReference = 70;
```

File

DSIntf

Description

This is constant DSIntf.fldstReference.

64.5.131 DSIntf.fldstTYPEDBINARY Constant

Pascal

```
fldstTYPEDBINARY = 28;
```

C++

```
fldstTYPEDBINARY = 28;
```

File

DSIntf

Description

This is constant DSIntf.fldstTYPEDBINARY.

64.5.132 DSIntf.fldstWIDEMEMO Constant

Pascal

```
fldstWIDEMEMO = 32;
```

C++

```
fldstWIDEMEMO = 32;
```

File

DSIntf

Description

This is constant DSIntf.fldstWIDEMEMO.

64.5.133 DSIntf.FldSubTypeMap Constant

Pascal

```
FldSubTypeMap: array[TFieldType] of Word = ( 0, 0, 0, 0, 0, 0, 0, fldstMONEY, 0, 0, 0, 0, 0,
0, fldstAUTOINC, fldstBINARY, fldstMEMO, fldstGRAPHIC, fldstFMTMEMO, fldstOLEOBJ,
fldstDBSOLEOBJ, fldstTYPEDBINARY, 0, fldstFIXED, 0, 0, 0, 0, 0, 0, fldstHBINARY, fldstHMEMO,
0, 0, 0, fldstGUID, fldDATETIME, 0, fldstFIXED, fldstWIDEMEMO, fldstORATIMESTAMP,
fldstORAINTERVAL);
```

C++

```
array[TFieldType] of Word FldSubTypeMap = ( 0, 0, 0, 0, 0, 0, 0, fldstMONEY, 0, 0, 0, 0, 0, 0,
fldstAUTOINC, fldstBINARY, fldstMEMO, fldstGRAPHIC, fldstFMTMEMO, fldstOLEOBJ, fldstDBSOLEOBJ,
fldstTYPEDBINARY, 0, fldstFIXED, 0, 0, 0, 0, 0, 0, fldstHBINARY, fldstHMEMO, 0, 0, 0,
fldstGUID, fldDATETIME, 0, fldstFIXED, fldstWIDEMEMO, fldstORATIMESTAMP, fldstORAINTERVAL);
```

File

DSIntf

Description

This is constant DSIntf.FldSubTypeMap.

64.5.134 DSIntf.fldTABLE Constant

Pascal

```
fldTABLE = 23;
```

C++

```
fldTABLE = 23;
```

File

DSIntf

Description

This is constant DSIntf.fldTABLE.

64.5.135 DSIntf.fldTIME Constant

Pascal

```
fldTIME = 10;
```

C++

```
fldTIME = 10;
```

File

DSIntf

Description

This is constant DSIntf.fldTIME.

64.5.136 DSIntf.fldTIMESTAMP Constant

Pascal

```
fldTIMESTAMP = 11;
```

C++

```
fldTIMESTAMP = 11;
```

File

DSIntf

Description

This is constant DSIntf.fldTIMESTAMP.

64.5.137 DSIntf.fldUINT16 Constant

Pascal

```
fldUINT16 = 12;
```

C++

```
fldUINT16 = 12;
```

File

DSIntf

Description

This is constant DSIntf.fldUINT16.

64.5.138 DSIntf.fldUINT32 Constant

Pascal

```
fldUINT32 = 13;
```

C++

```
fldUINT32 = 13;
```

File

DSIntf

Description

This is constant DSIntf.fldUINT32.

64.5.139 DSIntf.fldUINT64 Constant

Pascal

```
fldUINT64 = 19;
```

C++

```
fldUINT64 = 19;
```

File

DSIntf

Description

This is constant DSIntf.fldUINT64.

64.5.140 DSIntf.fldUNICODE Constant

Pascal

```
fldUNICODE = $1007;
```

C++

```
fldUNICODE = 0x1007;
```

File

DSIntf

Description

This is constant DSIntf.fldUNICODE.

64.5.141 DSIntf.fldUNKNOWN Constant

Pascal

```
fldUNKNOWN = 0;
```

C++

```
fldUNKNOWN = 0;
```

File

DSIntf

Description

This is constant DSIntf.fldUNKNOWN.

64.5.142 DSIntf.fldVARBYTES Constant

Pascal

```
fldVARBYTES = 15;
```

C++

```
fldVARBYTES = 15;
```

File

DSIntf

Description

This is constant DSIntf.fldVARBYTES.

64.5.143 DSIntf.fldWIDESTRING Constant

Pascal

```
fldWIDESTRING = 26;
```

C++

```
fldWIDESTRING = 26;
```

File

DSIntf

Description

This is constant DSIntf.fldWIDESTRING.

64.5.144 DSIntf.fldZSTRING Constant

Pascal

```
fldZSTRING = 1;
```

C++

```
fldZSTRING = 1;
```

File

DSIntf

Description

This is constant DSIntf.fldZSTRING.

64.5.145 DSIntf.MAXKEYFIELDS Constant

Pascal

```
MAXKEYFIELDS = 16;
```

C++

```
MAXKEYFIELDS = 16;
```

File

DSIntf

Description

This is constant DSIntf.MAXKEYFIELDS.

64.5.146 DSIntf.MAXLOGFLDTYPES Constant

Pascal

```
MAXLOGFLDTYPES = 27;
```

C++

```
MAXLOGFLDTYPES = 27;
```

File

DSIntf

Description

This is constant DSIntf.MAXLOGFLDTYPES.

64.5.147 DSIntf.mdALLOWLINKCHANGE Constant

Pascal

```
mdALLOWLINKCHANGE = $0010;
```

C++

```
mdALLOWLINKCHANGE = 0x0010;
```

File

DSIntf

Description

This is constant DSIntf.mdALLOWLINKCHANGE.

64.5.148 DSIntf.mdCASCADEDEL Constant

Pascal

```
mdCASCADEDEL = $0004;
```

C++

```
mdCASCADEDEL = 0x0004;
```

File

DSIntf

Description

This is constant DSIntf.mdCASCADEDEL.

64.5.149 DSIntf.mdCASCADEMOD Constant

Pascal

```
mdCASCADEMOD = $0008;
```

C++

```
mdCASCADEMOD = 0x0008;
```

File

DSIntf

Description

This is constant DSIntf.mdCASCADEMOD.

64.5.150 DSIntf.PACKETVERSION_1 Constant

Pascal

```
PACKETVERSION_1 = 1;
```

C++

```
PACKETVERSION_1 = 1;
```

File

DSIntf

Description

This is constant DSIntf.PACKETVERSION_1.

64.5.151 DSIntf.PACKETVERSION_2 Constant

Pascal

```
PACKETVERSION_2 = 2;
```

C++

```
PACKETVERSION_2 = 2;
```

File

DSIntf

Description

This is constant DSIntf.PACKETVERSION_2.

64.5.152 DSIntf.PACKETVERSION_3 Constant

Pascal

```
PACKETVERSION_3 = 3;
```

C++

```
PACKETVERSION_3 = 3;
```

File

DSIntf

Description

This is constant DSIntf.PACKETVERSION_3.

64.5.153 DSIntf.szAUTOINCVALUE Constant

Pascal

```
szAUTOINCVALUE = 'AUTOINCVALUE';
```

C++

```
szAUTOINCVALUE = 'AUTOINCVALUE';
```

File

DSIntf

Description

This is constant DSIntf.szAUTOINCVALUE.

64.5.154 DSIntf.szBDEDEFCL Constant

Pascal

```
szBDEDEFCL = 'BDEDEFAULT_CL';
```

C++

```
szBDEDEFCL = 'BDEDEFAULT_CL';
```

File

DSIntf

Description

This is constant DSIntf.szBDEDEFCL.

64.5.155 DSIntf.szBDEDEFX Constant

Pascal

```
szBDEDEFX = 'BDEDEFAULT_X';
```

C++

```
szBDEDEFX = 'BDEDEFAULT_X';
```

File

DSIntf

Description

This is constant DSIntf.szBDEDEFX.

64.5.156 DSIntf.szBDEDOMCL Constant

Pascal

```
szBDEDOMCL = 'BDEDOMAIN_CL';
```

C++

```
szBDEDOMCL = 'BDEDOMAIN_CL';
```

File

DSIntf

Description

This is constant DSIntf.szBDEDOMCL.

64.5.157 DSIntf.szBDEDOMX Constant

Pascal

```
szBDEDOMX = 'BDEDOMAIN_X';
```

C++

```
szBDEDOMX = 'BDEDOMAIN_X';
```

File

DSIntf

Description

This is constant DSIntf.szBDEDOMX.

64.5.158 DSIntf.szBDERECCL Constant

Pascal

```
szBDERECCL = 'BDERECORD_CL';
```

C++

```
szBDERECCL = 'BDERECORD_CL';
```

File

DSIntf

Description

This is constant DSIntf.szBDERECCL.

64.5.159 DSIntf.szBDERECX Constant

Pascal

```
szBDERECX = 'BDERECORD_X';
```

C++

```
szBDERECX = 'BDERECORD_X';
```

File

DSIntf

Description

This is constant DSIntf.szBDERECX.

64.5.160 DSIntf.szCHANGE_LOG Constant

Pascal

```
szCHANGE_LOG = 'CHANGE_LOG';
```

C++

```
szCHANGE_LOG = 'CHANGE_LOG';
```

File

DSIntf

Description

This is constant DSIntf.szCHANGE_LOG.

64.5.161 DSIntf.szCHANGEINDEX Constant

Pascal

```
szCHANGEINDEX = 'CHANGEINDEX';
```

C++

```
szCHANGEINDEX = 'CHANGEINDEX';
```

File

DSIntf

Description

This is constant DSIntf.szCHANGEINDEX.

64.5.162 DSIntf.szCONSTRAINTS Constant

Pascal

```
szCONSTRAINTS = 'CONSTRAINTS';
```

C++

```
szCONSTRAINTS = 'CONSTRAINTS';
```

File

DSIntf

Description

This is constant DSIntf.szCONSTRAINTS.

64.5.163 DSIntf.szDATASET_CONTEXT Constant

Pascal

```
szDATASET_CONTEXT = 'DATASET_CONTEXT';
```

C++

```
szDATASET_CONTEXT = 'DATASET_CONTEXT';
```

File

DSIntf

Description

This is constant DSIntf.szDATASET_CONTEXT.

64.5.164 DSIntf.szDATASET_DELTA Constant

Pascal

```
szDATASET_DELTA = 'DATASET_DELTA';
```

C++

```
szDATASET_DELTA = 'DATASET_DELTA';
```

File

DSIntf

Description

This is constant DSIntf.szDATASET_DELTA.

64.5.165 DSIntf.szDECIMALS Constant

Pascal

```
szDECIMALS = 'DECIMALS';
```

C++

```
szDECIMALS = 'DECIMALS';
```

File

DSIntf

Description

This is constant DSIntf.szDECIMALS.

64.5.166 DSIntf.szDEFAULT_ORDER Constant

Pascal

```
szDEFAULT_ORDER = 'DEFAULT_ORDER';
```

C++

```
szDEFAULT_ORDER = 'DEFAULT_ORDER';
```

File

DSIntf

Description

This is constant DSIntf.szDEFAULT_ORDER.

64.5.167 DSIntf.szDISABLE_DELETES Constant

Pascal

```
szDISABLE_DELETES = 'DISABLE_DELETES';
```

C++

```
szDISABLE_DELETES = 'DISABLE_DELETES';
```

File

DSIntf

Description

This is constant DSIntf.szDISABLE_DELETES.

64.5.168 DSIntf.szDISABLE_EDITS Constant

Pascal

```
szDISABLE_EDITS = 'DISABLE_EDITS';
```

C++

```
szDISABLE_EDITS = 'DISABLE_EDITS';
```

File

DSIntf

Description

This is constant DSIntf.szDISABLE_EDITS.

64.5.169 DSIntf.szDISABLE_INSERTS Constant

Pascal

```
szDISABLE_INSERTS = 'DISABLE_INSERTS';
```

C++

```
szDISABLE_INSERTS = 'DISABLE_INSERTS';
```

File

DSIntf

Description

This is constant DSIntf.szDISABLE_INSERTS.

64.5.170 DSIntf.szELEMENTS Constant

Pascal

```
szELEMENTS = 'ELEMENTS';
```

C++

```
szELEMENTS = 'ELEMENTS';
```

File

DSIntf

Description

This is constant DSIntf.szELEMENTS.

64.5.171 DSIntf.szFIELDNAME Constant

Pascal

```
szFIELDNAME = 'FIELDNAME';
```

C++

```
szFIELDNAME = 'FIELDNAME';
```

File

DSIntf

Description

This is constant DSIntf.szFIELDNAME.

64.5.172 DSIntf.szFIELDPROPS Constant

Pascal

```
szFIELDPROPS = 'FIELDPROPS';
```

C++

```
szFIELDPROPS = 'FIELDPROPS';
```

File

DSIntf

Description

This is constant DSIntf.szFIELDPROPS.

64.5.173 DSIntf.szLCID Constant

Pascal

```
szLCID = 'LCID';
```

C++

```
szLCID = 'LCID';
```

File

DSIntf

Description

This is constant DSIntf.szLCID.

64.5.174 DSIntf.szMAXVALUE Constant

Pascal

```
szMAXVALUE = 'MAXVALUE';
```

C++

```
szMAXVALUE = 'MAXVALUE';
```

File

DSIntf

Description

This is constant DSIntf.szMAXVALUE.

64.5.175 DSIntf.szMD_FIELDLINKS Constant

Pascal

```
szMD_FIELDLINKS = 'MD_FIELDLINKS';
```

C++

```
szMD_FIELDLINKS = 'MD_FIELDLINKS';
```

File

DSIntf

Description

This is constant DSIntf.szMD_FIELDLINKS.

64.5.176 DSIntf.szMD_SEMANTICS Constant

Pascal

```
szMD_SEMANTICS = 'MD_SEMANTICS';
```

C++

```
szMD_SEMANTICS = 'MD_SEMANTICS';
```

File

DSIntf

Description

This is constant DSIntf.szMD_SEMANTICS.

64.5.177 DSIntf.szMINVALUE Constant

Pascal

```
szMINVALUE = 'MINVALUE';
```

C++

```
szMINVALUE = 'MINVALUE';
```

File

DSIntf

Description

This is constant DSIntf.szMINVALUE.

64.5.178 DSIntf.szNO_RESET_CALL Constant

Pascal

```
szNO_RESET_CALL = 'NO_RESET_CALL';
```

C++

```
szNO_RESET_CALL = 'NO_RESET_CALL';
```

File

DSIntf

Description

This is constant DSIntf.szNO_RESET_CALL.

64.5.179 DSIntf.szORIGIN Constant

Pascal

```
szORIGIN = 'ORIGIN';
```

C++

```
szORIGIN = 'ORIGIN';
```

File

DSIntf

Description

This is constant DSIntf.szORIGIN.

64.5.180 DSIntf.szPRIMARY_KEY Constant

Pascal

```
szPRIMARY_KEY = 'PRIMARY_KEY';
```

C++

```
szPRIMARY_KEY = 'PRIMARY_KEY';
```

File

DSIntf

Description

This is constant DSIntf.szPRIMARY_KEY.

64.5.181 DSIntf.szPROVFLAGS Constant

Pascal

```
szPROVFLAGS = 'PROVFLAGS';
```

C++

```
szPROVFLAGS = 'PROVFLAGS';
```

File

DSIntf

Description

This is constant DSIntf.szPROVFLAGS.

64.5.182 DSIntf.szREADONLY Constant

Pascal

```
szREADONLY = 'READONLY';
```

C++

```
szREADONLY = 'READONLY';
```

File

DSIntf

Description

This is constant DSIntf.szREADONLY.

64.5.183 DSIntf.szSERVER_COL Constant

Pascal

```
szSERVER_COL = 'SERVER_COL';
```

C++

```
szSERVER_COL = 'SERVER_COL';
```

File

DSIntf

Description

This is constant DSIntf.szSERVER_COL.

64.5.184 DSIntf.szSERVERCALC Constant

Pascal

```
szSERVERCALC = 'SERVER_CALC';
```

C++

```
szSERVERCALC = 'SERVER_CALC';
```

File

DSIntf

Description

This is constant DSIntf.szSERVERCALC.

64.5.185 DSIntf.szstACCOLEOBJ Constant

Pascal

```
szstACCOLEOBJ = 'AccessOle';
```

C++

```
szstACCOLEOBJ = 'AccessOle';
```

File

DSIntf

Description

This is constant DSIntf.szstACCOLEOBJ.

64.5.186 DSIntf.szstADTNESTEDTABLE Constant

Pascal

```
szstADTNESTEDTABLE = 'ADTNestedTable';
```

C++

```
szstADTNESTEDTABLE = 'ADTNestedTable';
```

File

DSIntf

Description

This is constant DSIntf.szstADTNESTEDTABLE.

64.5.187 DSIntf.szstAUTOINC Constant

Pascal

```
szstAUTOINC = 'Autoinc';
```

C++

```
szstAUTOINC = 'Autoinc';
```

File

DSIntf

Description

This is constant DSIntf.szstAUTOINC.

64.5.188 DSIntf.szstBINARY Constant

Pascal

```
szstBINARY = 'Binary';
```

C++

```
szstBINARY = 'Binary';
```

File

DSIntf

Description

This is constant DSIntf.szstBINARY.

64.5.189 DSIntf.szstDBSOLEOBJ Constant

Pascal

```
szstDBSOLEOBJ = 'dBASEOle';
```

C++

```
szstDBSOLEOBJ = 'dBASEOle';
```

File

DSIntf

Description

This is constant DSIntf.szstDBSOLEOBJ.

64.5.190 DSIntf.szstFIXEDCHAR Constant

Pascal

```
szstFIXEDCHAR = 'FixedChar';
```

C++

```
szstFIXEDCHAR = 'FixedChar';
```

File

DSIntf

Description

This is constant DSIntf.szstFIXEDCHAR.

64.5.191 DSIntf.szstFMTMEMO Constant

Pascal

```
szstFMTMEMO = 'Formatted';
```

C++

```
szstFMTMEMO = 'Formatted';
```

File

DSIntf

Description

This is constant DSIntf.szstFMTMEMO.

64.5.192 DSIntf.szstGRAPHIC Constant

Pascal

```
szstGRAPHIC = 'Graphics';
```

C++

```
szstGRAPHIC = 'Graphics';
```

File

DSIntf

Description

This is constant DSIntf.szstGRAPHIC.

64.5.193 DSIntf.szstGUID Constant

Pascal

```
szstGUID = 'Guid';
```

C++

```
szstGUID = 'Guid';
```

File

DSIntf

Description

This is constant DSIntf.szstGUID.

64.5.194 DSIntf.szstHBINARY Constant

Pascal

```
szstHBINARY = 'HBinary';
```

C++

```
szstHBINARY = 'HBinary';
```

File

DSIntf

Description

This is constant DSIntf.szstHBINARY.

64.5.195 DSIntf.szstHMEMO Constant

Pascal

```
szstHMEMO = 'HMemo';
```

C++

```
szstHMEMO = 'HMemo';
```

File

DSIntf

Description

This is constant DSIntf.szstHMEMO.

64.5.196 DSIntf.szstMEMO Constant

Pascal

```
szstMEMO = 'Text';
```

C++

```
szstMEMO = 'Text';
```

File

DSIntf

Description

This is constant DSIntf.szstMEMO.

64.5.197 DSIntf.szstMONEY Constant

Pascal

```
szstMONEY = 'Money';
```

C++

```
szstMONEY = 'Money';
```

File

DSIntf

Description

This is constant DSIntf.szstMONEY.

64.5.198 DSIntf.szstOLEOBJ Constant

Pascal

```
szstOLEOBJ = 'Ole';
```

C++

```
szstOLEOBJ = 'Ole';
```

File

DSIntf

Description

This is constant DSIntf.szstOLEOBJ.

64.5.199 DSIntf.szstREFNESTEDTABLE Constant

Pascal

```
szstREFNESTEDTABLE = 'Reference';
```

C++

```
szstREFNESTEDTABLE = 'Reference';
```

File

DSIntf

Description

This is constant DSIntf.szstREFNESTEDTABLE.

64.5.200 DSIntf.szstTYPEDBINARY Constant

Pascal

```
szstTYPEDBINARY = 'TypedBinary';
```

C++

```
szstTYPEDBINARY = 'TypedBinary';
```

File

DSIntf

Description

This is constant DSIntf.szstTYPEDBINARY.

64.5.201 DSIntf.szstWideMEMO Constant

Pascal

```
szstWideMEMO = 'WideText';
```

C++

```
szstWideMEMO = 'WideText';
```

File

DSIntf

Description

This is constant DSIntf.szstWideMEMO.

64.5.202 DSIntf.szSUBTYPE Constant

Pascal

```
szSUBTYPE = 'SUBTYPE';
```

C++

```
szSUBTYPE = 'SUBTYPE';
```

File

DSIntf

Description

This is constant DSIntf.szSUBTYPE.

64.5.203 DSIntf.szTABLE_NAME Constant

Pascal

```
szTABLE_NAME = 'TABLE_NAME';
```

C++

```
szTABLE_NAME = 'TABLE_NAME';
```

File

DSIntf

Description

This is constant DSIntf.szTABLE_NAME.

64.5.204 DSIntf.szTYPENAME Constant

Pascal

```
szTYPENAME = 'TYPENAME';
```

C++

```
szTYPENAME = 'TYPENAME';
```

File

DSIntf

Description

This is constant DSIntf.szTYPENAME.

64.5.205 DSIntf.szUNIQUE_KEY Constant

Pascal

```
szUNIQUE_KEY = 'UNIQUE_KEY';
```

C++

```
szUNIQUE_KEY = 'UNIQUE_KEY';
```

File

DSIntf

Description

This is constant DSIntf.szUNIQUE_KEY.

64.5.206 DSIntf.szUPDATEMODE Constant

Pascal

```
szUPDATEMODE = 'UPDATEMODE';
```

C++

```
szUPDATEMODE = 'UPDATEMODE';
```

File

DSIntf

Description

This is constant DSIntf.szUPDATEMODE.

64.5.207 DSIntf.szWIDTH Constant

Pascal

```
szWIDTH = 'WIDTH';
```

C++

```
szWIDTH = 'WIDTH';
```

File

DSIntf

Description

This is constant DSIntf.szWIDTH.

64.5.208 DSIntf.xmlOFF Constant

Pascal

```
xmlOFF = 0;
```

C++

```
xmlOFF = 0;
```

File

DSIntf

Description

This is constant DSIntf.xmlOFF.

64.5.209 DSIntf.xmlON Constant

Pascal

```
xmlON = xmlXMLSCHEMA or xmlUNTYPED;
```

C++

```
xmlON = xmlXMLSCHEMA or xmlUNTYPED;
```

File

DSIntf

Description

This is constant DSIntf.xmlON.

64.5.210 DSIntf.xmlUNTYPED Constant

Pascal

```
xmlUNTYPED = 1;
```

C++

```
xmlUNTYPED = 1;
```

File

DSIntf

Description

This is constant DSIntf.xmlUNTYPED.

64.5.211 DSIntf.xmlUTF8 Constant

Pascal

```
xmlUTF8 = xmlON or xmlXMLUTF8;
```

C++

```
xmlUTF8 = xmlON or xmlXMLUTF8;
```

File

DSIntf

Description

This is constant DSIntf.xmlUTF8.

64.5.212 DSIntf.xmlXMLDATATYPED Constant

Pascal

```
xmlXMLDATATYPED = 2;
```

C++

```
xmlXMLDATATYPED = 2;
```

File

DSIntf

Description

This is constant DSIntf.xmlXMLDATATYPED.

64.5.213 DSIntf.xmlXMLSCHEMA Constant

Pascal

```
xmlXMLSCHEMA = 4;
```

C++

```
xmlXMLSCHEMA = 4;
```

File

DSIntf

Description

This is constant DSIntf.xmlXMLSCHEMA.

64.5.214 DSIntf.xmlXMLUTF8 Constant

Pascal

```
xmlXMLUTF8 = 8;
```

C++

```
xmlXMLUTF8 = 8;
```

File

DSIntf

Description

This is constant DSIntf.xmlXMLUTF8.

65 DSProd Namespace

This is namespace DSProd.

Topics

Name	Description
Classes (see page 11800)	The following table lists classes in this documentation.

Classes

	Name	Description
	TCustomDataSetPageProducer (see page 11800)	TCustomDataSetPageProducer is the ancestor of the data set page producer classes.
	TDataSetPageProducer (see page 11807)	TDataSetPageProducer produces a string of HTML commands based on an input template.

65.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TCustomDataSetPageProducer (see page 11800)	TCustomDataSetPageProducer is the ancestor of the data set page producer classes.
	TDataSetPageProducer (see page 11807)	TDataSetPageProducer produces a string of HTML commands based on an input template.

65.1.1 TCustomDataSetPageProducer Class

TCustomDataSetPageProducer is the ancestor of the data set page producer classes.

Class Hierarchy

Pascal

```
TCustomDataSetPageProducer = class(TCustomPageProducer);
```

C++

```
class TCustomDataSetPageProducer : public TCustomPageProducer;
```

File

DSProd

Description

Do not create instances of TCustomDataSetPageProducer. Use TCustomDataSetPageProducer as a base class when declaring non-visual components that can appear on the component palette and be used in the form designer. Properties and methods of TCustomDataSetPageProducer provide basic behavior that descendant classes inherit as well as behavior that components can override to customize their behavior.

See Also

TDataSetPageProducer (see page 11807)

TPageProducer (see page 15309)

65.1.1.1 TCustomDataSetPageProducer Members

The following tables list the members exposed by TCustomDataSetPageProducer.

Protected Events

	Name	Description
	OnHTMLTag (see page 15280)	Occurs when the page producer needs to interpret the value of an HTML-transparent tag in the HTML template.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DoTagEvent (see page 11805)	This is DoTagEvent, a member of class TCustomDataSetPageProducer.
	GetAppDispatcher (see page 15108)	This is GetAppDispatcher, a member of class TCustomContentProducer.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetDataSet (see page 11805)	This is GetDataSet, a member of class TCustomDataSetPageProducer.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetProducerTemplateFileName (see page 15276)	This is GetProducerTemplateFileName, a member of class TBasePageProducer.
	GetProducerTemplateStream (see page 15276)	This is GetProducerTemplateStream, a member of class TBasePageProducer.
V	GetScriptEngine (see page 15277)	This is GetScriptEngine, a member of class TBasePageProducer.
	GetTagID (see page 15277)	This is GetTagID, a member of class TBasePageProducer.
V	GetTemplateFileName (see page 15277)	This is GetTemplateFileName, a member of class TBasePageProducer.
V	GetTemplateFileName (see page 15286)	This is GetTemplateFileName, a member of class TCustomPageProducer.
V	GetTemplateStream (see page 15277)	This is GetTemplateStream, a member of class TBasePageProducer.
V	GetTemplateStream (see page 15286)	This is GetTemplateStream, a member of class TCustomPageProducer.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
V	HandleScriptTag (see page 15277)	This is HandleScriptTag, a member of class TBasePageProducer.
V	HandleTag (see page 15278)	This is HandleTag, a member of class TBasePageProducer.
V	HandleTag (see page 15286)	This is HandleTag, a member of class TCustomPageProducer.
	ImplHandleTag (see page 15278)	This is ImplHandleTag, a member of class TBasePageProducer.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 11805)	Overrides the inherited method to respond to messages that the dispatcher is going away.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.

	ProduceContent (see page 15108)	Returns the content that the producer creates.
	ProduceContentFromStream (see page 15109)	This is ProduceContentFromStream, a member of class TCustomContentProducer.
	ProduceContentFromString (see page 15109)	This is ProduceContentFromString, a member of class TCustomContentProducer.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	ServerScriptFromStream (see page 15278)	This is ServerScriptFromStream, a member of class TBasePageProducer.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetAppDispatcher (see page 15109)	This is SetAppDispatcher, a member of class TCustomContentProducer.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDataSet (see page 11806)	This is SetDataSet, a member of class TCustomDataSetPageProducer.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	UseScriptEngine (see page 15278)	This is UseScriptEngine, a member of class TBasePageProducer.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Content (see page 11804)	Returns the translated HTML template.
	ContentFromStream (see page 15107)	Returns the content produced in response to input read from a stream.
	ContentFromStream (see page 15275)	Returns the content produced in response to input read from a stream.
	ContentFromString (see page 15107)	Returns the content produced in response to an input string.
	ContentFromString (see page 15275)	Returns the content produced in response to an input string.
	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 15274)	Creates an instance of TBasePageProducer (see page 15269).
	Create (see page 15285)	Creates an instance of TCustomPageProducer (see page 15281).
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.

	Destroy (see page 2766)	Disposes of the component and its owned components.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 15285)	Destroys an instance of TCustomPageProducer (see page 15281).
	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetAppDispatcher (see page 15220)	This is GetAppDispatcher, a member of class IGetAppDispatcher.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetProducerTemplateFileName (see page 15320)	This is GetProducerTemplateFileName, a member of class IGetProducerTemplate.
	GetProducerTemplateStream (see page 15320)	This is GetProducerTemplateStream, a member of class IGetProducerTemplate.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	ProduceContent (see page 15224)	Returns the content that the producer creates.
	ProduceContentFromStream (see page 15225)	This is ProduceContentFromStream, a member of class IProduceContentFrom.
	ProduceContentFromString (see page 15226)	This is ProduceContentFromString, a member of class IProduceContentFrom.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetAppDispatcher (see page 15227)	This is SetAppDispatcher, a member of class ISetAppDispatcher.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DataSet (see page 11806)	Refers to the page producer's DataSet object.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	Dispatcher (see page 15109)	Provides access to the dispatcher for the Web server application that includes the TCustomContentProducer (see page 15102) object.
R	DispatcherComponent (see page 15110)	Provides access to the dispatcher component.
	HTMLDoc (see page 15287)	Specifies the HTML template used to generate the value returned by the Content (see page 15274) method.
	HTMLFile (see page 15287)	Specifies the name of a file that contains the HTML template used to generate the value returned by the Content (see page 15274) method.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	ScriptEngine (see page 15279)	Names the script engine that generates or interprets script embedded in the documents that this producer creates.
	StripParamQuotes (see page 15279)	Specifies whether to strip quotation marks when extracting the parameters from an HTML-transparent tag.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
R	WebModuleContext (see page 15279)	Provides access to the Web module context object.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

65.1.1.2 TCustomDataSetPageProducer Methods

The methods of the TCustomDataSetPageProducer class are listed here.

Protected Methods

	Name	Description
V	DoTagEvent (see page 11805)	This is DoTagEvent, a member of class TCustomDataSetPageProducer.
V	GetDataSet (see page 11805)	This is GetDataSet, a member of class TCustomDataSetPageProducer.
V	Notification (see page 11805)	Overrides the inherited method to respond to messages that the dispatcher is going away.
V	SetDataSet (see page 11806)	This is SetDataSet, a member of class TCustomDataSetPageProducer.

Public Methods

	Name	Description
V	Content (see page 11804)	Returns the translated HTML template.

65.1.1.2.1 TCustomDataSetPageProducer.Content Method

Returns the translated HTML template.

Pascal

```
function Content: string; override;
```

C++

```
virtual __fastcall AnsiString Content();
```

Description

Call Content to get the HTML commands that result from converting the HTML template. Content reads the template from HTMLDoc or HTMLFile, depending on which property is set. Content replaces each tag in the template that has the form <#Fieldname> with the value of the field in DataSet (see page 11806) that has the specified name. Any HTML-transparent tags in the template that do not have tag names which match a field in DataSet (see page 11806) are passed on to the OnHTMLTag event handler.

See Also

DataSet (see page 11806)

OnHTMLTag (see page 15280)

ContentFromString (see page 15275)

ContentFromStream (see page 15275)

HTMLDoc (see page 15287)

HTMLFile (see page 15287)

65.1.1.2.2 TCustomDataSetPageProducer.DoTagEvent Method

Pascal

```
procedure DoTagEvent(Tag: TTag; const TagString: string; TagParams: TStrings; var ReplaceText:
string); override;
```

C++

```
virtual __fastcall DoTagEvent(TTag Tag, const AnsiString TagString, TStrings TagParams,
AnsiString ReplaceText);
```

Description

This is DoTagEvent, a member of class TCustomDataSetPageProducer.

65.1.1.2.3 TCustomDataSetPageProducer.GetDataSet Method

Pascal

```
function GetDataSet: TDataSet; virtual;
```

C++

```
virtual __fastcall TDataSet GetDataSet();
```

Description

This is GetDataSet, a member of class TCustomDataSetPageProducer.

65.1.1.2.4 TCustomDataSetPageProducer.Notification Method

Overrides the inherited method to respond to messages that the dispatcher is going away.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

After calling the inherited method, Notification checks whether this call was triggered by the removal of the dispatcher. If so, the Dispatcher property is set to nil. NULL.

See Also

DispatcherComponent (see page 15110)

Dispatcher (see page 15109)

65.1.1.2.5 TCustomDataSetPageProducer.SetDataSet Method

Pascal

```
procedure SetDataSet(ADataSet: TDataSet); virtual;
```

C++

```
virtual __fastcall SetDataSet(TDataSet ADataSet);
```

Description

This is SetDataSet, a member of class TCustomDataSetPageProducer.

65.1.1.3 TCustomDataSetPageProducer Properties

The properties of the TCustomDataSetPageProducer class are listed here.

Public Properties

	Name	Description
	DataSet (see page 11806)	Refers to the page producer's DataSet object.

65.1.1.3.1 TCustomDataSetPageProducer.DataSet Property

Refers to the page producer's DataSet object.

Pascal

```
property DataSet: TDataSet;
```

C++

```
__property TDataSet DataSet;
```

Description

DataSet is a reference to the page producer's data set. Use this property to directly access the data set object, which is derived from TDataSet.

See Also

TDataSet (see page 6894)

Using Dataset Page Producers

65.1.2 TDataSetPageProducer Class

TDataSetPageProducer produces a string of HTML commands based on an input template.

Class Hierarchy

Pascal

```
TDataSetPageProducer = class(TCustomDataSetPageProducer);
```

C++

```
class TDataSetPageProducer : public TCustomDataSetPageProducer;
```

File

DSProd

Description

Use TDataSetPageProducer to convert an HTML template that includes field data into a string of HTML commands that can be interpreted by a client application such as a Web browser. HTML templates include HTML commands and HTML-transparent tags that are replaced with customized content by the dataset page producer in an OnHTMLTag (see page 11814) event handler.

Dataset page producers differ from other page producer components in that they replace HTML-transparent tags that match fields in a dataset with the current value of those fields.

The Web Module

Using Dataset Page Producers

65.1.2.1 TDataSetPageProducer Members

The following tables list the members exposed by TDataSetPageProducer.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DoTagEvent (see page 11805)	This is DoTagEvent, a member of class TCustomDataSetPageProducer.
	DoTagEvent (see page 15276)	This is DoTagEvent, a member of class TBasePageProducer.
	GetAppDispatcher (see page 15108)	This is GetAppDispatcher, a member of class TCustomContentProducer.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetDataSet (see page 11805)	This is GetDataSet, a member of class TCustomDataSetPageProducer.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetProducerTemplateFileName (see page 15276)	This is GetProducerTemplateFileName, a member of class TBasePageProducer.
	GetProducerTemplateStream (see page 15276)	This is GetProducerTemplateStream, a member of class TBasePageProducer.
V	GetScriptEngine (see page 15277)	This is GetScriptEngine, a member of class TBasePageProducer.
	GetTagID (see page 15277)	This is GetTagID, a member of class TBasePageProducer.
V	GetTemplateFileName (see page 15277)	This is GetTemplateFileName, a member of class TBasePageProducer.
V	GetTemplateFileName (see page 15286)	This is GetTemplateFileName, a member of class TCustomPageProducer.
V	GetTemplateStream (see page 15277)	This is GetTemplateStream, a member of class TBasePageProducer.
V	GetTemplateStream (see page 15286)	This is GetTemplateStream, a member of class TCustomPageProducer.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
V	HandleScriptTag (see page 15277)	This is HandleScriptTag, a member of class TBasePageProducer.
V	HandleTag (see page 15278)	This is HandleTag, a member of class TBasePageProducer.
V	HandleTag (see page 15286)	This is HandleTag, a member of class TCustomPageProducer.
	ImplHandleTag (see page 15278)	This is ImplHandleTag, a member of class TBasePageProducer.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	Notification (see page 11805)	Overrides the inherited method to respond to messages that the dispatcher is going away.
V	Notification (see page 15108)	Overrides the inherited method to respond to messages that the dispatcher is going away.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.

	ProduceContent (see page 15108)	Returns the content that the producer creates.
	ProduceContentFromStream (see page 15109)	This is ProduceContentFromStream, a member of class TCustomContentProducer.
	ProduceContentFromString (see page 15109)	This is ProduceContentFromString, a member of class TCustomContentProducer.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	ServerScriptFromStream (see page 15278)	This is ServerScriptFromStream, a member of class TBasePageProducer.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetAppDispatcher (see page 15109)	This is SetAppDispatcher, a member of class TCustomContentProducer.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
V	SetDataSet (see page 11806)	This is SetDataSet, a member of class TCustomDataSetPageProducer.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
V	UseScriptEngine (see page 15278)	This is UseScriptEngine, a member of class TBasePageProducer.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Content (see page 11804)	Returns the translated HTML template.
V	Content (see page 15106)	Returns the content produced by the content producer.
V	Content (see page 15274)	Returns the content produced by the content producer.
V	ContentFromStream (see page 15107)	Returns the content produced in response to input read from a stream.
V	ContentFromStream (see page 15275)	Returns the content produced in response to input read from a stream.
V	ContentFromString (see page 15107)	Returns the content produced in response to an input string.
V	ContentFromString (see page 15275)	Returns the content produced in response to an input string.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
V	Create (see page 15274)	Creates an instance of TBasePageProducer (see page 15269).
V	Create (see page 15285)	Creates an instance of TCustomPageProducer (see page 15281).

	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 15285)	Destroys an instance of TCustomPageProducer (see page 15281).
V	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetAppDispatcher (see page 15220)	This is GetAppDispatcher, a member of class IGetAppDispatcher.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetProducerTemplateFileName (see page 15320)	This is GetProducerTemplateFileName, a member of class IGetProducerTemplate.
	GetProducerTemplateStream (see page 15320)	This is GetProducerTemplateStream, a member of class IGetProducerTemplate.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	ProduceContent (see page 15224)	Returns the content that the producer creates.
	ProduceContentFromStream (see page 15225)	This is ProduceContentFromStream, a member of class IProduceContentFrom.
	ProduceContentFromString (see page 15226)	This is ProduceContentFromString, a member of class IProduceContentFrom.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetAppDispatcher (see page 15227)	This is SetAppDispatcher, a member of class ISetAppDispatcher.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.

	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	Dispatcher (see page 15109)	Provides access to the dispatcher for the Web server application that includes the TCustomContentProducer (see page 15102) object.
R	DispatcherComponent (see page 15110)	Provides access to the dispatcher component.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	StripParamQuotes (see page 15279)	Specifies whether to strip quotation marks when extracting the parameters from an HTML-transparent tag.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
R	WebModuleContext (see page 15279)	Provides access to the Web module context object.

Published Events

	Name	Description
	OnHTMLTag (see page 11814)	Occurs when the page producer needs to interpret the value of an HTML-transparent tag in the HTML template.

Published Properties

	Name	Description
	DataSet (see page 11811)	Refers to the page producer's DataSet object.
	HTMLDoc (see page 11812)	Specifies the HTML template used to generate the value returned by the Content method.
	HTMLFile (see page 11812)	Specifies the name of a file that contains the HTML template used to generate the value returned by the Content method.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	ScriptEngine (see page 11813)	Names the script engine that generates or interprets script embedded in the documents that this producer creates.
	Tag (see page 2808)	Stores an integer value as part of a component.

65.1.2.2 TDataSetPageProducer Properties

The properties of the TDataSetPageProducer class are listed here.

Published Properties

	Name	Description
	DataSet (see page 11811)	Refers to the page producer's DataSet object.
	HTMLDoc (see page 11812)	Specifies the HTML template used to generate the value returned by the Content method.
	HTMLFile (see page 11812)	Specifies the name of a file that contains the HTML template used to generate the value returned by the Content method.
	ScriptEngine (see page 11813)	Names the script engine that generates or interprets script embedded in the documents that this producer creates.

65.1.2.2.1 TDataSetPageProducer.DataSet Property

Refers to the page producer's DataSet object.

Pascal

```
property DataSet: TDataSet;
```

C++

```
__property TDataSet DataSet;
```

Description

DataSet is a reference to the page producer's data set. Use this property to directly access the data set object, which is derived from TDataSet.

See Also

TDataSet (see page 6894)

Using Dataset Page Producers

65.1.2.2.2 TDataSetPageProducer.HTMLDoc Property

Specifies the HTML template used to generate the value returned by the Content method.

Pascal

```
property HTMLDoc: TStrings;
```

C++

```
__property TStrings HTMLDoc;
```

Description

Set HTMLDoc to a set of strings that make up the HTML template. Each string is a sequence of one or more HTML commands or HTML-transparent tags. An HTML-transparent tag has the form

```
<#TagName Param1=Value1 Param2=Value2 ...>
```

A pound sign (#) immediately follows the opening angle bracket (<) with no spaces separating it from the angle bracket. The pound sign identifies the string to the page producer as an HTML-transparent tag. The tag name immediately follows the pound sign with no spaces separating it from the pound sign. The page producer converts the entire HTML-transparent tag into true HTML commands based on the value of the tag name. Following the tag name, the HTML-transparent tag can optionally include parameters that specify details of the conversion to be performed. Each parameter is of the form ParamName=Value, where there is no space between the parameter name, the equals symbol (=) and the value. Each parameter is delimited by white space.

The angle brackets (< >) make the tag transparent to HTML browsers that do not recognize the #TagName construct.

Note: Setting HTMLDoc clears the HTMLFile property.

See Also

Content (see page 15274)

HTMLFile (see page 15287)

Specifying the HTML Template

65.1.2.2.3 TDataSetPageProducer.HTMLFile Property

Specifies the name of a file that contains the HTML template used to generate the value returned by the Content method.

Pascal

```
property HTMLFile: TFileName;
```

C++

```
__property TFileName HTMLFile;
```

Description

Set HTMLFile to the name of the file that contains an HTML template. The HTML template is a sequence of HTML commands and HTML-transparent tags. An HTML-transparent tag has the form

```
<#TagName Param1=Value1 Param2=Value2 ...>
```

A pound sign (#) immediately follows the opening angle bracket (<) with no spaces separating it from the angle bracket. The pound sign identifies the string to the page producer as an HTML-transparent tag. The tag name immediately follows the pound sign with no spaces separating it from the pound sign. The page producer converts the entire HTML-transparent tag into true HTML commands based on the value of the tag name. Following the tag name, the HTML-transparent tag can optionally include parameters that specify details of the conversion to be performed. Each parameter is of the form ParamName=Value, where there is no space between the parameter name, the equals symbol (=) and the value. Each parameter is delimited by white space.

The angle brackets (< >) make the tag transparent to HTML browsers that do not recognize the #TagName construct.

Note: Setting HTMLFile clears the HTMLDoc property.

Note: When distributing applications that contain page producers which use the HTMLFile property, be sure to distribute the file along with the application. Also, be sure that the value of HTMLFile does not include a hard-coded path name that will not be available on the user's disk.

See Also

Content (see page 15274)

HTMLDoc (see page 15287)

Specifying the HTML Template

65.1.2.2.4 TDataSetPageProducer.ScriptEngine Property

Names the script engine that generates or interprets script embedded in the documents that this producer creates.

Pascal

```
property ScriptEngine: string;
```

C++

```
__property AnsiString ScriptEngine;
```

Description

ScriptEngine indicates the scripting language that the producer uses in its generated documents. For example, if the producer generates code that includes jscript, the value of ScriptEngine is 'JSCRIPT'.

When ScriptEngine is defined, the page producer generates its content using a special script-producer component. When ScriptEngine is not defined, the page producer uses only the OnHTMLTag event, plus any other built-in translations provided by a descendant class.

See Also

OnHTMLTag (see page 15280)

65.1.2.3 TDataSetPageProducer Events

The events of the TDataSetPageProducer class are listed here.

Published Events

	Name	Description
	OnHTMLTag (see page 11814)	Occurs when the page producer needs to interpret the value of an HTML-transparent tag in the HTML template.

65.1.2.3.1 TDataSetPageProducer.OnHTMLTag Event

Occurs when the page producer needs to interpret the value of an HTML-transparent tag in the HTML template.

Pascal

```
property OnHTMLTag: THTMLTagEvent;
```

C++

```
__property THTMLTagEvent OnHTMLTag;
```

Description

Write an OnHTMLTag event handler to convert an HTML-transparent tag into the corresponding HTML commands that can be interpreted by a Web browser. If an OnHTMLTag event is not supplied, the HTML-transparent tags in the HTML template will be replaced by empty strings.

Note: The sequence of HTML that the event handler produces for an HTML-transparent tag can contain HTML-transparent tags for another page producer to convert. For example, one page producer might have a template that represents the format of the final HTTP response. It could read the HTTP request and for each section in the request assemble a set of HTML-transparent tags with parameters based on the request. Another page producer might take the content of the first page producer, and interpret those parameters.

Variables (see page 11825)	The following table lists variables in this documentation.
Constants (see page 11826)	The following table lists constants in this documentation.

Classes

	Name	Description
	TIExpert (see page 11817)	This is class ExptIntf.TIExpert.

Constants

Name	Description
ExpertEntryPoint (see page 11826)	This is constant ExptIntf.ExpertEntryPoint.
isExperts (see page 11826)	This is constant ExptIntf.isExperts.
ValidExpertVersion (see page 11826)	This is constant ExptIntf.ValidExpertVersion.

Functions

	Name	Description
	RegisterLibraryExpert (see page 11821)	Registers an expert so that it is installed when a package is installed.

Structs, Records, Enums

	Name	Description
	TExpertStyle (see page 11822)	This is record ExptIntf.TExpertStyle.

Types

Name	Description
TExpertInitProc (see page 11823)	This is type ExptIntf.TExpertInitProc.
TExpertRegisterProc (see page 11823)	This is type ExptIntf.TExpertRegisterProc.
TExpertState (see page 11824)	This is type ExptIntf.TExpertState.
TExpertTerminateProc (see page 11824)	This is type ExptIntf.TExpertTerminateProc.

Variables

Name	Description
LibraryExpertProc (see page 11825)	This is variable ExptIntf.LibraryExpertProc.
ToolServices (see page 11825)	This is variable ExptIntf.ToolServices.

66.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TIExpert (see page 11817)	This is class ExptIntf.TIExpert.

66.1.1 TIExpert Class

Class Hierarchy

Pascal

```
TIExpert = class(TInterface);
```

C++

```
class TIExpert : public TInterface;
```

File

ExptIntf

Description

This is class ExptIntf.TIExpert.

66.1.1.1 TIExpert Members

The following tables list the members exposed by TIExpert.

Public Methods

	Name	Description
	Execute (see page 11818)	This is Execute, a member of class TIExpert.
	GetAuthor (see page 11818)	This is GetAuthor, a member of class TIExpert.
	GetComment (see page 11818)	This is GetComment, a member of class TIExpert.
	GetGlyph (see page 11818)	This is GetGlyph, a member of class TIExpert.
	GetIDString (see page 11819)	This is GetIDString, a member of class TIExpert.
	GetMenuText (see page 11819)	This is GetMenuText, a member of class TIExpert.
	GetName (see page 11819)	This is GetName, a member of class TIExpert.
	GetPage (see page 11819)	This is GetPage, a member of class TIExpert.
	GetState (see page 11820)	This is GetState, a member of class TIExpert.
	GetStyle (see page 11820)	This is GetStyle, a member of class TIExpert.

66.1.1.2 TIExpert Methods

The methods of the TIExpert class are listed here.

Public Methods

	Name	Description
	Execute (see page 11818)	This is Execute, a member of class TIExpert.
	GetAuthor (see page 11818)	This is GetAuthor, a member of class TIExpert.
	GetComment (see page 11818)	This is GetComment, a member of class TIExpert.
	GetGlyph (see page 11818)	This is GetGlyph, a member of class TIExpert.
	GetIDString (see page 11819)	This is GetIDString, a member of class TIExpert.
	GetMenuText (see page 11819)	This is GetMenuText, a member of class TIExpert.
	GetName (see page 11819)	This is GetName, a member of class TIExpert.
	GetPage (see page 11819)	This is GetPage, a member of class TIExpert.
	GetState (see page 11820)	This is GetState, a member of class TIExpert.
	GetStyle (see page 11820)	This is GetStyle, a member of class TIExpert.

66.1.1.2.1 TIExpert.Execute Method

Pascal

```
procedure Execute; virtual; abstract; stdcall;
```

C++

```
virtual __fastcall __stdcall Execute() = 0;
```

Description

This is Execute, a member of class TIExpert.

66.1.1.2.2 TIExpert.GetAuthor Method

Pascal

```
function GetAuthor: string; virtual; abstract; stdcall;
```

C++

```
virtual __fastcall __stdcall AnsiString GetAuthor() = 0;
```

Description

This is GetAuthor, a member of class TIExpert.

66.1.1.2.3 TIExpert.GetComment Method

Pascal

```
function GetComment: string; virtual; abstract; stdcall;
```

C++

```
virtual __fastcall __stdcall AnsiString GetComment() = 0;
```

Description

This is GetComment, a member of class TIExpert.

66.1.1.2.4 TIExpert.GetGlyph Method

Pascal

```
function GetGlyph: HICON; virtual; abstract; stdcall;
```

C++

```
virtual __fastcall __stdcall HICON GetGlyph() = 0;
```

Description

This is GetGlyph, a member of class TIExpert.

66.1.1.2.5 TIExpert.GetIDString Method

Pascal

```
function GetIDString: string; virtual; abstract; stdcall;
```

C++

```
virtual __fastcall __stdcall AnsiString GetIDString() = 0;
```

Description

This is GetIDString, a member of class TIExpert.

66.1.1.2.6 TIExpert.GetMenuText Method

Pascal

```
function GetMenuText: string; virtual; abstract; stdcall;
```

C++

```
virtual __fastcall __stdcall AnsiString GetMenuText() = 0;
```

Description

This is GetMenuText, a member of class TIExpert.

66.1.1.2.7 TIExpert.GetName Method

Pascal

```
function GetName: string; virtual; abstract; stdcall;
```

C++

```
virtual __fastcall __stdcall AnsiString GetName() = 0;
```

Description

This is GetName, a member of class TIExpert.

66.1.1.2.8 TIExpert.GetPage Method

Pascal

```
function GetPage: string; virtual; abstract; stdcall;
```

C++

```
virtual __fastcall __stdcall AnsiString GetPage() = 0;
```

Description

This is GetPage, a member of class TIExpert.

66.1.1.2.9 TIExpert.GetState Method

Pascal

```
function GetState: TExpertState; virtual; abstract; stdcall;
```

C++

```
virtual __fastcall __stdcall TExpertState GetState() = 0;
```

Description

This is GetState, a member of class TIExpert.

66.1.1.2.10 TIExpert.GetStyle Method

Pascal

```
function GetStyle: TExpertStyle; virtual; abstract; stdcall;
```

C++

```
virtual __fastcall __stdcall TExpertStyle GetStyle() = 0;
```

Description

This is GetStyle, a member of class TIExpert.

66.2 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	RegisterLibraryExpert (see page 11821)	Registers an expert so that it is installed when a package is installed.

66.2.1 ExptIntf.RegisterLibraryExpert Function

Registers an expert so that it is installed when a package is installed.

Pascal

```
procedure RegisterLibraryExpert(Expert: TIExpert);
```

C++

```
RegisterLibraryExpert(TIExpert Expert);
```

File

ExptIntf

Description

Call RegisterLibrary to register an expert for a package so that it appears in the New Items dialog. If the package already has a registered expert, RegisterLibraryExpert does nothing.

66.3 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TExpertStyle (see page 11822)	This is record ExptIntf.TExpertStyle.

66.3.1 ExptIntf.TExpertStyle Enumeration

Pascal

```
TExpertStyle = (
  esStandard,
  esForm,
  esProject,
  esAddIn
);
```

C++

```
enum TExpertStyle {
  esStandard,
  esForm,
  esProject,
  esAddIn
};
```

File

ExptIntf

Description

This is record ExptIntf.TExpertStyle.

66.4 Types

The following table lists types in this documentation.

Types

Name	Description
TExpertInitProc (see page 11823)	This is type ExptIntf.TExpertInitProc.
TExpertRegisterProc (see page 11823)	This is type ExptIntf.TExpertRegisterProc.
TExpertState (see page 11824)	This is type ExptIntf.TExpertState.
TExpertTerminateProc (see page 11824)	This is type ExptIntf.TExpertTerminateProc.

66.4.1 ExptIntf.TExpertInitProc Type

Pascal

```
TExpertInitProc = function (ToolServices: TIToolServices; RegisterProc: TExpertRegisterProc;
var Terminate: TExpertTerminateProc): Boolean stdcall;
```

C++

```
(ToolServices: TIToolServices; RegisterProc: TExpertRegisterProc; var Terminate:
TExpertTerminateProc): Boolean stdcall ( TExpertInitProc)();
```

File

ExptIntf

Description

This is type ExptIntf.TExpertInitProc.

66.4.2 ExptIntf.TExpertRegisterProc Type

Pascal

```
TExpertRegisterProc = function (Expert: TIExpert): Boolean;
```

C++

```
(Expert: TIExpert): Boolean ( TExpertRegisterProc)();
```

File

ExptIntf

Description

This is type ExptIntf.TExpertRegisterProc.

66.4.3 ExptIntf.TExpertState Type

Pascal

```
TExpertState = set of (esEnabled, esChecked);
```

C++

```
(esEnabled, esChecked) TExpertState;
```

File

ExptIntf

Description

This is type ExptIntf.TExpertState.

66.4.4 ExptIntf.TExpertTerminateProc Type

Pascal

```
TExpertTerminateProc = procedure;
```

C++

```
( TExpertTerminateProc)();
```

File

ExptIntf

Description

This is type ExptIntf.TExpertTerminateProc.

66.5 Variables

The following table lists variables in this documentation.

Variables

Name	Description
LibraryExpertProc (see page 11825)	This is variable ExptIntf.LibraryExpertProc.
ToolServices (see page 11825)	This is variable ExptIntf.ToolServices.

66.5.1 ExptIntf.LibraryExpertProc Variable

Pascal

```
LibraryExpertProc: TExpertRegisterProc = nil;
```

C++

```
TExpertRegisterProc LibraryExpertProc = nil;
```

File

ExptIntf

Description

This is variable ExptIntf.LibraryExpertProc.

66.5.2 ExptIntf.ToolServices Variable

Pascal

```
ToolServices: TIToolServices = nil;
```

C++

```
TIToolServices ToolServices = nil;
```

File

ExptIntf

Description

This is variable ExptIntf.ToolServices.

66.6 Constants

The following table lists constants in this documentation.

Constants

Name	Description
ExpertEntryPoint (see page 11826)	This is constant ExptIntf.ExpertEntryPoint.
isExperts (see page 11826)	This is constant ExptIntf.isExperts.
ValidExpertVersion (see page 11826)	This is constant ExptIntf.ValidExpertVersion.

66.6.1 ExptIntf.ExpertEntryPoint Constant

Pascal

```
ExpertEntryPoint = 'INITEXPERT0017';
```

C++

```
ExpertEntryPoint = 'INITEXPERT0017';
```

File

ExptIntf

Description

This is constant ExptIntf.ExpertEntryPoint.

66.6.2 ExptIntf.isExperts Constant

Pascal

```
isExperts = 'Experts';
```

C++

```
isExperts = 'Experts';
```

File

ExptIntf

Description

This is constant ExptIntf.isExperts.

66.6.3 ExptIntf.ValidExpertVersion Constant

Pascal

```
ValidExpertVersion = 3;
```

C++

```
ValidExpertVersion = 3;
```

File

ExptIntf

Description

This is constant ExptIntf.ValidExpertVersion.

67 ExtActns Namespace

This is namespace ExtActns.

Topics

Name	Description
Classes (see page 11831)	The following table lists classes in this documentation.
Structs, Records, Enums (see page 12096)	The following table lists structs, records, enums in this documentation.
Types (see page 12099)	The following table lists types in this documentation.

Classes

	Name	Description
	TBrowseURL (see page 11832)	TBrowseURL is the standard action for launching the default browser to display a specified URL (see page 11841).
	TCustomFileRun (see page 11844)	TCustomFileRun is the base class for actions that perform a specified operation on a file.
	TDownLoadURL (see page 11857)	TDownLoadURL is the standard action for saving the contents of a specified URL (see page 11869) to a file.
	TFileRun (see page 11872)	TFileRun is the standard action for performing a specified operation on a file.
	TListControlAction (see page 11886)	TListControlAction is the base class for action objects that operate on the selection of a list control (list box or list view).
	TListControlClearSelection (see page 11893)	TListControlClearSelection deselects all selected items in a list control (list view or list box).
	TListControlCopySelection (see page 11906)	TListControlCopySelection copies the selected items in a list control (list view or list box) to another (destination) list control.
	TListControlDeleteSelection (see page 11919)	TListControlDeleteSelection deletes the selected items in a list control (list view or listbox).
	TListControlMoveSelection (see page 11931)	TListControlMoveSelection moves the selected items in a list control (list view or list box) to another (destination) list control.
	TListControlSelectAll (see page 11937)	TListControlSelectAll selects all the items in a list control (list view or listbox).
	TNextTab (see page 11949)	TNextTab moves a tabbed control to its next page.
	TOpenPicture (see page 11965)	TOpenPicture is the standard action for displaying the open picture dialog.
	TPreviousTab (see page 11977)	TPreviousTab moves a page control to its previous page.
	TRichEditAction (see page 11992)	TRichEditAction is the base class for action objects that apply rich text attributes to a rich edit control.
	TRichEditAlignCenter (see page 11998)	TRichEditAlignCenter centers the text horizontally in the current paragraph of a rich edit control.
	TRichEditAlignLeft (see page 12005)	TRichEditAlignLeft left-justifies the text in the current paragraph of a rich edit control.

	TRichEditAlignRight (see page 12011)	TRichEditAlignRight right-justifies the text in the current paragraph of a rich edit control.
	TRichEditBold (see page 12017)	TRichEditBold toggles the bold attribute of the currently selected text in a rich edit control.
	TRichEditBullets (see page 12023)	TRichEditBullets toggles whether the current paragraph of a rich edit control is bulleted.
	TRichEditItalic (see page 12029)	TRichEditItalic toggles the italic attribute of the currently selected text in a rich edit control.
	TRichEditStrikeOut (see page 12036)	TRichEditStrikeOut toggles the strikeout attribute of the currently selected text in a rich edit control.
	TRichEditUnderline (see page 12042)	TRichEditUnderline toggles the underline attribute of the currently selected text in a rich edit control.
	TSavePicture (see page 12048)	TSavePicture is the standard action for displaying the save picture dialog.
	TSendMail (see page 12061)	TSendMail is the standard action for sending an email message.
	TTabAction (see page 12073)	TTabAction is the base class for action objects designed to respond to the buttons in a tabbed dialog.
	TURLAction (see page 12083)	TURLAction is the base class for actions that perform some function based on an URL (see page 12093).

Structs, Records, Enums

	Name	Description
	TShowCmd (see page 12096)	This is record ExtActns.TShowCmd.
	TURLDownloadStatus (see page 12097)	This is record ExtActns.TURLDownloadStatus.

Types

Name	Description
TDownloadProgressEvent (see page 12099)	This is type ExtActns.TDownloadProgressEvent.
TValidateTabEvent (see page 12099)	This is type ExtActns.TValidateTabEvent.

67.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TBrowseURL (see page 11832)	TBrowseURL is the standard action for launching the default browser to display a specified URL (see page 11841).
	TCustomFileRun (see page 11844)	TCustomFileRun is the base class for actions that perform a specified operation on a file.
	TDownLoadURL (see page 11857)	TDownLoadURL is the standard action for saving the contents of a specified URL (see page 11869) to a file.
	TFileRun (see page 11872)	TFileRun is the standard action for performing a specified operation on a file.
	TListControlAction (see page 11886)	TListControlAction is the base class for action objects that operate on the selection of a list control (list box or list view).
	TListControlClearSelection (see page 11893)	TListControlClearSelection deselects all selected items in a list control (list view or list box).
	TListControlCopySelection (see page 11906)	TListControlCopySelection copies the selected items in a list control (list view or list box) to another (destination) list control.
	TListControlDeleteSelection (see page 11919)	TListControlDeleteSelection deletes the selected items in a list control (list view or listbox).
	TListControlMoveSelection (see page 11931)	TListControlMoveSelection moves the selected items in a list control (list view or list box) to another (destination) list control.
	TListControlSelectAll (see page 11937)	TListControlSelectAll selects all the items in a list control (list view or listbox).
	TNextTab (see page 11949)	TNextTab moves a tabbed control to its next page.
	TOpenPicture (see page 11965)	TOpenPicture is the standard action for displaying the open picture dialog.
	TPreviousTab (see page 11977)	TPreviousTab moves a page control to its previous page.
	TRichEditAction (see page 11992)	TRichEditAction is the base class for action objects that apply rich text attributes to a rich edit control.
	TRichEditAlignCenter (see page 11998)	TRichEditAlignCenter centers the text horizontally in the current paragraph of a rich edit control.
	TRichEditAlignLeft (see page 12005)	TRichEditAlignLeft left-justifies the text in the current paragraph of a rich edit control.
	TRichEditAlignRight (see page 12011)	TRichEditAlignRight right-justifies the text in the current paragraph of a rich edit control.
	TRichEditBold (see page 12017)	TRichEditBold toggles the bold attribute of the currently selected text in a rich edit control.
	TRichEditBullets (see page 12023)	TRichEditBullets toggles whether the current paragraph of a rich edit control is bulleted.
	TRichEditItalic (see page 12029)	TRichEditItalic toggles the italic attribute of the currently selected text in a rich edit control.
	TRichEditStrikeOut (see page 12036)	TRichEditStrikeOut toggles the strikeout attribute of the currently selected text in a rich edit control.
	TRichEditUnderline (see page 12042)	TRichEditUnderline toggles the underline attribute of the currently selected text in a rich edit control.
	TSavePicture (see page 12048)	TSavePicture is the standard action for displaying the save picture dialog.
	TSendMail (see page 12061)	TSendMail is the standard action for sending an email message.
	TTabAction (see page 12073)	TTabAction is the base class for action objects designed to respond to the buttons in a tabbed dialog.
	TURLAction (see page 12083)	TURLAction is the base class for actions that perform some function based on an URL (see page 12093).

67.1.1 TBrowseURL Class

TBrowseURL is the standard action for launching the default browser to display a specified URL (see page 11841).

Class Hierarchy

Pascal

```
TBrowseURL = class(TURLAction);
```

C++

```
class TBrowseURL : public TURLAction;
```

File

ExtActns

Description

Add TBrowseURL to an action manager or action list to let your application launch a browser to display a specific Web page in response to user actions. Controls (see page 5711) linked to this action cause the application to launch the default browser, as specified in the system registry, and display the Web page specified by the URL (see page 11841) property. You should assign a value to the URL (see page 11841) property before the user invokes this action.

See Also

TFileRun (see page 11872)

TSendMail (see page 12061)

TDownLoadURL (see page 11857)

67.1.1.1 TBrowseURL Members

The following tables list the members exposed by TBrowseURL.

Protected Events

	Name	Description
	OnChange (see page 2716)	Occurs when one of the action's properties changes.

Protected Fields

	Name	Description
	FClients (see page 2711)	This is FClients, a member of class TBasicAction.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FImage (see page 302)	This is FImage, a member of class TCustomAction.
	FMask (see page 303)	This is FMask, a member of class TCustomAction.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.

	AssignTo (see page 303)	Copies the properties of this action to a destination object.
	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	Change (see page 2712)	Generates an OnChange (see page 2716) event.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	HandleShortCut (see page 306)	Executes the action when the user types on of its short cuts.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Notification (see page 2713)	Responds when components are created or destroyed.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 294)	This is ReadState, a member of class TContainedAction.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetHelpContext (see page 306)	This is SetHelpContext, a member of class TCustomAction.
	SetHelpKeyword (see page 306)	This is SetHelpKeyword, a member of class TCustomAction.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 307)	Sets the value of the Name property.
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetOnExecute (see page 2714)	Assigns an OnExecute (see page 2716) event handler.
	SetParentComponent (see page 294)	This is SetParentComponent, a member of class TContainedAction.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	SavedEnabledState (see page 313)	Saves the value of the Enabled (see page 310) property when the action is suspended.

Public Events

	Name	Description
	OnExecute (see page 2716)	Occurs when the client event that is linked to it fires.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 301)	Instantiates and initializes a TCustomAction (see page 297) object.
V	Create (see page 2710)	Instantiates and initializes a TBasicAction (see page 2707) object.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 292)	Destroys the instance of the contained action.
V	Destroy (see page 302)	Frees an instance of TCustomAction (see page 297).
V	Destroy (see page 2711)	Disposes of an instance of a TBasicAction (see page 2707) object.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DoHint (see page 303)	Generates an OnHint (see page 315) event.
V	Execute (see page 293)	Responds when the client control "fires".
V	Execute (see page 304)	Responds when a client control "fires".
	Execute (see page 2712)	Generates an OnExecute (see page 2716) event.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
V	ExecuteTarget (see page 11836)	Launches the default Web browser to display the Web page specified by URL (see page 11841).
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.

	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
V	GetParentComponent (see page 293)	Returns the action list or action manager that contains the action.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	HandlesTarget (see page 2713)	Introduces an interface for verifying that the type, and state, of a target component or control are appropriate for the action.
V	HandlesTarget (see page 12088)	Indicates whether the action can execute.
V	HasParent (see page 294)	Indicates whether the action is contained in an action list or action manager.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RegisterChanges (see page 2713)	Associates the action with an action link.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UnRegisterChanges (see page 2714)	Breaks the association between the action and the action link.
V	Update (see page 295)	Indicates whether the action updates itself.
V	Update (see page 2714)	Provides an opportunity to execute centralized code when an application is idle.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
V	UpdateTarget (see page 2715)	Introduces an interface for a method of notifying a client when the action updates itself.
V	UpdateTarget (see page 12088)	Enables or disables the action, depending on whether the URL (see page 12093) property is set.

Public Properties

	Name	Description
	ActionComponent (see page 2715)	Indicates the client component that caused this action to execute.
	ActionList (see page 295)	Indicates the action list or action manager that contains the action.
	AutoCheck (see page 308)	Controls (see page 5711) whether the Checked (see page 308) property toggles when the action executes.
	Checked (see page 308)	Indicates whether client controls and menu items appear checked.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.

R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DisableIfNoHandler (see page 310)	Indicates whether client components should be disabled if no handler is found.
	GroupIndex (see page 311)	Indicates whether the action acts like a radio button with other actions in the same action list.
	Index (see page 296)	Specifies the index of the action in its action list or action manager.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Events

	Name	Description
	AfterBrowse (see page 11842)	Occurs after the default browser launches and loads the specified URL (see page 11841).
	BeforeBrowse (see page 11842)	Occurs immediately before the default browser launches and loads the specified URL (see page 11841).
	OnHint (see page 11842)	Occurs when the mouse pauses over a client control or menu item.
	OnUpdate (see page 11843)	Occurs when the application is idle or when the action list updates.

Published Properties

	Name	Description
	Caption (see page 11837)	Represents the caption of client controls and menu items.
	Category (see page 296)	Specifies the category under which the action appears in its action list or action manager.
	Enabled (see page 11838)	Indicates whether client controls and menu items are enabled.
	HelpContext (see page 11838)	Indicates the help context ID for client controls and menu items.
	HelpKeyword (see page 11838)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 11839)	Indicates the mechanism for client controls and menu items to use when invoking help.
	Hint (see page 11839)	Indicates the Help hint for client controls and menu items.
	ImageIndex (see page 11840)	Indicates the ImageIndex property for client controls and menu items.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	SecondaryShortCuts (see page 11840)	Specifies the short cuts (in addition to ShortCut) for triggering clients.
	ShortCut (see page 11840)	Specifies the ShortCut property for client menu items.
	Tag (see page 2808)	Stores an integer value as part of a component.
	URL (see page 11841)	Specifies the Uniform Resource Locator (URL) on which this action performs its function.
	Visible (see page 11841)	Specifies the Visible property for client controls and menu items.

67.1.1.2 TBrowseURL Methods

The methods of the TBrowseURL class are listed here.

Public Methods

	Name	Description
V	ExecuteTarget (see page 11836)	Launches the default Web browser to display the Web page specified by URL (see page 11841).

67.1.1.2.1 TBrowseURL.ExecuteTarget Method

Launches the default Web browser to display the Web page specified by URL (see page 11841).

Pascal

```
procedure ExecuteTarget(Target: TObject); override;
```

C++

```
virtual __fastcall ExecuteTarget(TObject * Target);
```

Description

ExecuteTarget is called automatically when the action fires in response to a user action (for example, when the user selects a menu item or presses a tool button that is linked to this action).

Target is the currently active object when the action fires.

ExecuteTarget ignores the Target parameter and launches the default Web browser, passing in the URL (see page 11841) specified by the URL (see page 11841) property so that the browser displays the associated Web page.

See Also

URL (see page 12093)

67.1.1.3 TBrowseURL Properties

The properties of the TBrowseURL class are listed here.

Published Properties

	Name	Description
	Caption (see page 11837)	Represents the caption of client controls and menu items.
	Enabled (see page 11838)	Indicates whether client controls and menu items are enabled.
	HelpContext (see page 11838)	Indicates the help context ID for client controls and menu items.
	HelpKeyword (see page 11838)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 11839)	Indicates the mechanism for client controls and menu items to use when invoking help.
	Hint (see page 11839)	Indicates the Help hint for client controls and menu items.
	ImageIndex (see page 11840)	Indicates the ImageIndex property for client controls and menu items.
	SecondaryShortCuts (see page 11840)	Specifies the short cuts (in addition to ShortCut) for triggering clients.
	ShortCut (see page 11840)	Specifies the ShortCut property for client menu items.
	URL (see page 11841)	Specifies the Uniform Resource Locator (URL) on which this action performs its function.
	Visible (see page 11841)	Specifies the Visible property for client controls and menu items.

67.1.1.3.1 TBrowseURL.Caption Property

Represents the caption of client controls and menu items.

Pascal

```
property Caption: string;
```

C++

```
__property AnsiString Caption;
```

Description

Caption holds the string that is the caption for the action when it is set. The value of Caption is propagated to client controls and menu items.

See Also

Caption (see page 5806)

Caption (see page 16136)

67.1.1.3.2 TBrowseURL.Enabled Property

Indicates whether client controls and menu items are enabled.

Pascal

```
property Enabled: Boolean;
```

C++

```
__property Boolean Enabled;
```

Description

Enabled specifies the enabled state for the action. The value of Enabled is propagated to client controls and menu items.

See Also

Enabled (see page 5821)

Enabled (see page 16145)

67.1.1.3.3 TBrowseURL.HelpContext Property

Indicates the help context ID for client controls and menu items.

Pascal

```
property HelpContext: THelpContext;
```

C++

```
__property THelpContext HelpContext;
```

Description

HelpContext specifies the help context for the action when it is set. This value is propagated to client controls and menu items.

When a client control has focus and the user presses the F1 key, the control uses the value of HelpContext for this associated action to invoke the online help targeting a specific topic. The target topic is uniquely identified by a nonzero HelpContext value. Leave the HelpContext property of the client control at its default value of zero. This allows multiple controls (and multiple types of controls) to be associated with the same help topic through the one action object.

Note: HelpContext is only used when the HelpType property of this action or the client control is htInteger.

See Also

HelpType (see page 312)

HelpKeyword (see page 311)

67.1.1.3.4 TBrowseURL.HelpKeyword Property

Indicates the help keyword for client controls and menu items.

Pascal

```
property HelpKeyword: string;
```

C++

```
__property AnsiString HelpKeyword;
```

Description

HelpKeyword, when set, specifies the keyword that identifies a help topic for this action. This value is propagated to the

HelpKeyword property of client controls and menu items. The interpretation of HelpKeyword depends on which help system is used to display the topic. For example, when using HyperHelp (on Linux) or WinHelp (on Windows), HelpKeyword refers to an A link.

When a client control has focus and the user presses the F1 key (or the key specified by the application's HelpKey property), the control uses the value of HelpKeyword for this associated action object to invoke the online help targeting a specific topic. Leave the HelpKeyword property of the client control unassigned. This allows multiple controls (and multiple types of controls) to be associated with the same help topic through the one action object.

Note: HelpKeyword is only used when the HelpType property of this action or the client control is htKeyword.

See Also

HelpKeyword (see page 5826)

HelpContext (see page 311)

HelpType (see page 312)

HelpKey

67.1.1.3.5 TBrowseURL.HelpType Property

Indicates the mechanism for client controls and menu items to use when invoking help.

Pascal

```
property HelpType: THelpType;
```

C++

```
__property THelpType HelpType;
```

Description

HelpType, when set, indicates whether client controls and menu items should use the HelpContext or the HelpKeyword property for invoking the help system. This value is propagated to the HelpType property of client controls and menu items.

See Also

HelpType (see page 5827)

HelpType

HelpContext (see page 311)

HelpKeyword (see page 311)

67.1.1.3.6 TBrowseURL.Hint Property

Indicates the Help hint for client controls and menu items.

Pascal

```
property Hint: string;
```

C++

```
__property AnsiString Hint;
```

Description

Hint holds the string that is the hint for that action when it is set. This value is propagated to client controls and menu items.

See Also

Hint (see page 5827)

Hint (see page 16148)

67.1.1.3.7 TBrowseURL.ImageIndex Property

Indicates the ImageIndex property for client controls and menu items.

Pascal

```
property ImageIndex: TImageIndex;
```

C++

```
__property TImageIndex ImageIndex;
```

Description

ImageIndex is an index into the Images property of the action list or action manager that contains the action. It identifies an image that is associated with controls and menu items that use this action.

See Also

ImageIndex (see page 5135)

ImageIndex (see page 16148)

Images (see page 325)

67.1.1.3.8 TBrowseURL.SecondaryShortCuts Property

Specifies the short cuts (in addition to ShortCut) for triggering clients.

Pascal

```
property SecondaryShortCuts: TShortCutList;
```

C++

```
__property TShortCutList SecondaryShortCuts;
```

Description

Actions can execute in response to multiple short cut key combinations. SecondaryShortCuts lists all the short cut key combinations (other than the one specified by the ShortCut property) that can trigger the action. This lets you specify shortcuts for clients that do not have a ShortCut property or provide additional, secondary shortcuts.

When the user types one of the key combinations listed in SecondaryShortCuts, the action's Execute method is called.

See Also

ShortCut (see page 314)

Execute (see page 304)

67.1.1.3.9 TBrowseURL.ShortCut Property

Specifies the ShortCut property for client menu items.

Pascal

```
property ShortCut: TShortCut;
```

C++

```
__property TShortCut ShortCut;
```

Description

ShortCut holds the value that is the shortcut for the action when it is set. This value is propagated to client menu items.

See Also

ShortCut (see page 16152)

SecondaryShortCuts (see page 314)

67.1.1.3.10 TBrowseURL.URL Property

Specifies the Uniform Resource Locator (URL) on which this action performs its function.

Pascal

```
property URL: String;
```

C++

```
__property AnsiString URL;
```

Description

URL is the Uniform Resource Locator (URL) with which this action works. Each TURLAction descendant performs a different function that uses this URL.

This value is not assigned automatically: it is the responsibility of the application to supply a value for URL. If no value is supplied, TURLAction automatically disables itself.

See Also

UpdateTarget (see page 12088)

67.1.1.3.11 TBrowseURL.Visible Property

Specifies the Visible property for client controls and menu items.

Pascal

```
property Visible: Boolean;
```

C++

```
__property Boolean Visible;
```

Description

Visible specifies the visible state for the action. This value is propagated to client controls and menu items.

See Also

Visible (see page 16153)

Visible (see page 5847)

67.1.1.4 TBrowseURL Events

The events of the TBrowseURL class are listed here.

Published Events

	Name	Description
	AfterBrowse (see page 11842)	Occurs after the default browser launches and loads the specified URL (see page 11841).
	BeforeBrowse (see page 11842)	Occurs immediately before the default browser launches and loads the specified URL (see page 11841).
	OnHint (see page 11842)	Occurs when the mouse pauses over a client control or menu item.
	OnUpdate (see page 11843)	Occurs when the application is idle or when the action list updates.

67.1.1.4.1 TBrowseURL.AfterBrowse Event

Occurs after the default browser launches and loads the specified URL (see page 11841).

Pascal

```
property AfterBrowse: TNotifyEvent;
```

C++

```
__property TNotifyEvent AfterBrowse;
```

Description

Write an AfterBrowse event handler to take application-specific actions immediately after TBrowseURL (see page 11832) launches the default browser and loads a specified URL (see page 11841).

See Also

BeforeBrowse (see page 11842)

67.1.1.4.2 TBrowseURL.BeforeBrowse Event

Occurs immediately before the default browser launches and loads the specified URL (see page 11841).

Pascal

```
property BeforeBrowse: TNotifyEvent;
```

C++

```
__property TNotifyEvent BeforeBrowse;
```

Description

Write a BeforeBrowse event handler to take application-specific actions immediately before TBrowseURL (see page 11832) launches the default browser and loads a specified URL (see page 11841).

See Also

AfterBrowse (see page 11842)

67.1.1.4.3 TBrowseURL.OnHint Event

Occurs when the mouse pauses over a client control or menu item.

Pascal

```
property OnHint: THintEvent;
```

C++

```
__property THintEvent OnHint;
```

Description

Use OnHint to override the default hint that appears when the user pauses the mouse over a client control or menu item. The OnHint event handler can change the hint that appears (by changing the HintStr parameter), or display the hint in some application-specific way.

67.1.1.4.4 TBrowseURL.OnUpdate Event

Occurs when the application is idle or when the action list updates.

Pascal

```
property OnUpdate: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnUpdate;
```

Description

Write an OnUpdate event handler to execute centralized code while an application is idle. For example, actions may want to update enabling and disabling, or checking and unchecking of client targets.

C++ Examples:

```
/*
When the application is idle, the OnUpdate event occurs for
every action that is linked to a visible control or menu
item that is showing. This provides an opportunity for
applications to execute centralized code for enabling and
disabling, checking and unchecking, and so on. For example,
the following code illustrates the OnUpdate event handler
for an action that is "checked" when the toolbar is visible.
This example requires a TActionList (with one TAction) and a
TToolBar on a form. This example requires a TActionList
(with one TAction) and a TToolBar on a form.  Double click
on the TActionList and create an TAction named Action1.  The
TAction has an OnUpdate event handler called Action1Update.
Then set an object's (such as a button or menu item) Action
to Action1.
*/
void __fastcall TForm1::Action1Update(TObject *Sender)
{
   // Indicate whether ToolBar1 is currently visible.
   TAction* pa = dynamic_cast<TAction*>(Sender);
   if (pa)
   {
     if (pa->Checked != ToolBar1->Visible)
     {
       lbOther->Items->Add("Event Action1Update: toolbar visibility changed");
     }
     pa->Checked = ToolBar1->Visible;
   }
}
```

Delphi Examples:

```
{
When the application is idle, the OnUpdate event occurs for
every action that is linked to a visible control or menu
item that is showing. This provides an opportunity for
applications to execute centralized code for enabling and
disabling, checking and unchecking, and so on. For example,
the following code illustrates the OnUpdate event handler
for an action that is "checked" when the toolbar is visible.
This example requires a TActionList (with one TAction) and a
```

```
TToolBar on a form. This example requires a TActionList
(with one TAction) and a TToolBar on a form.  Double click
on the TActionList and create an TAction named Action1.  The
TAction has an OnUpdate event handler called Action1Update.
Then set an object's (such as a button or menu item) Action
to Action1.
}
procedure TMainForm.Action1Update(Sender: TObject);
begin
  if ((Sender as TAction).Checked <> ToolBar1.Visible) then
    lbOther.Items.Add('Event Action1Update: toolbar visibility changed');
    { Indicate whether ToolBar1 is currently visible }
    (Sender as TAction).Checked := ToolBar1.Visible;
end;
```

UpdateAction (see page 2790)

67.1.2 TCustomFileRun Class

TCustomFileRun is the base class for actions that perform a specified operation on a file.

Class Hierarchy

Pascal

```
TCustomFileRun = class(TCustomAction);
```

C++

```
class TCustomFileRun : public TCustomAction;
```

File

ExtActns

Description

Use TCustomFileRun as a base class when defining a pre-defined action that uses ShellExecute to perform an operation on a file. TCustomFileRun implements properties for specifying

A target file or the option of letting the user select one using a browse dialog.

The operation to perform on the target file.

Parameters (see page 11855) to supply to an external application that performs the desired operation.

The startup directory for the external application.

The state of the window that appears when performing the specified operation.

When the ExecuteTarget (see page 11849) method is called, TCustomFileRun uses these properties to call the Windows API ShellExecute, which performs the specified operation if it is listed as applicable to the target file type in the system registry. Depending on the operation, this may involve launching an external application, calling a dynamic-link library (DLL), or displaying a system dialog (such as the file properties dialog).

Do not add TCustomFileRun to an action list or action manager. To add a generic file run action, use TFileRun (see page

11872) instead.

See Also

TFileRun (see page 11872)

67.1.2.1 TCustomFileRun Members

The following tables list the members exposed by TCustomFileRun.

Protected Events

	Name	Description
	OnChange (see page 2716)	Occurs when one of the action's properties changes.

Protected Fields

	Name	Description
	FClients (see page 2711)	This is FClients, a member of class TBasicAction.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FImage (see page 302)	This is FImage, a member of class TCustomAction.
	FMask (see page 303)	This is FMask, a member of class TCustomAction.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 303)	Copies the properties of this action to a destination object.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	Change (see page 2712)	Generates an OnChange (see page 2716) event.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
V	HandleShortCut (see page 306)	Executes the action when the user types on of its short cuts.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 11850)	Responds when components are created or destroyed.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 294)	This is ReadState, a member of class TContainedAction.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.

	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetHelpContext (see page 306)	This is SetHelpContext, a member of class TCustomAction.
	SetHelpKeyword (see page 306)	This is SetHelpKeyword, a member of class TCustomAction.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 307)	Sets the value of the Name property.
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetOnExecute (see page 2714)	Assigns an OnExecute (see page 2716) event handler.
	SetParentComponent (see page 294)	This is SetParentComponent, a member of class TContainedAction.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	SavedEnabledState (see page 313)	Saves the value of the Enabled (see page 310) property when the action is suspended.

Public Events

	Name	Description
	OnExecute (see page 2716)	Occurs when the client event that is linked to it fires.
	OnHint (see page 315)	Occurs when the mouse pauses over a client control or menu item.
	OnUpdate (see page 2718)	Occurs when the application is idle or when the action list updates.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 11849)	Creates an instance of TCustomFileRun (see page 11844).
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 292)	Destroys the instance of the contained action.
	Destroy (see page 302)	Frees an instance of TCustomAction (see page 297).
	Destroy (see page 2711)	Disposes of an instance of a TBasicAction (see page 2707) object.
	Destroy (see page 2766)	Disposes of the component and its owned components.

	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DoHint (see page 303)	Generates an OnHint (see page 315) event.
	Execute (see page 293)	Responds when the client control "fires".
	Execute (see page 304)	Responds when a client control "fires".
	Execute (see page 2712)	Generates an OnExecute (see page 2716) event.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	ExecuteTarget (see page 11849)	Performs the specified operation on a target file.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 293)	Returns the action list or action manager that contains the action.
	GetParentComponent (see page 2778)	Returns the containing Component.
	HandlesTarget (see page 11850)	Indicates whether the action can execute.
	HasParent (see page 294)	Indicates whether the action is contained in an action list or action manager.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RegisterChanges (see page 2713)	Associates the action with an action link.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	SetupBrowseDialog (see page 11851)	Creates an instance of TOpenDialog and assigns it as the value of the BrowseDlg (see page 11853) property.
	UnRegisterChanges (see page 2714)	Breaks the association between the action and the action link.

V	Update (see page 295)	Indicates whether the action updates itself.
V	Update (see page 2714)	Provides an opportunity to execute centralized code when an application is idle.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
V	UpdateTarget (see page 11851)	Enables or disables the action, depending on current conditions.

Public Properties

	Name	Description
	ActionComponent (see page 2715)	Indicates the client component that caused this action to execute.
	ActionList (see page 295)	Indicates the action list or action manager that contains the action.
	AutoCheck (see page 308)	Controls (see page 5711) whether the Checked (see page 308) property toggles when the action executes.
	Browse (see page 11852)	Controls (see page 5711) whether an open dialog automatically appears to let users browse for the target file.
	BrowseDlg (see page 11853)	Specifies the dialog that allows users to select the target file to run.
	Caption (see page 308)	Represents the caption of client controls and menu items.
	Checked (see page 308)	Indicates whether client controls and menu items appear checked.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	Directory (see page 11853)	Specifies the default directory for the externally-launched application.
	DisableIfNoHandler (see page 310)	Indicates whether client components should be disabled if no handler is found.
	Enabled (see page 310)	Indicates whether client controls and menu items are enabled.
	FileName (see page 11853)	Specifies the target file to run.
	GroupIndex (see page 311)	Indicates whether the action acts like a radio button with other actions in the same action list.
	HelpContext (see page 311)	Indicates the help context ID for client controls and menu items.
	HelpKeyword (see page 311)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 312)	Indicates the mechanism for client controls and menu items to use when invoking help.
R	HInst (see page 11854)	Indicates the Windows error code that is returned when TCustomFileRun (see page 11844) launches the external application.
	Hint (see page 312)	Indicates the Help hint for client controls and menu items.
	ImageIndex (see page 313)	Indicates the ImageIndex property for client controls and menu items.
	Index (see page 296)	Specifies the index of the action in its action list or action manager.
	Operation (see page 11855)	Indicates what TCustomFileRun (see page 11844) should do with the target file.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Parameters (see page 11855)	Specifies parameters to be passed to the application when the target file is an executable.
	ParentControl (see page 11856)	This is ParentControl, a member of class TCustomFileRun.
	SecondaryShortCuts (see page 314)	Specifies the short cuts (in addition to ShortCut (see page 314)) for triggering clients.
	ShortCut (see page 314)	Specifies the ShortCut property for client menu items.
	ShowCmd (see page 11856)	Specifies how the launched application window appears.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	Visible (see page 314)	Specifies the Visible property for client controls and menu items.

Published Properties

	Name	Description
	Category (see page 296)	Specifies the category under which the action appears in its action list or action manager.

	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

67.1.2.2 TCustomFileRun.Create Constructor

Creates an instance of TCustomFileRun (see page 11844).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomFileRun(TComponent * AOwner);
```

Description

Most applications do not need to call the TCustomFileRun (see page 11844) constructor because actions are added at design time to an action list or action manager.

AOwner specifies the Owner for the action. This is the component that is responsible for freeing the TCustomFileRun (see page 11844) instance.

Create initializes the action's properties and creates a default TOpenDialog instance to act as the value of the BrowseDlg (see page 11853) property.

See Also

Owner (see page 2807)

SetupBrowseDialog (see page 11851)

BrowseDlg (see page 11853)

67.1.2.3 TCustomFileRun Methods

The methods of the TCustomFileRun class are listed here.

Protected Methods

	Name	Description
	Notification (see page 11850)	Responds when components are created or destroyed.

Public Methods

	Name	Description
	ExecuteTarget (see page 11849)	Performs the specified operation on a target file.
	HandlesTarget (see page 11850)	Indicates whether the action can execute.
	SetupBrowseDialog (see page 11851)	Creates an instance of TOpenDialog and assigns it as the value of the BrowseDlg (see page 11853) property.
	UpdateTarget (see page 11851)	Enables or disables the action, depending on current conditions.

67.1.2.3.1 TCustomFileRun.ExecuteTarget Method

Performs the specified operation on a target file.

Pascal

```
procedure ExecuteTarget(Target: TObject); override;
```

C++

```
virtual __fastcall ExecuteTarget(TObject * Target);
```

Description

Do not call the ExecuteTarget method. This method is called automatically when the action fires in response to a user action (for example, when the user selects a menu item or presses a tool button that is linked to this action).

Target is the currently active object when the action fires.

ExecuteTarget ignores the Target parameter and performs the operation specified by the Operation (see page 11855) property on the target file specified by the FileName (see page 11853) property or chosen by the user if the value of the Browse (see page 11852) property is true. The values of Parameters (see page 11855), ShowCmd (see page 11856), and Directory (see page 11853), as well as the window handle for ParentControl (see page 11856) are passed to Windows with the request to perform the specified operation.

Note: If the attempt to perform the operation fails, the HInst (see page 11854) property contains an error code that indicates what was wrong. If the attempt succeeds, the HInst (see page 11854) property is greater than 32.

See Also

FileName (see page 11853)

Browse (see page 11852)

Operation (see page 11855)

Parameters (see page 11855)

ShowCmd (see page 11856)

Directory (see page 11853)

parentcontrol (see page 11856)

HInst (see page 11854)

67.1.2.3.2 TCustomFileRun.HandlesTarget Method

Indicates whether the action can execute.

Pascal

```
function HandlesTarget(Target: TObject): Boolean; override;
```

C++

```
virtual __fastcall Boolean HandlesTarget(TObject * Target);
```

Description

Do not call the HandlesTarget method. This method is called automatically when the user invokes an object (such as a tool button or menu item) that is linked to this action. The HandlesTarget method lets the action object indicate whether it is appropriate to execute at this time with the object specified by the Target parameter as a "target".

HandlesTarget always returns true, because TCustomFileRun (see page 11844) does not use the target object.

67.1.2.3.3 TCustomFileRun.Notification Method

Responds when components are created or destroyed.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

Do not call the Notification method in an application. Notification is called automatically when the component specified by AComponent is about to be inserted or removed, as specified by Operation.

TBasicAction overrides the Notification method to check whether the component that is the value of the ActionComponent property is about to be freed. If so, it sets the ActionComponent property to nil (Delphi) or NULL (C++).

ActionComponent (see page 2715)

67.1.2.3.4 TCustomFileRun.SetupBrowseDialog Method

Creates an instance of TOpenDialog and assigns it as the value of the BrowseDlg (see page 11853) property.

Pascal

```
procedure SetupBrowseDialog;
```

C++

```
__fastcall SetupBrowseDialog();
```

Description

SetupBrowseDialog generates the default open dialog instance for the dialog that appears when the Browse (see page 11852) property is true. It assigns this newly created dialog component as the value of the BrowseDlg (see page 11853) property.

Most applications do not need to call SetupBrowseDialog because it is called automatically by the TCustomFileRun (see page 11844) constructor.

See Also

BrowseDlg (see page 11853)

TOpenDialog (see page 11407)

Browse (see page 11852)

67.1.2.3.5 TCustomFileRun.UpdateTarget Method

Enables or disables the action, depending on current conditions.

Pascal

```
procedure UpdateTarget(Target: TObject); override;
```

C++

```
virtual __fastcall UpdateTarget(TObject * Target);
```

Description

Do not call the UpdateTarget method. This method is called automatically when application is idle so that the action can update itself to reflect current conditions.

In TCustomFileRun (see page 11844), UpdateTarget checks whether it can obtain a target file. If the FileName (see page

11853) property specifies a target file, or if the Browse (see page 11852) property is true, indicating that users can select a target file, then UpdateTarget sets Enabled to true. If not, UpdateTarget sets Enabled to false.

See Also

Enabled (see page 310)

FileName (see page 11853)

Browse (see page 11852)

67.1.2.4 TCustomFileRun Properties

The properties of the TCustomFileRun class are listed here.

Public Properties

	Name	Description
	Browse (see page 11852)	Controls (see page 5711) whether an open dialog automatically appears to let users browse for the target file.
	BrowseDlg (see page 11853)	Specifies the dialog that allows users to select the target file to run.
	Directory (see page 11853)	Specifies the default directory for the externally-launched application.
	FileName (see page 11853)	Specifies the target file to run.
R	HInst (see page 11854)	Indicates the Windows error code that is returned when TCustomFileRun (see page 11844) launches the external application.
	Operation (see page 11855)	Indicates what TCustomFileRun (see page 11844) should do with the target file.
	Parameters (see page 11855)	Specifies parameters to be passed to the application when the target file is an executable.
	ParentControl (see page 11856)	This is ParentControl, a member of class TCustomFileRun.
	ShowCmd (see page 11856)	Specifies how the launched application window appears.

67.1.2.4.1 TCustomFileRun.Browse Property

Controls (see page 5711) whether an open dialog automatically appears to let users browse for the target file.

Pascal

```
property Browse: Boolean;
```

C++

```
__property Boolean Browse;
```

Description

Browse controls whether TCustomFileRun (see page 11844) displays the dialog specified by BrowseDlg (see page 11853) when it fires, letting users select the target file to be launched. When Browse is true, firing TCustomFileRun (see page 11844) displays the open dialog specified by BrowseDlg (see page 11853), and then (if the user does not cancel) performs the operation specified by Operation (see page 11855) on the chosen file. When Browse is false, your application must specify the target file by explicitly setting the FileName (see page 11853) property.

Note: When Browse is true, TCustomFileRun (see page 11844) ignores the FileName (see page 11853) property.

See Also

BrowseDlg (see page 11853)

FileName (see page 11853)

Operation (see page 11855)

67.1.2.4.2 TCustomFileRun.BrowseDlg Property

Specifies the dialog that allows users to select the target file to run.

Pascal

```
property BrowseDlg: TOpenDialog;
```

C++

```
__property TOpenDialog BrowseDlg;
```

Description

Use BrowseDlg when the Browse (see page 11852) property is true to configure the dialog that users use to select a target file. By expanding BrowseDlg in the Object Inspector at design time, or by setting its properties at runtime, you can customize the way the dialog first appears when the action fires.

By default, BrowseDlg is an internally-generated TOpenDialog object. When using the default dialog, there is no need to explicitly add a dialog component to your application. If you want to use a specialized TOpenDialog descendant (such as TOpenPictureDialog), however, set BrowseDlg to an open dialog component you place in the same form or data module as the TCustomFileRun (see page 11844) action.

See Also

Browse (see page 11852)

FileName (see page 11853)

TOpenDialog (see page 11407)

67.1.2.4.3 TCustomFileRun.Directory Property

Specifies the default directory for the externally-launched application.

Pascal

```
property Directory: TFileName;
```

C++

```
__property TFileName Directory;
```

Description

Set Directory to specify a default (startup) directory for the external application that is launched when the action fires.

See Also

Parameters (see page 11855)

FileName (see page 11853)

67.1.2.4.4 TCustomFileRun.FileName Property

Specifies the target file to run.

Pascal

```
property FileName: TFileName;
```

C++

```
__property TFileName FileName;
```

Description

Set FileName to specify the file on which TCustomFileRun (see page 11844) performs the operation specified by Operation (see page 11855) when the action fires. FileName can specify a file that is opened using an external application (such as a .txt file that causes a text editor to launch), or it can specify an executable file for the application itself. When the action fires in response to a user action, TCustomFileRun (see page 11844) launches an external application or dll to perform Operation (see page 11855) on the file specified by FileName.

Note:

See Also

Browse (see page 11852)

BrowseDlg (see page 11853)

Parameters (see page 11855)

Operation (see page 11855)

67.1.2.4.5 TCustomFileRun.HInst Property

Indicates the Windows error code that is returned when TCustomFileRun (see page 11844) launches the external application.

Pascal

```
property HInst: HInst;
```

C++

```
__property HInst HInst;
```

Description

TCustomFileRun (see page 11844) sets HInst to the Windows return value when it launches the external application. If this value is less than 32, it represents an error code that indicates why the application failed to launch. This value is only available after the action has executed.

The following table lists the possible error values (defined in shellapi.pas) that can be the value of HInst when it is less than 32.

Value	Meaning
0	The operating system is out of memory or resources.
ERROR_FILE_NOT_FOUND	The specified file was not found.
ERROR_PATH_NOT_FOUND	The specified path was not found.
ERROR_BAD_FORMAT	The .exe file is invalid (does not have the correct internal format).
SE_ERR_ACCESSDENIED	The operating system denied access to the specified file.
SE_ERR_ASSOCINCOMPLETE	The file name association is incomplete or invalid.
SE_ERR_DDEBUSY	A DDE transaction could not be completed because other DDE transactions were being processed.
SE_ERR_DDEFAIL	A DDE transaction failed.
SE_ERR_DDETIMEOUT	A DDE transaction could not be completed because the request timed out.
SE_ERR_DLLNOTFOUND	A specified dynamic-link library was not found.
SE_ERR_FNF	The specified file was not found.
SE_ERR_NOASSOC	There is no application associated with the given file name extension or TCustomFileRun (see page 11844) attempted to print an unprintable file.

SE_ERR_OOM	There was not enough memory to complete the operation.
SE_ERR_PNF	The specified path was not found.
SE_ERR_SHARE	A sharing violation occurred.

67.1.2.4.6 TCustomFileRun.Operation Property

Indicates what TCustomFileRun (see page 11844) should do with the target file.

Pascal

```
property Operation: String;
```

C++

```
__property AnsiString Operation;
```

Description

Set Operation to indicate what should be done with the target file when TCustomFileRun (see page 11844) fires. The possible values for Operation depend on the particular file or folder specified by FileName (see page 11853) or selected by the user when Browse (see page 11852) is true. The possible operations for a particular file or folder are listed in the system Registry (see page 18633).

The following strings are usually valid:

Value	Meaning
edit	TCustomFileRun (see page 11844) opens an editor. If FileName (see page 11853) is not an editable file, the action fails.
explore	TCustomFileRun (see page 11844) launches the Windows explorer for the folder specified by FileName (see page 11853).
open	TCustomFileRun (see page 11844) opens the file specified by FileName (see page 11853). FileName (see page 11853) can be an executable file, a file associated with an application that can open it, or a folder.
print	TCustomFileRun (see page 11844) prints the file specified by FileName (see page 11853). If FileName (see page 11853) is a binary file (for example, if it is an executable), the action fails.
properties	TCustomFileRun (see page 11844) displays the file or folder's properties in a Properties dialog.

Note: If Operation is an empty string, Windows tries to use the "open" operation. If the specified file does not support the "open" operation, Windows tries to use the default operation. If there is no "open" operation and no default operation, and if the application is running on Windows 2000 or later, Windows uses the first verb listed in the Registry (see page 18633).

See Also

FileName (see page 11853)

Browse (see page 11852)

67.1.2.4.7 TCustomFileRun.Parameters Property

Specifies parameters to be passed to the application when the target file is an executable.

Pascal

```
property Parameters: String;
```

C++

```
__property AnsiString Parameters;
```

Description

Use Parameters to specify any parameters that should be passed to the external application when it is launched. Only set Parameters if FileName (see page 11853) is the name of an Executable file or the user is browsing for an executable file. If the target file holds data associated with the application to launch, Parameters should be an empty string.

See Also

FileName (see page 11853)

Operation (see page 11855)

67.1.2.4.8 TCustomFileRun.ParentControl Property

Pascal

```
property ParentControl: TWinControl;
```

C++

```
__property TWinControl * ParentControl;
```

Description

This is ParentControl, a member of class TCustomFileRun.

67.1.2.4.9 TCustomFileRun.ShowCmd Property

Specifies how the launched application window appears.

Pascal

```
property ShowCmd: TShowCmd;
```

C++

```
__property TShowCmd ShowCmd;
```

Description

Use ShowCmd to indicate how you want the application window to appear when TCustomFileRun (see page 11844) performs the specified operation on its target file. ShowCmd can have any of the following values:

Value	Meaning
scHide	The external application window is hidden. If it was active, another window is activated.
scMaximize	The external application window is maximized (but not necessarily activated)
scMinimize	The external application window is minimized (but not necessarily activated).
scRestore	The external application window is activated. If it was minimized or maximized, Windows restores it to its original size and position.
scShow	The external application window is activated in its current size and position.
scShowDefault	The external application window is shown in the default startup state specified by that external application.
scShowMaximized	The external application window is activated and maximized.
scShowMinimized	The external application window is activated and minimized.
scShowMinNoActive	The external application window is minimized. The active window does not change.
scShowNA	The external application window is displayed (after being hidden) but activation does not change.

scShowNoActivate	The external application window is displayed in its most recent size and position, but activation does not change.
scShowNormal	The external application window is activated and restored to its original size and position if it was maximized or minimized.

Operation (see page 11855)

67.1.3 TDownLoadURL Class

TDownLoadURL is the standard action for saving the contents of a specified URL (see page 11869) to a file.

Class Hierarchy

Pascal

```
TDownLoadURL = class(TURLAction, IBindStatusCallback);
```

C++

```
class TDownLoadURL : public TURLAction, public IBindStatusCallback;
```

File

ExtActns

Description

Add TDownLoadURL to an action manager or action list to let your application save the contents of a specified URL (see page 11869) to a file. Controls (see page 5711) linked to this action cause the application to lookup the resource specified by the URL (see page 11869) property and save it to the file specified by the Filename (see page 11866) property. While TDownLoadURL is writing to the specified file, it periodically generates an OnDownloadProgress (see page 11870) event, so that you can provide users with feedback about the process.

You should assign a value to the URL (see page 11869) property and to the FileName property before the user invokes this action.

See Also

TFileRun (see page 11872)

TSendMail (see page 12061)

TBrowseURL (see page 11832)

67.1.3.1 TDownLoadURL Members

The following tables list the members exposed by TDownLoadURL.

Protected Events

	Name	Description
	OnChange (see page 2716)	Occurs when one of the action's properties changes.

Protected Fields

	Name	Description
	FClients (see page 2711)	This is FClients, a member of class TBasicAction.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FImage (see page 302)	This is FImage, a member of class TCustomAction.
	FMask (see page 303)	This is FMask, a member of class TCustomAction.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 303)	Copies the properties of this action to a destination object.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	Change (see page 2712)	Generates an OnChange (see page 2716) event.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetBindInfo (see page 11863)	This is GetBindInfo, a member of class TDownLoadURL.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetPriority (see page 11863)	This is GetPriority, a member of class TDownLoadURL.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
V	HandleShortCut (see page 306)	Executes the action when the user types on of its short cuts.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2713)	Responds when components are created or destroyed.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
	OnDataAvailable (see page 11863)	This is OnDataAvailable, a member of class TDownLoadURL.
	OnLowResource (see page 11863)	This is OnLowResource, a member of class TDownLoadURL.
	OnObjectAvailable (see page 11864)	This is OnObjectAvailable, a member of class TDownLoadURL.
	OnProgress (see page 11864)	This is OnProgress, a member of class TDownLoadURL.
	OnStartBinding (see page 11864)	This is OnStartBinding, a member of class TDownLoadURL.
	OnStopBinding (see page 11864)	This is OnStopBinding, a member of class TDownLoadURL.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 294)	This is ReadState, a member of class TContainedAction.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.

	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetHelpContext (see page 306)	This is SetHelpContext, a member of class TCustomAction.
	SetHelpKeyword (see page 306)	This is SetHelpKeyword, a member of class TCustomAction.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 307)	Sets the value of the Name property.
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetOnExecute (see page 2714)	Assigns an OnExecute (see page 2716) event handler.
	SetParentComponent (see page 294)	This is SetParentComponent, a member of class TContainedAction.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	SavedEnabledState (see page 313)	Saves the value of the Enabled (see page 310) property when the action is suspended.

Public Events

	Name	Description
	OnExecute (see page 2716)	Occurs when the client event that is linked to it fires.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 301)	Instantiates and initializes a TCustomAction (see page 297) object.
	Create (see page 2710)	Instantiates and initializes a TBasicAction (see page 2707) object.
	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 292)	Destroys the instance of the contained action.
	Destroy (see page 302)	Frees an instance of TCustomAction (see page 297).
	Destroy (see page 2711)	Disposes of an instance of a TBasicAction (see page 2707) object.
	Destroy (see page 2766)	Disposes of the component and its owned components.

	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DoHint (see page 303)	Generates an OnHint (see page 315) event.
	Execute (see page 293)	Responds when the client control "fires".
	Execute (see page 304)	Responds when a client control "fires".
	Execute (see page 2712)	Generates an OnExecute (see page 2716) event.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	ExecuteTarget (see page 11862)	Creates the file specified by the Filename (see page 11866) property and downloads the contents of URL (see page 11869) to it.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 293)	Returns the action list or action manager that contains the action.
	GetParentComponent (see page 2778)	Returns the containing Component.
	HandlesTarget (see page 2713)	Introduces an interface for verifying that the type, and state, of a target component or control are appropriate for the action.
	HandlesTarget (see page 12088)	Indicates whether the action can execute.
	HasParent (see page 294)	Indicates whether the action is contained in an action list or action manager.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RegisterChanges (see page 2713)	Associates the action with an action link.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.

	UnRegisterChanges (see page 2714)	Breaks the association between the action and the action link.
V	Update (see page 295)	Indicates whether the action updates itself.
V	Update (see page 2714)	Provides an opportunity to execute centralized code when an application is idle.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
V	UpdateTarget (see page 2715)	Introduces an interface for a method of notifying a client when the action updates itself.
V	UpdateTarget (see page 12088)	Enables or disables the action, depending on whether the URL (see page 12093) property is set.

Public Properties

	Name	Description
	ActionComponent (see page 2715)	Indicates the client component that caused this action to execute.
	ActionList (see page 295)	Indicates the action list or action manager that contains the action.
	AutoCheck (see page 308)	Controls (see page 5711) whether the Checked (see page 308) property toggles when the action executes.
	Checked (see page 308)	Indicates whether client controls and menu items appear checked.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DisableIfNoHandler (see page 310)	Indicates whether client components should be disabled if no handler is found.
	GroupIndex (see page 311)	Indicates whether the action acts like a radio button with other actions in the same action list.
	Index (see page 296)	Specifies the index of the action in its action list or action manager.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Events

	Name	Description
	AfterDownload (see page 11870)	Occurs after TDownLoadURL (see page 11857) downloads the specified resource and writes it to a file.
	BeforeDownload (see page 11870)	Occurs before TDownLoadURL (see page 11857) downloads the specified resource and writes it to a file.
	OnDownloadProgress (see page 11870)	Occurs periodically while TDownLoadURL (see page 11857) is downloading the specified resource and writing it to a file.
	OnHint (see page 11871)	Occurs when the mouse pauses over a client control or menu item.
	OnUpdate (see page 11871)	Occurs when the application is idle or when the action list updates.

Published Properties

	Name	Description
	Caption (see page 11865)	Represents the caption of client controls and menu items.
	Category (see page 296)	Specifies the category under which the action appears in its action list or action manager.
	Enabled (see page 11865)	Indicates whether client controls and menu items are enabled.
	Filename (see page 11866)	Specifies the file to which this action copies the resource identified by the URL (see page 11869) property.
	HelpContext (see page 11866)	Indicates the help context ID for client controls and menu items.
	HelpKeyword (see page 11866)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 11867)	Indicates the mechanism for client controls and menu items to use when invoking help.
	Hint (see page 11867)	Indicates the Help hint for client controls and menu items.
	ImageIndex (see page 11868)	Indicates the ImageIndex property for client controls and menu items.

	Name (see page 2805)	Specifies the name of the component as referenced in code.
	SecondaryShortCuts (see page 11868)	Specifies the short cuts (in addition to ShortCut) for triggering clients.
	ShortCut (see page 11869)	Specifies the ShortCut property for client menu items.
	Tag (see page 2808)	Stores an integer value as part of a component.
	URL (see page 11869)	Specifies the Uniform Resource Locator (URL) on which this action performs its function.
	Visible (see page 11869)	Specifies the Visible property for client controls and menu items.

67.1.3.2 TDownLoadURL Methods

The methods of the TDownLoadURL class are listed here.

Protected Methods

	Name	Description
	GetBindInfo (see page 11863)	This is GetBindInfo, a member of class TDownLoadURL.
	GetPriority (see page 11863)	This is GetPriority, a member of class TDownLoadURL.
	OnDataAvailable (see page 11863)	This is OnDataAvailable, a member of class TDownLoadURL.
	OnLowResource (see page 11863)	This is OnLowResource, a member of class TDownLoadURL.
	OnObjectAvailable (see page 11864)	This is OnObjectAvailable, a member of class TDownLoadURL.
	OnProgress (see page 11864)	This is OnProgress, a member of class TDownLoadURL.
	OnStartBinding (see page 11864)	This is OnStartBinding, a member of class TDownLoadURL.
	OnStopBinding (see page 11864)	This is OnStopBinding, a member of class TDownLoadURL.

Public Methods

	Name	Description
	ExecuteTarget (see page 11862)	Creates the file specified by the Filename (see page 11866) property and downloads the contents of URL (see page 11869) to it.

67.1.3.2.1 TDownLoadURL.ExecuteTarget Method

Creates the file specified by the Filename (see page 11866) property and downloads the contents of URL (see page 11869) to it.

Pascal

```
procedure ExecuteTarget(Target: TObject); override;
```

C++

```
virtual __fastcall ExecuteTarget(TObject * Target);
```

Description

ExecuteTarget is called automatically when the action fires in response to a user action (for example, when the user selects a menu item or presses a tool button that is linked to this action).

Target is the currently active object when the action fires.

ExecuteTarget ignores the Target parameter and looks up (on the internet) the URL (see page 11869) specified by the URL (see page 11869) property, creates the file specified by the Filename (see page 11866) property, and writes the bits found at the specified URL (see page 11869) to the file.

Periodically throughout this download process, TDownLoadURL (see page 11857) generates an OnDownloadProgress (see page 11870) event.

See Also

URL (see page 12093)

Filename (see page 11866)

OnDownloadProgress (see page 11870)

67.1.3.2.2 TDownLoadURL.GetBindInfo Method

Pascal

```
function GetBindInfo(out grfBINDF: Cardinal; var bindinfo: _tagBINDINFO): HRESULT; stdcall;
```

C++

```
__fastcall __stdcall HRESULT GetBindInfo(unsigned grfBINDF, _tagBINDINFO bindinfo);
```

Description

This is GetBindInfo, a member of class TDownLoadURL.

67.1.3.2.3 TDownLoadURL.GetPriority Method

Pascal

```
function GetPriority(out nPriority): HRESULT; stdcall;
```

C++

```
__fastcall __stdcall HRESULT GetPriority( nPriority);
```

Description

This is GetPriority, a member of class TDownLoadURL.

67.1.3.2.4 TDownLoadURL.OnDataAvailable Method

Pascal

```
function OnDataAvailable(grfBSCF: Cardinal; dwSize: Cardinal; formatetc: PFormatEtc; stgmed:
PStgMedium): HRESULT; stdcall;
```

C++

```
__fastcall __stdcall HRESULT OnDataAvailable(unsigned grfBSCF, unsigned dwSize, PFormatEtc
formatetc, PStgMedium stgmed);
```

Description

This is OnDataAvailable, a member of class TDownLoadURL.

67.1.3.2.5 TDownLoadURL.OnLowResource Method

Pascal

```
function OnLowResource(reserved: Cardinal): HRESULT; stdcall;
```

C++

```
__fastcall __stdcall HRESULT OnLowResource(unsigned reserved);
```

Description

This is OnLowResource, a member of class TDownLoadURL.

67.1.3.2.6 TDownLoadURL.OnObjectAvailable Method

Pascal

```
function OnObjectAvailable(const iid: TGUID; punk: IUnknown): HRESULT; stdcall;
```

C++

```
__fastcall __stdcall HRESULT OnObjectAvailable(const TGUID iid, IUnknown punk);
```

Description

This is OnObjectAvailable, a member of class TDownLoadURL.

67.1.3.2.7 TDownLoadURL.OnProgress Method

Pascal

```
function OnProgress(ulProgress: Cardinal; ulProgressMax: Cardinal; ulStatusCode: Cardinal;
szStatusText: PWideChar): HRESULT; stdcall;
```

C++

```
__fastcall __stdcall HRESULT OnProgress(unsigned ulProgress, unsigned ulProgressMax, unsigned
ulStatusCode, PWideChar szStatusText);
```

Description

This is OnProgress, a member of class TDownLoadURL.

67.1.3.2.8 TDownLoadURL.OnStartBinding Method

Pascal

```
function OnStartBinding(dwReserved: Cardinal; pib: IBinding): HRESULT; stdcall;
```

C++

```
__fastcall __stdcall HRESULT OnStartBinding(unsigned dwReserved, IBinding pib);
```

Description

This is OnStartBinding, a member of class TDownLoadURL.

67.1.3.2.9 TDownLoadURL.OnStopBinding Method

Pascal

```
function OnStopBinding(hresult: HRESULT; szError: PWideChar): HRESULT; stdcall;
```

C++

```
__fastcall __stdcall HRESULT OnStopBinding(HRESULT hresult, PWideChar szError);
```

Description

This is OnStopBinding, a member of class TDownLoadURL.

67.1.3.3 TDownLoadURL Properties

The properties of the TDownLoadURL class are listed here.

Published Properties

	Name	Description
	Caption (see page 11865)	Represents the caption of client controls and menu items.
	Enabled (see page 11865)	Indicates whether client controls and menu items are enabled.
	Filename (see page 11866)	Specifies the file to which this action copies the resource identified by the URL (see page 11869) property.
	HelpContext (see page 11866)	Indicates the help context ID for client controls and menu items.
	HelpKeyword (see page 11866)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 11867)	Indicates the mechanism for client controls and menu items to use when invoking help.
	Hint (see page 11867)	Indicates the Help hint for client controls and menu items.
	ImageIndex (see page 11868)	Indicates the ImageIndex property for client controls and menu items.
	SecondaryShortCuts (see page 11868)	Specifies the short cuts (in addition to ShortCut) for triggering clients.
	ShortCut (see page 11869)	Specifies the ShortCut property for client menu items.
	URL (see page 11869)	Specifies the Uniform Resource Locator (URL) on which this action performs its function.
	Visible (see page 11869)	Specifies the Visible property for client controls and menu items.

67.1.3.3.1 TDownLoadURL.Caption Property

Represents the caption of client controls and menu items.

Pascal

```
property Caption: string;
```

C++

```
__property AnsiString Caption;
```

Description

Caption holds the string that is the caption for the action when it is set. The value of Caption is propagated to client controls and menu items.

See Also

Caption (see page 5806)

Caption (see page 16136)

67.1.3.3.2 TDownLoadURL.Enabled Property

Indicates whether client controls and menu items are enabled.

Pascal

```
property Enabled: Boolean;
```

C++

```
__property Boolean Enabled;
```

Description

Enabled specifies the enabled state for the action. The value of Enabled is propagated to client controls and menu items.

See Also

Enabled (see page 5821)

Enabled (see page 16145)

67.1.3.3.3 TDownLoadURL.Filename Property

Specifies the file to which this action copies the resource identified by the URL (see page 11869) property.

Pascal

```
property Filename: TFilename;
```

C++

```
__property TFilename Filename;
```

Description

Filename is the name of the file that TDownLoadURL (see page 11857) creates to hold the contents of the URL (see page 11869) specified by the URL (see page 11869) property. When the user triggers this action, TDownLoadURL (see page 11857) looks up URL (see page 11869) on the internet, creates the file specified by Filename, and writes the bits it finds at URL (see page 11869) to this file.

This value is not assigned automatically: it is the responsibility of the application to supply a value for Filename.

See Also

ExecuteTarget (see page 11862)

URL (see page 12093)

67.1.3.3.4 TDownLoadURL.HelpContext Property

Indicates the help context ID for client controls and menu items.

Pascal

```
property HelpContext: THelpContext;
```

C++

```
__property THelpContext HelpContext;
```

Description

HelpContext specifies the help context for the action when it is set. This value is propagated to client controls and menu items.

When a client control has focus and the user presses the F1 key, the control uses the value of HelpContext for this associated action to invoke the online help targeting a specific topic. The target topic is uniquely identified by a nonzero HelpContext value. Leave the HelpContext property of the client control at its default value of zero. This allows multiple controls (and multiple types of controls) to be associated with the same help topic through the one action object.

Note: HelpContext is only used when the HelpType property of this action or the client control is htInteger.

See Also

HelpType (see page 312)

HelpKeyword (see page 311)

67.1.3.3.5 TDownLoadURL.HelpKeyword Property

Indicates the help keyword for client controls and menu items.

Pascal

```
property HelpKeyword: string;
```

C++

```
__property AnsiString HelpKeyword;
```

Description

HelpKeyword, when set, specifies the keyword that identifies a help topic for this action. This value is propagated to the HelpKeyword property of client controls and menu items. The interpretation of HelpKeyword depends on which help system is used to display the topic. For example, when using HyperHelp (on Linux) or WinHelp (on Windows), HelpKeyword refers to an A link.

When a client control has focus and the user presses the F1 key (or the key specified by the application's HelpKey property), the control uses the value of HelpKeyword for this associated action object to invoke the online help targeting a specific topic. Leave the HelpKeyword property of the client control unassigned. This allows multiple controls (and multiple types of controls) to be associated with the same help topic through the one action object.

Note: HelpKeyword is only used when the HelpType property of this action or the client control is htKeyword.

See Also

HelpKeyword (see page 5826)

HelpContext (see page 311)

HelpType (see page 312)

HelpKey

67.1.3.3.6 TDownLoadURL.HelpType Property

Indicates the mechanism for client controls and menu items to use when invoking help.

Pascal

```
property HelpType: THelpType;
```

C++

```
__property THelpType HelpType;
```

Description

HelpType, when set, indicates whether client controls and menu items should use the HelpContext or the HelpKeyword property for invoking the help system. This value is propagated to the HelpType property of client controls and menu items.

See Also

HelpType (see page 5827)

HelpType

HelpContext (see page 311)

HelpKeyword (see page 311)

67.1.3.3.7 TDownLoadURL.Hint Property

Indicates the Help hint for client controls and menu items.

Pascal

```
property Hint: string;
```

C++

```
__property AnsiString Hint;
```

Description

Hint holds the string that is the hint for that action when it is set. This value is propagated to client controls and menu items.

See Also

Hint (see page 5827)

Hint (see page 16148)

67.1.3.3.8 TDownLoadURL.ImageIndex Property

Indicates the ImageIndex property for client controls and menu items.

Pascal

```
property ImageIndex: TImageIndex;
```

C++

```
__property TImageIndex ImageIndex;
```

Description

ImageIndex is an index into the Images property of the action list or action manager that contains the action. It identifies an image that is associated with controls and menu items that use this action.

See Also

ImageIndex (see page 5135)

ImageIndex (see page 16148)

Images (see page 325)

67.1.3.3.9 TDownLoadURL.SecondaryShortCuts Property

Specifies the short cuts (in addition to ShortCut) for triggering clients.

Pascal

```
property SecondaryShortCuts: TShortCutList;
```

C++

```
__property TShortCutList SecondaryShortCuts;
```

Description

Actions can execute in response to multiple short cut key combinations. SecondaryShortCuts lists all the short cut key combinations (other than the one specified by the ShortCut property) that can trigger the action. This lets you specify shortcuts for clients that do not have a ShortCut property or provide additional, secondary shortcuts.

When the user types one of the key combinations listed in SecondaryShortCuts, the action's Execute method is called.

See Also

ShortCut (see page 314)

Execute (see page 304)

67.1.3.3.10 TDownLoadURL.ShortCut Property

Specifies the ShortCut property for client menu items.

Pascal

```
property ShortCut: TShortCut;
```

C++

```
__property TShortCut ShortCut;
```

Description

ShortCut holds the value that is the shortcut for the action when it is set. This value is propagated to client menu items.

See Also

ShortCut (see page 16152)

SecondaryShortCuts (see page 314)

67.1.3.3.11 TDownLoadURL.URL Property

Specifies the Uniform Resource Locator (URL) on which this action performs its function.

Pascal

```
property URL: String;
```

C++

```
__property AnsiString URL;
```

Description

URL is the Uniform Resource Locator (URL) with which this action works. Each TURLAction descendant performs a different function that uses this URL.

This value is not assigned automatically: it is the responsibility of the application to supply a value for URL. If no value is supplied, TURLAction automatically disables itself.

See Also

UpdateTarget (see page 12088)

67.1.3.3.12 TDownLoadURL.Visible Property

Specifies the Visible property for client controls and menu items.

Pascal

```
property Visible: Boolean;
```

C++

```
__property Boolean Visible;
```

Description

Visible specifies the visible state for the action. This value is propagated to client controls and menu items.

See Also

Visible (see page 16153)

Visible (see page 5847)

67.1.3.4 TDownLoadURL Events

The events of the TDownLoadURL class are listed here.

Published Events

	Name	Description
	AfterDownload (see page 11870)	Occurs after TDownLoadURL (see page 11857) downloads the specified resource and writes it to a file.
	BeforeDownload (see page 11870)	Occurs before TDownLoadURL (see page 11857) downloads the specified resource and writes it to a file.
	OnDownloadProgress (see page 11870)	Occurs periodically while TDownLoadURL (see page 11857) is downloading the specified resource and writing it to a file.
	OnHint (see page 11871)	Occurs when the mouse pauses over a client control or menu item.
	OnUpdate (see page 11871)	Occurs when the application is idle or when the action list updates.

67.1.3.4.1 TDownLoadURL.AfterDownload Event

Occurs after TDownLoadURL (see page 11857) downloads the specified resource and writes it to a file.

Pascal

```
property AfterDownload: TNotifyEvent;
```

C++

```
__property TNotifyEvent AfterDownload;
```

Description

Write an AfterDownload event handler to perform a specific action after downloading the specified resource.

67.1.3.4.2 TDownLoadURL.BeforeDownload Event

Occurs before TDownLoadURL (see page 11857) downloads the specified resource and writes it to a file.

Pascal

```
property BeforeDownload: TNotifyEvent;
```

C++

```
__property TNotifyEvent BeforeDownload;
```

Description

Write a BeforeDownload event handler to perform a specific action before downloading the specified resource.

67.1.3.4.3 TDownLoadURL.OnDownloadProgress Event

Occurs periodically while TDownLoadURL (see page 11857) is downloading the specified resource and writing it to a file.

Pascal

```
property OnDownloadProgress: TDownloadProgressEvent;
```

C++

```
__property TDownloadProgressEvent OnDownloadProgress;
```

Description

OnDownloadProgress occurs periodically while the contents of the specified URL (see page 11869) are downloaded to a file.

Sender is the action that is copying the contents of an URL (see page 11869) to a file.

Progress indicates the current progress of the download operation relative to the expected maximum indicated in the ProgressMax parameter.

ProgressMax indicates the expected maximum value of the Progress parameter. This value can change during the download operation as more information becomes available. A value of zero means that the maximum value is unknown.

StatusCode indicates the current stage of the download process or other information about the download process.

StatusText is a string that corresponds to StatusCode. It can be used for displaying the status of the download to users.

Cancel allows the event handler to cancel the download operation. On entry to the event handler, Cancel is false. If the event handler changes Cancel to true, the download operation is aborted.

See Also

Filename (see page 11866)

URL (see page 12093)

67.1.3.4.4 TDownLoadURL.OnHint Event

Occurs when the mouse pauses over a client control or menu item.

Pascal

```
property OnHint: THintEvent;
```

C++

```
__property THintEvent OnHint;
```

Description

Use OnHint to override the default hint that appears when the user pauses the mouse over a client control or menu item. The OnHint event handler can change the hint that appears (by changing the HintStr parameter), or display the hint in some application-specific way.

67.1.3.4.5 TDownLoadURL.OnUpdate Event

Occurs when the application is idle or when the action list updates.

Pascal

```
property OnUpdate: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnUpdate;
```

Description

Write an OnUpdate event handler to execute centralized code while an application is idle. For example, actions may want to update enabling and disabling, or checking and unchecking of client targets.

C++ Examples:

```
/*
When the application is idle, the OnUpdate event occurs for
every action that is linked to a visible control or menu
item that is showing. This provides an opportunity for
applications to execute centralized code for enabling and
disabling, checking and unchecking, and so on. For example,
the following code illustrates the OnUpdate event handler
```

```
for an action that is "checked" when the toolbar is visible.
This example requires a TActionList (with one TAction) and a
TToolBar on a form. This example requires a TActionList
(with one TAction) and a TToolBar on a form.  Double click
on the TActionList and create an TAction named Action1.  The
TAction has an OnUpdate event handler called Action1Update.
Then set an object's (such as a button or menu item) Action
to Action1.
*/
void __fastcall TForm1::Action1Update(TObject *Sender)
{
   // Indicate whether ToolBar1 is currently visible.
   TAction* pa = dynamic_cast<TAction*>(Sender);
   if (pa)
   {
     if (pa->Checked != ToolBar1->Visible)
     {
       lbOther->Items->Add("Event Action1Update: toolbar visibility changed");
     }
     pa->Checked = ToolBar1->Visible;
   }
}
```

Delphi Examples:

```
{
When the application is idle, the OnUpdate event occurs for
every action that is linked to a visible control or menu
item that is showing. This provides an opportunity for
applications to execute centralized code for enabling and
disabling, checking and unchecking, and so on. For example,
the following code illustrates the OnUpdate event handler
for an action that is "checked" when the toolbar is visible.
This example requires a TActionList (with one TAction) and a
TToolBar on a form. This example requires a TActionList
(with one TAction) and a TToolBar on a form.  Double click
on the TActionList and create an TAction named Action1.  The
TAction has an OnUpdate event handler called Action1Update.
Then set an object's (such as a button or menu item) Action
to Action1.
}
procedure TMainForm.Action1Update(Sender: TObject);
begin
  if ((Sender as TAction).Checked <> ToolBar1.Visible) then
    lbOther.Items.Add('Event Action1Update: toolbar visibility changed');
    { Indicate whether ToolBar1 is currently visible }
    (Sender as TAction).Checked := ToolBar1.Visible;
end;
```

See Also

UpdateAction (see page 2790)

67.1.4 TFileRun Class

TFileRun is the standard action for performing a specified operation on a file.

Class Hierarchy

Pascal

```
TFileRun = class(TCustomFileRun);
```

C++

```
class TFileRun : public TCustomFileRun;
```

File

ExtActns

Description

Add TFileRun to an action list to let your application launch an external application or dll in response to user actions. Controls (see page 5711) linked to this action cause your application to perform the operation specified by the Operation (see page 11882) property on the file specified by the FileName (see page 11880) property.

Before this action fires, configure its properties to indicate what application to launch and how to launch it:

To indicate the target file to run, set the FileName (see page 11880) property to the name of a file on which the external application operates or to the name of the application's executable file. If you want to let the user select the file name instead when the action fires, set the Browse (see page 11878) property to true, and an open dialog appears when the action fires.

To indicate what action to perform on the specified file, set the Operation (see page 11882) property.

To supply parameters to the external application when it is launched, use the Parameters (see page 11882) property.

To specify a default directory for the external application, use the Directory (see page 11879) property.

To control how the external application's window appears (minimized, maximized, hidden, and so on), use the ShowCmd (see page 11884) property.

If the external application needs a parent window (to parent a dialog such as a properties dialog), or if you want to allow TFileRun to display error messages, use the ParentControl (see page 11883) property.

See Also

TBrowseURL (see page 11832)

TSendMail (see page 12061)

TFileOpenWith (see page 20619)

TDownloadURL

67.1.4.1 TFileRun Members

The following tables list the members exposed by TFileRun.

Protected Events

	Name	Description
	OnChange (see page 2716)	Occurs when one of the action's properties changes.

Protected Fields

	Name	Description
	FClients (see page 2711)	This is FClients, a member of class TBasicAction.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FImage (see page 302)	This is FImage, a member of class TCustomAction.
	FMask (see page 303)	This is FMask, a member of class TCustomAction.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 303)	Copies the properties of this action to a destination object.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	Change (see page 2712)	Generates an OnChange (see page 2716) event.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
V	HandleShortCut (see page 306)	Executes the action when the user types on of its short cuts.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2713)	Responds when components are created or destroyed.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	Notification (see page 11850)	Responds when components are created or destroyed.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 294)	This is ReadState, a member of class TContainedAction.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
V	SetHelpContext (see page 306)	This is SetHelpContext, a member of class TCustomAction.
V	SetHelpKeyword (see page 306)	This is SetHelpKeyword, a member of class TCustomAction.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 307)	Sets the value of the Name property.
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
V	SetOnExecute (see page 2714)	Assigns an OnExecute (see page 2716) event handler.
V	SetParentComponent (see page 294)	This is SetParentComponent, a member of class TContainedAction.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.

	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	SavedEnabledState (see page 313)	Saves the value of the Enabled (see page 310) property when the action is suspended.

Public Events

	Name	Description
	OnExecute (see page 2716)	Occurs when the client event that is linked to it fires.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 301)	Instantiates and initializes a TCustomAction (see page 297) object.
V	Create (see page 2710)	Instantiates and initializes a TBasicAction (see page 2707) object.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
V	Create (see page 11849)	Creates an instance of TCustomFileRun (see page 11844).
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 292)	Destroys the instance of the contained action.
V	Destroy (see page 302)	Frees an instance of TCustomAction (see page 297).
V	Destroy (see page 2711)	Disposes of an instance of a TBasicAction (see page 2707) object.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DoHint (see page 303)	Generates an OnHint (see page 315) event.
V	Execute (see page 293)	Responds when the client control "fires".
V	Execute (see page 304)	Responds when a client control "fires".

	Execute (see page 2712)	Generates an OnExecute (see page 2716) event.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
V	ExecuteTarget (see page 2712)	Introduces an interface for invoking an action on a target client component or control.
V	ExecuteTarget (see page 11849)	Performs the specified operation on a target file.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
V	GetParentComponent (see page 293)	Returns the action list or action manager that contains the action.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	HandlesTarget (see page 2713)	Introduces an interface for verifying that the type, and state, of a target component or control are appropriate for the action.
V	HandlesTarget (see page 11850)	Indicates whether the action can execute.
V	HasParent (see page 294)	Indicates whether the action is contained in an action list or action manager.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RegisterChanges (see page 2713)	Associates the action with an action link.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	SetupBrowseDialog (see page 11851)	Creates an instance of TOpenDialog and assigns it as the value of the BrowseDlg (see page 11853) property.
	UnRegisterChanges (see page 2714)	Breaks the association between the action and the action link.
V	Update (see page 295)	Indicates whether the action updates itself.
V	Update (see page 2714)	Provides an opportunity to execute centralized code when an application is idle.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
V	UpdateTarget (see page 2715)	Introduces an interface for a method of notifying a client when the action updates itself.
V	UpdateTarget (see page 11851)	Enables or disables the action, depending on current conditions.

Public Properties

	Name	Description
	ActionComponent (see page 2715)	Indicates the client component that caused this action to execute.
	ActionList (see page 295)	Indicates the action list or action manager that contains the action.
	AutoCheck (see page 308)	Controls (see page 5711) whether the Checked (see page 308) property toggles when the action executes.
	Checked (see page 308)	Indicates whether client controls and menu items appear checked.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DisableIfNoHandler (see page 310)	Indicates whether client components should be disabled if no handler is found.
	GroupIndex (see page 311)	Indicates whether the action acts like a radio button with other actions in the same action list.
	HelpKeyword (see page 311)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 312)	Indicates the mechanism for client controls and menu items to use when invoking help.
R	HInst (see page 11854)	Indicates the Windows error code that is returned when TCustomFileRun (see page 11844) launches the external application.
	Index (see page 296)	Specifies the index of the action in its action list or action manager.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Events

	Name	Description
	OnHint (see page 11885)	Occurs when the mouse pauses over a client control or menu item.
	OnUpdate (see page 11885)	Occurs when the application is idle or when the action list updates.

Published Properties

	Name	Description
	Browse (see page 11878)	Controls whether an open dialog automatically appears to let users browse for the target file.
	BrowseDlg (see page 11879)	Specifies the dialog that allows users to select the target file to run.
	Caption (see page 11879)	Represents the caption of client controls and menu items.
	Category (see page 296)	Specifies the category under which the action appears in its action list or action manager.
	Directory (see page 11879)	Specifies the default directory for the externally-launched application.
	Enabled (see page 11880)	Indicates whether client controls and menu items are enabled.
	FileName (see page 11880)	Specifies the target file to run.
	HelpContext (see page 11881)	Indicates the help context ID for client controls and menu items.
	Hint (see page 11881)	Indicates the Help hint for client controls and menu items.
	ImageIndex (see page 11881)	Indicates the ImageIndex property for client controls and menu items.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Operation (see page 11882)	Indicates what TCustomFileRun should do with the target file.
	Parameters (see page 11882)	Specifies parameters to be passed to the application when the target file is an executable.
	ParentControl (see page 11883)	This is ParentControl, a member of class TFileRun.
	SecondaryShortCuts (see page 11883)	Specifies the short cuts (in addition to ShortCut) for triggering clients.
	ShortCut (see page 11883)	Specifies the ShortCut property for client menu items.
	ShowCmd (see page 11884)	Specifies how the launched application window appears.
	Tag (see page 2808)	Stores an integer value as part of a component.

	Visible (see page 11884)	Specifies the Visible property for client controls and menu items.

67.1.4.2 TFileRun Properties

The properties of the TFileRun class are listed here.

Published Properties

	Name	Description
	Browse (see page 11878)	Controls whether an open dialog automatically appears to let users browse for the target file.
	BrowseDlg (see page 11879)	Specifies the dialog that allows users to select the target file to run.
	Caption (see page 11879)	Represents the caption of client controls and menu items.
	Directory (see page 11879)	Specifies the default directory for the externally-launched application.
	Enabled (see page 11880)	Indicates whether client controls and menu items are enabled.
	FileName (see page 11880)	Specifies the target file to run.
	HelpContext (see page 11881)	Indicates the help context ID for client controls and menu items.
	Hint (see page 11881)	Indicates the Help hint for client controls and menu items.
	ImageIndex (see page 11881)	Indicates the ImageIndex property for client controls and menu items.
	Operation (see page 11882)	Indicates what TCustomFileRun should do with the target file.
	Parameters (see page 11882)	Specifies parameters to be passed to the application when the target file is an executable.
	ParentControl (see page 11883)	This is ParentControl, a member of class TFileRun.
	SecondaryShortCuts (see page 11883)	Specifies the short cuts (in addition to ShortCut) for triggering clients.
	ShortCut (see page 11883)	Specifies the ShortCut property for client menu items.
	ShowCmd (see page 11884)	Specifies how the launched application window appears.
	Visible (see page 11884)	Specifies the Visible property for client controls and menu items.

67.1.4.2.1 TFileRun.Browse Property

Controls whether an open dialog automatically appears to let users browse for the target file.

Pascal

```
property Browse: Boolean;
```

C++

```
__property Boolean Browse;
```

Description

Browse controls whether TCustomFileRun displays the dialog specified by BrowseDlg when it fires, letting users select the target file to be launched. When Browse is true, firing TCustomFileRun displays the open dialog specified by BrowseDlg, and then (if the user does not cancel) performs the operation specified by Operation on the chosen file. When Browse is false, your application must specify the target file by explicitly setting the FileName property.

Note: When Browse is true, TCustomFileRun ignores the FileName property.

See Also

BrowseDlg (see page 11853)

FileName (see page 11853)

Operation (see page 11855)

67.1.4.2.2 TFileRun.BrowseDlg Property

Specifies the dialog that allows users to select the target file to run.

Pascal

```
property BrowseDlg: TOpenDialog;
```

C++

```
__property TOpenDialog BrowseDlg;
```

Description

Use BrowseDlg when the Browse property is true to configure the dialog that users use to select a target file. By expanding BrowseDlg in the Object Inspector at design time, or by setting its properties at runtime, you can customize the way the dialog first appears when the action fires.

By default, BrowseDlg is an internally-generated TOpenDialog object. When using the default dialog, there is no need to explicitly add a dialog component to your application. If you want to use a specialized TOpenDialog descendant (such as TOpenPictureDialog), however, set BrowseDlg to an open dialog component you place in the same form or data module as the TCustomFileRun action.

See Also

Browse (see page 11852)

FileName (see page 11853)

TOpenDialog (see page 11407)

67.1.4.2.3 TFileRun.Caption Property

Represents the caption of client controls and menu items.

Pascal

```
property Caption: string;
```

C++

```
__property AnsiString Caption;
```

Description

Caption holds the string that is the caption for the action when it is set. The value of Caption is propagated to client controls and menu items.

See Also

Caption (see page 5806)

Caption (see page 16136)

67.1.4.2.4 TFileRun.Directory Property

Specifies the default directory for the externally-launched application.

Pascal

```
property Directory: TFileName;
```

C++

```
__property TFileName Directory;
```

Description

Set Directory to specify a default (startup) directory for the external application that is launched when the action fires.

See Also

Parameters (see page 11855)

FileName (see page 11853)

67.1.4.2.5 TFileRun.Enabled Property

Indicates whether client controls and menu items are enabled.

Pascal

```
property Enabled: Boolean;
```

C++

```
__property Boolean Enabled;
```

Description

Enabled specifies the enabled state for the action. The value of Enabled is propagated to client controls and menu items.

See Also

Enabled (see page 5821)

Enabled (see page 16145)

67.1.4.2.6 TFileRun.FileName Property

Specifies the target file to run.

Pascal

```
property FileName: TFileName;
```

C++

```
__property TFileName FileName;
```

Description

Set FileName to specify the file on which TCustomFileRun performs the operation specified by Operation when the action fires. FileName can specify a file that is opened using an external application (such as a .txt file that causes a text editor to launch), or it can specify an executable file for the application itself. When the action fires in response to a user action, TCustomFileRun launches an external application or dll to perform Operation on the file specified by FileName.

Note:

See Also

Browse (see page 11852)

BrowseDlg (see page 11853)

Parameters (see page 11855)

Operation (see page 11855)

67.1.4.2.7 TFileRun.HelpContext Property

Indicates the help context ID for client controls and menu items.

Pascal

```
property HelpContext: THelpContext;
```

C++

```
__property THelpContext HelpContext;
```

Description

HelpContext specifies the help context for the action when it is set. This value is propagated to client controls and menu items.

When a client control has focus and the user presses the F1 key, the control uses the value of HelpContext for this associated action to invoke the online help targeting a specific topic. The target topic is uniquely identified by a nonzero HelpContext value. Leave the HelpContext property of the client control at its default value of zero. This allows multiple controls (and multiple types of controls) to be associated with the same help topic through the one action object.

Note: HelpContext is only used when the HelpType property of this action or the client control is htInteger.

See Also

HelpType (see page 312)

HelpKeyword (see page 311)

67.1.4.2.8 TFileRun.Hint Property

Indicates the Help hint for client controls and menu items.

Pascal

```
property Hint: string;
```

C++

```
__property AnsiString Hint;
```

Description

Hint holds the string that is the hint for that action when it is set. This value is propagated to client controls and menu items.

See Also

Hint (see page 5827)

Hint (see page 16148)

67.1.4.2.9 TFileRun.ImageIndex Property

Indicates the ImageIndex property for client controls and menu items.

Pascal

```
property ImageIndex: TImageIndex;
```

C++

```
__property TImageIndex ImageIndex;
```

Description

ImageIndex is an index into the Images property of the action list or action manager that contains the action. It identifies an

image that is associated with controls and menu items that use this action.

See Also

ImageIndex (see page 5135)

ImageIndex (see page 16148)

Images (see page 325)

67.1.4.2.10 TFileRun.Operation Property

Indicates what TCustomFileRun should do with the target file.

Pascal

```
property Operation: String;
```

C++

```
__property AnsiString Operation;
```

Description

Set Operation to indicate what should be done with the target file when TCustomFileRun fires. The possible values for Operation depend on the particular file or folder specified by FileName or selected by the user when Browse is true. The possible operations for a particular file or folder are listed in the system Registry.

The following strings are usually valid:

Value	Meaning
edit	TCustomFileRun opens an editor. If FileName is not an editable file, the action fails.
explore	TCustomFileRun launches the Windows explorer for the folder specified by FileName.
open	TCustomFileRun opens the file specified by FileName. FileName can be an executable file, a file associated with an application that can open it, or a folder.
print	TCustomFileRun prints the file specified by FileName. If FileName is a binary file (for example, if it is an executable), the action fails.
properties	TCustomFileRun displays the file or folder's properties in a Properties dialog.

Note: If Operation is an empty string, Windows tries to use the "open" operation. If the specified file does not support the "open" operation, Windows tries to use the default operation. If there is no "open" operation and no default operation, and if the application is running on Windows 2000 or later, Windows uses the first verb listed in the Registry.

See Also

FileName (see page 11853)

Browse (see page 11852)

67.1.4.2.11 TFileRun.Parameters Property

Specifies parameters to be passed to the application when the target file is an executable.

Pascal

```
property Parameters: String;
```

C++

```
__property AnsiString Parameters;
```

Description

Use Parameters to specify any parameters that should be passed to the external application when it is launched. Only set Parameters if FileName is the name of an Executable file or the user is browsing for an executable file. If the target file holds data associated with the application to launch, Parameters should be an empty string.

See Also

FileName (see page 11853)

Operation (see page 11855)

67.1.4.2.12 TFileRun.ParentControl Property

Pascal

```
property ParentControl: TWinControl;
```

C++

```
__property TWinControl * ParentControl;
```

Description

This is ParentControl, a member of class TFileRun.

67.1.4.2.13 TFileRun.SecondaryShortCuts Property

Specifies the short cuts (in addition to ShortCut) for triggering clients.

Pascal

```
property SecondaryShortCuts: TShortCutList;
```

C++

```
__property TShortCutList SecondaryShortCuts;
```

Description

Actions can execute in response to multiple short cut key combinations. SecondaryShortCuts lists all the short cut key combinations (other than the one specified by the ShortCut property) that can trigger the action. This lets you specify shortcuts for clients that do not have a ShortCut property or provide additional, secondary shortcuts.

When the user types one of the key combinations listed in SecondaryShortCuts, the action's Execute method is called.

See Also

ShortCut (see page 314)

Execute (see page 304)

67.1.4.2.14 TFileRun.ShortCut Property

Specifies the ShortCut property for client menu items.

Pascal

```
property ShortCut: TShortCut;
```

C++

```
__property TShortCut ShortCut;
```

Description

ShortCut holds the value that is the shortcut for the action when it is set. This value is propagated to client menu items.

See Also

ShortCut (see page 16152)

SecondaryShortCuts (see page 314)

67.1.4.2.15 TFileRun.ShowCmd Property

Specifies how the launched application window appears.

Pascal

```
property ShowCmd: TShowCmd;
```

C++

```
__property TShowCmd ShowCmd;
```

Description

Use ShowCmd to indicate how you want the application window to appear when TCustomFileRun performs the specified operation on its target file. ShowCmd can have any of the following values:

Value	Meaning
scHide	The external application window is hidden. If it was active, another window is activated.
scMaximize	The external application window is maximized (but not necessarily activated)
scMinimize	The external application window is minimized (but not necessarily activated).
scRestore	The external application window is activated. If it was minimized or maximized, Windows restores it to its original size and position.
scShow	The external application window is activated in its current size and position.
scShowDefault	The external application window is shown in the default startup state specified by that external application.
scShowMaximized	The external application window is activated and maximized.
scShowMinimized	The external application window is activated and minimized.
scShowMinNoActive	The external application window is minimized. The active window does not change.
scShowNA	The external application window is displayed (after being hidden) but activation does not change.
scShowNoActivate	The external application window is displayed in its most recent size and position, but activation does not change.
scShowNormal	The external application window is activated and restored to its original size and position if it was maximized or minimized.

See Also

Operation (see page 11855)

67.1.4.2.16 TFileRun.Visible Property

Specifies the Visible property for client controls and menu items.

Pascal

```
property Visible: Boolean;
```

C++

```
__property Boolean Visible;
```

Description

Visible specifies the visible state for the action. This value is propagated to client controls and menu items.

See Also

Visible (see page 16153)

Visible (see page 5847)

67.1.4.3 TFileRun Events

The events of the TFileRun class are listed here.

Published Events

	Name	Description
	OnHint (see page 11885)	Occurs when the mouse pauses over a client control or menu item.
	OnUpdate (see page 11885)	Occurs when the application is idle or when the action list updates.

67.1.4.3.1 TFileRun.OnHint Event

Occurs when the mouse pauses over a client control or menu item.

Pascal

```
property OnHint: THintEvent;
```

C++

```
__property THintEvent OnHint;
```

Description

Use OnHint to override the default hint that appears when the user pauses the mouse over a client control or menu item. The OnHint event handler can change the hint that appears (by changing the HintStr parameter), or display the hint in some application-specific way.

67.1.4.3.2 TFileRun.OnUpdate Event

Occurs when the application is idle or when the action list updates.

Pascal

```
property OnUpdate: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnUpdate;
```

Description

Write an OnUpdate event handler to execute centralized code while an application is idle. For example, actions may want to update enabling and disabling, or checking and unchecking of client targets.

C++ Examples:

```
/*
When the application is idle, the OnUpdate event occurs for
every action that is linked to a visible control or menu
item that is showing. This provides an opportunity for
applications to execute centralized code for enabling and
disabling, checking and unchecking, and so on. For example,
the following code illustrates the OnUpdate event handler
for an action that is "checked" when the toolbar is visible.
This example requires a TActionList (with one TAction) and a
TToolBar on a form. This example requires a TActionList
(with one TAction) and a TToolBar on a form.  Double click
on the TActionList and create an TAction named Action1.  The
TAction has an OnUpdate event handler called Action1Update.
Then set an object's (such as a button or menu item) Action
to Action1.
*/
void __fastcall TForm1::Action1Update(TObject *Sender)
{
   // Indicate whether ToolBar1 is currently visible.
   TAction* pa = dynamic_cast<TAction*>(Sender);
   if (pa)
   {
     if (pa->Checked != ToolBar1->Visible)
     {
       lbOther->Items->Add("Event Action1Update: toolbar visibility changed");
     }
     pa->Checked = ToolBar1->Visible;
   }
}
```

Delphi Examples:

```
{
When the application is idle, the OnUpdate event occurs for
every action that is linked to a visible control or menu
item that is showing. This provides an opportunity for
applications to execute centralized code for enabling and
disabling, checking and unchecking, and so on. For example,
the following code illustrates the OnUpdate event handler
for an action that is "checked" when the toolbar is visible.
This example requires a TActionList (with one TAction) and a
TToolBar on a form. This example requires a TActionList
(with one TAction) and a TToolBar on a form.  Double click
on the TActionList and create an TAction named Action1.  The
TAction has an OnUpdate event handler called Action1Update.
Then set an object's (such as a button or menu item) Action
to Action1.
}
procedure TMainForm.Action1Update(Sender: TObject);
begin
  if ((Sender as TAction).Checked <> ToolBar1.Visible) then
    lbOther.Items.Add('Event Action1Update: toolbar visibility changed');
    { Indicate whether ToolBar1 is currently visible }
    (Sender as TAction).Checked := ToolBar1.Visible;
end;
```

67.1.5 TListControlAction Class

TListControlAction is the base class for action objects that operate on the selection of a list control (list box or list view).

Class Hierarchy

Pascal

```
TListControlAction = class(TCustomAction);
```

C++

```
class TListControlAction : public TCustomAction;
```

File

ExtActns

Description

TListControlAction implements the common behavior for actions that work with list controls (list boxes and list views). Each descendant class performs a specific operation on the target list control. Do not use TListControlAction directly in an application. Instead, use a TListControlAction descendant such as TListControlSelectAll (see page 11937), TListControlClearSelection (see page 11893), TListControlDeleteSelection (see page 11919), TListControlCopySelection (see page 11906), or TListControlMoveSelection (see page 11931).

TListControlAction makes the target list control available to descendant classes as the value of the ListControl (see page 11893) property. TListControlAction descendants then override the ExecuteTarget method to perform their specific function on the target list control.

TListControlSelectAll (see page 11937)

TCustomListControl (see page 5928)

67.1.5.1 TListControlAction Members

The following tables list the members exposed by TListControlAction.

Protected Events

	Name	Description
	OnChange (see page 2716)	Occurs when one of the action's properties changes.

Protected Fields

	Name	Description
	FClients (see page 2711)	This is FClients, a member of class TBasicAction.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FImage (see page 302)	This is FImage, a member of class TCustomAction.
	FMask (see page 303)	This is FMask, a member of class TCustomAction.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 303)	Copies the properties of this action to a destination object.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	Change (see page 2712)	Generates an OnChange (see page 2716) event.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
V	HandleShortCut (see page 306)	Executes the action when the user types on of its short cuts.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsEnabled (see page 11892)	This is IsEnabled, a member of class TListControlAction.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 11892)	Responds when components are created or destroyed.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 294)	This is ReadState, a member of class TContainedAction.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
V	SetHelpContext (see page 306)	This is SetHelpContext, a member of class TCustomAction.
V	SetHelpKeyword (see page 306)	This is SetHelpKeyword, a member of class TCustomAction.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 307)	Sets the value of the Name property.
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
V	SetOnExecute (see page 2714)	Assigns an OnExecute (see page 2716) event handler.
V	SetParentComponent (see page 294)	This is SetParentComponent, a member of class TContainedAction.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.

	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	SavedEnabledState (see page 313)	Saves the value of the Enabled (see page 310) property when the action is suspended.

Public Events

	Name	Description
	OnExecute (see page 2716)	Occurs when the client event that is linked to it fires.
	OnHint (see page 315)	Occurs when the mouse pauses over a client control or menu item.
	OnUpdate (see page 2718)	Occurs when the application is idle or when the action list updates.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 11891)	Creates an instance of TListControlAction (see page 11886).
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 292)	Destroys the instance of the contained action.
	Destroy (see page 302)	Frees an instance of TCustomAction (see page 297).
	Destroy (see page 2711)	Disposes of an instance of a TBasicAction (see page 2707) object.
	Destroy (see page 2766)	Disposes of the component and its owned components.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DoHint (see page 303)	Generates an OnHint (see page 315) event.
	Execute (see page 293)	Responds when the client control "fires".
	Execute (see page 304)	Responds when a client control "fires".
	Execute (see page 2712)	Generates an OnExecute (see page 2716) event.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	ExecuteTarget (see page 2712)	Introduces an interface for invoking an action on a target client component or control.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.

	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
V	GetParentComponent (see page 293)	Returns the action list or action manager that contains the action.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	HandlesTarget (see page 11892)	Indicates whether the action can execute its function.
V	HasParent (see page 294)	Indicates whether the action is contained in an action list or action manager.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RegisterChanges (see page 2713)	Associates the action with an action link.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UnRegisterChanges (see page 2714)	Breaks the association between the action and the action link.
V	Update (see page 295)	Indicates whether the action updates itself.
V	Update (see page 2714)	Provides an opportunity to execute centralized code when an application is idle.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
V	UpdateTarget (see page 2715)	Introduces an interface for a method of notifying a client when the action updates itself.

Public Properties

	Name	Description
	ActionComponent (see page 2715)	Indicates the client component that caused this action to execute.
	ActionList (see page 295)	Indicates the action list or action manager that contains the action.
	AutoCheck (see page 308)	Controls (see page 5711) whether the Checked (see page 308) property toggles when the action executes.
	Caption (see page 308)	Represents the caption of client controls and menu items.
	Checked (see page 308)	Indicates whether client controls and menu items appear checked.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.

	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DisableIfNoHandler (see page 310)	Indicates whether client components should be disabled if no handler is found.
	Enabled (see page 310)	Indicates whether client controls and menu items are enabled.
	GroupIndex (see page 311)	Indicates whether the action acts like a radio button with other actions in the same action list.
	HelpContext (see page 311)	Indicates the help context ID for client controls and menu items.
	HelpKeyword (see page 311)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 312)	Indicates the mechanism for client controls and menu items to use when invoking help.
	Hint (see page 312)	Indicates the Help hint for client controls and menu items.
	ImageIndex (see page 313)	Indicates the ImageIndex property for client controls and menu items.
	Index (see page 296)	Specifies the index of the action in its action list or action manager.
	ListControl (see page 11893)	Provides access to the target of the action.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	SecondaryShortCuts (see page 314)	Specifies the short cuts (in addition to ShortCut (see page 314)) for triggering clients.
	ShortCut (see page 314)	Specifies the ShortCut property for client menu items.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	Visible (see page 314)	Specifies the Visible property for client controls and menu items.

Published Properties

	Name	Description
	Category (see page 296)	Specifies the category under which the action appears in its action list or action manager.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

67.1.5.2 TListControlAction.Create Constructor

Creates an instance of TListControlAction (see page 11886).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TListControlAction(TComponent * AOwner);
```

Description

Most applications do not need to call the TListControlAction (see page 11886) constructor because actions are added at design time to an action list or action manager.

AOwner specifies the Owner for the action. This is the component that is responsible for freeing the TListControlAction (see page 11886) instance.

See Also

Owner (see page 2807)

67.1.5.3 TListControlAction Methods

The methods of the TListControlAction class are listed here.

Protected Methods

	Name	Description
	IsEnabled (see page 11892)	This is IsEnabled, a member of class TListControlAction.
V	Notification (see page 11892)	Responds when components are created or destroyed.

Public Methods

	Name	Description
V	HandlesTarget (see page 11892)	Indicates whether the action can execute its function.

67.1.5.3.1 TListControlAction.HandlesTarget Method

Indicates whether the action can execute its function.

Pascal

```
function HandlesTarget(Target: TObject): Boolean; override;
```

C++

```
virtual __fastcall Boolean HandlesTarget(TObject * Target);
```

Description

Do not call the HandlesTarget method. This method is called automatically when the user invokes an object (such as a tool button or menu item) that is linked to this action. The HandlesTarget method provides the action object with an opportunity to indicate whether it is appropriate to execute at this time with the object specified by the Target parameter as a "target".

Target is the currently active object.

HandlesTarget checks that the target is a TCustomListControl descendant (or that the ListControl (see page 11893) property is set if Target is nil (Delphi) or NULL (C++)). HandlesTarget returns true if there is a list control to act as target, false otherwise.

See Also

ExecuteTarget (see page 2712)

TCustomListControl (see page 5928)

ListControl (see page 11893)

67.1.5.3.2 TListControlAction.IsEnabled Method

Pascal

```
function IsEnabled(Target: TObject): Boolean;
```

C++

```
__fastcall Boolean IsEnabled(TObject * Target);
```

Description

This is IsEnabled, a member of class TListControlAction.

67.1.5.3.3 TListControlAction.Notification Method

Responds when components are created or destroyed.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

Do not call the Notification method in an application. Notification is called automatically when the component specified by AComponent is about to be inserted or removed, as specified by Operation.

TBasicAction overrides the Notification method to check whether the component that is the value of the ActionComponent property is about to be freed. If so, it sets the ActionComponent property to nil (Delphi) or NULL (C++).

See Also

ActionComponent (see page 2715)

67.1.5.4 TListControlAction Properties

The properties of the TListControlAction class are listed here.

Public Properties

	Name	Description
	ListControl (see page 11893)	Provides access to the target of the action.

67.1.5.4.1 TListControlAction.ListControl Property

Provides access to the target of the action.

Pascal

```
property ListControl: TCustomListControl;
```

C++

```
__property TCustomListControl ListControl;
```

Description

ListControl is the list control on which the action performs its function. It is a TCustomListControl descendant, such a TListView or TListBox.

Set ListControl to associate the action with a particular control. If ListControl is not explicitly set, it is assumed to be the active listbox or list view when the action fires.

See Also

TListView (see page 4285)

TListBox (see page 21598)

67.1.6 TListControlClearSelection Class

TListControlClearSelection deselects all selected items in a list control (list view or list box).

Class Hierarchy

Pascal

```
TListControlClearSelection = class(TListControlAction);
```

C++

```
class TListControlClearSelection : public TListControlAction;
```

File

ExtActns

Description

Add TListControlClearSelection to an action list to allow users to deselect any selected items of a list control by using menu items or toolbar buttons. Controls (see page 5711) such as menu items and tool buttons linked to this action cause the application to deselect all selected items in the target control.

TListControlClearSelection is designed to work with a list control (TCustomListControl descendant) as a target. TListControlClearSelection automatically disables itself if the target control is not a list control or if that list box or list view has no selected items.

See Also

TListControlCopySelection

TListControlMoveSelection

TListControlDeleteSelection

TListControlSelectAll

TCustomListControl (see page 5928)

67.1.6.1 TListControlClearSelection Members

The following tables list the members exposed by TListControlClearSelection.

Protected Events

	Name	Description
	OnChange (see page 2716)	Occurs when one of the action's properties changes.

Protected Fields

	Name	Description
	FClients (see page 2711)	This is FClients, a member of class TBasicAction.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FImage (see page 302)	This is FImage, a member of class TCustomAction.
	FMask (see page 303)	This is FMask, a member of class TCustomAction.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.

	AssignTo (see page 303)	Copies the properties of this action to a destination object.
	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	Change (see page 2712)	Generates an OnChange (see page 2716) event.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	HandleShortCut (see page 306)	Executes the action when the user types on of its short cuts.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsEnabled (see page 11892)	This is IsEnabled, a member of class TListControlAction.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Notification (see page 2713)	Responds when components are created or destroyed.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	Notification (see page 11892)	Responds when components are created or destroyed.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 294)	This is ReadState, a member of class TContainedAction.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetHelpContext (see page 306)	This is SetHelpContext, a member of class TCustomAction.
	SetHelpKeyword (see page 306)	This is SetHelpKeyword, a member of class TCustomAction.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 307)	Sets the value of the Name property.
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetOnExecute (see page 2714)	Assigns an OnExecute (see page 2716) event handler.
	SetParentComponent (see page 294)	This is SetParentComponent, a member of class TContainedAction.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	SavedEnabledState (see page 313)	Saves the value of the Enabled (see page 310) property when the action is suspended.

Public Events

	Name	Description
	OnExecute (see page 2716)	Occurs when the client event that is linked to it fires.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 301)	Instantiates and initializes a TCustomAction (see page 297) object.
V	Create (see page 2710)	Instantiates and initializes a TBasicAction (see page 2707) object.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
V	Create (see page 11891)	Creates an instance of TListControlAction (see page 11886).
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 292)	Destroys the instance of the contained action.
V	Destroy (see page 302)	Frees an instance of TCustomAction (see page 297).
V	Destroy (see page 2711)	Disposes of an instance of a TBasicAction (see page 2707) object.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DoHint (see page 303)	Generates an OnHint (see page 315) event.
V	Execute (see page 293)	Responds when the client control "fires".
V	Execute (see page 304)	Responds when a client control "fires".
	Execute (see page 2712)	Generates an OnExecute (see page 2716) event.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
V	ExecuteTarget (see page 11898)	Deselects the currently selected items in the target list control.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.

	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
V	GetParentComponent (see page 293)	Returns the action list or action manager that contains the action.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	HandlesTarget (see page 2713)	Introduces an interface for verifying that the type, and state, of a target component or control are appropriate for the action.
V	HandlesTarget (see page 11892)	Indicates whether the action can execute its function.
V	HasParent (see page 294)	Indicates whether the action is contained in an action list or action manager.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RegisterChanges (see page 2713)	Associates the action with an action link.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UnRegisterChanges (see page 2714)	Breaks the association between the action and the action link.
V	Update (see page 295)	Indicates whether the action updates itself.
V	Update (see page 2714)	Provides an opportunity to execute centralized code when an application is idle.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
V	UpdateTarget (see page 11899)	Enables or disables the action, depending on the state of the target control.

Public Properties

	Name	Description
	ActionComponent (see page 2715)	Indicates the client component that caused this action to execute.
	ActionList (see page 295)	Indicates the action list or action manager that contains the action.
	AutoCheck (see page 308)	Controls (see page 5711) whether the Checked (see page 308) property toggles when the action executes.
	Checked (see page 308)	Indicates whether client controls and menu items appear checked.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.

	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DisableIfNoHandler (see page 310)	Indicates whether client components should be disabled if no handler is found.
	GroupIndex (see page 311)	Indicates whether the action acts like a radio button with other actions in the same action list.
	Index (see page 296)	Specifies the index of the action in its action list or action manager.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Events

	Name	Description
	OnHint (see page 11904)	Occurs when the mouse pauses over a client control or menu item.
	OnUpdate (see page 11904)	Occurs when the application is idle or when the action list updates.

Published Properties

	Name	Description
	Caption (see page 11900)	Represents the caption of client controls and menu items.
	Category (see page 296)	Specifies the category under which the action appears in its action list or action manager.
	Enabled (see page 11900)	Indicates whether client controls and menu items are enabled.
	HelpContext (see page 11900)	Indicates the help context ID for client controls and menu items.
	HelpKeyword (see page 11901)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 11901)	Indicates the mechanism for client controls and menu items to use when invoking help.
	Hint (see page 11902)	Indicates the Help hint for client controls and menu items.
	ImageIndex (see page 11902)	Indicates the ImageIndex property for client controls and menu items.
	ListControl (see page 11902)	Provides access to the target of the action.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	SecondaryShortCuts (see page 11903)	Specifies the short cuts (in addition to ShortCut) for triggering clients.
	ShortCut (see page 11903)	Specifies the ShortCut property for client menu items.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Visible (see page 11904)	Specifies the Visible property for client controls and menu items.

67.1.6.2 TListControlClearSelection Methods

The methods of the TListControlClearSelection class are listed here.

Public Methods

	Name	Description
V	ExecuteTarget (see page 11898)	Deselects the currently selected items in the target list control.
V	UpdateTarget (see page 11899)	Enables or disables the action, depending on the state of the target control.

67.1.6.2.1 TListControlClearSelection.ExecuteTarget Method

Deselects the currently selected items in the target list control.

Pascal

```
procedure ExecuteTarget(Target: TObject); override;
```

C++

```
virtual __fastcall ExecuteTarget(TObject * Target);
```

Description

Do not call the ExecuteTarget method. This method is called automatically when the action fires in response to a user action (for example, when the user selects a menu item or presses a tool button that is linked to this action).

Target is the currently active object when the action fires. It should always be a TCustomListControl descendant (because HandlesTarget (see page 11892) returns false if it is not).

ExecuteTarget sets the ListControl (see page 11902) property to Target it is not already set. It then calls the list control's ClearSelection method, deselecting any selected items.

See Also

TCustomListControl (see page 5928)

ListControl (see page 11893)

ClearSelection (see page 5940)

67.1.6.2.2 TListControlClearSelection.UpdateTarget Method

Enables or disables the action, depending on the state of the target control.

Pascal

```
procedure UpdateTarget(Target: TObject); override;
```

C++

```
virtual __fastcall UpdateTarget(TObject * Target);
```

Description

Do not call the UpdateTarget method. This method is called automatically when the application is idle so that actions can update themselves according to current conditions.

In TListControlClearSelection (see page 11893), UpdateTarget checks whether the current target object (specified by the ListControl (see page 11902) property if it is set, otherwise by the Target parameter) is a list control that includes at least one selected item. If so, UpdateTarget sets Enabled (see page 11900) to true. If not, UpdateTarget sets Enabled (see page 11900) to false.

See Also

Enabled (see page 310)

SelCount (see page 5957)

ListControl (see page 11893)

67.1.6.3 TListControlClearSelection Properties

The properties of the TListControlClearSelection class are listed here.

Published Properties

	Name	Description
	Caption (see page 11900)	Represents the caption of client controls and menu items.
	Enabled (see page 11900)	Indicates whether client controls and menu items are enabled.
	HelpContext (see page 11900)	Indicates the help context ID for client controls and menu items.
	HelpKeyword (see page 11901)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 11901)	Indicates the mechanism for client controls and menu items to use when invoking help.
	Hint (see page 11902)	Indicates the Help hint for client controls and menu items.
	ImageIndex (see page 11902)	Indicates the ImageIndex property for client controls and menu items.
	ListControl (see page 11902)	Provides access to the target of the action.
	SecondaryShortCuts (see page 11903)	Specifies the short cuts (in addition to ShortCut) for triggering clients.

	ShortCut (see page 11903)	Specifies the ShortCut property for client menu items.
	Visible (see page 11904)	Specifies the Visible property for client controls and menu items.

67.1.6.3.1 TListControlClearSelection.Caption Property

Represents the caption of client controls and menu items.

Pascal

```
property Caption: string;
```

C++

```
__property AnsiString Caption;
```

Description

Caption holds the string that is the caption for the action when it is set. The value of Caption is propagated to client controls and menu items.

See Also

Caption (see page 5806)

Caption (see page 16136)

67.1.6.3.2 TListControlClearSelection.Enabled Property

Indicates whether client controls and menu items are enabled.

Pascal

```
property Enabled: Boolean;
```

C++

```
__property Boolean Enabled;
```

Description

Enabled specifies the enabled state for the action. The value of Enabled is propagated to client controls and menu items.

See Also

Enabled (see page 5821)

Enabled (see page 16145)

67.1.6.3.3 TListControlClearSelection.HelpContext Property

Indicates the help context ID for client controls and menu items.

Pascal

```
property HelpContext: THelpContext;
```

C++

```
__property THelpContext HelpContext;
```

Description

HelpContext specifies the help context for the action when it is set. This value is propagated to client controls and menu items.

When a client control has focus and the user presses the F1 key, the control uses the value of HelpContext for this associated action to invoke the online help targeting a specific topic. The target topic is uniquely identified by a nonzero HelpContext value.

Leave the HelpContext property of the client control at its default value of zero. This allows multiple controls (and multiple types of controls) to be associated with the same help topic through the one action object.

Note: HelpContext is only used when the HelpType property of this action or the client control is htInteger.

See Also

HelpType (see page 312)

HelpKeyword (see page 311)

67.1.6.3.4 TListControlClearSelection.HelpKeyword Property

Indicates the help keyword for client controls and menu items.

Pascal

```
property HelpKeyword: string;
```

C++

```
__property AnsiString HelpKeyword;
```

Description

HelpKeyword, when set, specifies the keyword that identifies a help topic for this action. This value is propagated to the HelpKeyword property of client controls and menu items. The interpretation of HelpKeyword depends on which help system is used to display the topic. For example, when using HyperHelp (on Linux) or WinHelp (on Windows), HelpKeyword refers to an A link.

When a client control has focus and the user presses the F1 key (or the key specified by the application's HelpKey property), the control uses the value of HelpKeyword for this associated action object to invoke the online help targeting a specific topic. Leave the HelpKeyword property of the client control unassigned. This allows multiple controls (and multiple types of controls) to be associated with the same help topic through the one action object.

Note: HelpKeyword is only used when the HelpType property of this action or the client control is htKeyword.

See Also

HelpKeyword (see page 5826)

HelpContext (see page 311)

HelpType (see page 312)

HelpKey

67.1.6.3.5 TListControlClearSelection.HelpType Property

Indicates the mechanism for client controls and menu items to use when invoking help.

Pascal

```
property HelpType: THelpType;
```

C++

```
__property THelpType HelpType;
```

Description

HelpType, when set, indicates whether client controls and menu items should use the HelpContext or the HelpKeyword property for invoking the help system. This value is propagated to the HelpType property of client controls and menu items.

See Also

HelpType (see page 5827)

HelpType

HelpContext (see page 311)

HelpKeyword (see page 311)

67.1.6.3.6 TListControlClearSelection.Hint Property

Indicates the Help hint for client controls and menu items.

Pascal

```
property Hint: string;
```

C++

```
__property AnsiString Hint;
```

Description

Hint holds the string that is the hint for that action when it is set. This value is propagated to client controls and menu items.

See Also

Hint (see page 5827)

Hint (see page 16148)

67.1.6.3.7 TListControlClearSelection.ImageIndex Property

Indicates the ImageIndex property for client controls and menu items.

Pascal

```
property ImageIndex: TImageIndex;
```

C++

```
__property TImageIndex ImageIndex;
```

Description

ImageIndex is an index into the Images property of the action list or action manager that contains the action. It identifies an image that is associated with controls and menu items that use this action.

See Also

ImageIndex (see page 5135)

ImageIndex (see page 16148)

Images (see page 325)

67.1.6.3.8 TListControlClearSelection.ListControl Property

Provides access to the target of the action.

Pascal

```
property ListControl: TCustomListControl;
```

C++

```
__property TCustomListControl ListControl;
```

Description

ListControl is the list control on which the action performs its function. It is a TCustomListControl descendant, such a TListView or TListBox.

Set ListControl to associate the action with a particular control. If ListControl is not explicitly set, it is assumed to be the active listbox or list view when the action fires.

See Also

TListView (see page 4285)

TListBox (see page 21598)

67.1.6.3.9 TListControlClearSelection.SecondaryShortCuts Property

Specifies the short cuts (in addition to ShortCut) for triggering clients.

Pascal

```
property SecondaryShortCuts: TShortCutList;
```

C++

```
__property TShortCutList SecondaryShortCuts;
```

Description

Actions can execute in response to multiple short cut key combinations. SecondaryShortCuts lists all the short cut key combinations (other than the one specified by the ShortCut property) that can trigger the action. This lets you specify shortcuts for clients that do not have a ShortCut property or provide additional, secondary shortcuts.

When the user types one of the key combinations listed in SecondaryShortCuts, the action's Execute method is called.

See Also

ShortCut (see page 314)

Execute (see page 304)

67.1.6.3.10 TListControlClearSelection.ShortCut Property

Specifies the ShortCut property for client menu items.

Pascal

```
property ShortCut: TShortCut;
```

C++

```
__property TShortCut ShortCut;
```

Description

ShortCut holds the value that is the shortcut for the action when it is set. This value is propagated to client menu items.

See Also

ShortCut (see page 16152)

SecondaryShortCuts (see page 314)

67.1.6.3.11 TListControlClearSelection.Visible Property

Specifies the Visible property for client controls and menu items.

Pascal

```
property Visible: Boolean;
```

C++

```
__property Boolean Visible;
```

Description

Visible specifies the visible state for the action. This value is propagated to client controls and menu items.

See Also

Visible (see page 16153)

Visible (see page 5847)

67.1.6.4 TListControlClearSelection Events

The events of the TListControlClearSelection class are listed here.

Published Events

	Name	Description
	OnHint (see page 11904)	Occurs when the mouse pauses over a client control or menu item.
	OnUpdate (see page 11904)	Occurs when the application is idle or when the action list updates.

67.1.6.4.1 TListControlClearSelection.OnHint Event

Occurs when the mouse pauses over a client control or menu item.

Pascal

```
property OnHint: THintEvent;
```

C++

```
__property THintEvent OnHint;
```

Description

Use OnHint to override the default hint that appears when the user pauses the mouse over a client control or menu item. The OnHint event handler can change the hint that appears (by changing the HintStr parameter), or display the hint in some application-specific way.

67.1.6.4.2 TListControlClearSelection.OnUpdate Event

Occurs when the application is idle or when the action list updates.

Pascal

```
property OnUpdate: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnUpdate;
```

Description

Write an OnUpdate event handler to execute centralized code while an application is idle. For example, actions may want to update enabling and disabling, or checking and unchecking of client targets.

C++ Examples:

```
/*
When the application is idle, the OnUpdate event occurs for
every action that is linked to a visible control or menu
item that is showing. This provides an opportunity for
applications to execute centralized code for enabling and
disabling, checking and unchecking, and so on. For example,
the following code illustrates the OnUpdate event handler
for an action that is "checked" when the toolbar is visible.
This example requires a TActionList (with one TAction) and a
TToolBar on a form. This example requires a TActionList
(with one TAction) and a TToolBar on a form.  Double click
on the TActionList and create an TAction named Action1.  The
TAction has an OnUpdate event handler called Action1Update.
Then set an object's (such as a button or menu item) Action
to Action1.
*/
void __fastcall TForm1::Action1Update(TObject *Sender)
{
   // Indicate whether ToolBar1 is currently visible.
   TAction* pa = dynamic_cast<TAction*>(Sender);
   if (pa)
   {
     if (pa->Checked != ToolBar1->Visible)
     {
       lbOther->Items->Add("Event Action1Update: toolbar visibility changed");
     }
     pa->Checked = ToolBar1->Visible;
   }
}
```

Delphi Examples:

```
{
When the application is idle, the OnUpdate event occurs for
every action that is linked to a visible control or menu
item that is showing. This provides an opportunity for
applications to execute centralized code for enabling and
disabling, checking and unchecking, and so on. For example,
the following code illustrates the OnUpdate event handler
for an action that is "checked" when the toolbar is visible.
This example requires a TActionList (with one TAction) and a
TToolBar on a form. This example requires a TActionList
(with one TAction) and a TToolBar on a form.  Double click
on the TActionList and create an TAction named Action1.  The
TAction has an OnUpdate event handler called Action1Update.
Then set an object's (such as a button or menu item) Action
to Action1.
}
procedure TMainForm.Action1Update(Sender: TObject);
begin
  if ((Sender as TAction).Checked <> ToolBar1.Visible) then
    lbOther.Items.Add('Event Action1Update: toolbar visibility changed');
    { Indicate whether ToolBar1 is currently visible }
    (Sender as TAction).Checked := ToolBar1.Visible;
end;
```

See Also

UpdateAction (see page 2790)

67.1.7 TListControlCopySelection Class

TListControlCopySelection copies the selected items in a list control (list view or list box) to another (destination) list control.

Class Hierarchy

Pascal

```
TListControlCopySelection = class(TListControlAction);
```

C++

```
class TListControlCopySelection : public TListControlAction;
```

File

ExtActns

Description

Add TListControlCopySelection to an action list to allow users to copy the selected items of a list control to another list control by using menu items or toolbar buttons. Controls (see page 5711) such as menu items and tool buttons linked to this action cause the application to copy all selected items in the target control to another (destination) list control.

Your application must explicitly set the Destination (see page 11913) property to indicate the list to which items are copied.

TListControlCopySelection is designed to work with a list control (TCustomListControl descendant) as a target. This target is the source list control, not the destination. TListControlCopySelection automatically disables itself if the target control is not a list control, if that list box or list view has no selected items, or if there is no destination list control assigned.

TListControlDeleteSelection

TListControlSelectAll

TCustomListControl (see page 5928)

67.1.7.1 TListControlCopySelection Members

The following tables list the members exposed by TListControlCopySelection.

Protected Events

	Name	Description
	OnChange (see page 2716)	Occurs when one of the action's properties changes.

Protected Fields

	Name	Description
	FClients (see page 2711)	This is FClients, a member of class TBasicAction.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

	FImage (see page 302)	This is FImage, a member of class TCustomAction.
	FMask (see page 303)	This is FMask, a member of class TCustomAction.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 303)	Copies the properties of this action to a destination object.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	Change (see page 2712)	Generates an OnChange (see page 2716) event.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
V	HandleShortCut (see page 306)	Executes the action when the user types on of its short cuts.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsEnabled (see page 11892)	This is IsEnabled, a member of class TListControlAction.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2713)	Responds when components are created or destroyed.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	Notification (see page 11892)	Responds when components are created or destroyed.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 294)	This is ReadState, a member of class TContainedAction.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
V	SetHelpContext (see page 306)	This is SetHelpContext, a member of class TCustomAction.
V	SetHelpKeyword (see page 306)	This is SetHelpKeyword, a member of class TCustomAction.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 307)	Sets the value of the Name property.
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
V	SetOnExecute (see page 2714)	Assigns an OnExecute (see page 2716) event handler.
V	SetParentComponent (see page 294)	This is SetParentComponent, a member of class TContainedAction.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.

	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	SavedEnabledState (see page 313)	Saves the value of the Enabled (see page 310) property when the action is suspended.

Public Events

	Name	Description
	OnExecute (see page 2716)	Occurs when the client event that is linked to it fires.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 301)	Instantiates and initializes a TCustomAction (see page 297) object.
V	Create (see page 2710)	Instantiates and initializes a TBasicAction (see page 2707) object.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
V	Create (see page 11891)	Creates an instance of TListControlAction (see page 11886).
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 292)	Destroys the instance of the contained action.
V	Destroy (see page 302)	Frees an instance of TCustomAction (see page 297).
V	Destroy (see page 2711)	Disposes of an instance of a TBasicAction (see page 2707) object.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DoHint (see page 303)	Generates an OnHint (see page 315) event.
V	Execute (see page 293)	Responds when the client control "fires".
V	Execute (see page 304)	Responds when a client control "fires".
	Execute (see page 2712)	Generates an OnExecute (see page 2716) event.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
V	ExecuteTarget (see page 11910)	Copies the selected items in the target list control to the list control specified by Destination (see page 11913).

	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
V	GetParentComponent (see page 293)	Returns the action list or action manager that contains the action.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	HandlesTarget (see page 11911)	Indicates whether the action can execute its function.
V	HasParent (see page 294)	Indicates whether the action is contained in an action list or action manager.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RegisterChanges (see page 2713)	Associates the action with an action link.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UnRegisterChanges (see page 2714)	Breaks the association between the action and the action link.
V	Update (see page 295)	Indicates whether the action updates itself.
V	Update (see page 2714)	Provides an opportunity to execute centralized code when an application is idle.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
V	UpdateTarget (see page 11912)	Enables or disables the action, depending on the state of the target control.

Public Properties

	Name	Description
	ActionComponent (see page 2715)	Indicates the client component that caused this action to execute.
	ActionList (see page 295)	Indicates the action list or action manager that contains the action.
	AutoCheck (see page 308)	Controls (see page 5711) whether the Checked (see page 308) property toggles when the action executes.
	Checked (see page 308)	Indicates whether client controls and menu items appear checked.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.

	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DisableIfNoHandler (see page 310)	Indicates whether client components should be disabled if no handler is found.
	GroupIndex (see page 311)	Indicates whether the action acts like a radio button with other actions in the same action list.
	Index (see page 296)	Specifies the index of the action in its action list or action manager.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Events

	Name	Description
	OnHint (see page 11917)	Occurs when the mouse pauses over a client control or menu item.
	OnUpdate (see page 11918)	Occurs when the application is idle or when the action list updates.

Published Properties

	Name	Description
	Caption (see page 11912)	Represents the caption of client controls and menu items.
	Category (see page 296)	Specifies the category under which the action appears in its action list or action manager.
	Destination (see page 11913)	Specifies the list control to which items are copied.
	Enabled (see page 11913)	Indicates whether client controls and menu items are enabled.
	HelpContext (see page 11914)	Indicates the help context ID for client controls and menu items.
	HelpKeyword (see page 11914)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 11915)	Indicates the mechanism for client controls and menu items to use when invoking help.
	Hint (see page 11915)	Indicates the Help hint for client controls and menu items.
	ImageIndex (see page 11915)	Indicates the ImageIndex property for client controls and menu items.
	ListControl (see page 11916)	Provides access to the target of the action.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	SecondaryShortCuts (see page 11916)	Specifies the short cuts (in addition to ShortCut) for triggering clients.
	ShortCut (see page 11916)	Specifies the ShortCut property for client menu items.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Visible (see page 11917)	Specifies the Visible property for client controls and menu items.

67.1.7.2 TListControlCopySelection Methods

The methods of the TListControlCopySelection class are listed here.

Public Methods

	Name	Description
V	ExecuteTarget (see page 11910)	Copies the selected items in the target list control to the list control specified by Destination (see page 11913).
V	HandlesTarget (see page 11911)	Indicates whether the action can execute its function.
V	UpdateTarget (see page 11912)	Enables or disables the action, depending on the state of the target control.

67.1.7.2.1 TListControlCopySelection.ExecuteTarget Method

Copies the selected items in the target list control to the list control specified by Destination (see page 11913).

Pascal

```
procedure ExecuteTarget(Target: TObject); override;
```

C++

```
virtual __fastcall ExecuteTarget(TObject * Target);
```

Description

Do not call the ExecuteTarget method. This method is called automatically when the action fires in response to a user action (for example, when the user selects a menu item or presses a tool button that is linked to this action).

Target is the currently active object when the action fires. It should always be a TCustomListControl descendant (because HandlesTarget (see page 11911) returns false if it is not).

ExecuteTarget sets the ListControl (see page 11916) property to Target it is not already set. It then calls the list control's ClearSelection method, copying any selected items to the list box or list view specified by the Destination (see page 11913) property.

See Also

TCustomListControl (see page 5928)

ListControl (see page 11893)

CopySelection (see page 5941)

Destination

67.1.7.2.2 TListControlCopySelection.HandlesTarget Method

Indicates whether the action can execute its function.

Pascal

```
function HandlesTarget(Target: TObject): Boolean; override;
```

C++

```
virtual __fastcall Boolean HandlesTarget(TObject * Target);
```

Description

Do not call the HandlesTarget method. This method is called automatically when the user invokes an object (such as a tool button or menu item) that is linked to this action. The HandlesTarget method provides the action object with an opportunity to indicate whether it is appropriate to execute at this time with the object specified by the Target parameter as a "target".

Target is the currently active object.

HandlesTarget checks that the target is a TCustomListControl descendant (or that the ListControl (see page 11916) property is set if Target is nil (Delphi) or NULL (C++)). It also ensures that the Destination (see page 11913) property has been asssigned. HandlesTarget returns true if there is a list control to act as target and a destination control, false otherwise.

See Also

ExecuteTarget (see page 2712)

TCustomListControl (see page 5928)

ListControl (see page 11893)

Destination

67.1.7.2.3 TListControlCopySelection.UpdateTarget Method

Enables or disables the action, depending on the state of the target control.

Pascal

```
procedure UpdateTarget(Target: TObject); override;
```

C++

```
virtual __fastcall UpdateTarget(TObject * Target);
```

Description

Do not call the UpdateTarget method. This method is called automatically when the application is idle so that actions can update themselves according to current conditions.

In TListControlCopySelection (see page 11906), UpdateTarget checks whether the current target object (specified by the ListControl (see page 11916) property if it is set, otherwise by the Target parameter) is a list control that includes at least one selected item. If so, UpdateTarget sets Enabled (see page 11913) to true. If not, UpdateTarget sets Enabled (see page 11913) to false.

See Also

Enabled (see page 310)

SelCount (see page 5957)

ListControl (see page 11893)

67.1.7.3 TListControlCopySelection Properties

The properties of the TListControlCopySelection class are listed here.

Published Properties

	Name	Description
	Caption (see page 11912)	Represents the caption of client controls and menu items.
	Destination (see page 11913)	Specifies the list control to which items are copied.
	Enabled (see page 11913)	Indicates whether client controls and menu items are enabled.
	HelpContext (see page 11914)	Indicates the help context ID for client controls and menu items.
	HelpKeyword (see page 11914)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 11915)	Indicates the mechanism for client controls and menu items to use when invoking help.
	Hint (see page 11915)	Indicates the Help hint for client controls and menu items.
	ImageIndex (see page 11915)	Indicates the ImageIndex property for client controls and menu items.
	ListControl (see page 11916)	Provides access to the target of the action.
	SecondaryShortCuts (see page 11916)	Specifies the short cuts (in addition to ShortCut) for triggering clients.
	ShortCut (see page 11916)	Specifies the ShortCut property for client menu items.
	Visible (see page 11917)	Specifies the Visible property for client controls and menu items.

67.1.7.3.1 TListControlCopySelection.Caption Property

Represents the caption of client controls and menu items.

Pascal

```
property Caption: string;
```

C++

```
__property AnsiString Caption;
```

Description

Caption holds the string that is the caption for the action when it is set. The value of Caption is propagated to client controls and menu items.

See Also

Caption (see page 5806)

Caption (see page 16136)

67.1.7.3.2 TListControlCopySelection.Destination Property

Specifies the list control to which items are copied.

Pascal

```
property Destination: TCustomListControl;
```

C++

```
__property TCustomListControl Destination;
```

Description

Destination is the list control to which the action copies selected items from its target. It is a TCustomListControl descendant, such a TListView or TListBox.

You must explicitly set Destination to indicate the list control that receives the new items. These items are copied from the list control specified by the ListControl (see page 11916) property. Destination and ListControl (see page 11916) do not need to be the same type of control, as long as they are both TCustomListControl descendants.

See Also

TListView (see page 4285)

TListBox (see page 21598)

ListControl (see page 11893)

67.1.7.3.3 TListControlCopySelection.Enabled Property

Indicates whether client controls and menu items are enabled.

Pascal

```
property Enabled: Boolean;
```

C++

```
__property Boolean Enabled;
```

Description

Enabled specifies the enabled state for the action. The value of Enabled is propagated to client controls and menu items.

See Also

Enabled (see page 5821)

Enabled (see page 16145)

67.1.7.3.4 TListControlCopySelection.HelpContext Property

Indicates the help context ID for client controls and menu items.

Pascal

```
property HelpContext: THelpContext;
```

C++

```
__property THelpContext HelpContext;
```

Description

HelpContext specifies the help context for the action when it is set. This value is propagated to client controls and menu items.

When a client control has focus and the user presses the F1 key, the control uses the value of HelpContext for this associated action to invoke the online help targeting a specific topic. The target topic is uniquely identified by a nonzero HelpContext value. Leave the HelpContext property of the client control at its default value of zero. This allows multiple controls (and multiple types of controls) to be associated with the same help topic through the one action object.

Note: HelpContext is only used when the HelpType property of this action or the client control is htInteger.

See Also

HelpType (see page 312)

HelpKeyword (see page 311)

67.1.7.3.5 TListControlCopySelection.HelpKeyword Property

Indicates the help keyword for client controls and menu items.

Pascal

```
property HelpKeyword: string;
```

C++

```
__property AnsiString HelpKeyword;
```

Description

HelpKeyword, when set, specifies the keyword that identifies a help topic for this action. This value is propagated to the HelpKeyword property of client controls and menu items. The interpretation of HelpKeyword depends on which help system is used to display the topic. For example, when using HyperHelp (on Linux) or WinHelp (on Windows), HelpKeyword refers to an A link.

When a client control has focus and the user presses the F1 key (or the key specified by the application's HelpKey property), the control uses the value of HelpKeyword for this associated action object to invoke the online help targeting a specific topic. Leave the HelpKeyword property of the client control unassigned. This allows multiple controls (and multiple types of controls) to be associated with the same help topic through the one action object.

Note: HelpKeyword is only used when the HelpType property of this action or the client control is htKeyword.

See Also

HelpKeyword (see page 5826)

HelpContext (see page 311)

HelpType (see page 312)

HelpKey

67.1.7.3.6 TListControlCopySelection.HelpType Property

Indicates the mechanism for client controls and menu items to use when invoking help.

Pascal

```
property HelpType: THelpType;
```

C++

```
__property THelpType HelpType;
```

Description

HelpType, when set, indicates whether client controls and menu items should use the HelpContext or the HelpKeyword property for invoking the help system. This value is propagated to the HelpType property of client controls and menu items.

See Also

HelpType (see page 5827)

HelpType

HelpContext (see page 311)

HelpKeyword (see page 311)

67.1.7.3.7 TListControlCopySelection.Hint Property

Indicates the Help hint for client controls and menu items.

Pascal

```
property Hint: string;
```

C++

```
__property AnsiString Hint;
```

Description

Hint holds the string that is the hint for that action when it is set. This value is propagated to client controls and menu items.

See Also

Hint (see page 5827)

Hint (see page 16148)

67.1.7.3.8 TListControlCopySelection.ImageIndex Property

Indicates the ImageIndex property for client controls and menu items.

Pascal

```
property ImageIndex: TImageIndex;
```

C++

```
__property TImageIndex ImageIndex;
```

Description

ImageIndex is an index into the Images property of the action list or action manager that contains the action. It identifies an image that is associated with controls and menu items that use this action.

See Also

ImageIndex (see page 5135)

ImageIndex (see page 16148)

Images (see page 325)

67.1.7.3.9 TListControlCopySelection.ListControl Property

Provides access to the target of the action.

Pascal

```
property ListControl: TCustomListControl;
```

C++

```
__property TCustomListControl ListControl;
```

Description

ListControl is the list control on which the action performs its function. It is a TCustomListControl descendant, such a TListView or TListBox.

Set ListControl to associate the action with a particular control. If ListControl is not explicitly set, it is assumed to be the active listbox or list view when the action fires.

See Also

TListView (see page 4285)

TListBox (see page 21598)

67.1.7.3.10 TListControlCopySelection.SecondaryShortCuts Property

Specifies the short cuts (in addition to ShortCut) for triggering clients.

Pascal

```
property SecondaryShortCuts: TShortCutList;
```

C++

```
__property TShortCutList SecondaryShortCuts;
```

Description

Actions can execute in response to multiple short cut key combinations. SecondaryShortCuts lists all the short cut key combinations (other than the one specified by the ShortCut property) that can trigger the action. This lets you specify shortcuts for clients that do not have a ShortCut property or provide additional, secondary shortcuts.

When the user types one of the key combinations listed in SecondaryShortCuts, the action's Execute method is called.

See Also

ShortCut (see page 314)

Execute (see page 304)

67.1.7.3.11 TListControlCopySelection.ShortCut Property

Specifies the ShortCut property for client menu items.

Pascal

```
property ShortCut: TShortCut;
```

C++

```
__property TShortCut ShortCut;
```

Description

ShortCut holds the value that is the shortcut for the action when it is set. This value is propagated to client menu items.

See Also

ShortCut (see page 16152)

SecondaryShortCuts (see page 314)

67.1.7.3.12 TListControlCopySelection.Visible Property

Specifies the Visible property for client controls and menu items.

Pascal

```
property Visible: Boolean;
```

C++

```
__property Boolean Visible;
```

Description

Visible specifies the visible state for the action. This value is propagated to client controls and menu items.

See Also

Visible (see page 16153)

Visible (see page 5847)

67.1.7.4 TListControlCopySelection Events

The events of the TListControlCopySelection class are listed here.

Published Events

	Name	Description
	OnHint (see page 11917)	Occurs when the mouse pauses over a client control or menu item.
	OnUpdate (see page 11918)	Occurs when the application is idle or when the action list updates.

67.1.7.4.1 TListControlCopySelection.OnHint Event

Occurs when the mouse pauses over a client control or menu item.

Pascal

```
property OnHint: THintEvent;
```

C++

```
__property THintEvent OnHint;
```

Description

Use OnHint to override the default hint that appears when the user pauses the mouse over a client control or menu item. The

OnHint event handler can change the hint that appears (by changing the HintStr parameter), or display the hint in some application-specific way.

67.1.7.4.2 TListControlCopySelection.OnUpdate Event

Occurs when the application is idle or when the action list updates.

Pascal

```
property OnUpdate: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnUpdate;
```

Description

Write an OnUpdate event handler to execute centralized code while an application is idle. For example, actions may want to update enabling and disabling, or checking and unchecking of client targets.

C++ Examples:

```
/*
When the application is idle, the OnUpdate event occurs for
every action that is linked to a visible control or menu
item that is showing. This provides an opportunity for
applications to execute centralized code for enabling and
disabling, checking and unchecking, and so on. For example,
the following code illustrates the OnUpdate event handler
for an action that is "checked" when the toolbar is visible.
This example requires a TActionList (with one TAction) and a
TToolBar on a form. This example requires a TActionList
(with one TAction) and a TToolBar on a form.  Double click
on the TActionList and create an TAction named Action1.  The
TAction has an OnUpdate event handler called Action1Update.
Then set an object's (such as a button or menu item) Action
to Action1.
*/
void __fastcall TForm1::Action1Update(TObject *Sender)
{
   // Indicate whether ToolBar1 is currently visible.
   TAction* pa = dynamic_cast<TAction*>(Sender);
   if (pa)
   {
     if (pa->Checked != ToolBar1->Visible)
     {
       lbOther->Items->Add("Event Action1Update: toolbar visibility changed");
     }
     pa->Checked = ToolBar1->Visible;
   }
}
```

Delphi Examples:

```
{
When the application is idle, the OnUpdate event occurs for
every action that is linked to a visible control or menu
item that is showing. This provides an opportunity for
applications to execute centralized code for enabling and
disabling, checking and unchecking, and so on. For example,
the following code illustrates the OnUpdate event handler
for an action that is "checked" when the toolbar is visible.
This example requires a TActionList (with one TAction) and a
TToolBar on a form. This example requires a TActionList
(with one TAction) and a TToolBar on a form.  Double click
on the TActionList and create an TAction named Action1.  The
```

```
TAction has an OnUpdate event handler called Action1Update.
Then set an object's (such as a button or menu item) Action
to Action1.
}
procedure TMainForm.Action1Update(Sender: TObject);
begin
  if ((Sender as TAction).Checked <> ToolBar1.Visible) then
    lbOther.Items.Add('Event Action1Update: toolbar visibility changed');
    { Indicate whether ToolBar1 is currently visible }
    (Sender as TAction).Checked := ToolBar1.Visible;
end;
```

See Also

UpdateAction (see page 2790)

67.1.8 TListControlDeleteSelection Class

TListControlDeleteSelection deletes the selected items in a list control (list view or listbox).

Class Hierarchy

Pascal

```
TListControlDeleteSelection = class(TListControlAction);
```

C++

```
class TListControlDeleteSelection : public TListControlAction;
```

File

ExtActns

Description

Add TListControlDeleteSelection to an action list to allow users to delete the selected items of a list control by using menu items or toolbar buttons. Controls (see page 5711) such as menu items and tool buttons linked to this action cause the application to delete all selected items in the target control (a listbox or list view).

TListControlDeleteSelection is designed to work with a list control (TCustomListControl descendant) as a target. TListControlDeleteSelection automatically disables itself if the target control is not a list control or if that list box or list view has no selected items.

TListControlClearSelection

TListControlMoveSelection

TListControlDeleteSelection

TListControlSelectAll

TCustomListControl (see page 5928)

67.1.8.1 TListControlDeleteSelection Members

The following tables list the members exposed by TListControlDeleteSelection.

Protected Events

	Name	Description
	OnChange (see page 2716)	Occurs when one of the action's properties changes.

Protected Fields

	Name	Description
	FClients (see page 2711)	This is FClients, a member of class TBasicAction.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FImage (see page 302)	This is FImage, a member of class TCustomAction.
	FMask (see page 303)	This is FMask, a member of class TCustomAction.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 303)	Copies the properties of this action to a destination object.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	Change (see page 2712)	Generates an OnChange (see page 2716) event.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
V	HandleShortCut (see page 306)	Executes the action when the user types on of its short cuts.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsEnabled (see page 11892)	This is IsEnabled, a member of class TListControlAction.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2713)	Responds when components are created or destroyed.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	Notification (see page 11892)	Responds when components are created or destroyed.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 294)	This is ReadState, a member of class TContainedAction.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.

	SetHelpContext (see page 306)	This is SetHelpContext, a member of class TCustomAction.
	SetHelpKeyword (see page 306)	This is SetHelpKeyword, a member of class TCustomAction.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 307)	Sets the value of the Name property.
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetOnExecute (see page 2714)	Assigns an OnExecute (see page 2716) event handler.
	SetParentComponent (see page 294)	This is SetParentComponent, a member of class TContainedAction.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	SavedEnabledState (see page 313)	Saves the value of the Enabled (see page 310) property when the action is suspended.

Public Events

	Name	Description
	OnExecute (see page 2716)	Occurs when the client event that is linked to it fires.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 301)	Instantiates and initializes a TCustomAction (see page 297) object.
	Create (see page 2710)	Instantiates and initializes a TBasicAction (see page 2707) object.
	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 11891)	Creates an instance of TListControlAction (see page 11886).
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 292)	Destroys the instance of the contained action.
	Destroy (see page 302)	Frees an instance of TCustomAction (see page 297).
	Destroy (see page 2711)	Disposes of an instance of a TBasicAction (see page 2707) object.
	Destroy (see page 2766)	Disposes of the component and its owned components.

	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DoHint (see page 303)	Generates an OnHint (see page 315) event.
	Execute (see page 293)	Responds when the client control "fires".
	Execute (see page 304)	Responds when a client control "fires".
	Execute (see page 2712)	Generates an OnExecute (see page 2716) event.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	ExecuteTarget (see page 11924)	Deletes the selected items in the target list control.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 293)	Returns the action list or action manager that contains the action.
	GetParentComponent (see page 2778)	Returns the containing Component.
	HandlesTarget (see page 2713)	Introduces an interface for verifying that the type, and state, of a target component or control are appropriate for the action.
	HandlesTarget (see page 11892)	Indicates whether the action can execute its function.
	HasParent (see page 294)	Indicates whether the action is contained in an action list or action manager.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RegisterChanges (see page 2713)	Associates the action with an action link.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UnRegisterChanges (see page 2714)	Breaks the association between the action and the action link.

V	Update (see page 295)	Indicates whether the action updates itself.
V	Update (see page 2714)	Provides an opportunity to execute centralized code when an application is idle.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
V	UpdateTarget (see page 11924)	Enables or disables the action, depending on the state of the target control.

Public Properties

	Name	Description
	ActionComponent (see page 2715)	Indicates the client component that caused this action to execute.
	ActionList (see page 295)	Indicates the action list or action manager that contains the action.
	AutoCheck (see page 308)	Controls (see page 5711) whether the Checked (see page 308) property toggles when the action executes.
	Checked (see page 308)	Indicates whether client controls and menu items appear checked.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DisableIfNoHandler (see page 310)	Indicates whether client components should be disabled if no handler is found.
	GroupIndex (see page 311)	Indicates whether the action acts like a radio button with other actions in the same action list.
	Index (see page 296)	Specifies the index of the action in its action list or action manager.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Events

	Name	Description
	OnHint (see page 11929)	Occurs when the mouse pauses over a client control or menu item.
	OnUpdate (see page 11930)	Occurs when the application is idle or when the action list updates.

Published Properties

	Name	Description
	Caption (see page 11925)	Represents the caption of client controls and menu items.
	Category (see page 296)	Specifies the category under which the action appears in its action list or action manager.
	Enabled (see page 11925)	Indicates whether client controls and menu items are enabled.
	HelpContext (see page 11926)	Indicates the help context ID for client controls and menu items.
	HelpKeyword (see page 11926)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 11927)	Indicates the mechanism for client controls and menu items to use when invoking help.
	Hint (see page 11927)	Indicates the Help hint for client controls and menu items.
	ImageIndex (see page 11927)	Indicates the ImageIndex property for client controls and menu items.
	ListControl (see page 11928)	Provides access to the target of the action.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	SecondaryShortCuts (see page 11928)	Specifies the short cuts (in addition to ShortCut) for triggering clients.
	ShortCut (see page 11929)	Specifies the ShortCut property for client menu items.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Visible (see page 11929)	Specifies the Visible property for client controls and menu items.

67.1.8.2 TListControlDeleteSelection Methods

The methods of the TListControlDeleteSelection class are listed here.

Public Methods

	Name	Description
	ExecuteTarget (see page 11924)	Deletes the selected items in the target list control.
	UpdateTarget (see page 11924)	Enables or disables the action, depending on the state of the target control.

67.1.8.2.1 TListControlDeleteSelection.ExecuteTarget Method

Deletes the selected items in the target list control.

Pascal

```
procedure ExecuteTarget(Target: TObject); override;
```

C++

```
virtual __fastcall ExecuteTarget(TObject * Target);
```

Description

Do not call the ExecuteTarget method. This method is called automatically when the action fires in response to a user action (for example, when the user selects a menu item or presses a tool button that is linked to this action).

Target is the currently active object when the action fires. It should always be a TCustomListControl descendant (because HandlesTarget (see page 11892) returns false if it is not).

ExecuteTarget sets the ListControl (see page 11928) property to Target it is not already set. It then calls the list control's DeleteSelected method, deleting any selected items.

See Also

TCustomListControl (see page 5928)

ListControl (see page 11893)

DeleteSelected (see page 5941)

67.1.8.2.2 TListControlDeleteSelection.UpdateTarget Method

Enables or disables the action, depending on the state of the target control.

Pascal

```
procedure UpdateTarget(Target: TObject); override;
```

C++

```
virtual __fastcall UpdateTarget(TObject * Target);
```

Description

Do not call the UpdateTarget method. This method is called automatically when the application is idle so that actions can update themselves according to current conditions.

In TListControlDeleteSelection (see page 11919), UpdateTarget checks whether the current target object (specified by the ListControl (see page 11928) property if it is set, otherwise by the Target parameter) is a list control that includes at least one selected item. If so, UpdateTarget sets Enabled (see page 11925) to true. If not, UpdateTarget sets Enabled (see page 11925) to false.

See Also

Enabled (see page 310)

SelCount (see page 5957)

ListControl (see page 11893)

67.1.8.3 TListControlDeleteSelection Properties

The properties of the TListControlDeleteSelection class are listed here.

Published Properties

	Name	Description
	Caption (see page 11925)	Represents the caption of client controls and menu items.
	Enabled (see page 11925)	Indicates whether client controls and menu items are enabled.
	HelpContext (see page 11926)	Indicates the help context ID for client controls and menu items.
	HelpKeyword (see page 11926)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 11927)	Indicates the mechanism for client controls and menu items to use when invoking help.
	Hint (see page 11927)	Indicates the Help hint for client controls and menu items.
	ImageIndex (see page 11927)	Indicates the ImageIndex property for client controls and menu items.
	ListControl (see page 11928)	Provides access to the target of the action.
	SecondaryShortCuts (see page 11928)	Specifies the short cuts (in addition to ShortCut) for triggering clients.
	ShortCut (see page 11929)	Specifies the ShortCut property for client menu items.
	Visible (see page 11929)	Specifies the Visible property for client controls and menu items.

67.1.8.3.1 TListControlDeleteSelection.Caption Property

Represents the caption of client controls and menu items.

Pascal

```
property Caption: string;
```

C++

```
__property AnsiString Caption;
```

Description

Caption holds the string that is the caption for the action when it is set. The value of Caption is propagated to client controls and menu items.

See Also

Caption (see page 5806)

Caption (see page 16136)

67.1.8.3.2 TListControlDeleteSelection.Enabled Property

Indicates whether client controls and menu items are enabled.

Pascal

```
property Enabled: Boolean;
```

C++

```
__property Boolean Enabled;
```

Description

Enabled specifies the enabled state for the action. The value of Enabled is propagated to client controls and menu items.

See Also

Enabled (see page 5821)

Enabled (see page 16145)

67.1.8.3.3 TListControlDeleteSelection.HelpContext Property

Indicates the help context ID for client controls and menu items.

Pascal

```
property HelpContext: THelpContext;
```

C++

```
__property THelpContext HelpContext;
```

Description

HelpContext specifies the help context for the action when it is set. This value is propagated to client controls and menu items.

When a client control has focus and the user presses the F1 key, the control uses the value of HelpContext for this associated action to invoke the online help targeting a specific topic. The target topic is uniquely identified by a nonzero HelpContext value. Leave the HelpContext property of the client control at its default value of zero. This allows multiple controls (and multiple types of controls) to be associated with the same help topic through the one action object.

Note: HelpContext is only used when the HelpType property of this action or the client control is htInteger.

See Also

HelpType (see page 312)

HelpKeyword (see page 311)

67.1.8.3.4 TListControlDeleteSelection.HelpKeyword Property

Indicates the help keyword for client controls and menu items.

Pascal

```
property HelpKeyword: string;
```

C++

```
__property AnsiString HelpKeyword;
```

Description

HelpKeyword, when set, specifies the keyword that identifies a help topic for this action. This value is propagated to the HelpKeyword property of client controls and menu items. The interpretation of HelpKeyword depends on which help system is used to display the topic. For example, when using HyperHelp (on Linux) or WinHelp (on Windows), HelpKeyword refers to an A link.

When a client control has focus and the user presses the F1 key (or the key specified by the application's HelpKey property), the control uses the value of HelpKeyword for this associated action object to invoke the online help targeting a specific topic. Leave the HelpKeyword property of the client control unassigned. This allows multiple controls (and multiple types of controls) to be associated with the same help topic through the one action object.

Note: HelpKeyword is only used when the HelpType property of this action or the client control is htKeyword.

See Also

HelpKeyword (see page 5826)

HelpContext (see page 311)

HelpType (see page 312)

HelpKey

67.1.8.3.5 TListControlDeleteSelection.HelpType Property

Indicates the mechanism for client controls and menu items to use when invoking help.

Pascal

```
property HelpType: THelpType;
```

C++

```
__property THelpType HelpType;
```

Description

HelpType, when set, indicates whether client controls and menu items should use the HelpContext or the HelpKeyword property for invoking the help system. This value is propagated to the HelpType property of client controls and menu items.

See Also

HelpType (see page 5827)

HelpType

HelpContext (see page 311)

HelpKeyword (see page 311)

67.1.8.3.6 TListControlDeleteSelection.Hint Property

Indicates the Help hint for client controls and menu items.

Pascal

```
property Hint: string;
```

C++

```
__property AnsiString Hint;
```

Description

Hint holds the string that is the hint for that action when it is set. This value is propagated to client controls and menu items.

See Also

Hint (see page 5827)

Hint (see page 16148)

67.1.8.3.7 TListControlDeleteSelection.ImageIndex Property

Indicates the ImageIndex property for client controls and menu items.

Pascal

```
property ImageIndex: TImageIndex;
```

C++

```
__property TImageIndex ImageIndex;
```

Description

ImageIndex is an index into the Images property of the action list or action manager that contains the action. It identifies an image that is associated with controls and menu items that use this action.

See Also

ImageIndex (see page 5135)

ImageIndex (see page 16148)

Images (see page 325)

67.1.8.3.8 TListControlDeleteSelection.ListControl Property

Provides access to the target of the action.

Pascal

```
property ListControl: TCustomListControl;
```

C++

```
__property TCustomListControl ListControl;
```

Description

ListControl is the list control on which the action performs its function. It is a TCustomListControl descendant, such a TListView or TListBox.

Set ListControl to associate the action with a particular control. If ListControl is not explicitly set, it is assumed to be the active listbox or list view when the action fires.

See Also

TListView (see page 4285)

TListBox (see page 21598)

67.1.8.3.9 TListControlDeleteSelection.SecondaryShortCuts Property

Specifies the short cuts (in addition to ShortCut) for triggering clients.

Pascal

```
property SecondaryShortCuts: TShortCutList;
```

C++

```
__property TShortCutList SecondaryShortCuts;
```

Description

Actions can execute in response to multiple short cut key combinations. SecondaryShortCuts lists all the short cut key combinations (other than the one specified by the ShortCut property) that can trigger the action. This lets you specify shortcuts for clients that do not have a ShortCut property or provide additional, secondary shortcuts.

When the user types one of the key combinations listed in SecondaryShortCuts, the action's Execute method is called.

See Also

ShortCut (see page 314)

Execute (see page 304)

67.1.8.3.10 TListControlDeleteSelection.ShortCut Property

Specifies the ShortCut property for client menu items.

Pascal

```
property ShortCut: TShortCut;
```

C++

```
__property TShortCut ShortCut;
```

Description

ShortCut holds the value that is the shortcut for the action when it is set. This value is propagated to client menu items.

See Also

ShortCut (see page 16152)

SecondaryShortCuts (see page 314)

67.1.8.3.11 TListControlDeleteSelection.Visible Property

Specifies the Visible property for client controls and menu items.

Pascal

```
property Visible: Boolean;
```

C++

```
__property Boolean Visible;
```

Description

Visible specifies the visible state for the action. This value is propagated to client controls and menu items.

See Also

Visible (see page 16153)

Visible (see page 5847)

67.1.8.4 TListControlDeleteSelection Events

The events of the TListControlDeleteSelection class are listed here.

Published Events

	Name	Description
	OnHint (see page 11929)	Occurs when the mouse pauses over a client control or menu item.
	OnUpdate (see page 11930)	Occurs when the application is idle or when the action list updates.

67.1.8.4.1 TListControlDeleteSelection.OnHint Event

Occurs when the mouse pauses over a client control or menu item.

Pascal

```
property OnHint: THintEvent;
```

C++

```
__property THintEvent OnHint;
```

Description

Use OnHint to override the default hint that appears when the user pauses the mouse over a client control or menu item. The OnHint event handler can change the hint that appears (by changing the HintStr parameter), or display the hint in some application-specific way.

67.1.8.4.2 TListControlDeleteSelection.OnUpdate Event

Occurs when the application is idle or when the action list updates.

Pascal

```
property OnUpdate: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnUpdate;
```

Description

Write an OnUpdate event handler to execute centralized code while an application is idle. For example, actions may want to update enabling and disabling, or checking and unchecking of client targets.

C++ Examples:

```
/*
When the application is idle, the OnUpdate event occurs for
every action that is linked to a visible control or menu
item that is showing. This provides an opportunity for
applications to execute centralized code for enabling and
disabling, checking and unchecking, and so on. For example,
the following code illustrates the OnUpdate event handler
for an action that is "checked" when the toolbar is visible.
This example requires a TActionList (with one TAction) and a
TToolBar on a form. This example requires a TActionList
(with one TAction) and a TToolBar on a form.  Double click
on the TActionList and create an TAction named Action1.  The
TAction has an OnUpdate event handler called Action1Update.
Then set an object's (such as a button or menu item) Action
to Action1.
*/
void __fastcall TForm1::Action1Update(TObject *Sender)
{
   // Indicate whether ToolBar1 is currently visible.
   TAction* pa = dynamic_cast<TAction*>(Sender);
   if (pa)
   {
     if (pa->Checked != ToolBar1->Visible)
     {
       lbOther->Items->Add("Event Action1Update: toolbar visibility changed");
     }
     pa->Checked = ToolBar1->Visible;
   }
}
```

Delphi Examples:

```
{
When the application is idle, the OnUpdate event occurs for
every action that is linked to a visible control or menu
item that is showing. This provides an opportunity for
applications to execute centralized code for enabling and
```

```
disabling, checking and unchecking, and so on. For example,
the following code illustrates the OnUpdate event handler
for an action that is "checked" when the toolbar is visible.
This example requires a TActionList (with one TAction) and a
TToolBar on a form. This example requires a TActionList
(with one TAction) and a TToolBar on a form.  Double click
on the TActionList and create an TAction named Action1.  The
TAction has an OnUpdate event handler called Action1Update.
Then set an object's (such as a button or menu item) Action
to Action1.
}
procedure TMainForm.Action1Update(Sender: TObject);
begin
  if ((Sender as TAction).Checked <> ToolBar1.Visible) then
    lbOther.Items.Add('Event Action1Update: toolbar visibility changed');
    { Indicate whether ToolBar1 is currently visible }
    (Sender as TAction).Checked := ToolBar1.Visible;
end;
```

See Also

UpdateAction (see page 2790)

67.1.9 TListControlMoveSelection Class

TListControlMoveSelection moves the selected items in a list control (list view or list box) to another (destination) list control.

Class Hierarchy

Pascal

```
TListControlMoveSelection = class(TListControlCopySelection);
```

C++

```
class TListControlMoveSelection : public TListControlCopySelection;
```

File

ExtActns

Description

Add TListControlMoveSelection to an action list to allow users to move the selected items of a list control to another list control by using menu items or toolbar buttons. Controls (see page 5711) such as menu items and tool buttons linked to this action cause the application to move all selected items in the target control to another (destination) list control.

Your application must explicitly set the Destination (see page 11913) property to indicate the list to which items are copied.

TListControlMoveSelection is designed to work with a list control (TCustomListControl descendant) as a target. This target is the source list control, not the destination. TListControlMoveSelection automatically disables itself if the target control is not a list control, if that list box or list view has no selected items, or if there is no destination list control assigned.

TListControlCopySelection

TListControlDeleteSelection

TListControlSelectAll

TCustomListControl (see page 5928)

67.1.9.1 TListControlMoveSelection Members

The following tables list the members exposed by TListControlMoveSelection.

Protected Events

	Name	Description
	OnChange (see page 2716)	Occurs when one of the action's properties changes.

Protected Fields

	Name	Description
	FClients (see page 2711)	This is FClients, a member of class TBasicAction.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FImage (see page 302)	This is FImage, a member of class TCustomAction.
	FMask (see page 303)	This is FMask, a member of class TCustomAction.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 303)	Copies the properties of this action to a destination object.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	Change (see page 2712)	Generates an OnChange (see page 2716) event.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
V	HandleShortCut (see page 306)	Executes the action when the user types on of its short cuts.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsEnabled (see page 11892)	This is IsEnabled, a member of class TListControlAction.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2713)	Responds when components are created or destroyed.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	Notification (see page 11892)	Responds when components are created or destroyed.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 294)	This is ReadState, a member of class TContainedAction.

	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetHelpContext (see page 306)	This is SetHelpContext, a member of class TCustomAction.
	SetHelpKeyword (see page 306)	This is SetHelpKeyword, a member of class TCustomAction.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 307)	Sets the value of the Name property.
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetOnExecute (see page 2714)	Assigns an OnExecute (see page 2716) event handler.
	SetParentComponent (see page 294)	This is SetParentComponent, a member of class TContainedAction.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	SavedEnabledState (see page 313)	Saves the value of the Enabled (see page 310) property when the action is suspended.

Public Events

	Name	Description
	OnExecute (see page 2716)	Occurs when the client event that is linked to it fires.
	OnHint (see page 315)	Occurs when the mouse pauses over a client control or menu item.
	OnUpdate (see page 2718)	Occurs when the application is idle or when the action list updates.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 301)	Instantiates and initializes a TCustomAction (see page 297) object.
	Create (see page 2710)	Instantiates and initializes a TBasicAction (see page 2707) object.
	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.

	Create (see page 11891)	Creates an instance of TListControlAction (see page 11886).
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 292)	Destroys the instance of the contained action.
	Destroy (see page 302)	Frees an instance of TCustomAction (see page 297).
	Destroy (see page 2711)	Disposes of an instance of a TBasicAction (see page 2707) object.
	Destroy (see page 2766)	Disposes of the component and its owned components.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DoHint (see page 303)	Generates an OnHint (see page 315) event.
	Execute (see page 293)	Responds when the client control "fires".
	Execute (see page 304)	Responds when a client control "fires".
	Execute (see page 2712)	Generates an OnExecute (see page 2716) event.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	ExecuteTarget (see page 11936)	Moves the selected items in the target list control to the list control specified by Destination (see page 11913).
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 293)	Returns the action list or action manager that contains the action.
	GetParentComponent (see page 2778)	Returns the containing Component.
	HandlesTarget (see page 2713)	Introduces an interface for verifying that the type, and state, of a target component or control are appropriate for the action.
	HandlesTarget (see page 11892)	Indicates whether the action can execute its function.
	HandlesTarget (see page 11911)	Indicates whether the action can execute its function.
	HasParent (see page 294)	Indicates whether the action is contained in an action list or action manager.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.

	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RegisterChanges (see page 2713)	Associates the action with an action link.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UnRegisterChanges (see page 2714)	Breaks the association between the action and the action link.
V	Update (see page 295)	Indicates whether the action updates itself.
V	Update (see page 2714)	Provides an opportunity to execute centralized code when an application is idle.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
V	UpdateTarget (see page 2715)	Introduces an interface for a method of notifying a client when the action updates itself.
V	UpdateTarget (see page 11912)	Enables or disables the action, depending on the state of the target control.

Public Properties

	Name	Description
	ActionComponent (see page 2715)	Indicates the client component that caused this action to execute.
	ActionList (see page 295)	Indicates the action list or action manager that contains the action.
	AutoCheck (see page 308)	Controls (see page 5711) whether the Checked (see page 308) property toggles when the action executes.
	Caption (see page 308)	Represents the caption of client controls and menu items.
	Checked (see page 308)	Indicates whether client controls and menu items appear checked.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DisableIfNoHandler (see page 310)	Indicates whether client components should be disabled if no handler is found.
	Enabled (see page 310)	Indicates whether client controls and menu items are enabled.
	GroupIndex (see page 311)	Indicates whether the action acts like a radio button with other actions in the same action list.
	HelpContext (see page 311)	Indicates the help context ID for client controls and menu items.
	HelpKeyword (see page 311)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 312)	Indicates the mechanism for client controls and menu items to use when invoking help.
	Hint (see page 312)	Indicates the Help hint for client controls and menu items.
	ImageIndex (see page 313)	Indicates the ImageIndex property for client controls and menu items.
	Index (see page 296)	Specifies the index of the action in its action list or action manager.
	ListControl (see page 11893)	Provides access to the target of the action.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	SecondaryShortCuts (see page 314)	Specifies the short cuts (in addition to ShortCut (see page 314)) for triggering clients.
	ShortCut (see page 314)	Specifies the ShortCut property for client menu items.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	Visible (see page 314)	Specifies the Visible property for client controls and menu items.

Published Events

	Name	Description
	OnHint (see page 11917)	Occurs when the mouse pauses over a client control or menu item.

	OnUpdate (see page 11918)	Occurs when the application is idle or when the action list updates.

Published Properties

	Name	Description
	Caption (see page 11912)	Represents the caption of client controls and menu items.
	Category (see page 296)	Specifies the category under which the action appears in its action list or action manager.
	Destination (see page 11913)	Specifies the list control to which items are copied.
	Enabled (see page 11913)	Indicates whether client controls and menu items are enabled.
	HelpContext (see page 11914)	Indicates the help context ID for client controls and menu items.
	HelpKeyword (see page 11914)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 11915)	Indicates the mechanism for client controls and menu items to use when invoking help.
	Hint (see page 11915)	Indicates the Help hint for client controls and menu items.
	ImageIndex (see page 11915)	Indicates the ImageIndex property for client controls and menu items.
	ListControl (see page 11916)	Provides access to the target of the action.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	SecondaryShortCuts (see page 11916)	Specifies the short cuts (in addition to ShortCut) for triggering clients.
	ShortCut (see page 11916)	Specifies the ShortCut property for client menu items.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Visible (see page 11917)	Specifies the Visible property for client controls and menu items.

67.1.9.2 TListControlMoveSelection Methods

The methods of the TListControlMoveSelection class are listed here.

Public Methods

	Name	Description
	ExecuteTarget (see page 11936)	Moves the selected items in the target list control to the list control specified by Destination (see page 11913).

67.1.9.2.1 TListControlMoveSelection.ExecuteTarget Method

Moves the selected items in the target list control to the list control specified by Destination (see page 11913).

Pascal

```
procedure ExecuteTarget(Target: TObject); override;
```

C++

```
virtual __fastcall ExecuteTarget(TObject * Target);
```

Description

Do not call the ExecuteTarget method. This method is called automatically when the action fires in response to a user action (for example, when the user selects a menu item or presses a tool button that is linked to this action).

Target is the currently active object when the action fires. It should always be a TCustomListControl descendant (because HandlesTarget (see page 11911) returns false if it is not).

ExecuteTarget sets the ListControl (see page 11916) property to Target it is not already set. It then calls the list control's MoveSelection method, copying any selected items to the list box or list view specified by the Destination (see page 11913) property and removing them from the target (source list control).

TCustomListControl (see page 5928)

ListControl (see page 11893)

MoveSelection (see page 5942)

Destination

67.1.10 TListControlSelectAll Class

TListControlSelectAll selects all the items in a list control (list view or listbox).

Class Hierarchy

Pascal

```
TListControlSelectAll = class(TListControlAction);
```

C++

```
class TListControlSelectAll : public TListControlAction;
```

File

ExtActns

Description

Add TListControlSelectAll to an action list to allow users to select all the items of a list control by using menu items or toolbar buttons. Controls (see page 5711) such as menu items and tool buttons linked to this action cause the application to select all items in the target control (a listbox or list view).

TListControlSelectAll is designed to work with a list control (TCustomListControl descendant) as a target. TListControlSelectAll automatically disables itself if the target control is not a list control, if that target control does not permit multiple selection, or if all of the items in the target control are already selected.

TListControlClearSelection

TListControlMoveSelection

TListControlSelectAll

TListControlSelectAll

TCustomListControl (see page 5928)

67.1.10.1 TListControlSelectAll Members

The following tables list the members exposed by TListControlSelectAll.

Protected Events

	Name	Description
	OnChange (see page 2716)	Occurs when one of the action's properties changes.

Protected Fields

	Name	Description
	FClients (see page 2711)	This is FClients, a member of class TBasicAction.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FImage (see page 302)	This is FImage, a member of class TCustomAction.
	FMask (see page 303)	This is FMask, a member of class TCustomAction.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 303)	Copies the properties of this action to a destination object.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	Change (see page 2712)	Generates an OnChange (see page 2716) event.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
V	HandleShortCut (see page 306)	Executes the action when the user types on of its short cuts.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsEnabled (see page 11892)	This is IsEnabled, a member of class TListControlAction.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2713)	Responds when components are created or destroyed.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	Notification (see page 11892)	Responds when components are created or destroyed.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 294)	This is ReadState, a member of class TContainedAction.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
V	SetHelpContext (see page 306)	This is SetHelpContext, a member of class TCustomAction.
V	SetHelpKeyword (see page 306)	This is SetHelpKeyword, a member of class TCustomAction.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 307)	Sets the value of the Name property.
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
V	SetOnExecute (see page 2714)	Assigns an OnExecute (see page 2716) event handler.
V	SetParentComponent (see page 294)	This is SetParentComponent, a member of class TContainedAction.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.

	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	SavedEnabledState (see page 313)	Saves the value of the Enabled (see page 310) property when the action is suspended.

Public Events

	Name	Description
	OnExecute (see page 2716)	Occurs when the client event that is linked to it fires.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 301)	Instantiates and initializes a TCustomAction (see page 297) object.
V	Create (see page 2710)	Instantiates and initializes a TBasicAction (see page 2707) object.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
V	Create (see page 11891)	Creates an instance of TListControlAction (see page 11886).
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 292)	Destroys the instance of the contained action.
V	Destroy (see page 302)	Frees an instance of TCustomAction (see page 297).
V	Destroy (see page 2711)	Disposes of an instance of a TBasicAction (see page 2707) object.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DoHint (see page 303)	Generates an OnHint (see page 315) event.
V	Execute (see page 293)	Responds when the client control "fires".
V	Execute (see page 304)	Responds when a client control "fires".

	Execute (see page 2712)	Generates an OnExecute (see page 2716) event.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
V	ExecuteTarget (see page 11942)	Selects all the items in the target list control.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
V	GetParentComponent (see page 293)	Returns the action list or action manager that contains the action.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	HandlesTarget (see page 2713)	Introduces an interface for verifying that the type, and state, of a target component or control are appropriate for the action.
V	HandlesTarget (see page 11892)	Indicates whether the action can execute its function.
V	HasParent (see page 294)	Indicates whether the action is contained in an action list or action manager.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RegisterChanges (see page 2713)	Associates the action with an action link.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UnRegisterChanges (see page 2714)	Breaks the association between the action and the action link.
V	Update (see page 295)	Indicates whether the action updates itself.
V	Update (see page 2714)	Provides an opportunity to execute centralized code when an application is idle.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
V	UpdateTarget (see page 11942)	Enables or disables the action, depending on the state of the target control.

Public Properties

	Name	Description
	ActionComponent (see page 2715)	Indicates the client component that caused this action to execute.
	ActionList (see page 295)	Indicates the action list or action manager that contains the action.

	AutoCheck (see page 308)	Controls (see page 5711) whether the Checked (see page 308) property toggles when the action executes.
	Checked (see page 308)	Indicates whether client controls and menu items appear checked.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DisableIfNoHandler (see page 310)	Indicates whether client components should be disabled if no handler is found.
	GroupIndex (see page 311)	Indicates whether the action acts like a radio button with other actions in the same action list.
	Index (see page 296)	Specifies the index of the action in its action list or action manager.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Events

	Name	Description
	OnHint (see page 11947)	Occurs when the mouse pauses over a client control or menu item.
	OnUpdate (see page 11948)	Occurs when the application is idle or when the action list updates.

Published Properties

	Name	Description
	Caption (see page 11943)	Represents the caption of client controls and menu items.
	Category (see page 296)	Specifies the category under which the action appears in its action list or action manager.
	Enabled (see page 11943)	Indicates whether client controls and menu items are enabled.
	HelpContext (see page 11944)	Indicates the help context ID for client controls and menu items.
	HelpKeyword (see page 11944)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 11945)	Indicates the mechanism for client controls and menu items to use when invoking help.
	Hint (see page 11945)	Indicates the Help hint for client controls and menu items.
	ImageIndex (see page 11945)	Indicates the ImageIndex property for client controls and menu items.
	ListControl (see page 11946)	Provides access to the target of the action.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	SecondaryShortCuts (see page 11946)	Specifies the short cuts (in addition to ShortCut) for triggering clients.
	ShortCut (see page 11946)	Specifies the ShortCut property for client menu items.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Visible (see page 11947)	Specifies the Visible property for client controls and menu items.

67.1.10.2 TListControlSelectAll Methods

The methods of the TListControlSelectAll class are listed here.

Public Methods

	Name	Description
V	ExecuteTarget (see page 11942)	Selects all the items in the target list control.
V	UpdateTarget (see page 11942)	Enables or disables the action, depending on the state of the target control.

67.1.10.2.1 TListControlSelectAll.ExecuteTarget Method

Selects all the items in the target list control.

Pascal

```
procedure ExecuteTarget(Target: TObject); override;
```

C++

```
virtual __fastcall ExecuteTarget(TObject * Target);
```

Description

Do not call the ExecuteTarget method. This method is called automatically when the action fires in response to a user action (for example, when the user selects a menu item or presses a tool button that is linked to this action).

Target is the currently active object when the action fires. It should always be a TCustomListControl descendant (because HandlesTarget (see page 11892) returns false if it is not).

ExecuteTarget sets the ListControl (see page 11946) property to Target it is not already set. It then calls the list control's SelectAll method, selecting all of its items.

See Also

TCustomListControl (see page 5928)

ListControl (see page 11893)

SelectAll (see page 5943)

67.1.10.2.2 TListControlSelectAll.UpdateTarget Method

Enables or disables the action, depending on the state of the target control.

Pascal

```
procedure UpdateTarget(Target: TObject); override;
```

C++

```
virtual __fastcall UpdateTarget(TObject * Target);
```

Description

Do not call the UpdateTarget method. This method is called automatically when the application is idle so that actions can update themselves according to current conditions.

In TListControlSelectAll (see page 11937), UpdateTarget checks whether the current target object (specified by the ListControl (see page 11946) property if it is set, otherwise by the Target parameter) is a list control that includes allows multiple selections and that includes at least one unselected item. If so, UpdateTarget sets Enabled (see page 11943) to true. If not, UpdateTarget sets Enabled (see page 11943) to false.

See Also

Enabled (see page 310)

MultiSelect (see page 5957)

ListControl (see page 11893)

67.1.10.3 TListControlSelectAll Properties

The properties of the TListControlSelectAll class are listed here.

Published Properties

	Name	Description
	Caption (see page 11943)	Represents the caption of client controls and menu items.
	Enabled (see page 11943)	Indicates whether client controls and menu items are enabled.
	HelpContext (see page 11944)	Indicates the help context ID for client controls and menu items.
	HelpKeyword (see page 11944)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 11945)	Indicates the mechanism for client controls and menu items to use when invoking help.
	Hint (see page 11945)	Indicates the Help hint for client controls and menu items.
	ImageIndex (see page 11945)	Indicates the ImageIndex property for client controls and menu items.
	ListControl (see page 11946)	Provides access to the target of the action.
	SecondaryShortCuts (see page 11946)	Specifies the short cuts (in addition to ShortCut) for triggering clients.
	ShortCut (see page 11946)	Specifies the ShortCut property for client menu items.
	Visible (see page 11947)	Specifies the Visible property for client controls and menu items.

67.1.10.3.1 TListControlSelectAll.Caption Property

Represents the caption of client controls and menu items.

Pascal

```
property Caption: string;
```

C++

```
__property AnsiString Caption;
```

Description

Caption holds the string that is the caption for the action when it is set. The value of Caption is propagated to client controls and menu items.

See Also

Caption (see page 5806)

Caption (see page 16136)

67.1.10.3.2 TListControlSelectAll.Enabled Property

Indicates whether client controls and menu items are enabled.

Pascal

```
property Enabled: Boolean;
```

C++

```
__property Boolean Enabled;
```

Description

Enabled specifies the enabled state for the action. The value of Enabled is propagated to client controls and menu items.

See Also

Enabled (see page 5821)

Enabled (see page 16145)

67.1.10.3.3 TListControlSelectAll.HelpContext Property

Indicates the help context ID for client controls and menu items.

Pascal

```
property HelpContext: THelpContext;
```

C++

```
__property THelpContext HelpContext;
```

Description

HelpContext specifies the help context for the action when it is set. This value is propagated to client controls and menu items.

When a client control has focus and the user presses the F1 key, the control uses the value of HelpContext for this associated action to invoke the online help targeting a specific topic. The target topic is uniquely identified by a nonzero HelpContext value. Leave the HelpContext property of the client control at its default value of zero. This allows multiple controls (and multiple types of controls) to be associated with the same help topic through the one action object.

Note: HelpContext is only used when the HelpType property of this action or the client control is htInteger.

See Also

HelpType (see page 312)

HelpKeyword (see page 311)

67.1.10.3.4 TListControlSelectAll.HelpKeyword Property

Indicates the help keyword for client controls and menu items.

Pascal

```
property HelpKeyword: string;
```

C++

```
__property AnsiString HelpKeyword;
```

Description

HelpKeyword, when set, specifies the keyword that identifies a help topic for this action. This value is propagated to the HelpKeyword property of client controls and menu items. The interpretation of HelpKeyword depends on which help system is used to display the topic. For example, when using HyperHelp (on Linux) or WinHelp (on Windows), HelpKeyword refers to an A link.

When a client control has focus and the user presses the F1 key (or the key specified by the application's HelpKey property), the control uses the value of HelpKeyword for this associated action object to invoke the online help targeting a specific topic. Leave the HelpKeyword property of the client control unassigned. This allows multiple controls (and multiple types of controls) to be associated with the same help topic through the one action object.

Note: HelpKeyword is only used when the HelpType property of this action or the client control is htKeyword.

See Also

HelpKeyword (see page 5826)

HelpContext (see page 311)

HelpType (see page 312)

HelpKey

67.1.10.3.5 TListControlSelectAll.HelpType Property

Indicates the mechanism for client controls and menu items to use when invoking help.

Pascal

```
property HelpType: THelpType;
```

C++

```
__property THelpType HelpType;
```

Description

HelpType, when set, indicates whether client controls and menu items should use the HelpContext or the HelpKeyword property for invoking the help system. This value is propagated to the HelpType property of client controls and menu items.

See Also

HelpType (see page 5827)

HelpType

HelpContext (see page 311)

HelpKeyword (see page 311)

67.1.10.3.6 TListControlSelectAll.Hint Property

Indicates the Help hint for client controls and menu items.

Pascal

```
property Hint: string;
```

C++

```
__property AnsiString Hint;
```

Description

Hint holds the string that is the hint for that action when it is set. This value is propagated to client controls and menu items.

See Also

Hint (see page 5827)

Hint (see page 16148)

67.1.10.3.7 TListControlSelectAll.ImageIndex Property

Indicates the ImageIndex property for client controls and menu items.

Pascal

```
property ImageIndex: TImageIndex;
```

C++

```
__property TImageIndex ImageIndex;
```

Description

ImageIndex is an index into the Images property of the action list or action manager that contains the action. It identifies an

image that is associated with controls and menu items that use this action.

See Also

ImageIndex (see page 5135)

ImageIndex (see page 16148)

Images (see page 325)

67.1.10.3.8 TListControlSelectAll.ListControl Property

Provides access to the target of the action.

Pascal

```
property ListControl: TCustomListControl;
```

C++

```
__property TCustomListControl ListControl;
```

Description

ListControl is the list control on which the action performs its function. It is a TCustomListControl descendant, such a TListView or TListBox.

Set ListControl to associate the action with a particular control. If ListControl is not explicitly set, it is assumed to be the active listbox or list view when the action fires.

See Also

TListView (see page 4285)

TListBox (see page 21598)

67.1.10.3.9 TListControlSelectAll.SecondaryShortCuts Property

Specifies the short cuts (in addition to ShortCut) for triggering clients.

Pascal

```
property SecondaryShortCuts: TShortCutList;
```

C++

```
__property TShortCutList SecondaryShortCuts;
```

Description

Actions can execute in response to multiple short cut key combinations. SecondaryShortCuts lists all the short cut key combinations (other than the one specified by the ShortCut property) that can trigger the action. This lets you specify shortcuts for clients that do not have a ShortCut property or provide additional, secondary shortcuts.

When the user types one of the key combinations listed in SecondaryShortCuts, the action's Execute method is called.

See Also

ShortCut (see page 314)

Execute (see page 304)

67.1.10.3.10 TListControlSelectAll.ShortCut Property

Specifies the ShortCut property for client menu items.

Pascal

```
property ShortCut: TShortCut;
```

C++

```
__property TShortCut ShortCut;
```

Description

ShortCut holds the value that is the shortcut for the action when it is set. This value is propagated to client menu items.

See Also

ShortCut (see page 16152)

SecondaryShortCuts (see page 314)

67.1.10.3.11 TListControlSelectAll.Visible Property

Specifies the Visible property for client controls and menu items.

Pascal

```
property Visible: Boolean;
```

C++

```
__property Boolean Visible;
```

Description

Visible specifies the visible state for the action. This value is propagated to client controls and menu items.

See Also

Visible (see page 16153)

Visible (see page 5847)

67.1.10.4 TListControlSelectAll Events

The events of the TListControlSelectAll class are listed here.

Published Events

	Name	Description
	OnHint (see page 11947)	Occurs when the mouse pauses over a client control or menu item.
	OnUpdate (see page 11948)	Occurs when the application is idle or when the action list updates.

67.1.10.4.1 TListControlSelectAll.OnHint Event

Occurs when the mouse pauses over a client control or menu item.

Pascal

```
property OnHint: THintEvent;
```

C++

```
__property THintEvent OnHint;
```

Description

Use OnHint to override the default hint that appears when the user pauses the mouse over a client control or menu item. The

OnHint event handler can change the hint that appears (by changing the HintStr parameter), or display the hint in some application-specific way.

67.1.10.4.2 TListControlSelectAll.OnUpdate Event

Occurs when the application is idle or when the action list updates.

Pascal

```
property OnUpdate: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnUpdate;
```

Description

Write an OnUpdate event handler to execute centralized code while an application is idle. For example, actions may want to update enabling and disabling, or checking and unchecking of client targets.

C++ Examples:

```
/*
When the application is idle, the OnUpdate event occurs for
every action that is linked to a visible control or menu
item that is showing. This provides an opportunity for
applications to execute centralized code for enabling and
disabling, checking and unchecking, and so on. For example,
the following code illustrates the OnUpdate event handler
for an action that is "checked" when the toolbar is visible.
This example requires a TActionList (with one TAction) and a
TToolBar on a form. This example requires a TActionList
(with one TAction) and a TToolBar on a form.  Double click
on the TActionList and create an TAction named Action1.  The
TAction has an OnUpdate event handler called Action1Update.
Then set an object's (such as a button or menu item) Action
to Action1.
*/
void __fastcall TForm1::Action1Update(TObject *Sender)
{
   // Indicate whether ToolBar1 is currently visible.
   TAction* pa = dynamic_cast<TAction*>(Sender);
   if (pa)
   {
     if (pa->Checked != ToolBar1->Visible)
     {
       lbOther->Items->Add("Event Action1Update: toolbar visibility changed");
     }
     pa->Checked = ToolBar1->Visible;
   }
}
```

Delphi Examples:

```
{
When the application is idle, the OnUpdate event occurs for
every action that is linked to a visible control or menu
item that is showing. This provides an opportunity for
applications to execute centralized code for enabling and
disabling, checking and unchecking, and so on. For example,
the following code illustrates the OnUpdate event handler
for an action that is "checked" when the toolbar is visible.
This example requires a TActionList (with one TAction) and a
TToolBar on a form. This example requires a TActionList
(with one TAction) and a TToolBar on a form.  Double click
on the TActionList and create an TAction named Action1.  The
```

```
TAction has an OnUpdate event handler called Action1Update.
Then set an object's (such as a button or menu item) Action
to Action1.
}
procedure TMainForm.Action1Update(Sender: TObject);
begin
  if ((Sender as TAction).Checked <> ToolBar1.Visible) then
    lbOther.Items.Add('Event Action1Update: toolbar visibility changed');
    { Indicate whether ToolBar1 is currently visible }
    (Sender as TAction).Checked := ToolBar1.Visible;
end;
```

See Also

UpdateAction (see page 2790)

67.1.11 TNextTab Class

TNextTab moves a tabbed control to its next page.

Class Hierarchy

Pascal

```
TNextTab = class(TTabAction);
```

C++

```
class TNextTab : public TTabAction;
```

File

ExtActns

Description

Add TNextTab to an action list to provide the response to the "Next" and "Finish" buttons or menu items in a tabbed dialog. Controls (see page 5711) such as menu items and tool buttons linked to this action cause a different response, depending on the value of the Wrap (see page 11960) property and on whether the target control is on the last page:

If the target page control is not on the last page, or if Wrap (see page 11960) is true, client controls cause this action to change the current page to the next page. (When Wrap (see page 11960) is true, the next page after the last tab is the first tabbed page).

If Wrap (see page 11960) is false and the target page control is on the last page, this action changes the caption of client controls (for example, from "Next" to "Finish") and, when fired, responds by generating an OnFinish (see page 11962) event.

Before you can use TNextTab, you must assign a target page control or tab control as the value of the TabControl (see page 11960) property. Once the target control is assigned, TNextTab automatically disables itself if the target control is not enabled.

See Also

TPreviousTab (see page 11977)

TPageControl (see page 4459)

TTabControl (see page 4841)

67.1.11.1 TNextTab Members

The following tables list the members exposed by TNextTab.

Protected Events

	Name	Description
	OnChange (see page 2716)	Occurs when one of the action's properties changes.

Protected Fields

	Name	Description
	FClients (see page 2711)	This is FClients, a member of class TBasicAction.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FImage (see page 302)	This is FImage, a member of class TCustomAction.
	FMask (see page 303)	This is FMask, a member of class TCustomAction.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 303)	Copies the properties of this action to a destination object.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	Change (see page 2712)	Generates an OnChange (see page 2716) event.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
V	HandleShortCut (see page 306)	Executes the action when the user types on of its short cuts.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2713)	Responds when components are created or destroyed.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	Notification (see page 12079)	Responds when components are created or destroyed.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 294)	This is ReadState, a member of class TContainedAction.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SelectNextTab (see page 12079)	This is SelectNextTab, a member of class TTabAction.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.

	SetHelpContext (see page 306)	This is SetHelpContext, a member of class TCustomAction.
	SetHelpKeyword (see page 306)	This is SetHelpKeyword, a member of class TCustomAction.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 307)	Sets the value of the Name property.
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetOnExecute (see page 2714)	Assigns an OnExecute (see page 2716) event handler.
	SetParentComponent (see page 294)	This is SetParentComponent, a member of class TContainedAction.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	SavedEnabledState (see page 313)	Saves the value of the Enabled (see page 310) property when the action is suspended.

Public Events

	Name	Description
	OnExecute (see page 2716)	Occurs when the client event that is linked to it fires.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 301)	Instantiates and initializes a TCustomAction (see page 297) object.
	Create (see page 2710)	Instantiates and initializes a TBasicAction (see page 2707) object.
	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 12078)	Creates an instance of TTabAction (see page 12073).
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 292)	Destroys the instance of the contained action.
	Destroy (see page 302)	Frees an instance of TCustomAction (see page 297).
	Destroy (see page 2711)	Disposes of an instance of a TBasicAction (see page 2707) object.
	Destroy (see page 2766)	Disposes of the component and its owned components.

	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DoHint (see page 303)	Generates an OnHint (see page 315) event.
	Execute (see page 293)	Responds when the client control "fires".
	Execute (see page 304)	Responds when a client control "fires".
	Execute (see page 2712)	Generates an OnExecute (see page 2716) event.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	ExecuteTarget (see page 11954)	Changes the selected tab in the target tab control to the next one, or generates an OnFinish (see page 11962) event.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 293)	Returns the action list or action manager that contains the action.
	GetParentComponent (see page 2778)	Returns the containing Component.
	HandlesTarget (see page 2713)	Introduces an interface for verifying that the type, and state, of a target component or control are appropriate for the action.
	HandlesTarget (see page 12078)	Indicates whether the action can execute its function.
	HasParent (see page 294)	Indicates whether the action is contained in an action list or action manager.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RegisterChanges (see page 2713)	Associates the action with an action link.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.

	UnRegisterChanges (see page 2714)	Breaks the association between the action and the action link.
V	Update (see page 295)	Indicates whether the action updates itself.
V	Update (see page 2714)	Provides an opportunity to execute centralized code when an application is idle.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
V	UpdateTarget (see page 11955)	Updates the action to reflect current conditions.

Public Properties

	Name	Description
	ActionComponent (see page 2715)	Indicates the client component that caused this action to execute.
	ActionList (see page 295)	Indicates the action list or action manager that contains the action.
	AutoCheck (see page 308)	Controls (see page 5711) whether the Checked (see page 308) property toggles when the action executes.
	Checked (see page 308)	Indicates whether client controls and menu items appear checked.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DisableIfNoHandler (see page 310)	Indicates whether client components should be disabled if no handler is found.
	GroupIndex (see page 311)	Indicates whether the action acts like a radio button with other actions in the same action list.
	Index (see page 296)	Specifies the index of the action in its action list or action manager.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	SecondaryShortCuts (see page 314)	Specifies the short cuts (in addition to ShortCut (see page 314)) for triggering clients.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Events

	Name	Description
	AfterTabChange (see page 11961)	Occurs immediately after the action changes the page of the associated tab control.
	BeforeTabChange (see page 11962)	Occurs immediately before the action changes the page of the associated tab control.
	OnFinish (see page 11962)	Occurs when the action fires and the target page control is on its last page.
	OnHint (see page 11963)	Occurs when the mouse pauses over a client control or menu item.
	OnUpdate (see page 11963)	Occurs when the application is idle or when the action list updates.
	OnValidateTab (see page 11964)	Occurs when the application is idle or when the action list updates.

Published Properties

	Name	Description
	Caption (see page 11956)	Represents the caption of client controls and menu items.
	Category (see page 296)	Specifies the category under which the action appears in its action list or action manager.
	Enabled (see page 11956)	Indicates whether client controls and menu items are enabled.
	HelpContext (see page 11956)	Indicates the help context ID for client controls and menu items.
	HelpKeyword (see page 11957)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 11957)	Indicates the mechanism for client controls and menu items to use when invoking help.
	Hint (see page 11958)	Indicates the Help hint for client controls and menu items.
	ImageIndex (see page 11958)	Indicates the ImageIndex property for client controls and menu items.
	LastTabCaption (see page 11958)	Specifies the caption when the target page control is on its last page and Wrap (see page 11960) is false.
	Name (see page 2805)	Specifies the name of the component as referenced in code.

	ShortCut (see page 11959)	Specifies the ShortCut property for client menu items.
	SkipHiddenTabs (see page 11959)	Indicates whether the tab action should consider hidden tabbed pages when moving to the next page.
	TabControl (see page 11960)	Specifies the target of the action.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Visible (see page 11960)	Specifies the Visible property for client controls and menu items.
	Wrap (see page 11960)	Indicates whether the tab action should "wrap" when navigating to the next tab page.

67.1.11.2 TNextTab Methods

The methods of the TNextTab class are listed here.

Public Methods

	Name	Description
	ExecuteTarget (see page 11954)	Changes the selected tab in the target tab control to the next one, or generates an OnFinish (see page 11962) event.
	UpdateTarget (see page 11955)	Updates the action to reflect current conditions.

67.1.11.2.1 TNextTab.ExecuteTarget Method

Changes the selected tab in the target tab control to the next one, or generates an OnFinish (see page 11962) event.

Pascal

```
procedure ExecuteTarget(Target: TObject); override;
```

C++

```
virtual __fastcall ExecuteTarget(TObject * Target);
```

Description

ExecuteTarget causes the action to perform its default response based on the state of the target tab control.

Target is the currently active object when the action fires. TNextTab (see page 11949) ignores this parameter and uses the TabControl (see page 11960) property to identify the target control.

ExecuteTarget performs differently, depending on whether the target control is on the last page and on the value of the Wrap (see page 11960) property:

If Wrap (see page 11960) is true or the target control is not on the last page, ExecuteTarget generates a BeforeTabChange (see page 11962) event, changes the target control to the next page, and generates an AfterTabChange (see page 11961) event. If Wrap (see page 11960) is true and the target control is on the last page, this causes the target control to move to the first page. Note that the SkipHiddenTabs (see page 11959) property determines whether the next page can include a hidden page.

If Wrap (see page 11960) is false and the target control is on the last page, ExecuteTarget generates an OnFinish (see page 11962) event.

See Also

ExecuteTarget (see page 2712)

ActivePageIndex (see page 4484)

TabControl (see page 12080)

OnFinish (see page 11962)

BeforeTabChange (see page 12082)

AfterTabChange (see page 12082)

SkipHiddenTabs (see page 12080)

Wrap (see page 12081)

TabIndex (see page 3946)

67.1.11.2.2 TNextTab.UpdateTarget Method

Updates the action to reflect current conditions.

Pascal

```
procedure UpdateTarget(Target: TObject); override;
```

C++

```
virtual __fastcall UpdateTarget(TObject * Target);
```

Description

Do not call the UpdateTarget method. This method is called automatically when the application is idle so that actions can update themselves according to current conditions.

In TNextTab (see page 11949), UpdateTarget first checks whether the TabControl (see page 11960) property specifies an enabled control that can act as a target. If not, UpdateTarget sets the Enabled (see page 11956) property to false.

If the target control is enabled, UpdateTarget sets the Enabled (see page 11956) property to true and checks whether the target control is on its last page. If so, (and if Wrap (see page 11960) is false) it changes the Caption (see page 11956) property to the value of LastTabCaption (see page 11958). If not, it restores the Caption (see page 11956) property to its original value.

See Also

Enabled (see page 310)

Caption (see page 308)

LastTabCaption (see page 11958)

TabControl (see page 12080)

Wrap (see page 12081)

67.1.11.3 TNextTab Properties

The properties of the TNextTab class are listed here.

Published Properties

	Name	Description
	Caption (see page 11956)	Represents the caption of client controls and menu items.
	Enabled (see page 11956)	Indicates whether client controls and menu items are enabled.
	HelpContext (see page 11956)	Indicates the help context ID for client controls and menu items.
	HelpKeyword (see page 11957)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 11957)	Indicates the mechanism for client controls and menu items to use when invoking help.
	Hint (see page 11958)	Indicates the Help hint for client controls and menu items.
	ImageIndex (see page 11958)	Indicates the ImageIndex property for client controls and menu items.
	LastTabCaption (see page 11958)	Specifies the caption when the target page control is on its last page and Wrap (see page 11960) is false.

	ShortCut (see page 11959)	Specifies the ShortCut property for client menu items.
	SkipHiddenTabs (see page 11959)	Indicates whether the tab action should consider hidden tabbed pages when moving to the next page.
	TabControl (see page 11960)	Specifies the target of the action.
	Visible (see page 11960)	Specifies the Visible property for client controls and menu items.
	Wrap (see page 11960)	Indicates whether the tab action should "wrap" when navigating to the next tab page.

67.1.11.3.1 TNextTab.Caption Property

Represents the caption of client controls and menu items.

Pascal

```
property Caption: string;
```

C++

```
__property AnsiString Caption;
```

Description

Caption holds the string that is the caption for the action when it is set. The value of Caption is propagated to client controls and menu items.

See Also

Caption (see page 5806)

Caption (see page 16136)

67.1.11.3.2 TNextTab.Enabled Property

Indicates whether client controls and menu items are enabled.

Pascal

```
property Enabled: Boolean;
```

C++

```
__property Boolean Enabled;
```

Description

Enabled specifies the enabled state for the action. The value of Enabled is propagated to client controls and menu items.

See Also

Enabled (see page 5821)

Enabled (see page 16145)

67.1.11.3.3 TNextTab.HelpContext Property

Indicates the help context ID for client controls and menu items.

Pascal

```
property HelpContext: THelpContext;
```

C++

```
__property THelpContext HelpContext;
```

Description

HelpContext specifies the help context for the action when it is set. This value is propagated to client controls and menu items.

When a client control has focus and the user presses the F1 key, the control uses the value of HelpContext for this associated action to invoke the online help targeting a specific topic. The target topic is uniquely identified by a nonzero HelpContext value. Leave the HelpContext property of the client control at its default value of zero. This allows multiple controls (and multiple types of controls) to be associated with the same help topic through the one action object.

Note: HelpContext is only used when the HelpType property of this action or the client control is htInteger.

See Also

HelpType (see page 312)

HelpKeyword (see page 311)

67.1.11.3.4 TNextTab.HelpKeyword Property

Indicates the help keyword for client controls and menu items.

Pascal

```
property HelpKeyword: string;
```

C++

```
__property AnsiString HelpKeyword;
```

Description

HelpKeyword, when set, specifies the keyword that identifies a help topic for this action. This value is propagated to the HelpKeyword property of client controls and menu items. The interpretation of HelpKeyword depends on which help system is used to display the topic. For example, when using HyperHelp (on Linux) or WinHelp (on Windows), HelpKeyword refers to an A link.

When a client control has focus and the user presses the F1 key (or the key specified by the application's HelpKey property), the control uses the value of HelpKeyword for this associated action object to invoke the online help targeting a specific topic. Leave the HelpKeyword property of the client control unassigned. This allows multiple controls (and multiple types of controls) to be associated with the same help topic through the one action object.

Note: HelpKeyword is only used when the HelpType property of this action or the client control is htKeyword.

See Also

HelpKeyword (see page 5826)

HelpContext (see page 311)

HelpType (see page 312)

HelpKey

67.1.11.3.5 TNextTab.HelpType Property

Indicates the mechanism for client controls and menu items to use when invoking help.

Pascal

```
property HelpType: THelpType;
```

C++

```
__property THelpType HelpType;
```

Description

HelpType, when set, indicates whether client controls and menu items should use the HelpContext or the HelpKeyword property for invoking the help system. This value is propagated to the HelpType property of client controls and menu items.

See Also

HelpType (see page 5827)

HelpType

HelpContext (see page 311)

HelpKeyword (see page 311)

67.1.11.3.6 TNextTab.Hint Property

Indicates the Help hint for client controls and menu items.

Pascal

```
property Hint: string;
```

C++

```
__property AnsiString Hint;
```

Description

Hint holds the string that is the hint for that action when it is set. This value is propagated to client controls and menu items.

See Also

Hint (see page 5827)

Hint (see page 16148)

67.1.11.3.7 TNextTab.ImageIndex Property

Indicates the ImageIndex property for client controls and menu items.

Pascal

```
property ImageIndex: TImageIndex;
```

C++

```
__property TImageIndex ImageIndex;
```

Description

ImageIndex is an index into the Images property of the action list or action manager that contains the action. It identifies an image that is associated with controls and menu items that use this action.

See Also

ImageIndex (see page 5135)

ImageIndex (see page 16148)

Images (see page 325)

67.1.11.3.8 TNextTab.LastTabCaption Property

Specifies the caption when the target page control is on its last page and Wrap (see page 11960) is false.

Pascal

```
property LastTabCaption: String;
```

C++

```
__property AnsiString LastTabCaption;
```

Description

Set LastTabCaption to the caption of target controls when the control specified by the TabControl (see page 11960) property is on its last page and the action can't tab beyond the last page. When the target page control is not on the last page, the caption for client controls is given by the Caption (see page 11956) property. When the target page control is on the last page (and Wrap (see page 11960) is false), TNextTab (see page 11949) caches the original value of Caption (see page 11956) and changes the Caption (see page 11956) property to LastTabCaption. If the target page control returns to a previous page, TNextTab (see page 11949) then restores the original value of the Caption (see page 11956) property.

LastTabCaption is designed for client controls such as the button in a tabbed dialog that changes from a "Next" button to a "Finish" button when the tabbed dialog reaches the last page.

See Also

Caption (see page 308)

TabControl (see page 12080)

Wrap (see page 12081)

67.1.11.3.9 TNextTab.ShortCut Property

Specifies the ShortCut property for client menu items.

Pascal

```
property ShortCut: TShortCut;
```

C++

```
__property TShortCut ShortCut;
```

Description

ShortCut holds the value that is the shortcut for the action when it is set. This value is propagated to client menu items.

See Also

ShortCut (see page 16152)

SecondaryShortCuts (see page 314)

67.1.11.3.10 TNextTab.SkipHiddenTabs Property

Indicates whether the tab action should consider hidden tabbed pages when moving to the next page.

Pascal

```
property SkipHiddenTabs: Boolean;
```

C++

```
__property Boolean SkipHiddenTabs;
```

Description

Set SkipHiddenTabs to true if you do not want the action to move to a tab page if its TabVisible property is false. Set SkipHiddenTabs to false if the tab action can move to and make visible a hidden page.

Note: SkipHiddenTabs only has an effect when the TabControl property identifies a TPageControl object. (TTabControl does not support hidden pages).

See Also

ExecuteTarget (see page 11954)

ExecuteTarget (see page 11982)

TabVisible (see page 4956)

TPageControl (see page 4459)

67.1.11.3.11 TNextTab.TabControl Property

Specifies the target of the action.

Pascal

```
property TabControl: TCustomTabControl;
```

C++

```
__property TCustomTabControl TabControl;
```

Description

Set TabControl to the control on which the action operates when its ExecuteTarget method is called. Typically, this is a page control or tab control object that implements the pages of a tabbed dialog.

An application must explicitly assign a value to the TabControl property before the TTabAction descendant is enabled. The action does not infer the target page control when it fires.

See Also

ExecuteTarget (see page 11954)

ExecuteTarget (see page 11982)

67.1.11.3.12 TNextTab.Visible Property

Specifies the Visible property for client controls and menu items.

Pascal

```
property Visible: Boolean;
```

C++

```
__property Boolean Visible;
```

Description

Visible specifies the visible state for the action. This value is propagated to client controls and menu items.

See Also

Visible (see page 16153)

Visible (see page 5847)

67.1.11.3.13 TNextTab.Wrap Property

Indicates whether the tab action should "wrap" when navigating to the next tab page.

Pascal

```
property Wrap: Boolean;
```

C++

```
__property Boolean Wrap;
```

Description

When Wrap is true, the tab action can move previous to the first tabbed page or after the last tabbed page in the associated control. When Wrap is false, an attempt to move beyond the first or last page does not result in any page change, although it still results in a BeforeTabChange and an AfterTabChange event or in an OnFinish event.

See Also

ExecuteTarget (see page 11954)

ExecuteTarget (see page 11982)

TabControl (see page 12080)

BeforeTabChange (see page 12082)

AfterTabChange (see page 12082)

OnFinish (see page 11962)

67.1.11.4 TNextTab Events

The events of the TNextTab class are listed here.

Published Events

	Name	Description
	AfterTabChange (see page 11961)	Occurs immediately after the action changes the page of the associated tab control.
	BeforeTabChange (see page 11962)	Occurs immediately before the action changes the page of the associated tab control.
	OnFinish (see page 11962)	Occurs when the action fires and the target page control is on its last page.
	OnHint (see page 11963)	Occurs when the mouse pauses over a client control or menu item.
	OnUpdate (see page 11963)	Occurs when the application is idle or when the action list updates.
	OnValidateTab (see page 11964)	Occurs when the application is idle or when the action list updates.

67.1.11.4.1 TNextTab.AfterTabChange Event

Occurs immediately after the action changes the page of the associated tab control.

Pascal

```
property AfterTabChange: TNotifyEvent;
```

C++

```
__property TNotifyEvent AfterTabChange;
```

Description

Write an AfterTabChange event handler to perform any additional tasks after the tab action changes the current page of the associated tab control. Typically, this event is used to initialize the current page of the tab control.

Note: AfterTabChange only occurs if the action tries to change the page of the tab control (even if it is not successful). If the action attempts some other task (for example, when TNextPage is on the last page of the tab control), AfterTabChange does not occur.

See Also

BeforeTabChange (see page 12082)

TabControl (see page 12080)

Wrap (see page 12081)

67.1.11.4.2 TNextTab.BeforeTabChange Event

Occurs immediately before the action changes the page of the associated tab control.

Pascal

```
property BeforeTabChange: TNotifyEvent;
```

C++

```
__property TNotifyEvent BeforeTabChange;
```

Description

Write a BeforeTabChange event handler to perform any additional tasks before the tab action changes the current page of the associated tab control. Typically, this event is used to save or respond to the changes the user made on the current page before it changes.

Note: BeforeTabChange only occurs if the action tries to change the page of the tab control (even if it is not successful). If the action attempts some other task (for example, when TNextPage is on the last page of the tab control), BeforeTabChange does not occur.

See Also

AfterTabChange (see page 12082)

TabControl (see page 12080)

Wrap (see page 12081)

67.1.11.4.3 TNextTab.OnFinish Event

Occurs when the action fires and the target page control is on its last page.

Pascal

```
property OnFinish: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnFinish;
```

Description

Write an OnFinish event handler to respond when the user indicates that they are finished with the tabbed dialog by clicking a client control when the tabbed dialog is on its last page. OnFinish only occurs when the target control is on its last page and the Wrap (see page 11960) property is false. When the target page control is on any other page, or when Wrap (see page 11960) is true, TNextTab (see page 11949) generates an BeforeTabChange (see page 11962) event, changes the current page of the target control, and generates an AfterTabChange (see page 11961) event.

Note: Use the OnFinish event rather than the action's OnExecute event. If you supply an event handler to the OnExecute event, it blocks the default response by this action, and the action won't change the current page when the target tabbed dialog is not on its last page.

See Also

AfterTabChange (see page 12082)

BeforeTabChange (see page 12082)

TabControl (see page 12080)

Wrap (see page 12081)

67.1.11.4.4 TNextTab.OnHint Event

Occurs when the mouse pauses over a client control or menu item.

Pascal

```
property OnHint: THintEvent;
```

C++

```
__property THintEvent OnHint;
```

Description

Use OnHint to override the default hint that appears when the user pauses the mouse over a client control or menu item. The OnHint event handler can change the hint that appears (by changing the HintStr parameter), or display the hint in some application-specific way.

67.1.11.4.5 TNextTab.OnUpdate Event

Occurs when the application is idle or when the action list updates.

Pascal

```
property OnUpdate: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnUpdate;
```

Description

Write an OnUpdate event handler to execute centralized code while an application is idle. For example, actions may want to update enabling and disabling, or checking and unchecking of client targets.

C++ Examples:

```
/*
When the application is idle, the OnUpdate event occurs for
every action that is linked to a visible control or menu
item that is showing. This provides an opportunity for
applications to execute centralized code for enabling and
disabling, checking and unchecking, and so on. For example,
the following code illustrates the OnUpdate event handler
for an action that is "checked" when the toolbar is visible.
This example requires a TActionList (with one TAction) and a
TToolBar on a form. This example requires a TActionList
(with one TAction) and a TToolBar on a form.  Double click
on the TActionList and create an TAction named Action1.  The
TAction has an OnUpdate event handler called Action1Update.
Then set an object's (such as a button or menu item) Action
to Action1.
*/
void __fastcall TForm1::Action1Update(TObject *Sender)
{
```

```
    // Indicate whether ToolBar1 is currently visible.
    TAction* pa = dynamic_cast<TAction*>(Sender);
    if (pa)
    {
      if (pa->Checked != ToolBar1->Visible)
      {
        lbOther->Items->Add("Event Action1Update: toolbar visibility changed");
      }
      pa->Checked = ToolBar1->Visible;
    }
}
```

Delphi Examples:

```
{
When the application is idle, the OnUpdate event occurs for
every action that is linked to a visible control or menu
item that is showing. This provides an opportunity for
applications to execute centralized code for enabling and
disabling, checking and unchecking, and so on. For example,
the following code illustrates the OnUpdate event handler
for an action that is "checked" when the toolbar is visible.
This example requires a TActionList (with one TAction) and a
TToolBar on a form. This example requires a TActionList
(with one TAction) and a TToolBar on a form.  Double click
on the TActionList and create an TAction named Action1.  The
TAction has an OnUpdate event handler called Action1Update.
Then set an object's (such as a button or menu item) Action
to Action1.
}
procedure TMainForm.Action1Update(Sender: TObject);
begin
  if ((Sender as TAction).Checked <> ToolBar1.Visible) then
    lbOther.Items.Add('Event Action1Update: toolbar visibility changed');
    { Indicate whether ToolBar1 is currently visible }
    (Sender as TAction).Checked := ToolBar1.Visible;
end;
```

See Also

UpdateAction (see page 2790)

67.1.11.4.6 TNextTab.OnValidateTab Event

Occurs when the application is idle or when the action list updates.

Pascal

```
property OnValidateTab: TValidateTabEvent;
```

C++

```
__property TValidateTabEvent OnValidateTab;
```

Description

Use the OnValidateTab event rather than the OnUpdate event to update the properties of a tab action when the application is idle. Unlike the OnUpdate event, which prevents the default behavior of the UpdateTarget method, OnValidateTab occurs after UpdateTarget has set the Enabled property to reflect whether the target tab control is enabled.

OnValidateTab can be used to update any of the properties of the tab action, but it is intended primarily for enabling or disabling the action, depending on the contents of the current page of the target tab control.

Sender is the tab action component to update in this event.

TabControl is the target tab control.

Enabled reflects the Enabled property of this action. Set Enabled in the event handler to enable or disable the action depending on current conditions.

See Also

OnUpdate (see page 2718)

UpdateTarget (see page 12079)

TabControl (see page 12080)

Enabled (see page 310)

67.1.12 TOpenPicture Class

TOpenPicture is the standard action for displaying the open picture dialog.

Class Hierarchy

Pascal

```
TOpenPicture = class(TCommonDialogAction);
```

C++

```
class TOpenPicture : public TCommonDialogAction;
```

File

ExtActns

Description

Add TOpenPicture to an action list to add a graphics file selection dialog to your application. Controls (see page 5711) such as menu items and tool buttons linked to this action cause the application to display the open picture dialog when invoked. Use the OnAccept (see page 11975) event to respond after the user selects a file name in the dialog or the OnCancel (see page 11975) event to respond when the user cancels from the dialog. In the event handler, you can read the file name from the dialog specified by the Dialog (see page 11971) property.

See Also

TFileOpen (see page 20605)

TOpenPictureDialog (see page 13282)

TSavePicture (see page 12048)

67.1.12.1 TOpenPicture Members

The following tables list the members exposed by TOpenPicture.

Protected Events

	Name	Description
	OnChange (see page 2716)	Occurs when one of the action's properties changes.

Protected Fields

	Name	Description
	FClients (see page 2711)	This is FClients, a member of class TBasicAction.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FDialog (see page 20539)	This is FDialog, a member of class TCommonDialogAction.
	FImage (see page 302)	This is FImage, a member of class TCustomAction.
	FMask (see page 303)	This is FMask, a member of class TCustomAction.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 303)	Copies the properties of this action to a destination object.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	Change (see page 2712)	Generates an OnChange (see page 2716) event.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DoAccept (see page 20540)	This is DoAccept, a member of class TCommonDialogAction.
V	DoCancel (see page 20540)	This is DoCancel, a member of class TCommonDialogAction.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetDialogClass (see page 11970)	This is GetDialogClass, a member of class TOpenPicture.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
V	HandleShortCut (see page 306)	Executes the action when the user types on of its short cuts.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2713)	Responds when components are created or destroyed.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	Notification (see page 20541)	Responds when components are created or destroyed.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 294)	This is ReadState, a member of class TContainedAction.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
V	SetHelpContext (see page 306)	This is SetHelpContext, a member of class TCustomAction.
V	SetHelpKeyword (see page 306)	This is SetHelpKeyword, a member of class TCustomAction.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 307)	Sets the value of the Name property.
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.

	SetOnExecute (see page 2714)	Assigns an OnExecute (see page 2716) event handler.
	SetParentComponent (see page 294)	This is SetParentComponent, a member of class TContainedAction.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	SetupDialog (see page 20542)	This is SetupDialog, a member of class TCommonDialogAction.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	SavedEnabledState (see page 313)	Saves the value of the Enabled (see page 310) property when the action is suspended.

Public Events

	Name	Description
	BeforeExecute (see page 20543)	Occurs immediately before the dialog appears.
	OnExecute (see page 2716)	Occurs when the client event that is linked to it fires.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 301)	Instantiates and initializes a TCustomAction (see page 297) object.
	Create (see page 2710)	Instantiates and initializes a TBasicAction (see page 2707) object.
	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 20538)	Creates an instance of TCommonDialogAction.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 292)	Destroys the instance of the contained action.
	Destroy (see page 302)	Frees an instance of TCustomAction (see page 297).
	Destroy (see page 2711)	Disposes of an instance of a TBasicAction (see page 2707) object.
	Destroy (see page 2766)	Disposes of the component and its owned components.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 20538)	Frees an instance of TCustomAction.
	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.

	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DoHint (see page 303)	Generates an OnHint (see page 315) event.
V	Execute (see page 293)	Responds when the client control "fires".
V	Execute (see page 304)	Responds when a client control "fires".
	Execute (see page 2712)	Generates an OnExecute (see page 2716) event.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
V	ExecuteTarget (see page 2712)	Introduces an interface for invoking an action on a target client component or control.
V	ExecuteTarget (see page 20540)	Executes the associated dialog and generates an OnAccept (see page 20543) or OnCancel (see page 20543) event.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
V	GetParentComponent (see page 293)	Returns the action list or action manager that contains the action.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	HandlesTarget (see page 2713)	Introduces an interface for verifying that the type, and state, of a target component or control are appropriate for the action.
V	HandlesTarget (see page 20541)	Indicates whether the action can execute its dialog.
V	HasParent (see page 294)	Indicates whether the action is contained in an action list or action manager.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RegisterChanges (see page 2713)	Associates the action with an action link.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UnRegisterChanges (see page 2714)	Breaks the association between the action and the action link.

V	Update (see page 295)	Indicates whether the action updates itself.
V	Update (see page 2714)	Provides an opportunity to execute centralized code when an application is idle.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
V	UpdateTarget (see page 2715)	Introduces an interface for a method of notifying a client when the action updates itself.

Public Properties

	Name	Description
	ActionComponent (see page 2715)	Indicates the client component that caused this action to execute.
	ActionList (see page 295)	Indicates the action list or action manager that contains the action.
	AutoCheck (see page 308)	Controls (see page 5711) whether the Checked (see page 308) property toggles when the action executes.
	Checked (see page 308)	Indicates whether client controls and menu items appear checked.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DisableIfNoHandler (see page 310)	Indicates whether client components should be disabled if no handler is found.
R	ExecuteResult (see page 20542)	Indicates the result of executing the associated dialog.
	GroupIndex (see page 311)	Indicates whether the action acts like a radio button with other actions in the same action list.
	Index (see page 296)	Specifies the index of the action in its action list or action manager.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Events

	Name	Description
	OnAccept (see page 11975)	This is OnAccept, a member of class TOpenPicture.
	OnCancel (see page 11975)	This is OnCancel, a member of class TOpenPicture.
	OnHint (see page 11975)	Occurs when the mouse pauses over a client control or menu item.
	OnUpdate (see page 11976)	Occurs when the application is idle or when the action list updates.

Published Properties

	Name	Description
	Caption (see page 11970)	Represents the caption of client controls and menu items.
	Category (see page 296)	Specifies the category under which the action appears in its action list or action manager.
R	Dialog (see page 11971)	Provides access the open picture dialog that the action executes.
	Enabled (see page 11971)	Indicates whether client controls and menu items are enabled.
	HelpContext (see page 11971)	Indicates the help context ID for client controls and menu items.
	HelpKeyword (see page 11972)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 11972)	Indicates the mechanism for client controls and menu items to use when invoking help.
	Hint (see page 11973)	Indicates the Help hint for client controls and menu items.
	ImageIndex (see page 11973)	Indicates the ImageIndex property for client controls and menu items.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	SecondaryShortCuts (see page 11974)	Specifies the short cuts (in addition to ShortCut) for triggering clients.
	ShortCut (see page 11974)	Specifies the ShortCut property for client menu items.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Visible (see page 11974)	Specifies the Visible property for client controls and menu items.

67.1.12.2 TOpenPicture Methods

The methods of the TOpenPicture class are listed here.

Protected Methods

	Name	Description
	GetDialogClass (see page 11970)	This is GetDialogClass, a member of class TOpenPicture.

67.1.12.2.1 TOpenPicture.GetDialogClass Method

Pascal

```
function GetDialogClass: TCommonDialogClass; override;
```

C++

```
virtual __fastcall TCommonDialogClass GetDialogClass();
```

Description

This is GetDialogClass, a member of class TOpenPicture.

67.1.12.3 TOpenPicture Properties

The properties of the TOpenPicture class are listed here.

Published Properties

	Name	Description
	Caption (see page 11970)	Represents the caption of client controls and menu items.
	Dialog (see page 11971)	Provides access the open picture dialog that the action executes.
	Enabled (see page 11971)	Indicates whether client controls and menu items are enabled.
	HelpContext (see page 11971)	Indicates the help context ID for client controls and menu items.
	HelpKeyword (see page 11972)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 11972)	Indicates the mechanism for client controls and menu items to use when invoking help.
	Hint (see page 11973)	Indicates the Help hint for client controls and menu items.
	ImageIndex (see page 11973)	Indicates the ImageIndex property for client controls and menu items.
	SecondaryShortCuts (see page 11974)	Specifies the short cuts (in addition to ShortCut) for triggering clients.
	ShortCut (see page 11974)	Specifies the ShortCut property for client menu items.
	Visible (see page 11974)	Specifies the Visible property for client controls and menu items.

67.1.12.3.1 TOpenPicture.Caption Property

Represents the caption of client controls and menu items.

Pascal

```
property Caption: string;
```

C++

```
__property AnsiString Caption;
```

Description

Caption holds the string that is the caption for the action when it is set. The value of Caption is propagated to client controls and menu items.

See Also

Caption (see page 5806)

Caption (see page 16136)

67.1.12.3.2 TOpenPicture.Dialog Property

Provides access the open picture dialog that the action executes.

Pascal

```
property Dialog: TOpenPictureDialog;
```

C++

```
__property TOpenPictureDialog Dialog;
```

Description

Use Dialog to configure the graphics file selection dialog before the action fires or to read the selected file name after the action executes the dialog. For example, you can set the dialog's default extension or initially selected file at design time using the Object Inspector or read the dialog's FileName property from an OnAccept (see page 11975) event handler to use the file that the user selected.

When using an open picture action, you do not place a TOpenPicture (see page 11965) Dialog component on the form or data module at design time. Instead, you add the TOpenPicture (see page 11965) object to your action list and then use the Dialog property. The dialog component is created by the TOpenPicture (see page 11965) constructor.

See Also

onaccept (see page 20543)

oncancel (see page 20543)

FileName (see page 11424)

67.1.12.3.3 TOpenPicture.Enabled Property

Indicates whether client controls and menu items are enabled.

Pascal

```
property Enabled: Boolean;
```

C++

```
__property Boolean Enabled;
```

Description

Enabled specifies the enabled state for the action. The value of Enabled is propagated to client controls and menu items.

See Also

Enabled (see page 5821)

Enabled (see page 16145)

67.1.12.3.4 TOpenPicture.HelpContext Property

Indicates the help context ID for client controls and menu items.

Pascal

```
property HelpContext: THelpContext;
```

C++

```
__property THelpContext HelpContext;
```

Description

HelpContext specifies the help context for the action when it is set. This value is propagated to client controls and menu items.

When a client control has focus and the user presses the F1 key, the control uses the value of HelpContext for this associated action to invoke the online help targeting a specific topic. The target topic is uniquely identified by a nonzero HelpContext value. Leave the HelpContext property of the client control at its default value of zero. This allows multiple controls (and multiple types of controls) to be associated with the same help topic through the one action object.

Note: HelpContext is only used when the HelpType property of this action or the client control is htInteger.

See Also

HelpType (see page 312)

HelpKeyword (see page 311)

67.1.12.3.5 TOpenPicture.HelpKeyword Property

Indicates the help keyword for client controls and menu items.

Pascal

```
property HelpKeyword: string;
```

C++

```
__property AnsiString HelpKeyword;
```

Description

HelpKeyword, when set, specifies the keyword that identifies a help topic for this action. This value is propagated to the HelpKeyword property of client controls and menu items. The interpretation of HelpKeyword depends on which help system is used to display the topic. For example, when using HyperHelp (on Linux) or WinHelp (on Windows), HelpKeyword refers to an A link.

When a client control has focus and the user presses the F1 key (or the key specified by the application's HelpKey property), the control uses the value of HelpKeyword for this associated action object to invoke the online help targeting a specific topic. Leave the HelpKeyword property of the client control unassigned. This allows multiple controls (and multiple types of controls) to be associated with the same help topic through the one action object.

Note: HelpKeyword is only used when the HelpType property of this action or the client control is htKeyword.

See Also

HelpKeyword (see page 5826)

HelpContext (see page 311)

HelpType (see page 312)

HelpKey

67.1.12.3.6 TOpenPicture.HelpType Property

Indicates the mechanism for client controls and menu items to use when invoking help.

Pascal

```
property HelpType: THelpType;
```

C++

```
__property THelpType HelpType;
```

Description

HelpType, when set, indicates whether client controls and menu items should use the HelpContext or the HelpKeyword property for invoking the help system. This value is propagated to the HelpType property of client controls and menu items.

See Also

HelpType (see page 5827)

HelpType

HelpContext (see page 311)

HelpKeyword (see page 311)

67.1.12.3.7 TOpenPicture.Hint Property

Indicates the Help hint for client controls and menu items.

Pascal

```
property Hint: string;
```

C++

```
__property AnsiString Hint;
```

Description

Hint holds the string that is the hint for that action when it is set. This value is propagated to client controls and menu items.

See Also

Hint (see page 5827)

Hint (see page 16148)

67.1.12.3.8 TOpenPicture.ImageIndex Property

Indicates the ImageIndex property for client controls and menu items.

Pascal

```
property ImageIndex: TImageIndex;
```

C++

```
__property TImageIndex ImageIndex;
```

Description

ImageIndex is an index into the Images property of the action list or action manager that contains the action. It identifies an image that is associated with controls and menu items that use this action.

See Also

ImageIndex (see page 5135)

ImageIndex (see page 16148)

Images (see page 325)

67.1.12.3.9 TOpenPicture.SecondaryShortCuts Property

Specifies the short cuts (in addition to ShortCut) for triggering clients.

Pascal

```
property SecondaryShortCuts: TShortCutList;
```

C++

```
__property TShortCutList SecondaryShortCuts;
```

Description

Actions can execute in response to multiple short cut key combinations. SecondaryShortCuts lists all the short cut key combinations (other than the one specified by the ShortCut property) that can trigger the action. This lets you specify shortcuts for clients that do not have a ShortCut property or provide additional, secondary shortcuts.

When the user types one of the key combinations listed in SecondaryShortCuts, the action's Execute method is called.

See Also

ShortCut (see page 314)

Execute (see page 304)

67.1.12.3.10 TOpenPicture.ShortCut Property

Specifies the ShortCut property for client menu items.

Pascal

```
property ShortCut: TShortCut;
```

C++

```
__property TShortCut ShortCut;
```

Description

ShortCut holds the value that is the shortcut for the action when it is set. This value is propagated to client menu items.

See Also

ShortCut (see page 16152)

SecondaryShortCuts (see page 314)

67.1.12.3.11 TOpenPicture.Visible Property

Specifies the Visible property for client controls and menu items.

Pascal

```
property Visible: Boolean;
```

C++

```
__property Boolean Visible;
```

Description

Visible specifies the visible state for the action. This value is propagated to client controls and menu items.

See Also

Visible (see page 16153)

Visible (see page 5847)

67.1.12.4 TOpenPicture Events

The events of the TOpenPicture class are listed here.

Published Events

	Name	Description
	OnAccept (see page 11975)	This is OnAccept, a member of class TOpenPicture.
	OnCancel (see page 11975)	This is OnCancel, a member of class TOpenPicture.
	OnHint (see page 11975)	Occurs when the mouse pauses over a client control or menu item.
	OnUpdate (see page 11976)	Occurs when the application is idle or when the action list updates.

67.1.12.4.1 TOpenPicture.OnAccept Event

Pascal

```
property OnAccept: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnAccept;
```

Description

This is OnAccept, a member of class TOpenPicture.

67.1.12.4.2 TOpenPicture.OnCancel Event

Pascal

```
property OnCancel: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnCancel;
```

Description

This is OnCancel, a member of class TOpenPicture.

67.1.12.4.3 TOpenPicture.OnHint Event

Occurs when the mouse pauses over a client control or menu item.

Pascal

```
property OnHint: THintEvent;
```

C++

```
__property THintEvent OnHint;
```

Description

Use OnHint to override the default hint that appears when the user pauses the mouse over a client control or menu item. The OnHint event handler can change the hint that appears (by changing the HintStr parameter), or display the hint in some

application-specific way.

67.1.12.4.4 TOpenPicture.OnUpdate Event

Occurs when the application is idle or when the action list updates.

Pascal

```
property OnUpdate: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnUpdate;
```

Description

Write an OnUpdate event handler to execute centralized code while an application is idle. For example, actions may want to update enabling and disabling, or checking and unchecking of client targets.

C++ Examples:

```
/*
When the application is idle, the OnUpdate event occurs for
every action that is linked to a visible control or menu
item that is showing. This provides an opportunity for
applications to execute centralized code for enabling and
disabling, checking and unchecking, and so on. For example,
the following code illustrates the OnUpdate event handler
for an action that is "checked" when the toolbar is visible.
This example requires a TActionList (with one TAction) and a
TToolBar on a form. This example requires a TActionList
(with one TAction) and a TToolBar on a form.  Double click
on the TActionList and create an TAction named Action1.  The
TAction has an OnUpdate event handler called Action1Update.
Then set an object's (such as a button or menu item) Action
to Action1.
*/
void __fastcall TForm1::Action1Update(TObject *Sender)
{
   // Indicate whether ToolBar1 is currently visible.
   TAction* pa = dynamic_cast<TAction*>(Sender);
   if (pa)
   {
     if (pa->Checked != ToolBar1->Visible)
     {
       lbOther->Items->Add("Event Action1Update: toolbar visibility changed");
     }
     pa->Checked = ToolBar1->Visible;
   }
}
```

Delphi Examples:

```
{
When the application is idle, the OnUpdate event occurs for
every action that is linked to a visible control or menu
item that is showing. This provides an opportunity for
applications to execute centralized code for enabling and
disabling, checking and unchecking, and so on. For example,
the following code illustrates the OnUpdate event handler
for an action that is "checked" when the toolbar is visible.
This example requires a TActionList (with one TAction) and a
TToolBar on a form. This example requires a TActionList
(with one TAction) and a TToolBar on a form.  Double click
on the TActionList and create an TAction named Action1.  The
TAction has an OnUpdate event handler called Action1Update.
Then set an object's (such as a button or menu item) Action
```

```
  to Action1.
  }
  procedure TMainForm.Action1Update(Sender: TObject);
  begin
    if ((Sender as TAction).Checked <> ToolBar1.Visible) then
      lbOther.Items.Add('Event Action1Update: toolbar visibility changed');
      { Indicate whether ToolBar1 is currently visible }
      (Sender as TAction).Checked := ToolBar1.Visible;
  end;
```

See Also

UpdateAction (see page 2790)

67.1.13 TPreviousTab Class

TPreviousTab moves a page control to its previous page.

Class Hierarchy

Pascal

```
TPreviousTab = class(TTabAction);
```

C++

```
class TPreviousTab : public TTabAction;
```

File

ExtActns

Description

Add TPreviousTab to an action list to allow users to move to the prior page of a page control using menu items or toolbar buttons. Controls (see page 5711) such as menu items and tool buttons linked to this action cause the application change the current page of a page control to the previous one. Typically, these client controls are the "Prior" button or menu item in a tabbed dialog.

Before you can use TPreviousTab, you must assign a target tab control as the value of the TabControl (see page 11987) property. Once the target tab control is assigned, TPreviousTab automatically disables itself if the target control is not enabled or if it is on the first page and wrapping is not permitted.

See Also

TNextTab (see page 11949)

TPageControl (see page 4459)

TTabControl (see page 4841)

67.1.13.1 TPreviousTab Members

The following tables list the members exposed by TPreviousTab.

Protected Events

	Name	Description
	OnChange (see page 2716)	Occurs when one of the action's properties changes.

Protected Fields

	Name	Description
	FClients (see page 2711)	This is FClients, a member of class TBasicAction.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FImage (see page 302)	This is FImage, a member of class TCustomAction.
	FMask (see page 303)	This is FMask, a member of class TCustomAction.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 303)	Copies the properties of this action to a destination object.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	Change (see page 2712)	Generates an OnChange (see page 2716) event.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
V	HandleShortCut (see page 306)	Executes the action when the user types on of its short cuts.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2713)	Responds when components are created or destroyed.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	Notification (see page 12079)	Responds when components are created or destroyed.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 294)	This is ReadState, a member of class TContainedAction.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SelectNextTab (see page 12079)	This is SelectNextTab, a member of class TTabAction.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
V	SetHelpContext (see page 306)	This is SetHelpContext, a member of class TCustomAction.
V	SetHelpKeyword (see page 306)	This is SetHelpKeyword, a member of class TCustomAction.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 307)	Sets the value of the Name property.

	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetOnExecute (see page 2714)	Assigns an OnExecute (see page 2716) event handler.
	SetParentComponent (see page 294)	This is SetParentComponent, a member of class TContainedAction.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	SavedEnabledState (see page 313)	Saves the value of the Enabled (see page 310) property when the action is suspended.

Public Events

	Name	Description
	OnExecute (see page 2716)	Occurs when the client event that is linked to it fires.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 301)	Instantiates and initializes a TCustomAction (see page 297) object.
	Create (see page 2710)	Instantiates and initializes a TBasicAction (see page 2707) object.
	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 12078)	Creates an instance of TTabAction (see page 12073).
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 292)	Destroys the instance of the contained action.
	Destroy (see page 302)	Frees an instance of TCustomAction (see page 297).
	Destroy (see page 2711)	Disposes of an instance of a TBasicAction (see page 2707) object.
	Destroy (see page 2766)	Disposes of the component and its owned components.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.

	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DoHint (see page 303)	Generates an OnHint (see page 315) event.
	Execute (see page 293)	Responds when the client control "fires".
	Execute (see page 304)	Responds when a client control "fires".
	Execute (see page 2712)	Generates an OnExecute (see page 2716) event.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	ExecuteTarget (see page 11982)	Changes the selected page in the target control to the previous one.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 293)	Returns the action list or action manager that contains the action.
	GetParentComponent (see page 2778)	Returns the containing Component.
	HandlesTarget (see page 2713)	Introduces an interface for verifying that the type, and state, of a target component or control are appropriate for the action.
	HandlesTarget (see page 12078)	Indicates whether the action can execute its function.
	HasParent (see page 294)	Indicates whether the action is contained in an action list or action manager.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RegisterChanges (see page 2713)	Associates the action with an action link.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UnRegisterChanges (see page 2714)	Breaks the association between the action and the action link.
	Update (see page 295)	Indicates whether the action updates itself.
	Update (see page 2714)	Provides an opportunity to execute centralized code when an application is idle.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	UpdateTarget (see page 11982)	Enables or disables the action, depending on the status of the target control.

Public Properties

	Name	Description
	ActionComponent (see page 2715)	Indicates the client component that caused this action to execute.
	ActionList (see page 295)	Indicates the action list or action manager that contains the action.
	AutoCheck (see page 308)	Controls (see page 5711) whether the Checked (see page 308) property toggles when the action executes.
	Checked (see page 308)	Indicates whether client controls and menu items appear checked.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DisableIfNoHandler (see page 310)	Indicates whether client components should be disabled if no handler is found.
	GroupIndex (see page 311)	Indicates whether the action acts like a radio button with other actions in the same action list.
	Index (see page 296)	Specifies the index of the action in its action list or action manager.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	SecondaryShortCuts (see page 314)	Specifies the short cuts (in addition to ShortCut (see page 314)) for triggering clients.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Events

	Name	Description
	AfterTabChange (see page 11989)	Occurs immediately after the action changes the page of the associated tab control.
	BeforeTabChange (see page 11989)	Occurs immediately before the action changes the page of the associated tab control.
	OnHint (see page 11989)	Occurs when the mouse pauses over a client control or menu item.
	OnUpdate (see page 11990)	Occurs when the application is idle or when the action list updates.
	OnValidateTab (see page 11991)	Occurs when the application is idle or when the action list updates.

Published Properties

	Name	Description
	Caption (see page 11983)	Represents the caption of client controls and menu items.
	Category (see page 296)	Specifies the category under which the action appears in its action list or action manager.
	Enabled (see page 11984)	Indicates whether client controls and menu items are enabled.
	HelpContext (see page 11984)	Indicates the help context ID for client controls and menu items.
	HelpKeyword (see page 11985)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 11985)	Indicates the mechanism for client controls and menu items to use when invoking help.
	Hint (see page 11986)	Indicates the Help hint for client controls and menu items.
	ImageIndex (see page 11986)	Indicates the ImageIndex property for client controls and menu items.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	ShortCut (see page 11986)	Specifies the ShortCut property for client menu items.
	SkipHiddenTabs (see page 11987)	Indicates whether the tab action should consider hidden tabbed pages when moving to the next page.
	TabControl (see page 11987)	Specifies the target of the action.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Visible (see page 11987)	Specifies the Visible property for client controls and menu items.
	Wrap (see page 11988)	Indicates whether the tab action should "wrap" when navigating to the next tab page.

67.1.13.2 TPreviousTab Methods

The methods of the TPreviousTab class are listed here.

Public Methods

	Name	Description
	ExecuteTarget (see page 11982)	Changes the selected page in the target control to the previous one.
	UpdateTarget (see page 11982)	Enables or disables the action, depending on the status of the target control.

67.1.13.2.1 TPreviousTab.ExecuteTarget Method

Changes the selected page in the target control to the previous one.

Pascal

```
procedure ExecuteTarget(Target: TObject); override;
```

C++

```
virtual __fastcall ExecuteTarget(TObject * Target);
```

Description

ExecuteTarget causes the action to perform its default response based on the state of the target tab control.

Target is the currently active object when the action fires. TPreviousTab (see page 11977) ignores this parameter and uses the TabControl (see page 11987) property to identify the target control.

ExecuteTarget

1. Generates a BeforeTabChange (see page 11989) event.
2. Moves the control identified by TabControl (see page 11987) to the previous page. If TabControl (see page 11987) is on the first page and the Wrap (see page 11988) property is true, this moves to the last page. If Wrap (see page 11988) is false, ExecuteTarget does not change the page when the tab control is on the first page. Note that the SkipHiddenTabs (see page 11987) property controls whether hidden pages are considered when locating the previous page.
3. Generates an AfterTabChange (see page 11989) event.

See Also

ExecuteTarget (see page 2712)

ActivePageIndex (see page 4484)

TabControl (see page 12080)

BeforeTabChange (see page 12082)

AfterTabChange (see page 12082)

Wrap (see page 12081)

TabIndex (see page 3946)

SkipHiddenTabs (see page 12080)

67.1.13.2.2 TPreviousTab.UpdateTarget Method

Enables or disables the action, depending on the status of the target control.

Pascal

```
procedure UpdateTarget(Target: TObject); override;
```

C++

```
virtual __fastcall UpdateTarget(TObject * Target);
```

Description

Do not call the UpdateTarget method. This method is called automatically when the application is idle so that actions can update themselves according to current conditions.

Target is the currently active object.

In TPreviousTab (see page 11977), UpdateTarget ignores the Target parameter and checks whether the target control specified by the TabControl (see page 11987) property is enabled. If so, it sets Enabled (see page 11984) to true if the first page is not currently selected or if Wrap (see page 11988) is true. It sets Enabled (see page 11984) to false if TabControl (see page 11987) is not enabled or if the first page is selected and Wrap (see page 11988) is false.

See Also

Enabled (see page 310)

TabControl (see page 12080)

Wrap (see page 12081)

67.1.13.3 TPreviousTab Properties

The properties of the TPreviousTab class are listed here.

Published Properties

	Name	Description
	Caption (see page 11983)	Represents the caption of client controls and menu items.
	Enabled (see page 11984)	Indicates whether client controls and menu items are enabled.
	HelpContext (see page 11984)	Indicates the help context ID for client controls and menu items.
	HelpKeyword (see page 11985)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 11985)	Indicates the mechanism for client controls and menu items to use when invoking help.
	Hint (see page 11986)	Indicates the Help hint for client controls and menu items.
	ImageIndex (see page 11986)	Indicates the ImageIndex property for client controls and menu items.
	ShortCut (see page 11986)	Specifies the ShortCut property for client menu items.
	SkipHiddenTabs (see page 11987)	Indicates whether the tab action should consider hidden tabbed pages when moving to the next page.
	TabControl (see page 11987)	Specifies the target of the action.
	Visible (see page 11987)	Specifies the Visible property for client controls and menu items.
	Wrap (see page 11988)	Indicates whether the tab action should "wrap" when navigating to the next tab page.

67.1.13.3.1 TPreviousTab.Caption Property

Represents the caption of client controls and menu items.

Pascal

```
property Caption: string;
```

C++

```
__property AnsiString Caption;
```

Description

Caption holds the string that is the caption for the action when it is set. The value of Caption is propagated to client controls and menu items.

See Also

Caption (see page 5806)

Caption (see page 16136)

67.1.13.3.2 TPreviousTab.Enabled Property

Indicates whether client controls and menu items are enabled.

Pascal

```
property Enabled: Boolean;
```

C++

```
__property Boolean Enabled;
```

Description

Enabled specifies the enabled state for the action. The value of Enabled is propagated to client controls and menu items.

See Also

Enabled (see page 5821)

Enabled (see page 16145)

67.1.13.3.3 TPreviousTab.HelpContext Property

Indicates the help context ID for client controls and menu items.

Pascal

```
property HelpContext: THelpContext;
```

C++

```
__property THelpContext HelpContext;
```

Description

HelpContext specifies the help context for the action when it is set. This value is propagated to client controls and menu items.

When a client control has focus and the user presses the F1 key, the control uses the value of HelpContext for this associated action to invoke the online help targeting a specific topic. The target topic is uniquely identified by a nonzero HelpContext value. Leave the HelpContext property of the client control at its default value of zero. This allows multiple controls (and multiple types of controls) to be associated with the same help topic through the one action object.

Note: HelpContext is only used when the HelpType property of this action or the client control is htInteger.

See Also

HelpType (see page 312)

HelpKeyword (see page 311)

67.1.13.3.4 TPreviousTab.HelpKeyword Property

Indicates the help keyword for client controls and menu items.

Pascal

```
property HelpKeyword: string;
```

C++

```
__property AnsiString HelpKeyword;
```

Description

HelpKeyword, when set, specifies the keyword that identifies a help topic for this action. This value is propagated to the HelpKeyword property of client controls and menu items. The interpretation of HelpKeyword depends on which help system is used to display the topic. For example, when using HyperHelp (on Linux) or WinHelp (on Windows), HelpKeyword refers to an A link.

When a client control has focus and the user presses the F1 key (or the key specified by the application's HelpKey property), the control uses the value of HelpKeyword for this associated action object to invoke the online help targeting a specific topic. Leave the HelpKeyword property of the client control unassigned. This allows multiple controls (and multiple types of controls) to be associated with the same help topic through the one action object.

Note: HelpKeyword is only used when the HelpType property of this action or the client control is htKeyword.

See Also

HelpKeyword (see page 5826)

HelpContext (see page 311)

HelpType (see page 312)

HelpKey

67.1.13.3.5 TPreviousTab.HelpType Property

Indicates the mechanism for client controls and menu items to use when invoking help.

Pascal

```
property HelpType: THelpType;
```

C++

```
__property THelpType HelpType;
```

Description

HelpType, when set, indicates whether client controls and menu items should use the HelpContext or the HelpKeyword property for invoking the help system. This value is propagated to the HelpType property of client controls and menu items.

See Also

HelpType (see page 5827)

HelpType

HelpContext (see page 311)

HelpKeyword (see page 311)

67.1.13.3.6 TPreviousTab.Hint Property

Indicates the Help hint for client controls and menu items.

Pascal

```
property Hint: string;
```

C++

```
__property AnsiString Hint;
```

Description

Hint holds the string that is the hint for that action when it is set. This value is propagated to client controls and menu items.

See Also

Hint (see page 5827)

Hint (see page 16148)

67.1.13.3.7 TPreviousTab.ImageIndex Property

Indicates the ImageIndex property for client controls and menu items.

Pascal

```
property ImageIndex: TImageIndex;
```

C++

```
__property TImageIndex ImageIndex;
```

Description

ImageIndex is an index into the Images property of the action list or action manager that contains the action. It identifies an image that is associated with controls and menu items that use this action.

See Also

ImageIndex (see page 5135)

ImageIndex (see page 16148)

Images (see page 325)

67.1.13.3.8 TPreviousTab.ShortCut Property

Specifies the ShortCut property for client menu items.

Pascal

```
property ShortCut: TShortCut;
```

C++

```
__property TShortCut ShortCut;
```

Description

ShortCut holds the value that is the shortcut for the action when it is set. This value is propagated to client menu items.

See Also

ShortCut (see page 16152)

SecondaryShortCuts (see page 314)

67.1.13.3.9 TPreviousTab.SkipHiddenTabs Property

Indicates whether the tab action should consider hidden tabbed pages when moving to the next page.

Pascal

```
property SkipHiddenTabs: Boolean;
```

C++

```
__property Boolean SkipHiddenTabs;
```

Description

Set SkipHiddenTabs to true if you do not want the action to move to a tab page if its TabVisible property is false. Set SkipHiddenTabs to false if the tab action can move to and make visible a hidden page.

Note: SkipHiddenTabs only has an effect when the TabControl property identifies a TPageControl object. (TTabControl does not support hidden pages).

See Also

ExecuteTarget (see page 11954)

ExecuteTarget (see page 11982)

TabVisible (see page 4956)

TPageControl (see page 4459)

67.1.13.3.10 TPreviousTab.TabControl Property

Specifies the target of the action.

Pascal

```
property TabControl: TCustomTabControl;
```

C++

```
__property TCustomTabControl TabControl;
```

Description

Set TabControl to the control on which the action operates when its ExecuteTarget method is called. Typically, this is a page control or tab control object that implements the pages of a tabbed dialog.

An application must explicitly assign a value to the TabControl property before the TTabAction descendant is enabled. The action does not infer the target page control when it fires.

See Also

ExecuteTarget (see page 11954)

ExecuteTarget (see page 11982)

67.1.13.3.11 TPreviousTab.Visible Property

Specifies the Visible property for client controls and menu items.

Pascal

```
property Visible: Boolean;
```

C++

```
__property Boolean Visible;
```

Description

Visible specifies the visible state for the action. This value is propagated to client controls and menu items.

See Also

Visible (see page 16153)

Visible (see page 5847)

67.1.13.3.12 TPreviousTab.Wrap Property

Indicates whether the tab action should "wrap" when navigating to the next tab page.

Pascal

```
property Wrap: Boolean;
```

C++

```
__property Boolean Wrap;
```

Description

When Wrap is true, the tab action can move previous to the first tabbed page or after the last tabbed page in the associated control. When Wrap is false, an attempt to move beyond the first or last page does not result in any page change, although it still results in a BeforeTabChange and an AfterTabChange event or in an OnFinish event.

See Also

ExecuteTarget (see page 11954)

ExecuteTarget (see page 11982)

TabControl (see page 12080)

BeforeTabChange (see page 12082)

AfterTabChange (see page 12082)

OnFinish (see page 11962)

67.1.13.4 TPreviousTab Events

The events of the TPreviousTab class are listed here.

Published Events

	Name	Description
	AfterTabChange (see page 11989)	Occurs immediately after the action changes the page of the associated tab control.
	BeforeTabChange (see page 11989)	Occurs immediately before the action changes the page of the associated tab control.
	OnHint (see page 11989)	Occurs when the mouse pauses over a client control or menu item.
	OnUpdate (see page 11990)	Occurs when the application is idle or when the action list updates.
	OnValidateTab (see page 11991)	Occurs when the application is idle or when the action list updates.

67.1.13.4.1 TPreviousTab.AfterTabChange Event

Occurs immediately after the action changes the page of the associated tab control.

Pascal

```
property AfterTabChange: TNotifyEvent;
```

C++

```
__property TNotifyEvent AfterTabChange;
```

Description

Write an AfterTabChange event handler to perform any additional tasks after the tab action changes the current page of the associated tab control. Typically, this event is used to initialize the current page of the tab control.

Note: AfterTabChange only occurs if the action tries to change the page of the tab control (even if it is not successful). If the action attempts some other task (for example, when TNextPage is on the last page of the tab control), AfterTabChange does not occur.

See Also

BeforeTabChange (see page 12082)

TabControl (see page 12080)

Wrap (see page 12081)

67.1.13.4.2 TPreviousTab.BeforeTabChange Event

Occurs immediately before the action changes the page of the associated tab control.

Pascal

```
property BeforeTabChange: TNotifyEvent;
```

C++

```
__property TNotifyEvent BeforeTabChange;
```

Description

Write a BeforeTabChange event handler to perform any additional tasks before the tab action changes the current page of the associated tab control. Typically, this event is used to save or respond to the changes the user made on the current page before it changes.

Note: BeforeTabChange only occurs if the action tries to change the page of the tab control (even if it is not successful). If the action attempts some other task (for example, when TNextPage is on the last page of the tab control), BeforeTabChange does not occur.

See Also

AfterTabChange (see page 12082)

TabControl (see page 12080)

Wrap (see page 12081)

67.1.13.4.3 TPreviousTab.OnHint Event

Occurs when the mouse pauses over a client control or menu item.

Pascal

```
property OnHint: THintEvent;
```

C++

```
__property THintEvent OnHint;
```

Description

Use OnHint to override the default hint that appears when the user pauses the mouse over a client control or menu item. The OnHint event handler can change the hint that appears (by changing the HintStr parameter), or display the hint in some application-specific way.

67.1.13.4.4 TPreviousTab.OnUpdate Event

Occurs when the application is idle or when the action list updates.

Pascal

```
property OnUpdate: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnUpdate;
```

Description

Write an OnUpdate event handler to execute centralized code while an application is idle. For example, actions may want to update enabling and disabling, or checking and unchecking of client targets.

C++ Examples:

```
/*
When the application is idle, the OnUpdate event occurs for
every action that is linked to a visible control or menu
item that is showing. This provides an opportunity for
applications to execute centralized code for enabling and
disabling, checking and unchecking, and so on. For example,
the following code illustrates the OnUpdate event handler
for an action that is "checked" when the toolbar is visible.
This example requires a TActionList (with one TAction) and a
TToolBar on a form. This example requires a TActionList
(with one TAction) and a TToolBar on a form.  Double click
on the TActionList and create an TAction named Action1.  The
TAction has an OnUpdate event handler called Action1Update.
Then set an object's (such as a button or menu item) Action
to Action1.
*/
void __fastcall TForm1::Action1Update(TObject *Sender)
{
   // Indicate whether ToolBar1 is currently visible.
   TAction* pa = dynamic_cast<TAction*>(Sender);
   if (pa)
   {
     if (pa->Checked != ToolBar1->Visible)
     {
       lbOther->Items->Add("Event Action1Update: toolbar visibility changed");
     }
     pa->Checked = ToolBar1->Visible;
   }
}
```

Delphi Examples:

```
{
When the application is idle, the OnUpdate event occurs for
```

```
every action that is linked to a visible control or menu
item that is showing. This provides an opportunity for
applications to execute centralized code for enabling and
disabling, checking and unchecking, and so on. For example,
the following code illustrates the OnUpdate event handler
for an action that is "checked" when the toolbar is visible.
This example requires a TActionList (with one TAction) and a
TToolBar on a form. This example requires a TActionList
(with one TAction) and a TToolBar on a form.  Double click
on the TActionList and create an TAction named Action1.  The
TAction has an OnUpdate event handler called Action1Update.
Then set an object's (such as a button or menu item) Action
to Action1.
}
procedure TMainForm.Action1Update(Sender: TObject);
begin
  if ((Sender as TAction).Checked <> ToolBar1.Visible) then
    lbOther.Items.Add('Event Action1Update: toolbar visibility changed');
    { Indicate whether ToolBar1 is currently visible }
    (Sender as TAction).Checked := ToolBar1.Visible;
end;
```

UpdateAction (see page 2790)

67.1.13.4.5 TPreviousTab.OnValidateTab Event

Occurs when the application is idle or when the action list updates.

Pascal

```
property OnValidateTab: TValidateTabEvent;
```

C++

```
__property TValidateTabEvent OnValidateTab;
```

Description

Use the OnValidateTab event rather than the OnUpdate event to update the properties of a tab action when the application is idle. Unlike the OnUpdate event, which prevents the default behavior of the UpdateTarget method, OnValidateTab occurs after UpdateTarget has set the Enabled property to reflect whether the target tab control is enabled.

OnValidateTab can be used to update any of the properties of the tab action, but it is intended primarily for enabling or disabling the action, depending on the contents of the current page of the target tab control.

Sender is the tab action component to update in this event.

TabControl is the target tab control.

Enabled reflects the Enabled property of this action. Set Enabled in the event handler to enable or disable the action depending on current conditions.

OnUpdate (see page 2718)

UpdateTarget (see page 12079)

TabControl (see page 12080)

Enabled (see page 310)

67.1.14 TRichEditAction Class

TRichEditAction is the base class for action objects that apply rich text attributes to a rich edit control.

Class Hierarchy

Pascal

```
TRichEditAction = class(TEditAction);
```

C++

```
class TRichEditAction : public TEditAction;
```

File

ExtActns

Description

TRichEditAction implements the common behavior for actions that assign text attributes to a rich edit control. Each descendant class represents a specific text attribute. Do not use TRichEditAction directly in an application. Instead, use a TRichEditAction descendant such as TRichEditBold (see page 12017), TRichEditItalic (see page 12029), TRichEditUnderline (see page 12042), TRichEditStrikeOut (see page 12036), TRichEditAlignCenter (see page 11998), TRichEditAlignLeft (see page 12005), TRichEditAlignRight (see page 12011), or TRichEditBullets (see page 12023).

TRichEditAction ensures that the action is only works with a TCustomRichEdit descendant as a target. TRichEditAction descendants toggle their specific text attribute in the target rich edit control: if the attribute is set, it is removed, and if it is not set (or set for only some of the text), the action sets it. If the target rich edit control has a selection, the attribute is toggled for the selected text only. If there is no selection, the attribute is toggled for all of the text.

67.1.14.1 TRichEditAction Members

The following tables list the members exposed by TRichEditAction.

Protected Events

	Name	Description
	OnChange (see page 2716)	Occurs when one of the action's properties changes.

Protected Fields

	Name	Description
	FClients (see page 2711)	This is FClients, a member of class TBasicAction.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FImage (see page 302)	This is FImage, a member of class TCustomAction.
	FMask (see page 303)	This is FMask, a member of class TCustomAction.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 303)	Copies the properties of this action to a destination object.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	Change (see page 2712)	Generates an OnChange (see page 2716) event.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	CurrText (see page 11997)	This is CurrText, a member of class TRichEditAction.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetControl (see page 20549)	Returns the target of the edit action.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
V	HandleShortCut (see page 306)	Executes the action when the user types on of its short cuts.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2713)	Responds when components are created or destroyed.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	Notification (see page 20550)	Responds when objects are added or removed.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 294)	This is ReadState, a member of class TContainedAction.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetFontStyle (see page 11998)	This is SetFontStyle, a member of class TRichEditAction.
V	SetHelpContext (see page 306)	This is SetHelpContext, a member of class TCustomAction.
V	SetHelpKeyword (see page 306)	This is SetHelpKeyword, a member of class TCustomAction.

	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 307)	Sets the value of the Name property.
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
V	SetOnExecute (see page 2714)	Assigns an OnExecute (see page 2716) event handler.
V	SetParentComponent (see page 294)	This is SetParentComponent, a member of class TContainedAction.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	SavedEnabledState (see page 313)	Saves the value of the Enabled (see page 310) property when the action is suspended.

Public Events

	Name	Description
	OnExecute (see page 2716)	Occurs when the client event that is linked to it fires.
	OnHint (see page 315)	Occurs when the mouse pauses over a client control or menu item.
	OnUpdate (see page 2718)	Occurs when the application is idle or when the action list updates.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 11997)	Creates an instance of TRichEditAction (see page 11992).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 292)	Destroys the instance of the contained action.
V	Destroy (see page 302)	Frees an instance of TCustomAction (see page 297).
V	Destroy (see page 2711)	Disposes of an instance of a TBasicAction (see page 2707) object.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 20549)	Frees an instance of TCustomAction.
V	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.

	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DoHint (see page 303)	Generates an OnHint (see page 315) event.
V	Execute (see page 293)	Responds when the client control "fires".
V	Execute (see page 304)	Responds when a client control "fires".
	Execute (see page 2712)	Generates an OnExecute (see page 2716) event.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
V	ExecuteTarget (see page 2712)	Introduces an interface for invoking an action on a target client component or control.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
V	GetParentComponent (see page 293)	Returns the action list or action manager that contains the action.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	HandlesTarget (see page 11998)	Indicates whether the action can execute its function.
V	HasParent (see page 294)	Indicates whether the action is contained in an action list or action manager.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RegisterChanges (see page 2713)	Associates the action with an action link.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UnRegisterChanges (see page 2714)	Breaks the association between the action and the action link.
V	Update (see page 295)	Indicates whether the action updates itself.
V	Update (see page 2714)	Provides an opportunity to execute centralized code when an application is idle.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

V	UpdateTarget (see page 2715)	Introduces an interface for a method of notifying a client when the action updates itself.
V	UpdateTarget (see page 20551)	Enables or disables the action, depending on the currently active control in the form.

Public Properties

	Name	Description
	ActionComponent (see page 2715)	Indicates the client component that caused this action to execute.
	ActionList (see page 295)	Indicates the action list or action manager that contains the action.
	AutoCheck (see page 308)	Controls (see page 5711) whether the Checked (see page 308) property toggles when the action executes.
	Caption (see page 308)	Represents the caption of client controls and menu items.
	Checked (see page 308)	Indicates whether client controls and menu items appear checked.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Control (see page 20551)	Provides access to the target of the action.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DisableIfNoHandler (see page 310)	Indicates whether client components should be disabled if no handler is found.
	Enabled (see page 310)	Indicates whether client controls and menu items are enabled.
	GroupIndex (see page 311)	Indicates whether the action acts like a radio button with other actions in the same action list.
	HelpContext (see page 311)	Indicates the help context ID for client controls and menu items.
	HelpKeyword (see page 311)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 312)	Indicates the mechanism for client controls and menu items to use when invoking help.
	Hint (see page 312)	Indicates the Help hint for client controls and menu items.
	ImageIndex (see page 313)	Indicates the ImageIndex property for client controls and menu items.
	Index (see page 296)	Specifies the index of the action in its action list or action manager.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	SecondaryShortCuts (see page 314)	Specifies the short cuts (in addition to ShortCut (see page 314)) for triggering clients.
	ShortCut (see page 314)	Specifies the ShortCut property for client menu items.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	Visible (see page 314)	Specifies the Visible property for client controls and menu items.

Published Events

	Name	Description
	OnExecute (see page 261)	Occurs when the client event that is linked to it fires.
	OnHint (see page 263)	Occurs when the mouse pauses over a client control or menu item.
	OnUpdate (see page 263)	Occurs when the application is idle or when the action list updates.

Published Properties

	Name	Description
	AutoCheck (see page 255)	Controls whether the Checked property toggles when the action executes.
	Caption (see page 255)	Represents the caption of client controls and menu items.
	Category (see page 296)	Specifies the category under which the action appears in its action list or action manager.
	Checked (see page 256)	Indicates whether client controls and menu items appear checked.
	Enabled (see page 257)	Indicates whether client controls and menu items are enabled.
	GroupIndex (see page 257)	Indicates whether the action acts like a radio button with other actions in the same action list.

	HelpContext (see page 258)	Indicates the help context ID for client controls and menu items.
	HelpKeyword (see page 258)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 259)	Indicates the mechanism for client controls and menu items to use when invoking help.
	Hint (see page 259)	Indicates the Help hint for client controls and menu items.
	ImageIndex (see page 259)	Indicates the ImageIndex property for client controls and menu items.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	SecondaryShortCuts (see page 260)	Specifies the short cuts (in addition to ShortCut) for triggering clients.
	ShortCut (see page 260)	Specifies the ShortCut property for client menu items.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Visible (see page 261)	Specifies the Visible property for client controls and menu items.

67.1.14.2 TRichEditAction.Create Constructor

Creates an instance of TRichEditAction (see page 11992).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TRichEditAction(TComponent * AOwner);
```

Description

Most applications do not need to call the TRichEditAction (see page 11992) constructor because actions are added at design time to an action list or action manager.

AOwner specifies the Owner for the action. This is the component that is responsible for freeing the TRichEditAction (see page 11992) instance.

See Also

Owner (see page 2807)

67.1.14.3 TRichEditAction Methods

The methods of the TRichEditAction class are listed here.

Protected Methods

	Name	Description
	CurrText (see page 11997)	This is CurrText, a member of class TRichEditAction.
	SetFontStyle (see page 11998)	This is SetFontStyle, a member of class TRichEditAction.

Public Methods

	Name	Description
	HandlesTarget (see page 11998)	Indicates whether the action can execute its function.

67.1.14.3.1 TRichEditAction.CurrText Method

Pascal

```
function CurrText(Edit: TCustomRichEdit): TTextAttributes;
```

C++

```
__fastcall TTextAttributes CurrText(TCustomRichEdit Edit);
```

Description

This is CurrText, a member of class TRichEditAction.

67.1.14.3.2 TRichEditAction.HandlesTarget Method

Indicates whether the action can execute its function.

Pascal

```
function HandlesTarget(Target: TObject): Boolean; override;
```

C++

```
virtual __fastcall Boolean HandlesTarget(TObject * Target);
```

Description

Do not call the HandlesTarget method. This method is called automatically when the user invokes an object (such as a tool button or menu item) that is linked to this action. The HandlesTarget method provides the action object with an opportunity to indicate whether it is appropriate to execute at this time with the object specified by the Target parameter as a "target".

Target is the currently active object.

HandlesTarget returns true if Target is a TCustomRichEdit descendant, false otherwise.

See Also

ExecuteTarget (see page 2712)

TCustomRichEdit (see page 3854)

67.1.14.3.3 TRichEditAction.SetFontStyle Method

Pascal

```
procedure SetFontStyle(Edit: TCustomRichEdit; Style: TFontStyle);
```

C++

```
__fastcall SetFontStyle(TCustomRichEdit Edit, TFontStyle Style);
```

Description

This is SetFontStyle, a member of class TRichEditAction.

67.1.15 TRichEditAlignCenter Class

TRichEditAlignCenter centers the text horizontally in the current paragraph of a rich edit control.

Class Hierarchy

Pascal

```
TRichEditAlignCenter = class(TRichEditAction);
```

C++

```
class TRichEditAlignCenter : public TRichEditAction;
```

File

ExtActns

Description

Add TRichEditAlignCenter to an action list to let users center the text in a rich edit control. Controls (see page 5711) such as menu items and tool buttons linked to this action cause the application to center the text in all paragraphs that contain selected text (or the paragraph with the cursor if no text is selected).

TRichEditAlignCenter is designed to work with a rich edit control (TCustomRichEdit descendant) as a target. It automatically disables itself if the active control in a form is not a rich edit control, and adds or removes a check mark to reflect whether the text in the target edit control is centered.

TRichEditBold (see page 12017)

67.1.15.1 TRichEditAlignCenter Members

The following tables list the members exposed by TRichEditAlignCenter.

Protected Events

	Name	Description
	OnChange (see page 2716)	Occurs when one of the action's properties changes.

Protected Fields

	Name	Description
	FClients (see page 2711)	This is FClients, a member of class TBasicAction.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FImage (see page 302)	This is FImage, a member of class TCustomAction.
	FMask (see page 303)	This is FMask, a member of class TCustomAction.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 303)	Copies the properties of this action to a destination object.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	Change (see page 2712)	Generates an OnChange (see page 2716) event.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.

	CurrText (see page 11997)	This is CurrText, a member of class TRichEditAction.
	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetControl (see page 20549)	Returns the target of the edit action.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	HandleShortCut (see page 306)	Executes the action when the user types on of its short cuts.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Notification (see page 2713)	Responds when components are created or destroyed.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	Notification (see page 20550)	Responds when objects are added or removed.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 294)	This is ReadState, a member of class TContainedAction.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetFontStyle (see page 11998)	This is SetFontStyle, a member of class TRichEditAction.
	SetHelpContext (see page 306)	This is SetHelpContext, a member of class TCustomAction.
	SetHelpKeyword (see page 306)	This is SetHelpKeyword, a member of class TCustomAction.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 307)	Sets the value of the Name property.
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetOnExecute (see page 2714)	Assigns an OnExecute (see page 2716) event handler.
	SetParentComponent (see page 294)	This is SetParentComponent, a member of class TContainedAction.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	SavedEnabledState (see page 313)	Saves the value of the Enabled (see page 310) property when the action is suspended.

Public Events

	Name	Description
	OnExecute (see page 2716)	Occurs when the client event that is linked to it fires.
	OnHint (see page 315)	Occurs when the mouse pauses over a client control or menu item.
	OnUpdate (see page 2718)	Occurs when the application is idle or when the action list updates.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 254)	Creates and initializes a TAction (see page 249) object.
V	Create (see page 301)	Instantiates and initializes a TCustomAction (see page 297) object.
V	Create (see page 2710)	Instantiates and initializes a TBasicAction (see page 2707) object.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
V	Create (see page 11997)	Creates an instance of TRichEditAction (see page 11992).
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 292)	Destroys the instance of the contained action.
V	Destroy (see page 302)	Frees an instance of TCustomAction (see page 297).
V	Destroy (see page 2711)	Disposes of an instance of a TBasicAction (see page 2707) object.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 20549)	Frees an instance of TCustomAction.
V	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DoHint (see page 303)	Generates an OnHint (see page 315) event.
V	Execute (see page 293)	Responds when the client control "fires".
V	Execute (see page 304)	Responds when a client control "fires".
	Execute (see page 2712)	Generates an OnExecute (see page 2716) event.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
V	ExecuteTarget (see page 12004)	Centers the text in the current paragraph of the target rich edit control.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.

	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 293)	Returns the action list or action manager that contains the action.
	GetParentComponent (see page 2778)	Returns the containing Component.
	HandlesTarget (see page 2713)	Introduces an interface for verifying that the type, and state, of a target component or control are appropriate for the action.
	HandlesTarget (see page 11998)	Indicates whether the action can execute its function.
	HandlesTarget (see page 20550)	Indicates whether the action can execute its function.
	HasParent (see page 294)	Indicates whether the action is contained in an action list or action manager.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RegisterChanges (see page 2713)	Associates the action with an action link.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UnRegisterChanges (see page 2714)	Breaks the association between the action and the action link.
	Update (see page 295)	Indicates whether the action updates itself.
	Update (see page 2714)	Provides an opportunity to execute centralized code when an application is idle.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	UpdateTarget (see page 12004)	Configures the action, depending on current conditions.

Public Properties

	Name	Description
	ActionComponent (see page 2715)	Indicates the client component that caused this action to execute.
	ActionList (see page 295)	Indicates the action list or action manager that contains the action.
	AutoCheck (see page 308)	Controls (see page 5711) whether the Checked (see page 308) property toggles when the action executes.
	Caption (see page 308)	Represents the caption of client controls and menu items.
	Checked (see page 308)	Indicates whether client controls and menu items appear checked.
	ComObject (see page 2793)	Specifies the interface reference implemented by the component.

R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Control (see page 20551)	Provides access to the target of the action.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DisableIfNoHandler (see page 310)	Indicates whether client components should be disabled if no handler is found.
	Enabled (see page 310)	Indicates whether client controls and menu items are enabled.
	GroupIndex (see page 311)	Indicates whether the action acts like a radio button with other actions in the same action list.
	HelpContext (see page 311)	Indicates the help context ID for client controls and menu items.
	HelpKeyword (see page 311)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 312)	Indicates the mechanism for client controls and menu items to use when invoking help.
	Hint (see page 312)	Indicates the Help hint for client controls and menu items.
	ImageIndex (see page 313)	Indicates the ImageIndex property for client controls and menu items.
	Index (see page 296)	Specifies the index of the action in its action list or action manager.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	SecondaryShortCuts (see page 314)	Specifies the short cuts (in addition to ShortCut (see page 314)) for triggering clients.
	ShortCut (see page 314)	Specifies the ShortCut property for client menu items.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	Visible (see page 314)	Specifies the Visible property for client controls and menu items.

Published Events

	Name	Description
	OnExecute (see page 261)	Occurs when the client event that is linked to it fires.
	OnHint (see page 263)	Occurs when the mouse pauses over a client control or menu item.
	OnUpdate (see page 263)	Occurs when the application is idle or when the action list updates.

Published Properties

	Name	Description
	AutoCheck (see page 255)	Controls whether the Checked property toggles when the action executes.
	Caption (see page 255)	Represents the caption of client controls and menu items.
	Category (see page 296)	Specifies the category under which the action appears in its action list or action manager.
	Checked (see page 256)	Indicates whether client controls and menu items appear checked.
	Enabled (see page 257)	Indicates whether client controls and menu items are enabled.
	GroupIndex (see page 257)	Indicates whether the action acts like a radio button with other actions in the same action list.
	HelpContext (see page 258)	Indicates the help context ID for client controls and menu items.
	HelpKeyword (see page 258)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 259)	Indicates the mechanism for client controls and menu items to use when invoking help.
	Hint (see page 259)	Indicates the Help hint for client controls and menu items.
	ImageIndex (see page 259)	Indicates the ImageIndex property for client controls and menu items.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	SecondaryShortCuts (see page 260)	Specifies the short cuts (in addition to ShortCut) for triggering clients.
	ShortCut (see page 260)	Specifies the ShortCut property for client menu items.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Visible (see page 261)	Specifies the Visible property for client controls and menu items.

67.1.15.2 TRichEditAlignCenter Methods

The methods of the TRichEditAlignCenter class are listed here.

Public Methods

	Name	Description
	ExecuteTarget (see page 12004)	Centers the text in the current paragraph of the target rich edit control.
	UpdateTarget (see page 12004)	Configures the action, depending on current conditions.

67.1.15.2.1 TRichEditAlignCenter.ExecuteTarget Method

Centers the text in the current paragraph of the target rich edit control.

Pascal

```
procedure ExecuteTarget(Target: TObject); override;
```

C++

```
virtual __fastcall ExecuteTarget(TObject * Target);
```

Description

Do not call the ExecuteTarget method. This method is called automatically when the action fires in response to a user action (for example, when the user selects a menu item or presses a tool button that is linked to this action).

Target is the currently active object when the action fires.

ExecuteTarget checks that Target is a rich edit control, and if so, sets its Alignment property to taCenter.

See Also

Paragraph (see page 3884)

Alignment (see page 4609)

67.1.15.2.2 TRichEditAlignCenter.UpdateTarget Method

Configures the action, depending on current conditions.

Pascal

```
procedure UpdateTarget(Target: TObject); override;
```

C++

```
virtual __fastcall UpdateTarget(TObject * Target);
```

Description

Do not call the UpdateTarget method. This method is called automatically when the application is idle so that actions can update themselves according to current conditions.

In TRichEditAlignCenter (see page 11998), UpdateTarget sets Enabled to true and sets the Checked property to true if the text in the current paragraph is centered.

See Also

Enabled (see page 310)

Checked (see page 308)

67.1.16 TRichEditAlignLeft Class

TRichEditAlignLeft left-justifies the text in the current paragraph of a rich edit control.

Class Hierarchy

Pascal

```
TRichEditAlignLeft = class(TRichEditAction);
```

C++

```
class TRichEditAlignLeft : public TRichEditAction;
```

File

ExtActns

Description

Add TRichEditAlignLeft to an action list to let users left-justify the text in a rich edit control. Controls (see page 5711) such as menu items and tool buttons linked to this action cause the application to align the text in all paragraphs that contain selected text (or the paragraph with the cursor if no text is selected) to the left margin.

TRichEditAlignLeft is designed to work with a rich edit control (TCustomRichEdit descendant) as a target. It automatically disables itself if the active control in a form is not a rich edit control, and adds or removes a check mark to indicate whether the text in the target control is left-aligned.

See Also

TCustomRichEdit (see page 3854)

TRichEditItalic (see page 12029)

TRichEditUnderline (see page 12042)

TRichEditStrikeOut (see page 12036)

TRichEditAlignRight (see page 12011)

TRichEditAlignCenter (see page 11998)

TRichEditBullets (see page 12023)

TRichEditBold (see page 12017)

67.1.16.1 TRichEditAlignLeft Members

The following tables list the members exposed by TRichEditAlignLeft.

Protected Events

	Name	Description
	OnChange (see page 2716)	Occurs when one of the action's properties changes.

Protected Fields

	Name	Description
	FClients (see page 2711)	This is FClients, a member of class TBasicAction.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FImage (see page 302)	This is FImage, a member of class TCustomAction.
	FMask (see page 303)	This is FMask, a member of class TCustomAction.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 303)	Copies the properties of this action to a destination object.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	Change (see page 2712)	Generates an OnChange (see page 2716) event.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	CurrText (see page 11997)	This is CurrText, a member of class TRichEditAction.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetControl (see page 20549)	Returns the target of the edit action.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
V	HandleShortCut (see page 306)	Executes the action when the user types on of its short cuts.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2713)	Responds when components are created or destroyed.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	Notification (see page 20550)	Responds when objects are added or removed.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 294)	This is ReadState, a member of class TContainedAction.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetFontStyle (see page 11998)	This is SetFontStyle, a member of class TRichEditAction.
V	SetHelpContext (see page 306)	This is SetHelpContext, a member of class TCustomAction.
V	SetHelpKeyword (see page 306)	This is SetHelpKeyword, a member of class TCustomAction.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 307)	Sets the value of the Name property.
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
V	SetOnExecute (see page 2714)	Assigns an OnExecute (see page 2716) event handler.

	SetParentComponent (see page 294)	This is SetParentComponent, a member of class TContainedAction.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	SavedEnabledState (see page 313)	Saves the value of the Enabled (see page 310) property when the action is suspended.

Public Events

	Name	Description
	OnExecute (see page 2716)	Occurs when the client event that is linked to it fires.
	OnHint (see page 315)	Occurs when the mouse pauses over a client control or menu item.
	OnUpdate (see page 2718)	Occurs when the application is idle or when the action list updates.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 254)	Creates and initializes a TAction (see page 249) object.
	Create (see page 301)	Instantiates and initializes a TCustomAction (see page 297) object.
	Create (see page 2710)	Instantiates and initializes a TBasicAction (see page 2707) object.
	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 11997)	Creates an instance of TRichEditAction (see page 11992).
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 292)	Destroys the instance of the contained action.
	Destroy (see page 302)	Frees an instance of TCustomAction (see page 297).
	Destroy (see page 2711)	Disposes of an instance of a TBasicAction (see page 2707) object.
	Destroy (see page 2766)	Disposes of the component and its owned components.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 20549)	Frees an instance of TCustomAction.
	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.

	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DoHint (see page 303)	Generates an OnHint (see page 315) event.
	Execute (see page 293)	Responds when the client control "fires".
	Execute (see page 304)	Responds when a client control "fires".
	Execute (see page 2712)	Generates an OnExecute (see page 2716) event.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	ExecuteTarget (see page 12010)	Left-justifies the text in the current paragraph of the target rich edit control.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 293)	Returns the action list or action manager that contains the action.
	GetParentComponent (see page 2778)	Returns the containing Component.
	HandlesTarget (see page 2713)	Introduces an interface for verifying that the type, and state, of a target component or control are appropriate for the action.
	HandlesTarget (see page 11998)	Indicates whether the action can execute its function.
	HandlesTarget (see page 20550)	Indicates whether the action can execute its function.
	HasParent (see page 294)	Indicates whether the action is contained in an action list or action manager.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RegisterChanges (see page 2713)	Associates the action with an action link.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UnRegisterChanges (see page 2714)	Breaks the association between the action and the action link.
	Update (see page 295)	Indicates whether the action updates itself.
	Update (see page 2714)	Provides an opportunity to execute centralized code when an application is idle.

	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
V	UpdateTarget (see page 12010)	Configures the action, depending on current conditions.

Public Properties

	Name	Description
	ActionComponent (see page 2715)	Indicates the client component that caused this action to execute.
	ActionList (see page 295)	Indicates the action list or action manager that contains the action.
	AutoCheck (see page 308)	Controls (see page 5711) whether the Checked (see page 308) property toggles when the action executes.
	Caption (see page 308)	Represents the caption of client controls and menu items.
	Checked (see page 308)	Indicates whether client controls and menu items appear checked.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Control (see page 20551)	Provides access to the target of the action.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DisableIfNoHandler (see page 310)	Indicates whether client components should be disabled if no handler is found.
	Enabled (see page 310)	Indicates whether client controls and menu items are enabled.
	GroupIndex (see page 311)	Indicates whether the action acts like a radio button with other actions in the same action list.
	HelpContext (see page 311)	Indicates the help context ID for client controls and menu items.
	HelpKeyword (see page 311)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 312)	Indicates the mechanism for client controls and menu items to use when invoking help.
	Hint (see page 312)	Indicates the Help hint for client controls and menu items.
	ImageIndex (see page 313)	Indicates the ImageIndex property for client controls and menu items.
	Index (see page 296)	Specifies the index of the action in its action list or action manager.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	SecondaryShortCuts (see page 314)	Specifies the short cuts (in addition to ShortCut (see page 314)) for triggering clients.
	ShortCut (see page 314)	Specifies the ShortCut property for client menu items.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	Visible (see page 314)	Specifies the Visible property for client controls and menu items.

Published Events

	Name	Description
	OnExecute (see page 261)	Occurs when the client event that is linked to it fires.
	OnHint (see page 263)	Occurs when the mouse pauses over a client control or menu item.
	OnUpdate (see page 263)	Occurs when the application is idle or when the action list updates.

Published Properties

	Name	Description
	AutoCheck (see page 255)	Controls whether the Checked property toggles when the action executes.
	Caption (see page 255)	Represents the caption of client controls and menu items.
	Category (see page 296)	Specifies the category under which the action appears in its action list or action manager.
	Checked (see page 256)	Indicates whether client controls and menu items appear checked.
	Enabled (see page 257)	Indicates whether client controls and menu items are enabled.
	GroupIndex (see page 257)	Indicates whether the action acts like a radio button with other actions in the same action list.
	HelpContext (see page 258)	Indicates the help context ID for client controls and menu items.

	HelpKeyword (see page 258)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 259)	Indicates the mechanism for client controls and menu items to use when invoking help.
	Hint (see page 259)	Indicates the Help hint for client controls and menu items.
	ImageIndex (see page 259)	Indicates the ImageIndex property for client controls and menu items.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	SecondaryShortCuts (see page 260)	Specifies the short cuts (in addition to ShortCut) for triggering clients.
	ShortCut (see page 260)	Specifies the ShortCut property for client menu items.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Visible (see page 261)	Specifies the Visible property for client controls and menu items.

67.1.16.2 TRichEditAlignLeft Methods

The methods of the TRichEditAlignLeft class are listed here.

Public Methods

	Name	Description
	ExecuteTarget (see page 12010)	Left-justifies the text in the current paragraph of the target rich edit control.
	UpdateTarget (see page 12010)	Configures the action, depending on current conditions.

67.1.16.2.1 TRichEditAlignLeft.ExecuteTarget Method

Left-justifies the text in the current paragraph of the target rich edit control.

Pascal

```
procedure ExecuteTarget(Target: TObject); override;
```

C++

```
virtual __fastcall ExecuteTarget(TObject * Target);
```

Description

Do not call the ExecuteTarget method. This method is called automatically when the action fires in response to a user action (for example, when the user selects a menu item or presses a tool button that is linked to this action).

Target is the currently active object when the action fires.

ExecuteTarget checks that Target is a rich edit control, and if so, sets its Alignment property to taLeftJustify.

See Also

Paragraph (see page 3884)

Alignment (see page 4609)

67.1.16.2.2 TRichEditAlignLeft.UpdateTarget Method

Configures the action, depending on current conditions.

Pascal

```
procedure UpdateTarget(Target: TObject); override;
```

C++

```
virtual __fastcall UpdateTarget(TObject * Target);
```

Description

Do not call the UpdateTarget method. This method is called automatically when the application is idle so that actions can update

themselves according to current conditions.

In TRichEditAlignLeft (see page 12005), UpdateTarget sets Enabled to true and sets the Checked property to true if the text in the current paragraph is left justified.

See Also

Enabled (see page 310)

Checked (see page 308)

67.1.17 TRichEditAlignRight Class

TRichEditAlignRight right-justifies the text in the current paragraph of a rich edit control.

Class Hierarchy

Pascal

```
TRichEditAlignRight = class(TRichEditAction);
```

C++

```
class TRichEditAlignRight : public TRichEditAction;
```

File

ExtActns

Description

Add TRichEditAlignRight to an action list to let users right-justify the text in a rich edit control. Controls (see page 5711) such as menu items and tool buttons linked to this action cause the application to align the text in all paragraphs that contain selected text (or the paragraph with the cursor if no text is selected) to the right margin.

TRichEditAlignRight is designed to work with a rich edit control (TCustomRichEdit descendant) as a target. It automatically disables itself if the active control in a form is not a rich edit control, and adds or removes a check mark to indicate whether the current paragraph of the target control is right-aligned.

See Also

TCustomRichEdit (see page 3854)

TRichEditItalic (see page 12029)

TRichEditUnderline (see page 12042)

TRichEditStrikeOut (see page 12036)

TRichEditAlignLeft (see page 12005)

TRichEditAlignCenter (see page 11998)

TRichEditBullets (see page 12023)

TRichEditBold (see page 12017)

67.1.17.1 TRichEditAlignRight Members

The following tables list the members exposed by TRichEditAlignRight.

Protected Events

	Name	Description
	OnChange (see page 2716)	Occurs when one of the action's properties changes.

Protected Fields

	Name	Description
	FClients (see page 2711)	This is FClients, a member of class TBasicAction.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FImage (see page 302)	This is FImage, a member of class TCustomAction.
	FMask (see page 303)	This is FMask, a member of class TCustomAction.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 303)	Copies the properties of this action to a destination object.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	Change (see page 2712)	Generates an OnChange (see page 2716) event.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	CurrText (see page 11997)	This is CurrText, a member of class TRichEditAction.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetControl (see page 20549)	Returns the target of the edit action.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
V	HandleShortCut (see page 306)	Executes the action when the user types on of its short cuts.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2713)	Responds when components are created or destroyed.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	Notification (see page 20550)	Responds when objects are added or removed.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 294)	This is ReadState, a member of class TContainedAction.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.

	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetFontStyle (see page 11998)	This is SetFontStyle, a member of class TRichEditAction.
	SetHelpContext (see page 306)	This is SetHelpContext, a member of class TCustomAction.
	SetHelpKeyword (see page 306)	This is SetHelpKeyword, a member of class TCustomAction.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 307)	Sets the value of the Name property.
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetOnExecute (see page 2714)	Assigns an OnExecute (see page 2716) event handler.
	SetParentComponent (see page 294)	This is SetParentComponent, a member of class TContainedAction.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	SavedEnabledState (see page 313)	Saves the value of the Enabled (see page 310) property when the action is suspended.

Public Events

	Name	Description
	OnExecute (see page 2716)	Occurs when the client event that is linked to it fires.
	OnHint (see page 315)	Occurs when the mouse pauses over a client control or menu item.
	OnUpdate (see page 2718)	Occurs when the application is idle or when the action list updates.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 254)	Creates and initializes a TAction (see page 249) object.
	Create (see page 301)	Instantiates and initializes a TCustomAction (see page 297) object.
	Create (see page 2710)	Instantiates and initializes a TBasicAction (see page 2707) object.
	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 11997)	Creates an instance of TRichEditAction (see page 11992).
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.

	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 292)	Destroys the instance of the contained action.
	Destroy (see page 302)	Frees an instance of TCustomAction (see page 297).
	Destroy (see page 2711)	Disposes of an instance of a TBasicAction (see page 2707) object.
	Destroy (see page 2766)	Disposes of the component and its owned components.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 20549)	Frees an instance of TCustomAction.
	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DoHint (see page 303)	Generates an OnHint (see page 315) event.
	Execute (see page 293)	Responds when the client control "fires".
	Execute (see page 304)	Responds when a client control "fires".
	Execute (see page 2712)	Generates an OnExecute (see page 2716) event.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	ExecuteTarget (see page 12016)	Right-justifies the text in the current paragraph of the target rich edit control.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 293)	Returns the action list or action manager that contains the action.
	GetParentComponent (see page 2778)	Returns the containing Component.
	HandlesTarget (see page 2713)	Introduces an interface for verifying that the type, and state, of a target component or control are appropriate for the action.
	HandlesTarget (see page 11998)	Indicates whether the action can execute its function.
	HandlesTarget (see page 20550)	Indicates whether the action can execute its function.
	HasParent (see page 294)	Indicates whether the action is contained in an action list or action manager.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RegisterChanges (see page 2713)	Associates the action with an action link.

	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UnRegisterChanges (see page 2714)	Breaks the association between the action and the action link.
V	Update (see page 295)	Indicates whether the action updates itself.
V	Update (see page 2714)	Provides an opportunity to execute centralized code when an application is idle.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
V	UpdateTarget (see page 12017)	Configures the action, depending on current conditions.

Public Properties

	Name	Description
	ActionComponent (see page 2715)	Indicates the client component that caused this action to execute.
	ActionList (see page 295)	Indicates the action list or action manager that contains the action.
	AutoCheck (see page 308)	Controls (see page 5711) whether the Checked (see page 308) property toggles when the action executes.
	Caption (see page 308)	Represents the caption of client controls and menu items.
	Checked (see page 308)	Indicates whether client controls and menu items appear checked.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Control (see page 20551)	Provides access to the target of the action.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DisableIfNoHandler (see page 310)	Indicates whether client components should be disabled if no handler is found.
	Enabled (see page 310)	Indicates whether client controls and menu items are enabled.
	GroupIndex (see page 311)	Indicates whether the action acts like a radio button with other actions in the same action list.
	HelpContext (see page 311)	Indicates the help context ID for client controls and menu items.
	HelpKeyword (see page 311)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 312)	Indicates the mechanism for client controls and menu items to use when invoking help.
	Hint (see page 312)	Indicates the Help hint for client controls and menu items.
	ImageIndex (see page 313)	Indicates the ImageIndex property for client controls and menu items.
	Index (see page 296)	Specifies the index of the action in its action list or action manager.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	SecondaryShortCuts (see page 314)	Specifies the short cuts (in addition to ShortCut (see page 314)) for triggering clients.
	ShortCut (see page 314)	Specifies the ShortCut property for client menu items.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	Visible (see page 314)	Specifies the Visible property for client controls and menu items.

Published Events

	Name	Description
	OnExecute (see page 261)	Occurs when the client event that is linked to it fires.
	OnHint (see page 263)	Occurs when the mouse pauses over a client control or menu item.
	OnUpdate (see page 263)	Occurs when the application is idle or when the action list updates.

Published Properties

	Name	Description
	AutoCheck (see page 255)	Controls whether the Checked property toggles when the action executes.
	Caption (see page 255)	Represents the caption of client controls and menu items.
	Category (see page 296)	Specifies the category under which the action appears in its action list or action manager.
	Checked (see page 256)	Indicates whether client controls and menu items appear checked.
	Enabled (see page 257)	Indicates whether client controls and menu items are enabled.
	GroupIndex (see page 257)	Indicates whether the action acts like a radio button with other actions in the same action list.
	HelpContext (see page 258)	Indicates the help context ID for client controls and menu items.
	HelpKeyword (see page 258)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 259)	Indicates the mechanism for client controls and menu items to use when invoking help.
	Hint (see page 259)	Indicates the Help hint for client controls and menu items.
	ImageIndex (see page 259)	Indicates the ImageIndex property for client controls and menu items.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	SecondaryShortCuts (see page 260)	Specifies the short cuts (in addition to ShortCut) for triggering clients.
	ShortCut (see page 260)	Specifies the ShortCut property for client menu items.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Visible (see page 261)	Specifies the Visible property for client controls and menu items.

67.1.17.2 TRichEditAlignRight Methods

The methods of the TRichEditAlignRight class are listed here.

Public Methods

	Name	Description
	ExecuteTarget (see page 12016)	Right-justifies the text in the current paragraph of the target rich edit control.
	UpdateTarget (see page 12017)	Configures the action, depending on current conditions.

67.1.17.2.1 TRichEditAlignRight.ExecuteTarget Method

Right-justifies the text in the current paragraph of the target rich edit control.

Pascal

```
procedure ExecuteTarget(Target: TObject); override;
```

C++

```
virtual __fastcall ExecuteTarget(TObject * Target);
```

Description

Do not call the ExecuteTarget method. This method is called automatically when the action fires in response to a user action (for example, when the user selects a menu item or presses a tool button that is linked to this action).

Target is the currently active object when the action fires.

ExecuteTarget checks that Target is a rich edit control, and if so, sets its Alignment property to taRightJustify.

See Also

Paragraph (see page 3884)

Alignment (see page 4609)

67.1.17.2.2 TRichEditAlignRight.UpdateTarget Method

Configures the action, depending on current conditions.

Pascal

```
procedure UpdateTarget(Target: TObject); override;
```

C++

```
virtual __fastcall UpdateTarget(TObject * Target);
```

Description

Do not call the UpdateTarget method. This method is called automatically when the application is idle so that actions can update themselves according to current conditions.

In TRichEditAlignRight (see page 12011), UpdateTarget sets Enabled to true and sets the Checked property to true if the text in the current paragraph is right justified.

See Also

Enabled (see page 310)

Checked (see page 308)

67.1.18 TRichEditBold Class

TRichEditBold toggles the bold attribute of the currently selected text in a rich edit control.

Class Hierarchy

Pascal

```
TRichEditBold = class(TRichEditAction);
```

C++

```
class TRichEditBold : public TRichEditAction;
```

File

ExtActns

Description

Add TRichEditBold to an action list to let users control whether the selected text in a rich edit control is bold. Controls (see page 5711) such as menu items and tool buttons linked to this action cause the application to toggle the bold attribute of selected text (or of all text if there is no text selected).

TRichEditBold is designed to work with a rich edit control (TCustomRichEdit descendant) as a target. It automatically disables itself if the active control in a form is not a rich edit control, and adds or removes a check mark to indicate whether the target control's text is bold.

See Also

TCustomRichEdit (see page 3854)

TRichEditItalic (see page 12029)

TRichEditUnderline (see page 12042)

TRichEditBullets (see page 12023)

TRichEditAlignRight (see page 12011)

TRichEditAlignLeft (see page 12005)

TRichEditAlignCenter (see page 11998)

TRichEditStrikeOut (see page 12036)

67.1.18.1 TRichEditBold Members

The following tables list the members exposed by TRichEditBold.

Protected Events

	Name	Description
	OnChange (see page 2716)	Occurs when one of the action's properties changes.

Protected Fields

	Name	Description
	FClients (see page 2711)	This is FClients, a member of class TBasicAction.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FImage (see page 302)	This is FImage, a member of class TCustomAction.
	FMask (see page 303)	This is FMask, a member of class TCustomAction.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 303)	Copies the properties of this action to a destination object.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	Change (see page 2712)	Generates an OnChange (see page 2716) event.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	CurrText (see page 11997)	This is CurrText, a member of class TRichEditAction.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetControl (see page 20549)	Returns the target of the edit action.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
V	HandleShortCut (see page 306)	Executes the action when the user types on of its short cuts.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.

	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Notification (see page 2713)	Responds when components are created or destroyed.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	Notification (see page 20550)	Responds when objects are added or removed.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 294)	This is ReadState, a member of class TContainedAction.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetFontStyle (see page 11998)	This is SetFontStyle, a member of class TRichEditAction.
	SetHelpContext (see page 306)	This is SetHelpContext, a member of class TCustomAction.
	SetHelpKeyword (see page 306)	This is SetHelpKeyword, a member of class TCustomAction.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 307)	Sets the value of the Name property.
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetOnExecute (see page 2714)	Assigns an OnExecute (see page 2716) event handler.
	SetParentComponent (see page 294)	This is SetParentComponent, a member of class TContainedAction.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	SavedEnabledState (see page 313)	Saves the value of the Enabled (see page 310) property when the action is suspended.

Public Events

	Name	Description
	OnExecute (see page 2716)	Occurs when the client event that is linked to it fires.
	OnHint (see page 315)	Occurs when the mouse pauses over a client control or menu item.
	OnUpdate (see page 2718)	Occurs when the application is idle or when the action list updates.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).

	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 254)	Creates and initializes a TAction (see page 249) object.
	Create (see page 301)	Instantiates and initializes a TCustomAction (see page 297) object.
	Create (see page 2710)	Instantiates and initializes a TBasicAction (see page 2707) object.
	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 11997)	Creates an instance of TRichEditAction (see page 11992).
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 292)	Destroys the instance of the contained action.
	Destroy (see page 302)	Frees an instance of TCustomAction (see page 297).
	Destroy (see page 2711)	Disposes of an instance of a TBasicAction (see page 2707) object.
	Destroy (see page 2766)	Disposes of the component and its owned components.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 20549)	Frees an instance of TCustomAction.
	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DoHint (see page 303)	Generates an OnHint (see page 315) event.
	Execute (see page 293)	Responds when the client control "fires".
	Execute (see page 304)	Responds when a client control "fires".
	Execute (see page 2712)	Generates an OnExecute (see page 2716) event.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	ExecuteTarget (see page 12022)	Toggles the fsBold style of the target rich edit control's text attributes.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 293)	Returns the action list or action manager that contains the action.
	GetParentComponent (see page 2778)	Returns the containing Component.
	HandlesTarget (see page 2713)	Introduces an interface for verifying that the type, and state, of a target component or control are appropriate for the action.
	HandlesTarget (see page 11998)	Indicates whether the action can execute its function.
	HandlesTarget (see page 20550)	Indicates whether the action can execute its function.
	HasParent (see page 294)	Indicates whether the action is contained in an action list or action manager.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.

	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RegisterChanges (see page 2713)	Associates the action with an action link.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UnRegisterChanges (see page 2714)	Breaks the association between the action and the action link.
V	Update (see page 295)	Indicates whether the action updates itself.
V	Update (see page 2714)	Provides an opportunity to execute centralized code when an application is idle.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
V	UpdateTarget (see page 12023)	Sets the Checked property to reflect whether the target control's text is bold.

Public Properties

	Name	Description
	ActionComponent (see page 2715)	Indicates the client component that caused this action to execute.
	ActionList (see page 295)	Indicates the action list or action manager that contains the action.
	AutoCheck (see page 308)	Controls (see page 5711) whether the Checked (see page 308) property toggles when the action executes.
	Caption (see page 308)	Represents the caption of client controls and menu items.
	Checked (see page 308)	Indicates whether client controls and menu items appear checked.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Control (see page 20551)	Provides access to the target of the action.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DisableIfNoHandler (see page 310)	Indicates whether client components should be disabled if no handler is found.
	Enabled (see page 310)	Indicates whether client controls and menu items are enabled.
	GroupIndex (see page 311)	Indicates whether the action acts like a radio button with other actions in the same action list.
	HelpContext (see page 311)	Indicates the help context ID for client controls and menu items.
	HelpKeyword (see page 311)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 312)	Indicates the mechanism for client controls and menu items to use when invoking help.
	Hint (see page 312)	Indicates the Help hint for client controls and menu items.
	ImageIndex (see page 313)	Indicates the ImageIndex property for client controls and menu items.
	Index (see page 296)	Specifies the index of the action in its action list or action manager.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	SecondaryShortCuts (see page 314)	Specifies the short cuts (in addition to ShortCut (see page 314)) for triggering clients.
	ShortCut (see page 314)	Specifies the ShortCut property for client menu items.

	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	Visible (see page 314)	Specifies the Visible property for client controls and menu items.

Published Events

	Name	Description
	OnExecute (see page 261)	Occurs when the client event that is linked to it fires.
	OnHint (see page 263)	Occurs when the mouse pauses over a client control or menu item.
	OnUpdate (see page 263)	Occurs when the application is idle or when the action list updates.

Published Properties

	Name	Description
	AutoCheck (see page 255)	Controls whether the Checked property toggles when the action executes.
	Caption (see page 255)	Represents the caption of client controls and menu items.
	Category (see page 296)	Specifies the category under which the action appears in its action list or action manager.
	Checked (see page 256)	Indicates whether client controls and menu items appear checked.
	Enabled (see page 257)	Indicates whether client controls and menu items are enabled.
	GroupIndex (see page 257)	Indicates whether the action acts like a radio button with other actions in the same action list.
	HelpContext (see page 258)	Indicates the help context ID for client controls and menu items.
	HelpKeyword (see page 258)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 259)	Indicates the mechanism for client controls and menu items to use when invoking help.
	Hint (see page 259)	Indicates the Help hint for client controls and menu items.
	ImageIndex (see page 259)	Indicates the ImageIndex property for client controls and menu items.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	SecondaryShortCuts (see page 260)	Specifies the short cuts (in addition to ShortCut) for triggering clients.
	ShortCut (see page 260)	Specifies the ShortCut property for client menu items.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Visible (see page 261)	Specifies the Visible property for client controls and menu items.

67.1.18.2 TRichEditBold Methods

The methods of the TRichEditBold class are listed here.

Public Methods

	Name	Description
	ExecuteTarget (see page 12022)	Toggles the fsBold style of the target rich edit control's text attributes.
	UpdateTarget (see page 12023)	Sets the Checked property to reflect whether the target control's text is bold.

67.1.18.2.1 TRichEditBold.ExecuteTarget Method

Toggles the fsBold style of the target rich edit control's text attributes.

Pascal

```
procedure ExecuteTarget(Target: TObject); override;
```

C++

```
virtual __fastcall ExecuteTarget(TObject * Target);
```

Description

Do not call the ExecuteTarget method. This method is called automatically when the action fires in response to a user action (for example, when the user selects a menu item or presses a tool button that is linked to this action).

Target is the currently active object when the action fires.

If the target rich edit control has a selection, ExecuteTarget toggles the fsBold style of the selected text attributes (SelAttributes property), adding the fsBold property if the selected text is not all bold and removing it if the selected text is entirely bold. Note that if the selected text contains both bold and non-bold text, this results in the text becoming entirely bold.

If the target rich edit control has no selection, ExecuteTarget toggles the default fsBold style of the control. This changes the bold attribute of all text that has not had a specific text attribute applied.

See Also

Style (see page 4992)

SelAttributes (see page 3887)

DefAttributes (see page 3877)

67.1.18.2.2 TRichEditBold.UpdateTarget Method

Sets the Checked property to reflect whether the target control's text is bold.

Pascal

```
procedure UpdateTarget(Target: TObject); override;
```

C++

```
virtual __fastcall UpdateTarget(TObject * Target);
```

Description

Do not call the UpdateTarget method. This method is called automatically when the application is idle so that actions can update themselves according to current conditions.

Target is the currently active object when the action fires.

UpdateTarget sets the Checked property to true if Target is a rich edit control whose selected text is bold, otherwise it sets Checked to false.

Style (see page 4992)

SelAttributes (see page 3887)

Checked (see page 308)

67.1.19 TRichEditBullets Class

TRichEditBullets toggles whether the current paragraph of a rich edit control is bulleted.

Class Hierarchy

Pascal

```
TRichEditBullets = class(TRichEditAction);
```

C++

```
class TRichEditBullets : public TRichEditAction;
```

File

ExtActns

Description

Add TRichEditBullets to an action list to let users control whether the current paragraphs in a rich edit control are bulleted. Controls (see page 5711) such as menu items and tool buttons linked to this action cause the application to toggle the bulleted attribute of all paragraphs that contain selected text (or the paragraph with the cursor if no text is selected).

TRichEditBullets is designed to work with a rich edit control (TCustomRichEdit descendant) as a target. It automatically disables itself if the active control in a form is not a rich edit control and adds or removes a check mark to indicate whether that control's paragraphs are bulleted.

TRichEditAlignRight (see page 12011)

TRichEditAlignLeft (see page 12005)

TRichEditAlignCenter (see page 11998)

TRichEditBold (see page 12017)

67.1.19.1 TRichEditBullets Members

The following tables list the members exposed by TRichEditBullets.

Protected Events

	Name	Description
	OnChange (see page 2716)	Occurs when one of the action's properties changes.

Protected Fields

	Name	Description
	FClients (see page 2711)	This is FClients, a member of class TBasicAction.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FImage (see page 302)	This is FImage, a member of class TCustomAction.
	FMask (see page 303)	This is FMask, a member of class TCustomAction.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 303)	Copies the properties of this action to a destination object.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	Change (see page 2712)	Generates an OnChange (see page 2716) event.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	CurrText (see page 11997)	This is CurrText, a member of class TRichEditAction.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.

	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetControl (see page 20549)	Returns the target of the edit action.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	HandleShortCut (see page 306)	Executes the action when the user types on of its short cuts.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Notification (see page 2713)	Responds when components are created or destroyed.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	Notification (see page 20550)	Responds when objects are added or removed.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 294)	This is ReadState, a member of class TContainedAction.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetFontStyle (see page 11998)	This is SetFontStyle, a member of class TRichEditAction.
	SetHelpContext (see page 306)	This is SetHelpContext, a member of class TCustomAction.
	SetHelpKeyword (see page 306)	This is SetHelpKeyword, a member of class TCustomAction.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 307)	Sets the value of the Name property.
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetOnExecute (see page 2714)	Assigns an OnExecute (see page 2716) event handler.
	SetParentComponent (see page 294)	This is SetParentComponent, a member of class TContainedAction.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	SavedEnabledState (see page 313)	Saves the value of the Enabled (see page 310) property when the action is suspended.

Public Events

	Name	Description
	OnExecute (see page 2716)	Occurs when the client event that is linked to it fires.
	OnHint (see page 315)	Occurs when the mouse pauses over a client control or menu item.
	OnUpdate (see page 2718)	Occurs when the application is idle or when the action list updates.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 254)	Creates and initializes a TAction (see page 249) object.
V	Create (see page 301)	Instantiates and initializes a TCustomAction (see page 297) object.
V	Create (see page 2710)	Instantiates and initializes a TBasicAction (see page 2707) object.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
V	Create (see page 11997)	Creates an instance of TRichEditAction (see page 11992).
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 292)	Destroys the instance of the contained action.
V	Destroy (see page 302)	Frees an instance of TCustomAction (see page 297).
V	Destroy (see page 2711)	Disposes of an instance of a TBasicAction (see page 2707) object.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 20549)	Frees an instance of TCustomAction.
V	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DoHint (see page 303)	Generates an OnHint (see page 315) event.
V	Execute (see page 293)	Responds when the client control "fires".
V	Execute (see page 304)	Responds when a client control "fires".
	Execute (see page 2712)	Generates an OnExecute (see page 2716) event.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
V	ExecuteTarget (see page 12029)	Introduces an interface for invoking an action on a target client component or control.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.

	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
V	GetParentComponent (see page 293)	Returns the action list or action manager that contains the action.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	HandlesTarget (see page 2713)	Introduces an interface for verifying that the type, and state, of a target component or control are appropriate for the action.
V	HandlesTarget (see page 11998)	Indicates whether the action can execute its function.
V	HandlesTarget (see page 20550)	Indicates whether the action can execute its function.
V	HasParent (see page 294)	Indicates whether the action is contained in an action list or action manager.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RegisterChanges (see page 2713)	Associates the action with an action link.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UnRegisterChanges (see page 2714)	Breaks the association between the action and the action link.
V	Update (see page 295)	Indicates whether the action updates itself.
V	Update (see page 2714)	Provides an opportunity to execute centralized code when an application is idle.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
V	UpdateTarget (see page 12029)	Configures the action, depending on current conditions.

Public Properties

	Name	Description
	ActionComponent (see page 2715)	Indicates the client component that caused this action to execute.
	ActionList (see page 295)	Indicates the action list or action manager that contains the action.
	AutoCheck (see page 308)	Controls (see page 5711) whether the Checked (see page 308) property toggles when the action executes.
	Caption (see page 308)	Represents the caption of client controls and menu items.
	Checked (see page 308)	Indicates whether client controls and menu items appear checked.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.

R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Control (see page 20551)	Provides access to the target of the action.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DisableIfNoHandler (see page 310)	Indicates whether client components should be disabled if no handler is found.
	Enabled (see page 310)	Indicates whether client controls and menu items are enabled.
	GroupIndex (see page 311)	Indicates whether the action acts like a radio button with other actions in the same action list.
	HelpContext (see page 311)	Indicates the help context ID for client controls and menu items.
	HelpKeyword (see page 311)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 312)	Indicates the mechanism for client controls and menu items to use when invoking help.
	Hint (see page 312)	Indicates the Help hint for client controls and menu items.
	ImageIndex (see page 313)	Indicates the ImageIndex property for client controls and menu items.
	Index (see page 296)	Specifies the index of the action in its action list or action manager.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	SecondaryShortCuts (see page 314)	Specifies the short cuts (in addition to ShortCut (see page 314)) for triggering clients.
	ShortCut (see page 314)	Specifies the ShortCut property for client menu items.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	Visible (see page 314)	Specifies the Visible property for client controls and menu items.

Published Events

	Name	Description
	OnExecute (see page 261)	Occurs when the client event that is linked to it fires.
	OnHint (see page 263)	Occurs when the mouse pauses over a client control or menu item.
	OnUpdate (see page 263)	Occurs when the application is idle or when the action list updates.

Published Properties

	Name	Description
	AutoCheck (see page 255)	Controls whether the Checked property toggles when the action executes.
	Caption (see page 255)	Represents the caption of client controls and menu items.
	Category (see page 296)	Specifies the category under which the action appears in its action list or action manager.
	Checked (see page 256)	Indicates whether client controls and menu items appear checked.
	Enabled (see page 257)	Indicates whether client controls and menu items are enabled.
	GroupIndex (see page 257)	Indicates whether the action acts like a radio button with other actions in the same action list.
	HelpContext (see page 258)	Indicates the help context ID for client controls and menu items.
	HelpKeyword (see page 258)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 259)	Indicates the mechanism for client controls and menu items to use when invoking help.
	Hint (see page 259)	Indicates the Help hint for client controls and menu items.
	ImageIndex (see page 259)	Indicates the ImageIndex property for client controls and menu items.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	SecondaryShortCuts (see page 260)	Specifies the short cuts (in addition to ShortCut) for triggering clients.
	ShortCut (see page 260)	Specifies the ShortCut property for client menu items.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Visible (see page 261)	Specifies the Visible property for client controls and menu items.

67.1.19.2 TRichEditBullets Methods

The methods of the TRichEditBullets class are listed here.

Public Methods

	Name	Description
	ExecuteTarget (see page 12029)	Introduces an interface for invoking an action on a target client component or control.
	UpdateTarget (see page 12029)	Configures the action, depending on current conditions.

67.1.19.2.1 TRichEditBullets.ExecuteTarget Method

Introduces an interface for invoking an action on a target client component or control.

Pascal

```
procedure ExecuteTarget(Target: TObject); override;
```

C++

```
virtual __fastcall ExecuteTarget(TObject * Target);
```

Description

ExecuteTarget does nothing in TBasicAction. ExecuteTarget was introduced in TBasicAction so that descendants can override it to initiate the action on the target. For example, an edit action that performs copying might copy the contents of an edit control to the clipboard.

See Also

OnExecute (see page 2716)

HandlesTarget (see page 2713)

67.1.19.2.2 TRichEditBullets.UpdateTarget Method

Configures the action, depending on current conditions.

Pascal

```
procedure UpdateTarget(Target: TObject); override;
```

C++

```
virtual __fastcall UpdateTarget(TObject * Target);
```

Description

Do not call the UpdateTarget method. This method is called automatically when the application is idle so that actions can update themselves according to current conditions.

In UpdateTarget, UpdateTarget sets Enabled to T true and sets the Checked property to T true if the current paragraph is bulleted or to F false if the current paragraph is not bulleted.

See Also

Enabled (see page 310)

Checked (see page 308)

67.1.20 TRichEditItalic Class

TRichEditItalic toggles the italic attribute of the currently selected text in a rich edit control.

Class Hierarchy

Pascal

```
TRichEditItalic = class(TRichEditAction);
```

C++

```
class TRichEditItalic : public TRichEditAction;
```

File

ExtActns

Description

Add TRichEditItalic to an action list to let users control whether the selected text in a rich edit control is italic. Controls (see page 5711) such as menu items and tool buttons linked to this action cause the application to toggle the italic attribute of selected text (or of all text if there is no text selected).

TRichEditItalic is designed to work with a rich edit control (TCustomRichEdit descendant) as a target. It automatically disables itself if the active control in a form is not a rich edit control, and adds or removes a check mark to reflect whether the target control's text is italic.

TRichEditAlignLeft (see page 12005)

TRichEditAlignCenter (see page 11998)

TRichEditStrikeout

67.1.20.1 TRichEditItalic Members

The following tables list the members exposed by TRichEditItalic.

Protected Events

	Name	Description
	OnChange (see page 2716)	Occurs when one of the action's properties changes.

Protected Fields

	Name	Description
	FClients (see page 2711)	This is FClients, a member of class TBasicAction.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FImage (see page 302)	This is FImage, a member of class TCustomAction.
	FMask (see page 303)	This is FMask, a member of class TCustomAction.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 303)	Copies the properties of this action to a destination object.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	Change (see page 2712)	Generates an OnChange (see page 2716) event.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	CurrText (see page 11997)	This is CurrText, a member of class TRichEditAction.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetControl (see page 20549)	Returns the target of the edit action.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
V	HandleShortCut (see page 306)	Executes the action when the user types on of its short cuts.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2713)	Responds when components are created or destroyed.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	Notification (see page 20550)	Responds when objects are added or removed.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 294)	This is ReadState, a member of class TContainedAction.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetFontStyle (see page 11998)	This is SetFontStyle, a member of class TRichEditAction.
V	SetHelpContext (see page 306)	This is SetHelpContext, a member of class TCustomAction.
V	SetHelpKeyword (see page 306)	This is SetHelpKeyword, a member of class TCustomAction.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 307)	Sets the value of the Name property.
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
V	SetOnExecute (see page 2714)	Assigns an OnExecute (see page 2716) event handler.
V	SetParentComponent (see page 294)	This is SetParentComponent, a member of class TContainedAction.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.

	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	SavedEnabledState (see page 313)	Saves the value of the Enabled (see page 310) property when the action is suspended.

Public Events

	Name	Description
	OnExecute (see page 2716)	Occurs when the client event that is linked to it fires.
	OnHint (see page 315)	Occurs when the mouse pauses over a client control or menu item.
	OnUpdate (see page 2718)	Occurs when the application is idle or when the action list updates.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 254)	Creates and initializes a TAction (see page 249) object.
V	Create (see page 301)	Instantiates and initializes a TCustomAction (see page 297) object.
V	Create (see page 2710)	Instantiates and initializes a TBasicAction (see page 2707) object.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
V	Create (see page 11997)	Creates an instance of TRichEditAction (see page 11992).
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 292)	Destroys the instance of the contained action.
V	Destroy (see page 302)	Frees an instance of TCustomAction (see page 297).
V	Destroy (see page 2711)	Disposes of an instance of a TBasicAction (see page 2707) object.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 20549)	Frees an instance of TCustomAction.
V	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DoHint (see page 303)	Generates an OnHint (see page 315) event.
V	Execute (see page 293)	Responds when the client control "fires".
V	Execute (see page 304)	Responds when a client control "fires".

	Execute (see page 2712)	Generates an OnExecute (see page 2716) event.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
V	ExecuteTarget (see page 12035)	Introduces an interface for invoking an action on a target client component or control.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
V	GetParentComponent (see page 293)	Returns the action list or action manager that contains the action.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	HandlesTarget (see page 2713)	Introduces an interface for verifying that the type, and state, of a target component or control are appropriate for the action.
V	HandlesTarget (see page 11998)	Indicates whether the action can execute its function.
V	HandlesTarget (see page 20550)	Indicates whether the action can execute its function.
V	HasParent (see page 294)	Indicates whether the action is contained in an action list or action manager.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RegisterChanges (see page 2713)	Associates the action with an action link.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UnRegisterChanges (see page 2714)	Breaks the association between the action and the action link.
V	Update (see page 295)	Indicates whether the action updates itself.
V	Update (see page 2714)	Provides an opportunity to execute centralized code when an application is idle.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
V	UpdateTarget (see page 12035)	Enables or disables the action, depending on the currently active control in the form.

Public Properties

	Name	Description
	ActionComponent (see page 2715)	Indicates the client component that caused this action to execute.
	ActionList (see page 295)	Indicates the action list or action manager that contains the action.
	AutoCheck (see page 308)	Controls (see page 5711) whether the Checked (see page 308) property toggles when the action executes.
	Caption (see page 308)	Represents the caption of client controls and menu items.
	Checked (see page 308)	Indicates whether client controls and menu items appear checked.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Control (see page 20551)	Provides access to the target of the action.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DisableIfNoHandler (see page 310)	Indicates whether client components should be disabled if no handler is found.
	Enabled (see page 310)	Indicates whether client controls and menu items are enabled.
	GroupIndex (see page 311)	Indicates whether the action acts like a radio button with other actions in the same action list.
	HelpContext (see page 311)	Indicates the help context ID for client controls and menu items.
	HelpKeyword (see page 311)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 312)	Indicates the mechanism for client controls and menu items to use when invoking help.
	Hint (see page 312)	Indicates the Help hint for client controls and menu items.
	ImageIndex (see page 313)	Indicates the ImageIndex property for client controls and menu items.
	Index (see page 296)	Specifies the index of the action in its action list or action manager.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	SecondaryShortCuts (see page 314)	Specifies the short cuts (in addition to ShortCut (see page 314)) for triggering clients.
	ShortCut (see page 314)	Specifies the ShortCut property for client menu items.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	Visible (see page 314)	Specifies the Visible property for client controls and menu items.

Published Events

	Name	Description
	OnExecute (see page 261)	Occurs when the client event that is linked to it fires.
	OnHint (see page 263)	Occurs when the mouse pauses over a client control or menu item.
	OnUpdate (see page 263)	Occurs when the application is idle or when the action list updates.

Published Properties

	Name	Description
	AutoCheck (see page 255)	Controls whether the Checked property toggles when the action executes.
	Caption (see page 255)	Represents the caption of client controls and menu items.
	Category (see page 296)	Specifies the category under which the action appears in its action list or action manager.
	Checked (see page 256)	Indicates whether client controls and menu items appear checked.
	Enabled (see page 257)	Indicates whether client controls and menu items are enabled.
	GroupIndex (see page 257)	Indicates whether the action acts like a radio button with other actions in the same action list.
	HelpContext (see page 258)	Indicates the help context ID for client controls and menu items.
	HelpKeyword (see page 258)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 259)	Indicates the mechanism for client controls and menu items to use when invoking help.

	Hint (see page 259)	Indicates the Help hint for client controls and menu items.
	ImageIndex (see page 259)	Indicates the ImageIndex property for client controls and menu items.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	SecondaryShortCuts (see page 260)	Specifies the short cuts (in addition to ShortCut) for triggering clients.
	ShortCut (see page 260)	Specifies the ShortCut property for client menu items.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Visible (see page 261)	Specifies the Visible property for client controls and menu items.

67.1.20.2 TRichEditItalic Methods

The methods of the TRichEditItalic class are listed here.

Public Methods

	Name	Description
	ExecuteTarget (see page 12035)	Introduces an interface for invoking an action on a target client component or control.
	UpdateTarget (see page 12035)	Enables or disables the action, depending on the currently active control in the form.

67.1.20.2.1 TRichEditItalic.ExecuteTarget Method

Introduces an interface for invoking an action on a target client component or control.

Pascal

```
procedure ExecuteTarget(Target: TObject); override;
```

C++

```
virtual __fastcall ExecuteTarget(TObject * Target);
```

Description

ExecuteTarget does nothing in TBasicAction. ExecuteTarget was introduced in TBasicAction so that descendants can override it to initiate the action on the target. For example, an edit action that performs copying might copy the contents of an edit control to the clipboard.

See Also

OnExecute (see page 2716)

HandlesTarget (see page 2713)

67.1.20.2.2 TRichEditItalic.UpdateTarget Method

Enables or disables the action, depending on the currently active control in the form.

Pascal

```
procedure UpdateTarget(Target: TObject); override;
```

C++

```
virtual __fastcall UpdateTarget(TObject * Target);
```

Description

Do not call the UpdateTarget method. This method is called automatically when the potential target changes so that actions can update themselves accordingly.

In TEditAction, UpdateTarget checks whether the current target object (specified by the Target parameter) is an edit control and,

if the action's function requires it, that some of its text is selected. If so, UpdateTarget sets Enabled to true. If not, UpdateTarget sets Enabled to false.

See Also

Enabled (see page 310)

67.1.21 TRichEditStrikeOut Class

TRichEditStrikeOut toggles the strikeout attribute of the currently selected text in a rich edit control.

Class Hierarchy

Pascal

```
TRichEditStrikeOut = class(TRichEditAction);
```

C++

```
class TRichEditStrikeOut : public TRichEditAction;
```

File

ExtActns

Description

Add TRichEditStrikeOut to an action list to let users control whether the selected text in a rich edit control has a line through it. Controls (see page 5711) such as menu items and tool buttons linked to this action cause the application to toggle the strikeout attribute of selected text (or of all text if there is no text selected).

TRichEditStrikeOut is designed to work with a rich edit control (TCustomRichEdit descendant) as a target. It automatically disables itself if the active control in a form is not a rich edit control and adds or removes a check mark to indicate whether the target control's text has the strike out attribute.

See Also

TCustomRichEdit (see page 3854)

TRichEditItalic (see page 12029)

TRichEditUnderline (see page 12042)

TRichEditBullets (see page 12023)

TRichEditAlignRight (see page 12011)

TRichEditAlignLeft (see page 12005)

TRichEditAlignCenter (see page 11998)

67.1.21.1 TRichEditStrikeOut Members

The following tables list the members exposed by TRichEditStrikeOut.

Protected Events

	Name	Description
	OnChange (see page 2716)	Occurs when one of the action's properties changes.

Protected Fields

	Name	Description
	FClients (see page 2711)	This is FClients, a member of class TBasicAction.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FImage (see page 302)	This is FImage, a member of class TCustomAction.
	FMask (see page 303)	This is FMask, a member of class TCustomAction.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 303)	Copies the properties of this action to a destination object.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	Change (see page 2712)	Generates an OnChange (see page 2716) event.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	CurrText (see page 11997)	This is CurrText, a member of class TRichEditAction.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetControl (see page 20549)	Returns the target of the edit action.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
V	HandleShortCut (see page 306)	Executes the action when the user types on of its short cuts.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2713)	Responds when components are created or destroyed.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	Notification (see page 20550)	Responds when objects are added or removed.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 294)	This is ReadState, a member of class TContainedAction.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetFontStyle (see page 11998)	This is SetFontStyle, a member of class TRichEditAction.
V	SetHelpContext (see page 306)	This is SetHelpContext, a member of class TCustomAction.
V	SetHelpKeyword (see page 306)	This is SetHelpKeyword, a member of class TCustomAction.

	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 307)	Sets the value of the Name property.
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
V	SetOnExecute (see page 2714)	Assigns an OnExecute (see page 2716) event handler.
V	SetParentComponent (see page 294)	This is SetParentComponent, a member of class TContainedAction.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	SavedEnabledState (see page 313)	Saves the value of the Enabled (see page 310) property when the action is suspended.

Public Events

	Name	Description
	OnExecute (see page 2716)	Occurs when the client event that is linked to it fires.
	OnHint (see page 315)	Occurs when the mouse pauses over a client control or menu item.
	OnUpdate (see page 2718)	Occurs when the application is idle or when the action list updates.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 254)	Creates and initializes a TAction (see page 249) object.
V	Create (see page 301)	Instantiates and initializes a TCustomAction (see page 297) object.
V	Create (see page 2710)	Instantiates and initializes a TBasicAction (see page 2707) object.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
V	Create (see page 11997)	Creates an instance of TRichEditAction (see page 11992).
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 292)	Destroys the instance of the contained action.
V	Destroy (see page 302)	Frees an instance of TCustomAction (see page 297).
V	Destroy (see page 2711)	Disposes of an instance of a TBasicAction (see page 2707) object.

	Destroy (see page 2766)	Disposes of the component and its owned components.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 20549)	Frees an instance of TCustomAction.
	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DoHint (see page 303)	Generates an OnHint (see page 315) event.
	Execute (see page 293)	Responds when the client control "fires".
	Execute (see page 304)	Responds when a client control "fires".
	Execute (see page 2712)	Generates an OnExecute (see page 2716) event.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	ExecuteTarget (see page 12041)	Toggles the fsStrikeOut style of the target rich edit control's text attributes.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 293)	Returns the action list or action manager that contains the action.
	GetParentComponent (see page 2778)	Returns the containing Component.
	HandlesTarget (see page 2713)	Introduces an interface for verifying that the type, and state, of a target component or control are appropriate for the action.
	HandlesTarget (see page 11998)	Indicates whether the action can execute its function.
	HandlesTarget (see page 20550)	Indicates whether the action can execute its function.
	HasParent (see page 294)	Indicates whether the action is contained in an action list or action manager.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RegisterChanges (see page 2713)	Associates the action with an action link.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.

V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UnRegisterChanges (see page 2714)	Breaks the association between the action and the action link.
V	Update (see page 295)	Indicates whether the action updates itself.
V	Update (see page 2714)	Provides an opportunity to execute centralized code when an application is idle.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
V	UpdateTarget (see page 12042)	Sets the Checked property to reflect whether the target control's text includes a strikeout line.

Public Properties

	Name	Description
	ActionComponent (see page 2715)	Indicates the client component that caused this action to execute.
	ActionList (see page 295)	Indicates the action list or action manager that contains the action.
	AutoCheck (see page 308)	Controls (see page 5711) whether the Checked (see page 308) property toggles when the action executes.
	Caption (see page 308)	Represents the caption of client controls and menu items.
	Checked (see page 308)	Indicates whether client controls and menu items appear checked.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Control (see page 20551)	Provides access to the target of the action.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DisableIfNoHandler (see page 310)	Indicates whether client components should be disabled if no handler is found.
	Enabled (see page 310)	Indicates whether client controls and menu items are enabled.
	GroupIndex (see page 311)	Indicates whether the action acts like a radio button with other actions in the same action list.
	HelpContext (see page 311)	Indicates the help context ID for client controls and menu items.
	HelpKeyword (see page 311)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 312)	Indicates the mechanism for client controls and menu items to use when invoking help.
	Hint (see page 312)	Indicates the Help hint for client controls and menu items.
	ImageIndex (see page 313)	Indicates the ImageIndex property for client controls and menu items.
	Index (see page 296)	Specifies the index of the action in its action list or action manager.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	SecondaryShortCuts (see page 314)	Specifies the short cuts (in addition to ShortCut (see page 314)) for triggering clients.
	ShortCut (see page 314)	Specifies the ShortCut property for client menu items.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	Visible (see page 314)	Specifies the Visible property for client controls and menu items.

Published Events

	Name	Description
	OnExecute (see page 261)	Occurs when the client event that is linked to it fires.
	OnHint (see page 263)	Occurs when the mouse pauses over a client control or menu item.
	OnUpdate (see page 263)	Occurs when the application is idle or when the action list updates.

Published Properties

	Name	Description
	AutoCheck (see page 255)	Controls whether the Checked property toggles when the action executes.
	Caption (see page 255)	Represents the caption of client controls and menu items.

	Category (see page 296)	Specifies the category under which the action appears in its action list or action manager.
	Checked (see page 256)	Indicates whether client controls and menu items appear checked.
	Enabled (see page 257)	Indicates whether client controls and menu items are enabled.
	GroupIndex (see page 257)	Indicates whether the action acts like a radio button with other actions in the same action list.
	HelpContext (see page 258)	Indicates the help context ID for client controls and menu items.
	HelpKeyword (see page 258)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 259)	Indicates the mechanism for client controls and menu items to use when invoking help.
	Hint (see page 259)	Indicates the Help hint for client controls and menu items.
	ImageIndex (see page 259)	Indicates the ImageIndex property for client controls and menu items.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	SecondaryShortCuts (see page 260)	Specifies the short cuts (in addition to ShortCut) for triggering clients.
	ShortCut (see page 260)	Specifies the ShortCut property for client menu items.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Visible (see page 261)	Specifies the Visible property for client controls and menu items.

67.1.21.2 TRichEditStrikeOut Methods

The methods of the TRichEditStrikeOut class are listed here.

Public Methods

	Name	Description
	ExecuteTarget (see page 12041)	Toggles the fsStrikeOut style of the target rich edit control's text attributes.
	UpdateTarget (see page 12042)	Sets the Checked property to reflect whether the target control's text includes a strikeout line.

67.1.21.2.1 TRichEditStrikeOut.ExecuteTarget Method

Toggles the fsStrikeOut style of the target rich edit control's text attributes.

Pascal

```
procedure ExecuteTarget(Target: TObject); override;
```

C++

```
virtual __fastcall ExecuteTarget(TObject * Target);
```

Description

Do not call the ExecuteTarget method. This method is called automatically when the action fires in response to a user action (for example, when the user selects a menu item or presses a tool button that is linked to this action).

Target is the currently active object when the action fires.

If the target rich edit control has a selection, ExecuteTarget toggles the fsStrikeOut style of the selected text attributes (SelAttributes property), adding the fsStrikeOut property if the selected text is not all struck out and removing it if the selected text is entirely struck out. Note that if the selected text contains both strikeout and non-strikeout text, this results in the text becoming entirely struck out.

If the target rich edit control has no selection, ExecuteTarget toggles the default fsStrikeOut style of the control. This changes the strikeout attribute of all text that has not had a specific text attribute applied.

See Also

Style (see page 4992)

SelAttributes (see page 3887)

DefAttributes (see page 3877)

67.1.21.2.2 TRichEditStrikeOut.UpdateTarget Method

Sets the Checked property to reflect whether the target control's text includes a strikeout line.

Pascal

```
procedure UpdateTarget(Target: TObject); override;
```

C++

```
virtual __fastcall UpdateTarget(TObject * Target);
```

Description

Do not call the UpdateTarget method. This method is called automatically when the application is idle so that actions can update themselves according to current conditions.

Target is the currently active object when the action fires.

UpdateTarget checks whether Target is a rich edit control with the strikeout font attribute on its selected text. If the selected text is struck out, UpdateTarget sets the Checked property to true, otherwise it sets Checked to false.

Style (see page 4992)

SelAttributes (see page 3887)

Checked (see page 308)

67.1.22 TRichEditUnderline Class

TRichEditUnderline toggles the underline attribute of the currently selected text in a rich edit control.

Class Hierarchy

Pascal

```
TRichEditUnderline = class(TRichEditAction);
```

C++

```
class TRichEditUnderline : public TRichEditAction;
```

File

ExtActns

Description

Add TRichEditUnderline to an action list to let users control whether the selected text in a rich edit control is underlined. Controls (see page 5711) such as menu items and tool buttons linked to this action cause the application to toggle the underline attribute of selected text (or of all text if there is no text selected).

TRichEditUnderline is designed to work with a rich edit control (TCustomRichEdit descendant) as a target. It automatically disables itself if the active control in a form is not a rich edit control, and adds or removes a check to indicate whether the target

control's text is underlined.

TCustomRichEdit (see page 3854)

TRichEditBold (see page 12017)

TRichEditUnderline

TRichEditStrikeOut (see page 12036)

TRichEditBullets (see page 12023)

TRichEditAlignRight (see page 12011)

TRichEditAlignLeft (see page 12005)

TRichEditAlignCenter (see page 11998)

TRichEditStrikeOut (see page 12036)

67.1.22.1 TRichEditUnderline Members

The following tables list the members exposed by TRichEditUnderline.

Protected Events

	Name	Description
	OnChange (see page 2716)	Occurs when one of the action's properties changes.

Protected Fields

	Name	Description
	FClients (see page 2711)	This is FClients, a member of class TBasicAction.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FImage (see page 302)	This is FImage, a member of class TCustomAction.
	FMask (see page 303)	This is FMask, a member of class TCustomAction.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 303)	Copies the properties of this action to a destination object.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	Change (see page 2712)	Generates an OnChange (see page 2716) event.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	CurrText (see page 11997)	This is CurrText, a member of class TRichEditAction.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetControl (see page 20549)	Returns the target of the edit action.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
V	GetOwner (see page 2778)	Returns the owner of a component.

	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	HandleShortCut (see page 306)	Executes the action when the user types on of its short cuts.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Notification (see page 2713)	Responds when components are created or destroyed.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	Notification (see page 20550)	Responds when objects are added or removed.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 294)	This is ReadState, a member of class TContainedAction.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetFontStyle (see page 11998)	This is SetFontStyle, a member of class TRichEditAction.
	SetHelpContext (see page 306)	This is SetHelpContext, a member of class TCustomAction.
	SetHelpKeyword (see page 306)	This is SetHelpKeyword, a member of class TCustomAction.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 307)	Sets the value of the Name property.
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetOnExecute (see page 2714)	Assigns an OnExecute (see page 2716) event handler.
	SetParentComponent (see page 294)	This is SetParentComponent, a member of class TContainedAction.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	SavedEnabledState (see page 313)	Saves the value of the Enabled (see page 310) property when the action is suspended.

Public Events

	Name	Description
	OnExecute (see page 2716)	Occurs when the client event that is linked to it fires.
	OnHint (see page 315)	Occurs when the mouse pauses over a client control or menu item.
	OnUpdate (see page 2718)	Occurs when the application is idle or when the action list updates.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.

	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 254)	Creates and initializes a TAction (see page 249) object.
	Create (see page 301)	Instantiates and initializes a TCustomAction (see page 297) object.
	Create (see page 2710)	Instantiates and initializes a TBasicAction (see page 2707) object.
	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 11997)	Creates an instance of TRichEditAction (see page 11992).
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 292)	Destroys the instance of the contained action.
	Destroy (see page 302)	Frees an instance of TCustomAction (see page 297).
	Destroy (see page 2711)	Disposes of an instance of a TBasicAction (see page 2707) object.
	Destroy (see page 2766)	Disposes of the component and its owned components.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 20549)	Frees an instance of TCustomAction.
	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DoHint (see page 303)	Generates an OnHint (see page 315) event.
	Execute (see page 293)	Responds when the client control "fires".
	Execute (see page 304)	Responds when a client control "fires".
	Execute (see page 2712)	Generates an OnExecute (see page 2716) event.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	ExecuteTarget (see page 12047)	Toggles the fsUnderline style of the target rich edit control's text attributes.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 293)	Returns the action list or action manager that contains the action.
	GetParentComponent (see page 2778)	Returns the containing Component.
	HandlesTarget (see page 2713)	Introduces an interface for verifying that the type, and state, of a target component or control are appropriate for the action.

V	HandlesTarget (see page 11998)	Indicates whether the action can execute its function.
V	HandlesTarget (see page 20550)	Indicates whether the action can execute its function.
V	HasParent (see page 294)	Indicates whether the action is contained in an action list or action manager.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RegisterChanges (see page 2713)	Associates the action with an action link.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UnRegisterChanges (see page 2714)	Breaks the association between the action and the action link.
V	Update (see page 295)	Indicates whether the action updates itself.
V	Update (see page 2714)	Provides an opportunity to execute centralized code when an application is idle.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
V	UpdateTarget (see page 12048)	Sets the Checked property to reflect whether the target control's text is underlined.

Public Properties

	Name	Description
	ActionComponent (see page 2715)	Indicates the client component that caused this action to execute.
	ActionList (see page 295)	Indicates the action list or action manager that contains the action.
	AutoCheck (see page 308)	Controls (see page 5711) whether the Checked (see page 308) property toggles when the action executes.
	Caption (see page 308)	Represents the caption of client controls and menu items.
	Checked (see page 308)	Indicates whether client controls and menu items appear checked.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Control (see page 20551)	Provides access to the target of the action.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DisableIfNoHandler (see page 310)	Indicates whether client components should be disabled if no handler is found.
	Enabled (see page 310)	Indicates whether client controls and menu items are enabled.
	GroupIndex (see page 311)	Indicates whether the action acts like a radio button with other actions in the same action list.
	HelpContext (see page 311)	Indicates the help context ID for client controls and menu items.
	HelpKeyword (see page 311)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 312)	Indicates the mechanism for client controls and menu items to use when invoking help.

	Hint (see page 312)	Indicates the Help hint for client controls and menu items.
	ImageIndex (see page 313)	Indicates the ImageIndex property for client controls and menu items.
	Index (see page 296)	Specifies the index of the action in its action list or action manager.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	SecondaryShortCuts (see page 314)	Specifies the short cuts (in addition to ShortCut (see page 314)) for triggering clients.
	ShortCut (see page 314)	Specifies the ShortCut property for client menu items.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	Visible (see page 314)	Specifies the Visible property for client controls and menu items.

Published Events

	Name	Description
	OnExecute (see page 261)	Occurs when the client event that is linked to it fires.
	OnHint (see page 263)	Occurs when the mouse pauses over a client control or menu item.
	OnUpdate (see page 263)	Occurs when the application is idle or when the action list updates.

Published Properties

	Name	Description
	AutoCheck (see page 255)	Controls whether the Checked property toggles when the action executes.
	Caption (see page 255)	Represents the caption of client controls and menu items.
	Category (see page 296)	Specifies the category under which the action appears in its action list or action manager.
	Checked (see page 256)	Indicates whether client controls and menu items appear checked.
	Enabled (see page 257)	Indicates whether client controls and menu items are enabled.
	GroupIndex (see page 257)	Indicates whether the action acts like a radio button with other actions in the same action list.
	HelpContext (see page 258)	Indicates the help context ID for client controls and menu items.
	HelpKeyword (see page 258)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 259)	Indicates the mechanism for client controls and menu items to use when invoking help.
	Hint (see page 259)	Indicates the Help hint for client controls and menu items.
	ImageIndex (see page 259)	Indicates the ImageIndex property for client controls and menu items.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	SecondaryShortCuts (see page 260)	Specifies the short cuts (in addition to ShortCut) for triggering clients.
	ShortCut (see page 260)	Specifies the ShortCut property for client menu items.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Visible (see page 261)	Specifies the Visible property for client controls and menu items.

67.1.22.2 TRichEditUnderline Methods

The methods of the TRichEditUnderline class are listed here.

Public Methods

	Name	Description
V	ExecuteTarget (see page 12047)	Toggles the fsUnderline style of the target rich edit control's text attributes.
V	UpdateTarget (see page 12048)	Sets the Checked property to reflect whether the target control's text is underlined.

67.1.22.2.1 TRichEditUnderline.ExecuteTarget Method

Toggles the fsUnderline style of the target rich edit control's text attributes.

Pascal

```
procedure ExecuteTarget(Target: TObject); override;
```

C++

```
virtual __fastcall ExecuteTarget(TObject * Target);
```

Description

Do not call the ExecuteTarget method. This method is called automatically when the action fires in response to a user action (for example, when the user selects a menu item or presses a tool button that is linked to this action).

Target is the currently active object when the action fires.

If the target rich edit control has a selection, ExecuteTarget toggles the fsUnderline style of the selected text attributes (SelAttributes property), adding the fsUnderline property if the selected text is not all underlined and removing it if the selected text is entirely underlined. Note that if the selected text contains both underlined and non-underlined text, this results in the text becoming entirely underlined.

If the target rich edit control has no selection, ExecuteTarget toggles the default fsUnderline style of the control. This changes the underlined attribute of all text that has not had a specific text attribute applied.

See Also

Style (see page 4992)

SelAttributes (see page 3887)

DefAttributes (see page 3877)

67.1.22.2.2 TRichEditUnderline.UpdateTarget Method

Sets the Checked property to reflect whether the target control's text is underlined.

Pascal

```
procedure UpdateTarget(Target: TObject); override;
```

C++

```
virtual __fastcall UpdateTarget(TObject * Target);
```

Description

Do not call the UpdateTarget method. This method is called automatically when the application is idle so that actions can update themselves according to current conditions.

Target is the currently active object when the action fires.

UpdateTarget checks the selected text of the target rich edit control (which is specified by the Control property or the Target parameter) is underlined. If the selected text is underlined, UpdateTarget sets the Checked property to true, otherwise it sets Checked to false.

Style (see page 4992)

SelAttributes (see page 3887)

Checked (see page 308)

67.1.23 TSavePicture Class

TSavePicture is the standard action for displaying the save picture dialog.

Class Hierarchy

Pascal

```
TSavePicture = class(TCommonDialogAction);
```

C++

```
class TSavePicture : public TCommonDialogAction;
```

File

ExtActns

Description

Add TSavePicture to an action list to add a graphics "save as" dialog to your application. Controls (see page 5711) such as menu items and tool buttons linked to this action cause the application to display the save picture dialog when invoked. Use the OnAccept (see page 12059) event to respond after the user selects a file name in the dialog or the OnCancel (see page 12059) event to respond when the user cancels from the dialog. In the event handler, you can read the file name from the dialog specified by the Dialog (see page 12054) property.

See Also

TFileSaveAs (see page 20654)

TSavePictureDialog (see page 13300)

TSavePicture

67.1.23.1 TSavePicture Members

The following tables list the members exposed by TSavePicture.

Protected Events

	Name	Description
	OnChange (see page 2716)	Occurs when one of the action's properties changes.

Protected Fields

	Name	Description
	FClients (see page 2711)	This is FClients, a member of class TBasicAction.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FDialog (see page 20539)	This is FDialog, a member of class TCommonDialogAction.
	FImage (see page 302)	This is FImage, a member of class TCustomAction.
	FMask (see page 303)	This is FMask, a member of class TCustomAction.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 303)	Copies the properties of this action to a destination object.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	Change (see page 2712)	Generates an OnChange (see page 2716) event.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.

	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	DoAccept (see page 20540)	This is DoAccept, a member of class TCommonDialogAction.
	DoCancel (see page 20540)	This is DoCancel, a member of class TCommonDialogAction.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetDialogClass (see page 12053)	This is GetDialogClass, a member of class TSavePicture.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	HandleShortCut (see page 306)	Executes the action when the user types on of its short cuts.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Notification (see page 2713)	Responds when components are created or destroyed.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	Notification (see page 20541)	Responds when components are created or destroyed.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 294)	This is ReadState, a member of class TContainedAction.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetHelpContext (see page 306)	This is SetHelpContext, a member of class TCustomAction.
	SetHelpKeyword (see page 306)	This is SetHelpKeyword, a member of class TCustomAction.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 307)	Sets the value of the Name property.
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetOnExecute (see page 2714)	Assigns an OnExecute (see page 2716) event handler.
	SetParentComponent (see page 294)	This is SetParentComponent, a member of class TContainedAction.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	SetupDialog (see page 20542)	This is SetupDialog, a member of class TCommonDialogAction.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	SavedEnabledState (see page 313)	Saves the value of the Enabled (see page 310) property when the action is suspended.

Public Events

	Name	Description
	BeforeExecute (see page 20543)	Occurs immediately before the dialog appears.
	OnExecute (see page 2716)	Occurs when the client event that is linked to it fires.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 301)	Instantiates and initializes a TCustomAction (see page 297) object.
V	Create (see page 2710)	Instantiates and initializes a TBasicAction (see page 2707) object.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
V	Create (see page 20538)	Creates an instance of TCommonDialogAction.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 292)	Destroys the instance of the contained action.
V	Destroy (see page 302)	Frees an instance of TCustomAction (see page 297).
V	Destroy (see page 2711)	Disposes of an instance of a TBasicAction (see page 2707) object.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 20538)	Frees an instance of TCustomAction.
V	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DoHint (see page 303)	Generates an OnHint (see page 315) event.
V	Execute (see page 293)	Responds when the client control "fires".
V	Execute (see page 304)	Responds when a client control "fires".
	Execute (see page 2712)	Generates an OnExecute (see page 2716) event.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
V	ExecuteTarget (see page 2712)	Introduces an interface for invoking an action on a target client component or control.
V	ExecuteTarget (see page 20540)	Executes the associated dialog and generates an OnAccept (see page 20543) or OnCancel (see page 20543) event.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.

V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
V	GetParentComponent (see page 293)	Returns the action list or action manager that contains the action.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	HandlesTarget (see page 2713)	Introduces an interface for verifying that the type, and state, of a target component or control are appropriate for the action.
V	HandlesTarget (see page 20541)	Indicates whether the action can execute its dialog.
V	HasParent (see page 294)	Indicates whether the action is contained in an action list or action manager.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RegisterChanges (see page 2713)	Associates the action with an action link.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UnRegisterChanges (see page 2714)	Breaks the association between the action and the action link.
V	Update (see page 295)	Indicates whether the action updates itself.
V	Update (see page 2714)	Provides an opportunity to execute centralized code when an application is idle.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
V	UpdateTarget (see page 2715)	Introduces an interface for a method of notifying a client when the action updates itself.

Public Properties

	Name	Description
	ActionComponent (see page 2715)	Indicates the client component that caused this action to execute.
	ActionList (see page 295)	Indicates the action list or action manager that contains the action.
	AutoCheck (see page 308)	Controls (see page 5711) whether the Checked (see page 308) property toggles when the action executes.
	Checked (see page 308)	Indicates whether client controls and menu items appear checked.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.

	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DisableIfNoHandler (see page 310)	Indicates whether client components should be disabled if no handler is found.
R	ExecuteResult (see page 20542)	Indicates the result of executing the associated dialog.
	GroupIndex (see page 311)	Indicates whether the action acts like a radio button with other actions in the same action list.
	Index (see page 296)	Specifies the index of the action in its action list or action manager.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Events

	Name	Description
	OnAccept (see page 12059)	This is OnAccept, a member of class TSavePicture.
	OnCancel (see page 12059)	This is OnCancel, a member of class TSavePicture.
	OnHint (see page 12059)	Occurs when the mouse pauses over a client control or menu item.
	OnUpdate (see page 12059)	Occurs when the application is idle or when the action list updates.

Published Properties

	Name	Description
	Caption (see page 12054)	Represents the caption of client controls and menu items.
	Category (see page 296)	Specifies the category under which the action appears in its action list or action manager.
R	Dialog (see page 12054)	Provides access the save picture dialog that the action executes.
	Enabled (see page 12055)	Indicates whether client controls and menu items are enabled.
	HelpContext (see page 12055)	Indicates the help context ID for client controls and menu items.
	HelpKeyword (see page 12056)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 12056)	Indicates the mechanism for client controls and menu items to use when invoking help.
	Hint (see page 12057)	Indicates the Help hint for client controls and menu items.
	ImageIndex (see page 12057)	Indicates the ImageIndex property for client controls and menu items.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	SecondaryShortCuts (see page 12057)	Specifies the short cuts (in addition to ShortCut) for triggering clients.
	ShortCut (see page 12058)	Specifies the ShortCut property for client menu items.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Visible (see page 12058)	Specifies the Visible property for client controls and menu items.

67.1.23.2 TSavePicture Methods

The methods of the TSavePicture class are listed here.

Protected Methods

	Name	Description
V	GetDialogClass (see page 12053)	This is GetDialogClass, a member of class TSavePicture.

67.1.23.2.1 TSavePicture.GetDialogClass Method

Pascal

```
function GetDialogClass: TCommonDialogClass; override;
```

C++

```
virtual __fastcall TCommonDialogClass GetDialogClass();
```

Description

This is GetDialogClass, a member of class TSavePicture.

67.1.23.3 TSavePicture Properties

The properties of the TSavePicture class are listed here.

Published Properties

	Name	Description
	Caption (see page 12054)	Represents the caption of client controls and menu items.
R	Dialog (see page 12054)	Provides access the save picture dialog that the action executes.
	Enabled (see page 12055)	Indicates whether client controls and menu items are enabled.
	HelpContext (see page 12055)	Indicates the help context ID for client controls and menu items.
	HelpKeyword (see page 12056)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 12056)	Indicates the mechanism for client controls and menu items to use when invoking help.
	Hint (see page 12057)	Indicates the Help hint for client controls and menu items.
	ImageIndex (see page 12057)	Indicates the ImageIndex property for client controls and menu items.
	SecondaryShortCuts (see page 12057)	Specifies the short cuts (in addition to ShortCut) for triggering clients.
	ShortCut (see page 12058)	Specifies the ShortCut property for client menu items.
	Visible (see page 12058)	Specifies the Visible property for client controls and menu items.

67.1.23.3.1 TSavePicture.Caption Property

Represents the caption of client controls and menu items.

Pascal

```
property Caption: string;
```

C++

```
__property AnsiString Caption;
```

Description

Caption holds the string that is the caption for the action when it is set. The value of Caption is propagated to client controls and menu items.

See Also

Caption (see page 5806)

Caption (see page 16136)

67.1.23.3.2 TSavePicture.Dialog Property

Provides access the save picture dialog that the action executes.

Pascal

```
property Dialog: TSavePictureDialog;
```

C++

```
__property TSavePictureDialog Dialog;
```

Description

Use Dialog to configure the graphics file "save as" dialog before the action fires or to read the specified file name after the action executes the dialog. For example, you can set the dialog's default extension or initial file name at design time using the Object Inspector or read the dialog's FileName property from an OnAccept (see page 12059) event handler to use the file name that the user selects.

When using a save picture action, you do not place a TSavePicture (see page 12048) Dialog component on the form or data module at design time. Instead, you add the TSavePicture (see page 12048) object to your action list and then use the Dialog property. The dialog component is created by the TSavePicture (see page 12048) constructor.

See Also

onaccept (see page 20543)

oncancel (see page 20543)

FileName (see page 11424)

67.1.23.3.3 TSavePicture.Enabled Property

Indicates whether client controls and menu items are enabled.

Pascal

```
property Enabled: Boolean;
```

C++

```
__property Boolean Enabled;
```

Description

Enabled specifies the enabled state for the action. The value of Enabled is propagated to client controls and menu items.

See Also

Enabled (see page 5821)

Enabled (see page 16145)

67.1.23.3.4 TSavePicture.HelpContext Property

Indicates the help context ID for client controls and menu items.

Pascal

```
property HelpContext: THelpContext;
```

C++

```
__property THelpContext HelpContext;
```

Description

HelpContext specifies the help context for the action when it is set. This value is propagated to client controls and menu items.

When a client control has focus and the user presses the F1 key, the control uses the value of HelpContext for this associated action to invoke the online help targeting a specific topic. The target topic is uniquely identified by a nonzero HelpContext value. Leave the HelpContext property of the client control at its default value of zero. This allows multiple controls (and multiple types of controls) to be associated with the same help topic through the one action object.

Note: HelpContext is only used when the HelpType property of this action or the client control is htInteger.

See Also

HelpType (see page 312)

HelpKeyword (see page 311)

67.1.23.3.5 TSavePicture.HelpKeyword Property

Indicates the help keyword for client controls and menu items.

Pascal

```
property HelpKeyword: string;
```

C++

```
__property AnsiString HelpKeyword;
```

Description

HelpKeyword, when set, specifies the keyword that identifies a help topic for this action. This value is propagated to the HelpKeyword property of client controls and menu items. The interpretation of HelpKeyword depends on which help system is used to display the topic. For example, when using HyperHelp (on Linux) or WinHelp (on Windows), HelpKeyword refers to an A link.

When a client control has focus and the user presses the F1 key (or the key specified by the application's HelpKey property), the control uses the value of HelpKeyword for this associated action object to invoke the online help targeting a specific topic. Leave the HelpKeyword property of the client control unassigned. This allows multiple controls (and multiple types of controls) to be associated with the same help topic through the one action object.

Note: HelpKeyword is only used when the HelpType property of this action or the client control is htKeyword.

See Also

HelpKeyword (see page 5826)

HelpContext (see page 311)

HelpType (see page 312)

HelpKey

67.1.23.3.6 TSavePicture.HelpType Property

Indicates the mechanism for client controls and menu items to use when invoking help.

Pascal

```
property HelpType: THelpType;
```

C++

```
__property THelpType HelpType;
```

Description

HelpType, when set, indicates whether client controls and menu items should use the HelpContext or the HelpKeyword property for invoking the help system. This value is propagated to the HelpType property of client controls and menu items.

See Also

HelpType (see page 5827)

HelpType

HelpContext (see page 311)

HelpKeyword (see page 311)

67.1.23.3.7 TSavePicture.Hint Property

Indicates the Help hint for client controls and menu items.

Pascal

```
property Hint: string;
```

C++

```
__property AnsiString Hint;
```

Description

Hint holds the string that is the hint for that action when it is set. This value is propagated to client controls and menu items.

See Also

Hint (see page 5827)

Hint (see page 16148)

67.1.23.3.8 TSavePicture.ImageIndex Property

Indicates the ImageIndex property for client controls and menu items.

Pascal

```
property ImageIndex: TImageIndex;
```

C++

```
__property TImageIndex ImageIndex;
```

Description

ImageIndex is an index into the Images property of the action list or action manager that contains the action. It identifies an image that is associated with controls and menu items that use this action.

See Also

ImageIndex (see page 5135)

ImageIndex (see page 16148)

Images (see page 325)

67.1.23.3.9 TSavePicture.SecondaryShortCuts Property

Specifies the short cuts (in addition to ShortCut) for triggering clients.

Pascal

```
property SecondaryShortCuts: TShortCutList;
```

C++

```
__property TShortCutList SecondaryShortCuts;
```

Description

Actions can execute in response to multiple short cut key combinations. SecondaryShortCuts lists all the short cut key

combinations (other than the one specified by the ShortCut property) that can trigger the action. This lets you specify shortcuts for clients that do not have a ShortCut property or provide additional, secondary shortcuts.

When the user types one of the key combinations listed in SecondaryShortCuts, the action's Execute method is called.

See Also

ShortCut (see page 314)

Execute (see page 304)

67.1.23.3.10 TSavePicture.ShortCut Property

Specifies the ShortCut property for client menu items.

Pascal

```
property ShortCut: TShortCut;
```

C++

```
__property TShortCut ShortCut;
```

Description

ShortCut holds the value that is the shortcut for the action when it is set. This value is propagated to client menu items.

See Also

ShortCut (see page 16152)

SecondaryShortCuts (see page 314)

67.1.23.3.11 TSavePicture.Visible Property

Specifies the Visible property for client controls and menu items.

Pascal

```
property Visible: Boolean;
```

C++

```
__property Boolean Visible;
```

Description

Visible specifies the visible state for the action. This value is propagated to client controls and menu items.

See Also

Visible (see page 16153)

Visible (see page 5847)

67.1.23.4 TSavePicture Events

The events of the TSavePicture class are listed here.

Published Events

	Name	Description
	OnAccept (see page 12059)	This is OnAccept, a member of class TSavePicture.
	OnCancel (see page 12059)	This is OnCancel, a member of class TSavePicture.

	OnHint (see page 12059)	Occurs when the mouse pauses over a client control or menu item.
	OnUpdate (see page 12059)	Occurs when the application is idle or when the action list updates.

67.1.23.4.1 TSavePicture.OnAccept Event

Pascal

```
property OnAccept: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnAccept;
```

Description

This is OnAccept, a member of class TSavePicture.

67.1.23.4.2 TSavePicture.OnCancel Event

Pascal

```
property OnCancel: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnCancel;
```

Description

This is OnCancel, a member of class TSavePicture.

67.1.23.4.3 TSavePicture.OnHint Event

Occurs when the mouse pauses over a client control or menu item.

Pascal

```
property OnHint: THintEvent;
```

C++

```
__property THintEvent OnHint;
```

Description

Use OnHint to override the default hint that appears when the user pauses the mouse over a client control or menu item. The OnHint event handler can change the hint that appears (by changing the HintStr parameter), or display the hint in some application-specific way.

67.1.23.4.4 TSavePicture.OnUpdate Event

Occurs when the application is idle or when the action list updates.

Pascal

```
property OnUpdate: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnUpdate;
```

Description

Write an OnUpdate event handler to execute centralized code while an application is idle. For example, actions may want to update enabling and disabling, or checking and unchecking of client targets.

C++ Examples:

```
/*
When the application is idle, the OnUpdate event occurs for
every action that is linked to a visible control or menu
item that is showing. This provides an opportunity for
applications to execute centralized code for enabling and
disabling, checking and unchecking, and so on. For example,
the following code illustrates the OnUpdate event handler
for an action that is "checked" when the toolbar is visible.
This example requires a TActionList (with one TAction) and a
TToolBar on a form. This example requires a TActionList
(with one TAction) and a TToolBar on a form.  Double click
on the TActionList and create an TAction named Action1.  The
TAction has an OnUpdate event handler called Action1Update.
Then set an object's (such as a button or menu item) Action
to Action1.
*/
void __fastcall TForm1::Action1Update(TObject *Sender)
{
   // Indicate whether ToolBar1 is currently visible.
   TAction* pa = dynamic_cast<TAction*>(Sender);
   if (pa)
   {
     if (pa->Checked != ToolBar1->Visible)
     {
       lbOther->Items->Add("Event Action1Update: toolbar visibility changed");
     }
     pa->Checked = ToolBar1->Visible;
   }
}
```

Delphi Examples:

```
{
When the application is idle, the OnUpdate event occurs for
every action that is linked to a visible control or menu
item that is showing. This provides an opportunity for
applications to execute centralized code for enabling and
disabling, checking and unchecking, and so on. For example,
the following code illustrates the OnUpdate event handler
for an action that is "checked" when the toolbar is visible.
This example requires a TActionList (with one TAction) and a
TToolBar on a form. This example requires a TActionList
(with one TAction) and a TToolBar on a form.  Double click
on the TActionList and create an TAction named Action1.  The
TAction has an OnUpdate event handler called Action1Update.
Then set an object's (such as a button or menu item) Action
to Action1.
}
procedure TMainForm.Action1Update(Sender: TObject);
begin
  if ((Sender as TAction).Checked <> ToolBar1.Visible) then
    lbOther.Items.Add('Event Action1Update: toolbar visibility changed');
    { Indicate whether ToolBar1 is currently visible }
    (Sender as TAction).Checked := ToolBar1.Visible;
end;
```

See Also

UpdateAction (see page 2790)

67.1.24 TSendMail Class

TSendMail is the standard action for sending an email message.

Class Hierarchy

Pascal

```
TSendMail = class(TCustomAction);
```

C++

```
class TSendMail : public TCustomAction;
```

File

ExtActns

Description

Add TSendMail to an action list to let your application send email messages in response to user actions. Controls (see page 5711) linked to this action cause the application to send a MAPI mail message containing the message specified in the Text (see page 12071) property.

See Also

TFileRun (see page 11872)

TSendMail

67.1.24.1 TSendMail Members

The following tables list the members exposed by TSendMail.

Protected Events

	Name	Description
	OnChange (see page 2716)	Occurs when one of the action's properties changes.

Protected Fields

	Name	Description
	FClients (see page 2711)	This is FClients, a member of class TBasicAction.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FImage (see page 302)	This is FImage, a member of class TCustomAction.
	FMask (see page 303)	This is FMask, a member of class TCustomAction.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 303)	Copies the properties of this action to a destination object.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	Change (see page 2712)	Generates an OnChange (see page 2716) event.

	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	HandleShortCut (see page 306)	Executes the action when the user types on of its short cuts.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Notification (see page 2713)	Responds when components are created or destroyed.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 294)	This is ReadState, a member of class TContainedAction.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetHelpContext (see page 306)	This is SetHelpContext, a member of class TCustomAction.
	SetHelpKeyword (see page 306)	This is SetHelpKeyword, a member of class TCustomAction.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 307)	Sets the value of the Name property.
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetOnExecute (see page 2714)	Assigns an OnExecute (see page 2716) event handler.
	SetParentComponent (see page 294)	This is SetParentComponent, a member of class TContainedAction.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	SavedEnabledState (see page 313)	Saves the value of the Enabled (see page 310) property when the action is suspended.

Public Events

	Name	Description
	OnExecute (see page 2716)	Occurs when the client event that is linked to it fires.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 301)	Instantiates and initializes a TCustomAction (see page 297) object.
V	Create (see page 2710)	Instantiates and initializes a TBasicAction (see page 2707) object.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 12065)	Frees the memory associated with the TSendMail (see page 12061) object.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DoHint (see page 303)	Generates an OnHint (see page 315) event.
V	Execute (see page 293)	Responds when the client control "fires".
V	Execute (see page 304)	Responds when a client control "fires".
	Execute (see page 2712)	Generates an OnExecute (see page 2716) event.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
V	ExecuteTarget (see page 12065)	Displays a dialog where the user can compose an email message and then sends the message.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
V	GetParentComponent (see page 293)	Returns the action list or action manager that contains the action.
	GetParentComponent (see page 2778)	Returns the containing Component.

V	HandlesTarget (see page 12066)	Indicates whether the action can execute.
V	HasParent (see page 294)	Indicates whether the action is contained in an action list or action manager.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RegisterChanges (see page 2713)	Associates the action with an action link.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UnRegisterChanges (see page 2714)	Breaks the association between the action and the action link.
V	Update (see page 295)	Indicates whether the action updates itself.
V	Update (see page 2714)	Provides an opportunity to execute centralized code when an application is idle.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
V	UpdateTarget (see page 12066)	Enables the action.

Public Properties

	Name	Description
	ActionComponent (see page 2715)	Indicates the client component that caused this action to execute.
	ActionList (see page 295)	Indicates the action list or action manager that contains the action.
	AutoCheck (see page 308)	Controls (see page 5711) whether the Checked (see page 308) property toggles when the action executes.
	Checked (see page 308)	Indicates whether client controls and menu items appear checked.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DisableIfNoHandler (see page 310)	Indicates whether client components should be disabled if no handler is found.
	GroupIndex (see page 311)	Indicates whether the action acts like a radio button with other actions in the same action list.
	Index (see page 296)	Specifies the index of the action in its action list or action manager.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Events

	Name	Description
	OnHint (see page 12071)	Occurs when the mouse pauses over a client control or menu item.

	OnUpdate (see page 12072)	Occurs when the application is idle or when the action list updates.

Published Properties

	Name	Description
	Caption (see page 12067)	Represents the caption of client controls and menu items.
	Category (see page 296)	Specifies the category under which the action appears in its action list or action manager.
	Enabled (see page 12067)	Indicates whether client controls and menu items are enabled.
	HelpContext (see page 12068)	Indicates the help context ID for client controls and menu items.
	HelpKeyword (see page 12068)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 12069)	Indicates the mechanism for client controls and menu items to use when invoking help.
	Hint (see page 12069)	Indicates the Help hint for client controls and menu items.
	ImageIndex (see page 12069)	Indicates the ImageIndex property for client controls and menu items.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	SecondaryShortCuts (see page 12070)	Specifies the short cuts (in addition to ShortCut) for triggering clients.
	ShortCut (see page 12070)	Specifies the ShortCut property for client menu items.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Text (see page 12071)	Specifies the content of the mail message.
	Visible (see page 12071)	Specifies the Visible property for client controls and menu items.

67.1.24.2 TSendMail.Destroy Destructor

Frees the memory associated with the TSendMail (see page 12061) object.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TSendMail();
```

Description

Do not explicitly destroy actions. Action objects are created and destroyed by the action manager or action list that uses them.

See Also

Free (see page 22300)

67.1.24.3 TSendMail Methods

The methods of the TSendMail class are listed here.

Public Methods

	Name	Description
	ExecuteTarget (see page 12065)	Displays a dialog where the user can compose an email message and then sends the message.
	HandlesTarget (see page 12066)	Indicates whether the action can execute.
	UpdateTarget (see page 12066)	Enables the action.

67.1.24.3.1 TSendMail.ExecuteTarget Method

Displays a dialog where the user can compose an email message and then sends the message.

Pascal

```
procedure ExecuteTarget(Target: TObject); override;
```

C++

```
virtual __fastcall ExecuteTarget(TObject * Target);
```

Description

Do not call the ExecuteTarget method. This method is called automatically when the action fires in response to a user action (for example, when the user selects a menu item or presses a tool button that is linked to this action).

Target is the currently active object when the action fires.

ExecuteTarget ignores the Target parameter, and displays a dialog where the user can compose an email message. The body of the message is initialized to the value of the Text (see page 12071) property. When the user exits the dialog, the message is sent.

ExecuteTarget always spawns a temporary MAPI session for every mail message, which lasts only for the duration of the message. If necessary, the user is prompted with a login dialog.

See Also

Text (see page 12071)

67.1.24.3.2 TSendMail.HandlesTarget Method

Indicates whether the action can execute.

Pascal

```
function HandlesTarget(Target: TObject): Boolean; override;
```

C++

```
virtual __fastcall Boolean HandlesTarget(TObject * Target);
```

Description

Do not call the HandlesTarget method. This method is called automatically when the user invokes an object (such as a tool button or menu item) that is linked to this action. The HandlesTarget method provides the action object with an opportunity to indicate whether it is appropriate to execute at this time with the object specified by the Target parameter as a "target".

HandlesTarget ignores the Target parameter and always returns true, because the ability to send mail is not dependant on the state of the application.

67.1.24.3.3 TSendMail.UpdateTarget Method

Enables the action.

Pascal

```
procedure UpdateTarget(Target: TObject); override;
```

C++

```
virtual __fastcall UpdateTarget(TObject * Target);
```

Description

Do not call the UpdateTarget method. This method is called automatically the application is idle so that actions can update themselves according to current conditions.

In TSendMail (see page 12061), UpdateTarget ignores the Target parameter and always sets the Enabled (see page

12067) property to true.

See Also

Enabled (see page 310)

67.1.24.4 TSendMail Properties

The properties of the TSendMail class are listed here.

Published Properties

	Name	Description
	Caption (see page 12067)	Represents the caption of client controls and menu items.
	Enabled (see page 12067)	Indicates whether client controls and menu items are enabled.
	HelpContext (see page 12068)	Indicates the help context ID for client controls and menu items.
	HelpKeyword (see page 12068)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 12069)	Indicates the mechanism for client controls and menu items to use when invoking help.
	Hint (see page 12069)	Indicates the Help hint for client controls and menu items.
	ImageIndex (see page 12069)	Indicates the ImageIndex property for client controls and menu items.
	SecondaryShortCuts (see page 12070)	Specifies the short cuts (in addition to ShortCut) for triggering clients.
	ShortCut (see page 12070)	Specifies the ShortCut property for client menu items.
	Text (see page 12071)	Specifies the content of the mail message.
	Visible (see page 12071)	Specifies the Visible property for client controls and menu items.

67.1.24.4.1 TSendMail.Caption Property

Represents the caption of client controls and menu items.

Pascal

```
property Caption: string;
```

C++

```
__property AnsiString Caption;
```

Description

Caption holds the string that is the caption for the action when it is set. The value of Caption is propagated to client controls and menu items.

See Also

Caption (see page 5806)

Caption (see page 16136)

67.1.24.4.2 TSendMail.Enabled Property

Indicates whether client controls and menu items are enabled.

Pascal

```
property Enabled: Boolean;
```

C++

```
__property Boolean Enabled;
```

Description

Enabled specifies the enabled state for the action. The value of Enabled is propagated to client controls and menu items.

See Also

Enabled (see page 5821)

Enabled (see page 16145)

67.1.24.4.3 TSendMail.HelpContext Property

Indicates the help context ID for client controls and menu items.

Pascal

```
property HelpContext: THelpContext;
```

C++

```
__property THelpContext HelpContext;
```

Description

HelpContext specifies the help context for the action when it is set. This value is propagated to client controls and menu items.

When a client control has focus and the user presses the F1 key, the control uses the value of HelpContext for this associated action to invoke the online help targeting a specific topic. The target topic is uniquely identified by a nonzero HelpContext value. Leave the HelpContext property of the client control at its default value of zero. This allows multiple controls (and multiple types of controls) to be associated with the same help topic through the one action object.

Note: HelpContext is only used when the HelpType property of this action or the client control is htInteger.

See Also

HelpType (see page 312)

HelpKeyword (see page 311)

67.1.24.4.4 TSendMail.HelpKeyword Property

Indicates the help keyword for client controls and menu items.

Pascal

```
property HelpKeyword: string;
```

C++

```
__property AnsiString HelpKeyword;
```

Description

HelpKeyword, when set, specifies the keyword that identifies a help topic for this action. This value is propagated to the HelpKeyword property of client controls and menu items. The interpretation of HelpKeyword depends on which help system is used to display the topic. For example, when using HyperHelp (on Linux) or WinHelp (on Windows), HelpKeyword refers to an A link.

When a client control has focus and the user presses the F1 key (or the key specified by the application's HelpKey property), the control uses the value of HelpKeyword for this associated action object to invoke the online help targeting a specific topic. Leave the HelpKeyword property of the client control unassigned. This allows multiple controls (and multiple types of controls) to be associated with the same help topic through the one action object.

Note: HelpKeyword is only used when the HelpType property of this action or the client control is htKeyword.

See Also

HelpKeyword (see page 5826)

HelpContext (see page 311)

HelpType (see page 312)

HelpKey

67.1.24.4.5 TSendMail.HelpType Property

Indicates the mechanism for client controls and menu items to use when invoking help.

Pascal

```
property HelpType: THelpType;
```

C++

```
__property THelpType HelpType;
```

Description

HelpType, when set, indicates whether client controls and menu items should use the HelpContext or the HelpKeyword property for invoking the help system. This value is propagated to the HelpType property of client controls and menu items.

See Also

HelpType (see page 5827)

HelpType

HelpContext (see page 311)

HelpKeyword (see page 311)

67.1.24.4.6 TSendMail.Hint Property

Indicates the Help hint for client controls and menu items.

Pascal

```
property Hint: string;
```

C++

```
__property AnsiString Hint;
```

Description

Hint holds the string that is the hint for that action when it is set. This value is propagated to client controls and menu items.

See Also

Hint (see page 5827)

Hint (see page 16148)

67.1.24.4.7 TSendMail.ImageIndex Property

Indicates the ImageIndex property for client controls and menu items.

Pascal

```
property ImageIndex: TImageIndex;
```

C++

```
__property TImageIndex ImageIndex;
```

Description

ImageIndex is an index into the Images property of the action list or action manager that contains the action. It identifies an image that is associated with controls and menu items that use this action.

See Also

ImageIndex (see page 5135)

ImageIndex (see page 16148)

Images (see page 325)

67.1.24.4.8 TSendMail.SecondaryShortCuts Property

Specifies the short cuts (in addition to ShortCut) for triggering clients.

Pascal

```
property SecondaryShortCuts: TShortCutList;
```

C++

```
__property TShortCutList SecondaryShortCuts;
```

Description

Actions can execute in response to multiple short cut key combinations. SecondaryShortCuts lists all the short cut key combinations (other than the one specified by the ShortCut property) that can trigger the action. This lets you specify shortcuts for clients that do not have a ShortCut property or provide additional, secondary shortcuts.

When the user types one of the key combinations listed in SecondaryShortCuts, the action's Execute method is called.

See Also

ShortCut (see page 314)

Execute (see page 304)

67.1.24.4.9 TSendMail.ShortCut Property

Specifies the ShortCut property for client menu items.

Pascal

```
property ShortCut: TShortCut;
```

C++

```
__property TShortCut ShortCut;
```

Description

ShortCut holds the value that is the shortcut for the action when it is set. This value is propagated to client menu items.

See Also

ShortCut (see page 16152)

SecondaryShortCuts (see page 314)

67.1.24.4.10 TSendMail.Text Property

Specifies the content of the mail message.

Pascal

```
property Text: TStrings;
```

C++

```
__property TStrings Text;
```

Description

Set Text to the content of the mail message. Because Text is a TStrings object, you can use the string list editor at design time to compose the message. Use the TStrings object's LoadFromFile method to load the value of Text from a file.

When the action executes, TSendMail (see page 12061) displays a dialog for the user to compose the mail message. In that dialog, the body of the message is initialized to Text.

See Also

ExecuteTarget (see page 12065)

LoadFromFile (see page 3061)

67.1.24.4.11 TSendMail.Visible Property

Specifies the Visible property for client controls and menu items.

Pascal

```
property Visible: Boolean;
```

C++

```
__property Boolean Visible;
```

Description

Visible specifies the visible state for the action. This value is propagated to client controls and menu items.

See Also

Visible (see page 16153)

Visible (see page 5847)

67.1.24.5 TSendMail Events

The events of the TSendMail class are listed here.

Published Events

	Name	Description
	OnHint (see page 12071)	Occurs when the mouse pauses over a client control or menu item.
	OnUpdate (see page 12072)	Occurs when the application is idle or when the action list updates.

67.1.24.5.1 TSendMail.OnHint Event

Occurs when the mouse pauses over a client control or menu item.

Pascal

```
property OnHint: THintEvent;
```

C++

```
__property THintEvent OnHint;
```

Description

Use OnHint to override the default hint that appears when the user pauses the mouse over a client control or menu item. The OnHint event handler can change the hint that appears (by changing the HintStr parameter), or display the hint in some application-specific way.

67.1.24.5.2 TSendMail.OnUpdate Event

Occurs when the application is idle or when the action list updates.

Pascal

```
property OnUpdate: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnUpdate;
```

Description

Write an OnUpdate event handler to execute centralized code while an application is idle. For example, actions may want to update enabling and disabling, or checking and unchecking of client targets.

C++ Examples:

```
/*
When the application is idle, the OnUpdate event occurs for
every action that is linked to a visible control or menu
item that is showing. This provides an opportunity for
applications to execute centralized code for enabling and
disabling, checking and unchecking, and so on. For example,
the following code illustrates the OnUpdate event handler
for an action that is "checked" when the toolbar is visible.
This example requires a TActionList (with one TAction) and a
TToolBar on a form. This example requires a TActionList
(with one TAction) and a TToolBar on a form.  Double click
on the TActionList and create an TAction named Action1.  The
TAction has an OnUpdate event handler called Action1Update.
Then set an object's (such as a button or menu item) Action
to Action1.
*/
void __fastcall TForm1::Action1Update(TObject *Sender)
{
   // Indicate whether ToolBar1 is currently visible.
   TAction* pa = dynamic_cast<TAction*>(Sender);
   if (pa)
   {
     if (pa->Checked != ToolBar1->Visible)
     {
       lbOther->Items->Add("Event Action1Update: toolbar visibility changed");
     }
     pa->Checked = ToolBar1->Visible;
   }
}
```

Delphi Examples:

```
{
When the application is idle, the OnUpdate event occurs for
```

```
every action that is linked to a visible control or menu
item that is showing. This provides an opportunity for
applications to execute centralized code for enabling and
disabling, checking and unchecking, and so on. For example,
the following code illustrates the OnUpdate event handler
for an action that is "checked" when the toolbar is visible.
This example requires a TActionList (with one TAction) and a
TToolBar on a form. This example requires a TActionList
(with one TAction) and a TToolBar on a form.  Double click
on the TActionList and create an TAction named Action1.  The
TAction has an OnUpdate event handler called Action1Update.
Then set an object's (such as a button or menu item) Action
to Action1.
}
procedure TMainForm.Action1Update(Sender: TObject);
begin
  if ((Sender as TAction).Checked <> ToolBar1.Visible) then
    lbOther.Items.Add('Event Action1Update: toolbar visibility changed');
    { Indicate whether ToolBar1 is currently visible }
    (Sender as TAction).Checked := ToolBar1.Visible;
end;
```

See Also

UpdateAction (see page 2790)

67.1.25 TTabAction Class

TTabAction is the base class for action objects designed to respond to the buttons in a tabbed dialog.

Class Hierarchy

Pascal

```
TTabAction = class(TCustomAction);
```

C++

```
class TTabAction : public TCustomAction;
```

File

ExtActns

Description

TTabAction implements the common behavior for actions that operate on tabbed controls (TCustomTabControl descendants). Each descendant class is designed to perform a specific function in a tabbed dialog such as a wizard. Do not use TTabAction directly in an application. Instead, use a TTabAction descendant such as TNextTab (see page 11949) or TPreviousTab (see page 11977).

TTabAction introduces the TabControl (see page 12080) property, which specifies the page control or tab control on which this action operates. It ensures that the action is only enabled when the TabControl (see page 12080) property is assigned to an enabled TPageControl or TTabControl object.

See Also

TPreviousTab (see page 11977)

TNextTab (see page 11949)

TPageControl (see page 4459)

TCustomTabControl (see page 3921)

TTabControl (see page 4841)

67.1.25.1 TTabAction Members

The following tables list the members exposed by TTabAction.

Protected Events

	Name	Description
	OnChange (see page 2716)	Occurs when one of the action's properties changes.

Protected Fields

	Name	Description
	FClients (see page 2711)	This is FClients, a member of class TBasicAction.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FImage (see page 302)	This is FImage, a member of class TCustomAction.
	FMask (see page 303)	This is FMask, a member of class TCustomAction.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 303)	Copies the properties of this action to a destination object.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	Change (see page 2712)	Generates an OnChange (see page 2716) event.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
V	HandleShortCut (see page 306)	Executes the action when the user types on of its short cuts.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 12079)	Responds when components are created or destroyed.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 294)	This is ReadState, a member of class TContainedAction.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SelectNextTab (see page 12079)	This is SelectNextTab, a member of class TTabAction.

	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
V	SetHelpContext (see page 306)	This is SetHelpContext, a member of class TCustomAction.
V	SetHelpKeyword (see page 306)	This is SetHelpKeyword, a member of class TCustomAction.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 307)	Sets the value of the Name property.
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
V	SetOnExecute (see page 2714)	Assigns an OnExecute (see page 2716) event handler.
V	SetParentComponent (see page 294)	This is SetParentComponent, a member of class TContainedAction.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	SavedEnabledState (see page 313)	Saves the value of the Enabled (see page 310) property when the action is suspended.

Public Events

	Name	Description
	AfterTabChange (see page 12082)	Occurs immediately after the action changes the page of the associated tab control.
	BeforeTabChange (see page 12082)	Occurs immediately before the action changes the page of the associated tab control.
	OnExecute (see page 2716)	Occurs when the client event that is linked to it fires.
	OnHint (see page 315)	Occurs when the mouse pauses over a client control or menu item.
	OnUpdate (see page 2718)	Occurs when the application is idle or when the action list updates.
	OnValidateTab (see page 12083)	Occurs when the application is idle or when the action list updates.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.

	Create (see page 12078)	Creates an instance of TTabAction (see page 12073).
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 292)	Destroys the instance of the contained action.
	Destroy (see page 302)	Frees an instance of TCustomAction (see page 297).
	Destroy (see page 2711)	Disposes of an instance of a TBasicAction (see page 2707) object.
	Destroy (see page 2766)	Disposes of the component and its owned components.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DoHint (see page 303)	Generates an OnHint (see page 315) event.
	Execute (see page 293)	Responds when the client control "fires".
	Execute (see page 304)	Responds when a client control "fires".
	Execute (see page 2712)	Generates an OnExecute (see page 2716) event.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	ExecuteTarget (see page 2712)	Introduces an interface for invoking an action on a target client component or control.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 293)	Returns the action list or action manager that contains the action.
	GetParentComponent (see page 2778)	Returns the containing Component.
	HandlesTarget (see page 12078)	Indicates whether the action can execute its function.
	HasParent (see page 294)	Indicates whether the action is contained in an action list or action manager.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RegisterChanges (see page 2713)	Associates the action with an action link.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.

	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UnRegisterChanges (see page 2714)	Breaks the association between the action and the action link.
V	Update (see page 295)	Indicates whether the action updates itself.
V	Update (see page 2714)	Provides an opportunity to execute centralized code when an application is idle.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
V	UpdateTarget (see page 12079)	Enables or disables the action, depending on the target tab control.

Public Properties

	Name	Description
	ActionComponent (see page 2715)	Indicates the client component that caused this action to execute.
	ActionList (see page 295)	Indicates the action list or action manager that contains the action.
	AutoCheck (see page 308)	Controls (see page 5711) whether the Checked (see page 308) property toggles when the action executes.
	Caption (see page 308)	Represents the caption of client controls and menu items.
	Checked (see page 308)	Indicates whether client controls and menu items appear checked.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DisableIfNoHandler (see page 310)	Indicates whether client components should be disabled if no handler is found.
	Enabled (see page 310)	Indicates whether client controls and menu items are enabled.
	GroupIndex (see page 311)	Indicates whether the action acts like a radio button with other actions in the same action list.
	HelpContext (see page 311)	Indicates the help context ID for client controls and menu items.
	HelpKeyword (see page 311)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 312)	Indicates the mechanism for client controls and menu items to use when invoking help.
	Hint (see page 312)	Indicates the Help hint for client controls and menu items.
	ImageIndex (see page 313)	Indicates the ImageIndex property for client controls and menu items.
	Index (see page 296)	Specifies the index of the action in its action list or action manager.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	SecondaryShortCuts (see page 314)	Specifies the short cuts (in addition to ShortCut (see page 314)) for triggering clients.
	ShortCut (see page 314)	Specifies the ShortCut property for client menu items.
	SkipHiddenTabs (see page 12080)	Indicates whether the tab action should consider hidden tabbed pages when moving to the next page.
	TabControl (see page 12080)	Specifies the target of the action.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	Visible (see page 314)	Specifies the Visible property for client controls and menu items.
	Wrap (see page 12081)	Indicates whether the tab action should "wrap" when navigating to the next tab page.

Published Properties

	Name	Description
	Category (see page 296)	Specifies the category under which the action appears in its action list or action manager.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

67.1.25.2 TTabAction.Create Constructor

Creates an instance of TTabAction (see page 12073).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TTabAction(TComponent * AOwner);
```

Description

Do not call the TTabAction (see page 12073) constructor. Actions are added at design time to an action list or action manager.

AOwner specifies the Owner for the action. This is the component that is responsible for freeing the TTabAction (see page 12073) instance.

See Also

Owner (see page 2807)

67.1.25.3 TTabAction Methods

The methods of the TTabAction class are listed here.

Protected Methods

	Name	Description
	Notification (see page 12079)	Responds when components are created or destroyed.
	SelectNextTab (see page 12079)	This is SelectNextTab, a member of class TTabAction.

Public Methods

	Name	Description
	HandlesTarget (see page 12078)	Indicates whether the action can execute its function.
	UpdateTarget (see page 12079)	Enables or disables the action, depending on the target tab control.

67.1.25.3.1 TTabAction.HandlesTarget Method

Indicates whether the action can execute its function.

Pascal

```
function HandlesTarget(Target: TObject): Boolean; override;
```

C++

```
virtual __fastcall Boolean HandlesTarget(TObject * Target);
```

Description

Do not call the HandlesTarget method. This method is called automatically when the user invokes an object (such as a tool button or menu item) that is linked to this action. The HandlesTarget method provides an action object with an opportunity to indicate whether it is appropriate to execute at this time with the object specified by the Target parameter as a "target".

Target is the currently active object.

In TTabAction (see page 12073), HandlesTarget ignores the Target parameter, and checks, instead, whether the TabControl (see page 12080) property has been set. If a target tab control has been assigned to the TabControl (see page 12080) property, HandlesTarget returns true. Otherwise, it returns false.

See Also

ExecuteTarget (see page 2712)

TabControl (see page 12080)

67.1.25.3.2 TTabAction.Notification Method

Responds when components are created or destroyed.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

Do not call the Notification method in an application. Notification is called automatically when the component specified by AComponent is about to be inserted or removed, as specified by Operation.

TBasicAction overrides the Notification method to check whether the component that is the value of the ActionComponent property is about to be freed. If so, it sets the ActionComponent property to nil (Delphi) or NULL (C++).

See Also

ActionComponent (see page 2715)

67.1.25.3.3 TTabAction.SelectNextTab Method

Pascal

```
procedure SelectNextTab(GoForward: Boolean = True);
```

C++

```
__fastcall SelectNextTab(Boolean GoForward = True);
```

Description

This is SelectNextTab, a member of class TTabAction.

67.1.25.3.4 TTabAction.UpdateTarget Method

Enables or disables the action, depending on the target tab control.

Pascal

```
procedure UpdateTarget(Target: TObject); override;
```

C++

```
virtual __fastcall UpdateTarget(TObject * Target);
```

Description

Do not call the UpdateTarget method. This method is called automatically when the application is idle so that actions can update themselves according to the current conditions.

Target is the potential target object identified by the application.

In TTabAction (see page 12073), UpdateTarget ignores the Target parameter and checks, instead, whether the TabControl (see page 12080) property is set. If TabControl (see page 12080) identifies an enabled page control or tab control that has

more than one page, UpdateTarget sets the Enabled property to true. If not, it sets Enabled to false.

After setting the Enabled property, UpdateTarget generates an OnValidateTab (see page 12083) event, where application-specific code can further determine whether the action should be enabled.

See Also

Enabled (see page 310)

TabControl (see page 12080)

Enabled (see page 5821)

OnValidateTab (see page 12083)

67.1.25.4 TTabAction Properties

The properties of the TTabAction class are listed here.

Public Properties

	Name	Description
	SkipHiddenTabs (see page 12080)	Indicates whether the tab action should consider hidden tabbed pages when moving to the next page.
	TabControl (see page 12080)	Specifies the target of the action.
	Wrap (see page 12081)	Indicates whether the tab action should "wrap" when navigating to the next tab page.

67.1.25.4.1 TTabAction.SkipHiddenTabs Property

Indicates whether the tab action should consider hidden tabbed pages when moving to the next page.

Pascal

```
property SkipHiddenTabs: Boolean;
```

C++

```
__property Boolean SkipHiddenTabs;
```

Description

Set SkipHiddenTabs to true if you do not want the action to move to a tab page if its TabVisible property is false. Set SkipHiddenTabs to false if the tab action can move to and make visible a hidden page.

Note: SkipHiddenTabs only has an effect when the TabControl (see page 12080) property identifies a TPageControl object. (TTabControl does not support hidden pages).

See Also

ExecuteTarget (see page 11954)

ExecuteTarget (see page 11982)

TabVisible (see page 4956)

TPageControl (see page 4459)

67.1.25.4.2 TTabAction.TabControl Property

Specifies the target of the action.

Pascal

```
property TabControl: TCustomTabControl;
```

C++

```
__property TCustomTabControl TabControl;
```

Description

Set TabControl to the control on which the action operates when its ExecuteTarget method is called. Typically, this is a page control or tab control object that implements the pages of a tabbed dialog.

An application must explicitly assign a value to the TabControl property before the TTabAction (see page 12073) descendant is enabled. The action does not infer the target page control when it fires.

See Also

ExecuteTarget (see page 11954)

ExecuteTarget (see page 11982)

67.1.25.4.3 TTabAction.Wrap Property

Indicates whether the tab action should "wrap" when navigating to the next tab page.

Pascal

```
property Wrap: Boolean;
```

C++

```
__property Boolean Wrap;
```

Description

When Wrap is true, the tab action can move previous to the first tabbed page or after the last tabbed page in the associated control. When Wrap is false, an attempt to move beyond the first or last page does not result in any page change, although it still results in a BeforeTabChange (see page 12082) and an AfterTabChange (see page 12082) event or in an OnFinish event.

See Also

ExecuteTarget (see page 11954)

ExecuteTarget (see page 11982)

TabControl (see page 12080)

BeforeTabChange (see page 12082)

AfterTabChange (see page 12082)

OnFinish (see page 11962)

67.1.25.5 TTabAction Events

The events of the TTabAction class are listed here.

Public Events

	Name	Description
	AfterTabChange (see page 12082)	Occurs immediately after the action changes the page of the associated tab control.
	BeforeTabChange (see page 12082)	Occurs immediately before the action changes the page of the associated tab control.

	OnValidateTab (see page 12083)	Occurs when the application is idle or when the action list updates.

67.1.25.5.1 TTabAction.AfterTabChange Event

Occurs immediately after the action changes the page of the associated tab control.

Pascal

```
property AfterTabChange: TNotifyEvent;
```

C++

```
__property TNotifyEvent AfterTabChange;
```

Description

Write an AfterTabChange event handler to perform any additional tasks after the tab action changes the current page of the associated tab control. Typically, this event is used to initialize the current page of the tab control.

Note: AfterTabChange only occurs if the action tries to change the page of the tab control (even if it is not successful). If the action attempts some other task (for example, when TNextPage is on the last page of the tab control), AfterTabChange does not occur.

See Also

BeforeTabChange (see page 12082)

TabControl (see page 12080)

Wrap (see page 12081)

67.1.25.5.2 TTabAction.BeforeTabChange Event

Occurs immediately before the action changes the page of the associated tab control.

Pascal

```
property BeforeTabChange: TNotifyEvent;
```

C++

```
__property TNotifyEvent BeforeTabChange;
```

Description

Write a BeforeTabChange event handler to perform any additional tasks before the tab action changes the current page of the associated tab control. Typically, this event is used to save or respond to the changes the user made on the current page before it changes.

Note: BeforeTabChange only occurs if the action tries to change the page of the tab control (even if it is not successful). If the action attempts some other task (for example, when TNextPage is on the last page of the tab control), BeforeTabChange does not occur.

See Also

AfterTabChange (see page 12082)

TabControl (see page 12080)

Wrap (see page 12081)

67.1.25.5.3 TTabAction.OnValidateTab Event

Occurs when the application is idle or when the action list updates.

Pascal

```
property OnValidateTab: TValidateTabEvent;
```

C++

```
__property TValidateTabEvent OnValidateTab;
```

Description

Use the OnValidateTab event rather than the OnUpdate event to update the properties of a tab action when the application is idle. Unlike the OnUpdate event, which prevents the default behavior of the UpdateTarget (see page 12079) method, OnValidateTab occurs after UpdateTarget (see page 12079) has set the Enabled property to reflect whether the target tab control is enabled.

OnValidateTab can be used to update any of the properties of the tab action, but it is intended primarily for enabling or disabling the action, depending on the contents of the current page of the target tab control.

Sender is the tab action component to update in this event.

TabControl (see page 12080) is the target tab control.

Enabled reflects the Enabled property of this action. Set Enabled in the event handler to enable or disable the action depending on current conditions.

See Also

OnUpdate (see page 2718)

UpdateTarget (see page 12079)

TabControl (see page 12080)

Enabled (see page 310)

67.1.26 TURLAction Class

TURLAction is the base class for actions that perform some function based on an URL (see page 12093).

Class Hierarchy

Pascal

```
TURLAction = class(TCustomAction);
```

C++

```
class TURLAction : public TCustomAction;
```

File

ExtActns

Description

Use TURLAction as a base class when creating an action component that uses a Uniform Resource Locator (URL (see page 12093)). TURLAction introduces the URL (see page 12093) property to get or set the URL (see page 12093) that it works with, but does not actually do anything with that URL (see page 12093). Rather, TURLAction descendants, such as TBrowseURL (see page 11832) or TDownLoadURL (see page 11857), override the ExecuteTarget method to perform some operation that uses the value of the URL (see page 12093) property.

TURLAction automatically disables itself if the URL (see page 12093) property has not been assigned.

See Also

TBrowseURL (see page 11832)

TDownLoadURL (see page 11857)

67.1.26.1 TURLAction Members

The following tables list the members exposed by TURLAction.

Protected Events

	Name	Description
	OnChange (see page 2716)	Occurs when one of the action's properties changes.

Protected Fields

	Name	Description
	FClients (see page 2711)	This is FClients, a member of class TBasicAction.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FImage (see page 302)	This is FImage, a member of class TCustomAction.
	FMask (see page 303)	This is FMask, a member of class TCustomAction.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 303)	Copies the properties of this action to a destination object.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	Change (see page 2712)	Generates an OnChange (see page 2716) event.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
V	HandleShortCut (see page 306)	Executes the action when the user types on of its short cuts.

	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2713)	Responds when components are created or destroyed.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 294)	This is ReadState, a member of class TContainedAction.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
V	SetHelpContext (see page 306)	This is SetHelpContext, a member of class TCustomAction.
V	SetHelpKeyword (see page 306)	This is SetHelpKeyword, a member of class TCustomAction.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 307)	Sets the value of the Name property.
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
V	SetOnExecute (see page 2714)	Assigns an OnExecute (see page 2716) event handler.
V	SetParentComponent (see page 294)	This is SetParentComponent, a member of class TContainedAction.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	SavedEnabledState (see page 313)	Saves the value of the Enabled (see page 310) property when the action is suspended.

Public Events

	Name	Description
	OnExecute (see page 2716)	Occurs when the client event that is linked to it fires.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.

	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 301)	Instantiates and initializes a TCustomAction (see page 297) object.
V	Create (see page 2710)	Instantiates and initializes a TBasicAction (see page 2707) object.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 292)	Destroys the instance of the contained action.
V	Destroy (see page 302)	Frees an instance of TCustomAction (see page 297).
V	Destroy (see page 2711)	Disposes of an instance of a TBasicAction (see page 2707) object.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DoHint (see page 303)	Generates an OnHint (see page 315) event.
V	Execute (see page 293)	Responds when the client control "fires".
V	Execute (see page 304)	Responds when a client control "fires".
	Execute (see page 2712)	Generates an OnExecute (see page 2716) event.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
V	ExecuteTarget (see page 2712)	Introduces an interface for invoking an action on a target client component or control.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
V	GetParentComponent (see page 293)	Returns the action list or action manager that contains the action.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	HandlesTarget (see page 12088)	Indicates whether the action can execute.
V	HasParent (see page 294)	Indicates whether the action is contained in an action list or action manager.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.

	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RegisterChanges (see page 2713)	Associates the action with an action link.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UnRegisterChanges (see page 2714)	Breaks the association between the action and the action link.
V	Update (see page 295)	Indicates whether the action updates itself.
V	Update (see page 2714)	Provides an opportunity to execute centralized code when an application is idle.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
V	UpdateTarget (see page 12088)	Enables or disables the action, depending on whether the URL (see page 12093) property is set.

Public Properties

	Name	Description
	ActionComponent (see page 2715)	Indicates the client component that caused this action to execute.
	ActionList (see page 295)	Indicates the action list or action manager that contains the action.
	AutoCheck (see page 308)	Controls (see page 5711) whether the Checked (see page 308) property toggles when the action executes.
	Checked (see page 308)	Indicates whether client controls and menu items appear checked.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DisableIfNoHandler (see page 310)	Indicates whether client components should be disabled if no handler is found.
	GroupIndex (see page 311)	Indicates whether the action acts like a radio button with other actions in the same action list.
	Index (see page 296)	Specifies the index of the action in its action list or action manager.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Events

	Name	Description
	OnHint (see page 12093)	Occurs when the mouse pauses over a client control or menu item.
	OnUpdate (see page 12094)	Occurs when the application is idle or when the action list updates.

Published Properties

	Name	Description
	Caption (see page 12089)	Represents the caption of client controls and menu items.
	Category (see page 296)	Specifies the category under which the action appears in its action list or action manager.
	Enabled (see page 12089)	Indicates whether client controls and menu items are enabled.
	HelpContext (see page 12090)	Indicates the help context ID for client controls and menu items.
	HelpKeyword (see page 12090)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 12091)	Indicates the mechanism for client controls and menu items to use when invoking help.
	Hint (see page 12091)	Indicates the Help hint for client controls and menu items.

	ImageIndex (see page 12091)	Indicates the ImageIndex property for client controls and menu items.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	SecondaryShortCuts (see page 12092)	Specifies the short cuts (in addition to ShortCut) for triggering clients.
	ShortCut (see page 12092)	Specifies the ShortCut property for client menu items.
	Tag (see page 2808)	Stores an integer value as part of a component.
	URL (see page 12093)	Specifies the Uniform Resource Locator (URL) on which this action performs its function.
	Visible (see page 12093)	Specifies the Visible property for client controls and menu items.

67.1.26.2 TURLAction Methods

The methods of the TURLAction class are listed here.

Public Methods

	Name	Description
	HandlesTarget (see page 12088)	Indicates whether the action can execute.
	UpdateTarget (see page 12088)	Enables or disables the action, depending on whether the URL (see page 12093) property is set.

67.1.26.2.1 TURLAction.HandlesTarget Method

Indicates whether the action can execute.

Pascal

```
function HandlesTarget(Target: TObject): Boolean; override;
```

C++

```
virtual __fastcall Boolean HandlesTarget(TObject * Target);
```

Description

Do not call the HandlesTarget method. This method is called automatically when the user invokes an object (such as a tool button or menu item) that is linked to this action. The HandlesTarget method provides the action object with an opportunity to indicate whether it is appropriate to execute at this time with the object specified by the Target parameter as a "target".

HandlesTarget always returns true, because TURLAction (see page 12083) does not use the target object.

67.1.26.2.2 TURLAction.UpdateTarget Method

Enables or disables the action, depending on whether the URL (see page 12093) property is set.

Pascal

```
procedure UpdateTarget(Target: TObject); override;
```

C++

```
virtual __fastcall UpdateTarget(TObject * Target);
```

Description

Do not call the UpdateTarget method. This method is called automatically the application is idle so that actions can update themselves according to current conditions.

In TURLAction (see page 12083), UpdateTarget checks whether the URL (see page 12093) property has been set. If so, UpdateTarget sets Enabled (see page 12089) to true. If not, UpdateTarget sets Enabled (see page 12089) to false.

See Also

Enabled (see page 310)

URL (see page 12093)

67.1.26.3 TURLAction Properties

The properties of the TURLAction class are listed here.

Published Properties

	Name	Description
	Caption (see page 12089)	Represents the caption of client controls and menu items.
	Enabled (see page 12089)	Indicates whether client controls and menu items are enabled.
	HelpContext (see page 12090)	Indicates the help context ID for client controls and menu items.
	HelpKeyword (see page 12090)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 12091)	Indicates the mechanism for client controls and menu items to use when invoking help.
	Hint (see page 12091)	Indicates the Help hint for client controls and menu items.
	ImageIndex (see page 12091)	Indicates the ImageIndex property for client controls and menu items.
	SecondaryShortCuts (see page 12092)	Specifies the short cuts (in addition to ShortCut) for triggering clients.
	ShortCut (see page 12092)	Specifies the ShortCut property for client menu items.
	URL (see page 12093)	Specifies the Uniform Resource Locator (URL) on which this action performs its function.
	Visible (see page 12093)	Specifies the Visible property for client controls and menu items.

67.1.26.3.1 TURLAction.Caption Property

Represents the caption of client controls and menu items.

Pascal

```
property Caption: string;
```

C++

```
__property AnsiString Caption;
```

Description

Caption holds the string that is the caption for the action when it is set. The value of Caption is propagated to client controls and menu items.

See Also

Caption (see page 5806)

Caption (see page 16136)

67.1.26.3.2 TURLAction.Enabled Property

Indicates whether client controls and menu items are enabled.

Pascal

```
property Enabled: Boolean;
```

C++

```
__property Boolean Enabled;
```

Description

Enabled specifies the enabled state for the action. The value of Enabled is propagated to client controls and menu items.

See Also

Enabled (see page 5821)

Enabled (see page 16145)

67.1.26.3.3 TURLAction.HelpContext Property

Indicates the help context ID for client controls and menu items.

Pascal

```
property HelpContext: THelpContext;
```

C++

```
__property THelpContext HelpContext;
```

Description

HelpContext specifies the help context for the action when it is set. This value is propagated to client controls and menu items.

When a client control has focus and the user presses the F1 key, the control uses the value of HelpContext for this associated action to invoke the online help targeting a specific topic. The target topic is uniquely identified by a nonzero HelpContext value. Leave the HelpContext property of the client control at its default value of zero. This allows multiple controls (and multiple types of controls) to be associated with the same help topic through the one action object.

Note: HelpContext is only used when the HelpType property of this action or the client control is htInteger.

See Also

HelpType (see page 312)

HelpKeyword (see page 311)

67.1.26.3.4 TURLAction.HelpKeyword Property

Indicates the help keyword for client controls and menu items.

Pascal

```
property HelpKeyword: string;
```

C++

```
__property AnsiString HelpKeyword;
```

Description

HelpKeyword, when set, specifies the keyword that identifies a help topic for this action. This value is propagated to the HelpKeyword property of client controls and menu items. The interpretation of HelpKeyword depends on which help system is used to display the topic. For example, when using HyperHelp (on Linux) or WinHelp (on Windows), HelpKeyword refers to an A link.

When a client control has focus and the user presses the F1 key (or the key specified by the application's HelpKey property), the control uses the value of HelpKeyword for this associated action object to invoke the online help targeting a specific topic. Leave the HelpKeyword property of the client control unassigned. This allows multiple controls (and multiple types of controls) to be associated with the same help topic through the one action object.

Note: HelpKeyword is only used when the HelpType property of this action or the client control is htKeyword.

See Also

HelpKeyword (see page 5826)

HelpContext (see page 311)

HelpType (see page 312)

HelpKey

67.1.26.3.5 TURLAction.HelpType Property

Indicates the mechanism for client controls and menu items to use when invoking help.

Pascal

```
property HelpType: THelpType;
```

C++

```
__property THelpType HelpType;
```

Description

HelpType, when set, indicates whether client controls and menu items should use the HelpContext or the HelpKeyword property for invoking the help system. This value is propagated to the HelpType property of client controls and menu items.

See Also

HelpType (see page 5827)

HelpType

HelpContext (see page 311)

HelpKeyword (see page 311)

67.1.26.3.6 TURLAction.Hint Property

Indicates the Help hint for client controls and menu items.

Pascal

```
property Hint: string;
```

C++

```
__property AnsiString Hint;
```

Description

Hint holds the string that is the hint for that action when it is set. This value is propagated to client controls and menu items.

See Also

Hint (see page 5827)

Hint (see page 16148)

67.1.26.3.7 TURLAction.ImageIndex Property

Indicates the ImageIndex property for client controls and menu items.

Pascal

```
property ImageIndex: TImageIndex;
```

C++

```
__property TImageIndex ImageIndex;
```

Description

ImageIndex is an index into the Images property of the action list or action manager that contains the action. It identifies an image that is associated with controls and menu items that use this action.

See Also

ImageIndex (see page 5135)

ImageIndex (see page 16148)

Images (see page 325)

67.1.26.3.8 TURLAction.SecondaryShortCuts Property

Specifies the short cuts (in addition to ShortCut) for triggering clients.

Pascal

```
property SecondaryShortCuts: TShortCutList;
```

C++

```
__property TShortCutList SecondaryShortCuts;
```

Description

Actions can execute in response to multiple short cut key combinations. SecondaryShortCuts lists all the short cut key combinations (other than the one specified by the ShortCut property) that can trigger the action. This lets you specify shortcuts for clients that do not have a ShortCut property or provide additional, secondary shortcuts.

When the user types one of the key combinations listed in SecondaryShortCuts, the action's Execute method is called.

See Also

ShortCut (see page 314)

Execute (see page 304)

67.1.26.3.9 TURLAction.ShortCut Property

Specifies the ShortCut property for client menu items.

Pascal

```
property ShortCut: TShortCut;
```

C++

```
__property TShortCut ShortCut;
```

Description

ShortCut holds the value that is the shortcut for the action when it is set. This value is propagated to client menu items.

See Also

ShortCut (see page 16152)

SecondaryShortCuts (see page 314)

67.1.26.3.10 TURLAction.URL Property

Specifies the Uniform Resource Locator (URL) on which this action performs its function.

Pascal

```
property URL: String;
```

C++

```
__property AnsiString URL;
```

Description

URL is the Uniform Resource Locator (URL) with which this action works. Each TURLAction (see page 12083) descendant performs a different function that uses this URL.

This value is not assigned automatically: it is the responsibility of the application to supply a value for URL. If no value is supplied, TURLAction (see page 12083) automatically disables itself.

See Also

UpdateTarget (see page 12088)

67.1.26.3.11 TURLAction.Visible Property

Specifies the Visible property for client controls and menu items.

Pascal

```
property Visible: Boolean;
```

C++

```
__property Boolean Visible;
```

Description

Visible specifies the visible state for the action. This value is propagated to client controls and menu items.

See Also

Visible (see page 16153)

Visible (see page 5847)

67.1.26.4 TURLAction Events

The events of the TURLAction class are listed here.

Published Events

	Name	Description
	OnHint (see page 12093)	Occurs when the mouse pauses over a client control or menu item.
	OnUpdate (see page 12094)	Occurs when the application is idle or when the action list updates.

67.1.26.4.1 TURLAction.OnHint Event

Occurs when the mouse pauses over a client control or menu item.

Pascal

```
property OnHint: THintEvent;
```

C++

```
__property THintEvent OnHint;
```

Description

Use OnHint to override the default hint that appears when the user pauses the mouse over a client control or menu item. The OnHint event handler can change the hint that appears (by changing the HintStr parameter), or display the hint in some application-specific way.

67.1.26.4.2 TURLAction.OnUpdate Event

Occurs when the application is idle or when the action list updates.

Pascal

```
property OnUpdate: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnUpdate;
```

Description

Write an OnUpdate event handler to execute centralized code while an application is idle. For example, actions may want to update enabling and disabling, or checking and unchecking of client targets.

C++ Examples:

```
/*
When the application is idle, the OnUpdate event occurs for
every action that is linked to a visible control or menu
item that is showing. This provides an opportunity for
applications to execute centralized code for enabling and
disabling, checking and unchecking, and so on. For example,
the following code illustrates the OnUpdate event handler
for an action that is "checked" when the toolbar is visible.
This example requires a TActionList (with one TAction) and a
TToolBar on a form. This example requires a TActionList
(with one TAction) and a TToolBar on a form.  Double click
on the TActionList and create an TAction named Action1.  The
TAction has an OnUpdate event handler called Action1Update.
Then set an object's (such as a button or menu item) Action
to Action1.
*/
void __fastcall TForm1::Action1Update(TObject *Sender)
{
   // Indicate whether ToolBar1 is currently visible.
   TAction* pa = dynamic_cast<TAction*>(Sender);
   if (pa)
   {
     if (pa->Checked != ToolBar1->Visible)
     {
       lbOther->Items->Add("Event Action1Update: toolbar visibility changed");
     }
     pa->Checked = ToolBar1->Visible;
   }
}
```

Delphi Examples:

```
{
When the application is idle, the OnUpdate event occurs for
every action that is linked to a visible control or menu
item that is showing. This provides an opportunity for
applications to execute centralized code for enabling and
```

```
disabling, checking and unchecking, and so on. For example,
the following code illustrates the OnUpdate event handler
for an action that is "checked" when the toolbar is visible.
This example requires a TActionList (with one TAction) and a
TToolBar on a form. This example requires a TActionList
(with one TAction) and a TToolBar on a form.  Double click
on the TActionList and create an TAction named Action1.  The
TAction has an OnUpdate event handler called Action1Update.
Then set an object's (such as a button or menu item) Action
to Action1.
}
procedure TMainForm.Action1Update(Sender: TObject);
begin
  if ((Sender as TAction).Checked <> ToolBar1.Visible) then
    lbOther.Items.Add('Event Action1Update: toolbar visibility changed');
    { Indicate whether ToolBar1 is currently visible }
    (Sender as TAction).Checked := ToolBar1.Visible;
end;
```

UpdateAction (see page 2790)

67.2 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TShowCmd (see page 12096)	This is record ExtActns.TShowCmd.
	TURLDownloadStatus (see page 12097)	This is record ExtActns.TURLDownloadStatus.

67.2.1 ExtActns.TShowCmd Enumeration

Pascal

```
TShowCmd = (
  scHide,
  scMaximize,
  scMinimize,
  scRestore,
  scShow,
  scShowDefault,
  scShowMaximized,
  scShowMinimized,
  scShowMinNoActive,
  scShowNA,
  scShowNoActivate,
  scShowNormal
);
```

C++

```
enum TShowCmd {
  scHide,
  scMaximize,
  scMinimize,
  scRestore,
  scShow,
  scShowDefault,
  scShowMaximized,
  scShowMinimized,
  scShowMinNoActive,
  scShowNA,
  scShowNoActivate,
  scShowNormal
};
```

File

ExtActns

Description

This is record ExtActns.TShowCmd.

67.2.2 ExtActns.TURLDownloadStatus Enumeration

Pascal

```
TURLDownloadStatus = (
  dsFindingResource,
  dsConnecting,
  dsRedirecting,
  dsBeginDownloadData,
  dsDownloadingData,
  dsEndDownloadData,
  dsBeginDownloadComponents,
  dsInstallingComponents,
  dsEndDownloadComponents,
  dsUsingCachedCopy,

    dsP3PHeader,
    dsSessionCookieReceived,
    dsPersistentCookieReceived,
    dsSessionCookiesAllowed
  };
```

File

ExtActns

Description

This is record ExtActns.TURLDownloadStatus.

67.3 Types

The following table lists types in this documentation.

Types

Name	Description
TDownloadProgressEvent (see page 12099)	This is type ExtActns.TDownloadProgressEvent.
TValidateTabEvent (see page 12099)	This is type ExtActns.TValidateTabEvent.

67.3.1 ExtActns.TDownloadProgressEvent Type

Pascal

```
TDownloadProgressEvent = procedure (Sender: TDownLoadURL; Progress, ProgressMax: Cardinal;
StatusCode: TURLDownloadStatus; StatusText: String; var Cancel: Boolean) of object;
```

C++

```
(Sender: TDownLoadURL; Progress, ProgressMax: Cardinal; StatusCode: TURLDownloadStatus;
StatusText: String; var Cancel: Boolean) ( TDownloadProgressEvent)();
```

File

ExtActns

Description

This is type ExtActns.TDownloadProgressEvent.

67.3.2 ExtActns.TValidateTabEvent Type

Pascal

```
TValidateTabEvent = procedure (Sender: TTabAction; TabControl: TCustomTabControl; var Enabled:
Boolean) of object;
```

C++

```
(Sender: TTabAction; TabControl: TCustomTabControl; var Enabled: Boolean) (
TValidateTabEvent)();
```

File

ExtActns

Description

This is type ExtActns.TValidateTabEvent.

68 ExtCtrls Namespace

This is namespace ExtCtrls.

Topics

Name	Description
Classes (see page 12104)	The following table lists classes in this documentation.
Functions (see page 13262)	The following table lists functions in this documentation.
Structs, Records, Enums (see page 13264)	The following table lists structs, records, enums in this documentation.
Types (see page 13272)	The following table lists types in this documentation.
Constants (see page 13279)	The following table lists constants in this documentation.

Classes

	Name	Description
	EGridPanelException (see page 12105)	The base class for runtime exceptions that occur in grid panels.
	TBevel (see page 12105)	TBevel represents a beveled outline.
	TBoundLabel (see page 12123)	TBoundLabel is the type of a labeled edit control's label.
	TCellCollection (see page 12172)	A collection of TCellItem (see page 12177) objects.
	TCellItem (see page 12177)	Represents an item in a TCellCollection (see page 12172).
	TColorBox (see page 12182)	TColorBox represents a combo box that lets users select a color.
	TColorListBox (see page 12246)	TColorListBox represents a list box that lets users select a color.
	TColumnCollection (see page 12311)	Controls (see page 5711) the **Collection Editor** for columns within a grid panel.
	TColumnItem (see page 12315)	This is class ExtCtrls.TColumnItem.
	TControlBar (see page 12316)	TControlBar manages the layout of toolbar components.
	TControlCollection (see page 12393)	This is class ExtCtrls.TControlCollection.
	TControlItem (see page 12400)	This is class ExtCtrls.TControlItem.
	TCustomColorBox (see page 12406)	TCustomColorBox represents a combo box that lets users select a color.
	TCustomColorListBox (see page 12426)	This is class ExtCtrls.TCustomColorListBox.
	TCustomControlBar (see page 12446)	TCustomControlBar is the base class for control bar components.
	TCustomFlowPanel (see page 12475)	The base class for all flow panel components.
	TCustomGridPanel (see page 12489)	The base class for all grid panel components.
	TCustomLabeledEdit (see page 12508)	TCustomLabeledEdit is the base class for edit controls that have an integrated label.
	TCustomPanel (see page 12525)	TCustomPanel is the base class for all panel components.
	TCustomRadioGroup (see page 12547)	TCustomRadioGroup is the base class for radio-group components.
	TCustomTrayIcon (see page 12564)	The base class for TTrayIcon (see page 13252).

	TFlowPanel (see page 12579)	TFlowPanel implements a flow panel control in which components are placed in pre-defined locations.
	TGridPanel (see page 12660)	TGridPanel implements a grid panel control in which each component is placed within a cell on a grid.
	THeader (see page 12744)	THeader is a sectioned visual control that displays text and allows each section to be resized with the mouse.
	TImage (see page 12777)	TImage displays a graphical image.
	TLabeledEdit (see page 12833)	TLabeledEdit is an edit control that has an associated label.
	TNotebook (see page 12902)	TNotebook displays multiple pages, each with its own set of controls.
	TPage (see page 12961)	This is class ExtCtrls.TPage.
	TPaintBox (see page 12981)	TPaintBox provides a canvas that applications can use for rendering an image.
	TPanel (see page 13032)	TPanel implements a generic panel control.
	TRadioGroup (see page 13115)	TRadioGroup represents a group of radio buttons that function together.
	TRowCollection (see page 13167)	Controls (see page 5711) the **Collection Editor** for rows within a grid panel.
	TRowItem (see page 13171)	This is class ExtCtrls.TRowItem.
	TShape (see page 13172)	TShape represents a geometric shape that can be drawn on a form.
	TSplitter (see page 13210)	TSplitter divides the client area of a form into resizable panes.
	TTimer (see page 13242)	TTimer encapsulates the Windows API timer functions.
	TTrayIcon (see page 13252)	Creates an icon in the system tray next to the clock.

Constants

Name	Description
NoColorSelected (see page 13279)	This is constant ExtCtrls.NoColorSelected.
WM_SYSTEM_TRAY_MESSAGE (see page 13279)	This is constant ExtCtrls.WM_SYSTEM_TRAY_MESSAGE.

Functions

	Name	Description
	Frame3D (see page 13262)	Draws a three dimensional frame on a canvas.
	NotebookHandlesNeeded (see page 13263)	This is function ExtCtrls.NotebookHandlesNeeded.

Structs, Records, Enums

	Name	Description
	TBalloonFlags (see page 13264)	A type specified when showing a balloon hint that puts one of the default icons on the balloon message.
	TBandDrawingStyle (see page 13265)	This is record ExtCtrls.TBandDrawingStyle.
	TBandPaintOption (see page 13265)	TBandPaintOption and TBandPaintOptions (see page 13274) specify which parts of a band are painted.
	TBevelShape (see page 13266)	TBevelShape determines the overall shape of a bevel control.
	TBevelStyle (see page 13267)	TBevelStyle indicates whether a bevel appears raised or lowered.
	TColorBoxStyles (see page 13267)	This is record ExtCtrls.TColorBoxStyles.
	TCornerEdge (see page 13268)	The size of the cornering for the edge of the bands in a TControlBar (see page 12316).
	TExpandStyle (see page 13268)	Specifies how a grid panel expands.
	TFlowStyle (see page 13269)	This is record ExtCtrls.TFlowStyle.
	TLabelPosition (see page 13269)	TLabelPosition specifies the position of the label in a labeled edit control.
	TResizeStyle (see page 13270)	This is record ExtCtrls.TResizeStyle.
	TShapeType (see page 13270)	TShapeType determines the shape of a TShape (see page 13172) control.
	TSizeStyle (see page 13271)	This is record ExtCtrls.TSizeStyle.

Types

Name	Description
NaturalNumber (see page 13272)	This is type ExtCtrls.NaturalNumber.
TBandDragEvent (see page 13272)	This is type ExtCtrls.TBandDragEvent.
TBandInfoEvent (see page 13273)	This is type ExtCtrls.TBandInfoEvent.
TBandMoveEvent (see page 13273)	This is type ExtCtrls.TBandMoveEvent.
TBandPaintEvent (see page 13273)	This is type ExtCtrls.TBandPaintEvent.

TBandPaintOptions (see page 13274)	This is type ExtCtrls.TBandPaintOptions.
TBeginBandMoveEvent (see page 13274)	This is type ExtCtrls.TBeginBandMoveEvent.
TCanResizeEvent (see page 13274)	This is type ExtCtrls.TCanResizeEvent.
TCellSpan (see page 13275)	This is type ExtCtrls.TCellSpan.
TColorBoxStyle (see page 13275)	TColorBoxStyle and TColorBoxStyles (see page 13267) specify how a color box control displays its selections.
TEndBandMoveEvent (see page 13276)	This is type ExtCtrls.TEndBandMoveEvent.
TGetColorsEvent (see page 13276)	This is type ExtCtrls.TGetColorsEvent.
TLBGetColorsEvent (see page 13276)	This is type ExtCtrls.TLBGetColorsEvent.
TPanelBevel (see page 13277)	TPanelBevel specifies a bevel's cut.
TRowSize (see page 13277)	This is type ExtCtrls.TRowSize.
TSectionEvent (see page 13278)	TSectionEvent is the type of event handlers that respond when a section of a THeader (see page 12744) control is resized.
TSplitterCanResizeEvent (see page 13278)	This is type ExtCtrls.TSplitterCanResizeEvent.

68.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	EGridPanelException (see page 12105)	The base class for runtime exceptions that occur in grid panels.
	TBevel (see page 12105)	TBevel represents a beveled outline.
	TBoundLabel (see page 12123)	TBoundLabel is the type of a labeled edit control's label.
	TCellCollection (see page 12172)	A collection of TCellItem (see page 12177) objects.
	TCellItem (see page 12177)	Represents an item in a TCellCollection (see page 12172).
	TColorBox (see page 12182)	TColorBox represents a combo box that lets users select a color.
	TColorListBox (see page 12246)	TColorListBox represents a list box that lets users select a color.
	TColumnCollection (see page 12311)	Controls (see page 5711) the **Collection Editor** for columns within a grid panel.
	TColumnItem (see page 12315)	This is class ExtCtrls.TColumnItem.
	TControlBar (see page 12316)	TControlBar manages the layout of toolbar components.
	TControlCollection (see page 12393)	This is class ExtCtrls.TControlCollection.
	TControlItem (see page 12400)	This is class ExtCtrls.TControlItem.
	TCustomColorBox (see page 12406)	TCustomColorBox represents a combo box that lets users select a color.
	TCustomColorListBox (see page 12426)	This is class ExtCtrls.TCustomColorListBox.
	TCustomControlBar (see page 12446)	TCustomControlBar is the base class for control bar components.
	TCustomFlowPanel (see page 12475)	The base class for all flow panel components.
	TCustomGridPanel (see page 12489)	The base class for all grid panel components.
	TCustomLabeledEdit (see page 12508)	TCustomLabeledEdit is the base class for edit controls that have an integrated label.
	TCustomPanel (see page 12525)	TCustomPanel is the base class for all panel components.
	TCustomRadioGroup (see page 12547)	TCustomRadioGroup is the base class for radio-group components.
	TCustomTrayIcon (see page 12564)	The base class for TTrayIcon (see page 13252).
	TFlowPanel (see page 12579)	TFlowPanel implements a flow panel control in which components are placed in pre-defined locations.
	TGridPanel (see page 12660)	TGridPanel implements a grid panel control in which each component is placed within a cell on a grid.
	THeader (see page 12744)	THeader is a sectioned visual control that displays text and allows each section to be resized with the mouse.
	TImage (see page 12777)	TImage displays a graphical image.
	TLabeledEdit (see page 12833)	TLabeledEdit is an edit control that has an associated label.
	TNotebook (see page 12902)	TNotebook displays multiple pages, each with its own set of controls.
	TPage (see page 12961)	This is class ExtCtrls.TPage.
	TPaintBox (see page 12981)	TPaintBox provides a canvas that applications can use for rendering an image.
	TPanel (see page 13032)	TPanel implements a generic panel control.
	TRadioGroup (see page 13115)	TRadioGroup represents a group of radio buttons that function together.
	TRowCollection (see page 13167)	Controls (see page 5711) the **Collection Editor** for rows within a grid panel.
	TRowItem (see page 13171)	This is class ExtCtrls.TRowItem.
	TShape (see page 13172)	TShape represents a geometric shape that can be drawn on a form.
	TSplitter (see page 13210)	TSplitter divides the client area of a form into resizable panes.
	TTimer (see page 13242)	TTimer encapsulates the Windows API timer functions.
	TTrayIcon (see page 13252)	Creates an icon in the system tray next to the clock.

68.1.1 EGridPanelException Class

The base class for runtime exceptions that occur in grid panels.

Class Hierarchy

Pascal

```
EGridPanelException = class(Exception);
```

C++

```
class EGridPanelException : public Exception;
```

File

ExtCtrls

Description

Use EGridPanelException as the base class for creating custom exceptions that occur in grid panels.

68.1.2 TBevel Class

TBevel represents a beveled outline.

Class Hierarchy

Pascal

```
TBevel = class(TGraphicControl);
```

C++

```
class TBevel : public TGraphicControl;
```

File

ExtCtrls

Description

Use TBevel to create beveled boxes, frames, or lines. The bevel can appear raised or lowered.

See Also

TShape (see page 13172)

Frame3D (see page 13262)

Bevels

Graphic Controls

68.1.2.1 TBevel Members

The following tables list the members exposed by TBevel.

Protected Events

	Name	Description
	OnCanResize (see page 5851)	Occurs when an attempt is made to resize the control.
	OnClick (see page 5851)	Occurs when the user clicks the control.
	OnConstrainedResize (see page 5853)	Adjust resize constraints.
	OnContextPopup (see page 5854)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnDblClick (see page 5854)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDragDrop (see page 5855)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 5857)	Occurs when the user drags an object over a control.
	OnEndDock (see page 5859)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 5860)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnMouseActivate (see page 5861)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 5862)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseEnter (see page 5864)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 5864)	Occurs when the user moves the mouse outside of a control.
	OnMouseMove (see page 5865)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 5867)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnMouseWheel (see page 5869)	Occurs when the mouse wheel is rotated.
	OnMouseWheelDown (see page 5869)	Occurs when the mouse wheel is rotated downward.
	OnMouseWheelUp (see page 5870)	Occurs when the mouse wheel is rotated upward.
	OnResize (see page 5870)	Occurs immediately after the control is resized.
	OnStartDock (see page 5871)	Occurs when the user begins to drag a control with a DragKind (see page 5819) of dkDock.
	OnStartDrag (see page 5871)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.

Protected Fields

	Name	Description
	FAnchorMove (see page 5733)	This is FAnchorMove, a member of class TControl.
	FAnchorOrigin (see page 5734)	This is FAnchorOrigin, a member of class TControl.
	FAnchorRules (see page 5734)	This is FAnchorRules, a member of class TControl.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FExplicitHeight (see page 5734)	This is FExplicitHeight, a member of class TControl.
	FExplicitLeft (see page 5734)	This is FExplicitLeft, a member of class TControl.
	FExplicitTop (see page 5734)	This is FExplicitTop, a member of class TControl.
	FExplicitWidth (see page 5735)	This is FExplicitWidth, a member of class TControl.
	FOriginalParentSize (see page 5735)	This is FOriginalParentSize, a member of class TControl.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	ActionChange (see page 5737)	Responds when the action associated with the control changes.

	AdjustSize (see page 5738)	Sets the size of the control as determined by the AutoSize (see page 5803) property.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	AssignTo (see page 5739)	Overrides the inherited AssignTo function to enable assignments to TAction objects.
	BeginAutoDrag (see page 5739)	Begin Automatic Drag.
	CalcCursorPos (see page 5741)	This is CalcCursorPos, a member of class TControl.
V	CanAutoSize (see page 5741)	Indicates whether the control can resize itself automatically to accommodate its contents.
V	CanResize (see page 5742)	OnCanResize (see page 5851) event dispatcher.
	Changed (see page 5742)	Sends a CM_CHANGED (see page 6330) message to the control.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	ChangeScale (see page 5743)	Rescaling event dispatcher.
	Click (see page 5743)	Respond to user click.
V	ConstrainedResize (see page 5746)	Notify control of resize with constraints.
	DblClick (see page 5747)	OnDblClick (see page 5854) event dispatcher.
	DefaultDockImage (see page 5747)	Handles the painting and erasing of a dock image.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DefineProperties (see page 5748)	Provides methods to read and write the IsControl (see page 5829) property to a stream such as a form file.
	DesignWndProc (see page 5749)	This is DesignWndProc, a member of class TControl.
	DockTrackNoTarget (see page 5749)	Handles dragging of the control over an invalid docking target.
	DoContextPopup (see page 5750)	OnContextPopup (see page 5854) event dispatcher.
	DoDock (see page 5750)	Docking event dispatcher.
	DoEndDock (see page 5750)	OnEndDock (see page 5859) event dispatcher.
	DoEndDrag (see page 5751)	OnEndDrag (see page 5860) event dispatcher.
	DoMouseWheel (see page 5751)	Processes mouse wheel motion.
	DoMouseWheelDown (see page 5752)	OnMouseWheelDown (see page 5869) event dispatcher.
	DoMouseWheelUp (see page 5752)	OnMouseWheelUp (see page 5870) event dispatcher.
	DoStartDock (see page 5753)	OnStartDock (see page 5871) event dispatcher.
	DoStartDrag (see page 5753)	OnStartDrag (see page 5871) event dispatcher.
	DragCanceled (see page 5754)	Provides the interface for a method that responds to the cancellation of a drag.
	DragOver (see page 5755)	OnDragOver (see page 5857) event dispatcher.
	DrawDragDockImage (see page 5755)	Draws the dock image for the control.
	EraseDragDockImage (see page 5757)	Erases the dock image for the control.
V	GetAction (see page 5758)	This is GetAction, a member of class TControl.
	GetActionLinkClass (see page 5758)	Returns the appropriate action link class that is associated with the control class.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetClientOrigin (see page 5758)	Returns the screen coordinates of the top-left corner of the control's client area.
V	GetClientRect (see page 5759)	Returns a rectangle defining the client area of the control.
V	GetDeviceContext (see page 5760)	Returns a device context for the control.
	GetDockEdge (see page 5763)	Returns the edge on which another control should be docked when it is dragged over the control.
V	GetDragImages (see page 5763)	Returns the control's image list containing the image to be displayed while dragging.
V	GetEnabled (see page 5763)	Returns the value of the Enabled (see page 5821) property.
V	GetFloating (see page 5764)	Returns the value of the Floating (see page 5823) property.
V	GetFloatingDockSiteClass (see page 5764)	Returns the class used for the control when it is floating.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
V	GetOwner (see page 2778)	Returns the owner of a component.

	GetOwner (see page 2932)	Returns the owner of an object.
	GetPalette (see page 5765)	Returns the handle to a palette for use by the control.
	GetPopupMenu (see page 5765)	Returns the pop-up menu associated with the control.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Loaded (see page 5771)	Initializes the control after it is loaded from a stream.
	MouseActivate (see page 5773)	This is MouseActivate, a member of class TControl.
	MouseDown (see page 5773)	OnMouseDown (see page 5862) event dispatcher.
	MouseMove (see page 5773)	Respond to mouse moving over control area..
	MouseUp (see page 5774)	OnMouseUp (see page 5867) event dispatcher.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	Notification (see page 5775)	Responds to notifications that components are being created or destroyed.
V	Paint (see page 12113)	Render control surface.
	PaletteChanged (see page 5775)	Responds to changes in the system's palette by realizing the control's palette.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	PositionDockRect (see page 5777)	Positions the docking rectangle according to the current drag-and-dock state.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 5778)	Prepares the control for having its properties assigned values read from a stream.
V	RequestAlign (see page 5780)	Instructs the parent of a control to reposition the control, enforcing its Align (see page 5798) property.
	Resize (see page 5780)	Respond to control resize.
	ScaleConstraints (see page 5781)	This is ScaleConstraints, a member of class TControl.
	SendCancelMode (see page 5781)	Cancels the modal state of the control.
	SendDockNotification (see page 5782)	Sends a Windows message to the control's host dock site.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
V	SetAutoSize (see page 5783)	This is SetAutoSize, a member of class TControl.
V	SetBiDiMode (see page 5783)	Sets the control's bi-directional mode.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
V	SetDragMode (see page 5785)	Sets the drag mode for the control.
V	SetEnabled (see page 5785)	Sets the value of the Enabled (see page 5821) property.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
V	SetName (see page 5785)	Sets the name of the control.
V	SetParent (see page 5786)	Sets the parent of the control.
V	SetParentBiDiMode (see page 5786)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 5787)	Sets the parent for the control.
	SetZOrder (see page 5788)	Repositions the control in its parent's control list, thereby changing position onscreen.
	UpdateBoundsRect (see page 5789)	Changes the Top (see page 5844), Left (see page 5830), Width (see page 5849), and Height (see page 5825) properties of the control, but doesn't update its screen image and bypasses all resize events.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateExplicitBounds (see page 5789)	This is UpdateExplicitBounds, a member of class TControl.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.

	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	VisibleChanging (see page 5791)	Provides the interface for a method that responds to changes in the control's visibility.
V	WndProc (see page 5791)	Provides specific message responses for the control.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	ActionLink (see page 5798)	Contains the action link object associated with the control.
	AutoSize (see page 5803)	Specifies whether the control sizes itself automatically to accommodate its contents.
R	Canvas (see page 6053)	Provides the drawing surface used by the graphic control.
	Caption (see page 5806)	Specifies a text string that identifies the control to the user.
	Color (see page 5812)	Specifies the background color of the control.
	DesktopFont (see page 5818)	Specifies whether the control uses the Windows icon font when writing text.
	DragCursor (see page 5818)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 5819)	Specifies whether the control is being dragged normally or for docking.
	DragMode (see page 5819)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	Font (see page 5823)	Controls (see page 5711) the attributes of text written on or in the control.
	IsControl (see page 5829)	Determines whether a form stores its form-specific properties to a stream.
	MouseCapture (see page 5831)	Indicates whether the control has "captured" mouse events.
	ParentBiDiMode (see page 5833)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	ParentColor (see page 5834)	Determines where a control looks for its color information.
	ParentFont (see page 5834)	Determines where a control looks for its font information.
	PopupMenu (see page 5835)	Identifies the pop-up menu associated with the control.
	ScalingFlags (see page 5840)	Reflects which attributes of the control have been scaled.
	Text (see page 5842)	Contains a text string associated with the control.
	WheelAccumulator (see page 5849)	Accumulates mouse wheel rotations.
	WindowText (see page 5850)	Contains the text string of the control.

Public Events

	Name	Description
	WindowProc (see page 5872)	Points to the window procedure that responds to messages sent to the control.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	BeginDrag (see page 5740)	Starts the dragging of a control.
	BringToFront (see page 5740)	Puts the control in front of all other controls in its parent control.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.

	ClientToParent (see page 5744)	Translates client coordinates to parent coordinates.
	ClientToScreen (see page 5744)	Translates a given point from client area coordinates to global screen coordinates.
V	Create (see page 12113)	Creates and initializes an instance of TBevel (see page 12105).
V	DefaultHandler (see page 5748)	Provides message handling for all messages that do not have specific handlers.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 5732)	Destroys an instance of TControl (see page 5724).
V	Destroy (see page 6052)	Destroys an instance of TGraphicControl (see page 6044).
V	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Dock (see page 5749)	Used internally to dock the control.
	DragDrop (see page 5754)	OnDragDrop (see page 5855) event dispatcher.
	Dragging (see page 5754)	Indicates whether a control is being dragged.
	DrawTextBiDiModeFlags (see page 5756)	Returns the text flags that reflect the current setting of the BiDiMode (see page 5803) property.
	DrawTextBiDiModeFlagsReadingOnly (see page 5756)	Returns the text flag to add that indicates whether the control's text should read from right to left.
	EndDrag (see page 5757)	Stops a control from being dragged any further.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetControlsAlignment (see page 5759)	Indicates how text is aligned within the control.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 5765)	Returns the parent of the control.
	GetTextBuf (see page 5766)	Retrieves the control's text, copies it into a buffer, and returns the number of characters copied.
	GetTextLen (see page 5767)	Returns the length of the control's text.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 5768)	Indicates whether the control has a parent.
	Hide (see page 5769)	Makes the control invisible.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
V	InitiateAction (see page 5769)	Calls the action link's Update (see page 5789) method if the control is associated with an action link.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
V	Invalidate (see page 5770)	Completely repaint control.

	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	IsRightToLeft (see page 5770)	Indicates whether the control should be reversed right to left.
	ManualDock (see page 5771)	Docks the control.
	ManualFloat (see page 5772)	Undocks the control.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	MouseWheelHandler (see page 5774)	Dispatches messages received from a mouse wheel.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	ParentToClient (see page 5776)	Translate parent coordinates to client coordinates.
	Perform (see page 5776)	Responds as if the control received a specified Windows message.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	Refresh (see page 5779)	Repaints the control on the screen.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	Repaint (see page 5779)	Forces the control to repaint its image on the screen.
	ReplaceDockedControl (see page 5779)	Docks the control in the place where another control is already docked.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	ScreenToClient (see page 5781)	Converts the screen coordinates of a specified point on the screen to client coordinates.
	SendToBack (see page 5782)	Puts a windowed control behind all other windowed controls, or puts a non-windowed control behind all other non-windowed controls.
V	SetBounds (see page 5783)	Sets the Left (see page 5830), Top (see page 5844), Width (see page 5849), and Height (see page 5825) properties all at once.
	SetDesignVisible (see page 5784)	Makes a control visible at design time.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	SetTextBuf (see page 5787)	Sets the text of the control.
	Show (see page 5788)	Makes a control visible.
V	Update (see page 5789)	Processes any pending paint messages immediately.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	UseRightToLeftAlignment (see page 5790)	Specifies whether the control's alignment should be reversed right-to-left.
	UseRightToLeftReading (see page 5790)	Specifies whether the control is using a right-to-left reading order.
	UseRightToLeftScrollBar (see page 5791)	Specifies whether the vertical scroll bar appears on the left side of the control.

Public Properties

	Name	Description
	Action (see page 5797)	Designates the action associated with the control.
	BiDiMode (see page 5803)	Specifies the bi-directional mode for the control.
	BoundsRect (see page 5803)	Specifies the bounding rectangle of the control, expressed in the coordinate system of the parent control.
	ClientHeight (see page 5808)	Specifies the height of the control's client area in pixels.
R	ClientOrigin (see page 5809)	Specifies the screen coordinates (in pixels) of the top left corner of a control's client area.
R	ClientRect (see page 5810)	Specifies the size (in pixels) of a control's client area.
	ClientWidth (see page 5811)	Specifies the horizontal size of the control's client area in pixels.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.

	ControlState (see page 5813)	Indicates the current state of a control at runtime.
	ControlStyle (see page 5814)	Determines style characteristics of the control.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DockOrientation (see page 5818)	Specifies how the control is docked relative to other controls docked in the same parent.
	Enabled (see page 5821)	Controls (see page 5711) whether the control responds to mouse, keyboard, and timer events.
R	ExplicitHeight (see page 5821)	Specifies the explicit vertical size of the control in pixels.
R	ExplicitLeft (see page 5822)	Specifies the explicit horizontal pixel coordinate of the left edge of a component relative to its parent.
R	ExplicitTop (see page 5822)	Specifies the explicit vertical pixel coordinate of the top edge of a component relative to its parent.
R	ExplicitWidth (see page 5822)	Specifies the explicit horizontal size of the control in pixels.
R	Floating (see page 5823)	Indicates whether the control is floating.
	FloatingDockSiteClass (see page 5823)	Specifies the class of the temporary control that hosts the control when it is floating.
	HostDockSite (see page 5829)	Specifies the control in which the control is docked.
	LRDockWidth (see page 5831)	Specifies the width of the control when it is docked horizontally.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Parent (see page 5832)	Indicates the parent of the control.
	TBDockHeight (see page 5842)	Specifies the height of the control when it is docked vertically.
	UndockHeight (see page 5845)	Specifies the height of the control when it is floating.
	UndockWidth (see page 5846)	Specifies the width of the control when it is floating.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Properties

	Name	Description
	Align (see page 12114)	Determines how the control aligns within its container (parent control).
	AlignWithMargins (see page 5802)	Indicates whether a control should be constrained by margins.
	Anchors (see page 12117)	Specifies how the control is anchored to its parent.
	Constraints (see page 12118)	Specifies the size constraints for the control.
	Cursor (see page 5815)	Specifies the image used to represent the mouse pointer when it passes into the region covered by the control.
	Height (see page 5825)	Specifies the vertical size of the control in pixels.
	HelpContext (see page 5826)	Numeric ID for control's context-sensitive help topic
	HelpKeyword (see page 5826)	Keyword for control's context-sensitive help topic
	HelpType (see page 5827)	Indicates whether the control's context sensitive help topic is identified by context ID or by keyword.
	Hint (see page 5827)	Contains the text string that can appear when the user moves the mouse over the control.
	Left (see page 5830)	Specifies the horizontal coordinate of the left edge of a component relative to its parent.
	Margins (see page 5831)	Specifies the margins for the control.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	ParentShowHint (see page 12118)	Determines where a control looks to find out if its Help Hint should be shown.
	Shape (see page 12119)	Determines the shape of the bevel.
	ShowHint (see page 12119)	Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.
	Style (see page 12121)	Determines whether the bevel appears raised or lowered.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Top (see page 5844)	Specifies the Y coordinate of the top left corner of a control, relative to its parent or containing control in pixels.
	Visible (see page 12121)	Determines whether the component appears onscreen.
	Width (see page 5849)	Specifies the horizontal size of the control or form in pixels.

68.1.2.2 TBevel.Create Constructor

Creates and initializes an instance of TBevel (see page 12105).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TBevel(TComponent * AOwner);
```

Description

Call Create to instantiate a bevel at runtime. Bevels placed on forms at design time are created automatically.

See Also

Shape (see page 12119)

Style (see page 12121)

68.1.2.3 TBevel Methods

The methods of the TBevel class are listed here.

Protected Methods

	Name	Description
	Paint (see page 12113)	Render control surface.

68.1.2.3.1 TBevel.Paint Method

Render control surface.

Pascal

```
procedure Paint; override;
```

C++

```
virtual __fastcall Paint();
```

Description

The Paint method is called automatically when a lightweight control needs update its display area. Code in the Paint method uses the Canvas property to render the control surface.

As implemented in TGraphicControl, Paint does nothing. Specific rendering logic is provided by Paint methods in descendant control classes.

See Also

Canvas (see page 6053)

68.1.2.4 TBevel Properties

The properties of the TBevel class are listed here.

Published Properties

	Name	Description
	Align (see page 12114)	Determines how the control aligns within its container (parent control).
	Anchors (see page 12117)	Specifies how the control is anchored to its parent.
	Constraints (see page 12118)	Specifies the size constraints for the control.
	ParentShowHint (see page 12118)	Determines where a control looks to find out if its Help Hint should be shown.
	Shape (see page 12119)	Determines the shape of the bevel.
	ShowHint (see page 12119)	Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.
	Style (see page 12121)	Determines whether the bevel appears raised or lowered.
	Visible (see page 12121)	Determines whether the component appears onscreen.

68.1.2.4.1 TBevel.Align Property

Determines how the control aligns within its container (parent control).

Pascal

```
property Align: TAlign;
```

C++

```
__property TAlign Align;
```

Description

Use Align to align a control to the top, bottom, left, or right of a form or panel and have it remain there even if the size of the form, panel, or component that contains the control changes. When the parent is resized, an aligned control also resizes so that it continues to span the top, bottom, left, or right edge of the parent.

For example, to use a panel component with various controls on it as a tool palette, change the panel's Align value to alLeft. The value of alLeft for the Align property of the panel guarantees that the tool palette remains on the left side of the form and always equals the client height of the form.

The default value of Align is alNone, which means a control remains where it is positioned on a form or panel.

Tip: If Align is set to alClient, the control fills the entire client area so that it is impossible to select the parent form by clicking on it. In this case, select the parent by selecting the control on the form and pressing Esc, or by using the Object Inspector.

Any number of child components within a single parent can have the same Align value, in which case they stack up along the edge of the parent. The child controls stack up in z-order. To adjust the order in which the controls stack up, drag the controls into their desired positions.

Note: To cause a control to maintain a specified relationship with an edge of its parent, but not necessarily lie along one edge of the parent, use the Anchors property instead.

C++ Examples:

```
/*
This example shows how to use a splitter to divide a form
into resizable panes.  All objects on the form are created
dynamically in the OnCreate event handler of the form. To
run this example, add ExtCtrls and FileCtrl to the uses
clause of the form’s implementation section.
Note that when creating a splitter dynamically at runtime,
it is important to set its position to the appropriate side
of the control it will resize.
*/
#include <Extctrls.hpp>
#include <Filectrl.hpp>
```

```
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  TSplitter* ps = new TSplitter(Form1);
  TFileListBox* pflb = new TFileListBox(Form1);
  TDirectoryListBox* pdlb = new TDirectoryListBox(Form1);

  // Line up the directory list box on the left of the form.
  pdlb->Parent = Form1;
  pdlb->Align = alLeft;
  pdlb->Width = Form1->ClientWidth/3;

  // Now use the splitter to divide the directory pane from the file pane.
  ps->Parent = Form1;
  ps->Left = pdlb->Left + pdlb->Width + 1; // Move to right of directory list.
  ps->Align = pdlb->Align; // Give same alignment as directory list.

  // Each pane must be at least one quarter of the form's width.
  ps->MinSize = Form1->ClientWidth/4;

  // Finally, create the last pane - a file list box.
  pflb->Parent = Form1;
  pflb->Align = alClient;
  pdlb->FileList = pflb; // Link the file list box to the directory list box.
}
/*
Dynamically create a TProgressBar control and align it to
the bottom of the form.
*/

#include <ComCtrls.hpp>
#include <Controls.hpp>

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  TProgressBar *ProgressBar = new TProgressBar(this);
  ProgressBar->Parent = this;
  ProgressBar->Align = alBottom;
  TButton *Button1 = new TButton(this);
  Button1->Parent = this;
}
/*
This example dynamically creates a Page Control, then a
series of Tab Sheets on the Page Control.
*/
#include <Comctrls.hpp>
TPageControl* ppc;
const int MAXTABS = 3;
TTabSheet* pts[MAXTABS];
const char * ppcTabTitles[] = { "ShortString", "Orders", "Items", "Parts" };
int iTabTitles = sizeof(ppcTabTitles)/sizeof(ppcTabTitles[0]);
const TColor colorPalette[12] = {
  clRed, clGreen, clYellow, clBlue, clWhite, clFuchsia,
  clTeal, clNavy, clMaroon, clLime, clOlive, clPurple};

void __fastcall TForm1::FormCreate(TObject *Sender)
{
    ppc = new TPageControl(this);
    ppc->Parent = this;
    ppc->Align = alClient;
    for (int i=0;i<iTabTitles;i++)
  {
        pts[i] = new TTabSheet(this);
        pts[i]->PageControl = ppc;
        pts[i]->Name = AnsiString("pts") + ppcTabTitles[i];
        pts[i]->Caption = ppcTabTitles[i];
```

```
        pts[i]->Brush->Color = colorPalette[i];
    }
}//---------------------------------------------------------------------------
void __fastcall TForm1::FormDestroy(TObject *Sender)
{
  for (int i=0;i<iTabTitles;i++)
        delete pts[i];
    delete ppc;
}
```

Delphi Examples:

```
{
This example shows how to use a splitter to divide a form
into resizable panes.  All objects on the form are created
dynamically in the OnCreate event handler of the form. To
run this example, add ExtCtrls and FileCtrl to the uses
clause of the form's implementation section.
Note that when creating a splitter dynamically at runtime,
it is important to set its position to the appropriate side
of the control it will resize.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  Split: TSplitter;
  Files: TFileListBox;
  Dirs: TDirectoryListBox;
begin
  { first add a directory list box to the form }
  Dirs := TDirectoryListBox.Create(Form1);
  { line it up on the left of the form }
  Dirs.Parent := Form1;
  Dirs.Align := alLeft;
  Dirs.Width := Form1.ClientWidth div 3;
{ now add the splitter to divide the directory pane from the file pane }
  Split := TSplitter.Create(Form1);
  Split.Parent := Form1;
  { make sure the splitter is to the right of the directory list box! }
  Split.Left := Dirs.Left + Dirs.Width + 1;
  Split.Align := Dirs.Align; { give it the same alignment as the directory }
  { each pane must be at least one quarter of the form's width }
  Split.MinSize := Form1.ClientWidth div 4;
  { Finally, create the last pane – a file list box }
  Files := TFileListBox.Create(Form1);
  Files.Parent := Form1;
  Files.Align := alClient;
  Dirs.FileList := Files; { link the file list box to the directory list box }
end;
{
Dynamically create a TProgressBar control and align it to
the bottom of the form.
}

var
  I: Integer;

var
  i: Integer;
begin
  for i := Low(TabTitles) to High(TabTitles) do
  begin
    pts[i].Free;
  end;
  PageControl1.Free;
end;
```

See Also

Parent (see page 5832)

Anchors (see page 5802)

68.1.2.4.2 TBevel.Anchors Property

Specifies how the control is anchored to its parent.

Pascal

```
property Anchors: TAnchors;
```

C++

```
__property TAnchors Anchors;
```

Description

Use Anchors to ensure that a control maintains its current position relative to an edge of its parent, even if the parent is resized. When its parent is resized, the control holds its position relative to the edges to which it is anchored.

If a control is anchored to opposite edges of its parent, the control stretches when its parent is resized. For example, if a control has its Anchors property set to [akLeft, akRight], the control stretches when the width of its parent changes.

Anchors is enforced only when the parent is resized. Thus, for example, if a control is anchored to opposite edges of a form at design time and the form is created in a maximized state, the control is not stretched because the form is not resized after the control is created.

Note: If a control should maintain contact with three edges of its parent (hugging one side of the parent and stretching the length of that side), use the Align property instead. Unlike Anchors, Align allows controls to adjust to changes in the size of other aligned sibling controls as well as changes to the parent's size.

See Also

Parent (see page 5832)

Align (see page 5798)

68.1.2.4.3 TBevel.Constraints Property

Specifies the size constraints for the control.

Pascal

```
property Constraints: TSizeConstraints;
```

C++

```
__property TSizeConstraints Constraints;
```

Description

Use Constraints to specify the minimum and maximum width and height of the control. When Constraints contains maximum or minimum values, the control cannot be resized to violate those constraints.

Note: Constraints apply to the height of the form. However, the height of the form depends on how large Windows makes the title bar. For example, Windows XP uses much larger title bars than other windowing systems. To work around this, note the ClientHeight when you design your form and set the constraints in the FormCreate event. In the following example, ClientHeight is represented by x: `Constraints.MinHeight := x + Height - ClientHeight`.

Warning: Do not set up constraints that conflict with the value of the Align or Anchors property. When these properties conflict, the response of the control to resize attempts is not well-defined.

See Also

AutoSize (see page 5803)

Align (see page 5798)

Anchors (see page 5802)

OnConstrainedResize (see page 5853)

OnCanResize (see page 5851)

68.1.2.4.4 TBevel.ParentShowHint Property

Determines where a control looks to find out if its Help Hint should be shown.

Pascal

```
property ParentShowHint: Boolean;
```

C++

```
__property Boolean ParentShowHint;
```

Description

Use ParentShowHint to ensure that all the controls on a form either uniformly show their Help Hints or uniformly do not show them.

If ParentShowHint is true, the control uses the ShowHint property value of its parent. If ParentShowHint is false, the control uses the value of its own ShowHint property.

To provide Help Hints for only selected controls on a form, set the ShowHint property for those controls that should have Help Hints to true, and ParentShowHint becomes false automatically.

Note: Enable or disable all Help Hints for the entire application using the ShowHint property of the application object.

See Also

Hint (see page 5827)

Parent (see page 5832)

ParentColor (see page 5834)

ParentFont (see page 5834)

ShowHint (see page 5840)

68.1.2.4.5 TBevel.Shape Property

Determines the shape of the bevel.

Pascal

```
property Shape: TBevelShape;
```

C++

```
__property TBevelShape Shape;
```

Description

Set Shape to specify whether the bevel appears as a line, box, frame, or space. For shapes that can appear either raised or lowered, the Style (see page 12121) property indicates which effect is used.

The default value for Shape is bsBox.

See Also

ClientRect (see page 5810)

Style (see page 12121)

68.1.2.4.6 TBevel.ShowHint Property

Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.

Pascal

```
property ShowHint: Boolean;
```

C++

```
__property Boolean ShowHint;
```

Description

The Help Hint is the value of the Hint property, which is displayed in a box just beneath the control. Use ShowHint to determine whether a Help Hint appears for the control.

To enable Help Hint for a particular control, the application ShowHint property must be true and either

the control's own ShowHint property must be true, or

the control's ParentShowHint property must be true and its parent's ShowHint property must be true.

For example, imagine a check box within a group box. If the ShowHint property of the group box is true and the ParentShowHint property of the check box is true, but the ShowHint property of the check box is false, the check box still displays its Help Hint.

Changing the ShowHint value automatically sets the ParentShowHint property to false.

C++ Examples:

```
/*
This example uses an edit box and a list box on a form.
Items are added to the list box and a Help Hint is assigned
to both controls. The last statement enables the Help Hints
for the entire application.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  Edit1->Hint = "Enter your name";
  Edit1->ShowHint = true;

  char string[10];
  char index[3];
  for(int i = 1; i <= 10; i++)
  {
    strcpy(string, "Item");
    itoa(i, index, 10);
    strcat(string, index);
    ListBox1->Items->Add(string);
  }
  ListBox1->Hint = "Select an item";
  ListBox1->ShowHint = true;
  Application->ShowHint = true;
}
/*
Note: To see an example that displays the hints of controls
in some place other than in a Help Hint box, see the OnHint
example.
*/
```

Delphi Examples:

```
{
This example uses an edit box and a list box on a form.
Items are added to the list box and a Help Hint is assigned
to both controls. The last statement enables the Help Hints
for the entire application.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  I: Integer;
begin
  Edit1.Hint := 'Enter your name';
  Edit1.ShowHint := True;
  with ListBox1 do
  begin
    for I := 1 to 10 do
      Items.Add('Item ' + IntToStr(I));
```

```
      Hint := 'Select an item';
      ShowHint := True;
    end;
    Application.ShowHint := True;
  end;
  {
  Note: To see an example that displays the hints of controls
  in some place other than in a Help Hint box, see the OnHint
  example.
  }
```

Hint (see page 5827)

ParentShowHint (see page 5835)

ShowHint (see page 13721)

Displaying Fly-over Help

68.1.2.4.7 TBevel.Style Property

Determines whether the bevel appears raised or lowered.

Pascal

```
property Style: TBevelStyle;
```

C++

```
__property TBevelStyle Style;
```

Description

Set Style to indicate whether the bevel should create a raised or a lowered effect. When the Shape (see page 12119) property is bsBox, the entire client area appears raised or lowered. For all other values of Shape (see page 12119), the bevel displays a raised or lowered line along the edge or edges of the client area. The default value of Style is bsLowered.

See Also

Shape (see page 12119)

68.1.2.4.8 TBevel.Visible Property

Determines whether the component appears onscreen.

Pascal

```
property Visible: Boolean;
```

C++

```
__property Boolean Visible;
```

Description

Use the Visible property to control the visibility of the control at runtime. If Visible is true, the control appears. If Visible is false, the control is not visible.

Calling the Show method sets the control's Visible property to true. Calling the Hide method sets it to false.

C++ Examples:

```
/*
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
```

```
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
*/
void __fastcall TForm1::PageControl1Change(TObject *Sender)
{
  CheckBox1->Checked = PageControl1->ActivePage->Visible;
}

void __fastcall TForm1::CheckBox1Click(TObject *Sender)
{
  PageControl1->ActivePage->Visible = CheckBox1->Checked;
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < 10; i++)
  {
    TTabSheet *pPage = new TTabSheet(this);
    pPage->PageControl = PageControl1;
    pPage->Caption = AnsiString("Page") + IntToStr(i);
    TEdit *pEdit = new TEdit(this);
    pEdit->Parent = pPage;
    pEdit->Left = random(pPage->ClientWidth - pEdit->Width);
    pEdit->Top = random(pPage->ClientHeight - pEdit->Height);
  }
  PageControl1Change(Sender);
}
```

Delphi Examples:

```
{
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
}
procedure TForm1.CheckBox1Click(Sender: TObject);
begin
  PageControl1.ActivePage.Visible := CheckBox1.Checked;
end;

procedure TForm1.PageControl1Change(Sender: TObject);
begin
  CheckBox1.Checked := PageControl1.ActivePage.Visible;
end;

procedure TForm1.FormCreate(Sender: TObject);
var
  i: Integer;
begin
  for i := 0 to 9 do
    with TTabSheet.Create(Self) do
    begin
      PageControl := PageControl1;
      Caption := 'TabSheet' + IntToStr(i);
      with TEdit.Create(Self) do
      begin
        Parent := PageControl1.Pages[i];
        Left := Random(PageControl1.ActivePage.ClientWidth - Width);
        Top := Random(PageControl1.ActivePage.ClientHeight - Height);
      end;
    end;
    PageControl1Change(Sender);
end;
```

68.1.3 TBoundLabel Class

TBoundLabel is the type of a labeled edit control's label.

Class Hierarchy

Pascal

```
TBoundLabel = class(TCustomLabel);
```

C++

```
class TBoundLabel : public TCustomLabel;
```

File

ExtCtrls

Description

TBoundLabel implements the label of a labeled edit control. Unlike other label controls such as TLabel, TBoundLabel "belongs" to the labeled edit control (it is a subcomponent of the edit control). This means that the bound label's Owner is the edit control rather than the form, and the edit control is responsible for loading and saving the bound label.

Use the properties of TBoundLabel to specify how you want the labeled edit control's label to appear. For example, you can use the Caption (see page 12133) property to specify the text that appears in the label. You can use the Alignment and Layout (see page 12141) properties to specify the placement of that caption within the label.

TLabel (see page 21544)

TComponent (see page 2762)

68.1.3.1 TBoundLabel Members

The following tables list the members exposed by TBoundLabel.

Protected Events

	Name	Description
	OnCanResize (see page 5851)	Occurs when an attempt is made to resize the control.
	OnConstrainedResize (see page 5853)	Adjust resize constraints.

	OnMouseEnter (see page 5864)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 5864)	Occurs when the user moves the mouse outside of a control.
	OnMouseWheel (see page 5869)	Occurs when the mouse wheel is rotated.
	OnMouseWheelDown (see page 5869)	Occurs when the mouse wheel is rotated downward.
	OnMouseWheelUp (see page 5870)	Occurs when the mouse wheel is rotated upward.
	OnResize (see page 5870)	Occurs immediately after the control is resized.

Protected Fields

	Name	Description
	FAnchorMove (see page 5733)	This is FAnchorMove, a member of class TControl.
	FAnchorOrigin (see page 5734)	This is FAnchorOrigin, a member of class TControl.
	FAnchorRules (see page 5734)	This is FAnchorRules, a member of class TControl.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FExplicitHeight (see page 5734)	This is FExplicitHeight, a member of class TControl.
	FExplicitLeft (see page 5734)	This is FExplicitLeft, a member of class TControl.
	FExplicitTop (see page 5734)	This is FExplicitTop, a member of class TControl.
	FExplicitWidth (see page 5735)	This is FExplicitWidth, a member of class TControl.
	FOriginalParentSize (see page 5735)	This is FOriginalParentSize, a member of class TControl.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	ActionChange (see page 5737)	Responds when the action associated with the control changes.
V	AdjustBounds (see page 12131)	Resizes the label when the text changes.
	AdjustSize (see page 5738)	Sets the size of the control as determined by the AutoSize (see page 5803) property.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	AssignTo (see page 5739)	Overrides the inherited AssignTo function to enable assignments to TAction objects.
	BeginAutoDrag (see page 5739)	Begin Automatic Drag.
	CalcCursorPos (see page 5741)	This is CalcCursorPos, a member of class TControl.
V	CanAutoSize (see page 5741)	Indicates whether the control can resize itself automatically to accommodate its contents.
V	CanResize (see page 5742)	OnCanResize (see page 5851) event dispatcher.
	Changed (see page 5742)	Sends a CM_CHANGED (see page 6330) message to the control.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	ChangeScale (see page 5743)	Rescaling event dispatcher.
	Click (see page 5743)	Respond to user click.
V	ConstrainedResize (see page 5746)	Notify control of resize with constraints.
	DblClick (see page 5747)	OnDblClick (see page 5854) event dispatcher.
	DefaultDockImage (see page 5747)	Handles the painting and erasing of a dock image.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DefineProperties (see page 5748)	Provides methods to read and write the IsControl (see page 5829) property to a stream such as a form file.
	DesignWndProc (see page 5749)	This is DesignWndProc, a member of class TControl.
	DockTrackNoTarget (see page 5749)	Handles dragging of the control over an invalid docking target.
	DoContextPopup (see page 5750)	OnContextPopup (see page 5854) event dispatcher.
	DoDock (see page 5750)	Docking event dispatcher.
	DoDrawText (see page 21296)	Renders the text in the client area.
	DoEndDock (see page 5750)	OnEndDock (see page 5859) event dispatcher.
	DoEndDrag (see page 5751)	OnEndDrag (see page 5860) event dispatcher.
	DoMouseWheel (see page 5751)	Processes mouse wheel motion.

	DoMouseWheelDown (see page 5752)	OnMouseWheelDown (see page 5869) event dispatcher.
	DoMouseWheelUp (see page 5752)	OnMouseWheelUp (see page 5870) event dispatcher.
	DoStartDock (see page 5753)	OnStartDock (see page 5871) event dispatcher.
	DoStartDrag (see page 5753)	OnStartDrag (see page 5871) event dispatcher.
	DragCanceled (see page 5754)	Provides the interface for a method that responds to the cancellation of a drag.
	DragOver (see page 5755)	OnDragOver (see page 5857) event dispatcher.
	DrawDragDockImage (see page 5755)	Draws the dock image for the control.
	EraseDragDockImage (see page 5757)	Erases the dock image for the control.
	GetAction (see page 5758)	This is GetAction, a member of class TControl.
	GetActionLinkClass (see page 5758)	Returns the appropriate action link class that is associated with the control class.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetClientOrigin (see page 5758)	Returns the screen coordinates of the top-left corner of the control's client area.
	GetClientRect (see page 5759)	Returns a rectangle defining the client area of the control.
	GetDeviceContext (see page 5760)	Returns a device context for the control.
	GetDockEdge (see page 5763)	Returns the edge on which another control should be docked when it is dragged over the control.
	GetDragImages (see page 5763)	Returns the control's image list containing the image to be displayed while dragging.
	GetEnabled (see page 5763)	Returns the value of the Enabled (see page 5821) property.
	GetFloating (see page 5764)	Returns the value of the Floating (see page 5823) property.
	GetFloatingDockSiteClass (see page 5764)	Returns the class used for the control when it is floating.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetLabelText (see page 21297)	Returns the value of the Caption (see page 21303) property.
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetPalette (see page 5765)	Returns the handle to a palette for use by the control.
	GetPopupMenu (see page 5765)	Returns the pop-up menu associated with the control.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Loaded (see page 5771)	Initializes the control after it is loaded from a stream.
	Loaded (see page 21297)	Adjusts the size of the label when it is first loaded. .
	MouseActivate (see page 5773)	This is MouseActivate, a member of class TControl.
	MouseDown (see page 5773)	OnMouseDown (see page 5862) event dispatcher.
	MouseMove (see page 5773)	Respond to mouse moving over control area..
	MouseUp (see page 5774)	OnMouseUp (see page 5867) event dispatcher.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	Notification (see page 5775)	Responds to notifications that components are being created or destroyed.
	Notification (see page 21298)	Responds to notifications when objects are about to be created or destroyed.
	Paint (see page 6052)	Render control surface.
	Paint (see page 21298)	Draws the image of the label.
	PaletteChanged (see page 5775)	Responds to changes in the system's palette by realizing the control's palette.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	PositionDockRect (see page 5777)	Positions the docking rectangle according to the current drag-and-dock state.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	ReadState (see page 5778)	Prepares the control for having its properties assigned values read from a stream.
	RequestAlign (see page 5780)	Instructs the parent of a control to reposition the control, enforcing its Align (see page 5798) property.

	Resize (see page 5780)	Respond to control resize.
	ScaleConstraints (see page 5781)	This is ScaleConstraints, a member of class TControl.
	SendCancelMode (see page 5781)	Cancels the modal state of the control.
	SendDockNotification (see page 5782)	Sends a Windows message to the control's host dock site.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
V	SetAutoSize (see page 5783)	This is SetAutoSize, a member of class TControl.
V	SetAutoSize (see page 21298)	Sets the AutoSize (see page 21299) property.
V	SetBiDiMode (see page 5783)	Sets the control's bi-directional mode.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
V	SetDragMode (see page 5785)	Sets the drag mode for the control.
V	SetEnabled (see page 5785)	Sets the value of the Enabled (see page 5821) property.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
V	SetName (see page 5785)	Sets the name of the control.
V	SetParent (see page 5786)	Sets the parent of the control.
V	SetParentBiDiMode (see page 5786)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 5787)	Sets the parent for the control.
	SetZOrder (see page 5788)	Repositions the control in its parent's control list, thereby changing position onscreen.
	UpdateBoundsRect (see page 5789)	Changes the Top (see page 5844), Left (see page 5830), Width (see page 5849), and Height (see page 5825) properties of the control, but doesn't update its screen image and bypasses all resize events.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateExplicitBounds (see page 5789)	This is UpdateExplicitBounds, a member of class TControl.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	VisibleChanging (see page 5791)	Provides the interface for a method that responds to changes in the control's visibility.
V	WndProc (see page 5791)	Provides specific message responses for the control.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	ActionLink (see page 5798)	Contains the action link object associated with the control.
	Alignment (see page 21299)	Controls (see page 5711) the horizontal placement of the text within the label.
	AutoSize (see page 5803)	Specifies whether the control sizes itself automatically to accommodate its contents.
	AutoSize (see page 21299)	Determines whether the size of the label automatically resizes to accommodate the text.
R	Canvas (see page 6053)	Provides the drawing surface used by the graphic control.
	DesktopFont (see page 5818)	Specifies whether the control uses the Windows icon font when writing text.
	EllipsisPosition (see page 21305)	Specifies how ellipsis is placed in text not fitting in allocated rectangle.
	FocusControl (see page 21306)	Designates a windowed control associated with the label.
	IsControl (see page 5829)	Determines whether a form stores its form-specific properties to a stream.
	MouseCapture (see page 5831)	Indicates whether the control has "captured" mouse events.
	ScalingFlags (see page 5840)	Reflects which attributes of the control have been scaled.

	Text (see page 5842)	Contains a text string associated with the control.
	WheelAccumulator (see page 5849)	Accumulates mouse wheel rotations.
	WindowText (see page 5850)	Contains the text string of the control.

Public Events

	Name	Description
	WindowProc (see page 5872)	Points to the window procedure that responds to messages sent to the control.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	BeginDrag (see page 5740)	Starts the dragging of a control.
	BringToFront (see page 5740)	Puts the control in front of all other controls in its parent control.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	ClientToParent (see page 5744)	Translates client coordinates to parent coordinates.
	ClientToScreen (see page 5744)	Translates a given point from client area coordinates to global screen coordinates.
V	Create (see page 12131)	Creates a new TBoundLabel (see page 12123) object.
V	DefaultHandler (see page 5748)	Provides message handling for all messages that do not have specific handlers.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 5732)	Destroys an instance of TControl (see page 5724).
V	Destroy (see page 6052)	Destroys an instance of TGraphicControl (see page 6044).
V	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Dock (see page 5749)	Used internally to dock the control.
	DragDrop (see page 5754)	OnDragDrop (see page 5855) event dispatcher.
	Dragging (see page 5754)	Indicates whether a control is being dragged.
	DrawTextBiDiModeFlags (see page 5756)	Returns the text flags that reflect the current setting of the BiDiMode (see page 5803) property.
	DrawTextBiDiModeFlagsReadingOnly (see page 5756)	Returns the text flag to add that indicates whether the control's text should read from right to left.
	EndDrag (see page 5757)	Stops a control from being dragged any further.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.

	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetControlsAlignment (see page 5759)	Indicates how text is aligned within the control.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 5765)	Returns the parent of the control.
	GetTextBuf (see page 5766)	Retrieves the control's text, copies it into a buffer, and returns the number of characters copied.
	GetTextLen (see page 5767)	Returns the length of the control's text.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 5768)	Indicates whether the control has a parent.
	Hide (see page 5769)	Makes the control invisible.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
V	InitiateAction (see page 5769)	Calls the action link's Update (see page 5789) method if the control is associated with an action link.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
V	Invalidate (see page 5770)	Completely repaint control.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	IsRightToLeft (see page 5770)	Indicates whether the control should be reversed right to left.
	ManualDock (see page 5771)	Docks the control.
	ManualFloat (see page 5772)	Undocks the control.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	MouseWheelHandler (see page 5774)	Dispatches messages received from a mouse wheel.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	ParentToClient (see page 5776)	Translate parent coordinates to client coordinates.
	Perform (see page 5776)	Responds as if the control received a specified Windows message.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	Refresh (see page 5779)	Repaints the control on the screen.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	Repaint (see page 5779)	Forces the control to repaint its image on the screen.
	ReplaceDockedControl (see page 5779)	Docks the control in the place where another control is already docked.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	ScreenToClient (see page 5781)	Converts the screen coordinates of a specified point on the screen to client coordinates.
	SendToBack (see page 5782)	Puts a windowed control behind all other windowed controls, or puts a non-windowed control behind all other non-windowed controls.
V	SetBounds (see page 5783)	Sets the Left (see page 5830), Top (see page 5844), Width (see page 5849), and Height (see page 5825) properties all at once.
	SetDesignVisible (see page 5784)	Makes a control visible at design time.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.

	SetTextBuf (see page 5787)	Sets the text of the control.
	Show (see page 5788)	Makes a control visible.
V	Update (see page 5789)	Processes any pending paint messages immediately.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	UseRightToLeftAlignment (see page 5790)	Specifies whether the control's alignment should be reversed right-to-left.
	UseRightToLeftReading (see page 5790)	Specifies whether the control is using a right-to-left reading order.
	UseRightToLeftScrollBar (see page 5791)	Specifies whether the vertical scroll bar appears on the left side of the control.

Public Properties

	Name	Description
	Action (see page 5797)	Designates the action associated with the control.
	Align (see page 5798)	Determines how the control aligns within its container (parent control).
	Anchors (see page 5802)	Specifies how the control is anchored to its parent.
	BoundsRect (see page 5803)	Specifies the bounding rectangle of the control, expressed in the coordinate system of the parent control.
	Canvas (see page 21300)	Provides the drawing surface used by the graphic control.
	ClientHeight (see page 5808)	Specifies the height of the control's client area in pixels.
R	ClientOrigin (see page 5809)	Specifies the screen coordinates (in pixels) of the top left corner of a control's client area.
R	ClientRect (see page 5810)	Specifies the size (in pixels) of a control's client area.
	ClientWidth (see page 5811)	Specifies the horizontal size of the control's client area in pixels.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Constraints (see page 5812)	Specifies the size constraints for the control.
	ControlState (see page 5813)	Indicates the current state of a control at runtime.
	ControlStyle (see page 5814)	Determines style characteristics of the control.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DockOrientation (see page 5818)	Specifies how the control is docked relative to other controls docked in the same parent.
	Enabled (see page 5821)	Controls (see page 5711) whether the control responds to mouse, keyboard, and timer events.
R	ExplicitHeight (see page 5821)	Specifies the explicit vertical size of the control in pixels.
R	ExplicitLeft (see page 5822)	Specifies the explicit horizontal pixel coordinate of the left edge of a component relative to its parent.
R	ExplicitTop (see page 5822)	Specifies the explicit vertical pixel coordinate of the top edge of a component relative to its parent.
R	ExplicitWidth (see page 5822)	Specifies the explicit horizontal size of the control in pixels.
R	Floating (see page 5823)	Indicates whether the control is floating.
	FloatingDockSiteClass (see page 5823)	Specifies the class of the temporary control that hosts the control when it is floating.
	HostDockSite (see page 5829)	Specifies the control in which the control is docked.
	LRDockWidth (see page 5831)	Specifies the width of the control when it is docked horizontally.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Parent (see page 5832)	Indicates the parent of the control.
	TBDockHeight (see page 5842)	Specifies the height of the control when it is docked vertically.
	UndockHeight (see page 5845)	Specifies the height of the control when it is floating.
	UndockWidth (see page 5846)	Specifies the width of the control when it is floating.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	Visible (see page 5847)	Determines whether the component appears onscreen.

Published Events

	Name	Description
	OnClick (see page 12154)	Occurs when the user clicks the control.
	OnContextPopup (see page 12156)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnDblClick (see page 12157)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDragDrop (see page 12157)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 12159)	Occurs when the user drags an object over a control.
	OnEndDock (see page 12162)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 12162)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnMouseActivate (see page 12163)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 12164)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseMove (see page 12166)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 12168)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnStartDock (see page 12171)	Occurs when the user begins to drag a control with a DragKind of dkDock.
	OnStartDrag (see page 12171)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.

Published Properties

	Name	Description
	AlignWithMargins (see page 5802)	Indicates whether a control should be constrained by margins.
	BiDiMode (see page 12132)	Specifies the bi-directional mode for the control.
	Caption (see page 12133)	Specifies a text string that identifies the control to the user.
	Color (see page 12135)	Specifies the background color of the control.
	Cursor (see page 5815)	Specifies the image used to represent the mouse pointer when it passes into the region covered by the control.
	DragCursor (see page 12136)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 12137)	Specifies whether the control is being dragged normally or for docking.
	DragMode (see page 12137)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	Font (see page 12139)	Controls the attributes of text written on or in the control.
	Height (see page 12140)	Specifies the vertical size of the control in pixels.
	HelpContext (see page 5826)	Numeric ID for control's context-sensitive help topic
	HelpKeyword (see page 5826)	Keyword for control's context-sensitive help topic
	HelpType (see page 5827)	Indicates whether the control's context sensitive help topic is identified by context ID or by keyword.
	Hint (see page 5827)	Contains the text string that can appear when the user moves the mouse over the control.
	Layout (see page 12141)	Specifies the vertical placement of the text within the label.
R	Left (see page 12141)	Specifies the horizontal coordinate of the left edge of a component relative to its parent.
	Margins (see page 5831)	Specifies the margins for the control.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	ParentBiDiMode (see page 12142)	Specifies whether the control uses its parent's BiDiMode.
	ParentColor (see page 12142)	Determines where a control looks for its color information.
	ParentFont (see page 12143)	Determines where a control looks for its font information.
	ParentShowHint (see page 12143)	Determines where a control looks to find out if its Help Hint should be shown.
	PopupMenu (see page 12144)	Identifies the pop-up menu associated with the control.
	ShowAccelChar (see page 12148)	Determines how an ampersand in the label text is displayed.
	ShowHint (see page 12149)	Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.

	Tag (see page 2808)	Stores an integer value as part of a component.
R	Top (see page 12151)	Specifies the Y coordinate of the top left corner of a control, relative to its parent or containing control in pixels.
	Transparent (see page 12152)	Specifies whether controls that sit below the label on a form can be seen through the label.
	Width (see page 12153)	Specifies the horizontal size of the control or form in pixels.
	WordWrap (see page 12153)	Specifies whether the label text wraps when it is too long for the width of the label.

68.1.3.2 TBoundLabel.Create Constructor

Creates a new TBoundLabel (see page 12123) object.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TBoundLabel(TComponent * AOwner);
```

Description

Do not create instances of TBoundLabel (see page 12123). Bound labels are instantiated by the labeled edit controls to which they belong.

AOwner specifies the labeled edit control that acts as the bound label's Owner.

See Also

TLabeledEdit (see page 12833)

Owner (see page 2807)

68.1.3.3 TBoundLabel Methods

The methods of the TBoundLabel class are listed here.

Protected Methods

	Name	Description
V	AdjustBounds (see page 12131)	Resizes the label when the text changes.

68.1.3.3.1 TBoundLabel.AdjustBounds Method

Resizes the label when the text changes.

Pascal

```
procedure AdjustBounds; override;
```

C++

```
virtual __fastcall AdjustBounds();
```

Description

When the text in the label or the font changes, AdjustBounds is implicitly called. It redraws the text in the client area, and then resizes the label if the AutoSize property is true.

When WordWrap is true, the width of the label is fixed. If AutoSize is also true, changes to the text cause the label to change in height. When AutoSize is true and WordWrap is false, the height of the label is determined by the font, and changes to the text cause the label to change in width.

Override AdjustBounds to make additional adjustments when the text changes.

See Also

DoDrawText (see page 21296)

AutoSize (see page 21299)

68.1.3.4 TBoundLabel Properties

The properties of the TBoundLabel class are listed here.

Published Properties

	Name	Description
	BiDiMode (see page 12132)	Specifies the bi-directional mode for the control.
	Caption (see page 12133)	Specifies a text string that identifies the control to the user.
	Color (see page 12135)	Specifies the background color of the control.
	DragCursor (see page 12136)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 12137)	Specifies whether the control is being dragged normally or for docking.
	DragMode (see page 12137)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	Font (see page 12139)	Controls the attributes of text written on or in the control.
	Height (see page 12140)	Specifies the vertical size of the control in pixels.
	Layout (see page 12141)	Specifies the vertical placement of the text within the label.
R	Left (see page 12141)	Specifies the horizontal coordinate of the left edge of a component relative to its parent.
	ParentBiDiMode (see page 12142)	Specifies whether the control uses its parent's BiDiMode.
	ParentColor (see page 12142)	Determines where a control looks for its color information.
	ParentFont (see page 12143)	Determines where a control looks for its font information.
	ParentShowHint (see page 12143)	Determines where a control looks to find out if its Help Hint should be shown.
	PopupMenu (see page 12144)	Identifies the pop-up menu associated with the control.
	ShowAccelChar (see page 12148)	Determines how an ampersand in the label text is displayed.
	ShowHint (see page 12149)	Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.
R	Top (see page 12151)	Specifies the Y coordinate of the top left corner of a control, relative to its parent or containing control in pixels.
	Transparent (see page 12152)	Specifies whether controls that sit below the label on a form can be seen through the label.
	Width (see page 12153)	Specifies the horizontal size of the control or form in pixels.
	WordWrap (see page 12153)	Specifies whether the label text wraps when it is too long for the width of the label.

68.1.3.4.1 TBoundLabel.BiDiMode Property

Specifies the bi-directional mode for the control.

Pascal

```
property BiDiMode: TBiDiMode;
```

C++

```
__property TBiDiMode BiDiMode;
```

Description

Use BiDiMode to enable the control to adjust its appearance and behavior automatically when the application runs in a locale that reads from right to left instead of left to right. The bi-directional mode controls the reading order for the text, the placement of the vertical scroll bar, and whether the alignment is changed.

Alignment does not change for controls that are known to contain number, date, time, or currency values. For example, with data aware controls, the alignment does not change for the following field types: ftSmallint, ftInteger, ftWord, ftFloat, ftCurrency, ftBCD, ftDate, ftTime, ftDateTime, ftAutoInc.

See Also

UseRightToLeftAlignment (see page 5790)

UseRightToLeftReading (see page 5790)

UseRightToLeftScrollBar (see page 5791)

Including Bi-directional Functionality in Applications

68.1.3.4.2 TBoundLabel.Caption Property

Specifies a text string that identifies the control to the user.

Pascal

```
property Caption: TCaption;
```

C++

```
__property TCaption Caption;
```

Description

Use Caption to specify the text string that labels the control.

To underline a character in a Caption that labels a component, include an ampersand (&) before the character. This type of character is called an accelerator character. The user can then select the component by pressing Alt while typing the underlined character. To display an ampersand character in the caption, use two ampersands (&&).

Note: Controls that display text use either the Caption property or the Text property to specify the text value. Which property is used depends on the type of control. In general, Caption is used for text that appears as a window title or label, while Text is used for text that appears as the content of a control.

C++ Examples:

```
/*
The following code keeps the size of the label control
constant, even though the length of the label's caption
changes. As a result, the caption of the label is probably
too long to display in the label when the user clicks the
button:
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  Label1->AutoSize = false;
  Label1->Caption = "This string is too long as the caption of this label";
}
/*
This example requires a TPageControl populated by several
TabSheets, a TEdit and a TButton. When the button is
clicked, the caption of the active tab changes to that of
the TEdit.  These lines of code could also be written:
PageControl1.ActivePage.Caption := Edit1.Text;
This would make a TTabSheet variable unnecessary since
PageControl1.->ActivePage is already of type TTabSheet.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
```

```
  TTabSheet *sheet = PageControl1->ActivePage;
  sheet->Caption = Edit1->Text;
}
/*
This example creates a ToolBar and adds ToolButtons to it.
Include ComCtlrs in the uses clause.
*/
#include <comctrls.hpp>

void AddButtons(TToolBar *toolBar, TStringList *captions)
{
  for (int i = 0; i < captions->Count; i++)
  {
    TToolButton *button = new TToolButton(toolBar);
    button->Parent = toolBar;
    button->Caption = captions->Strings[i];
    if (button->Caption == "|")
      button->Style = tbsSeparator;
    else
      button->Style = tbsButton;
  }
}

TToolBar *myToolBar;

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  myToolBar = new TToolBar(this);
  myToolBar->Parent = this;
  TStringList *captions = new TStringList();
  captions->Add("New");
  captions->Add("Save");
  captions->Add("|");
  captions->Add("Cut");
  captions->Add("Copy");
  captions->Add("Paste");
  AddButtons(myToolBar, captions);
  delete captions;
  myToolBar->ShowCaptions = True;
  myToolBar->Height = 40;
}

void __fastcall TForm1::FormDestroy(TObject *Sender)
{
  for (int I = myToolBar->ButtonCount - 1; I >= 0; I--)
    delete myToolBar->Buttons[I];
  delete myToolBar;
}
```

Delphi Examples:

```
{
The following code keeps the size of the label control
constant, even though the length of the label's caption
changes. As a result, the caption of the label is probably
too long to display in the label when the user clicks the
button:
}
procedure TForm1.Button1Click(Sender: TObject);
begin
  Label1.AutoSize := False;
  Label1.Caption :=
    'This string is too long as the caption of this label';
end;
{
This example requires a TPageControl populated by several
TabSheets, a TEdit and a TButton. When the button is
```

```
clicked, the caption of the active tab changes to that of
the TEdit.  These lines of code could also be written:
PageControl1.ActivePage.Caption := Edit1.Text;
This would obviate the need for a TTabSheet variable since
PageControl1.->ActivePage is already of type TTabSheet.
}
procedure TForm1.Button1Click(Sender: TObject);
var
  sheet: TTabSheet;
begin
  sheet := PageControl1.ActivePage;
  sheet.Caption := Edit1.Text;
end;
{
This example creates a ToolBar and adds ToolButtons to it.
Include ComCtlrs in the uses clause.
}
procedure AddButtons(ToolBar: TToolBar;
  Const ButtonCaptions: array of String);
var
  I: Integer;
begin
  for I := 0 to High(ButtonCaptions) do
    begin
      with TToolButton.Create(ToolBar) do
      begin
        Parent := ToolBar;
        Caption := ButtonCaptions[I];
        if (ButtonCaptions[I] = '|') then
          Style := tbsSeparator
        else
          Style := tbsButton;
      end;
    end;
end;

procedure TForm1.FormCreate(Sender: TObject);
begin
  ToolBar1 := TToolBar.Create(Self);
  ToolBar1.Parent := Self;
  AddButtons(ToolBar1, ['New', 'Save', '|', 'Cut', 'Copy', 'Paste']);
  ToolBar1.ShowCaptions := True;
  ToolBar1.Height := 40;
end;

procedure TForm1.FormDestroy(Sender: TObject);
var
  I: Integer;
begin
  for I := ToolBar1.ButtonCount - 1 downto 0 do
    ToolBar1.Buttons[I].Free;
  ToolBar1.Free;
end;
```

68.1.3.4.3 TBoundLabel.Color Property

Specifies the background color of the control.

Pascal

```
property Color: TColor;
```

C++

```
__property TColor Color;
```

Description

Use Color to read or change the background color of the control.

If a control's ParentColor property is true, then changing the Color property of the control's parent automatically changes the Color property of the control. When the value of the Color property is changed, the control's ParentColor property is automatically set to false.

C++ Examples:

```
/*
The following code changes the color of a shape control
using the Color dialog box. The example displays the Color
dialog box when the Button1 button is clicked, allowing the
user to select a color with the dialog box. When a color
value is selected with the dialog box, it is assigned to
the shape control.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  if (ColorDialog1->Execute())
    Shape1->Brush->Color = ColorDialog1->Color;
}
```

Delphi Examples:

```
{
The following code changes the color of a shape control
using the Color dialog box. The example displays the Color
dialog box when the Button1 button is clicked, allowing the
user to select a color with the dialog box. When a color
value is selected with the dialog box, it is assigned to
the shape control.
}
procedure TForm1.Button1Click(Sender: TObject);
begin
  if ColorDialog1.Execute then
    Shape1.Brush.Color := ColorDialog1.Color;
end;
```

See Also

ParentColor (see page 5834)

68.1.3.4.4 TBoundLabel.DragCursor Property

Indicates the image used to represent the mouse pointer when the control is being dragged.

Pascal

```
property DragCursor: TCursor;
```

C++

```
__property TCursor DragCursor;
```

Description

Use the DragCursor property to change the cursor image presented when the control is being dragged.

Note: To make a custom cursor available for the DragCursor property, see the Cursor property.

See Also

Cursor (see page 5815)

DragKind (see page 5819)

DragMode (see page 5819)

68.1.3.4.5 TBoundLabel.DragKind Property

Specifies whether the control is being dragged normally or for docking.

Pascal

```
property DragKind: TDragKind;
```

C++

```
__property TDragKind DragKind;
```

Description

Use DragKind to get or set whether the control participates in drag-and-drop operations, or drag-and-dock operations.

See Also

DragCursor (see page 5818)

DragMode (see page 5819)

68.1.3.4.6 TBoundLabel.DragMode Property

Determines how the control initiates drag-and-drop or drag-and-dock operations.

Pascal

```
property DragMode: TDragMode;
```

C++

```
__property TDragMode DragMode;
```

Description

Use DragMode to control when the user can drag the control. Disable the drag-and-drop or drag-and-dock capability at runtime by setting the DragMode property value to dmManual. Enable automatic dragging by setting DragMode to dmAutomatic.

C++ Examples:

```
/*
The following code uses GetNodeAt to add a dragged node as a
child of the node under the mouse when it is dropped.  This
example requires a populated TreeView.  Also, the TTreeView
DragMode property set to dmAutomatic, and the TTreeView
OnDragOver event handler must be implemented to accept the
drop.
*/
void __fastcall TForm1::TreeView1DragDrop(TObject *Sender, TObject *Source,
      int X, int Y)
{
  if (Source != (TObject *)TreeView1 || TreeView1->Selected == NULL)
    return;
  THitTests HT = TreeView1->GetHitTestInfoAt(X, Y);
  TNodeAttachMode AttachMode;
  TTreeNode *Item = TreeView1->GetNodeAt(X, Y);
  if (HT.Contains(htOnItem) || HT.Contains(htOnIcon))
    AttachMode = naAddChild;
  else if (HT.Contains(htNowhere))
    AttachMode = naAdd;
  else if (HT.Contains(htOnIndent))
    AttachMode = naInsert;
  else
```

```
    return;
  TreeView1->Selected->MoveTo(Item, AttachMode);
}

void __fastcall TForm1::TreeView1DragOver(TObject *Sender, TObject *Source,
      int X, int Y, TDragState State, bool &Accept)
{
  Accept = (Source == (TObject *)TreeView1);
}
```

Delphi Examples:

```
{
The following code uses GetNodeAt to add a dragged node as a
child of the node under the mouse when it is dropped.  This
example requires a populated TreeView.  Also, the TTreeView
DragMode property set to dmAutomatic, and the TTreeView
OnDragOver event handler must be implemented to accept the
drop.
}
procedure TForm1.TreeView1DragDrop(Sender, Source: TObject; X, Y: Integer);
var
  AnItem: TTreeNode;
  AttachMode: TNodeAttachMode;
  HT: THitTests;
begin
  if TreeView1.Selected = nil then Exit;
  HT := TreeView1.GetHitTestInfoAt(X, Y);
  AnItem := TreeView1.GetNodeAt(X, Y);
  if (HT - [htOnItem, htOnIcon, htNowhere, htOnIndent] <> HT) then
  begin
    if (htOnItem in HT) or (htOnIcon in HT) then
      AttachMode := naAddChild
    else if htNowhere in HT then AttachMode := naAdd
    else if htOnIndent in HT then AttachMode := naInsert;
    TreeView1.Selected.MoveTo(AnItem, AttachMode);
  end;
end;

procedure TForm1.TreeView1DragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := Source is TTreeView;
end;
```

Arranging the Order of Persistent Columns

68.1.3.4.7 TBoundLabel.Font Property

Controls the attributes of text written on or in the control.

Pascal

```
property Font: TFont;
```

C++

```
__property TFont Font;
```

Description

To change to a new font, specify a new TFont object. To modify a font, change the value of the Charset, Color, Height, Name, Pitch, Size, or Style of the TFont object.

C++ Examples:

```
/*
To use this example, place a TComboBox and TRichEdit or
TMemo on a form.  During form creation, a list of font names
is loaded into the combo box. When the combo box is clicked,
the memo or Rich Edit control font is set to the
corresponding font name in the combo box.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < Screen->Fonts->Count; i++)
   ComboBox1->Items->Add(Screen->Fonts->Strings[i]);
//  ComboBox1->Items = Screen->Fonts;  // Another way to do it.
}

void __fastcall TForm1::ComboBox1Change(TObject *Sender)
{
  RichEdit1->Font->Name = ComboBox1->Text;
}
```

Delphi Examples:

```
{
To use this example, place a TComboBox and TRichEdit or
TMemo on a form.  During form creation, a list of font names
is loaded into the combo box. When the combo box is clicked,
the memo or Rich Edit control font is set to the
corresponding font name in the combo box.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  i : Integer;
begin
  for i := 0 to Screen.Fonts.Count - 1 do
   ComboBox1.Items.Add(Screen.Fonts.Strings[i]);
//  ComboBox1.Items := Screen.Fonts;  // Another way to do it.
  RichEdit1.Lines.Text := 'How is it to be you?';
end;

procedure TForm1.ComboBox1Click(Sender: TObject);
begin
  RichEdit1.Font.Name := ComboBox1.Text;
end;
```

Displaying and Editing Text in a Memo Control

68.1.3.4.8 TBoundLabel.Height Property

Specifies the vertical size of the control in pixels.

Pascal

```
property Height: Integer;
```

C++

```
__property int Height;
```

Description

Use the Height property to read or change the height of the control.

C++ Examples:

```
/*
This example needs only a blank form.  Three Rich Edit
controls are placed vertically on the form, each contain a
line of text, and the second form has HideSelection set to
false.  Try tabbing between the three Rich Edit controls and
observe the effect on the selected text.
*/
#include <ComCtrls.hpp>

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int I = 0; I <= 2; I++)
  {
    TRichEdit *pRich = new TRichEdit(this);
    pRich->Parent = this;
    pRich->Top = pRich->Height * I;
    pRich->Text = "This text will take the focus.";
    pRich->SelStart = 0;
    pRich->SelLength = pRich->Text.Length();
    if (I == 1)
      pRich->HideSelection = false;
  }
}
```

Delphi Examples:

```
{
HideSelection, Height example
This example needs only a blank form. Three Rich Edit
controls are placed vertically on the form, each contain a
line of text, and the second form has HideSelection set to
false.  Try tabbing between the three Rich Edit controls and
observe the effect on the selected text.
}
uses ComCtrls;

procedure TForm1.FormCreate(Sender: TObject);
var
  I: Integer;
begin
  for I := 0 to 2 do
    with TRichEdit.Create(Self) do
    begin
      Parent := Self;
      Top := Height * I;
      Text := 'This text will take the focus.';
      SelStart := 0;
```

```
        SelLength := Length(Text);
        if (I = 1) then
          HideSelection := False;
      end;
  end;
```

Using TDBListBox and TDBComboBox

68.1.3.4.9 TBoundLabel.Layout Property

Specifies the vertical placement of the text within the label.

Pascal

```
property Layout: TTextLayout;
```

C++

```
__property TTextLayout Layout;
```

Description

Set Layout to specify how the text of the label is placed within the ClientRect of the label control. Layout is the vertical analog to the Alignment property.

See Also

Alignment (see page 21299)

ClientRect (see page 5810)

68.1.3.4.10 TBoundLabel.Left Property

Specifies the horizontal coordinate of the left edge of a component relative to its parent.

Pascal

```
property Left: Integer;
```

C++

```
__property int Left;
```

Description

Use the Left property to determine where the left side of the control begins or to reposition the left side of the control.

If the control is contained in another control, the Left and Top properties are relative to the parent control. If the control is contained directly by the form, the property values are relative to the form. For forms, the value of the Left property is relative to the screen in pixels.

C++ Examples:

```
/*
Place a TTimer object in the form and enter Timer1Timer in
the OnTimer event.  Place other controls in the form and
change the active control at runtime.  The following event
handler responds to timer events by moving the active control
one pixel to the right every 100 miliseconds:
*/
void __fastcall TForm1::Timer1Timer(TObject *Sender)
```

```
{
  Timer1->Interval = 100;
  if (ActiveControl)
    ActiveControl->Left = ActiveControl->Left + 1;
}
```

Delphi Examples:

```
{
Place a TTimer object in the form and enter Timer1Timer in
the OnTimer event.  Place other controls in the form and
change the active control at runtime.  The following event
handler responds to timer events by moving the active control
one pixel to the right every 100 miliseconds:
}
procedure TForm1.Timer1Timer(Sender: TObject);
begin
  Timer1.Interval := 100;
  if ActiveControl <> nil then
    ActiveControl.Left := ActiveControl.Left + 1;
end;
```

68.1.3.4.11 TBoundLabel.ParentBiDiMode Property

Specifies whether the control uses its parent's BiDiMode.

Pascal

```
property ParentBiDiMode: Boolean;
```

C++

```
__property Boolean ParentBiDiMode;
```

Description

Use ParentBiDiMode to get or set whether the control uses its parent's BiDiMode. When ParentBiDiMode is true, the control's BiDiMode property is always equal to that of its parent. If ParentBiDiMode is false, the control uses its own BiDiMode property.

Set ParentBiDiMode to true for all controls in a form in order to ensure that the entire user interface adjusts to Middle Eastern locales in a uniform manner.

When the value of the control's BiDiMode property changes, ParentBiDiMode becomes false automatically.

See Also

Parent (see page 5832)

BiDiMode (see page 5803)

68.1.3.4.12 TBoundLabel.ParentColor Property

Determines where a control looks for its color information.

Pascal

```
property ParentColor: Boolean;
```

C++

```
__property Boolean ParentColor;
```

Description

To have a control use the same color as its parent control, set ParentColor to true. If ParentColor is false, the control uses its own Color property.

Set ParentColor to true for all controls in order to ensure that all the controls on a form have a uniform appearance. For example, if ParentColor is true for all controls in a form, changing the background color of the form to gray causes all the controls on the form to also have a gray background.

When the value of a control's Color property changes, ParentColor becomes false automatically.

See Also

Color (see page 5812)

Parent (see page 5832)

ParentFont (see page 5834)

ParentShowHint (see page 5835)

68.1.3.4.13 TBoundLabel.ParentFont Property

Determines where a control looks for its font information.

Pascal

```
property ParentFont: Boolean;
```

C++

```
__property Boolean ParentFont;
```

Description

To have a control use the same font as its parent control, set ParentFont to true. If ParentFont is false, the control uses its own Font property. Many controls default ParentFont to true so that all the controls in a form or other container present a uniform appearance. When the value of a control's Font property changes, ParentFont becomes false automatically.

When ParentFont is true for a form, the form uses the default font.

See Also

Font (see page 5823)

Parent (see page 5832)

ParentColor (see page 5834)

ParentShowHint (see page 5835)

68.1.3.4.14 TBoundLabel.ParentShowHint Property

Determines where a control looks to find out if its Help Hint should be shown.

Pascal

```
property ParentShowHint: Boolean;
```

C++

```
__property Boolean ParentShowHint;
```

Description

Use ParentShowHint to ensure that all the controls on a form either uniformly show their Help Hints or uniformly do not show

them.

If ParentShowHint is true, the control uses the ShowHint property value of its parent. If ParentShowHint is false, the control uses the value of its own ShowHint property.

To provide Help Hints for only selected controls on a form, set the ShowHint property for those controls that should have Help Hints to true, and ParentShowHint becomes false automatically.

Note: Enable or disable all Help Hints for the entire application using the ShowHint property of the application object.

68.1.3.4.15 TBoundLabel.PopupMenu Property

Identifies the pop-up menu associated with the control.

Pascal

```
property PopupMenu: TPopupMenu;
```

C++

```
__property TPopupMenu PopupMenu;
```

Description

Assign a value to PopupMenu to make a pop-up menu appear when the user selects the control and clicks the right mouse button. If the TPopupMenu's AutoPopup property is true, the pop-up menu appears automatically. If the menu's AutoPopup property is false, display the menu with a call to its Popup method from the control's OnContextPopup event handler.

C++ Examples:

```
/*
This example uses two edit boxes and one pop-up menu on a form.
The pop-up menu contains Cut, Copy, and Paste commands. This code
makes the pop-up menu available to both edit boxes:
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  PopupMenu1->AutoPopup = true;
  Edit1->PopupMenu = PopupMenu1;
  Edit2->PopupMenu = PopupMenu1;
}

/*
These are the cut, copy, and paste OnClick events for the commands
on the pop-up menu. Double click on the pop-up menu and add three
TMenuItems.  Then set the captions to "Cut", "Copy" and "Paste".
The names will be automatically set to "Cut1", "Copy1", and
"Paste1".  Then double click on the OnClick events and they will
be named "Cut1Click", "Copy1Click" and "Paste1Click" respectively.
Note: only the selected portion of the string in the edit box will
be copied, cut or replaced.
*/
void __fastcall TForm1::Copy1Click(TObject *Sender)
{
```

```
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
    if (pComponent->ClassNameIs("TEdit"))
      ((TEdit *)pComponent)->CopyToClipboard();
    else
      MessageBeep(0);
  }
  else
    MessageBeep(0);
}

void __fastcall TForm1::Cut1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
    if (pComponent->ClassNameIs("TEdit"))
      ((TEdit *)pComponent)->CutToClipboard();
    else
      MessageBeep(0);
  }
  else
    MessageBeep(0);
}

void __fastcall TForm1::Paste1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
    if (pComponent->ClassNameIs("TEdit"))
      ((TEdit *)pComponent)->PasteFromClipboard();
    else
      MessageBeep(0);
  }
  else
    MessageBeep(0);
}
/*
This example demonstrates how to add and delete menu items
to a popup menu at runtime and assign an event handler to
the OnClick event.  Place a TPopupMenu and three buttons on
the form named "AddButton", "EditButton",  and
"DestroyButton" and add OnClick events to all three buttons.
Put the TPopupMenu in the PopupMenu property of the form.
Place the PopupMenuItemsClick procedure in the TForm1 type
declaration so that it can be used as the method call for
the menu item OnClick event.
*/
void __fastcall TForm1::AddButtonClick(TObject *Sender)
{
    const int num_items = 4;
    for (int index = 0; index < num_items; ++index)
    {
        TMenuItem *NewItem = new TMenuItem(PopupMenu1); // create the new item
        PopupMenu1->Items->Add(NewItem);// add it to the Popupmenu
        NewItem->Caption = "Menu Item " + IntToStr(index);
        NewItem->Tag = index;
        NewItem->OnClick = PopupMenuItemsClick;// assign it an event handler
        TNotifyEvent();
    }
}

void __fastcall TForm1::PopupMenuItemsClick(TObject *Sender)
{
```

```
    TMenuItem *ClickedItem = dynamic_cast<TMenuItem *>(Sender);
    if (ClickedItem)
    {
        switch (ClickedItem->Tag)
        {
            case 0:
            {
                ShowMessage("first item clicked");
                break;
            }
            case 1:
            {
                ShowMessage("second item clicked");
                break;
            }
            case 2:
            {
                ShowMessage("third item clicked");
                break;
            }
            case 3:
            {
                ShowMessage("fourth item clicked");
                break;
            }
        }
    }
}

/*
To edit or destroy an item, grab its pointer via the Items
property.
*/
void __fastcall TForm1::EditButtonClick(TObject *Sender)
{
    const int index = 1;
    TMenuItem *ItemToEdit = PopupMenu->Items->Items[index];
    ItemToEdit->Caption = "Changed Caption";
}

void __fastcall TForm1::DestroyButtonClick(TObject *Sender)
{
    const int index = 2;
    TMenuItem *ItemToDelete = PopupMenu->Items->Items[index];
    delete ItemToDelete;
}
```

Delphi Examples:

```
{
This example uses two edit boxes and one pop-up menu on a form.
The pop-up menu contains Cut, Copy, and Paste commands. This code
makes the pop-up menu available to both edit boxes:
}
procedure TForm1.FormCreate(Sender: TObject);
begin
  PopupMenu1.AutoPopup := True;
  Edit1.PopupMenu := PopupMenu1;
  Edit2.PopupMenu := PopupMenu1;
end;

{
These are the cut, copy, and paste OnClick events for the commands
on the pop-up menu. Double click on the pop-up menu and add three
TMenuItems.  Then set the captions to "Cut", "Copy" and "Paste".
The names will be automatically set to "Cut1", "Copy1", and
"Paste1".  Then double click on the OnClick events and they will
```

```
be named "Cut1Click", "Copy1Click" and "Paste1Click" respectively.
Note: only the selected portion of the string in the edit box will
be copied, cut or replaced.
}
procedure TForm1.Copy1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
   Edit1.CopyToClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.CopyToClipboard
  else
    Beep;
end;

procedure TForm1.Cut1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
    Edit1.CutToClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.CutToClipboard
  else
    Beep;
end;

procedure TForm1.Paste1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
    Edit1.PasteFromClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.PasteFromClipboard
  else
    Beep;
end;
{
This example demonstrates how to add and delete menu items
to a popup menu at runtime and assign an event handler to
the OnClick event.  Place a TPopupMenu and three buttons on
the form named "AddButton", "EditButton",  and
"DestroyButton" and add OnClick events to all three buttons.
Put the TPopupMenu in the PopupMenu property of the form.
Place the PopupMenuItemsClick procedure in the TForm1 type
declaration so that it can be used as the method call for
the menu item OnClick event.
}

68.1.3.4.16 TBoundLabel.ShowAccelChar Property

Determines how an ampersand in the label text is displayed.

Pascal

```
property ShowAccelChar: Boolean;
```

C++

```
__property Boolean ShowAccelChar;
```

Description

Set ShowAccelChar to true to allow the label to display an underlined accelerator key value. When ShowAccelChar is true, any character preceded by an ampersand (&) appears underlined. If the FocusControl property is set, the windowed control specified by the FocusControl property receives input focus when the user types that underlined character. To display an ampersand when ShowAccelChar is true, use two ampersands (&&) to stand for the single ampersand that is displayed.

Set ShowAccelChar to false to display the label text with all ampersands appearing as ampersands. When ShowAccelChar is false, the value of the FocusControl property is not used.

C++ Examples:

```
/*
This example uses two labels on a form. The first label has
a caption with an accelerator character in it. The second
label also includes an ampersand, but it does not appear as
an accelerator character.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  Label1->ShowAccelChar = true;
  Label1->Caption = "An &Underlined character appears here";
  Label2->ShowAccelChar = false;
  Label2->Caption = "An ampersand (&) appears here";
}
```

Delphi Examples:

```
{
This example uses two labels on a form. The first label has
a caption with an accelerator character in it. The second
label also includes an ampersand, but it does not appear as
an accelerator character.
}
procedure TForm1.FormCreate(Sender: TObject);
begin
  Label1.ShowAccelChar := True;
  Label1.Caption := 'An &Underlined character appears here';
  Label2.ShowAccelChar := False;
  Label2.Caption := 'An ampersand (&) appears here';
end;
```

FocusControl (see page 21306)

GetLabelText (see page 21297)

68.1.3.4.17 TBoundLabel.ShowHint Property

Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.

Pascal

```
property ShowHint: Boolean;
```

C++

```
__property Boolean ShowHint;
```

Description

The Help Hint is the value of the Hint property, which is displayed in a box just beneath the control. Use ShowHint to determine whether a Help Hint appears for the control.

To enable Help Hint for a particular control, the application ShowHint property must be true and either

the control's own ShowHint property must be true, or

the control's ParentShowHint property must be true and its parent's ShowHint property must be true.

For example, imagine a check box within a group box. If the ShowHint property of the group box is true and the ParentShowHint property of the check box is true, but the ShowHint property of the check box is false, the check box still displays its Help Hint.

Changing the ShowHint value automatically sets the ParentShowHint property to false.

C++ Examples:

```
/*
This example uses an edit box and a list box on a form.
Items are added to the list box and a Help Hint is assigned
to both controls. The last statement enables the Help Hints
for the entire application.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  Edit1->Hint = "Enter your name";
  Edit1->ShowHint = true;

  char string[10];
  char index[3];
  for(int i = 1; i <= 10; i++)
  {
    strcpy(string, "Item");
    itoa(i, index, 10);
    strcat(string, index);
    ListBox1->Items->Add(string);
  }
  ListBox1->Hint = "Select an item";
  ListBox1->ShowHint = true;
  Application->ShowHint = true;
}
/*
Note: To see an example that displays the hints of controls
in some place other than in a Help Hint box, see the OnHint
example.
*/
```

Delphi Examples:

```
{
This example uses an edit box and a list box on a form.
Items are added to the list box and a Help Hint is assigned
to both controls. The last statement enables the Help Hints
for the entire application.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  I: Integer;
begin
  Edit1.Hint := 'Enter your name';
  Edit1.ShowHint := True;
  with ListBox1 do
  begin
    for I := 1 to 10 do
      Items.Add('Item ' + IntToStr(I));
```

```
    Hint := 'Select an item';
    ShowHint := True;
  end;
  Application.ShowHint := True;
end;
{
Note: To see an example that displays the hints of controls
in some place other than in a Help Hint box, see the OnHint
example.
}
```

Displaying Fly-over Help

68.1.3.4.18 TBoundLabel.Top Property

Specifies the Y coordinate of the top left corner of a control, relative to its parent or containing control in pixels.

Pascal

```
property Top: Integer;
```

C++

```
__property int Top;
```

Description

Use Top to locate the top of the control or reposition the control to a different Y coordinate. The Top property, like the Left property, is the position of the control relative to its container. Thus, if a control is contained in a TPanel, the Left and Top properties are relative to the panel. If the control is contained directly by the form, it is relative to the form. For forms, the value of the Top property is relative to the screen in pixels.

C++ Examples:

```
/*
This example uses an updown control and a group box on a
form, with several controls contained within the group box.
When the updown control or is clicked, the controls within
the group box are moved in the appropriate direction.
*/
void __fastcall TForm1::UpDown1Click(TObject *Sender, TUDBtnType Button)
{
  int I;
  TControl *ChildControl;

  for (I = 0; I < GroupBox1->ControlCount; I++)
  {
    ChildControl = GroupBox1->Controls[I];
    if (Button == btNext)
      ChildControl->Top = ChildControl->Top + 15;
    else
      ChildControl->Top = ChildControl->Top - 15;
  }
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  const TColor colorarray[5] = {clYellow, clGreen, clBlue, clLime, clFuchsia};
```

```
  GroupBox1->Brush->Color = clRed;
  for (int i = 0; i < GroupBox1->ControlCount; i++)
    ((TWinControl *)GroupBox1->Controls[i])->Brush->Color = colorarray[i];
}
```

Delphi Examples:

```
{
This example uses an updown control and a group box on a
form, with several controls contained within the group box.
When the updown control or is clicked, the controls within
the group box are moved in the appropriate direction.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  I: Integer;
const
  colorarray : Array[0..4] of TColor = (clYellow, clGreen, clBlue, clLime, clFuchsia);
begin
   GroupBox1.Brush.Color := clRed;
  for I:= 0 to GroupBox1.ControlCount -1 do
  begin
    TWinControl(GroupBox1.Controls[I]).Brush.Color := colorarray[I];
  end;
end;

procedure TForm1.UpDown1Click(Sender: TObject; Button: TUDBtnType);
var
  I: Integer;
  ChildControl: TControl;
begin
  for I:= 0 to GroupBox1.ControlCount -1 do
  begin
    ChildControl := GroupBox1.Controls[I];
    if Button = btNext then
      ChildControl.Top := ChildControl.Top + 15
    else
      ChildControl.Top := ChildControl.Top - 15;
  end;
end;
```

See Also

Left (see page 5830)

68.1.3.4.19 TBoundLabel.Transparent Property

Specifies whether controls that sit below the label on a form can be seen through the label.

Pascal

```
property Transparent: Boolean;
```

C++

```
__property Boolean Transparent;
```

Description

Set Transparent to true to prevent the label from obscuring other controls on the form. For example, if the label is used to add text to a graphic, set Transparent to true so that the label does not stand out as a separate object.

Writing text so that the background is transparent is slower than writing text when Transparent is false. If the label is not obscuring a complicated image, performance can be improved by setting the background color of the label to match the object beneath it and setting Transparent to false.

See Also

Color (see page 5812)

ParentColor (see page 5834)

68.1.3.4.20 TBoundLabel.Width Property

Specifies the horizontal size of the control or form in pixels.

Pascal

```
property Width: Integer;
```

C++

```
__property int Width;
```

Description

Use the Width property to read or change the width of the control.

Note: For tab sheet controls, changing this property at runtime has no effect.

See Also

ClientWidth (see page 5811)

Height (see page 5825)

Left (see page 5830)

68.1.3.4.21 TBoundLabel.WordWrap Property

Specifies whether the label text wraps when it is too long for the width of the label.

Pascal

```
property WordWrap: Boolean;
```

C++

```
__property Boolean WordWrap;
```

Description

Set WordWrap to true to allow the label to display multiple line of text. When WordWrap is true, text that is too wide for the label control wraps at the right margin and continues in additional lines.

Set WordWrap to false to limit the label to a single line. When WordWrap is false, text that is too wide for the label appears truncated.

See Also

ClientWidth (see page 5811)

GetLabelText (see page 21297)

68.1.3.5 TBoundLabel Events

The events of the TBoundLabel class are listed here.

Published Events

	Name	Description
	OnClick (see page 12154)	Occurs when the user clicks the control.
	OnContextPopup (see page 12156)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnDblClick (see page 12157)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDragDrop (see page 12157)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 12159)	Occurs when the user drags an object over a control.
	OnEndDock (see page 12162)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 12162)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnMouseActivate (see page 12163)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 12164)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseMove (see page 12166)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 12168)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnStartDock (see page 12171)	Occurs when the user begins to drag a control with a DragKind of dkDock.
	OnStartDrag (see page 12171)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.

68.1.3.5.1 TBoundLabel.OnClick Event

Occurs when the user clicks the control.

Pascal

```
property OnClick: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnClick;
```

Description

Use the OnClick event handler to respond when the user clicks the control. If the control has an associated action, and that action has an OnExecute method, the action's OnExecute method responds to click events unless it is superseded by an OnClick event handler.

Usually OnClick occurs when the user presses and releases the left mouse button with the mouse pointer over the control. This event can also occur when:

- The user selects an item in a grid, outline, list, or combo box by pressing an arrow key.
- The user presses Spacebar while a button or check box has focus.
- The user presses Enter when the active form has a default button (specified by the Default property).
- The user presses Esc when the active form has a cancel button (specified by the Cancel property).
- The user presses the accelerator key for a button or check box. For example, if the value of the Caption property of a check box is '&Bold', the B is underlined at runtime and the OnClick event of the check box is triggered when the user presses Alt+B. However, focus does not move to the control in these instances.
- The Checked property of a radio button is set to true.
- The value of the Checked property of a check box is changed.
- The Click method of a menu item is called.

For a form, an OnClick event occurs when the user clicks a blank area of the form or on a disabled component.

C++ Examples:

```
/*
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
*/
void __fastcall TForm1::PageControl1Change(TObject *Sender)
{
  CheckBox1->Checked = PageControl1->ActivePage->Visible;
}

void __fastcall TForm1::CheckBox1Click(TObject *Sender)
{
  PageControl1->ActivePage->Visible = CheckBox1->Checked;
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < 10; i++)
  {
    TTabSheet *pPage = new TTabSheet(this);
    pPage->PageControl = PageControl1;
    pPage->Caption = AnsiString("Page") + IntToStr(i);
    TEdit *pEdit = new TEdit(this);
    pEdit->Parent = pPage;
    pEdit->Left = random(pPage->ClientWidth - pEdit->Width);
    pEdit->Top = random(pPage->ClientHeight - pEdit->Height);
  }
  PageControl1Change(Sender);
}
```

Delphi Examples:

```
{
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
}
procedure TForm1.CheckBox1Click(Sender: TObject);
begin
  PageControl1.ActivePage.Visible := CheckBox1.Checked;
end;

procedure TForm1.PageControl1Change(Sender: TObject);
begin
  CheckBox1.Checked := PageControl1.ActivePage.Visible;
end;

procedure TForm1.FormCreate(Sender: TObject);
var
  i: Integer;
begin
  for i := 0 to 9 do
    with TTabSheet.Create(Self) do
    begin
      PageControl := PageControl1;
      Caption := 'TabSheet' + IntToStr(i);
      with TEdit.Create(Self) do
      begin
        Parent := PageControl1.Pages[i];
        Left := Random(PageControl1.ActivePage.ClientWidth - Width);
        Top := Random(PageControl1.ActivePage.ClientHeight - Height);
```

```
      end;
    end;
    PageControl1Change(Sender);
end;
```

68.1.3.5.2 TBoundLabel.OnContextPopup Event

Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).

Pascal

```
property OnContextPopup: TContextPopupEvent;
```

C++

```
__property TContextPopupEvent OnContextPopup;
```

Description

The OnContextPopup handler is called when the user uses the mouse or keyboard to request a popup menu. The OnContextPopup event is generated by a WM_CONTEXTMENU message, which is itself generated by the user clicking the right mouse button or by pressing SHIFT+F10 or the Applications key.

This event is especially useful when the control does not have an associated popup menu (the PopupMenu property is not set) or if the AutoPopup property of the control's associated popup menu is false. However, the OnContextPopup can also be used to override the automatic context menu that appears when the control has an associated popup menu with an AutoPopup property of true. In this last case, if the event handler displays its own menu, it should set the Handled parameter to true to suppress the default context menu.

The handler's MousePos parameter indicates the position of the mouse, in client coordinates.. If the event was not generated by a mouse click, MousePos is (-1,-1).

Note: Parent controls receive an OnContextPopup event before their child controls. In addition, for many child controls, the default window procedure causes the parent control to receive an OnContextPopup event after the child control. As a result, when parent controls do not set Handled to true in an OnContextPopup event handler, the event handler may be called multiple times for each context menu invocation.

68.1.3.5.3 TBoundLabel.OnDblClick Event

Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.

Pascal

```
property OnDblClick: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnDblClick;
```

Description

Use the OnDblClick event to respond to mouse double-clicks.

OnClick (see page 5851)

Responding to User Actions at Runtime

68.1.3.5.4 TBoundLabel.OnDragDrop Event

Occurs when the user drops an object being dragged.

Pascal

```
property OnDragDrop: TDragDropEvent;
```

C++

```
__property TDragDropEvent OnDragDrop;
```

Description

Use the OnDragDrop event handler to specify what happens when the user drops an object. The Source parameter of the OnDragDrop event is the object being dropped, and the Sender is the control the object is being dropped on. The X and Y parameters are the coordinates of the mouse positioned over the control.

C++ Examples:

```
/*
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
*/

// This OnDragOver event handler permits the list box to
// accept a dropped label:
void __fastcall TForm1::ListBox1DragOver(TObject *Sender, TObject *Source, int X, int Y,
TDragState State, bool &Accept)
{
   Accept = Source->ClassNameIs("TLabel");
}

/*
This OnDragDrop event handler implements the drop behavior.
*/
void __fastcall TForm1::ListBox1DragDrop(TObject *Sender, TObject *Source, int X, int Y)
{
  if (Sender->ClassNameIs("TListBox") && Source->ClassNameIs("TLabel"))
  {
```

```
    TListBox *DestList = (TListBox *)Sender;
    DestList->Font = ((TLabel *)Source)->Font;
    DestList->Color = ((TLabel *)Source)->Color;
    DestList->DoubleBuffered = true;
    DestList->Color = clWindow;
  }
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  ListBox1->Items->Add("Not");
  ListBox1->Items->Add("In");
  ListBox1->Items->Add("Alphabetical");
  ListBox1->Items->Add("Order");

}
```

Delphi Examples:

```
{
This code is an OnDragOver event handler that won't allow a
label control to be dropped on a panel control and stops the
dragging of the label as soon as the user drags the label
onto the panel:
Note: Set the label's DragMode property to dmAutomatic.
}
procedure TForm1.FormDragDrop(Sender, Source: TObject; X, Y: Integer);
begin
  TForm1(Source).Left := X;
  TForm1(Source).Top := Y;
end;

procedure TForm1.FormDragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := Source is TLabel;
end;

procedure TForm1.Panel1DragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := False;
  if (Source is TLabel) and (State = dsDragEnter) then
    (Source as TLabel).EndDrag(False);
end;
{
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
}

procedure TForm1.FormCreate(Sender: TObject);
begin
  ListBox1.Items.Add('Not');
  ListBox1.Items.Add('In');
  ListBox1.Items.Add('Alphabetical');
  ListBox1.Items.Add('Order');
end;

// This OnDragOver event handler permits the list box to
// accept a dropped label:

procedure TForm1.ListBox1DragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
```

```
begin
  Accept := Source is TLabel;
end;

// This OnDragDrop event handler implements the drop behavior.

procedure TForm1.ListBox1DragDrop(Sender, Source: TObject; X, Y: Integer);
begin
  if (Sender is TListBox) and (Source is TLabel) then
  begin
    with Sender as TListBox do
    begin
      Font := (Source as TLabel).Font;
      Color := (Source as TLabel).Color;
      DoubleBuffered := true;
      Color := clWindow;
    end;
  end;
end;

68.1.3.5.5 TBoundLabel.OnDragOver Event

Occurs when the user drags an object over a control.

Pascal

```
property OnDragOver: TDragOverEvent;
```

C++

```
__property TDragOverEvent OnDragOver;
```

Description

Use an OnDragOver event to signal that the control can accept a dragged object so the user can drop or dock it.

Within the OnDragOver event handler, change the Accept parameter to false to reject the dragged object. Leave Accept as true to allow the user to drop or dock the dragged object on the control.

To change the shape of the cursor, indicating that the control can accept the dragged object, change the value of the DragCursor property for the control before the OnDragOver event occurs.

The Source is the object being dragged, the Sender is the potential drop or dock site, and X and Y are screen coordinates in pixels. The State parameter specifies how the dragged object is moving over the control.

Note: Within the OnDragOver event handler, the Accept parameter defaults to true. However, if an OnDragOver event handler is not supplied, the control rejects the dragged object, as if the Accept parameter were changed to false.

C++ Examples:

```
/*
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
*/

// This OnDragOver event handler permits the list box to
// accept a dropped label:
void __fastcall TForm1::ListBox1DragOver(TObject *Sender, TObject *Source, int X, int Y,
TDragState State, bool &Accept)
{
   Accept = Source->ClassNameIs("TLabel");
}

/*
This OnDragDrop event handler implements the drop behavior.
*/
void __fastcall TForm1::ListBox1DragDrop(TObject *Sender, TObject *Source, int X, int Y)
{
  if (Sender->ClassNameIs("TListBox") && Source->ClassNameIs("TLabel"))
  {
    TListBox *DestList = (TListBox *)Sender;
    DestList->Font = ((TLabel *)Source)->Font;
    DestList->Color = ((TLabel *)Source)->Color;
    DestList->DoubleBuffered = true;
    DestList->Color = clWindow;
  }
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  ListBox1->Items->Add("Not");
  ListBox1->Items->Add("In");
  ListBox1->Items->Add("Alphabetical");
  ListBox1->Items->Add("Order");

}
```

Delphi Examples:

```
{
This code is an OnDragOver event handler that won't allow a
label control to be dropped on a panel control and stops the
dragging of the label as soon as the user drags the label
onto the panel:
Note: Set the label's DragMode property to dmAutomatic.
}
procedure TForm1.FormDragDrop(Sender, Source: TObject; X, Y: Integer);
begin
  TForm1(Source).Left := X;
  TForm1(Source).Top := Y;
end;

procedure TForm1.FormDragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := Source is TLabel;
end;

procedure TForm1.Panel1DragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
```

```
    Accept := False;
    if (Source is TLabel) and (State = dsDragEnter) then
      (Source as TLabel).EndDrag(False);
  end;
  {
  This code comes from an application that contains a list box
  and three labels, each with a different font and color.  The
  DragMode property for each of the labels is dmAutomatic.
  The user can select a label and drag it to a list box and
  drop it. When the label is dropped, the items in the list
  box assume the color and font of the dropped label.
  }

  procedure TForm1.FormCreate(Sender: TObject);
  begin
    ListBox1.Items.Add('Not');
    ListBox1.Items.Add('In');
    ListBox1.Items.Add('Alphabetical');
    ListBox1.Items.Add('Order');
  end;

  // This OnDragOver event handler permits the list box to
  // accept a dropped label:

  procedure TForm1.ListBox1DragOver(Sender, Source: TObject; X, Y: Integer;
    State: TDragState; var Accept: Boolean);
  begin
    Accept := Source is TLabel;
  end;

  // This OnDragDrop event handler implements the drop behavior.

  procedure TForm1.ListBox1DragDrop(Sender, Source: TObject; X, Y: Integer);
  begin
    if (Sender is TListBox) and (Source is TLabel) then
    begin
      with Sender as TListBox do
      begin
        Font := (Source as TLabel).Font;
        Color := (Source as TLabel).Color;
        DoubleBuffered := true;
        Color := clWindow;
      end;
    end;
  end;
```

68.1.3.5.6 TBoundLabel.OnEndDock Event

Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.

Pascal

```
property OnEndDock: TEndDragEvent;
```

C++

```
__property TEndDragEvent OnEndDock;
```

Description

Use OnEndDock to specify actions or special processing that when a drag-and-dock operation stops.

68.1.3.5.7 TBoundLabel.OnEndDrag Event

Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.

Pascal

```
property OnEndDrag: TEndDragEvent;
```

C++

```
__property TEndDragEvent OnEndDrag;
```

Description

Use the OnEndDrag event handler to specify any special processing that occurs when dragging stops.

C++ Examples:

```
/*
This code displays a message in a label named Status. The
message displayed depends on whether the dragged label
control was successfully dropped into and accepted by a
another control.
*/
void __fastcall TForm1::Label1EndDrag(TObject *Sender, TObject *Target, int X,
      int Y)
{
  if (Sender->ClassNameIs("TLabel"))
  {
    AnsiString S = ((TLabel *)Sender)->Name + " was dropped and ";
    if (Target)
      S = S + "accepted!";
    else
      S = S + "rejected.";
    Status->Caption = S;
  }
}
```

Delphi Examples:

```
{
```

```
This code displays a message in a label named Status. The
message displayed depends on whether the dragged label
control was successfully dropped into and accepted by a
another control.
}
procedure TForm1.Label1EndDrag(Sender, Target: TObject; X, Y: Integer);
var
  S: string;
begin
  S := (Sender as TLabel).Name + ' was dropped... and ';
  if Target <> nil then
    S := S + 'accepted!'
  else
    S := S + 'rejected!';
  Status.Caption := S;
end;
```

68.1.3.5.8 TBoundLabel.OnMouseActivate Event

Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.

Pascal

```
property OnMouseActivate: TMouseActivateEvent;
```

C++

```
__property TMouseActivateEvent OnMouseActivate;
```

Description

Use the OnMouseActivate event handler to implement any special processing that should occur as a result of pressing a mouse button on a control when the parent top-level form is not active.

The event type is:

```
TMouseActivateEvent = procedure (Sender: TObject; Button: TMouseButton; ShiftState:
TShiftState;
X, Y: Integer; HitTest: Integer; var MouseActivate: TMouseActivate) of object;
```

When you click on a control and the parent top-level form is not active, this event fires on the control that the mouse cursor is over. MouseActivate is a protected virtual function in TControl. MouseActivate can be overridden in custom control descendants to provide special built-in processing of the OnMouseActivate events. If you leave the default value of MouseActivate as maDefault, the parent control fires the OnMouseActivate event and repeats the process all the way up to the top-level form. If no control in the chain sets the value of MouseActivate, the behavior is the same as if a control set TMouseActivate to maActivate. At any point, a control can set the value of TMouseActivate and the parent processing stops.

Some controls set focus to themselves when they get a button down message so, in some cases, setting maNoActivate appears to have no effect. For instance, a TButton control sets focus to itself in the WM_LBUTTONDOWN message regardless of whether or not TMouseActivate is set to maNoActivate. In this case, setting maNoActivateAndEat will work because the top-level form is not activated and the WM_LBUTTONDOWN message is suppressed.

The HitTest parameter is the hit test value obtained from the WM_NCHITTEST message. See Windows.pas for valid values and their meanings. In most cases this value will be HTCLIENT, which means that the user clicked in the client area of a control.

However, in the case of a top-level form, this can take other values such as HTCAPTION, or HTBOTTOM. This allows the code to decide which value to set for MouseActivate, based on the HitTest code. For example, the following code in the OnMouseActivate event handler for a TForm forces the user to click into a non-client area to activate the form:

```
if HitTest = HTCLIENT then
    MouseActivate := maNoActivateAndEat;
```

Even though this event is tied to how Windows processes WM_MOUSEACTIVATE, the actual handling of the message is done at the TControl level, which is the point in the VCL hierarchy where the control has no window handle. The OnMouseActivate event is then simulated since the all TControl descendants also have OnMouseDown, OnMouseMove, and OnMouseUp events. This information is applicable to both VCL Win32 and VCL.NET.

68.1.3.5.9 TBoundLabel.OnMouseDown Event

Occurs when the user presses a mouse button with the mouse pointer over a control.

Pascal

```
property OnMouseDown: TMouseEvent;
```

C++

```
__property TMouseEvent OnMouseDown;
```

Description

Use the OnMouseDown event handler to implement any special processing that should occur as a result of pressing a mouse button.

The OnMouseDown event handler can respond to left, right, or center mouse button presses and shift key plus mouse-button combinations. Shift keys are the Shift, Ctrl, and Alt keys. X and Y are the pixel coordinates of the mouse pointer in the client area of the Sender.

C++ Examples:

```
/*
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a
rectangle is drawn on the form. When the mouse button is
released, the rectangle appears on the form's canvas. Its
top-left and bottom-right corners are defined by the
location of the mouse pointer when the user pressed and
released the mouse button.  While the user drags the mouse,
the location of the top, left, bottom, and right sides of
the rectangle are displayed in the status bar.
*/
int StartX, StartY; // Declare at the top of the form's unit
// Use this code as the OnMouseDown event handler of the form:
void __fastcall TForm1::FormMouseDown(TObject *Sender, TMouseButton Button, TShiftState Shift,
int X, int Y)
{
  StartX = X;
  StartY = Y;
```

```
}

// Use this code as the OnMouseUp event handler of the form:
void __fastcall TForm1::FormMouseUp(TObject *Sender, TMouseButton Button, TShiftState Shift,
int X, int Y)
{
  Form1->Canvas->Rectangle(StartX, StartY, X, Y);
  StatusBar1->Panels->Items[0]->Text = "";
  StatusBar1->Panels->Items[1]->Text = "";
  StatusBar1->Panels->Items[2]->Text = "";
  StatusBar1->Panels->Items[3]->Text = "";
}

// Use this code as the OnMouseMove event handler of the form:
void __fastcall TForm1::FormMouseMove(TObject *Sender, TShiftState Shift, int X, int Y)
{
  if (Shift.Contains(ssLeft)) // make sure button is down
  {
    if (Y > StartY)
    {
      StatusBar1->Panels->Items[0]->Text = "Top: " + IntToStr(StartY);
      StatusBar1->Panels->Items[2]->Text = "Bottom: " + IntToStr(Y);
    }
    else
    {
      StatusBar1->Panels->Items[0]->Text = "Top: " + IntToStr(Y);
      StatusBar1->Panels->Items[2]->Text = "Bottom: " + IntToStr(StartY);
    }
    if (X > StartX)
    {
      StatusBar1->Panels->Items[1]->Text = "Left: " + IntToStr(StartX);
      StatusBar1->Panels->Items[3]->Text = "Right: " + IntToStr(X);
    }
    else
    {
      StatusBar1->Panels->Items[1]->Text = "Left: " + IntToStr(X);
      StatusBar1->Panels->Items[3]->Text = "Right: " + IntToStr(StartX);
    }
  }
}
```

Delphi Examples:

```
{
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a
rectangle is drawn on the form. When the mouse button is
released, the rectangle appears on the form’s canvas. Its
top-left and bottom-right corners are defined by the
location of the mouse pointer when the user pressed and
released the mouse button.  While the user drags the mouse,
the location of the top, left, bottom, and right sides of

68.1.3.5.10 TBoundLabel.OnMouseMove Event

Occurs when the user moves the mouse pointer while the mouse pointer is over a control.

Pascal

```
property OnMouseMove: TMouseMoveEvent;
```

C++

```
__property TMouseMoveEvent OnMouseMove;
```

Description

Use the OnMouseMove event handler to respond when the mouse pointer moves after the control has captured the mouse.

Use the Shift parameter of the OnMouseDown event handler, to determine to the state of the shift keys and mouse buttons. Shift keys are the Shift, Ctrl, and Alt keys or shift key-mouse button combinations. X and Y are pixel coordinates of the new location of the mouse pointer in the client area of the Sender.

C++ Examples:

```
/*
The following example requires a form with a four-paneled
```

```
status bar.  (Set the Width of the status panels to 150
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a
rectangle is drawn on the form. When the mouse button is
released, the rectangle appears on the form's canvas. Its
top-left and bottom-right corners are defined by the
location of the mouse pointer when the user pressed and
released the mouse button.  While the user drags the mouse,
the location of the top, left, bottom, and right sides of
the rectangle are displayed in the status bar.
*/

  Form1->Canvas->Rectangle(StartX, StartY, X, Y);
  StatusBar1->Panels->Items[0]->Text = "";
  StatusBar1->Panels->Items[1]->Text = "";
  StatusBar1->Panels->Items[2]->Text = "";
  StatusBar1->Panels->Items[3]->Text = "";
}

// Use this code as the OnMouseMove event handler of the form:
void __fastcall TForm1::FormMouseMove(TObject *Sender, TShiftState Shift, int X, int Y)
{
  if (Shift.Contains(ssLeft)) // make sure button is down
  {
    if (Y > StartY)
    {
      StatusBar1->Panels->Items[0]->Text = "Top: " + IntToStr(StartY);
      StatusBar1->Panels->Items[2]->Text = "Bottom: " + IntToStr(Y);
    }
    else
    {
      StatusBar1->Panels->Items[0]->Text = "Top: " + IntToStr(Y);
      StatusBar1->Panels->Items[2]->Text = "Bottom: " + IntToStr(StartY);
    }
    if (X > StartX)
    {
      StatusBar1->Panels->Items[1]->Text = "Left: " + IntToStr(StartX);
      StatusBar1->Panels->Items[3]->Text = "Right: " + IntToStr(X);
    }
    else
    {
      StatusBar1->Panels->Items[1]->Text = "Left: " + IntToStr(X);
      StatusBar1->Panels->Items[3]->Text = "Right: " + IntToStr(StartX);
    }
  }
}
```

Delphi Examples:

```
{
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a
rectangle is drawn on the form. When the mouse button is
```

```
  released, the rectangle appears on the form's canvas. Its
  top-left and bottom-right corners are defined by the
  location of the mouse pointer when the user pressed and
  released the mouse button.  While the user drags the mouse,
  the location of the top, left, bottom, and right sides of
  the rectangle are displayed in the status bar.
  }
  procedure TForm1.FormMouseDown(Sender: TObject; Button: TMouseButton; Shift: TShiftState; X,
  Y: Integer);
  begin
    StartX := X;
    StartY := Y;
  end;

  procedure TForm1.FormMouseUp(Sender: TObject; Button: TMouseButton; Shift: TShiftState; X, Y:
  Integer);
  begin
    Form1.Canvas.Rectangle(StartX, StartY, X, Y);
    StatusBar1.Panels[0].Text := '';
    StatusBar1.Panels[1].Text := '';
    StatusBar1.Panels[2].Text := '';
    StatusBar1.Panels[3].Text := '';
  end;

  procedure TForm1.FormMouseMove(Sender: TObject; Shift: TShiftState; X, Y: Integer);
  begin
    if ssLeft in Shift then { make sure button is down }
    begin
      if Y > StartY then
        begin
        StatusBar1.Panels[0].Text := 'Top: ' + IntToStr(StartY);
        StatusBar1.Panels[2].Text := 'Bottom: ' + IntToStr(Y);
        end
      else
        begin
        StatusBar1.Panels[0].Text := 'Top: ' + IntToStr(Y);
        StatusBar1.Panels[2].Text := 'Bottom: ' + IntToStr(StartY);
        end;
      if X > StartX then
        begin
        StatusBar1.Panels[1].Text := 'Left: ' + IntToStr(StartX);
        StatusBar1.Panels[3].Text := 'Right: ' + IntToStr(X);
        end
      else
        begin
        StatusBar1.Panels[1].Text := 'Left: ' + IntToStr(X);
        StatusBar1.Panels[3].Text := 'Right: ' + IntToStr(StartX);
        end;
    end;
  end;
```

68.1.3.5.11 TBoundLabel.OnMouseUp Event

Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.

Pascal

```
  property OnMouseUp: TMouseEvent;
```

C++

```
__property TMouseEvent OnMouseUp;
```

Description

Use an OnMouseUp event handler to implement special processing when the user releases a mouse button.

The OnMouseUp event handler can respond to left, right, or center mouse button presses and shift key plus mouse-button combinations. Shift keys are the Shift, Ctrl, and Alt keys. X and Y are the pixel coordinates of the mouse pointer in the client area of the Sender.

C++ Examples:

```
/*
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a
rectangle is drawn on the form. When the mouse button is
released, the rectangle appears on the form's canvas. Its
top-left and bottom-right corners are defined by the
location of the mouse pointer when the user pressed and
released the mouse button.  While the user drags the mouse,
the location of the top, left, bottom, and right sides of
the rectangle are displayed in the status bar.
*/
int StartX, StartY; // Declare at the top of the form's unit
// Use this code as the OnMouseDown event handler of the form:
void __fastcall TForm1::FormMouseDown(TObject *Sender, TMouseButton Button, TShiftState Shift,
int X, int Y)
{
  StartX = X;
  StartY = Y;
}

// Use this code as the OnMouseUp event handler of the form:
void __fastcall TForm1::FormMouseUp(TObject *Sender, TMouseButton Button, TShiftState Shift,
int X, int Y)
{
  Form1->Canvas->Rectangle(StartX, StartY, X, Y);
  StatusBar1->Panels->Items[0]->Text = "";
  StatusBar1->Panels->Items[1]->Text = "";
  StatusBar1->Panels->Items[2]->Text = "";
  StatusBar1->Panels->Items[3]->Text = "";
}

// Use this code as the OnMouseMove event handler of the form:
void __fastcall TForm1::FormMouseMove(TObject *Sender, TShiftState Shift, int X, int Y)
{
  if (Shift.Contains(ssLeft)) // make sure button is down
  {
    if (Y > StartY)
    {
      StatusBar1->Panels->Items[0]->Text = "Top: " + IntToStr(StartY);
      StatusBar1->Panels->Items[2]->Text = "Bottom: " + IntToStr(Y);
    }
    else
    {
      StatusBar1->Panels->Items[0]->Text = "Top: " + IntToStr(Y);
      StatusBar1->Panels->Items[2]->Text = "Bottom: " + IntToStr(StartY);
    }
    if (X > StartX)
    {
      StatusBar1->Panels->Items[1]->Text = "Left: " + IntToStr(StartX);
      StatusBar1->Panels->Items[3]->Text = "Right: " + IntToStr(X);
```

```
      }
      else
      {

Responding to a Mouse-up Action

68.1.3.5.12 TBoundLabel.OnStartDock Event

Occurs when the user begins to drag a control with a DragKind of dkDock.

Pascal

```
property OnStartDock: TStartDockEvent;
```

C++

```
__property TStartDockEvent OnStartDock;
```

Description

Use the OnStartDock event handler to implement special processing when the user starts a drag-and-dock operation by dragging the control.

The OnStartDock event handler can create a TDragDockObjectEx object for the DragObject parameter to specify the appearance of the dragging rectangle and how the dragged control interacts with potential docking sites. If you return TDragDockObjectEx as the drag object, there is no need to call the Free method for the DragObject when dragging is over. If you use TDragDockObject, your application is responsible for freeing the drag object.

If the OnStartDock event handler sets the DragObject parameter to nil (Delphi) or NULL (C++), a TDragDockObject object is automatically created.

Note: This information applies to Win32 applications only.

68.1.3.5.13 TBoundLabel.OnStartDrag Event

Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.

Pascal

```
property OnStartDrag: TStartDragEvent;
```

C++

```
__property TStartDragEvent OnStartDrag;
```

Description

Use the OnStartDrag event handler to implement special processing when the user starts to drag the control or an object it contains. OnStartDrag only occurs if DragKind is dkDrag.

Sender is the control that is about to be dragged, or that contains the object about to be dragged.

The OnStartDrag event handler can create a TDragControlObjectEx instance for the DragObject parameter to specify the drag cursor, or, optionally, a drag image list. If you create a TDragControlObjectEx instance, there is no need to call the Free method for the DragObject when dragging is over. If you create, instead, a TDragControlObject instance, your application is responsible for freeing the drag object instance.

If the OnStartDrag event handler sets the DragObject parameter to nil (Delphi) or NULL (C++), a TDragControlObject object is automatically created and dragging begins on the control itself.

Note: On some controls, such as TRichEdit, the underlying Windows control handles internal drag operations. For these controls, there are no OnStartDrag or OnEndDrag events for drag operations within the control.

68.1.4 TCellCollection Class

A collection of TCellItem (see page 12177) objects.

Class Hierarchy

Pascal

```
TCellCollection = class(TOwnedCollection);
```

C++

```
class TCellCollection : public TOwnedCollection;
```

File

ExtCtrls

Description

Use TCellCollection to represent all the cell items in a grid panel.

68.1.4.1 TCellCollection Members

The following tables list the members exposed by TCellCollection.

Protected Methods

	Name	Description
	Added (see page 2736)	Responds when items are added to the collection.
	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	Changed (see page 2740)	Responds when the collection or any of its items changes.

V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	Deleting (see page 2741)	Responds when items are deleted from the collection.
V	GetAttr (see page 12174)	Returns the name of a custom attribute that can be retrieved using the GetItemAttr method.
V	GetAttrCount (see page 12175)	Returns the number of custom attributes associated with items in the collection.
	GetItem (see page 12175)	Returns a specified item in the collection.
V	GetItemAttr (see page 12176)	Returns the value of a custom attribute assigned to one of the collection's items.
V	GetOwner (see page 2915)	Returns the owner of an object.
	GetOwner (see page 2932)	Returns the owner of an object.
V	Notify (see page 2746)	Responds when items are added to or removed from the collection.
	SetItem (see page 12176)	This is SetItem, a member of class TCellCollection.
V	SetItemName (see page 2747)	Initializes the name of a newly inserted collection item.
V	Update (see page 12176)	Updates the collection to reflect changes to its items.

Protected Properties

	Name	Description
R	NextID (see page 2752)	Specifies a unique ID that can be assigned to the next added collection item.
	PropName (see page 2752)	Specifies the name of the property that the collection implements.
R	UpdateCount (see page 2753)	Counts the number of times BeginUpdate (see page 2739) was called without a corresponding call to EndUpdate (see page 2742).

Public Methods

	Name	Description
	Add (see page 2736)	Creates a new TCollectionItem (see page 2755) instance and adds it to the Items (see page 2751) array.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2736)	Copies the contents of another collection to the object where the method is executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
V	BeginUpdate (see page 2739)	Suspends screen repainting.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Clear (see page 2741)	Deletes all items from the collection.
	Create (see page 2734)	Creates and initializes a collection.
	Create (see page 2914)	Creates and initializes a TOwnedCollection (see page 2912) instance.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Delete (see page 2741)	Deletes a single item from the collection.
V	Destroy (see page 2735)	Destroys the collection and each item in it.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
V	EndUpdate (see page 2742)	Re-enables screen repainting.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindItemID (see page 2743)	Returns the item with the specified ID.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.

	GetEnumerator (see page 2744)	Returns a TCollection (see page 2731) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2745)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	Insert (see page 2746)	Creates a new TCollectionItem (see page 2755) instance and adds it to the Items (see page 2751) array.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	Owner (see page 12176)	Returns the Owner of the cell collection.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
	Capacity (see page 2748)	Provides access to the internal TList (see page 2868) Capacity property.
R	Count (see page 2749)	Returns the number of items in the collection.
R	ItemClass (see page 2751)	Indicates the class to which the collection's items belong.
	Items (see page 12177)	Lists the items of the cell collection.

68.1.4.2 TCellCollection Methods

The methods of the TCellCollection class are listed here.

Protected Methods

	Name	Description
V	GetAttr (see page 12174)	Returns the name of a custom attribute that can be retrieved using the GetItemAttr method.
V	GetAttrCount (see page 12175)	Returns the number of custom attributes associated with items in the collection.
	GetItem (see page 12175)	Returns a specified item in the collection.
V	GetItemAttr (see page 12176)	Returns the value of a custom attribute assigned to one of the collection's items.
	SetItem (see page 12176)	This is SetItem, a member of class TCellCollection.
V	Update (see page 12176)	Updates the collection to reflect changes to its items.

Public Methods

	Name	Description
	Owner (see page 12176)	Returns the Owner of the cell collection.

68.1.4.2.1 TCellCollection.GetAttr Method

Returns the name of a custom attribute that can be retrieved using the GetItemAttr method.

Pascal

```
function GetAttr(Index: Integer): string; override;
```

C++

```
virtual __fastcall AnsiString GetAttr(int Index);
```

Description

TCollection descendants can associate user-defined attributes with the items in the collection. Each attribute has a name and, for each item in the collection, a value that is a string. The GetAttr method returns the name of an attribute.

Index identifies the attribute whose name is requested. This is a value between 0 and n-1, where n is the value returned by GetAttrCount.

As implemented by TCollection, GetAttr always returns an empty string, because TCollection defines no custom attributes.

See Also

GetAttrCount (see page 2744)

GetItemAttr (see page 2745)

68.1.4.2.2 TCellCollection.GetAttrCount Method

Returns the number of custom attributes associated with items in the collection.

Pascal

```
function GetAttrCount: Integer; override;
```

C++

```
virtual __fastcall int GetAttrCount();
```

Description

TCollection descendants can associate user-defined attributes with the items in the collection. Each attribute has a name and, for each item in the collection, a value that is a string. GetAttrCount returns the number of distinct attributes assigned to each item in the collection.

As implemented in TCollection, GetAttrCount always returns 0, because TCollection defines no custom attributes.

See Also

GetAttr (see page 2743)

GetItemAttr (see page 2745)

68.1.4.2.3 TCellCollection.GetItem Method

Returns a specified item in the collection.

Pascal

```
function GetItem(Index: Integer): TCellItem;
```

C++

```
__fastcall TCellItem GetItem(int Index);
```

Description

GetItem is the protected read implementation of the Items property.

See Also

Items (see page 2751)

68.1.4.2.4 TCellCollection.GetItemAttr Method

Returns the value of a custom attribute assigned to one of the collection's items.

Pascal

```
function GetItemAttr(Index: Integer; ItemIndex: Integer): string; override;
```

C++

```
virtual __fastcall AnsiString GetItemAttr(int Index, int ItemIndex);
```

Description

TCollection descendants can associate user-defined attributes with the items in the collection. Each attribute has a name and, for each item in the collection, a value that is a string. GetItemAttr returns the value of one of these attributes for a specified item in the collection.

Index identifies which attribute's value is desired. This is a value between 0 and n-1, where n is the value returned by GetAttrCount.

ItemIndex identifies the item whose attribute value is desired. This is an index into the Items property array.

As implemented in TCollection, GetItemAttr always returns an empty string, because TCollection defines no custom attributes.

See Also

GetAttr (see page 2743)

GetAttrCount (see page 2744)

68.1.4.2.5 TCellCollection.Owner Method

Returns the Owner of the cell collection.

Pascal

```
function Owner: TCustomGridPanel;
```

C++

```
__fastcall TCustomGridPanel Owner();
```

Description

Use the Owner method to obtain a reference to the list view that owns this cell collection.

68.1.4.2.6 TCellCollection.SetItem Method

Pascal

```
procedure SetItem(Index: Integer; Value: TCellItem);
```

C++

```
__fastcall SetItem(int Index, TCellItem Value);
```

Description

This is SetItem, a member of class TCellCollection.

68.1.4.2.7 TCellCollection.Update Method

Updates the collection to reflect changes to its items.

Pascal

```
procedure Update(Item: TCollectionItem); override;
```

C++

```
virtual __fastcall Update(TCollectionItem Item);
```

Description

Override Update in a descendant class to make any necessary changes when the items in the collection change. This method is called automatically when an update is complete.

Item identifies the item that changed. If the Item parameter is nil (Delphi) or NULL (C++), then the change affects more than one item in the collection.

As implemented in TCollection, Update does nothing. Descendant classes override this method to make any necessary adjustments.

See Also

Changed (see page 2740)

Changed (see page 2758)

68.1.4.3 TCellCollection Properties

The properties of the TCellCollection class are listed here.

Public Properties

	Name	Description
	Items (see page 12177)	Lists the items of the cell collection.

68.1.4.3.1 TCellCollection.Items Property

Lists the items of the cell collection.

Pascal

```
property Items [Index: Integer]: TCellItem;
```

C++

```
__property TCellItem Items[int Index];
```

Description

Use the Items property to list the items of TCellCollection (see page 12172).

68.1.5 TCellItem Class

Represents an item in a TCellCollection (see page 12172).

Class Hierarchy

Pascal

```
TCellItem = class(TCollectionItem);
```

C++

```
class TCellItem : public TCollectionItem;
```

File

ExtCtrls

Description

The TCellItem class represents a cell on a grid panel.

68.1.5.1 TCellItem Members

The following tables list the members exposed by TCellItem.

Protected Methods

	Name	Description
	AssignTo (see page 12180)	Copies the properties of an object to a destination object.
	Changed (see page 2758)	Updates the collection to reflect changes to the collection item.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetDisplayName (see page 2758)	Returns the name of the collection item as it appears in the collection editor.
	GetOwner (see page 2759)	Returns the collection to which this item belongs.
	GetOwner (see page 2932)	Returns the owner of an object.
	SetCollection (see page 2759)	Sets the value of the Collection (see page 2761) property.
	SetDisplayName (see page 2760)	Sets the name of the collection item as it appears in the collection editor.
	SetIndex (see page 2760)	Moves the collection item to a specified position in the parent collection.
	SetSizeStyle (see page 12180)	This is SetSizeStyle, a member of class TCellItem.
	SetValue (see page 12181)	This is SetValue, a member of class TCellItem.

Protected Properties

	Name	Description
	AutoAdded (see page 12181)	This is AutoAdded, a member of class TCellItem.
	Size (see page 12181)	This is Size, a member of class TCellItem.

Public Methods

	Name	Description
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 12179)	Creates and initializes a TCollectionItem instance.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 2757)	Destroys the TCollectionItem (see page 2755) instance and frees its memory.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 22287)	Disposes of an object instance.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.

	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2759)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
	Collection (see page 2761)	Specifies the TCollection (see page 2731) instance to which the TCollectionItem (see page 2755) belongs.
	DisplayName (see page 2761)	The name displayed in the Collection (see page 2761) editor.
R	ID (see page 2761)	A unique, permanent index for the item.
	Index (see page 2762)	Returns the item's position in the Items array of TCollection (see page 2731).

Published Properties

	Name	Description
	SizeStyle (see page 12181)	Specifies the manner in which column size or row size is specified.
	Value (see page 12182)	Sets the size of the cell item.

68.1.5.2 TCellItem.Create Constructor

Creates and initializes a TCollectionItem instance.

Pascal

```
constructor Create(Collection: TCollection); override;
```

C++

```
virtual __fastcall TCellItem(TCollection Collection);
```

Description

Do not call Create to instantiate a collection item. Instead, call the Add method of the collection to which the item should belong.

Collection identifies the TCollection instance to which the new item belongs.

See Also

Add (see page 2736)

Collection (see page 2761)

68.1.5.3 TCellItem Methods

The methods of the TCellItem class are listed here.

Protected Methods

	Name	Description
	AssignTo (see page 12180)	Copies the properties of an object to a destination object.
	SetSizeStyle (see page 12180)	This is SetSizeStyle, a member of class TCellItem.
	SetValue (see page 12181)	This is SetValue, a member of class TCellItem.

68.1.5.3.1 TCellItem.AssignTo Method

Copies the properties of an object to a destination object.

Pascal

```
procedure AssignTo(Dest: TPersistent); override;
```

C++

```
virtual __fastcall AssignTo(TPersistent * Dest);
```

Description

Override the AssignTo method to extend the functionality of the Assign method of destination objects so that they handle newly created object classes. When defining a new object class, override the Assign method for every existing object class that should be able to copy its properties to the new class. Override the AssignTo method for every existing class to which the new class can copy.

The Assign method of TPersistent calls AssignTo if the descendant object does not succeed in copying the properties of a source object. The AssignTo method defined by TPersistent raises an EConvertError exception.

For example, given the following code in which A and B are instance variables:

```
A.Assign(B); {Delphi}
A->Assign(B); // C++
```

if A knows how to handle B, then it does so and returns. If A doesn't know how to handle B's type, execution will trickle to the TPersistent version of Assign, which calls:

```
B.AssignTo(A); {Delphi}
B->AssignTo(A); // C++
```

If B knows how to copy to A, the assignment succeeds. Otherwise, TPersistent raises an exception.

See Also

Assign (see page 2930)

EConvertError (see page 22724)

68.1.5.3.2 TCellItem.SetSizeStyle Method

Pascal

```
procedure SetSizeStyle(Value: TSizeStyle);
```

C++

```
__fastcall SetSizeStyle(TSizeStyle Value);
```

Description

This is SetSizeStyle, a member of class TCellItem.

68.1.5.3.3 TCellItem.SetValue Method

Pascal

```
procedure SetValue(Value: Double);
```

C++

```
__fastcall SetValue(Double Value);
```

Description

This is SetValue, a member of class TCellItem.

68.1.5.4 TCellItem Properties

The properties of the TCellItem class are listed here.

Protected Properties

	Name	Description
	AutoAdded (see page 12181)	This is AutoAdded, a member of class TCellItem.
	Size (see page 12181)	This is Size, a member of class TCellItem.

Published Properties

	Name	Description
	SizeStyle (see page 12181)	Specifies the manner in which column size or row size is specified.
	Value (see page 12182)	Sets the size of the cell item.

68.1.5.4.1 TCellItem.AutoAdded Property

Pascal

```
property AutoAdded: Boolean;
```

C++

```
__property Boolean AutoAdded;
```

Description

This is AutoAdded, a member of class TCellItem.

68.1.5.4.2 TCellItem.Size Property

Pascal

```
property Size: Integer;
```

C++

```
__property int Size;
```

Description

This is Size, a member of class TCellItem.

68.1.5.4.3 TCellItem.SizeStyle Property

Specifies the manner in which column size or row size is specified.

Pascal

```
property SizeStyle: TSizeStyle;
```

C++

```
__property TSizeStyle SizeStyle;
```

Description

Use the SizeStyle property to specify whether the size of the row or column in a grid is an absolute value, a percentage of the grid size, or generated automatically.

Style	Description
ssAbsolute	The number specified for the Value (see page 12182) property is interpreted as the number of pixels for the row or column.
ssAuto	The number specified for the Value (see page 12182) property is ignored, and the row or column is sized automatically.
ssPercent	The number specified for the Value (see page 12182) property is interpreted as a percentage of the entire grid panel.

68.1.5.4.4 TCellItem.Value Property

Sets the size of the cell item.

Pascal

```
property Value: Double;
```

C++

```
__property Double Value;
```

Description

Use the Value property to specify the size of the column or row in the grid. This value can be set automatically or expressed as a percentage of the grid size or as an absolute value, depending on the SizeStyle (see page 12181). For example, if SizeStyle (see page 12181) is set to ssPercent, and you specify a value of 60, the column occupies approximately 60% of the grid panes width or a row occupies approximately 60% of the grid panel height.

68.1.6 TColorBox Class

TColorBox represents a combo box that lets users select a color.

Class Hierarchy

Pascal

```
TColorBox = class(TCustomColorBox);
```

C++

```
class TColorBox : public TCustomColorBox;
```

File

ExtCtrls

Description

Use TColorBox to provide the user with a drop-down combo box from which to select a color. Use the Style (see page 12217) property to specify which colors the color box should list. Each color is displayed next to a small square that is drawn in the corresponding color.

Use the Selected (see page 12215) property to access the color that the user selects. The Colors (see page 12424) property provides access to the entire list of colors, while the ColorNames (see page 12423) property lists their names.

See Also

TComboBox (see page 21064)

TColorDialog (see page 11270)

68.1.6.1 TColorBox Members

The following tables list the members exposed by TColorBox.

Protected Events

	Name	Description
	OnAlignInsertBefore (see page 6213)	Occurs when an object with custom alignment is aligned.
	OnAlignPosition (see page 6214)	Occurs when an object with custom alignment is aligned.
	OnCanResize (see page 5851)	Occurs when an attempt is made to resize the control.
	OnConstrainedResize (see page 5853)	Adjust resize constraints.
	OnDockDrop (see page 6214)	Occurs when another control is docked to the control.
	OnDockOver (see page 6216)	Occurs when another control is dragged over the control.
	OnDrawItem (see page 21224)	Occurs when an item in an owner-draw combo box needs to be displayed.
	OnGetSiteInfo (see page 6223)	Returns the control's docking information.
	OnMeasureItem (see page 21225)	Occurs when an item in a csOwnerDrawVariable combo box needs to be redisplayed.
	OnMouseActivate (see page 5861)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 5862)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseMove (see page 5865)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 5867)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnMouseWheel (see page 5869)	Occurs when the mouse wheel is rotated.
	OnMouseWheelDown (see page 5869)	Occurs when the mouse wheel is rotated downward.
	OnMouseWheelUp (see page 5870)	Occurs when the mouse wheel is rotated upward.
	OnResize (see page 5870)	Occurs immediately after the control is resized.
	OnUnDock (see page 6230)	Occurs when the application tries to undock a control that is docked to the windowed control.

Protected Fields

	Name	Description
	FAnchorMove (see page 5733)	This is FAnchorMove, a member of class TControl.
	FAnchorOrigin (see page 5734)	This is FAnchorOrigin, a member of class TControl.
	FAnchorRules (see page 5734)	This is FAnchorRules, a member of class TControl.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FDefEditProc (see page 21167)	This is FDefEditProc, a member of class TCustomCombo.
	FDefListProc (see page 21167)	This is FDefListProc, a member of class TCustomCombo.

	FDesignSize (see page 6124)	This is FDesignSize, a member of class TWinControl.
	FDoubleBuffered (see page 6124)	This is FDoubleBuffered, a member of class TWinControl.
	FDropHandle (see page 21168)	This is FDropHandle, a member of class TCustomCombo.
	FDroppingDown (see page 21168)	This is FDroppingDown, a member of class TCustomCombo.
	FEditHandle (see page 21168)	This is FEditHandle, a member of class TCustomCombo.
	FEditInstance (see page 21168)	This is FEditInstance, a member of class TCustomCombo.
	FExplicitHeight (see page 5734)	This is FExplicitHeight, a member of class TControl.
	FExplicitLeft (see page 5734)	This is FExplicitLeft, a member of class TControl.
	FExplicitTop (see page 5734)	This is FExplicitTop, a member of class TControl.
	FExplicitWidth (see page 5735)	This is FExplicitWidth, a member of class TControl.
	FFocusChanged (see page 21168)	This is FFocusChanged, a member of class TCustomCombo.
	FInImeComposition (see page 6125)	This is FInImeComposition, a member of class TWinControl.
	FIsFocused (see page 21169)	This is FIsFocused, a member of class TCustomCombo.
	FListHandle (see page 21169)	This is FListHandle, a member of class TCustomCombo.
	FListInstance (see page 21169)	This is FListInstance, a member of class TCustomCombo.
	FOriginalParentSize (see page 5735)	This is FOriginalParentSize, a member of class TControl.
	FSaveIndex (see page 21169)	This is FSaveIndex, a member of class TCustomCombo.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	ActionChange (see page 5737)	Responds when the action associated with the control changes.
V	ActionChange (see page 6127)	Updates the control to reflect changes in its associated action.
	AddBiDiModeExStyle (see page 6128)	Sets control's window style according to its bi-directional support.
V	AdjustClientRect (see page 6128)	Provides the interface that adjusts the ClientRect (see page 5810) property for idiosyncrasies of the window.
V	AdjustDropDown (see page 21171)	Adjusts the size and position of the drop down list.
	AdjustSize (see page 5738)	Sets the size of the control as determined by the AutoSize (see page 5803) property.
V	AdjustSize (see page 6129)	Adjusts the control's size according to its contents and constraints.
V	AlignControls (see page 6129)	Aligns any controls for which the control is the parent within a specified area of the control.
	ArrangeControl (see page 6130)	This is ArrangeControl, a member of class TWinControl.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	AssignTo (see page 5739)	Overrides the inherited AssignTo function to enable assignments to TAction objects.
V	AssignTo (see page 6130)	Copies the properties of the windowed control to another object.
	BeginAutoDrag (see page 5739)	Begin Automatic Drag.
	CalcCursorPos (see page 5741)	This is CalcCursorPos, a member of class TControl.
V	CanAutoSize (see page 5741)	Indicates whether the control can resize itself automatically to accommodate its contents.
V	CanAutoSize (see page 6131)	Indicates how the control can be resized.
V	CanResize (see page 5742)	OnCanResize (see page 5851) event dispatcher.
V	CanResize (see page 6132)	Indicates how the control can respond to a resize attempt.
	Change (see page 21171)	Generates an OnChange (see page 21197) event.
	Changed (see page 5742)	Sends a CM_CHANGED (see page 6330) message to the control.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	ChangeScale (see page 5743)	Rescaling event dispatcher.
V	ChangeScale (see page 6132)	Resize (see page 5780) and reposition children and self.
	Click (see page 5743)	Respond to user click.
V	CloseUp (see page 12419)	Generates an OnCloseUp event.
	CloseUp (see page 21172)	Generates an OnCloseUp (see page 21199) event.
V	ComboWndProc (see page 21173)	Responds to Windows messages sent to the edit control or drop-down list.
V	ConstrainedResize (see page 5746)	Notify control of resize with constraints.

	ConstrainedResize (see page 6133)	Generates an OnConstrainedResize (see page 5853) event.
	ControlsAligned (see page 6134)	This is ControlsAligned, a member of class TWinControl.
	CreateDockManager (see page 6134)	Creates the dock manager for the control.
	CreateHandle (see page 6135)	Creates underlying screen object.
	CreateParams (see page 6135)	Initializes a window-creation parameter data structure.
	CreateParams (see page 21215)	Initializes the window-creation parameter record.
	CreateSubClass (see page 6136)	Creates a windowed control derived from an existing Windows window class.
	CreateWindowHandle (see page 6137)	Creates a Windows control to represent the control.
	CreateWnd (see page 6137)	Creates the underlying window.
	CreateWnd (see page 12420)	Creates the window used to implement the color box.
	CreateWnd (see page 21174)	Creates the Windows control that represents the combo box.
	CreateWnd (see page 21215)	Creates the Windows control that represents the combo box.
	CustomAlignInsertBefore (see page 6137)	Returns placement order of custom-aligned child control.
	CustomAlignPosition (see page 6138)	Returns aligned position of custom-aligned child control.
	DblClick (see page 5747)	OnDblClick (see page 5854) event dispatcher.
	DefaultDockImage (see page 5747)	Handles the painting and erasing of a dock image.
	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	DefineProperties (see page 5748)	Provides methods to read and write the IsControl (see page 5829) property to a stream such as a form file.
	DefineProperties (see page 6139)	Provides methods to read and write the IsControl property to a stream such as a form file.
	DesignWndProc (see page 5749)	This is DesignWndProc, a member of class TControl.
	DestroyHandle (see page 6140)	Destroys the control's window without destroying the control.
	DestroyWindowHandle (see page 6140)	Destroys the window created in the CreateWindowHandle (see page 6137) method.
	DestroyWindowHandle (see page 21174)	Destroys all of the windows controls that implement the combo box.
	DestroyWnd (see page 6141)	Destroys the control's window.
	DestroyWnd (see page 21215)	Destroys the Windows control that represents the combo box.
	DoAddDockClient (see page 6142)	Performs actions when a control is docked to the windowed control.
	DockOver (see page 6143)	Responds when a docking client is dragged over the windowed control.
	DockReplaceDockClient (see page 6143)	This is DockReplaceDockClient, a member of class TWinControl.
	DockTrackNoTarget (see page 5749)	Handles dragging of the control over an invalid docking target.
	DoContextPopup (see page 5750)	OnContextPopup (see page 5854) event dispatcher.
	DoDock (see page 5750)	Docking event dispatcher.
	DoDockOver (see page 6143)	Generates an OnDockOver (see page 6216) event.
	DoEndDock (see page 5750)	OnEndDock (see page 5859) event dispatcher.
	DoEndDrag (see page 5751)	OnEndDrag (see page 5860) event dispatcher.
	DoEnter (see page 6144)	Respond to receiving input focus.
	DoExit (see page 6144)	Respond to losing input focus
	DoFlipChildren (see page 6145)	Flips the control's children.
	DoKeyDown (see page 6145)	Performs some preprocessing before generating an OnKeyDown (see page 6225) event.
	DoKeyPress (see page 6146)	Performs some preprocessing before generating an OnKeyPress (see page 6227) event.
	DoKeyUp (see page 6146)	Performs some preprocessing before generating an OnKeyUp (see page 6228) event.
	DoMouseWheel (see page 5751)	Processes mouse wheel motion.
	DoMouseWheelDown (see page 5752)	OnMouseWheelDown (see page 5869) event dispatcher.
	DoMouseWheelUp (see page 5752)	OnMouseWheelUp (see page 5870) event dispatcher.
	DoRemoveDockClient (see page 6147)	Responds when a control is undocked from the windowed control.
	DoStartDock (see page 5753)	OnStartDock (see page 5871) event dispatcher.
	DoStartDrag (see page 5753)	OnStartDrag (see page 5871) event dispatcher.
	DoUnDock (see page 6147)	Undocks a control that is currently docked to the windowed control.
	DragCanceled (see page 5754)	Provides the interface for a method that responds to the cancellation of a drag.

	DragOver (see page 5755)	OnDragOver (see page 5857) event dispatcher.
	DrawDragDockImage (see page 5755)	Draws the dock image for the control.
V	DrawItem (see page 12420)	Renders an individual item in the color box.
V	DrawItem (see page 21216)	Generates an OnDrawItem (see page 21224) event.
	DropDown (see page 21175)	Generates an OnDropDown (see page 21199) event.
V	EditWndProc (see page 21175)	Responds to Windows messages that are sent to the edit control portion of the combo box.
	EraseDragDockImage (see page 5757)	Erases the dock image for the control.
	FindNextControl (see page 6149)	Returns the control's next child in the tab order after the specified control.
	FixupTabList (see page 6149)	Sorts the child controls by their tab order.
V	GetAction (see page 5758)	This is GetAction, a member of class TControl.
	GetActionLinkClass (see page 5758)	Returns the appropriate action link class that is associated with the control class.
V	GetActionLinkClass (see page 6152)	Returns the associated action link class.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetChildren (see page 6153)	Calls a specified method for each child of the control.
V	GetClientOrigin (see page 5758)	Returns the screen coordinates of the top-left corner of the control's client area.
V	GetClientOrigin (see page 6153)	Returns the value of the ClientOrigin (see page 5809) property.
V	GetClientRect (see page 5759)	Returns a rectangle defining the client area of the control.
V	GetClientRect (see page 6154)	Returns the value of the ClientRect (see page 5810) property.
V	GetControlExtents (see page 6154)	Returns the smallest rectangle in which all the control's children fit.
A	GetCount (see page 5942)	Returns the number of items in the list.
V	GetCount (see page 21176)	Returns the value of the ItemCount (see page 21186) property.
V	GetDeviceContext (see page 5760)	Returns a device context for the control.
V	GetDeviceContext (see page 6155)	Provides access to a device context for the control.
	GetDockEdge (see page 5763)	Returns the edge on which another control should be docked when it is dragged over the control.
V	GetDragImages (see page 5763)	Returns the control's image list containing the image to be displayed while dragging.
	GetDroppedDown (see page 21176)	Returns the value of the DroppedDown (see page 21185) property.
V	GetEnabled (see page 5763)	Returns the value of the Enabled (see page 5821) property.
V	GetFloating (see page 5764)	Returns the value of the Floating (see page 5823) property.
V	GetFloatingDockSiteClass (see page 5764)	Returns the class used for the control when it is floating.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
A	GetItemCount (see page 21176)	Returns the value of the ItemCount (see page 21186) property.
V	GetItemCount (see page 21216)	Returns the number of items in the Items (see page 21187) property list.
A	GetItemHt (see page 21177)	Returns the value of the ItemHeight (see page 21186) property.
V	GetItemHt (see page 21216)	Returns the value of the ItemHeight (see page 21186) property.
A	GetItemIndex (see page 5942)	Returns the value of the ItemIndex (see page 5944) property.
V	GetItemIndex (see page 21177)	Returns the value of the ItemIndex property.
A	GetItemsClass (see page 21177)	Indicates the class that implements the Items (see page 21187) property.
V	GetItemsClass (see page 21217)	Returns the class used to implement the Items (see page 21187) property.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetPalette (see page 5765)	Returns the handle to a palette for use by the control.
	GetParentHandle (see page 6157)	Returns the window handle for the window of the control's parent.
	GetPopupMenu (see page 5765)	Returns the pop-up menu associated with the control.
	GetSelLength (see page 21178)	Returns the value of the SelLength (see page 21190) property.
	GetSelStart (see page 21178)	Returns the value of the SelStart (see page 21193) property.
	GetSelText (see page 21217)	Returns the value of the SelText (see page 21222) property.
	GetSiteInfo (see page 6158)	Generates an OnGetSiteInfo (see page 6223) event
	GetTopParentHandle (see page 6159)	Returns the window handle of the first window not associated with a VCL control that contains the windowed control.

	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	InvalidateDockHostSite (see page 6162)	This is InvalidateDockHostSite, a member of class TWinControl.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsControlActivateMsg (see page 6162)	This is IsControlActivateMsg, a member of class TWinControl.
	IsControlMouseMsg (see page 6162)	Indicates whether a specified mouse message is directed to one of the windowed control's child controls.
	IsQualifyingSite (see page 6163)	This is IsQualifyingSite, a member of class TWinControl.
	KeyDown (see page 6163)	Respond to key press events.
V	KeyDown (see page 12420)	Generates an OnKeyDown event.
	KeyPress (see page 6163)	Respond to keyboard input.
V	KeyPress (see page 12421)	Generates an OnKeyPress event.
V	KeyPress (see page 21217)	Responds to WM_CHAR messages sent to the combo box.
	KeyUp (see page 6164)	Respond to released key.
	ListWndProc (see page 21178)	Responds to Windows messages that are sent to the drop-down list portion of the combo box.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Loaded (see page 5771)	Initializes the control after it is loaded from a stream.
V	Loaded (see page 12421)	Initializes the combo box after its form is loaded into memory.
V	Loaded (see page 21179)	Initializes the combo box after its form is loaded into memory.
	MainWndProc (see page 6165)	Receives Windows messages for the control.
V	MeasureItem (see page 21218)	Generates an OnMeasureItem (see page 21225) event.
	MouseActivate (see page 5773)	This is MouseActivate, a member of class TControl.
	MouseDown (see page 5773)	OnMouseDown (see page 5862) event dispatcher.
	MouseMove (see page 5773)	Respond to mouse moving over control area..
	MouseUp (see page 5774)	OnMouseUp (see page 5867) event dispatcher.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	Notification (see page 5775)	Responds to notifications that components are being created or destroyed.
V	Notification (see page 6165)	Responds to notifications that components are being created or destroyed.
	NotifyControls (see page 6165)	Sends a message to all the child controls.
	PaintControls (see page 6166)	Paints each of the child controls in a windowed control using the specified device context.
	PaintHandler (see page 6166)	Responds to WM_PAINT messages.
V	PaintWindow (see page 6169)	Renders the image of a windowed control.
	PaletteChanged (see page 5775)	Responds to changes in the system's palette by realizing the control's palette.
V	PaletteChanged (see page 6170)	Responds to changes in the system's palette by realizing the control's palette and the palette for each child control.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	PickCustomColor (see page 12422)	This is PickCustomColor, a member of class TCustomColorBox.
	PopulateList (see page 12422)	This is PopulateList, a member of class TCustomColorBox.
	PositionDockRect (see page 5777)	Positions the docking rectangle according to the current drag-and-dock state.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 5778)	Prepares the control for having its properties assigned values read from a stream.
V	ReadState (see page 6171)	Prepares the control for having its properties assigned values from a stream.
	RecreateWnd (see page 6171)	Recreate underlying Windows screen object.
	ReloadDockedControl (see page 6172)	Reloads a docked control.
	RemoveWindowProps (see page 6174)	This is RemoveWindowProps, a member of class TWinControl.
V	RequestAlign (see page 5780)	Instructs the parent of a control to reposition the control, enforcing its Align (see page 5798) property.
	ResetIme (see page 6174)	Restores the input method editor (IME) that was active when the application started.
	ResetImeComposition (see page 6175)	Directs the composition window of the input method editor (IME) to perform a specific action.
	Resize (see page 5780)	Respond to control resize.

	ScaleConstraints (see page 5781)	This is ScaleConstraints, a member of class TControl.
	ScaleControls (see page 6176)	Rescale child controls only.
V	Select (see page 12422)	Generates an OnSelect event.
	Select (see page 21179)	Generates an OnSelect (see page 21201) event.
	SelectFirst (see page 6177)	Locates first selectable child control.
	SelectItem (see page 21218)	Selects a specified item from the drop-down list.
	SelectNext (see page 6177)	Moves the input focus from the current child control to the next one in the tab order.
	SendCancelMode (see page 5781)	Cancels the modal state of the control.
	SendDockNotification (see page 5782)	Sends a Windows message to the control's host dock site.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
V	SetAutoSize (see page 5783)	This is SetAutoSize, a member of class TControl.
V	SetBiDiMode (see page 5783)	Sets the control's bi-directional mode.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
V	SetChildOrder (see page 6178)	Changes the order in which the child component appears in the list of child components returned by the GetChildren (see page 6153) method.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
V	SetDragMode (see page 5785)	Sets the drag mode for the control.
V	SetDropDownCount (see page 21180)	Sets the value of the DropDownCount (see page 21185) property.
	SetDroppedDown (see page 21180)	Sets the value of the DroppedDown (see page 21185) property.
V	SetEnabled (see page 5785)	Sets the value of the Enabled (see page 5821) property.
	SetIme (see page 6181)	Activates an input method editor (IME) using the values specified by the ImeMode (see page 6207) and ImeName (see page 6208) properties.
	SetImeCompositionWindow (see page 6181)	Sets the position and font of the composition window.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetItemHeight (see page 21181)	Sets the value of the ItemHeight (see page 21186) property.
A	SetItemIndex (see page 5943)	Sets the value of the ItemIndex (see page 5944) property.
V	SetItemIndex (see page 21181)	Sets the value of the ItemIndex property.
V	SetItems (see page 21181)	Sets the value of the Items (see page 21187) property.
	SetMaxLength (see page 21182)	Sets the value of the MaxLength (see page 21189) property.
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
V	SetName (see page 5785)	Sets the name of the control.
V	SetParent (see page 5786)	Sets the parent of the control.
V	SetParent (see page 6182)	Sets the parent of the control.
V	SetParentBackground (see page 6182)	This is SetParentBackground, a member of class TWinControl.
V	SetParentBiDiMode (see page 5786)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 5787)	Sets the parent for the control.
	SetSelLength (see page 21182)	Sets the value of the SelLength (see page 21190) property.
	SetSelStart (see page 21182)	Sets the value of the SelStart (see page 21193) property.
	SetStyle (see page 12422)	Sets the Style (see page 12425) property.
V	SetStyle (see page 21219)	Sets the Style (see page 21224) property.
	SetZOrder (see page 5788)	Repositions the control in its parent's control list, thereby changing position onscreen.
V	SetZOrder (see page 6182)	Moves the control to the top or bottom of the parent control's (or screen's) list of TWinControl (see page 6112) controls.
V	ShowControl (see page 6183)	Ensures that a specified child control is visible.
	UpdateBounds (see page 6185)	This is UpdateBounds, a member of class TWinControl.
	UpdateBoundsRect (see page 5789)	Changes the Top (see page 5844), Left (see page 5830), Width (see page 5849), and Height (see page 5825) properties of the control, but doesn't update its screen image and bypasses all resize events.
V	UpdateControlOriginalParentSize (see page 6186)	This is UpdateControlOriginalParentSize, a member of class TWinControl.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateExplicitBounds (see page 5789)	This is UpdateExplicitBounds, a member of class TControl.

	UpdateRecreatingFlag (see page 6186)	This is UpdateRecreatingFlag, a member of class TWinControl.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	UpdateUIState (see page 6186)	Updates form User Interface State as needed
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	VisibleChanging (see page 5791)	Provides the interface for a method that responds to changes in the control's visibility.
V	WndProc (see page 5791)	Provides specific message responses for the control.
V	WndProc (see page 6187)	Provides specific message responses for the control.
V	WndProc (see page 21183)	Processes messages received by the combo box.
V	WndProc (see page 21219)	Processes messages received by the combo box.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	ActionLink (see page 5798)	Contains the action link object associated with the control.
	AutoSize (see page 5803)	Specifies whether the control sizes itself automatically to accommodate its contents.
	BevelWidth (see page 6194)	Specifies the width of the inner and outer bevels.
	BorderWidth (see page 6195)	Specifies the width of the control's border.
	Caption (see page 5806)	Specifies a text string that identifies the control to the user.
	DefWndProc (see page 6199)	Specifies the default window procedure for the windowed control.
	DesktopFont (see page 5818)	Specifies whether the control uses the Windows icon font when writing text.
	DragCursor (see page 5818)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 5819)	Specifies whether the control is being dragged normally or for docking.
	DragMode (see page 5819)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
R	EditHandle (see page 21185)	Returns the window handle for the edit portion of the combo box.
	ImeMode (see page 6207)	Determines the behavior of the input method editor (IME).
	ImeName (see page 6208)	Specifies the input method editor (IME) to use for converting keyboard input to Asian language characters.
	IsControl (see page 5829)	Determines whether a form stores its form-specific properties to a stream.
R	ItemCount (see page 21186)	Specifies the number of items in the drop-down list.
R	ListHandle (see page 21189)	Provides access to the window handle of the list of items in the combo box.
	MaxLength (see page 21189)	Specifies the maximum number of characters the user can type into the edit portion of the combo box.
	MouseCapture (see page 5831)	Indicates whether the control has "captured" mouse events.
	ParentBackground (see page 6209)	Determines whether control uses parent's theme background.
	ScalingFlags (see page 5840)	Reflects which attributes of the control have been scaled.
	Sorted (see page 21222)	Determines whether the list portion of the combo box is alphabetized.
	Text (see page 5842)	Contains a text string associated with the control.
	WheelAccumulator (see page 5849)	Accumulates mouse wheel rotations.
	WindowHandle (see page 6212)	Provides access to a window handle for the control.
	WindowText (see page 5850)	Contains the text string of the control.

Public Events

	Name	Description
	WindowProc (see page 5872)	Points to the window procedure that responds to messages sent to the control.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
A	AddItem (see page 5940)	Adds an item to the list control.
V	AddItem (see page 21170)	Adds an item to the drop-down list of items.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	BeginDrag (see page 5740)	Starts the dragging of a control.
	BringToFront (see page 5740)	Puts the control in front of all other controls in its parent control.
	Broadcast (see page 6130)	Sends a message to each of the child controls.
	CanFocus (see page 6131)	Indicates whether a control can receive focus.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
A	Clear (see page 5940)	Deletes all of the items from the list control.
V	Clear (see page 21172)	Deletes all text from the edit box and all items from the Items (see page 21187) list.
A	ClearSelection (see page 5940)	Removes the selection, leaving all items unselected.
V	ClearSelection (see page 21172)	Deselects any selected items in the drop-down list.
	ClientToParent (see page 5744)	Translates client coordinates to parent coordinates.
	ClientToScreen (see page 5744)	Translates a given point from client area coordinates to global screen coordinates.
	ContainsControl (see page 6133)	Indicates whether a specified control exists within the control.
	ControlAtPos (see page 6133)	Returns the child control located at a specified position within the control.
A	CopySelection (see page 5941)	Copies the selected item or items to another TCustomListControl (see page 5928) descendant.
V	CopySelection (see page 21173)	Copies the selected item in the drop-down list to another list control.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
V	Create (see page 5731)	Creates an instance of TControl (see page 5724).
V	Create (see page 6123)	Creates an instance of TWinControl (see page 6112).
V	Create (see page 12419)	Creates a new TCustomColorBox (see page 12406) object.
V	Create (see page 21166)	Creates and initializes a TCustomCombo (see page 21154) instance.
V	Create (see page 21214)	Creates and initializes a TCustomComboBox (see page 21201) instance.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	CreateParented (see page 6123)	Creates and initializes a control as the child of a specified non-VCL container.
	CreateParentedControl (see page 6136)	Creates and initializes a control as the child of a specified non-VCL window.
V	DefaultHandler (see page 5748)	Provides message handling for all messages that do not have specific handlers.
V	DefaultHandler (see page 6139)	Provides message handling for all messages that the control does not fully process itself.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
A	DeleteSelected (see page 5941)	Deletes all the selected items.
V	DeleteSelected (see page 21174)	Deletes the selected item from the drop-down list.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 5732)	Destroys an instance of TControl (see page 5724).
V	Destroy (see page 6124)	Destroys an instance of TWinControl (see page 6112).
V	Destroy (see page 21166)	Destroys the combo box and frees its memory.
V	Destroy (see page 21214)	Destroys the combo box and frees its memory.

	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	DisableAlign (see page 6141)	Disables the realignment of child controls.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Dock (see page 5749)	Used internally to dock the control.
	DockDrop (see page 6142)	Generates an OnDockDrop (see page 6214) event.
	DragDrop (see page 5754)	OnDragDrop (see page 5855) event dispatcher.
	Dragging (see page 5754)	Indicates whether a control is being dragged.
	DrawTextBiDiModeFlags (see page 5756)	Returns the text flags that reflect the current setting of the BiDiMode (see page 5803) property.
	DrawTextBiDiModeFlagsReadingOnly (see page 5756)	Returns the text flag to add that indicates whether the control's text should read from right to left.
	EnableAlign (see page 6148)	Decrements the reference count incremented by the DisableAlign (see page 6141) method, eventually realigning the child controls.
	EndDrag (see page 5757)	Stops a control from being dragged any further.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindChildControl (see page 6148)	Returns a child control given its name.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FlipChildren (see page 6150)	Reverses the positions of child controls.
	Focused (see page 6150)	Determines whether the control has input focus.
	Focused (see page 21175)	Indicates whether the combo box has input focus.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetControlsAlignment (see page 5759)	Indicates how text is aligned within the control.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetParentComponent (see page 5765)	Returns the parent of the control.
	GetTabOrderList (see page 6158)	Builds a list of controls in tab order.
	GetTextBuf (see page 5766)	Retrieves the control's text, copies it into a buffer, and returns the number of characters copied.
	GetTextLen (see page 5767)	Returns the length of the control's text.
	HandleAllocated (see page 6159)	Reports whether a screen object handle exists for the control.
	HandleNeeded (see page 6160)	Creates a screen object for the control if it doesn't already exist.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	HasParent (see page 5768)	Indicates whether the control has a parent.
	Hide (see page 5769)	Makes the control invisible.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitiateAction (see page 5769)	Calls the action link's Update (see page 5789) method if the control is associated with an action link.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InsertControl (see page 6160)	Inserts a control into the Controls (see page 6197) array property.

	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
V	Invalidate (see page 5770)	Completely repaint control.
V	Invalidate (see page 6161)	Schedules a control repaint.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	IsRightToLeft (see page 5770)	Indicates whether the control should be reversed right to left.
	ManualDock (see page 5771)	Docks the control.
	ManualFloat (see page 5772)	Undocks the control.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	MouseWheelHandler (see page 5774)	Dispatches messages received from a mouse wheel.
V	MoveSelection (see page 5942)	Moves all selected items to another list control.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	PaintTo (see page 6167)	This is the overview for the PaintTo method overload.
	ParentToClient (see page 5776)	Translate parent coordinates to client coordinates.
	Perform (see page 5776)	Responds as if the control received a specified Windows message.
	PreProcessMessage (see page 6170)	This is PreProcessMessage, a member of class TWinControl.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	Realign (see page 6171)	Forces the control to realign children.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	Refresh (see page 5779)	Repaints the control on the screen.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveControl (see page 6172)	Removes a specified control from the Controls (see page 6197) array.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	Repaint (see page 5779)	Forces the control to repaint its image on the screen.
V	Repaint (see page 6174)	Repaints the entire control.
	ReplaceDockedControl (see page 5779)	Docks the control in the place where another control is already docked.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	ScaleBy (see page 6175)	Rescale control and its children.
	ScreenToClient (see page 5781)	Converts the screen coordinates of a specified point on the screen to client coordinates.
	ScrollBy (see page 6176)	Scroll control contents.
A	SelectAll (see page 5943)	Selects all items or all text in the selected item.
V	SelectAll (see page 21180)	Selects the entire block of text in the edit box.
	SendToBack (see page 5782)	Puts a windowed control behind all other windowed controls, or puts a non-windowed control behind all other non-windowed controls.
V	SetBounds (see page 5783)	Sets the Left (see page 5830), Top (see page 5844), Width (see page 5849), and Height (see page 5825) properties all at once.
V	SetBounds (see page 6178)	Sets the windowed control's boundary properties all at once.
	SetDesignVisible (see page 5784)	Makes a control visible at design time.
V	SetDesignVisible (see page 6178)	Makes a control visible at design time.
V	SetFocus (see page 6179)	Gives the input focus to the control.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	SetTextBuf (see page 5787)	Sets the text of the control.
	Show (see page 5788)	Makes a control visible.
V	Update (see page 5789)	Processes any pending paint messages immediately.
V	Update (see page 6183)	Forces the control to update.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	UpdateControlState (see page 6186)	Respond to state change.
	UseRightToLeftAlignment (see page 5790)	Specifies whether the control's alignment should be reversed right-to-left.
	UseRightToLeftReading (see page 5790)	Specifies whether the control is using a right-to-left reading order.
	UseRightToLeftScrollBar (see page 5791)	Specifies whether the vertical scroll bar appears on the left side of the control.

Public Properties

	Name	Description
	Action (see page 5797)	Designates the action associated with the control.
R	AlignDisabled (see page 6192)	Indicates child control realignment disabled.
	AutoCloseUp (see page 21220)	Specifies whether the drop-down closes up automatically when the user selects an item.
	AutoCompleteDelay (see page 21220)	Specifies the delay between a key press and an attempt to autocomplete the field.
	BoundsRect (see page 5803)	Specifies the bounding rectangle of the control, expressed in the coordinate system of the parent control.
R	Brush (see page 6195)	Determines the color and pattern used for painting the background of the control.
R	Canvas (see page 21184)	Provides access to the drawing surface of the combo box.
	CharCase (see page 21221)	Determines the case of the text in the combo box.
	ClientHeight (see page 5808)	Specifies the height of the control's client area in pixels.
R	ClientOrigin (see page 5809)	Specifies the screen coordinates (in pixels) of the top left corner of a control's client area.
R	ClientRect (see page 5810)	Specifies the size (in pixels) of a control's client area.
	ClientWidth (see page 5811)	Specifies the horizontal size of the control's client area in pixels.
R	ColorNames (see page 12423)	Lists the names of the colors in the color box.
R	Colors (see page 12424)	Lists the colors in the color box.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
R	ControlCount (see page 6195)	Returns the number of child controls.
R	Controls (see page 6197)	Lists all child controls.
	ControlState (see page 5813)	Indicates the current state of a control at runtime.
	ControlStyle (see page 5814)	Determines style characteristics of the control.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	DockClientCount (see page 6199)	Specifies the number of controls that are docked on the windowed control.
R	DockClients (see page 6201)	Lists the controls that are docked to the windowed control.
	DockManager (see page 6202)	Specifies the control's docking manager interface.
	DockOrientation (see page 5818)	Specifies how the control is docked relative to other controls docked in the same parent.
	DockSite (see page 6204)	Specifies whether the control can be the target of drag-and-dock operations.
	DoubleBuffered (see page 6205)	Determines whether the control's image is rendered directly to the window or painted to an in-memory bitmap first.
	DroppedDown (see page 21185)	Indicates whether the drop-down list is currently displayed.
R	ExplicitHeight (see page 5821)	Specifies the explicit vertical size of the control in pixels.
R	ExplicitLeft (see page 5822)	Specifies the explicit horizontal pixel coordinate of the left edge of a component relative to its parent.
R	ExplicitTop (see page 5822)	Specifies the explicit vertical pixel coordinate of the top edge of a component relative to its parent.
R	ExplicitWidth (see page 5822)	Specifies the explicit horizontal size of the control in pixels.
R	Floating (see page 5823)	Indicates whether the control is floating.
	FloatingDockSiteClass (see page 5823)	Specifies the class of the temporary control that hosts the control when it is floating.
R	Handle (see page 6207)	Provides access to the underlying Windows screen object for the control.
	HostDockSite (see page 5829)	Specifies the control in which the control is docked.
	ItemIndex (see page 5944)	Specifies the index of the selected item.
	Items (see page 21187)	Provides access to the list of items (strings) in the list portion of the combo box.
	LRDockWidth (see page 5831)	Specifies the width of the control when it is docked horizontally.
R	MouseInClient (see page 6209)	This is MouseInClient, a member of class TWinControl.

R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Padding (see page 6209)	Specifies the padding of a control.
	Parent (see page 5832)	Indicates the parent of the control.
	ParentWindow (see page 6210)	Reference to parent's underlying control.
	SelLength (see page 21190)	Specifies the length, in characters, of the selected text in the edit portion of the combo box.
	SelStart (see page 21193)	Specifies the position of the first selected character in the edit portion of the combo box.
	SelText (see page 21222)	Represents the selected text in the edit region.
R	Showing (see page 6210)	Indicates whether the control is showing on the screen.
	TBDockHeight (see page 5842)	Specifies the height of the control when it is docked vertically.
	UndockHeight (see page 5845)	Specifies the height of the control when it is floating.
	UndockWidth (see page 5846)	Specifies the width of the control when it is floating.
	UseDockManager (see page 6212)	Specifies whether the docking manager is used in drag-and-dock operations.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
R	VisibleDockClientCount (see page 6212)	Specifies the number of visible controls that are docked on the windowed control.

Published Events

	Name	Description
	OnChange (see page 12221)	Occurs when the user changes the text displayed in the edit region.
	OnClick (see page 12223)	Occurs when the user clicks the control.
	OnCloseUp (see page 12225)	Occurs when the drop-down list closes up due to some user action.
	OnContextPopup (see page 12225)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnDblClick (see page 12226)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDragDrop (see page 12226)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 12228)	Occurs when the user drags an object over a control.
	OnDropDown (see page 12231)	Occurs when the user opens the drop-down list.
	OnEndDock (see page 12232)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 12232)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnEnter (see page 12233)	Occurs when a control receives the input focus.
	OnExit (see page 12236)	Occurs when the input focus shifts away from one control to another.
	OnGetColors (see page 12237)	Occurs when the control is populated with colors.
	OnKeyDown (see page 12238)	Occurs when a user presses any key while the control has focus.
	OnKeyPress (see page 12240)	Occurs when a key is pressed.
	OnKeyUp (see page 12242)	Occurs when the user releases a key that has been pressed.
	OnMouseEnter (see page 12243)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 12244)	Occurs when the user moves the mouse outside of a control.
	OnSelect (see page 12244)	Occurs when the user selects a string in the drop-down list.
	OnStartDock (see page 12244)	Occurs when the user begins to drag a control with a DragKind of dkDock.
	OnStartDrag (see page 12245)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.

Published Properties

	Name	Description
	Align (see page 12196)	Determines how the control aligns within its container (parent control).
	AlignWithMargins (see page 5802)	Indicates whether a control should be constrained by margins.
	Anchors (see page 12200)	Specifies how the control is anchored to its parent.
	AutoComplete (see page 12200)	Positions to matching list items as you type.
	AutoDropDown (see page 12201)	Specifies whether the drop-down list drops down automatically in response to user keystrokes.
	BevelEdges (see page 12201)	Specifies which edges of the control are beveled.
	BevelInner (see page 12201)	Specifies the cut of the inner bevel.

	BevelKind (see page 12202)	Specifies the control's bevel style.
	BevelOuter (see page 12202)	Specifies the cut of the outer bevel.
	BiDiMode (see page 12203)	Specifies the bi-directional mode for the control.
	Color (see page 12203)	Specifies the background color of the control.
	Constraints (see page 12204)	Specifies the size constraints for the control.
	Ctl3D (see page 12205)	Determines whether a control has a three-dimensional (3-D) or two-dimensional look.
	Cursor (see page 5815)	Specifies the image used to represent the mouse pointer when it passes into the region covered by the control.
	DefaultColorColor (see page 12205)	Specifies the color displayed in the color box for clDefault.
	DropDownCount (see page 12205)	Specifies the maximum number of items displayed in the drop-down list.
	Enabled (see page 12206)	Controls whether the control responds to mouse, keyboard, and timer events.
	Font (see page 12206)	Controls the attributes of text written on or in the control.
	Height (see page 5825)	Specifies the vertical size of the control in pixels.
	HelpContext (see page 5826)	Numeric ID for control's context-sensitive help topic
	HelpKeyword (see page 5826)	Keyword for control's context-sensitive help topic
	HelpType (see page 5827)	Indicates whether the control's context sensitive help topic is identified by context ID or by keyword.
	Hint (see page 5827)	Contains the text string that can appear when the user moves the mouse over the control.
	ItemHeight (see page 12207)	Specifies the height, in pixels, of the items in the drop-down list.
	Left (see page 5830)	Specifies the horizontal coordinate of the left edge of a component relative to its parent.
	Margins (see page 5831)	Specifies the margins for the control.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	NoneColorColor (see page 12208)	Specifies the color displayed in the color box for clNone.
	ParentBiDiMode (see page 12208)	Specifies whether the control uses its parent's BiDiMode.
	ParentColor (see page 12209)	Determines where a control looks for its color information.
	ParentCtl3D (see page 12209)	Determines where a component looks to determine if it should appear three dimensional.
	ParentFont (see page 12210)	Determines where a control looks for its font information.
	ParentShowHint (see page 12210)	Determines where a control looks to find out if its Help Hint should be shown.
	PopupMenu (see page 12211)	Identifies the pop-up menu associated with the control.
	Selected (see page 12215)	Specifies the currently selected color.
	ShowHint (see page 12215)	Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.
	Style (see page 12217)	Controls what colors are listed and how their names are formatted.
	TabOrder (see page 12217)	Indicates the position of the control in its parent's tab order.
	TabStop (see page 12218)	Determines if the user can tab to a control.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Top (see page 5844)	Specifies the Y coordinate of the top left corner of a control, relative to its parent or containing control in pixels.
	Visible (see page 12218)	Determines whether the component appears onscreen.
	Width (see page 5849)	Specifies the horizontal size of the control or form in pixels.

68.1.6.2 TColorBox Properties

The properties of the TColorBox class are listed here.

Published Properties

	Name	Description
	Align (see page 12196)	Determines how the control aligns within its container (parent control).
	Anchors (see page 12200)	Specifies how the control is anchored to its parent.
	AutoComplete (see page 12200)	Positions to matching list items as you type.
	AutoDropDown (see page 12201)	Specifies whether the drop-down list drops down automatically in response to user keystrokes.

	BevelEdges (see page 12201)	Specifies which edges of the control are beveled.
	BevelInner (see page 12201)	Specifies the cut of the inner bevel.
	BevelKind (see page 12202)	Specifies the control's bevel style.
	BevelOuter (see page 12202)	Specifies the cut of the outer bevel.
	BiDiMode (see page 12203)	Specifies the bi-directional mode for the control.
	Color (see page 12203)	Specifies the background color of the control.
	Constraints (see page 12204)	Specifies the size constraints for the control.
	Ctl3D (see page 12205)	Determines whether a control has a three-dimensional (3-D) or two-dimensional look.
	DefaultColorColor (see page 12205)	Specifies the color displayed in the color box for clDefault.
	DropDownCount (see page 12205)	Specifies the maximum number of items displayed in the drop-down list.
	Enabled (see page 12206)	Controls whether the control responds to mouse, keyboard, and timer events.
	Font (see page 12206)	Controls the attributes of text written on or in the control.
	ItemHeight (see page 12207)	Specifies the height, in pixels, of the items in the drop-down list.
	NoneColorColor (see page 12208)	Specifies the color displayed in the color box for clNone.
	ParentBiDiMode (see page 12208)	Specifies whether the control uses its parent's BiDiMode.
	ParentColor (see page 12209)	Determines where a control looks for its color information.
	ParentCtl3D (see page 12209)	Determines where a component looks to determine if it should appear three dimensional.
	ParentFont (see page 12210)	Determines where a control looks for its font information.
	ParentShowHint (see page 12210)	Determines where a control looks to find out if its Help Hint should be shown.
	PopupMenu (see page 12211)	Identifies the pop-up menu associated with the control.
	Selected (see page 12215)	Specifies the currently selected color.
	ShowHint (see page 12215)	Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.
	Style (see page 12217)	Controls what colors are listed and how their names are formatted.
	TabOrder (see page 12217)	Indicates the position of the control in its parent's tab order.
	TabStop (see page 12218)	Determines if the user can tab to a control.
	Visible (see page 12218)	Determines whether the component appears onscreen.

68.1.6.2.1 TColorBox.Align Property

Determines how the control aligns within its container (parent control).

Pascal

```
property Align: TAlign;
```

C++

```
__property TAlign Align;
```

Description

Use Align to align a control to the top, bottom, left, or right of a form or panel and have it remain there even if the size of the form, panel, or component that contains the control changes. When the parent is resized, an aligned control also resizes so that it continues to span the top, bottom, left, or right edge of the parent.

For example, to use a panel component with various controls on it as a tool palette, change the panel's Align value to alLeft. The value of alLeft for the Align property of the panel guarantees that the tool palette remains on the left side of the form and always equals the client height of the form.

The default value of Align is alNone, which means a control remains where it is positioned on a form or panel.

Tip: If Align is set to alClient, the control fills the entire client area so that it is impossible to select the parent form by clicking on it. In this case, select the parent by selecting the control on the form and pressing Esc, or by using the Object Inspector.

Any number of child components within a single parent can have the same Align value, in which case they stack up along the edge of the parent. The child controls stack up in z-order. To adjust the order in which the controls stack up, drag the controls into their desired positions.

Note: To cause a control to maintain a specified relationship with an edge of its parent, but not necessarily lie along one edge of the parent, use the Anchors property instead.

C++ Examples:

```
/*
This example shows how to use a splitter to divide a form
into resizable panes.  All objects on the form are created
dynamically in the OnCreate event handler of the form. To
run this example, add ExtCtrls and FileCtrl to the uses
clause of the form's implementation section.
Note that when creating a splitter dynamically at runtime,
it is important to set its position to the appropriate side
of the control it will resize.
*/
#include <Extctrls.hpp>
#include <Filectrl.hpp>

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  TSplitter* ps = new TSplitter(Form1);
  TFileListBox* pflb = new TFileListBox(Form1);
  TDirectoryListBox* pdlb = new TDirectoryListBox(Form1);

  // Line up the directory list box on the left of the form.
  pdlb->Parent = Form1;
  pdlb->Align = alLeft;
  pdlb->Width = Form1->ClientWidth/3;

  // Now use the splitter to divide the directory pane from the file pane.
  ps->Parent = Form1;
  ps->Left = pdlb->Left + pdlb->Width + 1; // Move to right of directory list.
  ps->Align = pdlb->Align; // Give same alignment as directory list.

  // Each pane must be at least one quarter of the form's width.
  ps->MinSize = Form1->ClientWidth/4;

  // Finally, create the last pane - a file list box.
  pflb->Parent = Form1;
  pflb->Align = alClient;
  pdlb->FileList = pflb; // Link the file list box to the directory list box.
}
/*
Dynamically create a TProgressBar control and align it to
the bottom of the form.
*/

#include <ComCtrls.hpp>
#include <Controls.hpp>

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  TProgressBar *ProgressBar = new TProgressBar(this);
  ProgressBar->Parent = this;
  ProgressBar->Align = alBottom;
  TButton *Button1 = new TButton(this);
  Button1->Parent = this;
}
/*
This example dynamically creates a Page Control, then a
series of Tab Sheets on the Page Control.
*/
#include <Comctrls.hpp>
TPageControl* ppc;
```

```
const int MAXTABS = 3;
TTabSheet* pts[MAXTABS];
const char * ppcTabTitles[] = { "ShortString", "Orders", "Items", "Parts" };
int iTabTitles = sizeof(ppcTabTitles)/sizeof(ppcTabTitles[0]);
const TColor colorPalette[12] = {
  clRed, clGreen, clYellow, clBlue, clWhite, clFuchsia,
  clTeal, clNavy, clMaroon, clLime, clOlive, clPurple};

void __fastcall TForm1::FormCreate(TObject *Sender)
{

    ppc->Parent = this;
    ppc->Align = alClient;
    for (int i=0;i<iTabTitles;i++)
  {
        pts[i] = new TTabSheet(this);
        pts[i]->PageControl = ppc;
        pts[i]->Name = AnsiString("pts") + ppcTabTitles[i];
        pts[i]->Caption = ppcTabTitles[i];
        pts[i]->Brush->Color = colorPalette[i];
  }
}//---------------------------------------------------------------------------
void __fastcall TForm1::FormDestroy(TObject *Sender)
{
  for (int i=0;i<iTabTitles;i++)
        delete pts[i];
    delete ppc;
}
```

Delphi Examples:

```
{
This example shows how to use a splitter to divide a form
into resizable panes.  All objects on the form are created
dynamically in the OnCreate event handler of the form. To
run this example, add ExtCtrls and FileCtrl to the uses
clause of the form's implementation section.
Note that when creating a splitter dynamically at runtime,
it is important to set its position to the appropriate side
of the control it will resize.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  Split: TSplitter;
  Files: TFileListBox;
  Dirs: TDirectoryListBox;
begin
  { first add a directory list box to the form }
  Dirs := TDirectoryListBox.Create(Form1);
  { line it up on the left of the form }
  Dirs.Parent := Form1;
  Dirs.Align := alLeft;
  Dirs.Width := Form1.ClientWidth div 3;
{ now add the splitter to divide the directory pane from the file pane }
  Split := TSplitter.Create(Form1);
  Split.Parent := Form1;
  { make sure the splitter is to the right of the directory list box! }
  Split.Left := Dirs.Left + Dirs.Width + 1;
  Split.Align := Dirs.Align; { give it the same alignment as the directory }
  { each pane must be at least one quarter of the form's width }
  Split.MinSize := Form1.ClientWidth div 4;
  { Finally, create the last pane – a file list box }
  Files := TFileListBox.Create(Form1);
  Files.Parent := Form1;
  Files.Align := alClient;
  Dirs.FileList := Files; { link the file list box to the directory list box }
end;
```

```
{
Dynamically create a TProgressBar control and align it to
the bottom of the form.

  begin
    pts[i].Free;
  end;
  PageControl1.Free;
end;
```

See Also

Parent (see page 5832)

Anchors (see page 5802)

68.1.6.2.2 TColorBox.Anchors Property

Specifies how the control is anchored to its parent.

Pascal

```
property Anchors: TAnchors;
```

C++

```
__property TAnchors Anchors;
```

Description

Use Anchors to ensure that a control maintains its current position relative to an edge of its parent, even if the parent is resized. When its parent is resized, the control holds its position relative to the edges to which it is anchored.

If a control is anchored to opposite edges of its parent, the control stretches when its parent is resized. For example, if a control has its Anchors property set to [akLeft, akRight], the control stretches when the width of its parent changes.

Anchors is enforced only when the parent is resized. Thus, for example, if a control is anchored to opposite edges of a form at design time and the form is created in a maximized state, the control is not stretched because the form is not resized after the control is created.

Note: If a control should maintain contact with three edges of its parent (hugging one side of the parent and stretching the length of that side), use the Align property instead. Unlike Anchors, Align allows controls to adjust to changes in the size of other aligned sibling controls as well as changes to the parent's size.

See Also

Parent (see page 5832)

Align (see page 5798)

68.1.6.2.3 TColorBox.AutoComplete Property

Positions to matching list items as you type.

Pascal

```
property AutoComplete: Boolean;
```

C++

```
__property Boolean AutoComplete;
```

Description

AutoComplete will position to matching list values as you type, saving you keystrokes.

As you type, the ItemIndex property is updated with the list entry that matches the characters you have entered. As you type, different list entries may match, and ItemIndex changes accordingly.

There is a delay of AutoCompleteDelay milliseconds between the characters typed and the autocomplete operation.

See Also

AutoCompleteDelay (see page 21220)

68.1.6.2.4 TColorBox.AutoDropDown Property

Specifies whether the drop-down list drops down automatically in response to user keystrokes.

Pascal

```
property AutoDropDown: Boolean;
```

C++

```
__property Boolean AutoDropDown;
```

Description

When AutoDropDown is true, the combo box automatically drops down its list when the user starts typing a string while the combo box has focus.

When AutoDropDown is false, the user must explicitly use the drop-down button to drop down the combo box list.

See Also

autocomplete (see page 21220)

OnDropDown (see page 21199)

DroppedDown (see page 21185)

68.1.6.2.5 TColorBox.BevelEdges Property

Specifies which edges of the control are beveled.

Pascal

```
property BevelEdges: TBevelEdges;
```

C++

```
__property TBevelEdges BevelEdges;
```

Description

Use BevelEdges to get or set which edges of the control are beveled. The BevelInner, BevelOuter, and BevelKind properties determine the appearance of the specified edges.

See Also

BevelInner (see page 6193)

BevelOuter (see page 6194)

BevelKind (see page 6193)

68.1.6.2.6 TColorBox.BevelInner Property

Specifies the cut of the inner bevel.

Pascal

```
property BevelInner: TBevelCut;
```

C++

```
__property TBevelCut BevelInner;
```

Description

Use BevelInner to specify whether the inner bevel has a raised, lowered, or flat look.

The inner bevel appears immediately inside the outer bevel. If there is no outer bevel (BevelOuter is bvNone), the inner bevel appears immediately inside the border.

See Also

BevelEdges (see page 6192)

BevelOuter (see page 6194)

BevelKind (see page 6193)

BevelWidth (see page 6194)

BorderWidth (see page 6195)

68.1.6.2.7 TColorBox.BevelKind Property

Specifies the control's bevel style.

Pascal

```
property BevelKind: TBevelKind;
```

C++

```
__property TBevelKind BevelKind;
```

Description

Use BevelKind to modify the appearance of a bevel. BevelKind influences how sharply the bevel stands out.

BevelKind, in combination with BevelWidth and the cut of the bevel specified by BevelInner or BevelOuter, can create a variety of effects. Experiment with various combinations to get the look you want.

See Also

BevelEdges (see page 6192)

BevelOuter (see page 6194)

BevelInner (see page 6193)

BevelWidth (see page 6194)

68.1.6.2.8 TColorBox.BevelOuter Property

Specifies the cut of the outer bevel.

Pascal

```
property BevelOuter: TBevelCut;
```

C++

```
__property TBevelCut BevelOuter;
```

Description

Use BevelInner to specify whether the outer bevel has a raised, lowered, or flat look.

The outer bevel appears immediately inside the border and outside the inner bevel.

See Also

BevelEdges (see page 6192)

BevelInner (see page 6193)

BevelKind (see page 6193)

BevelWidth (see page 6194)

68.1.6.2.9 TColorBox.BiDiMode Property

Specifies the bi-directional mode for the control.

Pascal

```
property BiDiMode: TBiDiMode;
```

C++

```
__property TBiDiMode BiDiMode;
```

Description

Use BiDiMode to enable the control to adjust its appearance and behavior automatically when the application runs in a locale that reads from right to left instead of left to right. The bi-directional mode controls the reading order for the text, the placement of the vertical scroll bar, and whether the alignment is changed.

Alignment does not change for controls that are known to contain number, date, time, or currency values. For example, with data aware controls, the alignment does not change for the following field types: ftSmallint, ftInteger, ftWord, ftFloat, ftCurrency, ftBCD, ftDate, ftTime, ftDateTime, ftAutoInc.

See Also

UseRightToLeftAlignment (see page 5790)

UseRightToLeftReading (see page 5790)

UseRightToLeftScrollBar (see page 5791)

Including Bi-directional Functionality in Applications

68.1.6.2.10 TColorBox.Color Property

Specifies the background color of the control.

Pascal

```
property Color: TColor;
```

C++

```
__property TColor Color;
```

Description

Use Color to read or change the background color of the control.

If a control's ParentColor property is true, then changing the Color property of the control's parent automatically changes the Color property of the control. When the value of the Color property is changed, the control's ParentColor property is automatically set to false.

C++ Examples:

```
/*
The following code changes the color of a shape control
using the Color dialog box. The example displays the Color
dialog box when the Button1 button is clicked, allowing the
user to select a color with the dialog box. When a color
value is selected with the dialog box, it is assigned to
the shape control.
```

```
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  if (ColorDialog1->Execute())
    Shape1->Brush->Color = ColorDialog1->Color;
}
```

Delphi Examples:

```
{
The following code changes the color of a shape control
using the Color dialog box. The example displays the Color
dialog box when the Button1 button is clicked, allowing the
user to select a color with the dialog box. When a color
value is selected with the dialog box, it is assigned to
the shape control.
}
procedure TForm1.Button1Click(Sender: TObject);
begin
  if ColorDialog1.Execute then
    Shape1.Brush.Color := ColorDialog1.Color;
end;
```

See Also

ParentColor (see page 5834)

68.1.6.2.11 TColorBox.Constraints Property

Specifies the size constraints for the control.

Pascal

```
property Constraints: TSizeConstraints;
```

C++

```
__property TSizeConstraints Constraints;
```

Description

Use Constraints to specify the minimum and maximum width and height of the control. When Constraints contains maximum or minimum values, the control cannot be resized to violate those constraints.

Note: Constraints apply to the height of the form. However, the height of the form depends on how large Windows makes the title bar. For example, Windows XP uses much larger title bars than other windowing systems. To work around this, note the ClientHeight when you design your form and set the constraints in the FormCreate event. In the following example, ClientHeight is represented by x: `Constraints.MinHeight := x + Height - ClientHeight`.

Warning: Do not set up constraints that conflict with the value of the Align or Anchors property. When these properties conflict, the response of the control to resize attempts is not well-defined.

See Also

AutoSize (see page 5803)

Align (see page 5798)

Anchors (see page 5802)

OnConstrainedResize (see page 5853)

OnCanResize (see page 5851)

68.1.6.2.12 TColorBox.Ctl3D Property

Determines whether a control has a three-dimensional (3-D) or two-dimensional look.

Pascal

```
property Ctl3D: Boolean;
```

C++

```
__property Boolean Ctl3D;
```

Description

Ctl3D is provided for backward compatibility. It is not used by 32-bit versions of Windows or NT4.0 and later, with the exception of Windows XP Home, where it is used on occasion.

On earlier platforms, Ctl3D controlled whether the control had a flat or beveled appearance.

See Also

ParentCtl3D (see page 6209)

BevelKind (see page 6193)

BevelInner (see page 6193)

BevelOuter (see page 6194)

BorderWidth (see page 6195)

68.1.6.2.13 TColorBox.DefaultColorColor Property

Specifies the color displayed in the color box for clDefault.

Pascal

```
property DefaultColorColor: TColor;
```

C++

```
__property TColor DefaultColorColor;
```

Description

Set DefaultColorColor to indicate what color the color box should use when drawing the icon for clDefault. This property only affects the color box if the Style property includes cbSystemColors and cbIncludeDefault.

Note: DefaultColorColor only affects the way clDefault appears in the color box. When you assign clDefault to a control, the control determines its own default color.

See Also

Colors (see page 12424)

NoneColorColor (see page 12424)

Style (see page 12425)

68.1.6.2.14 TColorBox.DropDownCount Property

Specifies the maximum number of items displayed in the drop-down list.

Pascal

```
property DropDownCount: Integer;
```

C++

```
__property int DropDownCount;
```

Description

By default, the drop-down list is long enough to contain eight items without requiring the user to scroll to see them all. To make the drop-down list smaller or larger, specify a number larger or smaller than eight as the DropDownCount value.

If the DropDownCount value is larger than the number of items in the Items property, the drop-down list will be just large enough to hold all the possible choices and no more. If the DropDownCount value is smaller then the number of item in the Items property, the drop down list will display a scroll bar.

See Also

Items (see page 21187)

ItemCount (see page 21186)

68.1.6.2.15 TColorBox.Enabled Property

Controls whether the control responds to mouse, keyboard, and timer events.

Pascal

```
property Enabled: Boolean;
```

C++

```
__property Boolean Enabled;
```

Description

Use Enabled to change the availability of the control to the user. To disable a control, set Enabled to false. Disabled controls appear dimmed. If Enabled is false, the control ignores mouse, keyboard, and timer events.

To re-enable a control, set Enabled to true. The control is no longer dimmed, and the user can use the control.

See Also

Visible (see page 5847)

DisableControls (see page 6925)

EnableControls (see page 6934)

Enabling Mouse

68.1.6.2.16 TColorBox.Font Property

Controls the attributes of text written on or in the control.

Pascal

```
property Font: TFont;
```

C++

```
__property TFont Font;
```

Description

To change to a new font, specify a new TFont object. To modify a font, change the value of the Charset, Color, Height, Name,

Pitch, Size, or Style of the TFont object.

C++ Examples:

```
/*
To use this example, place a TComboBox and TRichEdit or
TMemo on a form.  During form creation, a list of font names
is loaded into the combo box. When the combo box is clicked,
the memo or Rich Edit control font is set to the
corresponding font name in the combo box.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < Screen->Fonts->Count; i++)
   ComboBox1->Items->Add(Screen->Fonts->Strings[i]);
//  ComboBox1->Items = Screen->Fonts;  // Another way to do it.
}

void __fastcall TForm1::ComboBox1Change(TObject *Sender)
{
  RichEdit1->Font->Name = ComboBox1->Text;
}
```

Delphi Examples:

```
{
To use this example, place a TComboBox and TRichEdit or
TMemo on a form.  During form creation, a list of font names
is loaded into the combo box. When the combo box is clicked,
the memo or Rich Edit control font is set to the
corresponding font name in the combo box.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  i : Integer;
begin
  for i := 0 to Screen.Fonts.Count - 1 do
   ComboBox1.Items.Add(Screen.Fonts.Strings[i]);
//  ComboBox1.Items := Screen.Fonts;  // Another way to do it.
  RichEdit1.Lines.Text := 'How is it to be you?';
end;

procedure TForm1.ComboBox1Click(Sender: TObject);
begin
  RichEdit1.Font.Name := ComboBox1.Text;
end;
```

See Also

DesktopFont (see page 5818)

ParentFont (see page 5834)

Displaying and Editing Text in a Memo Control

68.1.6.2.17 TColorBox.ItemHeight Property

Specifies the height, in pixels, of the items in the drop-down list.

Pascal

```
property ItemHeight: Integer;
```

C++

```
__property int ItemHeight;
```

Description

Read ItemHeight to determine the height of the items in the drop-down list.

The effect of setting ItemHeight varies, depending on the type of combo box and the style. For example, TComboBox lets you set the item height only when Style is set to csOwnerDrawFixed or csOwnerDrawVariable. If Style is csOwnerDrawVariable, ItemHeight is the default height for drawing list items, but this value can be overridden by an OnMeasureItem event handler.

TComboBoxEx does not let you change the value of ItemHeight.

Note: Combo boxes that do not support changes to ItemHeight do not raise an exception when you attempt to change ItemHeight; they simply ignore the attempt.

See Also

Items (see page 21187)

OnMeasureItem (see page 21225)

Style (see page 21224)

68.1.6.2.18 TColorBox.NoneColorColor Property

Specifies the color displayed in the color box for clNone.

Pascal

```
property NoneColorColor: TColor;
```

C++

```
__property TColor NoneColorColor;
```

Description

Set NoneColorColor to indicate what color the color box should use when drawing the icon for clNone. This property only affects the color box if the Style property includes cbSystemColors and cbIncludeNone.

Note: NoneColorColor only affects the way clNone appears in the color box. When you assign clNone to a control, the control determines how to interpret clNone.

See Also

Colors (see page 12424)

DefaultColorColor (see page 12424)

Style (see page 12425)

68.1.6.2.19 TColorBox.ParentBiDiMode Property

Specifies whether the control uses its parent's BiDiMode.

Pascal

```
property ParentBiDiMode: Boolean;
```

C++

```
__property Boolean ParentBiDiMode;
```

Description

Use ParentBiDiMode to get or set whether the control uses its parent's BiDiMode. When ParentBiDiMode is true, the control's BiDiMode property is always equal to that of its parent. If ParentBiDiMode is false, the control uses its own BiDiMode property.

Set ParentBiDiMode to true for all controls in a form in order to ensure that the entire user interface adjusts to Middle Eastern locales in a uniform manner.

When the value of the control's BiDiMode property changes, ParentBiDiMode becomes false automatically.

See Also

Parent (see page 5832)

BiDiMode (see page 5803)

68.1.6.2.20 TColorBox.ParentColor Property

Determines where a control looks for its color information.

Pascal

```
property ParentColor: Boolean;
```

C++

```
__property Boolean ParentColor;
```

Description

To have a control use the same color as its parent control, set ParentColor to true. If ParentColor is false, the control uses its own Color property.

Set ParentColor to true for all controls in order to ensure that all the controls on a form have a uniform appearance. For example, if ParentColor is true for all controls in a form, changing the background color of the form to gray causes all the controls on the form to also have a gray background.

When the value of a control's Color property changes, ParentColor becomes false automatically.

See Also

Color (see page 5812)

Parent (see page 5832)

ParentFont (see page 5834)

ParentShowHint (see page 5835)

68.1.6.2.21 TColorBox.ParentCtl3D Property

Determines where a component looks to determine if it should appear three dimensional.

Pascal

```
property ParentCtl3D: Boolean;
```

C++

```
__property Boolean ParentCtl3D;
```

Description

ParentCtl3D is provided for backwards compatibility. It has no effect on 32-bit versions of Windows or NT 4.0 and later.

ParentCtl3D determines whether the control uses its parent's Ctl3D property.

See Also

Ctl3D (see page 6198)

68.1.6.2.22 TColorBox.ParentFont Property

Determines where a control looks for its font information.

Pascal

```
property ParentFont: Boolean;
```

C++

```
__property Boolean ParentFont;
```

Description

To have a control use the same font as its parent control, set ParentFont to true. If ParentFont is false, the control uses its own Font property. Many controls default ParentFont to true so that all the controls in a form or other container present a uniform appearance. When the value of a control's Font property changes, ParentFont becomes false automatically.

When ParentFont is true for a form, the form uses the default font.

See Also

Font (see page 5823)

Parent (see page 5832)

ParentColor (see page 5834)

ParentShowHint (see page 5835)

68.1.6.2.23 TColorBox.ParentShowHint Property

Determines where a control looks to find out if its Help Hint should be shown.

Pascal

```
property ParentShowHint: Boolean;
```

C++

```
__property Boolean ParentShowHint;
```

Description

Use ParentShowHint to ensure that all the controls on a form either uniformly show their Help Hints or uniformly do not show them.

If ParentShowHint is true, the control uses the ShowHint property value of its parent. If ParentShowHint is false, the control uses the value of its own ShowHint property.

To provide Help Hints for only selected controls on a form, set the ShowHint property for those controls that should have Help Hints to true, and ParentShowHint becomes false automatically.

Note: Enable or disable all Help Hints for the entire application using the ShowHint property of the application object.

See Also

Hint (see page 5827)

Parent (see page 5832)

ParentColor (see page 5834)

ParentFont (see page 5834)

ShowHint (see page 5840)

68.1.6.2.24 TColorBox.PopupMenu Property

Identifies the pop-up menu associated with the control.

Pascal

```
property PopupMenu: TPopupMenu;
```

C++

```
__property TPopupMenu PopupMenu;
```

Description

Assign a value to PopupMenu to make a pop-up menu appear when the user selects the control and clicks the right mouse button. If the TPopupMenu's AutoPopup property is true, the pop-up menu appears automatically. If the menu's AutoPopup property is false, display the menu with a call to its Popup method from the control's OnContextPopup event handler.

C++ Examples:

```
/*
This example uses two edit boxes and one pop-up menu on a form.
The pop-up menu contains Cut, Copy, and Paste commands. This code
makes the pop-up menu available to both edit boxes:
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  PopupMenu1->AutoPopup = true;
  Edit1->PopupMenu = PopupMenu1;
  Edit2->PopupMenu = PopupMenu1;
}

/*
These are the cut, copy, and paste OnClick events for the commands
on the pop-up menu. Double click on the pop-up menu and add three
TMenuItems.  Then set the captions to "Cut", "Copy" and "Paste".
The names will be automatically set to "Cut1", "Copy1", and
"Paste1".  Then double click on the OnClick events and they will
be named "Cut1Click", "Copy1Click" and "Paste1Click" respectively.
Note: only the selected portion of the string in the edit box will
be copied, cut or replaced.
*/
void __fastcall TForm1::Copy1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
    if (pComponent->ClassNameIs("TEdit"))
      ((TEdit *)pComponent)->CopyToClipboard();
    else
      MessageBeep(0);
  }
  else
    MessageBeep(0);
}

void __fastcall TForm1::Cut1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
    if (pComponent->ClassNameIs("TEdit"))
      ((TEdit *)pComponent)->CutToClipboard();
    else
      MessageBeep(0);
  }
```

```
    else
      MessageBeep(0);
  }

  void __fastcall TForm1::Paste1Click(TObject *Sender)
  {
    TComponent *pComponent = PopupMenu1->PopupComponent;
    if (pComponent)
    {
      if (pComponent->ClassNameIs("TEdit"))
        ((TEdit *)pComponent)->PasteFromClipboard();
      else
        MessageBeep(0);
    }
    else
      MessageBeep(0);
  }
  /*
  This example demonstrates how to add and delete menu items
  to a popup menu at runtime and assign an event handler to
  the OnClick event.  Place a TPopupMenu and three buttons on
  the form named "AddButton", "EditButton",  and
  "DestroyButton" and add OnClick events to all three buttons.
  Put the TPopupMenu in the PopupMenu property of the form.
  Place the PopupMenuItemsClick procedure in the TForm1 type
  declaration so that it can be used as the method call for
  the menu item OnClick event.
  */
  void __fastcall TForm1::AddButtonClick(TObject *Sender)
  {
      const int num_items = 4;
      for (int index = 0; index < num_items; ++index)
      {
          TMenuItem *NewItem = new TMenuItem(PopupMenu1); // create the new item
          PopupMenu1->Items->Add(NewItem);// add it to the Popupmenu
          NewItem->Caption = "Menu Item " + IntToStr(index);
          NewItem->Tag = index;
          NewItem->OnClick = PopupMenuItemsClick;// assign it an event handler
          TNotifyEvent();
      }
  }

  void __fastcall TForm1::PopupMenuItemsClick(TObject *Sender)
  {
      TMenuItem *ClickedItem = dynamic_cast<TMenuItem *>(Sender);
      if (ClickedItem)
      {
          switch (ClickedItem->Tag)
          {
              case 0:
              {
                  ShowMessage("first item clicked");
                  break;
              }
              case 1:
              {
                  ShowMessage("second item clicked");
                  break;
              }
              case 2:
              {
                  ShowMessage("third item clicked");
                  break;
              }
              case 3:
              {
```

```
                ShowMessage("fourth item clicked");
                break;
            }
        }
    }
}

/*
To edit or destroy an item, grab its pointer via the Items
property.
*/
void __fastcall TForm1::EditButtonClick(TObject *Sender)
{
    const int index = 1;
    TMenuItem *ItemToEdit = PopupMenu->Items->Items[index];
    ItemToEdit->Caption = "Changed Caption";
}

void __fastcall TForm1::DestroyButtonClick(TObject *Sender)
{
    const int index = 2;
    TMenuItem *ItemToDelete = PopupMenu->Items->Items[index];
    delete ItemToDelete;
}
```

Delphi Examples:

```
{
This example uses two edit boxes and one pop-up menu on a form.
The pop-up menu contains Cut, Copy, and Paste commands. This code
makes the pop-up menu available to both edit boxes:
}
procedure TForm1.FormCreate(Sender: TObject);
begin
  PopupMenu1.AutoPopup := True;
  Edit1.PopupMenu := PopupMenu1;
  Edit2.PopupMenu := PopupMenu1;
end;

{
These are the cut, copy, and paste OnClick events for the commands
on the pop-up menu. Double click on the pop-up menu and add three
TMenuItems.  Then set the captions to "Cut", "Copy" and "Paste".
The names will be automatically set to "Cut1", "Copy1", and
"Paste1".  Then double click on the OnClick events and they will
be named "Cut1Click", "Copy1Click" and "Paste1Click" respectively.
Note: only the selected portion of the string in the edit box will
be copied, cut or replaced.
}
procedure TForm1.Copy1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
   Edit1.CopyToClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.CopyToClipboard
  else
    Beep;
end;

procedure TForm1.Cut1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
    Edit1.CutToClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.CutToClipboard
  else
    Beep;
```

```
end;

procedure TForm1.Paste1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
    Edit1.PasteFromClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.PasteFromClipboard
  else
    Beep;
end;
{
This example demonstrates how to add and delete menu items
to a popup menu at runtime and assign an event handler to
the OnClick event.  Place a TPopupMenu and three buttons on
the form named "AddButton", "EditButton",  and
"DestroyButton" and add OnClick events to all three buttons.
Put the TPopupMenu in the PopupMenu property of the form.
Place the PopupMenuItemsClick procedure in the TForm1 type
declaration so that it can be used as the method call for
the menu item OnClick event.
}

68.1.6.2.25 TColorBox.Selected Property

Specifies the currently selected color.

Pascal

```
property Selected: TColor;
```

C++

```
__property TColor Selected;
```

Description

Use Selected to get or set the selected color as a TColor value.

See Also

Colors (see page 12424)

ItemIndex

68.1.6.2.26 TColorBox.ShowHint Property

Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.

Pascal

```
property ShowHint: Boolean;
```

C++

```
__property Boolean ShowHint;
```

Description

The Help Hint is the value of the Hint property, which is displayed in a box just beneath the control. Use ShowHint to determine whether a Help Hint appears for the control.

To enable Help Hint for a particular control, the application ShowHint property must be true and either

the control's own ShowHint property must be true, or

the control's ParentShowHint property must be true and its parent's ShowHint property must be true.

For example, imagine a check box within a group box. If the ShowHint property of the group box is true and the ParentShowHint property of the check box is true, but the ShowHint property of the check box is false, the check box still displays its Help Hint.

Changing the ShowHint value automatically sets the ParentShowHint property to false.

C++ Examples:

```
/*
This example uses an edit box and a list box on a form.
Items are added to the list box and a Help Hint is assigned
to both controls. The last statement enables the Help Hints
for the entire application.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  Edit1->Hint = "Enter your name";
  Edit1->ShowHint = true;

  char string[10];
  char index[3];
  for(int i = 1; i <= 10; i++)
  {
    strcpy(string, "Item");
    itoa(i, index, 10);
    strcat(string, index);
    ListBox1->Items->Add(string);
  }
  ListBox1->Hint = "Select an item";
  ListBox1->ShowHint = true;
  Application->ShowHint = true;
}
/*
Note: To see an example that displays the hints of controls
in some place other than in a Help Hint box, see the OnHint
example.
*/
```

Delphi Examples:

```
{
This example uses an edit box and a list box on a form.
Items are added to the list box and a Help Hint is assigned
to both controls. The last statement enables the Help Hints
for the entire application.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  I: Integer;
begin
```

```
    Edit1.Hint := 'Enter your name';
    Edit1.ShowHint := True;
    with ListBox1 do
    begin
      for I := 1 to 10 do
        Items.Add('Item ' + IntToStr(I));
      Hint := 'Select an item';
      ShowHint := True;
    end;
    Application.ShowHint := True;
  end;
  {
  Note: To see an example that displays the hints of controls
  in some place other than in a Help Hint box, see the OnHint
  example.
  }

68.1.6.2.27 TColorBox.Style Property

Controls what colors are listed and how their names are formatted.

Pascal

```
property Style: TComboBoxStyle;
```

C++

```
__property TColorBoxStyle Style;__property TComboBoxStyle Style;
```

Description

Use Style to configure what colors appear in the list and how the names appear. Style is a set that includes 0 or more of the TColorBoxStyles flags.

See Also

DefaultColorColor (see page 12424)

NoneColorColor (see page 12424)

Colors (see page 12424)

TColor (see page 14648)

TColorDialog (see page 11270)

68.1.6.2.28 TColorBox.TabOrder Property

Indicates the position of the control in its parent's tab order.

Pascal

```
property TabOrder: TTabOrder;
```

C++

```
__property TTabOrder TabOrder;
```

Description

TabOrder is the order in which child windows are visited when the user presses the Tab key. The control with the TabOrder value of 0 is the control that has the focus when the form first appears.

Initially, the tab order is always the order in which the controls were added to the form. The first control added to the form has a TabOrder value of 0, the second is 1, the third is 2, and so on. Change this by changing the TabOrder property.

Each control has a unique tab-order value within its parent. If you change the TabOrder property value of one control to be the same as the value of a second control, the TabOrder value for all the other controls changes. For example, suppose a control is sixth in the tab order. If you change the control's TabOrder property value to 3 (making the control fourth in the tab order), the control that was originally fourth in the tab order now becomes fifth, and the control that was fifth becomes sixth.

Assigning TabOrder a value greater than the number of controls contained in the parent control moves the control to the end of the tab order. The control does not take on the assigned value of TabOrder, but instead is given the number that assures the control is the last in the tab order.

Note: TabOrder is meaningful only if the TabStop property is true and if the control has a parent. (The TabOrder property of a form is not used unless the form is the child of another form.) A control with a TabOrder of -1 has no parent, and therefore cannot be reached by pressing the Tab key. To remove a parented control from the Tab order, set its TabStop property to false.

See Also

FindNextControl (see page 6149)

TabStop (see page 6211)

68.1.6.2.29 TColorBox.TabStop Property

Determines if the user can tab to a control.

Pascal

```
property TabStop: Boolean;
```

C++

```
__property Boolean TabStop;
```

Description

Use the TabStop to allow or disallow access to the control using the Tab key.

If TabStop is true, the control is in the tab order. If TabStop is false, the control is not in the tab order and the user can't press the Tab key to move to the control.

Note: TabStop is not meaningful for a form unless the form assigns another form to be its parent.

See Also

TabOrder (see page 6211)

68.1.6.2.30 TColorBox.Visible Property

Determines whether the component appears onscreen.

Pascal

```
property Visible: Boolean;
```

C++

```
__property Boolean Visible;
```

Description

Use the Visible property to control the visibility of the control at runtime. If Visible is true, the control appears. If Visible is false, the control is not visible.

Calling the Show method sets the control's Visible property to true. Calling the Hide method sets it to false.

C++ Examples:

```
/*
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
*/
void __fastcall TForm1::PageControl1Change(TObject *Sender)
{
  CheckBox1->Checked = PageControl1->ActivePage->Visible;
}

void __fastcall TForm1::CheckBox1Click(TObject *Sender)
{
  PageControl1->ActivePage->Visible = CheckBox1->Checked;
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < 10; i++)
  {
    TTabSheet *pPage = new TTabSheet(this);
    pPage->PageControl = PageControl1;
    pPage->Caption = AnsiString("Page") + IntToStr(i);
    TEdit *pEdit = new TEdit(this);
    pEdit->Parent = pPage;
    pEdit->Left = random(pPage->ClientWidth - pEdit->Width);
    pEdit->Top = random(pPage->ClientHeight - pEdit->Height);
  }
  PageControl1Change(Sender);
}
```

Delphi Examples:

```
{
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
}
procedure TForm1.CheckBox1Click(Sender: TObject);
begin
  PageControl1.ActivePage.Visible := CheckBox1.Checked;
end;

procedure TForm1.PageControl1Change(Sender: TObject);
begin
  CheckBox1.Checked := PageControl1.ActivePage.Visible;
end;

procedure TForm1.FormCreate(Sender: TObject);
var
  i: Integer;
```

```
begin
  for i := 0 to 9 do
    with TTabSheet.Create(Self) do
    begin
      PageControl := PageControl1;
      Caption := 'TabSheet' + IntToStr(i);
      with TEdit.Create(Self) do
      begin
        Parent := PageControl1.Pages[i];
        Left := Random(PageControl1.ActivePage.ClientWidth - Width);
        Top := Random(PageControl1.ActivePage.ClientHeight - Height);
      end;
    end;
    PageControl1Change(Sender);
end;
```

68.1.6.3 TColorBox Events

The events of the TColorBox class are listed here.

Published Events

	Name	Description
	OnChange (see page 12221)	Occurs when the user changes the text displayed in the edit region.
	OnClick (see page 12223)	Occurs when the user clicks the control.
	OnCloseUp (see page 12225)	Occurs when the drop-down list closes up due to some user action.
	OnContextPopup (see page 12225)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnDblClick (see page 12226)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDragDrop (see page 12226)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 12228)	Occurs when the user drags an object over a control.
	OnDropDown (see page 12231)	Occurs when the user opens the drop-down list.
	OnEndDock (see page 12232)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 12232)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnEnter (see page 12233)	Occurs when a control receives the input focus.
	OnExit (see page 12236)	Occurs when the input focus shifts away from one control to another.
	OnGetColors (see page 12237)	Occurs when the control is populated with colors.
	OnKeyDown (see page 12238)	Occurs when a user presses any key while the control has focus.
	OnKeyPress (see page 12240)	Occurs when a key is pressed.
	OnKeyUp (see page 12242)	Occurs when the user releases a key that has been pressed.
	OnMouseEnter (see page 12243)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 12244)	Occurs when the user moves the mouse outside of a control.
	OnSelect (see page 12244)	Occurs when the user selects a string in the drop-down list.
	OnStartDock (see page 12244)	Occurs when the user begins to drag a control with a DragKind of dkDock.
	OnStartDrag (see page 12245)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.

68.1.6.3.1 TColorBox.OnChange Event

Occurs when the user changes the text displayed in the edit region.

Pascal

```
property OnChange: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnChange;
```

Description

Write an OnChange event handler to take specific action immediately after the user edits the text in the edit region or selects an item from the list. The Text property gives the new value in the edit region.

Note: OnChange only occurs in response to user actions. Changing the Text property programmatically does not trigger an OnChange event.

C++ Examples:

```
/*
This example requires a TPageControl already on the form.
Also, you must add pages to the TPageControl by right
clicking and selecting New Page.
The example code will allow the user to select the
ActivePage property through selection of a ComboBox item.
During the form create, the Combo Box control is loaded with
the names of each of the tabs, as well as the instance
pointers to the corresponding tab.  When the user selects
the Combo Box item, the associated TTabSheet object
contained in the Combo Box Objects array is used to set the
ActivePage property.  Select the Lines property of the
TRichEdit to enter a string.  Select the string before
justifying.
*/
void __fastcall TForm1::ComboBox1Change(TObject *Sender)
{
  TComboBox *pCB = dynamic_cast<TComboBox *>(Sender);
  if (pCB)
    PageControl1->ActivePage = (TTabSheet *)(pCB->Items->Objects[pCB->ItemIndex]);
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  const TColor colorPalette[12] = {
    clRed, clGreen, clYellow, clBlue, clWhite, clFuchsia,
    clTeal, clNavy, clMaroon, clLime, clOlive, clPurple};
  for (int i = 0; i < PageControl1->PageCount; i++)
  {
    PageControl1->Pages[i]->Brush->Color = colorPalette[i];
    ComboBox1->Items->AddObject(PageControl1->Pages[i]->Name, PageControl1->Pages[i]);
    ComboBox1->ItemIndex = 0;
  }
}
/*
The following example assumes that a drive combo box, a file
list box, and a directory list box are on a form. Add this
code as the OnChange event handler for the drive combo box
and the OnChange event handler for the directory list box.
When the user changes the drive using the combo box, the
directory list box and file list box will update to reflect
the new drive and the current directory on that drive.  When
```

```
the user double clicks on a directory in the file list box
will update to reflect the new directory.
*/
void __fastcall TForm1::DriveComboBox1Change(TObject *Sender)
{
  DirectoryListBox1->Drive = DriveComboBox1->Drive;
  FileListBox1->Drive = DriveComboBox1->Drive;
  FileListBox1->Directory = DirectoryListBox1->Directory;
}

void __fastcall TForm1::DirectoryListBox1Change(TObject *Sender)
{

  DirectoryListBox1.Drive := DriveComboBox1.Drive;
```

```
  FileListBox1.Drive := DriveComboBox1.Drive;
  FileListBox1.Directory := DirectoryListBox1.Directory;
end;
```

See Also

Text (see page 5842)

OnCloseUp (see page 21199)

68.1.6.3.2 TColorBox.OnClick Event

Occurs when the user clicks the control.

Pascal

```
property OnClick: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnClick;
```

Description

Use the OnClick event handler to respond when the user clicks the control. If the control has an associated action, and that action has an OnExecute method, the action's OnExecute method responds to click events unless it is superseded by an OnClick event handler.

Usually OnClick occurs when the user presses and releases the left mouse button with the mouse pointer over the control. This event can also occur when:

- The user selects an item in a grid, outline, list, or combo box by pressing an arrow key.
- The user presses Spacebar while a button or check box has focus.
- The user presses Enter when the active form has a default button (specified by the Default property).
- The user presses Esc when the active form has a cancel button (specified by the Cancel property).
- The user presses the accelerator key for a button or check box. For example, if the value of the Caption property of a check box is '&Bold', the B is underlined at runtime and the OnClick event of the check box is triggered when the user presses Alt+B. However, focus does not move to the control in these instances.
- The Checked property of a radio button is set to true.
- The value of the Checked property of a check box is changed.
- The Click method of a menu item is called.

For a form, an OnClick event occurs when the user clicks a blank area of the form or on a disabled component.

C++ Examples:

```
/*
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
*/
void __fastcall TForm1::PageControl1Change(TObject *Sender)
{
  CheckBox1->Checked = PageControl1->ActivePage->Visible;
}

void __fastcall TForm1::CheckBox1Click(TObject *Sender)
{
  PageControl1->ActivePage->Visible = CheckBox1->Checked;
}
```

```
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < 10; i++)
  {
    TTabSheet *pPage = new TTabSheet(this);
    pPage->PageControl = PageControl1;
    pPage->Caption = AnsiString("Page") + IntToStr(i);
    TEdit *pEdit = new TEdit(this);
    pEdit->Parent = pPage;
    pEdit->Left = random(pPage->ClientWidth - pEdit->Width);
    pEdit->Top = random(pPage->ClientHeight - pEdit->Height);
  }
  PageControl1Change(Sender);
}
```

Delphi Examples:

```
{
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
}
procedure TForm1.CheckBox1Click(Sender: TObject);
begin
  PageControl1.ActivePage.Visible := CheckBox1.Checked;
end;

procedure TForm1.PageControl1Change(Sender: TObject);
begin
  CheckBox1.Checked := PageControl1.ActivePage.Visible;
end;

procedure TForm1.FormCreate(Sender: TObject);
var
  i: Integer;
begin
  for i := 0 to 9 do
    with TTabSheet.Create(Self) do
    begin
      PageControl := PageControl1;
      Caption := 'TabSheet' + IntToStr(i);
      with TEdit.Create(Self) do
      begin
        Parent := PageControl1.Pages[i];
        Left := Random(PageControl1.ActivePage.ClientWidth - Width);
        Top := Random(PageControl1.ActivePage.ClientHeight - Height);
      end;
    end;
    PageControl1Change(Sender);
end;

68.1.6.3.3 TColorBox.OnCloseUp Event

Occurs when the drop-down list closes up due to some user action.

Pascal

```
property OnCloseUp: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnCloseUp;
```

Description

Write an OnCloseUp event handler to implement special processing that needs to occur when the drop-down list closes up. For example, an OnCloseUp event handler can check whether the user changed the selected item while the list was dropped down and respond accordingly.

See Also

OnDropDown (see page 21199)

DroppedDown (see page 21185)

68.1.6.3.4 TColorBox.OnContextPopup Event

Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).

Pascal

```
property OnContextPopup: TContextPopupEvent;
```

C++

```
__property TContextPopupEvent OnContextPopup;
```

Description

The OnContextPopup handler is called when the user uses the mouse or keyboard to request a popup menu. The OnContextPopup event is generated by a WM_CONTEXTMENU message, which is itself generated by the user clicking the right mouse button or by pressing SHIFT+F10 or the Applications key.

This event is especially useful when the control does not have an associated popup menu (the PopupMenu property is not set) or if the AutoPopup property of the control's associated popup menu is false. However, the OnContextPopup can also be used to override the automatic context menu that appears when the control has an associated popup menu with an AutoPopup property of true. In this last case, if the event handler displays its own menu, it should set the Handled parameter to true to suppress the default context menu.

The handler's MousePos parameter indicates the position of the mouse, in client coordinates.. If the event was not generated by a mouse click, MousePos is (-1,-1).

Note: Parent controls receive an OnContextPopup event before their child controls. In addition, for many child controls, the default window procedure causes the parent control to receive an OnContextPopup event after the child control. As a result, when parent controls do not set Handled to true in an OnContextPopup event handler, the event handler may be called multiple times for each context menu invocation.

AutoPopup (see page 16178)

68.1.6.3.5 TColorBox.OnDblClick Event

Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.

Pascal

```
property OnDblClick: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnDblClick;
```

Description

Use the OnDblClick event to respond to mouse double-clicks.

See Also

OnClick (see page 5851)

Responding to User Actions at Runtime

68.1.6.3.6 TColorBox.OnDragDrop Event

Occurs when the user drops an object being dragged.

Pascal

```
property OnDragDrop: TDragDropEvent;
```

C++

```
__property TDragDropEvent OnDragDrop;
```

Description

Use the OnDragDrop event handler to specify what happens when the user drops an object. The Source parameter of the OnDragDrop event is the object being dropped, and the Sender is the control the object is being dropped on. The X and Y parameters are the coordinates of the mouse positioned over the control.

C++ Examples:

```
/*
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
*/

// This OnDragOver event handler permits the list box to
// accept a dropped label:
void __fastcall TForm1::ListBox1DragOver(TObject *Sender, TObject *Source, int X, int Y,
TDragState State, bool &Accept)
{
   Accept = Source->ClassNameIs("TLabel");
}

/*
This OnDragDrop event handler implements the drop behavior.
*/
void __fastcall TForm1::ListBox1DragDrop(TObject *Sender, TObject *Source, int X, int Y)
{
```

```
  if (Sender->ClassNameIs("TListBox") && Source->ClassNameIs("TLabel"))
  {
    TListBox *DestList = (TListBox *)Sender;
    DestList->Font = ((TLabel *)Source)->Font;
    DestList->Color = ((TLabel *)Source)->Color;
    DestList->DoubleBuffered = true;
    DestList->Color = clWindow;
  }
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  ListBox1->Items->Add("Not");
  ListBox1->Items->Add("In");
  ListBox1->Items->Add("Alphabetical");
  ListBox1->Items->Add("Order");

}
```

Delphi Examples:

```
{
This code is an OnDragOver event handler that won't allow a
label control to be dropped on a panel control and stops the
dragging of the label as soon as the user drags the label
onto the panel:
Note: Set the label's DragMode property to dmAutomatic.
}
procedure TForm1.FormDragDrop(Sender, Source: TObject; X, Y: Integer);
begin
  TForm1(Source).Left := X;
  TForm1(Source).Top := Y;
end;

procedure TForm1.FormDragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := Source is TLabel;
end;

procedure TForm1.Panel1DragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := False;
  if (Source is TLabel) and (State = dsDragEnter) then
    (Source as TLabel).EndDrag(False);
end;
{
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
}

procedure TForm1.FormCreate(Sender: TObject);
begin
  ListBox1.Items.Add('Not');
  ListBox1.Items.Add('In');
  ListBox1.Items.Add('Alphabetical');
  ListBox1.Items.Add('Order');
end;

// This OnDragOver event handler permits the list box to
// accept a dropped label:
```

```
procedure TForm1.ListBox1DragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := Source is TLabel;
end;

// This OnDragDrop event handler implements the drop behavior.

procedure TForm1.ListBox1DragDrop(Sender, Source: TObject; X, Y: Integer);
begin
  if (Sender is TListBox) and (Source is TLabel) then
  begin
    with Sender as TListBox do
    begin
      Font := (Source as TLabel).Font;
      Color := (Source as TLabel).Color;
      DoubleBuffered := true;
      Color := clWindow;
    end;
  end;
end;
```

TDragObject (see page 6031)

68.1.6.3.7 TColorBox.OnDragOver Event

Occurs when the user drags an object over a control.

Pascal

```
property OnDragOver: TDragOverEvent;
```

C++

```
__property TDragOverEvent OnDragOver;
```

Description

Use an OnDragOver event to signal that the control can accept a dragged object so the user can drop or dock it.

Within the OnDragOver event handler, change the Accept parameter to false to reject the dragged object. Leave Accept as true to allow the user to drop or dock the dragged object on the control.

To change the shape of the cursor, indicating that the control can accept the dragged object, change the value of the DragCursor property for the control before the OnDragOver event occurs.

The Source is the object being dragged, the Sender is the potential drop or dock site, and X and Y are screen coordinates in pixels. The State parameter specifies how the dragged object is moving over the control.

Note: Within the OnDragOver event handler, the Accept parameter defaults to true. However, if an OnDragOver event handler

is not supplied, the control rejects the dragged object, as if the Accept parameter were changed to false.

C++ Examples:

```
/*
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
*/

// This OnDragOver event handler permits the list box to
// accept a dropped label:
void __fastcall TForm1::ListBox1DragOver(TObject *Sender, TObject *Source, int X, int Y,
TDragState State, bool &Accept)
{
   Accept = Source->ClassNameIs("TLabel");
}

/*
This OnDragDrop event handler implements the drop behavior.
*/
void __fastcall TForm1::ListBox1DragDrop(TObject *Sender, TObject *Source, int X, int Y)
{
  if (Sender->ClassNameIs("TListBox") && Source->ClassNameIs("TLabel"))
  {
    TListBox *DestList = (TListBox *)Sender;
    DestList->Font = ((TLabel *)Source)->Font;
    DestList->Color = ((TLabel *)Source)->Color;
    DestList->DoubleBuffered = true;
    DestList->Color = clWindow;
  }
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  ListBox1->Items->Add("Not");
  ListBox1->Items->Add("In");
  ListBox1->Items->Add("Alphabetical");
  ListBox1->Items->Add("Order");

}
```

Delphi Examples:

```
{
This code is an OnDragOver event handler that won't allow a
label control to be dropped on a panel control and stops the
dragging of the label as soon as the user drags the label
onto the panel:
Note: Set the label's DragMode property to dmAutomatic.
}
procedure TForm1.FormDragDrop(Sender, Source: TObject; X, Y: Integer);
begin
  TForm1(Source).Left := X;
  TForm1(Source).Top := Y;
end;

procedure TForm1.FormDragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := Source is TLabel;
end;
```

```
procedure TForm1.Panel1DragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := False;
  if (Source is TLabel) and (State = dsDragEnter) then
    (Source as TLabel).EndDrag(False);
end;
{
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
}

procedure TForm1.FormCreate(Sender: TObject);
begin
  ListBox1.Items.Add('Not');
  ListBox1.Items.Add('In');
  ListBox1.Items.Add('Alphabetical');
  ListBox1.Items.Add('Order');
end;

// This OnDragOver event handler permits the list box to
// accept a dropped label:

procedure TForm1.ListBox1DragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := Source is TLabel;
end;

// This OnDragDrop event handler implements the drop behavior.

procedure TForm1.ListBox1DragDrop(Sender, Source: TObject; X, Y: Integer);
begin
  if (Sender is TListBox) and (Source is TLabel) then
  begin
    with Sender as TListBox do
    begin
      Font := (Source as TLabel).Font;
      Color := (Source as TLabel).Color;
      DoubleBuffered := true;
      Color := clWindow;
    end;
  end;
end;
```

68.1.6.3.8 TColorBox.OnDropDown Event

Occurs when the user opens the drop-down list.

Pascal

```
property OnDropDown: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnDropDown;
```

Description

Write an OnDropDown event handler to implement special processing that needs to occur only when the drop-down list is activated.

C++ Examples:

```
/*
This example fills the list of a combo box with the set of
open forms when the user drops down the list. The list is
regenerated every time the list is dropped down, so if the
application opens or closes forms, the combo box stays current.
*/
#include "Unit2.h"
#include "Unit3.h"

void __fastcall TForm1::ComboBox1DropDown(TObject *Sender)
{
  ComboBox1->Items->BeginUpdate(); // prevent repaints until done
  ComboBox1->Items->Clear(); // empty the list of any old values
  for (int i = 0; i < Screen->CustomFormCount; i++)
  {
    if (((TForm1 *)Screen->CustomForms[i])->Visible)
      ComboBox1->Items->Add(Screen->CustomForms[i]->Caption);  // add form names
  }
  ComboBox1->Items->EndUpdate(); //reenable painting
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  ComboBox1->Sorted = True; // make sure the form names are sorted
}

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  Form2->Show();
}

void __fastcall TForm1::Button2Click(TObject *Sender)
{
  Form3->Show();
}
```

Delphi Examples:

```
{
This example fills the list of a combo box with the set of
open forms when the user drops down the list. The list is
regenerated every time the list is dropped down, so if the
application opens or closes forms, the combo box stays current.
}
procedure TForm1.ComboBox1DropDown(Sender: TObject);
var
```

```
    I: Integer;
  begin
    with ComboBox1 do
    begin
      Items.BeginUpdate; { prevent repaints until done }
      Items.Clear; { empty the list of any old values }
      for I := 0 to Screen.CustomFormCount - 1 do
      begin
        if (Screen.CustomForms[I].Visible) then
          Items.Add(Screen.CustomForms[I].Caption); { add form name }
      end;
      Items.EndUpdate; {reenable painting }
    end;
  end;

  procedure TForm1.FormCreate(Sender: TObject);
  begin
    ComboBox1.Sorted := True; { make sure the form names are sorted }
  end;

  procedure TForm1.Button1Click(Sender: TObject);
  begin
    Form2.Show;
  end;

  procedure TForm1.Button2Click(Sender: TObject);
  begin
    Form3.Show;
  end;
```

68.1.6.3.9 TColorBox.OnEndDock Event

Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.

Pascal

```
property OnEndDock: TEndDragEvent;
```

C++

```
__property TEndDragEvent OnEndDock;
```

Description

Use OnEndDock to specify actions or special processing that when a drag-and-dock operation stops.

68.1.6.3.10 TColorBox.OnEndDrag Event

Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.

Pascal

```
property OnEndDrag: TEndDragEvent;
```

C++

```
__property TEndDragEvent OnEndDrag;
```

Description

Use the OnEndDrag event handler to specify any special processing that occurs when dragging stops.

C++ Examples:

```
/*
This code displays a message in a label named Status. The
message displayed depends on whether the dragged label
control was successfully dropped into and accepted by a
another control.
*/
void __fastcall TForm1::Label1EndDrag(TObject *Sender, TObject *Target, int X,
      int Y)
{
  if (Sender->ClassNameIs("TLabel"))
  {
    AnsiString S = ((TLabel *)Sender)->Name + " was dropped and ";
    if (Target)
      S = S + "accepted!";
    else
      S = S + "rejected.";
    Status->Caption = S;
  }
}
```

Delphi Examples:

```
{
This code displays a message in a label named Status. The
message displayed depends on whether the dragged label
control was successfully dropped into and accepted by a
another control.
}
procedure TForm1.Label1EndDrag(Sender, Target: TObject; X, Y: Integer);
var
  S: string;
begin
  S := (Sender as TLabel).Name + ' was dropped... and ';
  if Target <> nil then
    S := S + 'accepted!'
  else
    S := S + 'rejected!';
  Status.Caption := S;
end;
```

68.1.6.3.11 TColorBox.OnEnter Event

Occurs when a control receives the input focus.

Pascal

```
property OnEnter: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnEnter;
```

Description

Use the OnEnter event handler to cause any special processing to occur when a control becomes active.

The OnEnter event does not occur when switching between forms or between another application and the application that includes the control.

When switching between controls in separate container controls such as the TPanel and the TGroupBox controls, an OnEnter event occurs for the container before the OnEnter event of the contained control.

Similarly, an OnExit event of the container occurs after the OnExit event of the control in a container when focus moves to another control outside the container.

For example, consider a form with an OK button and a group box that contains three radio buttons, where focus is currently on the OK button. When the user clicks one of the radio buttons, an OnExit event of the button occurs, followed by an OnEnter event on the group box, and finally an OnEnter event on the radio button that was clicked. If the user then clicks on the OK button, an OnExit event for the radio button occurs followed by an OnExit event for the group box, and then the button's OnEnter event occurs.

C++ Examples:

```
/*
This example takes an edit control, a button, and a rich
edit control on a form.  When the user presses the button, a
Font dialog appears.  When the user clicks the Apply (not OK)
button in the Font dialog, the currently selected font is
applied to the active control. Clicking the button sets the
ActiveControl to the button.  That is why we need to save
the ActiveControl in a shared OnEnter procedure.  In the rich
edit, only the text selected converts.
*/
TWinControl *myActiveControl;

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  FontDialog1->Options << fdApplyButton;
  FontDialog1->Execute();
}

void __fastcall TForm1::FontDialog1Apply(TObject *Sender, HWND Wnd)
{
  if (myActiveControl->ClassNameIs("TEdit"))
   ((TEdit *)myActiveControl)->Font->Assign(FontDialog1->Font);
  else if (myActiveControl->ClassNameIs("TRichEdit"))
    ((TRichEdit *)myActiveControl)->SelAttributes->Assign(FontDialog1->Font);
  else
    MessageBeep(0);
}

void __fastcall TForm1::Edit1Enter(TObject *Sender)
{
  myActiveControl = ActiveControl;
}
/*
This example uses an edit box and a memo control on a form.
When either the edit box or the memo is the active control,
it is colored yellow. When the active control becomes
inactive, the color of the control returns to the Windows
```

```
system color for a window.  These event handlers could also
be shared.
*/
void __fastcall TForm1::Edit1Enter(TObject *Sender)
{
  Edit1->Color = clYellow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Edit1Exit(TObject *Sender)
{
  Edit1->Color = clWindow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Memo1Enter(TObject *Sender)
{
  Memo1->Color = clYellow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Memo1Exit(TObject *Sender)
{
  Memo1->Color = clWindow;
}
```

Delphi Examples:

```
{
This example takes an edit control, a button, and a rich
edit control on a form.  When the user presses the button, a
Font dialog appears.  When the user clicks the Apply (not OK)
button in the Font dialog, the currently selected font is
applied to the active control. Clicking the button sets the
ActiveControl to the button.  That is why we need to save
the ActiveControl in a shared OnEnter procedure.  In the rich
edit, only the text selected converts.
}
procedure TForm1.Button1Click(Sender: TObject);
begin
   FontDialog1.Options := FontDialog1.Options + [fdApplyButton];
   FontDialog1.Execute;
end;

procedure TForm1.Edit1Enter(Sender: TObject);
begin
  myActiveControl := ActiveControl;
end;

procedure TForm1.FontDialog1Apply(Sender: TObject; Wnd: HWND);
begin
  if myActiveControl is TEdit then
    with myActiveControl as TEdit do
       Font.Assign(TFontDialog(Sender).Font)
  else if myActiveControl is TRichEdit then
    with myActiveControl as TRichEdit do
      SelAttributes.Assign(TFontDialog(Sender).Font)
  else
    Beep;
end;
{
This example uses an edit box and a memo control on a form.
When either the edit box or the memo is the active control,
it is colored yellow. When the active control becomes
inactive, the color of the control returns to the Windows
system color for a window.  These event handlers could also
be shared.
}
procedure TForm1.Edit1Enter(Sender: TObject);
begin
```

```
  Edit1.Color := clYellow;
end;

procedure TForm1.Edit1Exit(Sender: TObject);
begin
  Edit1.Color := clWindow;
end;

procedure TForm1.Memo1Enter(Sender: TObject);
begin
  Memo1.Color := clYellow;
end;

procedure TForm1.Memo1Exit(Sender: TObject);
begin
  Memo1.Color := clWindow;
end;
```

68.1.6.3.12 TColorBox.OnExit Event

Occurs when the input focus shifts away from one control to another.

Pascal

```
property OnExit: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnExit;
```

Description

Use the OnExit event handler to provide special processing when the control ceases to be active.

The OnExit event does not occur when switching between forms or between another application and your application.

When switching between controls in separate container controls such as the TPanel and the TGroupBox controls, an OnExit event occurs for the control inside the container before the OnExit event of the container.

Similarly, an OnEnter event of the container occurs before the OnEnter event of the control in a container when focus moves to a control inside a container.

For example, consider a form with an OK button and a group box that contains three radio buttons, where focus is currently on the OK button. When the user clicks one of the radio buttons, an OnExit event of the button occurs, followed by an OnEnter event on the group box, and finally an OnEnter event on the radio button that was clicked. If the user then clicks on the OK button, an OnExit event for the radio button occurs followed by an OnExit event for the group box, and then the button's OnEnter event occurs.

Note: In some control classes the ActiveControl property updates before the OnExit event occurs.

C++ Examples:

```
/*
This example uses an edit box and a memo control on a form.
```

```
When either the edit box or the memo is the active control,
it is colored yellow. When the active control becomes
inactive, the color of the control returns to the Windows
system color for a window.  These event handlers could also
be shared.
*/
void __fastcall TForm1::Edit1Enter(TObject *Sender)
{
  Edit1->Color = clYellow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Edit1Exit(TObject *Sender)
{
  Edit1->Color = clWindow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Memo1Enter(TObject *Sender)
{
  Memo1->Color = clYellow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Memo1Exit(TObject *Sender)
{
  Memo1->Color = clWindow;
}
```

Delphi Examples:

```
{
This example uses an edit box and a memo control on a form.
When either the edit box or the memo is the active control,
it is colored yellow. When the active control becomes
inactive, the color of the control returns to the Windows
system color for a window.  These event handlers could also
be shared.
}
procedure TForm1.Edit1Enter(Sender: TObject);
begin
  Edit1.Color := clYellow;
end;

procedure TForm1.Edit1Exit(Sender: TObject);
begin
  Edit1.Color := clWindow;
end;

procedure TForm1.Memo1Enter(Sender: TObject);
begin
  Memo1.Color := clYellow;
end;

procedure TForm1.Memo1Exit(Sender: TObject);
begin
  Memo1.Color := clWindow;
end;
```

68.1.6.3.13 TColorBox.OnGetColors Event

Occurs when the control is populated with colors.

Pascal

```
property OnGetColors: TGetColorsEvent;
```

C++

```
__property TGetColorsEvent OnGetColors;
```

68.1.6.3.14 TColorBox.OnKeyDown Event

Occurs when a user presses any key while the control has focus.

Pascal

```
property OnKeyDown: TKeyEvent;
```

C++

```
__property TKeyEvent OnKeyDown;
```

Description

Use the OnKeyDown event handler to specify special processing to occur when a key is pressed. The OnKeyDown handler can respond to keyboard keys, including function keys and keys combined with the `Shift`, `Alt`, and `Ctrl` keys, and pressed mouse buttons.

Note: TCheckBox does not fire OnKeyDown events for arrow keys.

The TKeyEvent type points to a method that handles keyboard events.

The Key parameter is the key on the keyboard. For non-alphanumeric keys, use virtual key codes to determine the key pressed. For more information, see Virtual Key codes.

The Shift parameter indicates whether the Shift, Alt, or Ctrl keys are combined with the keystroke.

An application gets Windows WM_KEYDOWN messages for all keys when the user presses a key. These messages indirectly fire the OnKeyDown event. If you set the Key to 0 there you prevent only any further processing of this message. But for keys that generate characters Windows also produces WM_CHAR. At the time your OnKeyDown event fires, the WM_CHAR message for the key will already be in the message queue. Setting Key to 0 does not stop it from being delivered, so it fires the OnKeyPress event. You must set the Key to #0 to prevent the control from intercepting the WM_CHAR message.

This method of organizing key processing has advantages. Code that only deals with characters, including control characters like #13 for carriage return, #3 for Ctrl-C and so on, should go into the OnKeyPress event. Code that deals with keys that do not generate characters should be put into the OnKeyDown event.

C++ Examples:

```
/*
This example changes a form's color to aqua when the user
presses the F1 key, even when a control on the form has the
focus. When the user releases the key, the form returns to
its original color.  Set the KeyPreview on the form to True.
Set the OnKeyDown event to FormKeyDown and set the OnKeyUp
event to FormKeyUp.  Set the KeyPreview on the form to True.
*/
void __fastcall TForm1::FormKeyDown(TObject *Sender, WORD &Key,
      TShiftState Shift)
{
  if (Key == VK_F1)
  {
    FormColor = Form1->Color;
    Form1->Color = clAqua;
    if (ComboBox1->Text == "KeyDown")
      ComboBox1->Text = "KeyDown2";
    else
```

```
      ComboBox1->Text = "KeyDown";
    Form1->Refresh();
    Memo1->Lines->Add(ComboBox1->Text);
  }
}

void __fastcall TForm1::FormKeyUp(TObject *Sender, WORD &Key, TShiftState Shift)
{
  if (Key == VK_F1)
  {
    Form1->Color = FormColor;
    if (ComboBox1->Text == "KeyUp")
      ComboBox1->Text = "KeyUp2";
    else
      ComboBox1->Text = "KeyUp";
    Form1->Refresh();
    Memo1->Lines->Add(ComboBox1->Text);
  }
}
```

Delphi Examples:

```
{
This example changes a form's color to aqua when the user
presses the F1 key, even when a control on the form has the
focus. When the user releases the key, the form returns to
its original color.  Set the KeyPreview on the form to True.
Set the OnKeyDown event to FormKeyDown and set the OnKeyUp
event to FormKeyUp.  Set the KeyPreview on the form to True.
}

68.1.6.3.15 TColorBox.OnKeyPress Event

Occurs when a key is pressed.

Pascal

```
property OnKeyPress: TKeyPressEvent;
```

C++

```
__property TKeyPressEvent OnKeyPress;
```

Description

Use the OnKeyPress event handler to make something happen as a result of a single character key press.

The Key parameter in the OnKeyPress event handler is of type Char; therefore, the OnKeyPress event registers the ASCII character of the key pressed. Keys that don't correspond to an ASCII Char value (Shift or F1, for example) don't generate an OnKeyPress event. Key combinations (such as Shift+A), generate only one OnKeyPress event (for this example, Shift+A results in a Key value of "A" if Caps Lock is off). To respond to non-ASCII keys or key combinations, use the OnKeyDown or OnKeyUp event handlers.

An application gets Windows WM_KEYDOWN messages for all keys when the user presses a key. These messages indirectly fire the OnKeyDown event. If you set the Key to 0 there you prevent only any further processing of this message. But for keys that generate characters Windows also produces WM_CHAR. At the time your OnKeyDown event fires, the WM_CHAR message for the key will already be in the message queue. Setting Key to 0 does not stop it from being delivered, so it fires the OnKeyPress event. You must set the Key to #0 to prevent the control from intercepting the WM_CHAR message.

This method of organizing key processing has advantages. Code that only deals with characters, including control characters like #13 for carriage return, #3 for Ctrl-C and so on, should go into the OnKeyPress event. Code that deals with keys that do not generate characters should be put into the OnKeyDown event.

C++ Examples:

```
/*
This event handler displays a message dialog box specifying
which key was pressed:
*/

void __fastcall TForm1::FormKeyPress(TObject *Sender, char &Key)
{
  char keyString[25];
  keyString[0] = Key;
  strcpy(&keyString[1], " Was Pressed");
  TMsgDlgButtons() << mbOK;
  MessageDlg(AnsiString(keyString), TMsgDlgType(mtInformation), TMsgDlgButtons() << mbOK, 0);
}
```

Delphi Examples:

```
{
This event handler displays a message dialog box specifying
which key was pressed:
}
procedure TForm1.FormKeyPress(Sender: TObject; var Key: Char);
begin
  MessageDlg(Key + ' has been pressed', mtInformation, [mbOK], 0)
end;
```

OnKeyDown (see page 6225)

OnKeyUp (see page 6228)

KeyPreview (see page 13918)

68.1.6.3.16 TColorBox.OnKeyUp Event

Occurs when the user releases a key that has been pressed.

Pascal

```
property OnKeyUp: TKeyEvent;
```

C++

```
__property TKeyEvent OnKeyUp;
```

Description

Use the OnKeyUp event handler to provide special processing that occurs when a key is released. The OnKeyUp handler can respond to all keyboard keys, including function keys and keys combined with the Shift, Alt, and Ctrl keys.

The TKeyEvent type points to a method that handles keyboard events. The Key parameter is the key on the keyboard. For non-alphanumeric keys, you must use virtual key codes to determine the key pressed. For more information, see Virtual Key codes.

The Shift parameter indicates whether the Shift, Alt, or Ctrl keys are combined with the keystroke.

C++ Examples:

```
/*
This example changes a form's color to aqua when the user
presses the F1 key, even when a control on the form has the
focus. When the user releases the key, the form returns to
its original color.  Set the KeyPreview on the form to True.
Set the OnKeyDown event to FormKeyDown and set the OnKeyUp
event to FormKeyUp.  Set the KeyPreview on the form to True.
*/
void __fastcall TForm1::FormKeyDown(TObject *Sender, WORD &Key,
      TShiftState Shift)
{
  if (Key == VK_F1)
  {
    FormColor = Form1->Color;
    Form1->Color = clAqua;
    if (ComboBox1->Text == "KeyDown")
      ComboBox1->Text = "KeyDown2";
    else
      ComboBox1->Text = "KeyDown";
    Form1->Refresh();
    Memo1->Lines->Add(ComboBox1->Text);
  }
}

void __fastcall TForm1::FormKeyUp(TObject *Sender, WORD &Key, TShiftState Shift)
{
  if (Key == VK_F1)
  {
    Form1->Color = FormColor;
    if (ComboBox1->Text == "KeyUp")
      ComboBox1->Text = "KeyUp2";
    else
      ComboBox1->Text = "KeyUp";
    Form1->Refresh();
    Memo1->Lines->Add(ComboBox1->Text);
  }
}
```

Delphi Examples:

```
{
```

```
This example changes a form's color to aqua when the user
presses the F1 key, even when a control on the form has the
focus. When the user releases the key, the form returns to
its original color.  Set the KeyPreview on the form to True.
Set the OnKeyDown event to FormKeyDown and set the OnKeyUp
event to FormKeyUp.  Set the KeyPreview on the form to True.
}
var
  FormColor: TColor;
procedure TForm1.FormCreate(Sender: TObject);
begin
  KeyPreview := True;
  FormColor := Form1.Color;
end;

procedure TForm1.FormKeyDown(
  Sender: TObject; var Key: Word; Shift: TShiftState);
begin
  if Key = VK_F1 then
  begin
    Form1.Color := clAqua;
    if (ComboBox1.Text = 'KeyDown') then
      ComboBox1.Text := 'KeyDown2'
    else
      ComboBox1.Text := 'KeyDown';
    WriteLn(ComboBox1.Text);
  end;
end;

procedure TForm1.FormKeyUp(
  Sender: TObject; var Key: Word; Shift: TShiftState);
begin
  if Key = VK_F1 then
  begin
    Form1.Color := FormColor;
    if (ComboBox1.Text = 'KeyUp') then
      ComboBox1.Text := 'KeyUp2'
    else
      ComboBox1.Text := 'KeyUp';
    WriteLn(ComboBox1.Text);
  end;
end;
```

OnKeyDown (see page 6225)

OnKeyPress (see page 6227)

68.1.6.3.17 TColorBox.OnMouseEnter Event

Occurs when the user moves the mouse into a control.

Pascal

```
property OnMouseEnter: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnMouseEnter;
```

Description

Use the OnMouseEnter event handler to implement any special processing that should occur as a result of moving the mouse into a control when the parent top-level form is not active.

68.1.6.3.18 TColorBox.OnMouseLeave Event

Occurs when the user moves the mouse outside of a control.

Pascal

```
property OnMouseLeave: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnMouseLeave;
```

Description

Use the OnMouseLeave event handler to implement any special processing that should occur as a result of moving the mouse outside of a control when the parent top-level form is not active.

68.1.6.3.19 TColorBox.OnSelect Event

Occurs when the user selects a string in the drop-down list.

Pascal

```
property OnSelect: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnSelect;
```

Description

Write an OnSelect event handler to respond when the user changes the selected item in the drop-down list. OnSelect occurs after the selection has changed and the Text property reflects the new item.

Text (see page 5842)

68.1.6.3.20 TColorBox.OnStartDock Event

Occurs when the user begins to drag a control with a DragKind of dkDock.

Pascal

```
property OnStartDock: TStartDockEvent;
```

C++

```
__property TStartDockEvent OnStartDock;
```

Description

Use the OnStartDock event handler to implement special processing when the user starts a drag-and-dock operation by dragging the control.

The OnStartDock event handler can create a TDragDockObjectEx object for the DragObject parameter to specify the appearance of the dragging rectangle and how the dragged control interacts with potential docking sites. If you return TDragDockObjectEx as the drag object, there is no need to call the Free method for the DragObject when dragging is over. If you use TDragDockObject, your application is responsible for freeing the drag object.

If the OnStartDock event handler sets the DragObject parameter to nil (Delphi) or NULL (C++), a TDragDockObject object is

automatically created.

Note: This information applies to Win32 applications only.

OnDockDrop (see page 6214)

68.1.6.3.21 TColorBox.OnStartDrag Event

Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.

Pascal

```
property OnStartDrag: TStartDragEvent;
```

C++

```
__property TStartDragEvent OnStartDrag;
```

Description

Use the OnStartDrag event handler to implement special processing when the user starts to drag the control or an object it contains. OnStartDrag only occurs if DragKind is dkDrag.

Sender is the control that is about to be dragged, or that contains the object about to be dragged.

The OnStartDrag event handler can create a TDragControlObjectEx instance for the DragObject parameter to specify the drag cursor, or, optionally, a drag image list. If you create a TDragControlObjectEx instance, there is no need to call the Free method for the DragObject when dragging is over. If you create, instead, a TDragControlObject instance, your application is responsible for freeing the drag object instance.

If the OnStartDrag event handler sets the DragObject parameter to nil (Delphi) or NULL (C++), a TDragControlObject object is automatically created and dragging begins on the control itself.

Note: On some controls, such as TRichEdit, the underlying Windows control handles internal drag operations. For these controls, there are no OnStartDrag or OnEndDrag events for drag operations within the control.

68.1.7 TColorListBox Class

TColorListBox represents a list box that lets users select a color.

Class Hierarchy

Pascal

```
TColorListBox = class(TCustomColorListBox);
```

C++

```
class TColorListBox : public TCustomColorListBox;
```

File

ExtCtrls

Description

TCustomColorBox (see page 12406) is the base class for TColorListBox and for combo boxes that display a list of colors. The list box displays a list of all the colors for which the Graphics (see page 14387) unit defines a constant. For a list of these colors, see TColor. Each color is displayed next to a small square that is drawn in the corresponding color.

Do not use TCustomColorBox (see page 12406) in applications. It is intended to act as a base class for color selection controls. Rather, to add a list box control with selectable colors, use the TColorListBox component. To use a drop-down combo box that lets users select a color, use the TColorBox (see page 12182) component, which appears on the Additional page of the component palette.

68.1.7.1 TColorListBox Members

The following tables list the members exposed by TColorListBox.

Protected Events

	Name	Description
	OnAlignInsertBefore (see page 6213)	Occurs when an object with custom alignment is aligned.
	OnAlignPosition (see page 6214)	Occurs when an object with custom alignment is aligned.
	OnCanResize (see page 5851)	Occurs when an attempt is made to resize the control.
	OnConstrainedResize (see page 5853)	Adjust resize constraints.
	OnData (see page 21357)	Occurs when a virtual list box needs to supply the text of an item.
	OnDataFind (see page 21357)	Occurs when a virtual list box needs to identify the index of an item given its text.
	OnDataObject (see page 21358)	Occurs when a virtual list box needs to supply the object associated with an item.
	OnDockDrop (see page 6214)	Occurs when another control is docked to the control.
	OnDockOver (see page 6216)	Occurs when another control is dragged over the control.
	OnDrawItem (see page 21358)	Occurs when an item in an owner-draw list box needs to be redisplayed.
	OnGetSiteInfo (see page 6223)	Returns the control's docking information.
	OnMeasureItem (see page 21360)	Occurs when the application needs to redisplay an item in a variable height owner-draw list box.
	OnMouseWheel (see page 5869)	Occurs when the mouse wheel is rotated.
	OnMouseWheelDown (see page 5869)	Occurs when the mouse wheel is rotated downward.
	OnMouseWheelUp (see page 5870)	Occurs when the mouse wheel is rotated upward.

	OnResize (see page 5870)	Occurs immediately after the control is resized.
	OnUnDock (see page 6230)	Occurs when the application tries to undock a control that is docked to the windowed control.

Protected Fields

	Name	Description
	FAnchorMove (see page 5733)	This is FAnchorMove, a member of class TControl.
	FAnchorOrigin (see page 5734)	This is FAnchorOrigin, a member of class TControl.
	FAnchorRules (see page 5734)	This is FAnchorRules, a member of class TControl.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FDesignSize (see page 6124)	This is FDesignSize, a member of class TWinControl.
	FDoubleBuffered (see page 6124)	This is FDoubleBuffered, a member of class TWinControl.
	FExplicitHeight (see page 5734)	This is FExplicitHeight, a member of class TControl.
	FExplicitLeft (see page 5734)	This is FExplicitLeft, a member of class TControl.
	FExplicitTop (see page 5734)	This is FExplicitTop, a member of class TControl.
	FExplicitWidth (see page 5735)	This is FExplicitWidth, a member of class TControl.
	FInImeComposition (see page 6125)	This is FInImeComposition, a member of class TWinControl.
	FMoving (see page 21321)	This is FMoving, a member of class TCustomListBox.
	FMultiSelect (see page 5956)	This is FMultiSelect, a member of class TCustomMultiSelectListControl.
	FOriginalParentSize (see page 5735)	This is FOriginalParentSize, a member of class TControl.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	ActionChange (see page 5737)	Responds when the action associated with the control changes.
V	ActionChange (see page 6127)	Updates the control to reflect changes in its associated action.
	AddBiDiModeExStyle (see page 6128)	Sets control's window style according to its bi-directional support.
V	AdjustClientRect (see page 6128)	Provides the interface that adjusts the ClientRect (see page 5810) property for idiosyncrasies of the window.
	AdjustSize (see page 5738)	Sets the size of the control as determined by the AutoSize (see page 5803) property.
V	AdjustSize (see page 6129)	Adjusts the control's size according to its contents and constraints.
V	AlignControls (see page 6129)	Aligns any controls for which the control is the parent within a specified area of the control.
	ArrangeControl (see page 6130)	This is ArrangeControl, a member of class TWinControl.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	AssignTo (see page 5739)	Overrides the inherited AssignTo function to enable assignments to TAction objects.
V	AssignTo (see page 6130)	Copies the properties of the windowed control to another object.
	BeginAutoDrag (see page 5739)	Begin Automatic Drag.
	CalcCursorPos (see page 5741)	This is CalcCursorPos, a member of class TControl.
V	CanAutoSize (see page 5741)	Indicates whether the control can resize itself automatically to accommodate its contents.
V	CanAutoSize (see page 6131)	Indicates how the control can be resized.
V	CanResize (see page 5742)	OnCanResize (see page 5851) event dispatcher.
V	CanResize (see page 6132)	Indicates how the control can respond to a resize attempt.
	Changed (see page 5742)	Sends a CM_CHANGED (see page 6330) message to the control.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	ChangeScale (see page 5743)	Rescaling event dispatcher.
V	ChangeScale (see page 6132)	Resize (see page 5780) and reposition children and self.
	Click (see page 5743)	Respond to user click.
V	ConstrainedResize (see page 5746)	Notify control of resize with constraints.
V	ConstrainedResize (see page 6133)	Generates an OnConstrainedResize (see page 5853) event.
	ControlsAligned (see page 6134)	This is ControlsAligned, a member of class TWinControl.
	CreateDockManager (see page 6134)	Creates the dock manager for the control.

	CreateHandle (see page 6135)	Creates underlying screen object.
	CreateParams (see page 6135)	Initializes a window-creation parameter data structure.
	CreateParams (see page 21324)	Initializes the window-creation parameter record passed in the Params parameter.
	CreateSubClass (see page 6136)	Creates a windowed control derived from an existing Windows window class.
	CreateWindowHandle (see page 6137)	Creates a Windows control to represent the control.
	CreateWnd (see page 6137)	Creates the underlying window.
	CreateWnd (see page 12439)	Creates a Windows control corresponding to the list box component.
	CreateWnd (see page 21325)	Creates a Windows control corresponding to the list box component.
	CustomAlignInsertBefore (see page 6137)	Returns placement order of custom-aligned child control.
	CustomAlignPosition (see page 6138)	Returns aligned position of custom-aligned child control.
	DblClick (see page 5747)	OnDblClick (see page 5854) event dispatcher.
	DefaultDockImage (see page 5747)	Handles the painting and erasing of a dock image.
	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	DefineProperties (see page 5748)	Provides methods to read and write the IsControl (see page 5829) property to a stream such as a form file.
	DefineProperties (see page 6139)	Provides methods to read and write the IsControl property to a stream such as a form file.
	DeleteString (see page 21326)	Deletes a string from the list box.
	DesignWndProc (see page 5749)	This is DesignWndProc, a member of class TControl.
	DestroyHandle (see page 6140)	Destroys the control's window without destroying the control.
	DestroyWindowHandle (see page 6140)	Destroys the window created in the CreateWindowHandle (see page 6137) method.
	DestroyWnd (see page 6141)	Destroys the control's window.
	DestroyWnd (see page 21326)	Saves the list box items in a string list before freeing the underlying Windows control.
	DoAddDockClient (see page 6142)	Performs actions when a control is docked to the windowed control.
	DockOver (see page 6143)	Responds when a docking client is dragged over the windowed control.
	DockReplaceDockClient (see page 6143)	This is DockReplaceDockClient, a member of class TWinControl.
	DockTrackNoTarget (see page 5749)	Handles dragging of the control over an invalid docking target.
	DoContextPopup (see page 5750)	OnContextPopup (see page 5854) event dispatcher.
	DoDock (see page 5750)	Docking event dispatcher.
	DoDockOver (see page 6143)	Generates an OnDockOver (see page 6216) event.
	DoEndDock (see page 5750)	OnEndDock (see page 5859) event dispatcher.
	DoEndDrag (see page 5751)	OnEndDrag (see page 5860) event dispatcher.
	DoEnter (see page 6144)	Respond to receiving input focus.
	DoExit (see page 6144)	Respond to losing input focus
	DoFindData (see page 21326)	Returns the index of a string in the list box.
	DoFlipChildren (see page 6145)	Flips the control's children.
	DoGetData (see page 21327)	Returns a string in the list box given its index.
	DoGetDataObject (see page 21327)	Returns the object associated with an item in a virtual list box.
	DoKeyDown (see page 6145)	Performs some preprocessing before generating an OnKeyDown (see page 6225) event.
	DoKeyPress (see page 6146)	Performs some preprocessing before generating an OnKeyPress (see page 6227) event.
	DoKeyUp (see page 6146)	Performs some preprocessing before generating an OnKeyUp (see page 6228) event.
	DoMouseWheel (see page 5751)	Processes mouse wheel motion.
	DoMouseWheelDown (see page 5752)	OnMouseWheelDown (see page 5869) event dispatcher.
	DoMouseWheelUp (see page 5752)	OnMouseWheelUp (see page 5870) event dispatcher.
	DoRemoveDockClient (see page 6147)	Responds when a control is undocked from the windowed control.
	DoStartDock (see page 5753)	OnStartDock (see page 5871) event dispatcher.
	DoStartDrag (see page 5753)	OnStartDrag (see page 5871) event dispatcher.
	DoUnDock (see page 6147)	Undocks a control that is currently docked to the windowed control.
	DragCanceled (see page 5754)	Provides the interface for a method that responds to the cancellation of a drag.

V	DragCanceled (see page 21328)	Sends a mouse message canceling the drag-and-drop operation.
	DragOver (see page 5755)	OnDragOver (see page 5857) event dispatcher.
	DrawDragDockImage (see page 5755)	Draws the dock image for the control.
V	DrawItem (see page 12439)	Generates an OnDrawItem event.
V	DrawItem (see page 21328)	Generates an OnDrawItem (see page 21358) event.
	EraseDragDockImage (see page 5757)	Erases the dock image for the control.
	FindNextControl (see page 6149)	Returns the control's next child in the tab order after the specified control.
	FixupTabList (see page 6149)	Sorts the child controls by their tab order.
V	GetAction (see page 5758)	This is GetAction, a member of class TControl.
	GetActionLinkClass (see page 5758)	Returns the appropriate action link class that is associated with the control class.
V	GetActionLinkClass (see page 6152)	Returns the associated action link class.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetChildren (see page 6153)	Calls a specified method for each child of the control.
V	GetClientOrigin (see page 5758)	Returns the screen coordinates of the top-left corner of the control's client area.
V	GetClientOrigin (see page 6153)	Returns the value of the ClientOrigin (see page 5809) property.
V	GetClientRect (see page 5759)	Returns a rectangle defining the client area of the control.
V	GetClientRect (see page 6154)	Returns the value of the ClientRect (see page 5810) property.
V	GetControlExtents (see page 6154)	Returns the smallest rectangle in which all the control's children fit.
A	GetCount (see page 5942)	Returns the number of items in the list.
V	GetCount (see page 21329)	Returns the value of the Count (see page 21346) property.
V	GetDeviceContext (see page 5760)	Returns a device context for the control.
V	GetDeviceContext (see page 6155)	Provides access to a device context for the control.
	GetDockEdge (see page 5763)	Returns the edge on which another control should be docked when it is dragged over the control.
V	GetDragImages (see page 5763)	Returns the control's image list containing the image to be displayed while dragging.
V	GetEnabled (see page 5763)	Returns the value of the Enabled (see page 5821) property.
V	GetFloating (see page 5764)	Returns the value of the Floating (see page 5823) property.
V	GetFloatingDockSiteClass (see page 5764)	Returns the class used for the control when it is floating.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
	GetItemData (see page 21329)	Returns a 32-bit value associated with the specified item in a list box.
A	GetItemIndex (see page 5942)	Returns the value of the ItemIndex (see page 5944) property.
V	GetItemIndex (see page 21329)	Returns the value of the ItemIndex property.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetPalette (see page 5765)	Returns the handle to a palette for use by the control.
	GetParentHandle (see page 6157)	Returns the window handle for the window of the control's parent.
	GetPopupMenu (see page 5765)	Returns the pop-up menu associated with the control.
A	GetSelCount (see page 5956)	Returns the value of the SelCount (see page 5957) property.
V	GetSelCount (see page 21330)	Returns the number of selected items.
	GetSelected (see page 21330)	Indicates whether a particular item is selected.
	GetSiteInfo (see page 6158)	Generates an OnGetSiteInfo (see page 6223) event
	GetTopParentHandle (see page 6159)	Returns the window handle of the first window not associated with a VCL control that contains the windowed control.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	InternalGetItemData (see page 21330)	Retrieves the data associated with an item in the list box.
	InternalSetItemData (see page 21330)	Associates an integer with a specified item in the list box.
	InvalidateDockHostSite (see page 6162)	This is InvalidateDockHostSite, a member of class TWinControl.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.

	IsControlActivateMsg (see page 6162)	This is IsControlActivateMsg, a member of class TWinControl.
	IsControlMouseMsg (see page 6162)	Indicates whether a specified mouse message is directed to one of the windowed control's child controls.
	IsQualifyingSite (see page 6163)	This is IsQualifyingSite, a member of class TWinControl.
	KeyDown (see page 6163)	Respond to key press events.
V	KeyDown (see page 12440)	Respond to key press events.
	KeyPress (see page 6163)	Respond to keyboard input.
V	KeyPress (see page 12441)	Responds when the user presses a key.
V	KeyPress (see page 21334)	Responds when the user presses a key.
	KeyUp (see page 6164)	Respond to released key.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Loaded (see page 5771)	Initializes the control after it is loaded from a stream.
V	Loaded (see page 12441)	Initializes the control after it is loaded from a stream.
V	LoadRecreateItems (see page 21334)	This is LoadRecreateItems, a member of class TCustomListBox.
	MainWndProc (see page 6165)	Receives Windows messages for the control.
V	MeasureItem (see page 21335)	Generates an OnMeasureItem (see page 21360) event.
	MouseActivate (see page 5773)	This is MouseActivate, a member of class TControl.
	MouseDown (see page 5773)	OnMouseDown (see page 5862) event dispatcher.
	MouseMove (see page 5773)	Respond to mouse moving over control area..
	MouseUp (see page 5774)	OnMouseUp (see page 5867) event dispatcher.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	Notification (see page 5775)	Responds to notifications that components are being created or destroyed.
V	Notification (see page 6165)	Responds to notifications that components are being created or destroyed.
	NotifyControls (see page 6165)	Sends a message to all the child controls.
	PaintControls (see page 6166)	Paints each of the child controls in a windowed control using the specified device context.
	PaintHandler (see page 6166)	Responds to WM_PAINT messages.
V	PaintWindow (see page 6169)	Renders the image of a windowed control.
	PaletteChanged (see page 5775)	Responds to changes in the system's palette by realizing the control's palette.
V	PaletteChanged (see page 6170)	Responds to changes in the system's palette by realizing the control's palette and the palette for each child control.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	PickCustomColor (see page 12441)	This is PickCustomColor, a member of class TCustomColorListBox.
	PopulateList (see page 12442)	This is PopulateList, a member of class TCustomColorListBox.
	PositionDockRect (see page 5777)	Positions the docking rectangle according to the current drag-and-dock state.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 5778)	Prepares the control for having its properties assigned values read from a stream.
V	ReadState (see page 6171)	Prepares the control for having its properties assigned values from a stream.
	RecreateWnd (see page 6171)	Recreate underlying Windows screen object.
	ReloadDockedControl (see page 6172)	Reloads a docked control.
	RemoveWindowProps (see page 6174)	This is RemoveWindowProps, a member of class TWinControl.
V	RequestAlign (see page 5780)	Instructs the parent of a control to reposition the control, enforcing its Align (see page 5798) property.
	ResetContent (see page 21335)	Removes all of the items from a list box.
	ResetIme (see page 6174)	Restores the input method editor (IME) that was active when the application started.
	ResetImeComposition (see page 6175)	Directs the composition window of the input method editor (IME) to perform a specific action.
	Resize (see page 5780)	Respond to control resize.
V	SaveRecreateItems (see page 21336)	This is SaveRecreateItems, a member of class TCustomListBox.
	ScaleConstraints (see page 5781)	This is ScaleConstraints, a member of class TControl.
	ScaleControls (see page 6176)	Rescale child controls only.
	SelectFirst (see page 6177)	Locates first selectable child control.
	SelectNext (see page 6177)	Moves the input focus from the current child control to the next one in the tab order.

	SendCancelMode (see page 5781)	Cancels the modal state of the control.
	SendDockNotification (see page 5782)	Sends a Windows message to the control's host dock site.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
V	SetAutoSize (see page 5783)	This is SetAutoSize, a member of class TControl.
V	SetBiDiMode (see page 5783)	Sets the control's bi-directional mode.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
V	SetChildOrder (see page 6178)	Changes the order in which the child component appears in the list of child components returned by the GetChildren (see page 6153) method.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
V	SetDragMode (see page 5785)	Sets the drag mode for the control.
V	SetEnabled (see page 5785)	Sets the value of the Enabled (see page 5821) property.
	SetIme (see page 6181)	Activates an input method editor (IME) using the values specified by the ImeMode (see page 6207) and ImeName (see page 6208) properties.
	SetImeCompositionWindow (see page 6181)	Sets the position and font of the composition window.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetItemData (see page 21336)	Sets the 32-bit value associated with the specified item in a list box.
A	SetItemIndex (see page 5943)	Sets the value of the ItemIndex (see page 5944) property.
V	SetItemIndex (see page 21336)	Gives focus to the item with a specified index.
A	SetMultiSelect (see page 5956)	Sets the value of the MultiSelect (see page 5957) property.
V	SetMultiSelect (see page 21337)	Sets the MultiSelect property.
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
V	SetName (see page 5785)	Sets the name of the control.
V	SetParent (see page 5786)	Sets the parent of the control.
V	SetParent (see page 6182)	Sets the parent of the control.
V	SetParentBackground (see page 6182)	This is SetParentBackground, a member of class TWinControl.
V	SetParentBiDiMode (see page 5786)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 5787)	Sets the parent for the control.
	SetStyle (see page 12442)	This is SetStyle, a member of class TCustomColorListBox.
	SetZOrder (see page 5788)	Repositions the control in its parent's control list, thereby changing position onscreen.
V	SetZOrder (see page 6182)	Moves the control to the top or bottom of the parent control's (or screen's) list of TWinControl (see page 6112) controls.
V	ShowControl (see page 6183)	Ensures that a specified child control is visible.
	UpdateBounds (see page 6185)	This is UpdateBounds, a member of class TWinControl.
	UpdateBoundsRect (see page 5789)	Changes the Top (see page 5844), Left (see page 5830), Width (see page 5849), and Height (see page 5825) properties of the control, but doesn't update its screen image and bypasses all resize events.
V	UpdateControlOriginalParentSize (see page 6186)	This is UpdateControlOriginalParentSize, a member of class TWinControl.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateExplicitBounds (see page 5789)	This is UpdateExplicitBounds, a member of class TControl.
	UpdateRecreatingFlag (see page 6186)	This is UpdateRecreatingFlag, a member of class TWinControl.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	UpdateUIState (see page 6186)	Updates form User Interface State as needed
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	VisibleChanging (see page 5791)	Provides the interface for a method that responds to changes in the control's visibility.
V	WndProc (see page 5791)	Provides specific message responses for the control.

	WndProc (see page 6187)	Provides specific message responses for the control.
	WndProc (see page 21337)	Handles Windows messages.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	ActionLink (see page 5798)	Contains the action link object associated with the control.
	AutoSize (see page 5803)	Specifies whether the control sizes itself automatically to accommodate its contents.
	BevelWidth (see page 6194)	Specifies the width of the inner and outer bevels.
	BorderStyle (see page 21343)	Determines whether the list box has a border.
	BorderWidth (see page 6195)	Specifies the width of the control's border.
	Caption (see page 5806)	Specifies a text string that identifies the control to the user.
	Columns (see page 21346)	Specifies the number of columns, in a multi-column list box, that are visible without having to scroll.
	DefWndProc (see page 6199)	Specifies the default window procedure for the windowed control.
	DesktopFont (see page 5818)	Specifies whether the control uses the Windows icon font when writing text.
	DragCursor (see page 5818)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 5819)	Specifies whether the control is being dragged normally or for docking.
	DragMode (see page 5819)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	ExtendedSelect (see page 21346)	This is ExtendedSelect, a member of class TCustomListBox.
	ImeMode (see page 6207)	Determines the behavior of the input method editor (IME).
	ImeName (see page 6208)	Specifies the input method editor (IME) to use for converting keyboard input to Asian language characters.
	IntegralHeight (see page 21347)	Determines whether the list box displays the partial items.
	IsControl (see page 5829)	Determines whether a form stores its form-specific properties to a stream.
	MouseCapture (see page 5831)	Indicates whether the control has "captured" mouse events.
	ParentBackground (see page 6209)	Determines whether control uses parent's theme background.
	ScalingFlags (see page 5840)	Reflects which attributes of the control have been scaled.
	Sorted (see page 21353)	Specifies whether the items in a list box are arranged alphabetically.
	TabWidth (see page 21355)	Specifies the size of the tabs in the list box.
	Text (see page 5842)	Contains a text string associated with the control.
	WheelAccumulator (see page 5849)	Accumulates mouse wheel rotations.
	WindowHandle (see page 6212)	Provides access to a window handle for the control.
	WindowText (see page 5850)	Contains the text string of the control.

Public Events

	Name	Description
	WindowProc (see page 5872)	Points to the window procedure that responds to messages sent to the control.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AddItem (see page 5940)	Adds an item to the list control.
	AddItem (see page 21322)	Adds an item to the list box
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	BeginDrag (see page 5740)	Starts the dragging of a control.
	BringToFront (see page 5740)	Puts the control in front of all other controls in its parent control.
	Broadcast (see page 6130)	Sends a message to each of the child controls.
	CanFocus (see page 6131)	Indicates whether a control can receive focus.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.

	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
A	Clear (see page 5940)	Deletes all of the items from the list control.
V	Clear (see page 21322)	Deletes all items from the list box.
A	ClearSelection (see page 5940)	Removes the selection, leaving all items unselected.
V	ClearSelection (see page 21323)	Deselects all selected items in the list box, if possible.
	ClientToParent (see page 5744)	Translates client coordinates to parent coordinates.
	ClientToScreen (see page 5744)	Translates a given point from client area coordinates to global screen coordinates.
	ContainsControl (see page 6133)	Indicates whether a specified control exists within the control.
	ControlAtPos (see page 6133)	Returns the child control located at a specified position within the control.
A	CopySelection (see page 5941)	Copies the selected item or items to another TCustomListControl (see page 5928) descendant.
V	CopySelection (see page 21323)	Copies the selected items to another list-type control
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
V	Create (see page 5731)	Creates an instance of TControl (see page 5724).
V	Create (see page 6123)	Creates an instance of TWinControl (see page 6112).
V	Create (see page 12438)	Instantiates a list box control.
V	Create (see page 21320)	Instantiates a list box control.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	CreateParented (see page 6123)	Creates and initializes a control as the child of a specified non-VCL container.
	CreateParentedControl (see page 6136)	Creates and initializes a control as the child of a specified non-VCL window.
V	DefaultHandler (see page 5748)	Provides message handling for all messages that do not have specific handlers.
V	DefaultHandler (see page 6139)	Provides message handling for all messages that the control does not fully process itself.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
A	DeleteSelected (see page 5941)	Deletes all the selected items.
V	DeleteSelected (see page 21325)	Deletes the selected items from the list box
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 5732)	Destroys an instance of TControl (see page 5724).
V	Destroy (see page 6124)	Destroys an instance of TWinControl (see page 6112).
V	Destroy (see page 21320)	Destroys the instance of a list box control.
V	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	DisableAlign (see page 6141)	Disables the realignment of child controls.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Dock (see page 5749)	Used internally to dock the control.
	DockDrop (see page 6142)	Generates an OnDockDrop (see page 6214) event.
	DragDrop (see page 5754)	OnDragDrop (see page 5855) event dispatcher.
	Dragging (see page 5754)	Indicates whether a control is being dragged.
	DrawTextBiDiModeFlags (see page 5756)	Returns the text flags that reflect the current setting of the BiDiMode (see page 5803) property.
	DrawTextBiDiModeFlagsReadingOnly (see page 5756)	Returns the text flag to add that indicates whether the control's text should read from right to left.
	EnableAlign (see page 6148)	Decrements the reference count incremented by the DisableAlign (see page 6141) method, eventually realigning the child controls.
	EndDrag (see page 5757)	Stops a control from being dragged any further.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.

	FindChildControl (see page 6148)	Returns a child control given its name.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FlipChildren (see page 6150)	Reverses the positions of child controls.
	Focused (see page 6150)	Determines whether the control has input focus.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetControlsAlignment (see page 5759)	Indicates how text is aligned within the control.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 5765)	Returns the parent of the control.
	GetTabOrderList (see page 6158)	Builds a list of controls in tab order.
	GetTextBuf (see page 5766)	Retrieves the control's text, copies it into a buffer, and returns the number of characters copied.
	GetTextLen (see page 5767)	Returns the length of the control's text.
	HandleAllocated (see page 6159)	Reports whether a screen object handle exists for the control.
	HandleNeeded (see page 6160)	Creates a screen object for the control if it doesn't already exist.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 5768)	Indicates whether the control has a parent.
	Hide (see page 5769)	Makes the control invisible.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
V	InitiateAction (see page 5769)	Calls the action link's Update (see page 5789) method if the control is associated with an action link.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InsertControl (see page 6160)	Inserts a control into the Controls (see page 6197) array property.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
V	Invalidate (see page 5770)	Completely repaint control.
V	Invalidate (see page 6161)	Schedules a control repaint.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	IsRightToLeft (see page 5770)	Indicates whether the control should be reversed right to left.
	ItemAtPos (see page 21331)	Returns the index of the list box item indicated by the coordinates of a point on the control.
	ItemRect (see page 21333)	Returns the rectangle that surrounds the item specified in the Item parameter.
	ManualDock (see page 5771)	Docks the control.
	ManualFloat (see page 5772)	Undocks the control.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	MouseWheelHandler (see page 5774)	Dispatches messages received from a mouse wheel.
V	MoveSelection (see page 5942)	Moves all selected items to another list control.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	PaintTo (see page 6167)	This is the overview for the PaintTo method overload.
	ParentToClient (see page 5776)	Translate parent coordinates to client coordinates.
	Perform (see page 5776)	Responds as if the control received a specified Windows message.
	PreProcessMessage (see page 6170)	This is PreProcessMessage, a member of class TWinControl.

	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	Realign (see page 6171)	Forces the control to realign children.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	Refresh (see page 5779)	Repaints the control on the screen.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveControl (see page 6172)	Removes a specified control from the Controls (see page 6197) array.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	Repaint (see page 5779)	Forces the control to repaint its image on the screen.
V	Repaint (see page 6174)	Repaints the entire control.
	ReplaceDockedControl (see page 5779)	Docks the control in the place where another control is already docked.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	ScaleBy (see page 6175)	Rescale control and its children.
	ScreenToClient (see page 5781)	Converts the screen coordinates of a specified point on the screen to client coordinates.
	ScrollBy (see page 6176)	Scroll control contents.
A	SelectAll (see page 5943)	Selects all items or all text in the selected item.
V	SelectAll (see page 21336)	Selects the entire block of text in the list box.
	SendToBack (see page 5782)	Puts a windowed control behind all other windowed controls, or puts a non-windowed control behind all other non-windowed controls.
V	SetBounds (see page 5783)	Sets the Left (see page 5830), Top (see page 5844), Width (see page 5849), and Height (see page 5825) properties all at once.
V	SetBounds (see page 6178)	Sets the windowed control's boundary properties all at once.
	SetDesignVisible (see page 5784)	Makes a control visible at design time.
V	SetDesignVisible (see page 6178)	Makes a control visible at design time.
V	SetFocus (see page 6179)	Gives the input focus to the control.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	SetTextBuf (see page 5787)	Sets the text of the control.
	Show (see page 5788)	Makes a control visible.
V	Update (see page 5789)	Processes any pending paint messages immediately.
V	Update (see page 6183)	Forces the control to update.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	UpdateControlState (see page 6186)	Respond to state change.
	UseRightToLeftAlignment (see page 5790)	Specifies whether the control's alignment should be reversed right-to-left.
	UseRightToLeftReading (see page 5790)	Specifies whether the control is using a right-to-left reading order.
	UseRightToLeftScrollBar (see page 5791)	Specifies whether the vertical scroll bar appears on the left side of the control.

Public Properties

	Name	Description
	Action (see page 5797)	Designates the action associated with the control.
R	AlignDisabled (see page 6192)	Indicates child control realignment disabled.
	AutoCompleteDelay (see page 21342)	Specifies the delay between a key press and an attempt to autocomplete the field.
	BoundsRect (see page 5803)	Specifies the bounding rectangle of the control, expressed in the coordinate system of the parent control.
R	Brush (see page 6195)	Determines the color and pattern used for painting the background of the control.
R	Canvas (see page 21343)	Provides a drawing surface when implementing a handler for the OnDrawItem (see page 21358) event of an owner-draw list box.
	ClientHeight (see page 5808)	Specifies the height of the control's client area in pixels.
R	ClientOrigin (see page 5809)	Specifies the screen coordinates (in pixels) of the top left corner of a control's client area.
R	ClientRect (see page 5810)	Specifies the size (in pixels) of a control's client area.
	ClientWidth (see page 5811)	Specifies the horizontal size of the control's client area in pixels.
R	ColorNames (see page 12442)	This is ColorNames, a member of class TCustomColorListBox.
R	Colors (see page 12443)	This is Colors, a member of class TCustomColorListBox.

R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
R	ControlCount (see page 6195)	Returns the number of child controls.
R	Controls (see page 6197)	Lists all child controls.
	ControlState (see page 5813)	Indicates the current state of a control at runtime.
	ControlStyle (see page 5814)	Determines style characteristics of the control.
	Count (see page 21346)	Indicates the number of items in the list box.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	DockClientCount (see page 6199)	Specifies the number of controls that are docked on the windowed control.
R	DockClients (see page 6201)	Lists the controls that are docked to the windowed control.
	DockManager (see page 6202)	Specifies the control's docking manager interface.
	DockOrientation (see page 5818)	Specifies how the control is docked relative to other controls docked in the same parent.
	DockSite (see page 6204)	Specifies whether the control can be the target of drag-and-dock operations.
	DoubleBuffered (see page 6205)	Determines whether the control's image is rendered directly to the window or painted to an in-memory bitmap first.
R	ExplicitHeight (see page 5821)	Specifies the explicit vertical size of the control in pixels.
R	ExplicitLeft (see page 5822)	Specifies the explicit horizontal pixel coordinate of the left edge of a component relative to its parent.
R	ExplicitTop (see page 5822)	Specifies the explicit vertical pixel coordinate of the top edge of a component relative to its parent.
R	ExplicitWidth (see page 5822)	Specifies the explicit horizontal size of the control in pixels.
R	Floating (see page 5823)	Indicates whether the control is floating.
	FloatingDockSiteClass (see page 5823)	Specifies the class of the temporary control that hosts the control when it is floating.
R	Handle (see page 6207)	Provides access to the underlying Windows screen object for the control.
	HostDockSite (see page 5829)	Specifies the control in which the control is docked.
	ItemIndex (see page 5944)	Specifies the index of the selected item.
	Items (see page 21348)	Contains the strings that appear in the list box.
	LRDockWidth (see page 5831)	Specifies the width of the control when it is docked horizontally.
R	MouseInClient (see page 6209)	This is MouseInClient, a member of class TWinControl.
	MultiSelect (see page 5957)	Specifies whether the user can select more than one item.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Padding (see page 6209)	Specifies the padding of a control.
	Parent (see page 5832)	Indicates the parent of the control.
	ParentWindow (see page 6210)	Reference to parent's underlying control.
	ScrollWidth (see page 21351)	Specifies the width, in pixels, by which the list box can scroll horizontally.
R	SelCount (see page 5957)	Indicates the number of selected items.
R	Showing (see page 6210)	Indicates whether the control is showing on the screen.
	TBDockHeight (see page 5842)	Specifies the height of the control when it is docked vertically.
	TopIndex (see page 21356)	Specifies the index number of the item that appears at the top of the list box.
	UndockHeight (see page 5845)	Specifies the height of the control when it is floating.
	UndockWidth (see page 5846)	Specifies the width of the control when it is floating.
	UseDockManager (see page 6212)	Specifies whether the docking manager is used in drag-and-dock operations.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
R	VisibleDockClientCount (see page 6212)	Specifies the number of visible controls that are docked on the windowed control.

Published Events

	Name	Description
	OnClick (see page 12283)	Occurs when the user clicks the control.

	OnContextPopup (see page 12285)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnDblClick (see page 12286)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDragDrop (see page 12286)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 12288)	Occurs when the user drags an object over a control.
	OnEndDock (see page 12291)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 12291)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnEnter (see page 12292)	Occurs when a control receives the input focus.
	OnExit (see page 12295)	Occurs when the input focus shifts away from one control to another.
	OnGetColors (see page 12296)	This is OnGetColors, a member of class TColorListBox.
	OnKeyDown (see page 12296)	Occurs when a user presses any key while the control has focus.
	OnKeyPress (see page 12299)	Occurs when a key is pressed.
	OnKeyUp (see page 12300)	Occurs when the user releases a key that has been pressed.
	OnMouseActivate (see page 12302)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 12303)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseEnter (see page 12305)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 12305)	Occurs when the user moves the mouse outside of a control.
	OnMouseMove (see page 12306)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 12308)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnStartDock (see page 12310)	Occurs when the user begins to drag a control with a DragKind of dkDock.
	OnStartDrag (see page 12311)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.

Published Properties

	Name	Description
	Align (see page 12259)	Determines how the control aligns within its container (parent control).
	AlignWithMargins (see page 5802)	Indicates whether a control should be constrained by margins.
	Anchors (see page 12262)	Specifies how the control is anchored to its parent.
	AutoComplete (see page 12263)	Determines whether the user can give focus to items by typing in the list.
	BevelEdges (see page 12263)	Specifies which edges of the control are beveled.
	BevelInner (see page 12264)	Specifies the cut of the inner bevel.
	BevelKind (see page 12264)	Specifies the control's bevel style.
	BevelOuter (see page 12264)	Specifies the cut of the outer bevel.
	BiDiMode (see page 12265)	Specifies the bi-directional mode for the control.
	Color (see page 12265)	Sets the background color of the TColorListBox (see page 12246) control.
	Constraints (see page 12266)	Specifies the size constraints for the control.
	Ctl3D (see page 12266)	Determines whether a control has a three-dimensional (3-D) or two-dimensional look.
	Cursor (see page 5815)	Specifies the image used to represent the mouse pointer when it passes into the region covered by the control.
	DefaultColorColor (see page 12267)	This is DefaultColorColor, a member of class TColorListBox.
	Enabled (see page 12267)	Controls whether the control responds to mouse, keyboard, and timer events.
	Font (see page 12267)	Controls the attributes of text written on or in the control.
	Height (see page 5825)	Specifies the vertical size of the control in pixels.
	HelpContext (see page 5826)	Numeric ID for control's context-sensitive help topic
	HelpKeyword (see page 5826)	Keyword for control's context-sensitive help topic
	HelpType (see page 5827)	Indicates whether the control's context sensitive help topic is identified by context ID or by keyword.
	Hint (see page 5827)	Contains the text string that can appear when the user moves the mouse over the control.
	ItemHeight (see page 12268)	Specifies the height in pixels of an item in an owner-draw list box.

	Left (see page 5830)	Specifies the horizontal coordinate of the left edge of a component relative to its parent.
	Margins (see page 5831)	Specifies the margins for the control.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	NoneColorColor (see page 12269)	This is NoneColorColor, a member of class TColorListBox.
	ParentBiDiMode (see page 12269)	Specifies whether the control uses its parent's BiDiMode.
	ParentColor (see page 12270)	Determines where a control looks for its color information.
	ParentCtl3D (see page 12270)	Determines where a component looks to determine if it should appear three dimensional.
	ParentFont (see page 12270)	Determines where a control looks for its font information.
	ParentShowHint (see page 12271)	Determines where a control looks to find out if its Help Hint should be shown.
	PopupMenu (see page 12271)	Identifies the pop-up menu associated with the control.
	Selected (see page 12276)	Indicates whether a particular item is selected.
	ShowHint (see page 12278)	Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.
	Style (see page 12279)	Determines whether the list box is standard or owner-draw and whether it is virtual.
	TabOrder (see page 12280)	Indicates the position of the control in its parent's tab order.
	TabStop (see page 12281)	Determines if the user can tab to a control.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Top (see page 5844)	Specifies the Y coordinate of the top left corner of a control, relative to its parent or containing control in pixels.
	Visible (see page 12281)	Determines whether the component appears onscreen.
	Width (see page 5849)	Specifies the horizontal size of the control or form in pixels.

68.1.7.2 TColorListBox Properties

The properties of the TColorListBox class are listed here.

Published Properties

	Name	Description
	Align (see page 12259)	Determines how the control aligns within its container (parent control).
	Anchors (see page 12262)	Specifies how the control is anchored to its parent.
	AutoComplete (see page 12263)	Determines whether the user can give focus to items by typing in the list.
	BevelEdges (see page 12263)	Specifies which edges of the control are beveled.
	BevelInner (see page 12264)	Specifies the cut of the inner bevel.
	BevelKind (see page 12264)	Specifies the control's bevel style.
	BevelOuter (see page 12264)	Specifies the cut of the outer bevel.
	BiDiMode (see page 12265)	Specifies the bi-directional mode for the control.
	Color (see page 12265)	Sets the background color of the TColorListBox (see page 12246) control.
	Constraints (see page 12266)	Specifies the size constraints for the control.
	Ctl3D (see page 12266)	Determines whether a control has a three-dimensional (3-D) or two-dimensional look.
	DefaultColorColor (see page 12267)	This is DefaultColorColor, a member of class TColorListBox.
	Enabled (see page 12267)	Controls whether the control responds to mouse, keyboard, and timer events.
	Font (see page 12267)	Controls the attributes of text written on or in the control.
	ItemHeight (see page 12268)	Specifies the height in pixels of an item in an owner-draw list box.
	NoneColorColor (see page 12269)	This is NoneColorColor, a member of class TColorListBox.
	ParentBiDiMode (see page 12269)	Specifies whether the control uses its parent's BiDiMode.
	ParentColor (see page 12270)	Determines where a control looks for its color information.
	ParentCtl3D (see page 12270)	Determines where a component looks to determine if it should appear three dimensional.
	ParentFont (see page 12270)	Determines where a control looks for its font information.
	ParentShowHint (see page 12271)	Determines where a control looks to find out if its Help Hint should be shown.
	PopupMenu (see page 12271)	Identifies the pop-up menu associated with the control.

	Selected (see page 12276)	Indicates whether a particular item is selected.
	ShowHint (see page 12278)	Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.
	Style (see page 12279)	Determines whether the list box is standard or owner-draw and whether it is virtual.
	TabOrder (see page 12280)	Indicates the position of the control in its parent's tab order.
	TabStop (see page 12281)	Determines if the user can tab to a control.
	Visible (see page 12281)	Determines whether the component appears onscreen.

68.1.7.2.1 TColorListBox.Align Property

Determines how the control aligns within its container (parent control).

Pascal

```
property Align: TAlign;
```

C++

```
__property TAlign Align;
```

Description

Use Align to align a control to the top, bottom, left, or right of a form or panel and have it remain there even if the size of the form, panel, or component that contains the control changes. When the parent is resized, an aligned control also resizes so that it continues to span the top, bottom, left, or right edge of the parent.

For example, to use a panel component with various controls on it as a tool palette, change the panel's Align value to alLeft. The value of alLeft for the Align property of the panel guarantees that the tool palette remains on the left side of the form and always equals the client height of the form.

The default value of Align is alNone, which means a control remains where it is positioned on a form or panel.

Tip: If Align is set to alClient, the control fills the entire client area so that it is impossible to select the parent form by clicking on it. In this case, select the parent by selecting the control on the form and pressing Esc, or by using the Object Inspector.

Any number of child components within a single parent can have the same Align value, in which case they stack up along the edge of the parent. The child controls stack up in z-order. To adjust the order in which the controls stack up, drag the controls into their desired positions.

Note: To cause a control to maintain a specified relationship with an edge of its parent, but not necessarily lie along one edge of the parent, use the Anchors property instead.

C++ Examples:

```
/*
This example shows how to use a splitter to divide a form
into resizable panes.  All objects on the form are created
dynamically in the OnCreate event handler of the form. To
run this example, add ExtCtrls and FileCtrl to the uses
clause of the form’s implementation section.
Note that when creating a splitter dynamically at runtime,
it is important to set its position to the appropriate side
of the control it will resize.
*/
#include <Extctrls.hpp>
#include <Filectrl.hpp>

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  TSplitter* ps = new TSplitter(Form1);
  TFileListBox* pflb = new TFileListBox(Form1);
```

```
    TDirectoryListBox* pdlb = new TDirectoryListBox(Form1);

    // Line up the directory list box on the left of the form.
    pdlb->Parent = Form1;
    pdlb->Align = alLeft;
    pdlb->Width = Form1->ClientWidth/3;

    // Now use the splitter to divide the directory pane from the file pane.
    ps->Parent = Form1;
    ps->Left = pdlb->Left + pdlb->Width + 1; // Move to right of directory list.
    ps->Align = pdlb->Align; // Give same alignment as directory list.

    // Each pane must be at least one quarter of the form's width.
    ps->MinSize = Form1->ClientWidth/4;

    // Finally, create the last pane - a file list box.
    pflb->Parent = Form1;
    pflb->Align = alClient;
    pdlb->FileList = pflb; // Link the file list box to the directory list box.
  }
  /*
  Dynamically create a TProgressBar control and align it to
  the bottom of the form.
  */

  #include <ComCtrls.hpp>
  #include <Controls.hpp>

  void __fastcall TForm1::Button1Click(TObject *Sender)
  {
    TProgressBar *ProgressBar = new TProgressBar(this);
    ProgressBar->Parent = this;
    ProgressBar->Align = alBottom;
    TButton *Button1 = new TButton(this);
    Button1->Parent = this;
  }
  /*
  This example dynamically creates a Page Control, then a
  series of Tab Sheets on the Page Control.
  */
  #include <Comctrls.hpp>
  TPageControl* ppc;
  const int MAXTABS = 3;
  TTabSheet* pts[MAXTABS];
  const char * ppcTabTitles[] = { "ShortString", "Orders", "Items", "Parts" };
  int iTabTitles = sizeof(ppcTabTitles)/sizeof(ppcTabTitles[0]);
  const TColor colorPalette[12] = {
    clRed, clGreen, clYellow, clBlue, clWhite, clFuchsia,
    clTeal, clNavy, clMaroon, clLime, clOlive, clPurple};

  void __fastcall TForm1::FormCreate(TObject *Sender)
  {
      ppc = new TPageControl(this);
      ppc->Parent = this;
      ppc->Align = alClient;
      for (int i=0;i<iTabTitles;i++)
    {
          pts[i] = new TTabSheet(this);
          pts[i]->PageControl = ppc;
          pts[i]->Name = AnsiString("pts") + ppcTabTitles[i];
          pts[i]->Caption = ppcTabTitles[i];
          pts[i]->Brush->Color = colorPalette[i];
    }
  }//---------------------------------------------------------------------------
  void __fastcall TForm1::FormDestroy(TObject *Sender)
  {
```

```
  for (int i=0;i<iTabTitles;i++)
        delete pts[i];
    delete ppc;
}
```

Delphi Examples:

```
{
This example shows how to use a splitter to divide a form
into resizable panes.  All objects on the form are created
dynamically in the OnCreate event handler of the form. To
run this example, add ExtCtrls and FileCtrl to the uses
clause of the form's implementation section.
Note that when creating a splitter dynamically at runtime,
it is important to set its position to the appropriate side
of the control it will resize.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  Split: TSplitter;
  Files: TFileListBox;
  Dirs: TDirectoryListBox;
begin
  { first add a directory list box to the form }
  Dirs := TDirectoryListBox.Create(Form1);
  { line it up on the left of the form }
  Dirs.Parent := Form1;
  Dirs.Align := alLeft;
  Dirs.Width := Form1.ClientWidth div 3;
{ now add the splitter to divide the directory pane from the file pane }
  Split := TSplitter.Create(Form1);
  Split.Parent := Form1;
  { make sure the splitter is to the right of the directory list box! }
  Split.Left := Dirs.Left + Dirs.Width + 1;
  Split.Align := Dirs.Align; { give it the same alignment as the directory }
  { each pane must be at least one quarter of the form's width }
  Split.MinSize := Form1.ClientWidth div 4;
  { Finally, create the last pane – a file list box }
  Files := TFileListBox.Create(Form1);
  Files.Parent := Form1;
  Files.Align := alClient;
  Dirs.FileList := Files; { link the file list box to the directory list box }
end;
{
Dynamically create a TProgressBar control and align it to
the bottom of the form.
}

var
  I: Integer;

  const
    TabTitles: array[0..3] of ShortString = ('Customer', 'Orders', 'Items', 'Parts' );

  procedure TForm1.FormCreate(Sender: TObject);
  const
    colorpalette: Array[0..11] of TColor = (
      clRed, clGreen, clYellow, clBlue, clWhite, clFuchsia, clTeal,
      clNavy, clMaroon, clLime, clOlive, clPurple);
  var
    i: Integer;
  begin
    PageControl1 := TPageControl.Create(Self);
    PageControl1.Parent := Self;
    PageControl1.Align := alClient;
    for i := Low(TabTitles) to High(TabTitles) do
    begin
      pts[i]:= TTabSheet.Create(PageControl1);
      with pts[i] do
      begin
        PageControl := PageControl1;
        Name := 'ts' + TabTitles[i];
        Caption := TabTitles[i];
        Brush.Color := colorPalette[i];
     end;
    end;
  end;

  procedure TForm1.FormDestroy(Sender: TObject);
  var
    i: Integer;
  begin
    for i := Low(TabTitles) to High(TabTitles) do
    begin
      pts[i].Free;
    end;
    PageControl1.Free;
  end;
```

See Also

Parent (see page 5832)

Anchors (see page 5802)

68.1.7.2.2 TColorListBox.Anchors Property

Specifies how the control is anchored to its parent.

Pascal

```
property Anchors: TAnchors;
```

C++

```
__property TAnchors Anchors;
```

Description

Use Anchors to ensure that a control maintains its current position relative to an edge of its parent, even if the parent is resized. When its parent is resized, the control holds its position relative to the edges to which it is anchored.

If a control is anchored to opposite edges of its parent, the control stretches when its parent is resized. For example, if a control has its Anchors property set to [akLeft, akRight], the control stretches when the width of its parent changes.

Anchors is enforced only when the parent is resized. Thus, for example, if a control is anchored to opposite edges of a form at design time and the form is created in a maximized state, the control is not stretched because the form is not resized after the control is created.

Note: If a control should maintain contact with three edges of its parent (hugging one side of the parent and stretching the length of that side), use the Align property instead. Unlike Anchors, Align allows controls to adjust to changes in the size of other aligned sibling controls as well as changes to the parent's size.

See Also

Parent (see page 5832)

Align (see page 5798)

68.1.7.2.3 TColorListBox.AutoComplete Property

Determines whether the user can give focus to items by typing in the list.

Pascal

```
property AutoComplete: Boolean;
```

C++

```
__property Boolean AutoComplete;
```

Description

Use AutoComplete to specify whether the list box automatically updates the ItemIndex property in response to user keystrokes. When AutoComplete is true, the item with focus changes to the first item that begins with the sequence of characters that the user typed. As the user types more characters, ItemIndex may change to a later item because the string to match becomes longer.

See Also

ItemIndex

68.1.7.2.4 TColorListBox.BevelEdges Property

Specifies which edges of the control are beveled.

Pascal

```
property BevelEdges: TBevelEdges;
```

C++

```
__property TBevelEdges BevelEdges;
```

Description

Use BevelEdges to get or set which edges of the control are beveled. The BevelInner, BevelOuter, and BevelKind properties determine the appearance of the specified edges.

See Also

BevelInner (see page 6193)

BevelOuter (see page 6194)

BevelKind (see page 6193)

68.1.7.2.5 TColorListBox.BevelInner Property

Specifies the cut of the inner bevel.

Pascal

```
property BevelInner: TBevelCut;
```

C++

```
__property TBevelCut BevelInner;
```

Description

Use BevelInner to specify whether the inner bevel has a raised, lowered, or flat look.

The inner bevel appears immediately inside the outer bevel. If there is no outer bevel (BevelOuter is bvNone), the inner bevel appears immediately inside the border.

See Also

BevelEdges (see page 6192)

BevelOuter (see page 6194)

BevelKind (see page 6193)

BevelWidth (see page 6194)

BorderWidth (see page 6195)

68.1.7.2.6 TColorListBox.BevelKind Property

Specifies the control's bevel style.

Pascal

```
property BevelKind: TBevelKind;
```

C++

```
__property TBevelKind BevelKind;
```

Description

Use BevelKind to modify the appearance of a bevel. BevelKind influences how sharply the bevel stands out.

BevelKind, in combination with BevelWidth and the cut of the bevel specified by BevelInner or BevelOuter, can create a variety of effects. Experiment with various combinations to get the look you want.

See Also

BevelEdges (see page 6192)

BevelOuter (see page 6194)

BevelInner (see page 6193)

BevelWidth (see page 6194)

68.1.7.2.7 TColorListBox.BevelOuter Property

Specifies the cut of the outer bevel.

Pascal

```
property BevelOuter: TBevelCut;
```

C++

```
__property TBevelCut BevelOuter;
```

Description

Use BevelInner to specify whether the outer bevel has a raised, lowered, or flat look.

The outer bevel appears immediately inside the border and outside the inner bevel.

See Also

BevelEdges (see page 6192)

BevelInner (see page 6193)

BevelKind (see page 6193)

BevelWidth (see page 6194)

68.1.7.2.8 TColorListBox.BiDiMode Property

Specifies the bi-directional mode for the control.

Pascal

```
property BiDiMode: TBiDiMode;
```

C++

```
__property TBiDiMode BiDiMode;
```

Description

Use BiDiMode to enable the control to adjust its appearance and behavior automatically when the application runs in a locale that reads from right to left instead of left to right. The bi-directional mode controls the reading order for the text, the placement of the vertical scroll bar, and whether the alignment is changed.

Alignment does not change for controls that are known to contain number, date, time, or currency values. For example, with data aware controls, the alignment does not change for the following field types: ftSmallint, ftInteger, ftWord, ftFloat, ftCurrency, ftBCD, ftDate, ftTime, ftDateTime, ftAutoInc.

UseRightToLeftAlignment (see page 5790)

UseRightToLeftReading (see page 5790)

UseRightToLeftScrollBar (see page 5791)

Including Bi-directional Functionality in Applications

68.1.7.2.9 TColorListBox.Color Property

Sets the background color of the TColorListBox (see page 12246) control.

Pascal

```
property Color: TColor;
```

C++

```
__property TColor Color;
```

Description

The color property is set to white, by default.

68.1.7.2.10 TColorListBox.Constraints Property

Specifies the size constraints for the control.

Pascal

```
property Constraints: TSizeConstraints;
```

C++

```
__property TSizeConstraints Constraints;
```

Description

Use Constraints to specify the minimum and maximum width and height of the control. When Constraints contains maximum or minimum values, the control cannot be resized to violate those constraints.

Note: Constraints apply to the height of the form. However, the height of the form depends on how large Windows makes the title bar. For example, Windows XP uses much larger title bars than other windowing systems. To work around this, note the ClientHeight when you design your form and set the constraints in the FormCreate event. In the following example, ClientHeight is represented by x: `Constraints.MinHeight := x + Height - ClientHeight`.

Warning: Do not set up constraints that conflict with the value of the Align or Anchors property. When these properties conflict, the response of the control to resize attempts is not well-defined.

See Also

AutoSize (see page 5803)

OnCanResize (see page 5851)

68.1.7.2.11 TColorListBox.Ctl3D Property

Determines whether a control has a three-dimensional (3-D) or two-dimensional look.

Pascal

```
property Ctl3D: Boolean;
```

C++

```
__property Boolean Ctl3D;
```

Description

Ctl3D is provided for backward compatibility. It is not used by 32-bit versions of Windows or NT4.0 and later, with the exception of Windows XP Home, where it is used on occasion.

On earlier platforms, Ctl3D controlled whether the control had a flat or beveled appearance.

See Also

ParentCtl3D (see page 6209)

BevelKind (see page 6193)

BevelInner (see page 6193)

BevelOuter (see page 6194)

BorderWidth (see page 6195)

68.1.7.2.12 TColorListBox.DefaultColorColor Property

Pascal

```
property DefaultColorColor: TColor;
```

C++

```
__property TColor DefaultColorColor;
```

Description

This is DefaultColorColor, a member of class TColorListBox.

68.1.7.2.13 TColorListBox.Enabled Property

Controls whether the control responds to mouse, keyboard, and timer events.

Pascal

```
property Enabled: Boolean;
```

C++

```
__property Boolean Enabled;
```

Description

Use Enabled to change the availability of the control to the user. To disable a control, set Enabled to false. Disabled controls appear dimmed. If Enabled is false, the control ignores mouse, keyboard, and timer events.

To re-enable a control, set Enabled to true. The control is no longer dimmed, and the user can use the control.

EnableControls (see page 6934)

Enabling Mouse

68.1.7.2.14 TColorListBox.Font Property

Controls the attributes of text written on or in the control.

Pascal

```
property Font: TFont;
```

C++

```
__property TFont Font;
```

Description

To change to a new font, specify a new TFont object. To modify a font, change the value of the Charset, Color, Height, Name,

Pitch, Size, or Style of the TFont object.

C++ Examples:

```
/*
To use this example, place a TComboBox and TRichEdit or
TMemo on a form.  During form creation, a list of font names
is loaded into the combo box. When the combo box is clicked,
the memo or Rich Edit control font is set to the
corresponding font name in the combo box.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < Screen->Fonts->Count; i++)
   ComboBox1->Items->Add(Screen->Fonts->Strings[i]);
//  ComboBox1->Items = Screen->Fonts;  // Another way to do it.
}

void __fastcall TForm1::ComboBox1Change(TObject *Sender)
{
  RichEdit1->Font->Name = ComboBox1->Text;
}
```

Delphi Examples:

```
{
To use this example, place a TComboBox and TRichEdit or
TMemo on a form.  During form creation, a list of font names
is loaded into the combo box. When the combo box is clicked,
the memo or Rich Edit control font is set to the
corresponding font name in the combo box.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  i : Integer;
begin
  for i := 0 to Screen.Fonts.Count - 1 do
   ComboBox1.Items.Add(Screen.Fonts.Strings[i]);
//  ComboBox1.Items := Screen.Fonts;  // Another way to do it.
  RichEdit1.Lines.Text := 'How is it to be you?';
end;

procedure TForm1.ComboBox1Click(Sender: TObject);
begin
  RichEdit1.Font.Name := ComboBox1.Text;
end;
```

Displaying and Editing Text in a Memo Control

68.1.7.2.15 TColorListBox.ItemHeight Property

Specifies the height in pixels of an item in an owner-draw list box.

Pascal

```
property ItemHeight: Integer;
```

C++

```
__property int ItemHeight;
```

Description

Use ItemHeight to control the height of an item in a list box when the Style property is lbOwnerDrawFixed. The ItemHeight property can also affect the height of the list box itself. When the IntegralHeight property is true, the height of the list box is always an increment of the ItemHeight value.

If the Style property is lbStandard or lbOwnerDrawVariable, the value of ItemHeight is ignored.

Using TDBListBox and TDBComboBox

68.1.7.2.16 TColorListBox.NoneColorColor Property

Pascal

```
property NoneColorColor: TColor;
```

C++

```
__property TColor NoneColorColor;
```

Description

This is NoneColorColor, a member of class TColorListBox.

68.1.7.2.17 TColorListBox.ParentBiDiMode Property

Specifies whether the control uses its parent's BiDiMode.

Pascal

```
property ParentBiDiMode: Boolean;
```

C++

```
__property Boolean ParentBiDiMode;
```

Description

Use ParentBiDiMode to get or set whether the control uses its parent's BiDiMode. When ParentBiDiMode is true, the control's BiDiMode property is always equal to that of its parent. If ParentBiDiMode is false, the control uses its own BiDiMode property.

Set ParentBiDiMode to true for all controls in a form in order to ensure that the entire user interface adjusts to Middle Eastern locales in a uniform manner.

When the value of the control's BiDiMode property changes, ParentBiDiMode becomes false automatically.

See Also

Parent (see page 5832)

BiDiMode (see page 5803)

68.1.7.2.18 TColorListBox.ParentColor Property

Determines where a control looks for its color information.

Pascal

```
property ParentColor: Boolean;
```

C++

```
__property Boolean ParentColor;
```

Description

To have a control use the same color as its parent control, set ParentColor to true. If ParentColor is false, the control uses its own Color property.

Set ParentColor to true for all controls in order to ensure that all the controls on a form have a uniform appearance. For example, if ParentColor is true for all controls in a form, changing the background color of the form to gray causes all the controls on the form to also have a gray background.

When the value of a control's Color property changes, ParentColor becomes false automatically.

See Also

Color (see page 5812)

Parent (see page 5832)

ParentFont (see page 5834)

ParentShowHint (see page 5835)

68.1.7.2.19 TColorListBox.ParentCtl3D Property

Determines where a component looks to determine if it should appear three dimensional.

Pascal

```
property ParentCtl3D: Boolean;
```

C++

```
__property Boolean ParentCtl3D;
```

Description

ParentCtl3D is provided for backwards compatibility. It has no effect on 32-bit versions of Windows or NT 4.0 and later.

ParentCtl3D determines whether the control uses its parent's Ctl3D property.

See Also

Ctl3D (see page 6198)

68.1.7.2.20 TColorListBox.ParentFont Property

Determines where a control looks for its font information.

Pascal

```
property ParentFont: Boolean;
```

C++

```
__property Boolean ParentFont;
```

Description

To have a control use the same font as its parent control, set ParentFont to true. If ParentFont is false, the control uses its own Font property. Many controls default ParentFont to true so that all the controls in a form or other container present a uniform appearance. When the value of a control's Font property changes, ParentFont becomes false automatically.

When ParentFont is true for a form, the form uses the default font.

See Also

Font (see page 5823)

Parent (see page 5832)

ParentColor (see page 5834)

ParentShowHint (see page 5835)

68.1.7.2.21 TColorListBox.ParentShowHint Property

Determines where a control looks to find out if its Help Hint should be shown.

Pascal

```
property ParentShowHint: Boolean;
```

C++

```
__property Boolean ParentShowHint;
```

Description

Use ParentShowHint to ensure that all the controls on a form either uniformly show their Help Hints or uniformly do not show them.

If ParentShowHint is true, the control uses the ShowHint property value of its parent. If ParentShowHint is false, the control uses the value of its own ShowHint property.

To provide Help Hints for only selected controls on a form, set the ShowHint property for those controls that should have Help Hints to true, and ParentShowHint becomes false automatically.

Note: Enable or disable all Help Hints for the entire application using the ShowHint property of the application object.

ParentColor (see page 5834)

ParentFont (see page 5834)

ShowHint (see page 5840)

68.1.7.2.22 TColorListBox.PopupMenu Property

Identifies the pop-up menu associated with the control.

Pascal

```
property PopupMenu: TPopupMenu;
```

C++

```
__property TPopupMenu PopupMenu;
```

Description

Assign a value to PopupMenu to make a pop-up menu appear when the user selects the control and clicks the right mouse button. If the TPopupMenu's AutoPopup property is true, the pop-up menu appears automatically. If the menu's AutoPopup property is false, display the menu with a call to its Popup method from the control's OnContextPopup event handler.

C++ Examples:

```
/*
This example uses two edit boxes and one pop-up menu on a form.
The pop-up menu contains Cut, Copy, and Paste commands. This code
makes the pop-up menu available to both edit boxes:
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  PopupMenu1->AutoPopup = true;
  Edit1->PopupMenu = PopupMenu1;
  Edit2->PopupMenu = PopupMenu1;
}

/*
These are the cut, copy, and paste OnClick events for the commands
on the pop-up menu. Double click on the pop-up menu and add three
TMenuItems.  Then set the captions to "Cut", "Copy" and "Paste".
The names will be automatically set to "Cut1", "Copy1", and
"Paste1".  Then double click on the OnClick events and they will
be named "Cut1Click", "Copy1Click" and "Paste1Click" respectively.
Note: only the selected portion of the string in the edit box will
be copied, cut or replaced.
*/
void __fastcall TForm1::Copy1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
    if (pComponent->ClassNameIs("TEdit"))
      ((TEdit *)pComponent)->CopyToClipboard();
    else
      MessageBeep(0);
  }
  else
    MessageBeep(0);
}

void __fastcall TForm1::Cut1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
    if (pComponent->ClassNameIs("TEdit"))
      ((TEdit *)pComponent)->CutToClipboard();
    else
      MessageBeep(0);
  }
  else
    MessageBeep(0);
}

void __fastcall TForm1::Paste1Click(TObject *Sender)
```

```
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
    if (pComponent->ClassNameIs("TEdit"))
      ((TEdit *)pComponent)->PasteFromClipboard();
    else
      MessageBeep(0);
  }
  else
    MessageBeep(0);
}
/*
This example demonstrates how to add and delete menu items
to a popup menu at runtime and assign an event handler to
the OnClick event.  Place a TPopupMenu and three buttons on
the form named "AddButton", "EditButton",  and
"DestroyButton" and add OnClick events to all three buttons.
Put the TPopupMenu in the PopupMenu property of the form.
Place the PopupMenuItemsClick procedure in the TForm1 type
declaration so that it can be used as the method call for
the menu item OnClick event.
*/
void __fastcall TForm1::AddButtonClick(TObject *Sender)
{
    const int num_items = 4;
    for (int index = 0; index < num_items; ++index)
    {
        TMenuItem *NewItem = new TMenuItem(PopupMenu1); // create the new item
        PopupMenu1->Items->Add(NewItem);// add it to the Popupmenu
        NewItem->Caption = "Menu Item " + IntToStr(index);
        NewItem->Tag = index;
        NewItem->OnClick = PopupMenuItemsClick;// assign it an event handler
        TNotifyEvent();
    }
}

void __fastcall TForm1::PopupMenuItemsClick(TObject *Sender)
{
    TMenuItem *ClickedItem = dynamic_cast<TMenuItem *>(Sender);
    if (ClickedItem)
    {
        switch (ClickedItem->Tag)
        {
            case 0:
            {
                ShowMessage("first item clicked");
                break;
            }
            case 1:
            {
                ShowMessage("second item clicked");
                break;
            }
            case 2:
            {
                ShowMessage("third item clicked");
                break;
            }
            case 3:
            {
                ShowMessage("fourth item clicked");
                break;
            }
        }
    }
```

```
}

/*
To edit or destroy an item, grab its pointer via the Items
property.
*/
void __fastcall TForm1::EditButtonClick(TObject *Sender)
{
    const int index = 1;
    TMenuItem *ItemToEdit = PopupMenu->Items->Items[index];
    ItemToEdit->Caption = "Changed Caption";
}

void __fastcall TForm1::DestroyButtonClick(TObject *Sender)
{
    const int index = 2;
    TMenuItem *ItemToDelete = PopupMenu->Items->Items[index];
    delete ItemToDelete;
}
```

Delphi Examples:

```
{
This example uses two edit boxes and one pop-up menu on a form.
The pop-up menu contains Cut, Copy, and Paste commands. This code
makes the pop-up menu available to both edit boxes:
}
procedure TForm1.FormCreate(Sender: TObject);
begin
  PopupMenu1.AutoPopup := True;
  Edit1.PopupMenu := PopupMenu1;
  Edit2.PopupMenu := PopupMenu1;
end;

{
These are the cut, copy, and paste OnClick events for the commands
on the pop-up menu. Double click on the pop-up menu and add three
TMenuItems.  Then set the captions to "Cut", "Copy" and "Paste".
The names will be automatically set to "Cut1", "Copy1", and
"Paste1".  Then double click on the OnClick events and they will
be named "Cut1Click", "Copy1Click" and "Paste1Click" respectively.
Note: only the selected portion of the string in the edit box will
be copied, cut or replaced.
}
procedure TForm1.Copy1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
   Edit1.CopyToClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.CopyToClipboard
  else
    Beep;
end;

procedure TForm1.Cut1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
    Edit1.CutToClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.CutToClipboard
  else
    Beep;
end;

procedure TForm1.Paste1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
```

```
    Edit1.PasteFromClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.PasteFromClipboard
  else
    Beep;
end;
{
This example demonstrates how to add and delete menu items
to a popup menu at runtime and assign an event handler to
the OnClick event.  Place a TPopupMenu and three buttons on
the form named "AddButton", "EditButton",  and
"DestroyButton" and add OnClick events to all three buttons.
Put the TPopupMenu in the PopupMenu property of the form.
Place the PopupMenuItemsClick procedure in the TForm1 type
declaration so that it can be used as the method call for
the menu item OnClick event.
}

68.1.7.2.23 TColorListBox.Selected Property

Indicates whether a particular item is selected.

Pascal

```
property Selected [Index: Integer]: Boolean;
```

C++

```
__property TColor Selected;__property Boolean Selected[int Index];
```

Description

Use Selected to query the state of a particular item in the list box. If the item specified by the Index parameter is selected in the list box, the value of the Selected property is true. If the specified item is not selected, Selected is false. Set Selected to change the currently selected item.

The Index parameter is the item referenced by its position in the list box, with the first item having an Index value of 0.

An item is selected when the user highlights it. More than one item in the list box can be selected by setting the MultiSelect property to true. In this case, the Selected item is the one that has focus when the list box has input focus.

C++ Examples:

```
/*
This example uses a file listbox and a regular listbox on a
form. The following routine scans through the files listed
in the file listbox and lists the sizes of any selected
files to the regular list box.  To exercise the error
condition create a file in the Debug directory, start this
application and then delete the file.  Now try to list the
```

```
size of the deleted file.  Continue will continue listing
file sizes in a multiple selection that includes the deleted
file.  Break will stop.  Set the MultiSelect and
ExtendedSelect properties on the FileListBox.
*/
#include <stdio.h>     // for FILE, fopen, fstat, fileno, fread and fclose
#include <sys\stat.h>  // for fstat and the stat struct

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  for (int i = 0; i < FileListBox1->Items->Count; i++)
  {
    if (FileListBox1->Selected[i])
    {
      if (!FileExists(FileListBox1->Items->Strings[i]))
      {
        MessageBeep(0);
        if (Application->MessageBox(
          AnsiString("File " + FileListBox1->Items->Strings[i] + "not found").c_str(),
          NULL,
          MB_OKCANCEL) == IDCANCEL)
          break;
        else
          continue;
      }
      FILE *F = fopen(FileListBox1->Items->Strings[i].c_str(),"r");
      struct stat statbuf;
      fstat(fileno(F), &statbuf);
      ListBox1->Items->Add(
          FileListBox1->Items->Strings[i] + ": " + IntToStr(statbuf.st_size));
      fclose(F);
    }
  }
}
```

Delphi Examples:

```
{
This example uses a file listbox and a regular listbox on a
form. The following routine scans through the files listed
in the file listbox and lists the sizes of any selected
files to the regular list box.  To exercise the error
condition create a file in the Debug directory, start this
application and then delete the file.  Now try to list the
size of the deleted file.  Set the MultiSelect and
ExtendedSelect properties on the FileListBox.
}
procedure TForm1.Button1Click(Sender: TObject);
var
  F: File;
  i, filehandle: Integer;
begin
  for i := 0 to (FileListBox1.Items.Count - 1) do begin
  try

SelCount

68.1.7.2.24 TColorListBox.ShowHint Property

Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.

Pascal

```
property ShowHint: Boolean;
```

C++

```
__property Boolean ShowHint;
```

Description

The Help Hint is the value of the Hint property, which is displayed in a box just beneath the control. Use ShowHint to determine whether a Help Hint appears for the control.

To enable Help Hint for a particular control, the application ShowHint property must be true and either

the control's own ShowHint property must be true, or

the control's ParentShowHint property must be true and its parent's ShowHint property must be true.

For example, imagine a check box within a group box. If the ShowHint property of the group box is true and the ParentShowHint property of the check box is true, but the ShowHint property of the check box is false, the check box still displays its Help Hint.

Changing the ShowHint value automatically sets the ParentShowHint property to false.

C++ Examples:

```
/*
This example uses an edit box and a list box on a form.
Items are added to the list box and a Help Hint is assigned
to both controls. The last statement enables the Help Hints
for the entire application.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  Edit1->Hint = "Enter your name";
  Edit1->ShowHint = true;
```

```
  char string[10];
  char index[3];
  for(int i = 1; i <= 10; i++)
  {
    strcpy(string, "Item");
    itoa(i, index, 10);
    strcat(string, index);
    ListBox1->Items->Add(string);
  }
  ListBox1->Hint = "Select an item";
  ListBox1->ShowHint = true;
  Application->ShowHint = true;
}
/*
Note: To see an example that displays the hints of controls
in some place other than in a Help Hint box, see the OnHint
example.
*/
```

Delphi Examples:

```
{
This example uses an edit box and a list box on a form.
Items are added to the list box and a Help Hint is assigned
to both controls. The last statement enables the Help Hints
for the entire application.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  I: Integer;
begin
  Edit1.Hint := 'Enter your name';
  Edit1.ShowHint := True;
  with ListBox1 do
  begin
    for I := 1 to 10 do
      Items.Add('Item ' + IntToStr(I));
    Hint := 'Select an item';
    ShowHint := True;
  end;
  Application.ShowHint := True;
end;
{
Note: To see an example that displays the hints of controls
in some place other than in a Help Hint box, see the OnHint
example.
}

68.1.7.2.25 TColorListBox.Style Property

Determines whether the list box is standard or owner-draw and whether it is virtual.

Pascal

```
property Style: TListBoxStyle;
```

C++

```
__property TColorBoxStyle Style;__property TListBoxStyle Style;
```

Description

Use Style to specify whether the list box is a standard list box that displays text strings, or an owner-draw list box that can display graphical images. Owner-draw list boxes let you display items in some nonstandard way. In this case, you must write the code to paint items in the list box.

In addition, Style controls whether the list box is virtual, which means that items are supplied dynamically using event handlers. By default, Style is lbStandard, meaning that the list box is not virtual and it displays each item as a string.

68.1.7.2.26 TColorListBox.TabOrder Property

Indicates the position of the control in its parent's tab order.

Pascal

```
property TabOrder: TTabOrder;
```

C++

```
__property TTabOrder TabOrder;
```

Description

TabOrder is the order in which child windows are visited when the user presses the Tab key. The control with the TabOrder value of 0 is the control that has the focus when the form first appears.

Initially, the tab order is always the order in which the controls were added to the form. The first control added to the form has a TabOrder value of 0, the second is 1, the third is 2, and so on. Change this by changing the TabOrder property.

Each control has a unique tab-order value within its parent. If you change the TabOrder property value of one control to be the same as the value of a second control, the TabOrder value for all the other controls changes. For example, suppose a control is sixth in the tab order. If you change the control's TabOrder property value to 3 (making the control fourth in the tab order), the control that was originally fourth in the tab order now becomes fifth, and the control that was fifth becomes sixth.

Assigning TabOrder a value greater than the number of controls contained in the parent control moves the control to the end of the tab order. The control does not take on the assigned value of TabOrder, but instead is given the number that assures the control is the last in the tab order.

Note: TabOrder is meaningful only if the TabStop property is true and if the control has a parent. (The TabOrder property of a form is not used unless the form is the child of another form.) A control with a TabOrder of -1 has no parent, and therefore

cannot be reached by pressing the Tab key. To remove a parented control from the Tab order, set its TabStop property to false.

See Also

FindNextControl (see page 6149)

TabStop (see page 6211)

68.1.7.2.27 TColorListBox.TabStop Property

Determines if the user can tab to a control.

Pascal

```
property TabStop: Boolean;
```

C++

```
__property Boolean TabStop;
```

Description

Use the TabStop to allow or disallow access to the control using the Tab key.

If TabStop is true, the control is in the tab order. If TabStop is false, the control is not in the tab order and the user can't press the Tab key to move to the control.

Note: TabStop is not meaningful for a form unless the form assigns another form to be its parent.

See Also

TabOrder (see page 6211)

68.1.7.2.28 TColorListBox.Visible Property

Determines whether the component appears onscreen.

Pascal

```
property Visible: Boolean;
```

C++

```
__property Boolean Visible;
```

Description

Use the Visible property to control the visibility of the control at runtime. If Visible is true, the control appears. If Visible is false, the control is not visible.

Calling the Show method sets the control's Visible property to true. Calling the Hide method sets it to false.

C++ Examples:

```
/*
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
*/
void __fastcall TForm1::PageControl1Change(TObject *Sender)
{
  CheckBox1->Checked = PageControl1->ActivePage->Visible;
}

void __fastcall TForm1::CheckBox1Click(TObject *Sender)
```

```
{
  PageControl1->ActivePage->Visible = CheckBox1->Checked;
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < 10; i++)
  {
    TTabSheet *pPage = new TTabSheet(this);
    pPage->PageControl = PageControl1;
    pPage->Caption = AnsiString("Page") + IntToStr(i);
    TEdit *pEdit = new TEdit(this);
    pEdit->Parent = pPage;
    pEdit->Left = random(pPage->ClientWidth - pEdit->Width);
    pEdit->Top = random(pPage->ClientHeight - pEdit->Height);
  }
  PageControl1Change(Sender);
}
```

Delphi Examples:

```
{
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
}
procedure TForm1.CheckBox1Click(Sender: TObject);
begin
  PageControl1.ActivePage.Visible := CheckBox1.Checked;
end;

procedure TForm1.PageControl1Change(Sender: TObject);
begin
  CheckBox1.Checked := PageControl1.ActivePage.Visible;
end;

procedure TForm1.FormCreate(Sender: TObject);
var
  i: Integer;
begin
  for i := 0 to 9 do
    with TTabSheet.Create(Self) do
    begin
      PageControl := PageControl1;
      Caption := 'TabSheet' + IntToStr(i);
      with TEdit.Create(Self) do
      begin
        Parent := PageControl1.Pages[i];
        Left := Random(PageControl1.ActivePage.ClientWidth - Width);
        Top := Random(PageControl1.ActivePage.ClientHeight - Height);
      end;
    end;
    PageControl1Change(Sender);
end;
```

68.1.7.3 TColorListBox Events

The events of the TColorListBox class are listed here.

Published Events

	Name	Description
	OnClick (see page 12283)	Occurs when the user clicks the control.
	OnContextPopup (see page 12285)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnDblClick (see page 12286)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDragDrop (see page 12286)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 12288)	Occurs when the user drags an object over a control.
	OnEndDock (see page 12291)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 12291)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnEnter (see page 12292)	Occurs when a control receives the input focus.
	OnExit (see page 12295)	Occurs when the input focus shifts away from one control to another.
	OnGetColors (see page 12296)	This is OnGetColors, a member of class TColorListBox.
	OnKeyDown (see page 12296)	Occurs when a user presses any key while the control has focus.
	OnKeyPress (see page 12299)	Occurs when a key is pressed.
	OnKeyUp (see page 12300)	Occurs when the user releases a key that has been pressed.
	OnMouseActivate (see page 12302)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 12303)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseEnter (see page 12305)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 12305)	Occurs when the user moves the mouse outside of a control.
	OnMouseMove (see page 12306)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 12308)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnStartDock (see page 12310)	Occurs when the user begins to drag a control with a DragKind of dkDock.
	OnStartDrag (see page 12311)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.

68.1.7.3.1 TColorListBox.OnClick Event

Occurs when the user clicks the control.

Pascal

```
property OnClick: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnClick;
```

Description

Use the OnClick event handler to respond when the user clicks the control. If the control has an associated action, and that action has an OnExecute method, the action's OnExecute method responds to click events unless it is superseded by an OnClick event handler.

Usually OnClick occurs when the user presses and releases the left mouse button with the mouse pointer over the control. This event can also occur when:

- The user selects an item in a grid, outline, list, or combo box by pressing an arrow key.

- The user presses Spacebar while a button or check box has focus.
- The user presses Enter when the active form has a default button (specified by the Default property).
- The user presses Esc when the active form has a cancel button (specified by the Cancel property).
- The user presses the accelerator key for a button or check box. For example, if the value of the Caption property of a check box is '&Bold', the B is underlined at runtime and the OnClick event of the check box is triggered when the user presses Alt+B. However, focus does not move to the control in these instances.
- The Checked property of a radio button is set to true.
- The value of the Checked property of a check box is changed.
- The Click method of a menu item is called.

For a form, an OnClick event occurs when the user clicks a blank area of the form or on a disabled component.

C++ Examples:

```
/*
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
*/
void __fastcall TForm1::PageControl1Change(TObject *Sender)
{
  CheckBox1->Checked = PageControl1->ActivePage->Visible;
}

void __fastcall TForm1::CheckBox1Click(TObject *Sender)
{
  PageControl1->ActivePage->Visible = CheckBox1->Checked;
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < 10; i++)
  {
    TTabSheet *pPage = new TTabSheet(this);
    pPage->PageControl = PageControl1;
    pPage->Caption = AnsiString("Page") + IntToStr(i);
    TEdit *pEdit = new TEdit(this);
    pEdit->Parent = pPage;
    pEdit->Left = random(pPage->ClientWidth - pEdit->Width);
    pEdit->Top = random(pPage->ClientHeight - pEdit->Height);
  }
  PageControl1Change(Sender);
}
```

Delphi Examples:

```
{
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
}
procedure TForm1.CheckBox1Click(Sender: TObject);
begin
  PageControl1.ActivePage.Visible := CheckBox1.Checked;
end;

procedure TForm1.PageControl1Change(Sender: TObject);
begin
  CheckBox1.Checked := PageControl1.ActivePage.Visible;
```

```
end;

procedure TForm1.FormCreate(Sender: TObject);
var
  i: Integer;
begin
  for i := 0 to 9 do
    with TTabSheet.Create(Self) do
    begin
      PageControl := PageControl1;
      Caption := 'TabSheet' + IntToStr(i);
      with TEdit.Create(Self) do
      begin
        Parent := PageControl1.Pages[i];
        Left := Random(PageControl1.ActivePage.ClientWidth - Width);
        Top := Random(PageControl1.ActivePage.ClientHeight - Height);
      end;
    end;
    PageControl1Change(Sender);
end;
```

68.1.7.3.2 TColorListBox.OnContextPopup Event

Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).

Pascal

```
property OnContextPopup: TContextPopupEvent;
```

C++

```
__property TContextPopupEvent OnContextPopup;
```

Description

The OnContextPopup handler is called when the user uses the mouse or keyboard to request a popup menu. The OnContextPopup event is generated by a WM_CONTEXTMENU message, which is itself generated by the user clicking the right mouse button or by pressing SHIFT+F10 or the Applications key.

This event is especially useful when the control does not have an associated popup menu (the PopupMenu property is not set) or if the AutoPopup property of the control's associated popup menu is false. However, the OnContextPopup can also be used to override the automatic context menu that appears when the control has an associated popup menu with an AutoPopup property of true. In this last case, if the event handler displays its own menu, it should set the Handled parameter to true to suppress the default context menu.

The handler's MousePos parameter indicates the position of the mouse, in client coordinates.. If the event was not generated by a mouse click, MousePos is (-1,-1).

Note: Parent controls receive an OnContextPopup event before their child controls. In addition, for many child controls, the

default window procedure causes the parent control to receive an OnContextPopup event after the child control. As a result, when parent controls do not set Handled to true in an OnContextPopup event handler, the event handler may be called multiple times for each context menu invocation.

PopupMenu (see page 5835)

AutoPopup (see page 16178)

68.1.7.3.3 TColorListBox.OnDblClick Event

Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.

Pascal

```
property OnDblClick: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnDblClick;
```

Description

Use the OnDblClick event to respond to mouse double-clicks.

See Also

OnClick (see page 5851)

Responding to User Actions at Runtime

68.1.7.3.4 TColorListBox.OnDragDrop Event

Occurs when the user drops an object being dragged.

Pascal

```
property OnDragDrop: TDragDropEvent;
```

C++

```
__property TDragDropEvent OnDragDrop;
```

Description

Use the OnDragDrop event handler to specify what happens when the user drops an object. The Source parameter of the OnDragDrop event is the object being dropped, and the Sender is the control the object is being dropped on. The X and Y parameters are the coordinates of the mouse positioned over the control.

C++ Examples:

```
/*
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
*/

// This OnDragOver event handler permits the list box to
// accept a dropped label:
void __fastcall TForm1::ListBox1DragOver(TObject *Sender, TObject *Source, int X, int Y,
```

```
TDragState State, bool &Accept)
{
   Accept = Source->ClassNameIs("TLabel");
}

/*
This OnDragDrop event handler implements the drop behavior.
*/
void __fastcall TForm1::ListBox1DragDrop(TObject *Sender, TObject *Source, int X, int Y)
{
  if (Sender->ClassNameIs("TListBox") && Source->ClassNameIs("TLabel"))
  {
    TListBox *DestList = (TListBox *)Sender;
    DestList->Font = ((TLabel *)Source)->Font;
    DestList->Color = ((TLabel *)Source)->Color;
    DestList->DoubleBuffered = true;
    DestList->Color = clWindow;
  }
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  ListBox1->Items->Add("Not");
  ListBox1->Items->Add("In");
  ListBox1->Items->Add("Alphabetical");
  ListBox1->Items->Add("Order");

}
```

Delphi Examples:

```
{
This code is an OnDragOver event handler that won't allow a
label control to be dropped on a panel control and stops the
dragging of the label as soon as the user drags the label
onto the panel:
Note: Set the label's DragMode property to dmAutomatic.
}
procedure TForm1.FormDragDrop(Sender, Source: TObject; X, Y: Integer);
begin
  TForm1(Source).Left := X;
  TForm1(Source).Top := Y;
end;

procedure TForm1.FormDragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := Source is TLabel;
end;

procedure TForm1.Panel1DragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := False;
  if (Source is TLabel) and (State = dsDragEnter) then
    (Source as TLabel).EndDrag(False);
end;
{
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
}

procedure TForm1.FormCreate(Sender: TObject);
```

```
begin
  ListBox1.Items.Add('Not');
  ListBox1.Items.Add('In');
  ListBox1.Items.Add('Alphabetical');
  ListBox1.Items.Add('Order');
end;

// This OnDragOver event handler permits the list box to
// accept a dropped label:

procedure TForm1.ListBox1DragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := Source is TLabel;
end;

// This OnDragDrop event handler implements the drop behavior.

procedure TForm1.ListBox1DragDrop(Sender, Source: TObject; X, Y: Integer);
begin
  if (Sender is TListBox) and (Source is TLabel) then
  begin
    with Sender as TListBox do
    begin
      Font := (Source as TLabel).Font;
      Color := (Source as TLabel).Color;
      DoubleBuffered := true;
      Color := clWindow;
    end;
  end;
end;
```

68.1.7.3.5 TColorListBox.OnDragOver Event

Occurs when the user drags an object over a control.

Pascal

```
property OnDragOver: TDragOverEvent;
```

C++

```
__property TDragOverEvent OnDragOver;
```

Description

Use an OnDragOver event to signal that the control can accept a dragged object so the user can drop or dock it.

Within the OnDragOver event handler, change the Accept parameter to false to reject the dragged object. Leave Accept as true

to allow the user to drop or dock the dragged object on the control.

To change the shape of the cursor, indicating that the control can accept the dragged object, change the value of the DragCursor property for the control before the OnDragOver event occurs.

The Source is the object being dragged, the Sender is the potential drop or dock site, and X and Y are screen coordinates in pixels. The State parameter specifies how the dragged object is moving over the control.

Note: Within the OnDragOver event handler, the Accept parameter defaults to true. However, if an OnDragOver event handler is not supplied, the control rejects the dragged object, as if the Accept parameter were changed to false.

C++ Examples:

```
/*
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
*/

// This OnDragOver event handler permits the list box to
// accept a dropped label:
void __fastcall TForm1::ListBox1DragOver(TObject *Sender, TObject *Source, int X, int Y,
TDragState State, bool &Accept)
{
   Accept = Source->ClassNameIs("TLabel");
}

/*
This OnDragDrop event handler implements the drop behavior.
*/
void __fastcall TForm1::ListBox1DragDrop(TObject *Sender, TObject *Source, int X, int Y)
{
  if (Sender->ClassNameIs("TListBox") && Source->ClassNameIs("TLabel"))
  {
    TListBox *DestList = (TListBox *)Sender;
    DestList->Font = ((TLabel *)Source)->Font;
    DestList->Color = ((TLabel *)Source)->Color;
    DestList->DoubleBuffered = true;
    DestList->Color = clWindow;
  }
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  ListBox1->Items->Add("Not");
  ListBox1->Items->Add("In");
  ListBox1->Items->Add("Alphabetical");
  ListBox1->Items->Add("Order");

}
```

Delphi Examples:

```
{
This code is an OnDragOver event handler that won't allow a
label control to be dropped on a panel control and stops the
dragging of the label as soon as the user drags the label
onto the panel:
Note: Set the label's DragMode property to dmAutomatic.
}
procedure TForm1.FormDragDrop(Sender, Source: TObject; X, Y: Integer);
```

```
begin
  TForm1(Source).Left := X;
  TForm1(Source).Top := Y;
end;

procedure TForm1.FormDragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := Source is TLabel;
end;

procedure TForm1.Panel1DragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := False;
  if (Source is TLabel) and (State = dsDragEnter) then
    (Source as TLabel).EndDrag(False);
end;
{
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
}

procedure TForm1.FormCreate(Sender: TObject);
begin
  ListBox1.Items.Add('Not');
  ListBox1.Items.Add('In');
  ListBox1.Items.Add('Alphabetical');
  ListBox1.Items.Add('Order');
end;

// This OnDragOver event handler permits the list box to
// accept a dropped label:

procedure TForm1.ListBox1DragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := Source is TLabel;
end;

// This OnDragDrop event handler implements the drop behavior.

procedure TForm1.ListBox1DragDrop(Sender, Source: TObject; X, Y: Integer);
begin
  if (Sender is TListBox) and (Source is TLabel) then
  begin
    with Sender as TListBox do
    begin
      Font := (Source as TLabel).Font;
      Color := (Source as TLabel).Color;
      DoubleBuffered := true;
      Color := clWindow;
    end;
  end;
end;
```

68.1.7.3.6 TColorListBox.OnEndDock Event

Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.

Pascal

```
property OnEndDock: TEndDragEvent;
```

C++

```
__property TEndDragEvent OnEndDock;
```

Description

Use OnEndDock to specify actions or special processing that when a drag-and-dock operation stops.

See Also

DragKind (see page 5819)

OnDragOver (see page 5857)

OnDockDrop (see page 6214)

OnStartDock (see page 5871)

68.1.7.3.7 TColorListBox.OnEndDrag Event

Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.

Pascal

```
property OnEndDrag: TEndDragEvent;
```

C++

```
__property TEndDragEvent OnEndDrag;
```

Description

Use the OnEndDrag event handler to specify any special processing that occurs when dragging stops.

C++ Examples:

```
/*
This code displays a message in a label named Status. The
message displayed depends on whether the dragged label
control was successfully dropped into and accepted by a
another control.
*/
void __fastcall TForm1::Label1EndDrag(TObject *Sender, TObject *Target, int X,
      int Y)
{
  if (Sender->ClassNameIs("TLabel"))
  {
```

```
    AnsiString S = ((TLabel *)Sender)->Name + " was dropped and ";
    if (Target)
      S = S + "accepted!";
    else
      S = S + "rejected.";
    Status->Caption = S;
  }
}
```

Delphi Examples:

```
{
This code displays a message in a label named Status. The
message displayed depends on whether the dragged label
control was successfully dropped into and accepted by a
another control.
}
procedure TForm1.Label1EndDrag(Sender, Target: TObject; X, Y: Integer);
var
  S: string;
begin
  S := (Sender as TLabel).Name + ' was dropped... and ';
  if Target <> nil then
    S := S + 'accepted!'
  else
    S := S + 'rejected!';
  Status.Caption := S;
end;
```

68.1.7.3.8 TColorListBox.OnEnter Event

Occurs when a control receives the input focus.

Pascal

```
property OnEnter: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnEnter;
```

Description

Use the OnEnter event handler to cause any special processing to occur when a control becomes active.

The OnEnter event does not occur when switching between forms or between another application and the application that includes the control.

When switching between controls in separate container controls such as the TPanel and the TGroupBox controls, an OnEnter event occurs for the container before the OnEnter event of the contained control.

Similarly, an OnExit event of the container occurs after the OnExit event of the control in a container when focus moves to another control outside the container.

For example, consider a form with an OK button and a group box that contains three radio buttons, where focus is currently on the OK button. When the user clicks one of the radio buttons, an OnExit event of the button occurs, followed by an OnEnter

event on the group box, and finally an OnEnter event on the radio button that was clicked. If the user then clicks on the OK button, an OnExit event for the radio button occurs followed by an OnExit event for the group box, and then the button's OnEnter event occurs.

C++ Examples:

```
/*
This example takes an edit control, a button, and a rich
edit control on a form.  When the user presses the button, a
Font dialog appears.  When the user clicks the Apply (not OK)
button in the Font dialog, the currently selected font is
applied to the active control. Clicking the button sets the
ActiveControl to the button.  That is why we need to save
the ActiveControl in a shared OnEnter procedure.  In the rich
edit, only the text selected converts.
*/
TWinControl *myActiveControl;

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  FontDialog1->Options << fdApplyButton;
  FontDialog1->Execute();
}

void __fastcall TForm1::FontDialog1Apply(TObject *Sender, HWND Wnd)
{
  if (myActiveControl->ClassNameIs("TEdit"))
   ((TEdit *)myActiveControl)->Font->Assign(FontDialog1->Font);
  else if (myActiveControl->ClassNameIs("TRichEdit"))
    ((TRichEdit *)myActiveControl)->SelAttributes->Assign(FontDialog1->Font);
  else
    MessageBeep(0);
}

void __fastcall TForm1::Edit1Enter(TObject *Sender)
{
  myActiveControl = ActiveControl;
}
/*
This example uses an edit box and a memo control on a form.
When either the edit box or the memo is the active control,
it is colored yellow. When the active control becomes
inactive, the color of the control returns to the Windows
system color for a window.  These event handlers could also
be shared.
*/
void __fastcall TForm1::Edit1Enter(TObject *Sender)
{
  Edit1->Color = clYellow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Edit1Exit(TObject *Sender)
{
  Edit1->Color = clWindow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Memo1Enter(TObject *Sender)
{
  Memo1->Color = clYellow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Memo1Exit(TObject *Sender)
{
  Memo1->Color = clWindow;
}
```

Delphi Examples:

```
{
This example takes an edit control, a button, and a rich
edit control on a form.  When the user presses the button, a
Font dialog appears.  When the user clicks the Apply (not OK)
button in the Font dialog, the currently selected font is
applied to the active control. Clicking the button sets the
ActiveControl to the button.  That is why we need to save
the ActiveControl in a shared OnEnter procedure.  In the rich
edit, only the text selected converts.
}
procedure TForm1.Button1Click(Sender: TObject);
begin
   FontDialog1.Options := FontDialog1.Options + [fdApplyButton];
   FontDialog1.Execute;
end;

procedure TForm1.Edit1Enter(Sender: TObject);
begin
  myActiveControl := ActiveControl;
end;

procedure TForm1.FontDialog1Apply(Sender: TObject; Wnd: HWND);
begin
  if myActiveControl is TEdit then
    with myActiveControl as TEdit do
       Font.Assign(TFontDialog(Sender).Font)
  else if myActiveControl is TRichEdit then
    with myActiveControl as TRichEdit do
      SelAttributes.Assign(TFontDialog(Sender).Font)
  else
    Beep;
end;
{
This example uses an edit box and a memo control on a form.
When either the edit box or the memo is the active control,
it is colored yellow. When the active control becomes
inactive, the color of the control returns to the Windows
system color for a window.  These event handlers could also
be shared.
}
procedure TForm1.Edit1Enter(Sender: TObject);
begin
  Edit1.Color := clYellow;
end;

procedure TForm1.Edit1Exit(Sender: TObject);
begin
  Edit1.Color := clWindow;
end;

procedure TForm1.Memo1Enter(Sender: TObject);
begin
  Memo1.Color := clYellow;
end;

procedure TForm1.Memo1Exit(Sender: TObject);
begin
  Memo1.Color := clWindow;
end;

68.1.7.3.9 TColorListBox.OnExit Event

Occurs when the input focus shifts away from one control to another.

Pascal

```
property OnExit: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnExit;
```

Description

Use the OnExit event handler to provide special processing when the control ceases to be active.

The OnExit event does not occur when switching between forms or between another application and your application.

When switching between controls in separate container controls such as the TPanel and the TGroupBox controls, an OnExit event occurs for the control inside the container before the OnExit event of the container.

Similarly, an OnEnter event of the container occurs before the OnEnter event of the control in a container when focus moves to a control inside a container.

For example, consider a form with an OK button and a group box that contains three radio buttons, where focus is currently on the OK button. When the user clicks one of the radio buttons, an OnExit event of the button occurs, followed by an OnEnter event on the group box, and finally an OnEnter event on the radio button that was clicked. If the user then clicks on the OK button, an OnExit event for the radio button occurs followed by an OnExit event for the group box, and then the button's OnEnter event occurs.

Note: In some control classes the ActiveControl property updates before the OnExit event occurs.

C++ Examples:

```
/*
This example uses an edit box and a memo control on a form.
When either the edit box or the memo is the active control,
it is colored yellow. When the active control becomes
inactive, the color of the control returns to the Windows
system color for a window.  These event handlers could also
be shared.
*/
void __fastcall TForm1::Edit1Enter(TObject *Sender)
{
  Edit1->Color = clYellow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Edit1Exit(TObject *Sender)
{
  Edit1->Color = clWindow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Memo1Enter(TObject *Sender)
{
  Memo1->Color = clYellow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Memo1Exit(TObject *Sender)
{
```

```
  Memo1->Color = clWindow;
}
```

Delphi Examples:

```
{
This example uses an edit box and a memo control on a form.
When either the edit box or the memo is the active control,
it is colored yellow. When the active control becomes
inactive, the color of the control returns to the Windows
system color for a window.  These event handlers could also
be shared.
}
procedure TForm1.Edit1Enter(Sender: TObject);
begin
  Edit1.Color := clYellow;
end;

procedure TForm1.Edit1Exit(Sender: TObject);
begin
  Edit1.Color := clWindow;
end;

procedure TForm1.Memo1Enter(Sender: TObject);
begin
  Memo1.Color := clYellow;
end;

procedure TForm1.Memo1Exit(Sender: TObject);
begin
  Memo1.Color := clWindow;
end;

68.1.7.3.10 TColorListBox.OnGetColors Event

Pascal

```
property OnGetColors: TLBGetColorsEvent;
```

C++

```
__property TLBGetColorsEvent OnGetColors;
```

Description

This is OnGetColors, a member of class TColorListBox.

68.1.7.3.11 TColorListBox.OnKeyDown Event

Occurs when a user presses any key while the control has focus.

Pascal

```
property OnKeyDown: TKeyEvent;
```

C++

```
__property TKeyEvent OnKeyDown;
```

Description

Use the OnKeyDown event handler to specify special processing to occur when a key is pressed. The OnKeyDown handler can respond to keyboard keys, including function keys and keys combined with the `Shift`, `Alt`, and `Ctrl` keys, and pressed mouse buttons.

Note: TCheckBox does not fire OnKeyDown events for arrow keys.

The TKeyEvent type points to a method that handles keyboard events.

The Key parameter is the key on the keyboard. For non-alphanumeric keys, use virtual key codes to determine the key pressed. For more information, see Virtual Key codes.

The Shift parameter indicates whether the Shift, Alt, or Ctrl keys are combined with the keystroke.

An application gets Windows WM_KEYDOWN messages for all keys when the user presses a key. These messages indirectly fire the OnKeyDown event. If you set the Key to 0 there you prevent only any further processing of this message. But for keys that generate characters Windows also produces WM_CHAR. At the time your OnKeyDown event fires, the WM_CHAR message for the key will already be in the message queue. Setting Key to 0 does not stop it from being delivered, so it fires the OnKeyPress event. You must set the Key to #0 to prevent the control from intercepting the WM_CHAR message.

This method of organizing key processing has advantages. Code that only deals with characters, including control characters like #13 for carriage return, #3 for Ctrl-C and so on, should go into the OnKeyPress event. Code that deals with keys that do not generate characters should be put into the OnKeyDown event.

C++ Examples:

```
/*
This example changes a form's color to aqua when the user
presses the F1 key, even when a control on the form has the
focus. When the user releases the key, the form returns to
its original color.  Set the KeyPreview on the form to True.
Set the OnKeyDown event to FormKeyDown and set the OnKeyUp
event to FormKeyUp.  Set the KeyPreview on the form to True.
*/
void __fastcall TForm1::FormKeyDown(TObject *Sender, WORD &Key,
      TShiftState Shift)
{
  if (Key == VK_F1)
  {
    FormColor = Form1->Color;
    Form1->Color = clAqua;
    if (ComboBox1->Text == "KeyDown")
      ComboBox1->Text = "KeyDown2";
    else
      ComboBox1->Text = "KeyDown";
    Form1->Refresh();
    Memo1->Lines->Add(ComboBox1->Text);
  }
}

void __fastcall TForm1::FormKeyUp(TObject *Sender, WORD &Key, TShiftState Shift)
{
  if (Key == VK_F1)
  {
    Form1->Color = FormColor;
    if (ComboBox1->Text == "KeyUp")
      ComboBox1->Text = "KeyUp2";
    else
      ComboBox1->Text = "KeyUp";
    Form1->Refresh();
    Memo1->Lines->Add(ComboBox1->Text);
  }
}
```

Delphi Examples:

```
{
This example changes a form's color to aqua when the user
presses the F1 key, even when a control on the form has the
focus. When the user releases the key, the form returns to
its original color.  Set the KeyPreview on the form to True.
Set the OnKeyDown event to FormKeyDown and set the OnKeyUp
event to FormKeyUp.  Set the KeyPreview on the form to True.
}
var
  FormColor: TColor;
procedure TForm1.FormCreate(Sender: TObject);
begin
  KeyPreview := True;
  FormColor := Form1.Color;
end;

procedure TForm1.FormKeyDown(
  Sender: TObject; var Key: Word; Shift: TShiftState);
begin
  if Key = VK_F1 then
  begin
    Form1.Color := clAqua;
    if (ComboBox1.Text = 'KeyDown') then
      ComboBox1.Text := 'KeyDown2'
    else
      ComboBox1.Text := 'KeyDown';
    WriteLn(ComboBox1.Text);
  end;
end;

procedure TForm1.FormKeyUp(
  Sender: TObject; var Key: Word; Shift: TShiftState);

68.1.7.3.12 TColorListBox.OnKeyPress Event

Occurs when a key is pressed.

Pascal

```
property OnKeyPress: TKeyPressEvent;
```

C++

```
__property TKeyPressEvent OnKeyPress;
```

Description

Use the OnKeyPress event handler to make something happen as a result of a single character key press.

The Key parameter in the OnKeyPress event handler is of type Char; therefore, the OnKeyPress event registers the ASCII character of the key pressed. Keys that don't correspond to an ASCII Char value (Shift or F1, for example) don't generate an OnKeyPress event. Key combinations (such as Shift+A), generate only one OnKeyPress event (for this example, Shift+A results in a Key value of "A" if Caps Lock is off). To respond to non-ASCII keys or key combinations, use the OnKeyDown or OnKeyUp event handlers.

An application gets Windows WM_KEYDOWN messages for all keys when the user presses a key. These messages indirectly fire the OnKeyDown event. If you set the Key to 0 there you prevent only any further processing of this message. But for keys

that generate characters Windows also produces WM_CHAR. At the time your OnKeyDown event fires, the WM_CHAR message for the key will already be in the message queue. Setting Key to 0 does not stop it from being delivered, so it fires the OnKeyPress event. You must set the Key to #0 to prevent the control from intercepting the WM_CHAR message.

This method of organizing key processing has advantages. Code that only deals with characters, including control characters like #13 for carriage return, #3 for Ctrl-C and so on, should go into the OnKeyPress event. Code that deals with keys that do not generate characters should be put into the OnKeyDown event.

C++ Examples:

```
/*
This event handler displays a message dialog box specifying
which key was pressed:
*/

void __fastcall TForm1::FormKeyPress(TObject *Sender, char &Key)
{
  char keyString[25];
  keyString[0] = Key;
  strcpy(&keyString[1], " Was Pressed");
  TMsgDlgButtons() << mbOK;
  MessageDlg(AnsiString(keyString), TMsgDlgType(mtInformation), TMsgDlgButtons() << mbOK, 0);
}
```

Delphi Examples:

```
{
This event handler displays a message dialog box specifying
which key was pressed:
}
procedure TForm1.FormKeyPress(Sender: TObject; var Key: Char);
begin
  MessageDlg(Key + ' has been pressed', mtInformation, [mbOK], 0)
end;
```

68.1.7.3.13 TColorListBox.OnKeyUp Event

Occurs when the user releases a key that has been pressed.

Pascal

```
property OnKeyUp: TKeyEvent;
```

C++

```
__property TKeyEvent OnKeyUp;
```

Description

Use the OnKeyUp event handler to provide special processing that occurs when a key is released. The OnKeyUp handler can respond to all keyboard keys, including function keys and keys combined with the Shift, Alt, and Ctrl keys.

The TKeyEvent type points to a method that handles keyboard events. The Key parameter is the key on the keyboard. For non-alphanumeric keys, you must use virtual key codes to determine the key pressed. For more information, see Virtual Key codes.

The Shift parameter indicates whether the Shift, Alt, or Ctrl keys are combined with the keystroke.

C++ Examples:

```
/*
This example changes a form's color to aqua when the user
presses the F1 key, even when a control on the form has the
focus. When the user releases the key, the form returns to
its original color.  Set the KeyPreview on the form to True.
Set the OnKeyDown event to FormKeyDown and set the OnKeyUp
event to FormKeyUp.  Set the KeyPreview on the form to True.
*/
void __fastcall TForm1::FormKeyDown(TObject *Sender, WORD &Key,
      TShiftState Shift)
{
  if (Key == VK_F1)
  {
    FormColor = Form1->Color;
    Form1->Color = clAqua;
    if (ComboBox1->Text == "KeyDown")
      ComboBox1->Text = "KeyDown2";
    else
      ComboBox1->Text = "KeyDown";
    Form1->Refresh();
    Memo1->Lines->Add(ComboBox1->Text);
  }
}

void __fastcall TForm1::FormKeyUp(TObject *Sender, WORD &Key, TShiftState Shift)
{
  if (Key == VK_F1)
  {
    Form1->Color = FormColor;
    if (ComboBox1->Text == "KeyUp")
      ComboBox1->Text = "KeyUp2";
    else
      ComboBox1->Text = "KeyUp";
    Form1->Refresh();
    Memo1->Lines->Add(ComboBox1->Text);
  }
}
```

Delphi Examples:

```
{
This example changes a form's color to aqua when the user
presses the F1 key, even when a control on the form has the
focus. When the user releases the key, the form returns to
its original color.  Set the KeyPreview on the form to True.
Set the OnKeyDown event to FormKeyDown and set the OnKeyUp
event to FormKeyUp.  Set the KeyPreview on the form to True.
}

68.1.7.3.14 TColorListBox.OnMouseActivate Event

Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.

Pascal

```
property OnMouseActivate: TMouseActivateEvent;
```

C++

```
__property TMouseActivateEvent OnMouseActivate;
```

Description

Use the OnMouseActivate event handler to implement any special processing that should occur as a result of pressing a mouse button on a control when the parent top-level form is not active.

The event type is:

```
TMouseActivateEvent = procedure (Sender: TObject; Button: TMouseButton; ShiftState:
TShiftState;
X, Y: Integer; HitTest: Integer; var MouseActivate: TMouseActivate) of object;
```

When you click on a control and the parent top-level form is not active, this event fires on the control that the mouse cursor is over. MouseActivate is a protected virtual function in TControl. MouseActivate can be overridden in custom control descendants to provide special built-in processing of the OnMouseActivate events. If you leave the default value of MouseActivate as maDefault, the parent control fires the OnMouseActivate event and repeats the process all the way up to the top-level form. If no control in the chain sets the value of MouseActivate, the behavior is the same as if a control set TMouseActivate to maActivate. At any point, a control can set the value of TMouseActivate and the parent processing stops.

Some controls set focus to themselves when they get a button down message so, in some cases, setting maNoActivate appears to have no effect. For instance, a TButton control sets focus to itself in the WM_LBUTTONDOWN message regardless of whether or not TMouseActivate is set to maNoActivate. In this case, setting maNoActivateAndEat will work because the top-level form is not activated and the WM_LBUTTONDOWN message is suppressed.

The HitTest parameter is the hit test value obtained from the WM_NCHITTEST message. See Windows.pas for valid values and their meanings. In most cases this value will be HTCLIENT, which means that the user clicked in the client area of a control. However, in the case of a top-level form, this can take other values such as HTCAPTION, or HTBOTTOM. This allows the code to decide which value to set for MouseActivate, based on the HitTest code. For example, the following code in the

OnMouseActivate event handler for a TForm forces the user to click into a non-client area to activate the form:

```
if HitTest = HTCLIENT then
    MouseActivate := maNoActivateAndEat;
```

Even though this event is tied to how Windows processes WM_MOUSEACTIVATE, the actual handling of the message is done at the TControl level, which is the point in the VCL hierarchy where the control has no window handle. The OnMouseActivate event is then simulated since the all TControl descendants also have OnMouseDown, OnMouseMove, and OnMouseUp events. This information is applicable to both VCL Win32 and VCL.NET.

68.1.7.3.15 TColorListBox.OnMouseDown Event

Occurs when the user presses a mouse button with the mouse pointer over a control.

Pascal

```
property OnMouseDown: TMouseEvent;
```

C++

```
__property TMouseEvent OnMouseDown;
```

Description

Use the OnMouseDown event handler to implement any special processing that should occur as a result of pressing a mouse button.

The OnMouseDown event handler can respond to left, right, or center mouse button presses and shift key plus mouse-button combinations. Shift keys are the Shift, Ctrl, and Alt keys. X and Y are the pixel coordinates of the mouse pointer in the client area of the Sender.

C++ Examples:

```
/*
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a
rectangle is drawn on the form. When the mouse button is
released, the rectangle appears on the form's canvas. Its
top-left and bottom-right corners are defined by the
location of the mouse pointer when the user pressed and
released the mouse button.  While the user drags the mouse,
the location of the top, left, bottom, and right sides of
the rectangle are displayed in the status bar.
*/
int StartX, StartY; // Declare at the top of the form's unit
// Use this code as the OnMouseDown event handler of the form:
void __fastcall TForm1::FormMouseDown(TObject *Sender, TMouseButton Button, TShiftState Shift,
int X, int Y)
{
  StartX = X;
  StartY = Y;
}

// Use this code as the OnMouseUp event handler of the form:
```

```
void __fastcall TForm1::FormMouseUp(TObject *Sender, TMouseButton Button, TShiftState Shift,
int X, int Y)
{
  Form1->Canvas->Rectangle(StartX, StartY, X, Y);
  StatusBar1->Panels->Items[0]->Text = "";
  StatusBar1->Panels->Items[1]->Text = "";
  StatusBar1->Panels->Items[2]->Text = "";
  StatusBar1->Panels->Items[3]->Text = "";
}

// Use this code as the OnMouseMove event handler of the form:
void __fastcall TForm1::FormMouseMove(TObject *Sender, TShiftState Shift, int X, int Y)
{
  if (Shift.Contains(ssLeft)) // make sure button is down
  {
    if (Y > StartY)
    {
      StatusBar1->Panels->Items[0]->Text = "Top: " + IntToStr(StartY);
      StatusBar1->Panels->Items[2]->Text = "Bottom: " + IntToStr(Y);
    }
    else
    {
      StatusBar1->Panels->Items[0]->Text = "Top: " + IntToStr(Y);
      StatusBar1->Panels->Items[2]->Text = "Bottom: " + IntToStr(StartY);
    }
    if (X > StartX)
    {
      StatusBar1->Panels->Items[1]->Text = "Left: " + IntToStr(StartX);
      StatusBar1->Panels->Items[3]->Text = "Right: " + IntToStr(X);
    }
    else
    {
      StatusBar1->Panels->Items[1]->Text = "Left: " + IntToStr(X);
      StatusBar1->Panels->Items[3]->Text = "Right: " + IntToStr(StartX);
    }
  }
}
```

Delphi Examples:

```
{

68.1.7.3.16 TColorListBox.OnMouseEnter Event

Occurs when the user moves the mouse into a control.

Pascal

```
property OnMouseEnter: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnMouseEnter;
```

Description

Use the OnMouseEnter event handler to implement any special processing that should occur as a result of moving the mouse into a control when the parent top-level form is not active.

68.1.7.3.17 TColorListBox.OnMouseLeave Event

Occurs when the user moves the mouse outside of a control.

Pascal

```
property OnMouseLeave: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnMouseLeave;
```

Description

Use the OnMouseLeave event handler to implement any special processing that should occur as a result of moving the mouse outside of a control when the parent top-level form is not active.

68.1.7.3.18 TColorListBox.OnMouseMove Event

Occurs when the user moves the mouse pointer while the mouse pointer is over a control.

Pascal

```
property OnMouseMove: TMouseMoveEvent;
```

C++

```
__property TMouseMoveEvent OnMouseMove;
```

Description

Use the OnMouseMove event handler to respond when the mouse pointer moves after the control has captured the mouse.

Use the Shift parameter of the OnMouseDown event handler, to determine to the state of the shift keys and mouse buttons. Shift keys are the Shift, Ctrl, and Alt keys or shift key-mouse button combinations. X and Y are pixel coordinates of the new location of the mouse pointer in the client area of the Sender.

C++ Examples:

```
/*
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a
rectangle is drawn on the form. When the mouse button is
released, the rectangle appears on the form's canvas. Its
top-left and bottom-right corners are defined by the
location of the mouse pointer when the user pressed and
released the mouse button.  While the user drags the mouse,
the location of the top, left, bottom, and right sides of
the rectangle are displayed in the status bar.
*/
int StartX, StartY; // Declare at the top of the form's unit
// Use this code as the OnMouseDown event handler of the form:
void __fastcall TForm1::FormMouseDown(TObject *Sender, TMouseButton Button, TShiftState Shift,
int X, int Y)
{
  StartX = X;
  StartY = Y;
}

// Use this code as the OnMouseUp event handler of the form:
void __fastcall TForm1::FormMouseUp(TObject *Sender, TMouseButton Button, TShiftState Shift,
int X, int Y)
{
  Form1->Canvas->Rectangle(StartX, StartY, X, Y);
  StatusBar1->Panels->Items[0]->Text = "";
  StatusBar1->Panels->Items[1]->Text = "";
  StatusBar1->Panels->Items[2]->Text = "";
  StatusBar1->Panels->Items[3]->Text = "";
}

// Use this code as the OnMouseMove event handler of the form:
void __fastcall TForm1::FormMouseMove(TObject *Sender, TShiftState Shift, int X, int Y)
```

```
{
  if (Shift.Contains(ssLeft)) // make sure button is down
  {
    if (Y > StartY)
    {
      StatusBar1->Panels->Items[0]->Text = "Top: " + IntToStr(StartY);
      StatusBar1->Panels->Items[2]->Text = "Bottom: " + IntToStr(Y);
    }
    else
    {
      StatusBar1->Panels->Items[0]->Text = "Top: " + IntToStr(Y);
      StatusBar1->Panels->Items[2]->Text = "Bottom: " + IntToStr(StartY);
    }
    if (X > StartX)
    {
      StatusBar1->Panels->Items[1]->Text = "Left: " + IntToStr(StartX);
      StatusBar1->Panels->Items[3]->Text = "Right: " + IntToStr(X);
    }
    else
    {
      StatusBar1->Panels->Items[1]->Text = "Left: " + IntToStr(X);
      StatusBar1->Panels->Items[3]->Text = "Right: " + IntToStr(StartX);
    }
  }
}
```

68.1.7.3.19 TColorListBox.OnMouseUp Event

Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.

Pascal

```
property OnMouseUp: TMouseEvent;
```

C++

```
__property TMouseEvent OnMouseUp;
```

Description

Use an OnMouseUp event handler to implement special processing when the user releases a mouse button.

The OnMouseUp event handler can respond to left, right, or center mouse button presses and shift key plus mouse-button combinations. Shift keys are the Shift, Ctrl, and Alt keys. X and Y are the pixel coordinates of the mouse pointer in the client area of the Sender.

C++ Examples:

```
/*
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a
rectangle is drawn on the form. When the mouse button is
released, the rectangle appears on the form's canvas. Its
top-left and bottom-right corners are defined by the
location of the mouse pointer when the user pressed and
released the mouse button.  While the user drags the mouse,
the location of the top, left, bottom, and right sides of
the rectangle are displayed in the status bar.
*/
int StartX, StartY; // Declare at the top of the form's unit

Responding to a Mouse-up Action

68.1.7.3.20 TColorListBox.OnStartDock Event

Occurs when the user begins to drag a control with a DragKind of dkDock.

Pascal

```
property OnStartDock: TStartDockEvent;
```

C++

```
__property TStartDockEvent OnStartDock;
```

Description

Use the OnStartDock event handler to implement special processing when the user starts a drag-and-dock operation by dragging the control.

The OnStartDock event handler can create a TDragDockObjectEx object for the DragObject parameter to specify the appearance of the dragging rectangle and how the dragged control interacts with potential docking sites. If you return TDragDockObjectEx as the drag object, there is no need to call the Free method for the DragObject when dragging is over. If you use TDragDockObject, your application is responsible for freeing the drag object.

If the OnStartDock event handler sets the DragObject parameter to nil (Delphi) or NULL (C++), a TDragDockObject object is automatically created.

Note: This information applies to Win32 applications only.

68.1.7.3.21 TColorListBox.OnStartDrag Event

Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.

Pascal

```
property OnStartDrag: TStartDragEvent;
```

C++

```
__property TStartDragEvent OnStartDrag;
```

Description

Use the OnStartDrag event handler to implement special processing when the user starts to drag the control or an object it contains. OnStartDrag only occurs if DragKind is dkDrag.

Sender is the control that is about to be dragged, or that contains the object about to be dragged.

The OnStartDrag event handler can create a TDragControlObjectEx instance for the DragObject parameter to specify the drag cursor, or, optionally, a drag image list. If you create a TDragControlObjectEx instance, there is no need to call the Free method for the DragObject when dragging is over. If you create, instead, a TDragControlObject instance, your application is responsible for freeing the drag object instance.

If the OnStartDrag event handler sets the DragObject parameter to nil (Delphi) or NULL (C++), a TDragControlObject object is automatically created and dragging begins on the control itself.

Note: On some controls, such as TRichEdit, the underlying Windows control handles internal drag operations. For these controls, there are no OnStartDrag or OnEndDrag events for drag operations within the control.

68.1.8 TColumnCollection Class

Controls (see page 5711) the **Collection Editor** for columns within a grid panel.

Class Hierarchy

System::TObject → Classes.TPersistent → Classes.TCollection → Classes.TOwnedCollection → ExtCtrls.TCellCollection → ExtCtrls.TColumnCollection

Pascal

```
TColumnCollection = class(TCellCollection);
```

C++

```
class TColumnCollection : public TCellCollection;
```

File

ExtCtrls

Description

TColumnCollection controls the **Collection Editor** for columns within a grid panel.

Collection Editor

68.1.8.1 TColumnCollection Members

The following tables list the members exposed by TColumnCollection.

Protected Methods

	Name	Description
V	Added (see page 2736)	Responds when items are added to the collection.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	Changed (see page 2740)	Responds when the collection or any of its items changes.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	Deleting (see page 2741)	Responds when items are deleted from the collection.
	GetAttr (see page 2743)	Returns the name of a custom attribute that can be retrieved using the GetItemAttr (see page 2745) method.
V	GetAttr (see page 12174)	Returns the name of a custom attribute that can be retrieved using the GetItemAttr method.
	GetAttrCount (see page 2744)	Returns the number of custom attributes associated with items in the collection.
V	GetAttrCount (see page 12175)	Returns the number of custom attributes associated with items in the collection.
	GetItem (see page 2744)	Returns a specified item in the collection.
	GetItem (see page 12175)	Returns a specified item in the collection.
V	GetItemAttr (see page 12314)	Returns the value of a custom attribute assigned to one of the collection's items.
V	GetOwner (see page 2915)	Returns the owner of an object.
	GetOwner (see page 2932)	Returns the owner of an object.
V	Notify (see page 12315)	Responds when items are added to or removed from the collection.
	SetItem (see page 2747)	Copies the properties of another item to a specified item in the collection.
	SetItem (see page 12176)	This is SetItem, a member of class TCellCollection.
V	SetItemName (see page 2747)	Initializes the name of a newly inserted collection item.
V	Update (see page 2747)	Updates the collection to reflect changes to its items.
V	Update (see page 12176)	Updates the collection to reflect changes to its items.

Protected Properties

	Name	Description
R	NextID (see page 2752)	Specifies a unique ID that can be assigned to the next added collection item.
	PropName (see page 2752)	Specifies the name of the property that the collection implements.
R	UpdateCount (see page 2753)	Counts the number of times BeginUpdate (see page 2739) was called without a corresponding call to EndUpdate (see page 2742).

Public Methods

	Name	Description
	Add (see page 12314)	Adds a column to the grid panel.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2736)	Copies the contents of another collection to the object where the method is executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
V	BeginUpdate (see page 2739)	Suspends screen repainting.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Clear (see page 2741)	Deletes all items from the collection.
	Create (see page 12314)	This is Create, a member of class TColumnCollection.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Delete (see page 2741)	Deletes a single item from the collection.
V	Destroy (see page 2735)	Destroys the collection and each item in it.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
V	EndUpdate (see page 2742)	Re-enables screen repainting.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindItemID (see page 2743)	Returns the item with the specified ID.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetEnumerator (see page 2744)	Returns a TCollection (see page 2731) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2745)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	Insert (see page 2746)	Creates a new TCollectionItem (see page 2755) instance and adds it to the Items (see page 2751) array.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	Owner (see page 2746)	Returns the Owner of the collection.
	Owner (see page 12176)	Returns the Owner of the cell collection.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
	Capacity (see page 2748)	Provides access to the internal TList (see page 2868) Capacity property.

R	Count (see page 2749)	Returns the number of items in the collection.
R	ItemClass (see page 2751)	Indicates the class to which the collection's items belong.
	Items (see page 2751)	Lists the items in the collection.
	Items (see page 12177)	Lists the items of the cell collection.

68.1.8.2 TColumnCollection.Create Constructor

Pascal

```
constructor Create(AOwner: TPersistent);
```

C++

```
__fastcall TColumnCollection(TPersistent * AOwner);
```

Description

This is Create, a member of class TColumnCollection.

68.1.8.3 TColumnCollection Methods

The methods of the TColumnCollection class are listed here.

Protected Methods

	Name	Description
V	GetItemAttr (see page 12314)	Returns the value of a custom attribute assigned to one of the collection's items.
V	Notify (see page 12315)	Responds when items are added to or removed from the collection.

Public Methods

	Name	Description
	Add (see page 12314)	Adds a column to the grid panel.

68.1.8.3.1 TColumnCollection.Add Method

Adds a column to the grid panel.

Pascal

```
function Add: TColumnItem;
```

C++

```
__fastcall TColumnItem Add();
```

Description

Use the Add method to add a new column to the grid panel.

68.1.8.3.2 TColumnCollection.GetItemAttr Method

Returns the value of a custom attribute assigned to one of the collection's items.

Pascal

```
function GetItemAttr(Index: Integer; ItemIndex: Integer): string; override;
```

C++

```
virtual __fastcall AnsiString GetItemAttr(int Index, int ItemIndex);
```

Description

TCollection descendants can associate user-defined attributes with the items in the collection. Each attribute has a name and, for each item in the collection, a value that is a string. GetItemAttr returns the value of one of these attributes for a specified item in the collection.

Index identifies which attribute's value is desired. This is a value between 0 and n-1, where n is the value returned by GetAttrCount.

ItemIndex identifies the item whose attribute value is desired. This is an index into the Items property array.

As implemented in TCollection, GetItemAttr always returns an empty string, because TCollection defines no custom attributes.

See Also

GetAttr (see page 2743)

GetAttrCount (see page 2744)

68.1.8.3.3 TColumnCollection.Notify Method

Responds when items are added to or removed from the collection.

Pascal

```
procedure Notify(Item: TCollectionItem; Action: TCollectionNotification); override;
```

C++

```
virtual __fastcall Notify(TCollectionItem Item, TCollectionNotification Action);
```

Description

Notify is called automatically when the items in the collection change.

Item is the item that was just added to or that is about to be removed from the collection.

Action indicates whether item was added, is about to be removed, or is about to be deleted:

As implemented in TCollection, Notify calls Added when Action is cnAdded and calls Deleting when Action is cnDeleting. TCollection ignores the cnExtracting action. Descendant classes can override Notify to modify this behavior.

Added (see page 2736)

Deleting (see page 2741)

68.1.9 TColumnItem Class

Class Hierarchy

Pascal

```
TColumnItem = class(TCellItem);
```

C++

```
class TColumnItem : public TCellItem;
```

File

ExtCtrls

Description

This is class ExtCtrls.TColumnItem.

68.1.10 TControlBar Class

TControlBar manages the layout of toolbar components.

Class Hierarchy

Pascal

```
TControlBar = class(TCustomControlBar);
```

C++

```
class TControlBar : public TCustomControlBar;
```

File

ExtCtrls

Description

Use TControlBar as a docking site for toolbar components. Control bars contain child controls (usually TToolBar objects) that can be moved and resized independently. As with a cool bar, each child control resides on its own individual band that the user positions by dragging its sizing grip.

Tip: When docking TToolBar objects to a control bar, you may find it useful to use TToolDockObject.

Note: If you want to use TActionToolBar on a TControlBar component, you should set the AutoSize (see page 12333) property to **False**. When the AutoSize (see page 12333) property is set to True (default), the TActionToolBar control wraps its controls and expands itself in size, accordingly. This does not allow the TActionToolBar component to display properly on a TControlBar component. When the AutoSize (see page 12333) property is set to **False**, the TActionToolBar hides items on the end of the bar and displays a dropdown button that provides access to those items. The control displays in the proper size.

TCoolBar (see page 3603)

TToolBar (see page 4994)

68.1.10.1 TControlBar Members

The following tables list the members exposed by TControlBar.

Protected Events

	Name	Description
	OnKeyDown (see page 6225)	Occurs when a user presses any key while the control has focus.
	OnKeyPress (see page 6227)	Occurs when a key is pressed.

	OnKeyUp (see page 6228)	Occurs when the user releases a key that has been pressed.
	OnMouseWheel (see page 5869)	Occurs when the mouse wheel is rotated.
	OnMouseWheelDown (see page 5869)	Occurs when the mouse wheel is rotated downward.
	OnMouseWheelUp (see page 5870)	Occurs when the mouse wheel is rotated upward.

Protected Fields

	Name	Description
	FAnchorMove (see page 5733)	This is FAnchorMove, a member of class TControl.
	FAnchorOrigin (see page 5734)	This is FAnchorOrigin, a member of class TControl.
	FAnchorRules (see page 5734)	This is FAnchorRules, a member of class TControl.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FDesignSize (see page 6124)	This is FDesignSize, a member of class TWinControl.
	FDoubleBuffered (see page 6124)	This is FDoubleBuffered, a member of class TWinControl.
	FExplicitHeight (see page 5734)	This is FExplicitHeight, a member of class TControl.
	FExplicitLeft (see page 5734)	This is FExplicitLeft, a member of class TControl.
	FExplicitTop (see page 5734)	This is FExplicitTop, a member of class TControl.
	FExplicitWidth (see page 5735)	This is FExplicitWidth, a member of class TControl.
	FInImeComposition (see page 6125)	This is FInImeComposition, a member of class TWinControl.
	FOriginalParentSize (see page 5735)	This is FOriginalParentSize, a member of class TControl.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	ActionChange (see page 5737)	Responds when the action associated with the control changes.
V	ActionChange (see page 6127)	Updates the control to reflect changes in its associated action.
	AddBiDiModeExStyle (see page 6128)	Sets control's window style according to its bi-directional support.
V	AdjustClientRect (see page 6128)	Provides the interface that adjusts the ClientRect (see page 5810) property for idiosyncrasies of the window.
	AdjustSize (see page 5738)	Sets the size of the control as determined by the AutoSize (see page 5803) property.
V	AdjustSize (see page 6129)	Adjusts the control's size according to its contents and constraints.
V	AlignControls (see page 6129)	Aligns any controls for which the control is the parent within a specified area of the control.
V	AlignControls (see page 12459)	Aligns controls in the control bar.
	ArrangeControl (see page 6130)	This is ArrangeControl, a member of class TWinControl.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	AssignTo (see page 5739)	Overrides the inherited AssignTo function to enable assignments to TAction objects.
V	AssignTo (see page 6130)	Copies the properties of the windowed control to another object.
	BeginAutoDrag (see page 5739)	Begin Automatic Drag.
	CalcCursorPos (see page 5741)	This is CalcCursorPos, a member of class TControl.
V	CanAutoSize (see page 5741)	Indicates whether the control can resize itself automatically to accommodate its contents.
V	CanAutoSize (see page 6131)	Indicates how the control can be resized.
V	CanAutoSize (see page 12459)	Indicates how the control can be resized.
V	CanResize (see page 5742)	OnCanResize (see page 5851) event dispatcher.
V	CanResize (see page 6132)	Indicates how the control can respond to a resize attempt.
	Changed (see page 5742)	Sends a CM_CHANGED (see page 6330) message to the control.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	ChangeScale (see page 5743)	Rescaling event dispatcher.
V	ChangeScale (see page 6132)	Resize (see page 5780) and reposition children and self.
	Click (see page 5743)	Respond to user click.
V	ConstrainedResize (see page 5746)	Notify control of resize with constraints.
V	ConstrainedResize (see page 6133)	Generates an OnConstrainedResize (see page 5853) event.

	ControlsAligned (see page 6134)	This is ControlsAligned, a member of class TWinControl.
	CreateDockManager (see page 6134)	Creates the dock manager for the control.
V	CreateHandle (see page 6135)	Creates underlying screen object.
V	CreateParams (see page 6135)	Initializes a window-creation parameter data structure.
V	CreateParams (see page 12460)	Sets the control bar's window flags.
	CreateSubClass (see page 6136)	Creates a windowed control derived from an existing Windows window class.
V	CreateWindowHandle (see page 6137)	Creates a Windows control to represent the control.
V	CreateWnd (see page 6137)	Creates the underlying window.
V	CustomAlignInsertBefore (see page 6137)	Returns placement order of custom-aligned child control.
V	CustomAlignPosition (see page 6138)	Returns aligned position of custom-aligned child control.
	DblClick (see page 5747)	OnDblClick (see page 5854) event dispatcher.
	DefaultDockImage (see page 5747)	Handles the painting and erasing of a dock image.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DefineProperties (see page 5748)	Provides methods to read and write the IsControl (see page 5829) property to a stream such as a form file.
V	DefineProperties (see page 6139)	Provides methods to read and write the IsControl property to a stream such as a form file.
	DesignWndProc (see page 5749)	This is DesignWndProc, a member of class TControl.
V	DestroyHandle (see page 6140)	Destroys the control's window without destroying the control.
V	DestroyWindowHandle (see page 6140)	Destroys the window created in the CreateWindowHandle (see page 6137) method.
V	DestroyWnd (see page 6141)	Destroys the control's window.
	DoAddDockClient (see page 6142)	Performs actions when a control is docked to the windowed control.
V	DoBandMove (see page 12460)	Generates an OnBandMove (see page 12473) event.
V	DoBandPaint (see page 12460)	This is DoBandPaint, a member of class TCustomControlBar.
	DoBeginBandMove (see page 12461)	This is DoBeginBandMove, a member of class TCustomControlBar.
	DockOver (see page 6143)	Responds when a docking client is dragged over the windowed control.
V	DockOver (see page 12461)	Generates an OnDockOver event and ensures proper docking of floating controls.
V	DockReplaceDockClient (see page 6143)	This is DockReplaceDockClient, a member of class TWinControl.
	DockTrackNoTarget (see page 5749)	Handles dragging of the control over an invalid docking target.
	DoContextPopup (see page 5750)	OnContextPopup (see page 5854) event dispatcher.
	DoDock (see page 5750)	Docking event dispatcher.
	DoDockOver (see page 6143)	Generates an OnDockOver (see page 6216) event.
	DoEndBandMove (see page 12461)	This is DoEndBandMove, a member of class TCustomControlBar.
	DoEndDock (see page 5750)	OnEndDock (see page 5859) event dispatcher.
	DoEndDrag (see page 5751)	OnEndDrag (see page 5860) event dispatcher.
	DoEnter (see page 6144)	Respond to receiving input focus.
	DoExit (see page 6144)	Respond to losing input focus
	DoFlipChildren (see page 6145)	Flips the control's children.
	DoKeyDown (see page 6145)	Performs some preprocessing before generating an OnKeyDown (see page 6225) event.
	DoKeyPress (see page 6146)	Performs some preprocessing before generating an OnKeyPress (see page 6227) event.
	DoKeyUp (see page 6146)	Performs some preprocessing before generating an OnKeyUp (see page 6228) event.
	DoMouseWheel (see page 5751)	Processes mouse wheel motion.
	DoMouseWheelDown (see page 5752)	OnMouseWheelDown (see page 5869) event dispatcher.
	DoMouseWheelUp (see page 5752)	OnMouseWheelUp (see page 5870) event dispatcher.
	DoPaletteChange (see page 12461)	Prepares the control bar to realize a new palette.
	DoRemoveDockClient (see page 6147)	Responds when a control is undocked from the windowed control.
	DoStartDock (see page 5753)	OnStartDock (see page 5871) event dispatcher.
	DoStartDrag (see page 5753)	OnStartDrag (see page 5871) event dispatcher.
	DoUnDock (see page 6147)	Undocks a control that is currently docked to the windowed control.
	DragCanceled (see page 5754)	Provides the interface for a method that responds to the cancellation of a drag.

	DragControl (see page 12462)	Starts a drag operation on a control band.
	DragOver (see page 5755)	OnDragOver (see page 5857) event dispatcher.
	DrawDragDockImage (see page 5755)	Draws the dock image for the control.
	EraseDragDockImage (see page 5757)	Erases the dock image for the control.
	FindNextControl (see page 6149)	Returns the control's next child in the tab order after the specified control.
	FixupTabList (see page 6149)	Sorts the child controls by their tab order.
	GetAction (see page 5758)	This is GetAction, a member of class TControl.
	GetActionLinkClass (see page 5758)	Returns the appropriate action link class that is associated with the control class.
	GetActionLinkClass (see page 6152)	Returns the associated action link class.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetChildren (see page 6153)	Calls a specified method for each child of the control.
	GetClientOrigin (see page 5758)	Returns the screen coordinates of the top-left corner of the control's client area.
	GetClientOrigin (see page 6153)	Returns the value of the ClientOrigin (see page 5809) property.
	GetClientRect (see page 5759)	Returns a rectangle defining the client area of the control.
	GetClientRect (see page 6154)	Returns the value of the ClientRect (see page 5810) property.
	GetControlExtents (see page 6154)	Returns the smallest rectangle in which all the control's children fit.
	GetControlInfo (see page 12463)	Generates an OnBandInfo (see page 12473) event.
	GetDeviceContext (see page 5760)	Returns a device context for the control.
	GetDeviceContext (see page 6155)	Provides access to a device context for the control.
	GetDockEdge (see page 5763)	Returns the edge on which another control should be docked when it is dragged over the control.
	GetDragImages (see page 5763)	Returns the control's image list containing the image to be displayed while dragging.
	GetEnabled (see page 5763)	Returns the value of the Enabled (see page 5821) property.
	GetFloating (see page 5764)	Returns the value of the Floating (see page 5823) property.
	GetFloatingDockSiteClass (see page 5764)	Returns the class used for the control when it is floating.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetPalette (see page 5765)	Returns the handle to a palette for use by the control.
	GetPalette (see page 12463)	Returns the handle to a palette for use by the control.
	GetParentHandle (see page 6157)	Returns the window handle for the window of the control's parent.
	GetPopupMenu (see page 5765)	Returns the pop-up menu associated with the control.
	GetSiteInfo (see page 6158)	Generates an OnGetSiteInfo (see page 6223) event
	GetSiteInfo (see page 12464)	Generates an OnGetSiteInfo event
	GetTopParentHandle (see page 6159)	Returns the window handle of the first window not associated with a VCL control that contains the windowed control.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	HitTest (see page 12464)	Returns the control at the specified coordinates.
	InvalidateDockHostSite (see page 6162)	This is InvalidateDockHostSite, a member of class TWinControl.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsControlActivateMsg (see page 6162)	This is IsControlActivateMsg, a member of class TWinControl.
	IsControlMouseMsg (see page 6162)	Indicates whether a specified mouse message is directed to one of the windowed control's child controls.
	IsQualifyingSite (see page 6163)	This is IsQualifyingSite, a member of class TWinControl.
	KeyDown (see page 6163)	Respond to key press events.
	KeyPress (see page 6163)	Respond to keyboard input.
	KeyUp (see page 6164)	Respond to released key.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Loaded (see page 5771)	Initializes the control after it is loaded from a stream.

	MainWndProc (see page 6165)	Receives Windows messages for the control.
	MouseActivate (see page 5773)	This is MouseActivate, a member of class TControl.
	MouseDown (see page 5773)	OnMouseDown (see page 5862) event dispatcher.
V	MouseDown (see page 12465)	Handles mouse button clicks.
	MouseMove (see page 5773)	Respond to mouse moving over control area..
V	MouseMove (see page 12465)	Handles mouse movements.
	MouseUp (see page 5774)	OnMouseUp (see page 5867) event dispatcher.
V	MouseUp (see page 12465)	Handles releasing of a mouse button.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	Notification (see page 5775)	Responds to notifications that components are being created or destroyed.
V	Notification (see page 6165)	Responds to notifications that components are being created or destroyed.
	NotifyControls (see page 6165)	Sends a message to all the child controls.
V	Paint (see page 5920)	Renders the image of a custom control.
V	Paint (see page 12466)	Paints the control bar.
V	PaintControlFrame (see page 12466)	Paints a control band's frame.
	PaintControls (see page 6166)	Paints each of the child controls in a windowed control using the specified device context.
	PaintHandler (see page 6166)	Responds to WM_PAINT messages.
V	PaintWindow (see page 5920)	Renders the image of the control on a specified device context.
V	PaintWindow (see page 6169)	Renders the image of a windowed control.
	PaletteChanged (see page 5775)	Responds to changes in the system's palette by realizing the control's palette.
V	PaletteChanged (see page 6170)	Responds to changes in the system's palette by realizing the control's palette and the palette for each child control.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	PositionDockRect (see page 5777)	Positions the docking rectangle according to the current drag-and-dock state.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 5778)	Prepares the control for having its properties assigned values read from a stream.
V	ReadState (see page 6171)	Prepares the control for having its properties assigned values from a stream.
	RecreateWnd (see page 6171)	Recreate underlying Windows screen object.
	ReloadDockedControl (see page 6172)	Reloads a docked control.
	RemoveWindowProps (see page 6174)	This is RemoveWindowProps, a member of class TWinControl.
V	RequestAlign (see page 5780)	Instructs the parent of a control to reposition the control, enforcing its Align (see page 5798) property.
	ResetIme (see page 6174)	Restores the input method editor (IME) that was active when the application started.
	ResetImeComposition (see page 6175)	Directs the composition window of the input method editor (IME) to perform a specific action.
	Resize (see page 5780)	Respond to control resize.
	ScaleConstraints (see page 5781)	This is ScaleConstraints, a member of class TControl.
	ScaleControls (see page 6176)	Rescale child controls only.
	SelectFirst (see page 6177)	Locates first selectable child control.
	SelectNext (see page 6177)	Moves the input focus from the current child control to the next one in the tab order.
	SendCancelMode (see page 5781)	Cancels the modal state of the control.
	SendDockNotification (see page 5782)	Sends a Windows message to the control's host dock site.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
V	SetAutoSize (see page 5783)	This is SetAutoSize, a member of class TControl.
V	SetBiDiMode (see page 5783)	Sets the control's bi-directional mode.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
V	SetChildOrder (see page 6178)	Changes the order in which the child component appears in the list of child components returned by the GetChildren (see page 6153) method.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
V	SetDragMode (see page 5785)	Sets the drag mode for the control.
V	SetEnabled (see page 5785)	Sets the value of the Enabled (see page 5821) property.

	SetIme (see page 6181)	Activates an input method editor (IME) using the values specified by the ImeMode (see page 6207) and ImeName (see page 6208) properties.
	SetImeCompositionWindow (see page 6181)	Sets the position and font of the composition window.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
V	SetName (see page 5785)	Sets the name of the control.
V	SetParent (see page 5786)	Sets the parent of the control.
V	SetParent (see page 6182)	Sets the parent of the control.
V	SetParentBackground (see page 6182)	This is SetParentBackground, a member of class TWinControl.
V	SetParentBiDiMode (see page 5786)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 5787)	Sets the parent for the control.
	SetZOrder (see page 5788)	Repositions the control in its parent's control list, thereby changing position onscreen.
V	SetZOrder (see page 6182)	Moves the control to the top or bottom of the parent control's (or screen's) list of TWinControl (see page 6112) controls.
V	ShowControl (see page 6183)	Ensures that a specified child control is visible.
	UpdateBounds (see page 6185)	This is UpdateBounds, a member of class TWinControl.
	UpdateBoundsRect (see page 5789)	Changes the Top (see page 5844), Left (see page 5830), Width (see page 5849), and Height (see page 5825) properties of the control, but doesn't update its screen image and bypasses all resize events.
V	UpdateControlOriginalParentSize (see page 6186)	This is UpdateControlOriginalParentSize, a member of class TWinControl.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateExplicitBounds (see page 5789)	This is UpdateExplicitBounds, a member of class TControl.
	UpdateRecreatingFlag (see page 6186)	This is UpdateRecreatingFlag, a member of class TWinControl.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	UpdateUIState (see page 6186)	Updates form User Interface State as needed
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	VisibleChanging (see page 5791)	Provides the interface for a method that responds to changes in the control's visibility.
V	WndProc (see page 5791)	Provides specific message responses for the control.
V	WndProc (see page 6187)	Provides specific message responses for the control.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	ActionLink (see page 5798)	Contains the action link object associated with the control.
	Caption (see page 5806)	Specifies a text string that identifies the control to the user.
	Ctl3D (see page 6198)	Determines whether a control has a three-dimensional (3-D) or two-dimensional look.
	DefWndProc (see page 6199)	Specifies the default window procedure for the windowed control.
	DesktopFont (see page 5818)	Specifies whether the control uses the Windows icon font when writing text.
	Font (see page 5823)	Controls (see page 5711) the attributes of text written on or in the control.
	ImeMode (see page 6207)	Determines the behavior of the input method editor (IME).
	ImeName (see page 6208)	Specifies the input method editor (IME) to use for converting keyboard input to Asian language characters.
	IsControl (see page 5829)	Determines whether a form stores its form-specific properties to a stream.
	MouseCapture (see page 5831)	Indicates whether the control has "captured" mouse events.
	ParentBiDiMode (see page 5833)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	ScalingFlags (see page 5840)	Reflects which attributes of the control have been scaled.

	Text (see page 5842)	Contains a text string associated with the control.
	WheelAccumulator (see page 5849)	Accumulates mouse wheel rotations.
	WindowHandle (see page 6212)	Provides access to a window handle for the control.
	WindowText (see page 5850)	Contains the text string of the control.

Public Events

	Name	Description
	WindowProc (see page 5872)	Points to the window procedure that responds to messages sent to the control.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	BeginDrag (see page 5740)	Starts the dragging of a control.
	BringToFront (see page 5740)	Puts the control in front of all other controls in its parent control.
	Broadcast (see page 6130)	Sends a message to each of the child controls.
	CanFocus (see page 6131)	Indicates whether a control can receive focus.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	ClientToParent (see page 5744)	Translates client coordinates to parent coordinates.
	ClientToScreen (see page 5744)	Translates a given point from client area coordinates to global screen coordinates.
	ContainsControl (see page 6133)	Indicates whether a specified control exists within the control.
	ControlAtPos (see page 6133)	Returns the child control located at a specified position within the control.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
V	Create (see page 5731)	Creates an instance of TControl (see page 5724).
V	Create (see page 5918)	Creates an instance of TCustomControl (see page 5908).
V	Create (see page 6123)	Creates an instance of TWinControl (see page 6112).
V	Create (see page 12457)	Creates and initializes an instance of TCustomControlBar (see page 12446).
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	CreateParented (see page 6123)	Creates and initializes a control as the child of a specified non-VCL container.
	CreateParentedControl (see page 6136)	Creates and initializes a control as the child of a specified non-VCL window.
V	DefaultHandler (see page 5748)	Provides message handling for all messages that do not have specific handlers.
V	DefaultHandler (see page 6139)	Provides message handling for all messages that the control does not fully process itself.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 5732)	Destroys an instance of TControl (see page 5724).
V	Destroy (see page 5919)	Destroys an instance of TCustomControl (see page 5908).
V	Destroy (see page 6124)	Destroys an instance of TWinControl (see page 6112).
V	Destroy (see page 12458)	Destroys the TCustomControlBar (see page 12446) instance.
V	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	DisableAlign (see page 6141)	Disables the realignment of child controls.

	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Dock (see page 5749)	Used internally to dock the control.
	DockDrop (see page 6142)	Generates an OnDockDrop (see page 6214) event.
	DragDrop (see page 5754)	OnDragDrop (see page 5855) event dispatcher.
	Dragging (see page 5754)	Indicates whether a control is being dragged.
	DrawTextBiDiModeFlags (see page 5756)	Returns the text flags that reflect the current setting of the BiDiMode (see page 5803) property.
	DrawTextBiDiModeFlagsReadingOnly (see page 5756)	Returns the text flag to add that indicates whether the control's text should read from right to left.
	EnableAlign (see page 6148)	Decrements the reference count incremented by the DisableAlign (see page 6141) method, eventually realigning the child controls.
	EndDrag (see page 5757)	Stops a control from being dragged any further.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindChildControl (see page 6148)	Returns a child control given its name.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FlipChildren (see page 6150)	Reverses the positions of child controls.
	FlipChildren (see page 12462)	Reverses the positions of child controls.
	Focused (see page 6150)	Determines whether the control has input focus.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetControlsAlignment (see page 5759)	Indicates how text is aligned within the control.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetParentComponent (see page 5765)	Returns the parent of the control.
	GetTabOrderList (see page 6158)	Builds a list of controls in tab order.
	GetTextBuf (see page 5766)	Retrieves the control's text, copies it into a buffer, and returns the number of characters copied.
	GetTextLen (see page 5767)	Returns the length of the control's text.
	HandleAllocated (see page 6159)	Reports whether a screen object handle exists for the control.
	HandleNeeded (see page 6160)	Creates a screen object for the control if it doesn't already exist.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	HasParent (see page 5768)	Indicates whether the control has a parent.
	Hide (see page 5769)	Makes the control invisible.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitiateAction (see page 5769)	Calls the action link's Update (see page 5789) method if the control is associated with an action link.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InsertControl (see page 6160)	Inserts a control into the Controls (see page 6197) array property.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	Invalidate (see page 5770)	Completely repaint control.
	Invalidate (see page 6161)	Schedules a control repaint.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.

	IsRightToLeft (see page 5770)	Indicates whether the control should be reversed right to left.
	ManualDock (see page 5771)	Docks the control.
	ManualFloat (see page 5772)	Undocks the control.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	MouseWheelHandler (see page 5774)	Dispatches messages received from a mouse wheel.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	PaintTo (see page 6167)	This is the overview for the PaintTo method overload.
	ParentToClient (see page 5776)	Translate parent coordinates to client coordinates.
	Perform (see page 5776)	Responds as if the control received a specified Windows message.
	PreProcessMessage (see page 6170)	This is PreProcessMessage, a member of class TWinControl.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	Realign (see page 6171)	Forces the control to realign children.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	Refresh (see page 5779)	Repaints the control on the screen.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveControl (see page 6172)	Removes a specified control from the Controls (see page 6197) array.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	Repaint (see page 5779)	Forces the control to repaint its image on the screen.
V	Repaint (see page 6174)	Repaints the entire control.
	ReplaceDockedControl (see page 5779)	Docks the control in the place where another control is already docked.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	ScaleBy (see page 6175)	Rescale control and its children.
	ScreenToClient (see page 5781)	Converts the screen coordinates of a specified point on the screen to client coordinates.
	ScrollBy (see page 6176)	Scroll control contents.
	SendToBack (see page 5782)	Puts a windowed control behind all other windowed controls, or puts a non-windowed control behind all other non-windowed controls.
V	SetBounds (see page 5783)	Sets the Left (see page 5830), Top (see page 5844), Width (see page 5849), and Height (see page 5825) properties all at once.
V	SetBounds (see page 6178)	Sets the windowed control's boundary properties all at once.
	SetDesignVisible (see page 5784)	Makes a control visible at design time.
V	SetDesignVisible (see page 6178)	Makes a control visible at design time.
V	SetFocus (see page 6179)	Gives the input focus to the control.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	SetTextBuf (see page 5787)	Sets the text of the control.
	Show (see page 5788)	Makes a control visible.
V	StickControls (see page 12467)	Places controls in their final positions after a control is moved in or dropped on the control bar.
V	Update (see page 5789)	Processes any pending paint messages immediately.
V	Update (see page 6183)	Forces the control to update.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	UpdateControlState (see page 6186)	Respond to state change.
	UseRightToLeftAlignment (see page 5790)	Specifies whether the control's alignment should be reversed right-to-left.
	UseRightToLeftReading (see page 5790)	Specifies whether the control is using a right-to-left reading order.
	UseRightToLeftScrollBar (see page 5791)	Specifies whether the vertical scroll bar appears on the left side of the control.

Public Properties

	Name	Description
	Action (see page 5797)	Designates the action associated with the control.
R	AlignDisabled (see page 6192)	Indicates child control realignment disabled.
	BiDiMode (see page 5803)	Specifies the bi-directional mode for the control.

	BoundsRect (see page 5803)	Specifies the bounding rectangle of the control, expressed in the coordinate system of the parent control.
R	Brush (see page 6195)	Determines the color and pattern used for painting the background of the control.
	Canvas (see page 12336)	Specifies the TCanvas object that presents a drawing surface for the control.
	ClientHeight (see page 5808)	Specifies the height of the control's client area in pixels.
R	ClientOrigin (see page 5809)	Specifies the screen coordinates (in pixels) of the top left corner of a control's client area.
R	ClientRect (see page 5810)	Specifies the size (in pixels) of a control's client area.
	ClientWidth (see page 5811)	Specifies the horizontal size of the control's client area in pixels.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
R	ControlCount (see page 6195)	Returns the number of child controls.
R	Controls (see page 6197)	Lists all child controls.
	ControlState (see page 5813)	Indicates the current state of a control at runtime.
	ControlStyle (see page 5814)	Determines style characteristics of the control.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	DockClientCount (see page 6199)	Specifies the number of controls that are docked on the windowed control.
R	DockClients (see page 6201)	Lists the controls that are docked to the windowed control.
	DockManager (see page 6202)	Specifies the control's docking manager interface.
	DockOrientation (see page 5818)	Specifies how the control is docked relative to other controls docked in the same parent.
	DoubleBuffered (see page 6205)	Determines whether the control's image is rendered directly to the window or painted to an in-memory bitmap first.
R	ExplicitHeight (see page 5821)	Specifies the explicit vertical size of the control in pixels.
R	ExplicitLeft (see page 5822)	Specifies the explicit horizontal pixel coordinate of the left edge of a component relative to its parent.
R	ExplicitTop (see page 5822)	Specifies the explicit vertical pixel coordinate of the top edge of a component relative to its parent.
R	ExplicitWidth (see page 5822)	Specifies the explicit horizontal size of the control in pixels.
R	Floating (see page 5823)	Indicates whether the control is floating.
	FloatingDockSiteClass (see page 5823)	Specifies the class of the temporary control that hosts the control when it is floating.
R	Handle (see page 6207)	Provides access to the underlying Windows screen object for the control.
	HostDockSite (see page 5829)	Specifies the control in which the control is docked.
	LRDockWidth (see page 5831)	Specifies the width of the control when it is docked horizontally.
R	MouseInClient (see page 6209)	This is MouseInClient, a member of class TWinControl.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Padding (see page 6209)	Specifies the padding of a control.
	Parent (see page 5832)	Indicates the parent of the control.
	ParentWindow (see page 6210)	Reference to parent's underlying control.
R	Showing (see page 6210)	Indicates whether the control is showing on the screen.
	TBDockHeight (see page 5842)	Specifies the height of the control when it is docked vertically.
	UndockHeight (see page 5845)	Specifies the height of the control when it is floating.
	UndockWidth (see page 5846)	Specifies the width of the control when it is floating.
	UseDockManager (see page 6212)	Specifies whether the docking manager is used in drag-and-dock operations.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
R	VisibleDockClientCount (see page 6212)	Specifies the number of visible controls that are docked on the windowed control.

Published Events

	Name	Description
	OnAlignInsertBefore (see page 12357)	Occurs when an object with custom alignment is aligned.
	OnAlignPosition (see page 12357)	Occurs when an object with custom alignment is aligned.
	OnBandDrag (see page 12358)	Occurs when the user starts a drag operation on a specified control.
	OnBandInfo (see page 12358)	Occurs when the control bar adjusts the docking position of a band.
	OnBandMove (see page 12359)	This is OnBandMove, a member of class TControlBar.
	OnBandPaint (see page 12359)	This is OnBandPaint, a member of class TControlBar.
	OnBeginBandMove (see page 12359)	This is OnBeginBandMove, a member of class TControlBar.
	OnCanResize (see page 12359)	Occurs when an attempt is made to resize the control.
	OnClick (see page 12360)	Occurs when the user clicks the control.
	OnConstrainedResize (see page 12362)	Adjust resize constraints.
	OnContextPopup (see page 12362)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnDblClick (see page 12363)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDockDrop (see page 12363)	Occurs when another control is docked to the control.
	OnDockOver (see page 12365)	Occurs when another control is dragged over the control.
	OnDragDrop (see page 12367)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 12370)	Occurs when the user drags an object over a control.
	OnEndBandMove (see page 12372)	This is OnEndBandMove, a member of class TControlBar.
	OnEndDock (see page 12372)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 12373)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnEnter (see page 12374)	Occurs when a control receives the input focus.
	OnExit (see page 12376)	Occurs when the input focus shifts away from one control to another.
	OnGetSiteInfo (see page 12378)	Returns the control's docking information.
	OnMouseActivate (see page 12380)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 12381)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseEnter (see page 12383)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 12383)	Occurs when the user moves the mouse outside of a control.
	OnMouseMove (see page 12384)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 12386)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnPaint (see page 12388)	Occurs when the control bar is painted.
	OnResize (see page 12389)	Occurs immediately after the control is resized.
	OnStartDock (see page 12389)	Occurs when the user begins to drag a control with a DragKind of dkDock.
	OnStartDrag (see page 12390)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.
	OnUnDock (see page 12390)	Occurs when the application tries to undock a control that is docked to the windowed control.

Published Properties

	Name	Description
	Align (see page 12328)	Determines how the control aligns within its container (parent control).
	AlignWithMargins (see page 5802)	Indicates whether a control should be constrained by margins.
	Anchors (see page 12332)	Specifies how the control is anchored to its parent.
	AutoDock (see page 12333)	Determines whether the control bar temporarily docks drag clients to provide visual feedback.
	AutoDrag (see page 12333)	Specifies whether control bands can be undocked by dragging.
	AutoSize (see page 12333)	Specifies whether the control sizes itself automatically to accommodate its contents.
	BevelEdges (see page 12334)	Specifies which edges of the control are beveled.

	BevelInner (see page 12334)	Specifies the cut of the inner bevel.
	BevelKind (see page 12335)	Specifies the control's bevel style.
	BevelOuter (see page 12335)	Specifies the cut of the outer bevel.
	BevelWidth (see page 12336)	Specifies the width of the inner and outer bevels.
	BorderWidth (see page 12336)	Specifies the width of the control's border.
	Color (see page 12338)	Specifies the background color of the control.
	Constraints (see page 12339)	Specifies the size constraints for the control.
	CornerEdge (see page 12340)	The size of the cornering for the edge of the bands.
	Cursor (see page 5815)	Specifies the image used to represent the mouse pointer when it passes into the region covered by the control.
	DockSite (see page 12340)	Specifies whether the control can be the target of drag-and-dock operations.
	DragCursor (see page 12341)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 12341)	Specifies whether the control is being dragged normally or for docking.
	DragMode (see page 12342)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	DrawingStyle (see page 12343)	This is DrawingStyle, a member of class TControlBar.
	Enabled (see page 12343)	Controls whether the control responds to mouse, keyboard, and timer events.
	GradientDirection (see page 12344)	Horizontal or Vertical.
	GradientEndColor (see page 12344)	Stores the color that the gradient is painted with when it ends.
	GradientStartColor (see page 12344)	Stores the color that the gradient is painted when it starts.
	Height (see page 5825)	Specifies the vertical size of the control in pixels.
	HelpContext (see page 5826)	Numeric ID for control's context-sensitive help topic
	HelpKeyword (see page 5826)	Keyword for control's context-sensitive help topic
	HelpType (see page 5827)	Indicates whether the control's context sensitive help topic is identified by context ID or by keyword.
	Hint (see page 5827)	Contains the text string that can appear when the user moves the mouse over the control.
	Left (see page 5830)	Specifies the horizontal coordinate of the left edge of a component relative to its parent.
	Margins (see page 5831)	Specifies the margins for the control.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	ParentBackground (see page 12345)	Determines whether control uses parent's theme background.
	ParentColor (see page 12345)	Determines where a control looks for its color information.
	ParentCtl3D (see page 12345)	Determines where a component looks to determine if it should appear three dimensional.
	ParentFont (see page 12346)	Determines where a control looks for its font information.
	ParentShowHint (see page 12346)	Determines where a control looks to find out if its Help Hint should be shown.
	Picture (see page 12347)	This is Picture, a member of class TControlBar.
	PopupMenu (see page 12347)	Identifies the pop-up menu associated with the control.
	RowSize (see page 12351)	This is RowSize, a member of class TControlBar.
	RowSnap (see page 12352)	This is RowSnap, a member of class TControlBar.
	ShowHint (see page 12352)	Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.
	TabOrder (see page 12353)	Indicates the position of the control in its parent's tab order.
	TabStop (see page 12354)	Determines if the user can tab to a control.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Top (see page 5844)	Specifies the Y coordinate of the top left corner of a control, relative to its parent or containing control in pixels.
	Visible (see page 12354)	Determines whether the component appears onscreen.
	Width (see page 5849)	Specifies the horizontal size of the control or form in pixels.

68.1.10.2 TControlBar Properties

The properties of the TControlBar class are listed here.

Public Properties

	Name	Description
	Canvas (see page 12336)	Specifies the TCanvas object that presents a drawing surface for the control.

Published Properties

	Name	Description
	Align (see page 12328)	Determines how the control aligns within its container (parent control).
	Anchors (see page 12332)	Specifies how the control is anchored to its parent.
	AutoDock (see page 12333)	Determines whether the control bar temporarily docks drag clients to provide visual feedback.
	AutoDrag (see page 12333)	Specifies whether control bands can be undocked by dragging.
	AutoSize (see page 12333)	Specifies whether the control sizes itself automatically to accommodate its contents.
	BevelEdges (see page 12334)	Specifies which edges of the control are beveled.
	BevelInner (see page 12334)	Specifies the cut of the inner bevel.
	BevelKind (see page 12335)	Specifies the control's bevel style.
	BevelOuter (see page 12335)	Specifies the cut of the outer bevel.
	BevelWidth (see page 12336)	Specifies the width of the inner and outer bevels.
	BorderWidth (see page 12336)	Specifies the width of the control's border.
	Color (see page 12338)	Specifies the background color of the control.
	Constraints (see page 12339)	Specifies the size constraints for the control.
	CornerEdge (see page 12340)	The size of the cornering for the edge of the bands.
	DockSite (see page 12340)	Specifies whether the control can be the target of drag-and-dock operations.
	DragCursor (see page 12341)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 12341)	Specifies whether the control is being dragged normally or for docking.
	DragMode (see page 12342)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	DrawingStyle (see page 12343)	This is DrawingStyle, a member of class TControlBar.
	Enabled (see page 12343)	Controls whether the control responds to mouse, keyboard, and timer events.
	GradientDirection (see page 12344)	Horizontal or Vertical.
	GradientEndColor (see page 12344)	Stores the color that the gradient is painted with when it ends.
	GradientStartColor (see page 12344)	Stores the color that the gradient is painted when it starts.
	ParentBackground (see page 12345)	Determines whether control uses parent's theme background.
	ParentColor (see page 12345)	Determines where a control looks for its color information.
	ParentCtl3D (see page 12345)	Determines where a component looks to determine if it should appear three dimensional.
	ParentFont (see page 12346)	Determines where a control looks for its font information.
	ParentShowHint (see page 12346)	Determines where a control looks to find out if its Help Hint should be shown.
	Picture (see page 12347)	This is Picture, a member of class TControlBar.
	PopupMenu (see page 12347)	Identifies the pop-up menu associated with the control.
	RowSize (see page 12351)	This is RowSize, a member of class TControlBar.
	RowSnap (see page 12352)	This is RowSnap, a member of class TControlBar.
	ShowHint (see page 12352)	Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.
	TabOrder (see page 12353)	Indicates the position of the control in its parent's tab order.
	TabStop (see page 12354)	Determines if the user can tab to a control.
	Visible (see page 12354)	Determines whether the component appears onscreen.

68.1.10.2.1 TControlBar.Align Property

Determines how the control aligns within its container (parent control).

Pascal

```
property Align: TAlign;
```

C++

```
__property TAlign Align;
```

Description

Use Align to align a control to the top, bottom, left, or right of a form or panel and have it remain there even if the size of the form, panel, or component that contains the control changes. When the parent is resized, an aligned control also resizes so that it continues to span the top, bottom, left, or right edge of the parent.

For example, to use a panel component with various controls on it as a tool palette, change the panel's Align value to alLeft. The value of alLeft for the Align property of the panel guarantees that the tool palette remains on the left side of the form and always equals the client height of the form.

The default value of Align is alNone, which means a control remains where it is positioned on a form or panel.

Tip: If Align is set to alClient, the control fills the entire client area so that it is impossible to select the parent form by clicking on it. In this case, select the parent by selecting the control on the form and pressing Esc, or by using the Object Inspector.

Any number of child components within a single parent can have the same Align value, in which case they stack up along the edge of the parent. The child controls stack up in z-order. To adjust the order in which the controls stack up, drag the controls into their desired positions.

Note: To cause a control to maintain a specified relationship with an edge of its parent, but not necessarily lie along one edge of the parent, use the Anchors property instead.

C++ Examples:

```
/*
This example shows how to use a splitter to divide a form
into resizable panes.  All objects on the form are created
dynamically in the OnCreate event handler of the form. To
run this example, add ExtCtrls and FileCtrl to the uses
clause of the form’s implementation section.
Note that when creating a splitter dynamically at runtime,
it is important to set its position to the appropriate side
of the control it will resize.
*/
#include <Extctrls.hpp>
#include <Filectrl.hpp>

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  TSplitter* ps = new TSplitter(Form1);
  TFileListBox* pflb = new TFileListBox(Form1);
  TDirectoryListBox* pdlb = new TDirectoryListBox(Form1);

  // Line up the directory list box on the left of the form.
  pdlb->Parent = Form1;
  pdlb->Align = alLeft;
  pdlb->Width = Form1->ClientWidth/3;

  // Now use the splitter to divide the directory pane from the file pane.
  ps->Parent = Form1;
  ps->Left = pdlb->Left + pdlb->Width + 1; // Move to right of directory list.
  ps->Align = pdlb->Align; // Give same alignment as directory list.

  // Each pane must be at least one quarter of the form's width.
  ps->MinSize = Form1->ClientWidth/4;

  // Finally, create the last pane - a file list box.
  pflb->Parent = Form1;
  pflb->Align = alClient;
```

```
  pdlb->FileList = pflb; // Link the file list box to the directory list box.
}
/*
Dynamically create a TProgressBar control and align it to
the bottom of the form.
*/

#include <ComCtrls.hpp>
#include <Controls.hpp>

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  TProgressBar *ProgressBar = new TProgressBar(this);
  ProgressBar->Parent = this;
  ProgressBar->Align = alBottom;
  TButton *Button1 = new TButton(this);
  Button1->Parent = this;
}
/*
This example dynamically creates a Page Control, then a
series of Tab Sheets on the Page Control.
*/
#include <Comctrls.hpp>

        pts[i] = new TTabSheet(this);
        pts[i]->PageControl = ppc;
        pts[i]->Name = AnsiString("pts") + ppcTabTitles[i];
        pts[i]->Caption = ppcTabTitles[i];
        pts[i]->Brush->Color = colorPalette[i];
  }
}//---------------------------------------------------------------------------
void __fastcall TForm1::FormDestroy(TObject *Sender)
{
  for (int i=0;i<iTabTitles;i++)
        delete pts[i];
    delete ppc;
}
```

Delphi Examples:

```
{
This example shows how to use a splitter to divide a form
into resizable panes.  All objects on the form are created
dynamically in the OnCreate event handler of the form. To
run this example, add ExtCtrls and FileCtrl to the uses
clause of the form's implementation section.
Note that when creating a splitter dynamically at runtime,
it is important to set its position to the appropriate side
of the control it will resize.
}
procedure TForm1.FormCreate(Sender: TObject);
var
```

```
    Split: TSplitter;
    Files: TFileListBox;
    Dirs: TDirectoryListBox;
  begin
    { first add a directory list box to the form }
    Dirs := TDirectoryListBox.Create(Form1);
    { line it up on the left of the form }
    Dirs.Parent := Form1;
    Dirs.Align := alLeft;
    Dirs.Width := Form1.ClientWidth div 3;
  { now add the splitter to divide the directory pane from the file pane }
    Split := TSplitter.Create(Form1);
    Split.Parent := Form1;
    { make sure the splitter is to the right of the directory list box! }
    Split.Left := Dirs.Left + Dirs.Width + 1;
    Split.Align := Dirs.Align; { give it the same alignment as the directory }
    { each pane must be at least one quarter of the form's width }
    Split.MinSize := Form1.ClientWidth div 4;
    { Finally, create the last pane – a file list box }
    Files := TFileListBox.Create(Form1);
    Files.Parent := Form1;
    Files.Align := alClient;
    Dirs.FileList := Files; { link the file list box to the directory list box }
  end;
  {
  Dynamically create a TProgressBar control and align it to
  the bottom of the form.
  }

  var

    begin
```

```
      pts[i]:= TTabSheet.Create(PageControl1);
      with pts[i] do
      begin
        PageControl := PageControl1;
        Name := 'ts' + TabTitles[i];
        Caption := TabTitles[i];
        Brush.Color := colorPalette[i];
    end;
  end;
end;

procedure TForm1.FormDestroy(Sender: TObject);
var
  i: Integer;
begin
  for i := Low(TabTitles) to High(TabTitles) do
  begin
    pts[i].Free;
  end;
  PageControl1.Free;
end;
```

See Also

Parent (see page 5832)

Anchors (see page 5802)

68.1.10.2.2 TControlBar.Anchors Property

Specifies how the control is anchored to its parent.

Pascal

```
property Anchors: TAnchors;
```

C++

```
__property TAnchors Anchors;
```

Description

Use Anchors to ensure that a control maintains its current position relative to an edge of its parent, even if the parent is resized. When its parent is resized, the control holds its position relative to the edges to which it is anchored.

If a control is anchored to opposite edges of its parent, the control stretches when its parent is resized. For example, if a control has its Anchors property set to [akLeft, akRight], the control stretches when the width of its parent changes.

Anchors is enforced only when the parent is resized. Thus, for example, if a control is anchored to opposite edges of a form at design time and the form is created in a maximized state, the control is not stretched because the form is not resized after the control is created.

Note: If a control should maintain contact with three edges of its parent (hugging one side of the parent and stretching the length of that side), use the Align property instead. Unlike Anchors, Align allows controls to adjust to changes in the size of other aligned sibling controls as well as changes to the parent's size.

See Also

Parent (see page 5832)

Align (see page 5798)

68.1.10.2.3 TControlBar.AutoDock Property

Determines whether the control bar temporarily docks drag clients to provide visual feedback.

Pascal

```
property AutoDock: Boolean;
```

C++

```
__property Boolean AutoDock;
```

Description

If AutoDock is true (the default), when a dockable object is dragged over the control bar, the control bar temporarily docks the object so that the user can see the impact of the drag operation. That is, the user can see the dock position and how other docked controls will be repositioned to make room. When the user releases the mouse, the dragged object is docked at the current spot, and any temporary dockings are canceled. However, if the user cancels the drag-and-dock operation, the dragged object reverts to its last temporary dock site rather than to its location at the start of the drag operation.

If AutoDock is false, the control bar does not temporarily dock dragged objects. Instead, the user only sees the dragging rectangle as it passes over the control bar, with no feedback as to the adjustments the control bar would make if the dragged object were released.

See Also

DockClients (see page 6201)

DockSite (see page 6204)

OnDockOver (see page 6216)

68.1.10.2.4 TControlBar.AutoDrag Property

Specifies whether control bands can be undocked by dragging.

Pascal

```
property AutoDrag: Boolean;
```

C++

```
__property Boolean AutoDrag;
```

Description

Use AutoDrag to specify whether control bands are automatically undocked when the user drags them. If AutoDrag is true, control bands (TToolBar objects) are undocked when dragged off the control bar. Otherwise, control bands are kept within the control bar.

See Also

DragMode (see page 5819)

OnBandDrag (see page 12472)

onbandmove (see page 12473)

68.1.10.2.5 TControlBar.AutoSize Property

Specifies whether the control sizes itself automatically to accommodate its contents.

Pascal

```
property AutoSize: Boolean;
```

C++

```
__property Boolean AutoSize;
```

Description

Use AutoSize to specify whether the control sizes itself automatically. When AutoSize is true, the control resizes automatically when its contents change.

By default, AutoSize is false.

See Also

Constraints (see page 5812)

CanAutoSize (see page 5741)

68.1.10.2.6 TControlBar.BevelEdges Property

Specifies which edges of the control are beveled.

Pascal

```
property BevelEdges: TBevelEdges;
```

C++

```
__property TBevelEdges BevelEdges;
```

Description

Use BevelEdges to get or set which edges of the control are beveled. The BevelInner, BevelOuter, and BevelKind properties determine the appearance of the specified edges.

See Also

BevelInner (see page 6193)

BevelOuter (see page 6194)

BevelKind (see page 6193)

68.1.10.2.7 TControlBar.BevelInner Property

Specifies the cut of the inner bevel.

Pascal

```
property BevelInner: TBevelCut;
```

C++

```
__property TBevelCut BevelInner;
```

Description

Use BevelInner to specify whether the inner bevel has a raised, lowered, or flat look.

The inner bevel appears immediately inside the outer bevel. If there is no outer bevel (BevelOuter is bvNone), the inner bevel appears immediately inside the border.

See Also

BevelEdges (see page 6192)

BevelOuter (see page 6194)

BevelKind (see page 6193)

BevelWidth (see page 6194)

BorderWidth (see page 6195)

68.1.10.2.8 TControlBar.BevelKind Property

Specifies the control's bevel style.

Pascal

```
property BevelKind: TBevelKind;
```

C++

```
__property TBevelKind BevelKind;
```

Description

Use BevelKind to modify the appearance of a bevel. BevelKind influences how sharply the bevel stands out.

BevelKind, in combination with BevelWidth and the cut of the bevel specified by BevelInner or BevelOuter, can create a variety of effects. Experiment with various combinations to get the look you want.

See Also

BevelEdges (see page 6192)

BevelOuter (see page 6194)

BevelInner (see page 6193)

BevelWidth (see page 6194)

68.1.10.2.9 TControlBar.BevelOuter Property

Specifies the cut of the outer bevel.

Pascal

```
property BevelOuter: TBevelCut;
```

C++

```
__property TBevelCut BevelOuter;
```

Description

Use BevelInner to specify whether the outer bevel has a raised, lowered, or flat look.

The outer bevel appears immediately inside the border and outside the inner bevel.

See Also

BevelEdges (see page 6192)

BevelInner (see page 6193)

BevelKind (see page 6193)

BevelWidth (see page 6194)

68.1.10.2.10 TControlBar.BevelWidth Property

Specifies the width of the inner and outer bevels.

Pascal

```
property BevelWidth: TBevelWidth;
```

C++

```
__property TBevelWidth BevelWidth;
```

Description

Use BevelWidth to specify the width, in pixels, of the inner and outer bevels.

See Also

BevelEdges (see page 6192)

BevelInner (see page 6193)

BevelKind (see page 6193)

BevelOuter (see page 6194)

68.1.10.2.11 TControlBar.BorderWidth Property

Specifies the width of the control's border.

Pascal

```
property BorderWidth: TBorderWidth;
```

C++

```
__property TBorderWidth BorderWidth;
```

Description

Use BorderWidth to get or set the width of the control's border. Graphics or text drawn by the control is clipped to the area within the border.

See Also

ClientRect

BevelOuter (see page 6194)

68.1.10.2.12 TControlBar.Canvas Property

Specifies the TCanvas object that presents a drawing surface for the control.

Pascal

```
property Canvas: TCanvas;
```

C++

```
__property TCanvas Canvas;
```

Description

Use the properties of the TCanvas object to draw or paint on the surface of the control. Canvas encapsulates a Windows device context, providing all the tools and methods needed for drawing and painting.

Canvas is a protected property that is usually redeclared as public in descendants of TCustomControl.

C++ Examples:

```
/*
The following code uses the bitmaps in an image list
component to draw the contents of each cell in a draw grid.
It draws a focus rectangle around the cell that has focus.
goDrawFocusSelect in the DrawGrid Options parameter must be
True to set focus on a cell.  The ImageList Draw method must
be called after DrawFocusRect. The OnSelectCell event handler
must implemented to return true.
*/
void __fastcall TForm1::DrawGrid1DrawCell(
  TObject *Sender, int ACol, int ARow, TRect &Rect, TGridDrawState State)
{
  long index = ARow * DrawGrid1->ColCount + ACol;
  DrawGrid1->Canvas->Brush->Color = clBackground;
  DrawGrid1->Canvas->FillRect(Rect);
  ImageList1->Draw(DrawGrid1->Canvas,Rect.Left,Rect.Top,index);
  if (State.Contains(gdFocused))
  {
    DrawGrid1->Canvas->DrawFocusRect(Rect);
    Label1->Caption = "Cell " + IntToStr(index) + " has the focus.";
  }
  ImageList1->Draw(
    DrawGrid1->Canvas, Rect.Left, Rect.Top, index, True);
}
//---------------------------------------------------------------------------
void __fastcall TForm1::DrawGrid1SelectCell(TObject *Sender, int ACol, int ARow,
      bool &CanSelect)
{
  CanSelect= True;
}
/*
The following code uses ClientRect to find and draw a line
from the top left to the bottom right of the current
control.  Select a TControl in the ListBox list.  This
example assumes that the current object is a descendent of
TControl and has a public Canvas property.
*/
{
  TPoint APoint = Point(X, Y);
  int Index = ListBox1->ItemAtPos(APoint, True);
  TStringGrid *myStringGrid;
  TClass ClassRef = ListBox1->Items->Objects[Index]->ClassType();
  if (String(ClassRef->ClassName()) == "TStringGrid")
  {
    myStringGrid = (TStringGrid *)ListBox1->Items->Objects[Index];
    // make sure we are using the TControls canvas and not the from's!
    myStringGrid->Canvas->MoveTo(myStringGrid->ClientRect.Left, myStringGrid->ClientRect.Top);
    myStringGrid->Canvas->LineTo(myStringGrid->ClientRect.Right,
myStringGrid->ClientRect.Bottom);
    myStringGrid = NULL;
  }
}
```

Delphi Examples:

```
{
The following code uses the bitmaps in an image list
component to draw the contents of each cell in a draw grid.
It draws a focus rectangle around the cell that has focus.
goDrawFocusSelect in the DrawGrid Options parameter must be
True to set focus on a cell.  The ImageList Draw method must
be called after DrawFocusRect. The OnSelectCell event handler
must implemented to return true.
}
procedure TForm1.DrawGrid1DrawCell(Sender: TObject; ACol, ARow: Integer;
```

```
    Rect: TRect; State: TGridDrawState);
  var
    index: Integer;
  begin
    index := ARow * DrawGrid1.ColCount + ACol;
    DrawGrid1.Canvas.Brush.Color := clWhite;
    DrawGrid1.Canvas.FillRect(Rect);
    if (gdFocused in State) then
    begin
      DrawGrid1.Canvas.DrawFocusRect(Rect);
      Label1.Caption:= 'Cell ' + InttoStr(index) + ' has the focus.';
    end;
    ImageList1.Draw(DrawGrid1.Canvas,Rect.Left,Rect.Top,index, True);
  end;

  procedure TForm1.DrawGrid1SelectCell(Sender: TObject; ACol, ARow: Integer;
    var CanSelect: Boolean);
  begin
    CanSelect:= True;
  end;
  {
  The following code uses ClientRect to find and draw a line
  from the top left to the bottom right of the current
  control.  Select a TControl in the ListBox list.  This
  example assumes that the current object is a descendent of
  TControl and has a public Canvas property.
  }
    if (ListBox1.Items.Objects[Index] is TStringGrid) then
    begin
      myStringGrid:= (ListBox1.Items.Objects[Index] as TStringGrid);
      with myStringGrid.ClientRect do
      begin // make sure we are using the TControl's canvas and not the form's!
        myStringGrid.Canvas.MoveTo(Left, Top);
        myStringGrid.Canvas.LineTo(Right, Bottom);
      end;
    myStringGrid:= nil;
    end;
```

See Also

Paint (see page 5920)

68.1.10.2.13 TControlBar.Color Property

Specifies the background color of the control.

Pascal

```
property Color: TColor;
```

C++

```
__property TColor Color;
```

Description

Use Color to read or change the background color of the control.

If a control's ParentColor property is true, then changing the Color property of the control's parent automatically changes the Color property of the control. When the value of the Color property is changed, the control's ParentColor property is automatically set to false.

C++ Examples:

```
/*
The following code changes the color of a shape control
using the Color dialog box. The example displays the Color
```

```
dialog box when the Button1 button is clicked, allowing the
user to select a color with the dialog box. When a color
value is selected with the dialog box, it is assigned to
the shape control.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  if (ColorDialog1->Execute())
    Shape1->Brush->Color = ColorDialog1->Color;
}
```

Delphi Examples:

```
{
The following code changes the color of a shape control
using the Color dialog box. The example displays the Color
dialog box when the Button1 button is clicked, allowing the
user to select a color with the dialog box. When a color
value is selected with the dialog box, it is assigned to
the shape control.
}
procedure TForm1.Button1Click(Sender: TObject);
begin
  if ColorDialog1.Execute then
    Shape1.Brush.Color := ColorDialog1.Color;
end;
```

See Also

ParentColor (see page 5834)

68.1.10.2.14 TControlBar.Constraints Property

Specifies the size constraints for the control.

Pascal

```
property Constraints: TSizeConstraints;
```

C++

```
__property TSizeConstraints Constraints;
```

Description

Use Constraints to specify the minimum and maximum width and height of the control. When Constraints contains maximum or minimum values, the control cannot be resized to violate those constraints.

Note: Constraints apply to the height of the form. However, the height of the form depends on how large Windows makes the title bar. For example, Windows XP uses much larger title bars than other windowing systems. To work around this, note the ClientHeight when you design your form and set the constraints in the FormCreate event. In the following example, ClientHeight is represented by x: `Constraints.MinHeight := x + Height - ClientHeight`.

Warning: Do not set up constraints that conflict with the value of the Align or Anchors property. When these properties conflict, the response of the control to resize attempts is not well-defined.

See Also

AutoSize (see page 5803)

Align (see page 5798)

Anchors (see page 5802)

OnConstrainedResize (see page 5853)

OnCanResize (see page 5851)

68.1.10.2.15 TControlBar.CornerEdge Property

The size of the cornering for the edge of the bands.

Pascal

```
property CornerEdge: TCornerEdge;
```

C++

```
__property TCornerEdge CornerEdge;
```

Description

This property stores the size of the cornering for the edge of the bands.

68.1.10.2.16 TControlBar.DockSite Property

Specifies whether the control can be the target of drag-and-dock operations.

Pascal

```
property DockSite: Boolean;
```

C++

```
__property Boolean DockSite;
```

Description

Set DockSite to true to allow other controls to be docked to this windowed control.

C++ Examples:

```
/*
The following example is taken from the docking demo. It
shows how the OnUnDock event handler of the conjoinment
docking site re-enables docking in the control that is
undocked (if it is a dockable form). In addition, when the
next to last docked control is undocked, the conjoinment
docking site sends itself a close message so that the last
docked control is undocked to its old position and size.
*/
void __fastcall TConjoinDockHost::FormUnDock(TObject *Sender, TControl *Client,
      TWinControl *NewTarget, bool &Allow)
{
  // Only 2 dock clients means the host must be destroyed and
  // the remaining window undocked to its old position and size.
  // Recall that OnUnDock gets called before the undocking
  // actually occurs.
  if (Client->ClassNameIs("TDockableForm"))
    dynamic_cast<TDockableForm *>(Client)->DockSite = True;
  if ((DockClientCount == 2) && (NewTarget != this))        // Self?
    PostMessage(dynamic_cast<TConjoinDockHost *>(this)->Handle, WM_CLOSE, 0, 0);
  UpdateCaption(Client);
}
```

Delphi Examples:

```
{
The following example is taken from the docking demo. It
shows how the OnUnDock event handler of the conjoinment
docking site re-enables docking in the control that is
undocked (if it is a dockable form). In addition, when the
next to last docked control is undocked, the conjoinment
```

```
docking site sends itself a close message so that the last
docked control is undocked to its old position and size.
}
procedure TConjoinDockHost.FormUnDock(Sender: TObject; Client: TControl;
  NewTarget: TWinControl; var Allow: Boolean);
begin
  // Only 2 dock clients means the host must be destroyed and
  // the remaining window undocked to its old position and size.
  // Recall that OnUnDock gets called before the undocking
  // actually occurs.
  if Client is TDockableForm then
    TDockableForm(Client).DockSite := True;
  if (DockClientCount = 2) and (NewTarget <> Self) then
    PostMessage(Self.Handle, WM_CLOSE, 0, 0);
  UpdateCaption(Client);
end;
```

68.1.10.2.17 TControlBar.DragCursor Property

Indicates the image used to represent the mouse pointer when the control is being dragged.

Pascal

```
property DragCursor: TCursor;
```

C++

```
__property TCursor DragCursor;
```

Description

Use the DragCursor property to change the cursor image presented when the control is being dragged.

Note: To make a custom cursor available for the DragCursor property, see the Cursor property.

See Also

Cursor (see page 5815)

DragKind (see page 5819)

DragMode (see page 5819)

68.1.10.2.18 TControlBar.DragKind Property

Specifies whether the control is being dragged normally or for docking.

Pascal

```
property DragKind: TDragKind;
```

C++

```
__property TDragKind DragKind;
```

Description

Use DragKind to get or set whether the control participates in drag-and-drop operations, or drag-and-dock operations.

See Also

DragCursor (see page 5818)

DragMode (see page 5819)

68.1.10.2.19 TControlBar.DragMode Property

Determines how the control initiates drag-and-drop or drag-and-dock operations.

Pascal

```
property DragMode: TDragMode;
```

C++

```
__property TDragMode DragMode;
```

Description

Use DragMode to control when the user can drag the control. Disable the drag-and-drop or drag-and-dock capability at runtime by setting the DragMode property value to dmManual. Enable automatic dragging by setting DragMode to dmAutomatic.

C++ Examples:

```
/*
The following code uses GetNodeAt to add a dragged node as a
child of the node under the mouse when it is dropped.  This
example requires a populated TreeView.  Also, the TTreeView
DragMode property set to dmAutomatic, and the TTreeView
OnDragOver event handler must be implemented to accept the
drop.
*/
void __fastcall TForm1::TreeView1DragDrop(TObject *Sender, TObject *Source,
      int X, int Y)
{
  if (Source != (TObject *)TreeView1 || TreeView1->Selected == NULL)
    return;
  THitTests HT = TreeView1->GetHitTestInfoAt(X, Y);
  TNodeAttachMode AttachMode;
  TTreeNode *Item = TreeView1->GetNodeAt(X, Y);
  if (HT.Contains(htOnItem) || HT.Contains(htOnIcon))
    AttachMode = naAddChild;
  else if (HT.Contains(htNowhere))
    AttachMode = naAdd;
  else if (HT.Contains(htOnIndent))
    AttachMode = naInsert;
  else
    return;
  TreeView1->Selected->MoveTo(Item, AttachMode);
}

void __fastcall TForm1::TreeView1DragOver(TObject *Sender, TObject *Source,
      int X, int Y, TDragState State, bool &Accept)
{
  Accept = (Source == (TObject *)TreeView1);
}
```

Delphi Examples:

```
{
The following code uses GetNodeAt to add a dragged node as a
child of the node under the mouse when it is dropped.  This
example requires a populated TreeView.  Also, the TTreeView
DragMode property set to dmAutomatic, and the TTreeView
OnDragOver event handler must be implemented to accept the
drop.
}
procedure TForm1.TreeView1DragDrop(Sender, Source: TObject; X, Y: Integer);
var
  AnItem: TTreeNode;
  AttachMode: TNodeAttachMode;
```

```
    HT: THitTests;
  begin
    if TreeView1.Selected = nil then Exit;
    HT := TreeView1.GetHitTestInfoAt(X, Y);
    AnItem := TreeView1.GetNodeAt(X, Y);
    if (HT - [htOnItem, htOnIcon, htNowhere, htOnIndent] <> HT) then
    begin
      if (htOnItem in HT) or (htOnIcon in HT) then
        AttachMode := naAddChild
      else if htNowhere in HT then AttachMode := naAdd
      else if htOnIndent in HT then AttachMode := naInsert;
      TreeView1.Selected.MoveTo(AnItem, AttachMode);
    end;
  end;

  procedure TForm1.TreeView1DragOver(Sender, Source: TObject; X, Y: Integer;
    State: TDragState; var Accept: Boolean);
  begin
    Accept := Source is TTreeView;
  end;
```

Arranging the Order of Persistent Columns

68.1.10.2.20 TControlBar.DrawingStyle Property

Pascal

```
property DrawingStyle: TBandDrawingStyle;
```

C++

```
__property TBandDrawingStyle DrawingStyle;
```

Description

This is DrawingStyle, a member of class TControlBar.

68.1.10.2.21 TControlBar.Enabled Property

Controls whether the control responds to mouse, keyboard, and timer events.

Pascal

```
property Enabled: Boolean;
```

C++

```
__property Boolean Enabled;
```

Description

Use Enabled to change the availability of the control to the user. To disable a control, set Enabled to false. Disabled controls appear dimmed. If Enabled is false, the control ignores mouse, keyboard, and timer events.

To re-enable a control, set Enabled to true. The control is no longer dimmed, and the user can use the control.

See Also

Visible (see page 5847)

DisableControls (see page 6925)

EnableControls (see page 6934)

Enabling Mouse

68.1.10.2.22 TControlBar.GradientDirection Property

Horizontal or Vertical.

Pascal

```
property GradientDirection: TGradientDirection;
```

C++

```
__property TGradientDirection GradientDirection;
```

Description

Stores the direction of the gradient as Horizontal or Vertical.

68.1.10.2.23 TControlBar.GradientEndColor Property

Stores the color that the gradient is painted with when it ends.

Pascal

```
property GradientEndColor: TColor;
```

C++

```
__property TColor GradientEndColor;
```

Description

Use this property to store the color that you want to use to end your drawing. (This blends with the start color.)

68.1.10.2.24 TControlBar.GradientStartColor Property

Stores the color that the gradient is painted when it starts.

Pascal

```
property GradientStartColor: TColor;
```

C++

```
__property TColor GradientStartColor;
```

Description

Use this property to store the color that you want to use to initialize the drawing.

68.1.10.2.25 TControlBar.ParentBackground Property

Determines whether control uses parent's theme background.

Pascal

```
property ParentBackground: Boolean;
```

C++

```
__property Boolean ParentBackground;
```

Description

If ParentBackground is true, the control uses the parent's theme background to draw its own background. ParentBackground has no effect unless XP themes are enabled.

68.1.10.2.26 TControlBar.ParentColor Property

Determines where a control looks for its color information.

Pascal

```
property ParentColor: Boolean;
```

C++

```
__property Boolean ParentColor;
```

Description

To have a control use the same color as its parent control, set ParentColor to true. If ParentColor is false, the control uses its own Color property.

Set ParentColor to true for all controls in order to ensure that all the controls on a form have a uniform appearance. For example, if ParentColor is true for all controls in a form, changing the background color of the form to gray causes all the controls on the form to also have a gray background.

When the value of a control's Color property changes, ParentColor becomes false automatically.

See Also

Color (see page 5812)

Parent (see page 5832)

ParentFont (see page 5834)

ParentShowHint (see page 5835)

68.1.10.2.27 TControlBar.ParentCtl3D Property

Determines where a component looks to determine if it should appear three dimensional.

Pascal

```
property ParentCtl3D: Boolean;
```

C++

```
__property Boolean ParentCtl3D;
```

Description

ParentCtl3D is provided for backwards compatibility. It has no effect on 32-bit versions of Windows or NT 4.0 and later.

ParentCtl3D determines whether the control uses its parent's Ctl3D property.

See Also

Ctl3D (see page 6198)

68.1.10.2.28 TControlBar.ParentFont Property

Determines where a control looks for its font information.

Pascal

```
property ParentFont: Boolean;
```

C++

```
__property Boolean ParentFont;
```

Description

To have a control use the same font as its parent control, set ParentFont to true. If ParentFont is false, the control uses its own Font property. Many controls default ParentFont to true so that all the controls in a form or other container present a uniform appearance. When the value of a control's Font property changes, ParentFont becomes false automatically.

When ParentFont is true for a form, the form uses the default font.

See Also

Font (see page 5823)

Parent (see page 5832)

ParentColor (see page 5834)

ParentShowHint (see page 5835)

68.1.10.2.29 TControlBar.ParentShowHint Property

Determines where a control looks to find out if its Help Hint should be shown.

Pascal

```
property ParentShowHint: Boolean;
```

C++

```
__property Boolean ParentShowHint;
```

Description

Use ParentShowHint to ensure that all the controls on a form either uniformly show their Help Hints or uniformly do not show them.

If ParentShowHint is true, the control uses the ShowHint property value of its parent. If ParentShowHint is false, the control uses the value of its own ShowHint property.

To provide Help Hints for only selected controls on a form, set the ShowHint property for those controls that should have Help Hints to true, and ParentShowHint becomes false automatically.

Note: Enable or disable all Help Hints for the entire application using the ShowHint property of the application object.

68.1.10.2.30 TControlBar.Picture Property

Pascal

```
property Picture: TPicture;
```

C++

```
__property TPicture Picture;
```

Description

This is Picture, a member of class TControlBar.

68.1.10.2.31 TControlBar.PopupMenu Property

Identifies the pop-up menu associated with the control.

Pascal

```
property PopupMenu: TPopupMenu;
```

C++

```
__property TPopupMenu PopupMenu;
```

Description

Assign a value to PopupMenu to make a pop-up menu appear when the user selects the control and clicks the right mouse button. If the TPopupMenu's AutoPopup property is true, the pop-up menu appears automatically. If the menu's AutoPopup property is false, display the menu with a call to its Popup method from the control's OnContextPopup event handler.

C++ Examples:

```
/*
This example uses two edit boxes and one pop-up menu on a form.
The pop-up menu contains Cut, Copy, and Paste commands. This code
makes the pop-up menu available to both edit boxes:
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  PopupMenu1->AutoPopup = true;
  Edit1->PopupMenu = PopupMenu1;
  Edit2->PopupMenu = PopupMenu1;
}

/*
These are the cut, copy, and paste OnClick events for the commands
on the pop-up menu. Double click on the pop-up menu and add three
TMenuItems.  Then set the captions to "Cut", "Copy" and "Paste".
The names will be automatically set to "Cut1", "Copy1", and
"Paste1".  Then double click on the OnClick events and they will
be named "Cut1Click", "Copy1Click" and "Paste1Click" respectively.
Note: only the selected portion of the string in the edit box will
be copied, cut or replaced.
*/
void __fastcall TForm1::Copy1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
```

```
    {
      if (pComponent->ClassNameIs("TEdit"))
        ((TEdit *)pComponent)->CopyToClipboard();
      else
        MessageBeep(0);
    }
    else
      MessageBeep(0);
  }

  void __fastcall TForm1::Cut1Click(TObject *Sender)
  {
    TComponent *pComponent = PopupMenu1->PopupComponent;
    if (pComponent)
    {
      if (pComponent->ClassNameIs("TEdit"))
        ((TEdit *)pComponent)->CutToClipboard();
      else
        MessageBeep(0);
    }
    else
      MessageBeep(0);
  }

  void __fastcall TForm1::Paste1Click(TObject *Sender)
  {
    TComponent *pComponent = PopupMenu1->PopupComponent;
    if (pComponent)
    {
      if (pComponent->ClassNameIs("TEdit"))
        ((TEdit *)pComponent)->PasteFromClipboard();
      else
        MessageBeep(0);
    }
    else
      MessageBeep(0);
  }
  /*
  This example demonstrates how to add and delete menu items
  to a popup menu at runtime and assign an event handler to
  the OnClick event.  Place a TPopupMenu and three buttons on
  the form named "AddButton", "EditButton",  and
  "DestroyButton" and add OnClick events to all three buttons.
  Put the TPopupMenu in the PopupMenu property of the form.
  Place the PopupMenuItemsClick procedure in the TForm1 type
  declaration so that it can be used as the method call for
  the menu item OnClick event.
  */
  void __fastcall TForm1::AddButtonClick(TObject *Sender)
  {
      const int num_items = 4;
      for (int index = 0; index < num_items; ++index)
      {
          TMenuItem *NewItem = new TMenuItem(PopupMenu1); // create the new item
          PopupMenu1->Items->Add(NewItem);// add it to the Popupmenu
          NewItem->Caption = "Menu Item " + IntToStr(index);
          NewItem->Tag = index;
          NewItem->OnClick = PopupMenuItemsClick;// assign it an event handler
          TNotifyEvent();
      }
  }

  void __fastcall TForm1::PopupMenuItemsClick(TObject *Sender)
  {
      TMenuItem *ClickedItem = dynamic_cast<TMenuItem *>(Sender);
      if (ClickedItem)
```

```
    {
        switch (ClickedItem->Tag)
        {
            case 0:
            {
                ShowMessage("first item clicked");
                break;
            }
            case 1:
            {
                ShowMessage("second item clicked");
                break;
            }
            case 2:
            {
                ShowMessage("third item clicked");
                break;
            }
            case 3:
            {
                ShowMessage("fourth item clicked");
                break;
            }
        }
    }
}

/*
To edit or destroy an item, grab its pointer via the Items
property.
*/
void __fastcall TForm1::EditButtonClick(TObject *Sender)
{
    const int index = 1;
    TMenuItem *ItemToEdit = PopupMenu->Items->Items[index];
    ItemToEdit->Caption = "Changed Caption";
}

void __fastcall TForm1::DestroyButtonClick(TObject *Sender)
{
    const int index = 2;
    TMenuItem *ItemToDelete = PopupMenu->Items->Items[index];
    delete ItemToDelete;
}
```

Delphi Examples:

```
{
This example uses two edit boxes and one pop-up menu on a form.
The pop-up menu contains Cut, Copy, and Paste commands. This code
makes the pop-up menu available to both edit boxes:
}
procedure TForm1.FormCreate(Sender: TObject);
begin
  PopupMenu1.AutoPopup := True;
  Edit1.PopupMenu := PopupMenu1;
  Edit2.PopupMenu := PopupMenu1;
end;

{
These are the cut, copy, and paste OnClick events for the commands
on the pop-up menu. Double click on the pop-up menu and add three
TMenuItems.  Then set the captions to "Cut", "Copy" and "Paste".
The names will be automatically set to "Cut1", "Copy1", and
"Paste1".  Then double click on the OnClick events and they will
be named "Cut1Click", "Copy1Click" and "Paste1Click" respectively.
Note: only the selected portion of the string in the edit box will
```

```
be copied, cut or replaced.
}
procedure TForm1.Copy1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
   Edit1.CopyToClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.CopyToClipboard
  else
    Beep;
end;

procedure TForm1.Cut1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
    Edit1.CutToClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.CutToClipboard
  else
    Beep;
end;

procedure TForm1.Paste1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
    Edit1.PasteFromClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.PasteFromClipboard
  else
    Beep;
end;
{
This example demonstrates how to add and delete menu items
to a popup menu at runtime and assign an event handler to
the OnClick event.  Place a TPopupMenu and three buttons on
the form named "AddButton", "EditButton",  and
"DestroyButton" and add OnClick events to all three buttons.
Put the TPopupMenu in the PopupMenu property of the form.
Place the PopupMenuItemsClick procedure in the TForm1 type
declaration so that it can be used as the method call for
the menu item OnClick event.
}

68.1.10.2.32 TControlBar.RowSize Property

Pascal

```
property RowSize: TRowSize;
```

C++

```
__property TRowSize RowSize;
```

Description

This is RowSize, a member of class TControlBar.

68.1.10.2.33 TControlBar.RowSnap Property

Pascal

```
property RowSnap: Boolean;
```

C++

```
__property Boolean RowSnap;
```

Description

This is RowSnap, a member of class TControlBar.

68.1.10.2.34 TControlBar.ShowHint Property

Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.

Pascal

```
property ShowHint: Boolean;
```

C++

```
__property Boolean ShowHint;
```

Description

The Help Hint is the value of the Hint property, which is displayed in a box just beneath the control. Use ShowHint to determine whether a Help Hint appears for the control.

To enable Help Hint for a particular control, the application ShowHint property must be true and either

the control's own ShowHint property must be true, or

the control's ParentShowHint property must be true and its parent's ShowHint property must be true.

For example, imagine a check box within a group box. If the ShowHint property of the group box is true and the ParentShowHint property of the check box is true, but the ShowHint property of the check box is false, the check box still displays its Help Hint.

Changing the ShowHint value automatically sets the ParentShowHint property to false.

C++ Examples:

```
/*
This example uses an edit box and a list box on a form.
Items are added to the list box and a Help Hint is assigned
to both controls. The last statement enables the Help Hints
for the entire application.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  Edit1->Hint = "Enter your name";
  Edit1->ShowHint = true;

  char string[10];
  char index[3];
  for(int i = 1; i <= 10; i++)
```

```
    {
      strcpy(string, "Item");
      itoa(i, index, 10);
      strcat(string, index);
      ListBox1->Items->Add(string);
    }
    ListBox1->Hint = "Select an item";
    ListBox1->ShowHint = true;
    Application->ShowHint = true;
  }
  /*
  Note: To see an example that displays the hints of controls
  in some place other than in a Help Hint box, see the OnHint
  example.
  */
```

Delphi Examples:

```
{
This example uses an edit box and a list box on a form.
Items are added to the list box and a Help Hint is assigned
to both controls. The last statement enables the Help Hints
for the entire application.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  I: Integer;
begin
  Edit1.Hint := 'Enter your name';
  Edit1.ShowHint := True;
  with ListBox1 do
  begin
    for I := 1 to 10 do
      Items.Add('Item ' + IntToStr(I));
    Hint := 'Select an item';
    ShowHint := True;
  end;
  Application.ShowHint := True;
end;
{
Note: To see an example that displays the hints of controls
in some place other than in a Help Hint box, see the OnHint
example.
}
```

Displaying Fly-over Help

68.1.10.2.35 TControlBar.TabOrder Property

Indicates the position of the control in its parent's tab order.

Pascal

```
property TabOrder: TTabOrder;
```

C++

```
__property TTabOrder TabOrder;
```

Description

TabOrder is the order in which child windows are visited when the user presses the Tab key. The control with the TabOrder value of 0 is the control that has the focus when the form first appears.

Initially, the tab order is always the order in which the controls were added to the form. The first control added to the form has a TabOrder value of 0, the second is 1, the third is 2, and so on. Change this by changing the TabOrder property.

Each control has a unique tab-order value within its parent. If you change the TabOrder property value of one control to be the same as the value of a second control, the TabOrder value for all the other controls changes. For example, suppose a control is sixth in the tab order. If you change the control's TabOrder property value to 3 (making the control fourth in the tab order), the control that was originally fourth in the tab order now becomes fifth, and the control that was fifth becomes sixth.

Assigning TabOrder a value greater than the number of controls contained in the parent control moves the control to the end of the tab order. The control does not take on the assigned value of TabOrder, but instead is given the number that assures the control is the last in the tab order.

Note: TabOrder is meaningful only if the TabStop property is true and if the control has a parent. (The TabOrder property of a form is not used unless the form is the child of another form.) A control with a TabOrder of -1 has no parent, and therefore cannot be reached by pressing the Tab key. To remove a parented control from the Tab order, set its TabStop property to false.

See Also

FindNextControl (see page 6149)

TabStop (see page 6211)

68.1.10.2.36 TControlBar.TabStop Property

Determines if the user can tab to a control.

Pascal

```
property TabStop: Boolean;
```

C++

```
__property Boolean TabStop;
```

Description

Use the TabStop to allow or disallow access to the control using the Tab key.

If TabStop is true, the control is in the tab order. If TabStop is false, the control is not in the tab order and the user can't press the Tab key to move to the control.

Note: TabStop is not meaningful for a form unless the form assigns another form to be its parent.

See Also

TabOrder (see page 6211)

68.1.10.2.37 TControlBar.Visible Property

Determines whether the component appears onscreen.

Pascal

```
property Visible: Boolean;
```

C++

```
__property Boolean Visible;
```

Description

Use the Visible property to control the visibility of the control at runtime. If Visible is true, the control appears. If Visible is false, the control is not visible.

Calling the Show method sets the control's Visible property to true. Calling the Hide method sets it to false.

C++ Examples:

```
/*
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
*/
void __fastcall TForm1::PageControl1Change(TObject *Sender)
{
  CheckBox1->Checked = PageControl1->ActivePage->Visible;
}

void __fastcall TForm1::CheckBox1Click(TObject *Sender)
{
  PageControl1->ActivePage->Visible = CheckBox1->Checked;
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < 10; i++)
  {
    TTabSheet *pPage = new TTabSheet(this);
    pPage->PageControl = PageControl1;
    pPage->Caption = AnsiString("Page") + IntToStr(i);
    TEdit *pEdit = new TEdit(this);
    pEdit->Parent = pPage;
    pEdit->Left = random(pPage->ClientWidth - pEdit->Width);
    pEdit->Top = random(pPage->ClientHeight - pEdit->Height);
  }
  PageControl1Change(Sender);
}
```

Delphi Examples:

```
{
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
}
procedure TForm1.CheckBox1Click(Sender: TObject);
begin
  PageControl1.ActivePage.Visible := CheckBox1.Checked;
end;

procedure TForm1.PageControl1Change(Sender: TObject);
begin
  CheckBox1.Checked := PageControl1.ActivePage.Visible;
end;

procedure TForm1.FormCreate(Sender: TObject);
var
  i: Integer;
begin
  for i := 0 to 9 do
    with TTabSheet.Create(Self) do
```

```
    begin
      PageControl := PageControl1;
      Caption := 'TabSheet' + IntToStr(i);
      with TEdit.Create(Self) do
      begin
        Parent := PageControl1.Pages[i];
        Left := Random(PageControl1.ActivePage.ClientWidth - Width);
        Top := Random(PageControl1.ActivePage.ClientHeight - Height);
      end;
    end;
    PageControl1Change(Sender);
end;
```

68.1.10.3 TControlBar Events

The events of the TControlBar class are listed here.

Published Events

	Name	Description
	OnAlignInsertBefore (see page 12357)	Occurs when an object with custom alignment is aligned.
	OnAlignPosition (see page 12357)	Occurs when an object with custom alignment is aligned.
	OnBandDrag (see page 12358)	Occurs when the user starts a drag operation on a specified control.
	OnBandInfo (see page 12358)	Occurs when the control bar adjusts the docking position of a band.
	OnBandMove (see page 12359)	This is OnBandMove, a member of class TControlBar.
	OnBandPaint (see page 12359)	This is OnBandPaint, a member of class TControlBar.
	OnBeginBandMove (see page 12359)	This is OnBeginBandMove, a member of class TControlBar.
	OnCanResize (see page 12359)	Occurs when an attempt is made to resize the control.
	OnClick (see page 12360)	Occurs when the user clicks the control.
	OnConstrainedResize (see page 12362)	Adjust resize constraints.
	OnContextPopup (see page 12362)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnDblClick (see page 12363)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDockDrop (see page 12363)	Occurs when another control is docked to the control.
	OnDockOver (see page 12365)	Occurs when another control is dragged over the control.
	OnDragDrop (see page 12367)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 12370)	Occurs when the user drags an object over a control.
	OnEndBandMove (see page 12372)	This is OnEndBandMove, a member of class TControlBar.
	OnEndDock (see page 12372)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 12373)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnEnter (see page 12374)	Occurs when a control receives the input focus.
	OnExit (see page 12376)	Occurs when the input focus shifts away from one control to another.
	OnGetSiteInfo (see page 12378)	Returns the control's docking information.
	OnMouseActivate (see page 12380)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 12381)	Occurs when the user presses a mouse button with the mouse pointer over a control.

	OnMouseEnter (see page 12383)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 12383)	Occurs when the user moves the mouse outside of a control.
	OnMouseMove (see page 12384)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 12386)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnPaint (see page 12388)	Occurs when the control bar is painted.
	OnResize (see page 12389)	Occurs immediately after the control is resized.
	OnStartDock (see page 12389)	Occurs when the user begins to drag a control with a DragKind of dkDock.
	OnStartDrag (see page 12390)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.
	OnUnDock (see page 12390)	Occurs when the application tries to undock a control that is docked to the windowed control.

68.1.10.3.1 TControlBar.OnAlignInsertBefore Event

Occurs when an object with custom alignment is aligned.

Pascal

```
property OnAlignInsertBefore: TAlignInsertBeforeEvent;
```

C++

```
__property TAlignInsertBeforeEvent OnAlignInsertBefore;
```

Description

OnAlignInsertBefore occurs for each pair of child controls with an Align property of **alCustom**.

It can determine the order in which custom-aligned child controls are placed. OnAlignInsertBefore returns true if **C2** should be presented before **C1**, and false otherwise. It holds a TAlignInsertBeforeEvent type.

CustomAlignInsertBefore triggers the OnAlignInsertBefore event. If this event is defined, CustomAlignInsertBefore returns the value returned by OnAlignInsertBefore. Defining this event allows users to define the order of control alignment without overriding CustomAlignInsertBefore.

See Also

CustomAlignInsertBefore (see page 6137)

Align (see page 5798)

TAlignInsertBeforeEvent (see page 6293)

68.1.10.3.2 TControlBar.OnAlignPosition Event

Occurs when an object with custom alignment is aligned.

Pascal

```
property OnAlignPosition: TAlignPositionEvent;
```

C++

```
__property TAlignPositionEvent OnAlignPosition;
```

Description

OnAlignPosition occurs when child controls with an Align property of **alCustom** are aligned.

CustomAlignPosition triggers the OnAlignPosition event. If this event is defined, CustomAlignPosition uses the alignment parameters it obtains from OnAlignPosition. Defining this event allows users to set the alignment parameters without overriding CustomAlignPosition. It holds a TAlignPositionEvent type.

These are the parameters:

Parameter	Meaning
NewLeft | NewTop | NewWidth | NewHeight	Location and size of child control, as determined by container's size and the Anchors TControl_Anchors constraints for the control. OnAlignPosition can modify these values to reposition the control.
AlignRect	The client area in which the control is aligned. OnAlignPosition can modify this value.
AlignInfo	Alignment information in a TAlignInfo.
As implemented in TWinControl, OnAlignPosition does nothing.

Anchors (see page 5802)

TAlignInfo (see page 6269)

TAlignPositionEvent (see page 6293)

68.1.10.3.3 TControlBar.OnBandDrag Event

Occurs when the user starts a drag operation on a specified control.

Pascal

```
property OnBandDrag: TBandDragEvent;
```

C++

```
__property TBandDragEvent OnBandDrag;
```

Description

Use OnBandDrag to conditionally allow the user to start dragging a control in the control bar.

The event handler indicates the control that the user is trying to drag. Change its Drag parameter to false to prevent the drag operation. If Drag remains true on exit from the event handler, the drag operation proceeds.

See Also

OnStartDock (see page 5871)

onbandmove (see page 12473)

68.1.10.3.4 TControlBar.OnBandInfo Event

Occurs when the control bar adjusts the docking position of a band.

Pascal

```
property OnBandInfo: TBandInfoEvent;
```

C++

```
__property TBandInfoEvent OnBandInfo;
```

Description

Write code in the OnBandInfo event handler to provide information to the control bar that it can use when arranging its bands.

The OnBandInfo event handler has several parameters that can be used to return information about how the band should be positioned, including its size, inset, and number of rows.

See Also

TBDockHeight (see page 5842)

onbandmove (see page 12473)

LRDockWidth (see page 5831)

Height (see page 5825)

Width (see page 5849)

68.1.10.3.5 TControlBar.OnBandMove Event

Pascal

```
property OnBandMove: TBandMoveEvent;
```

C++

```
__property TBandMoveEvent OnBandMove;
```

Description

This is OnBandMove, a member of class TControlBar.

68.1.10.3.6 TControlBar.OnBandPaint Event

Pascal

```
property OnBandPaint: TBandPaintEvent;
```

C++

```
__property TBandPaintEvent OnBandPaint;
```

Description

This is OnBandPaint, a member of class TControlBar.

68.1.10.3.7 TControlBar.OnBeginBandMove Event

Pascal

```
property OnBeginBandMove: TBeginBandMoveEvent;
```

C++

```
__property TBeginBandMoveEvent OnBeginBandMove;
```

Description

This is OnBeginBandMove, a member of class TControlBar.

68.1.10.3.8 TControlBar.OnCanResize Event

Occurs when an attempt is made to resize the control.

Pascal

```
property OnCanResize: TCanResizeEvent;
```

C++

```
__property TCanResizeEvent OnCanResize;
```

Description

Use OnCanResize to adjust the way a control is resized. If necessary, change the new width and height of the control in the OnCanResize event handler. The OnCanResize event handler also allows applications to indicate that the entire resize should be aborted.

If there is no OnCanResize event handler, or if the OnCanResize event handler indicates that the resize attempt can proceed, the OnCanResize event is followed immediately by an OnConstrainedResize event.

See Also

OnConstrainedResize (see page 5853)

SetBounds (see page 5783)

OnResize (see page 5870)

68.1.10.3.9 TControlBar.OnClick Event

Occurs when the user clicks the control.

Pascal

```
property OnClick: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnClick;
```

Description

Use the OnClick event handler to respond when the user clicks the control. If the control has an associated action, and that action has an OnExecute method, the action's OnExecute method responds to click events unless it is superseded by an OnClick event handler.

Usually OnClick occurs when the user presses and releases the left mouse button with the mouse pointer over the control. This event can also occur when:

- The user selects an item in a grid, outline, list, or combo box by pressing an arrow key.
- The user presses Spacebar while a button or check box has focus.
- The user presses Enter when the active form has a default button (specified by the Default property).
- The user presses Esc when the active form has a cancel button (specified by the Cancel property).
- The user presses the accelerator key for a button or check box. For example, if the value of the Caption property of a check box is '&Bold', the B is underlined at runtime and the OnClick event of the check box is triggered when the user presses Alt+B. However, focus does not move to the control in these instances.
- The Checked property of a radio button is set to true.
- The value of the Checked property of a check box is changed.
- The Click method of a menu item is called.

For a form, an OnClick event occurs when the user clicks a blank area of the form or on a disabled component.

C++ Examples:

```
/*
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
```

```
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
*/
void __fastcall TForm1::PageControl1Change(TObject *Sender)
{
  CheckBox1->Checked = PageControl1->ActivePage->Visible;
}

void __fastcall TForm1::CheckBox1Click(TObject *Sender)
{
  PageControl1->ActivePage->Visible = CheckBox1->Checked;
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < 10; i++)
  {
    TTabSheet *pPage = new TTabSheet(this);
    pPage->PageControl = PageControl1;
    pPage->Caption = AnsiString("Page") + IntToStr(i);
    TEdit *pEdit = new TEdit(this);
    pEdit->Parent = pPage;
    pEdit->Left = random(pPage->ClientWidth - pEdit->Width);
    pEdit->Top = random(pPage->ClientHeight - pEdit->Height);
  }
  PageControl1Change(Sender);
}
```

Delphi Examples:

```
{
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
}
procedure TForm1.CheckBox1Click(Sender: TObject);
begin
  PageControl1.ActivePage.Visible := CheckBox1.Checked;
end;

procedure TForm1.PageControl1Change(Sender: TObject);
begin
  CheckBox1.Checked := PageControl1.ActivePage.Visible;
end;

procedure TForm1.FormCreate(Sender: TObject);
var
  i: Integer;
begin
  for i := 0 to 9 do
    with TTabSheet.Create(Self) do
    begin
      PageControl := PageControl1;
      Caption := 'TabSheet' + IntToStr(i);
      with TEdit.Create(Self) do
      begin
        Parent := PageControl1.Pages[i];
        Left := Random(PageControl1.ActivePage.ClientWidth - Width);
        Top := Random(PageControl1.ActivePage.ClientHeight - Height);
      end;
    end;
    PageControl1Change(Sender);
end;
```

68.1.10.3.10 TControlBar.OnConstrainedResize Event

Adjust resize constraints.

Pascal

```
property OnConstrainedResize: TConstrainedResizeEvent;
```

C++

```
__property TConstrainedResizeEvent OnConstrainedResize;
```

Description

Use OnConstrainedResize to adjust a control's constraints when an attempt is made to resize it. Upon entry to the OnConstrainedResize event handler, the parameters of the event handler are set to the corresponding properties of the control's Constraints object. The event handler can adjust those values before they are applied to the new height and width that is being applied to the control. (The CanAutoSize method or an OnCanResize event handler may already have adjusted this new height and width).

On exit from the OnConstrainedResize event handler, the constraints are applied to the attempted new height and width. Once the constraints are applied, the control's height and width are changed. After the control's height and width change, an OnResize event occurs to allow any final adjustments or responses.

Note: The OnConstrainedResize handler is called immediately after the OnCanResize handler.

See Also

OnCanResize (see page 5851)

SetBounds (see page 5783)

Constraints (see page 5812)

OnResize (see page 5870)

CanAutoSize (see page 5741)

68.1.10.3.11 TControlBar.OnContextPopup Event

Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).

Pascal

```
property OnContextPopup: TContextPopupEvent;
```

C++

```
__property TContextPopupEvent OnContextPopup;
```

Description

The OnContextPopup handler is called when the user uses the mouse or keyboard to request a popup menu. The OnContextPopup event is generated by a WM_CONTEXTMENU message, which is itself generated by the user clicking the right mouse button or by pressing SHIFT+F10 or the Applications key.

This event is especially useful when the control does not have an associated popup menu (the PopupMenu property is not set) or if the AutoPopup property of the control's associated popup menu is false. However, the OnContextPopup can also be used to override the automatic context menu that appears when the control has an associated popup menu with an AutoPopup property of true. In this last case, if the event handler displays its own menu, it should set the Handled parameter to true to suppress the default context menu.

The handler's MousePos parameter indicates the position of the mouse, in client coordinates.. If the event was not generated by a mouse click, MousePos is (-1,-1).

Note: Parent controls receive an OnContextPopup event before their child controls. In addition, for many child controls, the default window procedure causes the parent control to receive an OnContextPopup event after the child control. As a result, when parent controls do not set Handled to true in an OnContextPopup event handler, the event handler may be called multiple times for each context menu invocation.

TPopupMenu (see page 16169)

PopupMenu (see page 5835)

AutoPopup (see page 16178)

68.1.10.3.12 TControlBar.OnDblClick Event

Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.

Pascal

```
property OnDblClick: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnDblClick;
```

Description

Use the OnDblClick event to respond to mouse double-clicks.

See Also

OnClick (see page 5851)

Responding to User Actions at Runtime

68.1.10.3.13 TControlBar.OnDockDrop Event

Occurs when another control is docked to the control.

Pascal

```
property OnDockDrop: TDockDropEvent;
```

C++

```
__property TDockDropEvent OnDockDrop;
```

Description

Write code in the OnDockDrop event to perform actions when another control is docked on the control.

OnDockDrop can only occur if DockSite is true.

C++ Examples:

```
/*
The following example is taken from the docking demo. It
shows how set permissions to dock dockable objects onto a
docking site.
*/

void __fastcall TMainForm::LeftDockPanelDockDrop(TObject *Sender,
      TDragDockObject *Source, int X, int Y)
{
  //OnDockDrop gets called AFTER the client has actually docked,
  //so we check for DockClientCount = 1 before making the dock panel visible.
  TPanel *panel = dynamic_cast<TPanel *>(Sender);
  if (panel->DockClientCount == 1)
    ShowDockPanel(panel, True, NULL);
  panel->DockManager->ResetBounds(True);
  //Make DockManager repaints it's clients.
}

void __fastcall TMainForm::LeftDockPanelDockOver(TObject *Sender,
      TDragDockObject *Source, int X, int Y, TDragState State, bool &Accept)
{
  Accept = (dynamic_cast<TDockableForm*>(Source->Control) != NULL);
  if (Accept)
  {
    // Modify the DockRect to preview dock area.
    Types::TPoint TopLeft = LeftDockPanel->ClientToScreen(Point(0, 0));
    Types::TPoint BottomRight = LeftDockPanel->ClientToScreen(
      Point(this->ClientWidth/3, LeftDockPanel->Height));
    Source->DockRect = Types::TRect(TopLeft, BottomRight);
  }
}

void __fastcall TMainForm::LeftDockPanelUnDock(TObject *Sender,
      TControl *Client, TWinControl *NewTarget, bool &Allow)
{
  //OnUnDock gets called BEFORE the client is undocked, in order to optionally
  //disallow the undock. DockClientCount is never 0 when called from this event.
  TPanel *panel = dynamic_cast<TPanel *>(Sender);
  if (panel->DockClientCount == 1)
    ShowDockPanel(panel, False, NULL);
}

void __fastcall TMainForm::LeftDockPanelGetSiteInfo(TObject *Sender,
      TControl *DockClient, TRect &InfluenceRect, TPoint &MousePos,
      bool &CanDock)
{
  //if CanDock is true, the panel will not automatically draw the preview rect.
  CanDock = DockClient->ClassNameIs("TDockableForm");
  if (!CanDock)
  {
     ShowMessage("GetSiteInfo CanDock went bad!");
  }
}
```

Delphi Examples:

```
{
The following example is taken from the docking demo. It
shows how set permissions to dock dockable objects onto a
```

```
docking site.
}

procedure TMainForm.LeftDockPanelDockDrop(Sender: TObject;
  Source: TDragDockObject; X, Y: Integer);
begin
  //OnDockDrop gets called AFTER the client has actually docked,
  //so we check for DockClientCount = 1 before making the dock panel visible.
  if (Sender as TPanel).DockClientCount = 1 then
    ShowDockPanel(Sender as TPanel, True, nil);
  (Sender as TPanel).DockManager.ResetBounds(True);
  //Make DockManager repaints it's clients.
end;

procedure TMainForm.LeftDockPanelDockOver(Sender: TObject;
  Source: TDragDockObject; X, Y: Integer; State: TDragState;
  var Accept: Boolean);
var
  ARect: TRect;
begin
  Accept := Source.Control is TDockableForm;
  if Accept then
  begin
    //Modify the DockRect to preview dock area.
    ARect.TopLeft := LeftDockPanel.ClientToScreen(Point(0, 0));
    ARect.BottomRight := LeftDockPanel.ClientToScreen(
      Point(Self.ClientWidth div 3, LeftDockPanel.Height));
    Source.DockRect := ARect;
  end;
end;

procedure TMainForm.LeftDockPanelUnDock(Sender: TObject; Client: TControl;
  NewTarget: TWinControl; var Allow: Boolean);
begin
  //OnUnDock gets called BEFORE the client is undocked, in order to optionally
  //disallow the undock. DockClientCount is never 0 when called from this event.
  if (Sender as TPanel).DockClientCount = 1 then
    ShowDockPanel(Sender as TPanel, False, nil);
end;

procedure TMainForm.LeftDockPanelGetSiteInfo(Sender: TObject;
  DockClient: TControl; var InfluenceRect: TRect; MousePos: TPoint;
  var CanDock: Boolean);
begin
  //if CanDock is true, the panel will not automatically draw the preview rect.
  CanDock := DockClient is TDockableForm;
end;
```

DockSite (see page 6204)

OnDockOver (see page 6216)

68.1.10.3.14 TControlBar.OnDockOver Event

Occurs when another control is dragged over the control.

Pascal

```
property OnDockOver: TDockOverEvent;
```

C++

```
__property TDockOverEvent OnDockOver;
```

Description

Write code in the OnDockOver event to indicate whether a dockable control that is dragged over the windowed control can be accepted as a dock client. OnDockOver occurs after the TDragDockObject has been initialized by an OnGetSiteInfo event.

OnDockOver occurs only if DockSite is true.

C++ Examples:

```
/*
The following example is taken from the docking demo. It
shows how set permissions to dock dockable objects onto a
docking site.
*/

void __fastcall TMainForm::LeftDockPanelDockDrop(TObject *Sender,
      TDragDockObject *Source, int X, int Y)
{
  //OnDockDrop gets called AFTER the client has actually docked,
  //so we check for DockClientCount = 1 before making the dock panel visible.
  TPanel *panel = dynamic_cast<TPanel *>(Sender);
  if (panel->DockClientCount == 1)
    ShowDockPanel(panel, True, NULL);
  panel->DockManager->ResetBounds(True);
  //Make DockManager repaints it's clients.
}

void __fastcall TMainForm::LeftDockPanelDockOver(TObject *Sender,
      TDragDockObject *Source, int X, int Y, TDragState State, bool &Accept)
{
  Accept = (dynamic_cast<TDockableForm*>(Source->Control) != NULL);
  if (Accept)
  {
    // Modify the DockRect to preview dock area.
    Types::TPoint TopLeft = LeftDockPanel->ClientToScreen(Point(0, 0));
    Types::TPoint BottomRight = LeftDockPanel->ClientToScreen(
      Point(this->ClientWidth/3, LeftDockPanel->Height));
    Source->DockRect = Types::TRect(TopLeft, BottomRight);
  }
}

void __fastcall TMainForm::LeftDockPanelUnDock(TObject *Sender,
      TControl *Client, TWinControl *NewTarget, bool &Allow)
{
  //OnUnDock gets called BEFORE the client is undocked, in order to optionally
  //disallow the undock. DockClientCount is never 0 when called from this event.
  TPanel *panel = dynamic_cast<TPanel *>(Sender);
  if (panel->DockClientCount == 1)
    ShowDockPanel(panel, False, NULL);
}

void __fastcall TMainForm::LeftDockPanelGetSiteInfo(TObject *Sender,
      TControl *DockClient, TRect &InfluenceRect, TPoint &MousePos,
      bool &CanDock)
{
  //if CanDock is true, the panel will not automatically draw the preview rect.
  CanDock = DockClient->ClassNameIs("TDockableForm");
  if (!CanDock)
  {
     ShowMessage("GetSiteInfo CanDock went bad!");
  }
}
```

Delphi Examples:

```
{
```

```
The following example is taken from the docking demo. It
shows how set permissions to dock dockable objects onto a
docking site.
}

procedure TMainForm.LeftDockPanelDockDrop(Sender: TObject;
  Source: TDragDockObject; X, Y: Integer);
begin
  //OnDockDrop gets called AFTER the client has actually docked,
  //so we check for DockClientCount = 1 before making the dock panel visible.
  if (Sender as TPanel).DockClientCount = 1 then
    ShowDockPanel(Sender as TPanel, True, nil);
  (Sender as TPanel).DockManager.ResetBounds(True);
  //Make DockManager repaints it's clients.
end;

procedure TMainForm.LeftDockPanelDockOver(Sender: TObject;
  Source: TDragDockObject; X, Y: Integer; State: TDragState;
  var Accept: Boolean);
var
  ARect: TRect;
begin
  Accept := Source.Control is TDockableForm;
  if Accept then
  begin
    //Modify the DockRect to preview dock area.
    ARect.TopLeft := LeftDockPanel.ClientToScreen(Point(0, 0));
    ARect.BottomRight := LeftDockPanel.ClientToScreen(
      Point(Self.ClientWidth div 3, LeftDockPanel.Height));
    Source.DockRect := ARect;
  end;
end;

procedure TMainForm.LeftDockPanelUnDock(Sender: TObject; Client: TControl;
  NewTarget: TWinControl; var Allow: Boolean);
begin
  //OnUnDock gets called BEFORE the client is undocked, in order to optionally
  //disallow the undock. DockClientCount is never 0 when called from this event.
  if (Sender as TPanel).DockClientCount = 1 then
    ShowDockPanel(Sender as TPanel, False, nil);
end;

procedure TMainForm.LeftDockPanelGetSiteInfo(Sender: TObject;
  DockClient: TControl; var InfluenceRect: TRect; MousePos: TPoint;
  var CanDock: Boolean);
begin
  //if CanDock is true, the panel will not automatically draw the preview rect.
  CanDock := DockClient is TDockableForm;
end;

68.1.10.3.15 TControlBar.OnDragDrop Event

Occurs when the user drops an object being dragged.

Pascal

```
property OnDragDrop: TDragDropEvent;
```

C++

```
__property TDragDropEvent OnDragDrop;
```

Description

Use the OnDragDrop event handler to specify what happens when the user drops an object. The Source parameter of the OnDragDrop event is the object being dropped, and the Sender is the control the object is being dropped on. The X and Y parameters are the coordinates of the mouse positioned over the control.

C++ Examples:

```
/*
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
*/

// This OnDragOver event handler permits the list box to
// accept a dropped label:
void __fastcall TForm1::ListBox1DragOver(TObject *Sender, TObject *Source, int X, int Y,
TDragState State, bool &Accept)
{
   Accept = Source->ClassNameIs("TLabel");
}

/*
This OnDragDrop event handler implements the drop behavior.
*/
void __fastcall TForm1::ListBox1DragDrop(TObject *Sender, TObject *Source, int X, int Y)
{
  if (Sender->ClassNameIs("TListBox") && Source->ClassNameIs("TLabel"))
  {
    TListBox *DestList = (TListBox *)Sender;
    DestList->Font = ((TLabel *)Source)->Font;
    DestList->Color = ((TLabel *)Source)->Color;
    DestList->DoubleBuffered = true;
    DestList->Color = clWindow;
  }
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  ListBox1->Items->Add("Not");
  ListBox1->Items->Add("In");
  ListBox1->Items->Add("Alphabetical");
  ListBox1->Items->Add("Order");

}
```

Delphi Examples:

```
{
This code is an OnDragOver event handler that won't allow a
label control to be dropped on a panel control and stops the
dragging of the label as soon as the user drags the label
onto the panel:
Note: Set the label's DragMode property to dmAutomatic.
}
procedure TForm1.FormDragDrop(Sender, Source: TObject; X, Y: Integer);
```

```
begin
  TForm1(Source).Left := X;
  TForm1(Source).Top := Y;
end;

procedure TForm1.FormDragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := Source is TLabel;
end;

procedure TForm1.Panel1DragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := False;
  if (Source is TLabel) and (State = dsDragEnter) then
    (Source as TLabel).EndDrag(False);
end;
{
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
}

procedure TForm1.FormCreate(Sender: TObject);
begin
  ListBox1.Items.Add('Not');
  ListBox1.Items.Add('In');
  ListBox1.Items.Add('Alphabetical');
  ListBox1.Items.Add('Order');
end;

// This OnDragOver event handler permits the list box to
// accept a dropped label:

procedure TForm1.ListBox1DragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := Source is TLabel;
end;

// This OnDragDrop event handler implements the drop behavior.

procedure TForm1.ListBox1DragDrop(Sender, Source: TObject; X, Y: Integer);
begin
  if (Sender is TListBox) and (Source is TLabel) then
  begin
    with Sender as TListBox do
    begin
      Font := (Source as TLabel).Font;
      Color := (Source as TLabel).Color;
      DoubleBuffered := true;
      Color := clWindow;
    end;
  end;
end;
```

68.1.10.3.16 TControlBar.OnDragOver Event

Occurs when the user drags an object over a control.

Pascal

```
property OnDragOver: TDragOverEvent;
```

C++

```
__property TDragOverEvent OnDragOver;
```

Description

Use an OnDragOver event to signal that the control can accept a dragged object so the user can drop or dock it.

Within the OnDragOver event handler, change the Accept parameter to false to reject the dragged object. Leave Accept as true to allow the user to drop or dock the dragged object on the control.

To change the shape of the cursor, indicating that the control can accept the dragged object, change the value of the DragCursor property for the control before the OnDragOver event occurs.

The Source is the object being dragged, the Sender is the potential drop or dock site, and X and Y are screen coordinates in pixels. The State parameter specifies how the dragged object is moving over the control.

Note: Within the OnDragOver event handler, the Accept parameter defaults to true. However, if an OnDragOver event handler is not supplied, the control rejects the dragged object, as if the Accept parameter were changed to false.

C++ Examples:

```
/*
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
*/

// This OnDragOver event handler permits the list box to
// accept a dropped label:
void __fastcall TForm1::ListBox1DragOver(TObject *Sender, TObject *Source, int X, int Y,
TDragState State, bool &Accept)
{
   Accept = Source->ClassNameIs("TLabel");
}

/*
This OnDragDrop event handler implements the drop behavior.
*/
void __fastcall TForm1::ListBox1DragDrop(TObject *Sender, TObject *Source, int X, int Y)
{
  if (Sender->ClassNameIs("TListBox") && Source->ClassNameIs("TLabel"))
  {
```

```
    TListBox *DestList = (TListBox *)Sender;
    DestList->Font = ((TLabel *)Source)->Font;
    DestList->Color = ((TLabel *)Source)->Color;
    DestList->DoubleBuffered = true;
    DestList->Color = clWindow;
  }
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  ListBox1->Items->Add("Not");
  ListBox1->Items->Add("In");
  ListBox1->Items->Add("Alphabetical");
  ListBox1->Items->Add("Order");

}
```

Delphi Examples:

```
{
This code is an OnDragOver event handler that won't allow a
label control to be dropped on a panel control and stops the
dragging of the label as soon as the user drags the label
onto the panel:
Note: Set the label's DragMode property to dmAutomatic.
}
procedure TForm1.FormDragDrop(Sender, Source: TObject; X, Y: Integer);
begin
  TForm1(Source).Left := X;
  TForm1(Source).Top := Y;
end;

procedure TForm1.FormDragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := Source is TLabel;
end;

procedure TForm1.Panel1DragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := False;
  if (Source is TLabel) and (State = dsDragEnter) then
    (Source as TLabel).EndDrag(False);
end;
{
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
}

procedure TForm1.FormCreate(Sender: TObject);
begin
  ListBox1.Items.Add('Not');
  ListBox1.Items.Add('In');
  ListBox1.Items.Add('Alphabetical');
  ListBox1.Items.Add('Order');
end;

// This OnDragOver event handler permits the list box to
// accept a dropped label:

procedure TForm1.ListBox1DragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
```

```
begin
  Accept := Source is TLabel;
end;

// This OnDragDrop event handler implements the drop behavior.

procedure TForm1.ListBox1DragDrop(Sender, Source: TObject; X, Y: Integer);
begin
  if (Sender is TListBox) and (Source is TLabel) then
  begin
    with Sender as TListBox do
    begin
      Font := (Source as TLabel).Font;
      Color := (Source as TLabel).Color;
      DoubleBuffered := true;
      Color := clWindow;
    end;
  end;
end;
```

68.1.10.3.17 TControlBar.OnEndBandMove Event

Pascal

```
property OnEndBandMove: TEndBandMoveEvent;
```

C++

```
__property TEndBandMoveEvent OnEndBandMove;
```

Description

This is OnEndBandMove, a member of class TControlBar.

68.1.10.3.18 TControlBar.OnEndDock Event

Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.

Pascal

```
property OnEndDock: TEndDragEvent;
```

C++

```
__property TEndDragEvent OnEndDock;
```

Description

Use OnEndDock to specify actions or special processing that when a drag-and-dock operation stops.

See Also

DragKind (see page 5819)

OnDragOver (see page 5857)

OnDockDrop (see page 6214)

68.1.10.3.19 TControlBar.OnEndDrag Event

Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.

Pascal

```
property OnEndDrag: TEndDragEvent;
```

C++

```
__property TEndDragEvent OnEndDrag;
```

Description

Use the OnEndDrag event handler to specify any special processing that occurs when dragging stops.

C++ Examples:

```
/*
This code displays a message in a label named Status. The
message displayed depends on whether the dragged label
control was successfully dropped into and accepted by a
another control.
*/
void __fastcall TForm1::Label1EndDrag(TObject *Sender, TObject *Target, int X,
      int Y)
{
  if (Sender->ClassNameIs("TLabel"))
  {
    AnsiString S = ((TLabel *)Sender)->Name + " was dropped and ";
    if (Target)
      S = S + "accepted!";
    else
      S = S + "rejected.";
    Status->Caption = S;
  }
}
```

Delphi Examples:

```
{
This code displays a message in a label named Status. The
message displayed depends on whether the dragged label
control was successfully dropped into and accepted by a
another control.
}
procedure TForm1.Label1EndDrag(Sender, Target: TObject; X, Y: Integer);
var
  S: string;
begin
  S := (Sender as TLabel).Name + ' was dropped... and ';
  if Target <> nil then
    S := S + 'accepted!'
```

```
    else
      S := S + 'rejected!';
    Status.Caption := S;
  end;
```

68.1.10.3.20 TControlBar.OnEnter Event

Occurs when a control receives the input focus.

Pascal

```
property OnEnter: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnEnter;
```

Description

Use the OnEnter event handler to cause any special processing to occur when a control becomes active.

The OnEnter event does not occur when switching between forms or between another application and the application that includes the control.

When switching between controls in separate container controls such as the TPanel and the TGroupBox controls, an OnEnter event occurs for the container before the OnEnter event of the contained control.

Similarly, an OnExit event of the container occurs after the OnExit event of the control in a container when focus moves to another control outside the container.

For example, consider a form with an OK button and a group box that contains three radio buttons, where focus is currently on the OK button. When the user clicks one of the radio buttons, an OnExit event of the button occurs, followed by an OnEnter event on the group box, and finally an OnEnter event on the radio button that was clicked. If the user then clicks on the OK button, an OnExit event for the radio button occurs followed by an OnExit event for the group box, and then the button's OnEnter event occurs.

C++ Examples:

```
/*
This example takes an edit control, a button, and a rich
edit control on a form.  When the user presses the button, a
Font dialog appears.  When the user clicks the Apply (not OK)
button in the Font dialog, the currently selected font is
applied to the active control. Clicking the button sets the
ActiveControl to the button.  That is why we need to save
the ActiveControl in a shared OnEnter procedure.  In the rich
edit, only the text selected converts.
*/
TWinControl *myActiveControl;

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  FontDialog1->Options << fdApplyButton;
  FontDialog1->Execute();
}
```

```
void __fastcall TForm1::FontDialog1Apply(TObject *Sender, HWND Wnd)
{
  if (myActiveControl->ClassNameIs("TEdit"))
   ((TEdit *)myActiveControl)->Font->Assign(FontDialog1->Font);

    ((TRichEdit *)myActiveControl)->SelAttributes->Assign(FontDialog1->Font);
  else
    MessageBeep(0);
}

void __fastcall TForm1::Edit1Enter(TObject *Sender)
{
  myActiveControl = ActiveControl;
}
/*
This example uses an edit box and a memo control on a form.
When either the edit box or the memo is the active control,
it is colored yellow. When the active control becomes
inactive, the color of the control returns to the Windows
system color for a window.  These event handlers could also
be shared.
*/
void __fastcall TForm1::Edit1Enter(TObject *Sender)
{
  Edit1->Color = clYellow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Edit1Exit(TObject *Sender)
{
  Edit1->Color = clWindow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Memo1Enter(TObject *Sender)
{
  Memo1->Color = clYellow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Memo1Exit(TObject *Sender)
{
  Memo1->Color = clWindow;
}
```

Delphi Examples:

```
{
This example takes an edit control, a button, and a rich
edit control on a form.  When the user presses the button, a
Font dialog appears.  When the user clicks the Apply (not OK)
button in the Font dialog, the currently selected font is
applied to the active control. Clicking the button sets the
ActiveControl to the button.  That is why we need to save
the ActiveControl in a shared OnEnter procedure.  In the rich
edit, only the text selected converts.
}
procedure TForm1.Button1Click(Sender: TObject);
begin
   FontDialog1.Options := FontDialog1.Options + [fdApplyButton];
   FontDialog1.Execute;
end;

procedure TForm1.Edit1Enter(Sender: TObject);
begin
  myActiveControl := ActiveControl;
end;

procedure TForm1.FontDialog1Apply(Sender: TObject; Wnd: HWND);
```

```
begin
  if myActiveControl is TEdit then
    with myActiveControl as TEdit do
       Font.Assign(TFontDialog(Sender).Font)
  else if myActiveControl is TRichEdit then
