68.1.10.3.21 TControlBar.OnExit Event

Occurs when the input focus shifts away from one control to another.

Pascal

```
property OnExit: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnExit;
```

Description

Use the OnExit event handler to provide special processing when the control ceases to be active.

The OnExit event does not occur when switching between forms or between another application and your application.

When switching between controls in separate container controls such as the TPanel and the TGroupBox controls, an OnExit

event occurs for the control inside the container before the OnExit event of the container.

Similarly, an OnEnter event of the container occurs before the OnEnter event of the control in a container when focus moves to a control inside a container.

For example, consider a form with an OK button and a group box that contains three radio buttons, where focus is currently on the OK button. When the user clicks one of the radio buttons, an OnExit event of the button occurs, followed by an OnEnter event on the group box, and finally an OnEnter event on the radio button that was clicked. If the user then clicks on the OK button, an OnExit event for the radio button occurs followed by an OnExit event for the group box, and then the button's OnEnter event occurs.

Note: In some control classes the ActiveControl property updates before the OnExit event occurs.

C++ Examples:

```
/*
This example uses an edit box and a memo control on a form.
When either the edit box or the memo is the active control,
it is colored yellow. When the active control becomes
inactive, the color of the control returns to the Windows
system color for a window.  These event handlers could also
be shared.
*/
void __fastcall TForm1::Edit1Enter(TObject *Sender)
{
  Edit1->Color = clYellow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Edit1Exit(TObject *Sender)
{
  Edit1->Color = clWindow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Memo1Enter(TObject *Sender)
{
  Memo1->Color = clYellow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Memo1Exit(TObject *Sender)
{
  Memo1->Color = clWindow;
}
```

Delphi Examples:

```
{
This example uses an edit box and a memo control on a form.
When either the edit box or the memo is the active control,
it is colored yellow. When the active control becomes
inactive, the color of the control returns to the Windows
system color for a window.  These event handlers could also
be shared.
}
procedure TForm1.Edit1Enter(Sender: TObject);
begin
  Edit1.Color := clYellow;
end;

procedure TForm1.Edit1Exit(Sender: TObject);
begin
  Edit1.Color := clWindow;
end;

procedure TForm1.Memo1Enter(Sender: TObject);
```

```
begin
  Memo1.Color := clYellow;
end;

procedure TForm1.Memo1Exit(Sender: TObject);
begin
  Memo1.Color := clWindow;
end;
```

68.1.10.3.22 TControlBar.OnGetSiteInfo Event

Returns the control's docking information.

Pascal

```
property OnGetSiteInfo: TGetSiteInfoEvent;
```

C++

```
__property TGetSiteInfoEvent OnGetSiteInfo;
```

Description

Write code in the OnGetSiteInfo event handler to initialize a TDragDockObject with information about where a dragged object can be docked, if at all. OnGetSiteInfo occurs before the OnDockOver event.

OnGetSiteInfo occurs only if DockSite is true.

C++ Examples:

```
/*
The following example is taken from the docking demo. It
shows how set permissions to dock dockable objects onto a
docking site.
*/

void __fastcall TMainForm::LeftDockPanelDockDrop(TObject *Sender,
      TDragDockObject *Source, int X, int Y)
{
  //OnDockDrop gets called AFTER the client has actually docked,
  //so we check for DockClientCount = 1 before making the dock panel visible.
  TPanel *panel = dynamic_cast<TPanel *>(Sender);
  if (panel->DockClientCount == 1)
    ShowDockPanel(panel, True, NULL);
  panel->DockManager->ResetBounds(True);
  //Make DockManager repaints it's clients.
}

void __fastcall TMainForm::LeftDockPanelDockOver(TObject *Sender,
      TDragDockObject *Source, int X, int Y, TDragState State, bool &Accept)
{
  Accept = (dynamic_cast<TDockableForm*>(Source->Control) != NULL);
  if (Accept)
  {
    // Modify the DockRect to preview dock area.
    Types::TPoint TopLeft = LeftDockPanel->ClientToScreen(Point(0, 0));
    Types::TPoint BottomRight = LeftDockPanel->ClientToScreen(
      Point(this->ClientWidth/3, LeftDockPanel->Height));
    Source->DockRect = Types::TRect(TopLeft, BottomRight);
  }
}
```

```
void __fastcall TMainForm::LeftDockPanelUnDock(TObject *Sender,
      TControl *Client, TWinControl *NewTarget, bool &Allow)
{
  //OnUnDock gets called BEFORE the client is undocked, in order to optionally
  //disallow the undock. DockClientCount is never 0 when called from this event.
  TPanel *panel = dynamic_cast<TPanel *>(Sender);
  if (panel->DockClientCount == 1)
    ShowDockPanel(panel, False, NULL);
}

void __fastcall TMainForm::LeftDockPanelGetSiteInfo(TObject *Sender,
      TControl *DockClient, TRect &InfluenceRect, TPoint &MousePos,
      bool &CanDock)
{
  //if CanDock is true, the panel will not automatically draw the preview rect.
  CanDock = DockClient->ClassNameIs("TDockableForm");
  if (!CanDock)
  {
     ShowMessage("GetSiteInfo CanDock went bad!");
  }
}
```

Delphi Examples:

```
{
The following example is taken from the docking demo. It
shows how set permissions to dock dockable objects onto a
docking site.
}

procedure TMainForm.LeftDockPanelDockDrop(Sender: TObject;
  Source: TDragDockObject; X, Y: Integer);
begin
  //OnDockDrop gets called AFTER the client has actually docked,
  //so we check for DockClientCount = 1 before making the dock panel visible.
  if (Sender as TPanel).DockClientCount = 1 then
    ShowDockPanel(Sender as TPanel, True, nil);
  (Sender as TPanel).DockManager.ResetBounds(True);
  //Make DockManager repaints it's clients.
end;

procedure TMainForm.LeftDockPanelDockOver(Sender: TObject;
  Source: TDragDockObject; X, Y: Integer; State: TDragState;
  var Accept: Boolean);
var
  ARect: TRect;
begin
  Accept := Source.Control is TDockableForm;
  if Accept then
  begin
    //Modify the DockRect to preview dock area.
    ARect.TopLeft := LeftDockPanel.ClientToScreen(Point(0, 0));
    ARect.BottomRight := LeftDockPanel.ClientToScreen(
      Point(Self.ClientWidth div 3, LeftDockPanel.Height));
    Source.DockRect := ARect;
  end;
end;

procedure TMainForm.LeftDockPanelUnDock(Sender: TObject; Client: TControl;
  NewTarget: TWinControl; var Allow: Boolean);
begin
  //OnUnDock gets called BEFORE the client is undocked, in order to optionally
  //disallow the undock. DockClientCount is never 0 when called from this event.
  if (Sender as TPanel).DockClientCount = 1 then
    ShowDockPanel(Sender as TPanel, False, nil);
end;
```

```
procedure TMainForm.LeftDockPanelGetSiteInfo(Sender: TObject;
  DockClient: TControl; var InfluenceRect: TRect; MousePos: TPoint;
  var CanDock: Boolean);
begin
  //if CanDock is true, the panel will not automatically draw the preview rect.
  CanDock := DockClient is TDockableForm;
end;
```

68.1.10.3.23 TControlBar.OnMouseActivate Event

Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.

Pascal

```
property OnMouseActivate: TMouseActivateEvent;
```

C++

```
__property TMouseActivateEvent OnMouseActivate;
```

Description

Use the OnMouseActivate event handler to implement any special processing that should occur as a result of pressing a mouse button on a control when the parent top-level form is not active.

The event type is:

```
TMouseActivateEvent = procedure (Sender: TObject; Button: TMouseButton; ShiftState:
TShiftState;
X, Y: Integer; HitTest: Integer; var MouseActivate: TMouseActivate) of object;
```

When you click on a control and the parent top-level form is not active, this event fires on the control that the mouse cursor is over. MouseActivate is a protected virtual function in TControl. MouseActivate can be overridden in custom control descendants to provide special built-in processing of the OnMouseActivate events. If you leave the default value of MouseActivate as maDefault, the parent control fires the OnMouseActivate event and repeats the process all the way up to the top-level form. If no control in the chain sets the value of MouseActivate, the behavior is the same as if a control set TMouseActivate to maActivate. At any point, a control can set the value of TMouseActivate and the parent processing stops.

Some controls set focus to themselves when they get a button down message so, in some cases, setting maNoActivate appears to have no effect. For instance, a TButton control sets focus to itself in the WM_LBUTTONDOWN message regardless of whether or not TMouseActivate is set to maNoActivate. In this case, setting maNoActivateAndEat will work because the top-level form is not activated and the WM_LBUTTONDOWN message is suppressed.

The HitTest parameter is the hit test value obtained from the WM_NCHITTEST message. See Windows.pas for valid values and their meanings. In most cases this value will be HTCLIENT, which means that the user clicked in the client area of a control. However, in the case of a top-level form, this can take other values such as HTCAPTION, or HTBOTTOM. This allows the code to decide which value to set for MouseActivate, based on the HitTest code. For example, the following code in the OnMouseActivate event handler for a TForm forces the user to click into a non-client area to activate the form:

```
if HitTest = HTCLIENT then
    MouseActivate := maNoActivateAndEat;
```

Even though this event is tied to how Windows processes WM_MOUSEACTIVATE, the actual handling of the message is done

at the TControl level, which is the point in the VCL hierarchy where the control has no window handle. The OnMouseActivate event is then simulated since the all TControl descendants also have OnMouseDown, OnMouseMove, and OnMouseUp events. This information is applicable to both VCL Win32 and VCL.NET.

68.1.10.3.24 TControlBar.OnMouseDown Event

Occurs when the user presses a mouse button with the mouse pointer over a control.

Pascal

```
property OnMouseDown: TMouseEvent;
```

C++

```
__property TMouseEvent OnMouseDown;
```

Description

Use the OnMouseDown event handler to implement any special processing that should occur as a result of pressing a mouse button.

The OnMouseDown event handler can respond to left, right, or center mouse button presses and shift key plus mouse-button combinations. Shift keys are the Shift, Ctrl, and Alt keys. X and Y are the pixel coordinates of the mouse pointer in the client area of the Sender.

C++ Examples:

```
/*
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a
rectangle is drawn on the form. When the mouse button is
released, the rectangle appears on the form's canvas. Its
top-left and bottom-right corners are defined by the
location of the mouse pointer when the user pressed and
released the mouse button.  While the user drags the mouse,
the location of the top, left, bottom, and right sides of
the rectangle are displayed in the status bar.
*/
int StartX, StartY; // Declare at the top of the form's unit
// Use this code as the OnMouseDown event handler of the form:
void __fastcall TForm1::FormMouseDown(TObject *Sender, TMouseButton Button, TShiftState Shift,
int X, int Y)
{
  StartX = X;
  StartY = Y;
}

// Use this code as the OnMouseUp event handler of the form:
void __fastcall TForm1::FormMouseUp(TObject *Sender, TMouseButton Button, TShiftState Shift,
int X, int Y)
{
  Form1->Canvas->Rectangle(StartX, StartY, X, Y);
  StatusBar1->Panels->Items[0]->Text = "";
  StatusBar1->Panels->Items[1]->Text = "";
```

```
  StatusBar1->Panels->Items[2]->Text = "";
  StatusBar1->Panels->Items[3]->Text = "";
}

// Use this code as the OnMouseMove event handler of the form:
void __fastcall TForm1::FormMouseMove(TObject *Sender, TShiftState Shift, int X, int Y)
{
  if (Shift.Contains(ssLeft)) // make sure button is down
  {
    if (Y > StartY)
    {
      StatusBar1->Panels->Items[0]->Text = "Top: " + IntToStr(StartY);
      StatusBar1->Panels->Items[2]->Text = "Bottom: " + IntToStr(Y);
    }
    else
    {
      StatusBar1->Panels->Items[0]->Text = "Top: " + IntToStr(Y);
      StatusBar1->Panels->Items[2]->Text = "Bottom: " + IntToStr(StartY);
    }
    if (X > StartX)
    {
      StatusBar1->Panels->Items[1]->Text = "Left: " + IntToStr(StartX);
      StatusBar1->Panels->Items[3]->Text = "Right: " + IntToStr(X);
    }
    else
    {
      StatusBar1->Panels->Items[1]->Text = "Left: " + IntToStr(X);
      StatusBar1->Panels->Items[3]->Text = "Right: " + IntToStr(StartX);
    }
  }
}
```

Delphi Examples:

```
{

68.1.10.3.25 TControlBar.OnMouseEnter Event

Occurs when the user moves the mouse into a control.

Pascal

```
property OnMouseEnter: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnMouseEnter;
```

Description

Use the OnMouseEnter event handler to implement any special processing that should occur as a result of moving the mouse into a control when the parent top-level form is not active.

68.1.10.3.26 TControlBar.OnMouseLeave Event

Occurs when the user moves the mouse outside of a control.

Pascal

```
property OnMouseLeave: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnMouseLeave;
```

Description

Use the OnMouseLeave event handler to implement any special processing that should occur as a result of moving the mouse

outside of a control when the parent top-level form is not active.

68.1.10.3.27 TControlBar.OnMouseMove Event

Occurs when the user moves the mouse pointer while the mouse pointer is over a control.

Pascal

```
property OnMouseMove: TMouseMoveEvent;
```

C++

```
__property TMouseMoveEvent OnMouseMove;
```

Description

Use the OnMouseMove event handler to respond when the mouse pointer moves after the control has captured the mouse.

Use the Shift parameter of the OnMouseDown event handler, to determine to the state of the shift keys and mouse buttons. Shift keys are the Shift, Ctrl, and Alt keys or shift key-mouse button combinations. X and Y are pixel coordinates of the new location of the mouse pointer in the client area of the Sender.

C++ Examples:

```
/*
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a

68.1.10.3.28 TControlBar.OnMouseUp Event

Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.

Pascal

```
property OnMouseUp: TMouseEvent;
```

C++

```
__property TMouseEvent OnMouseUp;
```

Description

Use an OnMouseUp event handler to implement special processing when the user releases a mouse button.

The OnMouseUp event handler can respond to left, right, or center mouse button presses and shift key plus mouse-button combinations. Shift keys are the Shift, Ctrl, and Alt keys. X and Y are the pixel coordinates of the mouse pointer in the client area of the Sender.

C++ Examples:

    if (X > StartX)
    {
      StatusBar1->Panels->Items[1]->Text = "Left: " + IntToStr(StartX);
      StatusBar1->Panels->Items[3]->Text = "Right: " + IntToStr(X);
    }
    else
    {
      StatusBar1->Panels->Items[1]->Text = "Left: " + IntToStr(X);
      StatusBar1->Panels->Items[3]->Text = "Right: " + IntToStr(StartX);
    }
  }
}
```

Delphi Examples:

```
{
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a
rectangle is drawn on the form. When the mouse button is
released, the rectangle appears on the form’s canvas. Its
top-left and bottom-right corners are defined by the
location of the mouse pointer when the user pressed and
released the mouse button.  While the user drags the mouse,
the location of the top, left, bottom, and right sides of
the rectangle are displayed in the status bar.
}
procedure TForm1.FormMouseDown(Sender: TObject; Button: TMouseButton; Shift: TShiftState; X,
Y: Integer);
begin
  StartX := X;
  StartY := Y;
end;

procedure TForm1.FormMouseUp(Sender: TObject; Button: TMouseButton; Shift: TShiftState; X, Y:
Integer);
begin
  Form1.Canvas.Rectangle(StartX, StartY, X, Y);
  StatusBar1.Panels[0].Text := '';
  StatusBar1.Panels[1].Text := '';
  StatusBar1.Panels[2].Text := '';
  StatusBar1.Panels[3].Text := '';
end;
```

```
procedure TForm1.FormMouseMove(Sender: TObject; Shift: TShiftState; X, Y: Integer);
begin
  if ssLeft in Shift then { make sure button is down }
  begin
    if Y > StartY then
      begin
      StatusBar1.Panels[0].Text := 'Top: ' + IntToStr(StartY);
      StatusBar1.Panels[2].Text := 'Bottom: ' + IntToStr(Y);
      end
    else
      begin
      StatusBar1.Panels[0].Text := 'Top: ' + IntToStr(Y);
      StatusBar1.Panels[2].Text := 'Bottom: ' + IntToStr(StartY);
      end;
    if X > StartX then
      begin
      StatusBar1.Panels[1].Text := 'Left: ' + IntToStr(StartX);
      StatusBar1.Panels[3].Text := 'Right: ' + IntToStr(X);
      end
    else
      begin
      StatusBar1.Panels[1].Text := 'Left: ' + IntToStr(X);
      StatusBar1.Panels[3].Text := 'Right: ' + IntToStr(StartX);
      end;
  end;
end;
```

Responding to a Mouse-up Action

68.1.10.3.29 TControlBar.OnPaint Event

Occurs when the control bar is painted.

Pascal

```
property OnPaint: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnPaint;
```

Description

Write an OnPaint event handler to change the way the control bar is rendered. When a control bar receives a Windows paint message, it first draws the background picture, if any, and then generates an OnPaint event. After the OnPaint event exits, the control bar generates an OnBandPaint event for each band, finally rendering the grabbers and frames for each band.

Use the Canvas property to draw the control bar's image. Use the ClientRect property to obtain the dimensions on which to draw.

If the custom drawing is intended to change the appearance of individual bands, use the OnBandPaint event instead.

See Also

onbandpaint (see page 12473)

Canvas (see page 5921)

ClientRect

picture (see page 12471)

68.1.10.3.30 TControlBar.OnResize Event

Occurs immediately after the control is resized.

Pascal

```
property OnResize: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnResize;
```

Description

Use OnResize to make any final adjustments after a control is resized.

To modify the way a control responds when an attempt is made to resize it, use OnCanResize or OnConstrainedResize.

Note: Some controls call this event handler when the control is first created.

Delphi Examples:

```
{
The following code keeps the right edge on Button1 against
the right edge of Form1 when Form1 is resized.
}
procedure TForm1.FormResize(Sender: TObject);
begin
  Button1.Left := Form1.ClientWidth-Button1.Width;
end;
```

See Also

OnCanResize (see page 5851)

SetBounds (see page 5783)

AutoSize (see page 5803)

OnConstrainedResize (see page 5853)

68.1.10.3.31 TControlBar.OnStartDock Event

Occurs when the user begins to drag a control with a DragKind of dkDock.

Pascal

```
property OnStartDock: TStartDockEvent;
```

C++

```
__property TStartDockEvent OnStartDock;
```

Description

Use the OnStartDock event handler to implement special processing when the user starts a drag-and-dock operation by dragging the control.

The OnStartDock event handler can create a TDragDockObjectEx object for the DragObject parameter to specify the appearance of the dragging rectangle and how the dragged control interacts with potential docking sites. If you return TDragDockObjectEx as the drag object, there is no need to call the Free method for the DragObject when dragging is over. If you use TDragDockObject, your application is responsible for freeing the drag object.

If the OnStartDock event handler sets the DragObject parameter to nil (Delphi) or NULL (C++), a TDragDockObject object is

automatically created.

Note: This information applies to Win32 applications only.

See Also

OnEndDock (see page 5859)

TDragDockObjectEx (see page 6018)

DragKind (see page 5819)

OnDragOver (see page 5857)

OnDockDrop (see page 6214)

68.1.10.3.32 TControlBar.OnStartDrag Event

Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.

Pascal

```
property OnStartDrag: TStartDragEvent;
```

C++

```
__property TStartDragEvent OnStartDrag;
```

Description

Use the OnStartDrag event handler to implement special processing when the user starts to drag the control or an object it contains. OnStartDrag only occurs if DragKind is dkDrag.

Sender is the control that is about to be dragged, or that contains the object about to be dragged.

The OnStartDrag event handler can create a TDragControlObjectEx instance for the DragObject parameter to specify the drag cursor, or, optionally, a drag image list. If you create a TDragControlObjectEx instance, there is no need to call the Free method for the DragObject when dragging is over. If you create, instead, a TDragControlObject instance, your application is responsible for freeing the drag object instance.

If the OnStartDrag event handler sets the DragObject parameter to nil (Delphi) or NULL (C++), a TDragControlObject object is automatically created and dragging begins on the control itself.

Note: On some controls, such as TRichEdit, the underlying Windows control handles internal drag operations. For these controls, there are no OnStartDrag or OnEndDrag events for drag operations within the control.

OnEndDrag (see page 5860)

TDragControlObjectEx (see page 6007)

DragKind (see page 5819)

OnDragOver (see page 5857)

OnDragDrop (see page 5855)

68.1.10.3.33 TControlBar.OnUnDock Event

Occurs when the application tries to undock a control that is docked to the windowed control.

Pascal

```
property OnUnDock: TUnDockEvent;
```

C++

```
__property TUnDockEvent OnUnDock;
```

Description

Write an OnUnDock event handler to adjust the windowed control when a dock client is undocked. The OnUnDock event handler can make any necessary adjustments, or it can block the undock attempt by setting the Allow parameter to false.

C++ Examples:

```
/*
The following example is taken from the docking demo. It
shows how the OnUnDock event handler of the conjoinment
docking site re-enables docking in the control that is
undocked (if it is a dockable form). In addition, when the
next to last docked control is undocked, the conjoinment
docking site sends itself a close message so that the last
docked control is undocked to its old position and size.
*/
void __fastcall TConjoinDockHost::FormUnDock(TObject *Sender, TControl *Client,
      TWinControl *NewTarget, bool &Allow)
{
  // Only 2 dock clients means the host must be destroyed and
  // the remaining window undocked to its old position and size.
  // Recall that OnUnDock gets called before the undocking
  // actually occurs.
  if (Client->ClassNameIs("TDockableForm"))
    dynamic_cast<TDockableForm *>(Client)->DockSite = True;
  if ((DockClientCount == 2) && (NewTarget != this))        // Self?
    PostMessage(dynamic_cast<TConjoinDockHost *>(this)->Handle, WM_CLOSE, 0, 0);
  UpdateCaption(Client);
}
/*
The following example is taken from the docking demo. It
shows how set permissions to dock dockable objects onto a
docking site.
*/

void __fastcall TMainForm::LeftDockPanelDockDrop(TObject *Sender,
      TDragDockObject *Source, int X, int Y)
{
  //OnDockDrop gets called AFTER the client has actually docked,
  //so we check for DockClientCount = 1 before making the dock panel visible.
  TPanel *panel = dynamic_cast<TPanel *>(Sender);
  if (panel->DockClientCount == 1)
    ShowDockPanel(panel, True, NULL);
  panel->DockManager->ResetBounds(True);
  //Make DockManager repaints it's clients.
}

void __fastcall TMainForm::LeftDockPanelDockOver(TObject *Sender,
      TDragDockObject *Source, int X, int Y, TDragState State, bool &Accept)
{
  Accept = (dynamic_cast<TDockableForm*>(Source->Control) != NULL);
  if (Accept)
  {
    // Modify the DockRect to preview dock area.
    Types::TPoint TopLeft = LeftDockPanel->ClientToScreen(Point(0, 0));
    Types::TPoint BottomRight = LeftDockPanel->ClientToScreen(
      Point(this->ClientWidth/3, LeftDockPanel->Height));
    Source->DockRect = Types::TRect(TopLeft, BottomRight);
  }
```

```
}

void __fastcall TMainForm::LeftDockPanelUnDock(TObject *Sender,
      TControl *Client, TWinControl *NewTarget, bool &Allow)
{
  //OnUnDock gets called BEFORE the client is undocked, in order to optionally
  //disallow the undock. DockClientCount is never 0 when called from this event.
  TPanel *panel = dynamic_cast<TPanel *>(Sender);
  if (panel->DockClientCount == 1)
    ShowDockPanel(panel, False, NULL);
}

void __fastcall TMainForm::LeftDockPanelGetSiteInfo(TObject *Sender,
      TControl *DockClient, TRect &InfluenceRect, TPoint &MousePos,
      bool &CanDock)
{
  //if CanDock is true, the panel will not automatically draw the preview rect.
  CanDock = DockClient->ClassNameIs("TDockableForm");
  if (!CanDock)
  {
     ShowMessage("GetSiteInfo CanDock went bad!");
  }
}
```

Delphi Examples:

```
{
The following example is taken from the docking demo. It
shows how the OnUnDock event handler of the conjoinment
docking site re-enables docking in the control that is
undocked (if it is a dockable form). In addition, when the
next to last docked control is undocked, the conjoinment
docking site sends itself a close message so that the last
docked control is undocked to its old position and size.
}
procedure TConjoinDockHost.FormUnDock(Sender: TObject; Client: TControl;
  NewTarget: TWinControl; var Allow: Boolean);
begin
  // Only 2 dock clients means the host must be destroyed and
  // the remaining window undocked to its old position and size.
  // Recall that OnUnDock gets called before the undocking
  // actually occurs.
  if Client is TDockableForm then
    TDockableForm(Client).DockSite := True;
  if (DockClientCount = 2) and (NewTarget <> Self) then
    PostMessage(Self.Handle, WM_CLOSE, 0, 0);
  UpdateCaption(Client);
end;
{
The following example is taken from the docking demo. It
shows how set permissions to dock dockable objects onto a
docking site.
}

procedure TMainForm.LeftDockPanelDockDrop(Sender: TObject;
  Source: TDragDockObject; X, Y: Integer);
begin
  //OnDockDrop gets called AFTER the client has actually docked,
  //so we check for DockClientCount = 1 before making the dock panel visible.
  if (Sender as TPanel).DockClientCount = 1 then
    ShowDockPanel(Sender as TPanel, True, nil);
  (Sender as TPanel).DockManager.ResetBounds(True);
  //Make DockManager repaints it's clients.
end;

procedure TMainForm.LeftDockPanelDockOver(Sender: TObject;
  Source: TDragDockObject; X, Y: Integer; State: TDragState;
```

```
    var Accept: Boolean);
  var
    ARect: TRect;
  begin
    Accept := Source.Control is TDockableForm;
    if Accept then
    begin
      //Modify the DockRect to preview dock area.
      ARect.TopLeft := LeftDockPanel.ClientToScreen(Point(0, 0));
      ARect.BottomRight := LeftDockPanel.ClientToScreen(
        Point(Self.ClientWidth div 3, LeftDockPanel.Height));
      Source.DockRect := ARect;
    end;
  end;

  procedure TMainForm.LeftDockPanelUnDock(Sender: TObject; Client: TControl;
    NewTarget: TWinControl; var Allow: Boolean);
  begin
    //OnUnDock gets called BEFORE the client is undocked, in order to optionally
    //disallow the undock. DockClientCount is never 0 when called from this event.
    if (Sender as TPanel).DockClientCount = 1 then
      ShowDockPanel(Sender as TPanel, False, nil);
  end;

  procedure TMainForm.LeftDockPanelGetSiteInfo(Sender: TObject;
    DockClient: TControl; var InfluenceRect: TRect; MousePos: TPoint;
    var CanDock: Boolean);
  begin
    //if CanDock is true, the panel will not automatically draw the preview rect.
    CanDock := DockClient is TDockableForm;
  end;
```

68.1.11 TControlCollection Class

Class Hierarchy

Pascal

```
TControlCollection = class(TOwnedCollection);
```

C++

```
class TControlCollection : public TOwnedCollection;
```

File

ExtCtrls

Description

This is class ExtCtrls.TControlCollection.

68.1.11.1 TControlCollection Members

The following tables list the members exposed by TControlCollection.

Protected Methods

	Name	Description
V	Added (see page 2736)	Responds when items are added to the collection.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	Changed (see page 2740)	Responds when the collection or any of its items changes.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	Deleting (see page 2741)	Responds when items are deleted from the collection.
	GetAttr (see page 2743)	Returns the name of a custom attribute that can be retrieved using the GetItemAttr (see page 2745) method.
	GetAttrCount (see page 2744)	Returns the number of custom attributes associated with items in the collection.
	GetControl (see page 12397)	This is GetControl, a member of class TControlCollection.
	GetControlItem (see page 12397)	This is GetControlItem, a member of class TControlCollection.
	GetItem (see page 12397)	Returns a specified item in the collection.
	GetItemAttr (see page 2745)	Returns the value of a custom attribute assigned to one of the collection's items.
V	GetOwner (see page 2915)	Returns the owner of an object.
	GetOwner (see page 2932)	Returns the owner of an object.
V	Notify (see page 2746)	Responds when items are added to or removed from the collection.
	SetControl (see page 12398)	This is SetControl, a member of class TControlCollection.
	SetItem (see page 12398)	This is SetItem, a member of class TControlCollection.
V	SetItemName (see page 2747)	Initializes the name of a newly inserted collection item.
V	Update (see page 12398)	Updates the collection to reflect changes to its items.

Protected Properties

	Name	Description
R	NextID (see page 2752)	Specifies a unique ID that can be assigned to the next added collection item.
	PropName (see page 2752)	Specifies the name of the property that the collection implements.
R	UpdateCount (see page 2753)	Counts the number of times BeginUpdate (see page 2739) was called without a corresponding call to EndUpdate (see page 2742).

Public Methods

	Name	Description
	Add (see page 12396)	Creates a new TCollectionItem instance and adds it to the Items array.
	AddControl (see page 12396)	This is AddControl, a member of class TControlCollection.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2736)	Copies the contents of another collection to the object where the method is executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
V	BeginUpdate (see page 2739)	Suspends screen repainting.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Clear (see page 2741)	Deletes all items from the collection.
	Create (see page 12395)	This is Create, a member of class TControlCollection.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.

	Delete (see page 2741)	Deletes a single item from the collection.
V	Destroy (see page 2735)	Destroys the collection and each item in it.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
V	EndUpdate (see page 2742)	Re-enables screen repainting.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindItemID (see page 2743)	Returns the item with the specified ID.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetEnumerator (see page 2744)	Returns a TCollection (see page 2731) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2745)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	IndexOf (see page 12397)	This is IndexOf, a member of class TControlCollection.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	Insert (see page 2746)	Creates a new TCollectionItem (see page 2755) instance and adds it to the Items (see page 2751) array.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	Owner (see page 12398)	Returns the Owner of the collection.
	RemoveControl (see page 12398)	This is RemoveControl, a member of class TControlCollection.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
	Capacity (see page 2748)	Provides access to the internal TList (see page 2868) Capacity property.
R	ControlItems (see page 12399)	This is ControlItems, a member of class TControlCollection.
	Controls (see page 12399)	This is Controls, a member of class TControlCollection.
R	Count (see page 2749)	Returns the number of items in the collection.
R	ItemClass (see page 2751)	Indicates the class to which the collection's items belong.
	Items (see page 12400)	Lists the items in the collection.

68.1.11.2 TControlCollection.Create Constructor

Pascal

```
constructor Create(AOwner: TPersistent);
```

C++

```
__fastcall TControlCollection(TPersistent * AOwner);
```

Description

This is Create, a member of class TControlCollection.

68.1.11.3 TControlCollection Methods

The methods of the TControlCollection class are listed here.

Protected Methods

	Name	Description
	GetControl (see page 12397)	This is GetControl, a member of class TControlCollection.
	GetControlItem (see page 12397)	This is GetControlItem, a member of class TControlCollection.
	GetItem (see page 12397)	Returns a specified item in the collection.
	SetControl (see page 12398)	This is SetControl, a member of class TControlCollection.
	SetItem (see page 12398)	This is SetItem, a member of class TControlCollection.
V	Update (see page 12398)	Updates the collection to reflect changes to its items.

Public Methods

	Name	Description
	Add (see page 12396)	Creates a new TCollectionItem instance and adds it to the Items array.
	AddControl (see page 12396)	This is AddControl, a member of class TControlCollection.
	IndexOf (see page 12397)	This is IndexOf, a member of class TControlCollection.
	Owner (see page 12398)	Returns the Owner of the collection.
	RemoveControl (see page 12398)	This is RemoveControl, a member of class TControlCollection.

68.1.11.3.1 TControlCollection.Add Method

Creates a new TCollectionItem instance and adds it to the Items array.

Pascal

```
function Add: TControlItem;
```

C++

```
__fastcall TControlItem Add();
```

Description

Call Add to create an item in the collection. The new item is placed at the end of the Items array.

Add returns the new collection item.

See Also

Items (see page 2751)

Insert (see page 2746)

Create (see page 2734)

Delete (see page 2741)

68.1.11.3.2 TControlCollection.AddControl Method

Pascal

```
procedure AddControl(AControl: TControl; AColumn: Integer = -1; ARow: Integer = -1);
```

C++

```
__fastcall AddControl(TControl * AControl, int AColumn = -1, int ARow = -1);
```

Description

This is AddControl, a member of class TControlCollection.

68.1.11.3.3 TControlCollection.GetControl Method

Pascal

```
function GetControl(AColumn: Integer; ARow: Integer): TControl;
```

C++

```
__fastcall TControl * GetControl(int AColumn, int ARow);
```

Description

This is GetControl, a member of class TControlCollection.

68.1.11.3.4 TControlCollection.GetControlItem Method

Pascal

```
function GetControlItem(AColumn: Integer; ARow: Integer): TControlItem;
```

C++

```
__fastcall TControlItem GetControlItem(int AColumn, int ARow);
```

Description

This is GetControlItem, a member of class TControlCollection.

68.1.11.3.5 TControlCollection.GetItem Method

Returns a specified item in the collection.

Pascal

```
function GetItem(Index: Integer): TControlItem;
```

C++

```
__fastcall TControlItem GetItem(int Index);
```

Description

GetItem is the protected read implementation of the Items property.

See Also

Items (see page 2751)

68.1.11.3.6 TControlCollection.IndexOf Method

Pascal

```
function IndexOf(AControl: TControl): Integer;
```

C++

```
__fastcall int IndexOf(TControl * AControl);
```

Description

This is IndexOf, a member of class TControlCollection.

68.1.11.3.7 TControlCollection.Owner Method

Returns the Owner of the collection.

Pascal

```
function Owner: TCustomGridPanel;
```

C++

```
__fastcall TCustomGridPanel Owner();
```

Description

Call Owner to obtain a reference to the object that owns this collection. Typically, the owner uses the collection to implement one of its properties.

68.1.11.3.8 TControlCollection.RemoveControl Method

Pascal

```
procedure RemoveControl(AControl: TControl);
```

C++

```
__fastcall RemoveControl(TControl * AControl);
```

Description

This is RemoveControl, a member of class TControlCollection.

68.1.11.3.9 TControlCollection.SetControl Method

Pascal

```
procedure SetControl(AColumn: Integer; ARow: Integer; Value: TControl);
```

C++

```
__fastcall SetControl(int AColumn, int ARow, TControl * Value);
```

Description

This is SetControl, a member of class TControlCollection.

68.1.11.3.10 TControlCollection.SetItem Method

Pascal

```
procedure SetItem(Index: Integer; Value: TControlItem);
```

C++

```
__fastcall SetItem(int Index, TControlItem Value);
```

Description

This is SetItem, a member of class TControlCollection.

68.1.11.3.11 TControlCollection.Update Method

Updates the collection to reflect changes to its items.

Pascal

```
procedure Update(Item: TCollectionItem); override;
```

C++

```
virtual __fastcall Update(TCollectionItem Item);
```

Description

Override Update in a descendant class to make any necessary changes when the items in the collection change. This method is called automatically when an update is complete.

Item identifies the item that changed. If the Item parameter is nil (Delphi) or NULL (C++), then the change affects more than one item in the collection.

As implemented in TCollection, Update does nothing. Descendant classes override this method to make any necessary adjustments.

Changed (see page 2740)

Changed (see page 2758)

68.1.11.4 TControlCollection Properties

The properties of the TControlCollection class are listed here.

Public Properties

	Name	Description
R	ControlItems (see page 12399)	This is ControlItems, a member of class TControlCollection.
	Controls (see page 12399)	This is Controls, a member of class TControlCollection.
	Items (see page 12400)	Lists the items in the collection.

68.1.11.4.1 TControlCollection.ControlItems Property

Pascal

```
property ControlItems [AColumn, ARow: Integer]: TControlItem;
```

C++

```
__property TControlItem ControlItems[int AColumn, ARow];
```

Description

This is ControlItems, a member of class TControlCollection.

68.1.11.4.2 TControlCollection.Controls Property

Pascal

```
property Controls [AColumn, ARow: Integer]: TControl;
```

C++

```
__property TControl * Controls[int AColumn, ARow];
```

Description

This is Controls, a member of class TControlCollection.

68.1.11.4.3 TControlCollection.Items Property

Lists the items in the collection.

Pascal

```
property Items [Index: Integer]: TControlItem;
```

C++

```
__property TControlItem Items[int Index];
```

Description

Use Items to access individual items in the collection. The value of the Index parameter corresponds to the Index property of TCollectionItem. It represents the position of the item in the collection.

See Also

Count (see page 2749)

ItemClass (see page 2751)

Index (see page 2762)

Add (see page 2736)

Insert (see page 2746)

68.1.12 TControlItem Class

Class Hierarchy

Pascal

```
TControlItem = class(TCollectionItem);
```

C++

```
class TControlItem : public TCollectionItem;
```

File

ExtCtrls

Description

This is class ExtCtrls.TControlItem.

68.1.12.1 TControlItem Members

The following tables list the members exposed by TControlItem.

Protected Methods

	Name	Description
	AssignTo (see page 12403)	Copies the properties of an object to a destination object.
	Changed (see page 2758)	Updates the collection to reflect changes to the collection item.

	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetDisplayName (see page 2758)	Returns the name of the collection item as it appears in the collection editor.
	GetOwner (see page 2759)	Returns the collection to which this item belongs.
	GetOwner (see page 2932)	Returns the owner of an object.
	InternalSetLocation (see page 12403)	This is InternalSetLocation, a member of class TControlItem.
	SetCollection (see page 2759)	Sets the value of the Collection (see page 2761) property.
	SetDisplayName (see page 2760)	Sets the name of the collection item as it appears in the collection editor.
	SetIndex (see page 2760)	Moves the collection item to a specified position in the parent collection.

Protected Properties

	Name	Description
	GridPanel (see page 12405)	This is GridPanel, a member of class TControlItem.
	Pushed (see page 12405)	This is Pushed, a member of class TControlItem.

Public Methods

	Name	Description
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 12402)	Creates and initializes a TCollectionItem instance.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 12402)	Destroys the TCollectionItem instance and frees its memory.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2759)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetLocation (see page 12404)	This is SetLocation, a member of class TControlItem.

Public Properties

	Name	Description
	Collection (see page 2761)	Specifies the TCollection (see page 2731) instance to which the TCollectionItem (see page 2755) belongs.
	DisplayName (see page 2761)	The name displayed in the Collection (see page 2761) editor.
R	ID (see page 2761)	A unique, permanent index for the item.
	Index (see page 2762)	Returns the item's position in the Items array of TCollection (see page 2731).

Published Properties

	Name	Description
	Column (see page 12404)	This is Column, a member of class TControlItem.
	ColumnSpan (see page 12404)	This is ColumnSpan, a member of class TControlItem.
	Control (see page 12405)	This is Control, a member of class TControlItem.
	Row (see page 12405)	This is Row, a member of class TControlItem.
	RowSpan (see page 12406)	This is RowSpan, a member of class TControlItem.

68.1.12.2 TControlItem.Create Constructor

Creates and initializes a TCollectionItem instance.

Pascal

```
constructor Create(Collection: TCollection); override;
```

C++

```
virtual __fastcall TControlItem(TCollection Collection);
```

Description

Do not call Create to instantiate a collection item. Instead, call the Add method of the collection to which the item should belong.

Collection identifies the TCollection instance to which the new item belongs.

See Also

Add (see page 2736)

Collection (see page 2761)

68.1.12.3 TControlItem.Destroy Destructor

Destroys the TCollectionItem instance and frees its memory.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TControlItem();
```

Description

Destroy is called indirectly by TCollection's Clear or Delete method.

See Also

Clear (see page 2741)

Delete (see page 2741)

Free (see page 22300)

68.1.12.4 TControlItem Methods

The methods of the TControlItem class are listed here.

Protected Methods

	Name	Description
	AssignTo (see page 12403)	Copies the properties of an object to a destination object.
	InternalSetLocation (see page 12403)	This is InternalSetLocation, a member of class TControlItem.

Public Methods

	Name	Description
	SetLocation (see page 12404)	This is SetLocation, a member of class TControlItem.

68.1.12.4.1 TControlItem.AssignTo Method

Copies the properties of an object to a destination object.

Pascal

```
procedure AssignTo(Dest: TPersistent); override;
```

C++

```
virtual __fastcall AssignTo(TPersistent * Dest);
```

Description

Override the AssignTo method to extend the functionality of the Assign method of destination objects so that they handle newly created object classes. When defining a new object class, override the Assign method for every existing object class that should be able to copy its properties to the new class. Override the AssignTo method for every existing class to which the new class can copy.

The Assign method of TPersistent calls AssignTo if the descendant object does not succeed in copying the properties of a source object. The AssignTo method defined by TPersistent raises an EConvertError exception.

For example, given the following code in which A and B are instance variables:

```
A.Assign(B); {Delphi}
A->Assign(B); // C++
```

if A knows how to handle B, then it does so and returns. If A doesn't know how to handle B's type, execution will trickle to the TPersistent version of Assign, which calls:

```
B.AssignTo(A); {Delphi}
B->AssignTo(A); // C++
```

If B knows how to copy to A, the assignment succeeds. Otherwise, TPersistent raises an exception.

See Also

Assign (see page 2930)

EConvertError (see page 22724)

68.1.12.4.2 TControlItem.InternalSetLocation Method

Pascal

```
procedure InternalSetLocation(AColumn: Integer; ARow: Integer; APushed: Boolean; MoveExisting:
```

```
Boolean);
```

C++

```
__fastcall InternalSetLocation(int AColumn, int ARow, Boolean APushed, Boolean MoveExisting);
```

Description

This is InternalSetLocation, a member of class TControlItem.

68.1.12.4.3 TControlItem.SetLocation Method

Pascal

```
procedure SetLocation(AColumn: Integer; ARow: Integer; APushed: Boolean = False);
```

C++

```
__fastcall SetLocation(int AColumn, int ARow, Boolean APushed = False);
```

Description

This is SetLocation, a member of class TControlItem.

68.1.12.5 TControlItem Properties

The properties of the TControlItem class are listed here.

Protected Properties

	Name	Description
R	GridPanel (see page 12405)	This is GridPanel, a member of class TControlItem.
R	Pushed (see page 12405)	This is Pushed, a member of class TControlItem.

Published Properties

	Name	Description
	Column (see page 12404)	This is Column, a member of class TControlItem.
	ColumnSpan (see page 12404)	This is ColumnSpan, a member of class TControlItem.
	Control (see page 12405)	This is Control, a member of class TControlItem.
	Row (see page 12405)	This is Row, a member of class TControlItem.
	RowSpan (see page 12406)	This is RowSpan, a member of class TControlItem.

68.1.12.5.1 TControlItem.Column Property

Pascal

```
property Column: Integer;
```

C++

```
__property int Column;
```

Description

This is Column, a member of class TControlItem.

68.1.12.5.2 TControlItem.ColumnSpan Property

Pascal

```
property ColumnSpan: TCellSpan;
```

C++

```
__property TCellSpan ColumnSpan;
```

Description

This is ColumnSpan, a member of class TControlItem.

68.1.12.5.3 TControlItem.Control Property

Pascal

```
property Control: TControl;
```

C++

```
__property TControl * Control;
```

Description

This is Control, a member of class TControlItem.

68.1.12.5.4 TControlItem.GridPanel Property

Pascal

```
property GridPanel: TCustomGridPanel;
```

C++

```
__property TCustomGridPanel GridPanel;
```

Description

This is GridPanel, a member of class TControlItem.

68.1.12.5.5 TControlItem.Pushed Property

Pascal

```
property Pushed: Boolean;
```

C++

```
__property Boolean Pushed;
```

Description

This is Pushed, a member of class TControlItem.

68.1.12.5.6 TControlItem.Row Property

Pascal

```
property Row: Integer;
```

C++

```
__property int Row;
```

Description

This is Row, a member of class TControlItem.

68.1.12.5.7 TControlItem.RowSpan Property

Pascal

```
property RowSpan: TCellSpan;
```

C++

```
__property TCellSpan RowSpan;
```

Description

This is RowSpan, a member of class TControlItem.

68.1.13 TCustomColorBox Class

TCustomColorBox represents a combo box that lets users select a color.

Class Hierarchy

Pascal

```
TCustomColorBox = class(TCustomComboBox);
```

C++

```
class TCustomColorBox : public TCustomComboBox;
```

File

ExtCtrls

Description

TCustomColorBox is the base class for drop-down combo boxes that display a list of colors. The combo box displays a list of all the colors for which the Graphics (see page 14387) unit defines a constant. For a list of these colors, see TColor. Each color is displayed next to a small square that is drawn in the corresponding color.

Do not use TCustomColorBox in applications. It is intended to act as a base class for color selection controls. Rather, to add a drop-down combo box that lets users select a color, use the TColorBox (see page 12182) component, which appears on the Additional page of the component palette.

See Also

TComboBox (see page 21064)

TColorDialog (see page 11270)

TColorBox (see page 12182)

68.1.13.1 TCustomColorBox Members

The following tables list the members exposed by TCustomColorBox.

Protected Events

	Name	Description
	OnAlignInsertBefore (see page 6213)	Occurs when an object with custom alignment is aligned.
	OnAlignPosition (see page 6214)	Occurs when an object with custom alignment is aligned.
	OnCanResize (see page 5851)	Occurs when an attempt is made to resize the control.
	OnChange (see page 21197)	Occurs when the user changes the text displayed in the edit region.
	OnClick (see page 5851)	Occurs when the user clicks the control.
	OnCloseUp (see page 21199)	Occurs when the drop-down list closes up due to some user action.
	OnConstrainedResize (see page 5853)	Adjust resize constraints.
	OnContextPopup (see page 5854)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnDblClick (see page 5854)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDockDrop (see page 6214)	Occurs when another control is docked to the control.
	OnDockOver (see page 6216)	Occurs when another control is dragged over the control.
	OnDragDrop (see page 5855)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 5857)	Occurs when the user drags an object over a control.
	OnDrawItem (see page 21224)	Occurs when an item in an owner-draw combo box needs to be displayed.
	OnDropDown (see page 21199)	Occurs when the user opens the drop-down list.
	OnEndDock (see page 5859)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 5860)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnEnter (see page 6219)	Occurs when a control receives the input focus.
	OnExit (see page 6221)	Occurs when the input focus shifts away from one control to another.
	OnGetSiteInfo (see page 6223)	Returns the control's docking information.
	OnKeyDown (see page 6225)	Occurs when a user presses any key while the control has focus.
	OnKeyPress (see page 6227)	Occurs when a key is pressed.
	OnKeyUp (see page 6228)	Occurs when the user releases a key that has been pressed.
	OnMeasureItem (see page 21225)	Occurs when an item in a csOwnerDrawVariable combo box needs to be redisplayed.
	OnMouseActivate (see page 5861)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 5862)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseEnter (see page 5864)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 5864)	Occurs when the user moves the mouse outside of a control.
	OnMouseMove (see page 5865)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 5867)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnMouseWheel (see page 5869)	Occurs when the mouse wheel is rotated.
	OnMouseWheelDown (see page 5869)	Occurs when the mouse wheel is rotated downward.
	OnMouseWheelUp (see page 5870)	Occurs when the mouse wheel is rotated upward.
	OnResize (see page 5870)	Occurs immediately after the control is resized.
	OnSelect (see page 21201)	Occurs when the user selects a string in the drop-down list.
	OnStartDock (see page 5871)	Occurs when the user begins to drag a control with a DragKind (see page 5819) of dkDock.
	OnStartDrag (see page 5871)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.
	OnUnDock (see page 6230)	Occurs when the application tries to undock a control that is docked to the windowed control.

Protected Fields

	Name	Description
	FAnchorMove (see page 5733)	This is FAnchorMove, a member of class TControl.
	FAnchorOrigin (see page 5734)	This is FAnchorOrigin, a member of class TControl.

	FAnchorRules (see page 5734)	This is FAnchorRules, a member of class TControl.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FDefEditProc (see page 21167)	This is FDefEditProc, a member of class TCustomCombo.
	FDefListProc (see page 21167)	This is FDefListProc, a member of class TCustomCombo.
	FDesignSize (see page 6124)	This is FDesignSize, a member of class TWinControl.
	FDoubleBuffered (see page 6124)	This is FDoubleBuffered, a member of class TWinControl.
	FDropHandle (see page 21168)	This is FDropHandle, a member of class TCustomCombo.
	FDroppingDown (see page 21168)	This is FDroppingDown, a member of class TCustomCombo.
	FEditHandle (see page 21168)	This is FEditHandle, a member of class TCustomCombo.
	FEditInstance (see page 21168)	This is FEditInstance, a member of class TCustomCombo.
	FExplicitHeight (see page 5734)	This is FExplicitHeight, a member of class TControl.
	FExplicitLeft (see page 5734)	This is FExplicitLeft, a member of class TControl.
	FExplicitTop (see page 5734)	This is FExplicitTop, a member of class TControl.
	FExplicitWidth (see page 5735)	This is FExplicitWidth, a member of class TControl.
	FFocusChanged (see page 21168)	This is FFocusChanged, a member of class TCustomCombo.
	FInImeComposition (see page 6125)	This is FInImeComposition, a member of class TWinControl.
	FIsFocused (see page 21169)	This is FIsFocused, a member of class TCustomCombo.
	FListHandle (see page 21169)	This is FListHandle, a member of class TCustomCombo.
	FListInstance (see page 21169)	This is FListInstance, a member of class TCustomCombo.
	FOriginalParentSize (see page 5735)	This is FOriginalParentSize, a member of class TControl.
	FSaveIndex (see page 21169)	This is FSaveIndex, a member of class TCustomCombo.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	ActionChange (see page 5737)	Responds when the action associated with the control changes.
V	ActionChange (see page 6127)	Updates the control to reflect changes in its associated action.
	AddBiDiModeExStyle (see page 6128)	Sets control's window style according to its bi-directional support.
V	AdjustClientRect (see page 6128)	Provides the interface that adjusts the ClientRect (see page 5810) property for idiosyncrasies of the window.
V	AdjustDropDown (see page 21171)	Adjusts the size and position of the drop down list.
	AdjustSize (see page 5738)	Sets the size of the control as determined by the AutoSize (see page 5803) property.
V	AdjustSize (see page 6129)	Adjusts the control's size according to its contents and constraints.
V	AlignControls (see page 6129)	Aligns any controls for which the control is the parent within a specified area of the control.
	ArrangeControl (see page 6130)	This is ArrangeControl, a member of class TWinControl.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	AssignTo (see page 5739)	Overrides the inherited AssignTo function to enable assignments to TAction objects.
V	AssignTo (see page 6130)	Copies the properties of the windowed control to another object.
	BeginAutoDrag (see page 5739)	Begin Automatic Drag.
	CalcCursorPos (see page 5741)	This is CalcCursorPos, a member of class TControl.
V	CanAutoSize (see page 5741)	Indicates whether the control can resize itself automatically to accommodate its contents.
V	CanAutoSize (see page 6131)	Indicates how the control can be resized.
V	CanResize (see page 5742)	OnCanResize (see page 5851) event dispatcher.
V	CanResize (see page 6132)	Indicates how the control can respond to a resize attempt.
	Change (see page 21171)	Generates an OnChange (see page 21197) event.
	Changed (see page 5742)	Sends a CM_CHANGED (see page 6330) message to the control.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	ChangeScale (see page 5743)	Rescaling event dispatcher.
V	ChangeScale (see page 6132)	Resize (see page 5780) and reposition children and self.
	Click (see page 5743)	Respond to user click.

	CloseUp (see page 12419)	Generates an OnCloseUp event.
	ComboWndProc (see page 21173)	Responds to Windows messages sent to the edit control or drop-down list.
	ConstrainedResize (see page 5746)	Notify control of resize with constraints.
	ConstrainedResize (see page 6133)	Generates an OnConstrainedResize (see page 5853) event.
	ControlsAligned (see page 6134)	This is ControlsAligned, a member of class TWinControl.
	CreateDockManager (see page 6134)	Creates the dock manager for the control.
	CreateHandle (see page 6135)	Creates underlying screen object.
	CreateParams (see page 6135)	Initializes a window-creation parameter data structure.
	CreateParams (see page 21215)	Initializes the window-creation parameter record.
	CreateSubClass (see page 6136)	Creates a windowed control derived from an existing Windows window class.
	CreateWindowHandle (see page 6137)	Creates a Windows control to represent the control.
	CreateWnd (see page 12420)	Creates the window used to implement the color box.
	CustomAlignInsertBefore (see page 6137)	Returns placement order of custom-aligned child control.
	CustomAlignPosition (see page 6138)	Returns aligned position of custom-aligned child control.
	DblClick (see page 5747)	OnDblClick (see page 5854) event dispatcher.
	DefaultDockImage (see page 5747)	Handles the painting and erasing of a dock image.
	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	DefineProperties (see page 5748)	Provides methods to read and write the IsControl (see page 5829) property to a stream such as a form file.
	DefineProperties (see page 6139)	Provides methods to read and write the IsControl property to a stream such as a form file.
	DesignWndProc (see page 5749)	This is DesignWndProc, a member of class TControl.
	DestroyHandle (see page 6140)	Destroys the control's window without destroying the control.
	DestroyWindowHandle (see page 6140)	Destroys the window created in the CreateWindowHandle (see page 6137) method.
	DestroyWindowHandle (see page 21174)	Destroys all of the windows controls that implement the combo box.
	DestroyWnd (see page 6141)	Destroys the control's window.
	DestroyWnd (see page 21215)	Destroys the Windows control that represents the combo box.
	DoAddDockClient (see page 6142)	Performs actions when a control is docked to the windowed control.
	DockOver (see page 6143)	Responds when a docking client is dragged over the windowed control.
	DockReplaceDockClient (see page 6143)	This is DockReplaceDockClient, a member of class TWinControl.
	DockTrackNoTarget (see page 5749)	Handles dragging of the control over an invalid docking target.
	DoContextPopup (see page 5750)	OnContextPopup (see page 5854) event dispatcher.
	DoDock (see page 5750)	Docking event dispatcher.
	DoDockOver (see page 6143)	Generates an OnDockOver (see page 6216) event.
	DoEndDock (see page 5750)	OnEndDock (see page 5859) event dispatcher.
	DoEndDrag (see page 5751)	OnEndDrag (see page 5860) event dispatcher.
	DoEnter (see page 6144)	Respond to receiving input focus.
	DoExit (see page 6144)	Respond to losing input focus
	DoFlipChildren (see page 6145)	Flips the control's children.
	DoKeyDown (see page 6145)	Performs some preprocessing before generating an OnKeyDown (see page 6225) event.
	DoKeyPress (see page 6146)	Performs some preprocessing before generating an OnKeyPress (see page 6227) event.
	DoKeyUp (see page 6146)	Performs some preprocessing before generating an OnKeyUp (see page 6228) event.
	DoMouseWheel (see page 5751)	Processes mouse wheel motion.
	DoMouseWheelDown (see page 5752)	OnMouseWheelDown (see page 5869) event dispatcher.
	DoMouseWheelUp (see page 5752)	OnMouseWheelUp (see page 5870) event dispatcher.
	DoRemoveDockClient (see page 6147)	Responds when a control is undocked from the windowed control.
	DoStartDock (see page 5753)	OnStartDock (see page 5871) event dispatcher.
	DoStartDrag (see page 5753)	OnStartDrag (see page 5871) event dispatcher.
	DoUnDock (see page 6147)	Undocks a control that is currently docked to the windowed control.
	DragCanceled (see page 5754)	Provides the interface for a method that responds to the cancellation of a drag.

	DragOver (see page 5755)	OnDragOver (see page 5857) event dispatcher.
	DrawDragDockImage (see page 5755)	Draws the dock image for the control.
V	DrawItem (see page 12420)	Renders an individual item in the color box.
	DropDown (see page 21175)	Generates an OnDropDown (see page 21199) event.
V	EditWndProc (see page 21175)	Responds to Windows messages that are sent to the edit control portion of the combo box.
	EraseDragDockImage (see page 5757)	Erases the dock image for the control.
	FindNextControl (see page 6149)	Returns the control's next child in the tab order after the specified control.
	FixupTabList (see page 6149)	Sorts the child controls by their tab order.
V	GetAction (see page 5758)	This is GetAction, a member of class TControl.
	GetActionLinkClass (see page 5758)	Returns the appropriate action link class that is associated with the control class.
V	GetActionLinkClass (see page 6152)	Returns the associated action link class.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetChildren (see page 6153)	Calls a specified method for each child of the control.
V	GetClientOrigin (see page 5758)	Returns the screen coordinates of the top-left corner of the control's client area.
V	GetClientOrigin (see page 6153)	Returns the value of the ClientOrigin (see page 5809) property.
V	GetClientRect (see page 5759)	Returns a rectangle defining the client area of the control.
V	GetClientRect (see page 6154)	Returns the value of the ClientRect (see page 5810) property.
V	GetControlExtents (see page 6154)	Returns the smallest rectangle in which all the control's children fit.
A	GetCount (see page 5942)	Returns the number of items in the list.
V	GetCount (see page 21176)	Returns the value of the ItemCount (see page 21186) property.
V	GetDeviceContext (see page 5760)	Returns a device context for the control.
V	GetDeviceContext (see page 6155)	Provides access to a device context for the control.
	GetDockEdge (see page 5763)	Returns the edge on which another control should be docked when it is dragged over the control.
V	GetDragImages (see page 5763)	Returns the control's image list containing the image to be displayed while dragging.
	GetDroppedDown (see page 21176)	Returns the value of the DroppedDown (see page 21185) property.
V	GetEnabled (see page 5763)	Returns the value of the Enabled (see page 5821) property.
V	GetFloating (see page 5764)	Returns the value of the Floating (see page 5823) property.
V	GetFloatingDockSiteClass (see page 5764)	Returns the class used for the control when it is floating.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
A	GetItemCount (see page 21176)	Returns the value of the ItemCount (see page 21186) property.
V	GetItemCount (see page 21216)	Returns the number of items in the Items (see page 21187) property list.
A	GetItemHt (see page 21177)	Returns the value of the ItemHeight (see page 21186) property.
V	GetItemHt (see page 21216)	Returns the value of the ItemHeight (see page 21186) property.
A	GetItemIndex (see page 5942)	Returns the value of the ItemIndex (see page 5944) property.
V	GetItemIndex (see page 21177)	Returns the value of the ItemIndex property.
A	GetItemsClass (see page 21177)	Indicates the class that implements the Items (see page 21187) property.
V	GetItemsClass (see page 21217)	Returns the class used to implement the Items (see page 21187) property.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetPalette (see page 5765)	Returns the handle to a palette for use by the control.
	GetParentHandle (see page 6157)	Returns the window handle for the window of the control's parent.
	GetPopupMenu (see page 5765)	Returns the pop-up menu associated with the control.
	GetSelLength (see page 21178)	Returns the value of the SelLength (see page 21190) property.
	GetSelStart (see page 21178)	Returns the value of the SelStart (see page 21193) property.
	GetSelText (see page 21217)	Returns the value of the SelText (see page 21222) property.
	GetSiteInfo (see page 6158)	Generates an OnGetSiteInfo (see page 6223) event
	GetTopParentHandle (see page 6159)	Returns the window handle of the first window not associated with a VCL control that contains the windowed control.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.

	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	InvalidateDockHostSite (see page 6162)	This is InvalidateDockHostSite, a member of class TWinControl.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsControlActivateMsg (see page 6162)	This is IsControlActivateMsg, a member of class TWinControl.
	IsControlMouseMsg (see page 6162)	Indicates whether a specified mouse message is directed to one of the windowed control's child controls.
	IsQualifyingSite (see page 6163)	This is IsQualifyingSite, a member of class TWinControl.
V	KeyDown (see page 12420)	Generates an OnKeyDown event.
V	KeyPress (see page 12421)	Generates an OnKeyPress event.
	KeyUp (see page 6164)	Respond to released key.
	ListWndProc (see page 21178)	Responds to Windows messages that are sent to the drop-down list portion of the combo box.
V	Loaded (see page 12421)	Initializes the combo box after its form is loaded into memory.
	MainWndProc (see page 6165)	Receives Windows messages for the control.
V	MeasureItem (see page 21218)	Generates an OnMeasureItem (see page 21225) event.
	MouseActivate (see page 5773)	This is MouseActivate, a member of class TControl.
	MouseDown (see page 5773)	OnMouseDown (see page 5862) event dispatcher.
	MouseMove (see page 5773)	Respond to mouse moving over control area..
	MouseUp (see page 5774)	OnMouseUp (see page 5867) event dispatcher.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	Notification (see page 5775)	Responds to notifications that components are being created or destroyed.
V	Notification (see page 6165)	Responds to notifications that components are being created or destroyed.
	NotifyControls (see page 6165)	Sends a message to all the child controls.
	PaintControls (see page 6166)	Paints each of the child controls in a windowed control using the specified device context.
	PaintHandler (see page 6166)	Responds to WM_PAINT messages.
V	PaintWindow (see page 6169)	Renders the image of a windowed control.
	PaletteChanged (see page 5775)	Responds to changes in the system's palette by realizing the control's palette.
V	PaletteChanged (see page 6170)	Responds to changes in the system's palette by realizing the control's palette and the palette for each child control.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	PickCustomColor (see page 12422)	This is PickCustomColor, a member of class TCustomColorBox.
	PopulateList (see page 12422)	This is PopulateList, a member of class TCustomColorBox.
	PositionDockRect (see page 5777)	Positions the docking rectangle according to the current drag-and-dock state.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 5778)	Prepares the control for having its properties assigned values read from a stream.
V	ReadState (see page 6171)	Prepares the control for having its properties assigned values from a stream.
	RecreateWnd (see page 6171)	Recreate underlying Windows screen object.
	ReloadDockedControl (see page 6172)	Reloads a docked control.
	RemoveWindowProps (see page 6174)	This is RemoveWindowProps, a member of class TWinControl.
V	RequestAlign (see page 5780)	Instructs the parent of a control to reposition the control, enforcing its Align (see page 5798) property.
	ResetIme (see page 6174)	Restores the input method editor (IME) that was active when the application started.
	ResetImeComposition (see page 6175)	Directs the composition window of the input method editor (IME) to perform a specific action.
	Resize (see page 5780)	Respond to control resize.
	ScaleConstraints (see page 5781)	This is ScaleConstraints, a member of class TControl.
	ScaleControls (see page 6176)	Rescale child controls only.
V	Select (see page 12422)	Generates an OnSelect event.
	SelectFirst (see page 6177)	Locates first selectable child control.
	SelectItem (see page 21218)	Selects a specified item from the drop-down list.
	SelectNext (see page 6177)	Moves the input focus from the current child control to the next one in the tab order.

	SendCancelMode (see page 5781)	Cancels the modal state of the control.
	SendDockNotification (see page 5782)	Sends a Windows message to the control's host dock site.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
V	SetAutoSize (see page 5783)	This is SetAutoSize, a member of class TControl.
V	SetBiDiMode (see page 5783)	Sets the control's bi-directional mode.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
V	SetChildOrder (see page 6178)	Changes the order in which the child component appears in the list of child components returned by the GetChildren (see page 6153) method.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
V	SetDragMode (see page 5785)	Sets the drag mode for the control.
V	SetDropDownCount (see page 21180)	Sets the value of the DropDownCount (see page 21185) property.
	SetDroppedDown (see page 21180)	Sets the value of the DroppedDown (see page 21185) property.
V	SetEnabled (see page 5785)	Sets the value of the Enabled (see page 5821) property.
	SetIme (see page 6181)	Activates an input method editor (IME) using the values specified by the ImeMode (see page 6207) and ImeName (see page 6208) properties.
	SetImeCompositionWindow (see page 6181)	Sets the position and font of the composition window.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetItemHeight (see page 21181)	Sets the value of the ItemHeight (see page 21186) property.
A	SetItemIndex (see page 5943)	Sets the value of the ItemIndex (see page 5944) property.
V	SetItemIndex (see page 21181)	Sets the value of the ItemIndex property.
V	SetItems (see page 21181)	Sets the value of the Items (see page 21187) property.
	SetMaxLength (see page 21182)	Sets the value of the MaxLength (see page 21189) property.
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
V	SetName (see page 5785)	Sets the name of the control.
V	SetParent (see page 5786)	Sets the parent of the control.
V	SetParent (see page 6182)	Sets the parent of the control.
V	SetParentBackground (see page 6182)	This is SetParentBackground, a member of class TWinControl.
V	SetParentBiDiMode (see page 5786)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 5787)	Sets the parent for the control.
	SetSelLength (see page 21182)	Sets the value of the SelLength (see page 21190) property.
	SetSelStart (see page 21182)	Sets the value of the SelStart (see page 21193) property.
	SetStyle (see page 12422)	Sets the Style (see page 12425) property.
	SetZOrder (see page 5788)	Repositions the control in its parent's control list, thereby changing position onscreen.
V	SetZOrder (see page 6182)	Moves the control to the top or bottom of the parent control's (or screen's) list of TWinControl (see page 6112) controls.
V	ShowControl (see page 6183)	Ensures that a specified child control is visible.
	UpdateBounds (see page 6185)	This is UpdateBounds, a member of class TWinControl.
	UpdateBoundsRect (see page 5789)	Changes the Top (see page 5844), Left (see page 5830), Width (see page 5849), and Height (see page 5825) properties of the control, but doesn't update its screen image and bypasses all resize events.
V	UpdateControlOriginalParentSize (see page 6186)	This is UpdateControlOriginalParentSize, a member of class TWinControl.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateExplicitBounds (see page 5789)	This is UpdateExplicitBounds, a member of class TControl.
	UpdateRecreatingFlag (see page 6186)	This is UpdateRecreatingFlag, a member of class TWinControl.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	UpdateUIState (see page 6186)	Updates form User Interface State as needed
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.

V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	VisibleChanging (see page 5791)	Provides the interface for a method that responds to changes in the control's visibility.
V	WndProc (see page 5791)	Provides specific message responses for the control.
V	WndProc (see page 6187)	Provides specific message responses for the control.
V	WndProc (see page 21183)	Processes messages received by the combo box.
V	WndProc (see page 21219)	Processes messages received by the combo box.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	ActionLink (see page 5798)	Contains the action link object associated with the control.
	AutoSize (see page 5803)	Specifies whether the control sizes itself automatically to accommodate its contents.
	BevelEdges (see page 6192)	Specifies which edges of the control are beveled.
	BevelInner (see page 6193)	Specifies the cut of the inner bevel.
	BevelKind (see page 6193)	Specifies the control's bevel style.
	BevelOuter (see page 6194)	Specifies the cut of the outer bevel.
	BevelWidth (see page 6194)	Specifies the width of the inner and outer bevels.
	BorderWidth (see page 6195)	Specifies the width of the control's border.
	Caption (see page 5806)	Specifies a text string that identifies the control to the user.
	Color (see page 5812)	Specifies the background color of the control.
	Ctl3D (see page 6198)	Determines whether a control has a three-dimensional (3-D) or two-dimensional look.
	DefWndProc (see page 6199)	Specifies the default window procedure for the windowed control.
	DesktopFont (see page 5818)	Specifies whether the control uses the Windows icon font when writing text.
	DragCursor (see page 5818)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 5819)	Specifies whether the control is being dragged normally or for docking.
	DragMode (see page 5819)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	DropDownCount (see page 21185)	Specifies the maximum number of items displayed in the drop-down list.
R	EditHandle (see page 21185)	Returns the window handle for the edit portion of the combo box.
	Font (see page 5823)	Controls (see page 5711) the attributes of text written on or in the control.
	ImeMode (see page 6207)	Determines the behavior of the input method editor (IME).
	ImeName (see page 6208)	Specifies the input method editor (IME) to use for converting keyboard input to Asian language characters.
	IsControl (see page 5829)	Determines whether a form stores its form-specific properties to a stream.
R	ItemCount (see page 21186)	Specifies the number of items in the drop-down list.
	ItemHeight (see page 21186)	Specifies the height, in pixels, of the items in the drop-down list.
R	ListHandle (see page 21189)	Provides access to the window handle of the list of items in the combo box.
	MaxLength (see page 21189)	Specifies the maximum number of characters the user can type into the edit portion of the combo box.
	MouseCapture (see page 5831)	Indicates whether the control has "captured" mouse events.
	ParentBackground (see page 6209)	Determines whether control uses parent's theme background.
	ParentBiDiMode (see page 5833)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	ParentColor (see page 5834)	Determines where a control looks for its color information.
	ParentColor (see page 21190)	Determines where a control looks for its color information.
	ParentCtl3D (see page 6209)	Determines where a component looks to determine if it should appear three dimensional.
	ParentFont (see page 5834)	Determines where a control looks for its font information.
	ParentShowHint (see page 5835)	Determines where a control looks to find out if its Help Hint (see page 5827) should be shown.
	PopupMenu (see page 5835)	Identifies the pop-up menu associated with the control.
	ScalingFlags (see page 5840)	Reflects which attributes of the control have been scaled.
	Sorted (see page 21222)	Determines whether the list portion of the combo box is alphabetized.
	Text (see page 5842)	Contains a text string associated with the control.
	WheelAccumulator (see page 5849)	Accumulates mouse wheel rotations.

	WindowHandle (see page 6212)	Provides access to a window handle for the control.
	WindowText (see page 5850)	Contains the text string of the control.

Public Events

	Name	Description
	OnGetColors (see page 12426)	Occurs when the control is populated with colors.
	WindowProc (see page 5872)	Points to the window procedure that responds to messages sent to the control.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
A	AddItem (see page 5940)	Adds an item to the list control.
V	AddItem (see page 21170)	Adds an item to the drop-down list of items.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	BeginDrag (see page 5740)	Starts the dragging of a control.
	BringToFront (see page 5740)	Puts the control in front of all other controls in its parent control.
	Broadcast (see page 6130)	Sends a message to each of the child controls.
	CanFocus (see page 6131)	Indicates whether a control can receive focus.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
A	Clear (see page 5940)	Deletes all of the items from the list control.
V	Clear (see page 21172)	Deletes all text from the edit box and all items from the Items (see page 21187) list.
A	ClearSelection (see page 5940)	Removes the selection, leaving all items unselected.
V	ClearSelection (see page 21172)	Deselects any selected items in the drop-down list.
	ClientToParent (see page 5744)	Translates client coordinates to parent coordinates.
	ClientToScreen (see page 5744)	Translates a given point from client area coordinates to global screen coordinates.
	ContainsControl (see page 6133)	Indicates whether a specified control exists within the control.
	ControlAtPos (see page 6133)	Returns the child control located at a specified position within the control.
A	CopySelection (see page 5941)	Copies the selected item or items to another TCustomListControl (see page 5928) descendant.
V	CopySelection (see page 21173)	Copies the selected item in the drop-down list to another list control.
V	Create (see page 12419)	Creates a new TCustomColorBox (see page 12406) object.
	CreateParented (see page 6123)	Creates and initializes a control as the child of a specified non-VCL container.
	CreateParentedControl (see page 6136)	Creates and initializes a control as the child of a specified non-VCL window.
V	DefaultHandler (see page 5748)	Provides message handling for all messages that do not have specific handlers.
V	DefaultHandler (see page 6139)	Provides message handling for all messages that the control does not fully process itself.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
A	DeleteSelected (see page 5941)	Deletes all the selected items.
V	DeleteSelected (see page 21174)	Deletes the selected item from the drop-down list.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 5732)	Destroys an instance of TControl (see page 5724).
V	Destroy (see page 6124)	Destroys an instance of TWinControl (see page 6112).
V	Destroy (see page 21166)	Destroys the combo box and frees its memory.

	Destroy (see page 21214)	Destroys the combo box and frees its memory.
	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	DisableAlign (see page 6141)	Disables the realignment of child controls.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Dock (see page 5749)	Used internally to dock the control.
	DockDrop (see page 6142)	Generates an OnDockDrop (see page 6214) event.
	DragDrop (see page 5754)	OnDragDrop (see page 5855) event dispatcher.
	Dragging (see page 5754)	Indicates whether a control is being dragged.
	DrawTextBiDiModeFlags (see page 5756)	Returns the text flags that reflect the current setting of the BiDiMode (see page 5803) property.
	DrawTextBiDiModeFlagsReadingOnly (see page 5756)	Returns the text flag to add that indicates whether the control's text should read from right to left.
	EnableAlign (see page 6148)	Decrements the reference count incremented by the DisableAlign (see page 6141) method, eventually realigning the child controls.
	EndDrag (see page 5757)	Stops a control from being dragged any further.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindChildControl (see page 6148)	Returns a child control given its name.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FlipChildren (see page 6150)	Reverses the positions of child controls.
	Focused (see page 6150)	Determines whether the control has input focus.
	Focused (see page 21175)	Indicates whether the combo box has input focus.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetControlsAlignment (see page 5759)	Indicates how text is aligned within the control.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetParentComponent (see page 5765)	Returns the parent of the control.
	GetTabOrderList (see page 6158)	Builds a list of controls in tab order.
	GetTextBuf (see page 5766)	Retrieves the control's text, copies it into a buffer, and returns the number of characters copied.
	GetTextLen (see page 5767)	Returns the length of the control's text.
	HandleAllocated (see page 6159)	Reports whether a screen object handle exists for the control.
	HandleNeeded (see page 6160)	Creates a screen object for the control if it doesn't already exist.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	HasParent (see page 5768)	Indicates whether the control has a parent.
	Hide (see page 5769)	Makes the control invisible.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitiateAction (see page 5769)	Calls the action link's Update (see page 5789) method if the control is associated with an action link.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.

	InsertControl (see page 6160)	Inserts a control into the Controls (see page 6197) array property.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
V	Invalidate (see page 5770)	Completely repaint control.
V	Invalidate (see page 6161)	Schedules a control repaint.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	IsRightToLeft (see page 5770)	Indicates whether the control should be reversed right to left.
	ManualDock (see page 5771)	Docks the control.
	ManualFloat (see page 5772)	Undocks the control.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	MouseWheelHandler (see page 5774)	Dispatches messages received from a mouse wheel.
V	MoveSelection (see page 5942)	Moves all selected items to another list control.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	PaintTo (see page 6167)	This is the overview for the PaintTo method overload.
	ParentToClient (see page 5776)	Translate parent coordinates to client coordinates.
	Perform (see page 5776)	Responds as if the control received a specified Windows message.
	PreProcessMessage (see page 6170)	This is PreProcessMessage, a member of class TWinControl.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	Realign (see page 6171)	Forces the control to realign children.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	Refresh (see page 5779)	Repaints the control on the screen.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveControl (see page 6172)	Removes a specified control from the Controls (see page 6197) array.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	Repaint (see page 5779)	Forces the control to repaint its image on the screen.
V	Repaint (see page 6174)	Repaints the entire control.
	ReplaceDockedControl (see page 5779)	Docks the control in the place where another control is already docked.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	ScaleBy (see page 6175)	Rescale control and its children.
	ScreenToClient (see page 5781)	Converts the screen coordinates of a specified point on the screen to client coordinates.
	ScrollBy (see page 6176)	Scroll control contents.
A	SelectAll (see page 5943)	Selects all items or all text in the selected item.
V	SelectAll (see page 21180)	Selects the entire block of text in the edit box.
	SendToBack (see page 5782)	Puts a windowed control behind all other windowed controls, or puts a non-windowed control behind all other non-windowed controls.
V	SetBounds (see page 5783)	Sets the Left (see page 5830), Top (see page 5844), Width (see page 5849), and Height (see page 5825) properties all at once.
V	SetBounds (see page 6178)	Sets the windowed control's boundary properties all at once.
	SetDesignVisible (see page 5784)	Makes a control visible at design time.
V	SetDesignVisible (see page 6178)	Makes a control visible at design time.
V	SetFocus (see page 6179)	Gives the input focus to the control.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	SetTextBuf (see page 5787)	Sets the text of the control.
	Show (see page 5788)	Makes a control visible.
V	Update (see page 5789)	Processes any pending paint messages immediately.
V	Update (see page 6183)	Forces the control to update.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	UpdateControlState (see page 6186)	Respond to state change.
	UseRightToLeftAlignment (see page 5790)	Specifies whether the control's alignment should be reversed right-to-left.
	UseRightToLeftReading (see page 5790)	Specifies whether the control is using a right-to-left reading order.

	UseRightToLeftScrollBar (see page 5791)	Specifies whether the vertical scroll bar appears on the left side of the control.

Public Properties

	Name	Description
	Action (see page 5797)	Designates the action associated with the control.
	Align (see page 5798)	Determines how the control aligns within its container (parent control).
R	AlignDisabled (see page 6192)	Indicates child control realignment disabled.
	Anchors (see page 5802)	Specifies how the control is anchored to its parent.
	AutoCloseUp (see page 21220)	Specifies whether the drop-down closes up automatically when the user selects an item.
	AutoComplete (see page 21220)	Positions to matching list items as you type.
	AutoCompleteDelay (see page 21220)	Specifies the delay between a key press and an attempt to autocomplete the field.
	AutoDropDown (see page 21221)	Specifies whether the drop-down list drops down automatically in response to user keystrokes.
	BiDiMode (see page 5803)	Specifies the bi-directional mode for the control.
	BoundsRect (see page 5803)	Specifies the bounding rectangle of the control, expressed in the coordinate system of the parent control.
R	Brush (see page 6195)	Determines the color and pattern used for painting the background of the control.
R	Canvas (see page 21184)	Provides access to the drawing surface of the combo box.
	CharCase (see page 21221)	Determines the case of the text in the combo box.
	ClientHeight (see page 5808)	Specifies the height of the control's client area in pixels.
R	ClientOrigin (see page 5809)	Specifies the screen coordinates (in pixels) of the top left corner of a control's client area.
R	ClientRect (see page 5810)	Specifies the size (in pixels) of a control's client area.
	ClientWidth (see page 5811)	Specifies the horizontal size of the control's client area in pixels.
R	ColorNames (see page 12423)	Lists the names of the colors in the color box.
R	Colors (see page 12424)	Lists the colors in the color box.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Constraints (see page 5812)	Specifies the size constraints for the control.
R	ControlCount (see page 6195)	Returns the number of child controls.
R	Controls (see page 6197)	Lists all child controls.
	ControlState (see page 5813)	Indicates the current state of a control at runtime.
	ControlStyle (see page 5814)	Determines style characteristics of the control.
	DefaultColorColor (see page 12424)	Specifies the color displayed in the color box for clDefault.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	DockClientCount (see page 6199)	Specifies the number of controls that are docked on the windowed control.
R	DockClients (see page 6201)	Lists the controls that are docked to the windowed control.
	DockManager (see page 6202)	Specifies the control's docking manager interface.
	DockOrientation (see page 5818)	Specifies how the control is docked relative to other controls docked in the same parent.
	DockSite (see page 6204)	Specifies whether the control can be the target of drag-and-dock operations.
	DoubleBuffered (see page 6205)	Determines whether the control's image is rendered directly to the window or painted to an in-memory bitmap first.
	DroppedDown (see page 21185)	Indicates whether the drop-down list is currently displayed.
	Enabled (see page 5821)	Controls (see page 5711) whether the control responds to mouse, keyboard, and timer events.
R	ExplicitHeight (see page 5821)	Specifies the explicit vertical size of the control in pixels.
R	ExplicitLeft (see page 5822)	Specifies the explicit horizontal pixel coordinate of the left edge of a component relative to its parent.
R	ExplicitTop (see page 5822)	Specifies the explicit vertical pixel coordinate of the top edge of a component relative to its parent.

R	ExplicitWidth (see page 5822)	Specifies the explicit horizontal size of the control in pixels.
R	Floating (see page 5823)	Indicates whether the control is floating.
	FloatingDockSiteClass (see page 5823)	Specifies the class of the temporary control that hosts the control when it is floating.
R	Handle (see page 6207)	Provides access to the underlying Windows screen object for the control.
	HostDockSite (see page 5829)	Specifies the control in which the control is docked.
	ItemIndex (see page 5944)	Specifies the index of the selected item.
	Items (see page 21187)	Provides access to the list of items (strings) in the list portion of the combo box.
	LRDockWidth (see page 5831)	Specifies the width of the control when it is docked horizontally.
R	MouseInClient (see page 6209)	This is MouseInClient, a member of class TWinControl.
	NoneColorColor (see page 12424)	Specifies the color displayed in the color box for clNone.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Padding (see page 6209)	Specifies the padding of a control.
	Parent (see page 5832)	Indicates the parent of the control.
	ParentWindow (see page 6210)	Reference to parent's underlying control.
	Selected (see page 12425)	Specifies the currently selected color.
	SelLength (see page 21190)	Specifies the length, in characters, of the selected text in the edit portion of the combo box.
	SelStart (see page 21193)	Specifies the position of the first selected character in the edit portion of the combo box.
	SelText (see page 21222)	Represents the selected text in the edit region.
	ShowHint (see page 5840)	Determines whether the control displays a Help Hint (see page 5827) when the mouse pointer rests momentarily on the control.
R	Showing (see page 6210)	Indicates whether the control is showing on the screen.
	Style (see page 12425)	Controls (see page 5711) what colors are listed and how their names are formatted.
	TabOrder (see page 6211)	Indicates the position of the control in its parent's tab order.
	TabStop (see page 6211)	Determines if the user can tab to a control.
	TabStop (see page 21196)	Determines if the user can tab to a control.
	TBDockHeight (see page 5842)	Specifies the height of the control when it is docked vertically.
	UndockHeight (see page 5845)	Specifies the height of the control when it is floating.
	UndockWidth (see page 5846)	Specifies the width of the control when it is floating.
	UseDockManager (see page 6212)	Specifies whether the docking manager is used in drag-and-dock operations.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	Visible (see page 5847)	Determines whether the component appears onscreen.
R	VisibleDockClientCount (see page 6212)	Specifies the number of visible controls that are docked on the windowed control.

Published Properties

	Name	Description
	AlignWithMargins (see page 5802)	Indicates whether a control should be constrained by margins.
	Cursor (see page 5815)	Specifies the image used to represent the mouse pointer when it passes into the region covered by the control.
	Height (see page 5825)	Specifies the vertical size of the control in pixels.
	HelpContext (see page 5826)	Numeric ID for control's context-sensitive help topic
	HelpKeyword (see page 5826)	Keyword for control's context-sensitive help topic
	HelpType (see page 5827)	Indicates whether the control's context sensitive help topic is identified by context ID or by keyword.
	Hint (see page 5827)	Contains the text string that can appear when the user moves the mouse over the control.
	Left (see page 5830)	Specifies the horizontal coordinate of the left edge of a component relative to its parent.
	Margins (see page 5831)	Specifies the margins for the control.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Top (see page 5844)	Specifies the Y coordinate of the top left corner of a control, relative to its parent or containing control in pixels.
	Width (see page 5849)	Specifies the horizontal size of the control or form in pixels.

68.1.13.2 TCustomColorBox.Create Constructor

Creates a new TCustomColorBox (see page 12406) object.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomColorBox(TComponent * AOwner);
```

Description

Call Create to instantiate a color box at runtime. TCustomColorBox (see page 12406) objects placed on a form at design time are created automatically.

AOwner specifies the owner of the color box. This component (typically the form) is responsible for freeing the color box.

See Also

Owner (see page 2807)

68.1.13.3 TCustomColorBox Methods

The methods of the TCustomColorBox class are listed here.

Protected Methods

	Name	Description
	CloseUp (see page 12419)	Generates an OnCloseUp event.
	CreateWnd (see page 12420)	Creates the window used to implement the color box.
	DrawItem (see page 12420)	Renders an individual item in the color box.
	KeyDown (see page 12420)	Generates an OnKeyDown event.
	KeyPress (see page 12421)	Generates an OnKeyPress event.
	Loaded (see page 12421)	Initializes the combo box after its form is loaded into memory.
	PickCustomColor (see page 12422)	This is PickCustomColor, a member of class TCustomColorBox.
	PopulateList (see page 12422)	This is PopulateList, a member of class TCustomColorBox.
	Select (see page 12422)	Generates an OnSelect event.
	SetStyle (see page 12422)	Sets the Style (see page 12425) property.

68.1.13.3.1 TCustomColorBox.CloseUp Method

Generates an OnCloseUp event.

Pascal

```
procedure CloseUp; override;
```

C++

```
virtual __fastcall CloseUp();
```

Description

Applications can't call this protected method. It is called automatically when the drop-down list of the combo box closes.

CloseUp generates an OnCloseUp event so that applications can respond when the list closes.

See Also

OnCloseUp (see page 21199)

68.1.13.3.2 TCustomColorBox.CreateWnd Method

Creates the window used to implement the color box.

Pascal

```
procedure CreateWnd; override;
```

C++

```
virtual __fastcall CreateWnd();
```

Description

Applications can't call this protected method. It is called automatically when the color box is first created or when the window must be destroyed and recreated to reflect property changes.

TCustomColorBox (see page 12406) overrides the inherited CreateWnd method to populate the combo box with the colors specified by the Style (see page 12425) property.

See Also

CreateWnd (see page 6137)

Style (see page 12425)

68.1.13.3.3 TCustomColorBox.DrawItem Method

Renders an individual item in the color box.

Pascal

```
procedure DrawItem(Index: Integer; Rect: TRect; State: TOwnerDrawState); override;
```

C++

```
virtual __fastcall DrawItem(int Index, TRect Rect, TOwnerDrawState State);
```

Description

Applications can't call this protected method. It is called automatically when the color box needs to paint one of the items in the list. DrawItem draws a small box that displays the color that the item represents, followed by the name of the color.

Index is the index of the item to draw, where 0 specifies the first item, 1 specifies the second item, and so on.

Rect indicates the boundaries of the item on the color box's canvas, in client coordinates.

State indicates state information that can affect the way the item is drawn. In TCustomColorBox (see page 12406), DrawItem uses State to determine whether an item is selected, but ignores all other state information.

See Also

Items (see page 21187)

68.1.13.3.4 TCustomColorBox.KeyDown Method

Generates an OnKeyDown event.

Pascal

```
procedure KeyDown(var Key: Word; Shift: TShiftState); override;
```

C++

```
virtual __fastcall KeyDown(Word Key, TShiftState Shift);
```

Description

Applications can't call this protected method. It is called automatically when the user first presses a key while the color box has focus.

Key is the key code of the key that was pressed.

Shift indicates the state of the Ctrl, Shift, and Alt keys when Key was pressed.

TCustomColorBox (see page 12406) overrides the inherited KeyDown method to prepare for the selection of a new color. It then calls the inherited method, which generates an OnKeyDown event.

See Also

OnKeyDown (see page 6225)

68.1.13.3.5 TCustomColorBox.KeyPress Method

Generates an OnKeyPress event.

Pascal

```
procedure KeyPress(var Key: Char); override;
```

C++

```
virtual __fastcall KeyPress(Char Key);
```

Description

Applications can't call this protected method. It is called automatically when the user presses a key while the color box has focus.

Key is the key code of the key that was pressed.

TCustomColorBox (see page 12406) overrides the inherited KeyPress method to display a color selection dialog if the user presses the Enter key while the custom color item has focus. Otherwise, KeyPress calls the inherited method, which generates an OnKeyPress event.

See Also

OnKeyPress (see page 6227)

TColorDialog (see page 11270)

68.1.13.3.6 TCustomColorBox.Loaded Method

Initializes the combo box after its form is loaded into memory.

Pascal

```
procedure Loaded; override;
```

C++

```
virtual __fastcall Loaded();
```

Description

Do not call the protected Loaded method. The component streaming system calls this method after it loads the combo box's form from a stream.

TCustomCombo overrides the inherited method to select the item specified by the ItemIndex property once the form is fully loaded.

See Also

Loaded (see page 2782)

ItemIndex

68.1.13.3.7 TCustomColorBox.PickCustomColor Method

Pascal

```
function PickCustomColor: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean PickCustomColor();
```

Description

This is PickCustomColor, a member of class TCustomColorBox.

68.1.13.3.8 TCustomColorBox.PopulateList Method

Pascal

```
procedure PopulateList;
```

C++

```
__fastcall PopulateList();
```

Description

This is PopulateList, a member of class TCustomColorBox.

68.1.13.3.9 TCustomColorBox.Select Method

Generates an OnSelect event.

Pascal

```
procedure Select; override;
```

C++

```
virtual __fastcall Select();
```

Description

Applications can't call this protected method. It is called automatically when the user selects a color.

TCustomColorBox (see page 12406) overrides the inherited method to display a color selection dialog if the user selects the custom color item. After checking for a custom color, TCustomColorBox (see page 12406) calls the inherited method, which generates an OnSelect event.

See Also

OnSelect (see page 21201)

68.1.13.3.10 TCustomColorBox.SetStyle Method

Sets the Style (see page 12425) property.

Pascal

```
procedure SetStyle(AStyle: TColorBoxStyle); reintroduce;
```

C++

```
__fastcall SetStyle(TColorBoxStyle AStyle);
```

Description

SetStyle is the protected write implementation of the Style (see page 12425) property. It repopulates the list to reflect the new value of Style (see page 12425), and disables the color box if the new value for Style (see page 12425) results in an empty color box.

See Also

Style (see page 12425)

68.1.13.4 TCustomColorBox Properties

The properties of the TCustomColorBox class are listed here.

Public Properties

	Name	Description
R	ColorNames (see page 12423)	Lists the names of the colors in the color box.
R	Colors (see page 12424)	Lists the colors in the color box.
	DefaultColorColor (see page 12424)	Specifies the color displayed in the color box for clDefault.
	NoneColorColor (see page 12424)	Specifies the color displayed in the color box for clNone.
	Selected (see page 12425)	Specifies the currently selected color.
	Style (see page 12425)	Controls (see page 5711) what colors are listed and how their names are formatted.

68.1.13.4.1 TCustomColorBox.ColorNames Property

Lists the names of the colors in the color box.

Pascal

```
property ColorNames [Index: Integer]: string;
```

C++

```
__property AnsiString ColorNames[int Index];
```

Description

Use ColorNames to obtain the name of one of the colors listed in the color box.

Index is the index of the name, where 0 is the index of the first color in the box, 1 is the index of the second color, and so on.

The value of each name is either the name of a color constant defined in the Graphics (see page 14387) unit (such as clBlack), or it is the name of the color with the "cl" stripped off (Black). The Style (see page 12425) property determines which name is used for each color.

The Style (see page 12425) property also controls which colors are included in the list.

See Also

Colors (see page 12424)

Items (see page 21187)

ItemIndex

Style (see page 12425)

68.1.13.4.2 TCustomColorBox.Colors Property

Lists the colors in the color box.

Pascal

```
property Colors [Index: Integer]: TColor;
```

C++

```
__property TColor Colors[int Index];
```

Description

Use Colors to obtain the value of a color in the color box.

Index is the index of the color, where 0 is the index of the first color in the box, 1 is the index of the second color, and so on.

Note: The Style (see page 12425) property controls which colors are included in the list.

See Also

ColorNames (see page 12423)

Selected (see page 12425)

DefaultColorColor (see page 12424)

NoneColorColor (see page 12424)

Style (see page 12425)

68.1.13.4.3 TCustomColorBox.DefaultColorColor Property

Specifies the color displayed in the color box for clDefault.

Pascal

```
property DefaultColorColor: TColor;
```

C++

```
__property TColor DefaultColorColor;
```

Description

Set DefaultColorColor to indicate what color the color box should use when drawing the icon for clDefault. This property only affects the color box if the Style (see page 12425) property includes cbSystemColors and cbIncludeDefault.

Note: DefaultColorColor only affects the way clDefault appears in the color box. When you assign clDefault to a control, the control determines its own default color.

See Also

Colors (see page 12424)

NoneColorColor (see page 12424)

Style (see page 12425)

68.1.13.4.4 TCustomColorBox.NoneColorColor Property

Specifies the color displayed in the color box for clNone.

Pascal

```
property NoneColorColor: TColor;
```

C++

```
__property TColor NoneColorColor;
```

Description

Set NoneColorColor to indicate what color the color box should use when drawing the icon for clNone. This property only affects the color box if the Style (see page 12425) property includes cbSystemColors and cbIncludeNone.

Note: NoneColorColor only affects the way clNone appears in the color box. When you assign clNone to a control, the control determines how to interpret clNone.

DefaultColorColor (see page 12424)

Style (see page 12425)

68.1.13.4.5 TCustomColorBox.Selected Property

Specifies the currently selected color.

Pascal

```
property Selected: TColor;
```

C++

```
__property TColor Selected;
```

Description

Use Selected to get or set the selected color as a TColor value.

See Also

Colors (see page 12424)

ItemIndex

68.1.13.4.6 TCustomColorBox.Style Property

Controls (see page 5711) what colors are listed and how their names are formatted.

Pascal

```
property Style: TColorBoxStyle;
```

C++

```
__property TColorBoxStyle Style;
```

Description

Use Style to configure what colors appear in the list and how the names appear. Style is a set that includes 0 or more of the TColorBoxStyles (see page 13267) flags.

68.1.13.5 TCustomColorBox Events

The events of the TCustomColorBox class are listed here.

Public Events

	Name	Description
	OnGetColors (see page 12426)	Occurs when the control is populated with colors.

68.1.13.5.1 TCustomColorBox.OnGetColors Event

Occurs when the control is populated with colors.

Pascal

```
property OnGetColors: TGetColorsEvent;
```

C++

```
__property TGetColorsEvent OnGetColors;
```

68.1.14 TCustomColorListBox Class

Class Hierarchy

Pascal

```
TCustomColorListBox = class(TCustomListBox);
```

C++

```
class TCustomColorListBox : public TCustomListBox;
```

File

ExtCtrls

Description

This is class ExtCtrls.TCustomColorListBox.

68.1.14.1 TCustomColorListBox Members

The following tables list the members exposed by TCustomColorListBox.

Protected Events

	Name	Description
	OnAlignInsertBefore (see page 6213)	Occurs when an object with custom alignment is aligned.
	OnAlignPosition (see page 6214)	Occurs when an object with custom alignment is aligned.
	OnCanResize (see page 5851)	Occurs when an attempt is made to resize the control.
	OnClick (see page 5851)	Occurs when the user clicks the control.
	OnConstrainedResize (see page 5853)	Adjust resize constraints.
	OnContextPopup (see page 5854)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnData (see page 21357)	Occurs when a virtual list box needs to supply the text of an item.
	OnDataFind (see page 21357)	Occurs when a virtual list box needs to identify the index of an item given its text.
	OnDataObject (see page 21358)	Occurs when a virtual list box needs to supply the object associated with an item.
	OnDblClick (see page 5854)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDockDrop (see page 6214)	Occurs when another control is docked to the control.
	OnDockOver (see page 6216)	Occurs when another control is dragged over the control.
	OnDragDrop (see page 5855)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 5857)	Occurs when the user drags an object over a control.
	OnDrawItem (see page 21358)	Occurs when an item in an owner-draw list box needs to be redisplayed.
	OnEndDock (see page 5859)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 5860)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnEnter (see page 6219)	Occurs when a control receives the input focus.
	OnExit (see page 6221)	Occurs when the input focus shifts away from one control to another.
	OnGetSiteInfo (see page 6223)	Returns the control's docking information.
	OnKeyDown (see page 6225)	Occurs when a user presses any key while the control has focus.
	OnKeyPress (see page 6227)	Occurs when a key is pressed.
	OnKeyUp (see page 6228)	Occurs when the user releases a key that has been pressed.
	OnMeasureItem (see page 21360)	Occurs when the application needs to redisplay an item in a variable height owner-draw list box.
	OnMouseActivate (see page 5861)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 5862)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseEnter (see page 5864)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 5864)	Occurs when the user moves the mouse outside of a control.
	OnMouseMove (see page 5865)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 5867)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnMouseWheel (see page 5869)	Occurs when the mouse wheel is rotated.
	OnMouseWheelDown (see page 5869)	Occurs when the mouse wheel is rotated downward.
	OnMouseWheelUp (see page 5870)	Occurs when the mouse wheel is rotated upward.
	OnResize (see page 5870)	Occurs immediately after the control is resized.
	OnStartDock (see page 5871)	Occurs when the user begins to drag a control with a DragKind (see page 5819) of dkDock.
	OnStartDrag (see page 5871)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.
	OnUnDock (see page 6230)	Occurs when the application tries to undock a control that is docked to the windowed control.

Protected Fields

	Name	Description
	FAnchorMove (see page 5733)	This is FAnchorMove, a member of class TControl.
	FAnchorOrigin (see page 5734)	This is FAnchorOrigin, a member of class TControl.
	FAnchorRules (see page 5734)	This is FAnchorRules, a member of class TControl.

	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FDesignSize (see page 6124)	This is FDesignSize, a member of class TWinControl.
	FDoubleBuffered (see page 6124)	This is FDoubleBuffered, a member of class TWinControl.
	FExplicitHeight (see page 5734)	This is FExplicitHeight, a member of class TControl.
	FExplicitLeft (see page 5734)	This is FExplicitLeft, a member of class TControl.
	FExplicitTop (see page 5734)	This is FExplicitTop, a member of class TControl.
	FExplicitWidth (see page 5735)	This is FExplicitWidth, a member of class TControl.
	FInImeComposition (see page 6125)	This is FInImeComposition, a member of class TWinControl.
	FMoving (see page 21321)	This is FMoving, a member of class TCustomListBox.
	FMultiSelect (see page 5956)	This is FMultiSelect, a member of class TCustomMultiSelectListControl.
	FOriginalParentSize (see page 5735)	This is FOriginalParentSize, a member of class TControl.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	ActionChange (see page 5737)	Responds when the action associated with the control changes.
V	ActionChange (see page 6127)	Updates the control to reflect changes in its associated action.
	AddBiDiModeExStyle (see page 6128)	Sets control's window style according to its bi-directional support.
V	AdjustClientRect (see page 6128)	Provides the interface that adjusts the ClientRect (see page 5810) property for idiosyncrasies of the window.
	AdjustSize (see page 5738)	Sets the size of the control as determined by the AutoSize (see page 5803) property.
V	AdjustSize (see page 6129)	Adjusts the control's size according to its contents and constraints.
V	AlignControls (see page 6129)	Aligns any controls for which the control is the parent within a specified area of the control.
	ArrangeControl (see page 6130)	This is ArrangeControl, a member of class TWinControl.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	AssignTo (see page 5739)	Overrides the inherited AssignTo function to enable assignments to TAction objects.
V	AssignTo (see page 6130)	Copies the properties of the windowed control to another object.
	BeginAutoDrag (see page 5739)	Begin Automatic Drag.
	CalcCursorPos (see page 5741)	This is CalcCursorPos, a member of class TControl.
V	CanAutoSize (see page 5741)	Indicates whether the control can resize itself automatically to accommodate its contents.
V	CanAutoSize (see page 6131)	Indicates how the control can be resized.
V	CanResize (see page 5742)	OnCanResize (see page 5851) event dispatcher.
V	CanResize (see page 6132)	Indicates how the control can respond to a resize attempt.
	Changed (see page 5742)	Sends a CM_CHANGED (see page 6330) message to the control.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	ChangeScale (see page 5743)	Rescaling event dispatcher.
V	ChangeScale (see page 6132)	Resize (see page 5780) and reposition children and self.
	Click (see page 5743)	Respond to user click.
V	ConstrainedResize (see page 5746)	Notify control of resize with constraints.
V	ConstrainedResize (see page 6133)	Generates an OnConstrainedResize (see page 5853) event.
	ControlsAligned (see page 6134)	This is ControlsAligned, a member of class TWinControl.
	CreateDockManager (see page 6134)	Creates the dock manager for the control.
V	CreateHandle (see page 6135)	Creates underlying screen object.
V	CreateParams (see page 6135)	Initializes a window-creation parameter data structure.
V	CreateParams (see page 21324)	Initializes the window-creation parameter record passed in the Params parameter.
	CreateSubClass (see page 6136)	Creates a windowed control derived from an existing Windows window class.
V	CreateWindowHandle (see page 6137)	Creates a Windows control to represent the control.
V	CreateWnd (see page 12439)	Creates a Windows control corresponding to the list box component.
V	CustomAlignInsertBefore (see page 6137)	Returns placement order of custom-aligned child control.
V	CustomAlignPosition (see page 6138)	Returns aligned position of custom-aligned child control.

	DblClick (see page 5747)	OnDblClick (see page 5854) event dispatcher.
	DefaultDockImage (see page 5747)	Handles the painting and erasing of a dock image.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DefineProperties (see page 5748)	Provides methods to read and write the IsControl (see page 5829) property to a stream such as a form file.
V	DefineProperties (see page 6139)	Provides methods to read and write the IsControl property to a stream such as a form file.
	DeleteString (see page 21326)	Deletes a string from the list box.
	DesignWndProc (see page 5749)	This is DesignWndProc, a member of class TControl.
V	DestroyHandle (see page 6140)	Destroys the control's window without destroying the control.
V	DestroyWindowHandle (see page 6140)	Destroys the window created in the CreateWindowHandle (see page 6137) method.
V	DestroyWnd (see page 6141)	Destroys the control's window.
V	DestroyWnd (see page 21326)	Saves the list box items in a string list before freeing the underlying Windows control.
	DoAddDockClient (see page 6142)	Performs actions when a control is docked to the windowed control.
	DockOver (see page 6143)	Responds when a docking client is dragged over the windowed control.
V	DockReplaceDockClient (see page 6143)	This is DockReplaceDockClient, a member of class TWinControl.
	DockTrackNoTarget (see page 5749)	Handles dragging of the control over an invalid docking target.
	DoContextPopup (see page 5750)	OnContextPopup (see page 5854) event dispatcher.
	DoDock (see page 5750)	Docking event dispatcher.
	DoDockOver (see page 6143)	Generates an OnDockOver (see page 6216) event.
	DoEndDock (see page 5750)	OnEndDock (see page 5859) event dispatcher.
	DoEndDrag (see page 5751)	OnEndDrag (see page 5860) event dispatcher.
	DoEnter (see page 6144)	Respond to receiving input focus.
	DoExit (see page 6144)	Respond to losing input focus
	DoFindData (see page 21326)	Returns the index of a string in the list box.
	DoFlipChildren (see page 6145)	Flips the control's children.
	DoGetData (see page 21327)	Returns a string in the list box given its index.
	DoGetDataObject (see page 21327)	Returns the object associated with an item in a virtual list box.
	DoKeyDown (see page 6145)	Performs some preprocessing before generating an OnKeyDown (see page 6225) event.
	DoKeyPress (see page 6146)	Performs some preprocessing before generating an OnKeyPress (see page 6227) event.
	DoKeyUp (see page 6146)	Performs some preprocessing before generating an OnKeyUp (see page 6228) event.
	DoMouseWheel (see page 5751)	Processes mouse wheel motion.
	DoMouseWheelDown (see page 5752)	OnMouseWheelDown (see page 5869) event dispatcher.
	DoMouseWheelUp (see page 5752)	OnMouseWheelUp (see page 5870) event dispatcher.
	DoRemoveDockClient (see page 6147)	Responds when a control is undocked from the windowed control.
	DoStartDock (see page 5753)	OnStartDock (see page 5871) event dispatcher.
	DoStartDrag (see page 5753)	OnStartDrag (see page 5871) event dispatcher.
	DoUnDock (see page 6147)	Undocks a control that is currently docked to the windowed control.
	DragCanceled (see page 5754)	Provides the interface for a method that responds to the cancellation of a drag.
V	DragCanceled (see page 21328)	Sends a mouse message canceling the drag-and-drop operation.
	DragOver (see page 5755)	OnDragOver (see page 5857) event dispatcher.
	DrawDragDockImage (see page 5755)	Draws the dock image for the control.
V	DrawItem (see page 12439)	Generates an OnDrawItem event.
	EraseDragDockImage (see page 5757)	Erases the dock image for the control.
	FindNextControl (see page 6149)	Returns the control's next child in the tab order after the specified control.
	FixupTabList (see page 6149)	Sorts the child controls by their tab order.
V	GetAction (see page 5758)	This is GetAction, a member of class TControl.
	GetActionLinkClass (see page 5758)	Returns the appropriate action link class that is associated with the control class.
V	GetActionLinkClass (see page 6152)	Returns the associated action link class.

	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetChildren (see page 6153)	Calls a specified method for each child of the control.
V	GetClientOrigin (see page 5758)	Returns the screen coordinates of the top-left corner of the control's client area.
V	GetClientOrigin (see page 6153)	Returns the value of the ClientOrigin (see page 5809) property.
V	GetClientRect (see page 5759)	Returns a rectangle defining the client area of the control.
V	GetClientRect (see page 6154)	Returns the value of the ClientRect (see page 5810) property.
V	GetControlExtents (see page 6154)	Returns the smallest rectangle in which all the control's children fit.
A	GetCount (see page 5942)	Returns the number of items in the list.
V	GetCount (see page 21329)	Returns the value of the Count (see page 21346) property.
V	GetDeviceContext (see page 5760)	Returns a device context for the control.
V	GetDeviceContext (see page 6155)	Provides access to a device context for the control.
	GetDockEdge (see page 5763)	Returns the edge on which another control should be docked when it is dragged over the control.
V	GetDragImages (see page 5763)	Returns the control's image list containing the image to be displayed while dragging.
V	GetEnabled (see page 5763)	Returns the value of the Enabled (see page 5821) property.
V	GetFloating (see page 5764)	Returns the value of the Floating (see page 5823) property.
V	GetFloatingDockSiteClass (see page 5764)	Returns the class used for the control when it is floating.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
	GetItemData (see page 21329)	Returns a 32-bit value associated with the specified item in a list box.
A	GetItemIndex (see page 5942)	Returns the value of the ItemIndex (see page 5944) property.
V	GetItemIndex (see page 21329)	Returns the value of the ItemIndex property.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetPalette (see page 5765)	Returns the handle to a palette for use by the control.
	GetParentHandle (see page 6157)	Returns the window handle for the window of the control's parent.
	GetPopupMenu (see page 5765)	Returns the pop-up menu associated with the control.
A	GetSelCount (see page 5956)	Returns the value of the SelCount (see page 5957) property.
V	GetSelCount (see page 21330)	Returns the number of selected items.
	GetSelected (see page 21330)	Indicates whether a particular item is selected.
	GetSiteInfo (see page 6158)	Generates an OnGetSiteInfo (see page 6223) event
	GetTopParentHandle (see page 6159)	Returns the window handle of the first window not associated with a VCL control that contains the windowed control.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	InternalGetItemData (see page 21330)	Retrieves the data associated with an item in the list box.
	InternalSetItemData (see page 21330)	Associates an integer with a specified item in the list box.
	InvalidateDockHostSite (see page 6162)	This is InvalidateDockHostSite, a member of class TWinControl.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsControlActivateMsg (see page 6162)	This is IsControlActivateMsg, a member of class TWinControl.
	IsControlMouseMsg (see page 6162)	Indicates whether a specified mouse message is directed to one of the windowed control's child controls.
	IsQualifyingSite (see page 6163)	This is IsQualifyingSite, a member of class TWinControl.
V	KeyDown (see page 12440)	Respond to key press events.
V	KeyPress (see page 12441)	Responds when the user presses a key.
	KeyUp (see page 6164)	Respond to released key.
V	Loaded (see page 12441)	Initializes the control after it is loaded from a stream.
V	LoadRecreateItems (see page 21334)	This is LoadRecreateItems, a member of class TCustomListBox.
	MainWndProc (see page 6165)	Receives Windows messages for the control.
V	MeasureItem (see page 21335)	Generates an OnMeasureItem (see page 21360) event.
	MouseActivate (see page 5773)	This is MouseActivate, a member of class TControl.

	MouseDown (see page 5773)	OnMouseDown (see page 5862) event dispatcher.
	MouseMove (see page 5773)	Respond to mouse moving over control area..
	MouseUp (see page 5774)	OnMouseUp (see page 5867) event dispatcher.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	Notification (see page 5775)	Responds to notifications that components are being created or destroyed.
V	Notification (see page 6165)	Responds to notifications that components are being created or destroyed.
	NotifyControls (see page 6165)	Sends a message to all the child controls.
	PaintControls (see page 6166)	Paints each of the child controls in a windowed control using the specified device context.
	PaintHandler (see page 6166)	Responds to WM_PAINT messages.
V	PaintWindow (see page 6169)	Renders the image of a windowed control.
	PaletteChanged (see page 5775)	Responds to changes in the system's palette by realizing the control's palette.
V	PaletteChanged (see page 6170)	Responds to changes in the system's palette by realizing the control's palette and the palette for each child control.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	PickCustomColor (see page 12441)	This is PickCustomColor, a member of class TCustomColorListBox.
	PopulateList (see page 12442)	This is PopulateList, a member of class TCustomColorListBox.
	PositionDockRect (see page 5777)	Positions the docking rectangle according to the current drag-and-dock state.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 5778)	Prepares the control for having its properties assigned values read from a stream.
V	ReadState (see page 6171)	Prepares the control for having its properties assigned values from a stream.
	RecreateWnd (see page 6171)	Recreate underlying Windows screen object.
	ReloadDockedControl (see page 6172)	Reloads a docked control.
	RemoveWindowProps (see page 6174)	This is RemoveWindowProps, a member of class TWinControl.
V	RequestAlign (see page 5780)	Instructs the parent of a control to reposition the control, enforcing its Align (see page 5798) property.
	ResetContent (see page 21335)	Removes all of the items from a list box.
	ResetIme (see page 6174)	Restores the input method editor (IME) that was active when the application started.
	ResetImeComposition (see page 6175)	Directs the composition window of the input method editor (IME) to perform a specific action.
	Resize (see page 5780)	Respond to control resize.
V	SaveRecreateItems (see page 21336)	This is SaveRecreateItems, a member of class TCustomListBox.
	ScaleConstraints (see page 5781)	This is ScaleConstraints, a member of class TControl.
	ScaleControls (see page 6176)	Rescale child controls only.
	SelectFirst (see page 6177)	Locates first selectable child control.
	SelectNext (see page 6177)	Moves the input focus from the current child control to the next one in the tab order.
	SendCancelMode (see page 5781)	Cancels the modal state of the control.
	SendDockNotification (see page 5782)	Sends a Windows message to the control's host dock site.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
V	SetAutoSize (see page 5783)	This is SetAutoSize, a member of class TControl.
V	SetBiDiMode (see page 5783)	Sets the control's bi-directional mode.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
V	SetChildOrder (see page 6178)	Changes the order in which the child component appears in the list of child components returned by the GetChildren (see page 6153) method.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
V	SetDragMode (see page 5785)	Sets the drag mode for the control.
V	SetEnabled (see page 5785)	Sets the value of the Enabled (see page 5821) property.
	SetIme (see page 6181)	Activates an input method editor (IME) using the values specified by the ImeMode (see page 6207) and ImeName (see page 6208) properties.
	SetImeCompositionWindow (see page 6181)	Sets the position and font of the composition window.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetItemData (see page 21336)	Sets the 32-bit value associated with the specified item in a list box.

	SetItemIndex (see page 5943)	Sets the value of the ItemIndex (see page 5944) property.
	SetItemIndex (see page 21336)	Gives focus to the item with a specified index.
	SetMultiSelect (see page 5956)	Sets the value of the MultiSelect (see page 5957) property.
	SetMultiSelect (see page 21337)	Sets the MultiSelect property.
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetName (see page 5785)	Sets the name of the control.
	SetParent (see page 5786)	Sets the parent of the control.
	SetParent (see page 6182)	Sets the parent of the control.
	SetParentBackground (see page 6182)	This is SetParentBackground, a member of class TWinControl.
	SetParentBiDiMode (see page 5786)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	SetParentComponent (see page 5787)	Sets the parent for the control.
	SetStyle (see page 12442)	This is SetStyle, a member of class TCustomColorListBox.
	SetZOrder (see page 5788)	Repositions the control in its parent's control list, thereby changing position onscreen.
	SetZOrder (see page 6182)	Moves the control to the top or bottom of the parent control's (or screen's) list of TWinControl (see page 6112) controls.
	ShowControl (see page 6183)	Ensures that a specified child control is visible.
	UpdateBounds (see page 6185)	This is UpdateBounds, a member of class TWinControl.
	UpdateBoundsRect (see page 5789)	Changes the Top (see page 5844), Left (see page 5830), Width (see page 5849), and Height (see page 5825) properties of the control, but doesn't update its screen image and bypasses all resize events.
	UpdateControlOriginalParentSize (see page 6186)	This is UpdateControlOriginalParentSize, a member of class TWinControl.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateExplicitBounds (see page 5789)	This is UpdateExplicitBounds, a member of class TControl.
	UpdateRecreatingFlag (see page 6186)	This is UpdateRecreatingFlag, a member of class TWinControl.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	UpdateUIState (see page 6186)	Updates form User Interface State as needed
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	VisibleChanging (see page 5791)	Provides the interface for a method that responds to changes in the control's visibility.
	WndProc (see page 5791)	Provides specific message responses for the control.
	WndProc (see page 6187)	Provides specific message responses for the control.
	WndProc (see page 21337)	Handles Windows messages.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	ActionLink (see page 5798)	Contains the action link object associated with the control.
	AutoSize (see page 5803)	Specifies whether the control sizes itself automatically to accommodate its contents.
	BevelEdges (see page 6192)	Specifies which edges of the control are beveled.
	BevelInner (see page 6193)	Specifies the cut of the inner bevel.
	BevelKind (see page 6193)	Specifies the control's bevel style.
	BevelOuter (see page 6194)	Specifies the cut of the outer bevel.
	BevelWidth (see page 6194)	Specifies the width of the inner and outer bevels.
	BorderStyle (see page 21343)	Determines whether the list box has a border.
	BorderWidth (see page 6195)	Specifies the width of the control's border.
	Caption (see page 5806)	Specifies a text string that identifies the control to the user.
	Color (see page 5812)	Specifies the background color of the control.

	Columns (see page 21346)	Specifies the number of columns, in a multi-column list box, that are visible without having to scroll.
	Ctl3D (see page 6198)	Determines whether a control has a three-dimensional (3-D) or two-dimensional look.
	DefWndProc (see page 6199)	Specifies the default window procedure for the windowed control.
	DesktopFont (see page 5818)	Specifies whether the control uses the Windows icon font when writing text.
	DragCursor (see page 5818)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 5819)	Specifies whether the control is being dragged normally or for docking.
	DragMode (see page 5819)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	ExtendedSelect (see page 21346)	This is ExtendedSelect, a member of class TCustomListBox.
	Font (see page 5823)	Controls (see page 5711) the attributes of text written on or in the control.
	ImeMode (see page 6207)	Determines the behavior of the input method editor (IME).
	ImeName (see page 6208)	Specifies the input method editor (IME) to use for converting keyboard input to Asian language characters.
	IntegralHeight (see page 21347)	Determines whether the list box displays the partial items.
	IsControl (see page 5829)	Determines whether a form stores its form-specific properties to a stream.
	ItemHeight (see page 21347)	Specifies the height in pixels of an item in an owner-draw list box.
	MouseCapture (see page 5831)	Indicates whether the control has "captured" mouse events.
	ParentBackground (see page 6209)	Determines whether control uses parent's theme background.
	ParentBiDiMode (see page 5833)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	ParentColor (see page 5834)	Determines where a control looks for its color information.
	ParentColor (see page 21350)	Determines where a control looks for its color information.
	ParentCtl3D (see page 6209)	Determines where a component looks to determine if it should appear three dimensional.
	ParentFont (see page 5834)	Determines where a control looks for its font information.
	ParentShowHint (see page 5835)	Determines where a control looks to find out if its Help Hint (see page 5827) should be shown.
	PopupMenu (see page 5835)	Identifies the pop-up menu associated with the control.
	ScalingFlags (see page 5840)	Reflects which attributes of the control have been scaled.
	Sorted (see page 21353)	Specifies whether the items in a list box are arranged alphabetically.
	TabWidth (see page 21355)	Specifies the size of the tabs in the list box.
	Text (see page 5842)	Contains a text string associated with the control.
	WheelAccumulator (see page 5849)	Accumulates mouse wheel rotations.
	WindowHandle (see page 6212)	Provides access to a window handle for the control.
	WindowText (see page 5850)	Contains the text string of the control.

Public Events

	Name	Description
	OnGetColors (see page 12446)	This is OnGetColors, a member of class TCustomColorListBox.
	WindowProc (see page 5872)	Points to the window procedure that responds to messages sent to the control.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AddItem (see page 5940)	Adds an item to the list control.
	AddItem (see page 21322)	Adds an item to the list box
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	BeginDrag (see page 5740)	Starts the dragging of a control.
	BringToFront (see page 5740)	Puts the control in front of all other controls in its parent control.
	Broadcast (see page 6130)	Sends a message to each of the child controls.
	CanFocus (see page 6131)	Indicates whether a control can receive focus.

	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
A	Clear (see page 5940)	Deletes all of the items from the list control.
V	Clear (see page 21322)	Deletes all items from the list box.
A	ClearSelection (see page 5940)	Removes the selection, leaving all items unselected.
V	ClearSelection (see page 21323)	Deselects all selected items in the list box, if possible.
	ClientToParent (see page 5744)	Translates client coordinates to parent coordinates.
	ClientToScreen (see page 5744)	Translates a given point from client area coordinates to global screen coordinates.
	ContainsControl (see page 6133)	Indicates whether a specified control exists within the control.
	ControlAtPos (see page 6133)	Returns the child control located at a specified position within the control.
A	CopySelection (see page 5941)	Copies the selected item or items to another TCustomListControl (see page 5928) descendant.
V	CopySelection (see page 21323)	Copies the selected items to another list-type control
V	Create (see page 12438)	Instantiates a list box control.
	CreateParented (see page 6123)	Creates and initializes a control as the child of a specified non-VCL container.
	CreateParentedControl (see page 6136)	Creates and initializes a control as the child of a specified non-VCL window.
V	DefaultHandler (see page 5748)	Provides message handling for all messages that do not have specific handlers.
V	DefaultHandler (see page 6139)	Provides message handling for all messages that the control does not fully process itself.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
A	DeleteSelected (see page 5941)	Deletes all the selected items.
V	DeleteSelected (see page 21325)	Deletes the selected items from the list box
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 5732)	Destroys an instance of TControl (see page 5724).
V	Destroy (see page 6124)	Destroys an instance of TWinControl (see page 6112).
V	Destroy (see page 21320)	Destroys the instance of a list box control.
V	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	DisableAlign (see page 6141)	Disables the realignment of child controls.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Dock (see page 5749)	Used internally to dock the control.
	DockDrop (see page 6142)	Generates an OnDockDrop (see page 6214) event.
	DragDrop (see page 5754)	OnDragDrop (see page 5855) event dispatcher.
	Dragging (see page 5754)	Indicates whether a control is being dragged.
	DrawTextBiDiModeFlags (see page 5756)	Returns the text flags that reflect the current setting of the BiDiMode (see page 5803) property.
	DrawTextBiDiModeFlagsReadingOnly (see page 5756)	Returns the text flag to add that indicates whether the control's text should read from right to left.
	EnableAlign (see page 6148)	Decrements the reference count incremented by the DisableAlign (see page 6141) method, eventually realigning the child controls.
	EndDrag (see page 5757)	Stops a control from being dragged any further.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindChildControl (see page 6148)	Returns a child control given its name.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FlipChildren (see page 6150)	Reverses the positions of child controls.
	Focused (see page 6150)	Determines whether the control has input focus.

	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetControlsAlignment (see page 5759)	Indicates how text is aligned within the control.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 5765)	Returns the parent of the control.
	GetTabOrderList (see page 6158)	Builds a list of controls in tab order.
	GetTextBuf (see page 5766)	Retrieves the control's text, copies it into a buffer, and returns the number of characters copied.
	GetTextLen (see page 5767)	Returns the length of the control's text.
	HandleAllocated (see page 6159)	Reports whether a screen object handle exists for the control.
	HandleNeeded (see page 6160)	Creates a screen object for the control if it doesn't already exist.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 5768)	Indicates whether the control has a parent.
	Hide (see page 5769)	Makes the control invisible.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
V	InitiateAction (see page 5769)	Calls the action link's Update (see page 5789) method if the control is associated with an action link.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InsertControl (see page 6160)	Inserts a control into the Controls (see page 6197) array property.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
V	Invalidate (see page 5770)	Completely repaint control.
V	Invalidate (see page 6161)	Schedules a control repaint.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	IsRightToLeft (see page 5770)	Indicates whether the control should be reversed right to left.
	ItemAtPos (see page 21331)	Returns the index of the list box item indicated by the coordinates of a point on the control.
	ItemRect (see page 21333)	Returns the rectangle that surrounds the item specified in the Item parameter.
	ManualDock (see page 5771)	Docks the control.
	ManualFloat (see page 5772)	Undocks the control.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	MouseWheelHandler (see page 5774)	Dispatches messages received from a mouse wheel.
V	MoveSelection (see page 5942)	Moves all selected items to another list control.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	PaintTo (see page 6167)	This is the overview for the PaintTo method overload.
	ParentToClient (see page 5776)	Translate parent coordinates to client coordinates.
	Perform (see page 5776)	Responds as if the control received a specified Windows message.
	PreProcessMessage (see page 6170)	This is PreProcessMessage, a member of class TWinControl.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	Realign (see page 6171)	Forces the control to realign children.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.

	Refresh (see page 5779)	Repaints the control on the screen.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveControl (see page 6172)	Removes a specified control from the Controls (see page 6197) array.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	Repaint (see page 5779)	Forces the control to repaint its image on the screen.
V	Repaint (see page 6174)	Repaints the entire control.
	ReplaceDockedControl (see page 5779)	Docks the control in the place where another control is already docked.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	ScaleBy (see page 6175)	Rescale control and its children.
	ScreenToClient (see page 5781)	Converts the screen coordinates of a specified point on the screen to client coordinates.
	ScrollBy (see page 6176)	Scroll control contents.
A	SelectAll (see page 5943)	Selects all items or all text in the selected item.
V	SelectAll (see page 21336)	Selects the entire block of text in the list box.
	SendToBack (see page 5782)	Puts a windowed control behind all other windowed controls, or puts a non-windowed control behind all other non-windowed controls.
V	SetBounds (see page 5783)	Sets the Left (see page 5830), Top (see page 5844), Width (see page 5849), and Height (see page 5825) properties all at once.
V	SetBounds (see page 6178)	Sets the windowed control's boundary properties all at once.
	SetDesignVisible (see page 5784)	Makes a control visible at design time.
V	SetDesignVisible (see page 6178)	Makes a control visible at design time.
V	SetFocus (see page 6179)	Gives the input focus to the control.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	SetTextBuf (see page 5787)	Sets the text of the control.
	Show (see page 5788)	Makes a control visible.
V	Update (see page 5789)	Processes any pending paint messages immediately.
V	Update (see page 6183)	Forces the control to update.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	UpdateControlState (see page 6186)	Respond to state change.
	UseRightToLeftAlignment (see page 5790)	Specifies whether the control's alignment should be reversed right-to-left.
	UseRightToLeftReading (see page 5790)	Specifies whether the control is using a right-to-left reading order.
	UseRightToLeftScrollBar (see page 5791)	Specifies whether the vertical scroll bar appears on the left side of the control.

Public Properties

	Name	Description
	Action (see page 5797)	Designates the action associated with the control.
	Align (see page 5798)	Determines how the control aligns within its container (parent control).
R	AlignDisabled (see page 6192)	Indicates child control realignment disabled.
	Anchors (see page 5802)	Specifies how the control is anchored to its parent.
	AutoComplete (see page 21342)	Determines whether the user can give focus to items by typing in the list.
	AutoCompleteDelay (see page 21342)	Specifies the delay between a key press and an attempt to autocomplete the field.
	BiDiMode (see page 5803)	Specifies the bi-directional mode for the control.
	BoundsRect (see page 5803)	Specifies the bounding rectangle of the control, expressed in the coordinate system of the parent control.
R	Brush (see page 6195)	Determines the color and pattern used for painting the background of the control.
R	Canvas (see page 21343)	Provides a drawing surface when implementing a handler for the OnDrawItem (see page 21358) event of an owner-draw list box.
	ClientHeight (see page 5808)	Specifies the height of the control's client area in pixels.
R	ClientOrigin (see page 5809)	Specifies the screen coordinates (in pixels) of the top left corner of a control's client area.
R	ClientRect (see page 5810)	Specifies the size (in pixels) of a control's client area.
	ClientWidth (see page 5811)	Specifies the horizontal size of the control's client area in pixels.
R	ColorNames (see page 12442)	This is ColorNames, a member of class TCustomColorListBox.
R	Colors (see page 12443)	This is Colors, a member of class TCustomColorListBox.

R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Constraints (see page 5812)	Specifies the size constraints for the control.
R	ControlCount (see page 6195)	Returns the number of child controls.
R	Controls (see page 6197)	Lists all child controls.
	ControlState (see page 5813)	Indicates the current state of a control at runtime.
	ControlStyle (see page 5814)	Determines style characteristics of the control.
	Count (see page 21346)	Indicates the number of items in the list box.
	DefaultColorColor (see page 12443)	This is DefaultColorColor, a member of class TCustomColorListBox.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	DockClientCount (see page 6199)	Specifies the number of controls that are docked on the windowed control.
R	DockClients (see page 6201)	Lists the controls that are docked to the windowed control.
	DockManager (see page 6202)	Specifies the control's docking manager interface.
	DockOrientation (see page 5818)	Specifies how the control is docked relative to other controls docked in the same parent.
	DockSite (see page 6204)	Specifies whether the control can be the target of drag-and-dock operations.
	DoubleBuffered (see page 6205)	Determines whether the control's image is rendered directly to the window or painted to an in-memory bitmap first.
	Enabled (see page 5821)	Controls (see page 5711) whether the control responds to mouse, keyboard, and timer events.
R	ExplicitHeight (see page 5821)	Specifies the explicit vertical size of the control in pixels.
R	ExplicitLeft (see page 5822)	Specifies the explicit horizontal pixel coordinate of the left edge of a component relative to its parent.
R	ExplicitTop (see page 5822)	Specifies the explicit vertical pixel coordinate of the top edge of a component relative to its parent.
R	ExplicitWidth (see page 5822)	Specifies the explicit horizontal size of the control in pixels.
R	Floating (see page 5823)	Indicates whether the control is floating.
	FloatingDockSiteClass (see page 5823)	Specifies the class of the temporary control that hosts the control when it is floating.
R	Handle (see page 6207)	Provides access to the underlying Windows screen object for the control.
	HostDockSite (see page 5829)	Specifies the control in which the control is docked.
	ItemIndex (see page 5944)	Specifies the index of the selected item.
	Items (see page 21348)	Contains the strings that appear in the list box.
	LRDockWidth (see page 5831)	Specifies the width of the control when it is docked horizontally.
R	MouseInClient (see page 6209)	This is MouseInClient, a member of class TWinControl.
	MultiSelect (see page 5957)	Specifies whether the user can select more than one item.
	NoneColorColor (see page 12443)	This is NoneColorColor, a member of class TCustomColorListBox.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Padding (see page 6209)	Specifies the padding of a control.
	Parent (see page 5832)	Indicates the parent of the control.
	ParentWindow (see page 6210)	Reference to parent's underlying control.
	ScrollWidth (see page 21351)	Specifies the width, in pixels, by which the list box can scroll horizontally.
R	SelCount (see page 5957)	Indicates the number of selected items.
	Selected (see page 12443)	Indicates whether a particular item is selected.
	ShowHint (see page 5840)	Determines whether the control displays a Help Hint (see page 5827) when the mouse pointer rests momentarily on the control.
R	Showing (see page 6210)	Indicates whether the control is showing on the screen.
	Style (see page 12445)	Determines whether the list box is standard or owner-draw and whether it is virtual.
	TabOrder (see page 6211)	Indicates the position of the control in its parent's tab order.
	TabStop (see page 6211)	Determines if the user can tab to a control.

	TBDockHeight (see page 5842)	Specifies the height of the control when it is docked vertically.
	TopIndex (see page 21356)	Specifies the index number of the item that appears at the top of the list box.
	UndockHeight (see page 5845)	Specifies the height of the control when it is floating.
	UndockWidth (see page 5846)	Specifies the width of the control when it is floating.
	UseDockManager (see page 6212)	Specifies whether the docking manager is used in drag-and-dock operations.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	Visible (see page 5847)	Determines whether the component appears onscreen.
R	VisibleDockClientCount (see page 6212)	Specifies the number of visible controls that are docked on the windowed control.

Published Properties

	Name	Description
	AlignWithMargins (see page 5802)	Indicates whether a control should be constrained by margins.
	Cursor (see page 5815)	Specifies the image used to represent the mouse pointer when it passes into the region covered by the control.
	Height (see page 5825)	Specifies the vertical size of the control in pixels.
	HelpContext (see page 5826)	Numeric ID for control's context-sensitive help topic
	HelpKeyword (see page 5826)	Keyword for control's context-sensitive help topic
	HelpType (see page 5827)	Indicates whether the control's context sensitive help topic is identified by context ID or by keyword.
	Hint (see page 5827)	Contains the text string that can appear when the user moves the mouse over the control.
	Left (see page 5830)	Specifies the horizontal coordinate of the left edge of a component relative to its parent.
	Margins (see page 5831)	Specifies the margins for the control.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	TabStop (see page 21355)	Determines if the user can tab to a control.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Top (see page 5844)	Specifies the Y coordinate of the top left corner of a control, relative to its parent or containing control in pixels.
	Width (see page 5849)	Specifies the horizontal size of the control or form in pixels.

68.1.14.2 TCustomColorListBox.Create Constructor

Instantiates a list box control.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomColorListBox(TComponent * AOwner);
```

Description

Call Create to instantiate a list box control at runtime. For list boxes created at design time, Create is called automatically.AOwner is the component that is responsible for freeing the list box. It becomes the value of the Owner property. If AOwner is nil, the caller is responsible for explicitly freeing the control.

See Also

Owner (see page 2807)

68.1.14.3 TCustomColorListBox Methods

The methods of the TCustomColorListBox class are listed here.

Protected Methods

	Name	Description
	CreateWnd (see page 12439)	Creates a Windows control corresponding to the list box component.
	DrawItem (see page 12439)	Generates an OnDrawItem event.
	KeyDown (see page 12440)	Respond to key press events.
	KeyPress (see page 12441)	Responds when the user presses a key.
	Loaded (see page 12441)	Initializes the control after it is loaded from a stream.
	PickCustomColor (see page 12441)	This is PickCustomColor, a member of class TCustomColorListBox.
	PopulateList (see page 12442)	This is PopulateList, a member of class TCustomColorListBox.
	SetStyle (see page 12442)	This is SetStyle, a member of class TCustomColorListBox.

68.1.14.3.1 TCustomColorListBox.CreateWnd Method

Creates a Windows control corresponding to the list box component.

Pascal

```
procedure CreateWnd; override;
```

C++

```
virtual __fastcall CreateWnd();
```

Description

CreateWnd is called automatically when the list box must be displayed. CreateWnd calls the inherited CreateWnd method, which calls

CreateParams to initialize the window-creation parameters.

CreateWindowHandle to create the window handle for the control.

CreateWnd additionally sets up the list box position, tabs, items, and columns.

See Also

Columns (see page 21346)

CreateHandle (see page 6135)

CreateParams (see page 21324)

CreateWindowHandle (see page 6137)

CreateWnd (see page 6137)

ItemIndex

Items (see page 21348)

TabWidth (see page 21355)

TopIndex (see page 21356)

68.1.14.3.2 TCustomColorListBox.DrawItem Method

Generates an OnDrawItem event.

Pascal

```
procedure DrawItem(Index: Integer; Rect: TRect; State: TOwnerDrawState); override;
```

C++

```
virtual __fastcall DrawItem(int Index, TRect Rect, TOwnerDrawState State);
```

Description

DrawItem is called whenever a visual aspect of an owner-draw list box changes. The list box calls DrawItem for each visible item in its list, passing the index of the item in the Index parameter.

By default, the DrawItem method for a list box calls any event handler attached to the component's OnDrawItem event. If there is no handler attached, DrawItem fills the rectangle passed in Rect and draws any text associated with the indexed item. The default drawing ignores the State parameter, although State is passed along to attached event handlers.

See Also

ItemHeight (see page 21347)

MeasureItem (see page 21335)

OnDrawItem (see page 21358)

OnMeasureItem (see page 21360)

Style (see page 21354)

68.1.14.3.3 TCustomColorListBox.KeyDown Method

Respond to key press events.

Pascal

```
procedure KeyDown(var Key: Word; Shift: TShiftState); override;
```

C++

```
virtual __fastcall KeyDown(Word Key, TShiftState Shift);
```

Description

When a windowed control receives a key-down message (WM_KEYDOWN) from Windows, its message handler calls the DoKeyDown method. If DoKeyDown determines that the control should, in fact, process the character, it calls KeyDown, passing the key code and shift-key state in the Key and Shift parameters, respectively.

KeyDown calls any event handler attached to the OnKeyDown event. Override KeyDown to provide other responses in addition to the event-handler call.

The Key parameter is the key on the keyboard. For non-alphanumeric keys, you must use WinAPI virtual key codes to determine the key pressed. For more information, search for virtual key codes in the Win32 Developer's Reference (WIN32.HLP).

The Shift parameter indicates whether the Shift, Alt, or Ctrl keys are combined with the keystroke.

Either KeyDown or the OnKeyDown event handler it calls can suppress further processing of a key by setting the Key parameter to zero.

See Also

KeyUp (see page 6164)

OnKeyDown (see page 6225)

DoKeyDown (see page 6145)

DoKeyPress (see page 6146)

DoKeyUp (see page 6146)

68.1.14.3.4 TCustomColorListBox.KeyPress Method

Responds when the user presses a key.

Pascal

```
procedure KeyPress(var Key: Char); override;
```

C++

```
virtual __fastcall KeyPress(Char Key);
```

Description

KeyPress is called automatically when the list box receives a key-press message (WM_CHAR). It generates an OnKeyPress event, and then, if the AutoComplete property is true, updates ItemIndex to reflect the next character that the user typed.

The Key parameter is the character represented by the key that is pressed, not a Windows virtual key code.

See Also

OnKeyPress (see page 6227)

68.1.14.3.5 TCustomColorListBox.Loaded Method

Initializes the control after it is loaded from a stream.

Pascal

```
procedure Loaded; override;
```

C++

```
virtual __fastcall Loaded();
```

Description

Do not call Loaded. The VCL streaming system calls Loaded automatically after the control's form is loaded into memory so that the control can complete any initializations that depend on other objects in the form.

Loaded overrides the inherited method in order to initialize the control from its associated Action. To change the properties the control copies from its action, override the ActionChange method.

See Also

Loaded (see page 2782)

Action (see page 5797)

ActionChange (see page 5737)

68.1.14.3.6 TCustomColorListBox.PickCustomColor Method

Pascal

```
function PickCustomColor: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean PickCustomColor();
```

Description

This is PickCustomColor, a member of class TCustomColorListBox.

68.1.14.3.7 TCustomColorListBox.PopulateList Method

Pascal

```
procedure PopulateList;
```

C++

```
__fastcall PopulateList();
```

Description

This is PopulateList, a member of class TCustomColorListBox.

68.1.14.3.8 TCustomColorListBox.SetStyle Method

Pascal

```
procedure SetStyle(AStyle: TColorBoxStyle); reintroduce;
```

C++

```
__fastcall SetStyle(TColorBoxStyle AStyle);
```

Description

This is SetStyle, a member of class TCustomColorListBox.

68.1.14.4 TCustomColorListBox Properties

The properties of the TCustomColorListBox class are listed here.

Public Properties

	Name	Description
R	ColorNames (see page 12442)	This is ColorNames, a member of class TCustomColorListBox.
R	Colors (see page 12443)	This is Colors, a member of class TCustomColorListBox.
	DefaultColorColor (see page 12443)	This is DefaultColorColor, a member of class TCustomColorListBox.
	NoneColorColor (see page 12443)	This is NoneColorColor, a member of class TCustomColorListBox.
	Selected (see page 12443)	Indicates whether a particular item is selected.
	Style (see page 12445)	Determines whether the list box is standard or owner-draw and whether it is virtual.

68.1.14.4.1 TCustomColorListBox.ColorNames Property

Pascal

```
property ColorNames [Index: Integer]: string;
```

C++

```
__property AnsiString ColorNames[int Index];
```

Description

This is ColorNames, a member of class TCustomColorListBox.

68.1.14.4.2 TCustomColorListBox.Colors Property

Pascal

```
property Colors [Index: Integer]: TColor;
```

C++

```
__property TColor Colors[int Index];
```

Description

This is Colors, a member of class TCustomColorListBox.

68.1.14.4.3 TCustomColorListBox.DefaultColorColor Property

Pascal

```
property DefaultColorColor: TColor;
```

C++

```
__property TColor DefaultColorColor;
```

Description

This is DefaultColorColor, a member of class TCustomColorListBox.

68.1.14.4.4 TCustomColorListBox.NoneColorColor Property

Pascal

```
property NoneColorColor: TColor;
```

C++

```
__property TColor NoneColorColor;
```

Description

This is NoneColorColor, a member of class TCustomColorListBox.

68.1.14.4.5 TCustomColorListBox.Selected Property

Indicates whether a particular item is selected.

Pascal

```
property Selected: TColor;
```

C++

```
__property TColor Selected;
```

Description

Use Selected to query the state of a particular item in the list box. If the item specified by the Index parameter is selected in the list box, the value of the Selected property is true. If the specified item is not selected, Selected is false. Set Selected to change the currently selected item.

The Index parameter is the item referenced by its position in the list box, with the first item having an Index value of 0.

An item is selected when the user highlights it. More than one item in the list box can be selected by setting the MultiSelect property to true. In this case, the Selected item is the one that has focus when the list box has input focus.

C++ Examples:

```
/*
This example uses a file listbox and a regular listbox on a
form. The following routine scans through the files listed
in the file listbox and lists the sizes of any selected
files to the regular list box.  To exercise the error
condition create a file in the Debug directory, start this
application and then delete the file.  Now try to list the
size of the deleted file.  Continue will continue listing
file sizes in a multiple selection that includes the deleted
file.  Break will stop.  Set the MultiSelect and
ExtendedSelect properties on the FileListBox.
*/
#include <stdio.h>     // for FILE, fopen, fstat, fileno, fread and fclose
#include <sys\stat.h>  // for fstat and the stat struct

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  for (int i = 0; i < FileListBox1->Items->Count; i++)
  {
    if (FileListBox1->Selected[i])
    {
      if (!FileExists(FileListBox1->Items->Strings[i]))
      {
        MessageBeep(0);
        if (Application->MessageBox(
          AnsiString("File " + FileListBox1->Items->Strings[i] + "not found").c_str(),
          NULL,
          MB_OKCANCEL) == IDCANCEL)
          break;
        else
          continue;
      }
      FILE *F = fopen(FileListBox1->Items->Strings[i].c_str(),"r");
      struct stat statbuf;
      fstat(fileno(F), &statbuf);
      ListBox1->Items->Add(
          FileListBox1->Items->Strings[i] + ": " + IntToStr(statbuf.st_size));
      fclose(F);
    }
  }
}
```

Delphi Examples:

```
{
This example uses a file listbox and a regular listbox on a
form. The following routine scans through the files listed
in the file listbox and lists the sizes of any selected
files to the regular list box.  To exercise the error
condition create a file in the Debug directory, start this
application and then delete the file.  Now try to list the
size of the deleted file.  Set the MultiSelect and
ExtendedSelect properties on the FileListBox.
}
procedure TForm1.Button1Click(Sender: TObject);
var
  F: File;
  i, filehandle: Integer;
begin
  for i := 0 to (FileListBox1.Items.Count - 1) do begin
  try
    if FileListBox1.Selected[i] then
    begin
      if not FileExists(FileListBox1.Items.Strings[i]) then
      begin
```

```
          MessageDlg('File: ' + FileListBox1.Items.Strings[i] +
                     ' not found', mtError, [mbOk], 0);
          Continue;
        end;
        filehandle:=  FileOpen(FileListBox1.Items.Strings[i], 1);
        if (filehandle = -1) then
        begin
          MessageDlg('File: ' + FileListBox1.Items.Strings[i] +
                     ' cannot be opened with access mode 1.', mtError, [mbOk], 0);
          Continue;
        end
        else
          FileClose(filehandle);

        AssignFile(F, FileListBox1.Items.Strings[i]);
        Reset(F, 1);
        ListBox1.Items.Add(
          FileListBox1.Items.Strings[i] + ': ' + IntToStr(FileSize(F)));
        CloseFile(F);
      end;
    finally
    { do something here }
    end;
  end;
end;
```

68.1.14.4.6 TCustomColorListBox.Style Property

Determines whether the list box is standard or owner-draw and whether it is virtual.

Pascal

```
property Style: TColorBoxStyle;
```

C++

```
__property TColorBoxStyle Style;
```

Description

Use Style to specify whether the list box is a standard list box that displays text strings, or an owner-draw list box that can display graphical images. Owner-draw list boxes let you display items in some nonstandard way. In this case, you must write the code to paint items in the list box.

In addition, Style controls whether the list box is virtual, which means that items are supplied dynamically using event handlers. By default, Style is lbStandard, meaning that the list box is not virtual and it displays each item as a string.

See Also

DrawItem (see page 21328)

ItemHeight (see page 21347)

Items (see page 21348)

MeasureItem (see page 21335)

68.1.14.5 TCustomColorListBox Events

The events of the TCustomColorListBox class are listed here.

Public Events

	Name	Description
	OnGetColors (see page 12446)	This is OnGetColors, a member of class TCustomColorListBox.

68.1.14.5.1 TCustomColorListBox.OnGetColors Event

Pascal

```
property OnGetColors: TLBGetColorsEvent;
```

C++

```
__property TLBGetColorsEvent OnGetColors;
```

Description

This is OnGetColors, a member of class TCustomColorListBox.

68.1.15 TCustomControlBar Class

TCustomControlBar is the base class for control bar components.

Class Hierarchy

Pascal

```
TCustomControlBar = class(TCustomControl);
```

C++

```
class TCustomControlBar : public TCustomControl;
```

File

ExtCtrls

Description

Use TCustomControlBar as a base class when defining control bar components. Control bars are designed to manage the layout of toolbar controls, although they can contain other controls as well. They provide a convenient docking site in applications that have dockable toolbars.

Do not create instances of TCustomControlBar. To add a control bar to a form, use TControlBar (see page 12316) instead.

See Also

TControlBar (see page 12316)

TToolBar (see page 4994)

68.1.15.1 TCustomControlBar Members

The following tables list the members exposed by TCustomControlBar.

Protected Events

	Name	Description
	OnAlignInsertBefore (see page 6213)	Occurs when an object with custom alignment is aligned.
	OnAlignPosition (see page 6214)	Occurs when an object with custom alignment is aligned.
	OnBandDrag (see page 12472)	Occurs when the user starts a drag operation on a specified control.
	OnBandInfo (see page 12473)	Occurs when the control bar adjusts the docking position of a band.
	OnBandMove (see page 12473)	This is OnBandMove, a member of class TCustomControlBar.
	OnBandPaint (see page 12473)	This is OnBandPaint, a member of class TCustomControlBar.
	OnBeginBandMove (see page 12474)	This is OnBeginBandMove, a member of class TCustomControlBar.
	OnCanResize (see page 5851)	Occurs when an attempt is made to resize the control.
	OnClick (see page 5851)	Occurs when the user clicks the control.
	OnConstrainedResize (see page 5853)	Adjust resize constraints.
	OnContextPopup (see page 5854)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnDblClick (see page 5854)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDockDrop (see page 6214)	Occurs when another control is docked to the control.
	OnDockOver (see page 6216)	Occurs when another control is dragged over the control.
	OnDragDrop (see page 5855)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 5857)	Occurs when the user drags an object over a control.
	OnEndBandMove (see page 12474)	This is OnEndBandMove, a member of class TCustomControlBar.
	OnEndDock (see page 5859)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 5860)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnEnter (see page 6219)	Occurs when a control receives the input focus.
	OnExit (see page 6221)	Occurs when the input focus shifts away from one control to another.
	OnGetSiteInfo (see page 6223)	Returns the control's docking information.
	OnKeyDown (see page 6225)	Occurs when a user presses any key while the control has focus.
	OnKeyPress (see page 6227)	Occurs when a key is pressed.
	OnKeyUp (see page 6228)	Occurs when the user releases a key that has been pressed.
	OnMouseActivate (see page 5861)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 5862)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseEnter (see page 5864)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 5864)	Occurs when the user moves the mouse outside of a control.
	OnMouseMove (see page 5865)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 5867)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnMouseWheel (see page 5869)	Occurs when the mouse wheel is rotated.
	OnMouseWheelDown (see page 5869)	Occurs when the mouse wheel is rotated downward.
	OnMouseWheelUp (see page 5870)	Occurs when the mouse wheel is rotated upward.
	OnPaint (see page 12474)	Occurs when the control bar is painted.

	OnResize (see page 5870)	Occurs immediately after the control is resized.
	OnStartDock (see page 5871)	Occurs when the user begins to drag a control with a DragKind (see page 5819) of dkDock.
	OnStartDrag (see page 5871)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.
	OnUnDock (see page 6230)	Occurs when the application tries to undock a control that is docked to the windowed control.

Protected Fields

	Name	Description
	FAnchorMove (see page 5733)	This is FAnchorMove, a member of class TControl.
	FAnchorOrigin (see page 5734)	This is FAnchorOrigin, a member of class TControl.
	FAnchorRules (see page 5734)	This is FAnchorRules, a member of class TControl.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FDesignSize (see page 6124)	This is FDesignSize, a member of class TWinControl.
	FDoubleBuffered (see page 6124)	This is FDoubleBuffered, a member of class TWinControl.
	FExplicitHeight (see page 5734)	This is FExplicitHeight, a member of class TControl.
	FExplicitLeft (see page 5734)	This is FExplicitLeft, a member of class TControl.
	FExplicitTop (see page 5734)	This is FExplicitTop, a member of class TControl.
	FExplicitWidth (see page 5735)	This is FExplicitWidth, a member of class TControl.
	FInImeComposition (see page 6125)	This is FInImeComposition, a member of class TWinControl.
	FOriginalParentSize (see page 5735)	This is FOriginalParentSize, a member of class TControl.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	ActionChange (see page 5737)	Responds when the action associated with the control changes.
V	ActionChange (see page 6127)	Updates the control to reflect changes in its associated action.
	AddBiDiModeExStyle (see page 6128)	Sets control's window style according to its bi-directional support.
V	AdjustClientRect (see page 6128)	Provides the interface that adjusts the ClientRect (see page 5810) property for idiosyncrasies of the window.
	AdjustSize (see page 5738)	Sets the size of the control as determined by the AutoSize (see page 5803) property.
V	AdjustSize (see page 6129)	Adjusts the control's size according to its contents and constraints.
V	AlignControls (see page 12459)	Aligns controls in the control bar.
	ArrangeControl (see page 6130)	This is ArrangeControl, a member of class TWinControl.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	AssignTo (see page 5739)	Overrides the inherited AssignTo function to enable assignments to TAction objects.
V	AssignTo (see page 6130)	Copies the properties of the windowed control to another object.
	BeginAutoDrag (see page 5739)	Begin Automatic Drag.
	CalcCursorPos (see page 5741)	This is CalcCursorPos, a member of class TControl.
V	CanAutoSize (see page 12459)	Indicates how the control can be resized.
V	CanResize (see page 5742)	OnCanResize (see page 5851) event dispatcher.
V	CanResize (see page 6132)	Indicates how the control can respond to a resize attempt.
	Changed (see page 5742)	Sends a CM_CHANGED (see page 6330) message to the control.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	ChangeScale (see page 5743)	Rescaling event dispatcher.
V	ChangeScale (see page 6132)	Resize (see page 5780) and reposition children and self.
	Click (see page 5743)	Respond to user click.
V	ConstrainedResize (see page 5746)	Notify control of resize with constraints.
V	ConstrainedResize (see page 6133)	Generates an OnConstrainedResize (see page 5853) event.
	ControlsAligned (see page 6134)	This is ControlsAligned, a member of class TWinControl.
	CreateDockManager (see page 6134)	Creates the dock manager for the control.
V	CreateHandle (see page 6135)	Creates underlying screen object.

	CreateParams (see page 12460)	Sets the control bar's window flags.
	CreateSubClass (see page 6136)	Creates a windowed control derived from an existing Windows window class.
	CreateWindowHandle (see page 6137)	Creates a Windows control to represent the control.
	CreateWnd (see page 6137)	Creates the underlying window.
	CustomAlignInsertBefore (see page 6137)	Returns placement order of custom-aligned child control.
	CustomAlignPosition (see page 6138)	Returns aligned position of custom-aligned child control.
	DblClick (see page 5747)	OnDblClick (see page 5854) event dispatcher.
	DefaultDockImage (see page 5747)	Handles the painting and erasing of a dock image.
	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	DefineProperties (see page 5748)	Provides methods to read and write the IsControl (see page 5829) property to a stream such as a form file.
	DefineProperties (see page 6139)	Provides methods to read and write the IsControl property to a stream such as a form file.
	DesignWndProc (see page 5749)	This is DesignWndProc, a member of class TControl.
	DestroyHandle (see page 6140)	Destroys the control's window without destroying the control.
	DestroyWindowHandle (see page 6140)	Destroys the window created in the CreateWindowHandle (see page 6137) method.
	DestroyWnd (see page 6141)	Destroys the control's window.
	DoAddDockClient (see page 6142)	Performs actions when a control is docked to the windowed control.
	DoBandMove (see page 12460)	Generates an OnBandMove (see page 12473) event.
	DoBandPaint (see page 12460)	This is DoBandPaint, a member of class TCustomControlBar.
	DoBeginBandMove (see page 12461)	This is DoBeginBandMove, a member of class TCustomControlBar.
	DockOver (see page 12461)	Generates an OnDockOver event and ensures proper docking of floating controls.
	DockReplaceDockClient (see page 6143)	This is DockReplaceDockClient, a member of class TWinControl.
	DockTrackNoTarget (see page 5749)	Handles dragging of the control over an invalid docking target.
	DoContextPopup (see page 5750)	OnContextPopup (see page 5854) event dispatcher.
	DoDock (see page 5750)	Docking event dispatcher.
	DoDockOver (see page 6143)	Generates an OnDockOver (see page 6216) event.
	DoEndBandMove (see page 12461)	This is DoEndBandMove, a member of class TCustomControlBar.
	DoEndDock (see page 5750)	OnEndDock (see page 5859) event dispatcher.
	DoEndDrag (see page 5751)	OnEndDrag (see page 5860) event dispatcher.
	DoEnter (see page 6144)	Respond to receiving input focus.
	DoExit (see page 6144)	Respond to losing input focus
	DoFlipChildren (see page 6145)	Flips the control's children.
	DoKeyDown (see page 6145)	Performs some preprocessing before generating an OnKeyDown (see page 6225) event.
	DoKeyPress (see page 6146)	Performs some preprocessing before generating an OnKeyPress (see page 6227) event.
	DoKeyUp (see page 6146)	Performs some preprocessing before generating an OnKeyUp (see page 6228) event.
	DoMouseWheel (see page 5751)	Processes mouse wheel motion.
	DoMouseWheelDown (see page 5752)	OnMouseWheelDown (see page 5869) event dispatcher.
	DoMouseWheelUp (see page 5752)	OnMouseWheelUp (see page 5870) event dispatcher.
	DoPaletteChange (see page 12461)	Prepares the control bar to realize a new palette.
	DoRemoveDockClient (see page 6147)	Responds when a control is undocked from the windowed control.
	DoStartDock (see page 5753)	OnStartDock (see page 5871) event dispatcher.
	DoStartDrag (see page 5753)	OnStartDrag (see page 5871) event dispatcher.
	DoUnDock (see page 6147)	Undocks a control that is currently docked to the windowed control.
	DragCanceled (see page 5754)	Provides the interface for a method that responds to the cancellation of a drag.
	DragControl (see page 12462)	Starts a drag operation on a control band.
	DragOver (see page 5755)	OnDragOver (see page 5857) event dispatcher.
	DrawDragDockImage (see page 5755)	Draws the dock image for the control.
	EraseDragDockImage (see page 5757)	Erases the dock image for the control.
	FindNextControl (see page 6149)	Returns the control's next child in the tab order after the specified control.

	FixupTabList (see page 6149)	Sorts the child controls by their tab order.
V	GetAction (see page 5758)	This is GetAction, a member of class TControl.
	GetActionLinkClass (see page 5758)	Returns the appropriate action link class that is associated with the control class.
V	GetActionLinkClass (see page 6152)	Returns the associated action link class.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetChildren (see page 6153)	Calls a specified method for each child of the control.
V	GetClientOrigin (see page 5758)	Returns the screen coordinates of the top-left corner of the control's client area.
V	GetClientOrigin (see page 6153)	Returns the value of the ClientOrigin (see page 5809) property.
V	GetClientRect (see page 5759)	Returns a rectangle defining the client area of the control.
V	GetClientRect (see page 6154)	Returns the value of the ClientRect (see page 5810) property.
V	GetControlExtents (see page 6154)	Returns the smallest rectangle in which all the control's children fit.
V	GetControlInfo (see page 12463)	Generates an OnBandInfo (see page 12473) event.
V	GetDeviceContext (see page 5760)	Returns a device context for the control.
V	GetDeviceContext (see page 6155)	Provides access to a device context for the control.
	GetDockEdge (see page 5763)	Returns the edge on which another control should be docked when it is dragged over the control.
V	GetDragImages (see page 5763)	Returns the control's image list containing the image to be displayed while dragging.
V	GetEnabled (see page 5763)	Returns the value of the Enabled (see page 5821) property.
V	GetFloating (see page 5764)	Returns the value of the Floating (see page 5823) property.
V	GetFloatingDockSiteClass (see page 5764)	Returns the class used for the control when it is floating.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
V	GetPalette (see page 12463)	Returns the handle to a palette for use by the control.
	GetParentHandle (see page 6157)	Returns the window handle for the window of the control's parent.
	GetPopupMenu (see page 5765)	Returns the pop-up menu associated with the control.
V	GetSiteInfo (see page 12464)	Generates an OnGetSiteInfo event
	GetTopParentHandle (see page 6159)	Returns the window handle of the first window not associated with a VCL control that contains the windowed control.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	HitTest (see page 12464)	Returns the control at the specified coordinates.
	InvalidateDockHostSite (see page 6162)	This is InvalidateDockHostSite, a member of class TWinControl.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsControlActivateMsg (see page 6162)	This is IsControlActivateMsg, a member of class TWinControl.
	IsControlMouseMsg (see page 6162)	Indicates whether a specified mouse message is directed to one of the windowed control's child controls.
	IsQualifyingSite (see page 6163)	This is IsQualifyingSite, a member of class TWinControl.
	KeyDown (see page 6163)	Respond to key press events.
	KeyPress (see page 6163)	Respond to keyboard input.
	KeyUp (see page 6164)	Respond to released key.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Loaded (see page 5771)	Initializes the control after it is loaded from a stream.
	MainWndProc (see page 6165)	Receives Windows messages for the control.
	MouseActivate (see page 5773)	This is MouseActivate, a member of class TControl.
V	MouseDown (see page 12465)	Handles mouse button clicks.
V	MouseMove (see page 12465)	Handles mouse movements.
V	MouseUp (see page 12465)	Handles releasing of a mouse button.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	Notification (see page 5775)	Responds to notifications that components are being created or destroyed.

	Notification (see page 6165)	Responds to notifications that components are being created or destroyed.
	NotifyControls (see page 6165)	Sends a message to all the child controls.
	Paint (see page 12466)	Paints the control bar.
	PaintControlFrame (see page 12466)	Paints a control band's frame.
	PaintControls (see page 6166)	Paints each of the child controls in a windowed control using the specified device context.
	PaintHandler (see page 6166)	Responds to WM_PAINT messages.
	PaintWindow (see page 5920)	Renders the image of the control on a specified device context.
	PaintWindow (see page 6169)	Renders the image of a windowed control.
	PaletteChanged (see page 5775)	Responds to changes in the system's palette by realizing the control's palette.
	PaletteChanged (see page 6170)	Responds to changes in the system's palette by realizing the control's palette and the palette for each child control.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	PositionDockRect (see page 5777)	Positions the docking rectangle according to the current drag-and-dock state.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	ReadState (see page 5778)	Prepares the control for having its properties assigned values read from a stream.
	ReadState (see page 6171)	Prepares the control for having its properties assigned values from a stream.
	RecreateWnd (see page 6171)	Recreate underlying Windows screen object.
	ReloadDockedControl (see page 6172)	Reloads a docked control.
	RemoveWindowProps (see page 6174)	This is RemoveWindowProps, a member of class TWinControl.
	RequestAlign (see page 5780)	Instructs the parent of a control to reposition the control, enforcing its Align (see page 5798) property.
	ResetIme (see page 6174)	Restores the input method editor (IME) that was active when the application started.
	ResetImeComposition (see page 6175)	Directs the composition window of the input method editor (IME) to perform a specific action.
	Resize (see page 5780)	Respond to control resize.
	ScaleConstraints (see page 5781)	This is ScaleConstraints, a member of class TControl.
	ScaleControls (see page 6176)	Rescale child controls only.
	SelectFirst (see page 6177)	Locates first selectable child control.
	SelectNext (see page 6177)	Moves the input focus from the current child control to the next one in the tab order.
	SendCancelMode (see page 5781)	Cancels the modal state of the control.
	SendDockNotification (see page 5782)	Sends a Windows message to the control's host dock site.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetAutoSize (see page 5783)	This is SetAutoSize, a member of class TControl.
	SetBiDiMode (see page 5783)	Sets the control's bi-directional mode.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetChildOrder (see page 6178)	Changes the order in which the child component appears in the list of child components returned by the GetChildren (see page 6153) method.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDragMode (see page 5785)	Sets the drag mode for the control.
	SetEnabled (see page 5785)	Sets the value of the Enabled (see page 5821) property.
	SetIme (see page 6181)	Activates an input method editor (IME) using the values specified by the ImeMode (see page 6207) and ImeName (see page 6208) properties.
	SetImeCompositionWindow (see page 6181)	Sets the position and font of the composition window.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetName (see page 5785)	Sets the name of the control.
	SetParent (see page 5786)	Sets the parent of the control.
	SetParent (see page 6182)	Sets the parent of the control.
	SetParentBackground (see page 6182)	This is SetParentBackground, a member of class TWinControl.
	SetParentBiDiMode (see page 5786)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.

V	SetParentComponent (see page 5787)	Sets the parent for the control.
	SetZOrder (see page 5788)	Repositions the control in its parent's control list, thereby changing position onscreen.
V	SetZOrder (see page 6182)	Moves the control to the top or bottom of the parent control's (or screen's) list of TWinControl (see page 6112) controls.
V	ShowControl (see page 6183)	Ensures that a specified child control is visible.
	UpdateBounds (see page 6185)	This is UpdateBounds, a member of class TWinControl.
	UpdateBoundsRect (see page 5789)	Changes the Top (see page 5844), Left (see page 5830), Width (see page 5849), and Height (see page 5825) properties of the control, but doesn't update its screen image and bypasses all resize events.
V	UpdateControlOriginalParentSize (see page 6186)	This is UpdateControlOriginalParentSize, a member of class TWinControl.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateExplicitBounds (see page 5789)	This is UpdateExplicitBounds, a member of class TControl.
	UpdateRecreatingFlag (see page 6186)	This is UpdateRecreatingFlag, a member of class TWinControl.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	UpdateUIState (see page 6186)	Updates form User Interface State as needed
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	VisibleChanging (see page 5791)	Provides the interface for a method that responds to changes in the control's visibility.
V	WndProc (see page 5791)	Provides specific message responses for the control.
V	WndProc (see page 6187)	Provides specific message responses for the control.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	ActionLink (see page 5798)	Contains the action link object associated with the control.
	AutoDock (see page 12467)	Determines whether the control bar temporarily docks drag clients to provide visual feedback.
	AutoDrag (see page 12468)	Specifies whether control bands can be undocked by dragging.
	AutoSize (see page 12468)	Specifies whether the control sizes itself automatically to accommodate its contents.
	BevelEdges (see page 6192)	Specifies which edges of the control are beveled.
	BevelInner (see page 6193)	Specifies the cut of the inner bevel.
	BevelKind (see page 12469)	Specifies the control's bevel style.
	BevelOuter (see page 6194)	Specifies the cut of the outer bevel.
	BevelWidth (see page 6194)	Specifies the width of the inner and outer bevels.
	BorderWidth (see page 6195)	Specifies the width of the control's border.
R	Canvas (see page 5921)	Specifies the TCanvas object that presents a drawing surface for the control.
	Caption (see page 5806)	Specifies a text string that identifies the control to the user.
	Color (see page 5812)	Specifies the background color of the control.
	CornerEdge (see page 12469)	This is CornerEdge, a member of class TCustomControlBar.
	Ctl3D (see page 6198)	Determines whether a control has a three-dimensional (3-D) or two-dimensional look.
	DefWndProc (see page 6199)	Specifies the default window procedure for the windowed control.
	DesktopFont (see page 5818)	Specifies whether the control uses the Windows icon font when writing text.
	DockSite (see page 12469)	Specifies whether the control can be the target of drag-and-dock operations.
	DragCursor (see page 5818)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 5819)	Specifies whether the control is being dragged normally or for docking.
	DragMode (see page 5819)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	DrawingStyle (see page 12470)	This is DrawingStyle, a member of class TCustomControlBar.

	Font (see page 5823)	Controls (see page 5711) the attributes of text written on or in the control.
	GradientDirection (see page 12471)	This is GradientDirection, a member of class TCustomControlBar.
	GradientEndColor (see page 12471)	This is GradientEndColor, a member of class TCustomControlBar.
	GradientStartColor (see page 12471)	This is GradientStartColor, a member of class TCustomControlBar.
	ImeMode (see page 6207)	Determines the behavior of the input method editor (IME).
	ImeName (see page 6208)	Specifies the input method editor (IME) to use for converting keyboard input to Asian language characters.
	IsControl (see page 5829)	Determines whether a form stores its form-specific properties to a stream.
	MouseCapture (see page 5831)	Indicates whether the control has "captured" mouse events.
	ParentBackground (see page 6209)	Determines whether control uses parent's theme background.
	ParentBiDiMode (see page 5833)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	ParentColor (see page 5834)	Determines where a control looks for its color information.
	ParentCtl3D (see page 6209)	Determines where a component looks to determine if it should appear three dimensional.
	ParentFont (see page 5834)	Determines where a control looks for its font information.
	ParentShowHint (see page 5835)	Determines where a control looks to find out if its Help Hint (see page 5827) should be shown.
	PopupMenu (see page 5835)	Identifies the pop-up menu associated with the control.
	RowSize (see page 12472)	This is RowSize, a member of class TCustomControlBar.
	RowSnap (see page 12472)	This is RowSnap, a member of class TCustomControlBar.
	ScalingFlags (see page 5840)	Reflects which attributes of the control have been scaled.
	Text (see page 5842)	Contains a text string associated with the control.
	WheelAccumulator (see page 5849)	Accumulates mouse wheel rotations.
	WindowHandle (see page 6212)	Provides access to a window handle for the control.
	WindowText (see page 5850)	Contains the text string of the control.

Public Events

	Name	Description
	WindowProc (see page 5872)	Points to the window procedure that responds to messages sent to the control.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	BeginDrag (see page 5740)	Starts the dragging of a control.
	BringToFront (see page 5740)	Puts the control in front of all other controls in its parent control.
	Broadcast (see page 6130)	Sends a message to each of the child controls.
	CanFocus (see page 6131)	Indicates whether a control can receive focus.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	ClientToParent (see page 5744)	Translates client coordinates to parent coordinates.
	ClientToScreen (see page 5744)	Translates a given point from client area coordinates to global screen coordinates.
	ContainsControl (see page 6133)	Indicates whether a specified control exists within the control.
	ControlAtPos (see page 6133)	Returns the child control located at a specified position within the control.
V	Create (see page 12457)	Creates and initializes an instance of TCustomControlBar (see page 12446).
	CreateParented (see page 6123)	Creates and initializes a control as the child of a specified non-VCL container.

	CreateParentedControl (see page 6136)	Creates and initializes a control as the child of a specified non-VCL window.
V	DefaultHandler (see page 5748)	Provides message handling for all messages that do not have specific handlers.
V	DefaultHandler (see page 6139)	Provides message handling for all messages that the control does not fully process itself.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 12458)	Destroys the TCustomControlBar (see page 12446) instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	DisableAlign (see page 6141)	Disables the realignment of child controls.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Dock (see page 5749)	Used internally to dock the control.
	DockDrop (see page 6142)	Generates an OnDockDrop (see page 6214) event.
	DragDrop (see page 5754)	OnDragDrop (see page 5855) event dispatcher.
	Dragging (see page 5754)	Indicates whether a control is being dragged.
	DrawTextBiDiModeFlags (see page 5756)	Returns the text flags that reflect the current setting of the BiDiMode (see page 5803) property.
	DrawTextBiDiModeFlagsReadingOnly (see page 5756)	Returns the text flag to add that indicates whether the control's text should read from right to left.
	EnableAlign (see page 6148)	Decrements the reference count incremented by the DisableAlign (see page 6141) method, eventually realigning the child controls.
	EndDrag (see page 5757)	Stops a control from being dragged any further.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindChildControl (see page 6148)	Returns a child control given its name.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
V	FlipChildren (see page 12462)	Reverses the positions of child controls.
	Focused (see page 6150)	Determines whether the control has input focus.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetControlsAlignment (see page 5759)	Indicates how text is aligned within the control.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 5765)	Returns the parent of the control.
	GetTabOrderList (see page 6158)	Builds a list of controls in tab order.
	GetTextBuf (see page 5766)	Retrieves the control's text, copies it into a buffer, and returns the number of characters copied.
	GetTextLen (see page 5767)	Returns the length of the control's text.
	HandleAllocated (see page 6159)	Reports whether a screen object handle exists for the control.
	HandleNeeded (see page 6160)	Creates a screen object for the control if it doesn't already exist.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 5768)	Indicates whether the control has a parent.
	Hide (see page 5769)	Makes the control invisible.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
V	InitiateAction (see page 5769)	Calls the action link's Update (see page 5789) method if the control is associated with an action link.

	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InsertControl (see page 6160)	Inserts a control into the Controls (see page 6197) array property.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
V	Invalidate (see page 5770)	Completely repaint control.
V	Invalidate (see page 6161)	Schedules a control repaint.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	IsRightToLeft (see page 5770)	Indicates whether the control should be reversed right to left.
	ManualDock (see page 5771)	Docks the control.
	ManualFloat (see page 5772)	Undocks the control.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	MouseWheelHandler (see page 5774)	Dispatches messages received from a mouse wheel.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	PaintTo (see page 6167)	This is the overview for the PaintTo method overload.
	ParentToClient (see page 5776)	Translate parent coordinates to client coordinates.
	Perform (see page 5776)	Responds as if the control received a specified Windows message.
	PreProcessMessage (see page 6170)	This is PreProcessMessage, a member of class TWinControl.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	Realign (see page 6171)	Forces the control to realign children.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	Refresh (see page 5779)	Repaints the control on the screen.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveControl (see page 6172)	Removes a specified control from the Controls (see page 6197) array.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	Repaint (see page 5779)	Forces the control to repaint its image on the screen.
V	Repaint (see page 6174)	Repaints the entire control.
	ReplaceDockedControl (see page 5779)	Docks the control in the place where another control is already docked.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	ScaleBy (see page 6175)	Rescale control and its children.
	ScreenToClient (see page 5781)	Converts the screen coordinates of a specified point on the screen to client coordinates.
	ScrollBy (see page 6176)	Scroll control contents.
	SendToBack (see page 5782)	Puts a windowed control behind all other windowed controls, or puts a non-windowed control behind all other non-windowed controls.
V	SetBounds (see page 5783)	Sets the Left (see page 5830), Top (see page 5844), Width (see page 5849), and Height (see page 5825) properties all at once.
V	SetBounds (see page 6178)	Sets the windowed control's boundary properties all at once.
	SetDesignVisible (see page 5784)	Makes a control visible at design time.
V	SetDesignVisible (see page 6178)	Makes a control visible at design time.
V	SetFocus (see page 6179)	Gives the input focus to the control.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	SetTextBuf (see page 5787)	Sets the text of the control.
	Show (see page 5788)	Makes a control visible.
V	StickControls (see page 12467)	Places controls in their final positions after a control is moved in or dropped on the control bar.
V	Update (see page 5789)	Processes any pending paint messages immediately.
V	Update (see page 6183)	Forces the control to update.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	UpdateControlState (see page 6186)	Respond to state change.
	UseRightToLeftAlignment (see page 5790)	Specifies whether the control's alignment should be reversed right-to-left.

	UseRightToLeftReading (see page 5790)	Specifies whether the control is using a right-to-left reading order.
	UseRightToLeftScrollBar (see page 5791)	Specifies whether the vertical scroll bar appears on the left side of the control.

Public Properties

	Name	Description
	Action (see page 5797)	Designates the action associated with the control.
	Align (see page 5798)	Determines how the control aligns within its container (parent control).
R	AlignDisabled (see page 6192)	Indicates child control realignment disabled.
	Anchors (see page 5802)	Specifies how the control is anchored to its parent.
	BiDiMode (see page 5803)	Specifies the bi-directional mode for the control.
	BoundsRect (see page 5803)	Specifies the bounding rectangle of the control, expressed in the coordinate system of the parent control.
R	Brush (see page 6195)	Determines the color and pattern used for painting the background of the control.
	ClientHeight (see page 5808)	Specifies the height of the control's client area in pixels.
R	ClientOrigin (see page 5809)	Specifies the screen coordinates (in pixels) of the top left corner of a control's client area.
R	ClientRect (see page 5810)	Specifies the size (in pixels) of a control's client area.
	ClientWidth (see page 5811)	Specifies the horizontal size of the control's client area in pixels.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Constraints (see page 5812)	Specifies the size constraints for the control.
R	ControlCount (see page 6195)	Returns the number of child controls.
R	Controls (see page 6197)	Lists all child controls.
	ControlState (see page 5813)	Indicates the current state of a control at runtime.
	ControlStyle (see page 5814)	Determines style characteristics of the control.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	DockClientCount (see page 6199)	Specifies the number of controls that are docked on the windowed control.
R	DockClients (see page 6201)	Lists the controls that are docked to the windowed control.
	DockManager (see page 6202)	Specifies the control's docking manager interface.
	DockOrientation (see page 5818)	Specifies how the control is docked relative to other controls docked in the same parent.
	DoubleBuffered (see page 6205)	Determines whether the control's image is rendered directly to the window or painted to an in-memory bitmap first.
	Enabled (see page 5821)	Controls (see page 5711) whether the control responds to mouse, keyboard, and timer events.
R	ExplicitHeight (see page 5821)	Specifies the explicit vertical size of the control in pixels.
R	ExplicitLeft (see page 5822)	Specifies the explicit horizontal pixel coordinate of the left edge of a component relative to its parent.
R	ExplicitTop (see page 5822)	Specifies the explicit vertical pixel coordinate of the top edge of a component relative to its parent.
R	ExplicitWidth (see page 5822)	Specifies the explicit horizontal size of the control in pixels.
R	Floating (see page 5823)	Indicates whether the control is floating.
	FloatingDockSiteClass (see page 5823)	Specifies the class of the temporary control that hosts the control when it is floating.
R	Handle (see page 6207)	Provides access to the underlying Windows screen object for the control.
	HostDockSite (see page 5829)	Specifies the control in which the control is docked.
	LRDockWidth (see page 5831)	Specifies the width of the control when it is docked horizontally.
R	MouseInClient (see page 6209)	This is MouseInClient, a member of class TWinControl.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Padding (see page 6209)	Specifies the padding of a control.
	Parent (see page 5832)	Indicates the parent of the control.

	ParentWindow (see page 6210)	Reference to parent's underlying control.
	Picture (see page 12471)	This is Picture, a member of class TCustomControlBar.
	ShowHint (see page 5840)	Determines whether the control displays a Help Hint (see page 5827) when the mouse pointer rests momentarily on the control.
R	Showing (see page 6210)	Indicates whether the control is showing on the screen.
	TabOrder (see page 6211)	Indicates the position of the control in its parent's tab order.
	TabStop (see page 6211)	Determines if the user can tab to a control.
	TBDockHeight (see page 5842)	Specifies the height of the control when it is docked vertically.
	UndockHeight (see page 5845)	Specifies the height of the control when it is floating.
	UndockWidth (see page 5846)	Specifies the width of the control when it is floating.
	UseDockManager (see page 6212)	Specifies whether the docking manager is used in drag-and-dock operations.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	Visible (see page 5847)	Determines whether the component appears onscreen.
R	VisibleDockClientCount (see page 6212)	Specifies the number of visible controls that are docked on the windowed control.

Published Properties

	Name	Description
	AlignWithMargins (see page 5802)	Indicates whether a control should be constrained by margins.
	Cursor (see page 5815)	Specifies the image used to represent the mouse pointer when it passes into the region covered by the control.
	Height (see page 5825)	Specifies the vertical size of the control in pixels.
	HelpContext (see page 5826)	Numeric ID for control's context-sensitive help topic
	HelpKeyword (see page 5826)	Keyword for control's context-sensitive help topic
	HelpType (see page 5827)	Indicates whether the control's context sensitive help topic is identified by context ID or by keyword.
	Hint (see page 5827)	Contains the text string that can appear when the user moves the mouse over the control.
	Left (see page 5830)	Specifies the horizontal coordinate of the left edge of a component relative to its parent.
	Margins (see page 5831)	Specifies the margins for the control.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Top (see page 5844)	Specifies the Y coordinate of the top left corner of a control, relative to its parent or containing control in pixels.
	Width (see page 5849)	Specifies the horizontal size of the control or form in pixels.

68.1.15.2 TCustomControlBar.Create Constructor

Creates and initializes an instance of TCustomControlBar (see page 12446).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomControlBar(TComponent * AOwner);
```

Description

Call Create to instantiate a control bar at runtime. Control bars added to forms at design time are created automatically.

AOwner is a component, typically the form, that is responsible for freeing the control bar instance. It becomes the value of the Owner property.

See Also

Owner (see page 2807)

68.1.15.3 TCustomControlBar.Destroy Destructor

Destroys the TCustomControlBar (see page 12446) instance.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TCustomControlBar();
```

Description

Do not call Destroy. Instead, call Free.

Destroy frees the memory allocated for the TCustomControlBar (see page 12446) properties.

See Also

Free (see page 22300)

68.1.15.4 TCustomControlBar Methods

The methods of the TCustomControlBar class are listed here.

Protected Methods

	Name	Description
	AlignControls (see page 12459)	Aligns controls in the control bar.
	CanAutoSize (see page 12459)	Indicates how the control can be resized.
	CreateParams (see page 12460)	Sets the control bar's window flags.
	DoBandMove (see page 12460)	Generates an OnBandMove (see page 12473) event.
	DoBandPaint (see page 12460)	This is DoBandPaint, a member of class TCustomControlBar.
	DoBeginBandMove (see page 12461)	This is DoBeginBandMove, a member of class TCustomControlBar.
	DockOver (see page 12461)	Generates an OnDockOver event and ensures proper docking of floating controls.
	DoEndBandMove (see page 12461)	This is DoEndBandMove, a member of class TCustomControlBar.
	DoPaletteChange (see page 12461)	Prepares the control bar to realize a new palette.
	DragControl (see page 12462)	Starts a drag operation on a control band.
	GetControlInfo (see page 12463)	Generates an OnBandInfo (see page 12473) event.
	GetPalette (see page 12463)	Returns the handle to a palette for use by the control.
	GetSiteInfo (see page 12464)	Generates an OnGetSiteInfo event
	HitTest (see page 12464)	Returns the control at the specified coordinates.
	MouseDown (see page 12465)	Handles mouse button clicks.
	MouseMove (see page 12465)	Handles mouse movements.
	MouseUp (see page 12465)	Handles releasing of a mouse button.
	Paint (see page 12466)	Paints the control bar.
	PaintControlFrame (see page 12466)	Paints a control band's frame.

Public Methods

	Name	Description
	FlipChildren (see page 12462)	Reverses the positions of child controls.
	StickControls (see page 12467)	Places controls in their final positions after a control is moved in or dropped on the control bar.

68.1.15.4.1 TCustomControlBar.AlignControls Method

Aligns controls in the control bar.

Pascal

```
procedure AlignControls(AControl: TControl; var ARect: TRect); override;
```

C++

```
virtual __fastcall AlignControls(TControl * AControl, TRect ARect);
```

Description

Use AlignControls to align all controls within an area of the control bar. The alignment of child controls is based on their Align property.

AControl is a child control that takes precedence in alignment over other, similarly-aligned controls. This parameter can be nil (Delphi) or NULL (C++).

Rect specifies the area in which to align the controls.

TCustomControlBar (see page 12446) overrides the inherited method to enforce the alignment of child controls in a manner appropriate to a control bar. AlignControls determines the best alignment for each control according to its size and the available space.

68.1.15.4.2 TCustomControlBar.CanAutoSize Method

Indicates how the control can be resized.

Pascal

```
function CanAutoSize(var NewWidth: Integer; var NewHeight: Integer): Boolean; override;
```

C++

```
virtual __fastcall Boolean CanAutoSize(int NewWidth, int NewHeight);
```

Description

CanAutoSize is called automatically when the AutoSize property is true and an attempt is made to resize the control. It allows controls to implement the AutoSize property before the resize sequence that begins with the OnCanResize and OnConstrainedResize events and ends with the OnResize event.

When CanAutoSize is called, the NewWidth and NewHeight parameters indicate the proposed new dimensions of the control. CanAutoSize adjusts these values so that the control's size adjusts to its contents. If the adjustment results in values of NewWidth and NewHeight that differ from the control's current width and height, CanAutoSize returns true, indicating that the resize sequence should proceed. If, after adjustment, NewWidth and NewHeight equal Width and Height, CanAutoSize returns false, and the resize sequence is aborted.

As implemented in TWinControl, CanAutoSize returns true, adjusting NewWidth and NewHeight so that all the control's children fit.

See Also

Constraints (see page 5812)

ConstrainedResize (see page 6133)

AdjustSize (see page 6129)

68.1.15.4.3 TCustomControlBar.CreateParams Method

Sets the control bar's window flags.

Pascal

```
procedure CreateParams(var Params: TCreateParams); override;
```

C++

```
virtual __fastcall CreateParams(TCreateParams Params);
```

Description

The CreateWnd method calls CreateParams to initialize the parameters it passes to CreateWindowHandle. CreateParams fills in the parameter record that is passed as the value of the Params parameter. This data structure holds information needed when telling Windows to create a window handle. The fields of a TCreateParams record become the parameters to a call to the CreateWindowEx API function.

In TCustomControlBar (see page 12446), CreateParams overrides the inherited method in order to turn off the CS_HREDRAW and CS_VREDRAW windows flags.

See Also

CreateWnd (see page 6137)

CreateWindowHandle (see page 6137)

68.1.15.4.4 TCustomControlBar.DoBandMove Method

Generates an OnBandMove (see page 12473) event.

Pascal

```
procedure DoBandMove(Control: TControl; var ARect: TRect); virtual;
```

C++

```
virtual __fastcall DoBandMove(TControl * Control, TRect ARect);
```

Description

Do not call DoBandMove. It is called automatically when a band is moved in the control bar.

Control is the band that is about to be moved.

ARect is the area to which the control is about to be moved. This value can be changed by the OnBandMove (see page 12473) event handler.

Override DoBandMove to perform actions in addition to calling the OnBandMove (see page 12473) event handler when a band is moved.

See Also

onbandmove (see page 12473)

68.1.15.4.5 TCustomControlBar.DoBandPaint Method

Pascal

```
procedure DoBandPaint(Control: TControl; Canvas: TCanvas; var ARect: TRect; var Options:
TBandPaintOptions); virtual;
```

C++

```
virtual __fastcall DoBandPaint(TControl * Control, TCanvas Canvas, TRect ARect,
TBandPaintOptions Options);
```

Description

This is DoBandPaint, a member of class TCustomControlBar.

68.1.15.4.6 TCustomControlBar.DoBeginBandMove Method

Pascal

```
function DoBeginBandMove(Control: TControl): Boolean; dynamic;
```

C++

```
__fastcall Boolean DoBeginBandMove(TControl * Control);
```

Description

This is DoBeginBandMove, a member of class TCustomControlBar.

68.1.15.4.7 TCustomControlBar.DockOver Method

Generates an OnDockOver event and ensures proper docking of floating controls.

Pascal

```
procedure DockOver(Source: TDragDockObject; X: Integer; Y: Integer; State: TDragState; var
Accept: Boolean); override;
```

C++

```
virtual __fastcall DockOver(TDragDockObject Source, int X, int Y, TDragState State, Boolean
Accept);
```

Description

DockOver overrides the inherited method to ensure proper docking of floating controls that are accepted by the OnDockOver event handler.

See Also

OnDockOver (see page 6216)

68.1.15.4.8 TCustomControlBar.DoEndBandMove Method

Pascal

```
procedure DoEndBandMove(Control: TControl); dynamic;
```

C++

```
__fastcall DoEndBandMove(TControl * Control);
```

Description

This is DoEndBandMove, a member of class TCustomControlBar.

68.1.15.4.9 TCustomControlBar.DoPaletteChange Method

Prepares the control bar to realize a new palette.

Pascal

```
function DoPaletteChange: Boolean;
```

C++

```
__fastcall Boolean DoPaletteChange();
```

Description

Call DoPaletteChange to prepare the control bar to realize a new palette. DoPaletteChange returns true if the control bar should be redrawn to reflect the new palette, and false otherwise.

DoPaletteChange is called when the Picture (see page 12471) property changes.

See Also

picture (see page 12471)

getpalette (see page 12463)

68.1.15.4.10 TCustomControlBar.DragControl Method

Starts a drag operation on a control band.

Pascal

```
function DragControl(AControl: TControl; X: Integer; Y: Integer; KeepCapture: Boolean =
False): Boolean; virtual;
```

C++

```
virtual __fastcall Boolean DragControl(TControl * AControl, int X, int Y, Boolean KeepCapture
= False);
```

Description

Call DragControl to start a drag operation on a control band.

If AutoDrag (see page 12468) is true, DragControl is called automatically when a control is undocked from the control bar.

AControl is the control on the band that should be dragged.

X and Y are the current positions of the mouse pointer.

KeepCapture indicates whether the control bar should capture the mouse when processing the drag.

See Also

AutoDrag (see page 12468)

Capture (see page 6099)

68.1.15.4.11 TCustomControlBar.FlipChildren Method

Reverses the positions of child controls.

Pascal

```
procedure FlipChildren(AllLevels: Boolean); override;
```

C++

```
virtual __fastcall FlipChildren(Boolean AllLevels);
```

Description

Call FlipChildren to flip the control's children; that is, to move children on the left side of the control to the right side and vice

versa. FlipChildren reverses the position of all child controls and adjusts their Align properties, if necessary, to enforce the new position.

AllLevels specifies whether FlipChildren should be called recursively on the control's children.

FlipChildren can be used to reverse the layout of an application when it is running in Middle Eastern locales where users read from right to left instead of left to right: Call UseRightToLeftAlignment to determine whether the BiDiMode property dictates a reversal of alignment based on the system locale.

Note: FlipChildren does the same thing as the Flip Children command on the control's context menu in the IDE.

See Also

BiDiMode (see page 5803)

UseRightToLeftAlignment (see page 5790)

68.1.15.4.12 TCustomControlBar.GetControlInfo Method

Generates an OnBandInfo (see page 12473) event.

Pascal

```
procedure GetControlInfo(AControl: TControl; var Insets: TRect; var PreferredSize: Integer;
var RowCount: Integer); virtual;
```

C++

```
virtual __fastcall GetControlInfo(TControl * AControl, TRect Insets, int PreferredSize, int
RowCount);
```

Description

GetControlInfo is called automatically when the control bar needs to arrange the position of its bands. It generates an OnBandInfo (see page 12473) event to obtain information about a control band.

AControl is the control associated with the band being positioned.

Insets returns the margin between the edges of the control and the edges of its band.

PreferredSize returns the control's preferred width. (The control's width is reduced if it can't fit inside the control bar.)

RowCount returns the number of control rows that the control spans in the control bar.

See Also

OnBandInfo (see page 12473)

68.1.15.4.13 TCustomControlBar.GetPalette Method

Returns the handle to a palette for use by the control.

Pascal

```
function GetPalette: HPALETTE; override;
```

C++

```
virtual __fastcall HPALETTE GetPalette();
```

Description

As implemented in TControl, GetPalette returns a null handle, indicating that the control does not have a palette. Override GetPalette to implement derived objects that use a palette. Create a palette handle for the control by a call to the Windows API function CreatePalette. GetPalette should return the palette handle for the control.

Specifying the palette for a control tells the application that the control's palette needs to be realized and designates the palette to use for realization.

GetPalette is called only if the run-time video mode requires color palette support, for example, in 256-color mode.

See Also

PaletteChanged (see page 5775)

68.1.15.4.14 TCustomControlBar.GetSiteInfo Method

Generates an OnGetSiteInfo event

Pascal

```
procedure GetSiteInfo(Client: TControl; var InfluenceRect: TRect; MousePos: TPoint; var
CanDock: Boolean); override;
```

C++

```
virtual __fastcall GetSiteInfo(TControl * Client, TRect InfluenceRect, TPoint MousePos,
Boolean CanDock);
```

Description

GetSiteInfo is called automatically during drag-and-dock operations to initialize a TDragDockObject with information about where a dragged object can be docked, if at all.

Client is a potential docking client.

InfluenceRect returns the area in which the client would be docked.

MousePos is the current mouse position.

CanDock returns whether the client can dock to the windowed control.

As implemented in TWinControl, GetSiteInfo generates an influence rectangle equal to BoundsRect expanded by 10 pixels on every side, and then calls the OnGetSiteInfo event handler.

See Also

OnGetSiteInfo (see page 6223)

BoundsRect (see page 5803)

68.1.15.4.15 TCustomControlBar.HitTest Method

Returns the control at the specified coordinates.

Pascal

```
function HitTest(X: Integer; Y: Integer): TControl;
```

C++

```
__fastcall TControl * HitTest(int X, int Y);
```

Description

Call HitTest to get the control at the specified coordinates.

X and Y are the coordinates.

See Also

MouseDown (see page 12465)

68.1.15.4.16 TCustomControlBar.MouseDown Method

Handles mouse button clicks.

Pascal

```
procedure MouseDown(Button: TMouseButton; Shift: TShiftState; X: Integer; Y: Integer);
override;
```

C++

```
virtual __fastcall MouseDown(TMouseButton Button, TShiftState Shift, int X, int Y);
```

Description

MouseDown is called automatically when the user clicks the control bar with the mouse. After generating an OnMouseDown event, MouseDown determines whether a band is being dragged and if so, computes its position.

Button indicates which button was clicked.

Shift indicates the state of the Alt, Ctrl, and Shift keys and the state of the mouse buttons.

X and Y are the position where the mouse was clicked.

See Also

OnMouseDown (see page 5862)

HitTest (see page 12464)

68.1.15.4.17 TCustomControlBar.MouseMove Method

Handles mouse movements.

Pascal

```
procedure MouseMove(Shift: TShiftState; X: Integer; Y: Integer); override;
```

C++

```
virtual __fastcall MouseMove(TShiftState Shift, int X, int Y);
```

Description

MouseMove generates an OnMouseMove event and then performs special processing if a control is being undocked from the control bar or moved within the control bar.

Shift indicates the state of the Alt, Ctrl, and Shift keys and the state of the mouse buttons.

X and Y are the current position of the mouse.

See Also

OnMouseMove (see page 5865)

AutoDrag (see page 12468)

68.1.15.4.18 TCustomControlBar.MouseUp Method

Handles releasing of a mouse button.

Pascal

```
procedure MouseUp(Button: TMouseButton; Shift: TShiftState; X: Integer; Y: Integer); override;
```

C++

```
virtual __fastcall MouseUp(TMouseButton Button, TShiftState Shift, int X, int Y);
```

Description

MouseUp handles the dropping of a control onto the control bar and, once the control (if any) is docked, generates an OnMouseUp event.

Button indicates which button was released.

Shift indicates the state of the Alt, Ctrl, and Shift keys and the state of the mouse buttons.

X and Y are the position where the mouse was released.

See Also

OnMouseUp (see page 5867)

68.1.15.4.19 TCustomControlBar.Paint Method

Paints the control bar.

Pascal

```
procedure Paint; override;
```

C++

```
virtual __fastcall Paint();
```

Description

Paint is called automatically when the control bar needs to paint itself.

To customize the painting, either override the Paint method, or specify options in the OnPaint (see page 12474) and OnBandPaint (see page 12473) event handlers.

See Also

OnPaint (see page 12474)

onbandpaint (see page 12473)

PaintControlFrame (see page 12466)

68.1.15.4.20 TCustomControlBar.PaintControlFrame Method

Paints a control band's frame.

Pascal

```
procedure PaintControlFrame(Canvas: TCanvas; AControl: TControl; var ARect: TRect); virtual;
```

C++

```
virtual __fastcall PaintControlFrame(TCanvas Canvas, TControl * AControl, TRect ARect);
```

Description

The Paint (see page 12466) method calls PaintControlFrame for each band to render its image. PaintControlFrame generates an OnBandPaint (see page 12473) event, and then draws the frame and grabber for the band, depending on the values returned by the event handler.

Canvas is the control bar's canvas.

AControl is the control on the band to be painted.

ARect indicates the dimensions of the band.

See Also

OnPaint (see page 12474)

onbandpaint (see page 12473)

PaintControlFrame

68.1.15.4.21 TCustomControlBar.StickControls Method

Places controls in their final positions after a control is moved in or dropped on the control bar.

Pascal

```
procedure StickControls; virtual;
```

C++

```
virtual __fastcall StickControls();
```

Description

Override StickControls to specify how controls are set in their final positions after a control is moved in or dropped on the control bar.

See Also

rowsnap (see page 12472)

68.1.15.5 TCustomControlBar Properties

The properties of the TCustomControlBar class are listed here.

Protected Properties

	Name	Description
	AutoDock (see page 12467)	Determines whether the control bar temporarily docks drag clients to provide visual feedback.
	AutoDrag (see page 12468)	Specifies whether control bands can be undocked by dragging.
	AutoSize (see page 12468)	Specifies whether the control sizes itself automatically to accommodate its contents.
	BevelKind (see page 12469)	Specifies the control's bevel style.
	CornerEdge (see page 12469)	This is CornerEdge, a member of class TCustomControlBar.
	DockSite (see page 12469)	Specifies whether the control can be the target of drag-and-dock operations.
	DrawingStyle (see page 12470)	This is DrawingStyle, a member of class TCustomControlBar.
	GradientDirection (see page 12471)	This is GradientDirection, a member of class TCustomControlBar.
	GradientEndColor (see page 12471)	This is GradientEndColor, a member of class TCustomControlBar.
	GradientStartColor (see page 12471)	This is GradientStartColor, a member of class TCustomControlBar.
	RowSize (see page 12472)	This is RowSize, a member of class TCustomControlBar.
	RowSnap (see page 12472)	This is RowSnap, a member of class TCustomControlBar.

Public Properties

	Name	Description
	Picture (see page 12471)	This is Picture, a member of class TCustomControlBar.

68.1.15.5.1 TCustomControlBar.AutoDock Property

Determines whether the control bar temporarily docks drag clients to provide visual feedback.

Pascal

```
property AutoDock: Boolean;
```

C++

```
__property Boolean AutoDock;
```

Description

If AutoDock is true (the default), when a dockable object is dragged over the control bar, the control bar temporarily docks the object so that the user can see the impact of the drag operation. That is, the user can see the dock position and how other docked controls will be repositioned to make room. When the user releases the mouse, the dragged object is docked at the current spot, and any temporary dockings are canceled. However, if the user cancels the drag-and-dock operation, the dragged object reverts to its last temporary dock site rather than to its location at the start of the drag operation.

If AutoDock is false, the control bar does not temporarily dock dragged objects. Instead, the user only sees the dragging rectangle as it passes over the control bar, with no feedback as to the adjustments the control bar would make if the dragged object were released.

See Also

DockClients (see page 6201)

DockSite (see page 6204)

OnDockOver (see page 6216)

68.1.15.5.2 TCustomControlBar.AutoDrag Property

Specifies whether control bands can be undocked by dragging.

Pascal

```
property AutoDrag: Boolean;
```

C++

```
__property Boolean AutoDrag;
```

Description

Use AutoDrag to specify whether control bands are automatically undocked when the user drags them. If AutoDrag is true, control bands (TToolBar objects) are undocked when dragged off the control bar. Otherwise, control bands are kept within the control bar.

See Also

DragMode (see page 5819)

OnBandDrag (see page 12472)

onbandmove (see page 12473)

68.1.15.5.3 TCustomControlBar.AutoSize Property

Specifies whether the control sizes itself automatically to accommodate its contents.

Pascal

```
property AutoSize: Boolean;
```

C++

```
__property Boolean AutoSize;
```

Description

Use AutoSize to specify whether the control sizes itself automatically. When AutoSize is true, the control resizes automatically when its contents change.

By default, AutoSize is false.

See Also

Constraints (see page 5812)

CanAutoSize (see page 5741)

68.1.15.5.4 TCustomControlBar.BevelKind Property

Specifies the control's bevel style.

Pascal

```
property BevelKind: TBevelKind;
```

C++

```
__property TBevelKind BevelKind;
```

Description

Use BevelKind to modify the appearance of a bevel. BevelKind influences how sharply the bevel stands out.

BevelKind, in combination with BevelWidth and the cut of the bevel specified by BevelInner or BevelOuter, can create a variety of effects. Experiment with various combinations to get the look you want.

See Also

BevelEdges (see page 6192)

BevelOuter (see page 6194)

BevelInner (see page 6193)

BevelWidth (see page 6194)

68.1.15.5.5 TCustomControlBar.CornerEdge Property

Pascal

```
property CornerEdge: TCornerEdge;
```

C++

```
__property TCornerEdge CornerEdge;
```

Description

This is CornerEdge, a member of class TCustomControlBar.

68.1.15.5.6 TCustomControlBar.DockSite Property

Specifies whether the control can be the target of drag-and-dock operations.

Pascal

```
property DockSite: Boolean;
```

C++

```
__property Boolean DockSite;
```

Description

Set DockSite to true to allow other controls to be docked to this windowed control.

C++ Examples:

```
/*
The following example is taken from the docking demo. It
shows how the OnUnDock event handler of the conjoinment
docking site re-enables docking in the control that is
undocked (if it is a dockable form). In addition, when the
next to last docked control is undocked, the conjoinment
docking site sends itself a close message so that the last
docked control is undocked to its old position and size.
*/
void __fastcall TConjoinDockHost::FormUnDock(TObject *Sender, TControl *Client,
      TWinControl *NewTarget, bool &Allow)
{
  // Only 2 dock clients means the host must be destroyed and
  // the remaining window undocked to its old position and size.
  // Recall that OnUnDock gets called before the undocking
  // actually occurs.
  if (Client->ClassNameIs("TDockableForm"))
    dynamic_cast<TDockableForm *>(Client)->DockSite = True;
  if ((DockClientCount == 2) && (NewTarget != this))        // Self?
    PostMessage(dynamic_cast<TConjoinDockHost *>(this)->Handle, WM_CLOSE, 0, 0);
  UpdateCaption(Client);
}
```

Delphi Examples:

```
{
The following example is taken from the docking demo. It
shows how the OnUnDock event handler of the conjoinment
docking site re-enables docking in the control that is
undocked (if it is a dockable form). In addition, when the
next to last docked control is undocked, the conjoinment
docking site sends itself a close message so that the last
docked control is undocked to its old position and size.
}
procedure TConjoinDockHost.FormUnDock(Sender: TObject; Client: TControl;
  NewTarget: TWinControl; var Allow: Boolean);
begin
  // Only 2 dock clients means the host must be destroyed and
  // the remaining window undocked to its old position and size.
  // Recall that OnUnDock gets called before the undocking
  // actually occurs.
  if Client is TDockableForm then
    TDockableForm(Client).DockSite := True;
  if (DockClientCount = 2) and (NewTarget <> Self) then
    PostMessage(Self.Handle, WM_CLOSE, 0, 0);
  UpdateCaption(Client);
end;
```

68.1.15.5.7 TCustomControlBar.DrawingStyle Property

Pascal

```
property DrawingStyle: TBandDrawingStyle;
```

C++

```
__property TBandDrawingStyle DrawingStyle;
```

Description

This is DrawingStyle, a member of class TCustomControlBar.

68.1.15.5.8 TCustomControlBar.GradientDirection Property

Pascal

```
property GradientDirection: TGradientDirection;
```

C++

```
__property TGradientDirection GradientDirection;
```

Description

This is GradientDirection, a member of class TCustomControlBar.

68.1.15.5.9 TCustomControlBar.GradientEndColor Property

Pascal

```
property GradientEndColor: TColor;
```

C++

```
__property TColor GradientEndColor;
```

Description

This is GradientEndColor, a member of class TCustomControlBar.

68.1.15.5.10 TCustomControlBar.GradientStartColor Property

Pascal

```
property GradientStartColor: TColor;
```

C++

```
__property TColor GradientStartColor;
```

Description

This is GradientStartColor, a member of class TCustomControlBar.

68.1.15.5.11 TCustomControlBar.Picture Property

Pascal

```
property Picture: TPicture;
```

C++

```
__property TPicture Picture;
```

Description

This is Picture, a member of class TCustomControlBar.

68.1.15.5.12 TCustomControlBar.RowSize Property

Pascal

```
property RowSize: TRowSize;
```

C++

```
__property TRowSize RowSize;
```

Description

This is RowSize, a member of class TCustomControlBar.

68.1.15.5.13 TCustomControlBar.RowSnap Property

Pascal

```
property RowSnap: Boolean;
```

C++

```
__property Boolean RowSnap;
```

Description

This is RowSnap, a member of class TCustomControlBar.

68.1.15.6 TCustomControlBar Events

The events of the TCustomControlBar class are listed here.

Protected Events

	Name	Description
	OnBandDrag (see page 12472)	Occurs when the user starts a drag operation on a specified control.
	OnBandInfo (see page 12473)	Occurs when the control bar adjusts the docking position of a band.
	OnBandMove (see page 12473)	This is OnBandMove, a member of class TCustomControlBar.
	OnBandPaint (see page 12473)	This is OnBandPaint, a member of class TCustomControlBar.
	OnBeginBandMove (see page 12474)	This is OnBeginBandMove, a member of class TCustomControlBar.
	OnEndBandMove (see page 12474)	This is OnEndBandMove, a member of class TCustomControlBar.
	OnPaint (see page 12474)	Occurs when the control bar is painted.

68.1.15.6.1 TCustomControlBar.OnBandDrag Event

Occurs when the user starts a drag operation on a specified control.

Pascal

```
property OnBandDrag: TBandDragEvent;
```

C++

```
__property TBandDragEvent OnBandDrag;
```

Description

Use OnBandDrag to conditionally allow the user to start dragging a control in the control bar.

The event handler indicates the control that the user is trying to drag. Change its Drag parameter to false to prevent the drag operation. If Drag remains true on exit from the event handler, the drag operation proceeds.

See Also

OnStartDock (see page 5871)

onbandmove (see page 12473)

68.1.15.6.2 TCustomControlBar.OnBandInfo Event

Occurs when the control bar adjusts the docking position of a band.

Pascal

```
property OnBandInfo: TBandInfoEvent;
```

C++

```
__property TBandInfoEvent OnBandInfo;
```

Description

Write code in the OnBandInfo event handler to provide information to the control bar that it can use when arranging its bands. The OnBandInfo event handler has several parameters that can be used to return information about how the band should be positioned, including its size, inset, and number of rows.

See Also

TBDockHeight (see page 5842)

onbandmove (see page 12473)

LRDockWidth (see page 5831)

Height (see page 5825)

Width (see page 5849)

68.1.15.6.3 TCustomControlBar.OnBandMove Event

Pascal

```
property OnBandMove: TBandMoveEvent;
```

C++

```
__property TBandMoveEvent OnBandMove;
```

Description

This is OnBandMove, a member of class TCustomControlBar.

68.1.15.6.4 TCustomControlBar.OnBandPaint Event

Pascal

```
property OnBandPaint: TBandPaintEvent;
```

C++

```
__property TBandPaintEvent OnBandPaint;
```

Description

This is OnBandPaint, a member of class TCustomControlBar.

68.1.15.6.5 TCustomControlBar.OnBeginBandMove Event

Pascal

```
property OnBeginBandMove: TBeginBandMoveEvent;
```

C++

```
__property TBeginBandMoveEvent OnBeginBandMove;
```

Description

This is OnBeginBandMove, a member of class TCustomControlBar.

68.1.15.6.6 TCustomControlBar.OnEndBandMove Event

Pascal

```
property OnEndBandMove: TEndBandMoveEvent;
```

C++

```
__property TEndBandMoveEvent OnEndBandMove;
```

Description

This is OnEndBandMove, a member of class TCustomControlBar.

68.1.15.6.7 TCustomControlBar.OnPaint Event

Occurs when the control bar is painted.

Pascal

```
property OnPaint: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnPaint;
```

Description

Write an OnPaint event handler to change the way the control bar is rendered. When a control bar receives a Windows paint message, it first draws the background picture, if any, and then generates an OnPaint event. After the OnPaint event exits, the control bar generates an OnBandPaint (see page 12473) event for each band, finally rendering the grabbers and frames for each band.

Use the Canvas property to draw the control bar's image. Use the ClientRect property to obtain the dimensions on which to draw.

If the custom drawing is intended to change the appearance of individual bands, use the OnBandPaint (see page 12473) event instead.

See Also

onbandpaint (see page 12473)

Canvas (see page 5921)

ClientRect

picture (see page 12471)

68.1.16 TCustomFlowPanel Class

The base class for all flow panel components.

Class Hierarchy

Pascal

```
TCustomFlowPanel = class(TCustomPanel);
```

C++

```
class TCustomFlowPanel : public TCustomPanel;
```

File

ExtCtrls

Description

Use TCustomFlowPanel as a base class when defining flow panels that include other controls as constituent parts.

See Also

TFlowPanel (see page 12579)

68.1.16.1 TCustomFlowPanel Members

The following tables list the members exposed by TCustomFlowPanel.

Protected Events

	Name	Description
	OnAlignInsertBefore (see page 6213)	Occurs when an object with custom alignment is aligned.
	OnAlignPosition (see page 6214)	Occurs when an object with custom alignment is aligned.
	OnCanResize (see page 5851)	Occurs when an attempt is made to resize the control.
	OnClick (see page 5851)	Occurs when the user clicks the control.
	OnConstrainedResize (see page 5853)	Adjust resize constraints.
	OnContextPopup (see page 5854)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnDblClick (see page 5854)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDockDrop (see page 6214)	Occurs when another control is docked to the control.
	OnDockOver (see page 6216)	Occurs when another control is dragged over the control.
	OnDragDrop (see page 5855)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 5857)	Occurs when the user drags an object over a control.
	OnEndDock (see page 5859)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 5860)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnEnter (see page 6219)	Occurs when a control receives the input focus.
	OnExit (see page 6221)	Occurs when the input focus shifts away from one control to another.
	OnGetSiteInfo (see page 6223)	Returns the control's docking information.
	OnKeyDown (see page 6225)	Occurs when a user presses any key while the control has focus.

	OnKeyPress (see page 6227)	Occurs when a key is pressed.
	OnKeyUp (see page 6228)	Occurs when the user releases a key that has been pressed.
	OnMouseActivate (see page 5861)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 5862)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseEnter (see page 5864)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 5864)	Occurs when the user moves the mouse outside of a control.
	OnMouseMove (see page 5865)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 5867)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnMouseWheel (see page 5869)	Occurs when the mouse wheel is rotated.
	OnMouseWheelDown (see page 5869)	Occurs when the mouse wheel is rotated downward.
	OnMouseWheelUp (see page 5870)	Occurs when the mouse wheel is rotated upward.
	OnResize (see page 5870)	Occurs immediately after the control is resized.
	OnStartDock (see page 5871)	Occurs when the user begins to drag a control with a DragKind (see page 5819) of dkDock.
	OnStartDrag (see page 5871)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.
	OnUnDock (see page 6230)	Occurs when the application tries to undock a control that is docked to the windowed control.

Protected Fields

	Name	Description
	FAnchorMove (see page 5733)	This is FAnchorMove, a member of class TControl.
	FAnchorOrigin (see page 5734)	This is FAnchorOrigin, a member of class TControl.
	FAnchorRules (see page 5734)	This is FAnchorRules, a member of class TControl.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FDesignSize (see page 6124)	This is FDesignSize, a member of class TWinControl.
	FDoubleBuffered (see page 6124)	This is FDoubleBuffered, a member of class TWinControl.
	FExplicitHeight (see page 5734)	This is FExplicitHeight, a member of class TControl.
	FExplicitLeft (see page 5734)	This is FExplicitLeft, a member of class TControl.
	FExplicitTop (see page 5734)	This is FExplicitTop, a member of class TControl.
	FExplicitWidth (see page 5735)	This is FExplicitWidth, a member of class TControl.
	FInImeComposition (see page 6125)	This is FInImeComposition, a member of class TWinControl.
	FOriginalParentSize (see page 5735)	This is FOriginalParentSize, a member of class TControl.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	ActionChange (see page 5737)	Responds when the action associated with the control changes.
V	ActionChange (see page 6127)	Updates the control to reflect changes in its associated action.
	AddBiDiModeExStyle (see page 6128)	Sets control's window style according to its bi-directional support.
V	AdjustClientRect (see page 6128)	Provides the interface that adjusts the ClientRect (see page 5810) property for idiosyncrasies of the window.
V	AdjustClientRect (see page 12537)	Adjusts the ClientRect property for the idiosyncrasies of the window.
	AdjustSize (see page 5738)	Sets the size of the control as determined by the AutoSize (see page 5803) property.
V	AdjustSize (see page 6129)	Adjusts the control's size according to its contents and constraints.
V	AlignControls (see page 12487)	Aligns any controls for which the control is the parent within a specified area of the control.
	ArrangeControl (see page 6130)	This is ArrangeControl, a member of class TWinControl.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	AssignTo (see page 5739)	Overrides the inherited AssignTo function to enable assignments to TAction objects.
V	AssignTo (see page 6130)	Copies the properties of the windowed control to another object.

	BeginAutoDrag (see page 5739)	Begin Automatic Drag.
	CalcCursorPos (see page 5741)	This is CalcCursorPos, a member of class TControl.
V	CanAutoSize (see page 5741)	Indicates whether the control can resize itself automatically to accommodate its contents.
V	CanAutoSize (see page 6131)	Indicates how the control can be resized.
V	CanAutoSize (see page 12537)	Adjusts the way the panel responds to resize attempts.
V	CanResize (see page 5742)	OnCanResize (see page 5851) event dispatcher.
V	CanResize (see page 6132)	Indicates how the control can respond to a resize attempt.
	Changed (see page 5742)	Sends a CM_CHANGED (see page 6330) message to the control.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	ChangeScale (see page 5743)	Rescaling event dispatcher.
V	ChangeScale (see page 6132)	Resize (see page 5780) and reposition children and self.
	Click (see page 5743)	Respond to user click.
V	ConstrainedResize (see page 5746)	Notify control of resize with constraints.
V	ConstrainedResize (see page 6133)	Generates an OnConstrainedResize (see page 5853) event.
	ControlsAligned (see page 6134)	This is ControlsAligned, a member of class TWinControl.
	CreateDockManager (see page 6134)	Creates the dock manager for the control.
V	CreateHandle (see page 6135)	Creates underlying screen object.
V	CreateParams (see page 6135)	Initializes a window-creation parameter data structure.
V	CreateParams (see page 12537)	Initializes a window-creation parameter record passed in the Params parameter.
	CreateSubClass (see page 6136)	Creates a windowed control derived from an existing Windows window class.
V	CreateWindowHandle (see page 6137)	Creates a Windows control to represent the control.
V	CreateWnd (see page 6137)	Creates the underlying window.
V	CustomAlignInsertBefore (see page 6137)	Returns placement order of custom-aligned child control.
V	CustomAlignPosition (see page 6138)	Returns aligned position of custom-aligned child control.
	DblClick (see page 5747)	OnDblClick (see page 5854) event dispatcher.
	DefaultDockImage (see page 5747)	Handles the painting and erasing of a dock image.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DefineProperties (see page 5748)	Provides methods to read and write the IsControl (see page 5829) property to a stream such as a form file.
V	DefineProperties (see page 6139)	Provides methods to read and write the IsControl property to a stream such as a form file.
	DesignWndProc (see page 5749)	This is DesignWndProc, a member of class TControl.
V	DestroyHandle (see page 6140)	Destroys the control's window without destroying the control.
V	DestroyWindowHandle (see page 6140)	Destroys the window created in the CreateWindowHandle (see page 6137) method.
V	DestroyWnd (see page 6141)	Destroys the control's window.
	DoAddDockClient (see page 6142)	Performs actions when a control is docked to the windowed control.
	DockOver (see page 6143)	Responds when a docking client is dragged over the windowed control.
V	DockReplaceDockClient (see page 6143)	This is DockReplaceDockClient, a member of class TWinControl.
	DockTrackNoTarget (see page 5749)	Handles dragging of the control over an invalid docking target.
	DoContextPopup (see page 5750)	OnContextPopup (see page 5854) event dispatcher.
	DoDock (see page 5750)	Docking event dispatcher.
	DoDockOver (see page 6143)	Generates an OnDockOver (see page 6216) event.
	DoEndDock (see page 5750)	OnEndDock (see page 5859) event dispatcher.
	DoEndDrag (see page 5751)	OnEndDrag (see page 5860) event dispatcher.
	DoEnter (see page 6144)	Respond to receiving input focus.
	DoExit (see page 6144)	Respond to losing input focus
	DoFlipChildren (see page 6145)	Flips the control's children.
	DoKeyDown (see page 6145)	Performs some preprocessing before generating an OnKeyDown (see page 6225) event.
	DoKeyPress (see page 6146)	Performs some preprocessing before generating an OnKeyPress (see page 6227) event.

	DoKeyUp (see page 6146)	Performs some preprocessing before generating an OnKeyUp (see page 6228) event.
	DoMouseWheel (see page 5751)	Processes mouse wheel motion.
	DoMouseWheelDown (see page 5752)	OnMouseWheelDown (see page 5869) event dispatcher.
	DoMouseWheelUp (see page 5752)	OnMouseWheelUp (see page 5870) event dispatcher.
	DoRemoveDockClient (see page 6147)	Responds when a control is undocked from the windowed control.
	DoStartDock (see page 5753)	OnStartDock (see page 5871) event dispatcher.
	DoStartDrag (see page 5753)	OnStartDrag (see page 5871) event dispatcher.
	DoUnDock (see page 6147)	Undocks a control that is currently docked to the windowed control.
	DragCanceled (see page 5754)	Provides the interface for a method that responds to the cancellation of a drag.
	DragOver (see page 5755)	OnDragOver (see page 5857) event dispatcher.
	DrawDragDockImage (see page 5755)	Draws the dock image for the control.
	EraseDragDockImage (see page 5757)	Erases the dock image for the control.
	FindNextControl (see page 6149)	Returns the control's next child in the tab order after the specified control.
	FixupTabList (see page 6149)	Sorts the child controls by their tab order.
V	GetAction (see page 5758)	This is GetAction, a member of class TControl.
	GetActionLinkClass (see page 5758)	Returns the appropriate action link class that is associated with the control class.
V	GetActionLinkClass (see page 6152)	Returns the associated action link class.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
V	GetClientOrigin (see page 5758)	Returns the screen coordinates of the top-left corner of the control's client area.
V	GetClientOrigin (see page 6153)	Returns the value of the ClientOrigin (see page 5809) property.
V	GetClientRect (see page 5759)	Returns a rectangle defining the client area of the control.
V	GetClientRect (see page 6154)	Returns the value of the ClientRect (see page 5810) property.
V	GetControlExtents (see page 6154)	Returns the smallest rectangle in which all the control's children fit.
V	GetDeviceContext (see page 5760)	Returns a device context for the control.
V	GetDeviceContext (see page 6155)	Provides access to a device context for the control.
	GetDockEdge (see page 5763)	Returns the edge on which another control should be docked when it is dragged over the control.
V	GetDragImages (see page 5763)	Returns the control's image list containing the image to be displayed while dragging.
V	GetEnabled (see page 5763)	Returns the value of the Enabled (see page 5821) property.
V	GetFloating (see page 5764)	Returns the value of the Floating (see page 5823) property.
V	GetFloatingDockSiteClass (see page 5764)	Returns the class used for the control when it is floating.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetPalette (see page 5765)	Returns the handle to a palette for use by the control.
	GetParentHandle (see page 6157)	Returns the window handle for the window of the control's parent.
	GetPopupMenu (see page 5765)	Returns the pop-up menu associated with the control.
	GetSiteInfo (see page 6158)	Generates an OnGetSiteInfo (see page 6223) event
	GetTopParentHandle (see page 6159)	Returns the window handle of the first window not associated with a VCL control that contains the windowed control.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	InvalidateDockHostSite (see page 6162)	This is InvalidateDockHostSite, a member of class TWinControl.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsControlActivateMsg (see page 6162)	This is IsControlActivateMsg, a member of class TWinControl.
	IsControlMouseMsg (see page 6162)	Indicates whether a specified mouse message is directed to one of the windowed control's child controls.
	IsQualifyingSite (see page 6163)	This is IsQualifyingSite, a member of class TWinControl.
	KeyDown (see page 6163)	Respond to key press events.
	KeyPress (see page 6163)	Respond to keyboard input.

	KeyUp (see page 6164)	Respond to released key.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Loaded (see page 5771)	Initializes the control after it is loaded from a stream.
	MainWndProc (see page 6165)	Receives Windows messages for the control.
	MouseActivate (see page 5773)	This is MouseActivate, a member of class TControl.
	MouseDown (see page 5773)	OnMouseDown (see page 5862) event dispatcher.
	MouseMove (see page 5773)	Respond to mouse moving over control area..
	MouseUp (see page 5774)	OnMouseUp (see page 5867) event dispatcher.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	Notification (see page 5775)	Responds to notifications that components are being created or destroyed.
V	Notification (see page 6165)	Responds to notifications that components are being created or destroyed.
	NotifyControls (see page 6165)	Sends a message to all the child controls.
V	Paint (see page 5920)	Renders the image of a custom control.
V	Paint (see page 12538)	Renders the image of the panel.
	PaintControls (see page 6166)	Paints each of the child controls in a windowed control using the specified device context.
	PaintHandler (see page 6166)	Responds to WM_PAINT messages.
V	PaintWindow (see page 5920)	Renders the image of the control on a specified device context.
V	PaintWindow (see page 6169)	Renders the image of a windowed control.
	PaletteChanged (see page 5775)	Responds to changes in the system's palette by realizing the control's palette.
V	PaletteChanged (see page 6170)	Responds to changes in the system's palette by realizing the control's palette and the palette for each child control.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	PositionDockRect (see page 5777)	Positions the docking rectangle according to the current drag-and-dock state.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 5778)	Prepares the control for having its properties assigned values read from a stream.
V	ReadState (see page 6171)	Prepares the control for having its properties assigned values from a stream.
	RecreateWnd (see page 6171)	Recreate underlying Windows screen object.
	ReloadDockedControl (see page 6172)	Reloads a docked control.
	RemoveWindowProps (see page 6174)	This is RemoveWindowProps, a member of class TWinControl.
V	RequestAlign (see page 5780)	Instructs the parent of a control to reposition the control, enforcing its Align (see page 5798) property.
	ResetIme (see page 6174)	Restores the input method editor (IME) that was active when the application started.
	ResetImeComposition (see page 6175)	Directs the composition window of the input method editor (IME) to perform a specific action.
	Resize (see page 5780)	Respond to control resize.
	ScaleConstraints (see page 5781)	This is ScaleConstraints, a member of class TControl.
	ScaleControls (see page 6176)	Rescale child controls only.
	SelectFirst (see page 6177)	Locates first selectable child control.
	SelectNext (see page 6177)	Moves the input focus from the current child control to the next one in the tab order.
	SendCancelMode (see page 5781)	Cancels the modal state of the control.
	SendDockNotification (see page 5782)	Sends a Windows message to the control's host dock site.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
V	SetAutoSize (see page 5783)	This is SetAutoSize, a member of class TControl.
V	SetBiDiMode (see page 5783)	Sets the control's bi-directional mode.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
V	SetChildOrder (see page 6178)	Changes the order in which the child component appears in the list of child components returned by the GetChildren (see page 6153) method.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
V	SetDragMode (see page 5785)	Sets the drag mode for the control.
V	SetEnabled (see page 5785)	Sets the value of the Enabled (see page 5821) property.
	SetIme (see page 6181)	Activates an input method editor (IME) using the values specified by the ImeMode (see page 6207) and ImeName (see page 6208) properties.

	SetImeCompositionWindow (see page 6181)	Sets the position and font of the composition window.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
V	SetName (see page 5785)	Sets the name of the control.
V	SetParent (see page 5786)	Sets the parent of the control.
V	SetParent (see page 6182)	Sets the parent of the control.
V	SetParentBackground (see page 6182)	This is SetParentBackground, a member of class TWinControl.
V	SetParentBackground (see page 12539)	This is SetParentBackground, a member of class TCustomPanel.
V	SetParentBiDiMode (see page 5786)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 5787)	Sets the parent for the control.
	SetZOrder (see page 5788)	Repositions the control in its parent's control list, thereby changing position onscreen.
V	SetZOrder (see page 6182)	Moves the control to the top or bottom of the parent control's (or screen's) list of TWinControl (see page 6112) controls.
V	ShowControl (see page 6183)	Ensures that a specified child control is visible.
	UpdateBounds (see page 6185)	This is UpdateBounds, a member of class TWinControl.
	UpdateBoundsRect (see page 5789)	Changes the Top (see page 5844), Left (see page 5830), Width (see page 5849), and Height (see page 5825) properties of the control, but doesn't update its screen image and bypasses all resize events.
V	UpdateControlOriginalParentSize (see page 6186)	This is UpdateControlOriginalParentSize, a member of class TWinControl.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateExplicitBounds (see page 5789)	This is UpdateExplicitBounds, a member of class TControl.
	UpdateRecreatingFlag (see page 6186)	This is UpdateRecreatingFlag, a member of class TWinControl.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	UpdateUIState (see page 6186)	Updates form User Interface State as needed
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	VisibleChanging (see page 5791)	Provides the interface for a method that responds to changes in the control's visibility.
V	WndProc (see page 5791)	Provides specific message responses for the control.
V	WndProc (see page 6187)	Provides specific message responses for the control.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	ActionLink (see page 5798)	Contains the action link object associated with the control.
	Alignment (see page 12539)	Determines how the caption is aligned within the panel.
	AutoSize (see page 5803)	Specifies whether the control sizes itself automatically to accommodate its contents.
	BevelEdges (see page 6192)	Specifies which edges of the control are beveled.
	BevelInner (see page 6193)	Specifies the cut of the inner bevel.
	BevelInner (see page 12540)	Determines the style of the inner bevel of a panel.
	BevelKind (see page 6193)	Specifies the control's bevel style.
	BevelOuter (see page 6194)	Specifies the cut of the outer bevel.
	BevelOuter (see page 12541)	Determines the style of the outer bevel of a panel.
	BevelWidth (see page 6194)	Specifies the width of the inner and outer bevels.
	BevelWidth (see page 12542)	Determines the width, in pixels, of both the inner and outer bevels of a panel.
	BorderStyle (see page 12543)	Determines the style of the line drawn around the perimeter of the panel control.
	BorderWidth (see page 6195)	Specifies the width of the control's border.

	BorderWidth (see page 12543)	Specifies the distance, in pixels, between the outer and inner bevels.
R	Canvas (see page 5921)	Specifies the TCanvas object that presents a drawing surface for the control.
	Caption (see page 5806)	Specifies a text string that identifies the control to the user.
	Color (see page 5812)	Specifies the background color of the control.
	Color (see page 12544)	Specifies the background color of the control.
	Ctl3D (see page 6198)	Determines whether a control has a three-dimensional (3-D) or two-dimensional look.
	DefWndProc (see page 6199)	Specifies the default window procedure for the windowed control.
	DesktopFont (see page 5818)	Specifies whether the control uses the Windows icon font when writing text.
	DragCursor (see page 5818)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 5819)	Specifies whether the control is being dragged normally or for docking.
	DragMode (see page 5819)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	Font (see page 5823)	Controls (see page 5711) the attributes of text written on or in the control.
	FullRepaint (see page 12545)	Determines how the panel repaints itself when it is resized.
	ImeMode (see page 6207)	Determines the behavior of the input method editor (IME).
	ImeName (see page 6208)	Specifies the input method editor (IME) to use for converting keyboard input to Asian language characters.
	IsControl (see page 5829)	Determines whether a form stores its form-specific properties to a stream.
	Locked (see page 12545)	Determines whether a panel that is used as a toolbar is replaced by a toolbar supplied by an OLE server.
	MouseCapture (see page 5831)	Indicates whether the control has "captured" mouse events.
	ParentBackground (see page 6209)	Determines whether control uses parent's theme background.
	ParentBiDiMode (see page 5833)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	ParentColor (see page 5834)	Determines where a control looks for its color information.
	ParentColor (see page 12546)	Determines where a control looks for its color information.
	ParentCtl3D (see page 6209)	Determines where a component looks to determine if it should appear three dimensional.
	ParentFont (see page 5834)	Determines where a control looks for its font information.
	ParentShowHint (see page 5835)	Determines where a control looks to find out if its Help Hint (see page 5827) should be shown.
	PopupMenu (see page 5835)	Identifies the pop-up menu associated with the control.
	ScalingFlags (see page 5840)	Reflects which attributes of the control have been scaled.
	Text (see page 5842)	Contains a text string associated with the control.
	VerticalAlignment (see page 12547)	Sets the vertical position of the caption.
	WheelAccumulator (see page 5849)	Accumulates mouse wheel rotations.
	WindowHandle (see page 6212)	Provides access to a window handle for the control.
	WindowText (see page 5850)	Contains the text string of the control.

Public Events

	Name	Description
	WindowProc (see page 5872)	Points to the window procedure that responds to messages sent to the control.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	BeginDrag (see page 5740)	Starts the dragging of a control.
	BringToFront (see page 5740)	Puts the control in front of all other controls in its parent control.
	Broadcast (see page 6130)	Sends a message to each of the child controls.
	CanFocus (see page 6131)	Indicates whether a control can receive focus.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.

	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	ClientToParent (see page 5744)	Translates client coordinates to parent coordinates.
	ClientToScreen (see page 5744)	Translates a given point from client area coordinates to global screen coordinates.
	ContainsControl (see page 6133)	Indicates whether a specified control exists within the control.
	ControlAtPos (see page 6133)	Returns the child control located at a specified position within the control.
V	Create (see page 12486)	Creates and initializes an instance of TCustomPanel.
	CreateParented (see page 6123)	Creates and initializes a control as the child of a specified non-VCL container.
	CreateParentedControl (see page 6136)	Creates and initializes a control as the child of a specified non-VCL window.
V	DefaultHandler (see page 5748)	Provides message handling for all messages that do not have specific handlers.
V	DefaultHandler (see page 6139)	Provides message handling for all messages that the control does not fully process itself.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 12486)	Destroys an instance of TCustomControl.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	DisableAlign (see page 6141)	Disables the realignment of child controls.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Dock (see page 5749)	Used internally to dock the control.
	DockDrop (see page 6142)	Generates an OnDockDrop (see page 6214) event.
	DragDrop (see page 5754)	OnDragDrop (see page 5855) event dispatcher.
	Dragging (see page 5754)	Indicates whether a control is being dragged.
	DrawTextBiDiModeFlags (see page 5756)	Returns the text flags that reflect the current setting of the BiDiMode (see page 5803) property.
	DrawTextBiDiModeFlagsReadingOnly (see page 5756)	Returns the text flag to add that indicates whether the control's text should read from right to left.
	EnableAlign (see page 6148)	Decrements the reference count incremented by the DisableAlign (see page 6141) method, eventually realigning the child controls.
	EndDrag (see page 5757)	Stops a control from being dragged any further.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindChildControl (see page 6148)	Returns a child control given its name.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FlipChildren (see page 6150)	Reverses the positions of child controls.
	Focused (see page 6150)	Determines whether the control has input focus.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
V	GetChildren (see page 12487)	Calls a specified method for each child of the control.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetControlIndex (see page 12488)	This is GetControlIndex, a member of class TCustomFlowPanel.
	GetControlsAlignment (see page 5759)	Indicates how text is aligned within the control.
V	GetControlsAlignment (see page 12538)	Returns the alignment of text in the panel.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.

	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetParentComponent (see page 5765)	Returns the parent of the control.
	GetTabOrderList (see page 6158)	Builds a list of controls in tab order.
	GetTextBuf (see page 5766)	Retrieves the control's text, copies it into a buffer, and returns the number of characters copied.
	GetTextLen (see page 5767)	Returns the length of the control's text.
	HandleAllocated (see page 6159)	Reports whether a screen object handle exists for the control.
	HandleNeeded (see page 6160)	Creates a screen object for the control if it doesn't already exist.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	HasParent (see page 5768)	Indicates whether the control has a parent.
	Hide (see page 5769)	Makes the control invisible.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitiateAction (see page 5769)	Calls the action link's Update (see page 5789) method if the control is associated with an action link.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InsertControl (see page 6160)	Inserts a control into the Controls (see page 6197) array property.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	Invalidate (see page 5770)	Completely repaint control.
	Invalidate (see page 6161)	Schedules a control repaint.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	IsRightToLeft (see page 5770)	Indicates whether the control should be reversed right to left.
	ManualDock (see page 5771)	Docks the control.
	ManualFloat (see page 5772)	Undocks the control.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	MouseWheelHandler (see page 5774)	Dispatches messages received from a mouse wheel.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	PaintTo (see page 6167)	This is the overview for the PaintTo method overload.
	ParentToClient (see page 5776)	Translate parent coordinates to client coordinates.
	Perform (see page 5776)	Responds as if the control received a specified Windows message.
	PreProcessMessage (see page 6170)	This is PreProcessMessage, a member of class TWinControl.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	Realign (see page 6171)	Forces the control to realign children.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	Refresh (see page 5779)	Repaints the control on the screen.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveControl (see page 6172)	Removes a specified control from the Controls (see page 6197) array.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
	Repaint (see page 5779)	Forces the control to repaint its image on the screen.
	Repaint (see page 6174)	Repaints the entire control.
	ReplaceDockedControl (see page 5779)	Docks the control in the place where another control is already docked.
	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	ScaleBy (see page 6175)	Rescale control and its children.
	ScreenToClient (see page 5781)	Converts the screen coordinates of a specified point on the screen to client coordinates.
	ScrollBy (see page 6176)	Scroll control contents.
	SendToBack (see page 5782)	Puts a windowed control behind all other windowed controls, or puts a non-windowed control behind all other non-windowed controls.

V	SetBounds (see page 5783)	Sets the Left (see page 5830), Top (see page 5844), Width (see page 5849), and Height (see page 5825) properties all at once.
V	SetBounds (see page 6178)	Sets the windowed control's boundary properties all at once.
	SetControlIndex (see page 12488)	This is SetControlIndex, a member of class TCustomFlowPanel.
	SetDesignVisible (see page 5784)	Makes a control visible at design time.
V	SetDesignVisible (see page 6178)	Makes a control visible at design time.
V	SetFocus (see page 6179)	Gives the input focus to the control.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	SetTextBuf (see page 5787)	Sets the text of the control.
	Show (see page 5788)	Makes a control visible.
V	Update (see page 5789)	Processes any pending paint messages immediately.
V	Update (see page 6183)	Forces the control to update.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	UpdateControlState (see page 6186)	Respond to state change.
	UseRightToLeftAlignment (see page 5790)	Specifies whether the control's alignment should be reversed right-to-left.
	UseRightToLeftReading (see page 5790)	Specifies whether the control is using a right-to-left reading order.
	UseRightToLeftScrollBar (see page 5791)	Specifies whether the vertical scroll bar appears on the left side of the control.

Public Properties

	Name	Description
	Action (see page 5797)	Designates the action associated with the control.
	Align (see page 5798)	Determines how the control aligns within its container (parent control).
R	AlignDisabled (see page 6192)	Indicates child control realignment disabled.
	Anchors (see page 5802)	Specifies how the control is anchored to its parent.
	AutoWrap (see page 12488)	Specifies whether controls are automatically wrapped to fit on the flow panel.
	BiDiMode (see page 5803)	Specifies the bi-directional mode for the control.
	BoundsRect (see page 5803)	Specifies the bounding rectangle of the control, expressed in the coordinate system of the parent control.
R	Brush (see page 6195)	Determines the color and pattern used for painting the background of the control.
	ClientHeight (see page 5808)	Specifies the height of the control's client area in pixels.
R	ClientOrigin (see page 5809)	Specifies the screen coordinates (in pixels) of the top left corner of a control's client area.
R	ClientRect (see page 5810)	Specifies the size (in pixels) of a control's client area.
	ClientWidth (see page 5811)	Specifies the horizontal size of the control's client area in pixels.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Constraints (see page 5812)	Specifies the size constraints for the control.
R	ControlCount (see page 6195)	Returns the number of child controls.
R	Controls (see page 6197)	Lists all child controls.
	ControlState (see page 5813)	Indicates the current state of a control at runtime.
	ControlStyle (see page 5814)	Determines style characteristics of the control.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	DockClientCount (see page 6199)	Specifies the number of controls that are docked on the windowed control.
R	DockClients (see page 6201)	Lists the controls that are docked to the windowed control.
	DockManager (see page 6202)	Specifies the control's docking manager interface.
	DockOrientation (see page 5818)	Specifies how the control is docked relative to other controls docked in the same parent.
	DockSite (see page 6204)	Specifies whether the control can be the target of drag-and-dock operations.
	DoubleBuffered (see page 6205)	Determines whether the control's image is rendered directly to the window or painted to an in-memory bitmap first.

	Enabled (see page 5821)	Controls (see page 5711) whether the control responds to mouse, keyboard, and timer events.
R	ExplicitHeight (see page 5821)	Specifies the explicit vertical size of the control in pixels.
R	ExplicitLeft (see page 5822)	Specifies the explicit horizontal pixel coordinate of the left edge of a component relative to its parent.
R	ExplicitTop (see page 5822)	Specifies the explicit vertical pixel coordinate of the top edge of a component relative to its parent.
R	ExplicitWidth (see page 5822)	Specifies the explicit horizontal size of the control in pixels.
R	Floating (see page 5823)	Indicates whether the control is floating.
	FloatingDockSiteClass (see page 5823)	Specifies the class of the temporary control that hosts the control when it is floating.
	FlowStyle (see page 12489)	Specifies the starting point and direction for controls added to a flow panel.
R	Handle (see page 6207)	Provides access to the underlying Windows screen object for the control.
	HostDockSite (see page 5829)	Specifies the control in which the control is docked.
	LRDockWidth (see page 5831)	Specifies the width of the control when it is docked horizontally.
R	MouseInClient (see page 6209)	This is MouseInClient, a member of class TWinControl.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Padding (see page 6209)	Specifies the padding of a control.
	Parent (see page 5832)	Indicates the parent of the control.
	ParentBackground (see page 12546)	Determines whether control uses parent's theme background.
	ParentWindow (see page 6210)	Reference to parent's underlying control.
	ShowHint (see page 5840)	Determines whether the control displays a Help Hint (see page 5827) when the mouse pointer rests momentarily on the control.
R	Showing (see page 6210)	Indicates whether the control is showing on the screen.
	TabOrder (see page 6211)	Indicates the position of the control in its parent's tab order.
	TabStop (see page 6211)	Determines if the user can tab to a control.
	TBDockHeight (see page 5842)	Specifies the height of the control when it is docked vertically.
	UndockHeight (see page 5845)	Specifies the height of the control when it is floating.
	UndockWidth (see page 5846)	Specifies the width of the control when it is floating.
	UseDockManager (see page 6212)	Specifies whether the docking manager is used in drag-and-dock operations.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	Visible (see page 5847)	Determines whether the component appears onscreen.
R	VisibleDockClientCount (see page 6212)	Specifies the number of visible controls that are docked on the windowed control.

Published Properties

	Name	Description
	AlignWithMargins (see page 5802)	Indicates whether a control should be constrained by margins.
	Cursor (see page 5815)	Specifies the image used to represent the mouse pointer when it passes into the region covered by the control.
	Height (see page 5825)	Specifies the vertical size of the control in pixels.
	HelpContext (see page 5826)	Numeric ID for control's context-sensitive help topic
	HelpKeyword (see page 5826)	Keyword for control's context-sensitive help topic
	HelpType (see page 5827)	Indicates whether the control's context sensitive help topic is identified by context ID or by keyword.
	Hint (see page 5827)	Contains the text string that can appear when the user moves the mouse over the control.
	Left (see page 5830)	Specifies the horizontal coordinate of the left edge of a component relative to its parent.
	Margins (see page 5831)	Specifies the margins for the control.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Top (see page 5844)	Specifies the Y coordinate of the top left corner of a control, relative to its parent or containing control in pixels.
	Width (see page 5849)	Specifies the horizontal size of the control or form in pixels.

68.1.16.2 TCustomFlowPanel.Create Constructor

Creates and initializes an instance of TCustomPanel.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomFlowPanel(TComponent * AOwner);
```

Description

Call Create to instantiate a panel at runtime. Panels placed in forms at design time do not need to be explicitly created because they are created automatically.

AOwner is the component, typically a form, that is responsible for freeing the panel.

See Also

Owner (see page 2807)

68.1.16.3 TCustomFlowPanel.Destroy Destructor

Destroys an instance of TCustomControl.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TCustomFlowPanel();
```

Description

Do not call Destroy directly in an application. Instead, call Free. Free verifies that the control is not nil, and only then calls Destroy.

Applications should only free controls explicitly when the constructor was called without assigning an owner to the control.

As the control is destroyed, it:

Destroys the TCanvas object in its Canvas property.

Override Destroy to free any memory or resources allocated in the Create method. When declaring a Destroy method in a descendant control type, always add the override directive to the declaration and call the inherited Destroy as the last statement in the redeclared method.

When a control is created, Delphi automatically provides exception handling around the constructor call. The destructor is called if an exception escapes from the constructor. This means that the destructor code must be prepared to clean up a partially constructed instance. Check all data fields for zero before disposing of their contents.

Free (see page 22300)

delete

Create (see page 5918)

68.1.16.4 TCustomFlowPanel Methods

The methods of the TCustomFlowPanel class are listed here.

Protected Methods

	Name	Description
	AlignControls (see page 12487)	Aligns any controls for which the control is the parent within a specified area of the control.

Public Methods

	Name	Description
	GetChildren (see page 12487)	Calls a specified method for each child of the control.
	GetControlIndex (see page 12488)	This is GetControlIndex, a member of class TCustomFlowPanel.
	SetControlIndex (see page 12488)	This is SetControlIndex, a member of class TCustomFlowPanel.

68.1.16.4.1 TCustomFlowPanel.AlignControls Method

Aligns any controls for which the control is the parent within a specified area of the control.

Pascal

```
procedure AlignControls(AControl: TControl; var Rect: TRect); override;
```

C++

```
virtual __fastcall AlignControls(TControl * AControl, TRect Rect);
```

Description

Use AlignControls to align all controls within an area of a form, panel, group box, scroll box, or any container control. Specify the area in which to align the controls as the value of the Rect parameter.

AlignControls uses the Align property value for each child control to determine how to align it. The AControl parameter can be nil (Delphi) or NULL (C++). If you specify a control in AControl, that control takes precedence in alignment over other, similarly-aligned controls.

See Also

Align (see page 5798)

68.1.16.4.2 TCustomFlowPanel.GetChildren Method

Calls a specified method for each child of the control.

Pascal

```
procedure GetChildren(Proc: TGetChildProc; Root: TComponent); override;
```

C++

```
virtual __fastcall GetChildren(TGetChildProc Proc, TComponent * Root);
```

Description

GetChildren is called by the streaming system that loads and saves components. Applications seldom need to call this routine.

GetChildren executes the callback specified by the Proc parameter for every child control listed by the Controls property that lists the Root parameter as its Owner.

Override GetChildren to limit or augment which child controls are saved with the control. When overriding GetChildren, call the procedure passed as the Proc parameter for every child control that should be saved. The Root parameter indicates the

component (usually a form) that owns the control.

See Also

Controls (see page 6197)

Owner (see page 2807)

68.1.16.4.3 TCustomFlowPanel.GetControlIndex Method

Pascal

```
function GetControlIndex(AControl: TControl): Integer;
```

C++

```
__fastcall int GetControlIndex(TControl * AControl);
```

Description

This is GetControlIndex, a member of class TCustomFlowPanel.

68.1.16.4.4 TCustomFlowPanel.SetControlIndex Method

Pascal

```
procedure SetControlIndex(AControl: TControl; Index: Integer);
```

C++

```
__fastcall SetControlIndex(TControl * AControl, int Index);
```

Description

This is SetControlIndex, a member of class TCustomFlowPanel.

68.1.16.5 TCustomFlowPanel Properties

The properties of the TCustomFlowPanel class are listed here.

Public Properties

	Name	Description
	AutoWrap (see page 12488)	Specifies whether controls are automatically wrapped to fit on the flow panel.
	FlowStyle (see page 12489)	Specifies the starting point and direction for controls added to a flow panel.

68.1.16.5.1 TCustomFlowPanel.AutoWrap Property

Specifies whether controls are automatically wrapped to fit on the flow panel.

Pascal

```
property AutoWrap: Boolean;
```

C++

```
__property Boolean AutoWrap;
```

Description

If set to True, a new control is automatically placed in a location on the flow panel in which it is visible. If set to False, a new control continues in the same direction as the previous control, even if it would no longer be visible on the panel. You can increase the size of the panel to view controls that are not automatically wrapped to the next line or column.

68.1.16.5.2 TCustomFlowPanel.FlowStyle Property

Specifies the starting point and direction for controls added to a flow panel.

Pascal

```
property FlowStyle: TFlowStyle;
```

C++

```
__property TFlowStyle FlowStyle;
```

Description

Use FlowStyle to set the starting position for the first control added to a flow panel, as well as the subsequent position for additional controls.

Flow Style	Description
BottomTopLeftRight	The first control is at the bottom left corner of the panel. Subsequent controls are added from bottom to top and then from left to right.
BottomTopRightLeft	The first control is at the bottom right corner of the panel. Subsequent controls are added from bottom to top and then from right to left.
LeftRightBottomTop	The first control is at the bottom left corner of the panel. Subsequent controls are added from left to right and then from bottom to top.
LeftRightTopBottom	The first control is at the top left corner of the panel. Subsequent controls are added from left to right and then from top to bottom. This is the default setting.
RightLeftBottomTop	The first control is at the bottom right corner of the panel. Subsequent controls are added from right to left and then from bottom to top.
RightLeftTopBottom	The first control is at the top right corner of the panel. Subsequent controls are added from right to left and then from top to bottom.
TopBottomLeftRight	The first control is at the top left corner of the panel. Subsequent controls are added from top to bottom and then from left to right.
TopBottomRightLeft	The first control is at the top right corner of the panel. Subsequent controls are added from top to bottom and then from right to left.

68.1.17 TCustomGridPanel Class

The base class for all grid panel components.

Class Hierarchy

Pascal

```
TCustomGridPanel = class(TCustomPanel);
```

C++

```
class TCustomGridPanel : public TCustomPanel;
```

File

ExtCtrls

Description

Use TCustomGridPanel as a base class when defining grid panels that include other controls as constituent parts.

See Also

TGridPanel (see page 12660)

68.1.17.1 TCustomGridPanel Members

The following tables list the members exposed by TCustomGridPanel.

Protected Events

	Name	Description
	OnAlignInsertBefore (see page 6213)	Occurs when an object with custom alignment is aligned.
	OnAlignPosition (see page 6214)	Occurs when an object with custom alignment is aligned.
	OnCanResize (see page 5851)	Occurs when an attempt is made to resize the control.
	OnClick (see page 5851)	Occurs when the user clicks the control.
	OnConstrainedResize (see page 5853)	Adjust resize constraints.
	OnContextPopup (see page 5854)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnDblClick (see page 5854)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDockDrop (see page 6214)	Occurs when another control is docked to the control.
	OnDockOver (see page 6216)	Occurs when another control is dragged over the control.
	OnDragDrop (see page 5855)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 5857)	Occurs when the user drags an object over a control.
	OnEndDock (see page 5859)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 5860)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnEnter (see page 6219)	Occurs when a control receives the input focus.
	OnExit (see page 6221)	Occurs when the input focus shifts away from one control to another.
	OnGetSiteInfo (see page 6223)	Returns the control's docking information.
	OnKeyDown (see page 6225)	Occurs when a user presses any key while the control has focus.
	OnKeyPress (see page 6227)	Occurs when a key is pressed.
	OnKeyUp (see page 6228)	Occurs when the user releases a key that has been pressed.
	OnMouseActivate (see page 5861)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 5862)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseEnter (see page 5864)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 5864)	Occurs when the user moves the mouse outside of a control.
	OnMouseMove (see page 5865)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 5867)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnMouseWheel (see page 5869)	Occurs when the mouse wheel is rotated.
	OnMouseWheelDown (see page 5869)	Occurs when the mouse wheel is rotated downward.
	OnMouseWheelUp (see page 5870)	Occurs when the mouse wheel is rotated upward.
	OnResize (see page 5870)	Occurs immediately after the control is resized.
	OnStartDock (see page 5871)	Occurs when the user begins to drag a control with a DragKind (see page 5819) of dkDock.

	OnStartDrag (see page 5871)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.
	OnUnDock (see page 6230)	Occurs when the application tries to undock a control that is docked to the windowed control.

Protected Fields

	Name	Description
	FAnchorMove (see page 5733)	This is FAnchorMove, a member of class TControl.
	FAnchorOrigin (see page 5734)	This is FAnchorOrigin, a member of class TControl.
	FAnchorRules (see page 5734)	This is FAnchorRules, a member of class TControl.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FDesignSize (see page 6124)	This is FDesignSize, a member of class TWinControl.
	FDoubleBuffered (see page 6124)	This is FDoubleBuffered, a member of class TWinControl.
	FExplicitHeight (see page 5734)	This is FExplicitHeight, a member of class TControl.
	FExplicitLeft (see page 5734)	This is FExplicitLeft, a member of class TControl.
	FExplicitTop (see page 5734)	This is FExplicitTop, a member of class TControl.
	FExplicitWidth (see page 5735)	This is FExplicitWidth, a member of class TControl.
	FInImeComposition (see page 6125)	This is FInImeComposition, a member of class TWinControl.
	FOriginalParentSize (see page 5735)	This is FOriginalParentSize, a member of class TControl.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	ActionChange (see page 5737)	Responds when the action associated with the control changes.
V	ActionChange (see page 6127)	Updates the control to reflect changes in its associated action.
	AddBiDiModeExStyle (see page 6128)	Sets control's window style according to its bi-directional support.
V	AdjustClientRect (see page 6128)	Provides the interface that adjusts the ClientRect (see page 5810) property for idiosyncrasies of the window.
V	AdjustClientRect (see page 12537)	Adjusts the ClientRect property for the idiosyncrasies of the window.
	AdjustSize (see page 5738)	Sets the size of the control as determined by the AutoSize (see page 5803) property.
V	AdjustSize (see page 6129)	Adjusts the control's size according to its contents and constraints.
V	AlignControls (see page 12502)	Aligns any controls for which the control is the parent within a specified area of the control.
	ArrangeControl (see page 6130)	This is ArrangeControl, a member of class TWinControl.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	AssignTo (see page 5739)	Overrides the inherited AssignTo function to enable assignments to TAction objects.
V	AssignTo (see page 6130)	Copies the properties of the windowed control to another object.
	AutoAddColumn (see page 12502)	This is AutoAddColumn, a member of class TCustomGridPanel.
	AutoAddRow (see page 12503)	This is AutoAddRow, a member of class TCustomGridPanel.
	BeginAutoDrag (see page 5739)	Begin Automatic Drag.
	CalcCursorPos (see page 5741)	This is CalcCursorPos, a member of class TControl.
V	CanAutoSize (see page 5741)	Indicates whether the control can resize itself automatically to accommodate its contents.
V	CanAutoSize (see page 6131)	Indicates how the control can be resized.
V	CanAutoSize (see page 12537)	Adjusts the way the panel responds to resize attempts.
V	CanResize (see page 5742)	OnCanResize (see page 5851) event dispatcher.
V	CanResize (see page 6132)	Indicates how the control can respond to a resize attempt.
	CellIndexToCell (see page 12503)	This is CellIndexToCell, a member of class TCustomGridPanel.
	CellToCellIndex (see page 12503)	This is CellToCellIndex, a member of class TCustomGridPanel.
	Changed (see page 5742)	Sends a CM_CHANGED (see page 6330) message to the control.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	ChangeScale (see page 5743)	Rescaling event dispatcher.
V	ChangeScale (see page 6132)	Resize (see page 5780) and reposition children and self.

	Click (see page 5743)	Respond to user click.
V	ConstrainedResize (see page 5746)	Notify control of resize with constraints.
V	ConstrainedResize (see page 6133)	Generates an OnConstrainedResize (see page 5853) event.
	ControlsAligned (see page 6134)	This is ControlsAligned, a member of class TWinControl.
	CreateDockManager (see page 6134)	Creates the dock manager for the control.
V	CreateHandle (see page 6135)	Creates underlying screen object.
V	CreateParams (see page 6135)	Initializes a window-creation parameter data structure.
V	CreateParams (see page 12537)	Initializes a window-creation parameter record passed in the Params parameter.
	CreateSubClass (see page 6136)	Creates a windowed control derived from an existing Windows window class.
V	CreateWindowHandle (see page 6137)	Creates a Windows control to represent the control.
V	CreateWnd (see page 6137)	Creates the underlying window.
V	CustomAlignInsertBefore (see page 6137)	Returns placement order of custom-aligned child control.
V	CustomAlignPosition (see page 6138)	Returns aligned position of custom-aligned child control.
	DblClick (see page 5747)	OnDblClick (see page 5854) event dispatcher.
	DefaultDockImage (see page 5747)	Handles the painting and erasing of a dock image.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DefineProperties (see page 5748)	Provides methods to read and write the IsControl (see page 5829) property to a stream such as a form file.
V	DefineProperties (see page 6139)	Provides methods to read and write the IsControl property to a stream such as a form file.
	DesignWndProc (see page 5749)	This is DesignWndProc, a member of class TControl.
V	DestroyHandle (see page 6140)	Destroys the control's window without destroying the control.
V	DestroyWindowHandle (see page 6140)	Destroys the window created in the CreateWindowHandle (see page 6137) method.
V	DestroyWnd (see page 6141)	Destroys the control's window.
	DoAddDockClient (see page 6142)	Performs actions when a control is docked to the windowed control.
	DockOver (see page 6143)	Responds when a docking client is dragged over the windowed control.
V	DockReplaceDockClient (see page 6143)	This is DockReplaceDockClient, a member of class TWinControl.
	DockTrackNoTarget (see page 5749)	Handles dragging of the control over an invalid docking target.
	DoContextPopup (see page 5750)	OnContextPopup (see page 5854) event dispatcher.
	DoDock (see page 5750)	Docking event dispatcher.
	DoDockOver (see page 6143)	Generates an OnDockOver (see page 6216) event.
	DoEndDock (see page 5750)	OnEndDock (see page 5859) event dispatcher.
	DoEndDrag (see page 5751)	OnEndDrag (see page 5860) event dispatcher.
	DoEnter (see page 6144)	Respond to receiving input focus.
	DoExit (see page 6144)	Respond to losing input focus
	DoFlipChildren (see page 6145)	Flips the control's children.
	DoKeyDown (see page 6145)	Performs some preprocessing before generating an OnKeyDown (see page 6225) event.
	DoKeyPress (see page 6146)	Performs some preprocessing before generating an OnKeyPress (see page 6227) event.
	DoKeyUp (see page 6146)	Performs some preprocessing before generating an OnKeyUp (see page 6228) event.
	DoMouseWheel (see page 5751)	Processes mouse wheel motion.
	DoMouseWheelDown (see page 5752)	OnMouseWheelDown (see page 5869) event dispatcher.
	DoMouseWheelUp (see page 5752)	OnMouseWheelUp (see page 5870) event dispatcher.
	DoRemoveDockClient (see page 6147)	Responds when a control is undocked from the windowed control.
	DoStartDock (see page 5753)	OnStartDock (see page 5871) event dispatcher.
	DoStartDrag (see page 5753)	OnStartDrag (see page 5871) event dispatcher.
	DoUnDock (see page 6147)	Undocks a control that is currently docked to the windowed control.
	DragCanceled (see page 5754)	Provides the interface for a method that responds to the cancellation of a drag.
	DragOver (see page 5755)	OnDragOver (see page 5857) event dispatcher.
	DrawDragDockImage (see page 5755)	Draws the dock image for the control.
	EraseDragDockImage (see page 5757)	Erases the dock image for the control.

	FindNextControl (see page 6149)	Returns the control's next child in the tab order after the specified control.
	FixupTabList (see page 6149)	Sorts the child controls by their tab order.
V	GetAction (see page 5758)	This is GetAction, a member of class TControl.
	GetActionLinkClass (see page 5758)	Returns the appropriate action link class that is associated with the control class.
V	GetActionLinkClass (see page 6152)	Returns the associated action link class.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
V	GetClientOrigin (see page 5758)	Returns the screen coordinates of the top-left corner of the control's client area.
V	GetClientOrigin (see page 6153)	Returns the value of the ClientOrigin (see page 5809) property.
V	GetClientRect (see page 5759)	Returns a rectangle defining the client area of the control.
V	GetClientRect (see page 6154)	Returns the value of the ClientRect (see page 5810) property.
V	GetControlExtents (see page 6154)	Returns the smallest rectangle in which all the control's children fit.
V	GetDeviceContext (see page 5760)	Returns a device context for the control.
V	GetDeviceContext (see page 6155)	Provides access to a device context for the control.
	GetDockEdge (see page 5763)	Returns the edge on which another control should be docked when it is dragged over the control.
V	GetDragImages (see page 5763)	Returns the control's image list containing the image to be displayed while dragging.
V	GetEnabled (see page 5763)	Returns the value of the Enabled (see page 5821) property.
V	GetFloating (see page 5764)	Returns the value of the Floating (see page 5823) property.
V	GetFloatingDockSiteClass (see page 5764)	Returns the class used for the control when it is floating.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetPalette (see page 5765)	Returns the handle to a palette for use by the control.
	GetParentHandle (see page 6157)	Returns the window handle for the window of the control's parent.
	GetPopupMenu (see page 5765)	Returns the pop-up menu associated with the control.
	GetSiteInfo (see page 6158)	Generates an OnGetSiteInfo (see page 6223) event
	GetTopParentHandle (see page 6159)	Returns the window handle of the first window not associated with a VCL control that contains the windowed control.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	InvalidateDockHostSite (see page 6162)	This is InvalidateDockHostSite, a member of class TWinControl.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsControlActivateMsg (see page 6162)	This is IsControlActivateMsg, a member of class TWinControl.
	IsControlMouseMsg (see page 6162)	Indicates whether a specified mouse message is directed to one of the windowed control's child controls.
	IsQualifyingSite (see page 6163)	This is IsQualifyingSite, a member of class TWinControl.
	KeyDown (see page 6163)	Respond to key press events.
	KeyPress (see page 6163)	Respond to keyboard input.
	KeyUp (see page 6164)	Respond to released key.
V	Loaded (see page 12504)	Initializes the control after it is loaded from a stream.
	MainWndProc (see page 6165)	Receives Windows messages for the control.
	MouseActivate (see page 5773)	This is MouseActivate, a member of class TControl.
	MouseDown (see page 5773)	OnMouseDown (see page 5862) event dispatcher.
	MouseMove (see page 5773)	Respond to mouse moving over control area..
	MouseUp (see page 5774)	OnMouseUp (see page 5867) event dispatcher.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	Notification (see page 5775)	Responds to notifications that components are being created or destroyed.
V	Notification (see page 6165)	Responds to notifications that components are being created or destroyed.
	NotifyControls (see page 6165)	Sends a message to all the child controls.
V	Paint (see page 12505)	Renders the image of the panel.

	PaintControls (see page 6166)	Paints each of the child controls in a windowed control using the specified device context.
	PaintHandler (see page 6166)	Responds to WM_PAINT messages.
V	PaintWindow (see page 5920)	Renders the image of the control on a specified device context.
V	PaintWindow (see page 6169)	Renders the image of a windowed control.
	PaletteChanged (see page 5775)	Responds to changes in the system's palette by realizing the control's palette.
V	PaletteChanged (see page 6170)	Responds to changes in the system's palette by realizing the control's palette and the palette for each child control.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	PositionDockRect (see page 5777)	Positions the docking rectangle according to the current drag-and-dock state.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 5778)	Prepares the control for having its properties assigned values read from a stream.
V	ReadState (see page 6171)	Prepares the control for having its properties assigned values from a stream.
	RecreateWnd (see page 6171)	Recreate underlying Windows screen object.
	ReloadDockedControl (see page 6172)	Reloads a docked control.
	RemoveEmptyAutoAddColumns (see page 12505)	This is RemoveEmptyAutoAddColumns, a member of class TCustomGridPanel.
	RemoveEmptyAutoAddRows (see page 12505)	This is RemoveEmptyAutoAddRows, a member of class TCustomGridPanel.
	RemoveWindowProps (see page 6174)	This is RemoveWindowProps, a member of class TWinControl.
V	RequestAlign (see page 5780)	Instructs the parent of a control to reposition the control, enforcing its Align (see page 5798) property.
	ResetIme (see page 6174)	Restores the input method editor (IME) that was active when the application started.
	ResetImeComposition (see page 6175)	Directs the composition window of the input method editor (IME) to perform a specific action.
	Resize (see page 5780)	Respond to control resize.
	ScaleConstraints (see page 5781)	This is ScaleConstraints, a member of class TControl.
	ScaleControls (see page 6176)	Rescale child controls only.
	SelectFirst (see page 6177)	Locates first selectable child control.
	SelectNext (see page 6177)	Moves the input focus from the current child control to the next one in the tab order.
	SendCancelMode (see page 5781)	Cancels the modal state of the control.
	SendDockNotification (see page 5782)	Sends a Windows message to the control's host dock site.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
V	SetAutoSize (see page 5783)	This is SetAutoSize, a member of class TControl.
V	SetBiDiMode (see page 5783)	Sets the control's bi-directional mode.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
V	SetChildOrder (see page 6178)	Changes the order in which the child component appears in the list of child components returned by the GetChildren (see page 6153) method.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
V	SetDragMode (see page 5785)	Sets the drag mode for the control.
V	SetEnabled (see page 5785)	Sets the value of the Enabled (see page 5821) property.
	SetIme (see page 6181)	Activates an input method editor (IME) using the values specified by the ImeMode (see page 6207) and ImeName (see page 6208) properties.
	SetImeCompositionWindow (see page 6181)	Sets the position and font of the composition window.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
V	SetName (see page 5785)	Sets the name of the control.
V	SetParent (see page 5786)	Sets the parent of the control.
V	SetParent (see page 6182)	Sets the parent of the control.
V	SetParentBackground (see page 6182)	This is SetParentBackground, a member of class TWinControl.
V	SetParentBackground (see page 12539)	This is SetParentBackground, a member of class TCustomPanel.
V	SetParentBiDiMode (see page 5786)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 5787)	Sets the parent for the control.

	SetZOrder (see page 5788)	Repositions the control in its parent's control list, thereby changing position onscreen.
V	SetZOrder (see page 6182)	Moves the control to the top or bottom of the parent control's (or screen's) list of TWinControl (see page 6112) controls.
V	ShowControl (see page 6183)	Ensures that a specified child control is visible.
	UpdateBounds (see page 6185)	This is UpdateBounds, a member of class TWinControl.
	UpdateBoundsRect (see page 5789)	Changes the Top (see page 5844), Left (see page 5830), Width (see page 5849), and Height (see page 5825) properties of the control, but doesn't update its screen image and bypasses all resize events.
V	UpdateControlOriginalParentSize (see page 12505)	This is UpdateControlOriginalParentSize, a member of class TCustomGridPanel.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateExplicitBounds (see page 5789)	This is UpdateExplicitBounds, a member of class TControl.
	UpdateRecreatingFlag (see page 6186)	This is UpdateRecreatingFlag, a member of class TWinControl.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	UpdateUIState (see page 6186)	Updates form User Interface State as needed
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	VisibleChanging (see page 5791)	Provides the interface for a method that responds to changes in the control's visibility.
V	WndProc (see page 5791)	Provides specific message responses for the control.
V	WndProc (see page 6187)	Provides specific message responses for the control.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	ActionLink (see page 5798)	Contains the action link object associated with the control.
	Alignment (see page 12539)	Determines how the caption is aligned within the panel.
	AutoSize (see page 5803)	Specifies whether the control sizes itself automatically to accommodate its contents.
	BevelEdges (see page 6192)	Specifies which edges of the control are beveled.
	BevelInner (see page 6193)	Specifies the cut of the inner bevel.
	BevelInner (see page 12540)	Determines the style of the inner bevel of a panel.
	BevelKind (see page 6193)	Specifies the control's bevel style.
	BevelOuter (see page 6194)	Specifies the cut of the outer bevel.
	BevelOuter (see page 12541)	Determines the style of the outer bevel of a panel.
	BevelWidth (see page 6194)	Specifies the width of the inner and outer bevels.
	BevelWidth (see page 12542)	Determines the width, in pixels, of both the inner and outer bevels of a panel.
	BorderStyle (see page 12543)	Determines the style of the line drawn around the perimeter of the panel control.
	BorderWidth (see page 6195)	Specifies the width of the control's border.
	BorderWidth (see page 12543)	Specifies the distance, in pixels, between the outer and inner bevels.
R	Canvas (see page 5921)	Specifies the TCanvas object that presents a drawing surface for the control.
	Caption (see page 5806)	Specifies a text string that identifies the control to the user.
	Color (see page 5812)	Specifies the background color of the control.
	Color (see page 12544)	Specifies the background color of the control.
	Ctl3D (see page 6198)	Determines whether a control has a three-dimensional (3-D) or two-dimensional look.
	DefWndProc (see page 6199)	Specifies the default window procedure for the windowed control.
	DesktopFont (see page 5818)	Specifies whether the control uses the Windows icon font when writing text.
	DragCursor (see page 5818)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 5819)	Specifies whether the control is being dragged normally or for docking.

	DragMode (see page 5819)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	Font (see page 5823)	Controls (see page 5711) the attributes of text written on or in the control.
	FullRepaint (see page 12545)	Determines how the panel repaints itself when it is resized.
	ImeMode (see page 6207)	Determines the behavior of the input method editor (IME).
	ImeName (see page 6208)	Specifies the input method editor (IME) to use for converting keyboard input to Asian language characters.
	IsControl (see page 5829)	Determines whether a form stores its form-specific properties to a stream.
	Locked (see page 12545)	Determines whether a panel that is used as a toolbar is replaced by a toolbar supplied by an OLE server.
	MouseCapture (see page 5831)	Indicates whether the control has "captured" mouse events.
	ParentBackground (see page 6209)	Determines whether control uses parent's theme background.
	ParentBiDiMode (see page 5833)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	ParentColor (see page 5834)	Determines where a control looks for its color information.
	ParentColor (see page 12546)	Determines where a control looks for its color information.
	ParentCtl3D (see page 6209)	Determines where a component looks to determine if it should appear three dimensional.
	ParentFont (see page 5834)	Determines where a control looks for its font information.
	ParentShowHint (see page 5835)	Determines where a control looks to find out if its Help Hint (see page 5827) should be shown.
	PopupMenu (see page 5835)	Identifies the pop-up menu associated with the control.
	ScalingFlags (see page 5840)	Reflects which attributes of the control have been scaled.
	Text (see page 5842)	Contains a text string associated with the control.
	VerticalAlignment (see page 12547)	Sets the vertical position of the caption.
	WheelAccumulator (see page 5849)	Accumulates mouse wheel rotations.
	WindowHandle (see page 6212)	Provides access to a window handle for the control.
	WindowText (see page 5850)	Contains the text string of the control.

Public Events

	Name	Description
	WindowProc (see page 5872)	Points to the window procedure that responds to messages sent to the control.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	BeginDrag (see page 5740)	Starts the dragging of a control.
	BringToFront (see page 5740)	Puts the control in front of all other controls in its parent control.
	Broadcast (see page 6130)	Sends a message to each of the child controls.
	CanFocus (see page 6131)	Indicates whether a control can receive focus.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	ClientToParent (see page 5744)	Translates client coordinates to parent coordinates.
	ClientToScreen (see page 5744)	Translates a given point from client area coordinates to global screen coordinates.
	ContainsControl (see page 6133)	Indicates whether a specified control exists within the control.
	ControlAtPos (see page 6133)	Returns the child control located at a specified position within the control.
V	Create (see page 12500)	Creates and initializes an instance of TCustomPanel.

	CreateParented (see page 6123)	Creates and initializes a control as the child of a specified non-VCL container.
	CreateParentedControl (see page 6136)	Creates and initializes a control as the child of a specified non-VCL window.
V	DefaultHandler (see page 5748)	Provides message handling for all messages that do not have specific handlers.
V	DefaultHandler (see page 6139)	Provides message handling for all messages that the control does not fully process itself.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 12501)	Destroys an instance of TCustomControl.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	DisableAlign (see page 6141)	Disables the realignment of child controls.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Dock (see page 5749)	Used internally to dock the control.
	DockDrop (see page 6142)	Generates an OnDockDrop (see page 6214) event.
	DragDrop (see page 5754)	OnDragDrop (see page 5855) event dispatcher.
	Dragging (see page 5754)	Indicates whether a control is being dragged.
	DrawTextBiDiModeFlags (see page 5756)	Returns the text flags that reflect the current setting of the BiDiMode (see page 5803) property.
	DrawTextBiDiModeFlagsReadingOnly (see page 5756)	Returns the text flag to add that indicates whether the control's text should read from right to left.
	EnableAlign (see page 6148)	Decrements the reference count incremented by the DisableAlign (see page 6141) method, eventually realigning the child controls.
	EndDrag (see page 5757)	Stops a control from being dragged any further.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindChildControl (see page 6148)	Returns a child control given its name.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FlipChildren (see page 6150)	Reverses the positions of child controls.
	Focused (see page 6150)	Determines whether the control has input focus.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
V	GetChildren (see page 12503)	Calls a specified method for each child of the control.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetControlsAlignment (see page 5759)	Indicates how text is aligned within the control.
V	GetControlsAlignment (see page 12538)	Returns the alignment of text in the panel.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 5765)	Returns the parent of the control.
	GetTabOrderList (see page 6158)	Builds a list of controls in tab order.
	GetTextBuf (see page 5766)	Retrieves the control's text, copies it into a buffer, and returns the number of characters copied.
	GetTextLen (see page 5767)	Returns the length of the control's text.
	HandleAllocated (see page 6159)	Reports whether a screen object handle exists for the control.
	HandleNeeded (see page 6160)	Creates a screen object for the control if it doesn't already exist.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 5768)	Indicates whether the control has a parent.

	Hide (see page 5769)	Makes the control invisible.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
V	InitiateAction (see page 5769)	Calls the action link's Update (see page 5789) method if the control is associated with an action link.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InsertControl (see page 6160)	Inserts a control into the Controls (see page 6197) array property.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
V	Invalidate (see page 5770)	Completely repaint control.
V	Invalidate (see page 6161)	Schedules a control repaint.
	IsColumnEmpty (see page 12504)	This is IsColumnEmpty, a member of class TCustomGridPanel.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	IsRightToLeft (see page 5770)	Indicates whether the control should be reversed right to left.
	IsRowEmpty (see page 12504)	This is IsRowEmpty, a member of class TCustomGridPanel.
	ManualDock (see page 5771)	Docks the control.
	ManualFloat (see page 5772)	Undocks the control.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	MouseWheelHandler (see page 5774)	Dispatches messages received from a mouse wheel.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	PaintTo (see page 6167)	This is the overview for the PaintTo method overload.
	ParentToClient (see page 5776)	Translate parent coordinates to client coordinates.
	Perform (see page 5776)	Responds as if the control received a specified Windows message.
	PreProcessMessage (see page 6170)	This is PreProcessMessage, a member of class TWinControl.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	Realign (see page 6171)	Forces the control to realign children.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	Refresh (see page 5779)	Repaints the control on the screen.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveControl (see page 6172)	Removes a specified control from the Controls (see page 6197) array.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	Repaint (see page 5779)	Forces the control to repaint its image on the screen.
V	Repaint (see page 6174)	Repaints the entire control.
	ReplaceDockedControl (see page 5779)	Docks the control in the place where another control is already docked.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	ScaleBy (see page 6175)	Rescale control and its children.
	ScreenToClient (see page 5781)	Converts the screen coordinates of a specified point on the screen to client coordinates.
	ScrollBy (see page 6176)	Scroll control contents.
	SendToBack (see page 5782)	Puts a windowed control behind all other windowed controls, or puts a non-windowed control behind all other non-windowed controls.
V	SetBounds (see page 5783)	Sets the Left (see page 5830), Top (see page 5844), Width (see page 5849), and Height (see page 5825) properties all at once.
V	SetBounds (see page 6178)	Sets the windowed control's boundary properties all at once.
	SetDesignVisible (see page 5784)	Makes a control visible at design time.
V	SetDesignVisible (see page 6178)	Makes a control visible at design time.
V	SetFocus (see page 6179)	Gives the input focus to the control.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	SetTextBuf (see page 5787)	Sets the text of the control.
	Show (see page 5788)	Makes a control visible.
V	Update (see page 5789)	Processes any pending paint messages immediately.

V	Update (see page 6183)	Forces the control to update.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	UpdateControlState (see page 6186)	Respond to state change.
	UseRightToLeftAlignment (see page 5790)	Specifies whether the control's alignment should be reversed right-to-left.
	UseRightToLeftReading (see page 5790)	Specifies whether the control is using a right-to-left reading order.
	UseRightToLeftScrollBar (see page 5791)	Specifies whether the vertical scroll bar appears on the left side of the control.

Public Properties

	Name	Description
	Action (see page 5797)	Designates the action associated with the control.
	Align (see page 5798)	Determines how the control aligns within its container (parent control).
R	AlignDisabled (see page 6192)	Indicates child control realignment disabled.
	Anchors (see page 5802)	Specifies how the control is anchored to its parent.
	BiDiMode (see page 5803)	Specifies the bi-directional mode for the control.
	BoundsRect (see page 5803)	Specifies the bounding rectangle of the control, expressed in the coordinate system of the parent control.
R	Brush (see page 6195)	Determines the color and pattern used for painting the background of the control.
R	CellCount (see page 12506)	This is CellCount, a member of class TCustomGridPanel.
R	CellRect (see page 12506)	Returns the screen coordinates of a cell in the grid.
R	CellSize (see page 12507)	This is CellSize, a member of class TCustomGridPanel.
	ClientHeight (see page 5808)	Specifies the height of the control's client area in pixels.
R	ClientOrigin (see page 5809)	Specifies the screen coordinates (in pixels) of the top left corner of a control's client area.
R	ClientRect (see page 5810)	Specifies the size (in pixels) of a control's client area.
	ClientWidth (see page 5811)	Specifies the horizontal size of the control's client area in pixels.
	ColumnCollection (see page 12507)	Sets the number and size of the columns on the grid panel.
R	ColumnSpanIndex (see page 12507)	This is ColumnSpanIndex, a member of class TCustomGridPanel.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Constraints (see page 5812)	Specifies the size constraints for the control.
	ControlCollection (see page 12507)	This is ControlCollection, a member of class TCustomGridPanel.
R	ControlCount (see page 6195)	Returns the number of child controls.
R	Controls (see page 6197)	Lists all child controls.
	ControlState (see page 5813)	Indicates the current state of a control at runtime.
	ControlStyle (see page 5814)	Determines style characteristics of the control.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	DockClientCount (see page 6199)	Specifies the number of controls that are docked on the windowed control.
R	DockClients (see page 6201)	Lists the controls that are docked to the windowed control.
	DockManager (see page 6202)	Specifies the control's docking manager interface.
	DockOrientation (see page 5818)	Specifies how the control is docked relative to other controls docked in the same parent.
	DockSite (see page 6204)	Specifies whether the control can be the target of drag-and-dock operations.
	DoubleBuffered (see page 6205)	Determines whether the control's image is rendered directly to the window or painted to an in-memory bitmap first.
	Enabled (see page 5821)	Controls (see page 5711) whether the control responds to mouse, keyboard, and timer events.
	ExpandStyle (see page 12507)	Specifies whether rows or columns are added to a filled grid panel to accommodate additional controls.
R	ExplicitHeight (see page 5821)	Specifies the explicit vertical size of the control in pixels.
R	ExplicitLeft (see page 5822)	Specifies the explicit horizontal pixel coordinate of the left edge of a component relative to its parent.

R	ExplicitTop (see page 5822)	Specifies the explicit vertical pixel coordinate of the top edge of a component relative to its parent.
R	ExplicitWidth (see page 5822)	Specifies the explicit horizontal size of the control in pixels.
R	Floating (see page 5823)	Indicates whether the control is floating.
	FloatingDockSiteClass (see page 5823)	Specifies the class of the temporary control that hosts the control when it is floating.
R	Handle (see page 6207)	Provides access to the underlying Windows screen object for the control.
	HostDockSite (see page 5829)	Specifies the control in which the control is docked.
	LRDockWidth (see page 5831)	Specifies the width of the control when it is docked horizontally.
R	MouseInClient (see page 6209)	This is MouseInClient, a member of class TWinControl.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Padding (see page 6209)	Specifies the padding of a control.
	Parent (see page 5832)	Indicates the parent of the control.
	ParentBackground (see page 12546)	Determines whether control uses parent's theme background.
	ParentWindow (see page 6210)	Reference to parent's underlying control.
	RowCollection (see page 12508)	Sets the number and size of the rows on the grid panel.
R	RowSpanIndex (see page 12508)	This is RowSpanIndex, a member of class TCustomGridPanel.
	ShowHint (see page 5840)	Determines whether the control displays a Help Hint (see page 5827) when the mouse pointer rests momentarily on the control.
R	Showing (see page 6210)	Indicates whether the control is showing on the screen.
	TabOrder (see page 6211)	Indicates the position of the control in its parent's tab order.
	TabStop (see page 6211)	Determines if the user can tab to a control.
	TBDockHeight (see page 5842)	Specifies the height of the control when it is docked vertically.
	UndockHeight (see page 5845)	Specifies the height of the control when it is floating.
	UndockWidth (see page 5846)	Specifies the width of the control when it is floating.
	UseDockManager (see page 6212)	Specifies whether the docking manager is used in drag-and-dock operations.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	Visible (see page 5847)	Determines whether the component appears onscreen.
R	VisibleDockClientCount (see page 6212)	Specifies the number of visible controls that are docked on the windowed control.

Published Properties

	Name	Description
	AlignWithMargins (see page 5802)	Indicates whether a control should be constrained by margins.
	Cursor (see page 5815)	Specifies the image used to represent the mouse pointer when it passes into the region covered by the control.
	Height (see page 5825)	Specifies the vertical size of the control in pixels.
	HelpContext (see page 5826)	Numeric ID for control's context-sensitive help topic
	HelpKeyword (see page 5826)	Keyword for control's context-sensitive help topic
	HelpType (see page 5827)	Indicates whether the control's context sensitive help topic is identified by context ID or by keyword.
	Hint (see page 5827)	Contains the text string that can appear when the user moves the mouse over the control.
	Left (see page 5830)	Specifies the horizontal coordinate of the left edge of a component relative to its parent.
	Margins (see page 5831)	Specifies the margins for the control.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Top (see page 5844)	Specifies the Y coordinate of the top left corner of a control, relative to its parent or containing control in pixels.
	Width (see page 5849)	Specifies the horizontal size of the control or form in pixels.

68.1.17.2 TCustomGridPanel.Create Constructor

Creates and initializes an instance of TCustomPanel.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomGridPanel(TComponent * AOwner);
```

Description

Call Create to instantiate a panel at runtime. Panels placed in forms at design time do not need to be explicitly created because they are created automatically.

AOwner is the component, typically a form, that is responsible for freeing the panel.

See Also

Owner (see page 2807)

68.1.17.3 TCustomGridPanel.Destroy Destructor

Destroys an instance of TCustomControl.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TCustomGridPanel();
```

Description

Do not call Destroy directly in an application. Instead, call Free. Free verifies that the control is not nil, and only then calls Destroy.

Applications should only free controls explicitly when the constructor was called without assigning an owner to the control.

As the control is destroyed, it:

Destroys the TCanvas object in its Canvas property.

Override Destroy to free any memory or resources allocated in the Create method. When declaring a Destroy method in a descendant control type, always add the override directive to the declaration and call the inherited Destroy as the last statement in the redeclared method.

When a control is created, Delphi automatically provides exception handling around the constructor call. The destructor is called if an exception escapes from the constructor. This means that the destructor code must be prepared to clean up a partially constructed instance. Check all data fields for zero before disposing of their contents.

Create (see page 5918)

68.1.17.4 TCustomGridPanel Methods

The methods of the TCustomGridPanel class are listed here.

Protected Methods

	Name	Description
	AlignControls (see page 12502)	Aligns any controls for which the control is the parent within a specified area of the control.
	AutoAddColumn (see page 12502)	This is AutoAddColumn, a member of class TCustomGridPanel.
	AutoAddRow (see page 12503)	This is AutoAddRow, a member of class TCustomGridPanel.
	CellIndexToCell (see page 12503)	This is CellIndexToCell, a member of class TCustomGridPanel.
	CellToCellIndex (see page 12503)	This is CellToCellIndex, a member of class TCustomGridPanel.
	Loaded (see page 12504)	Initializes the control after it is loaded from a stream.
	Paint (see page 12505)	Renders the image of the panel.
	RemoveEmptyAutoAddColumns (see page 12505)	This is RemoveEmptyAutoAddColumns, a member of class TCustomGridPanel.
	RemoveEmptyAutoAddRows (see page 12505)	This is RemoveEmptyAutoAddRows, a member of class TCustomGridPanel.
	UpdateControlOriginalParentSize (see page 12505)	This is UpdateControlOriginalParentSize, a member of class TCustomGridPanel.

Public Methods

	Name	Description
	GetChildren (see page 12503)	Calls a specified method for each child of the control.
	IsColumnEmpty (see page 12504)	This is IsColumnEmpty, a member of class TCustomGridPanel.
	IsRowEmpty (see page 12504)	This is IsRowEmpty, a member of class TCustomGridPanel.

68.1.17.4.1 TCustomGridPanel.AlignControls Method

Aligns any controls for which the control is the parent within a specified area of the control.

Pascal

```
procedure AlignControls(AControl: TControl; var Rect: TRect); override;
```

C++

```
virtual __fastcall AlignControls(TControl * AControl, TRect Rect);
```

Description

Use AlignControls to align all controls within an area of a form, panel, group box, scroll box, or any container control. Specify the area in which to align the controls as the value of the Rect parameter.

AlignControls uses the Align property value for each child control to determine how to align it. The AControl parameter can be nil (Delphi) or NULL (C++). If you specify a control in AControl, that control takes precedence in alignment over other, similarly-aligned controls.

See Also

Align (see page 5798)

68.1.17.4.2 TCustomGridPanel.AutoAddColumn Method

Pascal

```
function AutoAddColumn: TColumnItem;
```

C++

```
__fastcall TColumnItem AutoAddColumn();
```

Description

This is AutoAddColumn, a member of class TCustomGridPanel.

68.1.17.4.3 TCustomGridPanel.AutoAddRow Method

Pascal

```
function AutoAddRow: TRowItem;
```

C++

```
__fastcall TRowItem AutoAddRow();
```

Description

This is AutoAddRow, a member of class TCustomGridPanel.

68.1.17.4.4 TCustomGridPanel.CellIndexToCell Method

Pascal

```
procedure CellIndexToCell(AIndex: Integer; var AColumn: Integer; var ARow: Integer);
```

C++

```
__fastcall CellIndexToCell(int AIndex, int AColumn, int ARow);
```

Description

This is CellIndexToCell, a member of class TCustomGridPanel.

68.1.17.4.5 TCustomGridPanel.CellToCellIndex Method

Pascal

```
function CellToCellIndex(AColumn: Integer; ARow: Integer): Integer;
```

C++

```
__fastcall int CellToCellIndex(int AColumn, int ARow);
```

Description

This is CellToCellIndex, a member of class TCustomGridPanel.

68.1.17.4.6 TCustomGridPanel.GetChildren Method

Calls a specified method for each child of the control.

Pascal

```
procedure GetChildren(Proc: TGetChildProc; Root: TComponent); override;
```

C++

```
virtual __fastcall GetChildren(TGetChildProc Proc, TComponent * Root);
```

Description

GetChildren is called by the streaming system that loads and saves components. Applications seldom need to call this routine.

GetChildren executes the callback specified by the Proc parameter for every child control listed by the Controls property that lists the Root parameter as its Owner.

Override GetChildren to limit or augment which child controls are saved with the control. When overriding GetChildren, call the procedure passed as the Proc parameter for every child control that should be saved. The Root parameter indicates the component (usually a form) that owns the control.

See Also

Controls (see page 6197)

Owner (see page 2807)

68.1.17.4.7 TCustomGridPanel.IsColumnEmpty Method

Pascal

```
function IsColumnEmpty(AColumn: Integer): Boolean;
```

C++

```
__fastcall Boolean IsColumnEmpty(int AColumn);
```

Description

This is IsColumnEmpty, a member of class TCustomGridPanel.

68.1.17.4.8 TCustomGridPanel.IsRowEmpty Method

Pascal

```
function IsRowEmpty(ARow: Integer): Boolean;
```

C++

```
__fastcall Boolean IsRowEmpty(int ARow);
```

Description

This is IsRowEmpty, a member of class TCustomGridPanel.

68.1.17.4.9 TCustomGridPanel.Loaded Method

Initializes the control after it is loaded from a stream.

Pascal

```
procedure Loaded; override;
```

C++

```
virtual __fastcall Loaded();
```

Description

Do not call Loaded. The VCL streaming system calls Loaded automatically after the control's form is loaded into memory so that the control can complete any initializations that depend on other objects in the form.

Loaded overrides the inherited method in order to initialize the control from its associated Action. To change the properties the control copies from its action, override the ActionChange method.

See Also

Loaded (see page 2782)

Action (see page 5797)

ActionChange (see page 5737)

68.1.17.4.10 TCustomGridPanel.Paint Method

Renders the image of the panel.

Pascal

```
procedure Paint; override;
```

C++

```
virtual __fastcall Paint();
```

Description

Override the Paint method to change the way the panel is drawn. The Paint method for TCustomPanel draws the bevels of the panel, sets the brush and font for the panel, and fills in the interior of the panel. Finally, Paint writes the value of Caption on the panel.

See Also

BevelInner (see page 12540)

BevelOuter (see page 12541)

Brush (see page 6195)

Caption (see page 5806)

Canvas (see page 5921)

68.1.17.4.11 TCustomGridPanel.RemoveEmptyAutoAddColumns Method

Pascal

```
procedure RemoveEmptyAutoAddColumns;
```

C++

```
__fastcall RemoveEmptyAutoAddColumns();
```

Description

This is RemoveEmptyAutoAddColumns, a member of class TCustomGridPanel.

68.1.17.4.12 TCustomGridPanel.RemoveEmptyAutoAddRows Method

Pascal

```
procedure RemoveEmptyAutoAddRows;
```

C++

```
__fastcall RemoveEmptyAutoAddRows();
```

Description

This is RemoveEmptyAutoAddRows, a member of class TCustomGridPanel.

68.1.17.4.13 TCustomGridPanel.UpdateControlOriginalParentSize Method

Pascal

```
procedure UpdateControlOriginalParentSize(AControl: TControl; var AOriginalParentSize:
TPoint); override;
```

C++

```
virtual __fastcall UpdateControlOriginalParentSize(TControl * AControl, TPoint
AOriginalParentSize);
```

Description

This is UpdateControlOriginalParentSize, a member of class TCustomGridPanel.

68.1.17.5 TCustomGridPanel Properties

The properties of the TCustomGridPanel class are listed here.

Public Properties

	Name	Description
R	CellCount (see page 12506)	This is CellCount, a member of class TCustomGridPanel.
R	CellRect (see page 12506)	Returns the screen coordinates of a cell in the grid.
R	CellSize (see page 12507)	This is CellSize, a member of class TCustomGridPanel.
	ColumnCollection (see page 12507)	Sets the number and size of the columns on the grid panel.
R	ColumnSpanIndex (see page 12507)	This is ColumnSpanIndex, a member of class TCustomGridPanel.
	ControlCollection (see page 12507)	This is ControlCollection, a member of class TCustomGridPanel.
	ExpandStyle (see page 12507)	Specifies whether rows or columns are added to a filled grid panel to accommodate additional controls.
	RowCollection (see page 12508)	Sets the number and size of the rows on the grid panel.
R	RowSpanIndex (see page 12508)	This is RowSpanIndex, a member of class TCustomGridPanel.

68.1.17.5.1 TCustomGridPanel.CellCount Property

Pascal

```
property CellCount: Integer;
```

C++

```
__property int CellCount;
```

Description

This is CellCount, a member of class TCustomGridPanel.

68.1.17.5.2 TCustomGridPanel.CellRect Property

Returns the screen coordinates of a cell in the grid.

Pascal

```
property CellRect [AColumn, ARow: Integer]: TRect;
```

C++

```
__property TRect CellRect[int AColumn, ARow];
```

Description

Use the CellRect property to return the screen coordinates of a cell in the grid.

68.1.17.5.3 TCustomGridPanel.CellSize Property

Pascal

```
property CellSize [AColumn, ARow: Integer]: TPoint;
```

C++

```
__property TPoint CellSize[int AColumn, ARow];
```

Description

This is CellSize, a member of class TCustomGridPanel.

68.1.17.5.4 TCustomGridPanel.ColumnCollection Property

Sets the number and size of the columns on the grid panel.

Pascal

```
property ColumnCollection: TColumnCollection;
```

C++

```
__property TColumnCollection ColumnCollection;
```

Description

Use the ColumnCollection property to set the number of columns as well as the size of each column. You can use the SizeStyle property to specify whether column sizes are based on a percentage of the available width, based on an absolute value, or automatically sized.

68.1.17.5.5 TCustomGridPanel.ColumnSpanIndex Property

Pascal

```
property ColumnSpanIndex [AColumn, ARow: Integer]: Integer;
```

C++

```
__property int ColumnSpanIndex[int AColumn, ARow];
```

Description

This is ColumnSpanIndex, a member of class TCustomGridPanel.

68.1.17.5.6 TCustomGridPanel.ControlCollection Property

Pascal

```
property ControlCollection: TControlCollection;
```

C++

```
__property TControlCollection ControlCollection;
```

Description

This is ControlCollection, a member of class TCustomGridPanel.

68.1.17.5.7 TCustomGridPanel.ExpandStyle Property

Specifies whether rows or columns are added to a filled grid panel to accommodate additional controls.

Pascal

```
property ExpandStyle: TExpandStyle;
```

C++

```
__property TExpandStyle ExpandStyle;
```

Description

Use the ExpandStyle property to specify how a grid panel is expanded when each cell of the grid contains a control, and a new control is added.

68.1.17.5.8 TCustomGridPanel.RowCollection Property

Sets the number and size of the rows on the grid panel.

Pascal

```
property RowCollection: TRowCollection;
```

C++

```
__property TRowCollection RowCollection;
```

Description

Use the RowCollection property to set the number of rows as well as the size of each row. You can use the SizeStyle property to specify whether row sizes are based on a percentage of the available width, based on an absolute value, or automatically sized.

68.1.17.5.9 TCustomGridPanel.RowSpanIndex Property

Pascal

```
property RowSpanIndex [AColumn, ARow: Integer]: Integer;
```

C++

```
__property int RowSpanIndex[int AColumn, ARow];
```

Description

This is RowSpanIndex, a member of class TCustomGridPanel.

68.1.18 TCustomLabeledEdit Class

TCustomLabeledEdit is the base class for edit controls that have an integrated label.

Class Hierarchy

Pascal

```
TCustomLabeledEdit = class(TCustomEdit);
```

C++

```
class TCustomLabeledEdit : public TCustomEdit;
```

File

ExtCtrls

Description

TCustomLabeledEdit is the base class for edit controls that have an associated label. This class introduces new properties for managing a label that sits on one side of the edit control.

Do not create instances of TCustomLabeledEdit. Use TCustomLabeledEdit as a base class when declaring edit controls that include a label. Properties and methods of TCustomLabeledEdit provide basic behavior that descendant classes inherit as well as behavior that components can override to customize their behavior.

See Also

TEdit (see page 21402)

TLabeledEdit (see page 12833)

TBoundLabel (see page 12123)

68.1.18.1 TCustomLabeledEdit Members

The following tables list the members exposed by TCustomLabeledEdit.

Protected Events

	Name	Description
	OnAlignInsertBefore (see page 6213)	Occurs when an object with custom alignment is aligned.
	OnAlignPosition (see page 6214)	Occurs when an object with custom alignment is aligned.
	OnCanResize (see page 5851)	Occurs when an attempt is made to resize the control.
	OnChange (see page 21275)	Occurs when the text for the edit control may have changed.
	OnClick (see page 5851)	Occurs when the user clicks the control.
	OnConstrainedResize (see page 5853)	Adjust resize constraints.
	OnContextPopup (see page 5854)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnDblClick (see page 5854)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDockDrop (see page 6214)	Occurs when another control is docked to the control.
	OnDockOver (see page 6216)	Occurs when another control is dragged over the control.
	OnDragDrop (see page 5855)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 5857)	Occurs when the user drags an object over a control.
	OnEndDock (see page 5859)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 5860)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnEnter (see page 6219)	Occurs when a control receives the input focus.
	OnExit (see page 6221)	Occurs when the input focus shifts away from one control to another.
	OnGetSiteInfo (see page 6223)	Returns the control's docking information.
	OnKeyDown (see page 6225)	Occurs when a user presses any key while the control has focus.
	OnKeyPress (see page 6227)	Occurs when a key is pressed.
	OnKeyUp (see page 6228)	Occurs when the user releases a key that has been pressed.
	OnMouseActivate (see page 5861)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 5862)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseEnter (see page 5864)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 5864)	Occurs when the user moves the mouse outside of a control.

	OnMouseMove (see page 5865)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 5867)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnMouseWheel (see page 5869)	Occurs when the mouse wheel is rotated.
	OnMouseWheelDown (see page 5869)	Occurs when the mouse wheel is rotated downward.
	OnMouseWheelUp (see page 5870)	Occurs when the mouse wheel is rotated upward.
	OnResize (see page 5870)	Occurs immediately after the control is resized.
	OnStartDock (see page 5871)	Occurs when the user begins to drag a control with a DragKind (see page 5819) of dkDock.
	OnStartDrag (see page 5871)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.
	OnUnDock (see page 6230)	Occurs when the application tries to undock a control that is docked to the windowed control.

Protected Fields

	Name	Description
	FAnchorMove (see page 5733)	This is FAnchorMove, a member of class TControl.
	FAnchorOrigin (see page 5734)	This is FAnchorOrigin, a member of class TControl.
	FAnchorRules (see page 5734)	This is FAnchorRules, a member of class TControl.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FDesignSize (see page 6124)	This is FDesignSize, a member of class TWinControl.
	FDoubleBuffered (see page 6124)	This is FDoubleBuffered, a member of class TWinControl.
	FExplicitHeight (see page 5734)	This is FExplicitHeight, a member of class TControl.
	FExplicitLeft (see page 5734)	This is FExplicitLeft, a member of class TControl.
	FExplicitTop (see page 5734)	This is FExplicitTop, a member of class TControl.
	FExplicitWidth (see page 5735)	This is FExplicitWidth, a member of class TControl.
	FInImeComposition (see page 6125)	This is FInImeComposition, a member of class TWinControl.
	FOriginalParentSize (see page 5735)	This is FOriginalParentSize, a member of class TControl.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	ActionChange (see page 5737)	Responds when the action associated with the control changes.
	ActionChange (see page 6127)	Updates the control to reflect changes in its associated action.
	AddBiDiModeExStyle (see page 6128)	Sets control's window style according to its bi-directional support.
	AdjustClientRect (see page 6128)	Provides the interface that adjusts the ClientRect (see page 5810) property for idiosyncrasies of the window.
	AdjustSize (see page 5738)	Sets the size of the control as determined by the AutoSize (see page 5803) property.
	AdjustSize (see page 6129)	Adjusts the control's size according to its contents and constraints.
	AlignControls (see page 6129)	Aligns any controls for which the control is the parent within a specified area of the control.
	ArrangeControl (see page 6130)	This is ArrangeControl, a member of class TWinControl.
	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	AssignTo (see page 5739)	Overrides the inherited AssignTo function to enable assignments to TAction objects.
	AssignTo (see page 6130)	Copies the properties of the windowed control to another object.
	BeginAutoDrag (see page 5739)	Begin Automatic Drag.
	CalcCursorPos (see page 5741)	This is CalcCursorPos, a member of class TControl.
	CanAutoSize (see page 5741)	Indicates whether the control can resize itself automatically to accommodate its contents.
	CanAutoSize (see page 6131)	Indicates how the control can be resized.
	CanResize (see page 5742)	OnCanResize (see page 5851) event dispatcher.
	CanResize (see page 6132)	Indicates how the control can respond to a resize attempt.
	Change (see page 21245)	Generates an OnChange (see page 21275) event.

	Changed (see page 5742)	Sends a CM_CHANGED (see page 6330) message to the control.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	ChangeScale (see page 5743)	Rescaling event dispatcher.
V	ChangeScale (see page 6132)	Resize (see page 5780) and reposition children and self.
	Click (see page 5743)	Respond to user click.
	CMBidimodechanged (see page 12521)	This is CMBidimodechanged, a member of class TCustomLabeledEdit.
	CMEnabledchanged (see page 12521)	Responds when the Enabled property changes.
	CMVisiblechanged (see page 12521)	Responds when the Visible property changes.
V	ConstrainedResize (see page 5746)	Notify control of resize with constraints.
V	ConstrainedResize (see page 6133)	Generates an OnConstrainedResize (see page 5853) event.
	ControlsAligned (see page 6134)	This is ControlsAligned, a member of class TWinControl.
	CreateDockManager (see page 6134)	Creates the dock manager for the control.
V	CreateHandle (see page 6135)	Creates underlying screen object.
V	CreateParams (see page 6135)	Initializes a window-creation parameter data structure.
V	CreateParams (see page 21248)	Initializes a window-creation parameter record passed in the Params parameter.
	CreateSubClass (see page 6136)	Creates a windowed control derived from an existing Windows window class.
V	CreateWindowHandle (see page 6137)	Creates a Windows control to represent the control.
V	CreateWindowHandle (see page 21248)	Creates a Windows control to represent the control.
V	CreateWnd (see page 6137)	Creates the underlying window.
V	CreateWnd (see page 21248)	Creates a Windows control corresponding to the edit control.
V	CustomAlignInsertBefore (see page 6137)	Returns placement order of custom-aligned child control.
V	CustomAlignPosition (see page 6138)	Returns aligned position of custom-aligned child control.
	DblClick (see page 5747)	OnDblClick (see page 5854) event dispatcher.
	DefaultDockImage (see page 5747)	Handles the painting and erasing of a dock image.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DefineProperties (see page 5748)	Provides methods to read and write the IsControl (see page 5829) property to a stream such as a form file.
V	DefineProperties (see page 6139)	Provides methods to read and write the IsControl property to a stream such as a form file.
	DesignWndProc (see page 5749)	This is DesignWndProc, a member of class TControl.
V	DestroyHandle (see page 6140)	Destroys the control's window without destroying the control.
V	DestroyWindowHandle (see page 6140)	Destroys the window created in the CreateWindowHandle (see page 6137) method.
V	DestroyWnd (see page 6141)	Destroys the control's window.
V	DestroyWnd (see page 21251)	Destroys the Windows control that corresponds to the edit control.
	DoAddDockClient (see page 6142)	Performs actions when a control is docked to the windowed control.
	DockOver (see page 6143)	Responds when a docking client is dragged over the windowed control.
V	DockReplaceDockClient (see page 6143)	This is DockReplaceDockClient, a member of class TWinControl.
	DockTrackNoTarget (see page 5749)	Handles dragging of the control over an invalid docking target.
	DoContextPopup (see page 5750)	OnContextPopup (see page 5854) event dispatcher.
	DoDock (see page 5750)	Docking event dispatcher.
	DoDockOver (see page 6143)	Generates an OnDockOver (see page 6216) event.
	DoEndDock (see page 5750)	OnEndDock (see page 5859) event dispatcher.
	DoEndDrag (see page 5751)	OnEndDrag (see page 5860) event dispatcher.
	DoEnter (see page 6144)	Respond to receiving input focus.
	DoExit (see page 6144)	Respond to losing input focus
	DoFlipChildren (see page 6145)	Flips the control's children.
	DoKeyDown (see page 6145)	Performs some preprocessing before generating an OnKeyDown (see page 6225) event.
	DoKeyPress (see page 6146)	Performs some preprocessing before generating an OnKeyPress (see page 6227) event.
	DoKeyUp (see page 6146)	Performs some preprocessing before generating an OnKeyUp (see page 6228) event.

	DoMouseWheel (see page 5751)	Processes mouse wheel motion.
	DoMouseWheelDown (see page 5752)	OnMouseWheelDown (see page 5869) event dispatcher.
	DoMouseWheelUp (see page 5752)	OnMouseWheelUp (see page 5870) event dispatcher.
	DoRemoveDockClient (see page 6147)	Responds when a control is undocked from the windowed control.
V	DoSetMaxLength (see page 21251)	Sets the MaxLength (see page 21263) property.
	DoStartDock (see page 5753)	OnStartDock (see page 5871) event dispatcher.
	DoStartDrag (see page 5753)	OnStartDrag (see page 5871) event dispatcher.
	DoUnDock (see page 6147)	Undocks a control that is currently docked to the windowed control.
	DragCanceled (see page 5754)	Provides the interface for a method that responds to the cancellation of a drag.
	DragOver (see page 5755)	OnDragOver (see page 5857) event dispatcher.
	DrawDragDockImage (see page 5755)	Draws the dock image for the control.
	EraseDragDockImage (see page 5757)	Erases the dock image for the control.
	FindNextControl (see page 6149)	Returns the control's next child in the tab order after the specified control.
	FixupTabList (see page 6149)	Sorts the child controls by their tab order.
V	GetAction (see page 5758)	This is GetAction, a member of class TControl.
	GetActionLinkClass (see page 5758)	Returns the appropriate action link class that is associated with the control class.
V	GetActionLinkClass (see page 6152)	Returns the associated action link class.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetChildren (see page 6153)	Calls a specified method for each child of the control.
V	GetClientOrigin (see page 5758)	Returns the screen coordinates of the top-left corner of the control's client area.
V	GetClientOrigin (see page 6153)	Returns the value of the ClientOrigin (see page 5809) property.
V	GetClientRect (see page 5759)	Returns a rectangle defining the client area of the control.
V	GetClientRect (see page 6154)	Returns the value of the ClientRect (see page 5810) property.
V	GetControlExtents (see page 6154)	Returns the smallest rectangle in which all the control's children fit.
V	GetDeviceContext (see page 5760)	Returns a device context for the control.
V	GetDeviceContext (see page 6155)	Provides access to a device context for the control.
	GetDockEdge (see page 5763)	Returns the edge on which another control should be docked when it is dragged over the control.
V	GetDragImages (see page 5763)	Returns the control's image list containing the image to be displayed while dragging.
V	GetEnabled (see page 5763)	Returns the value of the Enabled (see page 5821) property.
V	GetFloating (see page 5764)	Returns the value of the Floating (see page 5823) property.
V	GetFloatingDockSiteClass (see page 5764)	Returns the class used for the control when it is floating.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetPalette (see page 5765)	Returns the handle to a palette for use by the control.
	GetParentHandle (see page 6157)	Returns the window handle for the window of the control's parent.
	GetPopupMenu (see page 5765)	Returns the pop-up menu associated with the control.
V	GetSelLength (see page 21252)	Returns the SelLength (see page 21265) property.
V	GetSelStart (see page 21252)	Returns the SelStart (see page 21269) property.
V	GetSelText (see page 21252)	Returns the SelText (see page 21272) property.
	GetSiteInfo (see page 6158)	Generates an OnGetSiteInfo (see page 6223) event
	GetTopParentHandle (see page 6159)	Returns the window handle of the first window not associated with a VCL control that contains the windowed control.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	InvalidateDockHostSite (see page 6162)	This is InvalidateDockHostSite, a member of class TWinControl.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsControlActivateMsg (see page 6162)	This is IsControlActivateMsg, a member of class TWinControl.

	IsControlMouseMsg (see page 6162)	Indicates whether a specified mouse message is directed to one of the windowed control's child controls.
	IsQualifyingSite (see page 6163)	This is IsQualifyingSite, a member of class TWinControl.
	KeyDown (see page 6163)	Respond to key press events.
	KeyPress (see page 6163)	Respond to keyboard input.
	KeyUp (see page 6164)	Respond to released key.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Loaded (see page 5771)	Initializes the control after it is loaded from a stream.
	MainWndProc (see page 6165)	Receives Windows messages for the control.
	MouseActivate (see page 5773)	This is MouseActivate, a member of class TControl.
	MouseDown (see page 5773)	OnMouseDown (see page 5862) event dispatcher.
	MouseMove (see page 5773)	Respond to mouse moving over control area..
	MouseUp (see page 5774)	OnMouseUp (see page 5867) event dispatcher.
V	Notification (see page 12522)	Responds to notifications when objects are created or destroyed.
	NotifyControls (see page 6165)	Sends a message to all the child controls.
	PaintControls (see page 6166)	Paints each of the child controls in a windowed control using the specified device context.
	PaintHandler (see page 6166)	Responds to WM_PAINT messages.
V	PaintWindow (see page 6169)	Renders the image of a windowed control.
	PaletteChanged (see page 5775)	Responds to changes in the system's palette by realizing the control's palette.
V	PaletteChanged (see page 6170)	Responds to changes in the system's palette by realizing the control's palette and the palette for each child control.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	PositionDockRect (see page 5777)	Positions the docking rectangle according to the current drag-and-dock state.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 5778)	Prepares the control for having its properties assigned values read from a stream.
V	ReadState (see page 6171)	Prepares the control for having its properties assigned values from a stream.
	RecreateWnd (see page 6171)	Recreate underlying Windows screen object.
	ReloadDockedControl (see page 6172)	Reloads a docked control.
	RemoveWindowProps (see page 6174)	This is RemoveWindowProps, a member of class TWinControl.
V	RequestAlign (see page 5780)	Instructs the parent of a control to reposition the control, enforcing its Align (see page 5798) property.
	ResetIme (see page 6174)	Restores the input method editor (IME) that was active when the application started.
	ResetImeComposition (see page 6175)	Directs the composition window of the input method editor (IME) to perform a specific action.
	Resize (see page 5780)	Respond to control resize.
	ScaleConstraints (see page 5781)	This is ScaleConstraints, a member of class TControl.
	ScaleControls (see page 6176)	Rescale child controls only.
	SelectFirst (see page 6177)	Locates first selectable child control.
	SelectNext (see page 6177)	Moves the input focus from the current child control to the next one in the tab order.
	SendCancelMode (see page 5781)	Cancels the modal state of the control.
	SendDockNotification (see page 5782)	Sends a Windows message to the control's host dock site.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
V	SetAutoSize (see page 5783)	This is SetAutoSize, a member of class TControl.
V	SetAutoSize (see page 21257)	Sets the AutoSize (see page 21260) property.
V	SetBiDiMode (see page 5783)	Sets the control's bi-directional mode.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
V	SetChildOrder (see page 6178)	Changes the order in which the child component appears in the list of child components returned by the GetChildren (see page 6153) method.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
V	SetDragMode (see page 5785)	Sets the drag mode for the control.
V	SetEnabled (see page 5785)	Sets the value of the Enabled (see page 5821) property.

	SetIme (see page 6181)	Activates an input method editor (IME) using the values specified by the ImeMode (see page 6207) and ImeName (see page 6208) properties.
	SetImeCompositionWindow (see page 6181)	Sets the position and font of the composition window.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 12523)	Sets the name of the control.
V	SetParent (see page 12523)	Sets the value of the Parent property.
V	SetParentBackground (see page 6182)	This is SetParentBackground, a member of class TWinControl.
V	SetParentBiDiMode (see page 5786)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 5787)	Sets the parent for the control.
V	SetSelLength (see page 21257)	Sets the SelLength (see page 21265) property.
V	SetSelStart (see page 21257)	Sets the SelStart (see page 21269) property.
	SetZOrder (see page 5788)	Repositions the control in its parent's control list, thereby changing position onscreen.
V	SetZOrder (see page 6182)	Moves the control to the top or bottom of the parent control's (or screen's) list of TWinControl (see page 6112) controls.
V	ShowControl (see page 6183)	Ensures that a specified child control is visible.
	UpdateBounds (see page 6185)	This is UpdateBounds, a member of class TWinControl.
	UpdateBoundsRect (see page 5789)	Changes the Top (see page 5844), Left (see page 5830), Width (see page 5849), and Height (see page 5825) properties of the control, but doesn't update its screen image and bypasses all resize events.
V	UpdateControlOriginalParentSize (see page 6186)	This is UpdateControlOriginalParentSize, a member of class TWinControl.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateExplicitBounds (see page 5789)	This is UpdateExplicitBounds, a member of class TControl.
	UpdateRecreatingFlag (see page 6186)	This is UpdateRecreatingFlag, a member of class TWinControl.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	UpdateUIState (see page 6186)	Updates form User Interface State as needed
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	VisibleChanging (see page 5791)	Provides the interface for a method that responds to changes in the control's visibility.
V	WndProc (see page 5791)	Provides specific message responses for the control.
V	WndProc (see page 6187)	Provides specific message responses for the control.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	ActionLink (see page 5798)	Contains the action link object associated with the control.
	AutoSelect (see page 21260)	Determines whether all the text in the edit control is automatically selected when the control gets focus.
	AutoSize (see page 5803)	Specifies whether the control sizes itself automatically to accommodate its contents.
	AutoSize (see page 21260)	Determines whether the height of the edit control automatically resizes to accommodate the text.
	BevelEdges (see page 6192)	Specifies which edges of the control are beveled.
	BevelInner (see page 6193)	Specifies the cut of the inner bevel.
	BevelKind (see page 6193)	Specifies the control's bevel style.
	BevelOuter (see page 6194)	Specifies the cut of the outer bevel.
	BevelWidth (see page 6194)	Specifies the width of the inner and outer bevels.
	BorderStyle (see page 21261)	Determines whether the edit control has a single line border around the client area.

	BorderWidth (see page 6195)	Specifies the width of the control's border.
	Caption (see page 5806)	Specifies a text string that identifies the control to the user.
	CharCase (see page 21262)	Determines the case of the text within the edit control.
	Color (see page 5812)	Specifies the background color of the control.
	Ctl3D (see page 6198)	Determines whether a control has a three-dimensional (3-D) or two-dimensional look.
	DefWndProc (see page 6199)	Specifies the default window procedure for the windowed control.
	DesktopFont (see page 5818)	Specifies whether the control uses the Windows icon font when writing text.
	DragCursor (see page 5818)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 5819)	Specifies whether the control is being dragged normally or for docking.
	DragMode (see page 5819)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	Font (see page 5823)	Controls (see page 5711) the attributes of text written on or in the control.
	HideSelection (see page 21262)	Determines whether the visual indication of the selected text remains when focus shifts to another control.
	ImeMode (see page 6207)	Determines the behavior of the input method editor (IME).
	ImeName (see page 6208)	Specifies the input method editor (IME) to use for converting keyboard input to Asian language characters.
	IsControl (see page 5829)	Determines whether a form stores its form-specific properties to a stream.
	MaxLength (see page 21263)	Specifies the maximum number of characters the user can enter into the edit control.
	MouseCapture (see page 5831)	Indicates whether the control has "captured" mouse events.
	OEMConvert (see page 21264)	Determines whether characters typed in the edit control are converted from ANSI to OEM and then back to ANSI.
	ParentBackground (see page 6209)	Determines whether control uses parent's theme background.
	ParentBiDiMode (see page 5833)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	ParentColor (see page 5834)	Determines where a control looks for its color information.
	ParentColor (see page 21264)	Determines where a control looks for its color information.
	ParentCtl3D (see page 6209)	Determines where a component looks to determine if it should appear three dimensional.
	ParentFont (see page 5834)	Determines where a control looks for its font information.
	ParentShowHint (see page 5835)	Determines where a control looks to find out if its Help Hint (see page 5827) should be shown.
	PasswordChar (see page 21265)	Indicates the character, if any, to display in place of the actual characters typed in the control.
	PopupMenu (see page 5835)	Identifies the pop-up menu associated with the control.
	ScalingFlags (see page 5840)	Reflects which attributes of the control have been scaled.
	Text (see page 5842)	Contains a text string associated with the control.
	WheelAccumulator (see page 5849)	Accumulates mouse wheel rotations.
	WindowHandle (see page 6212)	Provides access to a window handle for the control.
	WindowText (see page 5850)	Contains the text string of the control.

Public Events

	Name	Description
	WindowProc (see page 5872)	Points to the window procedure that responds to messages sent to the control.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	BeginDrag (see page 5740)	Starts the dragging of a control.
	BringToFront (see page 5740)	Puts the control in front of all other controls in its parent control.
	Broadcast (see page 6130)	Sends a message to each of the child controls.

	CanFocus (see page 6131)	Indicates whether a control can receive focus.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Clear (see page 21245)	Deletes all text from the edit control.
	ClearSelection (see page 21245)	Removes the selected text from the edit control.
	ClearUndo (see page 21246)	Clears the undo buffer so that no changes to the text can be backed out.
	ClientToParent (see page 5744)	Translates client coordinates to parent coordinates.
	ClientToScreen (see page 5744)	Translates a given point from client area coordinates to global screen coordinates.
	ContainsControl (see page 6133)	Indicates whether a specified control exists within the control.
	ControlAtPos (see page 6133)	Returns the child control located at a specified position within the control.
	CopyToClipboard (see page 21246)	Copies the selected text in the edit control to the Clipboard in CF_TEXT format.
V	Create (see page 12520)	Creates an instance of TCustomLabeledEdit (see page 12508).
	CreateParented (see page 6123)	Creates and initializes a control as the child of a specified non-VCL container.
	CreateParentedControl (see page 6136)	Creates and initializes a control as the child of a specified non-VCL window.
	CutToClipboard (see page 21249)	Copies the selected text to the Clipboard in CF_TEXT format and then deletes the selection.
V	DefaultHandler (see page 5748)	Provides message handling for all messages that do not have specific handlers.
V	DefaultHandler (see page 6139)	Provides message handling for all messages that the control does not fully process itself.
V	DefaultHandler (see page 21250)	Provides message handling for all messages that the control does not fully process itself.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 5732)	Destroys an instance of TControl (see page 5724).
V	Destroy (see page 6124)	Destroys an instance of TWinControl (see page 6112).
V	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	DisableAlign (see page 6141)	Disables the realignment of child controls.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Dock (see page 5749)	Used internally to dock the control.
	DockDrop (see page 6142)	Generates an OnDockDrop (see page 6214) event.
	DragDrop (see page 5754)	OnDragDrop (see page 5855) event dispatcher.
	Dragging (see page 5754)	Indicates whether a control is being dragged.
	DrawTextBiDiModeFlags (see page 5756)	Returns the text flags that reflect the current setting of the BiDiMode (see page 5803) property.
	DrawTextBiDiModeFlagsReadingOnly (see page 5756)	Returns the text flag to add that indicates whether the control's text should read from right to left.
	EnableAlign (see page 6148)	Decrements the reference count incremented by the DisableAlign (see page 6141) method, eventually realigning the child controls.
	EndDrag (see page 5757)	Stops a control from being dragged any further.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindChildControl (see page 6148)	Returns a child control given its name.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FlipChildren (see page 6150)	Reverses the positions of child controls.
	Focused (see page 6150)	Determines whether the control has input focus.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.

	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetControlsAlignment (see page 5759)	Indicates how text is aligned within the control.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetParentComponent (see page 5765)	Returns the parent of the control.
	GetSelTextBuf (see page 21253)	Copies the selected text into a buffer and returns the number of characters copied.
	GetTabOrderList (see page 6158)	Builds a list of controls in tab order.
	GetTextBuf (see page 5766)	Retrieves the control's text, copies it into a buffer, and returns the number of characters copied.
	GetTextLen (see page 5767)	Returns the length of the control's text.
	HandleAllocated (see page 6159)	Reports whether a screen object handle exists for the control.
	HandleNeeded (see page 6160)	Creates a screen object for the control if it doesn't already exist.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	HasParent (see page 5768)	Indicates whether the control has a parent.
	Hide (see page 5769)	Makes the control invisible.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitiateAction (see page 5769)	Calls the action link's Update (see page 5789) method if the control is associated with an action link.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InsertControl (see page 6160)	Inserts a control into the Controls (see page 6197) array property.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	Invalidate (see page 5770)	Completely repaint control.
	Invalidate (see page 6161)	Schedules a control repaint.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	IsRightToLeft (see page 5770)	Indicates whether the control should be reversed right to left.
	ManualDock (see page 5771)	Docks the control.
	ManualFloat (see page 5772)	Undocks the control.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	MouseWheelHandler (see page 5774)	Dispatches messages received from a mouse wheel.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	PaintTo (see page 6167)	This is the overview for the PaintTo method overload.
	ParentToClient (see page 5776)	Translate parent coordinates to client coordinates.
	PasteFromClipboard (see page 21254)	Pastes the contents of the Clipboard into edit control, replacing the current selection.
	Perform (see page 5776)	Responds as if the control received a specified Windows message.
	PreProcessMessage (see page 6170)	This is PreProcessMessage, a member of class TWinControl.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	Realign (see page 6171)	Forces the control to realign children.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	Refresh (see page 5779)	Repaints the control on the screen.

	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveControl (see page 6172)	Removes a specified control from the Controls (see page 6197) array.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	Repaint (see page 5779)	Forces the control to repaint its image on the screen.
V	Repaint (see page 6174)	Repaints the entire control.
	ReplaceDockedControl (see page 5779)	Docks the control in the place where another control is already docked.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	ScaleBy (see page 6175)	Rescale control and its children.
	ScreenToClient (see page 5781)	Converts the screen coordinates of a specified point on the screen to client coordinates.
	ScrollBy (see page 6176)	Scroll control contents.
	SelectAll (see page 21255)	Selects all text in the edit control.
	SendToBack (see page 5782)	Puts a windowed control behind all other windowed controls, or puts a non-windowed control behind all other non-windowed controls.
V	SetBounds (see page 12522)	Sets the windowed control's boundary properties all at once.
	SetDesignVisible (see page 5784)	Makes a control visible at design time.
V	SetDesignVisible (see page 6178)	Makes a control visible at design time.
V	SetFocus (see page 6179)	Gives the input focus to the control.
	SetSelTextBuf (see page 21258)	Replaces the selected text with a null-terminated string.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	SetTextBuf (see page 5787)	Sets the text of the control.
	SetupInternalLabel (see page 12523)	Initializes the control that implements the EditLabel (see page 12524) property.
	Show (see page 5788)	Makes a control visible.
	Undo (see page 21259)	Backs out all changes in the undo buffer.
V	Update (see page 5789)	Processes any pending paint messages immediately.
V	Update (see page 6183)	Forces the control to update.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	UpdateControlState (see page 6186)	Respond to state change.
	UseRightToLeftAlignment (see page 5790)	Specifies whether the control's alignment should be reversed right-to-left.
	UseRightToLeftReading (see page 5790)	Specifies whether the control is using a right-to-left reading order.
	UseRightToLeftScrollBar (see page 5791)	Specifies whether the vertical scroll bar appears on the left side of the control.

Public Properties

	Name	Description
	Action (see page 5797)	Designates the action associated with the control.
	Align (see page 5798)	Determines how the control aligns within its container (parent control).
R	AlignDisabled (see page 6192)	Indicates child control realignment disabled.
	Anchors (see page 5802)	Specifies how the control is anchored to its parent.
	BiDiMode (see page 5803)	Specifies the bi-directional mode for the control.
	BoundsRect (see page 5803)	Specifies the bounding rectangle of the control, expressed in the coordinate system of the parent control.
R	Brush (see page 6195)	Determines the color and pattern used for painting the background of the control.
R	CanUndo (see page 21262)	Indicates whether the edit control contains changes that can be backed out.
	ClientHeight (see page 5808)	Specifies the height of the control's client area in pixels.
R	ClientOrigin (see page 5809)	Specifies the screen coordinates (in pixels) of the top left corner of a control's client area.
R	ClientRect (see page 5810)	Specifies the size (in pixels) of a control's client area.
	ClientWidth (see page 5811)	Specifies the horizontal size of the control's client area in pixels.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.

R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Constraints (see page 5812)	Specifies the size constraints for the control.
R	ControlCount (see page 6195)	Returns the number of child controls.
R	Controls (see page 6197)	Lists all child controls.
	ControlState (see page 5813)	Indicates the current state of a control at runtime.
	ControlStyle (see page 5814)	Determines style characteristics of the control.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	DockClientCount (see page 6199)	Specifies the number of controls that are docked on the windowed control.
R	DockClients (see page 6201)	Lists the controls that are docked to the windowed control.
	DockManager (see page 6202)	Specifies the control's docking manager interface.
	DockOrientation (see page 5818)	Specifies how the control is docked relative to other controls docked in the same parent.
	DockSite (see page 6204)	Specifies whether the control can be the target of drag-and-dock operations.
	DoubleBuffered (see page 6205)	Determines whether the control's image is rendered directly to the window or painted to an in-memory bitmap first.
R	EditLabel (see page 12524)	Specifies the control that implements the label.
	Enabled (see page 5821)	Controls (see page 5711) whether the control responds to mouse, keyboard, and timer events.
R	ExplicitHeight (see page 5821)	Specifies the explicit vertical size of the control in pixels.
R	ExplicitLeft (see page 5822)	Specifies the explicit horizontal pixel coordinate of the left edge of a component relative to its parent.
R	ExplicitTop (see page 5822)	Specifies the explicit vertical pixel coordinate of the top edge of a component relative to its parent.
R	ExplicitWidth (see page 5822)	Specifies the explicit horizontal size of the control in pixels.
R	Floating (see page 5823)	Indicates whether the control is floating.
	FloatingDockSiteClass (see page 5823)	Specifies the class of the temporary control that hosts the control when it is floating.
R	Handle (see page 6207)	Provides access to the underlying Windows screen object for the control.
	HostDockSite (see page 5829)	Specifies the control in which the control is docked.
	LabelPosition (see page 12524)	Specifies the position of the label relative to the edit control.
	LabelSpacing (see page 12525)	Specifies the distance, in pixels, between the label and the edit region.
	LRDockWidth (see page 5831)	Specifies the width of the control when it is docked horizontally.
	Modified (see page 21263)	Indicates whether the user edited the text of the edit control.
R	MouseInClient (see page 6209)	This is MouseInClient, a member of class TWinControl.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Padding (see page 6209)	Specifies the padding of a control.
	Parent (see page 5832)	Indicates the parent of the control.
	ParentWindow (see page 6210)	Reference to parent's underlying control.
	ReadOnly (see page 21265)	Determines whether the user can change the text of the edit control.
	SelLength (see page 21265)	Specifies the number of characters (bytes) that are selected.
	SelStart (see page 21269)	Specifies the position of the first selected character in the text.
	SelText (see page 21272)	Specifies the selected portion of the edit control's text.
	ShowHint (see page 5840)	Determines whether the control displays a Help Hint (see page 5827) when the mouse pointer rests momentarily on the control.
R	Showing (see page 6210)	Indicates whether the control is showing on the screen.
	TabOrder (see page 6211)	Indicates the position of the control in its parent's tab order.
	TabStop (see page 6211)	Determines if the user can tab to a control.
	TBDockHeight (see page 5842)	Specifies the height of the control when it is docked vertically.
	Text (see page 21273)	Contains a text string associated with the control.
	UndockHeight (see page 5845)	Specifies the height of the control when it is floating.
	UndockWidth (see page 5846)	Specifies the width of the control when it is floating.
	UseDockManager (see page 6212)	Specifies whether the docking manager is used in drag-and-dock operations.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	Visible (see page 5847)	Determines whether the component appears onscreen.

R	VisibleDockClientCount (see page 6212)	Specifies the number of visible controls that are docked on the windowed control.

Published Properties

	Name	Description
	AlignWithMargins (see page 5802)	Indicates whether a control should be constrained by margins.
	Cursor (see page 5815)	Specifies the image used to represent the mouse pointer when it passes into the region covered by the control.
	Height (see page 5825)	Specifies the vertical size of the control in pixels.
	HelpContext (see page 5826)	Numeric ID for control's context-sensitive help topic
	HelpKeyword (see page 5826)	Keyword for control's context-sensitive help topic
	HelpType (see page 5827)	Indicates whether the control's context sensitive help topic is identified by context ID or by keyword.
	Hint (see page 5827)	Contains the text string that can appear when the user moves the mouse over the control.
	Left (see page 5830)	Specifies the horizontal coordinate of the left edge of a component relative to its parent.
	Margins (see page 5831)	Specifies the margins for the control.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	TabStop (see page 21273)	Determines if the user can tab to a control.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Top (see page 5844)	Specifies the Y coordinate of the top left corner of a control, relative to its parent or containing control in pixels.
	Width (see page 5849)	Specifies the horizontal size of the control or form in pixels.

68.1.18.2 TCustomLabeledEdit.Create Constructor

Creates an instance of TCustomLabeledEdit (see page 12508).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomLabeledEdit(TComponent * AOwner);
```

Description

Call Create to instantiate a labeled edit control. AOwner specifies a component, typically the form, that is responsible for freeing the labeled edit control.

See Also

Owner (see page 2807)

68.1.18.3 TCustomLabeledEdit Methods

The methods of the TCustomLabeledEdit class are listed here.

Protected Methods

	Name	Description
	CMBidimodechanged (see page 12521)	This is CMBidimodechanged, a member of class TCustomLabeledEdit.
	CMEnabledchanged (see page 12521)	Responds when the Enabled property changes.
	CMVisiblechanged (see page 12521)	Responds when the Visible property changes.
V	Notification (see page 12522)	Responds to notifications when objects are created or destroyed.
V	SetName (see page 12523)	Sets the name of the control.
V	SetParent (see page 12523)	Sets the value of the Parent property.

Public Methods

	Name	Description
	SetBounds (see page 12522)	Sets the windowed control's boundary properties all at once.
	SetupInternalLabel (see page 12523)	Initializes the control that implements the EditLabel (see page 12524) property.

68.1.18.3.1 TCustomLabeledEdit.CMBidimodechanged Method

Pascal

```
procedure CMBidimodechanged(var Message: TMessage); message CM_BIDIMODECHANGED;
```

C++

```
__fastcall CMBidimodechanged(TMessage Message);
```

Description

This is CMBidimodechanged, a member of class TCustomLabeledEdit.

68.1.18.3.2 TCustomLabeledEdit.CMEnabledchanged Method

Responds when the Enabled property changes.

Pascal

```
procedure CMEnabledchanged(var Message: TMessage); message CM_ENABLEDCHANGED;
```

C++

```
__fastcall CMEnabledchanged(TMessage Message);
```

Description

CMEnabledchanged is called automatically when an application changes the Enabled property.

Message is a CM_ENABLEDCHANGED message that notifies the labeled edit of the change.

The labeled edit control responds by changing the Enabled property of the associated label to the value of its own Enabled property.

See Also

Enabled (see page 5821)

EditLabel (see page 12524)

68.1.18.3.3 TCustomLabeledEdit.CMVisiblechanged Method

Responds when the Visible property changes.

Pascal

```
procedure CMVisiblechanged(var Message: TMessage); message CM_VISIBLECHANGED;
```

C++

```
__fastcall CMVisiblechanged(TMessage Message);
```

Description

CMVisiblechanged is called automatically when an application changes the Visible property.

Message is a CM_VISIBLECHANGED message that notifies the labeled edit of the change.

The labeled edit control responds by changing the Visible property of the associated label to the value of its own Visible property.

See Also

Visible (see page 5847)

EditLabel (see page 12524)

68.1.18.3.4 TCustomLabeledEdit.Notification Method

Responds to notifications when objects are created or destroyed.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

This protected method is called automatically immediately after objects are created and immediately before they are destroyed. TCustomLabeledEdit (see page 12508) overrides this method to update the EditLabel (see page 12524) property when it receives a notification that the label component is about to be destroyed.

AComponent is the component that was just created or that is about to be destroyed.

Operation indicates whether the notification indicates the creation or destruction of AComponent.

See Also

EditLabel (see page 12524)

68.1.18.3.5 TCustomLabeledEdit.SetBounds Method

Sets the windowed control's boundary properties all at once.

Pascal

```
procedure SetBounds(ALeft: Integer; ATop: Integer; AWidth: Integer; AHeight: Integer);
override;
```

C++

```
virtual __fastcall SetBounds(int ALeft, int ATop, int AWidth, int AHeight);
```

Description

Use SetBounds to change all of the control's boundary properties at once. The same effect can be achieved by setting the Left, Top, Width, and Height properties separately. By setting all four properties at once, SetBounds ensures that the control will not repaint between changes

Specify the values for the Left, Top, Width, and Height properties as the value of the ALeft, ATop, AWidth, and AHeight parameters, respectively.

See Also

Height (see page 5825)

Left (see page 5830)

Top (see page 5844)

Width (see page 5849)

68.1.18.3.6 TCustomLabeledEdit.SetName Method

Sets the name of the control.

Pascal

```
procedure SetName(const Value: TComponentName); override;
```

C++

```
virtual __fastcall SetName(const TComponentName Value);
```

Description

SetName is the protected write implementation of the Name property. TControl updates the Text or Caption property, if appropriate, after changing the value of Name.

Override SetName to execute additional code when the value of the Name property changes.

See Also

Name

Caption (see page 5806)

Text (see page 5842)

68.1.18.3.7 TCustomLabeledEdit.SetParent Method

Sets the value of the Parent property.

Pascal

```
procedure SetParent(AParent: TWinControl); override;
```

C++

```
virtual __fastcall SetParent(TWinControl * AParent);
```

Description

SetParent is the protected property setter for the Parent property. TCustomLabeledEdit (see page 12508) overrides SetParent to ensure that the label has the same parent as the edit control.

See Also

Parent (see page 5832)

EditLabel (see page 12524)

68.1.18.3.8 TCustomLabeledEdit.SetupInternalLabel Method

Initializes the control that implements the EditLabel (see page 12524) property.

Pascal

```
procedure SetupInternalLabel;
```

C++

```
__fastcall SetupInternalLabel();
```

Description

Applications do not need to call SetupInternalLabel because this method is called when you set the EditLabel (see page 12524) property.

SetupInternalLabel ensures that there is a control to implement the EditLabel (see page 12524) property, adds the labeled edit control to the list of components that should be notified when the label is freed, and sets the label's FocusControl property to the labeled edit control.

See Also

EditLabel (see page 12524)

FocusControl (see page 21306)

68.1.18.4 TCustomLabeledEdit Properties

The properties of the TCustomLabeledEdit class are listed here.

Public Properties

	Name	Description
R	EditLabel (see page 12524)	Specifies the control that implements the label.
	LabelPosition (see page 12524)	Specifies the position of the label relative to the edit control.
	LabelSpacing (see page 12525)	Specifies the distance, in pixels, between the label and the edit region.

68.1.18.4.1 TCustomLabeledEdit.EditLabel Property

Specifies the control that implements the label.

Pascal

```
property EditLabel: TBoundLabel;
```

C++

```
__property TBoundLabel EditLabel;
```

Description

Use EditLabel to work with the label that is associated with this labeled edit control. Use this label's properties to specify the caption that appears on the label, the position of the caption within the label, the font used to write that caption, and so on. At design time, expand the EditLabel property in the Object Inspector to set its properties.

See Also

LabelPosition (see page 12524)

LabelSpacing (see page 12525)

68.1.18.4.2 TCustomLabeledEdit.LabelPosition Property

Specifies the position of the label relative to the edit control.

Pascal

```
property LabelPosition: TLabelPosition;
```

C++

```
__property TLabelPosition LabelPosition;
```

Description

Set LabelPosition to indicate where the label sits relative to the edit control.

See Also

EditLabel (see page 12524)

LabelSpacing (see page 12525)

68.1.18.4.3 TCustomLabeledEdit.LabelSpacing Property

Specifies the distance, in pixels, between the label and the edit region.

Pascal

```
property LabelSpacing: Integer;
```

C++

```
__property int LabelSpacing;
```

Description

Set LabelSpacing to indicate the distance, in pixels, between the label and the edit control.

See Also

EditLabel (see page 12524)

LabelPosition (see page 12524)

68.1.19 TCustomPanel Class

TCustomPanel is the base class for all panel components.

Class Hierarchy

Pascal

```
TCustomPanel = class(TCustomControl);
```

C++

```
class TCustomPanel : public TCustomControl;
```

File

ExtCtrls

Description

Use TCustomPanel as a base class when defining objects that include other controls as constituent parts. Panel components are controls can contain other controls, grouping them together.

When a panel is aligned with the form using the Align property, it maintains the same relative position to the form even when the form is resized. For example, a panel can be aligned so that it always remains on the top of the form, even when the user changes the shape and size of the form. This makes panels useful for implementing components that act like tool bars or status bars. For example, construct a tool bar or tool palette by adding speed buttons that execute commands or set modes to a panel .

68.1.19.1 TCustomPanel Members

The following tables list the members exposed by TCustomPanel.

Protected Events

	Name	Description
	OnAlignInsertBefore (see page 6213)	Occurs when an object with custom alignment is aligned.
	OnAlignPosition (see page 6214)	Occurs when an object with custom alignment is aligned.
	OnCanResize (see page 5851)	Occurs when an attempt is made to resize the control.
	OnClick (see page 5851)	Occurs when the user clicks the control.
	OnConstrainedResize (see page 5853)	Adjust resize constraints.
	OnContextPopup (see page 5854)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnDblClick (see page 5854)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDockDrop (see page 6214)	Occurs when another control is docked to the control.
	OnDockOver (see page 6216)	Occurs when another control is dragged over the control.
	OnDragDrop (see page 5855)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 5857)	Occurs when the user drags an object over a control.
	OnEndDock (see page 5859)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 5860)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnEnter (see page 6219)	Occurs when a control receives the input focus.
	OnExit (see page 6221)	Occurs when the input focus shifts away from one control to another.
	OnGetSiteInfo (see page 6223)	Returns the control's docking information.
	OnKeyDown (see page 6225)	Occurs when a user presses any key while the control has focus.
	OnKeyPress (see page 6227)	Occurs when a key is pressed.
	OnKeyUp (see page 6228)	Occurs when the user releases a key that has been pressed.
	OnMouseActivate (see page 5861)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 5862)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseEnter (see page 5864)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 5864)	Occurs when the user moves the mouse outside of a control.
	OnMouseMove (see page 5865)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 5867)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnMouseWheel (see page 5869)	Occurs when the mouse wheel is rotated.
	OnMouseWheelDown (see page 5869)	Occurs when the mouse wheel is rotated downward.
	OnMouseWheelUp (see page 5870)	Occurs when the mouse wheel is rotated upward.
	OnResize (see page 5870)	Occurs immediately after the control is resized.
	OnStartDock (see page 5871)	Occurs when the user begins to drag a control with a DragKind (see page 5819) of dkDock.
	OnStartDrag (see page 5871)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.
	OnUnDock (see page 6230)	Occurs when the application tries to undock a control that is docked to the windowed control.

Protected Fields

	Name	Description
	FAnchorMove (see page 5733)	This is FAnchorMove, a member of class TControl.
	FAnchorOrigin (see page 5734)	This is FAnchorOrigin, a member of class TControl.

	FAnchorRules (see page 5734)	This is FAnchorRules, a member of class TControl.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FDesignSize (see page 6124)	This is FDesignSize, a member of class TWinControl.
	FDoubleBuffered (see page 6124)	This is FDoubleBuffered, a member of class TWinControl.
	FExplicitHeight (see page 5734)	This is FExplicitHeight, a member of class TControl.
	FExplicitLeft (see page 5734)	This is FExplicitLeft, a member of class TControl.
	FExplicitTop (see page 5734)	This is FExplicitTop, a member of class TControl.
	FExplicitWidth (see page 5735)	This is FExplicitWidth, a member of class TControl.
	FInImeComposition (see page 6125)	This is FInImeComposition, a member of class TWinControl.
	FOriginalParentSize (see page 5735)	This is FOriginalParentSize, a member of class TControl.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	ActionChange (see page 5737)	Responds when the action associated with the control changes.
V	ActionChange (see page 6127)	Updates the control to reflect changes in its associated action.
	AddBiDiModeExStyle (see page 6128)	Sets control's window style according to its bi-directional support.
V	AdjustClientRect (see page 12537)	Adjusts the ClientRect property for the idiosyncrasies of the window.
	AdjustSize (see page 5738)	Sets the size of the control as determined by the AutoSize (see page 5803) property.
V	AdjustSize (see page 6129)	Adjusts the control's size according to its contents and constraints.
V	AlignControls (see page 6129)	Aligns any controls for which the control is the parent within a specified area of the control.
	ArrangeControl (see page 6130)	This is ArrangeControl, a member of class TWinControl.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	AssignTo (see page 5739)	Overrides the inherited AssignTo function to enable assignments to TAction objects.
V	AssignTo (see page 6130)	Copies the properties of the windowed control to another object.
	BeginAutoDrag (see page 5739)	Begin Automatic Drag.
	CalcCursorPos (see page 5741)	This is CalcCursorPos, a member of class TControl.
V	CanAutoSize (see page 12537)	Adjusts the way the panel responds to resize attempts.
V	CanResize (see page 5742)	OnCanResize (see page 5851) event dispatcher.
V	CanResize (see page 6132)	Indicates how the control can respond to a resize attempt.
	Changed (see page 5742)	Sends a CM_CHANGED (see page 6330) message to the control.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	ChangeScale (see page 5743)	Rescaling event dispatcher.
V	ChangeScale (see page 6132)	Resize (see page 5780) and reposition children and self.
	Click (see page 5743)	Respond to user click.
V	ConstrainedResize (see page 5746)	Notify control of resize with constraints.
V	ConstrainedResize (see page 6133)	Generates an OnConstrainedResize (see page 5853) event.
	ControlsAligned (see page 6134)	This is ControlsAligned, a member of class TWinControl.
	CreateDockManager (see page 6134)	Creates the dock manager for the control.
V	CreateHandle (see page 6135)	Creates underlying screen object.
V	CreateParams (see page 12537)	Initializes a window-creation parameter record passed in the Params parameter.
	CreateSubClass (see page 6136)	Creates a windowed control derived from an existing Windows window class.
V	CreateWindowHandle (see page 6137)	Creates a Windows control to represent the control.
V	CreateWnd (see page 6137)	Creates the underlying window.
V	CustomAlignInsertBefore (see page 6137)	Returns placement order of custom-aligned child control.
V	CustomAlignPosition (see page 6138)	Returns aligned position of custom-aligned child control.
	DblClick (see page 5747)	OnDblClick (see page 5854) event dispatcher.
	DefaultDockImage (see page 5747)	Handles the painting and erasing of a dock image.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.

	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	DefineProperties (see page 5748)	Provides methods to read and write the IsControl (see page 5829) property to a stream such as a form file.
	DefineProperties (see page 6139)	Provides methods to read and write the IsControl property to a stream such as a form file.
	DesignWndProc (see page 5749)	This is DesignWndProc, a member of class TControl.
	DestroyHandle (see page 6140)	Destroys the control's window without destroying the control.
	DestroyWindowHandle (see page 6140)	Destroys the window created in the CreateWindowHandle (see page 6137) method.
	DestroyWnd (see page 6141)	Destroys the control's window.
	DoAddDockClient (see page 6142)	Performs actions when a control is docked to the windowed control.
	DockOver (see page 6143)	Responds when a docking client is dragged over the windowed control.
	DockReplaceDockClient (see page 6143)	This is DockReplaceDockClient, a member of class TWinControl.
	DockTrackNoTarget (see page 5749)	Handles dragging of the control over an invalid docking target.
	DoContextPopup (see page 5750)	OnContextPopup (see page 5854) event dispatcher.
	DoDock (see page 5750)	Docking event dispatcher.
	DoDockOver (see page 6143)	Generates an OnDockOver (see page 6216) event.
	DoEndDock (see page 5750)	OnEndDock (see page 5859) event dispatcher.
	DoEndDrag (see page 5751)	OnEndDrag (see page 5860) event dispatcher.
	DoEnter (see page 6144)	Respond to receiving input focus.
	DoExit (see page 6144)	Respond to losing input focus
	DoFlipChildren (see page 6145)	Flips the control's children.
	DoKeyDown (see page 6145)	Performs some preprocessing before generating an OnKeyDown (see page 6225) event.
	DoKeyPress (see page 6146)	Performs some preprocessing before generating an OnKeyPress (see page 6227) event.
	DoKeyUp (see page 6146)	Performs some preprocessing before generating an OnKeyUp (see page 6228) event.
	DoMouseWheel (see page 5751)	Processes mouse wheel motion.
	DoMouseWheelDown (see page 5752)	OnMouseWheelDown (see page 5869) event dispatcher.
	DoMouseWheelUp (see page 5752)	OnMouseWheelUp (see page 5870) event dispatcher.
	DoRemoveDockClient (see page 6147)	Responds when a control is undocked from the windowed control.
	DoStartDock (see page 5753)	OnStartDock (see page 5871) event dispatcher.
	DoStartDrag (see page 5753)	OnStartDrag (see page 5871) event dispatcher.
	DoUnDock (see page 6147)	Undocks a control that is currently docked to the windowed control.
	DragCanceled (see page 5754)	Provides the interface for a method that responds to the cancellation of a drag.
	DragOver (see page 5755)	OnDragOver (see page 5857) event dispatcher.
	DrawDragDockImage (see page 5755)	Draws the dock image for the control.
	EraseDragDockImage (see page 5757)	Erases the dock image for the control.
	FindNextControl (see page 6149)	Returns the control's next child in the tab order after the specified control.
	FixupTabList (see page 6149)	Sorts the child controls by their tab order.
	GetAction (see page 5758)	This is GetAction, a member of class TControl.
	GetActionLinkClass (see page 5758)	Returns the appropriate action link class that is associated with the control class.
	GetActionLinkClass (see page 6152)	Returns the associated action link class.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetChildren (see page 6153)	Calls a specified method for each child of the control.
	GetClientOrigin (see page 5758)	Returns the screen coordinates of the top-left corner of the control's client area.
	GetClientOrigin (see page 6153)	Returns the value of the ClientOrigin (see page 5809) property.
	GetClientRect (see page 5759)	Returns a rectangle defining the client area of the control.
	GetClientRect (see page 6154)	Returns the value of the ClientRect (see page 5810) property.
	GetControlExtents (see page 6154)	Returns the smallest rectangle in which all the control's children fit.
	GetDeviceContext (see page 5760)	Returns a device context for the control.
	GetDeviceContext (see page 6155)	Provides access to a device context for the control.

	GetDockEdge (see page 5763)	Returns the edge on which another control should be docked when it is dragged over the control.
V	GetDragImages (see page 5763)	Returns the control's image list containing the image to be displayed while dragging.
V	GetEnabled (see page 5763)	Returns the value of the Enabled (see page 5821) property.
V	GetFloating (see page 5764)	Returns the value of the Floating (see page 5823) property.
V	GetFloatingDockSiteClass (see page 5764)	Returns the class used for the control when it is floating.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetPalette (see page 5765)	Returns the handle to a palette for use by the control.
	GetParentHandle (see page 6157)	Returns the window handle for the window of the control's parent.
	GetPopupMenu (see page 5765)	Returns the pop-up menu associated with the control.
	GetSiteInfo (see page 6158)	Generates an OnGetSiteInfo (see page 6223) event
	GetTopParentHandle (see page 6159)	Returns the window handle of the first window not associated with a VCL control that contains the windowed control.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	InvalidateDockHostSite (see page 6162)	This is InvalidateDockHostSite, a member of class TWinControl.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsControlActivateMsg (see page 6162)	This is IsControlActivateMsg, a member of class TWinControl.
	IsControlMouseMsg (see page 6162)	Indicates whether a specified mouse message is directed to one of the windowed control's child controls.
	IsQualifyingSite (see page 6163)	This is IsQualifyingSite, a member of class TWinControl.
	KeyDown (see page 6163)	Respond to key press events.
	KeyPress (see page 6163)	Respond to keyboard input.
	KeyUp (see page 6164)	Respond to released key.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Loaded (see page 5771)	Initializes the control after it is loaded from a stream.
	MainWndProc (see page 6165)	Receives Windows messages for the control.
	MouseActivate (see page 5773)	This is MouseActivate, a member of class TControl.
	MouseDown (see page 5773)	OnMouseDown (see page 5862) event dispatcher.
	MouseMove (see page 5773)	Respond to mouse moving over control area..
	MouseUp (see page 5774)	OnMouseUp (see page 5867) event dispatcher.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	Notification (see page 5775)	Responds to notifications that components are being created or destroyed.
V	Notification (see page 6165)	Responds to notifications that components are being created or destroyed.
	NotifyControls (see page 6165)	Sends a message to all the child controls.
V	Paint (see page 12538)	Renders the image of the panel.
	PaintControls (see page 6166)	Paints each of the child controls in a windowed control using the specified device context.
	PaintHandler (see page 6166)	Responds to WM_PAINT messages.
V	PaintWindow (see page 5920)	Renders the image of the control on a specified device context.
V	PaintWindow (see page 6169)	Renders the image of a windowed control.
	PaletteChanged (see page 5775)	Responds to changes in the system's palette by realizing the control's palette.
V	PaletteChanged (see page 6170)	Responds to changes in the system's palette by realizing the control's palette and the palette for each child control.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	PositionDockRect (see page 5777)	Positions the docking rectangle according to the current drag-and-dock state.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 5778)	Prepares the control for having its properties assigned values read from a stream.
V	ReadState (see page 6171)	Prepares the control for having its properties assigned values from a stream.
	RecreateWnd (see page 6171)	Recreate underlying Windows screen object.

	ReloadDockedControl (see page 6172)	Reloads a docked control.
	RemoveWindowProps (see page 6174)	This is RemoveWindowProps, a member of class TWinControl.
V	RequestAlign (see page 5780)	Instructs the parent of a control to reposition the control, enforcing its Align (see page 5798) property.
	ResetIme (see page 6174)	Restores the input method editor (IME) that was active when the application started.
	ResetImeComposition (see page 6175)	Directs the composition window of the input method editor (IME) to perform a specific action.
	Resize (see page 5780)	Respond to control resize.
	ScaleConstraints (see page 5781)	This is ScaleConstraints, a member of class TControl.
	ScaleControls (see page 6176)	Rescale child controls only.
	SelectFirst (see page 6177)	Locates first selectable child control.
	SelectNext (see page 6177)	Moves the input focus from the current child control to the next one in the tab order.
	SendCancelMode (see page 5781)	Cancels the modal state of the control.
	SendDockNotification (see page 5782)	Sends a Windows message to the control's host dock site.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
V	SetAutoSize (see page 5783)	This is SetAutoSize, a member of class TControl.
V	SetBiDiMode (see page 5783)	Sets the control's bi-directional mode.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
V	SetChildOrder (see page 6178)	Changes the order in which the child component appears in the list of child components returned by the GetChildren (see page 6153) method.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
V	SetDragMode (see page 5785)	Sets the drag mode for the control.
V	SetEnabled (see page 5785)	Sets the value of the Enabled (see page 5821) property.
	SetIme (see page 6181)	Activates an input method editor (IME) using the values specified by the ImeMode (see page 6207) and ImeName (see page 6208) properties.
	SetImeCompositionWindow (see page 6181)	Sets the position and font of the composition window.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
V	SetName (see page 5785)	Sets the name of the control.
V	SetParent (see page 5786)	Sets the parent of the control.
V	SetParent (see page 6182)	Sets the parent of the control.
V	SetParentBackground (see page 12539)	This is SetParentBackground, a member of class TCustomPanel.
V	SetParentBiDiMode (see page 5786)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 5787)	Sets the parent for the control.
	SetZOrder (see page 5788)	Repositions the control in its parent's control list, thereby changing position onscreen.
V	SetZOrder (see page 6182)	Moves the control to the top or bottom of the parent control's (or screen's) list of TWinControl (see page 6112) controls.
V	ShowControl (see page 6183)	Ensures that a specified child control is visible.
	UpdateBounds (see page 6185)	This is UpdateBounds, a member of class TWinControl.
	UpdateBoundsRect (see page 5789)	Changes the Top (see page 5844), Left (see page 5830), Width (see page 5849), and Height (see page 5825) properties of the control, but doesn't update its screen image and bypasses all resize events.
V	UpdateControlOriginalParentSize (see page 6186)	This is UpdateControlOriginalParentSize, a member of class TWinControl.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateExplicitBounds (see page 5789)	This is UpdateExplicitBounds, a member of class TControl.
	UpdateRecreatingFlag (see page 6186)	This is UpdateRecreatingFlag, a member of class TWinControl.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	UpdateUIState (see page 6186)	Updates form User Interface State as needed
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.

	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	VisibleChanging (see page 5791)	Provides the interface for a method that responds to changes in the control's visibility.
V	WndProc (see page 5791)	Provides specific message responses for the control.
V	WndProc (see page 6187)	Provides specific message responses for the control.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	ActionLink (see page 5798)	Contains the action link object associated with the control.
	Alignment (see page 12539)	Determines how the caption is aligned within the panel.
	AutoSize (see page 5803)	Specifies whether the control sizes itself automatically to accommodate its contents.
	BevelEdges (see page 6192)	Specifies which edges of the control are beveled.
	BevelInner (see page 12540)	Determines the style of the inner bevel of a panel.
	BevelKind (see page 6193)	Specifies the control's bevel style.
	BevelOuter (see page 12541)	Determines the style of the outer bevel of a panel.
	BevelWidth (see page 12542)	Determines the width, in pixels, of both the inner and outer bevels of a panel.
	BorderStyle (see page 12543)	Determines the style of the line drawn around the perimeter of the panel control.
	BorderWidth (see page 12543)	Specifies the distance, in pixels, between the outer and inner bevels.
R	Canvas (see page 5921)	Specifies the TCanvas object that presents a drawing surface for the control.
	Caption (see page 5806)	Specifies a text string that identifies the control to the user.
	Color (see page 12544)	Specifies the background color of the control.
	Ctl3D (see page 6198)	Determines whether a control has a three-dimensional (3-D) or two-dimensional look.
	DefWndProc (see page 6199)	Specifies the default window procedure for the windowed control.
	DesktopFont (see page 5818)	Specifies whether the control uses the Windows icon font when writing text.
	DragCursor (see page 5818)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 5819)	Specifies whether the control is being dragged normally or for docking.
	DragMode (see page 5819)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	Font (see page 5823)	Controls (see page 5711) the attributes of text written on or in the control.
	FullRepaint (see page 12545)	Determines how the panel repaints itself when it is resized.
	ImeMode (see page 6207)	Determines the behavior of the input method editor (IME).
	ImeName (see page 6208)	Specifies the input method editor (IME) to use for converting keyboard input to Asian language characters.
	IsControl (see page 5829)	Determines whether a form stores its form-specific properties to a stream.
	Locked (see page 12545)	Determines whether a panel that is used as a toolbar is replaced by a toolbar supplied by an OLE server.
	MouseCapture (see page 5831)	Indicates whether the control has "captured" mouse events.
	ParentBiDiMode (see page 5833)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	ParentColor (see page 12546)	Determines where a control looks for its color information.
	ParentCtl3D (see page 6209)	Determines where a component looks to determine if it should appear three dimensional.
	ParentFont (see page 5834)	Determines where a control looks for its font information.
	ParentShowHint (see page 5835)	Determines where a control looks to find out if its Help Hint (see page 5827) should be shown.
	PopupMenu (see page 5835)	Identifies the pop-up menu associated with the control.
	ScalingFlags (see page 5840)	Reflects which attributes of the control have been scaled.
	Text (see page 5842)	Contains a text string associated with the control.
	VerticalAlignment (see page 12547)	Sets the vertical position of the caption.
	WheelAccumulator (see page 5849)	Accumulates mouse wheel rotations.
	WindowHandle (see page 6212)	Provides access to a window handle for the control.
	WindowText (see page 5850)	Contains the text string of the control.

Public Events

	Name	Description
	WindowProc (see page 5872)	Points to the window procedure that responds to messages sent to the control.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	BeginDrag (see page 5740)	Starts the dragging of a control.
	BringToFront (see page 5740)	Puts the control in front of all other controls in its parent control.
	Broadcast (see page 6130)	Sends a message to each of the child controls.
	CanFocus (see page 6131)	Indicates whether a control can receive focus.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	ClientToParent (see page 5744)	Translates client coordinates to parent coordinates.
	ClientToScreen (see page 5744)	Translates a given point from client area coordinates to global screen coordinates.
	ContainsControl (see page 6133)	Indicates whether a specified control exists within the control.
	ControlAtPos (see page 6133)	Returns the child control located at a specified position within the control.
V	Create (see page 12536)	Creates and initializes an instance of TCustomPanel (see page 12525).
	CreateParented (see page 6123)	Creates and initializes a control as the child of a specified non-VCL container.
	CreateParentedControl (see page 6136)	Creates and initializes a control as the child of a specified non-VCL window.
V	DefaultHandler (see page 5748)	Provides message handling for all messages that do not have specific handlers.
V	DefaultHandler (see page 6139)	Provides message handling for all messages that the control does not fully process itself.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 5732)	Destroys an instance of TControl (see page 5724).
V	Destroy (see page 5919)	Destroys an instance of TCustomControl (see page 5908).
V	Destroy (see page 6124)	Destroys an instance of TWinControl (see page 6112).
V	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	DisableAlign (see page 6141)	Disables the realignment of child controls.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Dock (see page 5749)	Used internally to dock the control.
	DockDrop (see page 6142)	Generates an OnDockDrop (see page 6214) event.
	DragDrop (see page 5754)	OnDragDrop (see page 5855) event dispatcher.
	Dragging (see page 5754)	Indicates whether a control is being dragged.
	DrawTextBiDiModeFlags (see page 5756)	Returns the text flags that reflect the current setting of the BiDiMode (see page 5803) property.
	DrawTextBiDiModeFlagsReadingOnly (see page 5756)	Returns the text flag to add that indicates whether the control's text should read from right to left.

	EnableAlign (see page 6148)	Decrements the reference count incremented by the DisableAlign (see page 6141) method, eventually realigning the child controls.
	EndDrag (see page 5757)	Stops a control from being dragged any further.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindChildControl (see page 6148)	Returns a child control given its name.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FlipChildren (see page 6150)	Reverses the positions of child controls.
	Focused (see page 6150)	Determines whether the control has input focus.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
V	GetControlsAlignment (see page 12538)	Returns the alignment of text in the panel.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 5765)	Returns the parent of the control.
	GetTabOrderList (see page 6158)	Builds a list of controls in tab order.
	GetTextBuf (see page 5766)	Retrieves the control's text, copies it into a buffer, and returns the number of characters copied.
	GetTextLen (see page 5767)	Returns the length of the control's text.
	HandleAllocated (see page 6159)	Reports whether a screen object handle exists for the control.
	HandleNeeded (see page 6160)	Creates a screen object for the control if it doesn't already exist.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 5768)	Indicates whether the control has a parent.
	Hide (see page 5769)	Makes the control invisible.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
V	InitiateAction (see page 5769)	Calls the action link's Update (see page 5789) method if the control is associated with an action link.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InsertControl (see page 6160)	Inserts a control into the Controls (see page 6197) array property.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
V	Invalidate (see page 5770)	Completely repaint control.
V	Invalidate (see page 6161)	Schedules a control repaint.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	IsRightToLeft (see page 5770)	Indicates whether the control should be reversed right to left.
	ManualDock (see page 5771)	Docks the control.
	ManualFloat (see page 5772)	Undocks the control.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	MouseWheelHandler (see page 5774)	Dispatches messages received from a mouse wheel.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	PaintTo (see page 6167)	This is the overview for the PaintTo method overload.
	ParentToClient (see page 5776)	Translate parent coordinates to client coordinates.
	Perform (see page 5776)	Responds as if the control received a specified Windows message.

	PreProcessMessage (see page 6170)	This is PreProcessMessage, a member of class TWinControl.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	Realign (see page 6171)	Forces the control to realign children.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	Refresh (see page 5779)	Repaints the control on the screen.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveControl (see page 6172)	Removes a specified control from the Controls (see page 6197) array.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	Repaint (see page 5779)	Forces the control to repaint its image on the screen.
V	Repaint (see page 6174)	Repaints the entire control.
	ReplaceDockedControl (see page 5779)	Docks the control in the place where another control is already docked.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	ScaleBy (see page 6175)	Rescale control and its children.
	ScreenToClient (see page 5781)	Converts the screen coordinates of a specified point on the screen to client coordinates.
	ScrollBy (see page 6176)	Scroll control contents.
	SendToBack (see page 5782)	Puts a windowed control behind all other windowed controls, or puts a non-windowed control behind all other non-windowed controls.
V	SetBounds (see page 5783)	Sets the Left (see page 5830), Top (see page 5844), Width (see page 5849), and Height (see page 5825) properties all at once.
V	SetBounds (see page 6178)	Sets the windowed control's boundary properties all at once.
	SetDesignVisible (see page 5784)	Makes a control visible at design time.
V	SetDesignVisible (see page 6178)	Makes a control visible at design time.
V	SetFocus (see page 6179)	Gives the input focus to the control.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	SetTextBuf (see page 5787)	Sets the text of the control.
	Show (see page 5788)	Makes a control visible.
V	Update (see page 5789)	Processes any pending paint messages immediately.
V	Update (see page 6183)	Forces the control to update.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	UpdateControlState (see page 6186)	Respond to state change.
	UseRightToLeftAlignment (see page 5790)	Specifies whether the control's alignment should be reversed right-to-left.
	UseRightToLeftReading (see page 5790)	Specifies whether the control is using a right-to-left reading order.
	UseRightToLeftScrollBar (see page 5791)	Specifies whether the vertical scroll bar appears on the left side of the control.

Public Properties

	Name	Description
	Action (see page 5797)	Designates the action associated with the control.
	Align (see page 5798)	Determines how the control aligns within its container (parent control).
R	AlignDisabled (see page 6192)	Indicates child control realignment disabled.
	Anchors (see page 5802)	Specifies how the control is anchored to its parent.
	BiDiMode (see page 5803)	Specifies the bi-directional mode for the control.
	BoundsRect (see page 5803)	Specifies the bounding rectangle of the control, expressed in the coordinate system of the parent control.
R	Brush (see page 6195)	Determines the color and pattern used for painting the background of the control.
	ClientHeight (see page 5808)	Specifies the height of the control's client area in pixels.
R	ClientOrigin (see page 5809)	Specifies the screen coordinates (in pixels) of the top left corner of a control's client area.
R	ClientRect (see page 5810)	Specifies the size (in pixels) of a control's client area.
	ClientWidth (see page 5811)	Specifies the horizontal size of the control's client area in pixels.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.

	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Constraints (see page 5812)	Specifies the size constraints for the control.
R	ControlCount (see page 6195)	Returns the number of child controls.
R	Controls (see page 6197)	Lists all child controls.
	ControlState (see page 5813)	Indicates the current state of a control at runtime.
	ControlStyle (see page 5814)	Determines style characteristics of the control.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	DockClientCount (see page 6199)	Specifies the number of controls that are docked on the windowed control.
R	DockClients (see page 6201)	Lists the controls that are docked to the windowed control.
	DockManager (see page 6202)	Specifies the control's docking manager interface.
	DockOrientation (see page 5818)	Specifies how the control is docked relative to other controls docked in the same parent.
	DockSite (see page 6204)	Specifies whether the control can be the target of drag-and-dock operations.
	DoubleBuffered (see page 6205)	Determines whether the control's image is rendered directly to the window or painted to an in-memory bitmap first.
	Enabled (see page 5821)	Controls (see page 5711) whether the control responds to mouse, keyboard, and timer events.
R	ExplicitHeight (see page 5821)	Specifies the explicit vertical size of the control in pixels.
R	ExplicitLeft (see page 5822)	Specifies the explicit horizontal pixel coordinate of the left edge of a component relative to its parent.
R	ExplicitTop (see page 5822)	Specifies the explicit vertical pixel coordinate of the top edge of a component relative to its parent.
R	ExplicitWidth (see page 5822)	Specifies the explicit horizontal size of the control in pixels.
R	Floating (see page 5823)	Indicates whether the control is floating.
	FloatingDockSiteClass (see page 5823)	Specifies the class of the temporary control that hosts the control when it is floating.
R	Handle (see page 6207)	Provides access to the underlying Windows screen object for the control.
	HostDockSite (see page 5829)	Specifies the control in which the control is docked.
	LRDockWidth (see page 5831)	Specifies the width of the control when it is docked horizontally.
R	MouseInClient (see page 6209)	This is MouseInClient, a member of class TWinControl.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Padding (see page 6209)	Specifies the padding of a control.
	Parent (see page 5832)	Indicates the parent of the control.
	ParentBackground (see page 12546)	Determines whether control uses parent's theme background.
	ParentWindow (see page 6210)	Reference to parent's underlying control.
	ShowHint (see page 5840)	Determines whether the control displays a Help Hint (see page 5827) when the mouse pointer rests momentarily on the control.
R	Showing (see page 6210)	Indicates whether the control is showing on the screen.
	TabOrder (see page 6211)	Indicates the position of the control in its parent's tab order.
	TabStop (see page 6211)	Determines if the user can tab to a control.
	TBDockHeight (see page 5842)	Specifies the height of the control when it is docked vertically.
	UndockHeight (see page 5845)	Specifies the height of the control when it is floating.
	UndockWidth (see page 5846)	Specifies the width of the control when it is floating.
	UseDockManager (see page 6212)	Specifies whether the docking manager is used in drag-and-dock operations.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	Visible (see page 5847)	Determines whether the component appears onscreen.
R	VisibleDockClientCount (see page 6212)	Specifies the number of visible controls that are docked on the windowed control.

Published Properties

	Name	Description
	AlignWithMargins (see page 5802)	Indicates whether a control should be constrained by margins.

	Cursor (see page 5815)	Specifies the image used to represent the mouse pointer when it passes into the region covered by the control.
	Height (see page 5825)	Specifies the vertical size of the control in pixels.
	HelpContext (see page 5826)	Numeric ID for control's context-sensitive help topic
	HelpKeyword (see page 5826)	Keyword for control's context-sensitive help topic
	HelpType (see page 5827)	Indicates whether the control's context sensitive help topic is identified by context ID or by keyword.
	Hint (see page 5827)	Contains the text string that can appear when the user moves the mouse over the control.
	Left (see page 5830)	Specifies the horizontal coordinate of the left edge of a component relative to its parent.
	Margins (see page 5831)	Specifies the margins for the control.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Top (see page 5844)	Specifies the Y coordinate of the top left corner of a control, relative to its parent or containing control in pixels.
	Width (see page 5849)	Specifies the horizontal size of the control or form in pixels.

68.1.19.2 TCustomPanel.Create Constructor

Creates and initializes an instance of TCustomPanel (see page 12525).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomPanel(TComponent * AOwner);
```

Description

Call Create to instantiate a panel at runtime. Panels placed in forms at design time do not need to be explicitly created because they are created automatically.

AOwner is the component, typically a form, that is responsible for freeing the panel.

See Also

Owner (see page 2807)

68.1.19.3 TCustomPanel Methods

The methods of the TCustomPanel class are listed here.

Protected Methods

	Name	Description
	AdjustClientRect (see page 12537)	Adjusts the ClientRect property for the idiosyncrasies of the window.
	CanAutoSize (see page 12537)	Adjusts the way the panel responds to resize attempts.
	CreateParams (see page 12537)	Initializes a window-creation parameter record passed in the Params parameter.
	Paint (see page 12538)	Renders the image of the panel.
	SetParentBackground (see page 12539)	This is SetParentBackground, a member of class TCustomPanel.

Public Methods

	Name	Description
	GetControlsAlignment (see page 12538)	Returns the alignment of text in the panel.

68.1.19.3.1 TCustomPanel.AdjustClientRect Method

Adjusts the ClientRect property for the idiosyncrasies of the window.

Pascal

```
procedure AdjustClientRect(var Rect: TRect); override;
```

C++

```
virtual __fastcall AdjustClientRect(TRect Rect);
```

Description

AdjustClientRect is called internally when the panel needs accurate information on where to place child controls within the client area. AdjustClientRect reduces ClientRect by the width of the inner and outer bevels so that child objects are not placed on the beveled region.

See Also

ClientRect

Controls (see page 6197)

68.1.19.3.2 TCustomPanel.CanAutoSize Method

Adjusts the way the panel responds to resize attempts.

Pascal

```
function CanAutoSize(var NewWidth: Integer; var NewHeight: Integer): Boolean; override;
```

C++

```
virtual __fastcall Boolean CanAutoSize(int NewWidth, int NewHeight);
```

Description

CanAutoSize is called automatically when the AutoSize property is true and an attempt is made to resize the panel. It allows the panel to implement the AutoSize property before the resize sequence that begins with the OnCanResize and OnConstrainedResize events and ends with the OnResize event.

When CanAutoSize is called, the NewWidth and NewHeight parameters indicate the proposed new dimensions of the panel. CanAutoSize adjusts these values so that the panel's size adjusts to its contents. If the adjustment results in values of NewWidth and NewHeight that differ from the panel's current width and height, CanAutoSize returns true, indicating that the resize sequence should proceed. If, after adjustment, NewWidth and NewHeight equal Width and Height, CanAutoSize returns false, and the resize sequence is aborted.

See Also

AutoSize (see page 5803)

AdjustSize (see page 6129)

ConstrainedResize (see page 6133)

OnCanResize (see page 5851)

68.1.19.3.3 TCustomPanel.CreateParams Method

Initializes a window-creation parameter record passed in the Params parameter.

Pascal

```
procedure CreateParams(var Params: TCreateParams); override;
```

C++

```
virtual __fastcall CreateParams(TCreateParams Params);
```

Description

CreateParams is called automatically to initialize the window-creation parameters whenever the window for the panel needs to be created. CreateParams overrides the inherited method to implement the BorderStyle (see page 12543) property.

See Also

BorderStyle (see page 12543)

CreateParams (see page 6135)

68.1.19.3.4 TCustomPanel.GetControlsAlignment Method

Returns the alignment of text in the panel.

Pascal

```
function GetControlsAlignment: TAlignment; override;
```

C++

```
virtual __fastcall TAlignment GetControlsAlignment();
```

Description

GetControlsAlignment returns the value of the Alignment (see page 12539) property.

See Also

Alignment (see page 12539)

UseRightToLeftAlignment (see page 5790)

68.1.19.3.5 TCustomPanel.Paint Method

Renders the image of the panel.

Pascal

```
procedure Paint; override;
```

C++

```
virtual __fastcall Paint();
```

Description

Override the Paint method to change the way the panel is drawn. The Paint method for TCustomPanel (see page 12525) draws the bevels of the panel, sets the brush and font for the panel, and fills in the interior of the panel. Finally, Paint writes the value of Caption on the panel.

See Also

BevelInner (see page 12540)

BevelOuter (see page 12541)

Brush (see page 6195)

Caption (see page 5806)

Canvas (see page 5921)

68.1.19.3.6 TCustomPanel.SetParentBackground Method

Pascal

```
procedure SetParentBackground(Value: Boolean); override;
```

C++

```
virtual __fastcall SetParentBackground(Boolean Value);
```

Description

This is SetParentBackground, a member of class TCustomPanel.

68.1.19.4 TCustomPanel Properties

The properties of the TCustomPanel class are listed here.

Protected Properties

	Name	Description
	Alignment (see page 12539)	Determines how the caption is aligned within the panel.
	BevelInner (see page 12540)	Determines the style of the inner bevel of a panel.
	BevelOuter (see page 12541)	Determines the style of the outer bevel of a panel.
	BevelWidth (see page 12542)	Determines the width, in pixels, of both the inner and outer bevels of a panel.
	BorderStyle (see page 12543)	Determines the style of the line drawn around the perimeter of the panel control.
	BorderWidth (see page 12543)	Specifies the distance, in pixels, between the outer and inner bevels.
	Color (see page 12544)	Specifies the background color of the control.
	FullRepaint (see page 12545)	Determines how the panel repaints itself when it is resized.
	Locked (see page 12545)	Determines whether a panel that is used as a toolbar is replaced by a toolbar supplied by an OLE server.
	ParentColor (see page 12546)	Determines where a control looks for its color information.
	VerticalAlignment (see page 12547)	Sets the vertical position of the caption.

Public Properties

	Name	Description
	ParentBackground (see page 12546)	Determines whether control uses parent's theme background.

68.1.19.4.1 TCustomPanel.Alignment Property

Determines how the caption is aligned within the panel.

Pascal

```
property Alignment: TAlignment;
```

C++

```
__property TAlignment Alignment;
```

Description

Use the Alignment property to specify if the caption of a panel appears on the left, right, or center of the panel. For example, to use a panel as a status bar that displays the TApplication. ::Hint property as the panel's Caption property, set Alignment to taLeftJustify to place the hint text on the left side of the panel.

Note: Use the VerticalAlignment (see page 12547) property to control the vertical position of the caption.

See Also

Hint (see page 13712)

Caption (see page 5806)

68.1.19.4.2 TCustomPanel.BevelInner Property

Determines the style of the inner bevel of a panel.

Pascal

```
property BevelInner: TPanelBevel;
```

C++

```
__property TPanelBevel BevelInner;
```

Description

Use BevelInner to provide the panel with a three-dimensional beveled look. A panel component has two bevels, an outer bevel drawn next to the border of the control, and an inner bevel drawn inside the outer bevel, separated by the number of pixels specified in the BorderWidth (see page 12543) property. The width of the bevels, if they are drawn, is the BevelWidth (see page 12542) property.

C++ Examples:

```
/*
This example uses a panel component and a button named
CreateStatusLine on a form. The code moves the panel to the
bottom of the form when the user clicks the button and gives
the panel the appearance of a status line by changing the
value of the BevelInner, BevelOuter, BevelWidth, and
BorderWidth properties.
*/
void __fastcall TForm1::CreateStatusLineClick(TObject *Sender)
{
  Panel1->Align = alBottom;
  Panel1->BevelInner = bvLowered;
  Panel1->BevelOuter = bvRaised;
  Panel1->BorderWidth = 1;
  Panel1->BevelWidth = 1;
}
```

Delphi Examples:

```
{
This example uses a panel component and a button named
CreateStatusLine on a form. The code moves the panel to the
bottom of the form when the user clicks the button and gives
the panel the appearance of a status line by changing the
value of the BevelInner, BevelOuter, BevelWidth, and
BorderWidth properties.
}
procedure TForm1.CreateStatusLineClick(Sender: TObject);
begin
  with Panel1 do
  begin
    Align := alBottom;
    BevelInner := bvLowered;
    BevelOuter := bvRaised;
    BorderWidth := 1;
    BevelWidth := 1;
  end;
end;
```

See Also

BevelOuter (see page 12541)

BevelWidth (see page 12542)

BorderWidth (see page 12543)

68.1.19.4.3 TCustomPanel.BevelOuter Property

Determines the style of the outer bevel of a panel.

Pascal

```
property BevelOuter: TPanelBevel;
```

C++

```
__property TPanelBevel BevelOuter;
```

Description

Use BevelOuter to provide the panel with a three-dimensional beveled look. A panel component has two bevels, an outer bevel drawn next to the border of the control, and an inner bevel drawn inside the outer bevel, separated by the number of pixels specified in the BorderWidth (see page 12543) property. The width of the outer bevel is specified in the BevelWidth (see page 12542) property in pixels.

C++ Examples:

```
/*
This example uses a panel component and a button named
CreateStatusLine on a form. The code moves the panel to the
bottom of the form when the user clicks the button and gives
the panel the appearance of a status line by changing the
value of the BevelInner, BevelOuter, BevelWidth, and
BorderWidth properties.
*/
void __fastcall TForm1::CreateStatusLineClick(TObject *Sender)
{
  Panel1->Align = alBottom;
  Panel1->BevelInner = bvLowered;
  Panel1->BevelOuter = bvRaised;
  Panel1->BorderWidth = 1;
  Panel1->BevelWidth = 1;
}
```

Delphi Examples:

```
{
This example uses a panel component and a button named
CreateStatusLine on a form. The code moves the panel to the
bottom of the form when the user clicks the button and gives
the panel the appearance of a status line by changing the
value of the BevelInner, BevelOuter, BevelWidth, and
BorderWidth properties.
}
procedure TForm1.CreateStatusLineClick(Sender: TObject);
begin
  with Panel1 do
  begin
    Align := alBottom;
    BevelInner := bvLowered;
    BevelOuter := bvRaised;
    BorderWidth := 1;
    BevelWidth := 1;
  end;
```

```
end;
```

See Also

BevelInner (see page 12540)

BevelWidth (see page 12542)

BorderWidth (see page 12543)

68.1.19.4.4 TCustomPanel.BevelWidth Property

Determines the width, in pixels, of both the inner and outer bevels of a panel.

Pascal

```
property BevelWidth: TBevelWidth;
```

C++

```
__property TBevelWidth BevelWidth;
```

Description

Use BevelWidth to specify how wide the inner or outer bevel should be. Do not confuse BevelWidth, which is the width of the bevels, with BorderWidth (see page 12543), which is the space between the bevels.

If both the BevelInner (see page 12540) and BevelOuter (see page 12541) properties are bvNone, BevelWidth has no effect. To remove both bevels, set the BevelInner (see page 12540) and BevelOuter (see page 12541) properties to bvNone, rather than setting the BevelWidth to 0, as this involves less overhead when painting.

C++ Examples:

```
/*
This example uses a panel component and a button named
CreateStatusLine on a form. The code moves the panel to the
bottom of the form when the user clicks the button and gives
the panel the appearance of a status line by changing the
value of the BevelInner, BevelOuter, BevelWidth, and
BorderWidth properties.
*/
void __fastcall TForm1::CreateStatusLineClick(TObject *Sender)
{
  Panel1->Align = alBottom;
  Panel1->BevelInner = bvLowered;
  Panel1->BevelOuter = bvRaised;
  Panel1->BorderWidth = 1;
  Panel1->BevelWidth = 1;
}
```

Delphi Examples:

```
{
This example uses a panel component and a button named
CreateStatusLine on a form. The code moves the panel to the
bottom of the form when the user clicks the button and gives
the panel the appearance of a status line by changing the
value of the BevelInner, BevelOuter, BevelWidth, and
BorderWidth properties.
}
procedure TForm1.CreateStatusLineClick(Sender: TObject);
begin
  with Panel1 do
  begin
    Align := alBottom;
    BevelInner := bvLowered;
    BevelOuter := bvRaised;
```

```
    BorderWidth := 1;
    BevelWidth := 1;
  end;
end;
```

See Also

BevelInner (see page 12540)

BevelOuter (see page 12541)

BorderWidth (see page 12543)

68.1.19.4.5 TCustomPanel.BorderStyle Property

Determines the style of the line drawn around the perimeter of the panel control.

Pascal

```
property BorderStyle: TBorderStyle;
```

C++

```
__property TBorderStyle BorderStyle;
```

Description

Use BorderStyle to specify whether the panel has a single line drawn around it. These are the possible values:

Value	Meaning
bsNone	No visible border
bsSingle	Single-line border

Do not confuse the line drawn around the panel with the BorderWidth (see page 12543) of the panel. The BorderWidth (see page 12543) of the panel is the distance between the outer and inner bevels.

See Also

BorderWidth (see page 12543)

68.1.19.4.6 TCustomPanel.BorderWidth Property

Specifies the distance, in pixels, between the outer and inner bevels.

Pascal

```
property BorderWidth: TBorderWidth;
```

C++

```
__property TBorderWidth BorderWidth;
```

Description

Use BorderWidth to specify how wide the border around the panel should be. A value of 0 (zero) means no border should appear.

The border of a panel is the area between the outer and inner bevels. It is visible only if the inner bevel is raised or lowered, but affects the inset of the caption within the panel even if BevelInner (see page 12540) is bvNone. If the Alignment (see page 12539) property is not taCenter, the Caption will be aligned to the inner edge of the border. This edge is BorderWidth pixels in from the outer bevel if BevelInner (see page 12540) is bvNone. It is the inner edge of the inner bevel otherwise.

Do not confuse the border of the panel with line drawn around the panel itself. The line around the panel is specified by the BorderStyle (see page 12543) property.

C++ Examples:

```
/*
This example uses a panel component and a button named
CreateStatusLine on a form. The code moves the panel to the
bottom of the form when the user clicks the button and gives
the panel the appearance of a status line by changing the
value of the BevelInner, BevelOuter, BevelWidth, and
BorderWidth properties.
*/
void __fastcall TForm1::CreateStatusLineClick(TObject *Sender)
{
  Panel1->Align = alBottom;
  Panel1->BevelInner = bvLowered;
  Panel1->BevelOuter = bvRaised;
  Panel1->BorderWidth = 1;
  Panel1->BevelWidth = 1;
}
```

Delphi Examples:

```
{
This example uses a panel component and a button named
CreateStatusLine on a form. The code moves the panel to the
bottom of the form when the user clicks the button and gives
the panel the appearance of a status line by changing the
value of the BevelInner, BevelOuter, BevelWidth, and
BorderWidth properties.
}
procedure TForm1.CreateStatusLineClick(Sender: TObject);
begin
  with Panel1 do
  begin
    Align := alBottom;
    BevelInner := bvLowered;
    BevelOuter := bvRaised;
    BorderWidth := 1;
    BevelWidth := 1;
  end;
end;
```

See Also

Alignment (see page 12539)

BevelInner (see page 12540)

BevelOuter (see page 12541)

BorderStyle (see page 12543)

Caption (see page 5806)

68.1.19.4.7 TCustomPanel.Color Property

Specifies the background color of the control.

Pascal

```
property Color: TColor;
```

C++

```
__property TColor Color;
```

Description

Use Color to read or change the background color of the control.

If a control's ParentColor property is true, then changing the Color property of the control's parent automatically changes the Color property of the control. When the value of the Color property is changed, the control's ParentColor property is automatically set to false.

C++ Examples:

```
/*
The following code changes the color of a shape control
using the Color dialog box. The example displays the Color
dialog box when the Button1 button is clicked, allowing the
user to select a color with the dialog box. When a color
value is selected with the dialog box, it is assigned to
the shape control.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  if (ColorDialog1->Execute())
    Shape1->Brush->Color = ColorDialog1->Color;
}
```

Delphi Examples:

```
{
The following code changes the color of a shape control
using the Color dialog box. The example displays the Color
dialog box when the Button1 button is clicked, allowing the
user to select a color with the dialog box. When a color
value is selected with the dialog box, it is assigned to
the shape control.
}
procedure TForm1.Button1Click(Sender: TObject);
begin
  if ColorDialog1.Execute then
    Shape1.Brush.Color := ColorDialog1.Color;
end;
```

See Also

ParentColor (see page 5834)

68.1.19.4.8 TCustomPanel.FullRepaint Property

Determines how the panel repaints itself when it is resized.

Pascal

```
property FullRepaint: Boolean;
```

C++

```
__property Boolean FullRepaint;
```

Description

FullRepaint controls how the panel responds when it is resized. When FullRepaint is true, the entire panel, including the beveled border repaints when the size changes. When FullRepaint is false, only the area inside the beveled border repaints.

See Also

Invalidate (see page 6161)

68.1.19.4.9 TCustomPanel.Locked Property

Determines whether a panel that is used as a toolbar is replaced by a toolbar supplied by an OLE server.

Pascal

```
property Locked: Boolean;
```

C++

```
__property Boolean Locked;
```

Description

Set the Locked property to false when the panel is used as a toolbar by a TOleContainer component. Any panels aligned to a TOleContainer are assumed to be replaceable toolbars unless the Locked property is true. Prevent the panel from being replaced by an OLE server's toolbar by setting the panel's Locked property to true.

Note: An OLE application's toolbars must be in panels aligned to a side of the form (that is, their Align properties must be set to alTop, alBottom, alLeft, or alRight).

See Also

Align (see page 5798)

TOleContainer (see page 17921)

68.1.19.4.10 TCustomPanel.ParentBackground Property

Determines whether control uses parent's theme background.

Pascal

```
property ParentBackground: Boolean;
```

C++

```
__property Boolean ParentBackground;
```

Description

If ParentBackground is true, the control uses the parent's theme background to draw its own background. ParentBackground has no effect unless XP themes are enabled.

68.1.19.4.11 TCustomPanel.ParentColor Property

Determines where a control looks for its color information.

Pascal

```
property ParentColor: Boolean;
```

C++

```
__property Boolean ParentColor;
```

Description

To have a control use the same color as its parent control, set ParentColor to true. If ParentColor is false, the control uses its own Color property.

Set ParentColor to true for all controls in order to ensure that all the controls on a form have a uniform appearance. For example, if ParentColor is true for all controls in a form, changing the background color of the form to gray causes all the controls on the form to also have a gray background.

When the value of a control's Color property changes, ParentColor becomes false automatically.

See Also

Color (see page 5812)

Parent (see page 5832)

ParentFont (see page 5834)

ParentShowHint (see page 5835)

68.1.19.4.12 TCustomPanel.VerticalAlignment Property

Sets the vertical position of the caption.

Pascal

```
property VerticalAlignment: TVerticalAlignment;
```

C++

```
__property TVerticalAlignment VerticalAlignment;
```

Description

Use the VerticalAlignment property to control the position of the caption within the panel. Choose one of the following values.

Value	Description
taAlignBottom	The caption displays at the bottom of the panel.
taAlignTop	The caption displays at the top of the panel.
taVerticalCenter	The caption displays at the center of the panel.

Note: Use the Alignment (see page 12539) property to control the horizontal position of the caption.

68.1.20 TCustomRadioGroup Class

TCustomRadioGroup is the base class for radio-group components.

Class Hierarchy

Pascal

```
TCustomRadioGroup = class(TCustomGroupBox);
```

C++

```
class TCustomRadioGroup : public TCustomGroupBox;
```

File

ExtCtrls

Description

Radio groups are collections of radio buttons in a single group box. TCustomRadioGroup is the class from which radio-group components—including TRadioGroup (see page 13115) and TDBRadioGroup—descend.

Radio buttons that are contained directly in the same control component are said to be "grouped." When the user checks a radio button, all other radio buttons in its group become unchecked. Hence, two radio buttons on a form can be checked at the same time only if they are placed in separate containers, such as group boxes.

See Also

TRadioGroup (see page 13115)

TDBRadioGroup (see page 9283)

TRadioButton (see page 21753)

68.1.20.1 TCustomRadioGroup Members

The following tables list the members exposed by TCustomRadioGroup.

Protected Events

	Name	Description
	OnAlignInsertBefore (see page 6213)	Occurs when an object with custom alignment is aligned.
	OnAlignPosition (see page 6214)	Occurs when an object with custom alignment is aligned.
	OnCanResize (see page 5851)	Occurs when an attempt is made to resize the control.
	OnClick (see page 5851)	Occurs when the user clicks the control.
	OnConstrainedResize (see page 5853)	Adjust resize constraints.
	OnContextPopup (see page 5854)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnDblClick (see page 5854)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDockDrop (see page 6214)	Occurs when another control is docked to the control.
	OnDockOver (see page 6216)	Occurs when another control is dragged over the control.
	OnDragDrop (see page 5855)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 5857)	Occurs when the user drags an object over a control.
	OnEndDock (see page 5859)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 5860)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnEnter (see page 6219)	Occurs when a control receives the input focus.
	OnExit (see page 6221)	Occurs when the input focus shifts away from one control to another.
	OnGetSiteInfo (see page 6223)	Returns the control's docking information.
	OnKeyDown (see page 6225)	Occurs when a user presses any key while the control has focus.
	OnKeyPress (see page 6227)	Occurs when a key is pressed.
	OnKeyUp (see page 6228)	Occurs when the user releases a key that has been pressed.
	OnMouseActivate (see page 5861)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 5862)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseEnter (see page 5864)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 5864)	Occurs when the user moves the mouse outside of a control.
	OnMouseMove (see page 5865)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 5867)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnMouseWheel (see page 5869)	Occurs when the mouse wheel is rotated.
	OnMouseWheelDown (see page 5869)	Occurs when the mouse wheel is rotated downward.
	OnMouseWheelUp (see page 5870)	Occurs when the mouse wheel is rotated upward.
	OnResize (see page 5870)	Occurs immediately after the control is resized.
	OnStartDock (see page 5871)	Occurs when the user begins to drag a control with a DragKind (see page 5819) of dkDock.

	OnStartDrag (see page 5871)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.
	OnUnDock (see page 6230)	Occurs when the application tries to undock a control that is docked to the windowed control.

Protected Fields

	Name	Description
	FAnchorMove (see page 5733)	This is FAnchorMove, a member of class TControl.
	FAnchorOrigin (see page 5734)	This is FAnchorOrigin, a member of class TControl.
	FAnchorRules (see page 5734)	This is FAnchorRules, a member of class TControl.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FDesignSize (see page 6124)	This is FDesignSize, a member of class TWinControl.
	FDoubleBuffered (see page 6124)	This is FDoubleBuffered, a member of class TWinControl.
	FExplicitHeight (see page 5734)	This is FExplicitHeight, a member of class TControl.
	FExplicitLeft (see page 5734)	This is FExplicitLeft, a member of class TControl.
	FExplicitTop (see page 5734)	This is FExplicitTop, a member of class TControl.
	FExplicitWidth (see page 5735)	This is FExplicitWidth, a member of class TControl.
	FInImeComposition (see page 6125)	This is FInImeComposition, a member of class TWinControl.
	FOriginalParentSize (see page 5735)	This is FOriginalParentSize, a member of class TControl.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	ActionChange (see page 5737)	Responds when the action associated with the control changes.
V	ActionChange (see page 6127)	Updates the control to reflect changes in its associated action.
	AddBiDiModeExStyle (see page 6128)	Sets control's window style according to its bi-directional support.
V	AdjustClientRect (see page 6128)	Provides the interface that adjusts the ClientRect (see page 5810) property for idiosyncrasies of the window.
V	AdjustClientRect (see page 21287)	Adjusts the ClientRect property for idiosyncrasies of the window.
	AdjustSize (see page 5738)	Sets the size of the control as determined by the AutoSize (see page 5803) property.
V	AdjustSize (see page 6129)	Adjusts the control's size according to its contents and constraints.
V	AlignControls (see page 6129)	Aligns any controls for which the control is the parent within a specified area of the control.
	ArrangeControl (see page 6130)	This is ArrangeControl, a member of class TWinControl.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	AssignTo (see page 5739)	Overrides the inherited AssignTo function to enable assignments to TAction objects.
V	AssignTo (see page 6130)	Copies the properties of the windowed control to another object.
	BeginAutoDrag (see page 5739)	Begin Automatic Drag.
	CalcCursorPos (see page 5741)	This is CalcCursorPos, a member of class TControl.
V	CanAutoSize (see page 5741)	Indicates whether the control can resize itself automatically to accommodate its contents.
V	CanAutoSize (see page 6131)	Indicates how the control can be resized.
V	CanModify (see page 12559)	Determines whether the user can select a different radio button in the group.
V	CanResize (see page 5742)	OnCanResize (see page 5851) event dispatcher.
V	CanResize (see page 6132)	Indicates how the control can respond to a resize attempt.
	Changed (see page 5742)	Sends a CM_CHANGED (see page 6330) message to the control.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	ChangeScale (see page 5743)	Rescaling event dispatcher.
V	ChangeScale (see page 6132)	Resize (see page 5780) and reposition children and self.
	Click (see page 5743)	Respond to user click.
V	ConstrainedResize (see page 5746)	Notify control of resize with constraints.
V	ConstrainedResize (see page 6133)	Generates an OnConstrainedResize (see page 5853) event.
	ControlsAligned (see page 6134)	This is ControlsAligned, a member of class TWinControl.

	CreateDockManager (see page 6134)	Creates the dock manager for the control.
V	CreateHandle (see page 6135)	Creates underlying screen object.
V	CreateParams (see page 6135)	Initializes a window-creation parameter data structure.
V	CreateParams (see page 21287)	Initializes a window-creation parameter record passed in the Params parameter.
	CreateSubClass (see page 6136)	Creates a windowed control derived from an existing Windows window class.
V	CreateWindowHandle (see page 6137)	Creates a Windows control to represent the control.
V	CreateWnd (see page 6137)	Creates the underlying window.
V	CustomAlignInsertBefore (see page 6137)	Returns placement order of custom-aligned child control.
V	CustomAlignPosition (see page 6138)	Returns aligned position of custom-aligned child control.
	DblClick (see page 5747)	OnDblClick (see page 5854) event dispatcher.
	DefaultDockImage (see page 5747)	Handles the painting and erasing of a dock image.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DefineProperties (see page 5748)	Provides methods to read and write the IsControl (see page 5829) property to a stream such as a form file.
V	DefineProperties (see page 6139)	Provides methods to read and write the IsControl property to a stream such as a form file.
	DesignWndProc (see page 5749)	This is DesignWndProc, a member of class TControl.
V	DestroyHandle (see page 6140)	Destroys the control's window without destroying the control.
V	DestroyWindowHandle (see page 6140)	Destroys the window created in the CreateWindowHandle (see page 6137) method.
V	DestroyWnd (see page 6141)	Destroys the control's window.
	DoAddDockClient (see page 6142)	Performs actions when a control is docked to the windowed control.
	DockOver (see page 6143)	Responds when a docking client is dragged over the windowed control.
V	DockReplaceDockClient (see page 6143)	This is DockReplaceDockClient, a member of class TWinControl.
	DockTrackNoTarget (see page 5749)	Handles dragging of the control over an invalid docking target.
	DoContextPopup (see page 5750)	OnContextPopup (see page 5854) event dispatcher.
	DoDock (see page 5750)	Docking event dispatcher.
	DoDockOver (see page 6143)	Generates an OnDockOver (see page 6216) event.
	DoEndDock (see page 5750)	OnEndDock (see page 5859) event dispatcher.
	DoEndDrag (see page 5751)	OnEndDrag (see page 5860) event dispatcher.
	DoEnter (see page 6144)	Respond to receiving input focus.
	DoExit (see page 6144)	Respond to losing input focus
	DoFlipChildren (see page 6145)	Flips the control's children.
	DoKeyDown (see page 6145)	Performs some preprocessing before generating an OnKeyDown (see page 6225) event.
	DoKeyPress (see page 6146)	Performs some preprocessing before generating an OnKeyPress (see page 6227) event.
	DoKeyUp (see page 6146)	Performs some preprocessing before generating an OnKeyUp (see page 6228) event.
	DoMouseWheel (see page 5751)	Processes mouse wheel motion.
	DoMouseWheelDown (see page 5752)	OnMouseWheelDown (see page 5869) event dispatcher.
	DoMouseWheelUp (see page 5752)	OnMouseWheelUp (see page 5870) event dispatcher.
	DoRemoveDockClient (see page 6147)	Responds when a control is undocked from the windowed control.
	DoStartDock (see page 5753)	OnStartDock (see page 5871) event dispatcher.
	DoStartDrag (see page 5753)	OnStartDrag (see page 5871) event dispatcher.
	DoUnDock (see page 6147)	Undocks a control that is currently docked to the windowed control.
	DragCanceled (see page 5754)	Provides the interface for a method that responds to the cancellation of a drag.
	DragOver (see page 5755)	OnDragOver (see page 5857) event dispatcher.
	DrawDragDockImage (see page 5755)	Draws the dock image for the control.
	EraseDragDockImage (see page 5757)	Erases the dock image for the control.
	FindNextControl (see page 6149)	Returns the control's next child in the tab order after the specified control.
	FixupTabList (see page 6149)	Sorts the child controls by their tab order.
V	GetAction (see page 5758)	This is GetAction, a member of class TControl.
	GetActionLinkClass (see page 5758)	Returns the appropriate action link class that is associated with the control class.

	GetActionLinkClass (see page 6152)	Returns the associated action link class.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 12560)	Prevents the streaming system from loading and saving child controls in the usual fashion.
	GetClientOrigin (see page 5758)	Returns the screen coordinates of the top-left corner of the control's client area.
	GetClientOrigin (see page 6153)	Returns the value of the ClientOrigin (see page 5809) property.
	GetClientRect (see page 5759)	Returns a rectangle defining the client area of the control.
	GetClientRect (see page 6154)	Returns the value of the ClientRect (see page 5810) property.
	GetControlExtents (see page 6154)	Returns the smallest rectangle in which all the control's children fit.
	GetDeviceContext (see page 5760)	Returns a device context for the control.
	GetDeviceContext (see page 6155)	Provides access to a device context for the control.
	GetDockEdge (see page 5763)	Returns the edge on which another control should be docked when it is dragged over the control.
	GetDragImages (see page 5763)	Returns the control's image list containing the image to be displayed while dragging.
	GetEnabled (see page 5763)	Returns the value of the Enabled (see page 5821) property.
	GetFloating (see page 5764)	Returns the value of the Floating (see page 5823) property.
	GetFloatingDockSiteClass (see page 5764)	Returns the class used for the control when it is floating.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetPalette (see page 5765)	Returns the handle to a palette for use by the control.
	GetParentHandle (see page 6157)	Returns the window handle for the window of the control's parent.
	GetPopupMenu (see page 5765)	Returns the pop-up menu associated with the control.
	GetSiteInfo (see page 6158)	Generates an OnGetSiteInfo (see page 6223) event
	GetTopParentHandle (see page 6159)	Returns the window handle of the first window not associated with a VCL control that contains the windowed control.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	InvalidateDockHostSite (see page 6162)	This is InvalidateDockHostSite, a member of class TWinControl.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsControlActivateMsg (see page 6162)	This is IsControlActivateMsg, a member of class TWinControl.
	IsControlMouseMsg (see page 6162)	Indicates whether a specified mouse message is directed to one of the windowed control's child controls.
	IsQualifyingSite (see page 6163)	This is IsQualifyingSite, a member of class TWinControl.
	KeyDown (see page 6163)	Respond to key press events.
	KeyPress (see page 6163)	Respond to keyboard input.
	KeyUp (see page 6164)	Respond to released key.
	Loaded (see page 12560)	Initializes the radio group after it is loaded into memory.
	MainWndProc (see page 6165)	Receives Windows messages for the control.
	MouseActivate (see page 5773)	This is MouseActivate, a member of class TControl.
	MouseDown (see page 5773)	OnMouseDown (see page 5862) event dispatcher.
	MouseMove (see page 5773)	Respond to mouse moving over control area..
	MouseUp (see page 5774)	OnMouseUp (see page 5867) event dispatcher.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	Notification (see page 5775)	Responds to notifications that components are being created or destroyed.
	Notification (see page 6165)	Responds to notifications that components are being created or destroyed.
	NotifyControls (see page 6165)	Sends a message to all the child controls.
	Paint (see page 5920)	Renders the image of a custom control.
	Paint (see page 21287)	Renders the onscreen image of the group box.
	PaintControls (see page 6166)	Paints each of the child controls in a windowed control using the specified device context.

	PaintHandler (see page 6166)	Responds to WM_PAINT messages.
V	PaintWindow (see page 5920)	Renders the image of the control on a specified device context.
V	PaintWindow (see page 6169)	Renders the image of a windowed control.
	PaletteChanged (see page 5775)	Responds to changes in the system's palette by realizing the control's palette.
V	PaletteChanged (see page 6170)	Responds to changes in the system's palette by realizing the control's palette and the palette for each child control.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	PositionDockRect (see page 5777)	Positions the docking rectangle according to the current drag-and-dock state.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 12560)	Prepares the control for having its properties assigned values from a stream.
	RecreateWnd (see page 6171)	Recreate underlying Windows screen object.
	ReloadDockedControl (see page 6172)	Reloads a docked control.
	RemoveWindowProps (see page 6174)	This is RemoveWindowProps, a member of class TWinControl.
V	RequestAlign (see page 5780)	Instructs the parent of a control to reposition the control, enforcing its Align (see page 5798) property.
	ResetIme (see page 6174)	Restores the input method editor (IME) that was active when the application started.
	ResetImeComposition (see page 6175)	Directs the composition window of the input method editor (IME) to perform a specific action.
	Resize (see page 5780)	Respond to control resize.
	ScaleConstraints (see page 5781)	This is ScaleConstraints, a member of class TControl.
	ScaleControls (see page 6176)	Rescale child controls only.
	SelectFirst (see page 6177)	Locates first selectable child control.
	SelectNext (see page 6177)	Moves the input focus from the current child control to the next one in the tab order.
	SendCancelMode (see page 5781)	Cancels the modal state of the control.
	SendDockNotification (see page 5782)	Sends a Windows message to the control's host dock site.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
V	SetAutoSize (see page 5783)	This is SetAutoSize, a member of class TControl.
V	SetBiDiMode (see page 5783)	Sets the control's bi-directional mode.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
V	SetChildOrder (see page 6178)	Changes the order in which the child component appears in the list of child components returned by the GetChildren (see page 6153) method.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
V	SetDragMode (see page 5785)	Sets the drag mode for the control.
V	SetEnabled (see page 5785)	Sets the value of the Enabled (see page 5821) property.
	SetIme (see page 6181)	Activates an input method editor (IME) using the values specified by the ImeMode (see page 6207) and ImeName (see page 6208) properties.
	SetImeCompositionWindow (see page 6181)	Sets the position and font of the composition window.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
V	SetName (see page 5785)	Sets the name of the control.
V	SetParent (see page 5786)	Sets the parent of the control.
V	SetParent (see page 6182)	Sets the parent of the control.
V	SetParentBackground (see page 6182)	This is SetParentBackground, a member of class TWinControl.
V	SetParentBiDiMode (see page 5786)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 5787)	Sets the parent for the control.
	SetZOrder (see page 5788)	Repositions the control in its parent's control list, thereby changing position onscreen.
V	SetZOrder (see page 6182)	Moves the control to the top or bottom of the parent control's (or screen's) list of TWinControl (see page 6112) controls.
V	ShowControl (see page 6183)	Ensures that a specified child control is visible.
	UpdateBounds (see page 6185)	This is UpdateBounds, a member of class TWinControl.

	UpdateBoundsRect (see page 5789)	Changes the Top (see page 5844), Left (see page 5830), Width (see page 5849), and Height (see page 5825) properties of the control, but doesn't update its screen image and bypasses all resize events.
V	UpdateControlOriginalParentSize (see page 6186)	This is UpdateControlOriginalParentSize, a member of class TWinControl.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateExplicitBounds (see page 5789)	This is UpdateExplicitBounds, a member of class TControl.
	UpdateRecreatingFlag (see page 6186)	This is UpdateRecreatingFlag, a member of class TWinControl.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	UpdateUIState (see page 6186)	Updates form User Interface State as needed
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	VisibleChanging (see page 5791)	Provides the interface for a method that responds to changes in the control's visibility.
V	WndProc (see page 5791)	Provides specific message responses for the control.
V	WndProc (see page 6187)	Provides specific message responses for the control.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	ActionLink (see page 5798)	Contains the action link object associated with the control.
	AutoSize (see page 5803)	Specifies whether the control sizes itself automatically to accommodate its contents.
	BevelEdges (see page 6192)	Specifies which edges of the control are beveled.
	BevelInner (see page 6193)	Specifies the cut of the inner bevel.
	BevelKind (see page 6193)	Specifies the control's bevel style.
	BevelOuter (see page 6194)	Specifies the cut of the outer bevel.
	BevelWidth (see page 6194)	Specifies the width of the inner and outer bevels.
	BorderWidth (see page 6195)	Specifies the width of the control's border.
R	Canvas (see page 5921)	Specifies the TCanvas object that presents a drawing surface for the control.
	Caption (see page 5806)	Specifies a text string that identifies the control to the user.
	Color (see page 5812)	Specifies the background color of the control.
	Columns (see page 12562)	Specifies number of columns in the radio group.
	Ctl3D (see page 6198)	Determines whether a control has a three-dimensional (3-D) or two-dimensional look.
	DefWndProc (see page 6199)	Specifies the default window procedure for the windowed control.
	DesktopFont (see page 5818)	Specifies whether the control uses the Windows icon font when writing text.
	DragCursor (see page 5818)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 5819)	Specifies whether the control is being dragged normally or for docking.
	DragMode (see page 5819)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	Font (see page 5823)	Controls (see page 5711) the attributes of text written on or in the control.
	ImeMode (see page 6207)	Determines the behavior of the input method editor (IME).
	ImeName (see page 6208)	Specifies the input method editor (IME) to use for converting keyboard input to Asian language characters.
	IsControl (see page 5829)	Determines whether a form stores its form-specific properties to a stream.
	ItemIndex (see page 12562)	Indicates which radio button in the group is currently selected.
	Items (see page 12563)	Lists the radio buttons in the radio group.
	MouseCapture (see page 5831)	Indicates whether the control has "captured" mouse events.
	ParentBackground (see page 6209)	Determines whether control uses parent's theme background.
	ParentBiDiMode (see page 5833)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	ParentColor (see page 5834)	Determines where a control looks for its color information.

	ParentCtl3D (see page 6209)	Determines where a component looks to determine if it should appear three dimensional.
	ParentFont (see page 5834)	Determines where a control looks for its font information.
	ParentShowHint (see page 5835)	Determines where a control looks to find out if its Help Hint (see page 5827) should be shown.
	PopupMenu (see page 5835)	Identifies the pop-up menu associated with the control.
	ScalingFlags (see page 5840)	Reflects which attributes of the control have been scaled.
	Text (see page 5842)	Contains a text string associated with the control.
	WheelAccumulator (see page 5849)	Accumulates mouse wheel rotations.
	WindowHandle (see page 6212)	Provides access to a window handle for the control.
	WindowText (see page 5850)	Contains the text string of the control.

Public Events

	Name	Description
	WindowProc (see page 5872)	Points to the window procedure that responds to messages sent to the control.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	BeginDrag (see page 5740)	Starts the dragging of a control.
	BringToFront (see page 5740)	Puts the control in front of all other controls in its parent control.
	Broadcast (see page 6130)	Sends a message to each of the child controls.
	CanFocus (see page 6131)	Indicates whether a control can receive focus.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	ClientToParent (see page 5744)	Translates client coordinates to parent coordinates.
	ClientToScreen (see page 5744)	Translates a given point from client area coordinates to global screen coordinates.
	ContainsControl (see page 6133)	Indicates whether a specified control exists within the control.
	ControlAtPos (see page 6133)	Returns the child control located at a specified position within the control.
	Create (see page 12558)	Creates and initializes a TCustomRadioGroup (see page 12547) instance.
	CreateParented (see page 6123)	Creates and initializes a control as the child of a specified non-VCL container.
	CreateParentedControl (see page 6136)	Creates and initializes a control as the child of a specified non-VCL window.
	DefaultHandler (see page 5748)	Provides message handling for all messages that do not have specific handlers.
	DefaultHandler (see page 6139)	Provides message handling for all messages that the control does not fully process itself.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 12558)	Destroys the TCustomRadioGroup (see page 12547) instance and the radio buttons it contains.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	DisableAlign (see page 6141)	Disables the realignment of child controls.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Dock (see page 5749)	Used internally to dock the control.
	DockDrop (see page 6142)	Generates an OnDockDrop (see page 6214) event.

	DragDrop (see page 5754)	OnDragDrop (see page 5855) event dispatcher.
	Dragging (see page 5754)	Indicates whether a control is being dragged.
	DrawTextBiDiModeFlags (see page 5756)	Returns the text flags that reflect the current setting of the BiDiMode (see page 5803) property.
	DrawTextBiDiModeFlagsReadingOnly (see page 5756)	Returns the text flag to add that indicates whether the control's text should read from right to left.
	EnableAlign (see page 6148)	Decrements the reference count incremented by the DisableAlign (see page 6141) method, eventually realigning the child controls.
	EndDrag (see page 5757)	Stops a control from being dragged any further.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindChildControl (see page 6148)	Returns a child control given its name.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
V	FlipChildren (see page 12559)	Prevents the default behavior of flipping the child radio buttons.
	Focused (see page 6150)	Determines whether the control has input focus.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetControlsAlignment (see page 5759)	Indicates how text is aligned within the control.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 5765)	Returns the parent of the control.
	GetTabOrderList (see page 6158)	Builds a list of controls in tab order.
	GetTextBuf (see page 5766)	Retrieves the control's text, copies it into a buffer, and returns the number of characters copied.
	GetTextLen (see page 5767)	Returns the length of the control's text.
	HandleAllocated (see page 6159)	Reports whether a screen object handle exists for the control.
	HandleNeeded (see page 6160)	Creates a screen object for the control if it doesn't already exist.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 5768)	Indicates whether the control has a parent.
	Hide (see page 5769)	Makes the control invisible.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
V	InitiateAction (see page 5769)	Calls the action link's Update (see page 5789) method if the control is associated with an action link.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InsertControl (see page 6160)	Inserts a control into the Controls (see page 6197) array property.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
V	Invalidate (see page 5770)	Completely repaint control.
V	Invalidate (see page 6161)	Schedules a control repaint.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	IsRightToLeft (see page 5770)	Indicates whether the control should be reversed right to left.
	ManualDock (see page 5771)	Docks the control.
	ManualFloat (see page 5772)	Undocks the control.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.

	MouseWheelHandler (see page 5774)	Dispatches messages received from a mouse wheel.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	PaintTo (see page 6167)	This is the overview for the PaintTo method overload.
	ParentToClient (see page 5776)	Translate parent coordinates to client coordinates.
	Perform (see page 5776)	Responds as if the control received a specified Windows message.
	PreProcessMessage (see page 6170)	This is PreProcessMessage, a member of class TWinControl.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	Realign (see page 6171)	Forces the control to realign children.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	Refresh (see page 5779)	Repaints the control on the screen.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveControl (see page 6172)	Removes a specified control from the Controls (see page 6197) array.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	Repaint (see page 5779)	Forces the control to repaint its image on the screen.
V	Repaint (see page 6174)	Repaints the entire control.
	ReplaceDockedControl (see page 5779)	Docks the control in the place where another control is already docked.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	ScaleBy (see page 6175)	Rescale control and its children.
	ScreenToClient (see page 5781)	Converts the screen coordinates of a specified point on the screen to client coordinates.
	ScrollBy (see page 6176)	Scroll control contents.
	SendToBack (see page 5782)	Puts a windowed control behind all other windowed controls, or puts a non-windowed control behind all other non-windowed controls.
V	SetBounds (see page 5783)	Sets the Left (see page 5830), Top (see page 5844), Width (see page 5849), and Height (see page 5825) properties all at once.
V	SetBounds (see page 6178)	Sets the windowed control's boundary properties all at once.
	SetDesignVisible (see page 5784)	Makes a control visible at design time.
V	SetDesignVisible (see page 6178)	Makes a control visible at design time.
V	SetFocus (see page 6179)	Gives the input focus to the control.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	SetTextBuf (see page 5787)	Sets the text of the control.
	Show (see page 5788)	Makes a control visible.
V	Update (see page 5789)	Processes any pending paint messages immediately.
V	Update (see page 6183)	Forces the control to update.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	UpdateControlState (see page 6186)	Respond to state change.
	UseRightToLeftAlignment (see page 5790)	Specifies whether the control's alignment should be reversed right-to-left.
	UseRightToLeftReading (see page 5790)	Specifies whether the control is using a right-to-left reading order.
	UseRightToLeftScrollBar (see page 5791)	Specifies whether the vertical scroll bar appears on the left side of the control.

Public Properties

	Name	Description
	Action (see page 5797)	Designates the action associated with the control.
	Align (see page 5798)	Determines how the control aligns within its container (parent control).
R	AlignDisabled (see page 6192)	Indicates child control realignment disabled.
	Anchors (see page 5802)	Specifies how the control is anchored to its parent.
	BiDiMode (see page 5803)	Specifies the bi-directional mode for the control.
	BoundsRect (see page 5803)	Specifies the bounding rectangle of the control, expressed in the coordinate system of the parent control.
R	Brush (see page 6195)	Determines the color and pattern used for painting the background of the control.
R	Buttons (see page 12561)	Access individual TRadioButton objects.
	ClientHeight (see page 5808)	Specifies the height of the control's client area in pixels.

R	ClientOrigin (see page 5809)	Specifies the screen coordinates (in pixels) of the top left corner of a control's client area.
R	ClientRect (see page 5810)	Specifies the size (in pixels) of a control's client area.
	ClientWidth (see page 5811)	Specifies the horizontal size of the control's client area in pixels.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Constraints (see page 5812)	Specifies the size constraints for the control.
R	ControlCount (see page 6195)	Returns the number of child controls.
R	Controls (see page 6197)	Lists all child controls.
	ControlState (see page 5813)	Indicates the current state of a control at runtime.
	ControlStyle (see page 5814)	Determines style characteristics of the control.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	DockClientCount (see page 6199)	Specifies the number of controls that are docked on the windowed control.
R	DockClients (see page 6201)	Lists the controls that are docked to the windowed control.
	DockManager (see page 6202)	Specifies the control's docking manager interface.
	DockOrientation (see page 5818)	Specifies how the control is docked relative to other controls docked in the same parent.
	DockSite (see page 6204)	Specifies whether the control can be the target of drag-and-dock operations.
	DoubleBuffered (see page 6205)	Determines whether the control's image is rendered directly to the window or painted to an in-memory bitmap first.
	Enabled (see page 5821)	Controls (see page 5711) whether the control responds to mouse, keyboard, and timer events.
R	ExplicitHeight (see page 5821)	Specifies the explicit vertical size of the control in pixels.
R	ExplicitLeft (see page 5822)	Specifies the explicit horizontal pixel coordinate of the left edge of a component relative to its parent.
R	ExplicitTop (see page 5822)	Specifies the explicit vertical pixel coordinate of the top edge of a component relative to its parent.
R	ExplicitWidth (see page 5822)	Specifies the explicit horizontal size of the control in pixels.
R	Floating (see page 5823)	Indicates whether the control is floating.
	FloatingDockSiteClass (see page 5823)	Specifies the class of the temporary control that hosts the control when it is floating.
R	Handle (see page 6207)	Provides access to the underlying Windows screen object for the control.
	HostDockSite (see page 5829)	Specifies the control in which the control is docked.
	LRDockWidth (see page 5831)	Specifies the width of the control when it is docked horizontally.
R	MouseInClient (see page 6209)	This is MouseInClient, a member of class TWinControl.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Padding (see page 6209)	Specifies the padding of a control.
	Parent (see page 5832)	Indicates the parent of the control.
	ParentWindow (see page 6210)	Reference to parent's underlying control.
	ShowHint (see page 5840)	Determines whether the control displays a Help Hint (see page 5827) when the mouse pointer rests momentarily on the control.
R	Showing (see page 6210)	Indicates whether the control is showing on the screen.
	TabOrder (see page 6211)	Indicates the position of the control in its parent's tab order.
	TabStop (see page 6211)	Determines if the user can tab to a control.
	TBDockHeight (see page 5842)	Specifies the height of the control when it is docked vertically.
	UndockHeight (see page 5845)	Specifies the height of the control when it is floating.
	UndockWidth (see page 5846)	Specifies the width of the control when it is floating.
	UseDockManager (see page 6212)	Specifies whether the docking manager is used in drag-and-dock operations.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	Visible (see page 5847)	Determines whether the component appears onscreen.
R	VisibleDockClientCount (see page 6212)	Specifies the number of visible controls that are docked on the windowed control.

Published Properties

	Name	Description
	AlignWithMargins (see page 5802)	Indicates whether a control should be constrained by margins.
	Cursor (see page 5815)	Specifies the image used to represent the mouse pointer when it passes into the region covered by the control.
	Height (see page 5825)	Specifies the vertical size of the control in pixels.
	HelpContext (see page 5826)	Numeric ID for control's context-sensitive help topic
	HelpKeyword (see page 5826)	Keyword for control's context-sensitive help topic
	HelpType (see page 5827)	Indicates whether the control's context sensitive help topic is identified by context ID or by keyword.
	Hint (see page 5827)	Contains the text string that can appear when the user moves the mouse over the control.
	Left (see page 5830)	Specifies the horizontal coordinate of the left edge of a component relative to its parent.
	Margins (see page 5831)	Specifies the margins for the control.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Top (see page 5844)	Specifies the Y coordinate of the top left corner of a control, relative to its parent or containing control in pixels.
	Width (see page 5849)	Specifies the horizontal size of the control or form in pixels.

68.1.20.2 TCustomRadioGroup.Create Constructor

Creates and initializes a TCustomRadioGroup (see page 12547) instance.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomRadioGroup(TComponent * AOwner);
```

Description

Call Create to instantiate a radio group at runtime. Radio group components added to forms at design time are created automatically.

AOwner is the component that is responsible for freeing the radio group instance. It becomes the value of the Owner property.

See Also

Owner (see page 2807)

68.1.20.3 TCustomRadioGroup.Destroy Destructor

Destroys the TCustomRadioGroup (see page 12547) instance and the radio buttons it contains.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TCustomRadioGroup();
```

Description

Do not call Destroy directly in an application. Instead, call Free. Free checks that the radio group is not nil, and only then calls Destroy.

Destroy frees the memory for each item in the group, then calls the inherited destructor.

See Also

Free (see page 22300)

68.1.20.4 TCustomRadioGroup Methods

The methods of the TCustomRadioGroup class are listed here.

Protected Methods

	Name	Description
	CanModify (see page 12559)	Determines whether the user can select a different radio button in the group.
	GetChildren (see page 12560)	Prevents the streaming system from loading and saving child controls in the usual fashion.
	Loaded (see page 12560)	Initializes the radio group after it is loaded into memory.
	ReadState (see page 12560)	Prepares the control for having its properties assigned values from a stream.

Public Methods

	Name	Description
	FlipChildren (see page 12559)	Prevents the default behavior of flipping the child radio buttons.

68.1.20.4.1 TCustomRadioGroup.CanModify Method

Determines whether the user can select a different radio button in the group.

Pascal

```
function CanModify: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean CanModify();
```

Description

Event handlers call CanModify to verify that the user is allowed to select a different radio button in the group. As defined in TCustomRadioGroup (see page 12547), this method always returns true; override it to return false in situations where the user should not be able to make changes.

See Also

CanModify

68.1.20.4.2 TCustomRadioGroup.FlipChildren Method

Prevents the default behavior of flipping the child radio buttons.

Pascal

```
procedure FlipChildren(AllLevels: Boolean); override;
```

C++

```
virtual __fastcall FlipChildren(Boolean AllLevels);
```

Description

FlipChildren overrides the inherited FlipChildren method to disable flipping the radio buttons.

To flip the children of a radio group, use the BiDiMode property.

See Also

BiDiMode (see page 5803)

68.1.20.4.3 TCustomRadioGroup.GetChildren Method

Prevents the streaming system from loading and saving child controls in the usual fashion.

Pascal

```
procedure GetChildren(Proc: TGetChildProc; Root: TComponent); override;
```

C++

```
virtual __fastcall GetChildren(TGetChildProc Proc, TComponent * Root);
```

Description

GetChildren is called in the streaming sequence that loads and saves VCL components. Because radio groups load and save their buttons using the ReadState (see page 12560) and WriteState methods, TCustomRadioGroup (see page 12547) overrides TWinControl to disable the GetChildren method.

See Also

GetChildren (see page 6153)

GetChildren

GetParentComponent

readstate (see page 12560)

WriteState

68.1.20.4.4 TCustomRadioGroup.Loaded Method

Initializes the radio group after it is loaded into memory.

Pascal

```
procedure Loaded; override;
```

C++

```
virtual __fastcall Loaded();
```

Description

Do not call Loaded. The component streaming system calls Loaded automatically after the radio group's form is loaded into memory so that it can complete any initializations that depend on other objects in the form.

Loaded overrides the inherited method to ensure that the buttons in the group are properly arranged.

See Also

Items (see page 12563)

68.1.20.4.5 TCustomRadioGroup.ReadState Method

Prepares the control for having its properties assigned values from a stream.

Pascal

```
procedure ReadState(Reader: TReader); override;
```

C++

```
virtual __fastcall ReadState(TReader Reader);
```

Description

Override ReadState to change the preparations the control makes as it readies itself to have its property values assigned from a stream. For example, a control might destroy temporary internal data structures or objects before new instances are loaded from the stream. Be sure to include a call to the inherited method when overriding ReadState.

As implemented in TWinControl, ReadState disables control alignment until all the child controls have been read from the stream, calls the inherited ReadState method, and re-enables the alignment of all the controls. The method then builds the tab order list of controls and synchronizes its visibility with that of its parent control.

See Also

Parent (see page 5832)

ReadState (see page 5778)

68.1.20.5 TCustomRadioGroup Properties

The properties of the TCustomRadioGroup class are listed here.

Protected Properties

	Name	Description
	Columns (see page 12562)	Specifies number of columns in the radio group.
	ItemIndex (see page 12562)	Indicates which radio button in the group is currently selected.
	Items (see page 12563)	Lists the radio buttons in the radio group.

Public Properties

	Name	Description
R	Buttons (see page 12561)	Access individual TRadioButton objects.

68.1.20.5.1 TCustomRadioGroup.Buttons Property

Access individual TRadioButton objects.

Pascal

```
property Buttons [Index: Integer]: TRadioButton;
```

C++

```
__property TRadioButton Buttons[int Index];
```

Description

Buttons provides direct access to the individual TRadioButton objects created by the control. Buttons is a read-only property. This means you can access individual TRadioButton objects, but you cannot add or delete TRadioButton objects. To modify the button list, change the Items (see page 12563) property.

Index is the zero-origin button index. If Index is equal to or greater than the number of buttons, an error is raised.

See Also

Items (see page 12563)

68.1.20.5.2 TCustomRadioGroup.Columns Property

Specifies number of columns in the radio group.

Pascal

```
property Columns: Integer;
```

C++

```
__property int Columns;
```

Description

Columns determines the number of columns in the radio group if Orientation is orVertical (the default), and the number of rows if Orientation is orHorizontal. Its value can range from 1 to 16. The default value is 1, which means that the radio buttons are arranged in a single line.

68.1.20.5.3 TCustomRadioGroup.ItemIndex Property

Indicates which radio button in the group is currently selected.

Pascal

```
property ItemIndex: Integer;
```

C++

```
__property int ItemIndex;
```

Description

ItemIndex holds the index of the selected radio button in the Items (see page 12563) list. (The first button is 0.) The value of ItemIndex changes at runtime as the user selects radio buttons. If you want one of the buttons to appear selected when the application starts, assign that button to ItemIndex at design time; otherwise, leave ItemIndex set to the default value of -1, which means that no button is selected.

C++ Examples:

```
/*
This example uses a radio group box and a scroll bar on a
form. When the user selects one of the radio buttons, the
scroll bar changes orientation accordingly.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  RadioGroup1->Items->Add("Vertical");
  RadioGroup1->Items->Add("Horizontal");
  RadioGroup1->ItemIndex = 2;
}

void __fastcall TForm1::RadioGroup1Click(TObject *Sender)
{
  if (RadioGroup1->Items->Strings[RadioGroup1->ItemIndex] == "Vertical")
    ScrollBar1->Kind = sbVertical;
  else if (RadioGroup1->Items->Strings[RadioGroup1->ItemIndex] == "Horizontal")
    ScrollBar1->Kind = sbHorizontal;
}
```

Delphi Examples:

```
{
This example uses a radio group box and a scroll bar on a
form. When the user selects one of the radio buttons, the
scroll bar changes orientation accordingly.
```

```
}
procedure TForm1.FormCreate(Sender: TObject);
begin
  RadioGroup1.Items.Add('Vertical');
  RadioGroup1.Items.Add('Horizontal');
  RadioGroup1.ItemIndex := 2;
end;

procedure TForm1.RadioGroup1Click(Sender: TObject);
begin
  if RadioGroup1.Items[RadioGroup1.ItemIndex] = 'Vertical' then
    ScrollBar1.Kind := sbVertical;
  if RadioGroup1.Items[RadioGroup1.ItemIndex] = 'Horizontal' then
    ScrollBar1.Kind := sbHorizontal;
end;
```

See Also

Items (see page 12563)

68.1.20.5.4 TCustomRadioGroup.Items Property

Lists the radio buttons in the radio group.

Pascal

```
property Items: TStrings;
```

C++

```
__property TStrings Items;
```

Description

Items holds a TStrings object that lists the captions of the radio buttons in the group. In TCustomRadioGroup (see page 12547) descendants, where this property is published, radio buttons can be added or removed by editing the Items list from the Object Inspector.

Note: A TRadioButton object is created automatically for each string in Items. You cannot directly add or remove TRadioButton objects, but you can access individual TButton objects through the Buttons (see page 12561) property.

C++ Examples:

```
/*
This example uses a radio group box and a scroll bar on a
form. When the user selects one of the radio buttons, the
scroll bar changes orientation accordingly.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  RadioGroup1->Items->Add("Vertical");
  RadioGroup1->Items->Add("Horizontal");
  RadioGroup1->ItemIndex = 2;
}

void __fastcall TForm1::RadioGroup1Click(TObject *Sender)
{
  if (RadioGroup1->Items->Strings[RadioGroup1->ItemIndex] == "Vertical")
    ScrollBar1->Kind = sbVertical;
  else if (RadioGroup1->Items->Strings[RadioGroup1->ItemIndex] == "Horizontal")
    ScrollBar1->Kind = sbHorizontal;
}
```

Delphi Examples:

```
{
This example uses a radio group box and a scroll bar on a
form. When the user selects one of the radio buttons, the
scroll bar changes orientation accordingly.
}
procedure TForm1.FormCreate(Sender: TObject);
begin
  RadioGroup1.Items.Add('Vertical');
  RadioGroup1.Items.Add('Horizontal');
  RadioGroup1.ItemIndex := 2;
end;

procedure TForm1.RadioGroup1Click(Sender: TObject);
begin
  if RadioGroup1.Items[RadioGroup1.ItemIndex] = 'Vertical' then
    ScrollBar1.Kind := sbVertical;
  if RadioGroup1.Items[RadioGroup1.ItemIndex] = 'Horizontal' then
    ScrollBar1.Kind := sbHorizontal;
end;
```

See Also

ItemIndex (see page 12562)

TRadioButton (see page 21753)

Buttons (see page 12561)

68.1.21 TCustomTrayIcon Class

The base class for TTrayIcon (see page 13252).

Class Hierarchy

Pascal

```
TCustomTrayIcon = class(TComponent);
```

C++

```
class TCustomTrayIcon : public TComponent;
```

File

ExtCtrls

Description

TCustomTrayIcon is the base class for TTrayIcon (see page 13252), which places an icon in the system tray next to the clock.

68.1.21.1 TCustomTrayIcon Members

The following tables list the members exposed by TCustomTrayIcon.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DoOnAnimate (see page 12569)	This is DoOnAnimate, a member of class TCustomTrayIcon.
	GetAnimateInterval (see page 12569)	This is GetAnimateInterval, a member of class TCustomTrayIcon.
	GetBalloonTimeout (see page 12569)	This is GetBalloonTimeout, a member of class TCustomTrayIcon.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetAnimate (see page 12570)	This is SetAnimate, a member of class TCustomTrayIcon.
	SetAnimateInterval (see page 12570)	This is SetAnimateInterval, a member of class TCustomTrayIcon.
	SetBalloonHint (see page 12571)	This is SetBalloonHint, a member of class TCustomTrayIcon.
	SetBalloonTimeout (see page 12571)	This is SetBalloonTimeout, a member of class TCustomTrayIcon.
	SetBalloonTitle (see page 12571)	This is SetBalloonTitle, a member of class TCustomTrayIcon.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetHint (see page 12571)	This is SetHint, a member of class TCustomTrayIcon.
	SetIcon (see page 12572)	This is SetIcon, a member of class TCustomTrayIcon.
V	SetIconIndex (see page 12572)	This is SetIconIndex, a member of class TCustomTrayIcon.
	SetIconList (see page 12572)	This is SetIconList, a member of class TCustomTrayIcon.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetVisible (see page 12572)	This is SetVisible, a member of class TCustomTrayIcon.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.

	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WindowProc (see page 12573)	This is WindowProc, a member of class TCustomTrayIcon.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	Data (see page 12575)	This is Data, a member of class TCustomTrayIcon.

Public Events

	Name	Description
	OnAnimate (see page 12577)	Occurs each time the icon changes when the tray icon is animating.
	OnClick (see page 12577)	Occurs when the user clicks the tray icon.
	OnDblClick (see page 12578)	Occurs when the user double clicks the tray icon.
	OnMouseDown (see page 12578)	Occurs when the user presses a mouse button while the mouse pointer is over a control.
	OnMouseMove (see page 12578)	Occurs when the user moves the mouse pointer while the mouse pointer is over the tray icon.
	OnMouseUp (see page 12578)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 12568)	Creates and initializes a TCustomTrayIcon (see page 12564) instance.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 12568)	Frees the memory associated with the TCustomTrayIcon (see page 12564) object.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.

V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	Refresh (see page 12570)	This is the overview for the Refresh method overload.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetDefaultIcon (see page 12571)	Sets the tray icon to the default application icon.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
V	ShowBalloonHint (see page 12573)	Displays the balloon hint.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
	Animate (see page 12573)	Specifies whether the icon in the system tray is static or animated.
	AnimateInterval (see page 12574)	Controls (see page 5711) the length of time between image changes for the tray icon image.
	BalloonFlags (see page 12574)	Specifies an icon for the balloon hint.
	BalloonHint (see page 12574)	Specifies the text within a balloon hint.
	BalloonTimeout (see page 12575)	Specifies the length of time that the balloon displays.
	BalloonTitle (see page 12575)	Specifies the text that appears as the balloon title.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.

	Hint (see page 12575)	Specifies the text that appears when the user moves the mouse over the control.
	Icon (see page 12576)	Specifies the default icon shown in the system tray.
	IconIndex (see page 12576)	This is an index into the Icons (see page 12576) image list which is the icon currently being displayed in the system tray.
	Icons (see page 12576)	Specifies the list of images to be displayed for the icon in the system tray.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	PopupMenu (see page 12576)	Identifies the pop-up menu associated with the tray icon.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	Visible (see page 12577)	Determines whether the icon appears in the system tray.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

68.1.21.2 TCustomTrayIcon.Create Constructor

Creates and initializes a TCustomTrayIcon (see page 12564) instance.

Pascal

```
constructor Create(Owner: TComponent); override;
```

C++

```
virtual __fastcall TCustomTrayIcon(TComponent * Owner);
```

Description

Creates and initializes a TCustomTrayIcon (see page 12564) instance.

68.1.21.3 TCustomTrayIcon.Destroy Destructor

Frees the memory associated with the TCustomTrayIcon (see page 12564) object.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TCustomTrayIcon();
```

Description

Frees the memory associated with the TCustomTrayIcon (see page 12564) object.

68.1.21.4 TCustomTrayIcon Methods

The methods of the TCustomTrayIcon class are listed here.

Protected Methods

	Name	Description
V	DoOnAnimate (see page 12569)	This is DoOnAnimate, a member of class TCustomTrayIcon.
	GetAnimateInterval (see page 12569)	This is GetAnimateInterval, a member of class TCustomTrayIcon.
	GetBalloonTimeout (see page 12569)	This is GetBalloonTimeout, a member of class TCustomTrayIcon.
	SetAnimate (see page 12570)	This is SetAnimate, a member of class TCustomTrayIcon.

	SetAnimateInterval (see page 12570)	This is SetAnimateInterval, a member of class TCustomTrayIcon.
	SetBalloonHint (see page 12571)	This is SetBalloonHint, a member of class TCustomTrayIcon.
	SetBalloonTimeout (see page 12571)	This is SetBalloonTimeout, a member of class TCustomTrayIcon.
	SetBalloonTitle (see page 12571)	This is SetBalloonTitle, a member of class TCustomTrayIcon.
	SetHint (see page 12571)	This is SetHint, a member of class TCustomTrayIcon.
	SetIcon (see page 12572)	This is SetIcon, a member of class TCustomTrayIcon.
V	SetIconIndex (see page 12572)	This is SetIconIndex, a member of class TCustomTrayIcon.
	SetIconList (see page 12572)	This is SetIconList, a member of class TCustomTrayIcon.
V	SetVisible (see page 12572)	This is SetVisible, a member of class TCustomTrayIcon.
V	WindowProc (see page 12573)	This is WindowProc, a member of class TCustomTrayIcon.

Public Methods

	Name	Description
	Refresh (see page 12570)	This is the overview for the Refresh method overload.
	SetDefaultIcon (see page 12571)	Sets the tray icon to the default application icon.
V	ShowBalloonHint (see page 12573)	Displays the balloon hint.

68.1.21.4.1 TCustomTrayIcon.DoOnAnimate Method

Pascal

```
procedure DoOnAnimate(Sender: TObject); virtual;
```

C++

```
virtual __fastcall DoOnAnimate(TObject * Sender);
```

Description

This is DoOnAnimate, a member of class TCustomTrayIcon.

68.1.21.4.2 TCustomTrayIcon.GetAnimateInterval Method

Pascal

```
function GetAnimateInterval: Cardinal;
```

C++

```
__fastcall unsigned GetAnimateInterval();
```

Description

This is GetAnimateInterval, a member of class TCustomTrayIcon.

68.1.21.4.3 TCustomTrayIcon.GetBalloonTimeout Method

Pascal

```
function GetBalloonTimeout: Integer;
```

C++

```
__fastcall int GetBalloonTimeout();
```

Description

This is GetBalloonTimeout, a member of class TCustomTrayIcon.

68.1.21.4.4 Refresh Method

This is the overview for the Refresh method overload.

Overload List

	Name	Description
	TCustomTrayIcon.Refresh () (see page 12570)	Repaints the tray icon on the screen.
	TCustomTrayIcon.Refresh (Integer) (see page 12570)	Repaints the tray icon on the screen.

68.1.21.4.4.1 TCustomTrayIcon.Refresh Method ()

Repaints the tray icon on the screen.

Pascal

```
function Refresh(Message: Integer): Boolean; overload;
procedure Refresh; overload;
```

C++

```
__fastcall Boolean Refresh(int Message);
__fastcall Refresh();
```

Description

Repaints the tray icon on the screen.

68.1.21.4.5 TCustomTrayIcon.SetAnimate Method

Pascal

```
procedure SetAnimate(Value: Boolean);
```

C++

```
__fastcall SetAnimate(Boolean Value);
```

Description

This is SetAnimate, a member of class TCustomTrayIcon.

68.1.21.4.6 TCustomTrayIcon.SetAnimateInterval Method

Pascal

```
procedure SetAnimateInterval(Value: Cardinal);
```

C++

```
__fastcall SetAnimateInterval(unsigned Value);
```

Description

This is SetAnimateInterval, a member of class TCustomTrayIcon.

68.1.21.4.7 TCustomTrayIcon.SetBalloonHint Method

Pascal

```
procedure SetBalloonHint(const Value: string);
```

C++

```
__fastcall SetBalloonHint(const AnsiString Value);
```

Description

This is SetBalloonHint, a member of class TCustomTrayIcon.

68.1.21.4.8 TCustomTrayIcon.SetBalloonTimeout Method

Pascal

```
procedure SetBalloonTimeout(Value: Integer);
```

C++

```
__fastcall SetBalloonTimeout(int Value);
```

Description

This is SetBalloonTimeout, a member of class TCustomTrayIcon.

68.1.21.4.9 TCustomTrayIcon.SetBalloonTitle Method

Pascal

```
procedure SetBalloonTitle(const Value: string);
```

C++

```
__fastcall SetBalloonTitle(const AnsiString Value);
```

Description

This is SetBalloonTitle, a member of class TCustomTrayIcon.

68.1.21.4.10 TCustomTrayIcon.SetDefaultIcon Method

Sets the tray icon to the default application icon.

Pascal

```
procedure SetDefaultIcon;
```

C++

```
__fastcall SetDefaultIcon();
```

Description

This method sets the tray icon to the default application icon if the Icon (see page 12576) property is unassigned. This method is generally not used.

68.1.21.4.11 TCustomTrayIcon.SetHint Method

Pascal

```
procedure SetHint(const Value: string);
```

C++

```
__fastcall SetHint(const AnsiString Value);
```

Description

This is SetHint, a member of class TCustomTrayIcon.

68.1.21.4.12 TCustomTrayIcon.SetIcon Method

Pascal

```
procedure SetIcon(Value: TIcon);
```

C++

```
__fastcall SetIcon(TIcon Value);
```

Description

This is SetIcon, a member of class TCustomTrayIcon.

68.1.21.4.13 TCustomTrayIcon.SetIconIndex Method

Pascal

```
procedure SetIconIndex(Value: Integer); virtual;
```

C++

```
virtual __fastcall SetIconIndex(int Value);
```

Description

This is SetIconIndex, a member of class TCustomTrayIcon.

68.1.21.4.14 TCustomTrayIcon.SetIconList Method

Pascal

```
procedure SetIconList(Value: TImageList);
```

C++

```
__fastcall SetIconList(TImageList Value);
```

Description

This is SetIconList, a member of class TCustomTrayIcon.

68.1.21.4.15 TCustomTrayIcon.SetVisible Method

Pascal

```
procedure SetVisible(Value: Boolean); virtual;
```

C++

```
virtual __fastcall SetVisible(Boolean Value);
```

Description

This is SetVisible, a member of class TCustomTrayIcon.

68.1.21.4.16 TCustomTrayIcon.ShowBalloonHint Method

Displays the balloon hint.

Pascal

```
procedure ShowBalloonHint; virtual;
```

C++

```
virtual __fastcall ShowBalloonHint();
```

Description

Displays the balloon hint.

68.1.21.4.17 TCustomTrayIcon.WindowProc Method

Pascal

```
procedure WindowProc(var Message: TMessage); virtual;
```

C++

```
virtual __fastcall WindowProc(TMessage Message);
```

Description

This is WindowProc, a member of class TCustomTrayIcon.

68.1.21.5 TCustomTrayIcon Properties

The properties of the TCustomTrayIcon class are listed here.

Protected Properties

	Name	Description
	Data (see page 12575)	This is Data, a member of class TCustomTrayIcon.

Public Properties

	Name	Description
	Animate (see page 12573)	Specifies whether the icon in the system tray is static or animated.
	AnimateInterval (see page 12574)	Controls (see page 5711) the length of time between image changes for the tray icon image.
	BalloonFlags (see page 12574)	Specifies an icon for the balloon hint.
	BalloonHint (see page 12574)	Specifies the text within a balloon hint.
	BalloonTimeout (see page 12575)	Specifies the length of time that the balloon displays.
	BalloonTitle (see page 12575)	Specifies the text that appears as the balloon title.
	Hint (see page 12575)	Specifies the text that appears when the user moves the mouse over the control.
	Icon (see page 12576)	Specifies the default icon shown in the system tray.
	IconIndex (see page 12576)	This is an index into the Icons (see page 12576) image list which is the icon currently being displayed in the system tray.
	Icons (see page 12576)	Specifies the list of images to be displayed for the icon in the system tray.
	PopupMenu (see page 12576)	Identifies the pop-up menu associated with the tray icon.
	Visible (see page 12577)	Determines whether the icon appears in the system tray.

68.1.21.5.1 TCustomTrayIcon.Animate Property

Specifies whether the icon in the system tray is static or animated.

Pascal

```
property Animate: Boolean;
```

C++

```
__property Boolean Animate;
```

Description

When set to True, the icon shown in the system tray displays, in sequence, the images in the image list specified by the Icons (see page 12576) property. The images change only if the specified image list contains images. The images change on a rotating basis by the interval set by the AnimateInterval (see page 12574) property. When set to False the animation stops.

68.1.21.5.2 TCustomTrayIcon.AnimateInterval Property

Controls (see page 5711) the length of time between image changes for the tray icon image.

Pascal

```
property AnimateInterval: Cardinal;
```

C++

```
__property unsigned AnimateInterval;
```

Description

Use AnimateInterval to specify the length of time between image changes in the tray icon. The default interval is 1000 ms (1 second).

68.1.21.5.3 TCustomTrayIcon.BalloonFlags Property

Specifies an icon for the balloon hint.

Pascal

```
property BalloonFlags: TBalloonFlags;
```

C++

```
__property TBalloonFlags BalloonFlags;
```

Description

The following values specify an icon to be displayed in the balloon hint:

- bfNone
- bfInfo
- bfWarning
- bfError

68.1.21.5.4 TCustomTrayIcon.BalloonHint Property

Specifies the text within a balloon hint.

Pascal

```
property BalloonHint: string;
```

C++

```
__property AnsiString BalloonHint;
```

Description

Use BalloonHint to specify the text string that appears when a balloon hint is shown.

68.1.21.5.5 TCustomTrayIcon.BalloonTimeout Property

Specifies the length of time that the balloon displays.

Pascal

```
property BalloonTimeout: Integer;
```

C++

```
__property int BalloonTimeout;
```

Description

Use BalloonTimeout to set the length of time that a balloon displays. By default, this value is set to 3000 ms (3 seconds).

68.1.21.5.6 TCustomTrayIcon.BalloonTitle Property

Specifies the text that appears as the balloon title.

Pascal

```
property BalloonTitle: string;
```

C++

```
__property AnsiString BalloonTitle;
```

Description

Specifies the text that appears as the balloon title.

68.1.21.5.7 TCustomTrayIcon.Data Property

Pascal

```
property Data: TNotifyIconData;
```

C++

```
__property TNotifyIconData Data;
```

Description

This is Data, a member of class TCustomTrayIcon.

68.1.21.5.8 TCustomTrayIcon.Hint Property

Specifies the text that appears when the user moves the mouse over the control.

Pascal

```
property Hint: string;
```

C++

```
__property AnsiString Hint;
```

Description

Specifies the text that appears when the user moves the mouse over the control.

68.1.21.5.9 TCustomTrayIcon.Icon Property

Specifies the default icon shown in the system tray.

Pascal

```
property Icon: TIcon;
```

C++

```
__property TIcon Icon;
```

Description

Use the Icon property to set the default icon to be shown in the system tray. If you do not specify a value, the application icon is used.

68.1.21.5.10 TCustomTrayIcon.IconIndex Property

This is an index into the Icons (see page 12576) image list which is the icon currently being displayed in the system tray.

Pascal

```
property IconIndex: Integer;
```

C++

```
__property int IconIndex;
```

Description

This is an index into the Icons (see page 12576) image list which is the icon currently being displayed in the system tray.

68.1.21.5.11 TCustomTrayIcon.Icons Property

Specifies the list of images to be displayed for the icon in the system tray.

Pascal

```
property Icons: TImageList;
```

C++

```
__property TImageList Icons;
```

Description

Use this property to specify the list of images used for the icon in the system tray. These images are displayed when the Animate (see page 12573) property is set to True.

68.1.21.5.12 TCustomTrayIcon.PopupMenu Property

Identifies the pop-up menu associated with the tray icon.

Pascal

```
property PopupMenu: TPopupMenu;
```

C++

```
__property TPopupMenu PopupMenu;
```

Description

Use PopupMenuOn to specify when the menu is displayed.

68.1.21.5.13 TCustomTrayIcon.Visible Property

Determines whether the icon appears in the system tray.

Pascal

```
property Visible: Boolean;
```

C++

```
__property Boolean Visible;
```

Description

Determines whether the icon appears in the system tray.

68.1.21.6 TCustomTrayIcon Events

The events of the TCustomTrayIcon class are listed here.

Public Events

	Name	Description
	OnAnimate (see page 12577)	Occurs each time the icon changes when the tray icon is animating.
	OnClick (see page 12577)	Occurs when the user clicks the tray icon.
	OnDblClick (see page 12578)	Occurs when the user double clicks the tray icon.
	OnMouseDown (see page 12578)	Occurs when the user presses a mouse button while the mouse pointer is over a control.
	OnMouseMove (see page 12578)	Occurs when the user moves the mouse pointer while the mouse pointer is over the tray icon.
	OnMouseUp (see page 12578)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.

68.1.21.6.1 TCustomTrayIcon.OnAnimate Event

Occurs each time the icon changes when the tray icon is animating.

Pascal

```
property OnAnimate: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnAnimate;
```

Description

Occurs each time the icon changes when the tray icon is animating.

68.1.21.6.2 TCustomTrayIcon.OnClick Event

Occurs when the user clicks the tray icon.

Pascal

```
property OnClick: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnClick;
```

Description

Occurs when the user clicks the tray icon.

68.1.21.6.3 TCustomTrayIcon.OnDblClick Event

Occurs when the user double clicks the tray icon.

Pascal

```
property OnDblClick: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnDblClick;
```

Description

Occurs when the user double clicks the tray icon.

68.1.21.6.4 TCustomTrayIcon.OnMouseDown Event

Occurs when the user presses a mouse button while the mouse pointer is over a control.

Pascal

```
property OnMouseDown: TMouseEvent;
```

C++

```
__property TMouseEvent OnMouseDown;
```

Description

Occurs when the user presses a mouse button while the mouse pointer is over a control.

68.1.21.6.5 TCustomTrayIcon.OnMouseMove Event

Occurs when the user moves the mouse pointer while the mouse pointer is over the tray icon.

Pascal

```
property OnMouseMove: TMouseMoveEvent;
```

C++

```
__property TMouseMoveEvent OnMouseMove;
```

Description

Occurs when the user moves the mouse pointer while the mouse pointer is over the tray icon.

68.1.21.6.6 TCustomTrayIcon.OnMouseUp Event

Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.

Pascal

```
property OnMouseUp: TMouseEvent;
```

C++

```
__property TMouseEvent OnMouseUp;
```

Description

Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.

68.1.22 TFlowPanel Class

TFlowPanel implements a flow panel control in which components are placed in pre-defined locations.

Class Hierarchy

Pascal

```
TFlowPanel = class(TCustomFlowPanel);
```

C++

```
class TFlowPanel : public TCustomFlowPanel;
```

File

ExtCtrls

Description

Use TFlowPanel to put an empty flow panel on a form. The major difference between a traditional panel and a flow panel is the way in which controls are placed. With a traditional panel, you place a control (such as a button) in a specific location. You can freely move that control to any location within the panel using the mouse. In a flow panel, each control is placed in a specific location, regardless of where you place it with the mouse. The automatic location is controlled by the FlowStyle (see page 12610) property. For example, using the default FlowStyle (see page 12610) property of LeftRightTopBottom, the first control you add to the flow panel snaps to the top left corner. The second control that you add snaps next to the first control, and so on.

See Also

TPanel (see page 13032)

68.1.22.1 TFlowPanel Members

The following tables list the members exposed by TFlowPanel.

Protected Events

	Name	Description
	OnKeyDown (see page 6225)	Occurs when a user presses any key while the control has focus.
	OnKeyPress (see page 6227)	Occurs when a key is pressed.
	OnKeyUp (see page 6228)	Occurs when the user releases a key that has been pressed.
	OnMouseWheel (see page 5869)	Occurs when the mouse wheel is rotated.
	OnMouseWheelDown (see page 5869)	Occurs when the mouse wheel is rotated downward.
	OnMouseWheelUp (see page 5870)	Occurs when the mouse wheel is rotated upward.

Protected Fields

	Name	Description
	FAnchorMove (see page 5733)	This is FAnchorMove, a member of class TControl.
	FAnchorOrigin (see page 5734)	This is FAnchorOrigin, a member of class TControl.

	FAnchorRules (see page 5734)	This is FAnchorRules, a member of class TControl.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FDesignSize (see page 6124)	This is FDesignSize, a member of class TWinControl.
	FDoubleBuffered (see page 6124)	This is FDoubleBuffered, a member of class TWinControl.
	FExplicitHeight (see page 5734)	This is FExplicitHeight, a member of class TControl.
	FExplicitLeft (see page 5734)	This is FExplicitLeft, a member of class TControl.
	FExplicitTop (see page 5734)	This is FExplicitTop, a member of class TControl.
	FExplicitWidth (see page 5735)	This is FExplicitWidth, a member of class TControl.
	FInImeComposition (see page 6125)	This is FInImeComposition, a member of class TWinControl.
	FOriginalParentSize (see page 5735)	This is FOriginalParentSize, a member of class TControl.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	ActionChange (see page 5737)	Responds when the action associated with the control changes.
V	ActionChange (see page 6127)	Updates the control to reflect changes in its associated action.
	AddBiDiModeExStyle (see page 6128)	Sets control's window style according to its bi-directional support.
V	AdjustClientRect (see page 6128)	Provides the interface that adjusts the ClientRect (see page 5810) property for idiosyncrasies of the window.
V	AdjustClientRect (see page 12537)	Adjusts the ClientRect property for the idiosyncrasies of the window.
	AdjustSize (see page 5738)	Sets the size of the control as determined by the AutoSize (see page 5803) property.
V	AdjustSize (see page 6129)	Adjusts the control's size according to its contents and constraints.
V	AlignControls (see page 6129)	Aligns any controls for which the control is the parent within a specified area of the control.
V	AlignControls (see page 12487)	Aligns any controls for which the control is the parent within a specified area of the control.
	ArrangeControl (see page 6130)	This is ArrangeControl, a member of class TWinControl.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	AssignTo (see page 5739)	Overrides the inherited AssignTo function to enable assignments to TAction objects.
V	AssignTo (see page 6130)	Copies the properties of the windowed control to another object.
	BeginAutoDrag (see page 5739)	Begin Automatic Drag.
	CalcCursorPos (see page 5741)	This is CalcCursorPos, a member of class TControl.
V	CanAutoSize (see page 5741)	Indicates whether the control can resize itself automatically to accommodate its contents.
V	CanAutoSize (see page 6131)	Indicates how the control can be resized.
V	CanAutoSize (see page 12537)	Adjusts the way the panel responds to resize attempts.
V	CanResize (see page 5742)	OnCanResize (see page 5851) event dispatcher.
V	CanResize (see page 6132)	Indicates how the control can respond to a resize attempt.
	Changed (see page 5742)	Sends a CM_CHANGED (see page 6330) message to the control.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	ChangeScale (see page 5743)	Rescaling event dispatcher.
V	ChangeScale (see page 6132)	Resize (see page 5780) and reposition children and self.
	Click (see page 5743)	Respond to user click.
V	ConstrainedResize (see page 5746)	Notify control of resize with constraints.
V	ConstrainedResize (see page 6133)	Generates an OnConstrainedResize (see page 5853) event.
	ControlsAligned (see page 6134)	This is ControlsAligned, a member of class TWinControl.
	CreateDockManager (see page 6134)	Creates the dock manager for the control.
V	CreateHandle (see page 6135)	Creates underlying screen object.
V	CreateParams (see page 6135)	Initializes a window-creation parameter data structure.
V	CreateParams (see page 12537)	Initializes a window-creation parameter record passed in the Params parameter.
	CreateSubClass (see page 6136)	Creates a windowed control derived from an existing Windows window class.
V	CreateWindowHandle (see page 6137)	Creates a Windows control to represent the control.
V	CreateWnd (see page 6137)	Creates the underlying window.

	CustomAlignInsertBefore (see page 6137)	Returns placement order of custom-aligned child control.
	CustomAlignPosition (see page 6138)	Returns aligned position of custom-aligned child control.
	DblClick (see page 5747)	OnDblClick (see page 5854) event dispatcher.
	DefaultDockImage (see page 5747)	Handles the painting and erasing of a dock image.
	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	DefineProperties (see page 5748)	Provides methods to read and write the IsControl (see page 5829) property to a stream such as a form file.
	DefineProperties (see page 6139)	Provides methods to read and write the IsControl property to a stream such as a form file.
	DesignWndProc (see page 5749)	This is DesignWndProc, a member of class TControl.
	DestroyHandle (see page 6140)	Destroys the control's window without destroying the control.
	DestroyWindowHandle (see page 6140)	Destroys the window created in the CreateWindowHandle (see page 6137) method.
	DestroyWnd (see page 6141)	Destroys the control's window.
	DoAddDockClient (see page 6142)	Performs actions when a control is docked to the windowed control.
	DockOver (see page 6143)	Responds when a docking client is dragged over the windowed control.
	DockReplaceDockClient (see page 6143)	This is DockReplaceDockClient, a member of class TWinControl.
	DockTrackNoTarget (see page 5749)	Handles dragging of the control over an invalid docking target.
	DoContextPopup (see page 5750)	OnContextPopup (see page 5854) event dispatcher.
	DoDock (see page 5750)	Docking event dispatcher.
	DoDockOver (see page 6143)	Generates an OnDockOver (see page 6216) event.
	DoEndDock (see page 5750)	OnEndDock (see page 5859) event dispatcher.
	DoEndDrag (see page 5751)	OnEndDrag (see page 5860) event dispatcher.
	DoEnter (see page 6144)	Respond to receiving input focus.
	DoExit (see page 6144)	Respond to losing input focus
	DoFlipChildren (see page 6145)	Flips the control's children.
	DoKeyDown (see page 6145)	Performs some preprocessing before generating an OnKeyDown (see page 6225) event.
	DoKeyPress (see page 6146)	Performs some preprocessing before generating an OnKeyPress (see page 6227) event.
	DoKeyUp (see page 6146)	Performs some preprocessing before generating an OnKeyUp (see page 6228) event.
	DoMouseWheel (see page 5751)	Processes mouse wheel motion.
	DoMouseWheelDown (see page 5752)	OnMouseWheelDown (see page 5869) event dispatcher.
	DoMouseWheelUp (see page 5752)	OnMouseWheelUp (see page 5870) event dispatcher.
	DoRemoveDockClient (see page 6147)	Responds when a control is undocked from the windowed control.
	DoStartDock (see page 5753)	OnStartDock (see page 5871) event dispatcher.
	DoStartDrag (see page 5753)	OnStartDrag (see page 5871) event dispatcher.
	DoUnDock (see page 6147)	Undocks a control that is currently docked to the windowed control.
	DragCanceled (see page 5754)	Provides the interface for a method that responds to the cancellation of a drag.
	DragOver (see page 5755)	OnDragOver (see page 5857) event dispatcher.
	DrawDragDockImage (see page 5755)	Draws the dock image for the control.
	EraseDragDockImage (see page 5757)	Erases the dock image for the control.
	FindNextControl (see page 6149)	Returns the control's next child in the tab order after the specified control.
	FixupTabList (see page 6149)	Sorts the child controls by their tab order.
	GetAction (see page 5758)	This is GetAction, a member of class TControl.
	GetActionLinkClass (see page 5758)	Returns the appropriate action link class that is associated with the control class.
	GetActionLinkClass (see page 6152)	Returns the associated action link class.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetChildren (see page 6153)	Calls a specified method for each child of the control.
	GetClientOrigin (see page 5758)	Returns the screen coordinates of the top-left corner of the control's client area.

	GetClientOrigin (see page 6153)	Returns the value of the ClientOrigin (see page 5809) property.
	GetClientRect (see page 5759)	Returns a rectangle defining the client area of the control.
	GetClientRect (see page 6154)	Returns the value of the ClientRect (see page 5810) property.
	GetControlExtents (see page 6154)	Returns the smallest rectangle in which all the control's children fit.
	GetDeviceContext (see page 5760)	Returns a device context for the control.
	GetDeviceContext (see page 6155)	Provides access to a device context for the control.
	GetDockEdge (see page 5763)	Returns the edge on which another control should be docked when it is dragged over the control.
	GetDragImages (see page 5763)	Returns the control's image list containing the image to be displayed while dragging.
	GetEnabled (see page 5763)	Returns the value of the Enabled (see page 5821) property.
	GetFloating (see page 5764)	Returns the value of the Floating (see page 5823) property.
	GetFloatingDockSiteClass (see page 5764)	Returns the class used for the control when it is floating.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetPalette (see page 5765)	Returns the handle to a palette for use by the control.
	GetParentHandle (see page 6157)	Returns the window handle for the window of the control's parent.
	GetPopupMenu (see page 5765)	Returns the pop-up menu associated with the control.
	GetSiteInfo (see page 6158)	Generates an OnGetSiteInfo (see page 6223) event
	GetTopParentHandle (see page 6159)	Returns the window handle of the first window not associated with a VCL control that contains the windowed control.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	InvalidateDockHostSite (see page 6162)	This is InvalidateDockHostSite, a member of class TWinControl.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsControlActivateMsg (see page 6162)	This is IsControlActivateMsg, a member of class TWinControl.
	IsControlMouseMsg (see page 6162)	Indicates whether a specified mouse message is directed to one of the windowed control's child controls.
	IsQualifyingSite (see page 6163)	This is IsQualifyingSite, a member of class TWinControl.
	KeyDown (see page 6163)	Respond to key press events.
	KeyPress (see page 6163)	Respond to keyboard input.
	KeyUp (see page 6164)	Respond to released key.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Loaded (see page 5771)	Initializes the control after it is loaded from a stream.
	MainWndProc (see page 6165)	Receives Windows messages for the control.
	MouseActivate (see page 5773)	This is MouseActivate, a member of class TControl.
	MouseDown (see page 5773)	OnMouseDown (see page 5862) event dispatcher.
	MouseMove (see page 5773)	Respond to mouse moving over control area..
	MouseUp (see page 5774)	OnMouseUp (see page 5867) event dispatcher.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	Notification (see page 5775)	Responds to notifications that components are being created or destroyed.
	Notification (see page 6165)	Responds to notifications that components are being created or destroyed.
	NotifyControls (see page 6165)	Sends a message to all the child controls.
	Paint (see page 5920)	Renders the image of a custom control.
	Paint (see page 12538)	Renders the image of the panel.
	PaintControls (see page 6166)	Paints each of the child controls in a windowed control using the specified device context.
	PaintHandler (see page 6166)	Responds to WM_PAINT messages.
	PaintWindow (see page 5920)	Renders the image of the control on a specified device context.
	PaintWindow (see page 6169)	Renders the image of a windowed control.
	PaletteChanged (see page 5775)	Responds to changes in the system's palette by realizing the control's palette.
	PaletteChanged (see page 6170)	Responds to changes in the system's palette by realizing the control's palette and the palette for each child control.

	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	PositionDockRect (see page 5777)	Positions the docking rectangle according to the current drag-and-dock state.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 5778)	Prepares the control for having its properties assigned values read from a stream.
V	ReadState (see page 6171)	Prepares the control for having its properties assigned values from a stream.
	RecreateWnd (see page 6171)	Recreate underlying Windows screen object.
	ReloadDockedControl (see page 6172)	Reloads a docked control.
	RemoveWindowProps (see page 6174)	This is RemoveWindowProps, a member of class TWinControl.
V	RequestAlign (see page 5780)	Instructs the parent of a control to reposition the control, enforcing its Align (see page 5798) property.
	ResetIme (see page 6174)	Restores the input method editor (IME) that was active when the application started.
	ResetImeComposition (see page 6175)	Directs the composition window of the input method editor (IME) to perform a specific action.
	Resize (see page 5780)	Respond to control resize.
	ScaleConstraints (see page 5781)	This is ScaleConstraints, a member of class TControl.
	ScaleControls (see page 6176)	Rescale child controls only.
	SelectFirst (see page 6177)	Locates first selectable child control.
	SelectNext (see page 6177)	Moves the input focus from the current child control to the next one in the tab order.
	SendCancelMode (see page 5781)	Cancels the modal state of the control.
	SendDockNotification (see page 5782)	Sends a Windows message to the control's host dock site.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
V	SetAutoSize (see page 5783)	This is SetAutoSize, a member of class TControl.
V	SetBiDiMode (see page 5783)	Sets the control's bi-directional mode.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
V	SetChildOrder (see page 6178)	Changes the order in which the child component appears in the list of child components returned by the GetChildren (see page 6153) method.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
V	SetDragMode (see page 5785)	Sets the drag mode for the control.
V	SetEnabled (see page 5785)	Sets the value of the Enabled (see page 5821) property.
	SetIme (see page 6181)	Activates an input method editor (IME) using the values specified by the ImeMode (see page 6207) and ImeName (see page 6208) properties.
	SetImeCompositionWindow (see page 6181)	Sets the position and font of the composition window.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
V	SetName (see page 5785)	Sets the name of the control.
V	SetParent (see page 5786)	Sets the parent of the control.
V	SetParent (see page 6182)	Sets the parent of the control.
V	SetParentBackground (see page 6182)	This is SetParentBackground, a member of class TWinControl.
V	SetParentBackground (see page 12539)	This is SetParentBackground, a member of class TCustomPanel.
V	SetParentBiDiMode (see page 5786)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 5787)	Sets the parent for the control.
	SetZOrder (see page 5788)	Repositions the control in its parent's control list, thereby changing position onscreen.
V	SetZOrder (see page 6182)	Moves the control to the top or bottom of the parent control's (or screen's) list of TWinControl (see page 6112) controls.
V	ShowControl (see page 6183)	Ensures that a specified child control is visible.
	UpdateBounds (see page 6185)	This is UpdateBounds, a member of class TWinControl.
	UpdateBoundsRect (see page 5789)	Changes the Top (see page 5844), Left (see page 5830), Width (see page 5849), and Height (see page 5825) properties of the control, but doesn't update its screen image and bypasses all resize events.
V	UpdateControlOriginalParentSize (see page 6186)	This is UpdateControlOriginalParentSize, a member of class TWinControl.

	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateExplicitBounds (see page 5789)	This is UpdateExplicitBounds, a member of class TControl.
	UpdateRecreatingFlag (see page 6186)	This is UpdateRecreatingFlag, a member of class TWinControl.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	UpdateUIState (see page 6186)	Updates form User Interface State as needed
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	VisibleChanging (see page 5791)	Provides the interface for a method that responds to changes in the control's visibility.
V	WndProc (see page 5791)	Provides specific message responses for the control.
V	WndProc (see page 6187)	Provides specific message responses for the control.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	ActionLink (see page 5798)	Contains the action link object associated with the control.
R	Canvas (see page 5921)	Specifies the TCanvas object that presents a drawing surface for the control.
	DefWndProc (see page 6199)	Specifies the default window procedure for the windowed control.
	DesktopFont (see page 5818)	Specifies whether the control uses the Windows icon font when writing text.
	ImeMode (see page 6207)	Determines the behavior of the input method editor (IME).
	ImeName (see page 6208)	Specifies the input method editor (IME) to use for converting keyboard input to Asian language characters.
	IsControl (see page 5829)	Determines whether a form stores its form-specific properties to a stream.
	MouseCapture (see page 5831)	Indicates whether the control has "captured" mouse events.
	ScalingFlags (see page 5840)	Reflects which attributes of the control have been scaled.
	Text (see page 5842)	Contains a text string associated with the control.
	WheelAccumulator (see page 5849)	Accumulates mouse wheel rotations.
	WindowHandle (see page 6212)	Provides access to a window handle for the control.
	WindowText (see page 5850)	Contains the text string of the control.

Public Events

	Name	Description
	WindowProc (see page 5872)	Points to the window procedure that responds to messages sent to the control.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	BeginDrag (see page 5740)	Starts the dragging of a control.
	BringToFront (see page 5740)	Puts the control in front of all other controls in its parent control.
	Broadcast (see page 6130)	Sends a message to each of the child controls.
	CanFocus (see page 6131)	Indicates whether a control can receive focus.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.

	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	ClientToParent (see page 5744)	Translates client coordinates to parent coordinates.
	ClientToScreen (see page 5744)	Translates a given point from client area coordinates to global screen coordinates.
	ContainsControl (see page 6133)	Indicates whether a specified control exists within the control.
	ControlAtPos (see page 6133)	Returns the child control located at a specified position within the control.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
V	Create (see page 5731)	Creates an instance of TControl (see page 5724).
V	Create (see page 5918)	Creates an instance of TCustomControl (see page 5908).
V	Create (see page 6123)	Creates an instance of TWinControl (see page 6112).
V	Create (see page 12486)	Creates and initializes an instance of TCustomPanel.
V	Create (see page 12536)	Creates and initializes an instance of TCustomPanel (see page 12525).
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	CreateParented (see page 6123)	Creates and initializes a control as the child of a specified non-VCL container.
	CreateParentedControl (see page 6136)	Creates and initializes a control as the child of a specified non-VCL window.
V	DefaultHandler (see page 5748)	Provides message handling for all messages that do not have specific handlers.
V	DefaultHandler (see page 6139)	Provides message handling for all messages that the control does not fully process itself.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 5732)	Destroys an instance of TControl (see page 5724).
V	Destroy (see page 5919)	Destroys an instance of TCustomControl (see page 5908).
V	Destroy (see page 6124)	Destroys an instance of TWinControl (see page 6112).
V	Destroy (see page 12486)	Destroys an instance of TCustomControl.
V	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	DisableAlign (see page 6141)	Disables the realignment of child controls.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Dock (see page 5749)	Used internally to dock the control.
	DockDrop (see page 6142)	Generates an OnDockDrop (see page 6214) event.
	DragDrop (see page 5754)	OnDragDrop (see page 5855) event dispatcher.
	Dragging (see page 5754)	Indicates whether a control is being dragged.
	DrawTextBiDiModeFlags (see page 5756)	Returns the text flags that reflect the current setting of the BiDiMode (see page 5803) property.
	DrawTextBiDiModeFlagsReadingOnly (see page 5756)	Returns the text flag to add that indicates whether the control's text should read from right to left.
	EnableAlign (see page 6148)	Decrements the reference count incremented by the DisableAlign (see page 6141) method, eventually realigning the child controls.
	EndDrag (see page 5757)	Stops a control from being dragged any further.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindChildControl (see page 6148)	Returns a child control given its name.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FlipChildren (see page 6150)	Reverses the positions of child controls.
	Focused (see page 6150)	Determines whether the control has input focus.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.

	GetChildren (see page 12487)	Calls a specified method for each child of the control.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetControlIndex (see page 12488)	This is GetControlIndex, a member of class TCustomFlowPanel.
	GetControlsAlignment (see page 5759)	Indicates how text is aligned within the control.
	GetControlsAlignment (see page 12538)	Returns the alignment of text in the panel.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetParentComponent (see page 5765)	Returns the parent of the control.
	GetTabOrderList (see page 6158)	Builds a list of controls in tab order.
	GetTextBuf (see page 5766)	Retrieves the control's text, copies it into a buffer, and returns the number of characters copied.
	GetTextLen (see page 5767)	Returns the length of the control's text.
	HandleAllocated (see page 6159)	Reports whether a screen object handle exists for the control.
	HandleNeeded (see page 6160)	Creates a screen object for the control if it doesn't already exist.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	HasParent (see page 5768)	Indicates whether the control has a parent.
	Hide (see page 5769)	Makes the control invisible.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitiateAction (see page 5769)	Calls the action link's Update (see page 5789) method if the control is associated with an action link.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InsertControl (see page 6160)	Inserts a control into the Controls (see page 6197) array property.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	Invalidate (see page 5770)	Completely repaint control.
	Invalidate (see page 6161)	Schedules a control repaint.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	IsRightToLeft (see page 5770)	Indicates whether the control should be reversed right to left.
	ManualDock (see page 5771)	Docks the control.
	ManualFloat (see page 5772)	Undocks the control.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	MouseWheelHandler (see page 5774)	Dispatches messages received from a mouse wheel.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	PaintTo (see page 6167)	This is the overview for the PaintTo method overload.
	ParentToClient (see page 5776)	Translate parent coordinates to client coordinates.
	Perform (see page 5776)	Responds as if the control received a specified Windows message.
	PreProcessMessage (see page 6170)	This is PreProcessMessage, a member of class TWinControl.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	Realign (see page 6171)	Forces the control to realign children.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	Refresh (see page 5779)	Repaints the control on the screen.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveControl (see page 6172)	Removes a specified control from the Controls (see page 6197) array.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
	Repaint (see page 5779)	Forces the control to repaint its image on the screen.

V	Repaint (see page 6174)	Repaints the entire control.
	ReplaceDockedControl (see page 5779)	Docks the control in the place where another control is already docked.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	ScaleBy (see page 6175)	Rescale control and its children.
	ScreenToClient (see page 5781)	Converts the screen coordinates of a specified point on the screen to client coordinates.
	ScrollBy (see page 6176)	Scroll control contents.
	SendToBack (see page 5782)	Puts a windowed control behind all other windowed controls, or puts a non-windowed control behind all other non-windowed controls.
V	SetBounds (see page 5783)	Sets the Left (see page 5830), Top (see page 5844), Width (see page 5849), and Height (see page 5825) properties all at once.
V	SetBounds (see page 6178)	Sets the windowed control's boundary properties all at once.
	SetControlIndex (see page 12488)	This is SetControlIndex, a member of class TCustomFlowPanel.
	SetDesignVisible (see page 5784)	Makes a control visible at design time.
V	SetDesignVisible (see page 6178)	Makes a control visible at design time.
V	SetFocus (see page 6179)	Gives the input focus to the control.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	SetTextBuf (see page 5787)	Sets the text of the control.
	Show (see page 5788)	Makes a control visible.
V	Update (see page 5789)	Processes any pending paint messages immediately.
V	Update (see page 6183)	Forces the control to update.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	UpdateControlState (see page 6186)	Respond to state change.
	UseRightToLeftAlignment (see page 5790)	Specifies whether the control's alignment should be reversed right-to-left.
	UseRightToLeftReading (see page 5790)	Specifies whether the control is using a right-to-left reading order.
	UseRightToLeftScrollBar (see page 5791)	Specifies whether the vertical scroll bar appears on the left side of the control.

Public Properties

	Name	Description
	Action (see page 5797)	Designates the action associated with the control.
R	AlignDisabled (see page 6192)	Indicates child control realignment disabled.
	BoundsRect (see page 5803)	Specifies the bounding rectangle of the control, expressed in the coordinate system of the parent control.
R	Brush (see page 6195)	Determines the color and pattern used for painting the background of the control.
	ClientHeight (see page 5808)	Specifies the height of the control's client area in pixels.
R	ClientOrigin (see page 5809)	Specifies the screen coordinates (in pixels) of the top left corner of a control's client area.
R	ClientRect (see page 5810)	Specifies the size (in pixels) of a control's client area.
	ClientWidth (see page 5811)	Specifies the horizontal size of the control's client area in pixels.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
R	ControlCount (see page 6195)	Returns the number of child controls.
R	Controls (see page 6197)	Lists all child controls.
	ControlState (see page 5813)	Indicates the current state of a control at runtime.
	ControlStyle (see page 5814)	Determines style characteristics of the control.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	DockClientCount (see page 6199)	Specifies the number of controls that are docked on the windowed control.
R	DockClients (see page 6201)	Lists the controls that are docked to the windowed control.
	DockManager (see page 6202)	Specifies the control's docking manager interface.

	DockOrientation (see page 5818)	Specifies how the control is docked relative to other controls docked in the same parent.
	DoubleBuffered (see page 6205)	Determines whether the control's image is rendered directly to the window or painted to an in-memory bitmap first.
R	ExplicitHeight (see page 5821)	Specifies the explicit vertical size of the control in pixels.
R	ExplicitLeft (see page 5822)	Specifies the explicit horizontal pixel coordinate of the left edge of a component relative to its parent.
R	ExplicitTop (see page 5822)	Specifies the explicit vertical pixel coordinate of the top edge of a component relative to its parent.
R	ExplicitWidth (see page 5822)	Specifies the explicit horizontal size of the control in pixels.
R	Floating (see page 5823)	Indicates whether the control is floating.
	FloatingDockSiteClass (see page 5823)	Specifies the class of the temporary control that hosts the control when it is floating.
R	Handle (see page 6207)	Provides access to the underlying Windows screen object for the control.
	HostDockSite (see page 5829)	Specifies the control in which the control is docked.
	LRDockWidth (see page 5831)	Specifies the width of the control when it is docked horizontally.
R	MouseInClient (see page 6209)	This is MouseInClient, a member of class TWinControl.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Parent (see page 5832)	Indicates the parent of the control.
	ParentWindow (see page 6210)	Reference to parent's underlying control.
R	Showing (see page 6210)	Indicates whether the control is showing on the screen.
	TBDockHeight (see page 5842)	Specifies the height of the control when it is docked vertically.
	UndockHeight (see page 5845)	Specifies the height of the control when it is floating.
	UndockWidth (see page 5846)	Specifies the width of the control when it is floating.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
R	VisibleDockClientCount (see page 6212)	Specifies the number of visible controls that are docked on the windowed control.

Published Events

	Name	Description
	OnAlignInsertBefore (see page 12626)	Occurs when an object with custom alignment is aligned.
	OnAlignPosition (see page 12626)	Occurs when an object with custom alignment is aligned.
	OnCanResize (see page 12627)	Occurs when an attempt is made to resize the control.
	OnClick (see page 12627)	Occurs when the user clicks the control.
	OnConstrainedResize (see page 12629)	Adjust resize constraints.
	OnContextPopup (see page 12630)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnDblClick (see page 12631)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDockDrop (see page 12631)	Occurs when another control is docked to the control.
	OnDockOver (see page 12633)	Occurs when another control is dragged over the control.
	OnDragDrop (see page 12635)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 12637)	Occurs when the user drags an object over a control.
	OnEndDock (see page 12640)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 12640)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnEnter (see page 12641)	Occurs when a control receives the input focus.
	OnExit (see page 12643)	Occurs when the input focus shifts away from one control to another.
	OnGetSiteInfo (see page 12645)	Returns the control's docking information.
	OnMouseActivate (see page 12647)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 12648)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseEnter (see page 12650)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 12651)	Occurs when the user moves the mouse outside of a control.
	OnMouseMove (see page 12651)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.

	OnMouseUp (see page 12653)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnResize (see page 12655)	Occurs immediately after the control is resized.
	OnStartDock (see page 12656)	Occurs when the user begins to drag a control with a DragKind of dkDock.
	OnStartDrag (see page 12657)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.
	OnUnDock (see page 12657)	Occurs when the application tries to undock a control that is docked to the windowed control.

Published Properties

	Name	Description
	Align (see page 12591)	Determines how the control aligns within its container (parent control).
	Alignment (see page 12594)	Determines how the caption is aligned within the panel.
	AlignWithMargins (see page 5802)	Indicates whether a control should be constrained by margins.
	Anchors (see page 12595)	Specifies how the control is anchored to its parent.
	AutoSize (see page 12595)	Specifies whether the control sizes itself automatically to accommodate its contents.
	AutoWrap (see page 12596)	Specifies whether controls are automatically wrapped to fit on the flow panel.
	BevelEdges (see page 12596)	Specifies which edges of the control are beveled.
	BevelInner (see page 12596)	Determines the style of the inner bevel of a panel.
	BevelKind (see page 12597)	Specifies the control's bevel style.
	BevelOuter (see page 12598)	Determines the style of the outer bevel of a panel.
	BevelWidth (see page 12599)	Determines the width, in pixels, of both the inner and outer bevels of a panel.
	BiDiMode (see page 12600)	Specifies the bi-directional mode for the control.
	BorderStyle (see page 12600)	Determines the style of the line drawn around the perimeter of the panel control.
	BorderWidth (see page 12601)	Specifies the distance, in pixels, between the outer and inner bevels.
	Caption (see page 12602)	Specifies a text string that identifies the control to the user.
	Color (see page 12605)	Specifies the background color of the control.
	Constraints (see page 12605)	Specifies the size constraints for the control.
	Ctl3D (see page 12606)	Determines whether a control has a three-dimensional (3-D) or two-dimensional look.
	Cursor (see page 5815)	Specifies the image used to represent the mouse pointer when it passes into the region covered by the control.
	DockSite (see page 12606)	Specifies whether the control can be the target of drag-and-dock operations.
	DragCursor (see page 12607)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 12608)	Specifies whether the control is being dragged normally or for docking.
	DragMode (see page 12608)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	Enabled (see page 12610)	Controls whether the control responds to mouse, keyboard, and timer events.
	FlowStyle (see page 12610)	Specifies the starting point and direction for controls added to a flow panel.
	Font (see page 12611)	Controls the attributes of text written on or in the control.
	FullRepaint (see page 12612)	Determines how the panel repaints itself when it is resized.
	Height (see page 5825)	Specifies the vertical size of the control in pixels.
	HelpContext (see page 5826)	Numeric ID for control's context-sensitive help topic
	HelpKeyword (see page 5826)	Keyword for control's context-sensitive help topic
	HelpType (see page 5827)	Indicates whether the control's context sensitive help topic is identified by context ID or by keyword.
	Hint (see page 5827)	Contains the text string that can appear when the user moves the mouse over the control.
	Left (see page 5830)	Specifies the horizontal coordinate of the left edge of a component relative to its parent.
	Locked (see page 12612)	Determines whether a panel that is used as a toolbar is replaced by a toolbar supplied by an OLE server.
	Margins (see page 5831)	Specifies the margins for the control.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Padding (see page 12613)	Specifies the padding of a control.
	ParentBackground (see page 12613)	Determines whether control uses parent's theme background.
	ParentBiDiMode (see page 12613)	Specifies whether the control uses its parent's BiDiMode.

	ParentColor (see page 12614)	Determines where a control looks for its color information.
	ParentCtl3D (see page 12614)	Determines where a component looks to determine if it should appear three dimensional.
	ParentFont (see page 12614)	Determines where a control looks for its font information.
	ParentShowHint (see page 12615)	Determines where a control looks to find out if its Help Hint should be shown.
	PopupMenu (see page 12616)	Identifies the pop-up menu associated with the control.
	ShowHint (see page 12620)	Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.
	TabOrder (see page 12622)	Indicates the position of the control in its parent's tab order.
	TabStop (see page 12622)	Determines if the user can tab to a control.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Top (see page 5844)	Specifies the Y coordinate of the top left corner of a control, relative to its parent or containing control in pixels.
	UseDockManager (see page 12623)	Specifies whether the docking manager is used in drag-and-dock operations.
	VerticalAlignment (see page 12623)	Sets the vertical position of the caption.
	Visible (see page 12623)	Determines whether the component appears onscreen.
	Width (see page 5849)	Specifies the horizontal size of the control or form in pixels.

68.1.22.2 TFlowPanel Properties

The properties of the TFlowPanel class are listed here.

Published Properties

	Name	Description
	Align (see page 12591)	Determines how the control aligns within its container (parent control).
	Alignment (see page 12594)	Determines how the caption is aligned within the panel.
	Anchors (see page 12595)	Specifies how the control is anchored to its parent.
	AutoSize (see page 12595)	Specifies whether the control sizes itself automatically to accommodate its contents.
	AutoWrap (see page 12596)	Specifies whether controls are automatically wrapped to fit on the flow panel.
	BevelEdges (see page 12596)	Specifies which edges of the control are beveled.
	BevelInner (see page 12596)	Determines the style of the inner bevel of a panel.
	BevelKind (see page 12597)	Specifies the control's bevel style.
	BevelOuter (see page 12598)	Determines the style of the outer bevel of a panel.
	BevelWidth (see page 12599)	Determines the width, in pixels, of both the inner and outer bevels of a panel.
	BiDiMode (see page 12600)	Specifies the bi-directional mode for the control.
	BorderStyle (see page 12600)	Determines the style of the line drawn around the perimeter of the panel control.
	BorderWidth (see page 12601)	Specifies the distance, in pixels, between the outer and inner bevels.
	Caption (see page 12602)	Specifies a text string that identifies the control to the user.
	Color (see page 12605)	Specifies the background color of the control.
	Constraints (see page 12605)	Specifies the size constraints for the control.
	Ctl3D (see page 12606)	Determines whether a control has a three-dimensional (3-D) or two-dimensional look.
	DockSite (see page 12606)	Specifies whether the control can be the target of drag-and-dock operations.
	DragCursor (see page 12607)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 12608)	Specifies whether the control is being dragged normally or for docking.
	DragMode (see page 12608)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	Enabled (see page 12610)	Controls whether the control responds to mouse, keyboard, and timer events.
	FlowStyle (see page 12610)	Specifies the starting point and direction for controls added to a flow panel.
	Font (see page 12611)	Controls the attributes of text written on or in the control.
	FullRepaint (see page 12612)	Determines how the panel repaints itself when it is resized.
	Locked (see page 12612)	Determines whether a panel that is used as a toolbar is replaced by a toolbar supplied by an OLE server.
	Padding (see page 12613)	Specifies the padding of a control.

	ParentBackground (see page 12613)	Determines whether control uses parent's theme background.
	ParentBiDiMode (see page 12613)	Specifies whether the control uses its parent's BiDiMode.
	ParentColor (see page 12614)	Determines where a control looks for its color information.
	ParentCtl3D (see page 12614)	Determines where a component looks to determine if it should appear three dimensional.
	ParentFont (see page 12614)	Determines where a control looks for its font information.
	ParentShowHint (see page 12615)	Determines where a control looks to find out if its Help Hint should be shown.
	PopupMenu (see page 12616)	Identifies the pop-up menu associated with the control.
	ShowHint (see page 12620)	Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.
	TabOrder (see page 12622)	Indicates the position of the control in its parent's tab order.
	TabStop (see page 12622)	Determines if the user can tab to a control.
	UseDockManager (see page 12623)	Specifies whether the docking manager is used in drag-and-dock operations.
	VerticalAlignment (see page 12623)	Sets the vertical position of the caption.
	Visible (see page 12623)	Determines whether the component appears onscreen.

68.1.22.2.1 TFlowPanel.Align Property

Determines how the control aligns within its container (parent control).

Pascal

```
property Align: TAlign;
```

C++

```
__property TAlign Align;
```

Description

Use Align to align a control to the top, bottom, left, or right of a form or panel and have it remain there even if the size of the form, panel, or component that contains the control changes. When the parent is resized, an aligned control also resizes so that it continues to span the top, bottom, left, or right edge of the parent.

For example, to use a panel component with various controls on it as a tool palette, change the panel's Align value to alLeft. The value of alLeft for the Align property of the panel guarantees that the tool palette remains on the left side of the form and always equals the client height of the form.

The default value of Align is alNone, which means a control remains where it is positioned on a form or panel.

Tip: If Align is set to alClient, the control fills the entire client area so that it is impossible to select the parent form by clicking on it. In this case, select the parent by selecting the control on the form and pressing Esc, or by using the Object Inspector.

Any number of child components within a single parent can have the same Align value, in which case they stack up along the edge of the parent. The child controls stack up in z-order. To adjust the order in which the controls stack up, drag the controls into their desired positions.

Note: To cause a control to maintain a specified relationship with an edge of its parent, but not necessarily lie along one edge of the parent, use the Anchors property instead.

C++ Examples:

```
/*
This example shows how to use a splitter to divide a form
into resizable panes.  All objects on the form are created
dynamically in the OnCreate event handler of the form. To
run this example, add ExtCtrls and FileCtrl to the uses
clause of the form’s implementation section.
Note that when creating a splitter dynamically at runtime,
it is important to set its position to the appropriate side
```

```
of the control it will resize.
*/
#include <Extctrls.hpp>
#include <Filectrl.hpp>

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  TSplitter* ps = new TSplitter(Form1);
  TFileListBox* pflb = new TFileListBox(Form1);
  TDirectoryListBox* pdlb = new TDirectoryListBox(Form1);

  // Line up the directory list box on the left of the form.
  pdlb->Parent = Form1;
  pdlb->Align = alLeft;
  pdlb->Width = Form1->ClientWidth/3;

  // Now use the splitter to divide the directory pane from the file pane.
  ps->Parent = Form1;
  ps->Left = pdlb->Left + pdlb->Width + 1; // Move to right of directory list.
  ps->Align = pdlb->Align; // Give same alignment as directory list.

  // Each pane must be at least one quarter of the form's width.
  ps->MinSize = Form1->ClientWidth/4;

  // Finally, create the last pane - a file list box.
  pflb->Parent = Form1;
  pflb->Align = alClient;
  pdlb->FileList = pflb; // Link the file list box to the directory list box.
}
/*
Dynamically create a TProgressBar control and align it to
the bottom of the form.
*/

#include <ComCtrls.hpp>
#include <Controls.hpp>

        Brush.Color := colorPalette[i];
     end;
    end;
  end;

  procedure TForm1.FormDestroy(Sender: TObject);
  var
    i: Integer;
  begin
    for i := Low(TabTitles) to High(TabTitles) do
    begin
      pts[i].Free;
    end;
    PageControl1.Free;
  end;
```

Parent (see page 5832)

Anchors (see page 5802)

68.1.22.2.2 TFlowPanel.Alignment Property

Determines how the caption is aligned within the panel.

Pascal

```
property Alignment: TAlignment;
```

C++

```
__property TAlignment Alignment;
```

Description

Use the Alignment property to specify if the caption of a panel appears on the left, right, or center of the panel. For example, to use a panel as a status bar that displays the TApplication. ::Hint property as the panel's Caption property, set Alignment to taLeftJustify to place the hint text on the left side of the panel.

Note: Use the VerticalAlignment property to control the vertical position of the caption.

See Also

Hint (see page 13712)

Caption (see page 5806)

68.1.22.2.3 TFlowPanel.Anchors Property

Specifies how the control is anchored to its parent.

Pascal

```
property Anchors: TAnchors;
```

C++

```
__property TAnchors Anchors;
```

Description

Use Anchors to ensure that a control maintains its current position relative to an edge of its parent, even if the parent is resized. When its parent is resized, the control holds its position relative to the edges to which it is anchored.

If a control is anchored to opposite edges of its parent, the control stretches when its parent is resized. For example, if a control has its Anchors property set to [akLeft, akRight], the control stretches when the width of its parent changes.

Anchors is enforced only when the parent is resized. Thus, for example, if a control is anchored to opposite edges of a form at design time and the form is created in a maximized state, the control is not stretched because the form is not resized after the control is created.

Note: If a control should maintain contact with three edges of its parent (hugging one side of the parent and stretching the length of that side), use the Align property instead. Unlike Anchors, Align allows controls to adjust to changes in the size of other aligned sibling controls as well as changes to the parent's size.

See Also

Parent (see page 5832)

Align (see page 5798)

68.1.22.2.4 TFlowPanel.AutoSize Property

Specifies whether the control sizes itself automatically to accommodate its contents.

Pascal

```
property AutoSize: Boolean;
```

C++

```
__property Boolean AutoSize;
```

Description

Use AutoSize to specify whether the control sizes itself automatically. When AutoSize is true, the control resizes automatically when its contents change.

By default, AutoSize is false.

See Also

Constraints (see page 5812)

CanAutoSize (see page 5741)

68.1.22.2.5 TFlowPanel.AutoWrap Property

Specifies whether controls are automatically wrapped to fit on the flow panel.

Pascal

```
property AutoWrap: Boolean;
```

C++

```
__property Boolean AutoWrap;
```

Description

If set to True, a new control is automatically placed in a location on the flow panel in which it is visible. If set to False, a new control continues in the same direction as the previous control, even if it would no longer be visible on the panel. You can increase the size of the panel to view controls that are not automatically wrapped to the next line or column.

68.1.22.2.6 TFlowPanel.BevelEdges Property

Specifies which edges of the control are beveled.

Pascal

```
property BevelEdges: TBevelEdges;
```

C++

```
__property TBevelEdges BevelEdges;
```

Description

Use BevelEdges to get or set which edges of the control are beveled. The BevelInner, BevelOuter, and BevelKind properties determine the appearance of the specified edges.

See Also

BevelInner (see page 6193)

BevelOuter (see page 6194)

BevelKind (see page 6193)

68.1.22.2.7 TFlowPanel.BevelInner Property

Determines the style of the inner bevel of a panel.

Pascal

```
property BevelInner: TBevelCut;
```

C++

```
__property TPanelBevel BevelInner;__property TBevelCut BevelInner;
```

Description

Use BevelInner to provide the panel with a three-dimensional beveled look. A panel component has two bevels, an outer bevel

drawn next to the border of the control, and an inner bevel drawn inside the outer bevel, separated by the number of pixels specified in the BorderWidth property. The width of the bevels, if they are drawn, is the BevelWidth property.

C++ Examples:

```
/*
This example uses a panel component and a button named
CreateStatusLine on a form. The code moves the panel to the
bottom of the form when the user clicks the button and gives
the panel the appearance of a status line by changing the
value of the BevelInner, BevelOuter, BevelWidth, and
BorderWidth properties.
*/
void __fastcall TForm1::CreateStatusLineClick(TObject *Sender)
{
  Panel1->Align = alBottom;
  Panel1->BevelInner = bvLowered;
  Panel1->BevelOuter = bvRaised;
  Panel1->BorderWidth = 1;
  Panel1->BevelWidth = 1;
}
```

Delphi Examples:

```
{
This example uses a panel component and a button named
CreateStatusLine on a form. The code moves the panel to the
bottom of the form when the user clicks the button and gives
the panel the appearance of a status line by changing the
value of the BevelInner, BevelOuter, BevelWidth, and
BorderWidth properties.
}
procedure TForm1.CreateStatusLineClick(Sender: TObject);
begin
  with Panel1 do
  begin
    Align := alBottom;
    BevelInner := bvLowered;
    BevelOuter := bvRaised;
    BorderWidth := 1;
    BevelWidth := 1;
  end;
end;
```

See Also

BevelOuter (see page 12541)

BevelWidth (see page 12542)

BorderWidth (see page 12543)

68.1.22.2.8 TFlowPanel.BevelKind Property

Specifies the control's bevel style.

Pascal

```
property BevelKind: TBevelKind;
```

C++

```
__property TBevelKind BevelKind;
```

Description

Use BevelKind to modify the appearance of a bevel. BevelKind influences how sharply the bevel stands out.

BevelKind, in combination with BevelWidth and the cut of the bevel specified by BevelInner or BevelOuter, can create a variety of effects. Experiment with various combinations to get the look you want.

See Also

BevelEdges (see page 6192)

BevelOuter (see page 6194)

BevelInner (see page 6193)

BevelWidth (see page 6194)

68.1.22.2.9 TFlowPanel.BevelOuter Property

Determines the style of the outer bevel of a panel.

Pascal

```
property BevelOuter: TBevelCut;
```

C++

```
__property TPanelBevel BevelOuter;__property TBevelCut BevelOuter;
```

Description

Use BevelOuter to provide the panel with a three-dimensional beveled look. A panel component has two bevels, an outer bevel drawn next to the border of the control, and an inner bevel drawn inside the outer bevel, separated by the number of pixels specified in the BorderWidth property. The width of the outer bevel is specified in the BevelWidth property in pixels.

C++ Examples:

```
/*
This example uses a panel component and a button named
CreateStatusLine on a form. The code moves the panel to the
bottom of the form when the user clicks the button and gives
the panel the appearance of a status line by changing the
value of the BevelInner, BevelOuter, BevelWidth, and
BorderWidth properties.
*/
void __fastcall TForm1::CreateStatusLineClick(TObject *Sender)
{
  Panel1->Align = alBottom;
  Panel1->BevelInner = bvLowered;
  Panel1->BevelOuter = bvRaised;
  Panel1->BorderWidth = 1;
  Panel1->BevelWidth = 1;
}
```

Delphi Examples:

```
{
This example uses a panel component and a button named
CreateStatusLine on a form. The code moves the panel to the
bottom of the form when the user clicks the button and gives
the panel the appearance of a status line by changing the
value of the BevelInner, BevelOuter, BevelWidth, and
BorderWidth properties.
}
procedure TForm1.CreateStatusLineClick(Sender: TObject);
begin
  with Panel1 do
  begin
    Align := alBottom;
    BevelInner := bvLowered;
    BevelOuter := bvRaised;
```

```
    BorderWidth := 1;
    BevelWidth := 1;
  end;
end;
```

See Also

BevelInner (see page 12540)

BevelWidth (see page 12542)

BorderWidth (see page 12543)

68.1.22.2.10 TFlowPanel.BevelWidth Property

Determines the width, in pixels, of both the inner and outer bevels of a panel.

Pascal

```
property BevelWidth: TBevelWidth;
```

C++

```
__property TBevelWidth BevelWidth;__property TBevelWidth BevelWidth;
```

Description

Use BevelWidth to specify how wide the inner or outer bevel should be. Do not confuse BevelWidth, which is the width of the bevels, with BorderWidth, which is the space between the bevels.

If both the BevelInner and BevelOuter properties are bvNone, BevelWidth has no effect. To remove both bevels, set the BevelInner and BevelOuter properties to bvNone, rather than setting the BevelWidth to 0, as this involves less overhead when painting.

C++ Examples:

```
/*
This example uses a panel component and a button named
CreateStatusLine on a form. The code moves the panel to the
bottom of the form when the user clicks the button and gives
the panel the appearance of a status line by changing the
value of the BevelInner, BevelOuter, BevelWidth, and
BorderWidth properties.
*/
void __fastcall TForm1::CreateStatusLineClick(TObject *Sender)
{
  Panel1->Align = alBottom;
  Panel1->BevelInner = bvLowered;
  Panel1->BevelOuter = bvRaised;
  Panel1->BorderWidth = 1;
  Panel1->BevelWidth = 1;
}
```

Delphi Examples:

```
{
This example uses a panel component and a button named
CreateStatusLine on a form. The code moves the panel to the
bottom of the form when the user clicks the button and gives
the panel the appearance of a status line by changing the
value of the BevelInner, BevelOuter, BevelWidth, and
BorderWidth properties.
}
procedure TForm1.CreateStatusLineClick(Sender: TObject);
begin
  with Panel1 do
  begin
```

```
      Align := alBottom;
      BevelInner := bvLowered;
      BevelOuter := bvRaised;
      BorderWidth := 1;
      BevelWidth := 1;
    end;
  end;
```

See Also

BevelInner (see page 12540)

BevelOuter (see page 12541)

BorderWidth (see page 12543)

68.1.22.2.11 TFlowPanel.BiDiMode Property

Specifies the bi-directional mode for the control.

Pascal

```
property BiDiMode: TBiDiMode;
```

C++

```
__property TBiDiMode BiDiMode;
```

Description

Use BiDiMode to enable the control to adjust its appearance and behavior automatically when the application runs in a locale that reads from right to left instead of left to right. The bi-directional mode controls the reading order for the text, the placement of the vertical scroll bar, and whether the alignment is changed.

Alignment does not change for controls that are known to contain number, date, time, or currency values. For example, with data aware controls, the alignment does not change for the following field types: ftSmallint, ftInteger, ftWord, ftFloat, ftCurrency, ftBCD, ftDate, ftTime, ftDateTime, ftAutoInc.

See Also

UseRightToLeftAlignment (see page 5790)

UseRightToLeftReading (see page 5790)

UseRightToLeftScrollBar (see page 5791)

Including Bi-directional Functionality in Applications

68.1.22.2.12 TFlowPanel.BorderStyle Property

Determines the style of the line drawn around the perimeter of the panel control.

Pascal

```
property BorderStyle: TBorderStyle;
```

C++

```
__property TBorderStyle BorderStyle;
```

Description

Use BorderStyle to specify whether the panel has a single line drawn around it. These are the possible values:

Value	Meaning
bsNone	No visible border
bsSingle	Single-line border

Do not confuse the line drawn around the panel with the BorderWidth of the panel. The BorderWidth of the panel is the distance between the outer and inner bevels.

See Also

BorderWidth (see page 12543)

68.1.22.2.13 TFlowPanel.BorderWidth Property

Specifies the distance, in pixels, between the outer and inner bevels.

Pascal

```
property BorderWidth: TBorderWidth;
```

C++

```
__property TBorderWidth BorderWidth;__property TBorderWidth BorderWidth;
```

Description

Use BorderWidth to specify how wide the border around the panel should be. A value of 0 (zero) means no border should appear.

The border of a panel is the area between the outer and inner bevels. It is visible only if the inner bevel is raised or lowered, but affects the inset of the caption within the panel even if BevelInner is bvNone. If the Alignment property is not taCenter, the Caption will be aligned to the inner edge of the border. This edge is BorderWidth pixels in from the outer bevel if BevelInner is bvNone. It is the inner edge of the inner bevel otherwise.

Do not confuse the border of the panel with line drawn around the panel itself. The line around the panel is specified by the BorderStyle property.

C++ Examples:

```
/*
This example uses a panel component and a button named
CreateStatusLine on a form. The code moves the panel to the
bottom of the form when the user clicks the button and gives
the panel the appearance of a status line by changing the
value of the BevelInner, BevelOuter, BevelWidth, and
BorderWidth properties.
*/
void __fastcall TForm1::CreateStatusLineClick(TObject *Sender)
{
  Panel1->Align = alBottom;
  Panel1->BevelInner = bvLowered;
  Panel1->BevelOuter = bvRaised;
  Panel1->BorderWidth = 1;
  Panel1->BevelWidth = 1;
}
```

Delphi Examples:

```
{
This example uses a panel component and a button named
CreateStatusLine on a form. The code moves the panel to the
bottom of the form when the user clicks the button and gives
the panel the appearance of a status line by changing the
value of the BevelInner, BevelOuter, BevelWidth, and
BorderWidth properties.
```

```
}
procedure TForm1.CreateStatusLineClick(Sender: TObject);
begin
  with Panel1 do
  begin
    Align := alBottom;
    BevelInner := bvLowered;
    BevelOuter := bvRaised;
    BorderWidth := 1;
    BevelWidth := 1;
  end;
end;
```

See Also

Alignment (see page 12539)

BevelInner (see page 12540)

BevelOuter (see page 12541)

BorderStyle (see page 12543)

Caption (see page 5806)

68.1.22.2.14 TFlowPanel.Caption Property

Specifies a text string that identifies the control to the user.

Pascal

```
property Caption: TCaption;
```

C++

```
__property TCaption Caption;
```

Description

Use Caption to specify the text string that labels the control.

To underline a character in a Caption that labels a component, include an ampersand (&) before the character. This type of character is called an accelerator character. The user can then select the component by pressing Alt while typing the underlined character. To display an ampersand character in the caption, use two ampersands (&&).

Note: Controls that display text use either the Caption property or the Text property to specify the text value. Which property is used depends on the type of control. In general, Caption is used for text that appears as a window title or label, while Text is used for text that appears as the content of a control.

C++ Examples:

```
/*
The following code keeps the size of the label control
constant, even though the length of the label's caption
changes. As a result, the caption of the label is probably
too long to display in the label when the user clicks the
button:
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  Label1->AutoSize = false;
  Label1->Caption = "This string is too long as the caption of this label";
}
/*
```

```
This example requires a TPageControl populated by several
TabSheets, a TEdit and a TButton. When the button is
clicked, the caption of the active tab changes to that of
the TEdit.  These lines of code could also be written:
PageControl1.ActivePage.Caption := Edit1.Text;
This would make a TTabSheet variable unnecessary since
PageControl1.->ActivePage is already of type TTabSheet.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  TTabSheet *sheet = PageControl1->ActivePage;
  sheet->Caption = Edit1->Text;
}
/*
This example creates a ToolBar and adds ToolButtons to it.
Include ComCtlrs in the uses clause.
*/
#include <comctrls.hpp>

void AddButtons(TToolBar *toolBar, TStringList *captions)
{
  for (int i = 0; i < captions->Count; i++)
  {
    TToolButton *button = new TToolButton(toolBar);
    button->Parent = toolBar;
    button->Caption = captions->Strings[i];
    if (button->Caption == "|")
      button->Style = tbsSeparator;
    else
      button->Style = tbsButton;
  }
}

TToolBar *myToolBar;

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  myToolBar = new TToolBar(this);
  myToolBar->Parent = this;
  TStringList *captions = new TStringList();
  captions->Add("New");
  captions->Add("Save");
  captions->Add("|");
  captions->Add("Cut");
  captions->Add("Copy");
  captions->Add("Paste");
  AddButtons(myToolBar, captions);
  delete captions;
  myToolBar->ShowCaptions = True;
  myToolBar->Height = 40;
}

void __fastcall TForm1::FormDestroy(TObject *Sender)
{
  for (int I = myToolBar->ButtonCount - 1; I >= 0; I--)
    delete myToolBar->Buttons[I];
  delete myToolBar;
}
```

Delphi Examples:

```
{
The following code keeps the size of the label control
constant, even though the length of the label's caption
changes. As a result, the caption of the label is probably
too long to display in the label when the user clicks the
button:
```

```
}
procedure TForm1.Button1Click(Sender: TObject);
begin
  Label1.AutoSize := False;
  Label1.Caption :=
    'This string is too long as the caption of this label';
end;
{
This example requires a TPageControl populated by several
TabSheets, a TEdit and a TButton. When the button is
clicked, the caption of the active tab changes to that of
the TEdit.  These lines of code could also be written:
PageControl1.ActivePage.Caption := Edit1.Text;
This would obviate the need for a TTabSheet variable since
PageControl1.->ActivePage is already of type TTabSheet.
}
procedure TForm1.Button1Click(Sender: TObject);
var
  sheet: TTabSheet;
begin
  sheet := PageControl1.ActivePage;
  sheet.Caption := Edit1.Text;
end;
{
This example creates a ToolBar and adds ToolButtons to it.
Include ComCtlrs in the uses clause.
}
procedure AddButtons(ToolBar: TToolBar;
  Const ButtonCaptions: array of String);
var
  I: Integer;
begin
  for I := 0 to High(ButtonCaptions) do
    begin
      with TToolButton.Create(ToolBar) do
      begin
        Parent := ToolBar;
        Caption := ButtonCaptions[I];
        if (ButtonCaptions[I] = '|') then
          Style := tbsSeparator
        else
          Style := tbsButton;
      end;
    end;
end;

procedure TForm1.FormCreate(Sender: TObject);
begin
  ToolBar1 := TToolBar.Create(Self);
  ToolBar1.Parent := Self;
  AddButtons(ToolBar1, ['New', 'Save', '|', 'Cut', 'Copy', 'Paste']);
  ToolBar1.ShowCaptions := True;
  ToolBar1.Height := 40;
end;

procedure TForm1.FormDestroy(Sender: TObject);
var
  I: Integer;
begin
  for I := ToolBar1.ButtonCount - 1 downto 0 do
    ToolBar1.Buttons[I].Free;
  ToolBar1.Free;
end;
```

68.1.22.2.15 TFlowPanel.Color Property

Specifies the background color of the control.

Pascal

```
property Color: TColor;
```

C++

```
__property TColor Color;
```

Description

Use Color to read or change the background color of the control.

If a control's ParentColor property is true, then changing the Color property of the control's parent automatically changes the Color property of the control. When the value of the Color property is changed, the control's ParentColor property is automatically set to false.

C++ Examples:

```
/*
The following code changes the color of a shape control
using the Color dialog box. The example displays the Color
dialog box when the Button1 button is clicked, allowing the
user to select a color with the dialog box. When a color
value is selected with the dialog box, it is assigned to
the shape control.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  if (ColorDialog1->Execute())
    Shape1->Brush->Color = ColorDialog1->Color;
}
```

Delphi Examples:

```
{
The following code changes the color of a shape control
using the Color dialog box. The example displays the Color
dialog box when the Button1 button is clicked, allowing the
user to select a color with the dialog box. When a color
value is selected with the dialog box, it is assigned to
the shape control.
}
procedure TForm1.Button1Click(Sender: TObject);
begin
  if ColorDialog1.Execute then
    Shape1.Brush.Color := ColorDialog1.Color;
end;
```

See Also

ParentColor (see page 5834)

68.1.22.2.16 TFlowPanel.Constraints Property

Specifies the size constraints for the control.

Pascal

```
property Constraints: TSizeConstraints;
```

C++

```
__property TSizeConstraints Constraints;
```

Description

Use Constraints to specify the minimum and maximum width and height of the control. When Constraints contains maximum or minimum values, the control cannot be resized to violate those constraints.

Note: Constraints apply to the height of the form. However, the height of the form depends on how large Windows makes the title bar. For example, Windows XP uses much larger title bars than other windowing systems. To work around this, note the ClientHeight when you design your form and set the constraints in the FormCreate event. In the following example, ClientHeight is represented by x: `Constraints.MinHeight := x + Height - ClientHeight`.

Warning: Do not set up constraints that conflict with the value of the Align or Anchors property. When these properties conflict, the response of the control to resize attempts is not well-defined.

See Also

AutoSize (see page 5803)

Align (see page 5798)

Anchors (see page 5802)

OnConstrainedResize (see page 5853)

OnCanResize (see page 5851)

68.1.22.2.17 TFlowPanel.Ctl3D Property

Determines whether a control has a three-dimensional (3-D) or two-dimensional look.

Pascal

```
property Ctl3D: Boolean;
```

C++

```
__property Boolean Ctl3D;
```

Description

Ctl3D is provided for backward compatibility. It is not used by 32-bit versions of Windows or NT4.0 and later, with the exception of Windows XP Home, where it is used on occasion.

On earlier platforms, Ctl3D controlled whether the control had a flat or beveled appearance.

See Also

ParentCtl3D (see page 6209)

BevelKind (see page 6193)

BevelInner (see page 6193)

BevelOuter (see page 6194)

BorderWidth (see page 6195)

68.1.22.2.18 TFlowPanel.DockSite Property

Specifies whether the control can be the target of drag-and-dock operations.

Pascal

```
property DockSite: Boolean;
```

C++

```
__property Boolean DockSite;
```

Description

Set DockSite to true to allow other controls to be docked to this windowed control.

C++ Examples:

```
/*
The following example is taken from the docking demo. It
shows how the OnUnDock event handler of the conjoinment
docking site re-enables docking in the control that is
undocked (if it is a dockable form). In addition, when the
next to last docked control is undocked, the conjoinment
docking site sends itself a close message so that the last
docked control is undocked to its old position and size.
*/
void __fastcall TConjoinDockHost::FormUnDock(TObject *Sender, TControl *Client,
      TWinControl *NewTarget, bool &Allow)
{
  // Only 2 dock clients means the host must be destroyed and
  // the remaining window undocked to its old position and size.
  // Recall that OnUnDock gets called before the undocking
  // actually occurs.
  if (Client->ClassNameIs("TDockableForm"))
    dynamic_cast<TDockableForm *>(Client)->DockSite = True;
  if ((DockClientCount == 2) && (NewTarget != this))        // Self?
    PostMessage(dynamic_cast<TConjoinDockHost *>(this)->Handle, WM_CLOSE, 0, 0);
  UpdateCaption(Client);
}
```

Delphi Examples:

```
{
The following example is taken from the docking demo. It
shows how the OnUnDock event handler of the conjoinment
docking site re-enables docking in the control that is
undocked (if it is a dockable form). In addition, when the
next to last docked control is undocked, the conjoinment
docking site sends itself a close message so that the last
docked control is undocked to its old position and size.
}
procedure TConjoinDockHost.FormUnDock(Sender: TObject; Client: TControl;
  NewTarget: TWinControl; var Allow: Boolean);
begin
  // Only 2 dock clients means the host must be destroyed and
  // the remaining window undocked to its old position and size.
  // Recall that OnUnDock gets called before the undocking
  // actually occurs.
  if Client is TDockableForm then
    TDockableForm(Client).DockSite := True;
  if (DockClientCount = 2) and (NewTarget <> Self) then
    PostMessage(Self.Handle, WM_CLOSE, 0, 0);
  UpdateCaption(Client);
end;
```

68.1.22.2.19 TFlowPanel.DragCursor Property

Indicates the image used to represent the mouse pointer when the control is being dragged.

Pascal

```
property DragCursor: TCursor;
```

C++

```
__property TCursor DragCursor;
```

Description

Use the DragCursor property to change the cursor image presented when the control is being dragged.

Note: To make a custom cursor available for the DragCursor property, see the Cursor property.

See Also

Cursor (see page 5815)

DragKind (see page 5819)

DragMode (see page 5819)

68.1.22.2.20 TFlowPanel.DragKind Property

Specifies whether the control is being dragged normally or for docking.

Pascal

```
property DragKind: TDragKind;
```

C++

```
__property TDragKind DragKind;
```

Description

Use DragKind to get or set whether the control participates in drag-and-drop operations, or drag-and-dock operations.

See Also

DragCursor (see page 5818)

DragMode (see page 5819)

68.1.22.2.21 TFlowPanel.DragMode Property

Determines how the control initiates drag-and-drop or drag-and-dock operations.

Pascal

```
property DragMode: TDragMode;
```

C++

```
__property TDragMode DragMode;
```

Description

Use DragMode to control when the user can drag the control. Disable the drag-and-drop or drag-and-dock capability at runtime by setting the DragMode property value to dmManual. Enable automatic dragging by setting DragMode to dmAutomatic.

C++ Examples:

```
/*
The following code uses GetNodeAt to add a dragged node as a
child of the node under the mouse when it is dropped.  This
example requires a populated TreeView.  Also, the TTreeView
DragMode property set to dmAutomatic, and the TTreeView
```

```
OnDragOver event handler must be implemented to accept the
drop.
*/
void __fastcall TForm1::TreeView1DragDrop(TObject *Sender, TObject *Source,
      int X, int Y)
{
  if (Source != (TObject *)TreeView1 || TreeView1->Selected == NULL)
    return;
  THitTests HT = TreeView1->GetHitTestInfoAt(X, Y);
  TNodeAttachMode AttachMode;
  TTreeNode *Item = TreeView1->GetNodeAt(X, Y);
  if (HT.Contains(htOnItem) || HT.Contains(htOnIcon))
    AttachMode = naAddChild;
  else if (HT.Contains(htNowhere))
    AttachMode = naAdd;
  else if (HT.Contains(htOnIndent))
    AttachMode = naInsert;
  else
    return;
  TreeView1->Selected->MoveTo(Item, AttachMode);
}

void __fastcall TForm1::TreeView1DragOver(TObject *Sender, TObject *Source,
      int X, int Y, TDragState State, bool &Accept)
{
  Accept = (Source == (TObject *)TreeView1);
}
```

Delphi Examples:

```
{
The following code uses GetNodeAt to add a dragged node as a
child of the node under the mouse when it is dropped.  This
example requires a populated TreeView.  Also, the TTreeView
DragMode property set to dmAutomatic, and the TTreeView
OnDragOver event handler must be implemented to accept the
drop.
}
procedure TForm1.TreeView1DragDrop(Sender, Source: TObject; X, Y: Integer);
var
  AnItem: TTreeNode;
  AttachMode: TNodeAttachMode;
  HT: THitTests;
begin
  if TreeView1.Selected = nil then Exit;
  HT := TreeView1.GetHitTestInfoAt(X, Y);
  AnItem := TreeView1.GetNodeAt(X, Y);
  if (HT - [htOnItem, htOnIcon, htNowhere, htOnIndent] <> HT) then
  begin
    if (htOnItem in HT) or (htOnIcon in HT) then
      AttachMode := naAddChild
    else if htNowhere in HT then AttachMode := naAdd
    else if htOnIndent in HT then AttachMode := naInsert;
    TreeView1.Selected.MoveTo(AnItem, AttachMode);
  end;
end;

procedure TForm1.TreeView1DragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := Source is TTreeView;
end;
```

Arranging the Order of Persistent Columns

68.1.22.2.22 TFlowPanel.Enabled Property

Controls whether the control responds to mouse, keyboard, and timer events.

Pascal

```
property Enabled: Boolean;
```

C++

```
__property Boolean Enabled;
```

Description

Use Enabled to change the availability of the control to the user. To disable a control, set Enabled to false. Disabled controls appear dimmed. If Enabled is false, the control ignores mouse, keyboard, and timer events.

To re-enable a control, set Enabled to true. The control is no longer dimmed, and the user can use the control.

EnableControls (see page 6934)

Enabling Mouse

68.1.22.2.23 TFlowPanel.FlowStyle Property

Specifies the starting point and direction for controls added to a flow panel.

Pascal

```
property FlowStyle: TFlowStyle;
```

C++

```
__property TFlowStyle FlowStyle;
```

Description

Use FlowStyle to set the starting position for the first control added to a flow panel, as well as the subsequent position for additional controls.

Flow Style	Description
BottomTopLeftRight	The first control is at the bottom left corner of the panel. Subsequent controls are added from bottom to top and then from left to right.

BottomTopRightLeft	The first control is at the bottom right corner of the panel. Subsequent controls are added from bottom to top and then from right to left.
LeftRightBottomTop	The first control is at the bottom left corner of the panel. Subsequent controls are added from left to right and then from bottom to top.
LeftRightTopBottom	The first control is at the top left corner of the panel. Subsequent controls are added from left to right and then from top to bottom. This is the default setting.
RightLeftBottomTop	The first control is at the bottom right corner of the panel. Subsequent controls are added from right to left and then from bottom to top.
RightLeftTopBottom	The first control is at the top right corner of the panel. Subsequent controls are added from right to left and then from top to bottom.
TopBottomLeftRight	The first control is at the top left corner of the panel. Subsequent controls are added from top to bottom and then from left to right.
TopBottomRightLeft	The first control is at the top right corner of the panel. Subsequent controls are added from top to bottom and then from right to left.

68.1.22.2.24 TFlowPanel.Font Property

Controls the attributes of text written on or in the control.

Pascal

```
property Font: TFont;
```

C++

```
__property TFont Font;
```

Description

To change to a new font, specify a new TFont object. To modify a font, change the value of the Charset, Color, Height, Name, Pitch, Size, or Style of the TFont object.

C++ Examples:

```
/*
To use this example, place a TComboBox and TRichEdit or
TMemo on a form.  During form creation, a list of font names
is loaded into the combo box. When the combo box is clicked,
the memo or Rich Edit control font is set to the
corresponding font name in the combo box.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < Screen->Fonts->Count; i++)
   ComboBox1->Items->Add(Screen->Fonts->Strings[i]);
//  ComboBox1->Items = Screen->Fonts;  // Another way to do it.
}

void __fastcall TForm1::ComboBox1Change(TObject *Sender)
{
  RichEdit1->Font->Name = ComboBox1->Text;
}
```

Delphi Examples:

```
{
To use this example, place a TComboBox and TRichEdit or
TMemo on a form.  During form creation, a list of font names
is loaded into the combo box. When the combo box is clicked,
the memo or Rich Edit control font is set to the
```

```
  corresponding font name in the combo box.
  }
  procedure TForm1.FormCreate(Sender: TObject);
  var
    i : Integer;
  begin
    for i := 0 to Screen.Fonts.Count - 1 do
     ComboBox1.Items.Add(Screen.Fonts.Strings[i]);
  //  ComboBox1.Items := Screen.Fonts;  // Another way to do it.
    RichEdit1.Lines.Text := 'How is it to be you?';
  end;

  procedure TForm1.ComboBox1Click(Sender: TObject);
  begin
    RichEdit1.Font.Name := ComboBox1.Text;
  end;
```

Displaying and Editing Text in a Memo Control

68.1.22.2.25 TFlowPanel.FullRepaint Property

Determines how the panel repaints itself when it is resized.

Pascal

```
property FullRepaint: Boolean;
```

C++

```
__property Boolean FullRepaint;
```

Description

FullRepaint controls how the panel responds when it is resized. When FullRepaint is true, the entire panel, including the beveled border repaints when the size changes. When FullRepaint is false, only the area inside the beveled border repaints.

See Also

Invalidate (see page 6161)

68.1.22.2.26 TFlowPanel.Locked Property

Determines whether a panel that is used as a toolbar is replaced by a toolbar supplied by an OLE server.

Pascal

```
property Locked: Boolean;
```

C++

```
__property Boolean Locked;
```

Description

Set the Locked property to false when the panel is used as a toolbar by a TOleContainer component. Any panels aligned to a TOleContainer are assumed to be replaceable toolbars unless the Locked property is true. Prevent the panel from being replaced by an OLE server's toolbar by setting the panel's Locked property to true.

Note: An OLE application's toolbars must be in panels aligned to a side of the form (that is, their Align properties must be set to alTop, alBottom, alLeft, or alRight).

See Also

Align (see page 5798)

TOleContainer (see page 17921)

68.1.22.2.27 TFlowPanel.Padding Property

Specifies the padding of a control.

Pascal

```
property Padding: TPadding;
```

C++

```
__property TPadding Padding;
```

Description

Use Padding to specify the padding of a control. This value is an instance of the class TPadding.

See Also

TPadding (see page 6103)

68.1.22.2.28 TFlowPanel.ParentBackground Property

Determines whether control uses parent's theme background.

Pascal

```
property ParentBackground: Boolean;
```

C++

```
__property Boolean ParentBackground;
```

Description

If ParentBackground is true, the control uses the parent's theme background to draw its own background. ParentBackground has no effect unless XP themes are enabled.

68.1.22.2.29 TFlowPanel.ParentBiDiMode Property

Specifies whether the control uses its parent's BiDiMode.

Pascal

```
property ParentBiDiMode: Boolean;
```

C++

```
__property Boolean ParentBiDiMode;
```

Description

Use ParentBiDiMode to get or set whether the control uses its parent's BiDiMode. When ParentBiDiMode is true, the control's BiDiMode property is always equal to that of its parent. If ParentBiDiMode is false, the control uses its own BiDiMode property.

Set ParentBiDiMode to true for all controls in a form in order to ensure that the entire user interface adjusts to Middle Eastern locales in a uniform manner.

When the value of the control's BiDiMode property changes, ParentBiDiMode becomes false automatically.

See Also

Parent (see page 5832)

BiDiMode (see page 5803)

68.1.22.2.30 TFlowPanel.ParentColor Property

Determines where a control looks for its color information.

Pascal

```
property ParentColor: Boolean;
```

C++

```
__property Boolean ParentColor;
```

Description

To have a control use the same color as its parent control, set ParentColor to true. If ParentColor is false, the control uses its own Color property.

Set ParentColor to true for all controls in order to ensure that all the controls on a form have a uniform appearance. For example, if ParentColor is true for all controls in a form, changing the background color of the form to gray causes all the controls on the form to also have a gray background.

When the value of a control's Color property changes, ParentColor becomes false automatically.

See Also

Color (see page 5812)

Parent (see page 5832)

ParentFont (see page 5834)

ParentShowHint (see page 5835)

68.1.22.2.31 TFlowPanel.ParentCtl3D Property

Determines where a component looks to determine if it should appear three dimensional.

Pascal

```
property ParentCtl3D: Boolean;
```

C++

```
__property Boolean ParentCtl3D;
```

Description

ParentCtl3D is provided for backwards compatibility. It has no effect on 32-bit versions of Windows or NT 4.0 and later.

ParentCtl3D determines whether the control uses its parent's Ctl3D property.

See Also

Ctl3D (see page 6198)

68.1.22.2.32 TFlowPanel.ParentFont Property

Determines where a control looks for its font information.

Pascal

```
property ParentFont: Boolean;
```

C++

```
__property Boolean ParentFont;
```

Description

To have a control use the same font as its parent control, set ParentFont to true. If ParentFont is false, the control uses its own Font property. Many controls default ParentFont to true so that all the controls in a form or other container present a uniform appearance. When the value of a control's Font property changes, ParentFont becomes false automatically.

When ParentFont is true for a form, the form uses the default font.

See Also

Font (see page 5823)

Parent (see page 5832)

ParentColor (see page 5834)

ParentShowHint (see page 5835)

68.1.22.2.33 TFlowPanel.ParentShowHint Property

Determines where a control looks to find out if its Help Hint should be shown.

Pascal

```
property ParentShowHint: Boolean;
```

C++

```
__property Boolean ParentShowHint;
```

Description

Use ParentShowHint to ensure that all the controls on a form either uniformly show their Help Hints or uniformly do not show them.

If ParentShowHint is true, the control uses the ShowHint property value of its parent. If ParentShowHint is false, the control uses the value of its own ShowHint property.

To provide Help Hints for only selected controls on a form, set the ShowHint property for those controls that should have Help Hints to true, and ParentShowHint becomes false automatically.

Note: Enable or disable all Help Hints for the entire application using the ShowHint property of the application object.

Hint (see page 5827)

Parent (see page 5832)

ParentColor (see page 5834)

ParentFont (see page 5834)

ShowHint (see page 5840)

68.1.22.2.34 TFlowPanel.PopupMenu Property

Identifies the pop-up menu associated with the control.

Pascal

```
property PopupMenu: TPopupMenu;
```

C++

```
__property TPopupMenu PopupMenu;
```

Description

Assign a value to PopupMenu to make a pop-up menu appear when the user selects the control and clicks the right mouse button. If the TPopupMenu's AutoPopup property is true, the pop-up menu appears automatically. If the menu's AutoPopup property is false, display the menu with a call to its Popup method from the control's OnContextPopup event handler.

C++ Examples:

```
/*
This example uses two edit boxes and one pop-up menu on a form.
The pop-up menu contains Cut, Copy, and Paste commands. This code
makes the pop-up menu available to both edit boxes:
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  PopupMenu1->AutoPopup = true;
  Edit1->PopupMenu = PopupMenu1;
  Edit2->PopupMenu = PopupMenu1;
}

/*
These are the cut, copy, and paste OnClick events for the commands
on the pop-up menu. Double click on the pop-up menu and add three
TMenuItems.  Then set the captions to "Cut", "Copy" and "Paste".
The names will be automatically set to "Cut1", "Copy1", and
"Paste1".  Then double click on the OnClick events and they will
be named "Cut1Click", "Copy1Click" and "Paste1Click" respectively.
Note: only the selected portion of the string in the edit box will
be copied, cut or replaced.
*/
void __fastcall TForm1::Copy1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
    if (pComponent->ClassNameIs("TEdit"))
      ((TEdit *)pComponent)->CopyToClipboard();
    else
      MessageBeep(0);
  }
  else
    MessageBeep(0);
}

void __fastcall TForm1::Cut1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
    if (pComponent->ClassNameIs("TEdit"))
      ((TEdit *)pComponent)->CutToClipboard();
    else
      MessageBeep(0);
  }
```

```
  else
    MessageBeep(0);
}

void __fastcall TForm1::Paste1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
    if (pComponent->ClassNameIs("TEdit"))
      ((TEdit *)pComponent)->PasteFromClipboard();
    else
      MessageBeep(0);
  }
  else
    MessageBeep(0);
}
/*
This example demonstrates how to add and delete menu items
to a popup menu at runtime and assign an event handler to
the OnClick event.  Place a TPopupMenu and three buttons on
the form named "AddButton", "EditButton",  and
"DestroyButton" and add OnClick events to all three buttons.
Put the TPopupMenu in the PopupMenu property of the form.
Place the PopupMenuItemsClick procedure in the TForm1 type
declaration so that it can be used as the method call for
the menu item OnClick event.
*/
void __fastcall TForm1::AddButtonClick(TObject *Sender)
{
    const int num_items = 4;
    for (int index = 0; index < num_items; ++index)
    {
        TMenuItem *NewItem = new TMenuItem(PopupMenu1); // create the new item
        PopupMenu1->Items->Add(NewItem);// add it to the Popupmenu
        NewItem->Caption = "Menu Item " + IntToStr(index);
        NewItem->Tag = index;
        NewItem->OnClick = PopupMenuItemsClick;// assign it an event handler
        TNotifyEvent();
    }
}

void __fastcall TForm1::PopupMenuItemsClick(TObject *Sender)
{
    TMenuItem *ClickedItem = dynamic_cast<TMenuItem *>(Sender);
    if (ClickedItem)
    {
        switch (ClickedItem->Tag)
        {
            case 0:
            {
                ShowMessage("first item clicked");
                break;
            }
            case 1:
            {
                ShowMessage("second item clicked");
                break;
            }
            case 2:
            {
                ShowMessage("third item clicked");
                break;
            }
            case 3:
            {
```

```
                ShowMessage("fourth item clicked");
                break;
            }
        }
    }
}

/*
To edit or destroy an item, grab its pointer via the Items
property.
*/
void __fastcall TForm1::EditButtonClick(TObject *Sender)
{
    const int index = 1;
    TMenuItem *ItemToEdit = PopupMenu->Items->Items[index];
    ItemToEdit->Caption = "Changed Caption";
}

void __fastcall TForm1::DestroyButtonClick(TObject *Sender)
{
    const int index = 2;
    TMenuItem *ItemToDelete = PopupMenu->Items->Items[index];
    delete ItemToDelete;
}
```

Delphi Examples:

```
{
This example uses two edit boxes and one pop-up menu on a form.
The pop-up menu contains Cut, Copy, and Paste commands. This code
makes the pop-up menu available to both edit boxes:
}
procedure TForm1.FormCreate(Sender: TObject);
begin
  PopupMenu1.AutoPopup := True;
  Edit1.PopupMenu := PopupMenu1;
  Edit2.PopupMenu := PopupMenu1;
end;

{
These are the cut, copy, and paste OnClick events for the commands
on the pop-up menu. Double click on the pop-up menu and add three
TMenuItems.  Then set the captions to "Cut", "Copy" and "Paste".
The names will be automatically set to "Cut1", "Copy1", and
"Paste1".  Then double click on the OnClick events and they will
be named "Cut1Click", "Copy1Click" and "Paste1Click" respectively.
Note: only the selected portion of the string in the edit box will
be copied, cut or replaced.
}
procedure TForm1.Copy1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
   Edit1.CopyToClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.CopyToClipboard
  else
    Beep;
end;

procedure TForm1.Cut1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
    Edit1.CutToClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.CutToClipboard
  else
    Beep;
```

```
end;

procedure TForm1.Paste1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
    Edit1.PasteFromClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.PasteFromClipboard
  else
    Beep;
end;
{
This example demonstrates how to add and delete menu items
to a popup menu at runtime and assign an event handler to
the OnClick event.  Place a TPopupMenu and three buttons on
the form named "AddButton", "EditButton",  and
"DestroyButton" and add OnClick events to all three buttons.
Put the TPopupMenu in the PopupMenu property of the form.
Place the PopupMenuItemsClick procedure in the TForm1 type
declaration so that it can be used as the method call for
the menu item OnClick event.
}

68.1.22.2.35 TFlowPanel.ShowHint Property

Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.

Pascal

```
property ShowHint: Boolean;
```

C++

```
__property Boolean ShowHint;
```

Description

The Help Hint is the value of the Hint property, which is displayed in a box just beneath the control. Use ShowHint to determine whether a Help Hint appears for the control.

To enable Help Hint for a particular control, the application ShowHint property must be true and either

the control's own ShowHint property must be true, or

the control's ParentShowHint property must be true and its parent's ShowHint property must be true.

For example, imagine a check box within a group box. If the ShowHint property of the group box is true and the ParentShowHint property of the check box is true, but the ShowHint property of the check box is false, the check box still displays its Help Hint.

Changing the ShowHint value automatically sets the ParentShowHint property to false.

C++ Examples:

```
/*
This example uses an edit box and a list box on a form.
Items are added to the list box and a Help Hint is assigned
to both controls. The last statement enables the Help Hints
for the entire application.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  Edit1->Hint = "Enter your name";
  Edit1->ShowHint = true;

  char string[10];
  char index[3];
  for(int i = 1; i <= 10; i++)
  {
    strcpy(string, "Item");
    itoa(i, index, 10);
    strcat(string, index);
    ListBox1->Items->Add(string);
  }
  ListBox1->Hint = "Select an item";
  ListBox1->ShowHint = true;
  Application->ShowHint = true;
}
/*
Note: To see an example that displays the hints of controls
in some place other than in a Help Hint box, see the OnHint
example.
*/
```

Delphi Examples:

```
{
This example uses an edit box and a list box on a form.
Items are added to the list box and a Help Hint is assigned
to both controls. The last statement enables the Help Hints
for the entire application.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  I: Integer;
begin
  Edit1.Hint := 'Enter your name';
  Edit1.ShowHint := True;
  with ListBox1 do
  begin
    for I := 1 to 10 do
      Items.Add('Item ' + IntToStr(I));
    Hint := 'Select an item';
    ShowHint := True;
  end;
  Application.ShowHint := True;
end;
{
Note: To see an example that displays the hints of controls
in some place other than in a Help Hint box, see the OnHint
example.
}

Displaying Fly-over Help

68.1.22.2.36 TFlowPanel.TabOrder Property

Indicates the position of the control in its parent's tab order.

Pascal

```
property TabOrder: TTabOrder;
```

C++

```
__property TTabOrder TabOrder;
```

Description

TabOrder is the order in which child windows are visited when the user presses the Tab key. The control with the TabOrder value of 0 is the control that has the focus when the form first appears.

Initially, the tab order is always the order in which the controls were added to the form. The first control added to the form has a TabOrder value of 0, the second is 1, the third is 2, and so on. Change this by changing the TabOrder property.

Each control has a unique tab-order value within its parent. If you change the TabOrder property value of one control to be the same as the value of a second control, the TabOrder value for all the other controls changes. For example, suppose a control is sixth in the tab order. If you change the control's TabOrder property value to 3 (making the control fourth in the tab order), the control that was originally fourth in the tab order now becomes fifth, and the control that was fifth becomes sixth.

Assigning TabOrder a value greater than the number of controls contained in the parent control moves the control to the end of the tab order. The control does not take on the assigned value of TabOrder, but instead is given the number that assures the control is the last in the tab order.

Note: TabOrder is meaningful only if the TabStop property is true and if the control has a parent. (The TabOrder property of a form is not used unless the form is the child of another form.) A control with a TabOrder of -1 has no parent, and therefore cannot be reached by pressing the Tab key. To remove a parented control from the Tab order, set its TabStop property to false.

FindNextControl (see page 6149)

TabStop (see page 6211)

68.1.22.2.37 TFlowPanel.TabStop Property

Determines if the user can tab to a control.

Pascal

```
property TabStop: Boolean;
```

C++

```
__property Boolean TabStop;
```

Description

Use the TabStop to allow or disallow access to the control using the Tab key.

If TabStop is true, the control is in the tab order. If TabStop is false, the control is not in the tab order and the user can't press the Tab key to move to the control.

Note: TabStop is not meaningful for a form unless the form assigns another form to be its parent.

See Also

TabOrder (see page 6211)

68.1.22.2.38 TFlowPanel.UseDockManager Property

Specifies whether the docking manager is used in drag-and-dock operations.

Pascal

```
property UseDockManager: Boolean;
```

C++

```
__property Boolean UseDockManager;
```

Description

Use UseDockManager to get or set whether a docking manager is used in drag-and-dock operations.

The docking manager handles the positioning of docked controls and any painting of docking zones around those controls. If you do not use a docking manager, docked controls are aligned to the windowed control based on the closest edge to where they are released. When you do not use a docking manager, there is no region for a user to grab to automatically undock a docked control.

See Also

DockManager (see page 6202)

68.1.22.2.39 TFlowPanel.VerticalAlignment Property

Sets the vertical position of the caption.

Pascal

```
property VerticalAlignment: TVerticalAlignment;
```

C++

```
__property TVerticalAlignment VerticalAlignment;
```

Description

Use the VerticalAlignment property to control the position of the caption within the panel. Choose one of the following values.

Value	Description
taAlignBottom	The caption displays at the bottom of the panel.
taAlignTop	The caption displays at the top of the panel.
taVerticalCenter	The caption displays at the center of the panel.

Note: Use the Alignment property to control the horizontal position of the caption.

See Also

Caption

68.1.22.2.40 TFlowPanel.Visible Property

Determines whether the component appears onscreen.

Pascal

```
property Visible: Boolean;
```

C++

```
__property Boolean Visible;
```

Description

Use the Visible property to control the visibility of the control at runtime. If Visible is true, the control appears. If Visible is false, the control is not visible.

Calling the Show method sets the control's Visible property to true. Calling the Hide method sets it to false.

C++ Examples:

```
/*
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
*/
void __fastcall TForm1::PageControl1Change(TObject *Sender)
{
  CheckBox1->Checked = PageControl1->ActivePage->Visible;
}

void __fastcall TForm1::CheckBox1Click(TObject *Sender)
{
  PageControl1->ActivePage->Visible = CheckBox1->Checked;
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < 10; i++)
  {
    TTabSheet *pPage = new TTabSheet(this);
    pPage->PageControl = PageControl1;
    pPage->Caption = AnsiString("Page") + IntToStr(i);
    TEdit *pEdit = new TEdit(this);
    pEdit->Parent = pPage;
    pEdit->Left = random(pPage->ClientWidth - pEdit->Width);
    pEdit->Top = random(pPage->ClientHeight - pEdit->Height);
  }
  PageControl1Change(Sender);
}
```

Delphi Examples:

```
{
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
}
procedure TForm1.CheckBox1Click(Sender: TObject);
begin
  PageControl1.ActivePage.Visible := CheckBox1.Checked;
end;

procedure TForm1.PageControl1Change(Sender: TObject);
begin
  CheckBox1.Checked := PageControl1.ActivePage.Visible;
end;
```

```
procedure TForm1.FormCreate(Sender: TObject);
var
  i: Integer;
begin
  for i := 0 to 9 do
    with TTabSheet.Create(Self) do
    begin
      PageControl := PageControl1;
      Caption := 'TabSheet' + IntToStr(i);
      with TEdit.Create(Self) do
      begin
        Parent := PageControl1.Pages[i];
        Left := Random(PageControl1.ActivePage.ClientWidth - Width);
        Top := Random(PageControl1.ActivePage.ClientHeight - Height);
      end;
    end;
    PageControl1Change(Sender);
end;
```

68.1.22.3 TFlowPanel Events

The events of the TFlowPanel class are listed here.

Published Events

	Name	Description
	OnAlignInsertBefore (see page 12626)	Occurs when an object with custom alignment is aligned.
	OnAlignPosition (see page 12626)	Occurs when an object with custom alignment is aligned.
	OnCanResize (see page 12627)	Occurs when an attempt is made to resize the control.
	OnClick (see page 12627)	Occurs when the user clicks the control.
	OnConstrainedResize (see page 12629)	Adjust resize constraints.
	OnContextPopup (see page 12630)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnDblClick (see page 12631)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDockDrop (see page 12631)	Occurs when another control is docked to the control.
	OnDockOver (see page 12633)	Occurs when another control is dragged over the control.
	OnDragDrop (see page 12635)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 12637)	Occurs when the user drags an object over a control.
	OnEndDock (see page 12640)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 12640)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnEnter (see page 12641)	Occurs when a control receives the input focus.
	OnExit (see page 12643)	Occurs when the input focus shifts away from one control to another.
	OnGetSiteInfo (see page 12645)	Returns the control's docking information.
	OnMouseActivate (see page 12647)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 12648)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseEnter (see page 12650)	Occurs when the user moves the mouse into a control.

	OnMouseLeave (see page 12651)	Occurs when the user moves the mouse outside of a control.
	OnMouseMove (see page 12651)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 12653)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnResize (see page 12655)	Occurs immediately after the control is resized.
	OnStartDock (see page 12656)	Occurs when the user begins to drag a control with a DragKind of dkDock.
	OnStartDrag (see page 12657)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.
	OnUnDock (see page 12657)	Occurs when the application tries to undock a control that is docked to the windowed control.

68.1.22.3.1 TFlowPanel.OnAlignInsertBefore Event

Occurs when an object with custom alignment is aligned.

Pascal

```
property OnAlignInsertBefore: TAlignInsertBeforeEvent;
```

C++

```
__property TAlignInsertBeforeEvent OnAlignInsertBefore;
```

Description

OnAlignInsertBefore occurs for each pair of child controls with an Align property of **alCustom**.

It can determine the order in which custom-aligned child controls are placed. OnAlignInsertBefore returns true if **C2** should be presented before **C1**, and false otherwise. It holds a TAlignInsertBeforeEvent type.

CustomAlignInsertBefore triggers the OnAlignInsertBefore event. If this event is defined, CustomAlignInsertBefore returns the value returned by OnAlignInsertBefore. Defining this event allows users to define the order of control alignment without overriding CustomAlignInsertBefore.

See Also

CustomAlignInsertBefore (see page 6137)

Align (see page 5798)

TAlignInsertBeforeEvent (see page 6293)

68.1.22.3.2 TFlowPanel.OnAlignPosition Event

Occurs when an object with custom alignment is aligned.

Pascal

```
property OnAlignPosition: TAlignPositionEvent;
```

C++

```
__property TAlignPositionEvent OnAlignPosition;
```

Description

OnAlignPosition occurs when child controls with an Align property of **alCustom** are aligned.

CustomAlignPosition triggers the OnAlignPosition event. If this event is defined, CustomAlignPosition uses the alignment parameters it obtains from OnAlignPosition. Defining this event allows users to set the alignment parameters without overriding CustomAlignPosition. It holds a TAlignPositionEvent type.

These are the parameters:

Parameter	Meaning
NewLeft | NewTop | NewWidth | NewHeight	Location and size of child control, as determined by container's size and the Anchors TControl_Anchors constraints for the control. OnAlignPosition can modify these values to reposition the control.
AlignRect	The client area in which the control is aligned. OnAlignPosition can modify this value.
AlignInfo	Alignment information in a TAlignInfo.
As implemented in TWinControl, OnAlignPosition does nothing.	

See Also

CustomAlignPosition (see page 6138)

Align (see page 5798)

Anchors (see page 5802)

TAlignInfo (see page 6269)

TAlignPositionEvent (see page 6293)

68.1.22.3.3 TFlowPanel.OnCanResize Event

Occurs when an attempt is made to resize the control.

Pascal

```
property OnCanResize: TCanResizeEvent;
```

C++

```
__property TCanResizeEvent OnCanResize;
```

Description

Use OnCanResize to adjust the way a control is resized. If necessary, change the new width and height of the control in the OnCanResize event handler. The OnCanResize event handler also allows applications to indicate that the entire resize should be aborted.

If there is no OnCanResize event handler, or if the OnCanResize event handler indicates that the resize attempt can proceed, the OnCanResize event is followed immediately by an OnConstrainedResize event.

See Also

OnConstrainedResize (see page 5853)

SetBounds (see page 5783)

OnResize (see page 5870)

68.1.22.3.4 TFlowPanel.OnClick Event

Occurs when the user clicks the control.

Pascal

```
property OnClick: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnClick;
```

Description

Use the OnClick event handler to respond when the user clicks the control. If the control has an associated action, and that action has an OnExecute method, the action's OnExecute method responds to click events unless it is superseded by an OnClick event handler.

Usually OnClick occurs when the user presses and releases the left mouse button with the mouse pointer over the control. This event can also occur when:

- The user selects an item in a grid, outline, list, or combo box by pressing an arrow key.
- The user presses Spacebar while a button or check box has focus.
- The user presses Enter when the active form has a default button (specified by the Default property).
- The user presses Esc when the active form has a cancel button (specified by the Cancel property).
- The user presses the accelerator key for a button or check box. For example, if the value of the Caption property of a check box is '&Bold', the B is underlined at runtime and the OnClick event of the check box is triggered when the user presses Alt+B. However, focus does not move to the control in these instances.
- The Checked property of a radio button is set to true.
- The value of the Checked property of a check box is changed.
- The Click method of a menu item is called.

For a form, an OnClick event occurs when the user clicks a blank area of the form or on a disabled component.

C++ Examples:

```
/*
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
*/
void __fastcall TForm1::PageControl1Change(TObject *Sender)
{
  CheckBox1->Checked = PageControl1->ActivePage->Visible;
}

void __fastcall TForm1::CheckBox1Click(TObject *Sender)
{
  PageControl1->ActivePage->Visible = CheckBox1->Checked;
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < 10; i++)
  {
    TTabSheet *pPage = new TTabSheet(this);
    pPage->PageControl = PageControl1;
    pPage->Caption = AnsiString("Page") + IntToStr(i);
    TEdit *pEdit = new TEdit(this);
    pEdit->Parent = pPage;
    pEdit->Left = random(pPage->ClientWidth - pEdit->Width);
    pEdit->Top = random(pPage->ClientHeight - pEdit->Height);
  }
  PageControl1Change(Sender);
}
```

Delphi Examples:

```
{
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
```

```
  edit control placed somewhere on the client area of the
  sheet.  Unchecking the checkbox will cause the client area
  (not the tab area) of the Tab Control to become invisible.
  }
  procedure TForm1.CheckBox1Click(Sender: TObject);
  begin
    PageControl1.ActivePage.Visible := CheckBox1.Checked;
  end;

  procedure TForm1.PageControl1Change(Sender: TObject);
  begin
    CheckBox1.Checked := PageControl1.ActivePage.Visible;
  end;

  procedure TForm1.FormCreate(Sender: TObject);
  var
    i: Integer;
  begin
    for i := 0 to 9 do
      with TTabSheet.Create(Self) do
      begin
        PageControl := PageControl1;
        Caption := 'TabSheet' + IntToStr(i);
        with TEdit.Create(Self) do
        begin
          Parent := PageControl1.Pages[i];
          Left := Random(PageControl1.ActivePage.ClientWidth - Width);
          Top := Random(PageControl1.ActivePage.ClientHeight - Height);
        end;
      end;
      PageControl1Change(Sender);
  end;
```

68.1.22.3.5 TFlowPanel.OnConstrainedResize Event

Adjust resize constraints.

Pascal

```
property OnConstrainedResize: TConstrainedResizeEvent;
```

C++

```
__property TConstrainedResizeEvent OnConstrainedResize;
```

Description

Use OnConstrainedResize to adjust a control's constraints when an attempt is made to resize it. Upon entry to the OnConstrainedResize event handler, the parameters of the event handler are set to the corresponding properties of the control's Constraints object. The event handler can adjust those values before they are applied to the new height and width that is being

applied to the control. (The CanAutoSize method or an OnCanResize event handler may already have adjusted this new height and width).

On exit from the OnConstrainedResize event handler, the constraints are applied to the attempted new height and width. Once the constraints are applied, the control's height and width are changed. After the control's height and width change, an OnResize event occurs to allow any final adjustments or responses.

Note: The OnConstrainedResize handler is called immediately after the OnCanResize handler.

See Also

OnCanResize (see page 5851)

SetBounds (see page 5783)

Constraints (see page 5812)

OnResize (see page 5870)

CanAutoSize (see page 5741)

68.1.22.3.6 TFlowPanel.OnContextPopup Event

Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).

Pascal

```
property OnContextPopup: TContextPopupEvent;
```

C++

```
__property TContextPopupEvent OnContextPopup;
```

Description

The OnContextPopup handler is called when the user uses the mouse or keyboard to request a popup menu. The OnContextPopup event is generated by a WM_CONTEXTMENU message, which is itself generated by the user clicking the right mouse button or by pressing SHIFT+F10 or the Applications key.

This event is especially useful when the control does not have an associated popup menu (the PopupMenu property is not set) or if the AutoPopup property of the control's associated popup menu is false. However, the OnContextPopup can also be used to override the automatic context menu that appears when the control has an associated popup menu with an AutoPopup property of true. In this last case, if the event handler displays its own menu, it should set the Handled parameter to true to suppress the default context menu.

The handler's MousePos parameter indicates the position of the mouse, in client coordinates.. If the event was not generated by a mouse click, MousePos is (-1,-1).

Note: Parent controls receive an OnContextPopup event before their child controls. In addition, for many child controls, the default window procedure causes the parent control to receive an OnContextPopup event after the child control. As a result, when parent controls do not set Handled to true in an OnContextPopup event handler, the event handler may be called multiple times for each context menu invocation.

AutoPopup (see page 16178)

68.1.22.3.7 TFlowPanel.OnDblClick Event

Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.

Pascal

```
property OnDblClick: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnDblClick;
```

Description

Use the OnDblClick event to respond to mouse double-clicks.

See Also

OnClick (see page 5851)

Responding to User Actions at Runtime

68.1.22.3.8 TFlowPanel.OnDockDrop Event

Occurs when another control is docked to the control.

Pascal

```
property OnDockDrop: TDockDropEvent;
```

C++

```
__property TDockDropEvent OnDockDrop;
```

Description

Write code in the OnDockDrop event to perform actions when another control is docked on the control.

OnDockDrop can only occur if DockSite is true.

C++ Examples:

```
/*
The following example is taken from the docking demo. It
shows how set permissions to dock dockable objects onto a
docking site.
*/

void __fastcall TMainForm::LeftDockPanelDockDrop(TObject *Sender,
      TDragDockObject *Source, int X, int Y)
{
  //OnDockDrop gets called AFTER the client has actually docked,
  //so we check for DockClientCount = 1 before making the dock panel visible.
  TPanel *panel = dynamic_cast<TPanel *>(Sender);
  if (panel->DockClientCount == 1)
    ShowDockPanel(panel, True, NULL);
  panel->DockManager->ResetBounds(True);
  //Make DockManager repaints it's clients.
}

void __fastcall TMainForm::LeftDockPanelDockOver(TObject *Sender,
      TDragDockObject *Source, int X, int Y, TDragState State, bool &Accept)
{
  Accept = (dynamic_cast<TDockableForm*>(Source->Control) != NULL);
  if (Accept)
  {
    // Modify the DockRect to preview dock area.
```

```
    Types::TPoint TopLeft = LeftDockPanel->ClientToScreen(Point(0, 0));
    Types::TPoint BottomRight = LeftDockPanel->ClientToScreen(
      Point(this->ClientWidth/3, LeftDockPanel->Height));
    Source->DockRect = Types::TRect(TopLeft, BottomRight);
  }
}

void __fastcall TMainForm::LeftDockPanelUnDock(TObject *Sender,
      TControl *Client, TWinControl *NewTarget, bool &Allow)
{
  //OnUnDock gets called BEFORE the client is undocked, in order to optionally
  //disallow the undock. DockClientCount is never 0 when called from this event.
  TPanel *panel = dynamic_cast<TPanel *>(Sender);
  if (panel->DockClientCount == 1)
    ShowDockPanel(panel, False, NULL);
}

void __fastcall TMainForm::LeftDockPanelGetSiteInfo(TObject *Sender,
      TControl *DockClient, TRect &InfluenceRect, TPoint &MousePos,
      bool &CanDock)
{
  //if CanDock is true, the panel will not automatically draw the preview rect.
  CanDock = DockClient->ClassNameIs("TDockableForm");
  if (!CanDock)
  {
     ShowMessage("GetSiteInfo CanDock went bad!");
  }
}
```

Delphi Examples:

```
{
The following example is taken from the docking demo. It
shows how set permissions to dock dockable objects onto a
docking site.
}

procedure TMainForm.LeftDockPanelDockDrop(Sender: TObject;
  Source: TDragDockObject; X, Y: Integer);
begin
  //OnDockDrop gets called AFTER the client has actually docked,
  //so we check for DockClientCount = 1 before making the dock panel visible.
  if (Sender as TPanel).DockClientCount = 1 then
    ShowDockPanel(Sender as TPanel, True, nil);
  (Sender as TPanel).DockManager.ResetBounds(True);
  //Make DockManager repaints it's clients.
end;

procedure TMainForm.LeftDockPanelDockOver(Sender: TObject;
  Source: TDragDockObject; X, Y: Integer; State: TDragState;
  var Accept: Boolean);
var
  ARect: TRect;
begin
  Accept := Source.Control is TDockableForm;
  if Accept then
  begin
    //Modify the DockRect to preview dock area.
    ARect.TopLeft := LeftDockPanel.ClientToScreen(Point(0, 0));
    ARect.BottomRight := LeftDockPanel.ClientToScreen(
      Point(Self.ClientWidth div 3, LeftDockPanel.Height));
    Source.DockRect := ARect;
  end;
end;

procedure TMainForm.LeftDockPanelUnDock(Sender: TObject; Client: TControl;
  NewTarget: TWinControl; var Allow: Boolean);
```

```
begin
  //OnUnDock gets called BEFORE the client is undocked, in order to optionally
  //disallow the undock. DockClientCount is never 0 when called from this event.
  if (Sender as TPanel).DockClientCount = 1 then
    ShowDockPanel(Sender as TPanel, False, nil);
end;

procedure TMainForm.LeftDockPanelGetSiteInfo(Sender: TObject;
  DockClient: TControl; var InfluenceRect: TRect; MousePos: TPoint;
  var CanDock: Boolean);
begin
  //if CanDock is true, the panel will not automatically draw the preview rect.
  CanDock := DockClient is TDockableForm;
end;
```

See Also

DockSite (see page 6204)

OnDockOver (see page 6216)

68.1.22.3.9 TFlowPanel.OnDockOver Event

Occurs when another control is dragged over the control.

Pascal

```
property OnDockOver: TDockOverEvent;
```

C++

```
__property TDockOverEvent OnDockOver;
```

Description

Write code in the OnDockOver event to indicate whether a dockable control that is dragged over the windowed control can be accepted as a dock client. OnDockOver occurs after the TDragDockObject has been initialized by an OnGetSiteInfo event.

OnDockOver occurs only if DockSite is true.

C++ Examples:

```
/*
The following example is taken from the docking demo. It
shows how set permissions to dock dockable objects onto a
docking site.
*/

void __fastcall TMainForm::LeftDockPanelDockDrop(TObject *Sender,
      TDragDockObject *Source, int X, int Y)
{
  //OnDockDrop gets called AFTER the client has actually docked,
  //so we check for DockClientCount = 1 before making the dock panel visible.
  TPanel *panel = dynamic_cast<TPanel *>(Sender);
  if (panel->DockClientCount == 1)
    ShowDockPanel(panel, True, NULL);
  panel->DockManager->ResetBounds(True);
  //Make DockManager repaints it's clients.
}

void __fastcall TMainForm::LeftDockPanelDockOver(TObject *Sender,
      TDragDockObject *Source, int X, int Y, TDragState State, bool &Accept)
{
  Accept = (dynamic_cast<TDockableForm*>(Source->Control) != NULL);
  if (Accept)
  {
    // Modify the DockRect to preview dock area.
```

```
    Types::TPoint TopLeft = LeftDockPanel->ClientToScreen(Point(0, 0));
    Types::TPoint BottomRight = LeftDockPanel->ClientToScreen(
      Point(this->ClientWidth/3, LeftDockPanel->Height));
    Source->DockRect = Types::TRect(TopLeft, BottomRight);
  }
}

void __fastcall TMainForm::LeftDockPanelUnDock(TObject *Sender,
      TControl *Client, TWinControl *NewTarget, bool &Allow)
{
  //OnUnDock gets called BEFORE the client is undocked, in order to optionally
  //disallow the undock. DockClientCount is never 0 when called from this event.
  TPanel *panel = dynamic_cast<TPanel *>(Sender);
  if (panel->DockClientCount == 1)
    ShowDockPanel(panel, False, NULL);
}

void __fastcall TMainForm::LeftDockPanelGetSiteInfo(TObject *Sender,
      TControl *DockClient, TRect &InfluenceRect, TPoint &MousePos,
      bool &CanDock)
{
  //if CanDock is true, the panel will not automatically draw the preview rect.
  CanDock = DockClient->ClassNameIs("TDockableForm");
  if (!CanDock)
  {
     ShowMessage("GetSiteInfo CanDock went bad!");
  }
}
```

Delphi Examples:

```
{
The following example is taken from the docking demo. It
shows how set permissions to dock dockable objects onto a
docking site.
}

procedure TMainForm.LeftDockPanelDockDrop(Sender: TObject;
  Source: TDragDockObject; X, Y: Integer);
begin
  //OnDockDrop gets called AFTER the client has actually docked,
  //so we check for DockClientCount = 1 before making the dock panel visible.
  if (Sender as TPanel).DockClientCount = 1 then
    ShowDockPanel(Sender as TPanel, True, nil);
  (Sender as TPanel).DockManager.ResetBounds(True);
  //Make DockManager repaints it's clients.
end;

procedure TMainForm.LeftDockPanelDockOver(Sender: TObject;
  Source: TDragDockObject; X, Y: Integer; State: TDragState;
  var Accept: Boolean);

68.1.22.3.10 TFlowPanel.OnDragDrop Event

Occurs when the user drops an object being dragged.

Pascal

```
property OnDragDrop: TDragDropEvent;
```

C++

```
__property TDragDropEvent OnDragDrop;
```

Description

Use the OnDragDrop event handler to specify what happens when the user drops an object. The Source parameter of the OnDragDrop event is the object being dropped, and the Sender is the control the object is being dropped on. The X and Y parameters are the coordinates of the mouse positioned over the control.

C++ Examples:

```
/*
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
*/

// This OnDragOver event handler permits the list box to
// accept a dropped label:
void __fastcall TForm1::ListBox1DragOver(TObject *Sender, TObject *Source, int X, int Y,
TDragState State, bool &Accept)
{
   Accept = Source->ClassNameIs("TLabel");
}

/*
This OnDragDrop event handler implements the drop behavior.
*/
void __fastcall TForm1::ListBox1DragDrop(TObject *Sender, TObject *Source, int X, int Y)
{
```

```
  if (Sender->ClassNameIs("TListBox") && Source->ClassNameIs("TLabel"))
  {
    TListBox *DestList = (TListBox *)Sender;
    DestList->Font = ((TLabel *)Source)->Font;
    DestList->Color = ((TLabel *)Source)->Color;
    DestList->DoubleBuffered = true;
    DestList->Color = clWindow;
  }
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  ListBox1->Items->Add("Not");
  ListBox1->Items->Add("In");
  ListBox1->Items->Add("Alphabetical");
  ListBox1->Items->Add("Order");

}
```

Delphi Examples:

```
{
This code is an OnDragOver event handler that won't allow a
label control to be dropped on a panel control and stops the
dragging of the label as soon as the user drags the label
onto the panel:
Note: Set the label's DragMode property to dmAutomatic.
}
procedure TForm1.FormDragDrop(Sender, Source: TObject; X, Y: Integer);
begin
  TForm1(Source).Left := X;
  TForm1(Source).Top := Y;
end;

procedure TForm1.FormDragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := Source is TLabel;
end;

procedure TForm1.Panel1DragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := False;
  if (Source is TLabel) and (State = dsDragEnter) then
    (Source as TLabel).EndDrag(False);
end;
{
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
}

procedure TForm1.FormCreate(Sender: TObject);
begin
  ListBox1.Items.Add('Not');
  ListBox1.Items.Add('In');
  ListBox1.Items.Add('Alphabetical');
  ListBox1.Items.Add('Order');
end;

// This OnDragOver event handler permits the list box to
// accept a dropped label:
```

```
procedure TForm1.ListBox1DragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := Source is TLabel;
end;

// This OnDragDrop event handler implements the drop behavior.

procedure TForm1.ListBox1DragDrop(Sender, Source: TObject; X, Y: Integer);
begin
  if (Sender is TListBox) and (Source is TLabel) then
  begin
    with Sender as TListBox do
    begin
      Font := (Source as TLabel).Font;
      Color := (Source as TLabel).Color;
      DoubleBuffered := true;
      Color := clWindow;
    end;
  end;
end;

68.1.22.3.11 TFlowPanel.OnDragOver Event

Occurs when the user drags an object over a control.

Pascal

```
property OnDragOver: TDragOverEvent;
```

C++

```
__property TDragOverEvent OnDragOver;
```

Description

Use an OnDragOver event to signal that the control can accept a dragged object so the user can drop or dock it.

Within the OnDragOver event handler, change the Accept parameter to false to reject the dragged object. Leave Accept as true to allow the user to drop or dock the dragged object on the control.

To change the shape of the cursor, indicating that the control can accept the dragged object, change the value of the DragCursor property for the control before the OnDragOver event occurs.

The Source is the object being dragged, the Sender is the potential drop or dock site, and X and Y are screen coordinates in pixels. The State parameter specifies how the dragged object is moving over the control.

Note: Within the OnDragOver event handler, the Accept parameter defaults to true. However, if an OnDragOver event handler

is not supplied, the control rejects the dragged object, as if the Accept parameter were changed to false.

C++ Examples:

```
/*
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
*/

// This OnDragOver event handler permits the list box to
// accept a dropped label:
void __fastcall TForm1::ListBox1DragOver(TObject *Sender, TObject *Source, int X, int Y,
TDragState State, bool &Accept)
{
   Accept = Source->ClassNameIs("TLabel");
}

/*
This OnDragDrop event handler implements the drop behavior.
*/
void __fastcall TForm1::ListBox1DragDrop(TObject *Sender, TObject *Source, int X, int Y)
{
  if (Sender->ClassNameIs("TListBox") && Source->ClassNameIs("TLabel"))
  {
    TListBox *DestList = (TListBox *)Sender;
    DestList->Font = ((TLabel *)Source)->Font;
    DestList->Color = ((TLabel *)Source)->Color;
    DestList->DoubleBuffered = true;
    DestList->Color = clWindow;
  }
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  ListBox1->Items->Add("Not");
  ListBox1->Items->Add("In");
  ListBox1->Items->Add("Alphabetical");
  ListBox1->Items->Add("Order");

}
```

Delphi Examples:

```
{
This code is an OnDragOver event handler that won't allow a
label control to be dropped on a panel control and stops the
dragging of the label as soon as the user drags the label
onto the panel:
Note: Set the label's DragMode property to dmAutomatic.
}
procedure TForm1.FormDragDrop(Sender, Source: TObject; X, Y: Integer);
begin
  TForm1(Source).Left := X;
  TForm1(Source).Top := Y;
end;

procedure TForm1.FormDragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := Source is TLabel;
end;
```

```
procedure TForm1.Panel1DragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := False;
  if (Source is TLabel) and (State = dsDragEnter) then
    (Source as TLabel).EndDrag(False);
end;
{
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
}

procedure TForm1.FormCreate(Sender: TObject);
begin
  ListBox1.Items.Add('Not');
  ListBox1.Items.Add('In');
  ListBox1.Items.Add('Alphabetical');
  ListBox1.Items.Add('Order');
end;

// This OnDragOver event handler permits the list box to
// accept a dropped label:

procedure TForm1.ListBox1DragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := Source is TLabel;
end;

// This OnDragDrop event handler implements the drop behavior.

procedure TForm1.ListBox1DragDrop(Sender, Source: TObject; X, Y: Integer);
begin
  if (Sender is TListBox) and (Source is TLabel) then
  begin
    with Sender as TListBox do
    begin
      Font := (Source as TLabel).Font;
      Color := (Source as TLabel).Color;
      DoubleBuffered := true;
      Color := clWindow;
    end;
  end;
end;
```

68.1.22.3.12 TFlowPanel.OnEndDock Event

Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.

Pascal

```
property OnEndDock: TEndDragEvent;
```

C++

```
__property TEndDragEvent OnEndDock;
```

Description

Use OnEndDock to specify actions or special processing that when a drag-and-dock operation stops.

See Also

DragKind (see page 5819)

68.1.22.3.13 TFlowPanel.OnEndDrag Event

Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.

Pascal

```
property OnEndDrag: TEndDragEvent;
```

C++

```
__property TEndDragEvent OnEndDrag;
```

Description

Use the OnEndDrag event handler to specify any special processing that occurs when dragging stops.

C++ Examples:

```
/*
This code displays a message in a label named Status. The
message displayed depends on whether the dragged label
control was successfully dropped into and accepted by a
another control.
*/
void __fastcall TForm1::Label1EndDrag(TObject *Sender, TObject *Target, int X,
      int Y)
{
  if (Sender->ClassNameIs("TLabel"))
  {
    AnsiString S = ((TLabel *)Sender)->Name + " was dropped and ";
    if (Target)
      S = S + "accepted!";
    else
      S = S + "rejected.";
    Status->Caption = S;
  }
}
```

Delphi Examples:

```
{
This code displays a message in a label named Status. The
message displayed depends on whether the dragged label
control was successfully dropped into and accepted by a
another control.
}
procedure TForm1.Label1EndDrag(Sender, Target: TObject; X, Y: Integer);
var
  S: string;
begin
  S := (Sender as TLabel).Name + ' was dropped... and ';
  if Target <> nil then
    S := S + 'accepted!'
  else
    S := S + 'rejected!';
  Status.Caption := S;
end;
```

68.1.22.3.14 TFlowPanel.OnEnter Event

Occurs when a control receives the input focus.

Pascal

```
property OnEnter: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnEnter;
```

Description

Use the OnEnter event handler to cause any special processing to occur when a control becomes active.

The OnEnter event does not occur when switching between forms or between another application and the application that includes the control.

When switching between controls in separate container controls such as the TPanel and the TGroupBox controls, an OnEnter event occurs for the container before the OnEnter event of the contained control.

Similarly, an OnExit event of the container occurs after the OnExit event of the control in a container when focus moves to another control outside the container.

For example, consider a form with an OK button and a group box that contains three radio buttons, where focus is currently on the OK button. When the user clicks one of the radio buttons, an OnExit event of the button occurs, followed by an OnEnter event on the group box, and finally an OnEnter event on the radio button that was clicked. If the user then clicks on the OK button, an OnExit event for the radio button occurs followed by an OnExit event for the group box, and then the button's OnEnter event occurs.

C++ Examples:

```
/*
This example takes an edit control, a button, and a rich
edit control on a form.  When the user presses the button, a
Font dialog appears.  When the user clicks the Apply (not OK)
```

```
button in the Font dialog, the currently selected font is
applied to the active control. Clicking the button sets the
ActiveControl to the button.  That is why we need to save
the ActiveControl in a shared OnEnter procedure.  In the rich
edit, only the text selected converts.
*/
TWinControl *myActiveControl;

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  FontDialog1->Options << fdApplyButton;
  FontDialog1->Execute();
}

void __fastcall TForm1::FontDialog1Apply(TObject *Sender, HWND Wnd)
{
  if (myActiveControl->ClassNameIs("TEdit"))
   ((TEdit *)myActiveControl)->Font->Assign(FontDialog1->Font);
  else if (myActiveControl->ClassNameIs("TRichEdit"))
    ((TRichEdit *)myActiveControl)->SelAttributes->Assign(FontDialog1->Font);
  else
    MessageBeep(0);
}

void __fastcall TForm1::Edit1Enter(TObject *Sender)
{
  myActiveControl = ActiveControl;
}
/*
This example uses an edit box and a memo control on a form.
When either the edit box or the memo is the active control,
it is colored yellow. When the active control becomes
inactive, the color of the control returns to the Windows
system color for a window.  These event handlers could also
be shared.
*/
void __fastcall TForm1::Edit1Enter(TObject *Sender)
{
  Edit1->Color = clYellow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Edit1Exit(TObject *Sender)
{
  Edit1->Color = clWindow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Memo1Enter(TObject *Sender)
{
  Memo1->Color = clYellow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Memo1Exit(TObject *Sender)
{
  Memo1->Color = clWindow;
}
```

Delphi Examples:

```
{
This example takes an edit control, a button, and a rich
edit control on a form.  When the user presses the button, a
Font dialog appears.  When the user clicks the Apply (not OK)
button in the Font dialog, the currently selected font is
applied to the active control. Clicking the button sets the
ActiveControl to the button.  That is why we need to save
the ActiveControl in a shared OnEnter procedure.  In the rich
edit, only the text selected converts.
```

```
}
procedure TForm1.Button1Click(Sender: TObject);
begin
   FontDialog1.Options := FontDialog1.Options + [fdApplyButton];
   FontDialog1.Execute;
end;

procedure TForm1.Edit1Enter(Sender: TObject);
begin
  myActiveControl := ActiveControl;
end;

procedure TForm1.FontDialog1Apply(Sender: TObject; Wnd: HWND);
begin
  if myActiveControl is TEdit then
    with myActiveControl as TEdit do
       Font.Assign(TFontDialog(Sender).Font)
  else if myActiveControl is TRichEdit then
    with myActiveControl as TRichEdit do
      SelAttributes.Assign(TFontDialog(Sender).Font)
  else
    Beep;
end;
{
This example uses an edit box and a memo control on a form.
When either the edit box or the memo is the active control,
it is colored yellow. When the active control becomes
inactive, the color of the control returns to the Windows
system color for a window.  These event handlers could also
be shared.
}
procedure TForm1.Edit1Enter(Sender: TObject);
begin
  Edit1.Color := clYellow;
end;

procedure TForm1.Edit1Exit(Sender: TObject);
begin
  Edit1.Color := clWindow;
end;

procedure TForm1.Memo1Enter(Sender: TObject);
begin
  Memo1.Color := clYellow;
end;

procedure TForm1.Memo1Exit(Sender: TObject);
begin
  Memo1.Color := clWindow;
end;
```

68.1.22.3.15 TFlowPanel.OnExit Event

Occurs when the input focus shifts away from one control to another.

Pascal

```
property OnExit: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnExit;
```

Description

Use the OnExit event handler to provide special processing when the control ceases to be active.

The OnExit event does not occur when switching between forms or between another application and your application.

When switching between controls in separate container controls such as the TPanel and the TGroupBox controls, an OnExit event occurs for the control inside the container before the OnExit event of the container.

Similarly, an OnEnter event of the container occurs before the OnEnter event of the control in a container when focus moves to a control inside a container.

For example, consider a form with an OK button and a group box that contains three radio buttons, where focus is currently on the OK button. When the user clicks one of the radio buttons, an OnExit event of the button occurs, followed by an OnEnter event on the group box, and finally an OnEnter event on the radio button that was clicked. If the user then clicks on the OK button, an OnExit event for the radio button occurs followed by an OnExit event for the group box, and then the button's OnEnter event occurs.

Note: In some control classes the ActiveControl property updates before the OnExit event occurs.

C++ Examples:

```
/*
This example uses an edit box and a memo control on a form.
When either the edit box or the memo is the active control,
it is colored yellow. When the active control becomes
inactive, the color of the control returns to the Windows
system color for a window.  These event handlers could also
be shared.
*/
void __fastcall TForm1::Edit1Enter(TObject *Sender)
{
  Edit1->Color = clYellow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Edit1Exit(TObject *Sender)
{
  Edit1->Color = clWindow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Memo1Enter(TObject *Sender)
{
  Memo1->Color = clYellow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Memo1Exit(TObject *Sender)
{
  Memo1->Color = clWindow;
}
```

Delphi Examples:

```
{
This example uses an edit box and a memo control on a form.
When either the edit box or the memo is the active control,
it is colored yellow. When the active control becomes
```

```
inactive, the color of the control returns to the Windows
system color for a window.  These event handlers could also
be shared.
}
procedure TForm1.Edit1Enter(Sender: TObject);
begin
  Edit1.Color := clYellow;
end;

procedure TForm1.Edit1Exit(Sender: TObject);
begin
  Edit1.Color := clWindow;
end;

procedure TForm1.Memo1Enter(Sender: TObject);
begin
  Memo1.Color := clYellow;
end;

procedure TForm1.Memo1Exit(Sender: TObject);
begin
  Memo1.Color := clWindow;
end;
```

68.1.22.3.16 TFlowPanel.OnGetSiteInfo Event

Returns the control's docking information.

Pascal

```
property OnGetSiteInfo: TGetSiteInfoEvent;
```

C++

```
__property TGetSiteInfoEvent OnGetSiteInfo;
```

Description

Write code in the OnGetSiteInfo event handler to initialize a TDragDockObject with information about where a dragged object can be docked, if at all. OnGetSiteInfo occurs before the OnDockOver event.

OnGetSiteInfo occurs only if DockSite is true.

C++ Examples:

```
/*
The following example is taken from the docking demo. It
shows how set permissions to dock dockable objects onto a
docking site.
*/

void __fastcall TMainForm::LeftDockPanelDockDrop(TObject *Sender,
      TDragDockObject *Source, int X, int Y)
{
  //OnDockDrop gets called AFTER the client has actually docked,
  //so we check for DockClientCount = 1 before making the dock panel visible.
  TPanel *panel = dynamic_cast<TPanel *>(Sender);
  if (panel->DockClientCount == 1)
    ShowDockPanel(panel, True, NULL);
  panel->DockManager->ResetBounds(True);
  //Make DockManager repaints it's clients.
```

```
}

void __fastcall TMainForm::LeftDockPanelDockOver(TObject *Sender,
      TDragDockObject *Source, int X, int Y, TDragState State, bool &Accept)
{
  Accept = (dynamic_cast<TDockableForm*>(Source->Control) != NULL);
  if (Accept)
  {
    // Modify the DockRect to preview dock area.
    Types::TPoint TopLeft = LeftDockPanel->ClientToScreen(Point(0, 0));
    Types::TPoint BottomRight = LeftDockPanel->ClientToScreen(
      Point(this->ClientWidth/3, LeftDockPanel->Height));
    Source->DockRect = Types::TRect(TopLeft, BottomRight);
  }
}

void __fastcall TMainForm::LeftDockPanelUnDock(TObject *Sender,
      TControl *Client, TWinControl *NewTarget, bool &Allow)
{
  //OnUnDock gets called BEFORE the client is undocked, in order to optionally
  //disallow the undock. DockClientCount is never 0 when called from this event.
  TPanel *panel = dynamic_cast<TPanel *>(Sender);
  if (panel->DockClientCount == 1)
    ShowDockPanel(panel, False, NULL);
}

void __fastcall TMainForm::LeftDockPanelGetSiteInfo(TObject *Sender,
      TControl *DockClient, TRect &InfluenceRect, TPoint &MousePos,
      bool &CanDock)
{
  //if CanDock is true, the panel will not automatically draw the preview rect.
  CanDock = DockClient->ClassNameIs("TDockableForm");
  if (!CanDock)
  {
     ShowMessage("GetSiteInfo CanDock went bad!");
  }
}
```

Delphi Examples:

```
{
The following example is taken from the docking demo. It
shows how set permissions to dock dockable objects onto a
docking site.
}

procedure TMainForm.LeftDockPanelDockDrop(Sender: TObject;
  Source: TDragDockObject; X, Y: Integer);
begin
  //OnDockDrop gets called AFTER the client has actually docked,
  //so we check for DockClientCount = 1 before making the dock panel visible.
  if (Sender as TPanel).DockClientCount = 1 then
    ShowDockPanel(Sender as TPanel, True, nil);
  (Sender as TPanel).DockManager.ResetBounds(True);
  //Make DockManager repaints it's clients.
end;

procedure TMainForm.LeftDockPanelDockOver(Sender: TObject;
  Source: TDragDockObject; X, Y: Integer; State: TDragState;
  var Accept: Boolean);
var
  ARect: TRect;
begin
  Accept := Source.Control is TDockableForm;
  if Accept then
  begin
    //Modify the DockRect to preview dock area.
```

```
      ARect.TopLeft := LeftDockPanel.ClientToScreen(Point(0, 0));
      ARect.BottomRight := LeftDockPanel.ClientToScreen(
        Point(Self.ClientWidth div 3, LeftDockPanel.Height));
      Source.DockRect := ARect;
    end;
  end;

  procedure TMainForm.LeftDockPanelUnDock(Sender: TObject; Client: TControl;
    NewTarget: TWinControl; var Allow: Boolean);
  begin
    //OnUnDock gets called BEFORE the client is undocked, in order to optionally
    //disallow the undock. DockClientCount is never 0 when called from this event.
    if (Sender as TPanel).DockClientCount = 1 then
      ShowDockPanel(Sender as TPanel, False, nil);
  end;

  procedure TMainForm.LeftDockPanelGetSiteInfo(Sender: TObject;
    DockClient: TControl; var InfluenceRect: TRect; MousePos: TPoint;
    var CanDock: Boolean);
  begin
    //if CanDock is true, the panel will not automatically draw the preview rect.
    CanDock := DockClient is TDockableForm;
  end;
```

68.1.22.3.17 TFlowPanel.OnMouseActivate Event

Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.

Pascal

```
property OnMouseActivate: TMouseActivateEvent;
```

C++

```
__property TMouseActivateEvent OnMouseActivate;
```

Description

Use the OnMouseActivate event handler to implement any special processing that should occur as a result of pressing a mouse button on a control when the parent top-level form is not active.

The event type is:

```
TMouseActivateEvent = procedure (Sender: TObject; Button: TMouseButton; ShiftState:
TShiftState;
X, Y: Integer; HitTest: Integer; var MouseActivate: TMouseActivate) of object;
```

When you click on a control and the parent top-level form is not active, this event fires on the control that the mouse cursor is over. MouseActivate is a protected virtual function in TControl. MouseActivate can be overridden in custom control descendants to provide special built-in processing of the OnMouseActivate events. If you leave the default value of MouseActivate as maDefault, the parent control fires the OnMouseActivate event and repeats the process all the way up to the top-level form. If no control in the chain sets the value of MouseActivate, the behavior is the same as if a control set TMouseActivate to maActivate. At any point, a control can set the value of TMouseActivate and the parent processing stops.

Some controls set focus to themselves when they get a button down message so, in some cases, setting maNoActivate appears to have no effect. For instance, a TButton control sets focus to itself in the WM_LBUTTONDOWN message regardless of

whether or not TMouseActivate is set to maNoActivate. In this case, setting maNoActivateAndEat will work because the top-level form is not activated and the WM_LBUTTONDOWN message is suppressed.

The HitTest parameter is the hit test value obtained from the WM_NCHITTEST message. See Windows.pas for valid values and their meanings. In most cases this value will be HTCLIENT, which means that the user clicked in the client area of a control. However, in the case of a top-level form, this can take other values such as HTCAPTION, or HTBOTTOM. This allows the code to decide which value to set for MouseActivate, based on the HitTest code. For example, the following code in the OnMouseActivate event handler for a TForm forces the user to click into a non-client area to activate the form:

```
if HitTest = HTCLIENT then
    MouseActivate := maNoActivateAndEat;
```

Even though this event is tied to how Windows processes WM_MOUSEACTIVATE, the actual handling of the message is done at the TControl level, which is the point in the VCL hierarchy where the control has no window handle. The OnMouseActivate event is then simulated since the all TControl descendants also have OnMouseDown, OnMouseMove, and OnMouseUp events. This information is applicable to both VCL Win32 and VCL.NET.

68.1.22.3.18 TFlowPanel.OnMouseDown Event

Occurs when the user presses a mouse button with the mouse pointer over a control.

Pascal

```
property OnMouseDown: TMouseEvent;
```

C++

```
__property TMouseEvent OnMouseDown;
```

Description

Use the OnMouseDown event handler to implement any special processing that should occur as a result of pressing a mouse button.

The OnMouseDown event handler can respond to left, right, or center mouse button presses and shift key plus mouse-button combinations. Shift keys are the Shift, Ctrl, and Alt keys. X and Y are the pixel coordinates of the mouse pointer in the client area of the Sender.

C++ Examples:

```
/*
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a
rectangle is drawn on the form. When the mouse button is
released, the rectangle appears on the form's canvas. Its
top-left and bottom-right corners are defined by the
location of the mouse pointer when the user pressed and
released the mouse button.  While the user drags the mouse,
the location of the top, left, bottom, and right sides of
the rectangle are displayed in the status bar.
*/
int StartX, StartY; // Declare at the top of the form's unit
```

```
// Use this code as the OnMouseDown event handler of the form:
void __fastcall TForm1::FormMouseDown(TObject *Sender, TMouseButton Button, TShiftState Shift,
int X, int Y)
{
  StartX = X;
  StartY = Y;
}

// Use this code as the OnMouseUp event handler of the form:
void __fastcall TForm1::FormMouseUp(TObject *Sender, TMouseButton Button, TShiftState Shift,
int X, int Y)
{
  Form1->Canvas->Rectangle(StartX, StartY, X, Y);
  StatusBar1->Panels->Items[0]->Text = "";
  StatusBar1->Panels->Items[1]->Text = "";
  StatusBar1->Panels->Items[2]->Text = "";
  StatusBar1->Panels->Items[3]->Text = "";
}

// Use this code as the OnMouseMove event handler of the form:
void __fastcall TForm1::FormMouseMove(TObject *Sender, TShiftState Shift, int X, int Y)
{
  if (Shift.Contains(ssLeft)) // make sure button is down
  {
    if (Y > StartY)
    {
      StatusBar1->Panels->Items[0]->Text = "Top: " + IntToStr(StartY);
      StatusBar1->Panels->Items[2]->Text = "Bottom: " + IntToStr(Y);
    }
    else
    {
      StatusBar1->Panels->Items[0]->Text = "Top: " + IntToStr(Y);
      StatusBar1->Panels->Items[2]->Text = "Bottom: " + IntToStr(StartY);
    }
    if (X > StartX)
    {
      StatusBar1->Panels->Items[1]->Text = "Left: " + IntToStr(StartX);
      StatusBar1->Panels->Items[3]->Text = "Right: " + IntToStr(X);
    }
    else
    {
      StatusBar1->Panels->Items[1]->Text = "Left: " + IntToStr(X);
      StatusBar1->Panels->Items[3]->Text = "Right: " + IntToStr(StartX);
    }
  }
}
```

Delphi Examples:

```
{
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a
rectangle is drawn on the form. When the mouse button is
released, the rectangle appears on the form's canvas. Its
top-left and bottom-right corners are defined by the
location of the mouse pointer when the user pressed and
released the mouse button.  While the user drags the mouse,
the location of the top, left, bottom, and right sides of
the rectangle are displayed in the status bar.
}
procedure TForm1.FormMouseDown(Sender: TObject; Button: TMouseButton; Shift: TShiftState; X,
Y: Integer);
begin
  StartX := X;
  StartY := Y;
```

```
end;

procedure TForm1.FormMouseUp(Sender: TObject; Button: TMouseButton; Shift: TShiftState; X, Y:
Integer);
begin
  Form1.Canvas.Rectangle(StartX, StartY, X, Y);
  StatusBar1.Panels[0].Text := '';
  StatusBar1.Panels[1].Text := '';
  StatusBar1.Panels[2].Text := '';
  StatusBar1.Panels[3].Text := '';
end;

procedure TForm1.FormMouseMove(Sender: TObject; Shift: TShiftState; X, Y: Integer);
begin
  if ssLeft in Shift then { make sure button is down }
  begin
    if Y > StartY then
      begin
      StatusBar1.Panels[0].Text := 'Top: ' + IntToStr(StartY);
      StatusBar1.Panels[2].Text := 'Bottom: ' + IntToStr(Y);
      end
    else
      begin
      StatusBar1.Panels[0].Text := 'Top: ' + IntToStr(Y);
      StatusBar1.Panels[2].Text := 'Bottom: ' + IntToStr(StartY);
      end;
    if X > StartX then
      begin
      StatusBar1.Panels[1].Text := 'Left: ' + IntToStr(StartX);
      StatusBar1.Panels[3].Text := 'Right: ' + IntToStr(X);
      end
    else
      begin
      StatusBar1.Panels[1].Text := 'Left: ' + IntToStr(X);
      StatusBar1.Panels[3].Text := 'Right: ' + IntToStr(StartX);
      end;
  end;
end;
```

68.1.22.3.19 TFlowPanel.OnMouseEnter Event

Occurs when the user moves the mouse into a control.

Pascal

```
property OnMouseEnter: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnMouseEnter;
```

Description

Use the OnMouseEnter event handler to implement any special processing that should occur as a result of moving the mouse into a control when the parent top-level form is not active.

68.1.22.3.20 TFlowPanel.OnMouseLeave Event

Occurs when the user moves the mouse outside of a control.

Pascal

```
property OnMouseLeave: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnMouseLeave;
```

Description

Use the OnMouseLeave event handler to implement any special processing that should occur as a result of moving the mouse outside of a control when the parent top-level form is not active.

68.1.22.3.21 TFlowPanel.OnMouseMove Event

Occurs when the user moves the mouse pointer while the mouse pointer is over a control.

Pascal

```
property OnMouseMove: TMouseMoveEvent;
```

C++

```
__property TMouseMoveEvent OnMouseMove;
```

Description

Use the OnMouseMove event handler to respond when the mouse pointer moves after the control has captured the mouse.

Use the Shift parameter of the OnMouseDown event handler, to determine to the state of the shift keys and mouse buttons. Shift keys are the Shift, Ctrl, and Alt keys or shift key-mouse button combinations. X and Y are pixel coordinates of the new location of the mouse pointer in the client area of the Sender.

C++ Examples:

```
/*
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a
rectangle is drawn on the form. When the mouse button is
released, the rectangle appears on the form's canvas. Its
top-left and bottom-right corners are defined by the
location of the mouse pointer when the user pressed and
released the mouse button.  While the user drags the mouse,
the location of the top, left, bottom, and right sides of
the rectangle are displayed in the status bar.
*/

{
  StartX = X;
  StartY = Y;
}

// Use this code as the OnMouseUp event handler of the form:
void __fastcall TForm1::FormMouseUp(TObject *Sender, TMouseButton Button, TShiftState Shift,
int X, int Y)
{
```

```
  Form1->Canvas->Rectangle(StartX, StartY, X, Y);
  StatusBar1->Panels->Items[0]->Text = "";
  StatusBar1->Panels->Items[1]->Text = "";
  StatusBar1->Panels->Items[2]->Text = "";
  StatusBar1->Panels->Items[3]->Text = "";
}

// Use this code as the OnMouseMove event handler of the form:
void __fastcall TForm1::FormMouseMove(TObject *Sender, TShiftState Shift, int X, int Y)
{
  if (Shift.Contains(ssLeft)) // make sure button is down
  {
    if (Y > StartY)
    {
      StatusBar1->Panels->Items[0]->Text = "Top: " + IntToStr(StartY);
      StatusBar1->Panels->Items[2]->Text = "Bottom: " + IntToStr(Y);
    }
    else
    {
      StatusBar1->Panels->Items[0]->Text = "Top: " + IntToStr(Y);
      StatusBar1->Panels->Items[2]->Text = "Bottom: " + IntToStr(StartY);
    }
    if (X > StartX)
    {
      StatusBar1->Panels->Items[1]->Text = "Left: " + IntToStr(StartX);
      StatusBar1->Panels->Items[3]->Text = "Right: " + IntToStr(X);
    }
    else
    {
      StatusBar1->Panels->Items[1]->Text = "Left: " + IntToStr(X);
      StatusBar1->Panels->Items[3]->Text = "Right: " + IntToStr(StartX);
    }
  }
}
```

Delphi Examples:

```
{
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a

68.1.22.3.22 TFlowPanel.OnMouseUp Event

Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.

Pascal

```
property OnMouseUp: TMouseEvent;
```

C++

```
__property TMouseEvent OnMouseUp;
```

Description

Use an OnMouseUp event handler to implement special processing when the user releases a mouse button.

The OnMouseUp event handler can respond to left, right, or center mouse button presses and shift key plus mouse-button combinations. Shift keys are the Shift, Ctrl, and Alt keys. X and Y are the pixel coordinates of the mouse pointer in the client area of the Sender.

C++ Examples:

```
/*
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a
rectangle is drawn on the form. When the mouse button is
released, the rectangle appears on the form's canvas. Its
top-left and bottom-right corners are defined by the
location of the mouse pointer when the user pressed and
released the mouse button.  While the user drags the mouse,
```

```
the location of the top, left, bottom, and right sides of
the rectangle are displayed in the status bar.
*/
int StartX, StartY; // Declare at the top of the form's unit
// Use this code as the OnMouseDown event handler of the form:

Responding to a Mouse-up Action

68.1.22.3.23 TFlowPanel.OnResize Event

Occurs immediately after the control is resized.

Pascal

```
property OnResize: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnResize;
```

Description

Use OnResize to make any final adjustments after a control is resized.

To modify the way a control responds when an attempt is made to resize it, use OnCanResize or OnConstrainedResize.

Note: Some controls call this event handler when the control is first created.

Delphi Examples:

```
{
The following code keeps the right edge on Button1 against
the right edge of Form1 when Form1 is resized.
}
procedure TForm1.FormResize(Sender: TObject);
begin
  Button1.Left := Form1.ClientWidth-Button1.Width;
end;
```

OnConstrainedResize (see page 5853)

68.1.22.3.24 TFlowPanel.OnStartDock Event

Occurs when the user begins to drag a control with a DragKind of dkDock.

Pascal

```
property OnStartDock: TStartDockEvent;
```

C++

```
__property TStartDockEvent OnStartDock;
```

Description

Use the OnStartDock event handler to implement special processing when the user starts a drag-and-dock operation by dragging the control.

The OnStartDock event handler can create a TDragDockObjectEx object for the DragObject parameter to specify the appearance of the dragging rectangle and how the dragged control interacts with potential docking sites. If you return TDragDockObjectEx as the drag object, there is no need to call the Free method for the DragObject when dragging is over. If you use TDragDockObject, your application is responsible for freeing the drag object.

If the OnStartDock event handler sets the DragObject parameter to nil (Delphi) or NULL (C++), a TDragDockObject object is automatically created.

Note: This information applies to Win32 applications only.

68.1.22.3.25 TFlowPanel.OnStartDrag Event

Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.

Pascal

```
property OnStartDrag: TStartDragEvent;
```

C++

```
__property TStartDragEvent OnStartDrag;
```

Description

Use the OnStartDrag event handler to implement special processing when the user starts to drag the control or an object it contains. OnStartDrag only occurs if DragKind is dkDrag.

Sender is the control that is about to be dragged, or that contains the object about to be dragged.

The OnStartDrag event handler can create a TDragControlObjectEx instance for the DragObject parameter to specify the drag cursor, or, optionally, a drag image list. If you create a TDragControlObjectEx instance, there is no need to call the Free method for the DragObject when dragging is over. If you create, instead, a TDragControlObject instance, your application is responsible for freeing the drag object instance.

If the OnStartDrag event handler sets the DragObject parameter to nil (Delphi) or NULL (C++), a TDragControlObject object is automatically created and dragging begins on the control itself.

Note: On some controls, such as TRichEdit, the underlying Windows control handles internal drag operations. For these controls, there are no OnStartDrag or OnEndDrag events for drag operations within the control.

68.1.22.3.26 TFlowPanel.OnUnDock Event

Occurs when the application tries to undock a control that is docked to the windowed control.

Pascal

```
property OnUnDock: TUnDockEvent;
```

C++

```
__property TUnDockEvent OnUnDock;
```

Description

Write an OnUnDock event handler to adjust the windowed control when a dock client is undocked. The OnUnDock event handler can make any necessary adjustments, or it can block the undock attempt by setting the Allow parameter to false.

C++ Examples:

```
/*
The following example is taken from the docking demo. It
shows how the OnUnDock event handler of the conjoinment
```

```
docking site re-enables docking in the control that is
undocked (if it is a dockable form). In addition, when the
next to last docked control is undocked, the conjoinment
docking site sends itself a close message so that the last
docked control is undocked to its old position and size.
*/
void __fastcall TConjoinDockHost::FormUnDock(TObject *Sender, TControl *Client,
      TWinControl *NewTarget, bool &Allow)
{
  // Only 2 dock clients means the host must be destroyed and
  // the remaining window undocked to its old position and size.
  // Recall that OnUnDock gets called before the undocking
  // actually occurs.
  if (Client->ClassNameIs("TDockableForm"))
    dynamic_cast<TDockableForm *>(Client)->DockSite = True;
  if ((DockClientCount == 2) && (NewTarget != this))        // Self?
    PostMessage(dynamic_cast<TConjoinDockHost *>(this)->Handle, WM_CLOSE, 0, 0);
  UpdateCaption(Client);
}
/*
The following example is taken from the docking demo. It
shows how set permissions to dock dockable objects onto a
docking site.
*/

void __fastcall TMainForm::LeftDockPanelDockDrop(TObject *Sender,
      TDragDockObject *Source, int X, int Y)
{
  //OnDockDrop gets called AFTER the client has actually docked,
  //so we check for DockClientCount = 1 before making the dock panel visible.
  TPanel *panel = dynamic_cast<TPanel *>(Sender);
  if (panel->DockClientCount == 1)
    ShowDockPanel(panel, True, NULL);
  panel->DockManager->ResetBounds(True);
  //Make DockManager repaints it's clients.
}

void __fastcall TMainForm::LeftDockPanelDockOver(TObject *Sender,
      TDragDockObject *Source, int X, int Y, TDragState State, bool &Accept)
{
  Accept = (dynamic_cast<TDockableForm*>(Source->Control) != NULL);
  if (Accept)
  {
    // Modify the DockRect to preview dock area.
    Types::TPoint TopLeft = LeftDockPanel->ClientToScreen(Point(0, 0));
    Types::TPoint BottomRight = LeftDockPanel->ClientToScreen(
      Point(this->ClientWidth/3, LeftDockPanel->Height));
    Source->DockRect = Types::TRect(TopLeft, BottomRight);
  }
}

void __fastcall TMainForm::LeftDockPanelUnDock(TObject *Sender,
      TControl *Client, TWinControl *NewTarget, bool &Allow)
{
  //OnUnDock gets called BEFORE the client is undocked, in order to optionally
  //disallow the undock. DockClientCount is never 0 when called from this event.
  TPanel *panel = dynamic_cast<TPanel *>(Sender);
  if (panel->DockClientCount == 1)
    ShowDockPanel(panel, False, NULL);
}

void __fastcall TMainForm::LeftDockPanelGetSiteInfo(TObject *Sender,
      TControl *DockClient, TRect &InfluenceRect, TPoint &MousePos,
      bool &CanDock)
{
  //if CanDock is true, the panel will not automatically draw the preview rect.
```

```
  CanDock = DockClient->ClassNameIs("TDockableForm");
  if (!CanDock)
  {
     ShowMessage("GetSiteInfo CanDock went bad!");
  }
}
```

Delphi Examples:

```
{
The following example is taken from the docking demo. It
shows how the OnUnDock event handler of the conjoinment
docking site re-enables docking in the control that is
undocked (if it is a dockable form). In addition, when the
next to last docked control is undocked, the conjoinment
docking site sends itself a close message so that the last
docked control is undocked to its old position and size.
}
procedure TConjoinDockHost.FormUnDock(Sender: TObject; Client: TControl;
  NewTarget: TWinControl; var Allow: Boolean);
begin
  // Only 2 dock clients means the host must be destroyed and
  // the remaining window undocked to its old position and size.
  // Recall that OnUnDock gets called before the undocking
  // actually occurs.
  if Client is TDockableForm then
    TDockableForm(Client).DockSite := True;
  if (DockClientCount = 2) and (NewTarget <> Self) then
    PostMessage(Self.Handle, WM_CLOSE, 0, 0);
  UpdateCaption(Client);
end;
{
The following example is taken from the docking demo. It
shows how set permissions to dock dockable objects onto a
docking site.
}

procedure TMainForm.LeftDockPanelDockDrop(Sender: TObject;
  Source: TDragDockObject; X, Y: Integer);
begin
  //OnDockDrop gets called AFTER the client has actually docked,
  //so we check for DockClientCount = 1 before making the dock panel visible.
  if (Sender as TPanel).DockClientCount = 1 then
    ShowDockPanel(Sender as TPanel, True, nil);
  (Sender as TPanel).DockManager.ResetBounds(True);
  //Make DockManager repaints it's clients.
end;

procedure TMainForm.LeftDockPanelDockOver(Sender: TObject;
  Source: TDragDockObject; X, Y: Integer; State: TDragState;
  var Accept: Boolean);
var
  ARect: TRect;
begin
  Accept := Source.Control is TDockableForm;
  if Accept then
  begin
    //Modify the DockRect to preview dock area.
    ARect.TopLeft := LeftDockPanel.ClientToScreen(Point(0, 0));
    ARect.BottomRight := LeftDockPanel.ClientToScreen(
      Point(Self.ClientWidth div 3, LeftDockPanel.Height));
    Source.DockRect := ARect;
  end;
end;

procedure TMainForm.LeftDockPanelUnDock(Sender: TObject; Client: TControl;
  NewTarget: TWinControl; var Allow: Boolean);
```

```
begin
  //OnUnDock gets called BEFORE the client is undocked, in order to optionally
  //disallow the undock. DockClientCount is never 0 when called from this event.
  if (Sender as TPanel).DockClientCount = 1 then
    ShowDockPanel(Sender as TPanel, False, nil);
end;

procedure TMainForm.LeftDockPanelGetSiteInfo(Sender: TObject;
  DockClient: TControl; var InfluenceRect: TRect; MousePos: TPoint;
  var CanDock: Boolean);
begin
  //if CanDock is true, the panel will not automatically draw the preview rect.
  CanDock := DockClient is TDockableForm;
end;
```

68.1.23 TGridPanel Class

TGridPanel implements a grid panel control in which each component is placed within a cell on a grid.

Class Hierarchy

Pascal

```
TGridPanel = class(TCustomGridPanel);
```

C++

```
class TGridPanel : public TCustomGridPanel;
```

File

ExtCtrls

Description

Use TGridPanel to put an empty grid panel on a form. The major difference between a traditional panel and a grid panel is the way in which controls are placed. With a traditional panel, you place a control (such as a button) in a specific location. You can freely move that control to any location within the panel using the mouse. In a grid panel, you specify the number of rows and columns on the panel, then each component is placed into the next available cell in the grid, regardless of where you place it with the mouse. If each grid contains a control and you add more controls, the location for the new controls is determined by the ExpandStyle (see page 12694) property. For example, using the default ExpandStyle (see page 12694) property of AddRows, a new row is added to the grid, and each cell in the row can contain a new control.

68.1.23.1 TGridPanel Members

The following tables list the members exposed by TGridPanel.

Protected Events

	Name	Description
	OnKeyDown (see page 6225)	Occurs when a user presses any key while the control has focus.
	OnKeyPress (see page 6227)	Occurs when a key is pressed.
	OnKeyUp (see page 6228)	Occurs when the user releases a key that has been pressed.
	OnMouseWheel (see page 5869)	Occurs when the mouse wheel is rotated.
	OnMouseWheelDown (see page 5869)	Occurs when the mouse wheel is rotated downward.
	OnMouseWheelUp (see page 5870)	Occurs when the mouse wheel is rotated upward.

Protected Fields

	Name	Description
	FAnchorMove (see page 5733)	This is FAnchorMove, a member of class TControl.
	FAnchorOrigin (see page 5734)	This is FAnchorOrigin, a member of class TControl.
	FAnchorRules (see page 5734)	This is FAnchorRules, a member of class TControl.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FDesignSize (see page 6124)	This is FDesignSize, a member of class TWinControl.
	FDoubleBuffered (see page 6124)	This is FDoubleBuffered, a member of class TWinControl.
	FExplicitHeight (see page 5734)	This is FExplicitHeight, a member of class TControl.
	FExplicitLeft (see page 5734)	This is FExplicitLeft, a member of class TControl.
	FExplicitTop (see page 5734)	This is FExplicitTop, a member of class TControl.
	FExplicitWidth (see page 5735)	This is FExplicitWidth, a member of class TControl.
	FInImeComposition (see page 6125)	This is FInImeComposition, a member of class TWinControl.
	FOriginalParentSize (see page 5735)	This is FOriginalParentSize, a member of class TControl.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	ActionChange (see page 5737)	Responds when the action associated with the control changes.
V	ActionChange (see page 6127)	Updates the control to reflect changes in its associated action.
	AddBiDiModeExStyle (see page 6128)	Sets control's window style according to its bi-directional support.
V	AdjustClientRect (see page 6128)	Provides the interface that adjusts the ClientRect (see page 5810) property for idiosyncrasies of the window.
V	AdjustClientRect (see page 12537)	Adjusts the ClientRect property for the idiosyncrasies of the window.
	AdjustSize (see page 5738)	Sets the size of the control as determined by the AutoSize (see page 5803) property.
V	AdjustSize (see page 6129)	Adjusts the control's size according to its contents and constraints.
V	AlignControls (see page 6129)	Aligns any controls for which the control is the parent within a specified area of the control.
V	AlignControls (see page 12502)	Aligns any controls for which the control is the parent within a specified area of the control.
	ArrangeControl (see page 6130)	This is ArrangeControl, a member of class TWinControl.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	AssignTo (see page 5739)	Overrides the inherited AssignTo function to enable assignments to TAction objects.
V	AssignTo (see page 6130)	Copies the properties of the windowed control to another object.
	AutoAddColumn (see page 12502)	This is AutoAddColumn, a member of class TCustomGridPanel.
	AutoAddRow (see page 12503)	This is AutoAddRow, a member of class TCustomGridPanel.
	BeginAutoDrag (see page 5739)	Begin Automatic Drag.
	CalcCursorPos (see page 5741)	This is CalcCursorPos, a member of class TControl.

	CanAutoSize (see page 5741)	Indicates whether the control can resize itself automatically to accommodate its contents.
	CanAutoSize (see page 6131)	Indicates how the control can be resized.
	CanAutoSize (see page 12537)	Adjusts the way the panel responds to resize attempts.
	CanResize (see page 5742)	OnCanResize (see page 5851) event dispatcher.
	CanResize (see page 6132)	Indicates how the control can respond to a resize attempt.
	CellIndexToCell (see page 12503)	This is CellIndexToCell, a member of class TCustomGridPanel.
	CellToCellIndex (see page 12503)	This is CellToCellIndex, a member of class TCustomGridPanel.
	Changed (see page 5742)	Sends a CM_CHANGED (see page 6330) message to the control.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	ChangeScale (see page 5743)	Rescaling event dispatcher.
	ChangeScale (see page 6132)	Resize (see page 5780) and reposition children and self.
	Click (see page 5743)	Respond to user click.
	ConstrainedResize (see page 5746)	Notify control of resize with constraints.
	ConstrainedResize (see page 6133)	Generates an OnConstrainedResize (see page 5853) event.
	ControlsAligned (see page 6134)	This is ControlsAligned, a member of class TWinControl.
	CreateDockManager (see page 6134)	Creates the dock manager for the control.
	CreateHandle (see page 6135)	Creates underlying screen object.
	CreateParams (see page 6135)	Initializes a window-creation parameter data structure.
	CreateParams (see page 12537)	Initializes a window-creation parameter record passed in the Params parameter.
	CreateSubClass (see page 6136)	Creates a windowed control derived from an existing Windows window class.
	CreateWindowHandle (see page 6137)	Creates a Windows control to represent the control.
	CreateWnd (see page 6137)	Creates the underlying window.
	CustomAlignInsertBefore (see page 6137)	Returns placement order of custom-aligned child control.
	CustomAlignPosition (see page 6138)	Returns aligned position of custom-aligned child control.
	DblClick (see page 5747)	OnDblClick (see page 5854) event dispatcher.
	DefaultDockImage (see page 5747)	Handles the painting and erasing of a dock image.
	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	DefineProperties (see page 5748)	Provides methods to read and write the IsControl (see page 5829) property to a stream such as a form file.
	DefineProperties (see page 6139)	Provides methods to read and write the IsControl property to a stream such as a form file.
	DesignWndProc (see page 5749)	This is DesignWndProc, a member of class TControl.
	DestroyHandle (see page 6140)	Destroys the control's window without destroying the control.
	DestroyWindowHandle (see page 6140)	Destroys the window created in the CreateWindowHandle (see page 6137) method.
	DestroyWnd (see page 6141)	Destroys the control's window.
	DoAddDockClient (see page 6142)	Performs actions when a control is docked to the windowed control.
	DockOver (see page 6143)	Responds when a docking client is dragged over the windowed control.
	DockReplaceDockClient (see page 6143)	This is DockReplaceDockClient, a member of class TWinControl.
	DockTrackNoTarget (see page 5749)	Handles dragging of the control over an invalid docking target.
	DoContextPopup (see page 5750)	OnContextPopup (see page 5854) event dispatcher.
	DoDock (see page 5750)	Docking event dispatcher.
	DoDockOver (see page 6143)	Generates an OnDockOver (see page 6216) event.
	DoEndDock (see page 5750)	OnEndDock (see page 5859) event dispatcher.
	DoEndDrag (see page 5751)	OnEndDrag (see page 5860) event dispatcher.
	DoEnter (see page 6144)	Respond to receiving input focus.
	DoExit (see page 6144)	Respond to losing input focus
	DoFlipChildren (see page 6145)	Flips the control's children.
	DoKeyDown (see page 6145)	Performs some preprocessing before generating an OnKeyDown (see page 6225) event.
	DoKeyPress (see page 6146)	Performs some preprocessing before generating an OnKeyPress (see page 6227) event.

	DoKeyUp (see page 6146)	Performs some preprocessing before generating an OnKeyUp (see page 6228) event.
	DoMouseWheel (see page 5751)	Processes mouse wheel motion.
	DoMouseWheelDown (see page 5752)	OnMouseWheelDown (see page 5869) event dispatcher.
	DoMouseWheelUp (see page 5752)	OnMouseWheelUp (see page 5870) event dispatcher.
	DoRemoveDockClient (see page 6147)	Responds when a control is undocked from the windowed control.
	DoStartDock (see page 5753)	OnStartDock (see page 5871) event dispatcher.
	DoStartDrag (see page 5753)	OnStartDrag (see page 5871) event dispatcher.
	DoUnDock (see page 6147)	Undocks a control that is currently docked to the windowed control.
	DragCanceled (see page 5754)	Provides the interface for a method that responds to the cancellation of a drag.
	DragOver (see page 5755)	OnDragOver (see page 5857) event dispatcher.
	DrawDragDockImage (see page 5755)	Draws the dock image for the control.
	EraseDragDockImage (see page 5757)	Erases the dock image for the control.
	FindNextControl (see page 6149)	Returns the control's next child in the tab order after the specified control.
	FixupTabList (see page 6149)	Sorts the child controls by their tab order.
	GetAction (see page 5758)	This is GetAction, a member of class TControl.
	GetActionLinkClass (see page 5758)	Returns the appropriate action link class that is associated with the control class.
	GetActionLinkClass (see page 6152)	Returns the associated action link class.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetChildren (see page 6153)	Calls a specified method for each child of the control.
	GetClientOrigin (see page 5758)	Returns the screen coordinates of the top-left corner of the control's client area.
	GetClientOrigin (see page 6153)	Returns the value of the ClientOrigin (see page 5809) property.
	GetClientRect (see page 5759)	Returns a rectangle defining the client area of the control.
	GetClientRect (see page 6154)	Returns the value of the ClientRect (see page 5810) property.
	GetControlExtents (see page 6154)	Returns the smallest rectangle in which all the control's children fit.
	GetDeviceContext (see page 5760)	Returns a device context for the control.
	GetDeviceContext (see page 6155)	Provides access to a device context for the control.
	GetDockEdge (see page 5763)	Returns the edge on which another control should be docked when it is dragged over the control.
	GetDragImages (see page 5763)	Returns the control's image list containing the image to be displayed while dragging.
	GetEnabled (see page 5763)	Returns the value of the Enabled (see page 5821) property.
	GetFloating (see page 5764)	Returns the value of the Floating (see page 5823) property.
	GetFloatingDockSiteClass (see page 5764)	Returns the class used for the control when it is floating.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetPalette (see page 5765)	Returns the handle to a palette for use by the control.
	GetParentHandle (see page 6157)	Returns the window handle for the window of the control's parent.
	GetPopupMenu (see page 5765)	Returns the pop-up menu associated with the control.
	GetSiteInfo (see page 6158)	Generates an OnGetSiteInfo (see page 6223) event
	GetTopParentHandle (see page 6159)	Returns the window handle of the first window not associated with a VCL control that contains the windowed control.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	InvalidateDockHostSite (see page 6162)	This is InvalidateDockHostSite, a member of class TWinControl.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsControlActivateMsg (see page 6162)	This is IsControlActivateMsg, a member of class TWinControl.
	IsControlMouseMsg (see page 6162)	Indicates whether a specified mouse message is directed to one of the windowed control's child controls.
	IsQualifyingSite (see page 6163)	This is IsQualifyingSite, a member of class TWinControl.

	KeyDown (see page 6163)	Respond to key press events.
	KeyPress (see page 6163)	Respond to keyboard input.
	KeyUp (see page 6164)	Respond to released key.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Loaded (see page 5771)	Initializes the control after it is loaded from a stream.
V	Loaded (see page 12504)	Initializes the control after it is loaded from a stream.
	MainWndProc (see page 6165)	Receives Windows messages for the control.
	MouseActivate (see page 5773)	This is MouseActivate, a member of class TControl.
	MouseDown (see page 5773)	OnMouseDown (see page 5862) event dispatcher.
	MouseMove (see page 5773)	Respond to mouse moving over control area..
	MouseUp (see page 5774)	OnMouseUp (see page 5867) event dispatcher.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	Notification (see page 5775)	Responds to notifications that components are being created or destroyed.
V	Notification (see page 6165)	Responds to notifications that components are being created or destroyed.
	NotifyControls (see page 6165)	Sends a message to all the child controls.
V	Paint (see page 5920)	Renders the image of a custom control.
V	Paint (see page 12505)	Renders the image of the panel.
V	Paint (see page 12538)	Renders the image of the panel.
	PaintControls (see page 6166)	Paints each of the child controls in a windowed control using the specified device context.
	PaintHandler (see page 6166)	Responds to WM_PAINT messages.
V	PaintWindow (see page 5920)	Renders the image of the control on a specified device context.
V	PaintWindow (see page 6169)	Renders the image of a windowed control.
	PaletteChanged (see page 5775)	Responds to changes in the system's palette by realizing the control's palette.
V	PaletteChanged (see page 6170)	Responds to changes in the system's palette by realizing the control's palette and the palette for each child control.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	PositionDockRect (see page 5777)	Positions the docking rectangle according to the current drag-and-dock state.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 5778)	Prepares the control for having its properties assigned values read from a stream.
V	ReadState (see page 6171)	Prepares the control for having its properties assigned values from a stream.
	RecreateWnd (see page 6171)	Recreate underlying Windows screen object.
	ReloadDockedControl (see page 6172)	Reloads a docked control.
	RemoveEmptyAutoAddColumns (see page 12505)	This is RemoveEmptyAutoAddColumns, a member of class TCustomGridPanel.
	RemoveEmptyAutoAddRows (see page 12505)	This is RemoveEmptyAutoAddRows, a member of class TCustomGridPanel.
	RemoveWindowProps (see page 6174)	This is RemoveWindowProps, a member of class TWinControl.
V	RequestAlign (see page 5780)	Instructs the parent of a control to reposition the control, enforcing its Align (see page 5798) property.
	ResetIme (see page 6174)	Restores the input method editor (IME) that was active when the application started.
	ResetImeComposition (see page 6175)	Directs the composition window of the input method editor (IME) to perform a specific action.
	Resize (see page 5780)	Respond to control resize.
	ScaleConstraints (see page 5781)	This is ScaleConstraints, a member of class TControl.
	ScaleControls (see page 6176)	Rescale child controls only.
	SelectFirst (see page 6177)	Locates first selectable child control.
	SelectNext (see page 6177)	Moves the input focus from the current child control to the next one in the tab order.
	SendCancelMode (see page 5781)	Cancels the modal state of the control.
	SendDockNotification (see page 5782)	Sends a Windows message to the control's host dock site.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
V	SetAutoSize (see page 5783)	This is SetAutoSize, a member of class TControl.
V	SetBiDiMode (see page 5783)	Sets the control's bi-directional mode.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.

V	SetChildOrder (see page 6178)	Changes the order in which the child component appears in the list of child components returned by the GetChildren (see page 6153) method.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
V	SetDragMode (see page 5785)	Sets the drag mode for the control.
V	SetEnabled (see page 5785)	Sets the value of the Enabled (see page 5821) property.
	SetIme (see page 6181)	Activates an input method editor (IME) using the values specified by the ImeMode (see page 6207) and ImeName (see page 6208) properties.
	SetImeCompositionWindow (see page 6181)	Sets the position and font of the composition window.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
V	SetName (see page 5785)	Sets the name of the control.
V	SetParent (see page 5786)	Sets the parent of the control.
V	SetParent (see page 6182)	Sets the parent of the control.
V	SetParentBackground (see page 6182)	This is SetParentBackground, a member of class TWinControl.
V	SetParentBackground (see page 12539)	This is SetParentBackground, a member of class TCustomPanel.
V	SetParentBiDiMode (see page 5786)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 5787)	Sets the parent for the control.
	SetZOrder (see page 5788)	Repositions the control in its parent's control list, thereby changing position onscreen.
V	SetZOrder (see page 6182)	Moves the control to the top or bottom of the parent control's (or screen's) list of TWinControl (see page 6112) controls.
V	ShowControl (see page 6183)	Ensures that a specified child control is visible.
	UpdateBounds (see page 6185)	This is UpdateBounds, a member of class TWinControl.
	UpdateBoundsRect (see page 5789)	Changes the Top (see page 5844), Left (see page 5830), Width (see page 5849), and Height (see page 5825) properties of the control, but doesn't update its screen image and bypasses all resize events.
V	UpdateControlOriginalParentSize (see page 6186)	This is UpdateControlOriginalParentSize, a member of class TWinControl.
V	UpdateControlOriginalParentSize (see page 12505)	This is UpdateControlOriginalParentSize, a member of class TCustomGridPanel.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateExplicitBounds (see page 5789)	This is UpdateExplicitBounds, a member of class TControl.
	UpdateRecreatingFlag (see page 6186)	This is UpdateRecreatingFlag, a member of class TWinControl.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	UpdateUIState (see page 6186)	Updates form User Interface State as needed
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	VisibleChanging (see page 5791)	Provides the interface for a method that responds to changes in the control's visibility.
V	WndProc (see page 5791)	Provides specific message responses for the control.
V	WndProc (see page 6187)	Provides specific message responses for the control.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	ActionLink (see page 5798)	Contains the action link object associated with the control.
	AutoSize (see page 5803)	Specifies whether the control sizes itself automatically to accommodate its contents.
R	Canvas (see page 5921)	Specifies the TCanvas object that presents a drawing surface for the control.
	DefWndProc (see page 6199)	Specifies the default window procedure for the windowed control.
	DesktopFont (see page 5818)	Specifies whether the control uses the Windows icon font when writing text.

	ImeMode (see page 6207)	Determines the behavior of the input method editor (IME).
	ImeName (see page 6208)	Specifies the input method editor (IME) to use for converting keyboard input to Asian language characters.
	IsControl (see page 5829)	Determines whether a form stores its form-specific properties to a stream.
	MouseCapture (see page 5831)	Indicates whether the control has "captured" mouse events.
	ScalingFlags (see page 5840)	Reflects which attributes of the control have been scaled.
	Text (see page 5842)	Contains a text string associated with the control.
	WheelAccumulator (see page 5849)	Accumulates mouse wheel rotations.
	WindowHandle (see page 6212)	Provides access to a window handle for the control.
	WindowText (see page 5850)	Contains the text string of the control.

Public Events

	Name	Description
	WindowProc (see page 5872)	Points to the window procedure that responds to messages sent to the control.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	BeginDrag (see page 5740)	Starts the dragging of a control.
	BringToFront (see page 5740)	Puts the control in front of all other controls in its parent control.
	Broadcast (see page 6130)	Sends a message to each of the child controls.
	CanFocus (see page 6131)	Indicates whether a control can receive focus.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	ClientToParent (see page 5744)	Translates client coordinates to parent coordinates.
	ClientToScreen (see page 5744)	Translates a given point from client area coordinates to global screen coordinates.
	ContainsControl (see page 6133)	Indicates whether a specified control exists within the control.
	ControlAtPos (see page 6133)	Returns the child control located at a specified position within the control.
	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 5731)	Creates an instance of TControl (see page 5724).
	Create (see page 5918)	Creates an instance of TCustomControl (see page 5908).
	Create (see page 6123)	Creates an instance of TWinControl (see page 6112).
	Create (see page 12500)	Creates and initializes an instance of TCustomPanel.
	Create (see page 12536)	Creates and initializes an instance of TCustomPanel (see page 12525).
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	CreateParented (see page 6123)	Creates and initializes a control as the child of a specified non-VCL container.
	CreateParentedControl (see page 6136)	Creates and initializes a control as the child of a specified non-VCL window.
	DefaultHandler (see page 5748)	Provides message handling for all messages that do not have specific handlers.
	DefaultHandler (see page 6139)	Provides message handling for all messages that the control does not fully process itself.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 2766)	Disposes of the component and its owned components.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 5732)	Destroys an instance of TControl (see page 5724).
	Destroy (see page 5919)	Destroys an instance of TCustomControl (see page 5908).

	Destroy (see page 6124)	Destroys an instance of TWinControl (see page 6112).
	Destroy (see page 12501)	Destroys an instance of TCustomControl.
	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	DisableAlign (see page 6141)	Disables the realignment of child controls.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Dock (see page 5749)	Used internally to dock the control.
	DockDrop (see page 6142)	Generates an OnDockDrop (see page 6214) event.
	DragDrop (see page 5754)	OnDragDrop (see page 5855) event dispatcher.
	Dragging (see page 5754)	Indicates whether a control is being dragged.
	DrawTextBiDiModeFlags (see page 5756)	Returns the text flags that reflect the current setting of the BiDiMode (see page 5803) property.
	DrawTextBiDiModeFlagsReadingOnly (see page 5756)	Returns the text flag to add that indicates whether the control's text should read from right to left.
	EnableAlign (see page 6148)	Decrements the reference count incremented by the DisableAlign (see page 6141) method, eventually realigning the child controls.
	EndDrag (see page 5757)	Stops a control from being dragged any further.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindChildControl (see page 6148)	Returns a child control given its name.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FlipChildren (see page 6150)	Reverses the positions of child controls.
	Focused (see page 6150)	Determines whether the control has input focus.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetChildren (see page 12503)	Calls a specified method for each child of the control.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetControlsAlignment (see page 5759)	Indicates how text is aligned within the control.
	GetControlsAlignment (see page 12538)	Returns the alignment of text in the panel.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetParentComponent (see page 5765)	Returns the parent of the control.
	GetTabOrderList (see page 6158)	Builds a list of controls in tab order.
	GetTextBuf (see page 5766)	Retrieves the control's text, copies it into a buffer, and returns the number of characters copied.
	GetTextLen (see page 5767)	Returns the length of the control's text.
	HandleAllocated (see page 6159)	Reports whether a screen object handle exists for the control.
	HandleNeeded (see page 6160)	Creates a screen object for the control if it doesn't already exist.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	HasParent (see page 5768)	Indicates whether the control has a parent.
	Hide (see page 5769)	Makes the control invisible.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitiateAction (see page 5769)	Calls the action link's Update (see page 5789) method if the control is associated with an action link.

	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InsertControl (see page 6160)	Inserts a control into the Controls (see page 6197) array property.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
V	Invalidate (see page 5770)	Completely repaint control.
V	Invalidate (see page 6161)	Schedules a control repaint.
	IsColumnEmpty (see page 12504)	This is IsColumnEmpty, a member of class TCustomGridPanel.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	IsRightToLeft (see page 5770)	Indicates whether the control should be reversed right to left.
	IsRowEmpty (see page 12504)	This is IsRowEmpty, a member of class TCustomGridPanel.
	ManualDock (see page 5771)	Docks the control.
	ManualFloat (see page 5772)	Undocks the control.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	MouseWheelHandler (see page 5774)	Dispatches messages received from a mouse wheel.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	PaintTo (see page 6167)	This is the overview for the PaintTo method overload.
	ParentToClient (see page 5776)	Translate parent coordinates to client coordinates.
	Perform (see page 5776)	Responds as if the control received a specified Windows message.
	PreProcessMessage (see page 6170)	This is PreProcessMessage, a member of class TWinControl.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	Realign (see page 6171)	Forces the control to realign children.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	Refresh (see page 5779)	Repaints the control on the screen.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveControl (see page 6172)	Removes a specified control from the Controls (see page 6197) array.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	Repaint (see page 5779)	Forces the control to repaint its image on the screen.
V	Repaint (see page 6174)	Repaints the entire control.
	ReplaceDockedControl (see page 5779)	Docks the control in the place where another control is already docked.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	ScaleBy (see page 6175)	Rescale control and its children.
	ScreenToClient (see page 5781)	Converts the screen coordinates of a specified point on the screen to client coordinates.
	ScrollBy (see page 6176)	Scroll control contents.
	SendToBack (see page 5782)	Puts a windowed control behind all other windowed controls, or puts a non-windowed control behind all other non-windowed controls.
V	SetBounds (see page 5783)	Sets the Left (see page 5830), Top (see page 5844), Width (see page 5849), and Height (see page 5825) properties all at once.
V	SetBounds (see page 6178)	Sets the windowed control's boundary properties all at once.
	SetDesignVisible (see page 5784)	Makes a control visible at design time.
V	SetDesignVisible (see page 6178)	Makes a control visible at design time.
V	SetFocus (see page 6179)	Gives the input focus to the control.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	SetTextBuf (see page 5787)	Sets the text of the control.
	Show (see page 5788)	Makes a control visible.
V	Update (see page 5789)	Processes any pending paint messages immediately.
V	Update (see page 6183)	Forces the control to update.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	UpdateControlState (see page 6186)	Respond to state change.
	UseRightToLeftAlignment (see page 5790)	Specifies whether the control's alignment should be reversed right-to-left.

	UseRightToLeftReading (see page 5790)	Specifies whether the control is using a right-to-left reading order.
	UseRightToLeftScrollBar (see page 5791)	Specifies whether the vertical scroll bar appears on the left side of the control.

Public Properties

	Name	Description
	Action (see page 5797)	Designates the action associated with the control.
R	AlignDisabled (see page 6192)	Indicates child control realignment disabled.
	BoundsRect (see page 5803)	Specifies the bounding rectangle of the control, expressed in the coordinate system of the parent control.
R	Brush (see page 6195)	Determines the color and pattern used for painting the background of the control.
R	CellCount (see page 12506)	This is CellCount, a member of class TCustomGridPanel.
R	CellRect (see page 12506)	Returns the screen coordinates of a cell in the grid.
R	CellSize (see page 12507)	This is CellSize, a member of class TCustomGridPanel.
	ClientHeight (see page 5808)	Specifies the height of the control's client area in pixels.
R	ClientOrigin (see page 5809)	Specifies the screen coordinates (in pixels) of the top left corner of a control's client area.
R	ClientRect (see page 5810)	Specifies the size (in pixels) of a control's client area.
	ClientWidth (see page 5811)	Specifies the horizontal size of the control's client area in pixels.
R	ColumnSpanIndex (see page 12507)	This is ColumnSpanIndex, a member of class TCustomGridPanel.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
R	ControlCount (see page 6195)	Returns the number of child controls.
R	Controls (see page 6197)	Lists all child controls.
	ControlState (see page 5813)	Indicates the current state of a control at runtime.
	ControlStyle (see page 5814)	Determines style characteristics of the control.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	DockClientCount (see page 6199)	Specifies the number of controls that are docked on the windowed control.
R	DockClients (see page 6201)	Lists the controls that are docked to the windowed control.
	DockManager (see page 12688)	Specifies the control's docking manager interface.
	DockOrientation (see page 5818)	Specifies how the control is docked relative to other controls docked in the same parent.
	DoubleBuffered (see page 6205)	Determines whether the control's image is rendered directly to the window or painted to an in-memory bitmap first.
R	ExplicitHeight (see page 5821)	Specifies the explicit vertical size of the control in pixels.
R	ExplicitLeft (see page 5822)	Specifies the explicit horizontal pixel coordinate of the left edge of a component relative to its parent.
R	ExplicitTop (see page 5822)	Specifies the explicit vertical pixel coordinate of the top edge of a component relative to its parent.
R	ExplicitWidth (see page 5822)	Specifies the explicit horizontal size of the control in pixels.
R	Floating (see page 5823)	Indicates whether the control is floating.
	FloatingDockSiteClass (see page 5823)	Specifies the class of the temporary control that hosts the control when it is floating.
R	Handle (see page 6207)	Provides access to the underlying Windows screen object for the control.
	HostDockSite (see page 5829)	Specifies the control in which the control is docked.
	LRDockWidth (see page 5831)	Specifies the width of the control when it is docked horizontally.
R	MouseInClient (see page 6209)	This is MouseInClient, a member of class TWinControl.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Parent (see page 5832)	Indicates the parent of the control.
	ParentWindow (see page 6210)	Reference to parent's underlying control.
R	RowSpanIndex (see page 12508)	This is RowSpanIndex, a member of class TCustomGridPanel.

R	Showing (see page 6210)	Indicates whether the control is showing on the screen.
	TBDockHeight (see page 5842)	Specifies the height of the control when it is docked vertically.
	UndockHeight (see page 5845)	Specifies the height of the control when it is floating.
	UndockWidth (see page 5846)	Specifies the width of the control when it is floating.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
R	VisibleDockClientCount (see page 6212)	Specifies the number of visible controls that are docked on the windowed control.

Published Events

	Name	Description
	OnAlignInsertBefore (see page 12709)	Occurs when an object with custom alignment is aligned.
	OnAlignPosition (see page 12710)	Occurs when an object with custom alignment is aligned.
	OnCanResize (see page 12711)	Occurs when an attempt is made to resize the control.
	OnClick (see page 12711)	Occurs when the user clicks the control.
	OnConstrainedResize (see page 12713)	Adjust resize constraints.
	OnContextPopup (see page 12713)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnDblClick (see page 12714)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDockDrop (see page 12714)	Occurs when another control is docked to the control.
	OnDockOver (see page 12716)	Occurs when another control is dragged over the control.
	OnDragDrop (see page 12719)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 12721)	Occurs when the user drags an object over a control.
	OnEndDock (see page 12723)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 12724)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnEnter (see page 12725)	Occurs when a control receives the input focus.
	OnExit (see page 12727)	Occurs when the input focus shifts away from one control to another.
	OnGetSiteInfo (see page 12729)	Returns the control's docking information.
	OnMouseActivate (see page 12731)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 12732)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseEnter (see page 12734)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 12734)	Occurs when the user moves the mouse outside of a control.
	OnMouseMove (see page 12734)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 12737)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnResize (see page 12739)	Occurs immediately after the control is resized.
	OnStartDock (see page 12740)	Occurs when the user begins to drag a control with a DragKind of dkDock.
	OnStartDrag (see page 12740)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.
	OnUnDock (see page 12741)	Occurs when the application tries to undock a control that is docked to the windowed control.

Published Properties

	Name	Description
	Align (see page 12673)	Determines how the control aligns within its container (parent control).
	Alignment (see page 12676)	Determines how the caption is aligned within the panel.
	AlignWithMargins (see page 5802)	Indicates whether a control should be constrained by margins.
	Anchors (see page 12677)	Specifies how the control is anchored to its parent.
	BevelEdges (see page 12677)	Specifies which edges of the control are beveled.
	BevelInner (see page 12677)	Determines the style of the inner bevel of a panel.
	BevelKind (see page 12678)	Specifies the control's bevel style.
	BevelOuter (see page 12679)	Determines the style of the outer bevel of a panel.
	BevelWidth (see page 12680)	Determines the width, in pixels, of both the inner and outer bevels of a panel.

	BiDiMode (see page 12681)	Specifies the bi-directional mode for the control.
	BorderStyle (see page 12681)	Determines the style of the line drawn around the perimeter of the panel control.
	BorderWidth (see page 12682)	Specifies the distance, in pixels, between the outer and inner bevels.
	Caption (see page 12683)	Specifies a text string that identifies the control to the user.
	Color (see page 12686)	Specifies the background color of the control.
	ColumnCollection (see page 12687)	Sets the number and size of the columns on the grid panel.
	Constraints (see page 12687)	Specifies the size constraints for the control.
	ControlCollection (see page 12687)	This is ControlCollection, a member of class TGridPanel.
	Ctl3D (see page 12688)	Determines whether a control has a three-dimensional (3-D) or two-dimensional look.
	Cursor (see page 5815)	Specifies the image used to represent the mouse pointer when it passes into the region covered by the control.
	DockSite (see page 12690)	Specifies whether the control can be the target of drag-and-dock operations.
	DragCursor (see page 12691)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 12692)	Specifies whether the control is being dragged normally or for docking.
	DragMode (see page 12692)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	Enabled (see page 12693)	Controls whether the control responds to mouse, keyboard, and timer events.
	ExpandStyle (see page 12694)	Specifies whether rows or columns are added to a filled grid panel to accommodate additional controls.
	Font (see page 12694)	Controls the attributes of text written on or in the control.
	FullRepaint (see page 12695)	Determines how the panel repaints itself when it is resized.
	Height (see page 5825)	Specifies the vertical size of the control in pixels.
	HelpContext (see page 5826)	Numeric ID for control's context-sensitive help topic
	HelpKeyword (see page 5826)	Keyword for control's context-sensitive help topic
	HelpType (see page 5827)	Indicates whether the control's context sensitive help topic is identified by context ID or by keyword.
	Hint (see page 5827)	Contains the text string that can appear when the user moves the mouse over the control.
	Left (see page 5830)	Specifies the horizontal coordinate of the left edge of a component relative to its parent.
	Locked (see page 12696)	Determines whether a panel that is used as a toolbar is replaced by a toolbar supplied by an OLE server.
	Margins (see page 5831)	Specifies the margins for the control.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Padding (see page 12696)	Specifies the padding of a control.
	ParentBackground (see page 12696)	Determines whether control uses parent's theme background.
	ParentBiDiMode (see page 12697)	Specifies whether the control uses its parent's BiDiMode.
	ParentColor (see page 12697)	Determines where a control looks for its color information.
	ParentCtl3D (see page 12697)	Determines where a component looks to determine if it should appear three dimensional.
	ParentFont (see page 12698)	Determines where a control looks for its font information.
	ParentShowHint (see page 12698)	Determines where a control looks to find out if its Help Hint should be shown.
	PopupMenu (see page 12699)	Identifies the pop-up menu associated with the control.
	RowCollection (see page 12703)	Sets the number and size of the rows on the grid panel.
	ShowHint (see page 12704)	Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.
	TabOrder (see page 12705)	Indicates the position of the control in its parent's tab order.
	TabStop (see page 12706)	Determines if the user can tab to a control.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Top (see page 5844)	Specifies the Y coordinate of the top left corner of a control, relative to its parent or containing control in pixels.
	UseDockManager (see page 12706)	Specifies whether the docking manager is used in drag-and-dock operations.
	VerticalAlignment (see page 12707)	Sets the vertical position of the caption.
	Visible (see page 12707)	Determines whether the component appears onscreen.
	Width (see page 5849)	Specifies the horizontal size of the control or form in pixels.

68.1.23.2 TGridPanel Properties

The properties of the TGridPanel class are listed here.

Public Properties

	Name	Description
	DockManager (see page 12688)	Specifies the control's docking manager interface.

Published Properties

	Name	Description
	Align (see page 12673)	Determines how the control aligns within its container (parent control).
	Alignment (see page 12676)	Determines how the caption is aligned within the panel.
	Anchors (see page 12677)	Specifies how the control is anchored to its parent.
	BevelEdges (see page 12677)	Specifies which edges of the control are beveled.
	BevelInner (see page 12677)	Determines the style of the inner bevel of a panel.
	BevelKind (see page 12678)	Specifies the control's bevel style.
	BevelOuter (see page 12679)	Determines the style of the outer bevel of a panel.
	BevelWidth (see page 12680)	Determines the width, in pixels, of both the inner and outer bevels of a panel.
	BiDiMode (see page 12681)	Specifies the bi-directional mode for the control.
	BorderStyle (see page 12681)	Determines the style of the line drawn around the perimeter of the panel control.
	BorderWidth (see page 12682)	Specifies the distance, in pixels, between the outer and inner bevels.
	Caption (see page 12683)	Specifies a text string that identifies the control to the user.
	Color (see page 12686)	Specifies the background color of the control.
	ColumnCollection (see page 12687)	Sets the number and size of the columns on the grid panel.
	Constraints (see page 12687)	Specifies the size constraints for the control.
	ControlCollection (see page 12687)	This is ControlCollection, a member of class TGridPanel.
	Ctl3D (see page 12688)	Determines whether a control has a three-dimensional (3-D) or two-dimensional look.
	DockSite (see page 12690)	Specifies whether the control can be the target of drag-and-dock operations.
	DragCursor (see page 12691)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 12692)	Specifies whether the control is being dragged normally or for docking.
	DragMode (see page 12692)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	Enabled (see page 12693)	Controls whether the control responds to mouse, keyboard, and timer events.
	ExpandStyle (see page 12694)	Specifies whether rows or columns are added to a filled grid panel to accommodate additional controls.
	Font (see page 12694)	Controls the attributes of text written on or in the control.
	FullRepaint (see page 12695)	Determines how the panel repaints itself when it is resized.
	Locked (see page 12696)	Determines whether a panel that is used as a toolbar is replaced by a toolbar supplied by an OLE server.
	Padding (see page 12696)	Specifies the padding of a control.
	ParentBackground (see page 12696)	Determines whether control uses parent's theme background.
	ParentBiDiMode (see page 12697)	Specifies whether the control uses its parent's BiDiMode.
	ParentColor (see page 12697)	Determines where a control looks for its color information.
	ParentCtl3D (see page 12697)	Determines where a component looks to determine if it should appear three dimensional.
	ParentFont (see page 12698)	Determines where a control looks for its font information.
	ParentShowHint (see page 12698)	Determines where a control looks to find out if its Help Hint should be shown.
	PopupMenu (see page 12699)	Identifies the pop-up menu associated with the control.
	RowCollection (see page 12703)	Sets the number and size of the rows on the grid panel.
	ShowHint (see page 12704)	Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.
	TabOrder (see page 12705)	Indicates the position of the control in its parent's tab order.
	TabStop (see page 12706)	Determines if the user can tab to a control.
	UseDockManager (see page 12706)	Specifies whether the docking manager is used in drag-and-dock operations.

	VerticalAlignment (see page 12707)	Sets the vertical position of the caption.
	Visible (see page 12707)	Determines whether the component appears onscreen.

68.1.23.2.1 TGridPanel.Align Property

Determines how the control aligns within its container (parent control).

Pascal

```
property Align: TAlign;
```

C++

```
__property TAlign Align;
```

Description

Use Align to align a control to the top, bottom, left, or right of a form or panel and have it remain there even if the size of the form, panel, or component that contains the control changes. When the parent is resized, an aligned control also resizes so that it continues to span the top, bottom, left, or right edge of the parent.

For example, to use a panel component with various controls on it as a tool palette, change the panel's Align value to alLeft. The value of alLeft for the Align property of the panel guarantees that the tool palette remains on the left side of the form and always equals the client height of the form.

The default value of Align is alNone, which means a control remains where it is positioned on a form or panel.

Tip: If Align is set to alClient, the control fills the entire client area so that it is impossible to select the parent form by clicking on it. In this case, select the parent by selecting the control on the form and pressing Esc, or by using the Object Inspector.

Any number of child components within a single parent can have the same Align value, in which case they stack up along the edge of the parent. The child controls stack up in z-order. To adjust the order in which the controls stack up, drag the controls into their desired positions.

Note: To cause a control to maintain a specified relationship with an edge of its parent, but not necessarily lie along one edge of the parent, use the Anchors property instead.

C++ Examples:

```
/*
This example shows how to use a splitter to divide a form
into resizable panes.  All objects on the form are created
dynamically in the OnCreate event handler of the form. To
run this example, add ExtCtrls and FileCtrl to the uses
clause of the form’s implementation section.
Note that when creating a splitter dynamically at runtime,
it is important to set its position to the appropriate side
of the control it will resize.
*/
#include <Extctrls.hpp>
#include <Filectrl.hpp>

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  TSplitter* ps = new TSplitter(Form1);
  TFileListBox* pflb = new TFileListBox(Form1);
  TDirectoryListBox* pdlb = new TDirectoryListBox(Form1);

  // Line up the directory list box on the left of the form.
  pdlb->Parent = Form1;
  pdlb->Align = alLeft;
  pdlb->Width = Form1->ClientWidth/3;
```

```
  // Now use the splitter to divide the directory pane from the file pane.
  ps->Parent = Form1;
  ps->Left = pdlb->Left + pdlb->Width + 1; // Move to right of directory list.
  ps->Align = pdlb->Align; // Give same alignment as directory list.

  // Each pane must be at least one quarter of the form's width.
  ps->MinSize = Form1->ClientWidth/4;

  // Finally, create the last pane - a file list box.
  pflb->Parent = Form1;
  pflb->Align = alClient;
  pdlb->FileList = pflb; // Link the file list box to the directory list box.
}
/*
Dynamically create a TProgressBar control and align it to
the bottom of the form.
*/

#include <ComCtrls.hpp>
#include <Controls.hpp>

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  TProgressBar *ProgressBar = new TProgressBar(this);
  ProgressBar->Parent = this;
  ProgressBar->Align = alBottom;
  TButton *Button1 = new TButton(this);
  Button1->Parent = this;
}
/*
This example dynamically creates a Page Control, then a
series of Tab Sheets on the Page Control.
*/
#include <Comctrls.hpp>
TPageControl* ppc;
const int MAXTABS = 3;
TTabSheet* pts[MAXTABS];
const char * ppcTabTitles[] = { "ShortString", "Orders", "Items", "Parts" };
int iTabTitles = sizeof(ppcTabTitles)/sizeof(ppcTabTitles[0]);
const TColor colorPalette[12] = {
  clRed, clGreen, clYellow, clBlue, clWhite, clFuchsia,
  clTeal, clNavy, clMaroon, clLime, clOlive, clPurple};

void __fastcall TForm1::FormCreate(TObject *Sender)
{
    ppc = new TPageControl(this);
    ppc->Parent = this;
    ppc->Align = alClient;
    for (int i=0;i<iTabTitles;i++)
  {
        pts[i] = new TTabSheet(this);
        pts[i]->PageControl = ppc;
        pts[i]->Name = AnsiString("pts") + ppcTabTitles[i];
        pts[i]->Caption = ppcTabTitles[i];
        pts[i]->Brush->Color = colorPalette[i];
  }
}//---------------------------------------------------------------------------
void __fastcall TForm1::FormDestroy(TObject *Sender)
{
  for (int i=0;i<iTabTitles;i++)
        delete pts[i];
    delete ppc;
}
```

Delphi Examples:

```
{
This example shows how to use a splitter to divide a form
into resizable panes.  All objects on the form are created
dynamically in the OnCreate event handler of the form. To
run this example, add ExtCtrls and FileCtrl to the uses
clause of the form's implementation section.
Note that when creating a splitter dynamically at runtime,
it is important to set its position to the appropriate side
of the control it will resize.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  Split: TSplitter;
  Files: TFileListBox;
  Dirs: TDirectoryListBox;
begin
  { first add a directory list box to the form }
  Dirs := TDirectoryListBox.Create(Form1);
  { line it up on the left of the form }
  Dirs.Parent := Form1;
  Dirs.Align := alLeft;
  Dirs.Width := Form1.ClientWidth div 3;
{ now add the splitter to divide the directory pane from the file pane }
  Split := TSplitter.Create(Form1);
  Split.Parent := Form1;
  { make sure the splitter is to the right of the directory list box! }
  Split.Left := Dirs.Left + Dirs.Width + 1;
  Split.Align := Dirs.Align; { give it the same alignment as the directory }
  { each pane must be at least one quarter of the form's width }
  Split.MinSize := Form1.ClientWidth div 4;
  { Finally, create the last pane – a file list box }
  Files := TFileListBox.Create(Form1);
  Files.Parent := Form1;
  Files.Align := alClient;
  Dirs.FileList := Files; { link the file list box to the directory list box }
end;
{
Dynamically create a TProgressBar control and align it to
the bottom of the form.
}

var
  I: Integer;

procedure TForm1.Button1Click(Sender: TObject);
var
  ProgressBar: TProgressBar;
begin
  ProgressBar := TProgressBar.Create(Self);
  with ProgressBar do
  begin
    Parent := Self;
    Align := alBottom;
  end;
end;
{
This example dynamically creates a Page Control, then a
series of Tab Sheets on the Page Control.
}
var

Parent (see page 5832)

Anchors (see page 5802)

68.1.23.2.2 TGridPanel.Alignment Property

Determines how the caption is aligned within the panel.

Pascal

```
property Alignment: TAlignment;
```

C++

```
__property TAlignment Alignment;
```

Description

Use the Alignment property to specify if the caption of a panel appears on the left, right, or center of the panel. For example, to use a panel as a status bar that displays the TApplication. ::Hint property as the panel's Caption property, set Alignment to taLeftJustify to place the hint text on the left side of the panel.

Note: Use the VerticalAlignment property to control the vertical position of the caption.

See Also

Hint (see page 13712)

Caption (see page 5806)

68.1.23.2.3 TGridPanel.Anchors Property

Specifies how the control is anchored to its parent.

Pascal

```
property Anchors: TAnchors;
```

C++

```
__property TAnchors Anchors;
```

Description

Use Anchors to ensure that a control maintains its current position relative to an edge of its parent, even if the parent is resized. When its parent is resized, the control holds its position relative to the edges to which it is anchored.

If a control is anchored to opposite edges of its parent, the control stretches when its parent is resized. For example, if a control has its Anchors property set to [akLeft, akRight], the control stretches when the width of its parent changes.

Anchors is enforced only when the parent is resized. Thus, for example, if a control is anchored to opposite edges of a form at design time and the form is created in a maximized state, the control is not stretched because the form is not resized after the control is created.

Note: If a control should maintain contact with three edges of its parent (hugging one side of the parent and stretching the length of that side), use the Align property instead. Unlike Anchors, Align allows controls to adjust to changes in the size of other aligned sibling controls as well as changes to the parent's size.

See Also

Parent (see page 5832)

Align (see page 5798)

68.1.23.2.4 TGridPanel.BevelEdges Property

Specifies which edges of the control are beveled.

Pascal

```
property BevelEdges: TBevelEdges;
```

C++

```
__property TBevelEdges BevelEdges;
```

Description

Use BevelEdges to get or set which edges of the control are beveled. The BevelInner, BevelOuter, and BevelKind properties determine the appearance of the specified edges.

See Also

BevelInner (see page 6193)

BevelOuter (see page 6194)

BevelKind (see page 6193)

68.1.23.2.5 TGridPanel.BevelInner Property

Determines the style of the inner bevel of a panel.

Pascal

```
property BevelInner: TBevelCut;
```

C++

```
__property TPanelBevel BevelInner;__property TBevelCut BevelInner;
```

Description

Use BevelInner to provide the panel with a three-dimensional beveled look. A panel component has two bevels, an outer bevel drawn next to the border of the control, and an inner bevel drawn inside the outer bevel, separated by the number of pixels specified in the BorderWidth property. The width of the bevels, if they are drawn, is the BevelWidth property.

C++ Examples:

```
/*
This example uses a panel component and a button named
CreateStatusLine on a form. The code moves the panel to the
bottom of the form when the user clicks the button and gives
the panel the appearance of a status line by changing the
value of the BevelInner, BevelOuter, BevelWidth, and
BorderWidth properties.
*/
void __fastcall TForm1::CreateStatusLineClick(TObject *Sender)
{
  Panel1->Align = alBottom;
  Panel1->BevelInner = bvLowered;
  Panel1->BevelOuter = bvRaised;
  Panel1->BorderWidth = 1;
  Panel1->BevelWidth = 1;
}
```

Delphi Examples:

```
{
This example uses a panel component and a button named
CreateStatusLine on a form. The code moves the panel to the
bottom of the form when the user clicks the button and gives
the panel the appearance of a status line by changing the
value of the BevelInner, BevelOuter, BevelWidth, and
BorderWidth properties.
}
procedure TForm1.CreateStatusLineClick(Sender: TObject);
begin
  with Panel1 do
  begin
    Align := alBottom;
    BevelInner := bvLowered;
    BevelOuter := bvRaised;
    BorderWidth := 1;
    BevelWidth := 1;
  end;
end;
```

See Also

BevelOuter (see page 12541)

BevelWidth (see page 12542)

BorderWidth (see page 12543)

68.1.23.2.6 TGridPanel.BevelKind Property

Specifies the control's bevel style.

Pascal

```
property BevelKind: TBevelKind;
```

C++

```
__property TBevelKind BevelKind;
```

Description

Use BevelKind to modify the appearance of a bevel. BevelKind influences how sharply the bevel stands out.

BevelKind, in combination with BevelWidth and the cut of the bevel specified by BevelInner or BevelOuter, can create a variety of effects. Experiment with various combinations to get the look you want.

See Also

BevelEdges (see page 6192)

BevelOuter (see page 6194)

BevelInner (see page 6193)

BevelWidth (see page 6194)

68.1.23.2.7 TGridPanel.BevelOuter Property

Determines the style of the outer bevel of a panel.

Pascal

```
property BevelOuter: TBevelCut;
```

C++

```
__property TPanelBevel BevelOuter;__property TBevelCut BevelOuter;
```

Description

Use BevelOuter to provide the panel with a three-dimensional beveled look. A panel component has two bevels, an outer bevel drawn next to the border of the control, and an inner bevel drawn inside the outer bevel, separated by the number of pixels specified in the BorderWidth property. The width of the outer bevel is specified in the BevelWidth property in pixels.

C++ Examples:

```
/*
This example uses a panel component and a button named
CreateStatusLine on a form. The code moves the panel to the
bottom of the form when the user clicks the button and gives
the panel the appearance of a status line by changing the
value of the BevelInner, BevelOuter, BevelWidth, and
BorderWidth properties.
*/
void __fastcall TForm1::CreateStatusLineClick(TObject *Sender)
{
  Panel1->Align = alBottom;
  Panel1->BevelInner = bvLowered;
  Panel1->BevelOuter = bvRaised;
  Panel1->BorderWidth = 1;
  Panel1->BevelWidth = 1;
}
```

Delphi Examples:

```
{
This example uses a panel component and a button named
CreateStatusLine on a form. The code moves the panel to the
bottom of the form when the user clicks the button and gives
```

```
  the panel the appearance of a status line by changing the
  value of the BevelInner, BevelOuter, BevelWidth, and
  BorderWidth properties.
  }
  procedure TForm1.CreateStatusLineClick(Sender: TObject);
  begin
    with Panel1 do
    begin
      Align := alBottom;
      BevelInner := bvLowered;
      BevelOuter := bvRaised;
      BorderWidth := 1;
      BevelWidth := 1;
    end;
  end;
```

See Also

BevelInner (see page 12540)

BevelWidth (see page 12542)

BorderWidth (see page 12543)

68.1.23.2.8 TGridPanel.BevelWidth Property

Determines the width, in pixels, of both the inner and outer bevels of a panel.

Pascal

```
property BevelWidth: TBevelWidth;
```

C++

```
__property TBevelWidth BevelWidth;__property TBevelWidth BevelWidth;
```

Description

Use BevelWidth to specify how wide the inner or outer bevel should be. Do not confuse BevelWidth, which is the width of the bevels, with BorderWidth, which is the space between the bevels.

If both the BevelInner and BevelOuter properties are bvNone, BevelWidth has no effect. To remove both bevels, set the BevelInner and BevelOuter properties to bvNone, rather than setting the BevelWidth to 0, as this involves less overhead when painting.

C++ Examples:

```
/*
This example uses a panel component and a button named
CreateStatusLine on a form. The code moves the panel to the
bottom of the form when the user clicks the button and gives
the panel the appearance of a status line by changing the
value of the BevelInner, BevelOuter, BevelWidth, and
BorderWidth properties.
*/
void __fastcall TForm1::CreateStatusLineClick(TObject *Sender)
{
  Panel1->Align = alBottom;
  Panel1->BevelInner = bvLowered;
  Panel1->BevelOuter = bvRaised;
  Panel1->BorderWidth = 1;
  Panel1->BevelWidth = 1;
}
```

Delphi Examples:

```
{
```

```
This example uses a panel component and a button named
CreateStatusLine on a form. The code moves the panel to the
bottom of the form when the user clicks the button and gives
the panel the appearance of a status line by changing the
value of the BevelInner, BevelOuter, BevelWidth, and
BorderWidth properties.
}
procedure TForm1.CreateStatusLineClick(Sender: TObject);
begin
  with Panel1 do
  begin
    Align := alBottom;
    BevelInner := bvLowered;
    BevelOuter := bvRaised;
    BorderWidth := 1;
    BevelWidth := 1;
  end;
end;
```

See Also

BevelInner (see page 12540)

BevelOuter (see page 12541)

BorderWidth (see page 12543)

68.1.23.2.9 TGridPanel.BiDiMode Property

Specifies the bi-directional mode for the control.

Pascal

```
property BiDiMode: TBiDiMode;
```

C++

```
__property TBiDiMode BiDiMode;
```

Description

Use BiDiMode to enable the control to adjust its appearance and behavior automatically when the application runs in a locale that reads from right to left instead of left to right. The bi-directional mode controls the reading order for the text, the placement of the vertical scroll bar, and whether the alignment is changed.

Alignment does not change for controls that are known to contain number, date, time, or currency values. For example, with data aware controls, the alignment does not change for the following field types: ftSmallint, ftInteger, ftWord, ftFloat, ftCurrency, ftBCD, ftDate, ftTime, ftDateTime, ftAutoInc.

See Also

UseRightToLeftAlignment (see page 5790)

UseRightToLeftReading (see page 5790)

UseRightToLeftScrollBar (see page 5791)

Including Bi-directional Functionality in Applications

68.1.23.2.10 TGridPanel.BorderStyle Property

Determines the style of the line drawn around the perimeter of the panel control.

Pascal

```
property BorderStyle: TBorderStyle;
```

C++

```
__property TBorderStyle BorderStyle;
```

Description

Use BorderStyle to specify whether the panel has a single line drawn around it. These are the possible values:

Value	Meaning
bsNone	No visible border
bsSingle	Single-line border

Do not confuse the line drawn around the panel with the BorderWidth of the panel. The BorderWidth of the panel is the distance between the outer and inner bevels.

See Also

BorderWidth (see page 12543)

68.1.23.2.11 TGridPanel.BorderWidth Property

Specifies the distance, in pixels, between the outer and inner bevels.

Pascal

```
property BorderWidth: TBorderWidth;
```

C++

```
__property TBorderWidth BorderWidth;__property TBorderWidth BorderWidth;
```

Description

Use BorderWidth to specify how wide the border around the panel should be. A value of 0 (zero) means no border should appear.

The border of a panel is the area between the outer and inner bevels. It is visible only if the inner bevel is raised or lowered, but affects the inset of the caption within the panel even if BevelInner is bvNone. If the Alignment property is not taCenter, the Caption will be aligned to the inner edge of the border. This edge is BorderWidth pixels in from the outer bevel if BevelInner is bvNone. It is the inner edge of the inner bevel otherwise.

Do not confuse the border of the panel with line drawn around the panel itself. The line around the panel is specified by the BorderStyle property.

C++ Examples:

```
/*
This example uses a panel component and a button named
CreateStatusLine on a form. The code moves the panel to the
bottom of the form when the user clicks the button and gives
the panel the appearance of a status line by changing the
value of the BevelInner, BevelOuter, BevelWidth, and
BorderWidth properties.
*/
void __fastcall TForm1::CreateStatusLineClick(TObject *Sender)
{
  Panel1->Align = alBottom;
  Panel1->BevelInner = bvLowered;
  Panel1->BevelOuter = bvRaised;
  Panel1->BorderWidth = 1;
  Panel1->BevelWidth = 1;
```

```
}
```

Delphi Examples:

```
{
This example uses a panel component and a button named
CreateStatusLine on a form. The code moves the panel to the
bottom of the form when the user clicks the button and gives
the panel the appearance of a status line by changing the
value of the BevelInner, BevelOuter, BevelWidth, and
BorderWidth properties.
}
procedure TForm1.CreateStatusLineClick(Sender: TObject);
begin
  with Panel1 do
  begin
    Align := alBottom;
    BevelInner := bvLowered;
    BevelOuter := bvRaised;
    BorderWidth := 1;
    BevelWidth := 1;
  end;
end;
```

See Also

Alignment (see page 12539)

BevelOuter (see page 12541)

BorderStyle (see page 12543)

Caption (see page 5806)

68.1.23.2.12 TGridPanel.Caption Property

Specifies a text string that identifies the control to the user.

Pascal

```
property Caption: TCaption;
```

C++

```
__property TCaption Caption;
```

Description

Use Caption to specify the text string that labels the control.

To underline a character in a Caption that labels a component, include an ampersand (&) before the character. This type of character is called an accelerator character. The user can then select the component by pressing Alt while typing the underlined character. To display an ampersand character in the caption, use two ampersands (&&).

Note: Controls that display text use either the Caption property or the Text property to specify the text value. Which property is used depends on the type of control. In general, Caption is used for text that appears as a window title or label, while Text is used for text that appears as the content of a control.

C++ Examples:

```
/*
The following code keeps the size of the label control
constant, even though the length of the label's caption
```

```
changes. As a result, the caption of the label is probably
too long to display in the label when the user clicks the
button:
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  Label1->AutoSize = false;
  Label1->Caption = "This string is too long as the caption of this label";
}
/*
This example requires a TPageControl populated by several
TabSheets, a TEdit and a TButton. When the button is
clicked, the caption of the active tab changes to that of
the TEdit.  These lines of code could also be written:
PageControl1.ActivePage.Caption := Edit1.Text;
This would make a TTabSheet variable unnecessary since
PageControl1.->ActivePage is already of type TTabSheet.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  TTabSheet *sheet = PageControl1->ActivePage;
  sheet->Caption = Edit1->Text;
}
/*
This example creates a ToolBar and adds ToolButtons to it.
Include ComCtlrs in the uses clause.
*/
#include <comctrls.hpp>

void AddButtons(TToolBar *toolBar, TStringList *captions)
{
  for (int i = 0; i < captions->Count; i++)
  {
    TToolButton *button = new TToolButton(toolBar);
    button->Parent = toolBar;
    button->Caption = captions->Strings[i];
    if (button->Caption == "|")
      button->Style = tbsSeparator;
    else
      button->Style = tbsButton;
  }
}

TToolBar *myToolBar;

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  myToolBar = new TToolBar(this);
  myToolBar->Parent = this;
  TStringList *captions = new TStringList();
  captions->Add("New");
  captions->Add("Save");
  captions->Add("|");
  captions->Add("Cut");
  captions->Add("Copy");
  captions->Add("Paste");
  AddButtons(myToolBar, captions);
  delete captions;
  myToolBar->ShowCaptions = True;
  myToolBar->Height = 40;
}

void __fastcall TForm1::FormDestroy(TObject *Sender)
{
  for (int I = myToolBar->ButtonCount - 1; I >= 0; I--)
    delete myToolBar->Buttons[I];
```

```
  delete myToolBar;
}
```

Delphi Examples:

```
{
The following code keeps the size of the label control
constant, even though the length of the label's caption
changes. As a result, the caption of the label is probably
too long to display in the label when the user clicks the
button:
}
procedure TForm1.Button1Click(Sender: TObject);
begin
  Label1.AutoSize := False;
  Label1.Caption :=
    'This string is too long as the caption of this label';
end;
{
This example requires a TPageControl populated by several
TabSheets, a TEdit and a TButton. When the button is
clicked, the caption of the active tab changes to that of
the TEdit.  These lines of code could also be written:
PageControl1.ActivePage.Caption := Edit1.Text;
This would obviate the need for a TTabSheet variable since
PageControl1.->ActivePage is already of type TTabSheet.
}
procedure TForm1.Button1Click(Sender: TObject);
var
  sheet: TTabSheet;
begin
  sheet := PageControl1.ActivePage;
  sheet.Caption := Edit1.Text;
end;
{
This example creates a ToolBar and adds ToolButtons to it.
Include ComCtlrs in the uses clause.
}
procedure AddButtons(ToolBar: TToolBar;
  Const ButtonCaptions: array of String);
var
  I: Integer;
begin
  for I := 0 to High(ButtonCaptions) do
    begin
      with TToolButton.Create(ToolBar) do
      begin
        Parent := ToolBar;
        Caption := ButtonCaptions[I];
        if (ButtonCaptions[I] = '|') then
          Style := tbsSeparator
        else
          Style := tbsButton;
      end;
    end;
end;

procedure TForm1.FormCreate(Sender: TObject);
begin
  ToolBar1 := TToolBar.Create(Self);
  ToolBar1.Parent := Self;
  AddButtons(ToolBar1, ['New', 'Save', '|', 'Cut', 'Copy', 'Paste']);
  ToolBar1.ShowCaptions := True;
  ToolBar1.Height := 40;
end;

procedure TForm1.FormDestroy(Sender: TObject);
```

```
var
  I: Integer;
begin
  for I := ToolBar1.ButtonCount - 1 downto 0 do
    ToolBar1.Buttons[I].Free;
  ToolBar1.Free;
end;
```

68.1.23.2.13 TGridPanel.Color Property

Specifies the background color of the control.

Pascal

```
property Color: TColor;
```

C++

```
__property TColor Color;
```

Description

Use Color to read or change the background color of the control.

If a control's ParentColor property is true, then changing the Color property of the control's parent automatically changes the Color property of the control. When the value of the Color property is changed, the control's ParentColor property is automatically set to false.

C++ Examples:

```
/*
The following code changes the color of a shape control
using the Color dialog box. The example displays the Color
dialog box when the Button1 button is clicked, allowing the
user to select a color with the dialog box. When a color
value is selected with the dialog box, it is assigned to
the shape control.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  if (ColorDialog1->Execute())
    Shape1->Brush->Color = ColorDialog1->Color;
}
```

Delphi Examples:

```
{
The following code changes the color of a shape control
using the Color dialog box. The example displays the Color
dialog box when the Button1 button is clicked, allowing the
user to select a color with the dialog box. When a color
value is selected with the dialog box, it is assigned to
the shape control.
}
procedure TForm1.Button1Click(Sender: TObject);
begin
  if ColorDialog1.Execute then
    Shape1.Brush.Color := ColorDialog1.Color;
end;
```

See Also

ParentColor (see page 5834)

68.1.23.2.14 TGridPanel.ColumnCollection Property

Sets the number and size of the columns on the grid panel.

Pascal

```
property ColumnCollection: TColumnCollection;
```

C++

```
__property TColumnCollection ColumnCollection;
```

Description

Use the ColumnCollection property to set the number of columns as well as the size of each column. You can use the SizeStyle property to specify whether column sizes are based on a percentage of the available width, based on an absolute value, or automatically sized.

68.1.23.2.15 TGridPanel.Constraints Property

Specifies the size constraints for the control.

Pascal

```
property Constraints: TSizeConstraints;
```

C++

```
__property TSizeConstraints Constraints;
```

Description

Use Constraints to specify the minimum and maximum width and height of the control. When Constraints contains maximum or minimum values, the control cannot be resized to violate those constraints.

Note: Constraints apply to the height of the form. However, the height of the form depends on how large Windows makes the title bar. For example, Windows XP uses much larger title bars than other windowing systems. To work around this, note the ClientHeight when you design your form and set the constraints in the FormCreate event. In the following example, ClientHeight is represented by x: `Constraints.MinHeight := x + Height - ClientHeight`.

Warning: Do not set up constraints that conflict with the value of the Align or Anchors property. When these properties conflict, the response of the control to resize attempts is not well-defined.

See Also

AutoSize (see page 5803)

Align (see page 5798)

Anchors (see page 5802)

OnConstrainedResize (see page 5853)

OnCanResize (see page 5851)

68.1.23.2.16 TGridPanel.ControlCollection Property

Pascal

```
property ControlCollection: TControlCollection;
```

C++

```
__property TControlCollection ControlCollection;
```

Description

This is ControlCollection, a member of class TGridPanel.

68.1.23.2.17 TGridPanel.Ctl3D Property

Determines whether a control has a three-dimensional (3-D) or two-dimensional look.

Pascal

```
property Ctl3D: Boolean;
```

C++

```
__property Boolean Ctl3D;
```

Description

Ctl3D is provided for backward compatibility. It is not used by 32-bit versions of Windows or NT4.0 and later, with the exception of Windows XP Home, where it is used on occasion.

On earlier platforms, Ctl3D controlled whether the control had a flat or beveled appearance.

See Also

ParentCtl3D (see page 6209)

BevelKind (see page 6193)

BevelInner (see page 6193)

BevelOuter (see page 6194)

BorderWidth (see page 6195)

68.1.23.2.18 TGridPanel.DockManager Property

Specifies the control's docking manager interface.

Pascal

```
property DockManager: IDockManager;
```

C++

```
__property IDockManager DockManager;
```

Description

Use DockManager to specify the control's docking manager. The docking manager handles the layout of docking zones (where controls are docked) and any painting associated with docking zones.

If you set DockSite and UseDockManager to true, but do not assign a value to DockManager, the windowed control generates a default docking manager, using the global DefaultDockTreeClass variable.

C++ Examples:

```
/*
The following example is taken from the docking demo. It
shows how set permissions to dock dockable objects onto a
docking site.
*/
```

```
void __fastcall TMainForm::LeftDockPanelDockDrop(TObject *Sender,
      TDragDockObject *Source, int X, int Y)
{
  //OnDockDrop gets called AFTER the client has actually docked,
  //so we check for DockClientCount = 1 before making the dock panel visible.
  TPanel *panel = dynamic_cast<TPanel *>(Sender);
  if (panel->DockClientCount == 1)
    ShowDockPanel(panel, True, NULL);
  panel->DockManager->ResetBounds(True);
  //Make DockManager repaints it's clients.
}

void __fastcall TMainForm::LeftDockPanelDockOver(TObject *Sender,
      TDragDockObject *Source, int X, int Y, TDragState State, bool &Accept)
{
  Accept = (dynamic_cast<TDockableForm*>(Source->Control) != NULL);
  if (Accept)
  {
    // Modify the DockRect to preview dock area.
    Types::TPoint TopLeft = LeftDockPanel->ClientToScreen(Point(0, 0));
    Types::TPoint BottomRight = LeftDockPanel->ClientToScreen(
      Point(this->ClientWidth/3, LeftDockPanel->Height));
    Source->DockRect = Types::TRect(TopLeft, BottomRight);
  }
}

void __fastcall TMainForm::LeftDockPanelUnDock(TObject *Sender,
      TControl *Client, TWinControl *NewTarget, bool &Allow)
{
  //OnUnDock gets called BEFORE the client is undocked, in order to optionally
  //disallow the undock. DockClientCount is never 0 when called from this event.
  TPanel *panel = dynamic_cast<TPanel *>(Sender);
  if (panel->DockClientCount == 1)
    ShowDockPanel(panel, False, NULL);
}

void __fastcall TMainForm::LeftDockPanelGetSiteInfo(TObject *Sender,
      TControl *DockClient, TRect &InfluenceRect, TPoint &MousePos,
      bool &CanDock)
{
  //if CanDock is true, the panel will not automatically draw the preview rect.
  CanDock = DockClient->ClassNameIs("TDockableForm");
  if (!CanDock)
  {
     ShowMessage("GetSiteInfo CanDock went bad!");
  }
}
```

Delphi Examples:

```
{
The following example is taken from the docking demo. It
shows how set permissions to dock dockable objects onto a
docking site.
}

procedure TMainForm.LeftDockPanelDockDrop(Sender: TObject;
  Source: TDragDockObject; X, Y: Integer);
begin
  //OnDockDrop gets called AFTER the client has actually docked,
  //so we check for DockClientCount = 1 before making the dock panel visible.
  if (Sender as TPanel).DockClientCount = 1 then
    ShowDockPanel(Sender as TPanel, True, nil);
  (Sender as TPanel).DockManager.ResetBounds(True);
  //Make DockManager repaints it's clients.
end;
```

```
procedure TMainForm.LeftDockPanelDockOver(Sender: TObject;
  Source: TDragDockObject; X, Y: Integer; State: TDragState;
  var Accept: Boolean);
var
  ARect: TRect;
begin
  Accept := Source.Control is TDockableForm;
  if Accept then
  begin
    //Modify the DockRect to preview dock area.
    ARect.TopLeft := LeftDockPanel.ClientToScreen(Point(0, 0));
    ARect.BottomRight := LeftDockPanel.ClientToScreen(
      Point(Self.ClientWidth div 3, LeftDockPanel.Height));
    Source.DockRect := ARect;
  end;
end;

procedure TMainForm.LeftDockPanelUnDock(Sender: TObject; Client: TControl;
  NewTarget: TWinControl; var Allow: Boolean);
begin
  //OnUnDock gets called BEFORE the client is undocked, in order to optionally
  //disallow the undock. DockClientCount is never 0 when called from this event.
  if (Sender as TPanel).DockClientCount = 1 then
    ShowDockPanel(Sender as TPanel, False, nil);
end;

procedure TMainForm.LeftDockPanelGetSiteInfo(Sender: TObject;
  DockClient: TControl; var InfluenceRect: TRect; MousePos: TPoint;
  var CanDock: Boolean);
begin
  //if CanDock is true, the panel will not automatically draw the preview rect.
  CanDock := DockClient is TDockableForm;
end;
```

DockSite (see page 6204)

UseDockManager (see page 6212)

DefaultDockTreeClass (see page 6321)

68.1.23.2.19 TGridPanel.DockSite Property

Specifies whether the control can be the target of drag-and-dock operations.

Pascal

```
property DockSite: Boolean;
```

C++

```
__property Boolean DockSite;
```

Description

Set DockSite to true to allow other controls to be docked to this windowed control.

C++ Examples:

```
/*
The following example is taken from the docking demo. It
shows how the OnUnDock event handler of the conjoinment
docking site re-enables docking in the control that is
undocked (if it is a dockable form). In addition, when the
next to last docked control is undocked, the conjoinment
docking site sends itself a close message so that the last
```

```
docked control is undocked to its old position and size.
*/
void __fastcall TConjoinDockHost::FormUnDock(TObject *Sender, TControl *Client,
      TWinControl *NewTarget, bool &Allow)
{
  // Only 2 dock clients means the host must be destroyed and
  // the remaining window undocked to its old position and size.
  // Recall that OnUnDock gets called before the undocking
  // actually occurs.
  if (Client->ClassNameIs("TDockableForm"))
    dynamic_cast<TDockableForm *>(Client)->DockSite = True;
  if ((DockClientCount == 2) && (NewTarget != this))        // Self?
    PostMessage(dynamic_cast<TConjoinDockHost *>(this)->Handle, WM_CLOSE, 0, 0);
  UpdateCaption(Client);
}
```

Delphi Examples:

```
{
The following example is taken from the docking demo. It
shows how the OnUnDock event handler of the conjoinment
docking site re-enables docking in the control that is
undocked (if it is a dockable form). In addition, when the
next to last docked control is undocked, the conjoinment
docking site sends itself a close message so that the last
docked control is undocked to its old position and size.
}
procedure TConjoinDockHost.FormUnDock(Sender: TObject; Client: TControl;
  NewTarget: TWinControl; var Allow: Boolean);
begin
  // Only 2 dock clients means the host must be destroyed and
  // the remaining window undocked to its old position and size.
  // Recall that OnUnDock gets called before the undocking
  // actually occurs.
  if Client is TDockableForm then
    TDockableForm(Client).DockSite := True;
  if (DockClientCount = 2) and (NewTarget <> Self) then
    PostMessage(Self.Handle, WM_CLOSE, 0, 0);
  UpdateCaption(Client);
end;
```

68.1.23.2.20 TGridPanel.DragCursor Property

Indicates the image used to represent the mouse pointer when the control is being dragged.

Pascal

```
property DragCursor: TCursor;
```

C++

```
__property TCursor DragCursor;
```

Description

Use the DragCursor property to change the cursor image presented when the control is being dragged.

Note: To make a custom cursor available for the DragCursor property, see the Cursor property.

See Also

Cursor (see page 5815)

DragKind (see page 5819)

DragMode (see page 5819)

68.1.23.2.21 TGridPanel.DragKind Property

Specifies whether the control is being dragged normally or for docking.

Pascal

```
property DragKind: TDragKind;
```

C++

```
__property TDragKind DragKind;
```

Description

Use DragKind to get or set whether the control participates in drag-and-drop operations, or drag-and-dock operations.

See Also

DragCursor (see page 5818)

DragMode (see page 5819)

68.1.23.2.22 TGridPanel.DragMode Property

Determines how the control initiates drag-and-drop or drag-and-dock operations.

Pascal

```
property DragMode: TDragMode;
```

C++

```
__property TDragMode DragMode;
```

Description

Use DragMode to control when the user can drag the control. Disable the drag-and-drop or drag-and-dock capability at runtime by setting the DragMode property value to dmManual. Enable automatic dragging by setting DragMode to dmAutomatic.

C++ Examples:

```
/*
The following code uses GetNodeAt to add a dragged node as a
child of the node under the mouse when it is dropped.  This
example requires a populated TreeView.  Also, the TTreeView
DragMode property set to dmAutomatic, and the TTreeView
OnDragOver event handler must be implemented to accept the
drop.
*/
void __fastcall TForm1::TreeView1DragDrop(TObject *Sender, TObject *Source,
      int X, int Y)
{
  if (Source != (TObject *)TreeView1 || TreeView1->Selected == NULL)
    return;
  THitTests HT = TreeView1->GetHitTestInfoAt(X, Y);
  TNodeAttachMode AttachMode;
  TTreeNode *Item = TreeView1->GetNodeAt(X, Y);
  if (HT.Contains(htOnItem) || HT.Contains(htOnIcon))
    AttachMode = naAddChild;
  else if (HT.Contains(htNowhere))
    AttachMode = naAdd;
  else if (HT.Contains(htOnIndent))
    AttachMode = naInsert;
  else
    return;
  TreeView1->Selected->MoveTo(Item, AttachMode);
```

```
}

void __fastcall TForm1::TreeView1DragOver(TObject *Sender, TObject *Source,
      int X, int Y, TDragState State, bool &Accept)
{
  Accept = (Source == (TObject *)TreeView1);
}
```

Delphi Examples:

```
{
The following code uses GetNodeAt to add a dragged node as a
child of the node under the mouse when it is dropped.  This
example requires a populated TreeView.  Also, the TTreeView
DragMode property set to dmAutomatic, and the TTreeView
OnDragOver event handler must be implemented to accept the
drop.
}
procedure TForm1.TreeView1DragDrop(Sender, Source: TObject; X, Y: Integer);
var
  AnItem: TTreeNode;
  AttachMode: TNodeAttachMode;
  HT: THitTests;
begin
  if TreeView1.Selected = nil then Exit;
  HT := TreeView1.GetHitTestInfoAt(X, Y);
  AnItem := TreeView1.GetNodeAt(X, Y);
  if (HT - [htOnItem, htOnIcon, htNowhere, htOnIndent] <> HT) then
  begin
    if (htOnItem in HT) or (htOnIcon in HT) then
      AttachMode := naAddChild
    else if htNowhere in HT then AttachMode := naAdd
    else if htOnIndent in HT then AttachMode := naInsert;
    TreeView1.Selected.MoveTo(AnItem, AttachMode);
  end;
end;

procedure TForm1.TreeView1DragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := Source is TTreeView;
end;
```

DragKind (see page 5819)

Arranging the Order of Persistent Columns

68.1.23.2.23 TGridPanel.Enabled Property

Controls whether the control responds to mouse, keyboard, and timer events.

Pascal

```
property Enabled: Boolean;
```

C++

```
__property Boolean Enabled;
```

Description

Use Enabled to change the availability of the control to the user. To disable a control, set Enabled to false. Disabled controls appear dimmed. If Enabled is false, the control ignores mouse, keyboard, and timer events.

To re-enable a control, set Enabled to true. The control is no longer dimmed, and the user can use the control.

See Also

Visible (see page 5847)

DisableControls (see page 6925)

EnableControls (see page 6934)

Enabling Mouse

68.1.23.2.24 TGridPanel.ExpandStyle Property

Specifies whether rows or columns are added to a filled grid panel to accommodate additional controls.

Pascal

```
property ExpandStyle: TExpandStyle;
```

C++

```
__property TExpandStyle ExpandStyle;
```

Description

Use the ExpandStyle property to specify how a grid panel is expanded when each cell of the grid contains a control, and a new control is added.

68.1.23.2.25 TGridPanel.Font Property

Controls the attributes of text written on or in the control.

Pascal

```
property Font: TFont;
```

C++

```
__property TFont Font;
```

Description

To change to a new font, specify a new TFont object. To modify a font, change the value of the Charset, Color, Height, Name, Pitch, Size, or Style of the TFont object.

C++ Examples:

```
/*
To use this example, place a TComboBox and TRichEdit or
TMemo on a form.  During form creation, a list of font names
is loaded into the combo box. When the combo box is clicked,
the memo or Rich Edit control font is set to the
corresponding font name in the combo box.
```

```
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < Screen->Fonts->Count; i++)
   ComboBox1->Items->Add(Screen->Fonts->Strings[i]);
//  ComboBox1->Items = Screen->Fonts;  // Another way to do it.
}

void __fastcall TForm1::ComboBox1Change(TObject *Sender)
{
  RichEdit1->Font->Name = ComboBox1->Text;
}
```

Delphi Examples:

```
{
To use this example, place a TComboBox and TRichEdit or
TMemo on a form.  During form creation, a list of font names
is loaded into the combo box. When the combo box is clicked,
the memo or Rich Edit control font is set to the
corresponding font name in the combo box.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  i : Integer;
begin
  for i := 0 to Screen.Fonts.Count - 1 do
   ComboBox1.Items.Add(Screen.Fonts.Strings[i]);
//  ComboBox1.Items := Screen.Fonts;  // Another way to do it.
  RichEdit1.Lines.Text := 'How is it to be you?';
end;

procedure TForm1.ComboBox1Click(Sender: TObject);
begin
  RichEdit1.Font.Name := ComboBox1.Text;
end;
```

DesktopFont (see page 5818)

ParentFont (see page 5834)

Displaying and Editing Text in a Memo Control

68.1.23.2.26 TGridPanel.FullRepaint Property

Determines how the panel repaints itself when it is resized.

Pascal

```
property FullRepaint: Boolean;
```

C++

```
__property Boolean FullRepaint;
```

Description

FullRepaint controls how the panel responds when it is resized. When FullRepaint is true, the entire panel, including the beveled border repaints when the size changes. When FullRepaint is false, only the area inside the beveled border repaints.

See Also

Invalidate (see page 6161)

68.1.23.2.27 TGridPanel.Locked Property

Determines whether a panel that is used as a toolbar is replaced by a toolbar supplied by an OLE server.

Pascal

```
property Locked: Boolean;
```

C++

```
__property Boolean Locked;
```

Description

Set the Locked property to false when the panel is used as a toolbar by a TOleContainer component. Any panels aligned to a TOleContainer are assumed to be replaceable toolbars unless the Locked property is true. Prevent the panel from being replaced by an OLE server's toolbar by setting the panel's Locked property to true.

Note: An OLE application's toolbars must be in panels aligned to a side of the form (that is, their Align properties must be set to alTop, alBottom, alLeft, or alRight).

See Also

Align (see page 5798)

TOleContainer (see page 17921)

68.1.23.2.28 TGridPanel.Padding Property

Specifies the padding of a control.

Pascal

```
property Padding: TPadding;
```

C++

```
__property TPadding Padding;
```

Description

Use Padding to specify the padding of a control. This value is an instance of the class TPadding.

See Also

TPadding (see page 6103)

68.1.23.2.29 TGridPanel.ParentBackground Property

Determines whether control uses parent's theme background.

Pascal

```
property ParentBackground: Boolean;
```

C++

```
__property Boolean ParentBackground;
```

Description

If ParentBackground is true, the control uses the parent's theme background to draw its own background. ParentBackground has no effect unless XP themes are enabled.

68.1.23.2.30 TGridPanel.ParentBiDiMode Property

Specifies whether the control uses its parent's BiDiMode.

Pascal

```
property ParentBiDiMode: Boolean;
```

C++

```
__property Boolean ParentBiDiMode;
```

Description

Use ParentBiDiMode to get or set whether the control uses its parent's BiDiMode. When ParentBiDiMode is true, the control's BiDiMode property is always equal to that of its parent. If ParentBiDiMode is false, the control uses its own BiDiMode property.

Set ParentBiDiMode to true for all controls in a form in order to ensure that the entire user interface adjusts to Middle Eastern locales in a uniform manner.

When the value of the control's BiDiMode property changes, ParentBiDiMode becomes false automatically.

See Also

Parent (see page 5832)

BiDiMode (see page 5803)

68.1.23.2.31 TGridPanel.ParentColor Property

Determines where a control looks for its color information.

Pascal

```
property ParentColor: Boolean;
```

C++

```
__property Boolean ParentColor;
```

Description

To have a control use the same color as its parent control, set ParentColor to true. If ParentColor is false, the control uses its own Color property.

Set ParentColor to true for all controls in order to ensure that all the controls on a form have a uniform appearance. For example, if ParentColor is true for all controls in a form, changing the background color of the form to gray causes all the controls on the form to also have a gray background.

When the value of a control's Color property changes, ParentColor becomes false automatically.

ParentShowHint (see page 5835)

68.1.23.2.32 TGridPanel.ParentCtl3D Property

Determines where a component looks to determine if it should appear three dimensional.

Pascal

```
property ParentCtl3D: Boolean;
```

C++

```
__property Boolean ParentCtl3D;
```

Description

ParentCtl3D is provided for backwards compatibility. It has no effect on 32-bit versions of Windows or NT 4.0 and later.

ParentCtl3D determines whether the control uses its parent's Ctl3D property.

See Also

Ctl3D (see page 6198)

68.1.23.2.33 TGridPanel.ParentFont Property

Determines where a control looks for its font information.

Pascal

```
property ParentFont: Boolean;
```

C++

```
__property Boolean ParentFont;
```

Description

To have a control use the same font as its parent control, set ParentFont to true. If ParentFont is false, the control uses its own Font property. Many controls default ParentFont to true so that all the controls in a form or other container present a uniform appearance. When the value of a control's Font property changes, ParentFont becomes false automatically.

When ParentFont is true for a form, the form uses the default font.

See Also

Font (see page 5823)

Parent (see page 5832)

ParentColor (see page 5834)

ParentShowHint (see page 5835)

68.1.23.2.34 TGridPanel.ParentShowHint Property

Determines where a control looks to find out if its Help Hint should be shown.

Pascal

```
property ParentShowHint: Boolean;
```

C++

```
__property Boolean ParentShowHint;
```

Description

Use ParentShowHint to ensure that all the controls on a form either uniformly show their Help Hints or uniformly do not show them.

If ParentShowHint is true, the control uses the ShowHint property value of its parent. If ParentShowHint is false, the control uses the value of its own ShowHint property.

To provide Help Hints for only selected controls on a form, set the ShowHint property for those controls that should have Help Hints to true, and ParentShowHint becomes false automatically.

Note: Enable or disable all Help Hints for the entire application using the ShowHint property of the application object.

ParentColor (see page 5834)

ParentFont (see page 5834)

ShowHint (see page 5840)

68.1.23.2.35 TGridPanel.PopupMenu Property

Identifies the pop-up menu associated with the control.

Pascal

```
property PopupMenu: TPopupMenu;
```

C++

```
__property TPopupMenu PopupMenu;
```

Description

Assign a value to PopupMenu to make a pop-up menu appear when the user selects the control and clicks the right mouse button. If the TPopupMenu's AutoPopup property is true, the pop-up menu appears automatically. If the menu's AutoPopup property is false, display the menu with a call to its Popup method from the control's OnContextPopup event handler.

C++ Examples:

```
/*
This example uses two edit boxes and one pop-up menu on a form.
The pop-up menu contains Cut, Copy, and Paste commands. This code
makes the pop-up menu available to both edit boxes:
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  PopupMenu1->AutoPopup = true;
  Edit1->PopupMenu = PopupMenu1;
  Edit2->PopupMenu = PopupMenu1;
}

/*
These are the cut, copy, and paste OnClick events for the commands
on the pop-up menu. Double click on the pop-up menu and add three
TMenuItems.  Then set the captions to "Cut", "Copy" and "Paste".
The names will be automatically set to "Cut1", "Copy1", and
"Paste1".  Then double click on the OnClick events and they will
be named "Cut1Click", "Copy1Click" and "Paste1Click" respectively.
Note: only the selected portion of the string in the edit box will
be copied, cut or replaced.
*/
void __fastcall TForm1::Copy1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
    if (pComponent->ClassNameIs("TEdit"))
      ((TEdit *)pComponent)->CopyToClipboard();
```

```
      else
        MessageBeep(0);
    }
    else
      MessageBeep(0);
  }

  void __fastcall TForm1::Cut1Click(TObject *Sender)
  {
    TComponent *pComponent = PopupMenu1->PopupComponent;
    if (pComponent)
    {
      if (pComponent->ClassNameIs("TEdit"))
        ((TEdit *)pComponent)->CutToClipboard();
      else
        MessageBeep(0);
    }
    else
      MessageBeep(0);
  }

  void __fastcall TForm1::Paste1Click(TObject *Sender)
  {
    TComponent *pComponent = PopupMenu1->PopupComponent;
    if (pComponent)
    {
      if (pComponent->ClassNameIs("TEdit"))
        ((TEdit *)pComponent)->PasteFromClipboard();
      else
        MessageBeep(0);
    }
    else
      MessageBeep(0);
  }
  /*
  This example demonstrates how to add and delete menu items
  to a popup menu at runtime and assign an event handler to
  the OnClick event.  Place a TPopupMenu and three buttons on
  the form named "AddButton", "EditButton",  and
  "DestroyButton" and add OnClick events to all three buttons.
  Put the TPopupMenu in the PopupMenu property of the form.
  Place the PopupMenuItemsClick procedure in the TForm1 type
  declaration so that it can be used as the method call for
  the menu item OnClick event.
  */
  void __fastcall TForm1::AddButtonClick(TObject *Sender)
  {
      const int num_items = 4;
      for (int index = 0; index < num_items; ++index)
      {
          TMenuItem *NewItem = new TMenuItem(PopupMenu1); // create the new item
          PopupMenu1->Items->Add(NewItem);// add it to the Popupmenu
          NewItem->Caption = "Menu Item " + IntToStr(index);
          NewItem->Tag = index;
          NewItem->OnClick = PopupMenuItemsClick;// assign it an event handler
          TNotifyEvent();
      }
  }

  void __fastcall TForm1::PopupMenuItemsClick(TObject *Sender)
  {
      TMenuItem *ClickedItem = dynamic_cast<TMenuItem *>(Sender);
      if (ClickedItem)
      {
          switch (ClickedItem->Tag)
          {
```

```
            case 0:
            {
                ShowMessage("first item clicked");
                break;
            }
            case 1:
            {
                ShowMessage("second item clicked");
                break;
            }
            case 2:
            {
                ShowMessage("third item clicked");
                break;
            }
            case 3:
            {
                ShowMessage("fourth item clicked");
                break;
            }
        }
    }
}

/*
To edit or destroy an item, grab its pointer via the Items
property.
*/
void __fastcall TForm1::EditButtonClick(TObject *Sender)
{
    const int index = 1;
    TMenuItem *ItemToEdit = PopupMenu->Items->Items[index];
    ItemToEdit->Caption = "Changed Caption";
}

void __fastcall TForm1::DestroyButtonClick(TObject *Sender)
{
    const int index = 2;
    TMenuItem *ItemToDelete = PopupMenu->Items->Items[index];
    delete ItemToDelete;
}
```

Delphi Examples:

```
{
This example uses two edit boxes and one pop-up menu on a form.
The pop-up menu contains Cut, Copy, and Paste commands. This code
makes the pop-up menu available to both edit boxes:
}
procedure TForm1.FormCreate(Sender: TObject);
begin
  PopupMenu1.AutoPopup := True;
  Edit1.PopupMenu := PopupMenu1;
  Edit2.PopupMenu := PopupMenu1;
end;

{
These are the cut, copy, and paste OnClick events for the commands
on the pop-up menu. Double click on the pop-up menu and add three
TMenuItems.  Then set the captions to "Cut", "Copy" and "Paste".
The names will be automatically set to "Cut1", "Copy1", and
"Paste1".  Then double click on the OnClick events and they will
be named "Cut1Click", "Copy1Click" and "Paste1Click" respectively.
Note: only the selected portion of the string in the edit box will
be copied, cut or replaced.
}
procedure TForm1.Copy1Click(Sender: TObject);
```

```
begin
  if PopupMenu1.PopupComponent = Edit1 then
   Edit1.CopyToClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.CopyToClipboard
  else
    Beep;
end;

procedure TForm1.Cut1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
    Edit1.CutToClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.CutToClipboard
  else
    Beep;
end;

procedure TForm1.Paste1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
    Edit1.PasteFromClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.PasteFromClipboard
  else
    Beep;
end;
{
This example demonstrates how to add and delete menu items
to a popup menu at runtime and assign an event handler to
the OnClick event.  Place a TPopupMenu and three buttons on
the form named "AddButton", "EditButton",  and
"DestroyButton" and add OnClick events to all three buttons.
Put the TPopupMenu in the PopupMenu property of the form.
Place the PopupMenuItemsClick procedure in the TForm1 type
declaration so that it can be used as the method call for
the menu item OnClick event.
}

68.1.23.2.36 TGridPanel.RowCollection Property

Sets the number and size of the rows on the grid panel.

Pascal

```
property RowCollection: TRowCollection;
```

C++

```
__property TRowCollection RowCollection;
```

Description

Use the RowCollection property to set the number of rows as well as the size of each row. You can use the SizeStyle property to specify whether row sizes are based on a percentage of the available width, based on an absolute value, or automatically sized.

68.1.23.2.37 TGridPanel.ShowHint Property

Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.

Pascal

```
property ShowHint: Boolean;
```

C++

```
__property Boolean ShowHint;
```

Description

The Help Hint is the value of the Hint property, which is displayed in a box just beneath the control. Use ShowHint to determine whether a Help Hint appears for the control.

To enable Help Hint for a particular control, the application ShowHint property must be true and either

the control's own ShowHint property must be true, or

the control's ParentShowHint property must be true and its parent's ShowHint property must be true.

For example, imagine a check box within a group box. If the ShowHint property of the group box is true and the ParentShowHint property of the check box is true, but the ShowHint property of the check box is false, the check box still displays its Help Hint.

Changing the ShowHint value automatically sets the ParentShowHint property to false.

C++ Examples:

```
/*
This example uses an edit box and a list box on a form.
Items are added to the list box and a Help Hint is assigned
to both controls. The last statement enables the Help Hints
for the entire application.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  Edit1->Hint = "Enter your name";
  Edit1->ShowHint = true;

  char string[10];
  char index[3];
  for(int i = 1; i <= 10; i++)
  {
    strcpy(string, "Item");
    itoa(i, index, 10);
    strcat(string, index);
    ListBox1->Items->Add(string);
  }
  ListBox1->Hint = "Select an item";
  ListBox1->ShowHint = true;
  Application->ShowHint = true;
}
/*
Note: To see an example that displays the hints of controls
in some place other than in a Help Hint box, see the OnHint
```

```
example.
*/
```

Delphi Examples:

```
{
This example uses an edit box and a list box on a form.
Items are added to the list box and a Help Hint is assigned
to both controls. The last statement enables the Help Hints
for the entire application.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  I: Integer;
begin
  Edit1.Hint := 'Enter your name';
  Edit1.ShowHint := True;
  with ListBox1 do
  begin
    for I := 1 to 10 do
      Items.Add('Item ' + IntToStr(I));
    Hint := 'Select an item';
    ShowHint := True;
  end;
  Application.ShowHint := True;
end;
{
Note: To see an example that displays the hints of controls
in some place other than in a Help Hint box, see the OnHint
example.
}

Displaying Fly-over Help

68.1.23.2.38 TGridPanel.TabOrder Property

Indicates the position of the control in its parent's tab order.

Pascal

```
property TabOrder: TTabOrder;
```

C++

```
__property TTabOrder TabOrder;
```

Description

TabOrder is the order in which child windows are visited when the user presses the Tab key. The control with the TabOrder value of 0 is the control that has the focus when the form first appears.

Initially, the tab order is always the order in which the controls were added to the form. The first control added to the form has a TabOrder value of 0, the second is 1, the third is 2, and so on. Change this by changing the TabOrder property.

Each control has a unique tab-order value within its parent. If you change the TabOrder property value of one control to be the same as the value of a second control, the TabOrder value for all the other controls changes. For example, suppose a control is sixth in the tab order. If you change the control's TabOrder property value to 3 (making the control fourth in the tab order), the control that was originally fourth in the tab order now becomes fifth, and the control that was fifth becomes sixth.

Assigning TabOrder a value greater than the number of controls contained in the parent control moves the control to the end of the tab order. The control does not take on the assigned value of TabOrder, but instead is given the number that assures the control is the last in the tab order.

Note: TabOrder is meaningful only if the TabStop property is true and if the control has a parent. (The TabOrder property of a form is not used unless the form is the child of another form.) A control with a TabOrder of -1 has no parent, and therefore cannot be reached by pressing the Tab key. To remove a parented control from the Tab order, set its TabStop property to false.

See Also

FindNextControl (see page 6149)

TabStop (see page 6211)

68.1.23.2.39 TGridPanel.TabStop Property

Determines if the user can tab to a control.

Pascal

```
property TabStop: Boolean;
```

C++

```
__property Boolean TabStop;
```

Description

Use the TabStop to allow or disallow access to the control using the Tab key.

If TabStop is true, the control is in the tab order. If TabStop is false, the control is not in the tab order and the user can't press the Tab key to move to the control.

Note: TabStop is not meaningful for a form unless the form assigns another form to be its parent.

See Also

TabOrder (see page 6211)

68.1.23.2.40 TGridPanel.UseDockManager Property

Specifies whether the docking manager is used in drag-and-dock operations.

Pascal

```
property UseDockManager: Boolean;
```

C++

```
__property Boolean UseDockManager;
```

Description

Use UseDockManager to get or set whether a docking manager is used in drag-and-dock operations.

The docking manager handles the positioning of docked controls and any painting of docking zones around those controls. If you do not use a docking manager, docked controls are aligned to the windowed control based on the closest edge to where they are released. When you do not use a docking manager, there is no region for a user to grab to automatically undock a docked control.

See Also

DockManager (see page 6202)

68.1.23.2.41 TGridPanel.VerticalAlignment Property

Sets the vertical position of the caption.

Pascal

```
property VerticalAlignment: TVerticalAlignment;
```

C++

```
__property TVerticalAlignment VerticalAlignment;
```

Description

Use the VerticalAlignment property to control the position of the caption within the panel. Choose one of the following values.

Value	Description
taAlignBottom	The caption displays at the bottom of the panel.
taAlignTop	The caption displays at the top of the panel.
taVerticalCenter	The caption displays at the center of the panel.

Note: Use the Alignment property to control the horizontal position of the caption.

See Also

Caption

68.1.23.2.42 TGridPanel.Visible Property

Determines whether the component appears onscreen.

Pascal

```
property Visible: Boolean;
```

C++

```
__property Boolean Visible;
```

Description

Use the Visible property to control the visibility of the control at runtime. If Visible is true, the control appears. If Visible is false, the control is not visible.

Calling the Show method sets the control's Visible property to true. Calling the Hide method sets it to false.

C++ Examples:

```
/*
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
*/
void __fastcall TForm1::PageControl1Change(TObject *Sender)
{
  CheckBox1->Checked = PageControl1->ActivePage->Visible;
}

void __fastcall TForm1::CheckBox1Click(TObject *Sender)
{
  PageControl1->ActivePage->Visible = CheckBox1->Checked;
```

```
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < 10; i++)
  {
    TTabSheet *pPage = new TTabSheet(this);
    pPage->PageControl = PageControl1;
    pPage->Caption = AnsiString("Page") + IntToStr(i);
    TEdit *pEdit = new TEdit(this);
    pEdit->Parent = pPage;
    pEdit->Left = random(pPage->ClientWidth - pEdit->Width);
    pEdit->Top = random(pPage->ClientHeight - pEdit->Height);
  }
  PageControl1Change(Sender);
}
```

Delphi Examples:

```
{
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
}
procedure TForm1.CheckBox1Click(Sender: TObject);
begin
  PageControl1.ActivePage.Visible := CheckBox1.Checked;
end;

procedure TForm1.PageControl1Change(Sender: TObject);
begin
  CheckBox1.Checked := PageControl1.ActivePage.Visible;
end;

procedure TForm1.FormCreate(Sender: TObject);
var
  i: Integer;
begin
  for i := 0 to 9 do
    with TTabSheet.Create(Self) do
    begin
      PageControl := PageControl1;
      Caption := 'TabSheet' + IntToStr(i);
      with TEdit.Create(Self) do
      begin
        Parent := PageControl1.Pages[i];
        Left := Random(PageControl1.ActivePage.ClientWidth - Width);
        Top := Random(PageControl1.ActivePage.ClientHeight - Height);
      end;
    end;
    PageControl1Change(Sender);
end;
```

68.1.23.3 TGridPanel Events

The events of the TGridPanel class are listed here.

Published Events

	Name	Description
	OnAlignInsertBefore (see page 12709)	Occurs when an object with custom alignment is aligned.
	OnAlignPosition (see page 12710)	Occurs when an object with custom alignment is aligned.
	OnCanResize (see page 12711)	Occurs when an attempt is made to resize the control.
	OnClick (see page 12711)	Occurs when the user clicks the control.
	OnConstrainedResize (see page 12713)	Adjust resize constraints.
	OnContextPopup (see page 12713)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnDblClick (see page 12714)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDockDrop (see page 12714)	Occurs when another control is docked to the control.
	OnDockOver (see page 12716)	Occurs when another control is dragged over the control.
	OnDragDrop (see page 12719)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 12721)	Occurs when the user drags an object over a control.
	OnEndDock (see page 12723)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 12724)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnEnter (see page 12725)	Occurs when a control receives the input focus.
	OnExit (see page 12727)	Occurs when the input focus shifts away from one control to another.
	OnGetSiteInfo (see page 12729)	Returns the control's docking information.
	OnMouseActivate (see page 12731)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 12732)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseEnter (see page 12734)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 12734)	Occurs when the user moves the mouse outside of a control.
	OnMouseMove (see page 12734)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 12737)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnResize (see page 12739)	Occurs immediately after the control is resized.
	OnStartDock (see page 12740)	Occurs when the user begins to drag a control with a DragKind of dkDock.
	OnStartDrag (see page 12740)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.
	OnUnDock (see page 12741)	Occurs when the application tries to undock a control that is docked to the windowed control.

68.1.23.3.1 TGridPanel.OnAlignInsertBefore Event

Occurs when an object with custom alignment is aligned.

Pascal

```
property OnAlignInsertBefore: TAlignInsertBeforeEvent;
```

C++

```
__property TAlignInsertBeforeEvent OnAlignInsertBefore;
```

Description

OnAlignInsertBefore occurs for each pair of child controls with an Align property of **alCustom**.

It can determine the order in which custom-aligned child controls are placed. OnAlignInsertBefore returns true if **C2** should be presented before **C1**, and false otherwise. It holds a TAlignInsertBeforeEvent type.

CustomAlignInsertBefore triggers the OnAlignInsertBefore event. If this event is defined, CustomAlignInsertBefore returns the value returned by OnAlignInsertBefore. Defining this event allows users to define the order of control alignment without overriding CustomAlignInsertBefore.

68.1.23.3.2 TGridPanel.OnAlignPosition Event

Occurs when an object with custom alignment is aligned.

Pascal

```
property OnAlignPosition: TAlignPositionEvent;
```

C++

```
__property TAlignPositionEvent OnAlignPosition;
```

Description

OnAlignPosition occurs when child controls with an Align property of **alCustom** are aligned.

CustomAlignPosition triggers the OnAlignPosition event. If this event is defined, CustomAlignPosition uses the alignment parameters it obtains from OnAlignPosition. Defining this event allows users to set the alignment parameters without overriding CustomAlignPosition. It holds a TAlignPositionEvent type.

These are the parameters:

Parameter	Meaning
NewLeft | NewTop | NewWidth | NewHeight	Location and size of child control, as determined by container's size and the Anchors TControl_Anchors constraints for the control. OnAlignPosition can modify these values to reposition the control.
AlignRect	The client area in which the control is aligned. OnAlignPosition can modify this value.
AlignInfo	Alignment information in a TAlignInfo.
As implemented in TWinControl, OnAlignPosition does nothing.

68.1.23.3.3 TGridPanel.OnCanResize Event

Occurs when an attempt is made to resize the control.

Pascal

```
property OnCanResize: TCanResizeEvent;
```

C++

```
__property TCanResizeEvent OnCanResize;
```

Description

Use OnCanResize to adjust the way a control is resized. If necessary, change the new width and height of the control in the OnCanResize event handler. The OnCanResize event handler also allows applications to indicate that the entire resize should be aborted.

If there is no OnCanResize event handler, or if the OnCanResize event handler indicates that the resize attempt can proceed, the OnCanResize event is followed immediately by an OnConstrainedResize event.

See Also

OnConstrainedResize (see page 5853)

SetBounds (see page 5783)

OnResize (see page 5870)

68.1.23.3.4 TGridPanel.OnClick Event

Occurs when the user clicks the control.

Pascal

```
property OnClick: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnClick;
```

Description

Use the OnClick event handler to respond when the user clicks the control. If the control has an associated action, and that action has an OnExecute method, the action's OnExecute method responds to click events unless it is superseded by an OnClick event handler.

Usually OnClick occurs when the user presses and releases the left mouse button with the mouse pointer over the control. This event can also occur when:

- The user selects an item in a grid, outline, list, or combo box by pressing an arrow key.
- The user presses Spacebar while a button or check box has focus.
- The user presses Enter when the active form has a default button (specified by the Default property).
- The user presses Esc when the active form has a cancel button (specified by the Cancel property).
- The user presses the accelerator key for a button or check box. For example, if the value of the Caption property of a check box is '&Bold', the B is underlined at runtime and the OnClick event of the check box is triggered when the user presses Alt+B. However, focus does not move to the control in these instances.
- The Checked property of a radio button is set to true.
- The value of the Checked property of a check box is changed.
- The Click method of a menu item is called.

For a form, an OnClick event occurs when the user clicks a blank area of the form or on a disabled component.

C++ Examples:

```
/*
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
*/
void __fastcall TForm1::PageControl1Change(TObject *Sender)
{
  CheckBox1->Checked = PageControl1->ActivePage->Visible;
}

void __fastcall TForm1::CheckBox1Click(TObject *Sender)
{
  PageControl1->ActivePage->Visible = CheckBox1->Checked;
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < 10; i++)
  {
    TTabSheet *pPage = new TTabSheet(this);
    pPage->PageControl = PageControl1;
    pPage->Caption = AnsiString("Page") + IntToStr(i);
    TEdit *pEdit = new TEdit(this);
    pEdit->Parent = pPage;
    pEdit->Left = random(pPage->ClientWidth - pEdit->Width);
    pEdit->Top = random(pPage->ClientHeight - pEdit->Height);
  }
  PageControl1Change(Sender);
}
```

Delphi Examples:

```
{
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
}
procedure TForm1.CheckBox1Click(Sender: TObject);
begin
  PageControl1.ActivePage.Visible := CheckBox1.Checked;
end;

procedure TForm1.PageControl1Change(Sender: TObject);
begin
  CheckBox1.Checked := PageControl1.ActivePage.Visible;
end;

procedure TForm1.FormCreate(Sender: TObject);
var
  i: Integer;
begin
  for i := 0 to 9 do
    with TTabSheet.Create(Self) do
    begin
      PageControl := PageControl1;
      Caption := 'TabSheet' + IntToStr(i);
      with TEdit.Create(Self) do
      begin
        Parent := PageControl1.Pages[i];
```

```
        Left := Random(PageControl1.ActivePage.ClientWidth - Width);
        Top := Random(PageControl1.ActivePage.ClientHeight - Height);
      end;
    end;
    PageControl1Change(Sender);
end;
```

68.1.23.3.5 TGridPanel.OnConstrainedResize Event

Adjust resize constraints.

Pascal

```
property OnConstrainedResize: TConstrainedResizeEvent;
```

C++

```
__property TConstrainedResizeEvent OnConstrainedResize;
```

Description

Use OnConstrainedResize to adjust a control's constraints when an attempt is made to resize it. Upon entry to the OnConstrainedResize event handler, the parameters of the event handler are set to the corresponding properties of the control's Constraints object. The event handler can adjust those values before they are applied to the new height and width that is being applied to the control. (The CanAutoSize method or an OnCanResize event handler may already have adjusted this new height and width).

On exit from the OnConstrainedResize event handler, the constraints are applied to the attempted new height and width. Once the constraints are applied, the control's height and width are changed. After the control's height and width change, an OnResize event occurs to allow any final adjustments or responses.

Note: The OnConstrainedResize handler is called immediately after the OnCanResize handler.

68.1.23.3.6 TGridPanel.OnContextPopup Event

Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).

Pascal

```
property OnContextPopup: TContextPopupEvent;
```

C++

```
__property TContextPopupEvent OnContextPopup;
```

Description

The OnContextPopup handler is called when the user uses the mouse or keyboard to request a popup menu. The OnContextPopup event is generated by a WM_CONTEXTMENU message, which is itself generated by the user clicking the right mouse button or by pressing SHIFT+F10 or the Applications key.

This event is especially useful when the control does not have an associated popup menu (the PopupMenu property is not set) or if the AutoPopup property of the control's associated popup menu is false. However, the OnContextPopup can also be used to override the automatic context menu that appears when the control has an associated popup menu with an AutoPopup property of true. In this last case, if the event handler displays its own menu, it should set the Handled parameter to true to suppress the default context menu.

The handler's MousePos parameter indicates the position of the mouse, in client coordinates.. If the event was not generated by a mouse click, MousePos is (-1,-1).

Note: Parent controls receive an OnContextPopup event before their child controls. In addition, for many child controls, the default window procedure causes the parent control to receive an OnContextPopup event after the child control. As a result, when parent controls do not set Handled to true in an OnContextPopup event handler, the event handler may be called multiple times for each context menu invocation.

68.1.23.3.7 TGridPanel.OnDblClick Event

Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.

Pascal

```
property OnDblClick: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnDblClick;
```

Description

Use the OnDblClick event to respond to mouse double-clicks.

OnClick (see page 5851)

Responding to User Actions at Runtime

68.1.23.3.8 TGridPanel.OnDockDrop Event

Occurs when another control is docked to the control.

Pascal

```
property OnDockDrop: TDockDropEvent;
```

C++

```
__property TDockDropEvent OnDockDrop;
```

Description

Write code in the OnDockDrop event to perform actions when another control is docked on the control.

OnDockDrop can only occur if DockSite is true.

C++ Examples:

```
/*
The following example is taken from the docking demo. It
shows how set permissions to dock dockable objects onto a
docking site.
*/

void __fastcall TMainForm::LeftDockPanelDockDrop(TObject *Sender,
      TDragDockObject *Source, int X, int Y)
{
  //OnDockDrop gets called AFTER the client has actually docked,
  //so we check for DockClientCount = 1 before making the dock panel visible.
  TPanel *panel = dynamic_cast<TPanel *>(Sender);
  if (panel->DockClientCount == 1)
    ShowDockPanel(panel, True, NULL);
  panel->DockManager->ResetBounds(True);
  //Make DockManager repaints it's clients.
}

void __fastcall TMainForm::LeftDockPanelDockOver(TObject *Sender,
      TDragDockObject *Source, int X, int Y, TDragState State, bool &Accept)
{
  Accept = (dynamic_cast<TDockableForm*>(Source->Control) != NULL);
  if (Accept)
  {
    // Modify the DockRect to preview dock area.
    Types::TPoint TopLeft = LeftDockPanel->ClientToScreen(Point(0, 0));
    Types::TPoint BottomRight = LeftDockPanel->ClientToScreen(
      Point(this->ClientWidth/3, LeftDockPanel->Height));
    Source->DockRect = Types::TRect(TopLeft, BottomRight);
  }
}

void __fastcall TMainForm::LeftDockPanelUnDock(TObject *Sender,
      TControl *Client, TWinControl *NewTarget, bool &Allow)
{
  //OnUnDock gets called BEFORE the client is undocked, in order to optionally
  //disallow the undock. DockClientCount is never 0 when called from this event.
  TPanel *panel = dynamic_cast<TPanel *>(Sender);
  if (panel->DockClientCount == 1)
    ShowDockPanel(panel, False, NULL);
}

void __fastcall TMainForm::LeftDockPanelGetSiteInfo(TObject *Sender,
      TControl *DockClient, TRect &InfluenceRect, TPoint &MousePos,
      bool &CanDock)
{
  //if CanDock is true, the panel will not automatically draw the preview rect.
  CanDock = DockClient->ClassNameIs("TDockableForm");
  if (!CanDock)
  {
     ShowMessage("GetSiteInfo CanDock went bad!");
  }
```

```
}
```

Delphi Examples:

```
{
The following example is taken from the docking demo. It
shows how set permissions to dock dockable objects onto a
docking site.
}

procedure TMainForm.LeftDockPanelDockDrop(Sender: TObject;
  Source: TDragDockObject; X, Y: Integer);
begin
  //OnDockDrop gets called AFTER the client has actually docked,
  //so we check for DockClientCount = 1 before making the dock panel visible.
  if (Sender as TPanel).DockClientCount = 1 then
    ShowDockPanel(Sender as TPanel, True, nil);
  (Sender as TPanel).DockManager.ResetBounds(True);
  //Make DockManager repaints it's clients.
end;

procedure TMainForm.LeftDockPanelDockOver(Sender: TObject;
  Source: TDragDockObject; X, Y: Integer; State: TDragState;
  var Accept: Boolean);
var
  ARect: TRect;
begin
  Accept := Source.Control is TDockableForm;
  if Accept then
  begin
    //Modify the DockRect to preview dock area.
    ARect.TopLeft := LeftDockPanel.ClientToScreen(Point(0, 0));
    ARect.BottomRight := LeftDockPanel.ClientToScreen(
      Point(Self.ClientWidth div 3, LeftDockPanel.Height));
    Source.DockRect := ARect;
  end;
end;

procedure TMainForm.LeftDockPanelUnDock(Sender: TObject; Client: TControl;
  NewTarget: TWinControl; var Allow: Boolean);
begin
  //OnUnDock gets called BEFORE the client is undocked, in order to optionally
  //disallow the undock. DockClientCount is never 0 when called from this event.
  if (Sender as TPanel).DockClientCount = 1 then
    ShowDockPanel(Sender as TPanel, False, nil);
end;

procedure TMainForm.LeftDockPanelGetSiteInfo(Sender: TObject;
  DockClient: TControl; var InfluenceRect: TRect; MousePos: TPoint;
  var CanDock: Boolean);
begin
  //if CanDock is true, the panel will not automatically draw the preview rect.
  CanDock := DockClient is TDockableForm;
end;
```

DockSite (see page 6204)

OnDockOver (see page 6216)

68.1.23.3.9 TGridPanel.OnDockOver Event

Occurs when another control is dragged over the control.

Pascal

```
property OnDockOver: TDockOverEvent;
```

C++

```
__property TDockOverEvent OnDockOver;
```

Description

Write code in the OnDockOver event to indicate whether a dockable control that is dragged over the windowed control can be accepted as a dock client. OnDockOver occurs after the TDragDockObject has been initialized by an OnGetSiteInfo event.

OnDockOver occurs only if DockSite is true.

C++ Examples:

```
/*
The following example is taken from the docking demo. It
shows how set permissions to dock dockable objects onto a
docking site.
*/

void __fastcall TMainForm::LeftDockPanelDockDrop(TObject *Sender,
      TDragDockObject *Source, int X, int Y)
{
  //OnDockDrop gets called AFTER the client has actually docked,
  //so we check for DockClientCount = 1 before making the dock panel visible.
  TPanel *panel = dynamic_cast<TPanel *>(Sender);
  if (panel->DockClientCount == 1)
    ShowDockPanel(panel, True, NULL);
  panel->DockManager->ResetBounds(True);
  //Make DockManager repaints it's clients.
}

void __fastcall TMainForm::LeftDockPanelDockOver(TObject *Sender,
      TDragDockObject *Source, int X, int Y, TDragState State, bool &Accept)
{
  Accept = (dynamic_cast<TDockableForm*>(Source->Control) != NULL);
  if (Accept)
  {
    // Modify the DockRect to preview dock area.
    Types::TPoint TopLeft = LeftDockPanel->ClientToScreen(Point(0, 0));
    Types::TPoint BottomRight = LeftDockPanel->ClientToScreen(
      Point(this->ClientWidth/3, LeftDockPanel->Height));
    Source->DockRect = Types::TRect(TopLeft, BottomRight);
  }
}

void __fastcall TMainForm::LeftDockPanelUnDock(TObject *Sender,
      TControl *Client, TWinControl *NewTarget, bool &Allow)
{
  //OnUnDock gets called BEFORE the client is undocked, in order to optionally
  //disallow the undock. DockClientCount is never 0 when called from this event.
  TPanel *panel = dynamic_cast<TPanel *>(Sender);
  if (panel->DockClientCount == 1)
    ShowDockPanel(panel, False, NULL);
}

void __fastcall TMainForm::LeftDockPanelGetSiteInfo(TObject *Sender,
      TControl *DockClient, TRect &InfluenceRect, TPoint &MousePos,
      bool &CanDock)
{
  //if CanDock is true, the panel will not automatically draw the preview rect.
  CanDock = DockClient->ClassNameIs("TDockableForm");
  if (!CanDock)
  {
```

```
      ShowMessage("GetSiteInfo CanDock went bad!");
    }
  }
```

Delphi Examples:

```
{
The following example is taken from the docking demo. It
shows how set permissions to dock dockable objects onto a
docking site.
}

procedure TMainForm.LeftDockPanelDockDrop(Sender: TObject;
  Source: TDragDockObject; X, Y: Integer);
begin
  //OnDockDrop gets called AFTER the client has actually docked,
  //so we check for DockClientCount = 1 before making the dock panel visible.
  if (Sender as TPanel).DockClientCount = 1 then
    ShowDockPanel(Sender as TPanel, True, nil);
  (Sender as TPanel).DockManager.ResetBounds(True);
  //Make DockManager repaints it's clients.
end;

procedure TMainForm.LeftDockPanelDockOver(Sender: TObject;
  Source: TDragDockObject; X, Y: Integer; State: TDragState;
  var Accept: Boolean);
var
  ARect: TRect;
begin
  Accept := Source.Control is TDockableForm;
  if Accept then
  begin
    //Modify the DockRect to preview dock area.
    ARect.TopLeft := LeftDockPanel.ClientToScreen(Point(0, 0));
    ARect.BottomRight := LeftDockPanel.ClientToScreen(
      Point(Self.ClientWidth div 3, LeftDockPanel.Height));
    Source.DockRect := ARect;
  end;
end;

procedure TMainForm.LeftDockPanelUnDock(Sender: TObject; Client: TControl;
  NewTarget: TWinControl; var Allow: Boolean);
begin
  //OnUnDock gets called BEFORE the client is undocked, in order to optionally
  //disallow the undock. DockClientCount is never 0 when called from this event.
  if (Sender as TPanel).DockClientCount = 1 then
    ShowDockPanel(Sender as TPanel, False, nil);
end;

procedure TMainForm.LeftDockPanelGetSiteInfo(Sender: TObject;
  DockClient: TControl; var InfluenceRect: TRect; MousePos: TPoint;
  var CanDock: Boolean);
begin
  //if CanDock is true, the panel will not automatically draw the preview rect.
  CanDock := DockClient is TDockableForm;
end;
```

68.1.23.3.10 TGridPanel.OnDragDrop Event

Occurs when the user drops an object being dragged.

Pascal

```
property OnDragDrop: TDragDropEvent;
```

C++

```
__property TDragDropEvent OnDragDrop;
```

Description

Use the OnDragDrop event handler to specify what happens when the user drops an object. The Source parameter of the OnDragDrop event is the object being dropped, and the Sender is the control the object is being dropped on. The X and Y parameters are the coordinates of the mouse positioned over the control.

C++ Examples:

```
/*
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
*/

// This OnDragOver event handler permits the list box to
// accept a dropped label:
void __fastcall TForm1::ListBox1DragOver(TObject *Sender, TObject *Source, int X, int Y,
TDragState State, bool &Accept)
{
   Accept = Source->ClassNameIs("TLabel");
}

/*
This OnDragDrop event handler implements the drop behavior.
*/
void __fastcall TForm1::ListBox1DragDrop(TObject *Sender, TObject *Source, int X, int Y)
{
  if (Sender->ClassNameIs("TListBox") && Source->ClassNameIs("TLabel"))
  {
    TListBox *DestList = (TListBox *)Sender;
    DestList->Font = ((TLabel *)Source)->Font;
    DestList->Color = ((TLabel *)Source)->Color;
    DestList->DoubleBuffered = true;
    DestList->Color = clWindow;
  }
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  ListBox1->Items->Add("Not");
  ListBox1->Items->Add("In");
  ListBox1->Items->Add("Alphabetical");
  ListBox1->Items->Add("Order");

}
```

Delphi Examples:

```
{
This code is an OnDragOver event handler that won't allow a
label control to be dropped on a panel control and stops the
```

```
dragging of the label as soon as the user drags the label
onto the panel:
Note: Set the label's DragMode property to dmAutomatic.
}
procedure TForm1.FormDragDrop(Sender, Source: TObject; X, Y: Integer);
begin
  TForm1(Source).Left := X;
  TForm1(Source).Top := Y;
end;

procedure TForm1.FormDragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := Source is TLabel;
end;

procedure TForm1.Panel1DragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := False;
  if (Source is TLabel) and (State = dsDragEnter) then
    (Source as TLabel).EndDrag(False);
end;
{
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
}

procedure TForm1.FormCreate(Sender: TObject);
begin
  ListBox1.Items.Add('Not');
  ListBox1.Items.Add('In');
  ListBox1.Items.Add('Alphabetical');
  ListBox1.Items.Add('Order');
end;

// This OnDragOver event handler permits the list box to
// accept a dropped label:

procedure TForm1.ListBox1DragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := Source is TLabel;
end;

// This OnDragDrop event handler implements the drop behavior.

procedure TForm1.ListBox1DragDrop(Sender, Source: TObject; X, Y: Integer);
begin
  if (Sender is TListBox) and (Source is TLabel) then
  begin
    with Sender as TListBox do

68.1.23.3.11 TGridPanel.OnDragOver Event

Occurs when the user drags an object over a control.

Pascal

```
property OnDragOver: TDragOverEvent;
```

C++

```
__property TDragOverEvent OnDragOver;
```

Description

Use an OnDragOver event to signal that the control can accept a dragged object so the user can drop or dock it.

Within the OnDragOver event handler, change the Accept parameter to false to reject the dragged object. Leave Accept as true to allow the user to drop or dock the dragged object on the control.

To change the shape of the cursor, indicating that the control can accept the dragged object, change the value of the DragCursor property for the control before the OnDragOver event occurs.

The Source is the object being dragged, the Sender is the potential drop or dock site, and X and Y are screen coordinates in pixels. The State parameter specifies how the dragged object is moving over the control.

Note: Within the OnDragOver event handler, the Accept parameter defaults to true. However, if an OnDragOver event handler is not supplied, the control rejects the dragged object, as if the Accept parameter were changed to false.

C++ Examples:

```
/*
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
*/

// This OnDragOver event handler permits the list box to
// accept a dropped label:
void __fastcall TForm1::ListBox1DragOver(TObject *Sender, TObject *Source, int X, int Y,
TDragState State, bool &Accept)
{
   Accept = Source->ClassNameIs("TLabel");
}
```

```
/*
This OnDragDrop event handler implements the drop behavior.
*/
void __fastcall TForm1::ListBox1DragDrop(TObject *Sender, TObject *Source, int X, int Y)
{
  if (Sender->ClassNameIs("TListBox") && Source->ClassNameIs("TLabel"))
  {
    TListBox *DestList = (TListBox *)Sender;
    DestList->Font = ((TLabel *)Source)->Font;
    DestList->Color = ((TLabel *)Source)->Color;
    DestList->DoubleBuffered = true;
    DestList->Color = clWindow;
  }
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  ListBox1->Items->Add("Not");
  ListBox1->Items->Add("In");
  ListBox1->Items->Add("Alphabetical");
  ListBox1->Items->Add("Order");

}
```

Delphi Examples:

```
{
This code is an OnDragOver event handler that won't allow a
label control to be dropped on a panel control and stops the
dragging of the label as soon as the user drags the label
onto the panel:
Note: Set the label's DragMode property to dmAutomatic.
}
procedure TForm1.FormDragDrop(Sender, Source: TObject; X, Y: Integer);
begin
  TForm1(Source).Left := X;
  TForm1(Source).Top := Y;
end;

procedure TForm1.FormDragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := Source is TLabel;
end;

procedure TForm1.Panel1DragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := False;
  if (Source is TLabel) and (State = dsDragEnter) then
    (Source as TLabel).EndDrag(False);
end;
{
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
}

procedure TForm1.FormCreate(Sender: TObject);
begin
  ListBox1.Items.Add('Not');
  ListBox1.Items.Add('In');
  ListBox1.Items.Add('Alphabetical');
```

```
    ListBox1.Items.Add('Order');
  end;

  // This OnDragOver event handler permits the list box to
  // accept a dropped label:

  procedure TForm1.ListBox1DragOver(Sender, Source: TObject; X, Y: Integer;
    State: TDragState; var Accept: Boolean);
  begin
    Accept := Source is TLabel;
  end;

  // This OnDragDrop event handler implements the drop behavior.

  procedure TForm1.ListBox1DragDrop(Sender, Source: TObject; X, Y: Integer);
  begin
    if (Sender is TListBox) and (Source is TLabel) then
    begin
      with Sender as TListBox do
      begin
        Font := (Source as TLabel).Font;
        Color := (Source as TLabel).Color;
        DoubleBuffered := true;
        Color := clWindow;
      end;
    end;
  end;
```

68.1.23.3.12 TGridPanel.OnEndDock Event

Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.

Pascal

```
property OnEndDock: TEndDragEvent;
```

C++

```
__property TEndDragEvent OnEndDock;
```

Description

Use OnEndDock to specify actions or special processing that when a drag-and-dock operation stops.

See Also

DragKind (see page 5819)

68.1.23.3.13 TGridPanel.OnEndDrag Event

Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.

Pascal

```
property OnEndDrag: TEndDragEvent;
```

C++

```
__property TEndDragEvent OnEndDrag;
```

Description

Use the OnEndDrag event handler to specify any special processing that occurs when dragging stops.

C++ Examples:

```
/*
This code displays a message in a label named Status. The
message displayed depends on whether the dragged label
control was successfully dropped into and accepted by a
another control.
*/
void __fastcall TForm1::Label1EndDrag(TObject *Sender, TObject *Target, int X,
      int Y)
{
  if (Sender->ClassNameIs("TLabel"))
  {
    AnsiString S = ((TLabel *)Sender)->Name + " was dropped and ";
    if (Target)
      S = S + "accepted!";
    else
      S = S + "rejected.";
    Status->Caption = S;
  }
}
```

Delphi Examples:

```
{
This code displays a message in a label named Status. The
message displayed depends on whether the dragged label
control was successfully dropped into and accepted by a
another control.
}
procedure TForm1.Label1EndDrag(Sender, Target: TObject; X, Y: Integer);
var
  S: string;
begin
  S := (Sender as TLabel).Name + ' was dropped... and ';
  if Target <> nil then
    S := S + 'accepted!'
  else
    S := S + 'rejected!';
  Status.Caption := S;
end;
```

68.1.23.3.14 TGridPanel.OnEnter Event

Occurs when a control receives the input focus.

Pascal

```
property OnEnter: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnEnter;
```

Description

Use the OnEnter event handler to cause any special processing to occur when a control becomes active.

The OnEnter event does not occur when switching between forms or between another application and the application that includes the control.

When switching between controls in separate container controls such as the TPanel and the TGroupBox controls, an OnEnter event occurs for the container before the OnEnter event of the contained control.

Similarly, an OnExit event of the container occurs after the OnExit event of the control in a container when focus moves to another control outside the container.

For example, consider a form with an OK button and a group box that contains three radio buttons, where focus is currently on the OK button. When the user clicks one of the radio buttons, an OnExit event of the button occurs, followed by an OnEnter event on the group box, and finally an OnEnter event on the radio button that was clicked. If the user then clicks on the OK button, an OnExit event for the radio button occurs followed by an OnExit event for the group box, and then the button's OnEnter event occurs.

C++ Examples:

```
/*
This example takes an edit control, a button, and a rich
edit control on a form.  When the user presses the button, a
Font dialog appears.  When the user clicks the Apply (not OK)
button in the Font dialog, the currently selected font is
applied to the active control. Clicking the button sets the
ActiveControl to the button.  That is why we need to save
the ActiveControl in a shared OnEnter procedure.  In the rich
edit, only the text selected converts.
*/
TWinControl *myActiveControl;

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  FontDialog1->Options << fdApplyButton;
  FontDialog1->Execute();
}

void __fastcall TForm1::FontDialog1Apply(TObject *Sender, HWND Wnd)
{
  if (myActiveControl->ClassNameIs("TEdit"))
   ((TEdit *)myActiveControl)->Font->Assign(FontDialog1->Font);
  else if (myActiveControl->ClassNameIs("TRichEdit"))
    ((TRichEdit *)myActiveControl)->SelAttributes->Assign(FontDialog1->Font);
  else
    MessageBeep(0);
```

```
}

void __fastcall TForm1::Edit1Enter(TObject *Sender)
{
  myActiveControl = ActiveControl;
}
/*
This example uses an edit box and a memo control on a form.
When either the edit box or the memo is the active control,
it is colored yellow. When the active control becomes
inactive, the color of the control returns to the Windows
system color for a window.  These event handlers could also
be shared.
*/
void __fastcall TForm1::Edit1Enter(TObject *Sender)
{
  Edit1->Color = clYellow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Edit1Exit(TObject *Sender)
{
  Edit1->Color = clWindow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Memo1Enter(TObject *Sender)
{
  Memo1->Color = clYellow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Memo1Exit(TObject *Sender)
{
  Memo1->Color = clWindow;
}
```

Delphi Examples:

```
{
This example takes an edit control, a button, and a rich
edit control on a form.  When the user presses the button, a
Font dialog appears.  When the user clicks the Apply (not OK)
button in the Font dialog, the currently selected font is
applied to the active control. Clicking the button sets the
ActiveControl to the button.  That is why we need to save
the ActiveControl in a shared OnEnter procedure.  In the rich
edit, only the text selected converts.
}
procedure TForm1.Button1Click(Sender: TObject);
begin
   FontDialog1.Options := FontDialog1.Options + [fdApplyButton];
   FontDialog1.Execute;
end;

procedure TForm1.Edit1Enter(Sender: TObject);
begin
  myActiveControl := ActiveControl;
end;

procedure TForm1.FontDialog1Apply(Sender: TObject; Wnd: HWND);
begin
  if myActiveControl is TEdit then
    with myActiveControl as TEdit do
       Font.Assign(TFontDialog(Sender).Font)
  else if myActiveControl is TRichEdit then
    with myActiveControl as TRichEdit do
      SelAttributes.Assign(TFontDialog(Sender).Font)
  else
    Beep;
```

```
end;
{
This example uses an edit box and a memo control on a form.
When either the edit box or the memo is the active control,
it is colored yellow. When the active control becomes
inactive, the color of the control returns to the Windows
system color for a window.  These event handlers could also
be shared.
}
procedure TForm1.Edit1Enter(Sender: TObject);
begin
  Edit1.Color := clYellow;
end;

procedure TForm1.Edit1Exit(Sender: TObject);
begin
  Edit1.Color := clWindow;
end;

procedure TForm1.Memo1Enter(Sender: TObject);
begin
  Memo1.Color := clYellow;
end;

procedure TForm1.Memo1Exit(Sender: TObject);
begin
  Memo1.Color := clWindow;
end;
```

68.1.23.3.15 TGridPanel.OnExit Event

Occurs when the input focus shifts away from one control to another.

Pascal

```
property OnExit: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnExit;
```

Description

Use the OnExit event handler to provide special processing when the control ceases to be active.

The OnExit event does not occur when switching between forms or between another application and your application.

When switching between controls in separate container controls such as the TPanel and the TGroupBox controls, an OnExit event occurs for the control inside the container before the OnExit event of the container.

Similarly, an OnEnter event of the container occurs before the OnEnter event of the control in a container when focus moves to a control inside a container.

For example, consider a form with an OK button and a group box that contains three radio buttons, where focus is currently on the OK button. When the user clicks one of the radio buttons, an OnExit event of the button occurs, followed by an OnEnter event on the group box, and finally an OnEnter event on the radio button that was clicked. If the user then clicks on the OK

button, an OnExit event for the radio button occurs followed by an OnExit event for the group box, and then the button's OnEnter event occurs.

Note: In some control classes the ActiveControl property updates before the OnExit event occurs.

C++ Examples:

```
/*
This example uses an edit box and a memo control on a form.
When either the edit box or the memo is the active control,
it is colored yellow. When the active control becomes
inactive, the color of the control returns to the Windows
system color for a window.  These event handlers could also
be shared.
*/
void __fastcall TForm1::Edit1Enter(TObject *Sender)
{
  Edit1->Color = clYellow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Edit1Exit(TObject *Sender)
{
  Edit1->Color = clWindow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Memo1Enter(TObject *Sender)
{
  Memo1->Color = clYellow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Memo1Exit(TObject *Sender)
{
  Memo1->Color = clWindow;
}
```

Delphi Examples:

```
{
This example uses an edit box and a memo control on a form.
When either the edit box or the memo is the active control,
it is colored yellow. When the active control becomes
inactive, the color of the control returns to the Windows
system color for a window.  These event handlers could also
be shared.
}
procedure TForm1.Edit1Enter(Sender: TObject);
begin
  Edit1.Color := clYellow;
end;

procedure TForm1.Edit1Exit(Sender: TObject);
begin
  Edit1.Color := clWindow;
end;

procedure TForm1.Memo1Enter(Sender: TObject);
begin
  Memo1.Color := clYellow;
end;

procedure TForm1.Memo1Exit(Sender: TObject);
begin
  Memo1.Color := clWindow;
end;
```

68.1.23.3.16 TGridPanel.OnGetSiteInfo Event

Returns the control's docking information.

Pascal

```
property OnGetSiteInfo: TGetSiteInfoEvent;
```

C++

```
__property TGetSiteInfoEvent OnGetSiteInfo;
```

Description

Write code in the OnGetSiteInfo event handler to initialize a TDragDockObject with information about where a dragged object can be docked, if at all. OnGetSiteInfo occurs before the OnDockOver event.

OnGetSiteInfo occurs only if DockSite is true.

C++ Examples:

```
/*
The following example is taken from the docking demo. It
shows how set permissions to dock dockable objects onto a
docking site.
*/

void __fastcall TMainForm::LeftDockPanelDockDrop(TObject *Sender,
      TDragDockObject *Source, int X, int Y)
{
  //OnDockDrop gets called AFTER the client has actually docked,
  //so we check for DockClientCount = 1 before making the dock panel visible.
  TPanel *panel = dynamic_cast<TPanel *>(Sender);
  if (panel->DockClientCount == 1)
    ShowDockPanel(panel, True, NULL);
  panel->DockManager->ResetBounds(True);
  //Make DockManager repaints it's clients.
}

void __fastcall TMainForm::LeftDockPanelDockOver(TObject *Sender,
      TDragDockObject *Source, int X, int Y, TDragState State, bool &Accept)
{
  Accept = (dynamic_cast<TDockableForm*>(Source->Control) != NULL);
  if (Accept)
  {
    // Modify the DockRect to preview dock area.
    Types::TPoint TopLeft = LeftDockPanel->ClientToScreen(Point(0, 0));
    Types::TPoint BottomRight = LeftDockPanel->ClientToScreen(
      Point(this->ClientWidth/3, LeftDockPanel->Height));
    Source->DockRect = Types::TRect(TopLeft, BottomRight);
  }
}

void __fastcall TMainForm::LeftDockPanelUnDock(TObject *Sender,
      TControl *Client, TWinControl *NewTarget, bool &Allow)
{
  //OnUnDock gets called BEFORE the client is undocked, in order to optionally
  //disallow the undock. DockClientCount is never 0 when called from this event.
  TPanel *panel = dynamic_cast<TPanel *>(Sender);
  if (panel->DockClientCount == 1)
```

```
    ShowDockPanel(panel, False, NULL);
}

void __fastcall TMainForm::LeftDockPanelGetSiteInfo(TObject *Sender,
      TControl *DockClient, TRect &InfluenceRect, TPoint &MousePos,
      bool &CanDock)
{
  //if CanDock is true, the panel will not automatically draw the preview rect.
  CanDock = DockClient->ClassNameIs("TDockableForm");
  if (!CanDock)
  {
     ShowMessage("GetSiteInfo CanDock went bad!");
  }
}
```

Delphi Examples:

```
{
The following example is taken from the docking demo. It
shows how set permissions to dock dockable objects onto a
docking site.
}

procedure TMainForm.LeftDockPanelDockDrop(Sender: TObject;
  Source: TDragDockObject; X, Y: Integer);
begin
  //OnDockDrop gets called AFTER the client has actually docked,
  //so we check for DockClientCount = 1 before making the dock panel visible.
  if (Sender as TPanel).DockClientCount = 1 then
    ShowDockPanel(Sender as TPanel, True, nil);
  (Sender as TPanel).DockManager.ResetBounds(True);
  //Make DockManager repaints it's clients.
end;

procedure TMainForm.LeftDockPanelDockOver(Sender: TObject;
  Source: TDragDockObject; X, Y: Integer; State: TDragState;
  var Accept: Boolean);
var
  ARect: TRect;
begin
  Accept := Source.Control is TDockableForm;
  if Accept then
  begin
    //Modify the DockRect to preview dock area.
    ARect.TopLeft := LeftDockPanel.ClientToScreen(Point(0, 0));
    ARect.BottomRight := LeftDockPanel.ClientToScreen(
      Point(Self.ClientWidth div 3, LeftDockPanel.Height));
    Source.DockRect := ARect;
  end;
end;

procedure TMainForm.LeftDockPanelUnDock(Sender: TObject; Client: TControl;
  NewTarget: TWinControl; var Allow: Boolean);
begin
  //OnUnDock gets called BEFORE the client is undocked, in order to optionally
  //disallow the undock. DockClientCount is never 0 when called from this event.
  if (Sender as TPanel).DockClientCount = 1 then
    ShowDockPanel(Sender as TPanel, False, nil);
end;

procedure TMainForm.LeftDockPanelGetSiteInfo(Sender: TObject;
  DockClient: TControl; var InfluenceRect: TRect; MousePos: TPoint;
  var CanDock: Boolean);
begin
  //if CanDock is true, the panel will not automatically draw the preview rect.
  CanDock := DockClient is TDockableForm;
end;
```

68.1.23.3.17 TGridPanel.OnMouseActivate Event

Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.

Pascal

```
property OnMouseActivate: TMouseActivateEvent;
```

C++

```
__property TMouseActivateEvent OnMouseActivate;
```

Description

Use the OnMouseActivate event handler to implement any special processing that should occur as a result of pressing a mouse button on a control when the parent top-level form is not active.

The event type is:

```
TMouseActivateEvent = procedure (Sender: TObject; Button: TMouseButton; ShiftState:
TShiftState;
X, Y: Integer; HitTest: Integer; var MouseActivate: TMouseActivate) of object;
```

When you click on a control and the parent top-level form is not active, this event fires on the control that the mouse cursor is over. MouseActivate is a protected virtual function in TControl. MouseActivate can be overridden in custom control descendants to provide special built-in processing of the OnMouseActivate events. If you leave the default value of MouseActivate as maDefault, the parent control fires the OnMouseActivate event and repeats the process all the way up to the top-level form. If no control in the chain sets the value of MouseActivate, the behavior is the same as if a control set TMouseActivate to maActivate. At any point, a control can set the value of TMouseActivate and the parent processing stops.

Some controls set focus to themselves when they get a button down message so, in some cases, setting maNoActivate appears to have no effect. For instance, a TButton control sets focus to itself in the WM_LBUTTONDOWN message regardless of whether or not TMouseActivate is set to maNoActivate. In this case, setting maNoActivateAndEat will work because the top-level form is not activated and the WM_LBUTTONDOWN message is suppressed.

The HitTest parameter is the hit test value obtained from the WM_NCHITTEST message. See Windows.pas for valid values and their meanings. In most cases this value will be HTCLIENT, which means that the user clicked in the client area of a control. However, in the case of a top-level form, this can take other values such as HTCAPTION, or HTBOTTOM. This allows the code to decide which value to set for MouseActivate, based on the HitTest code. For example, the following code in the OnMouseActivate event handler for a TForm forces the user to click into a non-client area to activate the form:

```
if HitTest = HTCLIENT then
    MouseActivate := maNoActivateAndEat;
```

Even though this event is tied to how Windows processes WM_MOUSEACTIVATE, the actual handling of the message is done at the TControl level, which is the point in the VCL hierarchy where the control has no window handle. The OnMouseActivate event is then simulated since the all TControl descendants also have OnMouseDown, OnMouseMove, and OnMouseUp events. This information is applicable to both VCL Win32 and VCL.NET.

68.1.23.3.18 TGridPanel.OnMouseDown Event

Occurs when the user presses a mouse button with the mouse pointer over a control.

Pascal

```
property OnMouseDown: TMouseEvent;
```

C++

```
__property TMouseEvent OnMouseDown;
```

Description

Use the OnMouseDown event handler to implement any special processing that should occur as a result of pressing a mouse button.

The OnMouseDown event handler can respond to left, right, or center mouse button presses and shift key plus mouse-button combinations. Shift keys are the Shift, Ctrl, and Alt keys. X and Y are the pixel coordinates of the mouse pointer in the client area of the Sender.

C++ Examples:

```
/*
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a
rectangle is drawn on the form. When the mouse button is
released, the rectangle appears on the form's canvas. Its
top-left and bottom-right corners are defined by the
location of the mouse pointer when the user pressed and
released the mouse button.  While the user drags the mouse,
the location of the top, left, bottom, and right sides of
the rectangle are displayed in the status bar.
*/
int StartX, StartY; // Declare at the top of the form's unit
// Use this code as the OnMouseDown event handler of the form:
void __fastcall TForm1::FormMouseDown(TObject *Sender, TMouseButton Button, TShiftState Shift,
int X, int Y)
{
  StartX = X;
  StartY = Y;
}

// Use this code as the OnMouseUp event handler of the form:
void __fastcall TForm1::FormMouseUp(TObject *Sender, TMouseButton Button, TShiftState Shift,
int X, int Y)
{
  Form1->Canvas->Rectangle(StartX, StartY, X, Y);
  StatusBar1->Panels->Items[0]->Text = "";
  StatusBar1->Panels->Items[1]->Text = "";
  StatusBar1->Panels->Items[2]->Text = "";
  StatusBar1->Panels->Items[3]->Text = "";
}

// Use this code as the OnMouseMove event handler of the form:
void __fastcall TForm1::FormMouseMove(TObject *Sender, TShiftState Shift, int X, int Y)
{
  if (Shift.Contains(ssLeft)) // make sure button is down
```

```
  {
    if (Y > StartY)
    {
      StatusBar1->Panels->Items[0]->Text = "Top: " + IntToStr(StartY);
      StatusBar1->Panels->Items[2]->Text = "Bottom: " + IntToStr(Y);
    }
    else
    {
      StatusBar1->Panels->Items[0]->Text = "Top: " + IntToStr(Y);
      StatusBar1->Panels->Items[2]->Text = "Bottom: " + IntToStr(StartY);
    }
    if (X > StartX)
    {
      StatusBar1->Panels->Items[1]->Text = "Left: " + IntToStr(StartX);
      StatusBar1->Panels->Items[3]->Text = "Right: " + IntToStr(X);
    }
    else
    {
      StatusBar1->Panels->Items[1]->Text = "Left: " + IntToStr(X);
      StatusBar1->Panels->Items[3]->Text = "Right: " + IntToStr(StartX);
    }
  }
}
```

Delphi Examples:

```
{
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a
rectangle is drawn on the form. When the mouse button is
released, the rectangle appears on the form’s canvas. Its
top-left and bottom-right corners are defined by the
location of the mouse pointer when the user pressed and
released the mouse button.  While the user drags the mouse,
the location of the top, left, bottom, and right sides of
the rectangle are displayed in the status bar.
}

68.1.23.3.19 TGridPanel.OnMouseEnter Event

Occurs when the user moves the mouse into a control.

Pascal

```
property OnMouseEnter: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnMouseEnter;
```

Description

Use the OnMouseEnter event handler to implement any special processing that should occur as a result of moving the mouse into a control when the parent top-level form is not active.

68.1.23.3.20 TGridPanel.OnMouseLeave Event

Occurs when the user moves the mouse outside of a control.

Pascal

```
property OnMouseLeave: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnMouseLeave;
```

Description

Use the OnMouseLeave event handler to implement any special processing that should occur as a result of moving the mouse outside of a control when the parent top-level form is not active.

68.1.23.3.21 TGridPanel.OnMouseMove Event

Occurs when the user moves the mouse pointer while the mouse pointer is over a control.

Pascal

```
property OnMouseMove: TMouseMoveEvent;
```

C++

```
__property TMouseMoveEvent OnMouseMove;
```

Description

Use the OnMouseMove event handler to respond when the mouse pointer moves after the control has captured the mouse.

Use the Shift parameter of the OnMouseDown event handler, to determine to the state of the shift keys and mouse buttons. Shift keys are the Shift, Ctrl, and Alt keys or shift key-mouse button combinations. X and Y are pixel coordinates of the new location of the mouse pointer in the client area of the Sender.

C++ Examples:

```
/*
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a
rectangle is drawn on the form. When the mouse button is
released, the rectangle appears on the form's canvas. Its
top-left and bottom-right corners are defined by the
location of the mouse pointer when the user pressed and
released the mouse button.  While the user drags the mouse,
the location of the top, left, bottom, and right sides of
the rectangle are displayed in the status bar.
*/
int StartX, StartY; // Declare at the top of the form's unit
// Use this code as the OnMouseDown event handler of the form:
void __fastcall TForm1::FormMouseDown(TObject *Sender, TMouseButton Button, TShiftState Shift,
int X, int Y)
{
  StartX = X;
  StartY = Y;
}

// Use this code as the OnMouseUp event handler of the form:
void __fastcall TForm1::FormMouseUp(TObject *Sender, TMouseButton Button, TShiftState Shift,
int X, int Y)
{
  Form1->Canvas->Rectangle(StartX, StartY, X, Y);
  StatusBar1->Panels->Items[0]->Text = "";
  StatusBar1->Panels->Items[1]->Text = "";
  StatusBar1->Panels->Items[2]->Text = "";
  StatusBar1->Panels->Items[3]->Text = "";
}

// Use this code as the OnMouseMove event handler of the form:
void __fastcall TForm1::FormMouseMove(TObject *Sender, TShiftState Shift, int X, int Y)
{
  if (Shift.Contains(ssLeft)) // make sure button is down
  {
    if (Y > StartY)
    {
      StatusBar1->Panels->Items[0]->Text = "Top: " + IntToStr(StartY);
      StatusBar1->Panels->Items[2]->Text = "Bottom: " + IntToStr(Y);
    }
    else
    {

68.1.23.3.22 TGridPanel.OnMouseUp Event

Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.

Pascal

```
property OnMouseUp: TMouseEvent;
```

C++

```
__property TMouseEvent OnMouseUp;
```

Description

Use an OnMouseUp event handler to implement special processing when the user releases a mouse button.

The OnMouseUp event handler can respond to left, right, or center mouse button presses and shift key plus mouse-button combinations. Shift keys are the Shift, Ctrl, and Alt keys. X and Y are the pixel coordinates of the mouse pointer in the client area of the Sender.

C++ Examples:

```
/*
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a
rectangle is drawn on the form. When the mouse button is
released, the rectangle appears on the form's canvas. Its
top-left and bottom-right corners are defined by the
location of the mouse pointer when the user pressed and
released the mouse button.  While the user drags the mouse,
the location of the top, left, bottom, and right sides of
the rectangle are displayed in the status bar.
*/

Responding to a Mouse-up Action

68.1.23.3.23 TGridPanel.OnResize Event

Occurs immediately after the control is resized.

Pascal

```
property OnResize: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnResize;
```

Description

Use OnResize to make any final adjustments after a control is resized.

To modify the way a control responds when an attempt is made to resize it, use OnCanResize or OnConstrainedResize.

Note: Some controls call this event handler when the control is first created.

Delphi Examples:

```
{
The following code keeps the right edge on Button1 against
the right edge of Form1 when Form1 is resized.
}
procedure TForm1.FormResize(Sender: TObject);
begin
  Button1.Left := Form1.ClientWidth-Button1.Width;
end;
```

See Also

OnCanResize (see page 5851)

SetBounds (see page 5783)

AutoSize (see page 5803)

OnConstrainedResize (see page 5853)

68.1.23.3.24 TGridPanel.OnStartDock Event

Occurs when the user begins to drag a control with a DragKind of dkDock.

Pascal

```
property OnStartDock: TStartDockEvent;
```

C++

```
__property TStartDockEvent OnStartDock;
```

Description

Use the OnStartDock event handler to implement special processing when the user starts a drag-and-dock operation by dragging the control.

The OnStartDock event handler can create a TDragDockObjectEx object for the DragObject parameter to specify the appearance of the dragging rectangle and how the dragged control interacts with potential docking sites. If you return TDragDockObjectEx as the drag object, there is no need to call the Free method for the DragObject when dragging is over. If you use TDragDockObject, your application is responsible for freeing the drag object.

If the OnStartDock event handler sets the DragObject parameter to nil (Delphi) or NULL (C++), a TDragDockObject object is automatically created.

Note: This information applies to Win32 applications only.

68.1.23.3.25 TGridPanel.OnStartDrag Event

Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.

Pascal

```
property OnStartDrag: TStartDragEvent;
```

C++

```
__property TStartDragEvent OnStartDrag;
```

Description

Use the OnStartDrag event handler to implement special processing when the user starts to drag the control or an object it contains. OnStartDrag only occurs if DragKind is dkDrag.

Sender is the control that is about to be dragged, or that contains the object about to be dragged.

The OnStartDrag event handler can create a TDragControlObjectEx instance for the DragObject parameter to specify the drag cursor, or, optionally, a drag image list. If you create a TDragControlObjectEx instance, there is no need to call the Free method for the DragObject when dragging is over. If you create, instead, a TDragControlObject instance, your application is responsible

for freeing the drag object instance.

If the OnStartDrag event handler sets the DragObject parameter to nil (Delphi) or NULL (C++), a TDragControlObject object is automatically created and dragging begins on the control itself.

Note: On some controls, such as TRichEdit, the underlying Windows control handles internal drag operations. For these controls, there are no OnStartDrag or OnEndDrag events for drag operations within the control.

68.1.23.3.26 TGridPanel.OnUnDock Event

Occurs when the application tries to undock a control that is docked to the windowed control.

Pascal

```
property OnUnDock: TUnDockEvent;
```

C++

```
__property TUnDockEvent OnUnDock;
```

Description

Write an OnUnDock event handler to adjust the windowed control when a dock client is undocked. The OnUnDock event handler can make any necessary adjustments, or it can block the undock attempt by setting the Allow parameter to false.

C++ Examples:

```
/*
The following example is taken from the docking demo. It
shows how the OnUnDock event handler of the conjoinment
docking site re-enables docking in the control that is
undocked (if it is a dockable form). In addition, when the
next to last docked control is undocked, the conjoinment
docking site sends itself a close message so that the last
docked control is undocked to its old position and size.
*/
void __fastcall TConjoinDockHost::FormUnDock(TObject *Sender, TControl *Client,
      TWinControl *NewTarget, bool &Allow)
{
  // Only 2 dock clients means the host must be destroyed and
  // the remaining window undocked to its old position and size.
  // Recall that OnUnDock gets called before the undocking
  // actually occurs.
  if (Client->ClassNameIs("TDockableForm"))
    dynamic_cast<TDockableForm *>(Client)->DockSite = True;
  if ((DockClientCount == 2) && (NewTarget != this))        // Self?
    PostMessage(dynamic_cast<TConjoinDockHost *>(this)->Handle, WM_CLOSE, 0, 0);
  UpdateCaption(Client);
}
/*
The following example is taken from the docking demo. It
shows how set permissions to dock dockable objects onto a
docking site.
*/
```

```
void __fastcall TMainForm::LeftDockPanelDockDrop(TObject *Sender,
      TDragDockObject *Source, int X, int Y)
{
  //OnDockDrop gets called AFTER the client has actually docked,
  //so we check for DockClientCount = 1 before making the dock panel visible.
  TPanel *panel = dynamic_cast<TPanel *>(Sender);
  if (panel->DockClientCount == 1)
    ShowDockPanel(panel, True, NULL);
  panel->DockManager->ResetBounds(True);
  //Make DockManager repaints it's clients.
}

void __fastcall TMainForm::LeftDockPanelDockOver(TObject *Sender,
      TDragDockObject *Source, int X, int Y, TDragState State, bool &Accept)
{
  Accept = (dynamic_cast<TDockableForm*>(Source->Control) != NULL);
  if (Accept)
  {
    // Modify the DockRect to preview dock area.
    Types::TPoint TopLeft = LeftDockPanel->ClientToScreen(Point(0, 0));
    Types::TPoint BottomRight = LeftDockPanel->ClientToScreen(
      Point(this->ClientWidth/3, LeftDockPanel->Height));
    Source->DockRect = Types::TRect(TopLeft, BottomRight);
  }
}

void __fastcall TMainForm::LeftDockPanelUnDock(TObject *Sender,
      TControl *Client, TWinControl *NewTarget, bool &Allow)
{
  //OnUnDock gets called BEFORE the client is undocked, in order to optionally
  //disallow the undock. DockClientCount is never 0 when called from this event.
  TPanel *panel = dynamic_cast<TPanel *>(Sender);
  if (panel->DockClientCount == 1)
    ShowDockPanel(panel, False, NULL);
}

void __fastcall TMainForm::LeftDockPanelGetSiteInfo(TObject *Sender,
      TControl *DockClient, TRect &InfluenceRect, TPoint &MousePos,
      bool &CanDock)

68.1.24 THeader Class

THeader is a sectioned visual control that displays text and allows each section to be resized with the mouse.

Class Hierarchy

Pascal

```
THeader = class(TCustomControl);
```

C++

```
class THeader : public TCustomControl;
```

File

ExtCtrls

Description

THeader is provided for backward compatibility. New applications should use THeaderControl instead.

68.1.24.1 THeader Members

The following tables list the members exposed by THeader.

Protected Events

	Name	Description
	OnAlignInsertBefore (see page 6213)	Occurs when an object with custom alignment is aligned.
	OnAlignPosition (see page 6214)	Occurs when an object with custom alignment is aligned.
	OnCanResize (see page 5851)	Occurs when an attempt is made to resize the control.
	OnClick (see page 5851)	Occurs when the user clicks the control.
	OnConstrainedResize (see page 5853)	Adjust resize constraints.
	OnDblClick (see page 5854)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDockDrop (see page 6214)	Occurs when another control is docked to the control.
	OnDockOver (see page 6216)	Occurs when another control is dragged over the control.
	OnDragDrop (see page 5855)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 5857)	Occurs when the user drags an object over a control.
	OnEndDock (see page 5859)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 5860)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnEnter (see page 6219)	Occurs when a control receives the input focus.
	OnExit (see page 6221)	Occurs when the input focus shifts away from one control to another.
	OnGetSiteInfo (see page 6223)	Returns the control's docking information.
	OnKeyDown (see page 6225)	Occurs when a user presses any key while the control has focus.
	OnKeyPress (see page 6227)	Occurs when a key is pressed.
	OnKeyUp (see page 6228)	Occurs when the user releases a key that has been pressed.
	OnMouseActivate (see page 5861)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.

	OnMouseDown (see page 5862)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseEnter (see page 5864)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 5864)	Occurs when the user moves the mouse outside of a control.
	OnMouseMove (see page 5865)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 5867)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnMouseWheel (see page 5869)	Occurs when the mouse wheel is rotated.
	OnMouseWheelDown (see page 5869)	Occurs when the mouse wheel is rotated downward.
	OnMouseWheelUp (see page 5870)	Occurs when the mouse wheel is rotated upward.
	OnResize (see page 5870)	Occurs immediately after the control is resized.
	OnStartDock (see page 5871)	Occurs when the user begins to drag a control with a DragKind (see page 5819) of dkDock.
	OnStartDrag (see page 5871)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.
	OnUnDock (see page 6230)	Occurs when the application tries to undock a control that is docked to the windowed control.

Protected Fields

	Name	Description
	FAnchorMove (see page 5733)	This is FAnchorMove, a member of class TControl.
	FAnchorOrigin (see page 5734)	This is FAnchorOrigin, a member of class TControl.
	FAnchorRules (see page 5734)	This is FAnchorRules, a member of class TControl.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FDesignSize (see page 6124)	This is FDesignSize, a member of class TWinControl.
	FDoubleBuffered (see page 6124)	This is FDoubleBuffered, a member of class TWinControl.
	FExplicitHeight (see page 5734)	This is FExplicitHeight, a member of class TControl.
	FExplicitLeft (see page 5734)	This is FExplicitLeft, a member of class TControl.
	FExplicitTop (see page 5734)	This is FExplicitTop, a member of class TControl.
	FExplicitWidth (see page 5735)	This is FExplicitWidth, a member of class TControl.
	FInImeComposition (see page 6125)	This is FInImeComposition, a member of class TWinControl.
	FOriginalParentSize (see page 5735)	This is FOriginalParentSize, a member of class TControl.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	ActionChange (see page 5737)	Responds when the action associated with the control changes.
	ActionChange (see page 6127)	Updates the control to reflect changes in its associated action.
	AddBiDiModeExStyle (see page 6128)	Sets control's window style according to its bi-directional support.
	AdjustClientRect (see page 6128)	Provides the interface that adjusts the ClientRect (see page 5810) property for idiosyncrasies of the window.
	AdjustSize (see page 5738)	Sets the size of the control as determined by the AutoSize (see page 5803) property.
	AdjustSize (see page 6129)	Adjusts the control's size according to its contents and constraints.
	AlignControls (see page 6129)	Aligns any controls for which the control is the parent within a specified area of the control.
	ArrangeControl (see page 6130)	This is ArrangeControl, a member of class TWinControl.
	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	AssignTo (see page 5739)	Overrides the inherited AssignTo function to enable assignments to TAction objects.
	AssignTo (see page 6130)	Copies the properties of the windowed control to another object.
	BeginAutoDrag (see page 5739)	Begin Automatic Drag.
	CalcCursorPos (see page 5741)	This is CalcCursorPos, a member of class TControl.
	CanAutoSize (see page 5741)	Indicates whether the control can resize itself automatically to accommodate its contents.
	CanAutoSize (see page 6131)	Indicates how the control can be resized.

	CanResize (see page 5742)	OnCanResize (see page 5851) event dispatcher.
	CanResize (see page 6132)	Indicates how the control can respond to a resize attempt.
	Changed (see page 5742)	Sends a CM_CHANGED (see page 6330) message to the control.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	ChangeScale (see page 5743)	Rescaling event dispatcher.
	ChangeScale (see page 6132)	Resize (see page 5780) and reposition children and self.
	Click (see page 5743)	Respond to user click.
	ConstrainedResize (see page 5746)	Notify control of resize with constraints.
	ConstrainedResize (see page 6133)	Generates an OnConstrainedResize (see page 5853) event.
	ControlsAligned (see page 6134)	This is ControlsAligned, a member of class TWinControl.
	CreateDockManager (see page 6134)	Creates the dock manager for the control.
	CreateHandle (see page 6135)	Creates underlying screen object.
	CreateParams (see page 12755)	Initializes a window-creation parameter data structure.
	CreateSubClass (see page 6136)	Creates a windowed control derived from an existing Windows window class.
	CreateWindowHandle (see page 6137)	Creates a Windows control to represent the control.
	CreateWnd (see page 6137)	Creates the underlying window.
	CustomAlignInsertBefore (see page 6137)	Returns placement order of custom-aligned child control.
	CustomAlignPosition (see page 6138)	Returns aligned position of custom-aligned child control.
	DblClick (see page 5747)	OnDblClick (see page 5854) event dispatcher.
	DefaultDockImage (see page 5747)	Handles the painting and erasing of a dock image.
	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	DefineProperties (see page 5748)	Provides methods to read and write the IsControl (see page 5829) property to a stream such as a form file.
	DefineProperties (see page 6139)	Provides methods to read and write the IsControl property to a stream such as a form file.
	DesignWndProc (see page 5749)	This is DesignWndProc, a member of class TControl.
	DestroyHandle (see page 6140)	Destroys the control's window without destroying the control.
	DestroyWindowHandle (see page 6140)	Destroys the window created in the CreateWindowHandle (see page 6137) method.
	DestroyWnd (see page 6141)	Destroys the control's window.
	DoAddDockClient (see page 6142)	Performs actions when a control is docked to the windowed control.
	DockOver (see page 6143)	Responds when a docking client is dragged over the windowed control.
	DockReplaceDockClient (see page 6143)	This is DockReplaceDockClient, a member of class TWinControl.
	DockTrackNoTarget (see page 5749)	Handles dragging of the control over an invalid docking target.
	DoContextPopup (see page 5750)	OnContextPopup (see page 5854) event dispatcher.
	DoDock (see page 5750)	Docking event dispatcher.
	DoDockOver (see page 6143)	Generates an OnDockOver (see page 6216) event.
	DoEndDock (see page 5750)	OnEndDock (see page 5859) event dispatcher.
	DoEndDrag (see page 5751)	OnEndDrag (see page 5860) event dispatcher.
	DoEnter (see page 6144)	Respond to receiving input focus.
	DoExit (see page 6144)	Respond to losing input focus
	DoFlipChildren (see page 6145)	Flips the control's children.
	DoKeyDown (see page 6145)	Performs some preprocessing before generating an OnKeyDown (see page 6225) event.
	DoKeyPress (see page 6146)	Performs some preprocessing before generating an OnKeyPress (see page 6227) event.
	DoKeyUp (see page 6146)	Performs some preprocessing before generating an OnKeyUp (see page 6228) event.
	DoMouseWheel (see page 5751)	Processes mouse wheel motion.
	DoMouseWheelDown (see page 5752)	OnMouseWheelDown (see page 5869) event dispatcher.
	DoMouseWheelUp (see page 5752)	OnMouseWheelUp (see page 5870) event dispatcher.
	DoRemoveDockClient (see page 6147)	Responds when a control is undocked from the windowed control.
	DoStartDock (see page 5753)	OnStartDock (see page 5871) event dispatcher.

	DoStartDrag (see page 5753)	OnStartDrag (see page 5871) event dispatcher.
	DoUnDock (see page 6147)	Undocks a control that is currently docked to the windowed control.
	DragCanceled (see page 5754)	Provides the interface for a method that responds to the cancellation of a drag.
	DragOver (see page 5755)	OnDragOver (see page 5857) event dispatcher.
	DrawDragDockImage (see page 5755)	Draws the dock image for the control.
	EraseDragDockImage (see page 5757)	Erases the dock image for the control.
	FindNextControl (see page 6149)	Returns the control's next child in the tab order after the specified control.
	FixupTabList (see page 6149)	Sorts the child controls by their tab order.
V	GetAction (see page 5758)	This is GetAction, a member of class TControl.
	GetActionLinkClass (see page 5758)	Returns the appropriate action link class that is associated with the control class.
V	GetActionLinkClass (see page 6152)	Returns the associated action link class.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetChildren (see page 6153)	Calls a specified method for each child of the control.
V	GetClientOrigin (see page 5758)	Returns the screen coordinates of the top-left corner of the control's client area.
V	GetClientOrigin (see page 6153)	Returns the value of the ClientOrigin (see page 5809) property.
V	GetClientRect (see page 5759)	Returns a rectangle defining the client area of the control.
V	GetClientRect (see page 6154)	Returns the value of the ClientRect (see page 5810) property.
V	GetControlExtents (see page 6154)	Returns the smallest rectangle in which all the control's children fit.
V	GetDeviceContext (see page 5760)	Returns a device context for the control.
V	GetDeviceContext (see page 6155)	Provides access to a device context for the control.
	GetDockEdge (see page 5763)	Returns the edge on which another control should be docked when it is dragged over the control.
V	GetDragImages (see page 5763)	Returns the control's image list containing the image to be displayed while dragging.
V	GetEnabled (see page 5763)	Returns the value of the Enabled (see page 5821) property.
V	GetFloating (see page 5764)	Returns the value of the Floating (see page 5823) property.
V	GetFloatingDockSiteClass (see page 5764)	Returns the class used for the control when it is floating.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetPalette (see page 5765)	Returns the handle to a palette for use by the control.
	GetParentHandle (see page 6157)	Returns the window handle for the window of the control's parent.
	GetPopupMenu (see page 5765)	Returns the pop-up menu associated with the control.
	GetSiteInfo (see page 6158)	Generates an OnGetSiteInfo (see page 6223) event
	GetTopParentHandle (see page 6159)	Returns the window handle of the first window not associated with a VCL control that contains the windowed control.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	InvalidateDockHostSite (see page 6162)	This is InvalidateDockHostSite, a member of class TWinControl.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsControlActivateMsg (see page 6162)	This is IsControlActivateMsg, a member of class TWinControl.
	IsControlMouseMsg (see page 6162)	Indicates whether a specified mouse message is directed to one of the windowed control's child controls.
	IsQualifyingSite (see page 6163)	This is IsQualifyingSite, a member of class TWinControl.
	KeyDown (see page 6163)	Respond to key press events.
	KeyPress (see page 6163)	Respond to keyboard input.
	KeyUp (see page 6164)	Respond to released key.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Loaded (see page 5771)	Initializes the control after it is loaded from a stream.
	MainWndProc (see page 6165)	Receives Windows messages for the control.
	MouseActivate (see page 5773)	This is MouseActivate, a member of class TControl.

	MouseDown (see page 12756)	OnMouseDown event dispatcher.
	MouseMove (see page 12756)	Respond to mouse moving over control area..
	MouseUp (see page 12757)	OnMouseUp event dispatcher.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	Notification (see page 5775)	Responds to notifications that components are being created or destroyed.
	Notification (see page 6165)	Responds to notifications that components are being created or destroyed.
	NotifyControls (see page 6165)	Sends a message to all the child controls.
	Paint (see page 12757)	Renders the image of a custom control.
	PaintControls (see page 6166)	Paints each of the child controls in a windowed control using the specified device context.
	PaintHandler (see page 6166)	Responds to WM_PAINT messages.
	PaintWindow (see page 5920)	Renders the image of the control on a specified device context.
	PaintWindow (see page 6169)	Renders the image of a windowed control.
	PaletteChanged (see page 5775)	Responds to changes in the system's palette by realizing the control's palette.
	PaletteChanged (see page 6170)	Responds to changes in the system's palette by realizing the control's palette and the palette for each child control.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	PositionDockRect (see page 5777)	Positions the docking rectangle according to the current drag-and-dock state.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	ReadState (see page 5778)	Prepares the control for having its properties assigned values read from a stream.
	ReadState (see page 6171)	Prepares the control for having its properties assigned values from a stream.
	RecreateWnd (see page 6171)	Recreate underlying Windows screen object.
	ReloadDockedControl (see page 6172)	Reloads a docked control.
	RemoveWindowProps (see page 6174)	This is RemoveWindowProps, a member of class TWinControl.
	RequestAlign (see page 5780)	Instructs the parent of a control to reposition the control, enforcing its Align (see page 5798) property.
	ResetIme (see page 6174)	Restores the input method editor (IME) that was active when the application started.
	ResetImeComposition (see page 6175)	Directs the composition window of the input method editor (IME) to perform a specific action.
	Resize (see page 5780)	Respond to control resize.
	ScaleConstraints (see page 5781)	This is ScaleConstraints, a member of class TControl.
	ScaleControls (see page 6176)	Rescale child controls only.
	SelectFirst (see page 6177)	Locates first selectable child control.
	SelectNext (see page 6177)	Moves the input focus from the current child control to the next one in the tab order.
	SendCancelMode (see page 5781)	Cancels the modal state of the control.
	SendDockNotification (see page 5782)	Sends a Windows message to the control's host dock site.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetAutoSize (see page 5783)	This is SetAutoSize, a member of class TControl.
	SetBiDiMode (see page 5783)	Sets the control's bi-directional mode.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetChildOrder (see page 6178)	Changes the order in which the child component appears in the list of child components returned by the GetChildren (see page 6153) method.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDragMode (see page 5785)	Sets the drag mode for the control.
	SetEnabled (see page 5785)	Sets the value of the Enabled (see page 5821) property.
	SetIme (see page 6181)	Activates an input method editor (IME) using the values specified by the ImeMode (see page 6207) and ImeName (see page 6208) properties.
	SetImeCompositionWindow (see page 6181)	Sets the position and font of the composition window.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetName (see page 5785)	Sets the name of the control.
	SetParent (see page 5786)	Sets the parent of the control.

V	SetParent (see page 6182)	Sets the parent of the control.
V	SetParentBackground (see page 6182)	This is SetParentBackground, a member of class TWinControl.
V	SetParentBiDiMode (see page 5786)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 5787)	Sets the parent for the control.
	SetZOrder (see page 5788)	Repositions the control in its parent's control list, thereby changing position onscreen.
V	SetZOrder (see page 6182)	Moves the control to the top or bottom of the parent control's (or screen's) list of TWinControl (see page 6112) controls.
V	ShowControl (see page 6183)	Ensures that a specified child control is visible.
	Sized (see page 12758)	This is Sized, a member of class THeader.
	Sizing (see page 12758)	This is Sizing, a member of class THeader.
	UpdateBounds (see page 6185)	This is UpdateBounds, a member of class TWinControl.
	UpdateBoundsRect (see page 5789)	Changes the Top (see page 5844), Left (see page 5830), Width (see page 5849), and Height (see page 5825) properties of the control, but doesn't update its screen image and bypasses all resize events.
V	UpdateControlOriginalParentSize (see page 6186)	This is UpdateControlOriginalParentSize, a member of class TWinControl.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateExplicitBounds (see page 5789)	This is UpdateExplicitBounds, a member of class TControl.
	UpdateRecreatingFlag (see page 6186)	This is UpdateRecreatingFlag, a member of class TWinControl.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	UpdateUIState (see page 6186)	Updates form User Interface State as needed
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	VisibleChanging (see page 5791)	Provides the interface for a method that responds to changes in the control's visibility.
V	WndProc (see page 5791)	Provides specific message responses for the control.
V	WndProc (see page 6187)	Provides specific message responses for the control.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	ActionLink (see page 5798)	Contains the action link object associated with the control.
	AutoSize (see page 5803)	Specifies whether the control sizes itself automatically to accommodate its contents.
	BevelEdges (see page 6192)	Specifies which edges of the control are beveled.
	BevelInner (see page 6193)	Specifies the cut of the inner bevel.
	BevelKind (see page 6193)	Specifies the control's bevel style.
	BevelOuter (see page 6194)	Specifies the cut of the outer bevel.
	BevelWidth (see page 6194)	Specifies the width of the inner and outer bevels.
	BorderWidth (see page 6195)	Specifies the width of the control's border.
R	Canvas (see page 5921)	Specifies the TCanvas object that presents a drawing surface for the control.
	Caption (see page 5806)	Specifies a text string that identifies the control to the user.
	Color (see page 5812)	Specifies the background color of the control.
	Ctl3D (see page 6198)	Determines whether a control has a three-dimensional (3-D) or two-dimensional look.
	DefWndProc (see page 6199)	Specifies the default window procedure for the windowed control.
	DesktopFont (see page 5818)	Specifies whether the control uses the Windows icon font when writing text.
	DragCursor (see page 5818)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 5819)	Specifies whether the control is being dragged normally or for docking.

	DragMode (see page 5819)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	ImeMode (see page 6207)	Determines the behavior of the input method editor (IME).
	ImeName (see page 6208)	Specifies the input method editor (IME) to use for converting keyboard input to Asian language characters.
	IsControl (see page 5829)	Determines whether a form stores its form-specific properties to a stream.
	MouseCapture (see page 5831)	Indicates whether the control has "captured" mouse events.
	ParentBackground (see page 6209)	Determines whether control uses parent's theme background.
	ParentBiDiMode (see page 5833)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	ParentColor (see page 5834)	Determines where a control looks for its color information.
	ParentCtl3D (see page 6209)	Determines where a component looks to determine if it should appear three dimensional.
	ScalingFlags (see page 5840)	Reflects which attributes of the control have been scaled.
	Text (see page 5842)	Contains a text string associated with the control.
	WheelAccumulator (see page 5849)	Accumulates mouse wheel rotations.
	WindowHandle (see page 6212)	Provides access to a window handle for the control.
	WindowText (see page 5850)	Contains the text string of the control.

Public Events

	Name	Description
	WindowProc (see page 5872)	Points to the window procedure that responds to messages sent to the control.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	BeginDrag (see page 5740)	Starts the dragging of a control.
	BringToFront (see page 5740)	Puts the control in front of all other controls in its parent control.
	Broadcast (see page 6130)	Sends a message to each of the child controls.
	CanFocus (see page 6131)	Indicates whether a control can receive focus.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	ClientToParent (see page 5744)	Translates client coordinates to parent coordinates.
	ClientToScreen (see page 5744)	Translates a given point from client area coordinates to global screen coordinates.
	ContainsControl (see page 6133)	Indicates whether a specified control exists within the control.
	ControlAtPos (see page 6133)	Returns the child control located at a specified position within the control.
V	Create (see page 12754)	Creates a new THeader (see page 12744) object.
	CreateParented (see page 6123)	Creates and initializes a control as the child of a specified non-VCL container.
	CreateParentedControl (see page 6136)	Creates and initializes a control as the child of a specified non-VCL window.
V	DefaultHandler (see page 5748)	Provides message handling for all messages that do not have specific handlers.
V	DefaultHandler (see page 6139)	Provides message handling for all messages that the control does not fully process itself.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 12755)	Frees the memory associated with the THeader (see page 12744) object.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.

	DisableAlign (see page 6141)	Disables the realignment of child controls.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Dock (see page 5749)	Used internally to dock the control.
	DockDrop (see page 6142)	Generates an OnDockDrop (see page 6214) event.
	DragDrop (see page 5754)	OnDragDrop (see page 5855) event dispatcher.
	Dragging (see page 5754)	Indicates whether a control is being dragged.
	DrawTextBiDiModeFlags (see page 5756)	Returns the text flags that reflect the current setting of the BiDiMode (see page 5803) property.
	DrawTextBiDiModeFlagsReadingOnly (see page 5756)	Returns the text flag to add that indicates whether the control's text should read from right to left.
	EnableAlign (see page 6148)	Decrements the reference count incremented by the DisableAlign (see page 6141) method, eventually realigning the child controls.
	EndDrag (see page 5757)	Stops a control from being dragged any further.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindChildControl (see page 6148)	Returns a child control given its name.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FlipChildren (see page 6150)	Reverses the positions of child controls.
	Focused (see page 6150)	Determines whether the control has input focus.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetControlsAlignment (see page 5759)	Indicates how text is aligned within the control.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 5765)	Returns the parent of the control.
	GetTabOrderList (see page 6158)	Builds a list of controls in tab order.
	GetTextBuf (see page 5766)	Retrieves the control's text, copies it into a buffer, and returns the number of characters copied.
	GetTextLen (see page 5767)	Returns the length of the control's text.
	HandleAllocated (see page 6159)	Reports whether a screen object handle exists for the control.
	HandleNeeded (see page 6160)	Creates a screen object for the control if it doesn't already exist.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 5768)	Indicates whether the control has a parent.
	Hide (see page 5769)	Makes the control invisible.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
V	InitiateAction (see page 5769)	Calls the action link's Update (see page 5789) method if the control is associated with an action link.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InsertControl (see page 6160)	Inserts a control into the Controls (see page 6197) array property.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
V	Invalidate (see page 5770)	Completely repaint control.
V	Invalidate (see page 6161)	Schedules a control repaint.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.

	IsRightToLeft (see page 5770)	Indicates whether the control should be reversed right to left.
	ManualDock (see page 5771)	Docks the control.
	ManualFloat (see page 5772)	Undocks the control.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	MouseWheelHandler (see page 5774)	Dispatches messages received from a mouse wheel.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	PaintTo (see page 6167)	This is the overview for the PaintTo method overload.
	ParentToClient (see page 5776)	Translate parent coordinates to client coordinates.
	Perform (see page 5776)	Responds as if the control received a specified Windows message.
	PreProcessMessage (see page 6170)	This is PreProcessMessage, a member of class TWinControl.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	Realign (see page 6171)	Forces the control to realign children.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	Refresh (see page 5779)	Repaints the control on the screen.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveControl (see page 6172)	Removes a specified control from the Controls (see page 6197) array.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	Repaint (see page 5779)	Forces the control to repaint its image on the screen.
V	Repaint (see page 6174)	Repaints the entire control.
	ReplaceDockedControl (see page 5779)	Docks the control in the place where another control is already docked.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	ScaleBy (see page 6175)	Rescale control and its children.
	ScreenToClient (see page 5781)	Converts the screen coordinates of a specified point on the screen to client coordinates.
	ScrollBy (see page 6176)	Scroll control contents.
	SendToBack (see page 5782)	Puts a windowed control behind all other windowed controls, or puts a non-windowed control behind all other non-windowed controls.
V	SetBounds (see page 5783)	Sets the Left (see page 5830), Top (see page 5844), Width (see page 5849), and Height (see page 5825) properties all at once.
V	SetBounds (see page 6178)	Sets the windowed control's boundary properties all at once.
	SetDesignVisible (see page 5784)	Makes a control visible at design time.
V	SetDesignVisible (see page 6178)	Makes a control visible at design time.
V	SetFocus (see page 6179)	Gives the input focus to the control.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	SetTextBuf (see page 5787)	Sets the text of the control.
	Show (see page 5788)	Makes a control visible.
V	Update (see page 5789)	Processes any pending paint messages immediately.
V	Update (see page 6183)	Forces the control to update.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	UpdateControlState (see page 6186)	Respond to state change.
	UseRightToLeftAlignment (see page 5790)	Specifies whether the control's alignment should be reversed right-to-left.
	UseRightToLeftReading (see page 5790)	Specifies whether the control is using a right-to-left reading order.
	UseRightToLeftScrollBar (see page 5791)	Specifies whether the vertical scroll bar appears on the left side of the control.

Public Properties

	Name	Description
	Action (see page 5797)	Designates the action associated with the control.
R	AlignDisabled (see page 6192)	Indicates child control realignment disabled.
	BiDiMode (see page 5803)	Specifies the bi-directional mode for the control.
	BoundsRect (see page 5803)	Specifies the bounding rectangle of the control, expressed in the coordinate system of the parent control.

R	Brush (see page 6195)	Determines the color and pattern used for painting the background of the control.
	ClientHeight (see page 5808)	Specifies the height of the control's client area in pixels.
R	ClientOrigin (see page 5809)	Specifies the screen coordinates (in pixels) of the top left corner of a control's client area.
R	ClientRect (see page 5810)	Specifies the size (in pixels) of a control's client area.
	ClientWidth (see page 5811)	Specifies the horizontal size of the control's client area in pixels.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
R	ControlCount (see page 6195)	Returns the number of child controls.
R	Controls (see page 6197)	Lists all child controls.
	ControlState (see page 5813)	Indicates the current state of a control at runtime.
	ControlStyle (see page 5814)	Determines style characteristics of the control.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	DockClientCount (see page 6199)	Specifies the number of controls that are docked on the windowed control.
R	DockClients (see page 6201)	Lists the controls that are docked to the windowed control.
	DockManager (see page 6202)	Specifies the control's docking manager interface.
	DockOrientation (see page 5818)	Specifies how the control is docked relative to other controls docked in the same parent.
	DockSite (see page 6204)	Specifies whether the control can be the target of drag-and-dock operations.
	DoubleBuffered (see page 6205)	Determines whether the control's image is rendered directly to the window or painted to an in-memory bitmap first.
R	ExplicitHeight (see page 5821)	Specifies the explicit vertical size of the control in pixels.
R	ExplicitLeft (see page 5822)	Specifies the explicit horizontal pixel coordinate of the left edge of a component relative to its parent.
R	ExplicitTop (see page 5822)	Specifies the explicit vertical pixel coordinate of the top edge of a component relative to its parent.
R	ExplicitWidth (see page 5822)	Specifies the explicit horizontal size of the control in pixels.
R	Floating (see page 5823)	Indicates whether the control is floating.
	FloatingDockSiteClass (see page 5823)	Specifies the class of the temporary control that hosts the control when it is floating.
R	Handle (see page 6207)	Provides access to the underlying Windows screen object for the control.
	HostDockSite (see page 5829)	Specifies the control in which the control is docked.
	LRDockWidth (see page 5831)	Specifies the width of the control when it is docked horizontally.
R	MouseInClient (see page 6209)	This is MouseInClient, a member of class TWinControl.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Padding (see page 6209)	Specifies the padding of a control.
	Parent (see page 5832)	Indicates the parent of the control.
	ParentWindow (see page 6210)	Reference to parent's underlying control.
	SectionWidth (see page 12771)	Determines the width, in pixels, of the sections of a header.
R	Showing (see page 6210)	Indicates whether the control is showing on the screen.
	TBDockHeight (see page 5842)	Specifies the height of the control when it is docked vertically.
	UndockHeight (see page 5845)	Specifies the height of the control when it is floating.
	UndockWidth (see page 5846)	Specifies the width of the control when it is floating.
	UseDockManager (see page 6212)	Specifies whether the docking manager is used in drag-and-dock operations.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
R	VisibleDockClientCount (see page 6212)	Specifies the number of visible controls that are docked on the windowed control.

Published Events

	Name	Description
	OnContextPopup (see page 12776)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnSized (see page 12777)	Occurs after the header has been resized.
	OnSizing (see page 12777)	Occurs before the header is resized.

Published Properties

	Name	Description
	Align (see page 12759)	Determines how the control aligns within its container (parent control).
	AlignWithMargins (see page 5802)	Indicates whether a control should be constrained by margins.
	AllowResize (see page 12762)	Determines if the user can modify the size of the header at runtime with the mouse.
	Anchors (see page 12763)	Specifies how the control is anchored to its parent.
	BorderStyle (see page 12763)	Determines whether the header control has a border.
	Constraints (see page 12763)	Specifies the size constraints for the control.
	Cursor (see page 5815)	Specifies the image used to represent the mouse pointer when it passes into the region covered by the control.
	Enabled (see page 12764)	Controls whether the control responds to mouse, keyboard, and timer events.
	Font (see page 12764)	Controls the attributes of text written on or in the control.
	Height (see page 5825)	Specifies the vertical size of the control in pixels.
	HelpContext (see page 5826)	Numeric ID for control's context-sensitive help topic
	HelpKeyword (see page 5826)	Keyword for control's context-sensitive help topic
	HelpType (see page 5827)	Indicates whether the control's context sensitive help topic is identified by context ID or by keyword.
	Hint (see page 5827)	Contains the text string that can appear when the user moves the mouse over the control.
	Left (see page 5830)	Specifies the horizontal coordinate of the left edge of a component relative to its parent.
	Margins (see page 5831)	Specifies the margins for the control.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	ParentFont (see page 12766)	Determines where a control looks for its font information.
	ParentShowHint (see page 12766)	Determines where a control looks to find out if its Help Hint should be shown.
	PopupMenu (see page 12767)	Identifies the pop-up menu associated with the control.
	Sections (see page 12771)	Lists the strings that contain the text for the sections of a header.
	ShowHint (see page 12772)	Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.
	TabOrder (see page 12773)	Indicates the position of the control in its parent's tab order.
	TabStop (see page 12774)	Determines if the user can tab to a control.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Top (see page 5844)	Specifies the Y coordinate of the top left corner of a control, relative to its parent or containing control in pixels.
	Visible (see page 12774)	Determines whether the component appears onscreen.
	Width (see page 5849)	Specifies the horizontal size of the control or form in pixels.

68.1.24.2 THeader.Create Constructor

Creates a new THeader (see page 12744) object.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall THeader(TComponent * AOwner);
```

Description

Call Create to instantiate a header at runtime. Headers added to forms at design time are created automatically.

The AOwner parameter initializes the Owner property of the header.

See Also

Owner (see page 2807)

68.1.24.3 THeader.Destroy Destructor

Frees the memory associated with the THeader (see page 12744) object.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~THeader();
```

Description

Do not call Destroy directly. Instead, use the Free method, which checks whether the THeader (see page 12744) reference is nil before calling Destroy.

See Also

Free (see page 22300)

68.1.24.4 THeader Methods

The methods of the THeader class are listed here.

Protected Methods

	Name	Description
	CreateParams (see page 12755)	Initializes a window-creation parameter data structure.
	MouseDown (see page 12756)	OnMouseDown event dispatcher.
	MouseMove (see page 12756)	Respond to mouse moving over control area..
	MouseUp (see page 12757)	OnMouseUp event dispatcher.
	Paint (see page 12757)	Renders the image of a custom control.
	Sized (see page 12758)	This is Sized, a member of class THeader.
	Sizing (see page 12758)	This is Sizing, a member of class THeader.

68.1.24.4.1 THeader.CreateParams Method

Initializes a window-creation parameter data structure.

Pascal

```
procedure CreateParams(var Params: TCreateParams); override;
```

C++

```
virtual __fastcall CreateParams(TCreateParams Params);
```

Description

The CreateWnd method calls CreateParams to initialize the parameters it passes to CreateWindowHandle. Override CreateParams to customize the way a control creates its Windows representation. When overriding CreateParams, always call

the inherited method first to set the default values, then make any desired adjustments.

CreateParams fills in the parameter that is passed as the value of the Params parameter. This data structure holds information needed when telling Windows to create a window handle. The fields of a TCreateParams record become the parameters to a call to the CreateWindowEx API function.

TWinControl implements CreateParams by setting all the fields of Params to generic base values. A number of the standard controls override CreateParams to change one or more of the default values in Params.

See Also

CreateWindowHandle (see page 6137)

CreateWnd (see page 6137)

AddBiDiModeExStyle (see page 6128)

68.1.24.4.2 THeader.MouseDown Method

OnMouseDown event dispatcher.

Pascal

```
procedure MouseDown(Button: TMouseButton; Shift: TShiftState; X: Integer; Y: Integer);
override;
```

C++

```
virtual __fastcall MouseDown(TMouseButton Button, TShiftState Shift, int X, int Y);
```

Description

Override the protected MouseDown method to provide other responses in addition to calling the OnMouseDown event handler when the user presses the mouse button down while the cursor's hotspot is over the control.

The Button parameter determines which mouse button the user pressed. Shift indicates which shift keys (Shift, Ctrl, or Alt) were down when the user pressed the mouse button. X and Y are the pixel coordinates of the mouse pointer within the client area of the control.

A control calls MouseDown in response to any of the Windows mouse-down messages (WM_LBUTTONDOWN, WM_MBUTTONDOWN, WM_RBUTTONDOWN), decoding the message parameters into the shift-key state and position, which it passes in the Shift, X, and Y parameters, respectively. The value of the Button parameter indicates which mouse button was pressed down: left, right, or middle.

See Also

MouseMove (see page 5773)

MouseUp (see page 5774)

OnMouseDown (see page 5862)

68.1.24.4.3 THeader.MouseMove Method

Respond to mouse moving over control area..

Pascal

```
procedure MouseMove(Shift: TShiftState; X: Integer; Y: Integer); override;
```

C++

```
virtual __fastcall MouseMove(TShiftState Shift, int X, int Y);
```

Description

Override the protected MouseMove method to provide other responses in addition to calling the OnMouseMove event handler when the user moves the mouse.

A control calls MouseMove in response to any of the Windows mouse-move messages (WM_MOUSEMOVE), decoding the message parameters into the shift-key state and position, which it passes in the Shift, X, and Y parameters, respectively.

As the mouse cursor moves across a control, this method is called repeatedly. Each time it is called, it is with the new coordinates that reflect the continuous path of the mouse cursor across the screen real estate covered by the control's visual representation.

See Also

MouseDown (see page 5773)

MouseUp (see page 5774)

OnMouseMove (see page 5865)

68.1.24.4.4 THeader.MouseUp Method

OnMouseUp event dispatcher.

Pascal

```
procedure MouseUp(Button: TMouseButton; Shift: TShiftState; X: Integer; Y: Integer); override;
```

C++

```
virtual __fastcall MouseUp(TMouseButton Button, TShiftState Shift, int X, int Y);
```

Description

Override the protected MouseDown method to provide other responses in addition to calling the OnMouseDown event handler when the user releases a previously pressed mouse button while the cursor's hotspot is over the control.

A control calls MouseUp in response to any of the Windows mouse-up messages (WM_LBUTTONUP, WM_MBUTTONUP, WM_RBUTTONUP), decoding the message parameters into the shift-key state and position, which it passes in the Shift, X, and Y parameters, respectively. The value of the Button parameter indicates which mouse button was released: left, right, or middle

See Also

MouseDown (see page 5773)

MouseMove (see page 5773)

OnMouseUp (see page 5867)

68.1.24.4.5 THeader.Paint Method

Renders the image of a custom control.

Pascal

```
procedure Paint; override;
```

C++

```
virtual __fastcall Paint();
```

Description

The Paint method for TCustomControl does nothing other than provide the interface for a method that responds to WM_PAINT messages. Paint is called by the PaintWindow method, after that method has supplied the Canvas with the handle to a device

context. When creating a custom control, always override Paint to draw the image of the control.

Tip: To determine which portions of the control's canvas need to be repainted when Paint is called, use the ClipRect property of the canvas.

See Also

Canvas (see page 5921)

PaintWindow (see page 5920)

GetDeviceContext (see page 6155)

ClipRect (see page 14486)

68.1.24.4.6 THeader.Sized Method

Pascal

```
procedure Sized(ASection: Integer; AWidth: Integer); dynamic;
```

C++

```
__fastcall Sized(int ASection, int AWidth);
```

Description

This is Sized, a member of class THeader.

68.1.24.4.7 THeader.Sizing Method

Pascal

```
procedure Sizing(ASection: Integer; AWidth: Integer); dynamic;
```

C++

```
__fastcall Sizing(int ASection, int AWidth);
```

Description

This is Sizing, a member of class THeader.

68.1.24.5 THeader Properties

The properties of the THeader class are listed here.

Public Properties

	Name	Description
	SectionWidth (see page 12771)	Determines the width, in pixels, of the sections of a header.

Published Properties

	Name	Description
	Align (see page 12759)	Determines how the control aligns within its container (parent control).
	AllowResize (see page 12762)	Determines if the user can modify the size of the header at runtime with the mouse.
	Anchors (see page 12763)	Specifies how the control is anchored to its parent.
	BorderStyle (see page 12763)	Determines whether the header control has a border.
	Constraints (see page 12763)	Specifies the size constraints for the control.
	Enabled (see page 12764)	Controls whether the control responds to mouse, keyboard, and timer events.
	Font (see page 12764)	Controls the attributes of text written on or in the control.

	ParentFont (see page 12766)	Determines where a control looks for its font information.
	ParentShowHint (see page 12766)	Determines where a control looks to find out if its Help Hint should be shown.
	PopupMenu (see page 12767)	Identifies the pop-up menu associated with the control.
	Sections (see page 12771)	Lists the strings that contain the text for the sections of a header.
	ShowHint (see page 12772)	Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.
	TabOrder (see page 12773)	Indicates the position of the control in its parent's tab order.
	TabStop (see page 12774)	Determines if the user can tab to a control.
	Visible (see page 12774)	Determines whether the component appears onscreen.

68.1.24.5.1 THeader.Align Property

Determines how the control aligns within its container (parent control).

Pascal

```
property Align: TAlign;
```

C++

```
__property TAlign Align;
```

Description

Use Align to align a control to the top, bottom, left, or right of a form or panel and have it remain there even if the size of the form, panel, or component that contains the control changes. When the parent is resized, an aligned control also resizes so that it continues to span the top, bottom, left, or right edge of the parent.

For example, to use a panel component with various controls on it as a tool palette, change the panel's Align value to alLeft. The value of alLeft for the Align property of the panel guarantees that the tool palette remains on the left side of the form and always equals the client height of the form.

The default value of Align is alNone, which means a control remains where it is positioned on a form or panel.

Tip: If Align is set to alClient, the control fills the entire client area so that it is impossible to select the parent form by clicking on it. In this case, select the parent by selecting the control on the form and pressing Esc, or by using the Object Inspector.

Any number of child components within a single parent can have the same Align value, in which case they stack up along the edge of the parent. The child controls stack up in z-order. To adjust the order in which the controls stack up, drag the controls into their desired positions.

Note: To cause a control to maintain a specified relationship with an edge of its parent, but not necessarily lie along one edge of the parent, use the Anchors property instead.

C++ Examples:

```
/*
This example shows how to use a splitter to divide a form
into resizable panes.  All objects on the form are created
dynamically in the OnCreate event handler of the form. To
run this example, add ExtCtrls and FileCtrl to the uses
clause of the form’s implementation section.
Note that when creating a splitter dynamically at runtime,
it is important to set its position to the appropriate side
of the control it will resize.
*/
#include <Extctrls.hpp>
#include <Filectrl.hpp>

void __fastcall TForm1::FormCreate(TObject *Sender)
{
```

```
  TSplitter* ps = new TSplitter(Form1);
  TFileListBox* pflb = new TFileListBox(Form1);
  TDirectoryListBox* pdlb = new TDirectoryListBox(Form1);

  // Line up the directory list box on the left of the form.
  pdlb->Parent = Form1;
  pdlb->Align = alLeft;
  pdlb->Width = Form1->ClientWidth/3;

  // Now use the splitter to divide the directory pane from the file pane.
  ps->Parent = Form1;
  ps->Left = pdlb->Left + pdlb->Width + 1; // Move to right of directory list.
  ps->Align = pdlb->Align; // Give same alignment as directory list.

  // Each pane must be at least one quarter of the form's width.
  ps->MinSize = Form1->ClientWidth/4;

  // Finally, create the last pane - a file list box.
  pflb->Parent = Form1;
  pflb->Align = alClient;
  pdlb->FileList = pflb; // Link the file list box to the directory list box.
}
/*
Dynamically create a TProgressBar control and align it to
the bottom of the form.
*/

#include <ComCtrls.hpp>
#include <Controls.hpp>

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  TProgressBar *ProgressBar = new TProgressBar(this);
  ProgressBar->Parent = this;
  ProgressBar->Align = alBottom;
  TButton *Button1 = new TButton(this);
  Button1->Parent = this;
}
/*
This example dynamically creates a Page Control, then a
series of Tab Sheets on the Page Control.
*/
#include <Comctrls.hpp>
TPageControl* ppc;
const int MAXTABS = 3;
TTabSheet* pts[MAXTABS];
const char * ppcTabTitles[] = { "ShortString", "Orders", "Items", "Parts" };
int iTabTitles = sizeof(ppcTabTitles)/sizeof(ppcTabTitles[0]);
const TColor colorPalette[12] = {
  clRed, clGreen, clYellow, clBlue, clWhite, clFuchsia,
  clTeal, clNavy, clMaroon, clLime, clOlive, clPurple};

void __fastcall TForm1::FormCreate(TObject *Sender)
{
    ppc = new TPageControl(this);
    ppc->Parent = this;
    ppc->Align = alClient;
    for (int i=0;i<iTabTitles;i++)
  {
        pts[i] = new TTabSheet(this);
        pts[i]->PageControl = ppc;
        pts[i]->Name = AnsiString("pts") + ppcTabTitles[i];
        pts[i]->Caption = ppcTabTitles[i];
        pts[i]->Brush->Color = colorPalette[i];
  }
}//---------------------------------------------------------------------------
```

```
void __fastcall TForm1::FormDestroy(TObject *Sender)
{
  for (int i=0;i<iTabTitles;i++)
        delete pts[i];
    delete ppc;
}
```

Delphi Examples:

```
{
This example shows how to use a splitter to divide a form
into resizable panes.  All objects on the form are created
dynamically in the OnCreate event handler of the form. To
run this example, add ExtCtrls and FileCtrl to the uses
clause of the form's implementation section.
Note that when creating a splitter dynamically at runtime,
it is important to set its position to the appropriate side
of the control it will resize.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  Split: TSplitter;
  Files: TFileListBox;
  Dirs: TDirectoryListBox;
begin
  { first add a directory list box to the form }
  Dirs := TDirectoryListBox.Create(Form1);
  { line it up on the left of the form }
  Dirs.Parent := Form1;
  Dirs.Align := alLeft;
  Dirs.Width := Form1.ClientWidth div 3;
{ now add the splitter to divide the directory pane from the file pane }
  Split := TSplitter.Create(Form1);
  Split.Parent := Form1;
  { make sure the splitter is to the right of the directory list box! }
  Split.Left := Dirs.Left + Dirs.Width + 1;
  Split.Align := Dirs.Align; { give it the same alignment as the directory }
  { each pane must be at least one quarter of the form's width }
  Split.MinSize := Form1.ClientWidth div 4;
  { Finally, create the last pane – a file list box }
  Files := TFileListBox.Create(Form1);
  Files.Parent := Form1;
  Files.Align := alClient;
  Dirs.FileList := Files; { link the file list box to the directory list box }
end;
{
Dynamically create a TProgressBar control and align it to
the bottom of the form.
}

var
  I: Integer;

procedure TForm1.Button1Click(Sender: TObject);
var
  ProgressBar: TProgressBar;
begin
  ProgressBar := TProgressBar.Create(Self);
  with ProgressBar do
  begin
    Parent := Self;
    Align := alBottom;
  end;
end;
{
This example dynamically creates a Page Control, then a
series of Tab Sheets on the Page Control.
```

```
}
var
  PageControl1: TPageControl;
  pts: array[0..3] of TTabSheet;
const
  TabTitles: array[0..3] of ShortString = ('Customer', 'Orders', 'Items', 'Parts' );

procedure TForm1.FormCreate(Sender: TObject);
const
  colorpalette: Array[0..11] of TColor = (
    clRed, clGreen, clYellow, clBlue, clWhite, clFuchsia, clTeal,
    clNavy, clMaroon, clLime, clOlive, clPurple);
var
  i: Integer;
begin
  PageControl1 := TPageControl.Create(Self);
  PageControl1.Parent := Self;
  PageControl1.Align := alClient;
  for i := Low(TabTitles) to High(TabTitles) do
  begin
    pts[i]:= TTabSheet.Create(PageControl1);
    with pts[i] do
    begin
      PageControl := PageControl1;
      Name := 'ts' + TabTitles[i];
      Caption := TabTitles[i];
      Brush.Color := colorPalette[i];
   end;
  end;
end;

procedure TForm1.FormDestroy(Sender: TObject);
var
  i: Integer;
begin
  for i := Low(TabTitles) to High(TabTitles) do
  begin
    pts[i].Free;
  end;
  PageControl1.Free;
end;
```

Parent (see page 5832)

Anchors (see page 5802)

68.1.24.5.2 THeader.AllowResize Property

Determines if the user can modify the size of the header at runtime with the mouse.

Pascal

```
property AllowResize: Boolean;
```

C++

```
__property Boolean AllowResize;
```

Description

If AllowResize is false, the sections within a header can't be resized. If AllowResize is true, clicking a border of a header section and dragging it left or right changes the width of the section. The default value is true.

68.1.24.5.3 THeader.Anchors Property

Specifies how the control is anchored to its parent.

Pascal

```
property Anchors: TAnchors;
```

C++

```
__property TAnchors Anchors;
```

Description

Use Anchors to ensure that a control maintains its current position relative to an edge of its parent, even if the parent is resized. When its parent is resized, the control holds its position relative to the edges to which it is anchored.

If a control is anchored to opposite edges of its parent, the control stretches when its parent is resized. For example, if a control has its Anchors property set to [akLeft, akRight], the control stretches when the width of its parent changes.

Anchors is enforced only when the parent is resized. Thus, for example, if a control is anchored to opposite edges of a form at design time and the form is created in a maximized state, the control is not stretched because the form is not resized after the control is created.

Note: If a control should maintain contact with three edges of its parent (hugging one side of the parent and stretching the length of that side), use the Align property instead. Unlike Anchors, Align allows controls to adjust to changes in the size of other aligned sibling controls as well as changes to the parent's size.

See Also

Parent (see page 5832)

Align (see page 5798)

68.1.24.5.4 THeader.BorderStyle Property

Determines whether the header control has a border.

Pascal

```
property BorderStyle: TBorderStyle;
```

C++

```
__property TBorderStyle BorderStyle;
```

Description

These are the possible values:

Value	Meaning
bsNone	No visible border
bsSingle	Single-line border

68.1.24.5.5 THeader.Constraints Property

Specifies the size constraints for the control.

Pascal

```
property Constraints: TSizeConstraints;
```

C++

```
__property TSizeConstraints Constraints;
```

Description

Use Constraints to specify the minimum and maximum width and height of the control. When Constraints contains maximum or minimum values, the control cannot be resized to violate those constraints.

Note: Constraints apply to the height of the form. However, the height of the form depends on how large Windows makes the title bar. For example, Windows XP uses much larger title bars than other windowing systems. To work around this, note the ClientHeight when you design your form and set the constraints in the FormCreate event. In the following example, ClientHeight is represented by x: `Constraints.MinHeight := x + Height - ClientHeight`.

Warning: Do not set up constraints that conflict with the value of the Align or Anchors property. When these properties conflict, the response of the control to resize attempts is not well-defined.

See Also

AutoSize (see page 5803)

Align (see page 5798)

Anchors (see page 5802)

OnConstrainedResize (see page 5853)

OnCanResize (see page 5851)

68.1.24.5.6 THeader.Enabled Property

Controls whether the control responds to mouse, keyboard, and timer events.

Pascal

```
property Enabled: Boolean;
```

C++

```
__property Boolean Enabled;
```

Description

Use Enabled to change the availability of the control to the user. To disable a control, set Enabled to false. Disabled controls appear dimmed. If Enabled is false, the control ignores mouse, keyboard, and timer events.

To re-enable a control, set Enabled to true. The control is no longer dimmed, and the user can use the control.

68.1.24.5.7 THeader.Font Property

Controls the attributes of text written on or in the control.

Pascal

```
property Font: TFont;
```

C++

```
__property TFont Font;
```

Description

To change to a new font, specify a new TFont object. To modify a font, change the value of the Charset, Color, Height, Name, Pitch, Size, or Style of the TFont object.

C++ Examples:

```
/*
To use this example, place a TComboBox and TRichEdit or
TMemo on a form.  During form creation, a list of font names
is loaded into the combo box. When the combo box is clicked,
the memo or Rich Edit control font is set to the
corresponding font name in the combo box.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < Screen->Fonts->Count; i++)
   ComboBox1->Items->Add(Screen->Fonts->Strings[i]);
//  ComboBox1->Items = Screen->Fonts;  // Another way to do it.
}

void __fastcall TForm1::ComboBox1Change(TObject *Sender)
{
  RichEdit1->Font->Name = ComboBox1->Text;
}
```

Delphi Examples:

```
{
To use this example, place a TComboBox and TRichEdit or
TMemo on a form.  During form creation, a list of font names
is loaded into the combo box. When the combo box is clicked,
the memo or Rich Edit control font is set to the
corresponding font name in the combo box.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  i : Integer;
begin
  for i := 0 to Screen.Fonts.Count - 1 do
   ComboBox1.Items.Add(Screen.Fonts.Strings[i]);
//  ComboBox1.Items := Screen.Fonts;  // Another way to do it.
  RichEdit1.Lines.Text := 'How is it to be you?';
end;

procedure TForm1.ComboBox1Click(Sender: TObject);
begin
  RichEdit1.Font.Name := ComboBox1.Text;
end;
```

See Also

DesktopFont (see page 5818)

ParentFont (see page 5834)

Displaying and Editing Text in a Memo Control

68.1.24.5.8 THeader.ParentFont Property

Determines where a control looks for its font information.

Pascal

```
property ParentFont: Boolean;
```

C++

```
__property Boolean ParentFont;
```

Description

To have a control use the same font as its parent control, set ParentFont to true. If ParentFont is false, the control uses its own Font property. Many controls default ParentFont to true so that all the controls in a form or other container present a uniform appearance. When the value of a control's Font property changes, ParentFont becomes false automatically.

When ParentFont is true for a form, the form uses the default font.

See Also

Font (see page 5823)

Parent (see page 5832)

ParentColor (see page 5834)

ParentShowHint (see page 5835)

68.1.24.5.9 THeader.ParentShowHint Property

Determines where a control looks to find out if its Help Hint should be shown.

Pascal

```
property ParentShowHint: Boolean;
```

C++

```
__property Boolean ParentShowHint;
```

Description

Use ParentShowHint to ensure that all the controls on a form either uniformly show their Help Hints or uniformly do not show them.

If ParentShowHint is true, the control uses the ShowHint property value of its parent. If ParentShowHint is false, the control uses the value of its own ShowHint property.

To provide Help Hints for only selected controls on a form, set the ShowHint property for those controls that should have Help Hints to true, and ParentShowHint becomes false automatically.

Note: Enable or disable all Help Hints for the entire application using the ShowHint property of the application object.

68.1.24.5.10 THeader.PopupMenu Property

Identifies the pop-up menu associated with the control.

Pascal

```
property PopupMenu: TPopupMenu;
```

C++

```
__property TPopupMenu PopupMenu;
```

Description

Assign a value to PopupMenu to make a pop-up menu appear when the user selects the control and clicks the right mouse button. If the TPopupMenu's AutoPopup property is true, the pop-up menu appears automatically. If the menu's AutoPopup property is false, display the menu with a call to its Popup method from the control's OnContextPopup event handler.

C++ Examples:

```
/*
This example uses two edit boxes and one pop-up menu on a form.
The pop-up menu contains Cut, Copy, and Paste commands. This code
makes the pop-up menu available to both edit boxes:
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  PopupMenu1->AutoPopup = true;
  Edit1->PopupMenu = PopupMenu1;
  Edit2->PopupMenu = PopupMenu1;
}

/*
These are the cut, copy, and paste OnClick events for the commands
on the pop-up menu. Double click on the pop-up menu and add three
TMenuItems.  Then set the captions to "Cut", "Copy" and "Paste".
The names will be automatically set to "Cut1", "Copy1", and
"Paste1".  Then double click on the OnClick events and they will
be named "Cut1Click", "Copy1Click" and "Paste1Click" respectively.
Note: only the selected portion of the string in the edit box will
be copied, cut or replaced.
*/
void __fastcall TForm1::Copy1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
    if (pComponent->ClassNameIs("TEdit"))
      ((TEdit *)pComponent)->CopyToClipboard();
    else
      MessageBeep(0);
  }
  else
    MessageBeep(0);
}

void __fastcall TForm1::Cut1Click(TObject *Sender)
{

  if (pComponent)
  {
    if (pComponent->ClassNameIs("TEdit"))
      ((TEdit *)pComponent)->CutToClipboard();
    else
      MessageBeep(0);
  }
```

```
    else
      MessageBeep(0);
  }

  void __fastcall TForm1::Paste1Click(TObject *Sender)
  {
    TComponent *pComponent = PopupMenu1->PopupComponent;
    if (pComponent)
    {
      if (pComponent->ClassNameIs("TEdit"))
        ((TEdit *)pComponent)->PasteFromClipboard();
      else
        MessageBeep(0);
    }
    else
      MessageBeep(0);
  }
  /*
  This example demonstrates how to add and delete menu items
  to a popup menu at runtime and assign an event handler to
  the OnClick event.  Place a TPopupMenu and three buttons on
  the form named "AddButton", "EditButton",  and
  "DestroyButton" and add OnClick events to all three buttons.
  Put the TPopupMenu in the PopupMenu property of the form.
  Place the PopupMenuItemsClick procedure in the TForm1 type
  declaration so that it can be used as the method call for
  the menu item OnClick event.
  */
  void __fastcall TForm1::AddButtonClick(TObject *Sender)
  {
      const int num_items = 4;
      for (int index = 0; index < num_items; ++index)
      {
          TMenuItem *NewItem = new TMenuItem(PopupMenu1); // create the new item
          PopupMenu1->Items->Add(NewItem);// add it to the Popupmenu
          NewItem->Caption = "Menu Item " + IntToStr(index);
          NewItem->Tag = index;
          NewItem->OnClick = PopupMenuItemsClick;// assign it an event handler
          TNotifyEvent();
      }
  }

  void __fastcall TForm1::PopupMenuItemsClick(TObject *Sender)
  {
      TMenuItem *ClickedItem = dynamic_cast<TMenuItem *>(Sender);
      if (ClickedItem)
      {
          switch (ClickedItem->Tag)
          {
              case 0:
              {
                  ShowMessage("first item clicked");
                  break;
              }
              case 1:
              {
                  ShowMessage("second item clicked");
                  break;
              }
              case 2:
              {
                  ShowMessage("third item clicked");
                  break;
              }
              case 3:
              {
```

```
                ShowMessage("fourth item clicked");
                break;
            }
        }
    }
}

/*
To edit or destroy an item, grab its pointer via the Items
property.
*/
void __fastcall TForm1::EditButtonClick(TObject *Sender)
{
    const int index = 1;
    TMenuItem *ItemToEdit = PopupMenu->Items->Items[index];
    ItemToEdit->Caption = "Changed Caption";
}

void __fastcall TForm1::DestroyButtonClick(TObject *Sender)
{
    const int index = 2;
    TMenuItem *ItemToDelete = PopupMenu->Items->Items[index];
    delete ItemToDelete;
}
```

Delphi Examples:

```
{
This example uses two edit boxes and one pop-up menu on a form.
The pop-up menu contains Cut, Copy, and Paste commands. This code
makes the pop-up menu available to both edit boxes:
}
procedure TForm1.FormCreate(Sender: TObject);
begin
  PopupMenu1.AutoPopup := True;
  Edit1.PopupMenu := PopupMenu1;
  Edit2.PopupMenu := PopupMenu1;
end;

{
These are the cut, copy, and paste OnClick events for the commands
on the pop-up menu. Double click on the pop-up menu and add three
TMenuItems.  Then set the captions to "Cut", "Copy" and "Paste".
The names will be automatically set to "Cut1", "Copy1", and
"Paste1".  Then double click on the OnClick events and they will
be named "Cut1Click", "Copy1Click" and "Paste1Click" respectively.
Note: only the selected portion of the string in the edit box will
be copied, cut or replaced.
}
procedure TForm1.Copy1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
   Edit1.CopyToClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.CopyToClipboard
  else
    Beep;
end;

procedure TForm1.Cut1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
    Edit1.CutToClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.CutToClipboard
  else
    Beep;
```

```
end;

procedure TForm1.Paste1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
    Edit1.PasteFromClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.PasteFromClipboard
  else
    Beep;
end;
{
This example demonstrates how to add and delete menu items
to a popup menu at runtime and assign an event handler to
the OnClick event.  Place a TPopupMenu and three buttons on
the form named "AddButton", "EditButton",  and
"DestroyButton" and add OnClick events to all three buttons.
Put the TPopupMenu in the PopupMenu property of the form.
Place the PopupMenuItemsClick procedure in the TForm1 type
declaration so that it can be used as the method call for
the menu item OnClick event.
}

AutoPopup (see page 16178)

Popup (see page 16174)

OnContextPopup (see page 5854)

68.1.24.5.11 THeader.Sections Property

Lists the strings that contain the text for the sections of a header.

Pascal

```
property Sections: TStrings;
```

C++

```
__property TStrings Sections;
```

Description

The number of lines of the string list determines the number of sections of the header. If the string list is empty, the header has one blank section. If this string list contains one or more lines, the text of each line is in its own section. The first line is in the leftmost section, the second line is in the next section to the right, and so on.

68.1.24.5.12 THeader.SectionWidth Property

Determines the width, in pixels, of the sections of a header.

Pascal

```
property SectionWidth [X: Integer]: Integer;
```

C++

```
__property int SectionWidth[int X];
```

Description

Use SectionWidth to specify the width of each header section. X is an index into the sections, from 0 to the number of sections - 1. For example, the index of the first section is 0, the second section is 1, and so on.

68.1.24.5.13 THeader.ShowHint Property

Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.

Pascal

```
property ShowHint: Boolean;
```

C++

```
__property Boolean ShowHint;
```

Description

The Help Hint is the value of the Hint property, which is displayed in a box just beneath the control. Use ShowHint to determine whether a Help Hint appears for the control.

To enable Help Hint for a particular control, the application ShowHint property must be true and either

the control's own ShowHint property must be true, or

the control's ParentShowHint property must be true and its parent's ShowHint property must be true.

For example, imagine a check box within a group box. If the ShowHint property of the group box is true and the ParentShowHint property of the check box is true, but the ShowHint property of the check box is false, the check box still displays its Help Hint.

Changing the ShowHint value automatically sets the ParentShowHint property to false.

C++ Examples:

```
/*
This example uses an edit box and a list box on a form.
Items are added to the list box and a Help Hint is assigned
to both controls. The last statement enables the Help Hints
for the entire application.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  Edit1->Hint = "Enter your name";
  Edit1->ShowHint = true;

  char string[10];
  char index[3];
  for(int i = 1; i <= 10; i++)
  {
    strcpy(string, "Item");
    itoa(i, index, 10);
    strcat(string, index);
    ListBox1->Items->Add(string);
  }
  ListBox1->Hint = "Select an item";
  ListBox1->ShowHint = true;
  Application->ShowHint = true;
}
/*
Note: To see an example that displays the hints of controls
in some place other than in a Help Hint box, see the OnHint
```

```
example.
*/
```

Delphi Examples:

```
{
This example uses an edit box and a list box on a form.
Items are added to the list box and a Help Hint is assigned
to both controls. The last statement enables the Help Hints
for the entire application.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  I: Integer;
begin
  Edit1.Hint := 'Enter your name';
  Edit1.ShowHint := True;
  with ListBox1 do
  begin
    for I := 1 to 10 do
      Items.Add('Item ' + IntToStr(I));
    Hint := 'Select an item';
    ShowHint := True;
  end;
  Application.ShowHint := True;
end;
{
Note: To see an example that displays the hints of controls
in some place other than in a Help Hint box, see the OnHint
example.
}

Displaying Fly-over Help

68.1.24.5.14 THeader.TabOrder Property

Indicates the position of the control in its parent's tab order.

Pascal

```
property TabOrder: TTabOrder;
```

C++

```
__property TTabOrder TabOrder;
```

Description

TabOrder is the order in which child windows are visited when the user presses the Tab key. The control with the TabOrder value of 0 is the control that has the focus when the form first appears.

Initially, the tab order is always the order in which the controls were added to the form. The first control added to the form has a TabOrder value of 0, the second is 1, the third is 2, and so on. Change this by changing the TabOrder property.

Each control has a unique tab-order value within its parent. If you change the TabOrder property value of one control to be the same as the value of a second control, the TabOrder value for all the other controls changes. For example, suppose a control is sixth in the tab order. If you change the control's TabOrder property value to 3 (making the control fourth in the tab order), the control that was originally fourth in the tab order now becomes fifth, and the control that was fifth becomes sixth.

Assigning TabOrder a value greater than the number of controls contained in the parent control moves the control to the end of the tab order. The control does not take on the assigned value of TabOrder, but instead is given the number that assures the control is the last in the tab order.

Note: TabOrder is meaningful only if the TabStop property is true and if the control has a parent. (The TabOrder property of a form is not used unless the form is the child of another form.) A control with a TabOrder of -1 has no parent, and therefore cannot be reached by pressing the Tab key. To remove a parented control from the Tab order, set its TabStop property to false.

See Also

FindNextControl (see page 6149)

TabStop (see page 6211)

68.1.24.5.15 THeader.TabStop Property

Determines if the user can tab to a control.

Pascal

```
property TabStop: Boolean;
```

C++

```
__property Boolean TabStop;
```

Description

Use the TabStop to allow or disallow access to the control using the Tab key.

If TabStop is true, the control is in the tab order. If TabStop is false, the control is not in the tab order and the user can't press the Tab key to move to the control.

Note: TabStop is not meaningful for a form unless the form assigns another form to be its parent.

See Also

TabOrder (see page 6211)

68.1.24.5.16 THeader.Visible Property

Determines whether the component appears onscreen.

Pascal

```
property Visible: Boolean;
```

C++

```
__property Boolean Visible;
```

Description

Use the Visible property to control the visibility of the control at runtime. If Visible is true, the control appears. If Visible is false, the control is not visible.

Calling the Show method sets the control's Visible property to true. Calling the Hide method sets it to false.

C++ Examples:

```
/*
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
```

```
*/
void __fastcall TForm1::PageControl1Change(TObject *Sender)
{
  CheckBox1->Checked = PageControl1->ActivePage->Visible;
}

void __fastcall TForm1::CheckBox1Click(TObject *Sender)
{
  PageControl1->ActivePage->Visible = CheckBox1->Checked;
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < 10; i++)
  {
    TTabSheet *pPage = new TTabSheet(this);
    pPage->PageControl = PageControl1;
    pPage->Caption = AnsiString("Page") + IntToStr(i);
    TEdit *pEdit = new TEdit(this);
    pEdit->Parent = pPage;
    pEdit->Left = random(pPage->ClientWidth - pEdit->Width);
    pEdit->Top = random(pPage->ClientHeight - pEdit->Height);
  }
  PageControl1Change(Sender);
}
```

Delphi Examples:

```
{
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
}
procedure TForm1.CheckBox1Click(Sender: TObject);
begin
  PageControl1.ActivePage.Visible := CheckBox1.Checked;
end;

procedure TForm1.PageControl1Change(Sender: TObject);
begin
  CheckBox1.Checked := PageControl1.ActivePage.Visible;
end;

procedure TForm1.FormCreate(Sender: TObject);
var
  i: Integer;
begin
  for i := 0 to 9 do
    with TTabSheet.Create(Self) do
    begin
      PageControl := PageControl1;
      Caption := 'TabSheet' + IntToStr(i);
      with TEdit.Create(Self) do
      begin
        Parent := PageControl1.Pages[i];
        Left := Random(PageControl1.ActivePage.ClientWidth - Width);
        Top := Random(PageControl1.ActivePage.ClientHeight - Height);
      end;
    end;
    PageControl1Change(Sender);
end;
```

68.1.24.6 THeader Events

The events of the THeader class are listed here.

Published Events

	Name	Description
	OnContextPopup (see page 12776)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnSized (see page 12777)	Occurs after the header has been resized.
	OnSizing (see page 12777)	Occurs before the header is resized.

68.1.24.6.1 THeader.OnContextPopup Event

Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).

Pascal

```
property OnContextPopup: TContextPopupEvent;
```

C++

```
__property TContextPopupEvent OnContextPopup;
```

Description

The OnContextPopup handler is called when the user uses the mouse or keyboard to request a popup menu. The OnContextPopup event is generated by a WM_CONTEXTMENU message, which is itself generated by the user clicking the right mouse button or by pressing SHIFT+F10 or the Applications key.

This event is especially useful when the control does not have an associated popup menu (the PopupMenu property is not set) or if the AutoPopup property of the control's associated popup menu is false. However, the OnContextPopup can also be used to override the automatic context menu that appears when the control has an associated popup menu with an AutoPopup property of true. In this last case, if the event handler displays its own menu, it should set the Handled parameter to true to suppress the default context menu.

The handler's MousePos parameter indicates the position of the mouse, in client coordinates.. If the event was not generated by a mouse click, MousePos is (-1,-1).

Note: Parent controls receive an OnContextPopup event before their child controls. In addition, for many child controls, the default window procedure causes the parent control to receive an OnContextPopup event after the child control. As a result, when parent controls do not set Handled to true in an OnContextPopup event handler, the event handler may be called multiple times for each context menu invocation.

TPopupMenu (see page 16169)

PopupMenu (see page 5835)

AutoPopup (see page 16178)

68.1.24.6.2 THeader.OnSized Event

Occurs after the header has been resized.

Pascal

```
property OnSized: TSectionEvent;
```

C++

```
__property TSectionEvent OnSized;
```

Description

Write an OnSized event handler to perform special processing after the header has been resized. In this event, the AWidth parameter is the width of the section before it was resized. Use the SectionWidth (see page 12771) property to determine the new size of the section.

See Also

OnSizing (see page 12777)

SectionWidth (see page 12771)

68.1.24.6.3 THeader.OnSizing Event

Occurs before the header is resized.

Pascal

```
property OnSizing: TSectionEvent;
```

C++

```
__property TSectionEvent OnSizing;
```

Description

Write an OnSizing event handler to perform special processing immediately before the header is resized. In this event, AWidth is the width that the section will have after it is resized. Use the SectionWidth (see page 12771) property to determine the current size of the section.

See Also

OnSized (see page 12777)

SectionWidth (see page 12771)

68.1.25 TImage Class

TImage displays a graphical image.

Class Hierarchy

Pascal

```
TImage = class(TGraphicControl);
```

C++

```
class TImage : public TGraphicControl;
```

File

ExtCtrls

Description

Use TImage to display a graphical image on a form. Use the TPicture object in the Picture (see page 12802) property to specify the actual bitmap, con, metafile, or other graphic object displayed by TImage. Properties and methods of TPicture can be used for such things as loading an image from file, clearing the image in the TImage, and assigning an image for another control. TImage introduces several properties to determine how the image is displayed within the boundaries of the TImage object.

To add an image to a form or data module so that it is available for display by other controls, such as action lists and bitmap buttons, use a TImageList control instead.

Images

68.1.25.1 TImage Members

The following tables list the members exposed by TImage.

Protected Events

	Name	Description
	OnCanResize (see page 5851)	Occurs when an attempt is made to resize the control.
	OnConstrainedResize (see page 5853)	Adjust resize constraints.
	OnMouseWheel (see page 5869)	Occurs when the mouse wheel is rotated.
	OnMouseWheelDown (see page 5869)	Occurs when the mouse wheel is rotated downward.
	OnMouseWheelUp (see page 5870)	Occurs when the mouse wheel is rotated upward.
	OnResize (see page 5870)	Occurs immediately after the control is resized.

Protected Fields

	Name	Description
	FAnchorMove (see page 5733)	This is FAnchorMove, a member of class TControl.
	FAnchorOrigin (see page 5734)	This is FAnchorOrigin, a member of class TControl.
	FAnchorRules (see page 5734)	This is FAnchorRules, a member of class TControl.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FExplicitHeight (see page 5734)	This is FExplicitHeight, a member of class TControl.
	FExplicitLeft (see page 5734)	This is FExplicitLeft, a member of class TControl.
	FExplicitTop (see page 5734)	This is FExplicitTop, a member of class TControl.

	FExplicitWidth (see page 5735)	This is FExplicitWidth, a member of class TControl.
	FOriginalParentSize (see page 5735)	This is FOriginalParentSize, a member of class TControl.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	ActionChange (see page 5737)	Responds when the action associated with the control changes.
	AdjustSize (see page 5738)	Sets the size of the control as determined by the AutoSize (see page 5803) property.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	AssignTo (see page 5739)	Overrides the inherited AssignTo function to enable assignments to TAction objects.
	BeginAutoDrag (see page 5739)	Begin Automatic Drag.
	CalcCursorPos (see page 5741)	This is CalcCursorPos, a member of class TControl.
V	CanAutoSize (see page 12786)	Indicates whether the control can resize itself automatically to accommodate its contents.
V	CanResize (see page 5742)	OnCanResize (see page 5851) event dispatcher.
	Changed (see page 5742)	Sends a CM_CHANGED (see page 6330) message to the control.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	ChangeScale (see page 5743)	Rescaling event dispatcher.
	Click (see page 5743)	Respond to user click.
V	ConstrainedResize (see page 5746)	Notify control of resize with constraints.
	DblClick (see page 5747)	OnDblClick (see page 5854) event dispatcher.
	DefaultDockImage (see page 5747)	Handles the painting and erasing of a dock image.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DefineProperties (see page 5748)	Provides methods to read and write the IsControl (see page 5829) property to a stream such as a form file.
	DesignWndProc (see page 5749)	This is DesignWndProc, a member of class TControl.
	DestRect (see page 12787)	This is DestRect, a member of class TImage.
	DockTrackNoTarget (see page 5749)	Handles dragging of the control over an invalid docking target.
	DoContextPopup (see page 5750)	OnContextPopup (see page 5854) event dispatcher.
	DoDock (see page 5750)	Docking event dispatcher.
	DoEndDock (see page 5750)	OnEndDock (see page 5859) event dispatcher.
	DoEndDrag (see page 5751)	OnEndDrag (see page 5860) event dispatcher.
	DoMouseWheel (see page 5751)	Processes mouse wheel motion.
	DoMouseWheelDown (see page 5752)	OnMouseWheelDown (see page 5869) event dispatcher.
	DoMouseWheelUp (see page 5752)	OnMouseWheelUp (see page 5870) event dispatcher.
	DoPaletteChange (see page 12787)	This is DoPaletteChange, a member of class TImage.
	DoStartDock (see page 5753)	OnStartDock (see page 5871) event dispatcher.
	DoStartDrag (see page 5753)	OnStartDrag (see page 5871) event dispatcher.
	DragCanceled (see page 5754)	Provides the interface for a method that responds to the cancellation of a drag.
	DragOver (see page 5755)	OnDragOver (see page 5857) event dispatcher.
	DrawDragDockImage (see page 5755)	Draws the dock image for the control.
	EraseDragDockImage (see page 5757)	Erases the dock image for the control.
V	GetAction (see page 5758)	This is GetAction, a member of class TControl.
	GetActionLinkClass (see page 5758)	Returns the appropriate action link class that is associated with the control class.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetClientOrigin (see page 5758)	Returns the screen coordinates of the top-left corner of the control's client area.
V	GetClientRect (see page 5759)	Returns a rectangle defining the client area of the control.

	GetDeviceContext (see page 5760)	Returns a device context for the control.
	GetDockEdge (see page 5763)	Returns the edge on which another control should be docked when it is dragged over the control.
	GetDragImages (see page 5763)	Returns the control's image list containing the image to be displayed while dragging.
	GetEnabled (see page 5763)	Returns the value of the Enabled (see page 5821) property.
	GetFloating (see page 5764)	Returns the value of the Floating (see page 5823) property.
	GetFloatingDockSiteClass (see page 5764)	Returns the class used for the control when it is floating.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetPalette (see page 12787)	Returns the handle to a palette for use by the control.
	GetPopupMenu (see page 5765)	Returns the pop-up menu associated with the control.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Loaded (see page 5771)	Initializes the control after it is loaded from a stream.
	MouseActivate (see page 5773)	This is MouseActivate, a member of class TControl.
	MouseDown (see page 5773)	OnMouseDown (see page 5862) event dispatcher.
	MouseMove (see page 5773)	Respond to mouse moving over control area..
	MouseUp (see page 5774)	OnMouseUp (see page 5867) event dispatcher.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	Notification (see page 5775)	Responds to notifications that components are being created or destroyed.
	Paint (see page 12788)	Render control surface.
	PaletteChanged (see page 5775)	Responds to changes in the system's palette by realizing the control's palette.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	PositionDockRect (see page 5777)	Positions the docking rectangle according to the current drag-and-dock state.
	Progress (see page 12788)	This is Progress, a member of class TImage.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	ReadState (see page 5778)	Prepares the control for having its properties assigned values read from a stream.
	RequestAlign (see page 5780)	Instructs the parent of a control to reposition the control, enforcing its Align (see page 5798) property.
	Resize (see page 5780)	Respond to control resize.
	ScaleConstraints (see page 5781)	This is ScaleConstraints, a member of class TControl.
	SendCancelMode (see page 5781)	Cancels the modal state of the control.
	SendDockNotification (see page 5782)	Sends a Windows message to the control's host dock site.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetAutoSize (see page 5783)	This is SetAutoSize, a member of class TControl.
	SetBiDiMode (see page 5783)	Sets the control's bi-directional mode.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDragMode (see page 5785)	Sets the drag mode for the control.
	SetEnabled (see page 5785)	Sets the value of the Enabled (see page 5821) property.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetName (see page 5785)	Sets the name of the control.
	SetParent (see page 5786)	Sets the parent of the control.
	SetParentBiDiMode (see page 5786)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.

	SetParentComponent (see page 5787)	Sets the parent for the control.
	SetZOrder (see page 5788)	Repositions the control in its parent's control list, thereby changing position onscreen.
	UpdateBoundsRect (see page 5789)	Changes the Top (see page 5844), Left (see page 5830), Width (see page 5849), and Height (see page 5825) properties of the control, but doesn't update its screen image and bypasses all resize events.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateExplicitBounds (see page 5789)	This is UpdateExplicitBounds, a member of class TControl.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	VisibleChanging (see page 5791)	Provides the interface for a method that responds to changes in the control's visibility.
	WndProc (see page 5791)	Provides specific message responses for the control.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	ActionLink (see page 5798)	Contains the action link object associated with the control.
	Caption (see page 5806)	Specifies a text string that identifies the control to the user.
	Color (see page 5812)	Specifies the background color of the control.
	DesktopFont (see page 5818)	Specifies whether the control uses the Windows icon font when writing text.
	Font (see page 5823)	Controls (see page 5711) the attributes of text written on or in the control.
	IsControl (see page 5829)	Determines whether a form stores its form-specific properties to a stream.
	MouseCapture (see page 5831)	Indicates whether the control has "captured" mouse events.
	ParentBiDiMode (see page 5833)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	ParentColor (see page 5834)	Determines where a control looks for its color information.
	ParentFont (see page 5834)	Determines where a control looks for its font information.
	ScalingFlags (see page 5840)	Reflects which attributes of the control have been scaled.
	Text (see page 5842)	Contains a text string associated with the control.
	WheelAccumulator (see page 5849)	Accumulates mouse wheel rotations.
	WindowText (see page 5850)	Contains the text string of the control.

Public Events

	Name	Description
	WindowProc (see page 5872)	Points to the window procedure that responds to messages sent to the control.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	BeginDrag (see page 5740)	Starts the dragging of a control.
	BringToFront (see page 5740)	Puts the control in front of all other controls in its parent control.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.

	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	ClientToParent (see page 5744)	Translates client coordinates to parent coordinates.
	ClientToScreen (see page 5744)	Translates a given point from client area coordinates to global screen coordinates.
V	Create (see page 12785)	Creates and initializes an instance of TImage (see page 12777).
V	DefaultHandler (see page 5748)	Provides message handling for all messages that do not have specific handlers.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 12786)	Destroys an instance of TImage (see page 12777).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Dock (see page 5749)	Used internally to dock the control.
	DragDrop (see page 5754)	OnDragDrop (see page 5855) event dispatcher.
	Dragging (see page 5754)	Indicates whether a control is being dragged.
	DrawTextBiDiModeFlags (see page 5756)	Returns the text flags that reflect the current setting of the BiDiMode (see page 5803) property.
	DrawTextBiDiModeFlagsReadingOnly (see page 5756)	Returns the text flag to add that indicates whether the control's text should read from right to left.
	EndDrag (see page 5757)	Stops a control from being dragged any further.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetControlsAlignment (see page 5759)	Indicates how text is aligned within the control.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 5765)	Returns the parent of the control.
	GetTextBuf (see page 5766)	Retrieves the control's text, copies it into a buffer, and returns the number of characters copied.
	GetTextLen (see page 5767)	Returns the length of the control's text.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 5768)	Indicates whether the control has a parent.
	Hide (see page 5769)	Makes the control invisible.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
V	InitiateAction (see page 5769)	Calls the action link's Update (see page 5789) method if the control is associated with an action link.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
V	Invalidate (see page 5770)	Completely repaint control.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.

	IsRightToLeft (see page 5770)	Indicates whether the control should be reversed right to left.
	ManualDock (see page 5771)	Docks the control.
	ManualFloat (see page 5772)	Undocks the control.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	MouseWheelHandler (see page 5774)	Dispatches messages received from a mouse wheel.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	ParentToClient (see page 5776)	Translate parent coordinates to client coordinates.
	Perform (see page 5776)	Responds as if the control received a specified Windows message.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	Refresh (see page 5779)	Repaints the control on the screen.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	Repaint (see page 5779)	Forces the control to repaint its image on the screen.
	ReplaceDockedControl (see page 5779)	Docks the control in the place where another control is already docked.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	ScreenToClient (see page 5781)	Converts the screen coordinates of a specified point on the screen to client coordinates.
	SendToBack (see page 5782)	Puts a windowed control behind all other windowed controls, or puts a non-windowed control behind all other non-windowed controls.
V	SetBounds (see page 5783)	Sets the Left (see page 5830), Top (see page 5844), Width (see page 5849), and Height (see page 5825) properties all at once.
	SetDesignVisible (see page 5784)	Makes a control visible at design time.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	SetTextBuf (see page 5787)	Sets the text of the control.
	Show (see page 5788)	Makes a control visible.
V	Update (see page 5789)	Processes any pending paint messages immediately.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	UseRightToLeftAlignment (see page 5790)	Specifies whether the control's alignment should be reversed right-to-left.
	UseRightToLeftReading (see page 5790)	Specifies whether the control is using a right-to-left reading order.
	UseRightToLeftScrollBar (see page 5791)	Specifies whether the vertical scroll bar appears on the left side of the control.

Public Properties

	Name	Description
	Action (see page 5797)	Designates the action associated with the control.
	BiDiMode (see page 5803)	Specifies the bi-directional mode for the control.
	BoundsRect (see page 5803)	Specifies the bounding rectangle of the control, expressed in the coordinate system of the parent control.
R	Canvas (see page 12794)	Provides a drawing surface for embellishing bitmap images.
	ClientHeight (see page 5808)	Specifies the height of the control's client area in pixels.
R	ClientOrigin (see page 5809)	Specifies the screen coordinates (in pixels) of the top left corner of a control's client area.
R	ClientRect (see page 5810)	Specifies the size (in pixels) of a control's client area.
	ClientWidth (see page 5811)	Specifies the horizontal size of the control's client area in pixels.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.

	ControlState (see page 5813)	Indicates the current state of a control at runtime.
	ControlStyle (see page 5814)	Determines style characteristics of the control.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DockOrientation (see page 5818)	Specifies how the control is docked relative to other controls docked in the same parent.
R	ExplicitHeight (see page 5821)	Specifies the explicit vertical size of the control in pixels.
R	ExplicitLeft (see page 5822)	Specifies the explicit horizontal pixel coordinate of the left edge of a component relative to its parent.
R	ExplicitTop (see page 5822)	Specifies the explicit vertical pixel coordinate of the top edge of a component relative to its parent.
R	ExplicitWidth (see page 5822)	Specifies the explicit horizontal size of the control in pixels.
R	Floating (see page 5823)	Indicates whether the control is floating.
	FloatingDockSiteClass (see page 5823)	Specifies the class of the temporary control that hosts the control when it is floating.
	HostDockSite (see page 5829)	Specifies the control in which the control is docked.
	LRDockWidth (see page 5831)	Specifies the width of the control when it is docked horizontally.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Parent (see page 5832)	Indicates the parent of the control.
	TBDockHeight (see page 5842)	Specifies the height of the control when it is docked vertically.
	UndockHeight (see page 5845)	Specifies the height of the control when it is floating.
	UndockWidth (see page 5846)	Specifies the width of the control when it is floating.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Events

	Name	Description
	OnClick (see page 12814)	Occurs when the user clicks the control.
	OnContextPopup (see page 12816)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnDblClick (see page 12817)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDragDrop (see page 12817)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 12819)	Occurs when the user drags an object over a control.
	OnEndDock (see page 12822)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 12822)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnMouseActivate (see page 12823)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 12824)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseEnter (see page 12826)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 12826)	Occurs when the user moves the mouse outside of a control.
	OnMouseMove (see page 12827)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 12829)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnProgress (see page 12831)	Occurs periodically during slow operations that affect the image.
	OnStartDock (see page 12832)	Occurs when the user begins to drag a control with a DragKind of dkDock.
	OnStartDrag (see page 12832)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.

Published Properties

	Name	Description
	Align (see page 12789)	Determines how the control aligns within its container (parent control).
	AlignWithMargins (see page 5802)	Indicates whether a control should be constrained by margins.
	Anchors (see page 12793)	Specifies how the control is anchored to its parent.
	AutoSize (see page 12793)	Specifies whether the control sizes itself automatically to accommodate the dimensions of the image.

	Center (see page 12797)	Indicates whether the image is centered in the image control.
	Constraints (see page 12797)	Specifies the size constraints for the control.
	Cursor (see page 5815)	Specifies the image used to represent the mouse pointer when it passes into the region covered by the control.
	DragCursor (see page 12798)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 12798)	Specifies whether the control is being dragged normally or for docking.
	DragMode (see page 12799)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	Enabled (see page 12800)	Controls whether the control responds to mouse, keyboard, and timer events.
	Height (see page 5825)	Specifies the vertical size of the control in pixels.
	HelpContext (see page 5826)	Numeric ID for control's context-sensitive help topic
	HelpKeyword (see page 5826)	Keyword for control's context-sensitive help topic
	HelpType (see page 5827)	Indicates whether the control's context sensitive help topic is identified by context ID or by keyword.
	Hint (see page 5827)	Contains the text string that can appear when the user moves the mouse over the control.
	IncrementalDisplay (see page 12801)	Specifies whether successive approximations of the image should be drawn during slow operations.
	Left (see page 5830)	Specifies the horizontal coordinate of the left edge of a component relative to its parent.
	Margins (see page 5831)	Specifies the margins for the control.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	ParentShowHint (see page 12801)	Determines where a control looks to find out if its Help Hint should be shown.
	Picture (see page 12802)	Specifies the image that appears on the image control.
	PopupMenu (see page 12803)	Identifies the pop-up menu associated with the control.
	Proportional (see page 12808)	Indicates whether the image should be changed, without distortion, so that it fits the bounds of the image control.
	ShowHint (see page 12808)	Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.
	Stretch (see page 12810)	Indicates whether the image should be changed so that it exactly fits the bounds of the image control.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Top (see page 5844)	Specifies the Y coordinate of the top left corner of a control, relative to its parent or containing control in pixels.
	Transparent (see page 12811)	Specifies whether the background of the image obscures objects below the image object.
	Visible (see page 12812)	Determines whether the component appears onscreen.
	Width (see page 5849)	Specifies the horizontal size of the control or form in pixels.

68.1.25.2 TImage.Create Constructor

Creates and initializes an instance of TImage (see page 12777).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TImage(TComponent * AOwner);
```

Description

Call Create to instantiate a TImage (see page 12777) object at runtime. Images placed on forms at design time are created automatically.

AOwner is the component that is responsible for freeing the TImage (see page 12777) instance. It becomes the value of the Owner property.

See Also

Owner (see page 2807)

68.1.25.3 TImage.Destroy Destructor

Destroys an instance of TImage (see page 12777).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TImage();
```

Description

Do not call Destroy directly in an application. Instead, call Free. Free verifies that the TImage (see page 12777) reference is not nil, and only then calls Destroy.

As the control is destroyed, it frees the TPicture object in the Picture (see page 12802) property.

See Also

Free (see page 22300)

68.1.25.4 TImage Methods

The methods of the TImage class are listed here.

Protected Methods

	Name	Description
V	CanAutoSize (see page 12786)	Indicates whether the control can resize itself automatically to accommodate its contents.
	DestRect (see page 12787)	This is DestRect, a member of class TImage.
	DoPaletteChange (see page 12787)	This is DoPaletteChange, a member of class TImage.
V	GetPalette (see page 12787)	Returns the handle to a palette for use by the control.
V	Paint (see page 12788)	Render control surface.
	Progress (see page 12788)	This is Progress, a member of class TImage.

68.1.25.4.1 TImage.CanAutoSize Method

Indicates whether the control can resize itself automatically to accommodate its contents.

Pascal

```
function CanAutoSize(var NewWidth: Integer; var NewHeight: Integer): Boolean; override;
```

C++

```
virtual __fastcall Boolean CanAutoSize(int NewWidth, int NewHeight);
```

Description

CanAutoSize is called automatically when the AutoSize property is true and an attempt is made to resize the control. It allows controls to implement the AutoSize property before the resize sequence that begins with the OnCanResize and OnConstrainedResize events and ends with the OnResize event.

When CanAutoSize is called, the NewWidth and NewHeight parameters indicate the proposed new dimensions of the control.

CanAutoSize adjusts these values so that the control's size adjusts to its contents. If the adjustment results in values of NewWidth and NewHeight that differ from the control's current width and height, CanAutoSize returns true, indicating that the resize sequence should proceed. If, after adjustment, NewWidth and NewHeight equal Width and Height, CanAutoSize returns true, and the resize sequence is aborted.

As implemented in TControl, CanAutoSize always returns true without changing NewWidth or NewHeight. Override CanAutoSize to implement the AutoSize property for a particular control class's contents.

See Also

AutoSize (see page 5803)

OnResize (see page 5870)

OnCanResize (see page 5851)

OnConstrainedResize (see page 5853)

Width (see page 5849)

Height (see page 5825)

68.1.25.4.2 TImage.DestRect Method

Pascal

```
function DestRect: TRect;
```

C++

```
__fastcall TRect DestRect();
```

Description

This is DestRect, a member of class TImage.

68.1.25.4.3 TImage.DoPaletteChange Method

Pascal

```
function DoPaletteChange: Boolean;
```

C++

```
__fastcall Boolean DoPaletteChange();
```

Description

This is DoPaletteChange, a member of class TImage.

68.1.25.4.4 TImage.GetPalette Method

Returns the handle to a palette for use by the control.

Pascal

```
function GetPalette: HPALETTE; override;
```

C++

```
virtual __fastcall HPALETTE GetPalette();
```

Description

As implemented in TControl, GetPalette returns a null handle, indicating that the control does not have a palette. Override

GetPalette to implement derived objects that use a palette. Create a palette handle for the control by a call to the Windows API function CreatePalette. GetPalette should return the palette handle for the control.

Specifying the palette for a control tells the application that the control's palette needs to be realized and designates the palette to use for realization.

GetPalette is called only if the run-time video mode requires color palette support, for example, in 256-color mode.

See Also

PaletteChanged (see page 5775)

68.1.25.4.5 TImage.Paint Method

Render control surface.

Pascal

```
procedure Paint; override;
```

C++

```
virtual __fastcall Paint();
```

Description

The Paint method is called automatically when a lightweight control needs update its display area. Code in the Paint method uses the Canvas property to render the control surface.

As implemented in TGraphicControl, Paint does nothing. Specific rendering logic is provided by Paint methods in descendant control classes.

See Also

Canvas (see page 6053)

68.1.25.4.6 TImage.Progress Method

Pascal

```
procedure Progress(Sender: TObject; Stage: TProgressStage; PercentDone: Byte; RedrawNow:
Boolean; const R: TRect; const Msg: string); dynamic;
```

C++

```
__fastcall Progress(TObject * Sender, TProgressStage Stage, Byte PercentDone, Boolean
RedrawNow, const TRect R, const AnsiString Msg);
```

Description

This is Progress, a member of class TImage.

68.1.25.5 TImage Properties

The properties of the TImage class are listed here.

Public Properties

	Name	Description
R	Canvas (see page 12794)	Provides a drawing surface for embellishing bitmap images.

Published Properties

	Name	Description
	Align (see page 12789)	Determines how the control aligns within its container (parent control).
	Anchors (see page 12793)	Specifies how the control is anchored to its parent.
	AutoSize (see page 12793)	Specifies whether the control sizes itself automatically to accommodate the dimensions of the image.
	Center (see page 12797)	Indicates whether the image is centered in the image control.
	Constraints (see page 12797)	Specifies the size constraints for the control.
	DragCursor (see page 12798)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 12798)	Specifies whether the control is being dragged normally or for docking.
	DragMode (see page 12799)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	Enabled (see page 12800)	Controls whether the control responds to mouse, keyboard, and timer events.
	IncrementalDisplay (see page 12801)	Specifies whether successive approximations of the image should be drawn during slow operations.
	ParentShowHint (see page 12801)	Determines where a control looks to find out if its Help Hint should be shown.
	Picture (see page 12802)	Specifies the image that appears on the image control.
	PopupMenu (see page 12803)	Identifies the pop-up menu associated with the control.
	Proportional (see page 12808)	Indicates whether the image should be changed, without distortion, so that it fits the bounds of the image control.
	ShowHint (see page 12808)	Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.
	Stretch (see page 12810)	Indicates whether the image should be changed so that it exactly fits the bounds of the image control.
	Transparent (see page 12811)	Specifies whether the background of the image obscures objects below the image object.
	Visible (see page 12812)	Determines whether the component appears onscreen.

68.1.25.5.1 TImage.Align Property

Determines how the control aligns within its container (parent control).

Pascal

```
property Align: TAlign;
```

C++

```
__property TAlign Align;
```

Description

Use Align to align a control to the top, bottom, left, or right of a form or panel and have it remain there even if the size of the form, panel, or component that contains the control changes. When the parent is resized, an aligned control also resizes so that it continues to span the top, bottom, left, or right edge of the parent.

For example, to use a panel component with various controls on it as a tool palette, change the panel's Align value to alLeft. The value of alLeft for the Align property of the panel guarantees that the tool palette remains on the left side of the form and always equals the client height of the form.

The default value of Align is alNone, which means a control remains where it is positioned on a form or panel.

Tip: If Align is set to alClient, the control fills the entire client area so that it is impossible to select the parent form by clicking on it. In this case, select the parent by selecting the control on the form and pressing Esc, or by using the Object Inspector.

Any number of child components within a single parent can have the same Align value, in which case they stack up along the edge of the parent. The child controls stack up in z-order. To adjust the order in which the controls stack up, drag the controls into their desired positions.

Note: To cause a control to maintain a specified relationship with an edge of its parent, but not necessarily lie along one edge of

the parent, use the Anchors property instead.

C++ Examples:

```
/*
This example shows how to use a splitter to divide a form
into resizable panes.  All objects on the form are created
dynamically in the OnCreate event handler of the form. To
run this example, add ExtCtrls and FileCtrl to the uses
clause of the form’s implementation section.
Note that when creating a splitter dynamically at runtime,
it is important to set its position to the appropriate side
of the control it will resize.
*/
#include <Extctrls.hpp>
#include <Filectrl.hpp>

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  TSplitter* ps = new TSplitter(Form1);
  TFileListBox* pflb = new TFileListBox(Form1);
  TDirectoryListBox* pdlb = new TDirectoryListBox(Form1);

  // Line up the directory list box on the left of the form.
  pdlb->Parent = Form1;
  pdlb->Align = alLeft;
  pdlb->Width = Form1->ClientWidth/3;

  // Now use the splitter to divide the directory pane from the file pane.
  ps->Parent = Form1;
  ps->Left = pdlb->Left + pdlb->Width + 1; // Move to right of directory list.
  ps->Align = pdlb->Align; // Give same alignment as directory list.

  // Each pane must be at least one quarter of the form's width.
  ps->MinSize = Form1->ClientWidth/4;

  // Finally, create the last pane - a file list box.
  pflb->Parent = Form1;
  pflb->Align = alClient;
  pdlb->FileList = pflb; // Link the file list box to the directory list box.
}
/*
Dynamically create a TProgressBar control and align it to
the bottom of the form.
*/

#include <ComCtrls.hpp>
#include <Controls.hpp>

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  TProgressBar *ProgressBar = new TProgressBar(this);
  ProgressBar->Parent = this;
  ProgressBar->Align = alBottom;
  TButton *Button1 = new TButton(this);
  Button1->Parent = this;
}
/*
This example dynamically creates a Page Control, then a
series of Tab Sheets on the Page Control.
*/
#include <Comctrls.hpp>
TPageControl* ppc;
const int MAXTABS = 3;
TTabSheet* pts[MAXTABS];
```

```
const char * ppcTabTitles[] = { "ShortString", "Orders", "Items", "Parts" };
int iTabTitles = sizeof(ppcTabTitles)/sizeof(ppcTabTitles[0]);
const TColor colorPalette[12] = {
  clRed, clGreen, clYellow, clBlue, clWhite, clFuchsia,
  clTeal, clNavy, clMaroon, clLime, clOlive, clPurple};

void __fastcall TForm1::FormCreate(TObject *Sender)
{
    ppc = new TPageControl(this);
    ppc->Parent = this;
    ppc->Align = alClient;
    for (int i=0;i<iTabTitles;i++)
  {
        pts[i] = new TTabSheet(this);
        pts[i]->PageControl = ppc;
        pts[i]->Name = AnsiString("pts") + ppcTabTitles[i];
        pts[i]->Caption = ppcTabTitles[i];
        pts[i]->Brush->Color = colorPalette[i];
  }
}//---------------------------------------------------------------------------
void __fastcall TForm1::FormDestroy(TObject *Sender)
{
  for (int i=0;i<iTabTitles;i++)
        delete pts[i];
    delete ppc;
}
```

Delphi Examples:

```
{
This example shows how to use a splitter to divide a form
into resizable panes.  All objects on the form are created
dynamically in the OnCreate event handler of the form. To
run this example, add ExtCtrls and FileCtrl to the uses
clause of the form’s implementation section.
Note that when creating a splitter dynamically at runtime,
it is important to set its position to the appropriate side
of the control it will resize.

    PageControl1 := TPageControl.Create(Self);
    PageControl1.Parent := Self;
    PageControl1.Align := alClient;
    for i := Low(TabTitles) to High(TabTitles) do
    begin
      pts[i]:= TTabSheet.Create(PageControl1);
      with pts[i] do
      begin
        PageControl := PageControl1;
        Name := 'ts' + TabTitles[i];
        Caption := TabTitles[i];
        Brush.Color := colorPalette[i];
     end;
    end;
  end;

  procedure TForm1.FormDestroy(Sender: TObject);
  var
    i: Integer;
  begin
    for i := Low(TabTitles) to High(TabTitles) do
    begin
      pts[i].Free;
    end;
    PageControl1.Free;
  end;
```

Parent (see page 5832)

Anchors (see page 5802)

68.1.25.5.2 TImage.Anchors Property

Specifies how the control is anchored to its parent.

Pascal

```
property Anchors: TAnchors;
```

C++

```
__property TAnchors Anchors;
```

Description

Use Anchors to ensure that a control maintains its current position relative to an edge of its parent, even if the parent is resized. When its parent is resized, the control holds its position relative to the edges to which it is anchored.

If a control is anchored to opposite edges of its parent, the control stretches when its parent is resized. For example, if a control has its Anchors property set to [akLeft, akRight], the control stretches when the width of its parent changes.

Anchors is enforced only when the parent is resized. Thus, for example, if a control is anchored to opposite edges of a form at design time and the form is created in a maximized state, the control is not stretched because the form is not resized after the control is created.

Note: If a control should maintain contact with three edges of its parent (hugging one side of the parent and stretching the length of that side), use the Align property instead. Unlike Anchors, Align allows controls to adjust to changes in the size of other aligned sibling controls as well as changes to the parent's size.

See Also

Parent (see page 5832)

Align (see page 5798)

68.1.25.5.3 TImage.AutoSize Property

Specifies whether the control sizes itself automatically to accommodate the dimensions of the image.

Pascal

```
property AutoSize: Boolean;
```

C++

```
__property Boolean AutoSize;
```

Description

Use AutoSize to specify whether the TImage (see page 12777) control adjusts its own dimensions to match the dimensions of the image that the Picture (see page 12802) property specifies. When AutoSize is true, the TImage (see page 12777) control forces its own height and width to match those of the picture it represents. When AutoSize is false (the default), the Center (see page 12797) and Stretch (see page 12810) properties determine how the image control deals with discrepancies between the size of the picture and the size of the image control.

See Also

Constraints (see page 5812)

Picture (see page 12802)

Width (see page 14602)

Height (see page 14600)

Height (see page 5825)

Width (see page 5849)

Center (see page 12797)

Stretch (see page 12810)

68.1.25.5.4 TImage.Canvas Property

Provides a drawing surface for embellishing bitmap images.

Pascal

```
property Canvas: TCanvas;
```

C++

```
__property TCanvas Canvas;
```

Description

Canvas is the TCanvas object on which the image for the TImage (see page 12777) component is drawn. The painting of the image specified in the Picture (see page 12802) property is automatic and does not require manual intercession for the picture to appear.

You can use properties and methods of TCanvas to do such things as draw lines, draw images, and write text to the TImage (see page 12777) control's canvas.

Note: Canvas is only available if the Picture (see page 12802) property represents a TBitmap object. Trying to read Canvas when Picture (see page 12802) represents another type of graphic image causes TImage (see page 12777) to raise an EInvalidOperation exception.

C++ Examples:

```
/*
This example creates a region and selects this region as the
clipping rectangle for the Image component's canvas. It then
sets the canvas's brush color to red and calls FillRect
using the ClipRect as the area to fill. Lastly, the ClipRect
is reset to the original value that it contained by calling
SelectClipRect with nil as the second parameter and deletes
the region.  Place a TImage object in the form.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
    HRGN MyRgn;

    MyRgn = ::CreateRectRgn(100,100,200,200);
    ::SelectClipRgn(Image1->Canvas->Handle,MyRgn);
    Image1->Canvas->Brush->Color = clRed;
    Image1->Canvas->FillRect(Image1->Canvas->ClipRect);
    Image1->Invalidate();
    ::SelectClipRgn(Image1->Canvas->Handle,NULL);
    ::DeleteObject(MyRgn);
}
/*
This example converts a specified icon to a bitmap. To run
this example, add an image, a button, and an Open dialog to
a form. Name the button ConvertIcon2Bitmap, and add the
following code as its OnClick event handler.
*/
void __fastcall TForm1::ConvertIcon2BitmapClick(TObject *Sender)
```

```
{
  OpenDialog1->DefaultExt = ".ICO";
  OpenDialog1->Filter = "icons (*.ico)|*.ICO";
  OpenDialog1->Options << ofOverwritePrompt << ofFileMustExist << ofHideReadOnly;
  if (OpenDialog1->Execute())
  {
    TIcon *pi = new TIcon();
    try
    {
      AnsiString as;
      pi->LoadFromFile(OpenDialog1->FileName);
      as = ChangeFileExt(OpenDialog1->FileName,".BMP");
      Image1->Width = pi->Width;
      Image1->Height = pi->Height;
      Image1->Canvas->Draw(0,0,pi);
      Image1->Picture->SaveToFile(as);
      ShowMessage(OpenDialog1->FileName + " Saved to " + as);
    }
    __finally
    {
      delete pi;
    }
  }
}
/*
The following code uses ClientRect to find and draw a line
from the top left to the bottom right of the current
control.  Select a TControl in the ListBox list.  This
example assumes that the current object is a descendent of
TControl and has a public Canvas property.
*/
{
  TPoint APoint = Point(X, Y);
  int Index = ListBox1->ItemAtPos(APoint, True);
  TImage *myImage;
  TClass ClassRef = ListBox1->Items->Objects[Index]->ClassType();
  if (String(ClassRef->ClassName()) == "TImage")
  {
    myImage = (TImage *)ListBox1->Items->Objects[Index];
    // make sure we are using the TControls canvas and not the from's!
    myImage->Canvas->MoveTo(myImage->ClientRect.Left, myImage->ClientRect.Top);
    myImage->Canvas->LineTo(myImage->ClientRect.Right, myImage->ClientRect.Bottom);
    myImage = NULL;
  }
}
/*
The following example paints a cross-hatched ellipse onto
Image1 which is a TImage on the form when the user clicks on
Button1.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{

}
```

Delphi Examples:

```
{
This example creates a region and selects this region as the
clipping rectangle for the Image component's canvas. It then
sets the canvas's brush color to red and calls FillRect
using the ClipRect as the area to fill. Lastly, the ClipRect
is reset to the original value that it contained by calling
SelectClipRect with nil as the second parameter and deletes
```

```
the region.  Place a TImage object in the form.
}
procedure TForm1.Button1Click(Sender: TObject);
var
    MyRgn: HRGN;
begin
    MyRgn := CreateRectRgn(100,100,200,200);
    SelectClipRgn(Image1.Canvas.Handle,MyRgn);
    Image1.Canvas.Brush.Color := clRed;
    Image1.Canvas.FillRect(Image1.Canvas.ClipRect);
    Image1.Invalidate;
    SelectClipRgn(Image1.Canvas.Handle, HRGN(nil));
    DeleteObject(MyRgn);
end;
{
This example converts a specified icon to a bitmap. To run
this example, add an image, a button, and an Open dialog to
a form. Name the button ConvertIcon2Bitmap, and add the
following code as its OnClick event handler.
}
procedure TForm1.ConvertIcon2BitmapClick(Sender: TObject);
var
  s : string;
  Icon: TIcon;
begin
  OpenDialog1.DefaultExt := '.ICO';
  OpenDialog1.Filter := 'icons (*.ico)|*.ICO';
  OpenDialog1.Options := [ofOverwritePrompt, ofFileMustExist, ofHideReadOnly ];
  if OpenDialog1.Execute then
  begin
    Icon := TIcon.Create;
    try
      Icon.Loadfromfile(OpenDialog1.FileName);
      s:= ChangeFileExt(OpenDialog1.FileName,'.BMP');
      Image1.Width := Icon.Width;
      Image1.Height := Icon.Height;
      Image1.Canvas.Draw(0,0,Icon);
      Image1.Picture.SaveToFile(s);
      ShowMessage(OpenDialog1.FileName + ' Saved to ' + s);
    finally
      Icon.Free;
    end;
  end;
end;
{
The following code uses ClientRect to find and draw a line
from the top left to the bottom right of the current
control.  Select a TControl in the ListBox list.  This
example assumes that the current object is a descendent of
TControl and has a public Canvas property.
}
  if (ListBox1.Items.Objects[Index] is TImage) then
  begin
    myImage:= (ListBox1.Items.Objects[Index] as TImage);
    with myImage.ClientRect do
    begin // make sure we are using the TControl's canvas and not the form's!
      myImage.Canvas.MoveTo(Left, Top);
      myImage.Canvas.LineTo(Right, Bottom);
    end;
  myImage:= nil;
  end;
{
The following example paints a cross-hatched ellipse onto
Image1 which is a TImage on the form when the user clicks on
Button1.
}
```

```
procedure TForm1.Button1Click(Sender: TObject);
begin
  with Image1 do begin
    Canvas.Brush.Color := clRed;
    Canvas.Brush.Style := bsDiagCross;
    Canvas.Ellipse(0, 0, Image1.Width, Image1.Height);
  end;
end;
```

Picture (see page 12802)

TCanvas (see page 14441)

68.1.25.5.5 TImage.Center Property

Indicates whether the image is centered in the image control.

Pascal

```
property Center: Boolean;
```

C++

```
__property Boolean Center;
```

Description

When the image does not fit perfectly within the image control, use Center to specify how the image is positioned. When Center is true, the image is centered in the control. When Center is false, the upper left corner of the image is positioned at the upper left corner of the control.

The default value for Center is false.

Note: Center has no effect if the AutoSize (see page 12793) property is true or if the Stretch (see page 12810) property is true and Picture (see page 12802) does not specify an icon.

See Also

AutoSize (see page 5803)

Picture (see page 12802)

Stretch (see page 12810)

Proportional (see page 12808)

68.1.25.5.6 TImage.Constraints Property

Specifies the size constraints for the control.

Pascal

```
property Constraints: TSizeConstraints;
```

C++

```
__property TSizeConstraints Constraints;
```

Description

Use Constraints to specify the minimum and maximum width and height of the control. When Constraints contains maximum or minimum values, the control cannot be resized to violate those constraints.

Note: Constraints apply to the height of the form. However, the height of the form depends on how large Windows makes the title bar. For example, Windows XP uses much larger title bars than other windowing systems. To work around this, note the ClientHeight when you design your form and set the constraints in the FormCreate event. In the following example, ClientHeight is represented by x: `Constraints.MinHeight := x + Height - ClientHeight`.

Warning: Do not set up constraints that conflict with the value of the Align or Anchors property. When these properties conflict, the response of the control to resize attempts is not well-defined.

See Also

AutoSize (see page 5803)

Align (see page 5798)

Anchors (see page 5802)

OnConstrainedResize (see page 5853)

OnCanResize (see page 5851)

68.1.25.5.7 TImage.DragCursor Property

Indicates the image used to represent the mouse pointer when the control is being dragged.

Pascal

```
property DragCursor: TCursor;
```

C++

```
__property TCursor DragCursor;
```

Description

Use the DragCursor property to change the cursor image presented when the control is being dragged.

Note: To make a custom cursor available for the DragCursor property, see the Cursor property.

See Also

Cursor (see page 5815)

DragKind (see page 5819)

DragMode (see page 5819)

68.1.25.5.8 TImage.DragKind Property

Specifies whether the control is being dragged normally or for docking.

Pascal

```
property DragKind: TDragKind;
```

C++

```
__property TDragKind DragKind;
```

Description

Use DragKind to get or set whether the control participates in drag-and-drop operations, or drag-and-dock operations.

See Also

DragCursor (see page 5818)

DragMode (see page 5819)

68.1.25.5.9 TImage.DragMode Property

Determines how the control initiates drag-and-drop or drag-and-dock operations.

Pascal

```
property DragMode: TDragMode;
```

C++

```
__property TDragMode DragMode;
```

Description

Use DragMode to control when the user can drag the control. Disable the drag-and-drop or drag-and-dock capability at runtime by setting the DragMode property value to dmManual. Enable automatic dragging by setting DragMode to dmAutomatic.

C++ Examples:

```
/*
The following code uses GetNodeAt to add a dragged node as a
child of the node under the mouse when it is dropped.  This
example requires a populated TreeView.  Also, the TTreeView
DragMode property set to dmAutomatic, and the TTreeView
OnDragOver event handler must be implemented to accept the
drop.
*/
void __fastcall TForm1::TreeView1DragDrop(TObject *Sender, TObject *Source,
      int X, int Y)
{
  if (Source != (TObject *)TreeView1 || TreeView1->Selected == NULL)
    return;
  THitTests HT = TreeView1->GetHitTestInfoAt(X, Y);
  TNodeAttachMode AttachMode;
  TTreeNode *Item = TreeView1->GetNodeAt(X, Y);
  if (HT.Contains(htOnItem) || HT.Contains(htOnIcon))
    AttachMode = naAddChild;
  else if (HT.Contains(htNowhere))
    AttachMode = naAdd;
  else if (HT.Contains(htOnIndent))
    AttachMode = naInsert;
  else
    return;
  TreeView1->Selected->MoveTo(Item, AttachMode);
}

void __fastcall TForm1::TreeView1DragOver(TObject *Sender, TObject *Source,
      int X, int Y, TDragState State, bool &Accept)
{
  Accept = (Source == (TObject *)TreeView1);
}
```

Delphi Examples:

```
{
The following code uses GetNodeAt to add a dragged node as a
child of the node under the mouse when it is dropped.  This
example requires a populated TreeView.  Also, the TTreeView
DragMode property set to dmAutomatic, and the TTreeView
OnDragOver event handler must be implemented to accept the
drop.
}
procedure TForm1.TreeView1DragDrop(Sender, Source: TObject; X, Y: Integer);
var
  AnItem: TTreeNode;
```

```
    AttachMode: TNodeAttachMode;
    HT: THitTests;
  begin
    if TreeView1.Selected = nil then Exit;
    HT := TreeView1.GetHitTestInfoAt(X, Y);
    AnItem := TreeView1.GetNodeAt(X, Y);
    if (HT - [htOnItem, htOnIcon, htNowhere, htOnIndent] <> HT) then
    begin
      if (htOnItem in HT) or (htOnIcon in HT) then
        AttachMode := naAddChild
      else if htNowhere in HT then AttachMode := naAdd
      else if htOnIndent in HT then AttachMode := naInsert;
      TreeView1.Selected.MoveTo(AnItem, AttachMode);
    end;
  end;

  procedure TForm1.TreeView1DragOver(Sender, Source: TObject; X, Y: Integer;
    State: TDragState; var Accept: Boolean);
  begin
    Accept := Source is TTreeView;
  end;
```

Arranging the Order of Persistent Columns

68.1.25.5.10 TImage.Enabled Property

Controls whether the control responds to mouse, keyboard, and timer events.

Pascal

```
property Enabled: Boolean;
```

C++

```
__property Boolean Enabled;
```

Description

Use Enabled to change the availability of the control to the user. To disable a control, set Enabled to false. Disabled controls appear dimmed. If Enabled is false, the control ignores mouse, keyboard, and timer events.

To re-enable a control, set Enabled to true. The control is no longer dimmed, and the user can use the control.

See Also

Visible (see page 5847)

DisableControls (see page 6925)

EnableControls (see page 6934)

Enabling Mouse

68.1.25.5.11 TImage.IncrementalDisplay Property

Specifies whether successive approximations of the image should be drawn during slow operations.

Pascal

```
property IncrementalDisplay: Boolean;
```

C++

```
__property Boolean IncrementalDisplay;
```

Description

Set IncrementalDisplay to true on large compressed images that take a long time to load or on images that may be altered by a computationally slow process. When IncrementalDisplay is true, partial renderings of the image are drawn periodically during slow operations such as loading. Set IncrementalDisplay to false to wait until the entire operation is complete before drawing the image.

For some classes of graphic objects, an OnProgress (see page 12831) event occurs at various points during slow operations. If IncrementalDisplay is true, the OnProgress (see page 12831) event occurs immediately after the approximate image is drawn. If IncrementalDisplay is false, OnProgress (see page 12831) occurs but the image is not updated until the entire image has been loaded.

The default value for IncrementalDisplay is false.

See Also

OnProgress (see page 12831)

68.1.25.5.12 TImage.ParentShowHint Property

Determines where a control looks to find out if its Help Hint should be shown.

Pascal

```
property ParentShowHint: Boolean;
```

C++

```
__property Boolean ParentShowHint;
```

Description

Use ParentShowHint to ensure that all the controls on a form either uniformly show their Help Hints or uniformly do not show them.

If ParentShowHint is true, the control uses the ShowHint property value of its parent. If ParentShowHint is false, the control uses the value of its own ShowHint property.

To provide Help Hints for only selected controls on a form, set the ShowHint property for those controls that should have Help Hints to true, and ParentShowHint becomes false automatically.

Note: Enable or disable all Help Hints for the entire application using the ShowHint property of the application object.

ParentColor (see page 5834)

ParentFont (see page 5834)

ShowHint (see page 5840)

68.1.25.5.13 TImage.Picture Property

Specifies the image that appears on the image control.

Pascal

```
property Picture: TPicture;
```

C++

```
__property TPicture Picture;
```

Description

Use Picture to specify the image for the TImage (see page 12777) component. Picture is a reference to a TPicture object. Use properties and methods of TPicture to specify a bitmap, icon, metafile, or user-defined graphic to be displayed by the image control.

Setting Picture at design time brings up the Picture Editor, which can be used to specify the file that contains the image.

C++ Examples:

```
/*
This example uses an image, a button, and a shape component
on a form. When the user clicks the button, an image of the
form is stored in the FormImage variable and copied to the
Clipboard. The image of the form is then copied back to
the image component, producing an interesting result,
especially if the button is clicked multiple times.  Add
ExtCtrls, StdCtrls, and Clipbrd to the uses clause.
}
*/

#include <Clipbrd.hpp>

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  Graphics::TBitmap *FormImage = GetFormImage();
  try
  {
    Clipboard()->Assign(FormImage);
    Image1->Picture->Assign(Clipboard());
  }
  __finally
  {
    delete FormImage;
  }
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  Shape1->Shape = stEllipse;
  Shape1->Brush->Color = clLime;
  Image1->Stretch = true;
}
/*
The following code draws the graphic in Picture1 in the
top-left corner PaintBox1.  Place a TPaintBox in the form
and a TImage in the form that contains a picture.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
```

```
  PaintBox1->Canvas->Draw(0,0, Image1->Picture->Graphic);
}
```

Delphi Examples:

```
{
This example uses an image, a button, and a shape component
on a form. When the user clicks the button, an image of the
form is stored in the FormImage variable and copied to the
Clipboard. The image of the form is then copied back to
the image component, producing an interesting result,
especially if the button is clicked multiple times.  Add
ExtCtrls, StdCtrls, and Clipbrd to the uses clause.
}
procedure TForm1.Button1Click(Sender: TObject);
var
  FormImage: TBitmap;
begin
  FormImage := GetFormImage;
  try
    Clipboard.Assign(FormImage);
    Image1.Picture.Assign(Clipboard);
  finally
    FormImage.Free;
  end;
end;

procedure TForm1.FormCreate(Sender: TObject);
begin
  Shape1.Shape := stEllipse;
  Shape1.Brush.Color := clLime;
  Image1.Stretch := True;
end;
{
The following code draws the graphic in Picture1 in the
top-left corner PaintBox1.  Place a TPaintBox in the form
and a TImage in the form that contains a picture.
}
procedure TForm1.Button1Click(Sender: TObject);
begin
  PaintBox1.Canvas.Draw(0,0, Image1.Picture.Graphic);
end;
```

See Also

Graphic (see page 14600)

68.1.25.5.14 TImage.PopupMenu Property

Identifies the pop-up menu associated with the control.

Pascal

```
property PopupMenu: TPopupMenu;
```

C++

```
__property TPopupMenu PopupMenu;
```

Description

Assign a value to PopupMenu to make a pop-up menu appear when the user selects the control and clicks the right mouse button. If the TPopupMenu's AutoPopup property is true, the pop-up menu appears automatically. If the menu's AutoPopup property is false, display the menu with a call to its Popup method from the control's OnContextPopup event handler.

C++ Examples:

```
/*
This example uses two edit boxes and one pop-up menu on a form.
The pop-up menu contains Cut, Copy, and Paste commands. This code
makes the pop-up menu available to both edit boxes:
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  PopupMenu1->AutoPopup = true;
  Edit1->PopupMenu = PopupMenu1;
  Edit2->PopupMenu = PopupMenu1;
}

/*
These are the cut, copy, and paste OnClick events for the commands
on the pop-up menu. Double click on the pop-up menu and add three
TMenuItems.  Then set the captions to "Cut", "Copy" and "Paste".
The names will be automatically set to "Cut1", "Copy1", and
"Paste1".  Then double click on the OnClick events and they will
be named "Cut1Click", "Copy1Click" and "Paste1Click" respectively.
Note: only the selected portion of the string in the edit box will
be copied, cut or replaced.
*/
void __fastcall TForm1::Copy1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
    if (pComponent->ClassNameIs("TEdit"))
      ((TEdit *)pComponent)->CopyToClipboard();
    else
      MessageBeep(0);
  }
  else
    MessageBeep(0);
}

void __fastcall TForm1::Cut1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
    if (pComponent->ClassNameIs("TEdit"))
      ((TEdit *)pComponent)->CutToClipboard();
    else
      MessageBeep(0);
  }
  else
    MessageBeep(0);
}

void __fastcall TForm1::Paste1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
    if (pComponent->ClassNameIs("TEdit"))
      ((TEdit *)pComponent)->PasteFromClipboard();
    else
      MessageBeep(0);
  }
  else
    MessageBeep(0);
}
/*
This example demonstrates how to add and delete menu items
to a popup menu at runtime and assign an event handler to
```

```
the OnClick event.  Place a TPopupMenu and three buttons on
the form named "AddButton", "EditButton",  and
"DestroyButton" and add OnClick events to all three buttons.
Put the TPopupMenu in the PopupMenu property of the form.
Place the PopupMenuItemsClick procedure in the TForm1 type
declaration so that it can be used as the method call for
the menu item OnClick event.
*/
void __fastcall TForm1::AddButtonClick(TObject *Sender)
{
    const int num_items = 4;
    for (int index = 0; index < num_items; ++index)
    {
        TMenuItem *NewItem = new TMenuItem(PopupMenu1); // create the new item
        PopupMenu1->Items->Add(NewItem);// add it to the Popupmenu
        NewItem->Caption = "Menu Item " + IntToStr(index);
        NewItem->Tag = index;
        NewItem->OnClick = PopupMenuItemsClick;// assign it an event handler
        TNotifyEvent();
    }
}

void __fastcall TForm1::PopupMenuItemsClick(TObject *Sender)
{
    TMenuItem *ClickedItem = dynamic_cast<TMenuItem *>(Sender);
    if (ClickedItem)
    {
        switch (ClickedItem->Tag)
        {
            case 0:
            {
                ShowMessage("first item clicked");
                break;
            }
            case 1:
            {
                ShowMessage("second item clicked");
                break;
            }
            case 2:
            {
                ShowMessage("third item clicked");
                break;
            }
            case 3:
            {
                ShowMessage("fourth item clicked");
                break;
            }
        }
    }
}

/*
To edit or destroy an item, grab its pointer via the Items
property.
*/
void __fastcall TForm1::EditButtonClick(TObject *Sender)
{
    const int index = 1;
    TMenuItem *ItemToEdit = PopupMenu->Items->Items[index];
    ItemToEdit->Caption = "Changed Caption";
}

void __fastcall TForm1::DestroyButtonClick(TObject *Sender)
{
```

```
    const int index = 2;
    TMenuItem *ItemToDelete = PopupMenu->Items->Items[index];
    delete ItemToDelete;
}
```

Delphi Examples:

```
{
This example uses two edit boxes and one pop-up menu on a form.
The pop-up menu contains Cut, Copy, and Paste commands. This code
makes the pop-up menu available to both edit boxes:
}
procedure TForm1.FormCreate(Sender: TObject);
begin
  PopupMenu1.AutoPopup := True;
  Edit1.PopupMenu := PopupMenu1;
  Edit2.PopupMenu := PopupMenu1;
end;

{
These are the cut, copy, and paste OnClick events for the commands
on the pop-up menu. Double click on the pop-up menu and add three
TMenuItems.  Then set the captions to "Cut", "Copy" and "Paste".
The names will be automatically set to "Cut1", "Copy1", and
"Paste1".  Then double click on the OnClick events and they will
be named "Cut1Click", "Copy1Click" and "Paste1Click" respectively.
Note: only the selected portion of the string in the edit box will
be copied, cut or replaced.
}
procedure TForm1.Copy1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
   Edit1.CopyToClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.CopyToClipboard
  else
    Beep;
end;

procedure TForm1.Cut1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
    Edit1.CutToClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.CutToClipboard
  else
    Beep;
end;

procedure TForm1.Paste1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
    Edit1.PasteFromClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.PasteFromClipboard
  else
    Beep;
end;
{
This example demonstrates how to add and delete menu items
to a popup menu at runtime and assign an event handler to
the OnClick event.  Place a TPopupMenu and three buttons on
the form named "AddButton", "EditButton",  and
"DestroyButton" and add OnClick events to all three buttons.
Put the TPopupMenu in the PopupMenu property of the form.
Place the PopupMenuItemsClick procedure in the TForm1 type
declaration so that it can be used as the method call for
```

```
the menu item OnClick event.
}

type
  TForm1 = class(TForm)
    AddButton: TButton;
    EditButton: TButton;
    DestroyButton: TButton;
    PopupMenu1: TPopupMenu;
    procedure AddButtonClick(Sender: TObject);

68.1.25.5.15 TImage.Proportional Property

Indicates whether the image should be changed, without distortion, so that it fits the bounds of the image control.

Pascal

```
property Proportional: Boolean;
```

C++

```
__property Boolean Proportional;
```

Description

Set Proportional to true to ensure that the image can be fully displayed in the image control without any distortion such as occurs with the Stretch (see page 12810) property. When Proportional is true, images that are too large to fit in the image control are scaled down (while maintaining the same aspect ratio) until they fit in the image control. Images that are too small are displayed normally. That is, Proportional can reduce the magnification of the image, but does not increase it.

When the image control resizes, the image resizes also.

To resize the image so that it fits exactly in the image control, even if that causes distortion, use the Stretch (see page 12810) property instead.

To resize the control to the image rather than resizing the image to the control, use the AutoSize (see page 12793) property instead.

The default value for Proportional is false.

Note: Proportional has no effect if the Picture (see page 12802) property contains an icon.

See Also

AutoSize (see page 12793)

Picture (see page 12802)

Stretch (see page 12810)

68.1.25.5.16 TImage.ShowHint Property

Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.

Pascal

```
property ShowHint: Boolean;
```

C++

```
__property Boolean ShowHint;
```

Description

The Help Hint is the value of the Hint property, which is displayed in a box just beneath the control. Use ShowHint to determine whether a Help Hint appears for the control.

To enable Help Hint for a particular control, the application ShowHint property must be true and either

the control's own ShowHint property must be true, or

the control's ParentShowHint property must be true and its parent's ShowHint property must be true.

For example, imagine a check box within a group box. If the ShowHint property of the group box is true and the ParentShowHint property of the check box is true, but the ShowHint property of the check box is false, the check box still displays its Help Hint.

Changing the ShowHint value automatically sets the ParentShowHint property to false.

C++ Examples:

```
/*
This example uses an edit box and a list box on a form.
Items are added to the list box and a Help Hint is assigned
to both controls. The last statement enables the Help Hints
for the entire application.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  Edit1->Hint = "Enter your name";
  Edit1->ShowHint = true;

  char string[10];
  char index[3];
  for(int i = 1; i <= 10; i++)
  {
    strcpy(string, "Item");
    itoa(i, index, 10);
    strcat(string, index);
    ListBox1->Items->Add(string);
  }
  ListBox1->Hint = "Select an item";
  ListBox1->ShowHint = true;
  Application->ShowHint = true;
}
/*
Note: To see an example that displays the hints of controls
in some place other than in a Help Hint box, see the OnHint
example.
*/
```

Delphi Examples:

```
{
This example uses an edit box and a list box on a form.
Items are added to the list box and a Help Hint is assigned
to both controls. The last statement enables the Help Hints
for the entire application.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  I: Integer;
begin
  Edit1.Hint := 'Enter your name';
  Edit1.ShowHint := True;
  with ListBox1 do
```

```
    begin
      for I := 1 to 10 do
        Items.Add('Item ' + IntToStr(I));
      Hint := 'Select an item';
      ShowHint := True;
    end;
    Application.ShowHint := True;
  end;
  {
  Note: To see an example that displays the hints of controls
  in some place other than in a Help Hint box, see the OnHint
  example.
  }
```

Displaying Fly-over Help

68.1.25.5.17 TImage.Stretch Property

Indicates whether the image should be changed so that it exactly fits the bounds of the image control.

Pascal

```
property Stretch: Boolean;
```

C++

```
__property Boolean Stretch;
```

Description

Set Stretch to true to cause the image to assume the size and shape of the image control. When the image control resizes, the image resizes also. Stretch resizes the height and width of the image independently. Thus, unlike a simple change in magnification, Stretch can distort the image if the image control is not the same shape as the image.

To resize the image without any distortion, use the Proportional (see page 12808) property instead.

To resize the control to the image rather than resizing the image to the control, use the AutoSize (see page 12793) property instead.

The default value for Stretch is false.

Note: Stretch has no effect if the Picture (see page 12802) property contains an icon.

C++ Examples:

```
/*
This example converts a bitmap image to a jpeg file by using
the Assign method.  This example requires a button and two
images.  One image must have it's Picture property loaded
with a bitmap at design time.
*/

#include <Jpeg.hpp>

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  //Requires "jpeg.hpp" to be included in the source file
```

```
  TJPEGImage *jp = new TJPEGImage();
  try
  {
    jp->Assign(Image1->Picture->Bitmap);
    jp->SaveToFile("..\\factory.jpg");
    Image2->Stretch = True;
    Image2->Picture->LoadFromFile("..\\factory.jpg");
  }
  __finally
  {
    delete jp;
  }
}
```

Delphi Examples:

```
{
This example assigns a bitmap contained in an ImageList to
an Image component's Picture's Bitmap property and displays
the bitmap.  TImage Stretch will fit the bitmap to the image
size.
}
procedure TForm1.Button1Click(Sender: TObject);
begin
   ImageList1.GetBitmap(2,Image1.Picture.Bitmap);
   Image1.Stretch := True;
end;
{
This example converts a bitmap image to a jpeg file by using
the Assign method.  This example requires a button and two
images.  One image must have it's Picture property loaded
with a bitmap at design time.
}
uses Jpeg;

procedure TForm1.Button1Click(Sender: TObject);
var
  jp: TJPEGImage;  //Requires the "jpeg" unit added to "uses" clause.
begin
  jp := TJPEGImage.Create;
  try
    with jp do
    begin
      Assign(Image1.Picture.Bitmap);
      SaveToFile('factory.jpg');
      Image2.Stretch := True;
      Image2.Picture.LoadFromFile('factory.jpg');
    end;
  finally
    jp.Free;
  end;
end;
```

AutoSize (see page 5803)

Picture (see page 12802)

Proportional (see page 12808)

68.1.25.5.18 TImage.Transparent Property

Specifies whether the background of the image obscures objects below the image object.

Pascal

```
property Transparent: Boolean;
```

C++

```
__property Boolean Transparent;
```

Description

Set Transparent to true to allow objects behind the TImage (see page 12777) object to show through the background of the image. Set Transparent to false to make the background of the image opaque. Setting Transparent sets the Transparent property of the Picture (see page 12802).

Note: Transparent has no effect unless the Picture (see page 12802) property specifies a TBitmap object.

See Also

Picture (see page 12802)

Transparent (see page 14529)

Graphic (see page 14600)

68.1.25.5.19 TImage.Visible Property

Determines whether the component appears onscreen.

Pascal

```
property Visible: Boolean;
```

C++

```
__property Boolean Visible;
```

Description

Use the Visible property to control the visibility of the control at runtime. If Visible is true, the control appears. If Visible is false, the control is not visible.

Calling the Show method sets the control's Visible property to true. Calling the Hide method sets it to false.

C++ Examples:

```
/*
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
*/
void __fastcall TForm1::PageControl1Change(TObject *Sender)
{
  CheckBox1->Checked = PageControl1->ActivePage->Visible;
}

void __fastcall TForm1::CheckBox1Click(TObject *Sender)
{
  PageControl1->ActivePage->Visible = CheckBox1->Checked;
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < 10; i++)
  {
    TTabSheet *pPage = new TTabSheet(this);
```

```
      pPage->PageControl = PageControl1;
      pPage->Caption = AnsiString("Page") + IntToStr(i);
      TEdit *pEdit = new TEdit(this);
      pEdit->Parent = pPage;
      pEdit->Left = random(pPage->ClientWidth - pEdit->Width);
      pEdit->Top = random(pPage->ClientHeight - pEdit->Height);
    }
    PageControl1Change(Sender);
  }
```

Delphi Examples:

```
{
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
}
procedure TForm1.CheckBox1Click(Sender: TObject);
begin
  PageControl1.ActivePage.Visible := CheckBox1.Checked;
end;

procedure TForm1.PageControl1Change(Sender: TObject);
begin
  CheckBox1.Checked := PageControl1.ActivePage.Visible;
end;

procedure TForm1.FormCreate(Sender: TObject);
var
  i: Integer;
begin
  for i := 0 to 9 do
    with TTabSheet.Create(Self) do
    begin
      PageControl := PageControl1;
      Caption := 'TabSheet' + IntToStr(i);
      with TEdit.Create(Self) do
      begin
        Parent := PageControl1.Pages[i];
        Left := Random(PageControl1.ActivePage.ClientWidth - Width);
        Top := Random(PageControl1.ActivePage.ClientHeight - Height);
      end;
    end;
    PageControl1Change(Sender);
end;
```

68.1.25.6 TImage Events

The events of the TImage class are listed here.

Published Events

	Name	Description
	OnClick (see page 12814)	Occurs when the user clicks the control.
	OnContextPopup (see page 12816)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnDblClick (see page 12817)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDragDrop (see page 12817)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 12819)	Occurs when the user drags an object over a control.
	OnEndDock (see page 12822)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 12822)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnMouseActivate (see page 12823)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 12824)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseEnter (see page 12826)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 12826)	Occurs when the user moves the mouse outside of a control.
	OnMouseMove (see page 12827)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 12829)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnProgress (see page 12831)	Occurs periodically during slow operations that affect the image.
	OnStartDock (see page 12832)	Occurs when the user begins to drag a control with a DragKind of dkDock.
	OnStartDrag (see page 12832)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.

68.1.25.6.1 TImage.OnClick Event

Occurs when the user clicks the control.

Pascal

```
property OnClick: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnClick;
```

Description

Use the OnClick event handler to respond when the user clicks the control. If the control has an associated action, and that action has an OnExecute method, the action's OnExecute method responds to click events unless it is superseded by an OnClick event handler.

Usually OnClick occurs when the user presses and releases the left mouse button with the mouse pointer over the control. This event can also occur when:

- The user selects an item in a grid, outline, list, or combo box by pressing an arrow key.
- The user presses Spacebar while a button or check box has focus.
- The user presses Enter when the active form has a default button (specified by the Default property).
- The user presses Esc when the active form has a cancel button (specified by the Cancel property).
- The user presses the accelerator key for a button or check box. For example, if the value of the Caption property of a check box is '&Bold', the B is underlined at runtime and the OnClick event of the check box is triggered when the user presses Alt+B. However, focus does not move to the control in these instances.
- The Checked property of a radio button is set to true.
- The value of the Checked property of a check box is changed.

- The Click method of a menu item is called.

For a form, an OnClick event occurs when the user clicks a blank area of the form or on a disabled component.

C++ Examples:

```
/*
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
*/
void __fastcall TForm1::PageControl1Change(TObject *Sender)
{
  CheckBox1->Checked = PageControl1->ActivePage->Visible;
}

void __fastcall TForm1::CheckBox1Click(TObject *Sender)
{
  PageControl1->ActivePage->Visible = CheckBox1->Checked;
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < 10; i++)
  {
    TTabSheet *pPage = new TTabSheet(this);
    pPage->PageControl = PageControl1;
    pPage->Caption = AnsiString("Page") + IntToStr(i);
    TEdit *pEdit = new TEdit(this);
    pEdit->Parent = pPage;
    pEdit->Left = random(pPage->ClientWidth - pEdit->Width);
    pEdit->Top = random(pPage->ClientHeight - pEdit->Height);
  }
  PageControl1Change(Sender);
}
```

Delphi Examples:

```
{
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
}
procedure TForm1.CheckBox1Click(Sender: TObject);
begin
  PageControl1.ActivePage.Visible := CheckBox1.Checked;
end;

procedure TForm1.PageControl1Change(Sender: TObject);
begin
  CheckBox1.Checked := PageControl1.ActivePage.Visible;
end;

procedure TForm1.FormCreate(Sender: TObject);
var
  i: Integer;
begin
  for i := 0 to 9 do
    with TTabSheet.Create(Self) do
    begin
      PageControl := PageControl1;
      Caption := 'TabSheet' + IntToStr(i);
      with TEdit.Create(Self) do
```

```
        begin
          Parent := PageControl1.Pages[i];
          Left := Random(PageControl1.ActivePage.ClientWidth - Width);
          Top := Random(PageControl1.ActivePage.ClientHeight - Height);
        end;
      end;
      PageControl1Change(Sender);
  end;
```

Adding Silent Video Clips to an Application

68.1.25.6.2 TImage.OnContextPopup Event

Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).

Pascal

```
property OnContextPopup: TContextPopupEvent;
```

C++

```
__property TContextPopupEvent OnContextPopup;
```

Description

The OnContextPopup handler is called when the user uses the mouse or keyboard to request a popup menu. The OnContextPopup event is generated by a WM_CONTEXTMENU message, which is itself generated by the user clicking the right mouse button or by pressing SHIFT+F10 or the Applications key.

This event is especially useful when the control does not have an associated popup menu (the PopupMenu property is not set) or if the AutoPopup property of the control's associated popup menu is false. However, the OnContextPopup can also be used to override the automatic context menu that appears when the control has an associated popup menu with an AutoPopup property of true. In this last case, if the event handler displays its own menu, it should set the Handled parameter to true to suppress the default context menu.

The handler's MousePos parameter indicates the position of the mouse, in client coordinates.. If the event was not generated by a mouse click, MousePos is (-1,-1).

Note: Parent controls receive an OnContextPopup event before their child controls. In addition, for many child controls, the default window procedure causes the parent control to receive an OnContextPopup event after the child control. As a result, when parent controls do not set Handled to true in an OnContextPopup event handler, the event handler may be called multiple times for each context menu invocation.

PopupMenu (see page 5835)

AutoPopup (see page 16178)

68.1.25.6.3 TImage.OnDblClick Event

Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.

Pascal

```
property OnDblClick: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnDblClick;
```

Description

Use the OnDblClick event to respond to mouse double-clicks.

See Also

OnClick (see page 5851)

Responding to User Actions at Runtime

68.1.25.6.4 TImage.OnDragDrop Event

Occurs when the user drops an object being dragged.

Pascal

```
property OnDragDrop: TDragDropEvent;
```

C++

```
__property TDragDropEvent OnDragDrop;
```

Description

Use the OnDragDrop event handler to specify what happens when the user drops an object. The Source parameter of the OnDragDrop event is the object being dropped, and the Sender is the control the object is being dropped on. The X and Y parameters are the coordinates of the mouse positioned over the control.

C++ Examples:

```
/*
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
*/

// This OnDragOver event handler permits the list box to
// accept a dropped label:
void __fastcall TForm1::ListBox1DragOver(TObject *Sender, TObject *Source, int X, int Y,
TDragState State, bool &Accept)
{
   Accept = Source->ClassNameIs("TLabel");
}

/*
This OnDragDrop event handler implements the drop behavior.
*/
void __fastcall TForm1::ListBox1DragDrop(TObject *Sender, TObject *Source, int X, int Y)
{
  if (Sender->ClassNameIs("TListBox") && Source->ClassNameIs("TLabel"))
  {
```

```
    TListBox *DestList = (TListBox *)Sender;
    DestList->Font = ((TLabel *)Source)->Font;
    DestList->Color = ((TLabel *)Source)->Color;
    DestList->DoubleBuffered = true;
    DestList->Color = clWindow;
  }
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  ListBox1->Items->Add("Not");
  ListBox1->Items->Add("In");
  ListBox1->Items->Add("Alphabetical");
  ListBox1->Items->Add("Order");

}
```

Delphi Examples:

```
{
This code is an OnDragOver event handler that won't allow a
label control to be dropped on a panel control and stops the
dragging of the label as soon as the user drags the label
onto the panel:
Note: Set the label's DragMode property to dmAutomatic.
}
procedure TForm1.FormDragDrop(Sender, Source: TObject; X, Y: Integer);
begin
  TForm1(Source).Left := X;
  TForm1(Source).Top := Y;
end;

procedure TForm1.FormDragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := Source is TLabel;
end;

procedure TForm1.Panel1DragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := False;
  if (Source is TLabel) and (State = dsDragEnter) then
    (Source as TLabel).EndDrag(False);
end;
{
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
}

procedure TForm1.FormCreate(Sender: TObject);
begin
  ListBox1.Items.Add('Not');
  ListBox1.Items.Add('In');
  ListBox1.Items.Add('Alphabetical');
  ListBox1.Items.Add('Order');
end;

// This OnDragOver event handler permits the list box to
// accept a dropped label:

procedure TForm1.ListBox1DragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
```

```
begin
  Accept := Source is TLabel;
end;

// This OnDragDrop event handler implements the drop behavior.

procedure TForm1.ListBox1DragDrop(Sender, Source: TObject; X, Y: Integer);
begin
  if (Sender is TListBox) and (Source is TLabel) then
  begin
    with Sender as TListBox do
    begin
      Font := (Source as TLabel).Font;
      Color := (Source as TLabel).Color;
      DoubleBuffered := true;
      Color := clWindow;
    end;
  end;
end;
```

68.1.25.6.5 TImage.OnDragOver Event

Occurs when the user drags an object over a control.

Pascal

```
property OnDragOver: TDragOverEvent;
```

C++

```
__property TDragOverEvent OnDragOver;
```

Description

Use an OnDragOver event to signal that the control can accept a dragged object so the user can drop or dock it.

Within the OnDragOver event handler, change the Accept parameter to false to reject the dragged object. Leave Accept as true to allow the user to drop or dock the dragged object on the control.

To change the shape of the cursor, indicating that the control can accept the dragged object, change the value of the DragCursor property for the control before the OnDragOver event occurs.

The Source is the object being dragged, the Sender is the potential drop or dock site, and X and Y are screen coordinates in pixels. The State parameter specifies how the dragged object is moving over the control.

Note: Within the OnDragOver event handler, the Accept parameter defaults to true. However, if an OnDragOver event handler is not supplied, the control rejects the dragged object, as if the Accept parameter were changed to false.

C++ Examples:

```
/*
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
*/

// This OnDragOver event handler permits the list box to
// accept a dropped label:
void __fastcall TForm1::ListBox1DragOver(TObject *Sender, TObject *Source, int X, int Y,
TDragState State, bool &Accept)
{
   Accept = Source->ClassNameIs("TLabel");
}

/*
This OnDragDrop event handler implements the drop behavior.
*/
void __fastcall TForm1::ListBox1DragDrop(TObject *Sender, TObject *Source, int X, int Y)
{
  if (Sender->ClassNameIs("TListBox") && Source->ClassNameIs("TLabel"))
  {
    TListBox *DestList = (TListBox *)Sender;
    DestList->Font = ((TLabel *)Source)->Font;
    DestList->Color = ((TLabel *)Source)->Color;
    DestList->DoubleBuffered = true;
    DestList->Color = clWindow;
  }
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  ListBox1->Items->Add("Not");
  ListBox1->Items->Add("In");
  ListBox1->Items->Add("Alphabetical");
  ListBox1->Items->Add("Order");

}
```

Delphi Examples:

```
{
This code is an OnDragOver event handler that won't allow a
label control to be dropped on a panel control and stops the
dragging of the label as soon as the user drags the label
onto the panel:
Note: Set the label's DragMode property to dmAutomatic.
}

68.1.25.6.6 TImage.OnEndDock Event

Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.

Pascal

```
property OnEndDock: TEndDragEvent;
```

C++

```
__property TEndDragEvent OnEndDock;
```

Description

Use OnEndDock to specify actions or special processing that when a drag-and-dock operation stops.

68.1.25.6.7 TImage.OnEndDrag Event

Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.

Pascal

```
property OnEndDrag: TEndDragEvent;
```

C++

```
__property TEndDragEvent OnEndDrag;
```

Description

Use the OnEndDrag event handler to specify any special processing that occurs when dragging stops.

C++ Examples:

```
/*
This code displays a message in a label named Status. The
message displayed depends on whether the dragged label
control was successfully dropped into and accepted by a
another control.
*/
void __fastcall TForm1::Label1EndDrag(TObject *Sender, TObject *Target, int X,
      int Y)
{
  if (Sender->ClassNameIs("TLabel"))
  {
    AnsiString S = ((TLabel *)Sender)->Name + " was dropped and ";
    if (Target)
      S = S + "accepted!";
    else
      S = S + "rejected.";
    Status->Caption = S;
  }
}
```

Delphi Examples:

```
{
```

```
This code displays a message in a label named Status. The
message displayed depends on whether the dragged label
control was successfully dropped into and accepted by a
another control.
}
procedure TForm1.Label1EndDrag(Sender, Target: TObject; X, Y: Integer);
var
  S: string;
begin
  S := (Sender as TLabel).Name + ' was dropped... and ';
  if Target <> nil then
    S := S + 'accepted!'
  else
    S := S + 'rejected!';
  Status.Caption := S;
end;

68.1.25.6.8 TImage.OnMouseActivate Event

Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.

Pascal

```
property OnMouseActivate: TMouseActivateEvent;
```

C++

```
__property TMouseActivateEvent OnMouseActivate;
```

Description

Use the OnMouseActivate event handler to implement any special processing that should occur as a result of pressing a mouse button on a control when the parent top-level form is not active.

The event type is:

```
TMouseActivateEvent = procedure (Sender: TObject; Button: TMouseButton; ShiftState:
TShiftState;
X, Y: Integer; HitTest: Integer; var MouseActivate: TMouseActivate) of object;
```

When you click on a control and the parent top-level form is not active, this event fires on the control that the mouse cursor is over. MouseActivate is a protected virtual function in TControl. MouseActivate can be overridden in custom control descendants to provide special built-in processing of the OnMouseActivate events. If you leave the default value of MouseActivate as maDefault, the parent control fires the OnMouseActivate event and repeats the process all the way up to the top-level form. If no control in the chain sets the value of MouseActivate, the behavior is the same as if a control set TMouseActivate to maActivate. At any point, a control can set the value of TMouseActivate and the parent processing stops.

Some controls set focus to themselves when they get a button down message so, in some cases, setting maNoActivate appears to have no effect. For instance, a TButton control sets focus to itself in the WM_LBUTTONDOWN message regardless of whether or not TMouseActivate is set to maNoActivate. In this case, setting maNoActivateAndEat will work because the top-level form is not activated and the WM_LBUTTONDOWN message is suppressed.

The HitTest parameter is the hit test value obtained from the WM_NCHITTEST message. See Windows.pas for valid values and their meanings. In most cases this value will be HTCLIENT, which means that the user clicked in the client area of a control.

However, in the case of a top-level form, this can take other values such as HTCAPTION, or HTBOTTOM. This allows the code to decide which value to set for MouseActivate, based on the HitTest code. For example, the following code in the OnMouseActivate event handler for a TForm forces the user to click into a non-client area to activate the form:

```
if HitTest = HTCLIENT then
    MouseActivate := maNoActivateAndEat;
```

Even though this event is tied to how Windows processes WM_MOUSEACTIVATE, the actual handling of the message is done at the TControl level, which is the point in the VCL hierarchy where the control has no window handle. The OnMouseActivate event is then simulated since the all TControl descendants also have OnMouseDown, OnMouseMove, and OnMouseUp events. This information is applicable to both VCL Win32 and VCL.NET.

68.1.25.6.9 TImage.OnMouseDown Event

Occurs when the user presses a mouse button with the mouse pointer over a control.

Pascal

```
property OnMouseDown: TMouseEvent;
```

C++

```
__property TMouseEvent OnMouseDown;
```

Description

Use the OnMouseDown event handler to implement any special processing that should occur as a result of pressing a mouse button.

The OnMouseDown event handler can respond to left, right, or center mouse button presses and shift key plus mouse-button combinations. Shift keys are the Shift, Ctrl, and Alt keys. X and Y are the pixel coordinates of the mouse pointer in the client area of the Sender.

C++ Examples:

```
/*
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a
rectangle is drawn on the form. When the mouse button is
released, the rectangle appears on the form's canvas. Its
top-left and bottom-right corners are defined by the
location of the mouse pointer when the user pressed and
released the mouse button.  While the user drags the mouse,
the location of the top, left, bottom, and right sides of
the rectangle are displayed in the status bar.
*/
int StartX, StartY; // Declare at the top of the form's unit
// Use this code as the OnMouseDown event handler of the form:
void __fastcall TForm1::FormMouseDown(TObject *Sender, TMouseButton Button, TShiftState Shift,
int X, int Y)
{
  StartX = X;
  StartY = Y;
```

```
}

// Use this code as the OnMouseUp event handler of the form:
void __fastcall TForm1::FormMouseUp(TObject *Sender, TMouseButton Button, TShiftState Shift,
int X, int Y)
{
  Form1->Canvas->Rectangle(StartX, StartY, X, Y);
  StatusBar1->Panels->Items[0]->Text = "";
  StatusBar1->Panels->Items[1]->Text = "";
  StatusBar1->Panels->Items[2]->Text = "";
  StatusBar1->Panels->Items[3]->Text = "";
}

// Use this code as the OnMouseMove event handler of the form:
void __fastcall TForm1::FormMouseMove(TObject *Sender, TShiftState Shift, int X, int Y)
{
  if (Shift.Contains(ssLeft)) // make sure button is down
  {
    if (Y > StartY)
    {
      StatusBar1->Panels->Items[0]->Text = "Top: " + IntToStr(StartY);
      StatusBar1->Panels->Items[2]->Text = "Bottom: " + IntToStr(Y);
    }
    else
    {
      StatusBar1->Panels->Items[0]->Text = "Top: " + IntToStr(Y);
      StatusBar1->Panels->Items[2]->Text = "Bottom: " + IntToStr(StartY);
    }
    if (X > StartX)
    {
      StatusBar1->Panels->Items[1]->Text = "Left: " + IntToStr(StartX);
      StatusBar1->Panels->Items[3]->Text = "Right: " + IntToStr(X);
    }
    else
    {
      StatusBar1->Panels->Items[1]->Text = "Left: " + IntToStr(X);
      StatusBar1->Panels->Items[3]->Text = "Right: " + IntToStr(StartX);
    }
  }
}
```

Delphi Examples:

```
{
The following example requires a form with a four-paneled

68.1.25.6.10 TImage.OnMouseEnter Event

Occurs when the user moves the mouse into a control.

Pascal

```
property OnMouseEnter: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnMouseEnter;
```

Description

Use the OnMouseEnter event handler to implement any special processing that should occur as a result of moving the mouse into a control when the parent top-level form is not active.

68.1.25.6.11 TImage.OnMouseLeave Event

Occurs when the user moves the mouse outside of a control.

Pascal

```
property OnMouseLeave: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnMouseLeave;
```

Description

Use the OnMouseLeave event handler to implement any special processing that should occur as a result of moving the mouse outside of a control when the parent top-level form is not active.

68.1.25.6.12 TImage.OnMouseMove Event

Occurs when the user moves the mouse pointer while the mouse pointer is over a control.

Pascal

```
property OnMouseMove: TMouseMoveEvent;
```

C++

```
__property TMouseMoveEvent OnMouseMove;
```

Description

Use the OnMouseMove event handler to respond when the mouse pointer moves after the control has captured the mouse.

Use the Shift parameter of the OnMouseDown event handler, to determine to the state of the shift keys and mouse buttons. Shift keys are the Shift, Ctrl, and Alt keys or shift key-mouse button combinations. X and Y are pixel coordinates of the new location of the mouse pointer in the client area of the Sender.

C++ Examples:

```
/*
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a

68.1.25.6.13 TImage.OnMouseUp Event

Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.

Pascal

```
property OnMouseUp: TMouseEvent;
```

C++

```
__property TMouseEvent OnMouseUp;
```

Description

Use an OnMouseUp event handler to implement special processing when the user releases a mouse button.

The OnMouseUp event handler can respond to left, right, or center mouse button presses and shift key plus mouse-button combinations. Shift keys are the Shift, Ctrl, and Alt keys. X and Y are the pixel coordinates of the mouse pointer in the client area of the Sender.

C++ Examples:

```
/*
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a

released the mouse button.  While the user drags the mouse,
the location of the top, left, bottom, and right sides of
the rectangle are displayed in the status bar.
*/
int StartX, StartY; // Declare at the top of the form's unit
// Use this code as the OnMouseDown event handler of the form:
void __fastcall TForm1::FormMouseDown(TObject *Sender, TMouseButton Button, TShiftState Shift,
```

```
int X, int Y)
{
  StartX = X;
  StartY = Y;
}

// Use this code as the OnMouseUp event handler of the form:
void __fastcall TForm1::FormMouseUp(TObject *Sender, TMouseButton Button, TShiftState Shift,
int X, int Y)
{
  Form1->Canvas->Rectangle(StartX, StartY, X, Y);
  StatusBar1->Panels->Items[0]->Text = "";
  StatusBar1->Panels->Items[1]->Text = "";
  StatusBar1->Panels->Items[2]->Text = "";
  StatusBar1->Panels->Items[3]->Text = "";
}

// Use this code as the OnMouseMove event handler of the form:
void __fastcall TForm1::FormMouseMove(TObject *Sender, TShiftState Shift, int X, int Y)
{
  if (Shift.Contains(ssLeft)) // make sure button is down
  {
    if (Y > StartY)
    {
      StatusBar1->Panels->Items[0]->Text = "Top: " + IntToStr(StartY);
      StatusBar1->Panels->Items[2]->Text = "Bottom: " + IntToStr(Y);
    }
    else
    {
      StatusBar1->Panels->Items[0]->Text = "Top: " + IntToStr(Y);
      StatusBar1->Panels->Items[2]->Text = "Bottom: " + IntToStr(StartY);
    }
    if (X > StartX)
    {
      StatusBar1->Panels->Items[1]->Text = "Left: " + IntToStr(StartX);
      StatusBar1->Panels->Items[3]->Text = "Right: " + IntToStr(X);
    }
    else
    {
      StatusBar1->Panels->Items[1]->Text = "Left: " + IntToStr(X);
      StatusBar1->Panels->Items[3]->Text = "Right: " + IntToStr(StartX);
    }
  }
}
```

Delphi Examples:

```
{
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a
rectangle is drawn on the form. When the mouse button is
released, the rectangle appears on the form’s canvas. Its
top-left and bottom-right corners are defined by the
location of the mouse pointer when the user pressed and
released the mouse button.  While the user drags the mouse,
the location of the top, left, bottom, and right sides of
the rectangle are displayed in the status bar.
}
procedure TForm1.FormMouseDown(Sender: TObject; Button: TMouseButton; Shift: TShiftState; X,
Y: Integer);
begin
  StartX := X;
  StartY := Y;
end;
```

```
procedure TForm1.FormMouseUp(Sender: TObject; Button: TMouseButton; Shift: TShiftState; X, Y:
Integer);
begin
  Form1.Canvas.Rectangle(StartX, StartY, X, Y);
  StatusBar1.Panels[0].Text := '';
  StatusBar1.Panels[1].Text := '';
  StatusBar1.Panels[2].Text := '';
  StatusBar1.Panels[3].Text := '';
end;

procedure TForm1.FormMouseMove(Sender: TObject; Shift: TShiftState; X, Y: Integer);
begin
  if ssLeft in Shift then { make sure button is down }
  begin
    if Y > StartY then
      begin
      StatusBar1.Panels[0].Text := 'Top: ' + IntToStr(StartY);
      StatusBar1.Panels[2].Text := 'Bottom: ' + IntToStr(Y);
      end
    else
      begin
      StatusBar1.Panels[0].Text := 'Top: ' + IntToStr(Y);
      StatusBar1.Panels[2].Text := 'Bottom: ' + IntToStr(StartY);
      end;
    if X > StartX then
      begin
      StatusBar1.Panels[1].Text := 'Left: ' + IntToStr(StartX);
      StatusBar1.Panels[3].Text := 'Right: ' + IntToStr(X);
      end
    else
      begin
      StatusBar1.Panels[1].Text := 'Left: ' + IntToStr(X);
      StatusBar1.Panels[3].Text := 'Right: ' + IntToStr(StartX);
      end;
  end;
end;
```

68.1.25.6.14 TImage.OnProgress Event

Occurs periodically during slow operations that affect the image.

Pascal

```
property OnProgress: TProgressEvent;
```

C++

```
__property TProgressEvent OnProgress;
```

Description

Write an OnProgress event handler to provide the user with feedback during slow operations such as loading large compressed images.

Note: The PercentDone parameter of the event handler is only an approximation. With some image formats, the value of PercentDone may actually decrease from the value in previous events, as the graphic object discovers there is more work to do.

See Also

IncrementalDisplay (see page 12801)

OnProgress (see page 14603)

TProgressBar (see page 4615)

68.1.25.6.15 TImage.OnStartDock Event

Occurs when the user begins to drag a control with a DragKind of dkDock.

Pascal

```
property OnStartDock: TStartDockEvent;
```

C++

```
__property TStartDockEvent OnStartDock;
```

Description

Use the OnStartDock event handler to implement special processing when the user starts a drag-and-dock operation by dragging the control.

The OnStartDock event handler can create a TDragDockObjectEx object for the DragObject parameter to specify the appearance of the dragging rectangle and how the dragged control interacts with potential docking sites. If you return TDragDockObjectEx as the drag object, there is no need to call the Free method for the DragObject when dragging is over. If you use TDragDockObject, your application is responsible for freeing the drag object.

If the OnStartDock event handler sets the DragObject parameter to nil (Delphi) or NULL (C++), a TDragDockObject object is automatically created.

Note: This information applies to Win32 applications only.

68.1.25.6.16 TImage.OnStartDrag Event

Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.

Pascal

```
property OnStartDrag: TStartDragEvent;
```

C++

```
__property TStartDragEvent OnStartDrag;
```

Description

Use the OnStartDrag event handler to implement special processing when the user starts to drag the control or an object it contains. OnStartDrag only occurs if DragKind is dkDrag.

Sender is the control that is about to be dragged, or that contains the object about to be dragged.

The OnStartDrag event handler can create a TDragControlObjectEx instance for the DragObject parameter to specify the drag cursor, or, optionally, a drag image list. If you create a TDragControlObjectEx instance, there is no need to call the Free method for the DragObject when dragging is over. If you create, instead, a TDragControlObject instance, your application is responsible for freeing the drag object instance.

If the OnStartDrag event handler sets the DragObject parameter to nil (Delphi) or NULL (C++), a TDragControlObject object is automatically created and dragging begins on the control itself.

Note: On some controls, such as TRichEdit, the underlying Windows control handles internal drag operations. For these controls, there are no OnStartDrag or OnEndDrag events for drag operations within the control.

68.1.26 TLabeledEdit Class

TLabeledEdit is an edit control that has an associated label.

Class Hierarchy

Pascal

```
TLabeledEdit = class(TCustomLabeledEdit);
```

C++

```
class TLabeledEdit : public TCustomLabeledEdit;
```

File

ExtCtrls

Description

Use TLabeledEdit to add an edit control with a label to a form. TLabeledEdit works with an associated label control, which is the value of its EditLabel (see page 12855) property. The position of that label relative to the edit control is determined by the LabelPosition (see page 12858) and LabelSpacing (see page 12859) properties.

Use the Text (see page 12870) property to work with the text in the control, and the label's Caption property to work with the text in the label.

TMaskEdit (see page 15824)

68.1.26.1 TLabeledEdit Members

The following tables list the members exposed by TLabeledEdit.

Protected Events

	Name	Description
	OnAlignInsertBefore (see page 6213)	Occurs when an object with custom alignment is aligned.
	OnAlignPosition (see page 6214)	Occurs when an object with custom alignment is aligned.
	OnCanResize (see page 5851)	Occurs when an attempt is made to resize the control.
	OnConstrainedResize (see page 5853)	Adjust resize constraints.
	OnDockDrop (see page 6214)	Occurs when another control is docked to the control.
	OnDockOver (see page 6216)	Occurs when another control is dragged over the control.
	OnGetSiteInfo (see page 6223)	Returns the control's docking information.
	OnMouseWheel (see page 5869)	Occurs when the mouse wheel is rotated.
	OnMouseWheelDown (see page 5869)	Occurs when the mouse wheel is rotated downward.
	OnMouseWheelUp (see page 5870)	Occurs when the mouse wheel is rotated upward.
	OnResize (see page 5870)	Occurs immediately after the control is resized.
	OnUnDock (see page 6230)	Occurs when the application tries to undock a control that is docked to the windowed control.

Protected Fields

	Name	Description
	FAnchorMove (see page 5733)	This is FAnchorMove, a member of class TControl.
	FAnchorOrigin (see page 5734)	This is FAnchorOrigin, a member of class TControl.
	FAnchorRules (see page 5734)	This is FAnchorRules, a member of class TControl.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FDesignSize (see page 6124)	This is FDesignSize, a member of class TWinControl.
	FDoubleBuffered (see page 6124)	This is FDoubleBuffered, a member of class TWinControl.
	FExplicitHeight (see page 5734)	This is FExplicitHeight, a member of class TControl.
	FExplicitLeft (see page 5734)	This is FExplicitLeft, a member of class TControl.
	FExplicitTop (see page 5734)	This is FExplicitTop, a member of class TControl.
	FExplicitWidth (see page 5735)	This is FExplicitWidth, a member of class TControl.
	FInImeComposition (see page 6125)	This is FInImeComposition, a member of class TWinControl.
	FOriginalParentSize (see page 5735)	This is FOriginalParentSize, a member of class TControl.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	ActionChange (see page 5737)	Responds when the action associated with the control changes.
V	ActionChange (see page 6127)	Updates the control to reflect changes in its associated action.
	AddBiDiModeExStyle (see page 6128)	Sets control's window style according to its bi-directional support.
V	AdjustClientRect (see page 6128)	Provides the interface that adjusts the ClientRect (see page 5810) property for idiosyncrasies of the window.
	AdjustSize (see page 5738)	Sets the size of the control as determined by the AutoSize (see page 5803) property.
V	AdjustSize (see page 6129)	Adjusts the control's size according to its contents and constraints.
V	AlignControls (see page 6129)	Aligns any controls for which the control is the parent within a specified area of the control.
	ArrangeControl (see page 6130)	This is ArrangeControl, a member of class TWinControl.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	AssignTo (see page 5739)	Overrides the inherited AssignTo function to enable assignments to TAction objects.

	AssignTo (see page 6130)	Copies the properties of the windowed control to another object.
	BeginAutoDrag (see page 5739)	Begin Automatic Drag.
	CalcCursorPos (see page 5741)	This is CalcCursorPos, a member of class TControl.
	CanAutoSize (see page 5741)	Indicates whether the control can resize itself automatically to accommodate its contents.
	CanAutoSize (see page 6131)	Indicates how the control can be resized.
	CanResize (see page 5742)	OnCanResize (see page 5851) event dispatcher.
	CanResize (see page 6132)	Indicates how the control can respond to a resize attempt.
	Change (see page 21245)	Generates an OnChange (see page 21275) event.
	Changed (see page 5742)	Sends a CM_CHANGED (see page 6330) message to the control.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	ChangeScale (see page 5743)	Rescaling event dispatcher.
	ChangeScale (see page 6132)	Resize (see page 5780) and reposition children and self.
	Click (see page 5743)	Respond to user click.
	CMBidimodechanged (see page 12521)	This is CMBidimodechanged, a member of class TCustomLabeledEdit.
	CMEnabledchanged (see page 12521)	Responds when the Enabled property changes.
	CMVisiblechanged (see page 12521)	Responds when the Visible property changes.
	ConstrainedResize (see page 5746)	Notify control of resize with constraints.
	ConstrainedResize (see page 6133)	Generates an OnConstrainedResize (see page 5853) event.
	ControlsAligned (see page 6134)	This is ControlsAligned, a member of class TWinControl.
	CreateDockManager (see page 6134)	Creates the dock manager for the control.
	CreateHandle (see page 6135)	Creates underlying screen object.
	CreateParams (see page 6135)	Initializes a window-creation parameter data structure.
	CreateParams (see page 21248)	Initializes a window-creation parameter record passed in the Params parameter.
	CreateSubClass (see page 6136)	Creates a windowed control derived from an existing Windows window class.
	CreateWindowHandle (see page 6137)	Creates a Windows control to represent the control.
	CreateWindowHandle (see page 21248)	Creates a Windows control to represent the control.
	CreateWnd (see page 6137)	Creates the underlying window.
	CreateWnd (see page 21248)	Creates a Windows control corresponding to the edit control.
	CustomAlignInsertBefore (see page 6137)	Returns placement order of custom-aligned child control.
	CustomAlignPosition (see page 6138)	Returns aligned position of custom-aligned child control.
	DblClick (see page 5747)	OnDblClick (see page 5854) event dispatcher.
	DefaultDockImage (see page 5747)	Handles the painting and erasing of a dock image.
	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	DefineProperties (see page 5748)	Provides methods to read and write the IsControl (see page 5829) property to a stream such as a form file.
	DefineProperties (see page 6139)	Provides methods to read and write the IsControl property to a stream such as a form file.
	DesignWndProc (see page 5749)	This is DesignWndProc, a member of class TControl.
	DestroyHandle (see page 6140)	Destroys the control's window without destroying the control.
	DestroyWindowHandle (see page 6140)	Destroys the window created in the CreateWindowHandle (see page 6137) method.
	DestroyWnd (see page 6141)	Destroys the control's window.
	DestroyWnd (see page 21251)	Destroys the Windows control that corresponds to the edit control.
	DoAddDockClient (see page 6142)	Performs actions when a control is docked to the windowed control.
	DockOver (see page 6143)	Responds when a docking client is dragged over the windowed control.
	DockReplaceDockClient (see page 6143)	This is DockReplaceDockClient, a member of class TWinControl.
	DockTrackNoTarget (see page 5749)	Handles dragging of the control over an invalid docking target.
	DoContextPopup (see page 5750)	OnContextPopup (see page 5854) event dispatcher.
	DoDock (see page 5750)	Docking event dispatcher.
	DoDockOver (see page 6143)	Generates an OnDockOver (see page 6216) event.
	DoEndDock (see page 5750)	OnEndDock (see page 5859) event dispatcher.

	DoEndDrag (see page 5751)	OnEndDrag (see page 5860) event dispatcher.
	DoEnter (see page 6144)	Respond to receiving input focus.
	DoExit (see page 6144)	Respond to losing input focus
	DoFlipChildren (see page 6145)	Flips the control's children.
	DoKeyDown (see page 6145)	Performs some preprocessing before generating an OnKeyDown (see page 6225) event.
	DoKeyPress (see page 6146)	Performs some preprocessing before generating an OnKeyPress (see page 6227) event.
	DoKeyUp (see page 6146)	Performs some preprocessing before generating an OnKeyUp (see page 6228) event.
	DoMouseWheel (see page 5751)	Processes mouse wheel motion.
	DoMouseWheelDown (see page 5752)	OnMouseWheelDown (see page 5869) event dispatcher.
	DoMouseWheelUp (see page 5752)	OnMouseWheelUp (see page 5870) event dispatcher.
	DoRemoveDockClient (see page 6147)	Responds when a control is undocked from the windowed control.
	DoSetMaxLength (see page 21251)	Sets the MaxLength (see page 21263) property.
	DoStartDock (see page 5753)	OnStartDock (see page 5871) event dispatcher.
	DoStartDrag (see page 5753)	OnStartDrag (see page 5871) event dispatcher.
	DoUnDock (see page 6147)	Undocks a control that is currently docked to the windowed control.
	DragCanceled (see page 5754)	Provides the interface for a method that responds to the cancellation of a drag.
	DragOver (see page 5755)	OnDragOver (see page 5857) event dispatcher.
	DrawDragDockImage (see page 5755)	Draws the dock image for the control.
	EraseDragDockImage (see page 5757)	Erases the dock image for the control.
	FindNextControl (see page 6149)	Returns the control's next child in the tab order after the specified control.
	FixupTabList (see page 6149)	Sorts the child controls by their tab order.
	GetAction (see page 5758)	This is GetAction, a member of class TControl.
	GetActionLinkClass (see page 5758)	Returns the appropriate action link class that is associated with the control class.
	GetActionLinkClass (see page 6152)	Returns the associated action link class.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetChildren (see page 6153)	Calls a specified method for each child of the control.
	GetClientOrigin (see page 5758)	Returns the screen coordinates of the top-left corner of the control's client area.
	GetClientOrigin (see page 6153)	Returns the value of the ClientOrigin (see page 5809) property.
	GetClientRect (see page 5759)	Returns a rectangle defining the client area of the control.
	GetClientRect (see page 6154)	Returns the value of the ClientRect (see page 5810) property.
	GetControlExtents (see page 6154)	Returns the smallest rectangle in which all the control's children fit.
	GetDeviceContext (see page 5760)	Returns a device context for the control.
	GetDeviceContext (see page 6155)	Provides access to a device context for the control.
	GetDockEdge (see page 5763)	Returns the edge on which another control should be docked when it is dragged over the control.
	GetDragImages (see page 5763)	Returns the control's image list containing the image to be displayed while dragging.
	GetEnabled (see page 5763)	Returns the value of the Enabled (see page 5821) property.
	GetFloating (see page 5764)	Returns the value of the Floating (see page 5823) property.
	GetFloatingDockSiteClass (see page 5764)	Returns the class used for the control when it is floating.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetPalette (see page 5765)	Returns the handle to a palette for use by the control.
	GetParentHandle (see page 6157)	Returns the window handle for the window of the control's parent.
	GetPopupMenu (see page 5765)	Returns the pop-up menu associated with the control.
	GetSelLength (see page 21252)	Returns the SelLength (see page 21265) property.
	GetSelStart (see page 21252)	Returns the SelStart (see page 21269) property.
	GetSelText (see page 21252)	Returns the SelText (see page 21272) property.

	GetSiteInfo (see page 6158)	Generates an OnGetSiteInfo (see page 6223) event
	GetTopParentHandle (see page 6159)	Returns the window handle of the first window not associated with a VCL control that contains the windowed control.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	InvalidateDockHostSite (see page 6162)	This is InvalidateDockHostSite, a member of class TWinControl.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsControlActivateMsg (see page 6162)	This is IsControlActivateMsg, a member of class TWinControl.
	IsControlMouseMsg (see page 6162)	Indicates whether a specified mouse message is directed to one of the windowed control's child controls.
	IsQualifyingSite (see page 6163)	This is IsQualifyingSite, a member of class TWinControl.
	KeyDown (see page 6163)	Respond to key press events.
	KeyPress (see page 6163)	Respond to keyboard input.
	KeyUp (see page 6164)	Respond to released key.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Loaded (see page 5771)	Initializes the control after it is loaded from a stream.
	MainWndProc (see page 6165)	Receives Windows messages for the control.
	MouseActivate (see page 5773)	This is MouseActivate, a member of class TControl.
	MouseDown (see page 5773)	OnMouseDown (see page 5862) event dispatcher.
	MouseMove (see page 5773)	Respond to mouse moving over control area..
	MouseUp (see page 5774)	OnMouseUp (see page 5867) event dispatcher.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	Notification (see page 5775)	Responds to notifications that components are being created or destroyed.
V	Notification (see page 6165)	Responds to notifications that components are being created or destroyed.
V	Notification (see page 12522)	Responds to notifications when objects are created or destroyed.
	NotifyControls (see page 6165)	Sends a message to all the child controls.
	PaintControls (see page 6166)	Paints each of the child controls in a windowed control using the specified device context.
	PaintHandler (see page 6166)	Responds to WM_PAINT messages.
V	PaintWindow (see page 6169)	Renders the image of a windowed control.
	PaletteChanged (see page 5775)	Responds to changes in the system's palette by realizing the control's palette.
V	PaletteChanged (see page 6170)	Responds to changes in the system's palette by realizing the control's palette and the palette for each child control.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	PositionDockRect (see page 5777)	Positions the docking rectangle according to the current drag-and-dock state.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 5778)	Prepares the control for having its properties assigned values read from a stream.
V	ReadState (see page 6171)	Prepares the control for having its properties assigned values from a stream.
	RecreateWnd (see page 6171)	Recreate underlying Windows screen object.
	ReloadDockedControl (see page 6172)	Reloads a docked control.
	RemoveWindowProps (see page 6174)	This is RemoveWindowProps, a member of class TWinControl.
V	RequestAlign (see page 5780)	Instructs the parent of a control to reposition the control, enforcing its Align (see page 5798) property.
	ResetIme (see page 6174)	Restores the input method editor (IME) that was active when the application started.
	ResetImeComposition (see page 6175)	Directs the composition window of the input method editor (IME) to perform a specific action.
	Resize (see page 5780)	Respond to control resize.
	ScaleConstraints (see page 5781)	This is ScaleConstraints, a member of class TControl.
	ScaleControls (see page 6176)	Rescale child controls only.
	SelectFirst (see page 6177)	Locates first selectable child control.
	SelectNext (see page 6177)	Moves the input focus from the current child control to the next one in the tab order.
	SendCancelMode (see page 5781)	Cancels the modal state of the control.

	SendDockNotification (see page 5782)	Sends a Windows message to the control's host dock site.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
V	SetAutoSize (see page 5783)	This is SetAutoSize, a member of class TControl.
V	SetAutoSize (see page 21257)	Sets the AutoSize (see page 21260) property.
V	SetBiDiMode (see page 5783)	Sets the control's bi-directional mode.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
V	SetChildOrder (see page 6178)	Changes the order in which the child component appears in the list of child components returned by the GetChildren (see page 6153) method.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
V	SetDragMode (see page 5785)	Sets the drag mode for the control.
V	SetEnabled (see page 5785)	Sets the value of the Enabled (see page 5821) property.
	SetIme (see page 6181)	Activates an input method editor (IME) using the values specified by the ImeMode (see page 6207) and ImeName (see page 6208) properties.
	SetImeCompositionWindow (see page 6181)	Sets the position and font of the composition window.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
V	SetName (see page 5785)	Sets the name of the control.
V	SetName (see page 12523)	Sets the name of the control.
V	SetParent (see page 5786)	Sets the parent of the control.
V	SetParent (see page 6182)	Sets the parent of the control.
V	SetParent (see page 12523)	Sets the value of the Parent property.
V	SetParentBackground (see page 6182)	This is SetParentBackground, a member of class TWinControl.
V	SetParentBiDiMode (see page 5786)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 5787)	Sets the parent for the control.
V	SetSelLength (see page 21257)	Sets the SelLength (see page 21265) property.
V	SetSelStart (see page 21257)	Sets the SelStart (see page 21269) property.
	SetZOrder (see page 5788)	Repositions the control in its parent's control list, thereby changing position onscreen.
V	SetZOrder (see page 6182)	Moves the control to the top or bottom of the parent control's (or screen's) list of TWinControl (see page 6112) controls.
V	ShowControl (see page 6183)	Ensures that a specified child control is visible.
	UpdateBounds (see page 6185)	This is UpdateBounds, a member of class TWinControl.
	UpdateBoundsRect (see page 5789)	Changes the Top (see page 5844), Left (see page 5830), Width (see page 5849), and Height (see page 5825) properties of the control, but doesn't update its screen image and bypasses all resize events.
V	UpdateControlOriginalParentSize (see page 6186)	This is UpdateControlOriginalParentSize, a member of class TWinControl.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateExplicitBounds (see page 5789)	This is UpdateExplicitBounds, a member of class TControl.
	UpdateRecreatingFlag (see page 6186)	This is UpdateRecreatingFlag, a member of class TWinControl.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	UpdateUIState (see page 6186)	Updates form User Interface State as needed
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	VisibleChanging (see page 5791)	Provides the interface for a method that responds to changes in the control's visibility.
V	WndProc (see page 5791)	Provides specific message responses for the control.
V	WndProc (see page 6187)	Provides specific message responses for the control.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	ActionLink (see page 5798)	Contains the action link object associated with the control.
	BevelWidth (see page 6194)	Specifies the width of the inner and outer bevels.
	BorderWidth (see page 6195)	Specifies the width of the control's border.
	Caption (see page 5806)	Specifies a text string that identifies the control to the user.
	DefWndProc (see page 6199)	Specifies the default window procedure for the windowed control.
	DesktopFont (see page 5818)	Specifies whether the control uses the Windows icon font when writing text.
	IsControl (see page 5829)	Determines whether a form stores its form-specific properties to a stream.
	MouseCapture (see page 5831)	Indicates whether the control has "captured" mouse events.
	ParentBackground (see page 6209)	Determines whether control uses parent's theme background.
	ScalingFlags (see page 5840)	Reflects which attributes of the control have been scaled.
	WheelAccumulator (see page 5849)	Accumulates mouse wheel rotations.
	WindowHandle (see page 6212)	Provides access to a window handle for the control.
	WindowText (see page 5850)	Contains the text string of the control.

Public Events

	Name	Description
	WindowProc (see page 5872)	Points to the window procedure that responds to messages sent to the control.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	BeginDrag (see page 5740)	Starts the dragging of a control.
	BringToFront (see page 5740)	Puts the control in front of all other controls in its parent control.
	Broadcast (see page 6130)	Sends a message to each of the child controls.
	CanFocus (see page 6131)	Indicates whether a control can receive focus.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Clear (see page 21245)	Deletes all text from the edit control.
	ClearSelection (see page 21245)	Removes the selected text from the edit control.
	ClearUndo (see page 21246)	Clears the undo buffer so that no changes to the text can be backed out.
	ClientToParent (see page 5744)	Translates client coordinates to parent coordinates.
	ClientToScreen (see page 5744)	Translates a given point from client area coordinates to global screen coordinates.
	ContainsControl (see page 6133)	Indicates whether a specified control exists within the control.
	ControlAtPos (see page 6133)	Returns the child control located at a specified position within the control.
	CopyToClipboard (see page 21246)	Copies the selected text in the edit control to the Clipboard in CF_TEXT format.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
V	Create (see page 5731)	Creates an instance of TControl (see page 5724).
V	Create (see page 6123)	Creates an instance of TWinControl (see page 6112).
V	Create (see page 12520)	Creates an instance of TCustomLabeledEdit (see page 12508).
V	Create (see page 21244)	Creates an instance of TCustomEdit (see page 21232).
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.

	CreateParented (see page 6123)	Creates and initializes a control as the child of a specified non-VCL container.
	CreateParentedControl (see page 6136)	Creates and initializes a control as the child of a specified non-VCL window.
	CutToClipboard (see page 21249)	Copies the selected text to the Clipboard in CF_TEXT format and then deletes the selection.
V	DefaultHandler (see page 5748)	Provides message handling for all messages that do not have specific handlers.
V	DefaultHandler (see page 6139)	Provides message handling for all messages that the control does not fully process itself.
V	DefaultHandler (see page 21250)	Provides message handling for all messages that the control does not fully process itself.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 5732)	Destroys an instance of TControl (see page 5724).
V	Destroy (see page 6124)	Destroys an instance of TWinControl (see page 6112).
V	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	DisableAlign (see page 6141)	Disables the realignment of child controls.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Dock (see page 5749)	Used internally to dock the control.
	DockDrop (see page 6142)	Generates an OnDockDrop (see page 6214) event.
	DragDrop (see page 5754)	OnDragDrop (see page 5855) event dispatcher.
	Dragging (see page 5754)	Indicates whether a control is being dragged.
	DrawTextBiDiModeFlags (see page 5756)	Returns the text flags that reflect the current setting of the BiDiMode (see page 5803) property.
	DrawTextBiDiModeFlagsReadingOnly (see page 5756)	Returns the text flag to add that indicates whether the control's text should read from right to left.
	EnableAlign (see page 6148)	Decrements the reference count incremented by the DisableAlign (see page 6141) method, eventually realigning the child controls.
	EndDrag (see page 5757)	Stops a control from being dragged any further.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindChildControl (see page 6148)	Returns a child control given its name.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FlipChildren (see page 6150)	Reverses the positions of child controls.
	Focused (see page 6150)	Determines whether the control has input focus.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetControlsAlignment (see page 5759)	Indicates how text is aligned within the control.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 5765)	Returns the parent of the control.
V	GetSelTextBuf (see page 21253)	Copies the selected text into a buffer and returns the number of characters copied.
	GetTabOrderList (see page 6158)	Builds a list of controls in tab order.

	GetTextBuf (see page 5766)	Retrieves the control's text, copies it into a buffer, and returns the number of characters copied.
	GetTextLen (see page 5767)	Returns the length of the control's text.
	HandleAllocated (see page 6159)	Reports whether a screen object handle exists for the control.
	HandleNeeded (see page 6160)	Creates a screen object for the control if it doesn't already exist.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 5768)	Indicates whether the control has a parent.
	Hide (see page 5769)	Makes the control invisible.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
V	InitiateAction (see page 5769)	Calls the action link's Update (see page 5789) method if the control is associated with an action link.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InsertControl (see page 6160)	Inserts a control into the Controls (see page 6197) array property.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
V	Invalidate (see page 5770)	Completely repaint control.
V	Invalidate (see page 6161)	Schedules a control repaint.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	IsRightToLeft (see page 5770)	Indicates whether the control should be reversed right to left.
	ManualDock (see page 5771)	Docks the control.
	ManualFloat (see page 5772)	Undocks the control.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	MouseWheelHandler (see page 5774)	Dispatches messages received from a mouse wheel.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	PaintTo (see page 6167)	This is the overview for the PaintTo method overload.
	ParentToClient (see page 5776)	Translate parent coordinates to client coordinates.
	PasteFromClipboard (see page 21254)	Pastes the contents of the Clipboard into edit control, replacing the current selection.
	Perform (see page 5776)	Responds as if the control received a specified Windows message.
	PreProcessMessage (see page 6170)	This is PreProcessMessage, a member of class TWinControl.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	Realign (see page 6171)	Forces the control to realign children.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	Refresh (see page 5779)	Repaints the control on the screen.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveControl (see page 6172)	Removes a specified control from the Controls (see page 6197) array.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	Repaint (see page 5779)	Forces the control to repaint its image on the screen.
V	Repaint (see page 6174)	Repaints the entire control.
	ReplaceDockedControl (see page 5779)	Docks the control in the place where another control is already docked.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	ScaleBy (see page 6175)	Rescale control and its children.
	ScreenToClient (see page 5781)	Converts the screen coordinates of a specified point on the screen to client coordinates.
	ScrollBy (see page 6176)	Scroll control contents.
	SelectAll (see page 21255)	Selects all text in the edit control.
	SendToBack (see page 5782)	Puts a windowed control behind all other windowed controls, or puts a non-windowed control behind all other non-windowed controls.
V	SetBounds (see page 5783)	Sets the Left (see page 5830), Top (see page 5844), Width (see page 5849), and Height (see page 5825) properties all at once.
V	SetBounds (see page 6178)	Sets the windowed control's boundary properties all at once.

V	SetBounds (see page 12522)	Sets the windowed control's boundary properties all at once.
	SetDesignVisible (see page 5784)	Makes a control visible at design time.
V	SetDesignVisible (see page 6178)	Makes a control visible at design time.
V	SetFocus (see page 6179)	Gives the input focus to the control.
	SetSelTextBuf (see page 21258)	Replaces the selected text with a null-terminated string.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	SetTextBuf (see page 5787)	Sets the text of the control.
	SetupInternalLabel (see page 12523)	Initializes the control that implements the EditLabel (see page 12524) property.
	Show (see page 5788)	Makes a control visible.
	Undo (see page 21259)	Backs out all changes in the undo buffer.
V	Update (see page 5789)	Processes any pending paint messages immediately.
V	Update (see page 6183)	Forces the control to update.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	UpdateControlState (see page 6186)	Respond to state change.
	UseRightToLeftAlignment (see page 5790)	Specifies whether the control's alignment should be reversed right-to-left.
	UseRightToLeftReading (see page 5790)	Specifies whether the control is using a right-to-left reading order.
	UseRightToLeftScrollBar (see page 5791)	Specifies whether the vertical scroll bar appears on the left side of the control.

Public Properties

	Name	Description
	Action (see page 5797)	Designates the action associated with the control.
	Align (see page 5798)	Determines how the control aligns within its container (parent control).
R	AlignDisabled (see page 6192)	Indicates child control realignment disabled.
	BoundsRect (see page 5803)	Specifies the bounding rectangle of the control, expressed in the coordinate system of the parent control.
R	Brush (see page 6195)	Determines the color and pattern used for painting the background of the control.
R	CanUndo (see page 21262)	Indicates whether the edit control contains changes that can be backed out.
	ClientHeight (see page 5808)	Specifies the height of the control's client area in pixels.
R	ClientOrigin (see page 5809)	Specifies the screen coordinates (in pixels) of the top left corner of a control's client area.
R	ClientRect (see page 5810)	Specifies the size (in pixels) of a control's client area.
	ClientWidth (see page 5811)	Specifies the horizontal size of the control's client area in pixels.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
R	ControlCount (see page 6195)	Returns the number of child controls.
R	Controls (see page 6197)	Lists all child controls.
	ControlState (see page 5813)	Indicates the current state of a control at runtime.
	ControlStyle (see page 5814)	Determines style characteristics of the control.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	DockClientCount (see page 6199)	Specifies the number of controls that are docked on the windowed control.
R	DockClients (see page 6201)	Lists the controls that are docked to the windowed control.
	DockManager (see page 6202)	Specifies the control's docking manager interface.
	DockOrientation (see page 5818)	Specifies how the control is docked relative to other controls docked in the same parent.
	DockSite (see page 6204)	Specifies whether the control can be the target of drag-and-dock operations.
	DoubleBuffered (see page 6205)	Determines whether the control's image is rendered directly to the window or painted to an in-memory bitmap first.
R	ExplicitHeight (see page 5821)	Specifies the explicit vertical size of the control in pixels.
R	ExplicitLeft (see page 5822)	Specifies the explicit horizontal pixel coordinate of the left edge of a component relative to its parent.

R	ExplicitTop (see page 5822)	Specifies the explicit vertical pixel coordinate of the top edge of a component relative to its parent.
R	ExplicitWidth (see page 5822)	Specifies the explicit horizontal size of the control in pixels.
R	Floating (see page 5823)	Indicates whether the control is floating.
	FloatingDockSiteClass (see page 5823)	Specifies the class of the temporary control that hosts the control when it is floating.
R	Handle (see page 6207)	Provides access to the underlying Windows screen object for the control.
	HostDockSite (see page 5829)	Specifies the control in which the control is docked.
	LRDockWidth (see page 5831)	Specifies the width of the control when it is docked horizontally.
	Modified (see page 21263)	Indicates whether the user edited the text of the edit control.
R	MouseInClient (see page 6209)	This is MouseInClient, a member of class TWinControl.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Padding (see page 6209)	Specifies the padding of a control.
	Parent (see page 5832)	Indicates the parent of the control.
	ParentWindow (see page 6210)	Reference to parent's underlying control.
	SelLength (see page 21265)	Specifies the number of characters (bytes) that are selected.
	SelStart (see page 21269)	Specifies the position of the first selected character in the text.
	SelText (see page 21272)	Specifies the selected portion of the edit control's text.
R	Showing (see page 6210)	Indicates whether the control is showing on the screen.
	TBDockHeight (see page 5842)	Specifies the height of the control when it is docked vertically.
	UndockHeight (see page 5845)	Specifies the height of the control when it is floating.
	UndockWidth (see page 5846)	Specifies the width of the control when it is floating.
	UseDockManager (see page 6212)	Specifies whether the docking manager is used in drag-and-dock operations.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
R	VisibleDockClientCount (see page 6212)	Specifies the number of visible controls that are docked on the windowed control.

Published Events

	Name	Description
	OnChange (see page 12873)	Occurs when the text for the edit control may have changed.
	OnClick (see page 12874)	Occurs when the user clicks the control.
	OnContextPopup (see page 12876)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnDblClick (see page 12876)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDragDrop (see page 12877)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 12879)	Occurs when the user drags an object over a control.
	OnEndDock (see page 12881)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 12882)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnEnter (see page 12883)	Occurs when a control receives the input focus.
	OnExit (see page 12885)	Occurs when the input focus shifts away from one control to another.
	OnKeyDown (see page 12887)	Occurs when a user presses any key while the control has focus.
	OnKeyPress (see page 12890)	Occurs when a key is pressed.
	OnKeyUp (see page 12891)	Occurs when the user releases a key that has been pressed.
	OnMouseActivate (see page 12892)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 12893)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseEnter (see page 12896)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 12896)	Occurs when the user moves the mouse outside of a control.
	OnMouseMove (see page 12896)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 12898)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnStartDock (see page 12901)	Occurs when the user begins to drag a control with a DragKind of dkDock.

	OnStartDrag (see page 12901)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.

Published Properties

	Name	Description
	AlignWithMargins (see page 5802)	Indicates whether a control should be constrained by margins.
	Anchors (see page 12846)	Specifies how the control is anchored to its parent.
	AutoSelect (see page 12846)	Determines whether all the text in the edit control is automatically selected when the control gets focus.
	AutoSize (see page 12847)	Determines whether the height of the edit control automatically resizes to accommodate the text.
	BevelEdges (see page 12848)	Specifies which edges of the control are beveled.
	BevelInner (see page 12848)	Specifies the cut of the inner bevel.
	BevelKind (see page 12849)	Specifies the control's bevel style.
	BevelOuter (see page 12849)	Specifies the cut of the outer bevel.
	BiDiMode (see page 12849)	Specifies the bi-directional mode for the control.
	BorderStyle (see page 12850)	Determines whether the edit control has a single line border around the client area.
	CharCase (see page 12850)	Determines the case of the text within the edit control.
	Color (see page 12851)	Specifies the background color of the control.
	Constraints (see page 12851)	Specifies the size constraints for the control.
	Ctl3D (see page 12852)	Determines whether a control has a three-dimensional (3-D) or two-dimensional look.
	Cursor (see page 5815)	Specifies the image used to represent the mouse pointer when it passes into the region covered by the control.
	DragCursor (see page 12853)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 12853)	Specifies whether the control is being dragged normally or for docking.
	DragMode (see page 12853)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	EditLabel (see page 12855)	Specifies the control that implements the label.
	Enabled (see page 12855)	Controls whether the control responds to mouse, keyboard, and timer events.
	Font (see page 12856)	Controls the attributes of text written on or in the control.
	Height (see page 5825)	Specifies the vertical size of the control in pixels.
	HelpContext (see page 5826)	Numeric ID for control's context-sensitive help topic
	HelpKeyword (see page 5826)	Keyword for control's context-sensitive help topic
	HelpType (see page 5827)	Indicates whether the control's context sensitive help topic is identified by context ID or by keyword.
	HideSelection (see page 12857)	Determines whether the visual indication of the selected text remains when focus shifts to another control.
	Hint (see page 5827)	Contains the text string that can appear when the user moves the mouse over the control.
	ImeMode (see page 12857)	Determines the behavior of the input method editor (IME).
	ImeName (see page 12858)	Specifies the input method editor (IME) to use for converting keyboard input to Asian language characters.
	LabelPosition (see page 12858)	Specifies the position of the label relative to the edit control.
	LabelSpacing (see page 12859)	Specifies the distance, in pixels, between the label and the edit region.
	Left (see page 5830)	Specifies the horizontal coordinate of the left edge of a component relative to its parent.
	Margins (see page 5831)	Specifies the margins for the control.
	MaxLength (see page 12859)	Specifies the maximum number of characters the user can enter into the edit control.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	OEMConvert (see page 12860)	Determines whether characters typed in the edit control are converted from ANSI to OEM and then back to ANSI.
	ParentBiDiMode (see page 12860)	Specifies whether the control uses its parent's BiDiMode.
	ParentColor (see page 12860)	Determines where a control looks for its color information.
	ParentCtl3D (see page 12861)	Determines where a component looks to determine if it should appear three dimensional.
	ParentFont (see page 12861)	Determines where a control looks for its font information.

	ParentShowHint (see page 12862)	Determines where a control looks to find out if its Help Hint should be shown.
	PasswordChar (see page 12862)	Indicates the character, if any, to display in place of the actual characters typed in the control.
	PopupMenu (see page 12863)	Identifies the pop-up menu associated with the control.
	ReadOnly (see page 12867)	Determines whether the user can change the text of the edit control.
	ShowHint (see page 12868)	Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.
	TabOrder (see page 12869)	Indicates the position of the control in its parent's tab order.
	TabStop (see page 12870)	Determines if the user can tab to a control.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Text (see page 12870)	Contains a text string associated with the control.
	Top (see page 5844)	Specifies the Y coordinate of the top left corner of a control, relative to its parent or containing control in pixels.
	Visible (see page 12871)	Determines whether the component appears onscreen.
	Width (see page 5849)	Specifies the horizontal size of the control or form in pixels.

68.1.26.2 TLabeledEdit Properties

The properties of the TLabeledEdit class are listed here.

Published Properties

	Name	Description
	Anchors (see page 12846)	Specifies how the control is anchored to its parent.
	AutoSelect (see page 12846)	Determines whether all the text in the edit control is automatically selected when the control gets focus.
	AutoSize (see page 12847)	Determines whether the height of the edit control automatically resizes to accommodate the text.
	BevelEdges (see page 12848)	Specifies which edges of the control are beveled.
	BevelInner (see page 12848)	Specifies the cut of the inner bevel.
	BevelKind (see page 12849)	Specifies the control's bevel style.
	BevelOuter (see page 12849)	Specifies the cut of the outer bevel.
	BiDiMode (see page 12849)	Specifies the bi-directional mode for the control.
	BorderStyle (see page 12850)	Determines whether the edit control has a single line border around the client area.
	CharCase (see page 12850)	Determines the case of the text within the edit control.
	Color (see page 12851)	Specifies the background color of the control.
	Constraints (see page 12851)	Specifies the size constraints for the control.
	Ctl3D (see page 12852)	Determines whether a control has a three-dimensional (3-D) or two-dimensional look.
	DragCursor (see page 12853)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 12853)	Specifies whether the control is being dragged normally or for docking.
	DragMode (see page 12853)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	EditLabel (see page 12855)	Specifies the control that implements the label.
	Enabled (see page 12855)	Controls whether the control responds to mouse, keyboard, and timer events.
	Font (see page 12856)	Controls the attributes of text written on or in the control.
	HideSelection (see page 12857)	Determines whether the visual indication of the selected text remains when focus shifts to another control.
	ImeMode (see page 12857)	Determines the behavior of the input method editor (IME).
	ImeName (see page 12858)	Specifies the input method editor (IME) to use for converting keyboard input to Asian language characters.
	LabelPosition (see page 12858)	Specifies the position of the label relative to the edit control.
	LabelSpacing (see page 12859)	Specifies the distance, in pixels, between the label and the edit region.
	MaxLength (see page 12859)	Specifies the maximum number of characters the user can enter into the edit control.
	OEMConvert (see page 12860)	Determines whether characters typed in the edit control are converted from ANSI to OEM and then back to ANSI.

	ParentBiDiMode (see page 12860)	Specifies whether the control uses its parent's BiDiMode.
	ParentColor (see page 12860)	Determines where a control looks for its color information.
	ParentCtl3D (see page 12861)	Determines where a component looks to determine if it should appear three dimensional.
	ParentFont (see page 12861)	Determines where a control looks for its font information.
	ParentShowHint (see page 12862)	Determines where a control looks to find out if its Help Hint should be shown.
	PasswordChar (see page 12862)	Indicates the character, if any, to display in place of the actual characters typed in the control.
	PopupMenu (see page 12863)	Identifies the pop-up menu associated with the control.
	ReadOnly (see page 12867)	Determines whether the user can change the text of the edit control.
	ShowHint (see page 12868)	Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.
	TabOrder (see page 12869)	Indicates the position of the control in its parent's tab order.
	TabStop (see page 12870)	Determines if the user can tab to a control.
	Text (see page 12870)	Contains a text string associated with the control.
	Visible (see page 12871)	Determines whether the component appears onscreen.

68.1.26.2.1 TLabeledEdit.Anchors Property

Specifies how the control is anchored to its parent.

Pascal

```
property Anchors: TAnchors;
```

C++

```
__property TAnchors Anchors;
```

Description

Use Anchors to ensure that a control maintains its current position relative to an edge of its parent, even if the parent is resized. When its parent is resized, the control holds its position relative to the edges to which it is anchored.

If a control is anchored to opposite edges of its parent, the control stretches when its parent is resized. For example, if a control has its Anchors property set to [akLeft, akRight], the control stretches when the width of its parent changes.

Anchors is enforced only when the parent is resized. Thus, for example, if a control is anchored to opposite edges of a form at design time and the form is created in a maximized state, the control is not stretched because the form is not resized after the control is created.

Note: If a control should maintain contact with three edges of its parent (hugging one side of the parent and stretching the length of that side), use the Align property instead. Unlike Anchors, Align allows controls to adjust to changes in the size of other aligned sibling controls as well as changes to the parent's size.

See Also

Parent (see page 5832)

Align (see page 5798)

68.1.26.2.2 TLabeledEdit.AutoSelect Property

Determines whether all the text in the edit control is automatically selected when the control gets focus.

Pascal

```
property AutoSelect: Boolean;
```

C++

```
__property Boolean AutoSelect;
```

Description

Set AutoSelect to select all the text when the edit control gets focus. AutoSelect only applies to single-line edit controls.

Use AutoSelect when the user is more likely to replace the text in the edit control than to append to it.

See Also

SelectAll (see page 21255)

SelLength (see page 21265)

SelStart (see page 21269)

SelText (see page 21272)

SetSelTextBuf (see page 21258)

68.1.26.2.3 TLabeledEdit.AutoSize Property

Determines whether the height of the edit control automatically resizes to accommodate the text.

Pascal

```
property AutoSize: Boolean;
```

C++

```
__property Boolean AutoSize;__property Boolean AutoSize;
```

Description

Use AutoSize to make the edit control adjust its size automatically so the client area accommodates the height of the text. When AutoSize is false, the edit control has a fixed height. When AutoSize is true, the size of the control is readjusted whenever a change occurs that could affect the height of the control, such as a change to the font or border style.

Note: AutoSize only adjusts the height of the edit control. Even with AutoSize set to true, text in the edit control may appear truncated if it extends beyond the width of the control.

C++ Examples:

```
/*
This example uses an edit box and a button on a form. When
the user clicks the button, the font in the edit box
enlarges, and the edit box enlarges also to accommodate the
larger font size.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  Edit1->AutoSize = true;
  Edit1->Font->Size = 20;
  Edit1->Text = "The edit box is taller now";
}
```

Delphi Examples:

```
{
{
This example uses an edit box and a button on a form. When
the user clicks the button, the font in the edit box
enlarges, and the edit box enlarges also to accommodate the
larger font size.
}
procedure TForm1.Button1Click(Sender: TObject);
```

```
begin
  Edit1.AutoSize := True;
  Edit1.Font.Size := 20;
  Edit1.Text := 'The edit box is taller now';
end;
```

See Also

BorderStyle (see page 21261)

ClientHeight (see page 5808)

ControlStyle (see page 5814)

Height (see page 5825)

68.1.26.2.4 TLabeledEdit.BevelEdges Property

Specifies which edges of the control are beveled.

Pascal

```
property BevelEdges: TBevelEdges;
```

C++

```
__property TBevelEdges BevelEdges;
```

Description

Use BevelEdges to get or set which edges of the control are beveled. The BevelInner, BevelOuter, and BevelKind properties determine the appearance of the specified edges.

See Also

BevelInner (see page 6193)

BevelOuter (see page 6194)

BevelKind (see page 6193)

68.1.26.2.5 TLabeledEdit.BevelInner Property

Specifies the cut of the inner bevel.

Pascal

```
property BevelInner: TBevelCut;
```

C++

```
__property TBevelCut BevelInner;
```

Description

Use BevelInner to specify whether the inner bevel has a raised, lowered, or flat look.

The inner bevel appears immediately inside the outer bevel. If there is no outer bevel (BevelOuter is bvNone), the inner bevel appears immediately inside the border.

See Also

BevelEdges (see page 6192)

BevelOuter (see page 6194)

BevelKind (see page 6193)

BevelWidth (see page 6194)

BorderWidth (see page 6195)

68.1.26.2.6 TLabeledEdit.BevelKind Property

Specifies the control's bevel style.

Pascal

```
property BevelKind: TBevelKind;
```

C++

```
__property TBevelKind BevelKind;
```

Description

Use BevelKind to modify the appearance of a bevel. BevelKind influences how sharply the bevel stands out.

BevelKind, in combination with BevelWidth and the cut of the bevel specified by BevelInner or BevelOuter, can create a variety of effects. Experiment with various combinations to get the look you want.

See Also

BevelEdges (see page 6192)

BevelOuter (see page 6194)

BevelInner (see page 6193)

BevelWidth (see page 6194)

68.1.26.2.7 TLabeledEdit.BevelOuter Property

Specifies the cut of the outer bevel.

Pascal

```
property BevelOuter: TBevelCut;
```

C++

```
__property TBevelCut BevelOuter;
```

Description

Use BevelInner to specify whether the outer bevel has a raised, lowered, or flat look.

The outer bevel appears immediately inside the border and outside the inner bevel.

See Also

BevelEdges (see page 6192)

BevelInner (see page 6193)

BevelKind (see page 6193)

BevelWidth (see page 6194)

68.1.26.2.8 TLabeledEdit.BiDiMode Property

Specifies the bi-directional mode for the control.

Pascal

```
property BiDiMode: TBiDiMode;
```

C++

```
__property TBiDiMode BiDiMode;
```

Description

Use BiDiMode to enable the control to adjust its appearance and behavior automatically when the application runs in a locale that reads from right to left instead of left to right. The bi-directional mode controls the reading order for the text, the placement of the vertical scroll bar, and whether the alignment is changed.

Alignment does not change for controls that are known to contain number, date, time, or currency values. For example, with data aware controls, the alignment does not change for the following field types: ftSmallint, ftInteger, ftWord, ftFloat, ftCurrency, ftBCD, ftDate, ftTime, ftDateTime, ftAutoInc.

See Also

UseRightToLeftAlignment (see page 5790)

UseRightToLeftReading (see page 5790)

UseRightToLeftScrollBar (see page 5791)

Including Bi-directional Functionality in Applications

68.1.26.2.9 TLabeledEdit.BorderStyle Property

Determines whether the edit control has a single line border around the client area.

Pascal

```
property BorderStyle: TBorderStyle;
```

C++

```
__property TBorderStyle BorderStyle;
```

Description

Use BorderStyle to affect the sharpness with which the client area of the edit control stands out. BorderStyle can have a value of either bsSingle or bsNone. If BorderStyle is bsSingle, the edit control has a single-line border around the client area. If BorderStyle is bsNone, there will be no border.

68.1.26.2.10 TLabeledEdit.CharCase Property

Determines the case of the text within the edit control.

Pascal

```
property CharCase: TEditCharCase;
```

C++

```
__property TEditCharCase CharCase;
```

Description

Use CharCase to force the contents of the edit control to assume a particular case.

When CharCase is set to ecLowerCase or ecUpperCase, the case of characters is converted as the user types them into the edit control. Changing the CharCase property to ecLowerCase or ecUpperCase changes the actual contents of the text, not just the appearance. Any case information is lost and can't be recaptured by changing CharCase to ecNormal.

See Also

Text (see page 5842)

68.1.26.2.11 TLabeledEdit.Color Property

Specifies the background color of the control.

Pascal

```
property Color: TColor;
```

C++

```
__property TColor Color;
```

Description

Use Color to read or change the background color of the control.

If a control's ParentColor property is true, then changing the Color property of the control's parent automatically changes the Color property of the control. When the value of the Color property is changed, the control's ParentColor property is automatically set to false.

C++ Examples:

```
/*
The following code changes the color of a shape control
using the Color dialog box. The example displays the Color
dialog box when the Button1 button is clicked, allowing the
user to select a color with the dialog box. When a color
value is selected with the dialog box, it is assigned to
the shape control.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  if (ColorDialog1->Execute())
    Shape1->Brush->Color = ColorDialog1->Color;
}
```

Delphi Examples:

```
{
The following code changes the color of a shape control
using the Color dialog box. The example displays the Color
dialog box when the Button1 button is clicked, allowing the
user to select a color with the dialog box. When a color
value is selected with the dialog box, it is assigned to
the shape control.
}
procedure TForm1.Button1Click(Sender: TObject);
begin
  if ColorDialog1.Execute then
    Shape1.Brush.Color := ColorDialog1.Color;
end;
```

See Also

ParentColor (see page 5834)

68.1.26.2.12 TLabeledEdit.Constraints Property

Specifies the size constraints for the control.

Pascal

```
property Constraints: TSizeConstraints;
```

C++

```
__property TSizeConstraints Constraints;
```

Description

Use Constraints to specify the minimum and maximum width and height of the control. When Constraints contains maximum or minimum values, the control cannot be resized to violate those constraints.

Note: Constraints apply to the height of the form. However, the height of the form depends on how large Windows makes the title bar. For example, Windows XP uses much larger title bars than other windowing systems. To work around this, note the ClientHeight when you design your form and set the constraints in the FormCreate event. In the following example, ClientHeight is represented by x: `Constraints.MinHeight := x + Height - ClientHeight`.

Warning: Do not set up constraints that conflict with the value of the Align or Anchors property. When these properties conflict, the response of the control to resize attempts is not well-defined.

See Also

AutoSize (see page 5803)

Align (see page 5798)

Anchors (see page 5802)

OnConstrainedResize (see page 5853)

OnCanResize (see page 5851)

68.1.26.2.13 TLabeledEdit.Ctl3D Property

Determines whether a control has a three-dimensional (3-D) or two-dimensional look.

Pascal

```
property Ctl3D: Boolean;
```

C++

```
__property Boolean Ctl3D;
```

Description

Ctl3D is provided for backward compatibility. It is not used by 32-bit versions of Windows or NT4.0 and later, with the exception of Windows XP Home, where it is used on occasion.

On earlier platforms, Ctl3D controlled whether the control had a flat or beveled appearance.

See Also

ParentCtl3D (see page 6209)

BevelKind (see page 6193)

BevelInner (see page 6193)

BevelOuter (see page 6194)

BorderWidth (see page 6195)

68.1.26.2.14 TLabeledEdit.DragCursor Property

Indicates the image used to represent the mouse pointer when the control is being dragged.

Pascal

```
property DragCursor: TCursor;
```

C++

```
__property TCursor DragCursor;
```

Description

Use the DragCursor property to change the cursor image presented when the control is being dragged.

Note: To make a custom cursor available for the DragCursor property, see the Cursor property.

See Also

Cursor (see page 5815)

DragKind (see page 5819)

DragMode (see page 5819)

68.1.26.2.15 TLabeledEdit.DragKind Property

Specifies whether the control is being dragged normally or for docking.

Pascal

```
property DragKind: TDragKind;
```

C++

```
__property TDragKind DragKind;
```

Description

Use DragKind to get or set whether the control participates in drag-and-drop operations, or drag-and-dock operations.

See Also

DragCursor (see page 5818)

DragMode (see page 5819)

68.1.26.2.16 TLabeledEdit.DragMode Property

Determines how the control initiates drag-and-drop or drag-and-dock operations.

Pascal

```
property DragMode: TDragMode;
```

C++

```
__property TDragMode DragMode;
```

Description

Use DragMode to control when the user can drag the control. Disable the drag-and-drop or drag-and-dock capability at runtime by setting the DragMode property value to dmManual. Enable automatic dragging by setting DragMode to dmAutomatic.

C++ Examples:

```
/*
The following code uses GetNodeAt to add a dragged node as a
child of the node under the mouse when it is dropped.  This
example requires a populated TreeView.  Also, the TTreeView
DragMode property set to dmAutomatic, and the TTreeView
OnDragOver event handler must be implemented to accept the
drop.
*/
void __fastcall TForm1::TreeView1DragDrop(TObject *Sender, TObject *Source,
      int X, int Y)
{
  if (Source != (TObject *)TreeView1 || TreeView1->Selected == NULL)
    return;
  THitTests HT = TreeView1->GetHitTestInfoAt(X, Y);
  TNodeAttachMode AttachMode;
  TTreeNode *Item = TreeView1->GetNodeAt(X, Y);
  if (HT.Contains(htOnItem) || HT.Contains(htOnIcon))
    AttachMode = naAddChild;
  else if (HT.Contains(htNowhere))
    AttachMode = naAdd;
  else if (HT.Contains(htOnIndent))
    AttachMode = naInsert;
  else
    return;
  TreeView1->Selected->MoveTo(Item, AttachMode);
}

void __fastcall TForm1::TreeView1DragOver(TObject *Sender, TObject *Source,
      int X, int Y, TDragState State, bool &Accept)
{
  Accept = (Source == (TObject *)TreeView1);
}
```

Delphi Examples:

```
{
The following code uses GetNodeAt to add a dragged node as a
child of the node under the mouse when it is dropped.  This
example requires a populated TreeView.  Also, the TTreeView
DragMode property set to dmAutomatic, and the TTreeView
OnDragOver event handler must be implemented to accept the
drop.
}
procedure TForm1.TreeView1DragDrop(Sender, Source: TObject; X, Y: Integer);
var
  AnItem: TTreeNode;
  AttachMode: TNodeAttachMode;
  HT: THitTests;
begin
  if TreeView1.Selected = nil then Exit;
  HT := TreeView1.GetHitTestInfoAt(X, Y);
  AnItem := TreeView1.GetNodeAt(X, Y);
  if (HT - [htOnItem, htOnIcon, htNowhere, htOnIndent] <> HT) then
  begin
    if (htOnItem in HT) or (htOnIcon in HT) then
      AttachMode := naAddChild
    else if htNowhere in HT then AttachMode := naAdd
    else if htOnIndent in HT then AttachMode := naInsert;
    TreeView1.Selected.MoveTo(AnItem, AttachMode);
  end;
end;

procedure TForm1.TreeView1DragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := Source is TTreeView;
end;
```

Arranging the Order of Persistent Columns

68.1.26.2.17 TLabeledEdit.EditLabel Property

Specifies the control that implements the label.

Pascal

```
property EditLabel: TBoundLabel;
```

C++

```
__property TBoundLabel EditLabel;
```

Description

Use EditLabel to work with the label that is associated with this labeled edit control. Use this label's properties to specify the caption that appears on the label, the position of the caption within the label, the font used to write that caption, and so on. At design time, expand the EditLabel property in the Object Inspector to set its properties.

See Also

LabelPosition (see page 12524)

LabelSpacing (see page 12525)

68.1.26.2.18 TLabeledEdit.Enabled Property

Controls whether the control responds to mouse, keyboard, and timer events.

Pascal

```
property Enabled: Boolean;
```

C++

```
__property Boolean Enabled;
```

Description

Use Enabled to change the availability of the control to the user. To disable a control, set Enabled to false. Disabled controls appear dimmed. If Enabled is false, the control ignores mouse, keyboard, and timer events.

To re-enable a control, set Enabled to true. The control is no longer dimmed, and the user can use the control.

See Also

Visible (see page 5847)

DisableControls (see page 6925)

EnableControls (see page 6934)

Enabling Mouse

68.1.26.2.19 TLabeledEdit.Font Property

Controls the attributes of text written on or in the control.

Pascal

```
property Font: TFont;
```

C++

```
__property TFont Font;
```

Description

To change to a new font, specify a new TFont object. To modify a font, change the value of the Charset, Color, Height, Name, Pitch, Size, or Style of the TFont object.

C++ Examples:

```
/*
To use this example, place a TComboBox and TRichEdit or
TMemo on a form.  During form creation, a list of font names
is loaded into the combo box. When the combo box is clicked,
the memo or Rich Edit control font is set to the
corresponding font name in the combo box.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < Screen->Fonts->Count; i++)
   ComboBox1->Items->Add(Screen->Fonts->Strings[i]);
//  ComboBox1->Items = Screen->Fonts;  // Another way to do it.
}

void __fastcall TForm1::ComboBox1Change(TObject *Sender)
{
  RichEdit1->Font->Name = ComboBox1->Text;
}
```

Delphi Examples:

```
{
To use this example, place a TComboBox and TRichEdit or
TMemo on a form.  During form creation, a list of font names
is loaded into the combo box. When the combo box is clicked,
the memo or Rich Edit control font is set to the
corresponding font name in the combo box.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  i : Integer;
begin
  for i := 0 to Screen.Fonts.Count - 1 do
   ComboBox1.Items.Add(Screen.Fonts.Strings[i]);
//  ComboBox1.Items := Screen.Fonts;  // Another way to do it.
  RichEdit1.Lines.Text := 'How is it to be you?';
end;

procedure TForm1.ComboBox1Click(Sender: TObject);
begin
  RichEdit1.Font.Name := ComboBox1.Text;
end;
```

Displaying and Editing Text in a Memo Control

68.1.26.2.20 TLabeledEdit.HideSelection Property

Determines whether the visual indication of the selected text remains when focus shifts to another control.

Pascal

```
property HideSelection: Boolean;
```

C++

```
__property Boolean HideSelection;
```

Description

Set HideSelection to false to provide visual feedback of the selected portion of the text even when the edit control does not have focus. Set HideSelection to true to show the selection only when the edit control has focus. HideSelection does not affect the actual value of the selection, only the visual indication. Always setting HideSelection to false can make forms with many edit controls look too busy.

SelText (see page 21272)

SetSelTextBuf (see page 21258)

68.1.26.2.21 TLabeledEdit.ImeMode Property

Determines the behavior of the input method editor (IME).

Pascal

```
property ImeMode: TImeMode;
```

C++

```
__property TImeMode ImeMode;
```

Description

Set ImeMode to configure the way an IME processes user keystrokes. An IME is a front-end input processor for Asian language characters. The IME hooks all keyboard input, converts it to Asian characters in a conversion window, and sends the converted characters or strings on to the application.

ImeMode allows a control to influence the type of conversion performed by the IME so that it is appropriate for the input expected by the control. For example, a control that only accepts numeric input might specify an ImeMode of imClose, as no conversion is necessary for numeric input.

Note: The value of ImeMode only takes effect when the control receives focus. To change the value of ImeMode when the control already has input focus, call the SetIme method.

See Also

ImeName (see page 6208)

ResetIme (see page 6174)

ResetImeComposition (see page 6175)

SetIme (see page 6181)

SetImeCompositionWindow (see page 6181)

68.1.26.2.22 TLabeledEdit.ImeName Property

Specifies the input method editor (IME) to use for converting keyboard input to Asian language characters.

Pascal

```
property ImeName: TImeName;
```

C++

```
__property TImeName ImeName;
```

Description

Set ImeName to specify which IME to use for converting keystrokes. An IME is a front-end input processor for Asian language characters. The IME hooks all keyboard input, converts it to Asian characters in a conversion window, and sends the converted characters or strings on to the application.

ImeName must specify one of the IMEs that has been installed through the Windows control panel. The property inspector provides a drop-down list of all currently installed IMEs on the system. At runtime, applications can obtain a list of currently installed IMEs from the global Screen variable.

If ImeName specifies an unavailable IME, the IME that was active when the application started is used instead. No exception is generated.

Note: The value of ImeName only takes effect when the control receives focus. To change the value of ImeName after the control has input focus, call the SetIme method.

SetIme (see page 6181)

DefaultIme (see page 14216)

Imes (see page 14227)

68.1.26.2.23 TLabeledEdit.LabelPosition Property

Specifies the position of the label relative to the edit control.

Pascal

```
property LabelPosition: TLabelPosition;
```

C++

```
__property TLabelPosition LabelPosition;
```

Description

Set LabelPosition to indicate where the label sits relative to the edit control.

See Also

EditLabel (see page 12524)

LabelSpacing (see page 12525)

68.1.26.2.24 TLabeledEdit.LabelSpacing Property

Specifies the distance, in pixels, between the label and the edit region.

Pascal

```
property LabelSpacing: Integer;
```

C++

```
__property int LabelSpacing;
```

Description

Set LabelSpacing to indicate the distance, in pixels, between the label and the edit control.

See Also

EditLabel (see page 12524)

LabelPosition (see page 12524)

68.1.26.2.25 TLabeledEdit.MaxLength Property

Specifies the maximum number of characters the user can enter into the edit control.

Pascal

```
property MaxLength: Integer;
```

C++

```
__property int MaxLength;
```

Description

Use MaxLength to limit the number of characters that can be entered into the edit control. A value of 0 indicates that there is no application-defined limit on the length.

Use MaxLength to limit the length of the text in an edit control if that text will be copied into a fixed-length buffer.

Note: Setting MaxLength will not truncate the existing text, it merely prevents the user from adding more text after reaching the limit of MaxLength characters.

Note: Even when MaxLength is 0, there may be limitations imposed by the operating system on the number of characters that may be entered into an edit control.

Note: The unit of MaxLength is characters (not bytes) if the application is using themes.

Text (see page 5842)

Displaying and Editing Text in a Memo Control

Displaying and Editing Text in a Rich Edit Memo Control

68.1.26.2.26 TLabeledEdit.OEMConvert Property

Determines whether characters typed in the edit control are converted from ANSI to OEM and then back to ANSI.

Pascal

```
property OEMConvert: Boolean;
```

C++

```
__property Boolean OEMConvert;
```

Description

To ensure that any characters typed in the edit control can be unambiguously converted to the OEM character set, set OEMConvert to true. This causes all characters to be converted from ANSI to OEM and then back to ANSI as they are typed. Set OEMConvert to false to avoid the overhead of this conversion when it does not matter whether the text can be unambiguously mapped to an OEM string.

OEMConvert is most useful for edit controls used to enter file names when the application does not use Unicode file names.

See Also

Text (see page 5842)

68.1.26.2.27 TLabeledEdit.ParentBiDiMode Property

Specifies whether the control uses its parent's BiDiMode.

Pascal

```
property ParentBiDiMode: Boolean;
```

C++

```
__property Boolean ParentBiDiMode;
```

Description

Use ParentBiDiMode to get or set whether the control uses its parent's BiDiMode. When ParentBiDiMode is true, the control's BiDiMode property is always equal to that of its parent. If ParentBiDiMode is false, the control uses its own BiDiMode property.

Set ParentBiDiMode to true for all controls in a form in order to ensure that the entire user interface adjusts to Middle Eastern locales in a uniform manner.

When the value of the control's BiDiMode property changes, ParentBiDiMode becomes false automatically.

See Also

Parent (see page 5832)

BiDiMode (see page 5803)

68.1.26.2.28 TLabeledEdit.ParentColor Property

Determines where a control looks for its color information.

Pascal

```
property ParentColor: Boolean;
```

C++

```
__property Boolean ParentColor;
```

Description

To have a control use the same color as its parent control, set ParentColor to true. If ParentColor is false, the control uses its own Color property.

Set ParentColor to true for all controls in order to ensure that all the controls on a form have a uniform appearance. For example, if ParentColor is true for all controls in a form, changing the background color of the form to gray causes all the controls on the form to also have a gray background.

When the value of a control's Color property changes, ParentColor becomes false automatically.

See Also

Color (see page 5812)

Parent (see page 5832)

ParentFont (see page 5834)

ParentShowHint (see page 5835)

68.1.26.2.29 TLabeledEdit.ParentCtl3D Property

Determines where a component looks to determine if it should appear three dimensional.

Pascal

```
property ParentCtl3D: Boolean;
```

C++

```
__property Boolean ParentCtl3D;
```

Description

ParentCtl3D is provided for backwards compatibility. It has no effect on 32-bit versions of Windows or NT 4.0 and later.

ParentCtl3D determines whether the control uses its parent's Ctl3D property.

See Also

Ctl3D (see page 6198)

68.1.26.2.30 TLabeledEdit.ParentFont Property

Determines where a control looks for its font information.

Pascal

```
property ParentFont: Boolean;
```

C++

```
__property Boolean ParentFont;
```

Description

To have a control use the same font as its parent control, set ParentFont to true. If ParentFont is false, the control uses its own Font property. Many controls default ParentFont to true so that all the controls in a form or other container present a uniform appearance. When the value of a control's Font property changes, ParentFont becomes false automatically.

When ParentFont is true for a form, the form uses the default font.

See Also

Font (see page 5823)

Parent (see page 5832)

ParentColor (see page 5834)

ParentShowHint (see page 5835)

68.1.26.2.31 TLabeledEdit.ParentShowHint Property

Determines where a control looks to find out if its Help Hint should be shown.

Pascal

```
property ParentShowHint: Boolean;
```

C++

```
__property Boolean ParentShowHint;
```

Description

Use ParentShowHint to ensure that all the controls on a form either uniformly show their Help Hints or uniformly do not show them.

If ParentShowHint is true, the control uses the ShowHint property value of its parent. If ParentShowHint is false, the control uses the value of its own ShowHint property.

To provide Help Hints for only selected controls on a form, set the ShowHint property for those controls that should have Help Hints to true, and ParentShowHint becomes false automatically.

Note: Enable or disable all Help Hints for the entire application using the ShowHint property of the application object.

See Also

Hint (see page 5827)

Parent (see page 5832)

ParentColor (see page 5834)

ParentFont (see page 5834)

ShowHint (see page 5840)

68.1.26.2.32 TLabeledEdit.PasswordChar Property

Indicates the character, if any, to display in place of the actual characters typed in the control.

Pascal

```
property PasswordChar: Char;
```

C++

```
__property Char PasswordChar;
```

Description

Use the PasswordChar property to create an edit control that displays a special character in place of any entered text. If PasswordChar is set to the null character (ANSI character zero), the edit control displays its text normally. If PasswordChar is any other character, the edit control displays PasswordChar in place of each character typed. PasswordChar affects the appearance of the edit control only. The value of the Text property reflects the actual characters that are typed.

See Also

Text (see page 5842)

68.1.26.2.33 TLabeledEdit.PopupMenu Property

Identifies the pop-up menu associated with the control.

Pascal

```
property PopupMenu: TPopupMenu;
```

C++

```
__property TPopupMenu PopupMenu;
```

Description

Assign a value to PopupMenu to make a pop-up menu appear when the user selects the control and clicks the right mouse button. If the TPopupMenu's AutoPopup property is true, the pop-up menu appears automatically. If the menu's AutoPopup property is false, display the menu with a call to its Popup method from the control's OnContextPopup event handler.

C++ Examples:

```
/*
This example uses two edit boxes and one pop-up menu on a form.
The pop-up menu contains Cut, Copy, and Paste commands. This code
makes the pop-up menu available to both edit boxes:
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  PopupMenu1->AutoPopup = true;
  Edit1->PopupMenu = PopupMenu1;
  Edit2->PopupMenu = PopupMenu1;
}

/*
These are the cut, copy, and paste OnClick events for the commands
on the pop-up menu. Double click on the pop-up menu and add three
TMenuItems.  Then set the captions to "Cut", "Copy" and "Paste".
The names will be automatically set to "Cut1", "Copy1", and
"Paste1".  Then double click on the OnClick events and they will
be named "Cut1Click", "Copy1Click" and "Paste1Click" respectively.
Note: only the selected portion of the string in the edit box will
be copied, cut or replaced.
*/
void __fastcall TForm1::Copy1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
    if (pComponent->ClassNameIs("TEdit"))
      ((TEdit *)pComponent)->CopyToClipboard();
    else
      MessageBeep(0);
  }
  else
    MessageBeep(0);
}

void __fastcall TForm1::Cut1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
    if (pComponent->ClassNameIs("TEdit"))
      ((TEdit *)pComponent)->CutToClipboard();
    else
      MessageBeep(0);
  }
```

```
  else
    MessageBeep(0);
}

void __fastcall TForm1::Paste1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
    if (pComponent->ClassNameIs("TEdit"))
      ((TEdit *)pComponent)->PasteFromClipboard();
    else
      MessageBeep(0);
  }
  else
    MessageBeep(0);
}
/*
This example demonstrates how to add and delete menu items
to a popup menu at runtime and assign an event handler to
the OnClick event.  Place a TPopupMenu and three buttons on
the form named "AddButton", "EditButton",  and
"DestroyButton" and add OnClick events to all three buttons.
Put the TPopupMenu in the PopupMenu property of the form.
Place the PopupMenuItemsClick procedure in the TForm1 type
declaration so that it can be used as the method call for
the menu item OnClick event.
*/
void __fastcall TForm1::AddButtonClick(TObject *Sender)
{
    const int num_items = 4;
    for (int index = 0; index < num_items; ++index)
    {
        TMenuItem *NewItem = new TMenuItem(PopupMenu1); // create the new item
        PopupMenu1->Items->Add(NewItem);// add it to the Popupmenu
        NewItem->Caption = "Menu Item " + IntToStr(index);
        NewItem->Tag = index;
        NewItem->OnClick = PopupMenuItemsClick;// assign it an event handler
        TNotifyEvent();
    }
}

void __fastcall TForm1::PopupMenuItemsClick(TObject *Sender)
{
    TMenuItem *ClickedItem = dynamic_cast<TMenuItem *>(Sender);
    if (ClickedItem)
    {
        switch (ClickedItem->Tag)
        {
            case 0:
            {
                ShowMessage("first item clicked");
                break;
            }
            case 1:
            {
                ShowMessage("second item clicked");
                break;
            }
            case 2:
            {
                ShowMessage("third item clicked");
                break;
            }
            case 3:
            {
```

```
                ShowMessage("fourth item clicked");
                break;
            }
        }
    }
}

/*
To edit or destroy an item, grab its pointer via the Items
property.
*/
void __fastcall TForm1::EditButtonClick(TObject *Sender)
{
    const int index = 1;
    TMenuItem *ItemToEdit = PopupMenu->Items->Items[index];
    ItemToEdit->Caption = "Changed Caption";
}

void __fastcall TForm1::DestroyButtonClick(TObject *Sender)
{
    const int index = 2;
    TMenuItem *ItemToDelete = PopupMenu->Items->Items[index];
    delete ItemToDelete;
}
```

Delphi Examples:

```
{
This example uses two edit boxes and one pop-up menu on a form.
The pop-up menu contains Cut, Copy, and Paste commands. This code
makes the pop-up menu available to both edit boxes:
}
procedure TForm1.FormCreate(Sender: TObject);
begin
  PopupMenu1.AutoPopup := True;
  Edit1.PopupMenu := PopupMenu1;
  Edit2.PopupMenu := PopupMenu1;
end;

{
These are the cut, copy, and paste OnClick events for the commands
on the pop-up menu. Double click on the pop-up menu and add three
TMenuItems.  Then set the captions to "Cut", "Copy" and "Paste".
The names will be automatically set to "Cut1", "Copy1", and
"Paste1".  Then double click on the OnClick events and they will
be named "Cut1Click", "Copy1Click" and "Paste1Click" respectively.
Note: only the selected portion of the string in the edit box will
be copied, cut or replaced.
}
procedure TForm1.Copy1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
   Edit1.CopyToClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.CopyToClipboard
  else
    Beep;
end;

procedure TForm1.Cut1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
    Edit1.CutToClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.CutToClipboard
  else
    Beep;
```

```
end;

procedure TForm1.Paste1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
    Edit1.PasteFromClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.PasteFromClipboard
  else
    Beep;
end;
{
This example demonstrates how to add and delete menu items
to a popup menu at runtime and assign an event handler to
the OnClick event.  Place a TPopupMenu and three buttons on
the form named "AddButton", "EditButton",  and
"DestroyButton" and add OnClick events to all three buttons.
Put the TPopupMenu in the PopupMenu property of the form.
Place the PopupMenuItemsClick procedure in the TForm1 type
declaration so that it can be used as the method call for
the menu item OnClick event.
}

68.1.26.2.34 TLabeledEdit.ReadOnly Property

Determines whether the user can change the text of the edit control.

Pascal

```
property ReadOnly: Boolean;
```

C++

```
__property Boolean ReadOnly;
```

Description

To restrict the edit control to display only, set the ReadOnly property to true. Set ReadOnly to false to allow the contents of the edit control to be edited.

Setting ReadOnly to true ensures that the text is not altered, while still allowing the user to select text. The selected text can then be manipulated by the application, or copied to the Clipboard.

See Also

CopyToClipboard (see page 21246)

GetSelTextBuf (see page 21253)

68.1.26.2.35 TLabeledEdit.ShowHint Property

Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.

Pascal

```
property ShowHint: Boolean;
```

C++

```
__property Boolean ShowHint;
```

Description

The Help Hint is the value of the Hint property, which is displayed in a box just beneath the control. Use ShowHint to determine whether a Help Hint appears for the control.

To enable Help Hint for a particular control, the application ShowHint property must be true and either

the control's own ShowHint property must be true, or

the control's ParentShowHint property must be true and its parent's ShowHint property must be true.

For example, imagine a check box within a group box. If the ShowHint property of the group box is true and the ParentShowHint property of the check box is true, but the ShowHint property of the check box is false, the check box still displays its Help Hint.

Changing the ShowHint value automatically sets the ParentShowHint property to false.

C++ Examples:

```
/*
This example uses an edit box and a list box on a form.
Items are added to the list box and a Help Hint is assigned
to both controls. The last statement enables the Help Hints
for the entire application.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  Edit1->Hint = "Enter your name";
  Edit1->ShowHint = true;

  char string[10];
  char index[3];
  for(int i = 1; i <= 10; i++)
  {
    strcpy(string, "Item");
    itoa(i, index, 10);
    strcat(string, index);
    ListBox1->Items->Add(string);
  }
  ListBox1->Hint = "Select an item";
  ListBox1->ShowHint = true;
  Application->ShowHint = true;
}
/*
Note: To see an example that displays the hints of controls
in some place other than in a Help Hint box, see the OnHint
example.
*/
```

Delphi Examples:

```
{
This example uses an edit box and a list box on a form.
Items are added to the list box and a Help Hint is assigned
to both controls. The last statement enables the Help Hints
for the entire application.
```

```
}
procedure TForm1.FormCreate(Sender: TObject);
var
  I: Integer;
begin
  Edit1.Hint := 'Enter your name';
  Edit1.ShowHint := True;
  with ListBox1 do
  begin
    for I := 1 to 10 do
      Items.Add('Item ' + IntToStr(I));
    Hint := 'Select an item';
    ShowHint := True;
  end;
  Application.ShowHint := True;
end;
{
Note: To see an example that displays the hints of controls
in some place other than in a Help Hint box, see the OnHint
example.
}

Displaying Fly-over Help

68.1.26.2.36 TLabeledEdit.TabOrder Property

Indicates the position of the control in its parent's tab order.

Pascal

```
property TabOrder: TTabOrder;
```

C++

```
__property TTabOrder TabOrder;
```

Description

TabOrder is the order in which child windows are visited when the user presses the Tab key. The control with the TabOrder value of 0 is the control that has the focus when the form first appears.

Initially, the tab order is always the order in which the controls were added to the form. The first control added to the form has a TabOrder value of 0, the second is 1, the third is 2, and so on. Change this by changing the TabOrder property.

Each control has a unique tab-order value within its parent. If you change the TabOrder property value of one control to be the same as the value of a second control, the TabOrder value for all the other controls changes. For example, suppose a control is sixth in the tab order. If you change the control's TabOrder property value to 3 (making the control fourth in the tab order), the control that was originally fourth in the tab order now becomes fifth, and the control that was fifth becomes sixth.

Assigning TabOrder a value greater than the number of controls contained in the parent control moves the control to the end of the tab order. The control does not take on the assigned value of TabOrder, but instead is given the number that assures the control is the last in the tab order.

Note: TabOrder is meaningful only if the TabStop property is true and if the control has a parent. (The TabOrder property of a form is not used unless the form is the child of another form.) A control with a TabOrder of -1 has no parent, and therefore cannot be reached by pressing the Tab key. To remove a parented control from the Tab order, set its TabStop property to false.

See Also

FindNextControl (see page 6149)

TabStop (see page 6211)

68.1.26.2.37 TLabeledEdit.TabStop Property

Determines if the user can tab to a control.

Pascal

```
property TabStop: Boolean;
```

C++

```
__property Boolean TabStop;
```

Description

Use the TabStop to allow or disallow access to the control using the Tab key.

If TabStop is true, the control is in the tab order. If TabStop is false, the control is not in the tab order and the user can't press the Tab key to move to the control.

Note: TabStop is not meaningful for a form unless the form assigns another form to be its parent.

See Also

TabOrder (see page 6211)

68.1.26.2.38 TLabeledEdit.Text Property

Contains a text string associated with the control.

Pascal

```
property Text: TCaption;
```

C++

```
__property TCaption Text;
```

Description

Use the Text property to read the Text of the control or specify a new string for the Text value. By default, Text is the control name. For edit controls and memos, the Text appears within the control. For combo boxes, the Text is the content of the edit control portion of the combo box.

Note: Controls that display text use either the Caption property or the Text property to specify the text value. Which property is used depends on the type of control. In general, Caption is used for text that appears as a window title or label, while Text is used for text that appears as the content of a control.

C++ Examples:

```
/*
This example requires two edit boxes and a button.  This example
copies the text in an edit box into a null-terminated string, and
puts this string in another edit box when the user clicks the
button on the form.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  int Size = Edit1->GetTextLen(); //Get length of string in Edit1
  Size++;                         //Add room for null character
```

```
  char *Buffer = new char[Size];  //Creates Buffer dynamic variable
  Edit1->GetTextBuf(Buffer,Size); //Puts Edit1->Text into Buffer
  Edit2->Text = Buffer;
  delete [] Buffer;
}
/*
Note: the same thing could be accomplished more simply as follows:
*/
void __fastcall TForm1::Button2Click(TObject *Sender)
{
  Edit2->Text = Edit1->Text;
}
```

Delphi Examples:

```
{
This example requires two edit boxes and a button.  This example
copies the text in an edit box into a null-terminated string, and
puts this string in another edit box when the user clicks the
button on the form.
}
procedure TForm1.Button1Click(Sender: TObject);
var
  Buffer: PChar;
  Size: Byte;
begin
  Size := Edit1.GetTextLen;       {Get length of string in Edit1}
  Inc(Size);                      {Add room for null character}
  GetMem(Buffer, Size);           {Creates Buffer dynamic variable}
  Edit1.GetTextBuf(Buffer,Size);  {Puts Edit1.Text into Buffer}
  Edit2.Text := StrPas(Buffer);   {Converts Buffer to a Pascal-style string}
  FreeMem(Buffer, Size);{Frees memory allocated to Buffer}
end;

{
Note: the same thing could be accomplished more simply as follows:
}
procedure TForm1.Button2Click(Sender: TObject);
begin
  Edit2.Text := Edit1.Text;
end;
```

Caption (see page 5806)

Lines (see page 21380)

68.1.26.2.39 TLabeledEdit.Visible Property

Determines whether the component appears onscreen.

Pascal

```
property Visible: Boolean;
```

C++

```
__property Boolean Visible;
```

Description

Use the Visible property to control the visibility of the control at runtime. If Visible is true, the control appears. If Visible is false, the control is not visible.

Calling the Show method sets the control's Visible property to true. Calling the Hide method sets it to false.

C++ Examples:

```
/*
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
*/
void __fastcall TForm1::PageControl1Change(TObject *Sender)
{
  CheckBox1->Checked = PageControl1->ActivePage->Visible;
}

void __fastcall TForm1::CheckBox1Click(TObject *Sender)
{
  PageControl1->ActivePage->Visible = CheckBox1->Checked;
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < 10; i++)
  {
    TTabSheet *pPage = new TTabSheet(this);
    pPage->PageControl = PageControl1;
    pPage->Caption = AnsiString("Page") + IntToStr(i);
    TEdit *pEdit = new TEdit(this);
    pEdit->Parent = pPage;
    pEdit->Left = random(pPage->ClientWidth - pEdit->Width);
    pEdit->Top = random(pPage->ClientHeight - pEdit->Height);
  }
  PageControl1Change(Sender);
}
```

Delphi Examples:

```
{
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
}
procedure TForm1.CheckBox1Click(Sender: TObject);
begin
  PageControl1.ActivePage.Visible := CheckBox1.Checked;
end;

procedure TForm1.PageControl1Change(Sender: TObject);
begin
  CheckBox1.Checked := PageControl1.ActivePage.Visible;
end;

procedure TForm1.FormCreate(Sender: TObject);
var
  i: Integer;
begin
  for i := 0 to 9 do
    with TTabSheet.Create(Self) do
    begin
      PageControl := PageControl1;
      Caption := 'TabSheet' + IntToStr(i);
      with TEdit.Create(Self) do
      begin
        Parent := PageControl1.Pages[i];
        Left := Random(PageControl1.ActivePage.ClientWidth - Width);
        Top := Random(PageControl1.ActivePage.ClientHeight - Height);
```

```
      end;
    end;
    PageControl1Change(Sender);
end;
```

68.1.26.3 TLabeledEdit Events

The events of the TLabeledEdit class are listed here.

Published Events

	Name	Description
	OnChange (see page 12873)	Occurs when the text for the edit control may have changed.
	OnClick (see page 12874)	Occurs when the user clicks the control.
	OnContextPopup (see page 12876)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnDblClick (see page 12876)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDragDrop (see page 12877)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 12879)	Occurs when the user drags an object over a control.
	OnEndDock (see page 12881)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 12882)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnEnter (see page 12883)	Occurs when a control receives the input focus.
	OnExit (see page 12885)	Occurs when the input focus shifts away from one control to another.
	OnKeyDown (see page 12887)	Occurs when a user presses any key while the control has focus.
	OnKeyPress (see page 12890)	Occurs when a key is pressed.
	OnKeyUp (see page 12891)	Occurs when the user releases a key that has been pressed.
	OnMouseActivate (see page 12892)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 12893)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseEnter (see page 12896)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 12896)	Occurs when the user moves the mouse outside of a control.
	OnMouseMove (see page 12896)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 12898)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnStartDock (see page 12901)	Occurs when the user begins to drag a control with a DragKind of dkDock.
	OnStartDrag (see page 12901)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.

68.1.26.3.1 TLabeledEdit.OnChange Event

Occurs when the text for the edit control may have changed.

Pascal

```
property OnChange: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnChange;
```

Description

Write an OnChange event handler to take specific action whenever the text for the edit control may have changed. Use the Modified property to see if a change actually occurred. The Text property of the edit control will already be updated to reflect any changes. This event provides the first opportunity to respond to modifications that the user types into the edit control.

See Also

Change (see page 21245)

Text (see page 5842)

68.1.26.3.2 TLabeledEdit.OnClick Event

Occurs when the user clicks the control.

Pascal

```
property OnClick: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnClick;
```

Description

Use the OnClick event handler to respond when the user clicks the control. If the control has an associated action, and that action has an OnExecute method, the action's OnExecute method responds to click events unless it is superseded by an OnClick event handler.

Usually OnClick occurs when the user presses and releases the left mouse button with the mouse pointer over the control. This event can also occur when:

- The user selects an item in a grid, outline, list, or combo box by pressing an arrow key.
- The user presses Spacebar while a button or check box has focus.
- The user presses Enter when the active form has a default button (specified by the Default property).
- The user presses Esc when the active form has a cancel button (specified by the Cancel property).
- The user presses the accelerator key for a button or check box. For example, if the value of the Caption property of a check box is '&Bold', the B is underlined at runtime and the OnClick event of the check box is triggered when the user presses Alt+B. However, focus does not move to the control in these instances.
- The Checked property of a radio button is set to true.
- The value of the Checked property of a check box is changed.
- The Click method of a menu item is called.

For a form, an OnClick event occurs when the user clicks a blank area of the form or on a disabled component.

C++ Examples:

```
/*
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
*/
void __fastcall TForm1::PageControl1Change(TObject *Sender)
{
```

```
  CheckBox1->Checked = PageControl1->ActivePage->Visible;
}

void __fastcall TForm1::CheckBox1Click(TObject *Sender)
{
  PageControl1->ActivePage->Visible = CheckBox1->Checked;
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < 10; i++)
  {
    TTabSheet *pPage = new TTabSheet(this);
    pPage->PageControl = PageControl1;
    pPage->Caption = AnsiString("Page") + IntToStr(i);
    TEdit *pEdit = new TEdit(this);
    pEdit->Parent = pPage;
    pEdit->Left = random(pPage->ClientWidth - pEdit->Width);
    pEdit->Top = random(pPage->ClientHeight - pEdit->Height);
  }
  PageControl1Change(Sender);
}
```

Delphi Examples:

```
{
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
}
procedure TForm1.CheckBox1Click(Sender: TObject);
begin
  PageControl1.ActivePage.Visible := CheckBox1.Checked;
end;

procedure TForm1.PageControl1Change(Sender: TObject);
begin
  CheckBox1.Checked := PageControl1.ActivePage.Visible;
end;

procedure TForm1.FormCreate(Sender: TObject);
var
  i: Integer;
begin
  for i := 0 to 9 do
    with TTabSheet.Create(Self) do
    begin
      PageControl := PageControl1;
      Caption := 'TabSheet' + IntToStr(i);
      with TEdit.Create(Self) do
      begin
        Parent := PageControl1.Pages[i];
        Left := Random(PageControl1.ActivePage.ClientWidth - Width);
        Top := Random(PageControl1.ActivePage.ClientHeight - Height);
      end;
    end;
    PageControl1Change(Sender);
end;
```

68.1.26.3.3 TLabeledEdit.OnContextPopup Event

Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).

Pascal

```
property OnContextPopup: TContextPopupEvent;
```

C++

```
__property TContextPopupEvent OnContextPopup;
```

Description

The OnContextPopup handler is called when the user uses the mouse or keyboard to request a popup menu. The OnContextPopup event is generated by a WM_CONTEXTMENU message, which is itself generated by the user clicking the right mouse button or by pressing SHIFT+F10 or the Applications key.

This event is especially useful when the control does not have an associated popup menu (the PopupMenu property is not set) or if the AutoPopup property of the control's associated popup menu is false. However, the OnContextPopup can also be used to override the automatic context menu that appears when the control has an associated popup menu with an AutoPopup property of true. In this last case, if the event handler displays its own menu, it should set the Handled parameter to true to suppress the default context menu.

The handler's MousePos parameter indicates the position of the mouse, in client coordinates.. If the event was not generated by a mouse click, MousePos is (-1,-1).

Note: Parent controls receive an OnContextPopup event before their child controls. In addition, for many child controls, the default window procedure causes the parent control to receive an OnContextPopup event after the child control. As a result, when parent controls do not set Handled to true in an OnContextPopup event handler, the event handler may be called multiple times for each context menu invocation.

TPopupMenu (see page 16169)

PopupMenu (see page 5835)

AutoPopup (see page 16178)

68.1.26.3.4 TLabeledEdit.OnDblClick Event

Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.

Pascal

```
property OnDblClick: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnDblClick;
```

Description

Use the OnDblClick event to respond to mouse double-clicks.

See Also

OnClick (see page 5851)

Responding to User Actions at Runtime

68.1.26.3.5 TLabeledEdit.OnDragDrop Event

Occurs when the user drops an object being dragged.

Pascal

```
property OnDragDrop: TDragDropEvent;
```

C++

```
__property TDragDropEvent OnDragDrop;
```

Description

Use the OnDragDrop event handler to specify what happens when the user drops an object. The Source parameter of the OnDragDrop event is the object being dropped, and the Sender is the control the object is being dropped on. The X and Y parameters are the coordinates of the mouse positioned over the control.

C++ Examples:

```
/*
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
*/

// This OnDragOver event handler permits the list box to
// accept a dropped label:
void __fastcall TForm1::ListBox1DragOver(TObject *Sender, TObject *Source, int X, int Y,
TDragState State, bool &Accept)
{
   Accept = Source->ClassNameIs("TLabel");
}

/*
This OnDragDrop event handler implements the drop behavior.
*/
void __fastcall TForm1::ListBox1DragDrop(TObject *Sender, TObject *Source, int X, int Y)
{
  if (Sender->ClassNameIs("TListBox") && Source->ClassNameIs("TLabel"))
  {
    TListBox *DestList = (TListBox *)Sender;
    DestList->Font = ((TLabel *)Source)->Font;
    DestList->Color = ((TLabel *)Source)->Color;
    DestList->DoubleBuffered = true;
    DestList->Color = clWindow;
  }
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  ListBox1->Items->Add("Not");
  ListBox1->Items->Add("In");
  ListBox1->Items->Add("Alphabetical");
  ListBox1->Items->Add("Order");

}
```

Delphi Examples:

```
{
This code is an OnDragOver event handler that won't allow a
label control to be dropped on a panel control and stops the
dragging of the label as soon as the user drags the label
onto the panel:
Note: Set the label's DragMode property to dmAutomatic.
}
procedure TForm1.FormDragDrop(Sender, Source: TObject; X, Y: Integer);
begin
  TForm1(Source).Left := X;
  TForm1(Source).Top := Y;
end;

procedure TForm1.FormDragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := Source is TLabel;
end;

procedure TForm1.Panel1DragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := False;
  if (Source is TLabel) and (State = dsDragEnter) then
    (Source as TLabel).EndDrag(False);
end;
{
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
}

procedure TForm1.FormCreate(Sender: TObject);
begin
  ListBox1.Items.Add('Not');
  ListBox1.Items.Add('In');
  ListBox1.Items.Add('Alphabetical');
  ListBox1.Items.Add('Order');
end;

// This OnDragOver event handler permits the list box to
// accept a dropped label:

procedure TForm1.ListBox1DragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := Source is TLabel;
end;

// This OnDragDrop event handler implements the drop behavior.

procedure TForm1.ListBox1DragDrop(Sender, Source: TObject; X, Y: Integer);
begin
  if (Sender is TListBox) and (Source is TLabel) then
  begin
    with Sender as TListBox do
    begin
      Font := (Source as TLabel).Font;
      Color := (Source as TLabel).Color;
      DoubleBuffered := true;
      Color := clWindow;
```

```
    end;
  end;
end;
```

68.1.26.3.6 TLabeledEdit.OnDragOver Event

Occurs when the user drags an object over a control.

Pascal

```
property OnDragOver: TDragOverEvent;
```

C++

```
__property TDragOverEvent OnDragOver;
```

Description

Use an OnDragOver event to signal that the control can accept a dragged object so the user can drop or dock it.

Within the OnDragOver event handler, change the Accept parameter to false to reject the dragged object. Leave Accept as true to allow the user to drop or dock the dragged object on the control.

To change the shape of the cursor, indicating that the control can accept the dragged object, change the value of the DragCursor property for the control before the OnDragOver event occurs.

The Source is the object being dragged, the Sender is the potential drop or dock site, and X and Y are screen coordinates in pixels. The State parameter specifies how the dragged object is moving over the control.

Note: Within the OnDragOver event handler, the Accept parameter defaults to true. However, if an OnDragOver event handler is not supplied, the control rejects the dragged object, as if the Accept parameter were changed to false.

C++ Examples:

```
/*
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
*/

// This OnDragOver event handler permits the list box to
// accept a dropped label:
void __fastcall TForm1::ListBox1DragOver(TObject *Sender, TObject *Source, int X, int Y,
TDragState State, bool &Accept)
```

```
{
   Accept = Source->ClassNameIs("TLabel");
}

/*
This OnDragDrop event handler implements the drop behavior.
*/
void __fastcall TForm1::ListBox1DragDrop(TObject *Sender, TObject *Source, int X, int Y)
{
  if (Sender->ClassNameIs("TListBox") && Source->ClassNameIs("TLabel"))
  {
    TListBox *DestList = (TListBox *)Sender;
    DestList->Font = ((TLabel *)Source)->Font;
    DestList->Color = ((TLabel *)Source)->Color;
    DestList->DoubleBuffered = true;
    DestList->Color = clWindow;
  }
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  ListBox1->Items->Add("Not");
  ListBox1->Items->Add("In");
  ListBox1->Items->Add("Alphabetical");
  ListBox1->Items->Add("Order");

}
```

Delphi Examples:

```
{
This code is an OnDragOver event handler that won't allow a
label control to be dropped on a panel control and stops the
dragging of the label as soon as the user drags the label
onto the panel:
Note: Set the label's DragMode property to dmAutomatic.
}
procedure TForm1.FormDragDrop(Sender, Source: TObject; X, Y: Integer);
begin
  TForm1(Source).Left := X;
  TForm1(Source).Top := Y;
end;

procedure TForm1.FormDragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := Source is TLabel;
end;

procedure TForm1.Panel1DragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := False;
  if (Source is TLabel) and (State = dsDragEnter) then
    (Source as TLabel).EndDrag(False);
end;
{
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
}

procedure TForm1.FormCreate(Sender: TObject);
begin
```

```
    ListBox1.Items.Add('Not');
    ListBox1.Items.Add('In');
    ListBox1.Items.Add('Alphabetical');
    ListBox1.Items.Add('Order');
  end;

  // This OnDragOver event handler permits the list box to
  // accept a dropped label:

  procedure TForm1.ListBox1DragOver(Sender, Source: TObject; X, Y: Integer;
    State: TDragState; var Accept: Boolean);
  begin
    Accept := Source is TLabel;
  end;

  // This OnDragDrop event handler implements the drop behavior.

  procedure TForm1.ListBox1DragDrop(Sender, Source: TObject; X, Y: Integer);
  begin
    if (Sender is TListBox) and (Source is TLabel) then
    begin
      with Sender as TListBox do
      begin
        Font := (Source as TLabel).Font;
        Color := (Source as TLabel).Color;
        DoubleBuffered := true;
        Color := clWindow;
      end;
    end;
  end;
```

68.1.26.3.7 TLabeledEdit.OnEndDock Event

Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.

Pascal

```
property OnEndDock: TEndDragEvent;
```

C++

```
__property TEndDragEvent OnEndDock;
```

Description

Use OnEndDock to specify actions or special processing that when a drag-and-dock operation stops.

See Also

DragKind (see page 5819)

OnDragOver (see page 5857)

OnDockDrop (see page 6214)

OnStartDock (see page 5871)

68.1.26.3.8 TLabeledEdit.OnEndDrag Event

Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.

Pascal

```
property OnEndDrag: TEndDragEvent;
```

C++

```
__property TEndDragEvent OnEndDrag;
```

Description

Use the OnEndDrag event handler to specify any special processing that occurs when dragging stops.

C++ Examples:

```
/*
This code displays a message in a label named Status. The
message displayed depends on whether the dragged label
control was successfully dropped into and accepted by a
another control.
*/
void __fastcall TForm1::Label1EndDrag(TObject *Sender, TObject *Target, int X,
      int Y)
{
  if (Sender->ClassNameIs("TLabel"))
  {
    AnsiString S = ((TLabel *)Sender)->Name + " was dropped and ";
    if (Target)
      S = S + "accepted!";
    else
      S = S + "rejected.";
    Status->Caption = S;
  }
}
```

Delphi Examples:

```
{
This code displays a message in a label named Status. The
message displayed depends on whether the dragged label
control was successfully dropped into and accepted by a
another control.
}
procedure TForm1.Label1EndDrag(Sender, Target: TObject; X, Y: Integer);
var
  S: string;
begin
  S := (Sender as TLabel).Name + ' was dropped... and ';
  if Target <> nil then
    S := S + 'accepted!'
  else
    S := S + 'rejected!';
  Status.Caption := S;
end;

68.1.26.3.9 TLabeledEdit.OnEnter Event

Occurs when a control receives the input focus.

Pascal

```
property OnEnter: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnEnter;
```

Description

Use the OnEnter event handler to cause any special processing to occur when a control becomes active.

The OnEnter event does not occur when switching between forms or between another application and the application that includes the control.

When switching between controls in separate container controls such as the TPanel and the TGroupBox controls, an OnEnter event occurs for the container before the OnEnter event of the contained control.

Similarly, an OnExit event of the container occurs after the OnExit event of the control in a container when focus moves to another control outside the container.

For example, consider a form with an OK button and a group box that contains three radio buttons, where focus is currently on the OK button. When the user clicks one of the radio buttons, an OnExit event of the button occurs, followed by an OnEnter event on the group box, and finally an OnEnter event on the radio button that was clicked. If the user then clicks on the OK button, an OnExit event for the radio button occurs followed by an OnExit event for the group box, and then the button's OnEnter event occurs.

C++ Examples:

```
/*
This example takes an edit control, a button, and a rich
edit control on a form.  When the user presses the button, a
Font dialog appears.  When the user clicks the Apply (not OK)
button in the Font dialog, the currently selected font is
applied to the active control. Clicking the button sets the
ActiveControl to the button.  That is why we need to save
the ActiveControl in a shared OnEnter procedure.  In the rich
edit, only the text selected converts.
*/
TWinControl *myActiveControl;

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  FontDialog1->Options << fdApplyButton;
  FontDialog1->Execute();
}

void __fastcall TForm1::FontDialog1Apply(TObject *Sender, HWND Wnd)
{
  if (myActiveControl->ClassNameIs("TEdit"))
```

```
    ((TEdit *)myActiveControl)->Font->Assign(FontDialog1->Font);
  else if (myActiveControl->ClassNameIs("TRichEdit"))
    ((TRichEdit *)myActiveControl)->SelAttributes->Assign(FontDialog1->Font);
  else
    MessageBeep(0);
}

void __fastcall TForm1::Edit1Enter(TObject *Sender)
{
  myActiveControl = ActiveControl;
}
/*
This example uses an edit box and a memo control on a form.
When either the edit box or the memo is the active control,
it is colored yellow. When the active control becomes
inactive, the color of the control returns to the Windows
system color for a window.  These event handlers could also
be shared.
*/
void __fastcall TForm1::Edit1Enter(TObject *Sender)
{
  Edit1->Color = clYellow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Edit1Exit(TObject *Sender)
{
  Edit1->Color = clWindow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Memo1Enter(TObject *Sender)
{
  Memo1->Color = clYellow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Memo1Exit(TObject *Sender)
{
  Memo1->Color = clWindow;
}
```

Delphi Examples:

```
{
This example takes an edit control, a button, and a rich
edit control on a form.  When the user presses the button, a
Font dialog appears.  When the user clicks the Apply (not OK)
button in the Font dialog, the currently selected font is
applied to the active control. Clicking the button sets the
ActiveControl to the button.  That is why we need to save
the ActiveControl in a shared OnEnter procedure.  In the rich
edit, only the text selected converts.
}
procedure TForm1.Button1Click(Sender: TObject);
begin
   FontDialog1.Options := FontDialog1.Options + [fdApplyButton];
   FontDialog1.Execute;
end;

procedure TForm1.Edit1Enter(Sender: TObject);
begin
  myActiveControl := ActiveControl;
end;

procedure TForm1.FontDialog1Apply(Sender: TObject; Wnd: HWND);
begin
  if myActiveControl is TEdit then
    with myActiveControl as TEdit do
       Font.Assign(TFontDialog(Sender).Font)
```

```
    else if myActiveControl is TRichEdit then
      with myActiveControl as TRichEdit do
        SelAttributes.Assign(TFontDialog(Sender).Font)
    else
      Beep;
  end;
  {
  This example uses an edit box and a memo control on a form.
  When either the edit box or the memo is the active control,
  it is colored yellow. When the active control becomes
  inactive, the color of the control returns to the Windows
  system color for a window.  These event handlers could also
  be shared.
  }
  procedure TForm1.Edit1Enter(Sender: TObject);
  begin
    Edit1.Color := clYellow;
  end;

  procedure TForm1.Edit1Exit(Sender: TObject);
  begin
    Edit1.Color := clWindow;
  end;

  procedure TForm1.Memo1Enter(Sender: TObject);
  begin
    Memo1.Color := clYellow;
  end;

  procedure TForm1.Memo1Exit(Sender: TObject);
  begin
    Memo1.Color := clWindow;
  end;

68.1.26.3.10 TLabeledEdit.OnExit Event

Occurs when the input focus shifts away from one control to another.

Pascal

```
property OnExit: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnExit;
```

Description

Use the OnExit event handler to provide special processing when the control ceases to be active.

The OnExit event does not occur when switching between forms or between another application and your application.

When switching between controls in separate container controls such as the TPanel and the TGroupBox controls, an OnExit event occurs for the control inside the container before the OnExit event of the container.

Similarly, an OnEnter event of the container occurs before the OnEnter event of the control in a container when focus moves to a control inside a container.

For example, consider a form with an OK button and a group box that contains three radio buttons, where focus is currently on the OK button. When the user clicks one of the radio buttons, an OnExit event of the button occurs, followed by an OnEnter event on the group box, and finally an OnEnter event on the radio button that was clicked. If the user then clicks on the OK button, an OnExit event for the radio button occurs followed by an OnExit event for the group box, and then the button's OnEnter event occurs.

Note: In some control classes the ActiveControl property updates before the OnExit event occurs.

C++ Examples:

```
/*
This example uses an edit box and a memo control on a form.
When either the edit box or the memo is the active control,
it is colored yellow. When the active control becomes
inactive, the color of the control returns to the Windows
system color for a window.  These event handlers could also
be shared.
*/
void __fastcall TForm1::Edit1Enter(TObject *Sender)
{
  Edit1->Color = clYellow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Edit1Exit(TObject *Sender)
{
  Edit1->Color = clWindow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Memo1Enter(TObject *Sender)
{
  Memo1->Color = clYellow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Memo1Exit(TObject *Sender)
{
  Memo1->Color = clWindow;
}
```

Delphi Examples:

```
{
This example uses an edit box and a memo control on a form.
When either the edit box or the memo is the active control,
it is colored yellow. When the active control becomes
inactive, the color of the control returns to the Windows
system color for a window.  These event handlers could also
be shared.

68.1.26.3.11 TLabeledEdit.OnKeyDown Event

Occurs when a user presses any key while the control has focus.

Pascal

```
property OnKeyDown: TKeyEvent;
```

C++

```
__property TKeyEvent OnKeyDown;
```

Description

Use the OnKeyDown event handler to specify special processing to occur when a key is pressed. The OnKeyDown handler can respond to keyboard keys, including function keys and keys combined with the `Shift`, `Alt`, and `Ctrl` keys, and pressed mouse buttons.

Note: TCheckBox does not fire OnKeyDown events for arrow keys.

The TKeyEvent type points to a method that handles keyboard events.

The Key parameter is the key on the keyboard. For non-alphanumeric keys, use virtual key codes to determine the key pressed. For more information, see Virtual Key codes.

The Shift parameter indicates whether the Shift, Alt, or Ctrl keys are combined with the keystroke.

An application gets Windows WM_KEYDOWN messages for all keys when the user presses a key. These messages indirectly fire the OnKeyDown event. If you set the Key to 0 there you prevent only any further processing of this message. But for keys that generate characters Windows also produces WM_CHAR. At the time your OnKeyDown event fires, the WM_CHAR message for the key will already be in the message queue. Setting Key to 0 does not stop it from being delivered, so it fires the OnKeyPress event. You must set the Key to #0 to prevent the control from intercepting the WM_CHAR message.

This method of organizing key processing has advantages. Code that only deals with characters, including control characters like #13 for carriage return, #3 for Ctrl-C and so on, should go into the OnKeyPress event. Code that deals with keys that do not generate characters should be put into the OnKeyDown event.

C++ Examples:

```
/*
This example changes a form's color to aqua when the user
presses the F1 key, even when a control on the form has the
focus. When the user releases the key, the form returns to
its original color.  Set the KeyPreview on the form to True.
Set the OnKeyDown event to FormKeyDown and set the OnKeyUp
event to FormKeyUp.  Set the KeyPreview on the form to True.
*/
void __fastcall TForm1::FormKeyDown(TObject *Sender, WORD &Key,
      TShiftState Shift)
{
  if (Key == VK_F1)
  {
    FormColor = Form1->Color;
    Form1->Color = clAqua;
    if (ComboBox1->Text == "KeyDown")
```

```
      ComboBox1->Text = "KeyDown2";
    else
      ComboBox1->Text = "KeyDown";
    Form1->Refresh();
    Memo1->Lines->Add(ComboBox1->Text);
  }
}

void __fastcall TForm1::FormKeyUp(TObject *Sender, WORD &Key, TShiftState Shift)
{
  if (Key == VK_F1)
  {
    Form1->Color = FormColor;
    if (ComboBox1->Text == "KeyUp")
      ComboBox1->Text = "KeyUp2";
    else
      ComboBox1->Text = "KeyUp";
    Form1->Refresh();
    Memo1->Lines->Add(ComboBox1->Text);
  }
}
```

Delphi Examples:

```
{
This example changes a form's color to aqua when the user
presses the F1 key, even when a control on the form has the
focus. When the user releases the key, the form returns to
its original color.  Set the KeyPreview on the form to True.
Set the OnKeyDown event to FormKeyDown and set the OnKeyUp
event to FormKeyUp.  Set the KeyPreview on the form to True.
}
var
  FormColor: TColor;
procedure TForm1.FormCreate(Sender: TObject);
begin
  KeyPreview := True;
  FormColor := Form1.Color;

68.1.26.3.12 TLabeledEdit.OnKeyPress Event

Occurs when a key is pressed.

Pascal

```
property OnKeyPress: TKeyPressEvent;
```

C++

```
__property TKeyPressEvent OnKeyPress;
```

Description

Use the OnKeyPress event handler to make something happen as a result of a single character key press.

The Key parameter in the OnKeyPress event handler is of type Char; therefore, the OnKeyPress event registers the ASCII character of the key pressed. Keys that don't correspond to an ASCII Char value (Shift or F1, for example) don't generate an OnKeyPress event. Key combinations (such as Shift+A), generate only one OnKeyPress event (for this example, Shift+A results in a Key value of "A" if Caps Lock is off). To respond to non-ASCII keys or key combinations, use the OnKeyDown or OnKeyUp event handlers.

An application gets Windows WM_KEYDOWN messages for all keys when the user presses a key. These messages indirectly fire the OnKeyDown event. If you set the Key to 0 there you prevent only any further processing of this message. But for keys that generate characters Windows also produces WM_CHAR. At the time your OnKeyDown event fires, the WM_CHAR message for the key will already be in the message queue. Setting Key to 0 does not stop it from being delivered, so it fires the OnKeyPress event. You must set the Key to #0 to prevent the control from intercepting the WM_CHAR message.

This method of organizing key processing has advantages. Code that only deals with characters, including control characters like #13 for carriage return, #3 for Ctrl-C and so on, should go into the OnKeyPress event. Code that deals with keys that do not generate characters should be put into the OnKeyDown event.

C++ Examples:

```
/*
This event handler displays a message dialog box specifying
which key was pressed:
*/

void __fastcall TForm1::FormKeyPress(TObject *Sender, char &Key)
{
  char keyString[25];
  keyString[0] = Key;
  strcpy(&keyString[1], " Was Pressed");
  TMsgDlgButtons() << mbOK;
  MessageDlg(AnsiString(keyString), TMsgDlgType(mtInformation), TMsgDlgButtons() << mbOK, 0);
}
```

Delphi Examples:

```
{
This event handler displays a message dialog box specifying
which key was pressed:
}
procedure TForm1.FormKeyPress(Sender: TObject; var Key: Char);
begin
  MessageDlg(Key + ' has been pressed', mtInformation, [mbOK], 0)
end;
```

68.1.26.3.13 TLabeledEdit.OnKeyUp Event

Occurs when the user releases a key that has been pressed.

Pascal

```
property OnKeyUp: TKeyEvent;
```

C++

```
__property TKeyEvent OnKeyUp;
```

Description

Use the OnKeyUp event handler to provide special processing that occurs when a key is released. The OnKeyUp handler can respond to all keyboard keys, including function keys and keys combined with the Shift, Alt, and Ctrl keys.

The TKeyEvent type points to a method that handles keyboard events. The Key parameter is the key on the keyboard. For non-alphanumeric keys, you must use virtual key codes to determine the key pressed. For more information, see Virtual Key codes.

The Shift parameter indicates whether the Shift, Alt, or Ctrl keys are combined with the keystroke.

C++ Examples:

```
/*
This example changes a form's color to aqua when the user
presses the F1 key, even when a control on the form has the
focus. When the user releases the key, the form returns to
its original color.  Set the KeyPreview on the form to True.
Set the OnKeyDown event to FormKeyDown and set the OnKeyUp
event to FormKeyUp.  Set the KeyPreview on the form to True.
*/
void __fastcall TForm1::FormKeyDown(TObject *Sender, WORD &Key,
      TShiftState Shift)
{
  if (Key == VK_F1)
  {
    FormColor = Form1->Color;
    Form1->Color = clAqua;
    if (ComboBox1->Text == "KeyDown")
      ComboBox1->Text = "KeyDown2";
    else
      ComboBox1->Text = "KeyDown";
    Form1->Refresh();
    Memo1->Lines->Add(ComboBox1->Text);
  }
}

void __fastcall TForm1::FormKeyUp(TObject *Sender, WORD &Key, TShiftState Shift)
{
  if (Key == VK_F1)
  {
    Form1->Color = FormColor;
    if (ComboBox1->Text == "KeyUp")
      ComboBox1->Text = "KeyUp2";
    else
      ComboBox1->Text = "KeyUp";
    Form1->Refresh();
    Memo1->Lines->Add(ComboBox1->Text);
  }
}
```

Delphi Examples:

```
{
This example changes a form's color to aqua when the user
presses the F1 key, even when a control on the form has the
focus. When the user releases the key, the form returns to
its original color.  Set the KeyPreview on the form to True.
Set the OnKeyDown event to FormKeyDown and set the OnKeyUp
event to FormKeyUp.  Set the KeyPreview on the form to True.
}
var
  FormColor: TColor;
procedure TForm1.FormCreate(Sender: TObject);
begin

68.1.26.3.14 TLabeledEdit.OnMouseActivate Event

Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.

Pascal

```
property OnMouseActivate: TMouseActivateEvent;
```

C++

```
__property TMouseActivateEvent OnMouseActivate;
```

Description

Use the OnMouseActivate event handler to implement any special processing that should occur as a result of pressing a mouse button on a control when the parent top-level form is not active.

The event type is:

```
TMouseActivateEvent = procedure (Sender: TObject; Button: TMouseButton; ShiftState:
TShiftState;
X, Y: Integer; HitTest: Integer; var MouseActivate: TMouseActivate) of object;
```

When you click on a control and the parent top-level form is not active, this event fires on the control that the mouse cursor is over. MouseActivate is a protected virtual function in TControl. MouseActivate can be overridden in custom control descendants to provide special built-in processing of the OnMouseActivate events. If you leave the default value of MouseActivate as maDefault, the parent control fires the OnMouseActivate event and repeats the process all the way up to the top-level form. If no control in the chain sets the value of MouseActivate, the behavior is the same as if a control set TMouseActivate to maActivate. At any point, a control can set the value of TMouseActivate and the parent processing stops.

Some controls set focus to themselves when they get a button down message so, in some cases, setting maNoActivate appears to have no effect. For instance, a TButton control sets focus to itself in the WM_LBUTTONDOWN message regardless of whether or not TMouseActivate is set to maNoActivate. In this case, setting maNoActivateAndEat will work because the top-level form is not activated and the WM_LBUTTONDOWN message is suppressed.

The HitTest parameter is the hit test value obtained from the WM_NCHITTEST message. See Windows.pas for valid values and their meanings. In most cases this value will be HTCLIENT, which means that the user clicked in the client area of a control. However, in the case of a top-level form, this can take other values such as HTCAPTION, or HTBOTTOM. This allows the code to decide which value to set for MouseActivate, based on the HitTest code. For example, the following code in the OnMouseActivate event handler for a TForm forces the user to click into a non-client area to activate the form:

```
if HitTest = HTCLIENT then
    MouseActivate := maNoActivateAndEat;
```

Even though this event is tied to how Windows processes WM_MOUSEACTIVATE, the actual handling of the message is done at the TControl level, which is the point in the VCL hierarchy where the control has no window handle. The OnMouseActivate event is then simulated since the all TControl descendants also have OnMouseDown, OnMouseMove, and OnMouseUp events. This information is applicable to both VCL Win32 and VCL.NET.

68.1.26.3.15 TLabeledEdit.OnMouseDown Event

Occurs when the user presses a mouse button with the mouse pointer over a control.

Pascal

```
property OnMouseDown: TMouseEvent;
```

C++

```
__property TMouseEvent OnMouseDown;
```

Description

Use the OnMouseDown event handler to implement any special processing that should occur as a result of pressing a mouse button.

The OnMouseDown event handler can respond to left, right, or center mouse button presses and shift key plus mouse-button combinations. Shift keys are the Shift, Ctrl, and Alt keys. X and Y are the pixel coordinates of the mouse pointer in the client area of the Sender.

C++ Examples:

```
/*
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a
rectangle is drawn on the form. When the mouse button is
released, the rectangle appears on the form’s canvas. Its
top-left and bottom-right corners are defined by the
location of the mouse pointer when the user pressed and
released the mouse button.  While the user drags the mouse,
the location of the top, left, bottom, and right sides of
the rectangle are displayed in the status bar.
*/
int StartX, StartY; // Declare at the top of the form’s unit
// Use this code as the OnMouseDown event handler of the form:
void __fastcall TForm1::FormMouseDown(TObject *Sender, TMouseButton Button, TShiftState Shift,
int X, int Y)
{
  StartX = X;
  StartY = Y;
}

// Use this code as the OnMouseUp event handler of the form:
void __fastcall TForm1::FormMouseUp(TObject *Sender, TMouseButton Button, TShiftState Shift,
int X, int Y)
{
  Form1->Canvas->Rectangle(StartX, StartY, X, Y);
  StatusBar1->Panels->Items[0]->Text = "";
  StatusBar1->Panels->Items[1]->Text = "";
  StatusBar1->Panels->Items[2]->Text = "";
  StatusBar1->Panels->Items[3]->Text = "";
}

// Use this code as the OnMouseMove event handler of the form:
void __fastcall TForm1::FormMouseMove(TObject *Sender, TShiftState Shift, int X, int Y)
{
  if (Shift.Contains(ssLeft)) // make sure button is down
  {
    if (Y > StartY)
    {
      StatusBar1->Panels->Items[0]->Text = "Top: " + IntToStr(StartY);
      StatusBar1->Panels->Items[2]->Text = "Bottom: " + IntToStr(Y);
    }
    else
    {
      StatusBar1->Panels->Items[0]->Text = "Top: " + IntToStr(Y);
      StatusBar1->Panels->Items[2]->Text = "Bottom: " + IntToStr(StartY);
    }
    if (X > StartX)
    {
      StatusBar1->Panels->Items[1]->Text = "Left: " + IntToStr(StartX);
      StatusBar1->Panels->Items[3]->Text = "Right: " + IntToStr(X);
    }
    else
    {
      StatusBar1->Panels->Items[1]->Text = "Left: " + IntToStr(X);
      StatusBar1->Panels->Items[3]->Text = "Right: " + IntToStr(StartX);
    }
  }
}
```

Delphi Examples:

```
{
The following example requires a form with a four-paneled
```

```
status bar.  (Set the Width of the status panels to 150
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a
rectangle is drawn on the form. When the mouse button is
released, the rectangle appears on the form's canvas. Its
top-left and bottom-right corners are defined by the
location of the mouse pointer when the user pressed and
released the mouse button.  While the user drags the mouse,
the location of the top, left, bottom, and right sides of
the rectangle are displayed in the status bar.

68.1.26.3.16 TLabeledEdit.OnMouseEnter Event

Occurs when the user moves the mouse into a control.

Pascal

```
property OnMouseEnter: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnMouseEnter;
```

Description

Use the OnMouseEnter event handler to implement any special processing that should occur as a result of moving the mouse into a control when the parent top-level form is not active.

68.1.26.3.17 TLabeledEdit.OnMouseLeave Event

Occurs when the user moves the mouse outside of a control.

Pascal

```
property OnMouseLeave: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnMouseLeave;
```

Description

Use the OnMouseLeave event handler to implement any special processing that should occur as a result of moving the mouse outside of a control when the parent top-level form is not active.

68.1.26.3.18 TLabeledEdit.OnMouseMove Event

Occurs when the user moves the mouse pointer while the mouse pointer is over a control.

Pascal

```
property OnMouseMove: TMouseMoveEvent;
```

C++

```
__property TMouseMoveEvent OnMouseMove;
```

Description

Use the OnMouseMove event handler to respond when the mouse pointer moves after the control has captured the mouse.

Use the Shift parameter of the OnMouseDown event handler, to determine to the state of the shift keys and mouse buttons. Shift keys are the Shift, Ctrl, and Alt keys or shift key-mouse button combinations. X and Y are pixel coordinates of the new location of the mouse pointer in the client area of the Sender.

C++ Examples:

```
/*
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a
rectangle is drawn on the form. When the mouse button is
released, the rectangle appears on the form's canvas. Its
top-left and bottom-right corners are defined by the
location of the mouse pointer when the user pressed and
```

```
released the mouse button.  While the user drags the mouse,
the location of the top, left, bottom, and right sides of
the rectangle are displayed in the status bar.
*/
int StartX, StartY; // Declare at the top of the form's unit

68.1.26.3.19 TLabeledEdit.OnMouseUp Event

Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.

Pascal

```
property OnMouseUp: TMouseEvent;
```

C++

```
__property TMouseEvent OnMouseUp;
```

Description

Use an OnMouseUp event handler to implement special processing when the user releases a mouse button.

The OnMouseUp event handler can respond to left, right, or center mouse button presses and shift key plus mouse-button combinations. Shift keys are the Shift, Ctrl, and Alt keys. X and Y are the pixel coordinates of the mouse pointer in the client area of the Sender.

C++ Examples:

```
/*
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a
rectangle is drawn on the form. When the mouse button is
released, the rectangle appears on the form's canvas. Its
top-left and bottom-right corners are defined by the
location of the mouse pointer when the user pressed and
released the mouse button.  While the user drags the mouse,
the location of the top, left, bottom, and right sides of
the rectangle are displayed in the status bar.
*/

Responding to a Mouse-up Action

68.1.26.3.20 TLabeledEdit.OnStartDock Event

Occurs when the user begins to drag a control with a DragKind of dkDock.

Pascal

```
property OnStartDock: TStartDockEvent;
```

C++

```
__property TStartDockEvent OnStartDock;
```

Description

Use the OnStartDock event handler to implement special processing when the user starts a drag-and-dock operation by dragging the control.

The OnStartDock event handler can create a TDragDockObjectEx object for the DragObject parameter to specify the appearance of the dragging rectangle and how the dragged control interacts with potential docking sites. If you return TDragDockObjectEx as the drag object, there is no need to call the Free method for the DragObject when dragging is over. If you use TDragDockObject, your application is responsible for freeing the drag object.

If the OnStartDock event handler sets the DragObject parameter to nil (Delphi) or NULL (C++), a TDragDockObject object is automatically created.

Note: This information applies to Win32 applications only.

68.1.26.3.21 TLabeledEdit.OnStartDrag Event

Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.

Pascal

```
property OnStartDrag: TStartDragEvent;
```

C++

```
__property TStartDragEvent OnStartDrag;
```

Description

Use the OnStartDrag event handler to implement special processing when the user starts to drag the control or an object it contains. OnStartDrag only occurs if DragKind is dkDrag.

Sender is the control that is about to be dragged, or that contains the object about to be dragged.

The OnStartDrag event handler can create a TDragControlObjectEx instance for the DragObject parameter to specify the drag cursor, or, optionally, a drag image list. If you create a TDragControlObjectEx instance, there is no need to call the Free method for the DragObject when dragging is over. If you create, instead, a TDragControlObject instance, your application is responsible for freeing the drag object instance.

If the OnStartDrag event handler sets the DragObject parameter to nil (Delphi) or NULL (C++), a TDragControlObject object is automatically created and dragging begins on the control itself.

Note: On some controls, such as TRichEdit, the underlying Windows control handles internal drag operations. For these controls, there are no OnStartDrag or OnEndDrag events for drag operations within the control.

68.1.27 TNotebook Class

TNotebook displays multiple pages, each with its own set of controls.

Class Hierarchy

Pascal

```
TNotebook = class(TCustomControl);
```

C++

```
class TNotebook : public TCustomControl;
```

File

ExtCtrls

Description

Notebook components are frequently used with tab set controls (TTabSet) to let the user select pages in the notebook by clicking a tab. TNotebook is provided for backward compatibility. New applications should use TPageControl instead.

68.1.27.1 TNotebook Members

The following tables list the members exposed by TNotebook.

Protected Events

	Name	Description
	OnAlignInsertBefore (see page 6213)	Occurs when an object with custom alignment is aligned.
	OnAlignPosition (see page 6214)	Occurs when an object with custom alignment is aligned.
	OnCanResize (see page 5851)	Occurs when an attempt is made to resize the control.
	OnConstrainedResize (see page 5853)	Adjust resize constraints.
	OnDockDrop (see page 6214)	Occurs when another control is docked to the control.
	OnDockOver (see page 6216)	Occurs when another control is dragged over the control.
	OnGetSiteInfo (see page 6223)	Returns the control's docking information.

	OnKeyDown (see page 6225)	Occurs when a user presses any key while the control has focus.
	OnKeyPress (see page 6227)	Occurs when a key is pressed.
	OnKeyUp (see page 6228)	Occurs when the user releases a key that has been pressed.
	OnMouseWheel (see page 5869)	Occurs when the mouse wheel is rotated.
	OnMouseWheelDown (see page 5869)	Occurs when the mouse wheel is rotated downward.
	OnMouseWheelUp (see page 5870)	Occurs when the mouse wheel is rotated upward.
	OnResize (see page 5870)	Occurs immediately after the control is resized.
	OnUnDock (see page 6230)	Occurs when the application tries to undock a control that is docked to the windowed control.

Protected Fields

	Name	Description
	FAnchorMove (see page 5733)	This is FAnchorMove, a member of class TControl.
	FAnchorOrigin (see page 5734)	This is FAnchorOrigin, a member of class TControl.
	FAnchorRules (see page 5734)	This is FAnchorRules, a member of class TControl.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FDesignSize (see page 6124)	This is FDesignSize, a member of class TWinControl.
	FDoubleBuffered (see page 6124)	This is FDoubleBuffered, a member of class TWinControl.
	FExplicitHeight (see page 5734)	This is FExplicitHeight, a member of class TControl.
	FExplicitLeft (see page 5734)	This is FExplicitLeft, a member of class TControl.
	FExplicitTop (see page 5734)	This is FExplicitTop, a member of class TControl.
	FExplicitWidth (see page 5735)	This is FExplicitWidth, a member of class TControl.
	FInImeComposition (see page 6125)	This is FInImeComposition, a member of class TWinControl.
	FOriginalParentSize (see page 5735)	This is FOriginalParentSize, a member of class TControl.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	ActionChange (see page 5737)	Responds when the action associated with the control changes.
	ActionChange (see page 6127)	Updates the control to reflect changes in its associated action.
	AddBiDiModeExStyle (see page 6128)	Sets control's window style according to its bi-directional support.
	AdjustClientRect (see page 6128)	Provides the interface that adjusts the ClientRect (see page 5810) property for idiosyncrasies of the window.
	AdjustSize (see page 5738)	Sets the size of the control as determined by the AutoSize (see page 5803) property.
	AdjustSize (see page 6129)	Adjusts the control's size according to its contents and constraints.
	AlignControls (see page 6129)	Aligns any controls for which the control is the parent within a specified area of the control.
	ArrangeControl (see page 6130)	This is ArrangeControl, a member of class TWinControl.
	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	AssignTo (see page 5739)	Overrides the inherited AssignTo function to enable assignments to TAction objects.
	AssignTo (see page 6130)	Copies the properties of the windowed control to another object.
	BeginAutoDrag (see page 5739)	Begin Automatic Drag.
	CalcCursorPos (see page 5741)	This is CalcCursorPos, a member of class TControl.
	CanAutoSize (see page 5741)	Indicates whether the control can resize itself automatically to accommodate its contents.
	CanAutoSize (see page 6131)	Indicates how the control can be resized.
	CanResize (see page 5742)	OnCanResize (see page 5851) event dispatcher.
	CanResize (see page 6132)	Indicates how the control can respond to a resize attempt.
	Changed (see page 5742)	Sends a CM_CHANGED (see page 6330) message to the control.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	ChangeScale (see page 5743)	Rescaling event dispatcher.
	ChangeScale (see page 6132)	Resize (see page 5780) and reposition children and self.
	Click (see page 5743)	Respond to user click.

	ConstrainedResize (see page 5746)	Notify control of resize with constraints.
	ConstrainedResize (see page 6133)	Generates an OnConstrainedResize (see page 5853) event.
	ControlsAligned (see page 6134)	This is ControlsAligned, a member of class TWinControl.
	CreateDockManager (see page 6134)	Creates the dock manager for the control.
	CreateHandle (see page 6135)	Creates underlying screen object.
	CreateParams (see page 12913)	Initializes a window-creation parameter data structure.
	CreateSubClass (see page 6136)	Creates a windowed control derived from an existing Windows window class.
	CreateWindowHandle (see page 6137)	Creates a Windows control to represent the control.
	CreateWnd (see page 6137)	Creates the underlying window.
	CustomAlignInsertBefore (see page 6137)	Returns placement order of custom-aligned child control.
	CustomAlignPosition (see page 6138)	Returns aligned position of custom-aligned child control.
	DblClick (see page 5747)	OnDblClick (see page 5854) event dispatcher.
	DefaultDockImage (see page 5747)	Handles the painting and erasing of a dock image.
	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	DefineProperties (see page 5748)	Provides methods to read and write the IsControl (see page 5829) property to a stream such as a form file.
	DefineProperties (see page 6139)	Provides methods to read and write the IsControl property to a stream such as a form file.
	DesignWndProc (see page 5749)	This is DesignWndProc, a member of class TControl.
	DestroyHandle (see page 6140)	Destroys the control's window without destroying the control.
	DestroyWindowHandle (see page 6140)	Destroys the window created in the CreateWindowHandle (see page 6137) method.
	DestroyWnd (see page 6141)	Destroys the control's window.
	DoAddDockClient (see page 6142)	Performs actions when a control is docked to the windowed control.
	DockOver (see page 6143)	Responds when a docking client is dragged over the windowed control.
	DockReplaceDockClient (see page 6143)	This is DockReplaceDockClient, a member of class TWinControl.
	DockTrackNoTarget (see page 5749)	Handles dragging of the control over an invalid docking target.
	DoContextPopup (see page 5750)	OnContextPopup (see page 5854) event dispatcher.
	DoDock (see page 5750)	Docking event dispatcher.
	DoDockOver (see page 6143)	Generates an OnDockOver (see page 6216) event.
	DoEndDock (see page 5750)	OnEndDock (see page 5859) event dispatcher.
	DoEndDrag (see page 5751)	OnEndDrag (see page 5860) event dispatcher.
	DoEnter (see page 6144)	Respond to receiving input focus.
	DoExit (see page 6144)	Respond to losing input focus
	DoFlipChildren (see page 6145)	Flips the control's children.
	DoKeyDown (see page 6145)	Performs some preprocessing before generating an OnKeyDown (see page 6225) event.
	DoKeyPress (see page 6146)	Performs some preprocessing before generating an OnKeyPress (see page 6227) event.
	DoKeyUp (see page 6146)	Performs some preprocessing before generating an OnKeyUp (see page 6228) event.
	DoMouseWheel (see page 5751)	Processes mouse wheel motion.
	DoMouseWheelDown (see page 5752)	OnMouseWheelDown (see page 5869) event dispatcher.
	DoMouseWheelUp (see page 5752)	OnMouseWheelUp (see page 5870) event dispatcher.
	DoRemoveDockClient (see page 6147)	Responds when a control is undocked from the windowed control.
	DoStartDock (see page 5753)	OnStartDock (see page 5871) event dispatcher.
	DoStartDrag (see page 5753)	OnStartDrag (see page 5871) event dispatcher.
	DoUnDock (see page 6147)	Undocks a control that is currently docked to the windowed control.
	DragCanceled (see page 5754)	Provides the interface for a method that responds to the cancellation of a drag.
	DragOver (see page 5755)	OnDragOver (see page 5857) event dispatcher.
	DrawDragDockImage (see page 5755)	Draws the dock image for the control.
	EraseDragDockImage (see page 5757)	Erases the dock image for the control.
	FindNextControl (see page 6149)	Returns the control's next child in the tab order after the specified control.
	FixupTabList (see page 6149)	Sorts the child controls by their tab order.

	GetAction (see page 5758)	This is GetAction, a member of class TControl.
	GetActionLinkClass (see page 5758)	Returns the appropriate action link class that is associated with the control class.
	GetActionLinkClass (see page 6152)	Returns the associated action link class.
	GetChildOwner (see page 12914)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 12914)	Calls a specified method for each child of the control.
	GetClientOrigin (see page 5758)	Returns the screen coordinates of the top-left corner of the control's client area.
	GetClientOrigin (see page 6153)	Returns the value of the ClientOrigin (see page 5809) property.
	GetClientRect (see page 5759)	Returns a rectangle defining the client area of the control.
	GetClientRect (see page 6154)	Returns the value of the ClientRect (see page 5810) property.
	GetControlExtents (see page 6154)	Returns the smallest rectangle in which all the control's children fit.
	GetDeviceContext (see page 5760)	Returns a device context for the control.
	GetDeviceContext (see page 6155)	Provides access to a device context for the control.
	GetDockEdge (see page 5763)	Returns the edge on which another control should be docked when it is dragged over the control.
	GetDragImages (see page 5763)	Returns the control's image list containing the image to be displayed while dragging.
	GetEnabled (see page 5763)	Returns the value of the Enabled (see page 5821) property.
	GetFloating (see page 5764)	Returns the value of the Floating (see page 5823) property.
	GetFloatingDockSiteClass (see page 5764)	Returns the class used for the control when it is floating.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetPalette (see page 5765)	Returns the handle to a palette for use by the control.
	GetParentHandle (see page 6157)	Returns the window handle for the window of the control's parent.
	GetPopupMenu (see page 5765)	Returns the pop-up menu associated with the control.
	GetSiteInfo (see page 6158)	Generates an OnGetSiteInfo (see page 6223) event
	GetTopParentHandle (see page 6159)	Returns the window handle of the first window not associated with a VCL control that contains the windowed control.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	InvalidateDockHostSite (see page 6162)	This is InvalidateDockHostSite, a member of class TWinControl.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsControlActivateMsg (see page 6162)	This is IsControlActivateMsg, a member of class TWinControl.
	IsControlMouseMsg (see page 6162)	Indicates whether a specified mouse message is directed to one of the windowed control's child controls.
	IsQualifyingSite (see page 6163)	This is IsQualifyingSite, a member of class TWinControl.
	KeyDown (see page 6163)	Respond to key press events.
	KeyPress (see page 6163)	Respond to keyboard input.
	KeyUp (see page 6164)	Respond to released key.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Loaded (see page 5771)	Initializes the control after it is loaded from a stream.
	MainWndProc (see page 6165)	Receives Windows messages for the control.
	MouseActivate (see page 5773)	This is MouseActivate, a member of class TControl.
	MouseDown (see page 5773)	OnMouseDown (see page 5862) event dispatcher.
	MouseMove (see page 5773)	Respond to mouse moving over control area..
	MouseUp (see page 5774)	OnMouseUp (see page 5867) event dispatcher.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	Notification (see page 5775)	Responds to notifications that components are being created or destroyed.
	Notification (see page 6165)	Responds to notifications that components are being created or destroyed.
	NotifyControls (see page 6165)	Sends a message to all the child controls.
	Paint (see page 5920)	Renders the image of a custom control.

	PaintControls (see page 6166)	Paints each of the child controls in a windowed control using the specified device context.
	PaintHandler (see page 6166)	Responds to WM_PAINT messages.
V	PaintWindow (see page 5920)	Renders the image of the control on a specified device context.
V	PaintWindow (see page 6169)	Renders the image of a windowed control.
	PaletteChanged (see page 5775)	Responds to changes in the system's palette by realizing the control's palette.
V	PaletteChanged (see page 6170)	Responds to changes in the system's palette by realizing the control's palette and the palette for each child control.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	PositionDockRect (see page 5777)	Positions the docking rectangle according to the current drag-and-dock state.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 12915)	Prepares the control for having its properties assigned values from a stream.
	RecreateWnd (see page 6171)	Recreate underlying Windows screen object.
	ReloadDockedControl (see page 6172)	Reloads a docked control.
	RemoveWindowProps (see page 6174)	This is RemoveWindowProps, a member of class TWinControl.
V	RequestAlign (see page 5780)	Instructs the parent of a control to reposition the control, enforcing its Align (see page 5798) property.
	ResetIme (see page 6174)	Restores the input method editor (IME) that was active when the application started.
	ResetImeComposition (see page 6175)	Directs the composition window of the input method editor (IME) to perform a specific action.
	Resize (see page 5780)	Respond to control resize.
	ScaleConstraints (see page 5781)	This is ScaleConstraints, a member of class TControl.
	ScaleControls (see page 6176)	Rescale child controls only.
	SelectFirst (see page 6177)	Locates first selectable child control.
	SelectNext (see page 6177)	Moves the input focus from the current child control to the next one in the tab order.
	SendCancelMode (see page 5781)	Cancels the modal state of the control.
	SendDockNotification (see page 5782)	Sends a Windows message to the control's host dock site.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
V	SetAutoSize (see page 5783)	This is SetAutoSize, a member of class TControl.
V	SetBiDiMode (see page 5783)	Sets the control's bi-directional mode.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
V	SetChildOrder (see page 6178)	Changes the order in which the child component appears in the list of child components returned by the GetChildren (see page 6153) method.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
V	SetDragMode (see page 5785)	Sets the drag mode for the control.
V	SetEnabled (see page 5785)	Sets the value of the Enabled (see page 5821) property.
	SetIme (see page 6181)	Activates an input method editor (IME) using the values specified by the ImeMode (see page 6207) and ImeName (see page 6208) properties.
	SetImeCompositionWindow (see page 6181)	Sets the position and font of the composition window.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
V	SetName (see page 5785)	Sets the name of the control.
V	SetParent (see page 5786)	Sets the parent of the control.
V	SetParent (see page 6182)	Sets the parent of the control.
V	SetParentBackground (see page 6182)	This is SetParentBackground, a member of class TWinControl.
V	SetParentBiDiMode (see page 5786)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 5787)	Sets the parent for the control.
	SetZOrder (see page 5788)	Repositions the control in its parent's control list, thereby changing position onscreen.
V	SetZOrder (see page 6182)	Moves the control to the top or bottom of the parent control's (or screen's) list of TWinControl (see page 6112) controls.
V	ShowControl (see page 12915)	Ensures that a specified child control is visible.
	UpdateBounds (see page 6185)	This is UpdateBounds, a member of class TWinControl.

	UpdateBoundsRect (see page 5789)	Changes the Top (see page 5844), Left (see page 5830), Width (see page 5849), and Height (see page 5825) properties of the control, but doesn't update its screen image and bypasses all resize events.
V	UpdateControlOriginalParentSize (see page 6186)	This is UpdateControlOriginalParentSize, a member of class TWinControl.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateExplicitBounds (see page 5789)	This is UpdateExplicitBounds, a member of class TControl.
	UpdateRecreatingFlag (see page 6186)	This is UpdateRecreatingFlag, a member of class TWinControl.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	UpdateUIState (see page 6186)	Updates form User Interface State as needed
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	VisibleChanging (see page 5791)	Provides the interface for a method that responds to changes in the control's visibility.
V	WndProc (see page 5791)	Provides specific message responses for the control.
V	WndProc (see page 6187)	Provides specific message responses for the control.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	ActionLink (see page 5798)	Contains the action link object associated with the control.
	AutoSize (see page 5803)	Specifies whether the control sizes itself automatically to accommodate its contents.
	BevelEdges (see page 6192)	Specifies which edges of the control are beveled.
	BevelInner (see page 6193)	Specifies the cut of the inner bevel.
	BevelKind (see page 6193)	Specifies the control's bevel style.
	BevelOuter (see page 6194)	Specifies the cut of the outer bevel.
	BevelWidth (see page 6194)	Specifies the width of the inner and outer bevels.
	BorderWidth (see page 6195)	Specifies the width of the control's border.
R	Canvas (see page 5921)	Specifies the TCanvas object that presents a drawing surface for the control.
	Caption (see page 5806)	Specifies a text string that identifies the control to the user.
	DefWndProc (see page 6199)	Specifies the default window procedure for the windowed control.
	DesktopFont (see page 5818)	Specifies whether the control uses the Windows icon font when writing text.
	ImeMode (see page 6207)	Determines the behavior of the input method editor (IME).
	ImeName (see page 6208)	Specifies the input method editor (IME) to use for converting keyboard input to Asian language characters.
	IsControl (see page 5829)	Determines whether a form stores its form-specific properties to a stream.
	MouseCapture (see page 5831)	Indicates whether the control has "captured" mouse events.
	ParentBackground (see page 6209)	Determines whether control uses parent's theme background.
	ParentBiDiMode (see page 5833)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	ScalingFlags (see page 5840)	Reflects which attributes of the control have been scaled.
	Text (see page 5842)	Contains a text string associated with the control.
	WheelAccumulator (see page 5849)	Accumulates mouse wheel rotations.
	WindowHandle (see page 6212)	Provides access to a window handle for the control.
	WindowText (see page 5850)	Contains the text string of the control.

Public Events

	Name	Description
	WindowProc (see page 5872)	Points to the window procedure that responds to messages sent to the control.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	BeginDrag (see page 5740)	Starts the dragging of a control.
	BringToFront (see page 5740)	Puts the control in front of all other controls in its parent control.
	Broadcast (see page 6130)	Sends a message to each of the child controls.
	CanFocus (see page 6131)	Indicates whether a control can receive focus.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	ClientToParent (see page 5744)	Translates client coordinates to parent coordinates.
	ClientToScreen (see page 5744)	Translates a given point from client area coordinates to global screen coordinates.
	ContainsControl (see page 6133)	Indicates whether a specified control exists within the control.
	ControlAtPos (see page 6133)	Returns the child control located at a specified position within the control.
V	Create (see page 12912)	Constructs a TNotebook (see page 12902) component.
	CreateParented (see page 6123)	Creates and initializes a control as the child of a specified non-VCL container.
	CreateParentedControl (see page 6136)	Creates and initializes a control as the child of a specified non-VCL window.
V	DefaultHandler (see page 5748)	Provides message handling for all messages that do not have specific handlers.
V	DefaultHandler (see page 6139)	Provides message handling for all messages that the control does not fully process itself.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 12913)	Destroys the TNotebook (see page 12902) component.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	DisableAlign (see page 6141)	Disables the realignment of child controls.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Dock (see page 5749)	Used internally to dock the control.
	DockDrop (see page 6142)	Generates an OnDockDrop (see page 6214) event.
	DragDrop (see page 5754)	OnDragDrop (see page 5855) event dispatcher.
	Dragging (see page 5754)	Indicates whether a control is being dragged.
	DrawTextBiDiModeFlags (see page 5756)	Returns the text flags that reflect the current setting of the BiDiMode (see page 5803) property.
	DrawTextBiDiModeFlagsReadingOnly (see page 5756)	Returns the text flag to add that indicates whether the control's text should read from right to left.
	EnableAlign (see page 6148)	Decrements the reference count incremented by the DisableAlign (see page 6141) method, eventually realigning the child controls.
	EndDrag (see page 5757)	Stops a control from being dragged any further.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindChildControl (see page 6148)	Returns a child control given its name.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FlipChildren (see page 6150)	Reverses the positions of child controls.
	Focused (see page 6150)	Determines whether the control has input focus.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.

	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetControlsAlignment (see page 5759)	Indicates how text is aligned within the control.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetParentComponent (see page 5765)	Returns the parent of the control.
	GetTabOrderList (see page 6158)	Builds a list of controls in tab order.
	GetTextBuf (see page 5766)	Retrieves the control's text, copies it into a buffer, and returns the number of characters copied.
	GetTextLen (see page 5767)	Returns the length of the control's text.
	HandleAllocated (see page 6159)	Reports whether a screen object handle exists for the control.
	HandleNeeded (see page 6160)	Creates a screen object for the control if it doesn't already exist.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	HasParent (see page 5768)	Indicates whether the control has a parent.
	Hide (see page 5769)	Makes the control invisible.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitiateAction (see page 5769)	Calls the action link's Update (see page 5789) method if the control is associated with an action link.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InsertControl (see page 6160)	Inserts a control into the Controls (see page 6197) array property.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	Invalidate (see page 5770)	Completely repaint control.
	Invalidate (see page 6161)	Schedules a control repaint.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	IsRightToLeft (see page 5770)	Indicates whether the control should be reversed right to left.
	ManualDock (see page 5771)	Docks the control.
	ManualFloat (see page 5772)	Undocks the control.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	MouseWheelHandler (see page 5774)	Dispatches messages received from a mouse wheel.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	PaintTo (see page 6167)	This is the overview for the PaintTo method overload.
	ParentToClient (see page 5776)	Translate parent coordinates to client coordinates.
	Perform (see page 5776)	Responds as if the control received a specified Windows message.
	PreProcessMessage (see page 6170)	This is PreProcessMessage, a member of class TWinControl.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	Realign (see page 6171)	Forces the control to realign children.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	Refresh (see page 5779)	Repaints the control on the screen.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveControl (see page 6172)	Removes a specified control from the Controls (see page 6197) array.

	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	Repaint (see page 5779)	Forces the control to repaint its image on the screen.
V	Repaint (see page 6174)	Repaints the entire control.
	ReplaceDockedControl (see page 5779)	Docks the control in the place where another control is already docked.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	ScaleBy (see page 6175)	Rescale control and its children.
	ScreenToClient (see page 5781)	Converts the screen coordinates of a specified point on the screen to client coordinates.
	ScrollBy (see page 6176)	Scroll control contents.
	SendToBack (see page 5782)	Puts a windowed control behind all other windowed controls, or puts a non-windowed control behind all other non-windowed controls.
V	SetBounds (see page 5783)	Sets the Left (see page 5830), Top (see page 5844), Width (see page 5849), and Height (see page 5825) properties all at once.
V	SetBounds (see page 6178)	Sets the windowed control's boundary properties all at once.
	SetDesignVisible (see page 5784)	Makes a control visible at design time.
V	SetDesignVisible (see page 6178)	Makes a control visible at design time.
V	SetFocus (see page 6179)	Gives the input focus to the control.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	SetTextBuf (see page 5787)	Sets the text of the control.
	Show (see page 5788)	Makes a control visible.
V	Update (see page 5789)	Processes any pending paint messages immediately.
V	Update (see page 6183)	Forces the control to update.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	UpdateControlState (see page 6186)	Respond to state change.
	UseRightToLeftAlignment (see page 5790)	Specifies whether the control's alignment should be reversed right-to-left.
	UseRightToLeftReading (see page 5790)	Specifies whether the control is using a right-to-left reading order.
	UseRightToLeftScrollBar (see page 5791)	Specifies whether the vertical scroll bar appears on the left side of the control.

Public Properties

	Name	Description
	Action (see page 5797)	Designates the action associated with the control.
R	AlignDisabled (see page 6192)	Indicates child control realignment disabled.
	BiDiMode (see page 5803)	Specifies the bi-directional mode for the control.
	BoundsRect (see page 5803)	Specifies the bounding rectangle of the control, expressed in the coordinate system of the parent control.
R	Brush (see page 6195)	Determines the color and pattern used for painting the background of the control.
	ClientHeight (see page 5808)	Specifies the height of the control's client area in pixels.
R	ClientOrigin (see page 5809)	Specifies the screen coordinates (in pixels) of the top left corner of a control's client area.
R	ClientRect (see page 5810)	Specifies the size (in pixels) of a control's client area.
	ClientWidth (see page 5811)	Specifies the horizontal size of the control's client area in pixels.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
R	ControlCount (see page 6195)	Returns the number of child controls.
R	Controls (see page 6197)	Lists all child controls.
	ControlState (see page 5813)	Indicates the current state of a control at runtime.
	ControlStyle (see page 5814)	Determines style characteristics of the control.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	DockClientCount (see page 6199)	Specifies the number of controls that are docked on the windowed control.

R	DockClients (see page 6201)	Lists the controls that are docked to the windowed control.
	DockManager (see page 6202)	Specifies the control's docking manager interface.
	DockOrientation (see page 5818)	Specifies how the control is docked relative to other controls docked in the same parent.
	DockSite (see page 6204)	Specifies whether the control can be the target of drag-and-dock operations.
	DoubleBuffered (see page 6205)	Determines whether the control's image is rendered directly to the window or painted to an in-memory bitmap first.
R	ExplicitHeight (see page 5821)	Specifies the explicit vertical size of the control in pixels.
R	ExplicitLeft (see page 5822)	Specifies the explicit horizontal pixel coordinate of the left edge of a component relative to its parent.
R	ExplicitTop (see page 5822)	Specifies the explicit vertical pixel coordinate of the top edge of a component relative to its parent.
R	ExplicitWidth (see page 5822)	Specifies the explicit horizontal size of the control in pixels.
R	Floating (see page 5823)	Indicates whether the control is floating.
	FloatingDockSiteClass (see page 5823)	Specifies the class of the temporary control that hosts the control when it is floating.
R	Handle (see page 6207)	Provides access to the underlying Windows screen object for the control.
	HostDockSite (see page 5829)	Specifies the control in which the control is docked.
	LRDockWidth (see page 5831)	Specifies the width of the control when it is docked horizontally.
R	MouseInClient (see page 6209)	This is MouseInClient, a member of class TWinControl.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Padding (see page 6209)	Specifies the padding of a control.
	Parent (see page 5832)	Indicates the parent of the control.
	ParentWindow (see page 6210)	Reference to parent's underlying control.
R	Showing (see page 6210)	Indicates whether the control is showing on the screen.
	TBDockHeight (see page 5842)	Specifies the height of the control when it is docked vertically.
	UndockHeight (see page 5845)	Specifies the height of the control when it is floating.
	UndockWidth (see page 5846)	Specifies the width of the control when it is floating.
	UseDockManager (see page 6212)	Specifies whether the docking manager is used in drag-and-dock operations.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
R	VisibleDockClientCount (see page 6212)	Specifies the number of visible controls that are docked on the windowed control.

Published Events

	Name	Description
	OnClick (see page 12938)	Occurs when the user clicks the control.
	OnContextPopup (see page 12940)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnDblClick (see page 12941)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDragDrop (see page 12941)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 12943)	Occurs when the user drags an object over a control.
	OnEndDock (see page 12946)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 12946)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnEnter (see page 12947)	Occurs when a control receives the input focus.
	OnExit (see page 12950)	Occurs when the input focus shifts away from one control to another.
	OnMouseActivate (see page 12951)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 12952)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseEnter (see page 12954)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 12955)	Occurs when the user moves the mouse outside of a control.
	OnMouseMove (see page 12955)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 12957)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnPageChanged (see page 12959)	Occurs when the user selects a new page in the notebook.

	OnStartDock (see page 12960)	Occurs when the user begins to drag a control with a DragKind of dkDock.
	OnStartDrag (see page 12960)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.

Published Properties

	Name	Description
	ActivePage (see page 12916)	Determines which page displays in the notebook.
	Align (see page 12917)	Determines how the control aligns within its container (parent control).
	AlignWithMargins (see page 5802)	Indicates whether a control should be constrained by margins.
	Anchors (see page 12920)	Specifies how the control is anchored to its parent.
	Color (see page 12921)	Specifies the background color of the control.
	Constraints (see page 12921)	Specifies the size constraints for the control.
	Ctl3D (see page 12922)	Determines whether a control has a three-dimensional (3-D) or two-dimensional look.
	Cursor (see page 5815)	Specifies the image used to represent the mouse pointer when it passes into the region covered by the control.
	DragCursor (see page 12923)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 12923)	Specifies whether the control is being dragged normally or for docking.
	DragMode (see page 12923)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	Enabled (see page 12925)	Controls whether the control responds to mouse, keyboard, and timer events.
	Font (see page 12925)	Controls the attributes of text written on or in the control.
	Height (see page 5825)	Specifies the vertical size of the control in pixels.
	HelpContext (see page 5826)	Numeric ID for control's context-sensitive help topic
	HelpKeyword (see page 5826)	Keyword for control's context-sensitive help topic
	HelpType (see page 5827)	Indicates whether the control's context sensitive help topic is identified by context ID or by keyword.
	Hint (see page 5827)	Contains the text string that can appear when the user moves the mouse over the control.
	Left (see page 5830)	Specifies the horizontal coordinate of the left edge of a component relative to its parent.
	Margins (see page 5831)	Specifies the margins for the control.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	PageIndex (see page 12926)	Determines which page displays in the notebook control.
	Pages (see page 12927)	Contains the strings that identify the individual pages of the notebook control.
	ParentColor (see page 12927)	Determines where a control looks for its color information.
	ParentCtl3D (see page 12928)	Determines where a component looks to determine if it should appear three dimensional.
	ParentFont (see page 12928)	Determines where a control looks for its font information.
	ParentShowHint (see page 12928)	Determines where a control looks to find out if its Help Hint should be shown.
	PopupMenu (see page 12929)	Identifies the pop-up menu associated with the control.
	ShowHint (see page 12934)	Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.
	TabOrder (see page 12935)	Indicates the position of the control in its parent's tab order.
	TabStop (see page 12936)	Determines if the user can tab to a control.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Top (see page 5844)	Specifies the Y coordinate of the top left corner of a control, relative to its parent or containing control in pixels.
	Visible (see page 12936)	Determines whether the component appears onscreen.
	Width (see page 5849)	Specifies the horizontal size of the control or form in pixels.

68.1.27.2 TNotebook.Create Constructor

Constructs a TNotebook (see page 12902) component.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TNotebook(TComponent * AOwner);
```

Description

Call Create to instantiate a notebook at runtime. Notebook components placed in forms at design time are created automatically.

The AOwner parameter specifies the component (usually the form) that is responsible for freeing the notebook.

68.1.27.3 TNotebook.Destroy Destructor

Destroys the TNotebook (see page 12902) component.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TNotebook();
```

Description

Do not call Destroy directly in an application. Instead, use Free, which checks that the TNotebook (see page 12902) reference is not nil before calling Destroy.

See Also

Free (see page 22300)

68.1.27.4 TNotebook Methods

The methods of the TNotebook class are listed here.

Protected Methods

	Name	Description
	CreateParams (see page 12913)	Initializes a window-creation parameter data structure.
	GetChildOwner (see page 12914)	Returns the owner of a child component being read from a stream.
	GetChildren (see page 12914)	Calls a specified method for each child of the control.
	ReadState (see page 12915)	Prepares the control for having its properties assigned values from a stream.
	ShowControl (see page 12915)	Ensures that a specified child control is visible.

68.1.27.4.1 TNotebook.CreateParams Method

Initializes a window-creation parameter data structure.

Pascal

```
procedure CreateParams(var Params: TCreateParams); override;
```

C++

```
virtual __fastcall CreateParams(TCreateParams Params);
```

Description

The CreateWnd method calls CreateParams to initialize the parameters it passes to CreateWindowHandle. Override

CreateParams to customize the way a control creates its Windows representation. When overriding CreateParams, always call the inherited method first to set the default values, then make any desired adjustments.

CreateParams fills in the parameter that is passed as the value of the Params parameter. This data structure holds information needed when telling Windows to create a window handle. The fields of a TCreateParams record become the parameters to a call to the CreateWindowEx API function.

TWinControl implements CreateParams by setting all the fields of Params to generic base values. A number of the standard controls override CreateParams to change one or more of the default values in Params.

See Also

CreateWindowHandle (see page 6137)

CreateWnd (see page 6137)

AddBiDiModeExStyle (see page 6128)

68.1.27.4.2 TNotebook.GetChildOwner Method

Returns the owner of a child component being read from a stream.

Pascal

```
function GetChildOwner: TComponent; override;
```

C++

```
virtual __fastcall TComponent * GetChildOwner();
```

Description

GetChildOwner is used internally by the component streaming system. It is rarely necessary to call it directly.

In TComponent, GetChildOwner always returns nil (Delphi) or NULL (C++), indicating that the owner is the root component currently being read (usually a form or data module). The Owner of a component is responsible for destroying it.

See Also

Create (see page 2766)

Owner (see page 2807)

68.1.27.4.3 TNotebook.GetChildren Method

Calls a specified method for each child of the control.

Pascal

```
procedure GetChildren(Proc: TGetChildProc; Root: TComponent); override;
```

C++

```
virtual __fastcall GetChildren(TGetChildProc Proc, TComponent * Root);
```

Description

GetChildren is called by the streaming system that loads and saves components. Applications seldom need to call this routine.

GetChildren executes the callback specified by the Proc parameter for every child control listed by the Controls property that lists the Root parameter as its Owner.

Override GetChildren to limit or augment which child controls are saved with the control. When overriding GetChildren, call the procedure passed as the Proc parameter for every child control that should be saved. The Root parameter indicates the component (usually a form) that owns the control.

See Also

Controls (see page 6197)

Owner (see page 2807)

68.1.27.4.4 TNotebook.ReadState Method

Prepares the control for having its properties assigned values from a stream.

Pascal

```
procedure ReadState(Reader: TReader); override;
```

C++

```
virtual __fastcall ReadState(TReader Reader);
```

Description

Override ReadState to change the preparations the control makes as it readies itself to have its property values assigned from a stream. For example, a control might destroy temporary internal data structures or objects before new instances are loaded from the stream. Be sure to include a call to the inherited method when overriding ReadState.

As implemented in TWinControl, ReadState disables control alignment until all the child controls have been read from the stream, calls the inherited ReadState method, and re-enables the alignment of all the controls. The method then builds the tab order list of controls and synchronizes its visibility with that of its parent control.

See Also

Parent (see page 5832)

ReadState (see page 5778)

68.1.27.4.5 TNotebook.ShowControl Method

Ensures that a specified child control is visible.

Pascal

```
procedure ShowControl(AControl: TControl); override;
```

C++

```
virtual __fastcall ShowControl(TControl * AControl);
```

Description

Call ShowControl to display a child control. Specify the control you want to ensure will be visible as the value of the AControl parameter.

As implemented in TWinControl, ShowControl simply calls the ShowControl method of the control's parent. Derived objects override ShowControl to perform whatever actions are necessary to allow the indicated child object to be visible. Possible actions include scrolling the particular child object into view, or changing to the appropriate notebook page.

See Also

Show (see page 5788)

Parent (see page 5832)

68.1.27.5 TNotebook Properties

The properties of the TNotebook class are listed here.

Published Properties

	Name	Description
	ActivePage (see page 12916)	Determines which page displays in the notebook.
	Align (see page 12917)	Determines how the control aligns within its container (parent control).
	Anchors (see page 12920)	Specifies how the control is anchored to its parent.
	Color (see page 12921)	Specifies the background color of the control.
	Constraints (see page 12921)	Specifies the size constraints for the control.
	Ctl3D (see page 12922)	Determines whether a control has a three-dimensional (3-D) or two-dimensional look.
	DragCursor (see page 12923)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 12923)	Specifies whether the control is being dragged normally or for docking.
	DragMode (see page 12923)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	Enabled (see page 12925)	Controls whether the control responds to mouse, keyboard, and timer events.
	Font (see page 12925)	Controls the attributes of text written on or in the control.
	PageIndex (see page 12926)	Determines which page displays in the notebook control.
	Pages (see page 12927)	Contains the strings that identify the individual pages of the notebook control.
	ParentColor (see page 12927)	Determines where a control looks for its color information.
	ParentCtl3D (see page 12928)	Determines where a component looks to determine if it should appear three dimensional.
	ParentFont (see page 12928)	Determines where a control looks for its font information.
	ParentShowHint (see page 12928)	Determines where a control looks to find out if its Help Hint should be shown.
	PopupMenu (see page 12929)	Identifies the pop-up menu associated with the control.
	ShowHint (see page 12934)	Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.
	TabOrder (see page 12935)	Indicates the position of the control in its parent's tab order.
	TabStop (see page 12936)	Determines if the user can tab to a control.
	Visible (see page 12936)	Determines whether the component appears onscreen.

68.1.27.5.1 TNotebook.ActivePage Property

Determines which page displays in the notebook.

Pascal

```
property ActivePage: string;
```

C++

```
__property AnsiString ActivePage;
```

Description

ActivePage determines which page displays in the notebook. The value of ActivePage must be one of the strings contained in the Pages (see page 12927) property.

To get or set the active page by index rather than string, use the PageIndex (see page 12926) property instead.

See Also

PageIndex (see page 12926)

Pages (see page 12927)

68.1.27.5.2 TNotebook.Align Property

Determines how the control aligns within its container (parent control).

Pascal

```
property Align: TAlign;
```

C++

```
__property TAlign Align;
```

Description

Use Align to align a control to the top, bottom, left, or right of a form or panel and have it remain there even if the size of the form, panel, or component that contains the control changes. When the parent is resized, an aligned control also resizes so that it continues to span the top, bottom, left, or right edge of the parent.

For example, to use a panel component with various controls on it as a tool palette, change the panel's Align value to alLeft. The value of alLeft for the Align property of the panel guarantees that the tool palette remains on the left side of the form and always equals the client height of the form.

The default value of Align is alNone, which means a control remains where it is positioned on a form or panel.

Tip: If Align is set to alClient, the control fills the entire client area so that it is impossible to select the parent form by clicking on it. In this case, select the parent by selecting the control on the form and pressing Esc, or by using the Object Inspector.

Any number of child components within a single parent can have the same Align value, in which case they stack up along the edge of the parent. The child controls stack up in z-order. To adjust the order in which the controls stack up, drag the controls into their desired positions.

Note: To cause a control to maintain a specified relationship with an edge of its parent, but not necessarily lie along one edge of the parent, use the Anchors property instead.

C++ Examples:

```
/*
This example shows how to use a splitter to divide a form
into resizable panes.  All objects on the form are created
dynamically in the OnCreate event handler of the form. To
run this example, add ExtCtrls and FileCtrl to the uses
clause of the form’s implementation section.
Note that when creating a splitter dynamically at runtime,
it is important to set its position to the appropriate side
of the control it will resize.
*/
#include <Extctrls.hpp>
#include <Filectrl.hpp>

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  TSplitter* ps = new TSplitter(Form1);
  TFileListBox* pflb = new TFileListBox(Form1);
  TDirectoryListBox* pdlb = new TDirectoryListBox(Form1);

  // Line up the directory list box on the left of the form.
  pdlb->Parent = Form1;
  pdlb->Align = alLeft;
  pdlb->Width = Form1->ClientWidth/3;

  // Now use the splitter to divide the directory pane from the file pane.
  ps->Parent = Form1;
```

```
  ps->Left = pdlb->Left + pdlb->Width + 1; // Move to right of directory list.
  ps->Align = pdlb->Align; // Give same alignment as directory list.

  // Each pane must be at least one quarter of the form's width.
  ps->MinSize = Form1->ClientWidth/4;

  // Finally, create the last pane - a file list box.
  pflb->Parent = Form1;
  pflb->Align = alClient;
  pdlb->FileList = pflb; // Link the file list box to the directory list box.
}
/*
Dynamically create a TProgressBar control and align it to
the bottom of the form.
*/

#include <ComCtrls.hpp>
#include <Controls.hpp>

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  TProgressBar *ProgressBar = new TProgressBar(this);
  ProgressBar->Parent = this;
  ProgressBar->Align = alBottom;
  TButton *Button1 = new TButton(this);
  Button1->Parent = this;
}
/*
This example dynamically creates a Page Control, then a
series of Tab Sheets on the Page Control.
*/
#include <Comctrls.hpp>

  end;
  PageControl1.Free;
end;
```

See Also

Parent (see page 5832)

Anchors (see page 5802)

68.1.27.5.3 TNotebook.Anchors Property

Specifies how the control is anchored to its parent.

Pascal

```
property Anchors: TAnchors;
```

C++

```
__property TAnchors Anchors;
```

Description

Use Anchors to ensure that a control maintains its current position relative to an edge of its parent, even if the parent is resized. When its parent is resized, the control holds its position relative to the edges to which it is anchored.

If a control is anchored to opposite edges of its parent, the control stretches when its parent is resized. For example, if a control has its Anchors property set to [akLeft, akRight], the control stretches when the width of its parent changes.

Anchors is enforced only when the parent is resized. Thus, for example, if a control is anchored to opposite edges of a form at design time and the form is created in a maximized state, the control is not stretched because the form is not resized after the control is created.

Note: If a control should maintain contact with three edges of its parent (hugging one side of the parent and stretching the length of that side), use the Align property instead. Unlike Anchors, Align allows controls to adjust to changes in the size of other aligned sibling controls as well as changes to the parent's size.

See Also

Parent (see page 5832)

Align (see page 5798)

68.1.27.5.4 TNotebook.Color Property

Specifies the background color of the control.

Pascal

```
property Color: TColor;
```

C++

```
__property TColor Color;
```

Description

Use Color to read or change the background color of the control.

If a control's ParentColor property is true, then changing the Color property of the control's parent automatically changes the Color property of the control. When the value of the Color property is changed, the control's ParentColor property is automatically set to false.

C++ Examples:

```
/*
The following code changes the color of a shape control
using the Color dialog box. The example displays the Color
dialog box when the Button1 button is clicked, allowing the
user to select a color with the dialog box. When a color
value is selected with the dialog box, it is assigned to
the shape control.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  if (ColorDialog1->Execute())
    Shape1->Brush->Color = ColorDialog1->Color;
}
```

Delphi Examples:

```
{
The following code changes the color of a shape control
using the Color dialog box. The example displays the Color
dialog box when the Button1 button is clicked, allowing the
user to select a color with the dialog box. When a color
value is selected with the dialog box, it is assigned to
the shape control.
}
procedure TForm1.Button1Click(Sender: TObject);
begin
  if ColorDialog1.Execute then
    Shape1.Brush.Color := ColorDialog1.Color;
end;
```

ParentColor (see page 5834)

68.1.27.5.5 TNotebook.Constraints Property

Specifies the size constraints for the control.

Pascal

```
property Constraints: TSizeConstraints;
```

C++

```
__property TSizeConstraints Constraints;
```

Description

Use Constraints to specify the minimum and maximum width and height of the control. When Constraints contains maximum or minimum values, the control cannot be resized to violate those constraints.

Note: Constraints apply to the height of the form. However, the height of the form depends on how large Windows makes the title bar. For example, Windows XP uses much larger title bars than other windowing systems. To work around this, note the ClientHeight when you design your form and set the constraints in the FormCreate event. In the following example, ClientHeight is represented by x: `Constraints.MinHeight := x + Height - ClientHeight`.

Warning: Do not set up constraints that conflict with the value of the Align or Anchors property. When these properties conflict, the response of the control to resize attempts is not well-defined.

See Also

AutoSize (see page 5803)

Align (see page 5798)

Anchors (see page 5802)

OnConstrainedResize (see page 5853)

OnCanResize (see page 5851)

68.1.27.5.6 TNotebook.Ctl3D Property

Determines whether a control has a three-dimensional (3-D) or two-dimensional look.

Pascal

```
property Ctl3D: Boolean;
```

C++

```
__property Boolean Ctl3D;
```

Description

Ctl3D is provided for backward compatibility. It is not used by 32-bit versions of Windows or NT4.0 and later, with the exception of Windows XP Home, where it is used on occasion.

On earlier platforms, Ctl3D controlled whether the control had a flat or beveled appearance.

See Also

ParentCtl3D (see page 6209)

BevelKind (see page 6193)

BevelInner (see page 6193)

BevelOuter (see page 6194)

BorderWidth (see page 6195)

68.1.27.5.7 TNotebook.DragCursor Property

Indicates the image used to represent the mouse pointer when the control is being dragged.

Pascal

```
property DragCursor: TCursor;
```

C++

```
__property TCursor DragCursor;
```

Description

Use the DragCursor property to change the cursor image presented when the control is being dragged.

Note: To make a custom cursor available for the DragCursor property, see the Cursor property.

See Also

Cursor (see page 5815)

DragKind (see page 5819)

DragMode (see page 5819)

68.1.27.5.8 TNotebook.DragKind Property

Specifies whether the control is being dragged normally or for docking.

Pascal

```
property DragKind: TDragKind;
```

C++

```
__property TDragKind DragKind;
```

Description

Use DragKind to get or set whether the control participates in drag-and-drop operations, or drag-and-dock operations.

See Also

DragCursor (see page 5818)

DragMode (see page 5819)

68.1.27.5.9 TNotebook.DragMode Property

Determines how the control initiates drag-and-drop or drag-and-dock operations.

Pascal

```
property DragMode: TDragMode;
```

C++

```
__property TDragMode DragMode;
```

Description

Use DragMode to control when the user can drag the control. Disable the drag-and-drop or drag-and-dock capability at runtime by setting the DragMode property value to dmManual. Enable automatic dragging by setting DragMode to dmAutomatic.

C++ Examples:

```
/*
The following code uses GetNodeAt to add a dragged node as a
child of the node under the mouse when it is dropped.  This
example requires a populated TreeView.  Also, the TTreeView
DragMode property set to dmAutomatic, and the TTreeView
OnDragOver event handler must be implemented to accept the
drop.
*/
void __fastcall TForm1::TreeView1DragDrop(TObject *Sender, TObject *Source,
      int X, int Y)
{
  if (Source != (TObject *)TreeView1 || TreeView1->Selected == NULL)
    return;
  THitTests HT = TreeView1->GetHitTestInfoAt(X, Y);
  TNodeAttachMode AttachMode;
  TTreeNode *Item = TreeView1->GetNodeAt(X, Y);
  if (HT.Contains(htOnItem) || HT.Contains(htOnIcon))
    AttachMode = naAddChild;
  else if (HT.Contains(htNowhere))
    AttachMode = naAdd;
  else if (HT.Contains(htOnIndent))
    AttachMode = naInsert;
  else
    return;
  TreeView1->Selected->MoveTo(Item, AttachMode);
}

void __fastcall TForm1::TreeView1DragOver(TObject *Sender, TObject *Source,
      int X, int Y, TDragState State, bool &Accept)
{
  Accept = (Source == (TObject *)TreeView1);
}
```

Delphi Examples:

```
{
The following code uses GetNodeAt to add a dragged node as a
child of the node under the mouse when it is dropped.  This
example requires a populated TreeView.  Also, the TTreeView
DragMode property set to dmAutomatic, and the TTreeView
OnDragOver event handler must be implemented to accept the
drop.
}
procedure TForm1.TreeView1DragDrop(Sender, Source: TObject; X, Y: Integer);
var
  AnItem: TTreeNode;
  AttachMode: TNodeAttachMode;
  HT: THitTests;
begin
  if TreeView1.Selected = nil then Exit;
  HT := TreeView1.GetHitTestInfoAt(X, Y);
  AnItem := TreeView1.GetNodeAt(X, Y);
  if (HT - [htOnItem, htOnIcon, htNowhere, htOnIndent] <> HT) then
  begin
    if (htOnItem in HT) or (htOnIcon in HT) then
      AttachMode := naAddChild
    else if htNowhere in HT then AttachMode := naAdd
    else if htOnIndent in HT then AttachMode := naInsert;
    TreeView1.Selected.MoveTo(AnItem, AttachMode);
  end;
end;

procedure TForm1.TreeView1DragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := Source is TTreeView;
end;
```

Arranging the Order of Persistent Columns

68.1.27.5.10 TNotebook.Enabled Property

Controls whether the control responds to mouse, keyboard, and timer events.

Pascal

```
property Enabled: Boolean;
```

C++

```
__property Boolean Enabled;
```

Description

Use Enabled to change the availability of the control to the user. To disable a control, set Enabled to false. Disabled controls appear dimmed. If Enabled is false, the control ignores mouse, keyboard, and timer events.

To re-enable a control, set Enabled to true. The control is no longer dimmed, and the user can use the control.

See Also

Visible (see page 5847)

EnableControls (see page 6934)

Enabling Mouse

68.1.27.5.11 TNotebook.Font Property

Controls the attributes of text written on or in the control.

Pascal

```
property Font: TFont;
```

C++

```
__property TFont Font;
```

Description

To change to a new font, specify a new TFont object. To modify a font, change the value of the Charset, Color, Height, Name, Pitch, Size, or Style of the TFont object.

C++ Examples:

```
/*
To use this example, place a TComboBox and TRichEdit or
TMemo on a form.  During form creation, a list of font names
is loaded into the combo box. When the combo box is clicked,
the memo or Rich Edit control font is set to the
corresponding font name in the combo box.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < Screen->Fonts->Count; i++)
   ComboBox1->Items->Add(Screen->Fonts->Strings[i]);
//  ComboBox1->Items = Screen->Fonts;  // Another way to do it.
}

void __fastcall TForm1::ComboBox1Change(TObject *Sender)
{
  RichEdit1->Font->Name = ComboBox1->Text;
}
```

Delphi Examples:

```
{
To use this example, place a TComboBox and TRichEdit or
TMemo on a form.  During form creation, a list of font names
is loaded into the combo box. When the combo box is clicked,
the memo or Rich Edit control font is set to the
corresponding font name in the combo box.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  i : Integer;
begin
  for i := 0 to Screen.Fonts.Count - 1 do
   ComboBox1.Items.Add(Screen.Fonts.Strings[i]);
//  ComboBox1.Items := Screen.Fonts;  // Another way to do it.
  RichEdit1.Lines.Text := 'How is it to be you?';
end;

procedure TForm1.ComboBox1Click(Sender: TObject);
begin
  RichEdit1.Font.Name := ComboBox1.Text;
end;
```

DesktopFont (see page 5818)

ParentFont (see page 5834)

Displaying and Editing Text in a Memo Control

68.1.27.5.12 TNotebook.PageIndex Property

Determines which page displays in the notebook control.

Pascal

```
property PageIndex: Integer;
```

C++

```
__property int PageIndex;
```

Description

The value of PageIndex determines which page displays in the notebook. Changing the PageIndex value changes the page in the control.

Each string in the Pages (see page 12927) property is automatically assigned a PageIndex value when the page is created. The first page receives a value of 0, the second has a value of 1, and so on. If you delete a string from the Pages (see page 12927) property, the PageIndex values are reassigned so that the values always begin with 0 and continue to increase without any gaps between values.

To get or set the current page using its string rather than its index, use the ActivePage (see page 12916) property instead.

See Also

ActivePage (see page 12916)

Pages (see page 12927)

68.1.27.5.13 TNotebook.Pages Property

Contains the strings that identify the individual pages of the notebook control.

Pascal

```
property Pages: TStrings;
```

C++

```
__property TStrings Pages;
```

Description

The Pages property contains the strings that identify the individual pages of the notebook control. Both these controls create a separate page for each string in the Pages property. For example, if Pages contains three strings, First, Second, and Third, the control has three separate pages.

You can access the various pages in a notebook or tabbed notebook control with either the ActivePage (see page 12916) or PageIndex (see page 12926) property.

See Also

ActivePage (see page 12916)

PageIndex (see page 12926)

68.1.27.5.14 TNotebook.ParentColor Property

Determines where a control looks for its color information.

Pascal

```
property ParentColor: Boolean;
```

C++

```
__property Boolean ParentColor;
```

Description

To have a control use the same color as its parent control, set ParentColor to true. If ParentColor is false, the control uses its own Color property.

Set ParentColor to true for all controls in order to ensure that all the controls on a form have a uniform appearance. For example, if ParentColor is true for all controls in a form, changing the background color of the form to gray causes all the controls on the form to also have a gray background.

When the value of a control's Color property changes, ParentColor becomes false automatically.

See Also

Color (see page 5812)

Parent (see page 5832)

ParentFont (see page 5834)

ParentShowHint (see page 5835)

68.1.27.5.15 TNotebook.ParentCtl3D Property

Determines where a component looks to determine if it should appear three dimensional.

Pascal

```
property ParentCtl3D: Boolean;
```

C++

```
__property Boolean ParentCtl3D;
```

Description

ParentCtl3D is provided for backwards compatibility. It has no effect on 32-bit versions of Windows or NT 4.0 and later.

ParentCtl3D determines whether the control uses its parent's Ctl3D property.

See Also

Ctl3D (see page 6198)

68.1.27.5.16 TNotebook.ParentFont Property

Determines where a control looks for its font information.

Pascal

```
property ParentFont: Boolean;
```

C++

```
__property Boolean ParentFont;
```

Description

To have a control use the same font as its parent control, set ParentFont to true. If ParentFont is false, the control uses its own Font property. Many controls default ParentFont to true so that all the controls in a form or other container present a uniform appearance. When the value of a control's Font property changes, ParentFont becomes false automatically.

When ParentFont is true for a form, the form uses the default font.

See Also

Font (see page 5823)

Parent (see page 5832)

ParentColor (see page 5834)

ParentShowHint (see page 5835)

68.1.27.5.17 TNotebook.ParentShowHint Property

Determines where a control looks to find out if its Help Hint should be shown.

Pascal

```
property ParentShowHint: Boolean;
```

C++

```
__property Boolean ParentShowHint;
```

Description

Use ParentShowHint to ensure that all the controls on a form either uniformly show their Help Hints or uniformly do not show them.

If ParentShowHint is true, the control uses the ShowHint property value of its parent. If ParentShowHint is false, the control uses the value of its own ShowHint property.

To provide Help Hints for only selected controls on a form, set the ShowHint property for those controls that should have Help Hints to true, and ParentShowHint becomes false automatically.

Note: Enable or disable all Help Hints for the entire application using the ShowHint property of the application object.

See Also

Hint (see page 5827)

ParentColor (see page 5834)

ParentFont (see page 5834)

ShowHint (see page 5840)

68.1.27.5.18 TNotebook.PopupMenu Property

Identifies the pop-up menu associated with the control.

Pascal

```
property PopupMenu: TPopupMenu;
```

C++

```
__property TPopupMenu PopupMenu;
```

Description

Assign a value to PopupMenu to make a pop-up menu appear when the user selects the control and clicks the right mouse button. If the TPopupMenu's AutoPopup property is true, the pop-up menu appears automatically. If the menu's AutoPopup property is false, display the menu with a call to its Popup method from the control's OnContextPopup event handler.

C++ Examples:

```
/*
This example uses two edit boxes and one pop-up menu on a form.
The pop-up menu contains Cut, Copy, and Paste commands. This code
makes the pop-up menu available to both edit boxes:
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  PopupMenu1->AutoPopup = true;
  Edit1->PopupMenu = PopupMenu1;
  Edit2->PopupMenu = PopupMenu1;
}

/*
These are the cut, copy, and paste OnClick events for the commands
```

```
on the pop-up menu. Double click on the pop-up menu and add three
TMenuItems.  Then set the captions to "Cut", "Copy" and "Paste".
The names will be automatically set to "Cut1", "Copy1", and
"Paste1".  Then double click on the OnClick events and they will
be named "Cut1Click", "Copy1Click" and "Paste1Click" respectively.
Note: only the selected portion of the string in the edit box will
be copied, cut or replaced.
*/
void __fastcall TForm1::Copy1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
    if (pComponent->ClassNameIs("TEdit"))
      ((TEdit *)pComponent)->CopyToClipboard();
    else
      MessageBeep(0);
  }
  else
    MessageBeep(0);
}

void __fastcall TForm1::Cut1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
    if (pComponent->ClassNameIs("TEdit"))
      ((TEdit *)pComponent)->CutToClipboard();
    else
      MessageBeep(0);
  }
  else
    MessageBeep(0);
}

void __fastcall TForm1::Paste1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
    if (pComponent->ClassNameIs("TEdit"))
      ((TEdit *)pComponent)->PasteFromClipboard();
    else
      MessageBeep(0);
  }
  else
    MessageBeep(0);
}
/*
This example demonstrates how to add and delete menu items
to a popup menu at runtime and assign an event handler to
the OnClick event.  Place a TPopupMenu and three buttons on
the form named "AddButton", "EditButton",  and
"DestroyButton" and add OnClick events to all three buttons.
Put the TPopupMenu in the PopupMenu property of the form.
Place the PopupMenuItemsClick procedure in the TForm1 type
declaration so that it can be used as the method call for
the menu item OnClick event.
*/
void __fastcall TForm1::AddButtonClick(TObject *Sender)
{
    const int num_items = 4;
    for (int index = 0; index < num_items; ++index)
    {
        TMenuItem *NewItem = new TMenuItem(PopupMenu1); // create the new item
```

```
        PopupMenu1->Items->Add(NewItem);// add it to the Popupmenu
        NewItem->Caption = "Menu Item " + IntToStr(index);
        NewItem->Tag = index;
        NewItem->OnClick = PopupMenuItemsClick;// assign it an event handler
        TNotifyEvent();
    }
}

void __fastcall TForm1::PopupMenuItemsClick(TObject *Sender)
{
    TMenuItem *ClickedItem = dynamic_cast<TMenuItem *>(Sender);
    if (ClickedItem)
    {
        switch (ClickedItem->Tag)
        {
            case 0:
            {
                ShowMessage("first item clicked");
                break;
            }
            case 1:
            {
                ShowMessage("second item clicked");
                break;
            }
            case 2:
            {
                ShowMessage("third item clicked");
                break;
            }
            case 3:
            {
                ShowMessage("fourth item clicked");
                break;
            }
        }
    }
}

/*
To edit or destroy an item, grab its pointer via the Items
property.
*/
void __fastcall TForm1::EditButtonClick(TObject *Sender)
{
    const int index = 1;
    TMenuItem *ItemToEdit = PopupMenu->Items->Items[index];
    ItemToEdit->Caption = "Changed Caption";
}

void __fastcall TForm1::DestroyButtonClick(TObject *Sender)
{
    const int index = 2;
    TMenuItem *ItemToDelete = PopupMenu->Items->Items[index];
    delete ItemToDelete;
}
```

Delphi Examples:

```
{
This example uses two edit boxes and one pop-up menu on a form.
The pop-up menu contains Cut, Copy, and Paste commands. This code
makes the pop-up menu available to both edit boxes:
}
procedure TForm1.FormCreate(Sender: TObject);
begin
  PopupMenu1.AutoPopup := True;
```

```
    Edit1.PopupMenu := PopupMenu1;
    Edit2.PopupMenu := PopupMenu1;
  end;

  {
  These are the cut, copy, and paste OnClick events for the commands
  on the pop-up menu. Double click on the pop-up menu and add three
  TMenuItems.  Then set the captions to "Cut", "Copy" and "Paste".
  The names will be automatically set to "Cut1", "Copy1", and
  "Paste1".  Then double click on the OnClick events and they will
  be named "Cut1Click", "Copy1Click" and "Paste1Click" respectively.
  Note: only the selected portion of the string in the edit box will
  be copied, cut or replaced.
  }
  procedure TForm1.Copy1Click(Sender: TObject);
  begin
    if PopupMenu1.PopupComponent = Edit1 then
     Edit1.CopyToClipboard
    else if PopupMenu1.PopupComponent = Edit2 then
      Edit2.CopyToClipboard
    else
      Beep;
  end;

  procedure TForm1.Cut1Click(Sender: TObject);
  begin
    if PopupMenu1.PopupComponent = Edit1 then
      Edit1.CutToClipboard
    else if PopupMenu1.PopupComponent = Edit2 then
      Edit2.CutToClipboard
    else
      Beep;
  end;

  procedure TForm1.Paste1Click(Sender: TObject);
  begin
    if PopupMenu1.PopupComponent = Edit1 then
      Edit1.PasteFromClipboard
    else if PopupMenu1.PopupComponent = Edit2 then
      Edit2.PasteFromClipboard
    else
      Beep;
  end;
  {
  This example demonstrates how to add and delete menu items
  to a popup menu at runtime and assign an event handler to
  the OnClick event.  Place a TPopupMenu and three buttons on
  the form named "AddButton", "EditButton",  and
  "DestroyButton" and add OnClick events to all three buttons.
  Put the TPopupMenu in the PopupMenu property of the form.
  Place the PopupMenuItemsClick procedure in the TForm1 type
  declaration so that it can be used as the method call for
  the menu item OnClick event.

68.1.27.5.19 TNotebook.ShowHint Property

Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.

Pascal

```
property ShowHint: Boolean;
```

C++

```
__property Boolean ShowHint;
```

Description

The Help Hint is the value of the Hint property, which is displayed in a box just beneath the control. Use ShowHint to determine whether a Help Hint appears for the control.

To enable Help Hint for a particular control, the application ShowHint property must be true and either

the control's own ShowHint property must be true, or

the control's ParentShowHint property must be true and its parent's ShowHint property must be true.

For example, imagine a check box within a group box. If the ShowHint property of the group box is true and the ParentShowHint property of the check box is true, but the ShowHint property of the check box is false, the check box still displays its Help Hint.

Changing the ShowHint value automatically sets the ParentShowHint property to false.

C++ Examples:

```
/*
This example uses an edit box and a list box on a form.
Items are added to the list box and a Help Hint is assigned
to both controls. The last statement enables the Help Hints
for the entire application.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  Edit1->Hint = "Enter your name";
  Edit1->ShowHint = true;

  char string[10];
  char index[3];
  for(int i = 1; i <= 10; i++)
  {
    strcpy(string, "Item");
    itoa(i, index, 10);
    strcat(string, index);
    ListBox1->Items->Add(string);
  }
  ListBox1->Hint = "Select an item";
  ListBox1->ShowHint = true;
  Application->ShowHint = true;
}
/*
Note: To see an example that displays the hints of controls
in some place other than in a Help Hint box, see the OnHint
example.
*/
```

Delphi Examples:

```
{
```

```
This example uses an edit box and a list box on a form.
Items are added to the list box and a Help Hint is assigned
to both controls. The last statement enables the Help Hints
for the entire application.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  I: Integer;
begin
  Edit1.Hint := 'Enter your name';
  Edit1.ShowHint := True;
  with ListBox1 do
  begin
    for I := 1 to 10 do
      Items.Add('Item ' + IntToStr(I));
    Hint := 'Select an item';
    ShowHint := True;
  end;

68.1.27.5.20 TNotebook.TabOrder Property

Indicates the position of the control in its parent's tab order.

Pascal

```
property TabOrder: TTabOrder;
```

C++

```
__property TTabOrder TabOrder;
```

Description

TabOrder is the order in which child windows are visited when the user presses the Tab key. The control with the TabOrder value of 0 is the control that has the focus when the form first appears.

Initially, the tab order is always the order in which the controls were added to the form. The first control added to the form has a TabOrder value of 0, the second is 1, the third is 2, and so on. Change this by changing the TabOrder property.

Each control has a unique tab-order value within its parent. If you change the TabOrder property value of one control to be the same as the value of a second control, the TabOrder value for all the other controls changes. For example, suppose a control is sixth in the tab order. If you change the control's TabOrder property value to 3 (making the control fourth in the tab order), the control that was originally fourth in the tab order now becomes fifth, and the control that was fifth becomes sixth.

Assigning TabOrder a value greater than the number of controls contained in the parent control moves the control to the end of the tab order. The control does not take on the assigned value of TabOrder, but instead is given the number that assures the control is the last in the tab order.

Note: TabOrder is meaningful only if the TabStop property is true and if the control has a parent. (The TabOrder property of a form is not used unless the form is the child of another form.) A control with a TabOrder of -1 has no parent, and therefore cannot be reached by pressing the Tab key. To remove a parented control from the Tab order, set its TabStop property to false.

See Also

FindNextControl (see page 6149)

TabStop (see page 6211)

68.1.27.5.21 TNotebook.TabStop Property

Determines if the user can tab to a control.

Pascal

```
property TabStop: Boolean;
```

C++

```
__property Boolean TabStop;
```

Description

Use the TabStop to allow or disallow access to the control using the Tab key.

If TabStop is true, the control is in the tab order. If TabStop is false, the control is not in the tab order and the user can't press the Tab key to move to the control.

Note: TabStop is not meaningful for a form unless the form assigns another form to be its parent.

See Also

TabOrder (see page 6211)

68.1.27.5.22 TNotebook.Visible Property

Determines whether the component appears onscreen.

Pascal

```
property Visible: Boolean;
```

C++

```
__property Boolean Visible;
```

Description

Use the Visible property to control the visibility of the control at runtime. If Visible is true, the control appears. If Visible is false, the control is not visible.

Calling the Show method sets the control's Visible property to true. Calling the Hide method sets it to false.

C++ Examples:

```
/*
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
*/
void __fastcall TForm1::PageControl1Change(TObject *Sender)
{
  CheckBox1->Checked = PageControl1->ActivePage->Visible;
```

```
}

void __fastcall TForm1::CheckBox1Click(TObject *Sender)
{
  PageControl1->ActivePage->Visible = CheckBox1->Checked;
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < 10; i++)
  {
    TTabSheet *pPage = new TTabSheet(this);
    pPage->PageControl = PageControl1;
    pPage->Caption = AnsiString("Page") + IntToStr(i);
    TEdit *pEdit = new TEdit(this);
    pEdit->Parent = pPage;
    pEdit->Left = random(pPage->ClientWidth - pEdit->Width);
    pEdit->Top = random(pPage->ClientHeight - pEdit->Height);
  }
  PageControl1Change(Sender);
}
```

Delphi Examples:

```
{
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
}
procedure TForm1.CheckBox1Click(Sender: TObject);
begin
  PageControl1.ActivePage.Visible := CheckBox1.Checked;
end;

procedure TForm1.PageControl1Change(Sender: TObject);
begin
  CheckBox1.Checked := PageControl1.ActivePage.Visible;
end;

procedure TForm1.FormCreate(Sender: TObject);
var
  i: Integer;
begin
  for i := 0 to 9 do
    with TTabSheet.Create(Self) do
    begin
      PageControl := PageControl1;
      Caption := 'TabSheet' + IntToStr(i);
      with TEdit.Create(Self) do
      begin
        Parent := PageControl1.Pages[i];
        Left := Random(PageControl1.ActivePage.ClientWidth - Width);
        Top := Random(PageControl1.ActivePage.ClientHeight - Height);
      end;
    end;
    PageControl1Change(Sender);
end;
```

68.1.27.6 TNotebook Events

The events of the TNotebook class are listed here.

Published Events

	Name	Description
	OnClick (see page 12938)	Occurs when the user clicks the control.
	OnContextPopup (see page 12940)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnDblClick (see page 12941)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDragDrop (see page 12941)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 12943)	Occurs when the user drags an object over a control.
	OnEndDock (see page 12946)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 12946)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnEnter (see page 12947)	Occurs when a control receives the input focus.
	OnExit (see page 12950)	Occurs when the input focus shifts away from one control to another.
	OnMouseActivate (see page 12951)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 12952)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseEnter (see page 12954)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 12955)	Occurs when the user moves the mouse outside of a control.
	OnMouseMove (see page 12955)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 12957)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnPageChanged (see page 12959)	Occurs when the user selects a new page in the notebook.
	OnStartDock (see page 12960)	Occurs when the user begins to drag a control with a DragKind of dkDock.
	OnStartDrag (see page 12960)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.

68.1.27.6.1 TNotebook.OnClick Event

Occurs when the user clicks the control.

Pascal

```
property OnClick: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnClick;
```

Description

Use the OnClick event handler to respond when the user clicks the control. If the control has an associated action, and that action has an OnExecute method, the action's OnExecute method responds to click events unless it is superseded by an OnClick event handler.

Usually OnClick occurs when the user presses and releases the left mouse button with the mouse pointer over the control. This event can also occur when:

- The user selects an item in a grid, outline, list, or combo box by pressing an arrow key.
- The user presses Spacebar while a button or check box has focus.

- The user presses Enter when the active form has a default button (specified by the Default property).
- The user presses Esc when the active form has a cancel button (specified by the Cancel property).
- The user presses the accelerator key for a button or check box. For example, if the value of the Caption property of a check box is '&Bold', the B is underlined at runtime and the OnClick event of the check box is triggered when the user presses Alt+B. However, focus does not move to the control in these instances.
- The Checked property of a radio button is set to true.
- The value of the Checked property of a check box is changed.
- The Click method of a menu item is called.

For a form, an OnClick event occurs when the user clicks a blank area of the form or on a disabled component.

C++ Examples:

```
/*
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
*/
void __fastcall TForm1::PageControl1Change(TObject *Sender)
{
  CheckBox1->Checked = PageControl1->ActivePage->Visible;
}

void __fastcall TForm1::CheckBox1Click(TObject *Sender)
{
  PageControl1->ActivePage->Visible = CheckBox1->Checked;
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < 10; i++)
  {
    TTabSheet *pPage = new TTabSheet(this);
    pPage->PageControl = PageControl1;
    pPage->Caption = AnsiString("Page") + IntToStr(i);
    TEdit *pEdit = new TEdit(this);
    pEdit->Parent = pPage;
    pEdit->Left = random(pPage->ClientWidth - pEdit->Width);
    pEdit->Top = random(pPage->ClientHeight - pEdit->Height);
  }
  PageControl1Change(Sender);
}
```

Delphi Examples:

```
{
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
}
procedure TForm1.CheckBox1Click(Sender: TObject);
begin
  PageControl1.ActivePage.Visible := CheckBox1.Checked;
end;

procedure TForm1.PageControl1Change(Sender: TObject);
begin
  CheckBox1.Checked := PageControl1.ActivePage.Visible;
end;
```

```
procedure TForm1.FormCreate(Sender: TObject);
var
  i: Integer;
begin
  for i := 0 to 9 do
    with TTabSheet.Create(Self) do
    begin
      PageControl := PageControl1;
      Caption := 'TabSheet' + IntToStr(i);
      with TEdit.Create(Self) do
      begin
        Parent := PageControl1.Pages[i];
        Left := Random(PageControl1.ActivePage.ClientWidth - Width);
        Top := Random(PageControl1.ActivePage.ClientHeight - Height);
      end;
    end;
    PageControl1Change(Sender);
end;
```

68.1.27.6.2 TNotebook.OnContextPopup Event

Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).

Pascal

```
property OnContextPopup: TContextPopupEvent;
```

C++

```
__property TContextPopupEvent OnContextPopup;
```

Description

The OnContextPopup handler is called when the user uses the mouse or keyboard to request a popup menu. The OnContextPopup event is generated by a WM_CONTEXTMENU message, which is itself generated by the user clicking the right mouse button or by pressing SHIFT+F10 or the Applications key.

This event is especially useful when the control does not have an associated popup menu (the PopupMenu property is not set) or if the AutoPopup property of the control's associated popup menu is false. However, the OnContextPopup can also be used to override the automatic context menu that appears when the control has an associated popup menu with an AutoPopup property of true. In this last case, if the event handler displays its own menu, it should set the Handled parameter to true to suppress the default context menu.

The handler's MousePos parameter indicates the position of the mouse, in client coordinates.. If the event was not generated by a mouse click, MousePos is (-1,-1).

Note: Parent controls receive an OnContextPopup event before their child controls. In addition, for many child controls, the default window procedure causes the parent control to receive an OnContextPopup event after the child control. As a result, when parent controls do not set Handled to true in an OnContextPopup event handler, the event handler may be called multiple

times for each context menu invocation.

68.1.27.6.3 TNotebook.OnDblClick Event

Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.

Pascal

```
property OnDblClick: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnDblClick;
```

Description

Use the OnDblClick event to respond to mouse double-clicks.

See Also

OnClick (see page 5851)

Responding to User Actions at Runtime

68.1.27.6.4 TNotebook.OnDragDrop Event

Occurs when the user drops an object being dragged.

Pascal

```
property OnDragDrop: TDragDropEvent;
```

C++

```
__property TDragDropEvent OnDragDrop;
```

Description

Use the OnDragDrop event handler to specify what happens when the user drops an object. The Source parameter of the OnDragDrop event is the object being dropped, and the Sender is the control the object is being dropped on. The X and Y parameters are the coordinates of the mouse positioned over the control.

C++ Examples:

```
/*
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
*/

// This OnDragOver event handler permits the list box to
// accept a dropped label:
void __fastcall TForm1::ListBox1DragOver(TObject *Sender, TObject *Source, int X, int Y,
TDragState State, bool &Accept)
{
   Accept = Source->ClassNameIs("TLabel");
```

```
}

/*
This OnDragDrop event handler implements the drop behavior.
*/
void __fastcall TForm1::ListBox1DragDrop(TObject *Sender, TObject *Source, int X, int Y)
{
  if (Sender->ClassNameIs("TListBox") && Source->ClassNameIs("TLabel"))
  {
    TListBox *DestList = (TListBox *)Sender;
    DestList->Font = ((TLabel *)Source)->Font;
    DestList->Color = ((TLabel *)Source)->Color;
    DestList->DoubleBuffered = true;
    DestList->Color = clWindow;
  }
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  ListBox1->Items->Add("Not");
  ListBox1->Items->Add("In");
  ListBox1->Items->Add("Alphabetical");
  ListBox1->Items->Add("Order");

}
```

Delphi Examples:

```
{
This code is an OnDragOver event handler that won't allow a
label control to be dropped on a panel control and stops the
dragging of the label as soon as the user drags the label
onto the panel:
Note: Set the label's DragMode property to dmAutomatic.
}
procedure TForm1.FormDragDrop(Sender, Source: TObject; X, Y: Integer);
begin
  TForm1(Source).Left := X;
  TForm1(Source).Top := Y;
end;

procedure TForm1.FormDragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := Source is TLabel;
end;

procedure TForm1.Panel1DragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := False;
  if (Source is TLabel) and (State = dsDragEnter) then
    (Source as TLabel).EndDrag(False);
end;
{
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
}

procedure TForm1.FormCreate(Sender: TObject);
begin
  ListBox1.Items.Add('Not');
  ListBox1.Items.Add('In');
```

```
    ListBox1.Items.Add('Alphabetical');
    ListBox1.Items.Add('Order');
  end;

  // This OnDragOver event handler permits the list box to
  // accept a dropped label:

  procedure TForm1.ListBox1DragOver(Sender, Source: TObject; X, Y: Integer;
    State: TDragState; var Accept: Boolean);
  begin
    Accept := Source is TLabel;
  end;

  // This OnDragDrop event handler implements the drop behavior.

  procedure TForm1.ListBox1DragDrop(Sender, Source: TObject; X, Y: Integer);
  begin
    if (Sender is TListBox) and (Source is TLabel) then
    begin
      with Sender as TListBox do
      begin
        Font := (Source as TLabel).Font;
        Color := (Source as TLabel).Color;
        DoubleBuffered := true;
        Color := clWindow;
      end;
    end;
  end;
```

68.1.27.6.5 TNotebook.OnDragOver Event

Occurs when the user drags an object over a control.

Pascal

```
property OnDragOver: TDragOverEvent;
```

C++

```
__property TDragOverEvent OnDragOver;
```

Description

Use an OnDragOver event to signal that the control can accept a dragged object so the user can drop or dock it.

Within the OnDragOver event handler, change the Accept parameter to false to reject the dragged object. Leave Accept as true to allow the user to drop or dock the dragged object on the control.

To change the shape of the cursor, indicating that the control can accept the dragged object, change the value of the DragCursor

property for the control before the OnDragOver event occurs.

The Source is the object being dragged, the Sender is the potential drop or dock site, and X and Y are screen coordinates in pixels. The State parameter specifies how the dragged object is moving over the control.

Note: Within the OnDragOver event handler, the Accept parameter defaults to true. However, if an OnDragOver event handler is not supplied, the control rejects the dragged object, as if the Accept parameter were changed to false.

C++ Examples:

```
/*
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
*/

// This OnDragOver event handler permits the list box to
// accept a dropped label:
void __fastcall TForm1::ListBox1DragOver(TObject *Sender, TObject *Source, int X, int Y,
TDragState State, bool &Accept)
{
   Accept = Source->ClassNameIs("TLabel");
}

/*
This OnDragDrop event handler implements the drop behavior.
*/
void __fastcall TForm1::ListBox1DragDrop(TObject *Sender, TObject *Source, int X, int Y)
{
  if (Sender->ClassNameIs("TListBox") && Source->ClassNameIs("TLabel"))
  {
    TListBox *DestList = (TListBox *)Sender;
    DestList->Font = ((TLabel *)Source)->Font;
    DestList->Color = ((TLabel *)Source)->Color;
    DestList->DoubleBuffered = true;
    DestList->Color = clWindow;
  }
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  ListBox1->Items->Add("Not");
  ListBox1->Items->Add("In");
  ListBox1->Items->Add("Alphabetical");
  ListBox1->Items->Add("Order");

}
```

Delphi Examples:

```
{
This code is an OnDragOver event handler that won't allow a
label control to be dropped on a panel control and stops the
dragging of the label as soon as the user drags the label
onto the panel:
Note: Set the label's DragMode property to dmAutomatic.
}
procedure TForm1.FormDragDrop(Sender, Source: TObject; X, Y: Integer);
begin
  TForm1(Source).Left := X;
  TForm1(Source).Top := Y;
```

```
end;

procedure TForm1.FormDragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := Source is TLabel;
end;

procedure TForm1.Panel1DragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := False;
  if (Source is TLabel) and (State = dsDragEnter) then
    (Source as TLabel).EndDrag(False);
end;
{
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
}

procedure TForm1.FormCreate(Sender: TObject);
begin
  ListBox1.Items.Add('Not');
  ListBox1.Items.Add('In');
  ListBox1.Items.Add('Alphabetical');
  ListBox1.Items.Add('Order');
end;

// This OnDragOver event handler permits the list box to
// accept a dropped label:

procedure TForm1.ListBox1DragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := Source is TLabel;
end;

// This OnDragDrop event handler implements the drop behavior.

procedure TForm1.ListBox1DragDrop(Sender, Source: TObject; X, Y: Integer);
begin
  if (Sender is TListBox) and (Source is TLabel) then
  begin
    with Sender as TListBox do
    begin
      Font := (Source as TLabel).Font;
      Color := (Source as TLabel).Color;
      DoubleBuffered := true;
      Color := clWindow;
    end;
  end;
end;
```

68.1.27.6.6 TNotebook.OnEndDock Event

Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.

Pascal

```
property OnEndDock: TEndDragEvent;
```

C++

```
__property TEndDragEvent OnEndDock;
```

Description

Use OnEndDock to specify actions or special processing that when a drag-and-dock operation stops.

See Also

DragKind (see page 5819)

OnDragOver (see page 5857)

OnDockDrop (see page 6214)

OnStartDock (see page 5871)

68.1.27.6.7 TNotebook.OnEndDrag Event

Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.

Pascal

```
property OnEndDrag: TEndDragEvent;
```

C++

```
__property TEndDragEvent OnEndDrag;
```

Description

Use the OnEndDrag event handler to specify any special processing that occurs when dragging stops.

C++ Examples:

```
/*
This code displays a message in a label named Status. The
message displayed depends on whether the dragged label
control was successfully dropped into and accepted by a
another control.
*/
void __fastcall TForm1::Label1EndDrag(TObject *Sender, TObject *Target, int X,
      int Y)
{
  if (Sender->ClassNameIs("TLabel"))
  {
    AnsiString S = ((TLabel *)Sender)->Name + " was dropped and ";
    if (Target)
```

```
      S = S + "accepted!";
    else
      S = S + "rejected.";
    Status->Caption = S;
  }
}
```

Delphi Examples:

```
{
This code displays a message in a label named Status. The
message displayed depends on whether the dragged label
control was successfully dropped into and accepted by a
another control.
}
procedure TForm1.Label1EndDrag(Sender, Target: TObject; X, Y: Integer);
var
  S: string;
begin
  S := (Sender as TLabel).Name + ' was dropped... and ';
  if Target <> nil then
    S := S + 'accepted!'
  else
    S := S + 'rejected!';
  Status.Caption := S;
end;
```

DragKind (see page 5819)

68.1.27.6.8 TNotebook.OnEnter Event

Occurs when a control receives the input focus.

Pascal

```
property OnEnter: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnEnter;
```

Description

Use the OnEnter event handler to cause any special processing to occur when a control becomes active.

The OnEnter event does not occur when switching between forms or between another application and the application that includes the control.

When switching between controls in separate container controls such as the TPanel and the TGroupBox controls, an OnEnter event occurs for the container before the OnEnter event of the contained control.

Similarly, an OnExit event of the container occurs after the OnExit event of the control in a container when focus moves to another control outside the container.

For example, consider a form with an OK button and a group box that contains three radio buttons, where focus is currently on the OK button. When the user clicks one of the radio buttons, an OnExit event of the button occurs, followed by an OnEnter event on the group box, and finally an OnEnter event on the radio button that was clicked. If the user then clicks on the OK button, an OnExit event for the radio button occurs followed by an OnExit event for the group box, and then the button's OnEnter

event occurs.

C++ Examples:

```
/*
This example takes an edit control, a button, and a rich
edit control on a form.  When the user presses the button, a
Font dialog appears.  When the user clicks the Apply (not OK)
button in the Font dialog, the currently selected font is
applied to the active control. Clicking the button sets the
ActiveControl to the button.  That is why we need to save
the ActiveControl in a shared OnEnter procedure.  In the rich
edit, only the text selected converts.
*/
TWinControl *myActiveControl;

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  FontDialog1->Options << fdApplyButton;
  FontDialog1->Execute();
}

void __fastcall TForm1::FontDialog1Apply(TObject *Sender, HWND Wnd)
{
  if (myActiveControl->ClassNameIs("TEdit"))
   ((TEdit *)myActiveControl)->Font->Assign(FontDialog1->Font);
  else if (myActiveControl->ClassNameIs("TRichEdit"))
    ((TRichEdit *)myActiveControl)->SelAttributes->Assign(FontDialog1->Font);
  else
    MessageBeep(0);
}

void __fastcall TForm1::Edit1Enter(TObject *Sender)
{
  myActiveControl = ActiveControl;
}
/*
This example uses an edit box and a memo control on a form.
When either the edit box or the memo is the active control,
it is colored yellow. When the active control becomes
inactive, the color of the control returns to the Windows
system color for a window.  These event handlers could also
be shared.
*/
void __fastcall TForm1::Edit1Enter(TObject *Sender)
{
  Edit1->Color = clYellow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Edit1Exit(TObject *Sender)
{
  Edit1->Color = clWindow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Memo1Enter(TObject *Sender)
{
  Memo1->Color = clYellow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Memo1Exit(TObject *Sender)
{
  Memo1->Color = clWindow;
}
```

Delphi Examples:

```
{
```

```
This example takes an edit control, a button, and a rich
edit control on a form.  When the user presses the button, a
Font dialog appears.  When the user clicks the Apply (not OK)
button in the Font dialog, the currently selected font is
applied to the active control. Clicking the button sets the
ActiveControl to the button.  That is why we need to save
the ActiveControl in a shared OnEnter procedure.  In the rich
edit, only the text selected converts.
}
procedure TForm1.Button1Click(Sender: TObject);
begin
   FontDialog1.Options := FontDialog1.Options + [fdApplyButton];
   FontDialog1.Execute;
end;

procedure TForm1.Edit1Enter(Sender: TObject);
begin
  myActiveControl := ActiveControl;
end;

procedure TForm1.FontDialog1Apply(Sender: TObject; Wnd: HWND);
begin
  if myActiveControl is TEdit then
    with myActiveControl as TEdit do
       Font.Assign(TFontDialog(Sender).Font)
  else if myActiveControl is TRichEdit then
    with myActiveControl as TRichEdit do
      SelAttributes.Assign(TFontDialog(Sender).Font)
  else
    Beep;
end;
{
This example uses an edit box and a memo control on a form.
When either the edit box or the memo is the active control,
it is colored yellow. When the active control becomes
inactive, the color of the control returns to the Windows
system color for a window.  These event handlers could also
be shared.
}
procedure TForm1.Edit1Enter(Sender: TObject);

68.1.27.6.9 TNotebook.OnExit Event

Occurs when the input focus shifts away from one control to another.

Pascal

```
property OnExit: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnExit;
```

Description

Use the OnExit event handler to provide special processing when the control ceases to be active.

The OnExit event does not occur when switching between forms or between another application and your application.

When switching between controls in separate container controls such as the TPanel and the TGroupBox controls, an OnExit event occurs for the control inside the container before the OnExit event of the container.

Similarly, an OnEnter event of the container occurs before the OnEnter event of the control in a container when focus moves to a control inside a container.

For example, consider a form with an OK button and a group box that contains three radio buttons, where focus is currently on the OK button. When the user clicks one of the radio buttons, an OnExit event of the button occurs, followed by an OnEnter event on the group box, and finally an OnEnter event on the radio button that was clicked. If the user then clicks on the OK button, an OnExit event for the radio button occurs followed by an OnExit event for the group box, and then the button's OnEnter event occurs.

Note: In some control classes the ActiveControl property updates before the OnExit event occurs.

C++ Examples:

```
/*
This example uses an edit box and a memo control on a form.
When either the edit box or the memo is the active control,
it is colored yellow. When the active control becomes
inactive, the color of the control returns to the Windows
system color for a window.  These event handlers could also
be shared.
*/
void __fastcall TForm1::Edit1Enter(TObject *Sender)
{
  Edit1->Color = clYellow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Edit1Exit(TObject *Sender)
{
  Edit1->Color = clWindow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Memo1Enter(TObject *Sender)
{
  Memo1->Color = clYellow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Memo1Exit(TObject *Sender)
{
  Memo1->Color = clWindow;
}
```

Delphi Examples:

```
{
This example uses an edit box and a memo control on a form.
When either the edit box or the memo is the active control,
it is colored yellow. When the active control becomes
inactive, the color of the control returns to the Windows
system color for a window.  These event handlers could also
be shared.

68.1.27.6.10 TNotebook.OnMouseActivate Event

Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.

Pascal

```
property OnMouseActivate: TMouseActivateEvent;
```

C++

```
__property TMouseActivateEvent OnMouseActivate;
```

Description

Use the OnMouseActivate event handler to implement any special processing that should occur as a result of pressing a mouse button on a control when the parent top-level form is not active.

The event type is:

```
TMouseActivateEvent = procedure (Sender: TObject; Button: TMouseButton; ShiftState:
TShiftState;
X, Y: Integer; HitTest: Integer; var MouseActivate: TMouseActivate) of object;
```

When you click on a control and the parent top-level form is not active, this event fires on the control that the mouse cursor is over. MouseActivate is a protected virtual function in TControl. MouseActivate can be overridden in custom control descendants to provide special built-in processing of the OnMouseActivate events. If you leave the default value of MouseActivate as maDefault, the parent control fires the OnMouseActivate event and repeats the process all the way up to the top-level form. If no control in the chain sets the value of MouseActivate, the behavior is the same as if a control set TMouseActivate to maActivate. At any point, a control can set the value of TMouseActivate and the parent processing stops.

Some controls set focus to themselves when they get a button down message so, in some cases, setting maNoActivate appears to have no effect. For instance, a TButton control sets focus to itself in the WM_LBUTTONDOWN message regardless of whether or not TMouseActivate is set to maNoActivate. In this case, setting maNoActivateAndEat will work because the top-level form is not activated and the WM_LBUTTONDOWN message is suppressed.

The HitTest parameter is the hit test value obtained from the WM_NCHITTEST message. See Windows.pas for valid values and their meanings. In most cases this value will be HTCLIENT, which means that the user clicked in the client area of a control. However, in the case of a top-level form, this can take other values such as HTCAPTION, or HTBOTTOM. This allows the code to decide which value to set for MouseActivate, based on the HitTest code. For example, the following code in the OnMouseActivate event handler for a TForm forces the user to click into a non-client area to activate the form:

```
if HitTest = HTCLIENT then
    MouseActivate := maNoActivateAndEat;
```

Even though this event is tied to how Windows processes WM_MOUSEACTIVATE, the actual handling of the message is done at the TControl level, which is the point in the VCL hierarchy where the control has no window handle. The OnMouseActivate event is then simulated since the all TControl descendants also have OnMouseDown, OnMouseMove, and OnMouseUp events. This information is applicable to both VCL Win32 and VCL.NET.

68.1.27.6.11 TNotebook.OnMouseDown Event

Occurs when the user presses a mouse button with the mouse pointer over a control.

Pascal

```
property OnMouseDown: TMouseEvent;
```

C++

```
__property TMouseEvent OnMouseDown;
```

Description

Use the OnMouseDown event handler to implement any special processing that should occur as a result of pressing a mouse button.

The OnMouseDown event handler can respond to left, right, or center mouse button presses and shift key plus mouse-button combinations. Shift keys are the Shift, Ctrl, and Alt keys. X and Y are the pixel coordinates of the mouse pointer in the client area of the Sender.

C++ Examples:

```
/*
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a
rectangle is drawn on the form. When the mouse button is
released, the rectangle appears on the form's canvas. Its
top-left and bottom-right corners are defined by the
location of the mouse pointer when the user pressed and
released the mouse button.  While the user drags the mouse,
the location of the top, left, bottom, and right sides of
the rectangle are displayed in the status bar.
```

```
*/
int StartX, StartY; // Declare at the top of the form's unit
// Use this code as the OnMouseDown event handler of the form:
void __fastcall TForm1::FormMouseDown(TObject *Sender, TMouseButton Button, TShiftState Shift,
int X, int Y)
{
  StartX = X;
  StartY = Y;
}

// Use this code as the OnMouseUp event handler of the form:
void __fastcall TForm1::FormMouseUp(TObject *Sender, TMouseButton Button, TShiftState Shift,
int X, int Y)
{
  Form1->Canvas->Rectangle(StartX, StartY, X, Y);
  StatusBar1->Panels->Items[0]->Text = "";
  StatusBar1->Panels->Items[1]->Text = "";
  StatusBar1->Panels->Items[2]->Text = "";
  StatusBar1->Panels->Items[3]->Text = "";
}

// Use this code as the OnMouseMove event handler of the form:
void __fastcall TForm1::FormMouseMove(TObject *Sender, TShiftState Shift, int X, int Y)
{
  if (Shift.Contains(ssLeft)) // make sure button is down
  {
    if (Y > StartY)
    {
      StatusBar1->Panels->Items[0]->Text = "Top: " + IntToStr(StartY);
      StatusBar1->Panels->Items[2]->Text = "Bottom: " + IntToStr(Y);
    }
    else
    {
      StatusBar1->Panels->Items[0]->Text = "Top: " + IntToStr(Y);
      StatusBar1->Panels->Items[2]->Text = "Bottom: " + IntToStr(StartY);
    }
    if (X > StartX)
    {
      StatusBar1->Panels->Items[1]->Text = "Left: " + IntToStr(StartX);
      StatusBar1->Panels->Items[3]->Text = "Right: " + IntToStr(X);
    }
    else
    {
      StatusBar1->Panels->Items[1]->Text = "Left: " + IntToStr(X);
      StatusBar1->Panels->Items[3]->Text = "Right: " + IntToStr(StartX);
    }
  }
}
```

68.1.27.6.12 TNotebook.OnMouseEnter Event

Occurs when the user moves the mouse into a control.

Pascal

```
property OnMouseEnter: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnMouseEnter;
```

Description

Use the OnMouseEnter event handler to implement any special processing that should occur as a result of moving the mouse into a control when the parent top-level form is not active.

68.1.27.6.13 TNotebook.OnMouseLeave Event

Occurs when the user moves the mouse outside of a control.

Pascal

```
property OnMouseLeave: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnMouseLeave;
```

Description

Use the OnMouseLeave event handler to implement any special processing that should occur as a result of moving the mouse outside of a control when the parent top-level form is not active.

68.1.27.6.14 TNotebook.OnMouseMove Event

Occurs when the user moves the mouse pointer while the mouse pointer is over a control.

Pascal

```
property OnMouseMove: TMouseMoveEvent;
```

C++

```
__property TMouseMoveEvent OnMouseMove;
```

Description

Use the OnMouseMove event handler to respond when the mouse pointer moves after the control has captured the mouse.

Use the Shift parameter of the OnMouseDown event handler, to determine to the state of the shift keys and mouse buttons. Shift keys are the Shift, Ctrl, and Alt keys or shift key-mouse button combinations. X and Y are pixel coordinates of the new location of the mouse pointer in the client area of the Sender.

C++ Examples:

```
/*
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a

  begin
    Form1.Canvas.Rectangle(StartX, StartY, X, Y);
    StatusBar1.Panels[0].Text := '';
    StatusBar1.Panels[1].Text := '';
    StatusBar1.Panels[2].Text := '';
    StatusBar1.Panels[3].Text := '';
  end;

  procedure TForm1.FormMouseMove(Sender: TObject; Shift: TShiftState; X, Y: Integer);
  begin
    if ssLeft in Shift then { make sure button is down }
    begin
      if Y > StartY then
        begin
        StatusBar1.Panels[0].Text := 'Top: ' + IntToStr(StartY);
        StatusBar1.Panels[2].Text := 'Bottom: ' + IntToStr(Y);
        end
      else
        begin
        StatusBar1.Panels[0].Text := 'Top: ' + IntToStr(Y);
        StatusBar1.Panels[2].Text := 'Bottom: ' + IntToStr(StartY);
        end;
      if X > StartX then
        begin
        StatusBar1.Panels[1].Text := 'Left: ' + IntToStr(StartX);
        StatusBar1.Panels[3].Text := 'Right: ' + IntToStr(X);
        end
      else
        begin
        StatusBar1.Panels[1].Text := 'Left: ' + IntToStr(X);
        StatusBar1.Panels[3].Text := 'Right: ' + IntToStr(StartX);
        end;
    end;
  end;

Responding to a Mouse-up Action

68.1.27.6.16 TNotebook.OnPageChanged Event

Occurs when the user selects a new page in the notebook.

Pascal

```
property OnPageChanged: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnPageChanged;
```

Description

Use the OnPageChanged event when you want special processing to occur when the active page changes.

68.1.27.6.17 TNotebook.OnStartDock Event

Occurs when the user begins to drag a control with a DragKind of dkDock.

Pascal

```
property OnStartDock: TStartDockEvent;
```

C++

```
__property TStartDockEvent OnStartDock;
```

Description

Use the OnStartDock event handler to implement special processing when the user starts a drag-and-dock operation by dragging the control.

The OnStartDock event handler can create a TDragDockObjectEx object for the DragObject parameter to specify the appearance of the dragging rectangle and how the dragged control interacts with potential docking sites. If you return TDragDockObjectEx as the drag object, there is no need to call the Free method for the DragObject when dragging is over. If you use TDragDockObject, your application is responsible for freeing the drag object.

If the OnStartDock event handler sets the DragObject parameter to nil (Delphi) or NULL (C++), a TDragDockObject object is automatically created.

Note: This information applies to Win32 applications only.

68.1.27.6.18 TNotebook.OnStartDrag Event

Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.

Pascal

```
property OnStartDrag: TStartDragEvent;
```

C++

```
__property TStartDragEvent OnStartDrag;
```

Description

Use the OnStartDrag event handler to implement special processing when the user starts to drag the control or an object it contains. OnStartDrag only occurs if DragKind is dkDrag.

Sender is the control that is about to be dragged, or that contains the object about to be dragged.

The OnStartDrag event handler can create a TDragControlObjectEx instance for the DragObject parameter to specify the drag cursor, or, optionally, a drag image list. If you create a TDragControlObjectEx instance, there is no need to call the Free method for the DragObject when dragging is over. If you create, instead, a TDragControlObject instance, your application is responsible for freeing the drag object instance.

If the OnStartDrag event handler sets the DragObject parameter to nil (Delphi) or NULL (C++), a TDragControlObject object is automatically created and dragging begins on the control itself.

Note: On some controls, such as TRichEdit, the underlying Windows control handles internal drag operations. For these controls, there are no OnStartDrag or OnEndDrag events for drag operations within the control.

ExtCtrls

Description

This is class ExtCtrls.TPage.

68.1.28.1 TPage Members

The following tables list the members exposed by TPage.

Protected Events

	Name	Description
	OnCanResize (see page 5851)	Occurs when an attempt is made to resize the control.
	OnClick (see page 5851)	Occurs when the user clicks the control.
	OnConstrainedResize (see page 5853)	Adjust resize constraints.
	OnContextPopup (see page 5854)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnDblClick (see page 5854)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDockDrop (see page 6214)	Occurs when another control is docked to the control.
	OnDockOver (see page 6216)	Occurs when another control is dragged over the control.
	OnDragDrop (see page 5855)	Occurs when the user drops an object being dragged.

	OnDragOver (see page 5857)	Occurs when the user drags an object over a control.
	OnEndDock (see page 5859)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 5860)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnEnter (see page 6219)	Occurs when a control receives the input focus.
	OnExit (see page 6221)	Occurs when the input focus shifts away from one control to another.
	OnGetSiteInfo (see page 6223)	Returns the control's docking information.
	OnKeyDown (see page 6225)	Occurs when a user presses any key while the control has focus.
	OnKeyPress (see page 6227)	Occurs when a key is pressed.
	OnKeyUp (see page 6228)	Occurs when the user releases a key that has been pressed.
	OnMouseActivate (see page 5861)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 5862)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseEnter (see page 5864)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 5864)	Occurs when the user moves the mouse outside of a control.
	OnMouseMove (see page 5865)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 5867)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnMouseWheel (see page 5869)	Occurs when the mouse wheel is rotated.
	OnMouseWheelDown (see page 5869)	Occurs when the mouse wheel is rotated downward.
	OnMouseWheelUp (see page 5870)	Occurs when the mouse wheel is rotated upward.
	OnResize (see page 5870)	Occurs immediately after the control is resized.
	OnStartDock (see page 5871)	Occurs when the user begins to drag a control with a DragKind (see page 5819) of dkDock.
	OnStartDrag (see page 5871)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.
	OnUnDock (see page 6230)	Occurs when the application tries to undock a control that is docked to the windowed control.

Protected Fields

	Name	Description
	FAnchorMove (see page 5733)	This is FAnchorMove, a member of class TControl.
	FAnchorOrigin (see page 5734)	This is FAnchorOrigin, a member of class TControl.
	FAnchorRules (see page 5734)	This is FAnchorRules, a member of class TControl.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FDesignSize (see page 6124)	This is FDesignSize, a member of class TWinControl.
	FDoubleBuffered (see page 6124)	This is FDoubleBuffered, a member of class TWinControl.
	FExplicitHeight (see page 5734)	This is FExplicitHeight, a member of class TControl.
	FExplicitLeft (see page 5734)	This is FExplicitLeft, a member of class TControl.
	FExplicitTop (see page 5734)	This is FExplicitTop, a member of class TControl.
	FExplicitWidth (see page 5735)	This is FExplicitWidth, a member of class TControl.
	FInImeComposition (see page 6125)	This is FInImeComposition, a member of class TWinControl.
	FOriginalParentSize (see page 5735)	This is FOriginalParentSize, a member of class TControl.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	ActionChange (see page 5737)	Responds when the action associated with the control changes.
V	ActionChange (see page 6127)	Updates the control to reflect changes in its associated action.
	AddBiDiModeExStyle (see page 6128)	Sets control's window style according to its bi-directional support.
V	AdjustClientRect (see page 6128)	Provides the interface that adjusts the ClientRect (see page 5810) property for idiosyncrasies of the window.
	AdjustSize (see page 5738)	Sets the size of the control as determined by the AutoSize (see page 5803) property.

	AdjustSize (see page 6129)	Adjusts the control's size according to its contents and constraints.
	AlignControls (see page 6129)	Aligns any controls for which the control is the parent within a specified area of the control.
	ArrangeControl (see page 6130)	This is ArrangeControl, a member of class TWinControl.
	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	AssignTo (see page 5739)	Overrides the inherited AssignTo function to enable assignments to TAction objects.
	AssignTo (see page 6130)	Copies the properties of the windowed control to another object.
	BeginAutoDrag (see page 5739)	Begin Automatic Drag.
	CalcCursorPos (see page 5741)	This is CalcCursorPos, a member of class TControl.
	CanAutoSize (see page 5741)	Indicates whether the control can resize itself automatically to accommodate its contents.
	CanAutoSize (see page 6131)	Indicates how the control can be resized.
	CanResize (see page 5742)	OnCanResize (see page 5851) event dispatcher.
	CanResize (see page 6132)	Indicates how the control can respond to a resize attempt.
	Changed (see page 5742)	Sends a CM_CHANGED (see page 6330) message to the control.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	ChangeScale (see page 5743)	Rescaling event dispatcher.
	ChangeScale (see page 6132)	Resize (see page 5780) and reposition children and self.
	Click (see page 5743)	Respond to user click.
	ConstrainedResize (see page 5746)	Notify control of resize with constraints.
	ConstrainedResize (see page 6133)	Generates an OnConstrainedResize (see page 5853) event.
	ControlsAligned (see page 6134)	This is ControlsAligned, a member of class TWinControl.
	CreateDockManager (see page 6134)	Creates the dock manager for the control.
	CreateHandle (see page 6135)	Creates underlying screen object.
	CreateParams (see page 6135)	Initializes a window-creation parameter data structure.
	CreateSubClass (see page 6136)	Creates a windowed control derived from an existing Windows window class.
	CreateWindowHandle (see page 6137)	Creates a Windows control to represent the control.
	CreateWnd (see page 6137)	Creates the underlying window.
	CustomAlignInsertBefore (see page 6137)	Returns placement order of custom-aligned child control.
	CustomAlignPosition (see page 6138)	Returns aligned position of custom-aligned child control.
	DblClick (see page 5747)	OnDblClick (see page 5854) event dispatcher.
	DefaultDockImage (see page 5747)	Handles the painting and erasing of a dock image.
	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	DefineProperties (see page 5748)	Provides methods to read and write the IsControl (see page 5829) property to a stream such as a form file.
	DefineProperties (see page 6139)	Provides methods to read and write the IsControl property to a stream such as a form file.
	DesignWndProc (see page 5749)	This is DesignWndProc, a member of class TControl.
	DestroyHandle (see page 6140)	Destroys the control's window without destroying the control.
	DestroyWindowHandle (see page 6140)	Destroys the window created in the CreateWindowHandle (see page 6137) method.
	DestroyWnd (see page 6141)	Destroys the control's window.
	DoAddDockClient (see page 6142)	Performs actions when a control is docked to the windowed control.
	DockOver (see page 6143)	Responds when a docking client is dragged over the windowed control.
	DockReplaceDockClient (see page 6143)	This is DockReplaceDockClient, a member of class TWinControl.
	DockTrackNoTarget (see page 5749)	Handles dragging of the control over an invalid docking target.
	DoContextPopup (see page 5750)	OnContextPopup (see page 5854) event dispatcher.
	DoDock (see page 5750)	Docking event dispatcher.
	DoDockOver (see page 6143)	Generates an OnDockOver (see page 6216) event.
	DoEndDock (see page 5750)	OnEndDock (see page 5859) event dispatcher.
	DoEndDrag (see page 5751)	OnEndDrag (see page 5860) event dispatcher.
	DoEnter (see page 6144)	Respond to receiving input focus.

	DoExit (see page 6144)	Respond to losing input focus
	DoFlipChildren (see page 6145)	Flips the control's children.
	DoKeyDown (see page 6145)	Performs some preprocessing before generating an OnKeyDown (see page 6225) event.
	DoKeyPress (see page 6146)	Performs some preprocessing before generating an OnKeyPress (see page 6227) event.
	DoKeyUp (see page 6146)	Performs some preprocessing before generating an OnKeyUp (see page 6228) event.
	DoMouseWheel (see page 5751)	Processes mouse wheel motion.
	DoMouseWheelDown (see page 5752)	OnMouseWheelDown (see page 5869) event dispatcher.
	DoMouseWheelUp (see page 5752)	OnMouseWheelUp (see page 5870) event dispatcher.
	DoRemoveDockClient (see page 6147)	Responds when a control is undocked from the windowed control.
	DoStartDock (see page 5753)	OnStartDock (see page 5871) event dispatcher.
	DoStartDrag (see page 5753)	OnStartDrag (see page 5871) event dispatcher.
	DoUnDock (see page 6147)	Undocks a control that is currently docked to the windowed control.
	DragCanceled (see page 5754)	Provides the interface for a method that responds to the cancellation of a drag.
	DragOver (see page 5755)	OnDragOver (see page 5857) event dispatcher.
	DrawDragDockImage (see page 5755)	Draws the dock image for the control.
	EraseDragDockImage (see page 5757)	Erases the dock image for the control.
	FindNextControl (see page 6149)	Returns the control's next child in the tab order after the specified control.
	FixupTabList (see page 6149)	Sorts the child controls by their tab order.
	GetAction (see page 5758)	This is GetAction, a member of class TControl.
	GetActionLinkClass (see page 5758)	Returns the appropriate action link class that is associated with the control class.
	GetActionLinkClass (see page 6152)	Returns the associated action link class.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetChildren (see page 6153)	Calls a specified method for each child of the control.
	GetClientOrigin (see page 5758)	Returns the screen coordinates of the top-left corner of the control's client area.
	GetClientOrigin (see page 6153)	Returns the value of the ClientOrigin (see page 5809) property.
	GetClientRect (see page 5759)	Returns a rectangle defining the client area of the control.
	GetClientRect (see page 6154)	Returns the value of the ClientRect (see page 5810) property.
	GetControlExtents (see page 6154)	Returns the smallest rectangle in which all the control's children fit.
	GetDeviceContext (see page 5760)	Returns a device context for the control.
	GetDeviceContext (see page 6155)	Provides access to a device context for the control.
	GetDockEdge (see page 5763)	Returns the edge on which another control should be docked when it is dragged over the control.
	GetDragImages (see page 5763)	Returns the control's image list containing the image to be displayed while dragging.
	GetEnabled (see page 5763)	Returns the value of the Enabled (see page 5821) property.
	GetFloating (see page 5764)	Returns the value of the Floating (see page 5823) property.
	GetFloatingDockSiteClass (see page 5764)	Returns the class used for the control when it is floating.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetPalette (see page 5765)	Returns the handle to a palette for use by the control.
	GetParentHandle (see page 6157)	Returns the window handle for the window of the control's parent.
	GetPopupMenu (see page 5765)	Returns the pop-up menu associated with the control.
	GetSiteInfo (see page 6158)	Generates an OnGetSiteInfo (see page 6223) event
	GetTopParentHandle (see page 6159)	Returns the window handle of the first window not associated with a VCL control that contains the windowed control.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	InvalidateDockHostSite (see page 6162)	This is InvalidateDockHostSite, a member of class TWinControl.

	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsControlActivateMsg (see page 6162)	This is IsControlActivateMsg, a member of class TWinControl.
	IsControlMouseMsg (see page 6162)	Indicates whether a specified mouse message is directed to one of the windowed control's child controls.
	IsQualifyingSite (see page 6163)	This is IsQualifyingSite, a member of class TWinControl.
	KeyDown (see page 6163)	Respond to key press events.
	KeyPress (see page 6163)	Respond to keyboard input.
	KeyUp (see page 6164)	Respond to released key.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Loaded (see page 5771)	Initializes the control after it is loaded from a stream.
	MainWndProc (see page 6165)	Receives Windows messages for the control.
	MouseActivate (see page 5773)	This is MouseActivate, a member of class TControl.
	MouseDown (see page 5773)	OnMouseDown (see page 5862) event dispatcher.
	MouseMove (see page 5773)	Respond to mouse moving over control area..
	MouseUp (see page 5774)	OnMouseUp (see page 5867) event dispatcher.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	Notification (see page 5775)	Responds to notifications that components are being created or destroyed.
V	Notification (see page 6165)	Responds to notifications that components are being created or destroyed.
	NotifyControls (see page 6165)	Sends a message to all the child controls.
V	Paint (see page 12972)	Renders the image of a custom control.
	PaintControls (see page 6166)	Paints each of the child controls in a windowed control using the specified device context.
	PaintHandler (see page 6166)	Responds to WM_PAINT messages.
V	PaintWindow (see page 5920)	Renders the image of the control on a specified device context.
V	PaintWindow (see page 6169)	Renders the image of a windowed control.
	PaletteChanged (see page 5775)	Responds to changes in the system's palette by realizing the control's palette.
V	PaletteChanged (see page 6170)	Responds to changes in the system's palette by realizing the control's palette and the palette for each child control.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	PositionDockRect (see page 5777)	Positions the docking rectangle according to the current drag-and-dock state.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 12973)	Prepares the control for having its properties assigned values from a stream.
	RecreateWnd (see page 6171)	Recreate underlying Windows screen object.
	ReloadDockedControl (see page 6172)	Reloads a docked control.
	RemoveWindowProps (see page 6174)	This is RemoveWindowProps, a member of class TWinControl.
V	RequestAlign (see page 5780)	Instructs the parent of a control to reposition the control, enforcing its Align (see page 5798) property.
	ResetIme (see page 6174)	Restores the input method editor (IME) that was active when the application started.
	ResetImeComposition (see page 6175)	Directs the composition window of the input method editor (IME) to perform a specific action.
	Resize (see page 5780)	Respond to control resize.
	ScaleConstraints (see page 5781)	This is ScaleConstraints, a member of class TControl.
	ScaleControls (see page 6176)	Rescale child controls only.
	SelectFirst (see page 6177)	Locates first selectable child control.
	SelectNext (see page 6177)	Moves the input focus from the current child control to the next one in the tab order.
	SendCancelMode (see page 5781)	Cancels the modal state of the control.
	SendDockNotification (see page 5782)	Sends a Windows message to the control's host dock site.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
V	SetAutoSize (see page 5783)	This is SetAutoSize, a member of class TControl.
V	SetBiDiMode (see page 5783)	Sets the control's bi-directional mode.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
V	SetChildOrder (see page 6178)	Changes the order in which the child component appears in the list of child components returned by the GetChildren (see page 6153) method.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.

	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
V	SetDragMode (see page 5785)	Sets the drag mode for the control.
V	SetEnabled (see page 5785)	Sets the value of the Enabled (see page 5821) property.
	SetIme (see page 6181)	Activates an input method editor (IME) using the values specified by the ImeMode (see page 6207) and ImeName (see page 6208) properties.
	SetImeCompositionWindow (see page 6181)	Sets the position and font of the composition window.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
V	SetName (see page 5785)	Sets the name of the control.
V	SetParent (see page 5786)	Sets the parent of the control.
V	SetParent (see page 6182)	Sets the parent of the control.
V	SetParentBackground (see page 6182)	This is SetParentBackground, a member of class TWinControl.
V	SetParentBiDiMode (see page 5786)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 5787)	Sets the parent for the control.
	SetZOrder (see page 5788)	Repositions the control in its parent's control list, thereby changing position onscreen.
V	SetZOrder (see page 6182)	Moves the control to the top or bottom of the parent control's (or screen's) list of TWinControl (see page 6112) controls.
V	ShowControl (see page 6183)	Ensures that a specified child control is visible.
	UpdateBounds (see page 6185)	This is UpdateBounds, a member of class TWinControl.
	UpdateBoundsRect (see page 5789)	Changes the Top (see page 5844), Left (see page 5830), Width (see page 5849), and Height (see page 5825) properties of the control, but doesn't update its screen image and bypasses all resize events.
V	UpdateControlOriginalParentSize (see page 6186)	This is UpdateControlOriginalParentSize, a member of class TWinControl.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateExplicitBounds (see page 5789)	This is UpdateExplicitBounds, a member of class TControl.
	UpdateRecreatingFlag (see page 6186)	This is UpdateRecreatingFlag, a member of class TWinControl.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	UpdateUIState (see page 6186)	Updates form User Interface State as needed
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	VisibleChanging (see page 5791)	Provides the interface for a method that responds to changes in the control's visibility.
V	WndProc (see page 5791)	Provides specific message responses for the control.
V	WndProc (see page 6187)	Provides specific message responses for the control.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	ActionLink (see page 5798)	Contains the action link object associated with the control.
	AutoSize (see page 5803)	Specifies whether the control sizes itself automatically to accommodate its contents.
	BevelEdges (see page 6192)	Specifies which edges of the control are beveled.
	BevelInner (see page 6193)	Specifies the cut of the inner bevel.
	BevelKind (see page 6193)	Specifies the control's bevel style.
	BevelOuter (see page 6194)	Specifies the cut of the outer bevel.
	BevelWidth (see page 6194)	Specifies the width of the inner and outer bevels.
	BorderWidth (see page 6195)	Specifies the width of the control's border.
R	Canvas (see page 5921)	Specifies the TCanvas object that presents a drawing surface for the control.

	Color (see page 5812)	Specifies the background color of the control.
	Ctl3D (see page 6198)	Determines whether a control has a three-dimensional (3-D) or two-dimensional look.
	DefWndProc (see page 6199)	Specifies the default window procedure for the windowed control.
	DesktopFont (see page 5818)	Specifies whether the control uses the Windows icon font when writing text.
	DragCursor (see page 5818)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 5819)	Specifies whether the control is being dragged normally or for docking.
	DragMode (see page 5819)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	Font (see page 5823)	Controls (see page 5711) the attributes of text written on or in the control.
	ImeMode (see page 6207)	Determines the behavior of the input method editor (IME).
	ImeName (see page 6208)	Specifies the input method editor (IME) to use for converting keyboard input to Asian language characters.
	IsControl (see page 5829)	Determines whether a form stores its form-specific properties to a stream.
	MouseCapture (see page 5831)	Indicates whether the control has "captured" mouse events.
	ParentBackground (see page 6209)	Determines whether control uses parent's theme background.
	ParentBiDiMode (see page 5833)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	ParentColor (see page 5834)	Determines where a control looks for its color information.
	ParentCtl3D (see page 6209)	Determines where a component looks to determine if it should appear three dimensional.
	ParentFont (see page 5834)	Determines where a control looks for its font information.
	ParentShowHint (see page 5835)	Determines where a control looks to find out if its Help Hint (see page 5827) should be shown.
	PopupMenu (see page 5835)	Identifies the pop-up menu associated with the control.
	ScalingFlags (see page 5840)	Reflects which attributes of the control have been scaled.
	Text (see page 5842)	Contains a text string associated with the control.
	WheelAccumulator (see page 5849)	Accumulates mouse wheel rotations.
	WindowHandle (see page 6212)	Provides access to a window handle for the control.
	WindowText (see page 5850)	Contains the text string of the control.

Public Events

	Name	Description
	WindowProc (see page 5872)	Points to the window procedure that responds to messages sent to the control.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	BeginDrag (see page 5740)	Starts the dragging of a control.
	BringToFront (see page 5740)	Puts the control in front of all other controls in its parent control.
	Broadcast (see page 6130)	Sends a message to each of the child controls.
	CanFocus (see page 6131)	Indicates whether a control can receive focus.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	ClientToParent (see page 5744)	Translates client coordinates to parent coordinates.
	ClientToScreen (see page 5744)	Translates a given point from client area coordinates to global screen coordinates.
	ContainsControl (see page 6133)	Indicates whether a specified control exists within the control.

	ControlAtPos (see page 6133)	Returns the child control located at a specified position within the control.
V	Create (see page 12971)	Creates an instance of TCustomControl.
	CreateParented (see page 6123)	Creates and initializes a control as the child of a specified non-VCL container.
	CreateParentedControl (see page 6136)	Creates and initializes a control as the child of a specified non-VCL window.
V	DefaultHandler (see page 5748)	Provides message handling for all messages that do not have specific handlers.
V	DefaultHandler (see page 6139)	Provides message handling for all messages that the control does not fully process itself.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 5732)	Destroys an instance of TControl (see page 5724).
V	Destroy (see page 5919)	Destroys an instance of TCustomControl (see page 5908).
V	Destroy (see page 6124)	Destroys an instance of TWinControl (see page 6112).
V	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	DisableAlign (see page 6141)	Disables the realignment of child controls.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Dock (see page 5749)	Used internally to dock the control.
	DockDrop (see page 6142)	Generates an OnDockDrop (see page 6214) event.
	DragDrop (see page 5754)	OnDragDrop (see page 5855) event dispatcher.
	Dragging (see page 5754)	Indicates whether a control is being dragged.
	DrawTextBiDiModeFlags (see page 5756)	Returns the text flags that reflect the current setting of the BiDiMode (see page 5803) property.
	DrawTextBiDiModeFlagsReadingOnly (see page 5756)	Returns the text flag to add that indicates whether the control's text should read from right to left.
	EnableAlign (see page 6148)	Decrements the reference count incremented by the DisableAlign (see page 6141) method, eventually realigning the child controls.
	EndDrag (see page 5757)	Stops a control from being dragged any further.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindChildControl (see page 6148)	Returns a child control given its name.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FlipChildren (see page 6150)	Reverses the positions of child controls.
	Focused (see page 6150)	Determines whether the control has input focus.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetControlsAlignment (see page 5759)	Indicates how text is aligned within the control.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 5765)	Returns the parent of the control.
	GetTabOrderList (see page 6158)	Builds a list of controls in tab order.
	GetTextBuf (see page 5766)	Retrieves the control's text, copies it into a buffer, and returns the number of characters copied.

	GetTextLen (see page 5767)	Returns the length of the control's text.
	HandleAllocated (see page 6159)	Reports whether a screen object handle exists for the control.
	HandleNeeded (see page 6160)	Creates a screen object for the control if it doesn't already exist.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 5768)	Indicates whether the control has a parent.
	Hide (see page 5769)	Makes the control invisible.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
V	InitiateAction (see page 5769)	Calls the action link's Update (see page 5789) method if the control is associated with an action link.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InsertControl (see page 6160)	Inserts a control into the Controls (see page 6197) array property.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
V	Invalidate (see page 5770)	Completely repaint control.
V	Invalidate (see page 6161)	Schedules a control repaint.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	IsRightToLeft (see page 5770)	Indicates whether the control should be reversed right to left.
	ManualDock (see page 5771)	Docks the control.
	ManualFloat (see page 5772)	Undocks the control.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	MouseWheelHandler (see page 5774)	Dispatches messages received from a mouse wheel.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	PaintTo (see page 6167)	This is the overview for the PaintTo method overload.
	ParentToClient (see page 5776)	Translate parent coordinates to client coordinates.
	Perform (see page 5776)	Responds as if the control received a specified Windows message.
	PreProcessMessage (see page 6170)	This is PreProcessMessage, a member of class TWinControl.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	Realign (see page 6171)	Forces the control to realign children.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	Refresh (see page 5779)	Repaints the control on the screen.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveControl (see page 6172)	Removes a specified control from the Controls (see page 6197) array.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	Repaint (see page 5779)	Forces the control to repaint its image on the screen.
V	Repaint (see page 6174)	Repaints the entire control.
	ReplaceDockedControl (see page 5779)	Docks the control in the place where another control is already docked.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	ScaleBy (see page 6175)	Rescale control and its children.
	ScreenToClient (see page 5781)	Converts the screen coordinates of a specified point on the screen to client coordinates.
	ScrollBy (see page 6176)	Scroll control contents.
	SendToBack (see page 5782)	Puts a windowed control behind all other windowed controls, or puts a non-windowed control behind all other non-windowed controls.
V	SetBounds (see page 5783)	Sets the Left (see page 5830), Top (see page 5844), Width (see page 5849), and Height (see page 5825) properties all at once.
V	SetBounds (see page 6178)	Sets the windowed control's boundary properties all at once.
	SetDesignVisible (see page 5784)	Makes a control visible at design time.
V	SetDesignVisible (see page 6178)	Makes a control visible at design time.
V	SetFocus (see page 6179)	Gives the input focus to the control.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.

	SetTextBuf (see page 5787)	Sets the text of the control.
	Show (see page 5788)	Makes a control visible.
V	Update (see page 5789)	Processes any pending paint messages immediately.
V	Update (see page 6183)	Forces the control to update.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	UpdateControlState (see page 6186)	Respond to state change.
	UseRightToLeftAlignment (see page 5790)	Specifies whether the control's alignment should be reversed right-to-left.
	UseRightToLeftReading (see page 5790)	Specifies whether the control is using a right-to-left reading order.
	UseRightToLeftScrollBar (see page 5791)	Specifies whether the vertical scroll bar appears on the left side of the control.

Public Properties

	Name	Description
	Action (see page 5797)	Designates the action associated with the control.
	Align (see page 5798)	Determines how the control aligns within its container (parent control).
R	AlignDisabled (see page 6192)	Indicates child control realignment disabled.
	Anchors (see page 5802)	Specifies how the control is anchored to its parent.
	BiDiMode (see page 5803)	Specifies the bi-directional mode for the control.
	BoundsRect (see page 5803)	Specifies the bounding rectangle of the control, expressed in the coordinate system of the parent control.
R	Brush (see page 6195)	Determines the color and pattern used for painting the background of the control.
	ClientHeight (see page 5808)	Specifies the height of the control's client area in pixels.
R	ClientOrigin (see page 5809)	Specifies the screen coordinates (in pixels) of the top left corner of a control's client area.
R	ClientRect (see page 5810)	Specifies the size (in pixels) of a control's client area.
	ClientWidth (see page 5811)	Specifies the horizontal size of the control's client area in pixels.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Constraints (see page 5812)	Specifies the size constraints for the control.
R	ControlCount (see page 6195)	Returns the number of child controls.
R	Controls (see page 6197)	Lists all child controls.
	ControlState (see page 5813)	Indicates the current state of a control at runtime.
	ControlStyle (see page 5814)	Determines style characteristics of the control.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	DockClientCount (see page 6199)	Specifies the number of controls that are docked on the windowed control.
R	DockClients (see page 6201)	Lists the controls that are docked to the windowed control.
	DockManager (see page 6202)	Specifies the control's docking manager interface.
	DockOrientation (see page 5818)	Specifies how the control is docked relative to other controls docked in the same parent.
	DockSite (see page 6204)	Specifies whether the control can be the target of drag-and-dock operations.
	DoubleBuffered (see page 6205)	Determines whether the control's image is rendered directly to the window or painted to an in-memory bitmap first.
	Enabled (see page 5821)	Controls (see page 5711) whether the control responds to mouse, keyboard, and timer events.
R	ExplicitHeight (see page 5821)	Specifies the explicit vertical size of the control in pixels.
R	ExplicitLeft (see page 5822)	Specifies the explicit horizontal pixel coordinate of the left edge of a component relative to its parent.
R	ExplicitTop (see page 5822)	Specifies the explicit vertical pixel coordinate of the top edge of a component relative to its parent.
R	ExplicitWidth (see page 5822)	Specifies the explicit horizontal size of the control in pixels.
R	Floating (see page 5823)	Indicates whether the control is floating.

	FloatingDockSiteClass (see page 5823)	Specifies the class of the temporary control that hosts the control when it is floating.
R	Handle (see page 6207)	Provides access to the underlying Windows screen object for the control.
	HostDockSite (see page 5829)	Specifies the control in which the control is docked.
	LRDockWidth (see page 5831)	Specifies the width of the control when it is docked horizontally.
R	MouseInClient (see page 6209)	This is MouseInClient, a member of class TWinControl.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Padding (see page 6209)	Specifies the padding of a control.
	Parent (see page 5832)	Indicates the parent of the control.
	ParentWindow (see page 6210)	Reference to parent's underlying control.
	ShowHint (see page 5840)	Determines whether the control displays a Help Hint (see page 5827) when the mouse pointer rests momentarily on the control.
R	Showing (see page 6210)	Indicates whether the control is showing on the screen.
	TabStop (see page 6211)	Determines if the user can tab to a control.
	TBDockHeight (see page 5842)	Specifies the height of the control when it is docked vertically.
	UndockHeight (see page 5845)	Specifies the height of the control when it is floating.
	UndockWidth (see page 5846)	Specifies the width of the control when it is floating.
	UseDockManager (see page 6212)	Specifies whether the docking manager is used in drag-and-dock operations.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
R	VisibleDockClientCount (see page 6212)	Specifies the number of visible controls that are docked on the windowed control.

Published Events

	Name	Description
	OnAlignInsertBefore (see page 12980)	Occurs when an object with custom alignment is aligned.
	OnAlignPosition (see page 12980)	Occurs when an object with custom alignment is aligned.

Published Properties

	Name	Description
	AlignWithMargins (see page 5802)	Indicates whether a control should be constrained by margins.
	Caption (see page 12973)	Specifies a text string that identifies the control to the user.
	Cursor (see page 5815)	Specifies the image used to represent the mouse pointer when it passes into the region covered by the control.
	Height (see page 12976)	Specifies the vertical size of the control in pixels.
	HelpContext (see page 5826)	Numeric ID for control's context-sensitive help topic
	HelpKeyword (see page 5826)	Keyword for control's context-sensitive help topic
	HelpType (see page 5827)	Indicates whether the control's context sensitive help topic is identified by context ID or by keyword.
	Hint (see page 5827)	Contains the text string that can appear when the user moves the mouse over the control.
	Left (see page 5830)	Specifies the horizontal coordinate of the left edge of a component relative to its parent.
	Margins (see page 5831)	Specifies the margins for the control.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	TabOrder (see page 12977)	Indicates the position of the control in its parent's tab order.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Top (see page 5844)	Specifies the Y coordinate of the top left corner of a control, relative to its parent or containing control in pixels.
	Visible (see page 12978)	Determines whether the component appears onscreen.
	Width (see page 12979)	Specifies the horizontal size of the control or form in pixels.

68.1.28.2 TPage.Create Constructor

Creates an instance of TCustomControl.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TPage(TComponent * AOwner);
```

Description

Calling Create constructs and initializes an instance of TCustomControl. However, you should never attempt to instantiate a TCustomControl. This class is intended solely as a base class from which other control classes descend and you should only call Create to instantiate one of these descendants. Controls placed on forms at design time are created automatically.

After calling the inherited constructor, Create initializes the control, including the following property settings:

Initializes a TCanvas object for its Canvas property.

When overriding Create, always call the inherited Create method first, then proceed with the control's initialization. Remember to specify the override directive when overriding the Create method.

Note: If a component's constructor allocates resources or memory, also override the destructor to free those resources.

See Also

Create (see page 6123)

Destroy (see page 5919)

Canvas (see page 5921)

Owner (see page 2807)

68.1.28.3 TPage Methods

The methods of the TPage class are listed here.

Protected Methods

	Name	Description
	Paint (see page 12972)	Renders the image of a custom control.
	ReadState (see page 12973)	Prepares the control for having its properties assigned values from a stream.

68.1.28.3.1 TPage.Paint Method

Renders the image of a custom control.

Pascal

```
procedure Paint; override;
```

C++

```
virtual __fastcall Paint();
```

Description

The Paint method for TCustomControl does nothing other than provide the interface for a method that responds to WM_PAINT messages. Paint is called by the PaintWindow method, after that method has supplied the Canvas with the handle to a device context. When creating a custom control, always override Paint to draw the image of the control.

Tip: To determine which portions of the control's canvas need to be repainted when Paint is called, use the ClipRect property of the canvas.

See Also

Canvas (see page 5921)

PaintWindow (see page 5920)

GetDeviceContext (see page 6155)

ClipRect (see page 14486)

68.1.28.3.2 TPage.ReadState Method

Prepares the control for having its properties assigned values from a stream.

Pascal

```
procedure ReadState(Reader: TReader); override;
```

C++

```
virtual __fastcall ReadState(TReader Reader);
```

Description

Override ReadState to change the preparations the control makes as it readies itself to have its property values assigned from a stream. For example, a control might destroy temporary internal data structures or objects before new instances are loaded from the stream. Be sure to include a call to the inherited method when overriding ReadState.

As implemented in TWinControl, ReadState disables control alignment until all the child controls have been read from the stream, calls the inherited ReadState method, and re-enables the alignment of all the controls. The method then builds the tab order list of controls and synchronizes its visibility with that of its parent control.

See Also

Parent (see page 5832)

ReadState (see page 5778)

68.1.28.4 TPage Properties

The properties of the TPage class are listed here.

Published Properties

	Name	Description
	Caption (see page 12973)	Specifies a text string that identifies the control to the user.
	Height (see page 12976)	Specifies the vertical size of the control in pixels.
	TabOrder (see page 12977)	Indicates the position of the control in its parent's tab order.
	Visible (see page 12978)	Determines whether the component appears onscreen.
	Width (see page 12979)	Specifies the horizontal size of the control or form in pixels.

68.1.28.4.1 TPage.Caption Property

Specifies a text string that identifies the control to the user.

Pascal

```
property Caption: TCaption;
```

C++

```
__property TCaption Caption;
```

Description

Use Caption to specify the text string that labels the control.

To underline a character in a Caption that labels a component, include an ampersand (&) before the character. This type of character is called an accelerator character. The user can then select the component by pressing Alt while typing the underlined character. To display an ampersand character in the caption, use two ampersands (&&).

Note: Controls that display text use either the Caption property or the Text property to specify the text value. Which property is used depends on the type of control. In general, Caption is used for text that appears as a window title or label, while Text is used for text that appears as the content of a control.

C++ Examples:

```
/*
The following code keeps the size of the label control
constant, even though the length of the label's caption
changes. As a result, the caption of the label is probably
too long to display in the label when the user clicks the
button:
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  Label1->AutoSize = false;
  Label1->Caption = "This string is too long as the caption of this label";
}
/*
This example requires a TPageControl populated by several
TabSheets, a TEdit and a TButton. When the button is
clicked, the caption of the active tab changes to that of
the TEdit.  These lines of code could also be written:
PageControl1.ActivePage.Caption := Edit1.Text;
This would make a TTabSheet variable unnecessary since
PageControl1.->ActivePage is already of type TTabSheet.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  TTabSheet *sheet = PageControl1->ActivePage;
  sheet->Caption = Edit1->Text;
}
/*
This example creates a ToolBar and adds ToolButtons to it.
Include ComCtlrs in the uses clause.
*/
#include <comctrls.hpp>

void AddButtons(TToolBar *toolBar, TStringList *captions)
{
  for (int i = 0; i < captions->Count; i++)
  {
    TToolButton *button = new TToolButton(toolBar);
    button->Parent = toolBar;
    button->Caption = captions->Strings[i];
    if (button->Caption == "|")
      button->Style = tbsSeparator;
    else
      button->Style = tbsButton;
  }
}

TToolBar *myToolBar;

void __fastcall TForm1::FormCreate(TObject *Sender)
```

```
{
  myToolBar = new TToolBar(this);
  myToolBar->Parent = this;
  TStringList *captions = new TStringList();
  captions->Add("New");
  captions->Add("Save");
  captions->Add("|");
  captions->Add("Cut");
  captions->Add("Copy");
  captions->Add("Paste");
  AddButtons(myToolBar, captions);
  delete captions;
  myToolBar->ShowCaptions = True;
  myToolBar->Height = 40;
}

void __fastcall TForm1::FormDestroy(TObject *Sender)
{
  for (int I = myToolBar->ButtonCount - 1; I >= 0; I--)
    delete myToolBar->Buttons[I];
  delete myToolBar;
}
```

Delphi Examples:

```
{
The following code keeps the size of the label control
constant, even though the length of the label's caption
changes. As a result, the caption of the label is probably
too long to display in the label when the user clicks the
button:
}
procedure TForm1.Button1Click(Sender: TObject);
begin
  Label1.AutoSize := False;
  Label1.Caption :=
    'This string is too long as the caption of this label';
end;
{
This example requires a TPageControl populated by several
TabSheets, a TEdit and a TButton. When the button is
clicked, the caption of the active tab changes to that of
the TEdit.  These lines of code could also be written:
PageControl1.ActivePage.Caption := Edit1.Text;
This would obviate the need for a TTabSheet variable since
PageControl1.->ActivePage is already of type TTabSheet.
}
procedure TForm1.Button1Click(Sender: TObject);
var
  sheet: TTabSheet;
begin
  sheet := PageControl1.ActivePage;
  sheet.Caption := Edit1.Text;
end;
{
This example creates a ToolBar and adds ToolButtons to it.
Include ComCtlrs in the uses clause.
}
procedure AddButtons(ToolBar: TToolBar;
  Const ButtonCaptions: array of String);
var
  I: Integer;
begin
  for I := 0 to High(ButtonCaptions) do
    begin
      with TToolButton.Create(ToolBar) do
      begin
```

```
          Parent := ToolBar;
          Caption := ButtonCaptions[I];
          if (ButtonCaptions[I] = '|') then
            Style := tbsSeparator
          else
            Style := tbsButton;
        end;
      end;
  end;

  procedure TForm1.FormCreate(Sender: TObject);
  begin
    ToolBar1 := TToolBar.Create(Self);
    ToolBar1.Parent := Self;
    AddButtons(ToolBar1, ['New', 'Save', '|', 'Cut', 'Copy', 'Paste']);
    ToolBar1.ShowCaptions := True;
    ToolBar1.Height := 40;
  end;

  procedure TForm1.FormDestroy(Sender: TObject);
  var
    I: Integer;
  begin
    for I := ToolBar1.ButtonCount - 1 downto 0 do
      ToolBar1.Buttons[I].Free;
    ToolBar1.Free;
  end;
```

68.1.28.4.2 TPage.Height Property

Specifies the vertical size of the control in pixels.

Pascal

```
property Height: Integer;
```

C++

```
__property int Height;
```

Description

Use the Height property to read or change the height of the control.

C++ Examples:

```
/*
This example needs only a blank form.  Three Rich Edit
controls are placed vertically on the form, each contain a
line of text, and the second form has HideSelection set to
false.  Try tabbing between the three Rich Edit controls and
observe the effect on the selected text.
*/
#include <ComCtrls.hpp>

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int I = 0; I <= 2; I++)
  {
    TRichEdit *pRich = new TRichEdit(this);
    pRich->Parent = this;
    pRich->Top = pRich->Height * I;
    pRich->Text = "This text will take the focus.";
    pRich->SelStart = 0;
    pRich->SelLength = pRich->Text.Length();
    if (I == 1)
      pRich->HideSelection = false;
```

```
  }
}
```

Delphi Examples:

```
{
HideSelection, Height example
This example needs only a blank form. Three Rich Edit
controls are placed vertically on the form, each contain a
line of text, and the second form has HideSelection set to
false.  Try tabbing between the three Rich Edit controls and
observe the effect on the selected text.
}
uses ComCtrls;

procedure TForm1.FormCreate(Sender: TObject);
var
  I: Integer;
begin
  for I := 0 to 2 do
    with TRichEdit.Create(Self) do
    begin
      Parent := Self;
      Top := Height * I;
      Text := 'This text will take the focus.';
      SelStart := 0;
      SelLength := Length(Text);
      if (I = 1) then
        HideSelection := False;
    end;
end;
```

Using TDBListBox and TDBComboBox

68.1.28.4.3 TPage.TabOrder Property

Indicates the position of the control in its parent's tab order.

Pascal

```
property TabOrder: TTabOrder;
```

C++

```
__property TTabOrder TabOrder;
```

Description

TabOrder is the order in which child windows are visited when the user presses the Tab key. The control with the TabOrder value of 0 is the control that has the focus when the form first appears.

Initially, the tab order is always the order in which the controls were added to the form. The first control added to the form has a TabOrder value of 0, the second is 1, the third is 2, and so on. Change this by changing the TabOrder property.

Each control has a unique tab-order value within its parent. If you change the TabOrder property value of one control to be the same as the value of a second control, the TabOrder value for all the other controls changes. For example, suppose a control is sixth in the tab order. If you change the control's TabOrder property value to 3 (making the control fourth in the tab order), the control that was originally fourth in the tab order now becomes fifth, and the control that was fifth becomes sixth.

Assigning TabOrder a value greater than the number of controls contained in the parent control moves the control to the end of

the tab order. The control does not take on the assigned value of TabOrder, but instead is given the number that assures the control is the last in the tab order.

Note: TabOrder is meaningful only if the TabStop property is true and if the control has a parent. (The TabOrder property of a form is not used unless the form is the child of another form.) A control with a TabOrder of -1 has no parent, and therefore cannot be reached by pressing the Tab key. To remove a parented control from the Tab order, set its TabStop property to false.

FindNextControl (see page 6149)

TabStop (see page 6211)

68.1.28.4.4 TPage.Visible Property

Determines whether the component appears onscreen.

Pascal

```
property Visible: Boolean;
```

C++

```
__property Boolean Visible;
```

Description

Use the Visible property to control the visibility of the control at runtime. If Visible is true, the control appears. If Visible is false, the control is not visible.

Calling the Show method sets the control's Visible property to true. Calling the Hide method sets it to false.

C++ Examples:

```
/*
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
*/
void __fastcall TForm1::PageControl1Change(TObject *Sender)
{
  CheckBox1->Checked = PageControl1->ActivePage->Visible;
}

void __fastcall TForm1::CheckBox1Click(TObject *Sender)
{
  PageControl1->ActivePage->Visible = CheckBox1->Checked;
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < 10; i++)
  {
    TTabSheet *pPage = new TTabSheet(this);
    pPage->PageControl = PageControl1;
    pPage->Caption = AnsiString("Page") + IntToStr(i);
    TEdit *pEdit = new TEdit(this);
    pEdit->Parent = pPage;
    pEdit->Left = random(pPage->ClientWidth - pEdit->Width);
    pEdit->Top = random(pPage->ClientHeight - pEdit->Height);
  }
  PageControl1Change(Sender);
}
```

Delphi Examples:

```
{
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
}
procedure TForm1.CheckBox1Click(Sender: TObject);
begin
  PageControl1.ActivePage.Visible := CheckBox1.Checked;
end;

procedure TForm1.PageControl1Change(Sender: TObject);
begin
  CheckBox1.Checked := PageControl1.ActivePage.Visible;
end;

procedure TForm1.FormCreate(Sender: TObject);
var
  i: Integer;
begin
  for i := 0 to 9 do
    with TTabSheet.Create(Self) do
    begin
      PageControl := PageControl1;
      Caption := 'TabSheet' + IntToStr(i);
      with TEdit.Create(Self) do
      begin
        Parent := PageControl1.Pages[i];
        Left := Random(PageControl1.ActivePage.ClientWidth - Width);
        Top := Random(PageControl1.ActivePage.ClientHeight - Height);
      end;
    end;
    PageControl1Change(Sender);
end;
```

68.1.28.4.5 TPage.Width Property

Specifies the horizontal size of the control or form in pixels.

Pascal

```
property Width: Integer;
```

C++

```
__property int Width;
```

Description

Use the Width property to read or change the width of the control.

Note: For tab sheet controls, changing this property at runtime has no effect.

ClientWidth (see page 5811)

Height (see page 5825)

Left (see page 5830)

68.1.28.5 TPage Events

The events of the TPage class are listed here.

Published Events

	Name	Description
	OnAlignInsertBefore (see page 12980)	Occurs when an object with custom alignment is aligned.
	OnAlignPosition (see page 12980)	Occurs when an object with custom alignment is aligned.

68.1.28.5.1 TPage.OnAlignInsertBefore Event

Occurs when an object with custom alignment is aligned.

Pascal

```
property OnAlignInsertBefore: TAlignInsertBeforeEvent;
```

C++

```
__property TAlignInsertBeforeEvent OnAlignInsertBefore;
```

Description

OnAlignInsertBefore occurs for each pair of child controls with an Align property of **alCustom**.

It can determine the order in which custom-aligned child controls are placed. OnAlignInsertBefore returns true if **C2** should be presented before **C1**, and false otherwise. It holds a TAlignInsertBeforeEvent type.

CustomAlignInsertBefore triggers the OnAlignInsertBefore event. If this event is defined, CustomAlignInsertBefore returns the value returned by OnAlignInsertBefore. Defining this event allows users to define the order of control alignment without overriding CustomAlignInsertBefore.

See Also

CustomAlignInsertBefore (see page 6137)

Align (see page 5798)

TAlignInsertBeforeEvent (see page 6293)

68.1.28.5.2 TPage.OnAlignPosition Event

Occurs when an object with custom alignment is aligned.

Pascal

```
property OnAlignPosition: TAlignPositionEvent;
```

C++

```
__property TAlignPositionEvent OnAlignPosition;
```

Description

OnAlignPosition occurs when child controls with an Align property of **alCustom** are aligned.

CustomAlignPosition triggers the OnAlignPosition event. If this event is defined, CustomAlignPosition uses the alignment parameters it obtains from OnAlignPosition. Defining this event allows users to set the alignment parameters without overriding CustomAlignPosition. It holds a TAlignPositionEvent type.

These are the parameters:

Parameter	Meaning
NewLeft | NewTop | NewWidth | NewHeight	Location and size of child control, as determined by container's size and the Anchors TControl_Anchors constraints for the control. OnAlignPosition can modify these values to reposition the control.
AlignRect	The client area in which the control is aligned. OnAlignPosition can modify this value.
AlignInfo	Alignment information in a TAlignInfo.
As implemented in TWinControl, OnAlignPosition does nothing.

CustomAlignPosition (see page 6138)

Align (see page 5798)

Anchors (see page 5802)

TAlignInfo (see page 6269)

TAlignPositionEvent (see page 6293)

68.1.29 TPaintBox Class

TPaintBox provides a canvas that applications can use for rendering an image.

Class Hierarchy

Pascal

```
TPaintBox = class(TGraphicControl);
```

C++

```
class TPaintBox : public TGraphicControl;
```

File

ExtCtrls

Description

Use TPaintBox to add custom images to a form. Unlike TImage (see page 12777), which displays an image that is stored in a bitmap, icon, or metafile, TPaintBox requires an application to draw the image directly on a canvas. Use the OnPaint (see page 13028) event handler to draw on the paint box's Canvas (see page 12994), the drawing surface of the paint box.

Graphic Controls

Paint Boxes

68.1.29.1 TPaintBox Members

The following tables list the members exposed by TPaintBox.

Protected Events

	Name	Description
	OnCanResize (see page 5851)	Occurs when an attempt is made to resize the control.
	OnConstrainedResize (see page 5853)	Adjust resize constraints.
	OnMouseWheel (see page 5869)	Occurs when the mouse wheel is rotated.
	OnMouseWheelDown (see page 5869)	Occurs when the mouse wheel is rotated downward.
	OnMouseWheelUp (see page 5870)	Occurs when the mouse wheel is rotated upward.
	OnResize (see page 5870)	Occurs immediately after the control is resized.

Protected Fields

	Name	Description
	FAnchorMove (see page 5733)	This is FAnchorMove, a member of class TControl.
	FAnchorOrigin (see page 5734)	This is FAnchorOrigin, a member of class TControl.
	FAnchorRules (see page 5734)	This is FAnchorRules, a member of class TControl.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FExplicitHeight (see page 5734)	This is FExplicitHeight, a member of class TControl.
	FExplicitLeft (see page 5734)	This is FExplicitLeft, a member of class TControl.
	FExplicitTop (see page 5734)	This is FExplicitTop, a member of class TControl.
	FExplicitWidth (see page 5735)	This is FExplicitWidth, a member of class TControl.
	FOriginalParentSize (see page 5735)	This is FOriginalParentSize, a member of class TControl.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	ActionChange (see page 5737)	Responds when the action associated with the control changes.
	AdjustSize (see page 5738)	Sets the size of the control as determined by the AutoSize (see page 5803) property.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	AssignTo (see page 5739)	Overrides the inherited AssignTo function to enable assignments to TAction objects.
	BeginAutoDrag (see page 5739)	Begin Automatic Drag.
	CalcCursorPos (see page 5741)	This is CalcCursorPos, a member of class TControl.
V	CanAutoSize (see page 5741)	Indicates whether the control can resize itself automatically to accommodate its contents.
V	CanResize (see page 5742)	OnCanResize (see page 5851) event dispatcher.
	Changed (see page 5742)	Sends a CM_CHANGED (see page 6330) message to the control.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	ChangeScale (see page 5743)	Rescaling event dispatcher.
	Click (see page 5743)	Respond to user click.
V	ConstrainedResize (see page 5746)	Notify control of resize with constraints.

	DblClick (see page 5747)	OnDblClick (see page 5854) event dispatcher.
	DefaultDockImage (see page 5747)	Handles the painting and erasing of a dock image.
	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	DefineProperties (see page 5748)	Provides methods to read and write the IsControl (see page 5829) property to a stream such as a form file.
	DesignWndProc (see page 5749)	This is DesignWndProc, a member of class TControl.
	DockTrackNoTarget (see page 5749)	Handles dragging of the control over an invalid docking target.
	DoContextPopup (see page 5750)	OnContextPopup (see page 5854) event dispatcher.
	DoDock (see page 5750)	Docking event dispatcher.
	DoEndDock (see page 5750)	OnEndDock (see page 5859) event dispatcher.
	DoEndDrag (see page 5751)	OnEndDrag (see page 5860) event dispatcher.
	DoMouseWheel (see page 5751)	Processes mouse wheel motion.
	DoMouseWheelDown (see page 5752)	OnMouseWheelDown (see page 5869) event dispatcher.
	DoMouseWheelUp (see page 5752)	OnMouseWheelUp (see page 5870) event dispatcher.
	DoStartDock (see page 5753)	OnStartDock (see page 5871) event dispatcher.
	DoStartDrag (see page 5753)	OnStartDrag (see page 5871) event dispatcher.
	DragCanceled (see page 5754)	Provides the interface for a method that responds to the cancellation of a drag.
	DragOver (see page 5755)	OnDragOver (see page 5857) event dispatcher.
	DrawDragDockImage (see page 5755)	Draws the dock image for the control.
	EraseDragDockImage (see page 5757)	Erases the dock image for the control.
	GetAction (see page 5758)	This is GetAction, a member of class TControl.
	GetActionLinkClass (see page 5758)	Returns the appropriate action link class that is associated with the control class.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetClientOrigin (see page 5758)	Returns the screen coordinates of the top-left corner of the control's client area.
	GetClientRect (see page 5759)	Returns a rectangle defining the client area of the control.
	GetDeviceContext (see page 5760)	Returns a device context for the control.
	GetDockEdge (see page 5763)	Returns the edge on which another control should be docked when it is dragged over the control.
	GetDragImages (see page 5763)	Returns the control's image list containing the image to be displayed while dragging.
	GetEnabled (see page 5763)	Returns the value of the Enabled (see page 5821) property.
	GetFloating (see page 5764)	Returns the value of the Floating (see page 5823) property.
	GetFloatingDockSiteClass (see page 5764)	Returns the class used for the control when it is floating.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetPalette (see page 5765)	Returns the handle to a palette for use by the control.
	GetPopupMenu (see page 5765)	Returns the pop-up menu associated with the control.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Loaded (see page 5771)	Initializes the control after it is loaded from a stream.
	MouseActivate (see page 5773)	This is MouseActivate, a member of class TControl.
	MouseDown (see page 5773)	OnMouseDown (see page 5862) event dispatcher.
	MouseMove (see page 5773)	Respond to mouse moving over control area..
	MouseUp (see page 5774)	OnMouseUp (see page 5867) event dispatcher.
	Notification (see page 2783)	Forwards notification messages to all owned components.

	Notification (see page 5775)	Responds to notifications that components are being created or destroyed.
	Paint (see page 12989)	Generates an OnPaint (see page 13028) event.
	PaletteChanged (see page 5775)	Responds to changes in the system's palette by realizing the control's palette.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	PositionDockRect (see page 5777)	Positions the docking rectangle according to the current drag-and-dock state.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	ReadState (see page 5778)	Prepares the control for having its properties assigned values read from a stream.
	RequestAlign (see page 5780)	Instructs the parent of a control to reposition the control, enforcing its Align (see page 5798) property.
	Resize (see page 5780)	Respond to control resize.
	ScaleConstraints (see page 5781)	This is ScaleConstraints, a member of class TControl.
	SendCancelMode (see page 5781)	Cancels the modal state of the control.
	SendDockNotification (see page 5782)	Sends a Windows message to the control's host dock site.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetAutoSize (see page 5783)	This is SetAutoSize, a member of class TControl.
	SetBiDiMode (see page 5783)	Sets the control's bi-directional mode.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDragMode (see page 5785)	Sets the drag mode for the control.
	SetEnabled (see page 5785)	Sets the value of the Enabled (see page 5821) property.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetName (see page 5785)	Sets the name of the control.
	SetParent (see page 5786)	Sets the parent of the control.
	SetParentBiDiMode (see page 5786)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	SetParentComponent (see page 5787)	Sets the parent for the control.
	SetZOrder (see page 5788)	Repositions the control in its parent's control list, thereby changing position onscreen.
	UpdateBoundsRect (see page 5789)	Changes the Top (see page 5844), Left (see page 5830), Width (see page 5849), and Height (see page 5825) properties of the control, but doesn't update its screen image and bypasses all resize events.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateExplicitBounds (see page 5789)	This is UpdateExplicitBounds, a member of class TControl.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	VisibleChanging (see page 5791)	Provides the interface for a method that responds to changes in the control's visibility.
	WndProc (see page 5791)	Provides specific message responses for the control.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	ActionLink (see page 5798)	Contains the action link object associated with the control.
	AutoSize (see page 5803)	Specifies whether the control sizes itself automatically to accommodate its contents.
	Caption (see page 5806)	Specifies a text string that identifies the control to the user.

	DesktopFont (see page 5818)	Specifies whether the control uses the Windows icon font when writing text.
	IsControl (see page 5829)	Determines whether a form stores its form-specific properties to a stream.
	MouseCapture (see page 5831)	Indicates whether the control has "captured" mouse events.
	ParentBiDiMode (see page 5833)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	ScalingFlags (see page 5840)	Reflects which attributes of the control have been scaled.
	Text (see page 5842)	Contains a text string associated with the control.
	WheelAccumulator (see page 5849)	Accumulates mouse wheel rotations.
	WindowText (see page 5850)	Contains the text string of the control.

Public Events

	Name	Description
	WindowProc (see page 5872)	Points to the window procedure that responds to messages sent to the control.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	BeginDrag (see page 5740)	Starts the dragging of a control.
	BringToFront (see page 5740)	Puts the control in front of all other controls in its parent control.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	ClientToParent (see page 5744)	Translates client coordinates to parent coordinates.
	ClientToScreen (see page 5744)	Translates a given point from client area coordinates to global screen coordinates.
V	Create (see page 12989)	Creates an instance of TPaintBox (see page 12981).
V	DefaultHandler (see page 5748)	Provides message handling for all messages that do not have specific handlers.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 5732)	Destroys an instance of TControl (see page 5724).
V	Destroy (see page 6052)	Destroys an instance of TGraphicControl (see page 6044).
V	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Dock (see page 5749)	Used internally to dock the control.
	DragDrop (see page 5754)	OnDragDrop (see page 5855) event dispatcher.
	Dragging (see page 5754)	Indicates whether a control is being dragged.
	DrawTextBiDiModeFlags (see page 5756)	Returns the text flags that reflect the current setting of the BiDiMode (see page 5803) property.
	DrawTextBiDiModeFlagsReadingOnly (see page 5756)	Returns the text flag to add that indicates whether the control's text should read from right to left.
	EndDrag (see page 5757)	Stops a control from being dragged any further.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.

	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetControlsAlignment (see page 5759)	Indicates how text is aligned within the control.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 5765)	Returns the parent of the control.
	GetTextBuf (see page 5766)	Retrieves the control's text, copies it into a buffer, and returns the number of characters copied.
	GetTextLen (see page 5767)	Returns the length of the control's text.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 5768)	Indicates whether the control has a parent.
	Hide (see page 5769)	Makes the control invisible.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
V	InitiateAction (see page 5769)	Calls the action link's Update (see page 5789) method if the control is associated with an action link.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
V	Invalidate (see page 5770)	Completely repaint control.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	IsRightToLeft (see page 5770)	Indicates whether the control should be reversed right to left.
	ManualDock (see page 5771)	Docks the control.
	ManualFloat (see page 5772)	Undocks the control.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	MouseWheelHandler (see page 5774)	Dispatches messages received from a mouse wheel.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	ParentToClient (see page 5776)	Translate parent coordinates to client coordinates.
	Perform (see page 5776)	Responds as if the control received a specified Windows message.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	Refresh (see page 5779)	Repaints the control on the screen.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	Repaint (see page 5779)	Forces the control to repaint its image on the screen.
	ReplaceDockedControl (see page 5779)	Docks the control in the place where another control is already docked.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	ScreenToClient (see page 5781)	Converts the screen coordinates of a specified point on the screen to client coordinates.

	SendToBack (see page 5782)	Puts a windowed control behind all other windowed controls, or puts a non-windowed control behind all other non-windowed controls.
V	SetBounds (see page 5783)	Sets the Left (see page 5830), Top (see page 5844), Width (see page 5849), and Height (see page 5825) properties all at once.
	SetDesignVisible (see page 5784)	Makes a control visible at design time.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	SetTextBuf (see page 5787)	Sets the text of the control.
	Show (see page 5788)	Makes a control visible.
V	Update (see page 5789)	Processes any pending paint messages immediately.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	UseRightToLeftAlignment (see page 5790)	Specifies whether the control's alignment should be reversed right-to-left.
	UseRightToLeftReading (see page 5790)	Specifies whether the control is using a right-to-left reading order.
	UseRightToLeftScrollBar (see page 5791)	Specifies whether the vertical scroll bar appears on the left side of the control.

Public Properties

	Name	Description
	Action (see page 5797)	Designates the action associated with the control.
	BiDiMode (see page 5803)	Specifies the bi-directional mode for the control.
	BoundsRect (see page 5803)	Specifies the bounding rectangle of the control, expressed in the coordinate system of the parent control.
	Canvas (see page 12994)	Provides the drawing surface used by the graphic control.
	ClientHeight (see page 5808)	Specifies the height of the control's client area in pixels.
R	ClientOrigin (see page 5809)	Specifies the screen coordinates (in pixels) of the top left corner of a control's client area.
R	ClientRect (see page 5810)	Specifies the size (in pixels) of a control's client area.
	ClientWidth (see page 5811)	Specifies the horizontal size of the control's client area in pixels.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	ControlState (see page 5813)	Indicates the current state of a control at runtime.
	ControlStyle (see page 5814)	Determines style characteristics of the control.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DockOrientation (see page 5818)	Specifies how the control is docked relative to other controls docked in the same parent.
R	ExplicitHeight (see page 5821)	Specifies the explicit vertical size of the control in pixels.
R	ExplicitLeft (see page 5822)	Specifies the explicit horizontal pixel coordinate of the left edge of a component relative to its parent.
R	ExplicitTop (see page 5822)	Specifies the explicit vertical pixel coordinate of the top edge of a component relative to its parent.
R	ExplicitWidth (see page 5822)	Specifies the explicit horizontal size of the control in pixels.
R	Floating (see page 5823)	Indicates whether the control is floating.
	FloatingDockSiteClass (see page 5823)	Specifies the class of the temporary control that hosts the control when it is floating.
	HostDockSite (see page 5829)	Specifies the control in which the control is docked.
	LRDockWidth (see page 5831)	Specifies the width of the control when it is docked horizontally.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Parent (see page 5832)	Indicates the parent of the control.
	TBDockHeight (see page 5842)	Specifies the height of the control when it is docked vertically.
	UndockHeight (see page 5845)	Specifies the height of the control when it is floating.
	UndockWidth (see page 5846)	Specifies the width of the control when it is floating.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Events

	Name	Description
	OnClick (see page 13011)	Occurs when the user clicks the control.
	OnContextPopup (see page 13013)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnDblClick (see page 13014)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDragDrop (see page 13014)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 13016)	Occurs when the user drags an object over a control.
	OnEndDock (see page 13019)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 13019)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnMouseActivate (see page 13020)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 13021)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseEnter (see page 13023)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 13024)	Occurs when the user moves the mouse outside of a control.
	OnMouseMove (see page 13024)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 13026)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnPaint (see page 13028)	OnPaint occurs when the paintbox receives a Windows paint message.
	OnStartDock (see page 13030)	Occurs when the user begins to drag a control with a DragKind of dkDock.
	OnStartDrag (see page 13031)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.

Published Properties

	Name	Description
	Align (see page 12990)	Determines how the control aligns within its container (parent control).
	AlignWithMargins (see page 5802)	Indicates whether a control should be constrained by margins.
	Anchors (see page 12994)	Specifies how the control is anchored to its parent.
	Color (see page 12996)	Specifies the background color of the control.
	Constraints (see page 12997)	Specifies the size constraints for the control.
	Cursor (see page 5815)	Specifies the image used to represent the mouse pointer when it passes into the region covered by the control.
	DragCursor (see page 12998)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 12998)	Specifies whether the control is being dragged normally or for docking.
	DragMode (see page 12998)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	Enabled (see page 13000)	Controls whether the control responds to mouse, keyboard, and timer events.
	Font (see page 13000)	Controls the attributes of text written on or in the control.
	Height (see page 5825)	Specifies the vertical size of the control in pixels.
	HelpContext (see page 5826)	Numeric ID for control's context-sensitive help topic
	HelpKeyword (see page 5826)	Keyword for control's context-sensitive help topic
	HelpType (see page 5827)	Indicates whether the control's context sensitive help topic is identified by context ID or by keyword.
	Hint (see page 5827)	Contains the text string that can appear when the user moves the mouse over the control.
	Left (see page 5830)	Specifies the horizontal coordinate of the left edge of a component relative to its parent.
	Margins (see page 5831)	Specifies the margins for the control.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	ParentColor (see page 13001)	Determines where a control looks for its color information.
	ParentFont (see page 13002)	Determines where a control looks for its font information.
	ParentShowHint (see page 13002)	Determines where a control looks to find out if its Help Hint should be shown.
	PopupMenu (see page 13003)	Identifies the pop-up menu associated with the control.

	ShowHint (see page 13008)	Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Top (see page 5844)	Specifies the Y coordinate of the top left corner of a control, relative to its parent or containing control in pixels.
	Visible (see page 13009)	Determines whether the component appears onscreen.
	Width (see page 5849)	Specifies the horizontal size of the control or form in pixels.

68.1.29.2 TPaintBox.Create Constructor

Creates an instance of TPaintBox (see page 12981).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TPaintBox(TComponent * AOwner);
```

Description

Call Create to instantiate a TPaintBox (see page 12981) object at runtime. TPaintBox (see page 12981) objects added to forms at design time are created automatically.

Call Create to instantiate a TImage (see page 12777) object at runtime. Images placed on forms at design time are created automatically.

AOwner is the component that is responsible for freeing the paintbox instance. It becomes the value of the Owner property.

See Also

Owner (see page 2807)

68.1.29.3 TPaintBox Methods

The methods of the TPaintBox class are listed here.

Protected Methods

	Name	Description
	Paint (see page 12989)	Generates an OnPaint (see page 13028) event.

68.1.29.3.1 TPaintBox.Paint Method

Generates an OnPaint (see page 13028) event.

Pascal

```
procedure Paint; override;
```

C++

```
virtual __fastcall Paint();
```

Description

Paint responds to WM_PAINT messages from Windows by initializing the canvas and calling the OnPaint (see page 13028) event handler if it is assigned.

See Also

OnPaint (see page 13028)

68.1.29.4 TPaintBox Properties

The properties of the TPaintBox class are listed here.

Public Properties

	Name	Description
	Canvas (see page 12994)	Provides the drawing surface used by the graphic control.

Published Properties

	Name	Description
	Align (see page 12990)	Determines how the control aligns within its container (parent control).
	Anchors (see page 12994)	Specifies how the control is anchored to its parent.
	Color (see page 12996)	Specifies the background color of the control.
	Constraints (see page 12997)	Specifies the size constraints for the control.
	DragCursor (see page 12998)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 12998)	Specifies whether the control is being dragged normally or for docking.
	DragMode (see page 12998)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	Enabled (see page 13000)	Controls whether the control responds to mouse, keyboard, and timer events.
	Font (see page 13000)	Controls the attributes of text written on or in the control.
	ParentColor (see page 13001)	Determines where a control looks for its color information.
	ParentFont (see page 13002)	Determines where a control looks for its font information.
	ParentShowHint (see page 13002)	Determines where a control looks to find out if its Help Hint should be shown.
	PopupMenu (see page 13003)	Identifies the pop-up menu associated with the control.
	ShowHint (see page 13008)	Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.
	Visible (see page 13009)	Determines whether the component appears onscreen.

68.1.29.4.1 TPaintBox.Align Property

Determines how the control aligns within its container (parent control).

Pascal

```
property Align: TAlign;
```

C++

```
__property TAlign Align;
```

Description

Use Align to align a control to the top, bottom, left, or right of a form or panel and have it remain there even if the size of the form, panel, or component that contains the control changes. When the parent is resized, an aligned control also resizes so that it continues to span the top, bottom, left, or right edge of the parent.

For example, to use a panel component with various controls on it as a tool palette, change the panel's Align value to alLeft. The value of alLeft for the Align property of the panel guarantees that the tool palette remains on the left side of the form and always equals the client height of the form.

The default value of Align is alNone, which means a control remains where it is positioned on a form or panel.

Tip: If Align is set to alClient, the control fills the entire client area so that it is impossible to select the parent form by clicking on it. In this case, select the parent by selecting the control on the form and pressing Esc, or by using the Object Inspector.

Any number of child components within a single parent can have the same Align value, in which case they stack up along the edge of the parent. The child controls stack up in z-order. To adjust the order in which the controls stack up, drag the controls into their desired positions.

Note: To cause a control to maintain a specified relationship with an edge of its parent, but not necessarily lie along one edge of the parent, use the Anchors property instead.

C++ Examples:

```
/*
This example shows how to use a splitter to divide a form
into resizable panes.  All objects on the form are created
dynamically in the OnCreate event handler of the form. To
run this example, add ExtCtrls and FileCtrl to the uses
clause of the form’s implementation section.
Note that when creating a splitter dynamically at runtime,
it is important to set its position to the appropriate side
of the control it will resize.
*/
#include <Extctrls.hpp>
#include <Filectrl.hpp>

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  TSplitter* ps = new TSplitter(Form1);
  TFileListBox* pflb = new TFileListBox(Form1);
  TDirectoryListBox* pdlb = new TDirectoryListBox(Form1);

  // Line up the directory list box on the left of the form.
  pdlb->Parent = Form1;
  pdlb->Align = alLeft;
  pdlb->Width = Form1->ClientWidth/3;

  // Now use the splitter to divide the directory pane from the file pane.
  ps->Parent = Form1;
  ps->Left = pdlb->Left + pdlb->Width + 1; // Move to right of directory list.
  ps->Align = pdlb->Align; // Give same alignment as directory list.

  // Each pane must be at least one quarter of the form's width.
  ps->MinSize = Form1->ClientWidth/4;

  // Finally, create the last pane - a file list box.
  pflb->Parent = Form1;
  pflb->Align = alClient;
  pdlb->FileList = pflb; // Link the file list box to the directory list box.
}
/*
Dynamically create a TProgressBar control and align it to
the bottom of the form.
*/

#include <ComCtrls.hpp>
#include <Controls.hpp>

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  TProgressBar *ProgressBar = new TProgressBar(this);
  ProgressBar->Parent = this;
  ProgressBar->Align = alBottom;
  TButton *Button1 = new TButton(this);
  Button1->Parent = this;
}
/*
This example dynamically creates a Page Control, then a
series of Tab Sheets on the Page Control.
*/
#include <Comctrls.hpp>
TPageControl* ppc;
```

```
const int MAXTABS = 3;
TTabSheet* pts[MAXTABS];
const char * ppcTabTitles[] = { "ShortString", "Orders", "Items", "Parts" };
int iTabTitles = sizeof(ppcTabTitles)/sizeof(ppcTabTitles[0]);
const TColor colorPalette[12] = {
  clRed, clGreen, clYellow, clBlue, clWhite, clFuchsia,
  clTeal, clNavy, clMaroon, clLime, clOlive, clPurple};

void __fastcall TForm1::FormCreate(TObject *Sender)
{
    ppc = new TPageControl(this);
    ppc->Parent = this;
    ppc->Align = alClient;
    for (int i=0;i<iTabTitles;i++)
  {
        pts[i] = new TTabSheet(this);
        pts[i]->PageControl = ppc;
        pts[i]->Name = AnsiString("pts") + ppcTabTitles[i];
        pts[i]->Caption = ppcTabTitles[i];
        pts[i]->Brush->Color = colorPalette[i];
  }
}//---------------------------------------------------------------------------
void __fastcall TForm1::FormDestroy(TObject *Sender)
{
  for (int i=0;i<iTabTitles;i++)
        delete pts[i];
    delete ppc;
}
```

Delphi Examples:

```
{
This example shows how to use a splitter to divide a form
into resizable panes.  All objects on the form are created
dynamically in the OnCreate event handler of the form. To
run this example, add ExtCtrls and FileCtrl to the uses
clause of the form's implementation section.
Note that when creating a splitter dynamically at runtime,
it is important to set its position to the appropriate side
of the control it will resize.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  Split: TSplitter;
  Files: TFileListBox;
  Dirs: TDirectoryListBox;
begin
  { first add a directory list box to the form }
  Dirs := TDirectoryListBox.Create(Form1);
  { line it up on the left of the form }
  Dirs.Parent := Form1;
  Dirs.Align := alLeft;
  Dirs.Width := Form1.ClientWidth div 3;
{ now add the splitter to divide the directory pane from the file pane }
  Split := TSplitter.Create(Form1);
  Split.Parent := Form1;
  { make sure the splitter is to the right of the directory list box! }
  Split.Left := Dirs.Left + Dirs.Width + 1;
  Split.Align := Dirs.Align; { give it the same alignment as the directory }
  { each pane must be at least one quarter of the form's width }
  Split.MinSize := Form1.ClientWidth div 4;
  { Finally, create the last pane – a file list box }
  Files := TFileListBox.Create(Form1);
  Files.Parent := Form1;
  Files.Align := alClient;
  Dirs.FileList := Files; { link the file list box to the directory list box }
end;
```

```
{
Dynamically create a TProgressBar control and align it to
the bottom of the form.
}

var
  I: Integer;

procedure TForm1.Button1Click(Sender: TObject);
var
  ProgressBar: TProgressBar;
begin
  ProgressBar := TProgressBar.Create(Self);
  with ProgressBar do
  begin
    Parent := Self;
    Align := alBottom;
  end;
end;
{
This example dynamically creates a Page Control, then a
series of Tab Sheets on the Page Control.
}
var
  PageControl1: TPageControl;
  pts: array[0..3] of TTabSheet;
const
  TabTitles: array[0..3] of ShortString = ('Customer', 'Orders', 'Items', 'Parts' );

procedure TForm1.FormCreate(Sender: TObject);
const
  colorpalette: Array[0..11] of TColor = (
    clRed, clGreen, clYellow, clBlue, clWhite, clFuchsia, clTeal,
    clNavy, clMaroon, clLime, clOlive, clPurple);
var
  i: Integer;
begin
  PageControl1 := TPageControl.Create(Self);
  PageControl1.Parent := Self;
  PageControl1.Align := alClient;
  for i := Low(TabTitles) to High(TabTitles) do
  begin
    pts[i]:= TTabSheet.Create(PageControl1);
    with pts[i] do
    begin
      PageControl := PageControl1;
      Name := 'ts' + TabTitles[i];
      Caption := TabTitles[i];
      Brush.Color := colorPalette[i];
   end;
  end;
end;

procedure TForm1.FormDestroy(Sender: TObject);
var
  i: Integer;
begin
  for i := Low(TabTitles) to High(TabTitles) do
  begin
    pts[i].Free;
  end;
  PageControl1.Free;
end;
```

See Also

Parent (see page 5832)

Anchors (see page 5802)

68.1.29.4.2 TPaintBox.Anchors Property

Specifies how the control is anchored to its parent.

Pascal

```
property Anchors: TAnchors;
```

C++

```
__property TAnchors Anchors;
```

Description

Use Anchors to ensure that a control maintains its current position relative to an edge of its parent, even if the parent is resized. When its parent is resized, the control holds its position relative to the edges to which it is anchored.

If a control is anchored to opposite edges of its parent, the control stretches when its parent is resized. For example, if a control has its Anchors property set to [akLeft, akRight], the control stretches when the width of its parent changes.

Anchors is enforced only when the parent is resized. Thus, for example, if a control is anchored to opposite edges of a form at design time and the form is created in a maximized state, the control is not stretched because the form is not resized after the control is created.

Note: If a control should maintain contact with three edges of its parent (hugging one side of the parent and stretching the length of that side), use the Align property instead. Unlike Anchors, Align allows controls to adjust to changes in the size of other aligned sibling controls as well as changes to the parent's size.

Parent (see page 5832)

Align (see page 5798)

68.1.29.4.3 TPaintBox.Canvas Property

Provides the drawing surface used by the graphic control.

Pascal

```
property Canvas: TCanvas;
```

C++

```
__property TCanvas Canvas;
```

Description

Use the properties of the TCanvas object to draw or paint on the surface of the control.

Since a TGraphicControl instance does not have its own Windows screen object, it obtains its device context from its parent control.

C++ Examples:

```
/*
When you do custom drawing, such as shown in the code for
the Button's OnClick event handler below, this drawing will
not be persistent and will be "erased" the first time the
PaintBox component needs to repaint.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
```

```
   PaintBox1->Canvas->Brush->Color = clRed;
   PaintBox1->Canvas->FillRect(PaintBox1->Canvas->ClipRect);
   PaintBox1->Canvas->Ellipse(0,0,100,100);
}

/*
In order for the drawing to be persistent, you need to also
include an OnPaint event handler that tells the PaintBox how
to redraw itself when it needs to. In the code below, an
ellipse will be drawn everytime the PaintBox renders itself,
but the PaintBox will only paint the client area of the
control red after the Button is clicked. This client area
will only stay red until it is invalidated, but the ellipse
will persist. This behavior is different from the TImage
component, because the TImage component maintains an
internal bitmap that stores this drawing information for
you.
*/
void __fastcall TForm1::PaintBox1Paint(TObject *Sender)
{
   PaintBox1->Canvas->Brush->Color = clBlue;
   PaintBox1->Canvas->Ellipse(0,0,100,100);
}
/*
The following code uses ClientRect to find and draw a line
from the top left to the bottom right of the current
control.  Select a TControl in the ListBox list.  This
example assumes that the current object is a descendent of
TControl and has a public Canvas property.
*/
{
  TPoint APoint = Point(X, Y);
  int Index = ListBox1->ItemAtPos(APoint, True);
  TLabel *myLabel;
  TClass ClassRef = ListBox1->Items->Objects[Index]->ClassType();
  if (String(ClassRef->ClassName()) == "TLabel")
  {
    myLabel = (TLabel *)ListBox1->Items->Objects[Index];
    // make sure we are using the TControls canvas and not the from's!
    myLabel->Canvas->MoveTo(myLabel->ClientRect.Left, myLabel->ClientRect.Top);
    myLabel->Canvas->LineTo(myLabel->ClientRect.Right, myLabel->ClientRect.Bottom);
    myLabel = NULL;
  }
}
/*
The following code draws the graphic in Picture1 in the
top-left corner PaintBox1.  Place a TPaintBox in the form
and a TImage in the form that contains a picture.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  PaintBox1->Canvas->Draw(0,0, Image1->Picture->Graphic);
}
```

Delphi Examples:

```
{
When you do custom drawing, such as shown in the code for
the Button's OnClick event handler below, this drawing will
not be persistent and will be "erased" the first time the
PaintBox component needs to repaint.
}
procedure TForm1.Button1Click(Sender: TObject);
begin
   PaintBox1.Canvas.Brush.Color := clRed;
   PaintBox1.Canvas.FillRect(PaintBox1.Canvas.ClipRect);
   PaintBox1.Canvas.Brush.Color := clBlue;
```

```
    PaintBox1.Canvas.Ellipse(0,0,100,50);
  end;
  {
  In order for the drawing to be persistent, you need to also
  include an OnPaint event handler that tells the PaintBox how
  to redraw itself when it needs to. In the code below, an
  ellipse will be drawn everytime the PaintBox renders itself,
  but the PaintBox will only paint the client area of the
  control red after the Button is clicked. This client area
  will only stay red until it is invalidated, but the ellipse
  will persist. This behavior is different from the TImage
  component, because the TImage component maintains an
  internal bitmap that stores this drawing information for
  you.
  }
  procedure TForm1.PaintBox1Paint(Sender: TObject);
  begin
    PaintBox1.Canvas.Brush.Color := clBlue;
    PaintBox1.Canvas.Ellipse(0,0,100,50);
  end;
  {
  The following code uses ClientRect to find and draw a line
  from the top left to the bottom right of the current
  control.  Select a TControl in the ListBox list.  This
  example assumes that the current object is a descendent of
  TControl and has a public Canvas property.
  }
    if (ListBox1.Items.Objects[Index] is TLabel) then
    begin
      myLabel:= (ListBox1.Items.Objects[Index] as TLabel);
      with myLabel.ClientRect do
      begin // make sure we are using the TControl's canvas and not the form's!
        myLabel.Canvas.MoveTo(Left, Top);
        myLabel.Canvas.LineTo(Right, Bottom);
      end;
    myLabel:= nil;
    end;
  {
  The following code draws the graphic in Picture1 in the
  top-left corner PaintBox1.  Place a TPaintBox in the form
  and a TImage in the form that contains a picture.
  }
  procedure TForm1.Button1Click(Sender: TObject);
  begin
    PaintBox1.Canvas.Draw(0,0, Image1.Picture.Graphic);
  end;
```

68.1.29.4.4 TPaintBox.Color Property

Specifies the background color of the control.

Pascal

```
property Color: TColor;
```

C++

```
__property TColor Color;
```

Description

Use Color to read or change the background color of the control.

If a control's ParentColor property is true, then changing the Color property of the control's parent automatically changes the Color property of the control. When the value of the Color property is changed, the control's ParentColor property is automatically set to false.

C++ Examples:

```
/*
The following code changes the color of a shape control
using the Color dialog box. The example displays the Color
dialog box when the Button1 button is clicked, allowing the
user to select a color with the dialog box. When a color
value is selected with the dialog box, it is assigned to
the shape control.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  if (ColorDialog1->Execute())
    Shape1->Brush->Color = ColorDialog1->Color;
}
```

Delphi Examples:

```
{
The following code changes the color of a shape control
using the Color dialog box. The example displays the Color
dialog box when the Button1 button is clicked, allowing the
user to select a color with the dialog box. When a color
value is selected with the dialog box, it is assigned to
the shape control.
}
procedure TForm1.Button1Click(Sender: TObject);
begin
  if ColorDialog1.Execute then
    Shape1.Brush.Color := ColorDialog1.Color;
end;
```

See Also

ParentColor (see page 5834)

68.1.29.4.5 TPaintBox.Constraints Property

Specifies the size constraints for the control.

Pascal

```
property Constraints: TSizeConstraints;
```

C++

```
__property TSizeConstraints Constraints;
```

Description

Use Constraints to specify the minimum and maximum width and height of the control. When Constraints contains maximum or minimum values, the control cannot be resized to violate those constraints.

Note: Constraints apply to the height of the form. However, the height of the form depends on how large Windows makes the title bar. For example, Windows XP uses much larger title bars than other windowing systems. To work around this, note the ClientHeight when you design your form and set the constraints in the FormCreate event. In the following example, ClientHeight is represented by x: `Constraints.MinHeight := x + Height - ClientHeight`.

Warning: Do not set up constraints that conflict with the value of the Align or Anchors property. When these properties conflict, the response of the control to resize attempts is not well-defined.

See Also

AutoSize (see page 5803)

Align (see page 5798)

Anchors (see page 5802)

OnConstrainedResize (see page 5853)

OnCanResize (see page 5851)

68.1.29.4.6 TPaintBox.DragCursor Property

Indicates the image used to represent the mouse pointer when the control is being dragged.

Pascal

```
property DragCursor: TCursor;
```

C++

```
__property TCursor DragCursor;
```

Description

Use the DragCursor property to change the cursor image presented when the control is being dragged.

Note: To make a custom cursor available for the DragCursor property, see the Cursor property.

See Also

Cursor (see page 5815)

DragKind (see page 5819)

DragMode (see page 5819)

68.1.29.4.7 TPaintBox.DragKind Property

Specifies whether the control is being dragged normally or for docking.

Pascal

```
property DragKind: TDragKind;
```

C++

```
__property TDragKind DragKind;
```

Description

Use DragKind to get or set whether the control participates in drag-and-drop operations, or drag-and-dock operations.

See Also

DragCursor (see page 5818)

DragMode (see page 5819)

68.1.29.4.8 TPaintBox.DragMode Property

Determines how the control initiates drag-and-drop or drag-and-dock operations.

Pascal

```
property DragMode: TDragMode;
```

C++

```
__property TDragMode DragMode;
```

Description

Use DragMode to control when the user can drag the control. Disable the drag-and-drop or drag-and-dock capability at runtime by setting the DragMode property value to dmManual. Enable automatic dragging by setting DragMode to dmAutomatic.

C++ Examples:

```
/*
The following code uses GetNodeAt to add a dragged node as a
child of the node under the mouse when it is dropped.  This
example requires a populated TreeView.  Also, the TTreeView
DragMode property set to dmAutomatic, and the TTreeView
OnDragOver event handler must be implemented to accept the
drop.
*/
void __fastcall TForm1::TreeView1DragDrop(TObject *Sender, TObject *Source,
      int X, int Y)
{
  if (Source != (TObject *)TreeView1 || TreeView1->Selected == NULL)
    return;
  THitTests HT = TreeView1->GetHitTestInfoAt(X, Y);
  TNodeAttachMode AttachMode;
  TTreeNode *Item = TreeView1->GetNodeAt(X, Y);
  if (HT.Contains(htOnItem) || HT.Contains(htOnIcon))
    AttachMode = naAddChild;
  else if (HT.Contains(htNowhere))
    AttachMode = naAdd;
  else if (HT.Contains(htOnIndent))
    AttachMode = naInsert;
  else
    return;
  TreeView1->Selected->MoveTo(Item, AttachMode);
}

void __fastcall TForm1::TreeView1DragOver(TObject *Sender, TObject *Source,
      int X, int Y, TDragState State, bool &Accept)
{
  Accept = (Source == (TObject *)TreeView1);
}
```

Delphi Examples:

```
{
The following code uses GetNodeAt to add a dragged node as a
child of the node under the mouse when it is dropped.  This
example requires a populated TreeView.  Also, the TTreeView
DragMode property set to dmAutomatic, and the TTreeView
OnDragOver event handler must be implemented to accept the
drop.
}
procedure TForm1.TreeView1DragDrop(Sender, Source: TObject; X, Y: Integer);
var
  AnItem: TTreeNode;
  AttachMode: TNodeAttachMode;
  HT: THitTests;
begin
  if TreeView1.Selected = nil then Exit;
  HT := TreeView1.GetHitTestInfoAt(X, Y);
  AnItem := TreeView1.GetNodeAt(X, Y);
  if (HT - [htOnItem, htOnIcon, htNowhere, htOnIndent] <> HT) then
  begin
    if (htOnItem in HT) or (htOnIcon in HT) then
      AttachMode := naAddChild
    else if htNowhere in HT then AttachMode := naAdd
    else if htOnIndent in HT then AttachMode := naInsert;
    TreeView1.Selected.MoveTo(AnItem, AttachMode);
```

```
    end;
  end;

  procedure TForm1.TreeView1DragOver(Sender, Source: TObject; X, Y: Integer;
    State: TDragState; var Accept: Boolean);
  begin
    Accept := Source is TTreeView;
  end;
```

Arranging the Order of Persistent Columns

68.1.29.4.9 TPaintBox.Enabled Property

Controls whether the control responds to mouse, keyboard, and timer events.

Pascal

```
property Enabled: Boolean;
```

C++

```
__property Boolean Enabled;
```

Description

Use Enabled to change the availability of the control to the user. To disable a control, set Enabled to false. Disabled controls appear dimmed. If Enabled is false, the control ignores mouse, keyboard, and timer events.

To re-enable a control, set Enabled to true. The control is no longer dimmed, and the user can use the control.

EnableControls (see page 6934)

Enabling Mouse

68.1.29.4.10 TPaintBox.Font Property

Controls the attributes of text written on or in the control.

Pascal

```
property Font: TFont;
```

C++

```
__property TFont Font;
```

Description

To change to a new font, specify a new TFont object. To modify a font, change the value of the Charset, Color, Height, Name, Pitch, Size, or Style of the TFont object.

C++ Examples:

```
/*
To use this example, place a TComboBox and TRichEdit or
TMemo on a form.  During form creation, a list of font names
is loaded into the combo box. When the combo box is clicked,
the memo or Rich Edit control font is set to the
corresponding font name in the combo box.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < Screen->Fonts->Count; i++)
   ComboBox1->Items->Add(Screen->Fonts->Strings[i]);
//  ComboBox1->Items = Screen->Fonts;  // Another way to do it.
}

void __fastcall TForm1::ComboBox1Change(TObject *Sender)
{
  RichEdit1->Font->Name = ComboBox1->Text;
}
```

Delphi Examples:

```
{
To use this example, place a TComboBox and TRichEdit or
TMemo on a form.  During form creation, a list of font names
is loaded into the combo box. When the combo box is clicked,
the memo or Rich Edit control font is set to the
corresponding font name in the combo box.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  i : Integer;
begin
  for i := 0 to Screen.Fonts.Count - 1 do
   ComboBox1.Items.Add(Screen.Fonts.Strings[i]);
//  ComboBox1.Items := Screen.Fonts;  // Another way to do it.
  RichEdit1.Lines.Text := 'How is it to be you?';
end;

procedure TForm1.ComboBox1Click(Sender: TObject);
begin
  RichEdit1.Font.Name := ComboBox1.Text;
end;
```

DesktopFont (see page 5818)

ParentFont (see page 5834)

Displaying and Editing Text in a Memo Control

68.1.29.4.11 TPaintBox.ParentColor Property

Determines where a control looks for its color information.

Pascal

```
property ParentColor: Boolean;
```

C++

```
__property Boolean ParentColor;
```

Description

To have a control use the same color as its parent control, set ParentColor to true. If ParentColor is false, the control uses its own Color property.

Set ParentColor to true for all controls in order to ensure that all the controls on a form have a uniform appearance. For example, if ParentColor is true for all controls in a form, changing the background color of the form to gray causes all the controls on the form to also have a gray background.

When the value of a control's Color property changes, ParentColor becomes false automatically.

See Also

Color (see page 5812)

Parent (see page 5832)

ParentFont (see page 5834)

ParentShowHint (see page 5835)

68.1.29.4.12 TPaintBox.ParentFont Property

Determines where a control looks for its font information.

Pascal

```
property ParentFont: Boolean;
```

C++

```
__property Boolean ParentFont;
```

Description

To have a control use the same font as its parent control, set ParentFont to true. If ParentFont is false, the control uses its own Font property. Many controls default ParentFont to true so that all the controls in a form or other container present a uniform appearance. When the value of a control's Font property changes, ParentFont becomes false automatically.

When ParentFont is true for a form, the form uses the default font.

See Also

Font (see page 5823)

Parent (see page 5832)

ParentColor (see page 5834)

ParentShowHint (see page 5835)

68.1.29.4.13 TPaintBox.ParentShowHint Property

Determines where a control looks to find out if its Help Hint should be shown.

Pascal

```
property ParentShowHint: Boolean;
```

C++

```
__property Boolean ParentShowHint;
```

Description

Use ParentShowHint to ensure that all the controls on a form either uniformly show their Help Hints or uniformly do not show them.

If ParentShowHint is true, the control uses the ShowHint property value of its parent. If ParentShowHint is false, the control uses the value of its own ShowHint property.

To provide Help Hints for only selected controls on a form, set the ShowHint property for those controls that should have Help Hints to true, and ParentShowHint becomes false automatically.

Note: Enable or disable all Help Hints for the entire application using the ShowHint property of the application object.

See Also

Hint (see page 5827)

Parent (see page 5832)

ParentColor (see page 5834)

ParentFont (see page 5834)

ShowHint (see page 5840)

68.1.29.4.14 TPaintBox.PopupMenu Property

Identifies the pop-up menu associated with the control.

Pascal

```
property PopupMenu: TPopupMenu;
```

C++

```
__property TPopupMenu PopupMenu;
```

Description

Assign a value to PopupMenu to make a pop-up menu appear when the user selects the control and clicks the right mouse button. If the TPopupMenu's AutoPopup property is true, the pop-up menu appears automatically. If the menu's AutoPopup property is false, display the menu with a call to its Popup method from the control's OnContextPopup event handler.

C++ Examples:

```
/*
This example uses two edit boxes and one pop-up menu on a form.
The pop-up menu contains Cut, Copy, and Paste commands. This code
makes the pop-up menu available to both edit boxes:
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  PopupMenu1->AutoPopup = true;
  Edit1->PopupMenu = PopupMenu1;
  Edit2->PopupMenu = PopupMenu1;
}

/*
These are the cut, copy, and paste OnClick events for the commands
on the pop-up menu. Double click on the pop-up menu and add three
TMenuItems.  Then set the captions to "Cut", "Copy" and "Paste".
The names will be automatically set to "Cut1", "Copy1", and
```

```
"Paste1".  Then double click on the OnClick events and they will
be named "Cut1Click", "Copy1Click" and "Paste1Click" respectively.
Note: only the selected portion of the string in the edit box will
be copied, cut or replaced.
*/
void __fastcall TForm1::Copy1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
    if (pComponent->ClassNameIs("TEdit"))
      ((TEdit *)pComponent)->CopyToClipboard();
    else
      MessageBeep(0);
  }
  else
    MessageBeep(0);
}

void __fastcall TForm1::Cut1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
    if (pComponent->ClassNameIs("TEdit"))
      ((TEdit *)pComponent)->CutToClipboard();
    else
      MessageBeep(0);
  }
  else
    MessageBeep(0);
}

void __fastcall TForm1::Paste1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
    if (pComponent->ClassNameIs("TEdit"))
      ((TEdit *)pComponent)->PasteFromClipboard();
    else
      MessageBeep(0);
  }
  else
    MessageBeep(0);
}
/*
This example demonstrates how to add and delete menu items
to a popup menu at runtime and assign an event handler to
the OnClick event.  Place a TPopupMenu and three buttons on
the form named "AddButton", "EditButton",  and
"DestroyButton" and add OnClick events to all three buttons.
Put the TPopupMenu in the PopupMenu property of the form.
Place the PopupMenuItemsClick procedure in the TForm1 type
declaration so that it can be used as the method call for
the menu item OnClick event.
*/
void __fastcall TForm1::AddButtonClick(TObject *Sender)
{
    const int num_items = 4;
    for (int index = 0; index < num_items; ++index)
    {
        TMenuItem *NewItem = new TMenuItem(PopupMenu1); // create the new item
        PopupMenu1->Items->Add(NewItem);// add it to the Popupmenu
        NewItem->Caption = "Menu Item " + IntToStr(index);
        NewItem->Tag = index;
```

```
        NewItem->OnClick = PopupMenuItemsClick;// assign it an event handler
        TNotifyEvent();
    }
}

    TMenuItem *ClickedItem = dynamic_cast<TMenuItem *>(Sender);
    if (ClickedItem)
    {
        switch (ClickedItem->Tag)
        {
            case 0:
            {
                ShowMessage("first item clicked");
                break;
            }
            case 1:
            {
                ShowMessage("second item clicked");
                break;
            }
            case 2:
            {
                ShowMessage("third item clicked");
                break;
            }
            case 3:
            {
                ShowMessage("fourth item clicked");
                break;
            }
        }
    }
}

/*
To edit or destroy an item, grab its pointer via the Items
property.
*/
void __fastcall TForm1::EditButtonClick(TObject *Sender)
{
    const int index = 1;
    TMenuItem *ItemToEdit = PopupMenu->Items->Items[index];
    ItemToEdit->Caption = "Changed Caption";
}

void __fastcall TForm1::DestroyButtonClick(TObject *Sender)
{
    const int index = 2;
    TMenuItem *ItemToDelete = PopupMenu->Items->Items[index];
    delete ItemToDelete;
}
```

Delphi Examples:

```
{
This example uses two edit boxes and one pop-up menu on a form.
The pop-up menu contains Cut, Copy, and Paste commands. This code
makes the pop-up menu available to both edit boxes:
}
procedure TForm1.FormCreate(Sender: TObject);
begin
  PopupMenu1.AutoPopup := True;
  Edit1.PopupMenu := PopupMenu1;
  Edit2.PopupMenu := PopupMenu1;
end;
```

```
{
These are the cut, copy, and paste OnClick events for the commands
on the pop-up menu. Double click on the pop-up menu and add three
TMenuItems.  Then set the captions to "Cut", "Copy" and "Paste".
The names will be automatically set to "Cut1", "Copy1", and
"Paste1".  Then double click on the OnClick events and they will
be named "Cut1Click", "Copy1Click" and "Paste1Click" respectively.
Note: only the selected portion of the string in the edit box will
be copied, cut or replaced.
}
procedure TForm1.Copy1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
   Edit1.CopyToClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.CopyToClipboard
  else
    Beep;
end;

procedure TForm1.Cut1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
    Edit1.CutToClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.CutToClipboard
  else
    Beep;
end;

procedure TForm1.Paste1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
    Edit1.PasteFromClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.PasteFromClipboard
  else
    Beep;
end;
{
This example demonstrates how to add and delete menu items
to a popup menu at runtime and assign an event handler to
the OnClick event.  Place a TPopupMenu and three buttons on
the form named "AddButton", "EditButton",  and
"DestroyButton" and add OnClick events to all three buttons.
Put the TPopupMenu in the PopupMenu property of the form.
Place the PopupMenuItemsClick procedure in the TForm1 type
declaration so that it can be used as the method call for
the menu item OnClick event.
}

type
  TForm1 = class(TForm)
    AddButton: TButton;
    EditButton: TButton;
    DestroyButton: TButton;
    PopupMenu1: TPopupMenu;
    procedure AddButtonClick(Sender: TObject);

68.1.29.4.15 TPaintBox.ShowHint Property

Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.

Pascal

```
property ShowHint: Boolean;
```

C++

```
__property Boolean ShowHint;
```

Description

The Help Hint is the value of the Hint property, which is displayed in a box just beneath the control. Use ShowHint to determine whether a Help Hint appears for the control.

To enable Help Hint for a particular control, the application ShowHint property must be true and either

the control's own ShowHint property must be true, or

the control's ParentShowHint property must be true and its parent's ShowHint property must be true.

For example, imagine a check box within a group box. If the ShowHint property of the group box is true and the ParentShowHint property of the check box is true, but the ShowHint property of the check box is false, the check box still displays its Help Hint.

Changing the ShowHint value automatically sets the ParentShowHint property to false.

C++ Examples:

```
/*
This example uses an edit box and a list box on a form.
Items are added to the list box and a Help Hint is assigned
to both controls. The last statement enables the Help Hints
for the entire application.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  Edit1->Hint = "Enter your name";
  Edit1->ShowHint = true;

  char string[10];
  char index[3];
  for(int i = 1; i <= 10; i++)
  {
    strcpy(string, "Item");
    itoa(i, index, 10);
    strcat(string, index);
    ListBox1->Items->Add(string);
  }
  ListBox1->Hint = "Select an item";
  ListBox1->ShowHint = true;
  Application->ShowHint = true;
}
/*
Note: To see an example that displays the hints of controls
in some place other than in a Help Hint box, see the OnHint
example.
*/
```

Delphi Examples:

```
{
This example uses an edit box and a list box on a form.
Items are added to the list box and a Help Hint is assigned
to both controls. The last statement enables the Help Hints
for the entire application.
```

```
}
procedure TForm1.FormCreate(Sender: TObject);
var
  I: Integer;
begin
  Edit1.Hint := 'Enter your name';
  Edit1.ShowHint := True;
  with ListBox1 do
  begin
    for I := 1 to 10 do
      Items.Add('Item ' + IntToStr(I));
    Hint := 'Select an item';
    ShowHint := True;
  end;
  Application.ShowHint := True;
end;
{
Note: To see an example that displays the hints of controls
in some place other than in a Help Hint box, see the OnHint
example.
}

68.1.29.4.16 TPaintBox.Visible Property

Determines whether the component appears onscreen.

Pascal

```
property Visible: Boolean;
```

C++

```
__property Boolean Visible;
```

Description

Use the Visible property to control the visibility of the control at runtime. If Visible is true, the control appears. If Visible is false, the control is not visible.

Calling the Show method sets the control's Visible property to true. Calling the Hide method sets it to false.

C++ Examples:

```
/*
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
*/
void __fastcall TForm1::PageControl1Change(TObject *Sender)
{
  CheckBox1->Checked = PageControl1->ActivePage->Visible;
}

void __fastcall TForm1::CheckBox1Click(TObject *Sender)
{
```

```
  PageControl1->ActivePage->Visible = CheckBox1->Checked;
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < 10; i++)
  {
    TTabSheet *pPage = new TTabSheet(this);
    pPage->PageControl = PageControl1;
    pPage->Caption = AnsiString("Page") + IntToStr(i);
    TEdit *pEdit = new TEdit(this);
    pEdit->Parent = pPage;
    pEdit->Left = random(pPage->ClientWidth - pEdit->Width);
    pEdit->Top = random(pPage->ClientHeight - pEdit->Height);
  }
  PageControl1Change(Sender);
}
```

Delphi Examples:

```
{
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
}
procedure TForm1.CheckBox1Click(Sender: TObject);
begin
  PageControl1.ActivePage.Visible := CheckBox1.Checked;
end;

procedure TForm1.PageControl1Change(Sender: TObject);
begin
  CheckBox1.Checked := PageControl1.ActivePage.Visible;
end;

procedure TForm1.FormCreate(Sender: TObject);
var
  i: Integer;
begin
  for i := 0 to 9 do
    with TTabSheet.Create(Self) do
    begin
      PageControl := PageControl1;
      Caption := 'TabSheet' + IntToStr(i);
      with TEdit.Create(Self) do
      begin
        Parent := PageControl1.Pages[i];
        Left := Random(PageControl1.ActivePage.ClientWidth - Width);
        Top := Random(PageControl1.ActivePage.ClientHeight - Height);
      end;
    end;
    PageControl1Change(Sender);
end;
```

68.1.29.5 TPaintBox Events

The events of the TPaintBox class are listed here.

Published Events

	Name	Description
	OnClick (see page 13011)	Occurs when the user clicks the control.
	OnContextPopup (see page 13013)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnDblClick (see page 13014)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDragDrop (see page 13014)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 13016)	Occurs when the user drags an object over a control.
	OnEndDock (see page 13019)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 13019)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnMouseActivate (see page 13020)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 13021)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseEnter (see page 13023)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 13024)	Occurs when the user moves the mouse outside of a control.
	OnMouseMove (see page 13024)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 13026)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnPaint (see page 13028)	OnPaint occurs when the paintbox receives a Windows paint message.
	OnStartDock (see page 13030)	Occurs when the user begins to drag a control with a DragKind of dkDock.
	OnStartDrag (see page 13031)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.

68.1.29.5.1 TPaintBox.OnClick Event

Occurs when the user clicks the control.

Pascal

```
property OnClick: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnClick;
```

Description

Use the OnClick event handler to respond when the user clicks the control. If the control has an associated action, and that action has an OnExecute method, the action's OnExecute method responds to click events unless it is superseded by an OnClick event handler.

Usually OnClick occurs when the user presses and releases the left mouse button with the mouse pointer over the control. This event can also occur when:

- The user selects an item in a grid, outline, list, or combo box by pressing an arrow key.
- The user presses Spacebar while a button or check box has focus.
- The user presses Enter when the active form has a default button (specified by the Default property).
- The user presses Esc when the active form has a cancel button (specified by the Cancel property).
- The user presses the accelerator key for a button or check box. For example, if the value of the Caption property of a check

box is '&Bold', the B is underlined at runtime and the OnClick event of the check box is triggered when the user presses Alt+B. However, focus does not move to the control in these instances.

- The Checked property of a radio button is set to true.
- The value of the Checked property of a check box is changed.
- The Click method of a menu item is called.

For a form, an OnClick event occurs when the user clicks a blank area of the form or on a disabled component.

C++ Examples:

```
/*
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
*/
void __fastcall TForm1::PageControl1Change(TObject *Sender)
{
  CheckBox1->Checked = PageControl1->ActivePage->Visible;
}

void __fastcall TForm1::CheckBox1Click(TObject *Sender)
{
  PageControl1->ActivePage->Visible = CheckBox1->Checked;
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < 10; i++)
  {
    TTabSheet *pPage = new TTabSheet(this);
    pPage->PageControl = PageControl1;
    pPage->Caption = AnsiString("Page") + IntToStr(i);
    TEdit *pEdit = new TEdit(this);
    pEdit->Parent = pPage;
    pEdit->Left = random(pPage->ClientWidth - pEdit->Width);
    pEdit->Top = random(pPage->ClientHeight - pEdit->Height);
  }
  PageControl1Change(Sender);
}
```

Delphi Examples:

```
{
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
}
procedure TForm1.CheckBox1Click(Sender: TObject);
begin
  PageControl1.ActivePage.Visible := CheckBox1.Checked;
end;

procedure TForm1.PageControl1Change(Sender: TObject);
begin
  CheckBox1.Checked := PageControl1.ActivePage.Visible;
end;

procedure TForm1.FormCreate(Sender: TObject);
var
  i: Integer;
begin
```

```
    for i := 0 to 9 do
      with TTabSheet.Create(Self) do
      begin
        PageControl := PageControl1;
        Caption := 'TabSheet' + IntToStr(i);
        with TEdit.Create(Self) do
        begin
          Parent := PageControl1.Pages[i];
          Left := Random(PageControl1.ActivePage.ClientWidth - Width);
          Top := Random(PageControl1.ActivePage.ClientHeight - Height);
        end;
      end;
      PageControl1Change(Sender);
  end;
```

Adding Silent Video Clips to an Application

68.1.29.5.2 TPaintBox.OnContextPopup Event

Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).

Pascal

```
property OnContextPopup: TContextPopupEvent;
```

C++

```
__property TContextPopupEvent OnContextPopup;
```

Description

The OnContextPopup handler is called when the user uses the mouse or keyboard to request a popup menu. The OnContextPopup event is generated by a WM_CONTEXTMENU message, which is itself generated by the user clicking the right mouse button or by pressing SHIFT+F10 or the Applications key.

This event is especially useful when the control does not have an associated popup menu (the PopupMenu property is not set) or if the AutoPopup property of the control's associated popup menu is false. However, the OnContextPopup can also be used to override the automatic context menu that appears when the control has an associated popup menu with an AutoPopup property of true. In this last case, if the event handler displays its own menu, it should set the Handled parameter to true to suppress the default context menu.

The handler's MousePos parameter indicates the position of the mouse, in client coordinates.. If the event was not generated by a mouse click, MousePos is (-1,-1).

Note: Parent controls receive an OnContextPopup event before their child controls. In addition, for many child controls, the default window procedure causes the parent control to receive an OnContextPopup event after the child control. As a result, when parent controls do not set Handled to true in an OnContextPopup event handler, the event handler may be called multiple times for each context menu invocation.

PopupMenu (see page 5835)

AutoPopup (see page 16178)

68.1.29.5.3 TPaintBox.OnDblClick Event

Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.

Pascal

```
property OnDblClick: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnDblClick;
```

Description

Use the OnDblClick event to respond to mouse double-clicks.

See Also

OnClick (see page 5851)

Responding to User Actions at Runtime

68.1.29.5.4 TPaintBox.OnDragDrop Event

Occurs when the user drops an object being dragged.

Pascal

```
property OnDragDrop: TDragDropEvent;
```

C++

```
__property TDragDropEvent OnDragDrop;
```

Description

Use the OnDragDrop event handler to specify what happens when the user drops an object. The Source parameter of the OnDragDrop event is the object being dropped, and the Sender is the control the object is being dropped on. The X and Y parameters are the coordinates of the mouse positioned over the control.

C++ Examples:

```
/*
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
*/

// This OnDragOver event handler permits the list box to
// accept a dropped label:
void __fastcall TForm1::ListBox1DragOver(TObject *Sender, TObject *Source, int X, int Y,
TDragState State, bool &Accept)
{
   Accept = Source->ClassNameIs("TLabel");
}
```

```
/*
This OnDragDrop event handler implements the drop behavior.
*/
void __fastcall TForm1::ListBox1DragDrop(TObject *Sender, TObject *Source, int X, int Y)
{
  if (Sender->ClassNameIs("TListBox") && Source->ClassNameIs("TLabel"))
  {
    TListBox *DestList = (TListBox *)Sender;
    DestList->Font = ((TLabel *)Source)->Font;
    DestList->Color = ((TLabel *)Source)->Color;
    DestList->DoubleBuffered = true;
    DestList->Color = clWindow;
  }
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  ListBox1->Items->Add("Not");
  ListBox1->Items->Add("In");
  ListBox1->Items->Add("Alphabetical");
  ListBox1->Items->Add("Order");

}
```

Delphi Examples:

```
{
This code is an OnDragOver event handler that won't allow a
label control to be dropped on a panel control and stops the
dragging of the label as soon as the user drags the label
onto the panel:
Note: Set the label's DragMode property to dmAutomatic.
}
procedure TForm1.FormDragDrop(Sender, Source: TObject; X, Y: Integer);
begin
  TForm1(Source).Left := X;
  TForm1(Source).Top := Y;
end;

procedure TForm1.FormDragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := Source is TLabel;
end;

procedure TForm1.Panel1DragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := False;
  if (Source is TLabel) and (State = dsDragEnter) then
    (Source as TLabel).EndDrag(False);
end;
{
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
}

procedure TForm1.FormCreate(Sender: TObject);
begin
  ListBox1.Items.Add('Not');
  ListBox1.Items.Add('In');
  ListBox1.Items.Add('Alphabetical');
```

```
    ListBox1.Items.Add('Order');
  end;

  // This OnDragOver event handler permits the list box to
  // accept a dropped label:

  procedure TForm1.ListBox1DragOver(Sender, Source: TObject; X, Y: Integer;
    State: TDragState; var Accept: Boolean);
  begin
    Accept := Source is TLabel;
  end;

  // This OnDragDrop event handler implements the drop behavior.

  procedure TForm1.ListBox1DragDrop(Sender, Source: TObject; X, Y: Integer);
  begin
    if (Sender is TListBox) and (Source is TLabel) then
    begin
      with Sender as TListBox do
      begin
        Font := (Source as TLabel).Font;
        Color := (Source as TLabel).Color;
        DoubleBuffered := true;
        Color := clWindow;
      end;
    end;
  end;
```

68.1.29.5.5 TPaintBox.OnDragOver Event

Occurs when the user drags an object over a control.

Pascal

```
property OnDragOver: TDragOverEvent;
```

C++

```
__property TDragOverEvent OnDragOver;
```

Description

Use an OnDragOver event to signal that the control can accept a dragged object so the user can drop or dock it.

Within the OnDragOver event handler, change the Accept parameter to false to reject the dragged object. Leave Accept as true to allow the user to drop or dock the dragged object on the control.

To change the shape of the cursor, indicating that the control can accept the dragged object, change the value of the DragCursor property for the control before the OnDragOver event occurs.

The Source is the object being dragged, the Sender is the potential drop or dock site, and X and Y are screen coordinates in pixels. The State parameter specifies how the dragged object is moving over the control.

Note: Within the OnDragOver event handler, the Accept parameter defaults to true. However, if an OnDragOver event handler is not supplied, the control rejects the dragged object, as if the Accept parameter were changed to false.

C++ Examples:

```
/*
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
*/

// This OnDragOver event handler permits the list box to
// accept a dropped label:
void __fastcall TForm1::ListBox1DragOver(TObject *Sender, TObject *Source, int X, int Y,
TDragState State, bool &Accept)
{
   Accept = Source->ClassNameIs("TLabel");
}

/*
This OnDragDrop event handler implements the drop behavior.
*/
void __fastcall TForm1::ListBox1DragDrop(TObject *Sender, TObject *Source, int X, int Y)
{
  if (Sender->ClassNameIs("TListBox") && Source->ClassNameIs("TLabel"))
  {
    TListBox *DestList = (TListBox *)Sender;
    DestList->Font = ((TLabel *)Source)->Font;
    DestList->Color = ((TLabel *)Source)->Color;
    DestList->DoubleBuffered = true;
    DestList->Color = clWindow;
  }
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  ListBox1->Items->Add("Not");
  ListBox1->Items->Add("In");
  ListBox1->Items->Add("Alphabetical");
  ListBox1->Items->Add("Order");

}
```

Delphi Examples:

```
{
This code is an OnDragOver event handler that won't allow a
label control to be dropped on a panel control and stops the
dragging of the label as soon as the user drags the label
onto the panel:
Note: Set the label's DragMode property to dmAutomatic.
}
procedure TForm1.FormDragDrop(Sender, Source: TObject; X, Y: Integer);
begin
  TForm1(Source).Left := X;
  TForm1(Source).Top := Y;
end;
```

```
procedure TForm1.FormDragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := Source is TLabel;
end;

procedure TForm1.Panel1DragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := False;
  if (Source is TLabel) and (State = dsDragEnter) then
    (Source as TLabel).EndDrag(False);
end;
{
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
}

procedure TForm1.FormCreate(Sender: TObject);
begin
  ListBox1.Items.Add('Not');
  ListBox1.Items.Add('In');
  ListBox1.Items.Add('Alphabetical');
  ListBox1.Items.Add('Order');
end;

// This OnDragOver event handler permits the list box to
// accept a dropped label:

procedure TForm1.ListBox1DragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := Source is TLabel;
end;

// This OnDragDrop event handler implements the drop behavior.

procedure TForm1.ListBox1DragDrop(Sender, Source: TObject; X, Y: Integer);
begin
  if (Sender is TListBox) and (Source is TLabel) then
  begin
    with Sender as TListBox do
    begin
      Font := (Source as TLabel).Font;
      Color := (Source as TLabel).Color;
      DoubleBuffered := true;
      Color := clWindow;
    end;
  end;
end;
```

68.1.29.5.6 TPaintBox.OnEndDock Event

Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.

Pascal

```
property OnEndDock: TEndDragEvent;
```

C++

```
__property TEndDragEvent OnEndDock;
```

Description

Use OnEndDock to specify actions or special processing that when a drag-and-dock operation stops.

68.1.29.5.7 TPaintBox.OnEndDrag Event

Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.

Pascal

```
property OnEndDrag: TEndDragEvent;
```

C++

```
__property TEndDragEvent OnEndDrag;
```

Description

Use the OnEndDrag event handler to specify any special processing that occurs when dragging stops.

C++ Examples:

```
/*
This code displays a message in a label named Status. The
message displayed depends on whether the dragged label
control was successfully dropped into and accepted by a
another control.
*/
void __fastcall TForm1::Label1EndDrag(TObject *Sender, TObject *Target, int X,
      int Y)
{
  if (Sender->ClassNameIs("TLabel"))
  {
    AnsiString S = ((TLabel *)Sender)->Name + " was dropped and ";
    if (Target)
      S = S + "accepted!";
    else
```

```
      S = S + "rejected.";
    Status->Caption = S;
  }
}
```

Delphi Examples:

```
{
This code displays a message in a label named Status. The
message displayed depends on whether the dragged label
control was successfully dropped into and accepted by a
another control.
}
procedure TForm1.Label1EndDrag(Sender, Target: TObject; X, Y: Integer);
var
  S: string;
begin
  S := (Sender as TLabel).Name + ' was dropped... and ';
  if Target <> nil then
    S := S + 'accepted!'
  else
    S := S + 'rejected!';
  Status.Caption := S;
end;
```

68.1.29.5.8 TPaintBox.OnMouseActivate Event

Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.

Pascal

```
property OnMouseActivate: TMouseActivateEvent;
```

C++

```
__property TMouseActivateEvent OnMouseActivate;
```

Description

Use the OnMouseActivate event handler to implement any special processing that should occur as a result of pressing a mouse button on a control when the parent top-level form is not active.

The event type is:

```
TMouseActivateEvent = procedure (Sender: TObject; Button: TMouseButton; ShiftState:
TShiftState;
X, Y: Integer; HitTest: Integer; var MouseActivate: TMouseActivate) of object;
```

When you click on a control and the parent top-level form is not active, this event fires on the control that the mouse cursor is over. MouseActivate is a protected virtual function in TControl. MouseActivate can be overridden in custom control descendants to provide special built-in processing of the OnMouseActivate events. If you leave the default value of MouseActivate as maDefault, the parent control fires the OnMouseActivate event and repeats the process all the way up to the top-level form. If no control in the chain sets the value of MouseActivate, the behavior is the same as if a control set TMouseActivate to maActivate. At any point, a control can set the value of TMouseActivate and the parent processing stops.

Some controls set focus to themselves when they get a button down message so, in some cases, setting maNoActivate appears

to have no effect. For instance, a TButton control sets focus to itself in the WM_LBUTTONDOWN message regardless of whether or not TMouseActivate is set to maNoActivate. In this case, setting maNoActivateAndEat will work because the top-level form is not activated and the WM_LBUTTONDOWN message is suppressed.

The HitTest parameter is the hit test value obtained from the WM_NCHITTEST message. See Windows.pas for valid values and their meanings. In most cases this value will be HTCLIENT, which means that the user clicked in the client area of a control. However, in the case of a top-level form, this can take other values such as HTCAPTION, or HTBOTTOM. This allows the code to decide which value to set for MouseActivate, based on the HitTest code. For example, the following code in the OnMouseActivate event handler for a TForm forces the user to click into a non-client area to activate the form:

```
if HitTest = HTCLIENT then
    MouseActivate := maNoActivateAndEat;
```

Even though this event is tied to how Windows processes WM_MOUSEACTIVATE, the actual handling of the message is done at the TControl level, which is the point in the VCL hierarchy where the control has no window handle. The OnMouseActivate event is then simulated since the all TControl descendants also have OnMouseDown, OnMouseMove, and OnMouseUp events. This information is applicable to both VCL Win32 and VCL.NET.

68.1.29.5.9 TPaintBox.OnMouseDown Event

Occurs when the user presses a mouse button with the mouse pointer over a control.

Pascal

```
property OnMouseDown: TMouseEvent;
```

C++

```
__property TMouseEvent OnMouseDown;
```

Description

Use the OnMouseDown event handler to implement any special processing that should occur as a result of pressing a mouse button.

The OnMouseDown event handler can respond to left, right, or center mouse button presses and shift key plus mouse-button combinations. Shift keys are the Shift, Ctrl, and Alt keys. X and Y are the pixel coordinates of the mouse pointer in the client area of the Sender.

C++ Examples:

```
/*
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a
rectangle is drawn on the form. When the mouse button is
released, the rectangle appears on the form's canvas. Its
top-left and bottom-right corners are defined by the
location of the mouse pointer when the user pressed and
released the mouse button.  While the user drags the mouse,
the location of the top, left, bottom, and right sides of
the rectangle are displayed in the status bar.
*/
```

```
int StartX, StartY; // Declare at the top of the form's unit
// Use this code as the OnMouseDown event handler of the form:
void __fastcall TForm1::FormMouseDown(TObject *Sender, TMouseButton Button, TShiftState Shift,
int X, int Y)
{
  StartX = X;
  StartY = Y;
}

// Use this code as the OnMouseUp event handler of the form:
void __fastcall TForm1::FormMouseUp(TObject *Sender, TMouseButton Button, TShiftState Shift,
int X, int Y)
{
  Form1->Canvas->Rectangle(StartX, StartY, X, Y);
  StatusBar1->Panels->Items[0]->Text = "";
  StatusBar1->Panels->Items[1]->Text = "";
  StatusBar1->Panels->Items[2]->Text = "";
  StatusBar1->Panels->Items[3]->Text = "";
}

// Use this code as the OnMouseMove event handler of the form:
void __fastcall TForm1::FormMouseMove(TObject *Sender, TShiftState Shift, int X, int Y)
{
  if (Shift.Contains(ssLeft)) // make sure button is down
  {
    if (Y > StartY)
    {
      StatusBar1->Panels->Items[0]->Text = "Top: " + IntToStr(StartY);
      StatusBar1->Panels->Items[2]->Text = "Bottom: " + IntToStr(Y);
    }
    else
    {
      StatusBar1->Panels->Items[0]->Text = "Top: " + IntToStr(Y);
      StatusBar1->Panels->Items[2]->Text = "Bottom: " + IntToStr(StartY);
    }
    if (X > StartX)
    {
      StatusBar1->Panels->Items[1]->Text = "Left: " + IntToStr(StartX);
      StatusBar1->Panels->Items[3]->Text = "Right: " + IntToStr(X);
    }
    else
    {
      StatusBar1->Panels->Items[1]->Text = "Left: " + IntToStr(X);
      StatusBar1->Panels->Items[3]->Text = "Right: " + IntToStr(StartX);
    }
  }
}
```

Delphi Examples:

```
{
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a
rectangle is drawn on the form. When the mouse button is
released, the rectangle appears on the form's canvas. Its
top-left and bottom-right corners are defined by the
location of the mouse pointer when the user pressed and
released the mouse button.  While the user drags the mouse,
the location of the top, left, bottom, and right sides of
the rectangle are displayed in the status bar.
}
procedure TForm1.FormMouseDown(Sender: TObject; Button: TMouseButton; Shift: TShiftState; X,
Y: Integer);
begin
  StartX := X;
```

```
    StartY := Y;
  end;

  procedure TForm1.FormMouseUp(Sender: TObject; Button: TMouseButton; Shift: TShiftState; X, Y:
  Integer);
  begin
    Form1.Canvas.Rectangle(StartX, StartY, X, Y);
    StatusBar1.Panels[0].Text := '';
    StatusBar1.Panels[1].Text := '';
    StatusBar1.Panels[2].Text := '';
    StatusBar1.Panels[3].Text := '';
  end;

  procedure TForm1.FormMouseMove(Sender: TObject; Shift: TShiftState; X, Y: Integer);
  begin
    if ssLeft in Shift then { make sure button is down }
    begin
      if Y > StartY then
        begin
        StatusBar1.Panels[0].Text := 'Top: ' + IntToStr(StartY);
        StatusBar1.Panels[2].Text := 'Bottom: ' + IntToStr(Y);
        end
      else
        begin
        StatusBar1.Panels[0].Text := 'Top: ' + IntToStr(Y);
        StatusBar1.Panels[2].Text := 'Bottom: ' + IntToStr(StartY);
        end;
      if X > StartX then
        begin
        StatusBar1.Panels[1].Text := 'Left: ' + IntToStr(StartX);
        StatusBar1.Panels[3].Text := 'Right: ' + IntToStr(X);
        end
      else
        begin
        StatusBar1.Panels[1].Text := 'Left: ' + IntToStr(X);
        StatusBar1.Panels[3].Text := 'Right: ' + IntToStr(StartX);
        end;
    end;
  end;

68.1.29.5.10 TPaintBox.OnMouseEnter Event

Occurs when the user moves the mouse into a control.

Pascal

```
property OnMouseEnter: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnMouseEnter;
```

Description

Use the OnMouseEnter event handler to implement any special processing that should occur as a result of moving the mouse into a control when the parent top-level form is not active.

68.1.29.5.11 TPaintBox.OnMouseLeave Event

Occurs when the user moves the mouse outside of a control.

Pascal

```
property OnMouseLeave: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnMouseLeave;
```

Description

Use the OnMouseLeave event handler to implement any special processing that should occur as a result of moving the mouse outside of a control when the parent top-level form is not active.

68.1.29.5.12 TPaintBox.OnMouseMove Event

Occurs when the user moves the mouse pointer while the mouse pointer is over a control.

Pascal

```
property OnMouseMove: TMouseMoveEvent;
```

C++

```
__property TMouseMoveEvent OnMouseMove;
```

Description

Use the OnMouseMove event handler to respond when the mouse pointer moves after the control has captured the mouse.

Use the Shift parameter of the OnMouseDown event handler, to determine to the state of the shift keys and mouse buttons. Shift keys are the Shift, Ctrl, and Alt keys or shift key-mouse button combinations. X and Y are pixel coordinates of the new location of the mouse pointer in the client area of the Sender.

C++ Examples:

```
/*
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a

68.1.29.5.13 TPaintBox.OnMouseUp Event

Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.

Pascal

```
property OnMouseUp: TMouseEvent;
```

C++

```
__property TMouseEvent OnMouseUp;
```

Description

Use an OnMouseUp event handler to implement special processing when the user releases a mouse button.

The OnMouseUp event handler can respond to left, right, or center mouse button presses and shift key plus mouse-button combinations. Shift keys are the Shift, Ctrl, and Alt keys. X and Y are the pixel coordinates of the mouse pointer in the client area of the Sender.

C++ Examples:

```
/*
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a

Responding to a Mouse-up Action

68.1.29.5.14 TPaintBox.OnPaint Event

OnPaint occurs when the paintbox receives a Windows paint message.

Pascal

```
property OnPaint: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnPaint;
```

Description

Write an OnPaint event handler to draw the image of the paint box. The OnPaint event fires when the system repaints the TPaintBox (see page 12981) control. If there is a handler for this event, its code is executed when the OnPaint event fires.

Use properties and methods of the canvas (such as LineTo, Draw, and TextOut) to programmatically construct the image that the paintbox presents on a form. This can consist of a number of operations including drawing lines, images, and shapes. A TPaintBox (see page 12981) itself has no visible manifestation, so if an OnPaint event handler is not provided or no drawing is done in the event handler, the paintbox can not be seen on the form at runtime.

C++ Examples:

```
/*
When you do custom drawing, such as shown in the code for
the Button's OnClick event handler below, this drawing will
not be persistent and will be "erased" the first time the
PaintBox component needs to repaint.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
   PaintBox1->Canvas->Brush->Color = clRed;
   PaintBox1->Canvas->FillRect(PaintBox1->Canvas->ClipRect);
   PaintBox1->Canvas->Ellipse(0,0,100,100);
}

/*
In order for the drawing to be persistent, you need to also
include an OnPaint event handler that tells the PaintBox how
to redraw itself when it needs to. In the code below, an
ellipse will be drawn everytime the PaintBox renders itself,
but the PaintBox will only paint the client area of the
control red after the Button is clicked. This client area
will only stay red until it is invalidated, but the ellipse
will persist. This behavior is different from the TImage
component, because the TImage component maintains an
internal bitmap that stores this drawing information for
you.
*/
void __fastcall TForm1::PaintBox1Paint(TObject *Sender)
{
   PaintBox1->Canvas->Brush->Color = clBlue;
   PaintBox1->Canvas->Ellipse(0,0,100,100);
}
/*
This example paints a white five-pointed star in a paintbox
control:
*/
void __fastcall TForm1::PaintBox1Paint(TObject *Sender)
{
  TPaintBox *pPB = (TPaintBox *)Sender;
  TPoint points[6];
  pPB->Canvas->Pen->Color = clWhite;
  points[0].x = 40;
  points[0].y = 10;
  points[1].x = 20;
  points[1].y = 60;
  points[2].x = 70;
  points[2].y = 30;
  points[3].x = 10;
  points[3].y = 30;
  points[4].x = 60;
  points[4].y = 60;
  points[5].x = 40;
  points[5].y = 10;
  pPB->Canvas->Polyline(points,5);
}
```

Delphi Examples:

```
{
When you do custom drawing, such as shown in the code for
```

```
the Button's OnClick event handler below, this drawing will
not be persistent and will be "erased" the first time the
PaintBox component needs to repaint.
}
procedure TForm1.Button1Click(Sender: TObject);
begin
   PaintBox1.Canvas.Brush.Color := clRed;
   PaintBox1.Canvas.FillRect(PaintBox1.Canvas.ClipRect);
   PaintBox1.Canvas.Brush.Color := clBlue;
   PaintBox1.Canvas.Ellipse(0,0,100,50);
end;
{
In order for the drawing to be persistent, you need to also
include an OnPaint event handler that tells the PaintBox how
to redraw itself when it needs to. In the code below, an
ellipse will be drawn everytime the PaintBox renders itself,
but the PaintBox will only paint the client area of the
control red after the Button is clicked. This client area
will only stay red until it is invalidated, but the ellipse
will persist. This behavior is different from the TImage
component, because the TImage component maintains an
internal bitmap that stores this drawing information for
you.
}
procedure TForm1.PaintBox1Paint(Sender: TObject);
begin
   PaintBox1.Canvas.Brush.Color := clBlue;
   PaintBox1.Canvas.Ellipse(0,0,100,50);
end;
{
This example paints a white five-pointed star in a paintbox
control:
}
procedure TForm1.PaintBox1Paint(Sender: TObject);
begin
  with Sender as TPaintBox do
  begin
    Canvas.Pen.Color := clWhite;
    Canvas.Polyline([Point(40, 10), Point(20, 60), Point(70, 30),
    Point(10, 30), Point(60, 60), Point(40, 10)]);
  end;
end;
```

68.1.29.5.15 TPaintBox.OnStartDock Event

Occurs when the user begins to drag a control with a DragKind of dkDock.

Pascal

```
property OnStartDock: TStartDockEvent;
```

C++

```
__property TStartDockEvent OnStartDock;
```

Description

Use the OnStartDock event handler to implement special processing when the user starts a drag-and-dock operation by dragging the control.

The OnStartDock event handler can create a TDragDockObjectEx object for the DragObject parameter to specify the

appearance of the dragging rectangle and how the dragged control interacts with potential docking sites. If you return TDragDockObjectEx as the drag object, there is no need to call the Free method for the DragObject when dragging is over. If you use TDragDockObject, your application is responsible for freeing the drag object.

If the OnStartDock event handler sets the DragObject parameter to nil (Delphi) or NULL (C++), a TDragDockObject object is automatically created.

Note: This information applies to Win32 applications only.

See Also

OnEndDock (see page 5859)

TDragDockObjectEx (see page 6018)

DragKind (see page 5819)

OnDragOver (see page 5857)

OnDockDrop (see page 6214)

68.1.29.5.16 TPaintBox.OnStartDrag Event

Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.

Pascal

```
property OnStartDrag: TStartDragEvent;
```

C++

```
__property TStartDragEvent OnStartDrag;
```

Description

Use the OnStartDrag event handler to implement special processing when the user starts to drag the control or an object it contains. OnStartDrag only occurs if DragKind is dkDrag.

Sender is the control that is about to be dragged, or that contains the object about to be dragged.

The OnStartDrag event handler can create a TDragControlObjectEx instance for the DragObject parameter to specify the drag cursor, or, optionally, a drag image list. If you create a TDragControlObjectEx instance, there is no need to call the Free method for the DragObject when dragging is over. If you create, instead, a TDragControlObject instance, your application is responsible for freeing the drag object instance.

If the OnStartDrag event handler sets the DragObject parameter to nil (Delphi) or NULL (C++), a TDragControlObject object is automatically created and dragging begins on the control itself.

Note: On some controls, such as TRichEdit, the underlying Windows control handles internal drag operations. For these controls, there are no OnStartDrag or OnEndDrag events for drag operations within the control.

68.1.30 TPanel Class

TPanel implements a generic panel control.

Class Hierarchy

Pascal

```
TPanel = class(TCustomPanel);
```

C++

```
class TPanel : public TCustomPanel;
```

File

ExtCtrls

Description

Use TPanel to put an empty panel on a form. Panels have properties for providing a beveled border around the control, as well as methods to help manage the placement of child controls embedded in the panel.

You can also use panels to group controls together, similar to the way you can use a group box, but with a beveled border (or no border) rather than the group box outline. Panels are typically used for groups of controls within a single form. If you intend to use the same grouping in other forms, you may want to use a frame instead.

Panels with no borders are useful as docking sites when writing applications that use drag-and-dock.

Although you can use a panel to implement a status bar or tool bar, it is recommended that you use the TToolBar and TStatusBar classes instead.

68.1.30.1 TPanel Members

The following tables list the members exposed by TPanel.

Protected Events

	Name	Description
	OnKeyDown (see page 6225)	Occurs when a user presses any key while the control has focus.
	OnKeyPress (see page 6227)	Occurs when a key is pressed.
	OnKeyUp (see page 6228)	Occurs when the user releases a key that has been pressed.
	OnMouseWheel (see page 5869)	Occurs when the mouse wheel is rotated.
	OnMouseWheelDown (see page 5869)	Occurs when the mouse wheel is rotated downward.
	OnMouseWheelUp (see page 5870)	Occurs when the mouse wheel is rotated upward.

Protected Fields

	Name	Description
	FAnchorMove (see page 5733)	This is FAnchorMove, a member of class TControl.
	FAnchorOrigin (see page 5734)	This is FAnchorOrigin, a member of class TControl.
	FAnchorRules (see page 5734)	This is FAnchorRules, a member of class TControl.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FDesignSize (see page 6124)	This is FDesignSize, a member of class TWinControl.
	FDoubleBuffered (see page 6124)	This is FDoubleBuffered, a member of class TWinControl.
	FExplicitHeight (see page 5734)	This is FExplicitHeight, a member of class TControl.
	FExplicitLeft (see page 5734)	This is FExplicitLeft, a member of class TControl.
	FExplicitTop (see page 5734)	This is FExplicitTop, a member of class TControl.
	FExplicitWidth (see page 5735)	This is FExplicitWidth, a member of class TControl.
	FInImeComposition (see page 6125)	This is FInImeComposition, a member of class TWinControl.
	FOriginalParentSize (see page 5735)	This is FOriginalParentSize, a member of class TControl.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	ActionChange (see page 5737)	Responds when the action associated with the control changes.
V	ActionChange (see page 6127)	Updates the control to reflect changes in its associated action.
	AddBiDiModeExStyle (see page 6128)	Sets control's window style according to its bi-directional support.
V	AdjustClientRect (see page 6128)	Provides the interface that adjusts the ClientRect (see page 5810) property for idiosyncrasies of the window.

	AdjustClientRect (see page 12537)	Adjusts the ClientRect property for the idiosyncrasies of the window.
	AdjustSize (see page 5738)	Sets the size of the control as determined by the AutoSize (see page 5803) property.
	AdjustSize (see page 6129)	Adjusts the control's size according to its contents and constraints.
	AlignControls (see page 6129)	Aligns any controls for which the control is the parent within a specified area of the control.
	ArrangeControl (see page 6130)	This is ArrangeControl, a member of class TWinControl.
	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	AssignTo (see page 5739)	Overrides the inherited AssignTo function to enable assignments to TAction objects.
	AssignTo (see page 6130)	Copies the properties of the windowed control to another object.
	BeginAutoDrag (see page 5739)	Begin Automatic Drag.
	CalcCursorPos (see page 5741)	This is CalcCursorPos, a member of class TControl.
	CanAutoSize (see page 5741)	Indicates whether the control can resize itself automatically to accommodate its contents.
	CanAutoSize (see page 6131)	Indicates how the control can be resized.
	CanAutoSize (see page 12537)	Adjusts the way the panel responds to resize attempts.
	CanResize (see page 5742)	OnCanResize (see page 5851) event dispatcher.
	CanResize (see page 6132)	Indicates how the control can respond to a resize attempt.
	Changed (see page 5742)	Sends a CM_CHANGED (see page 6330) message to the control.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	ChangeScale (see page 5743)	Rescaling event dispatcher.
	ChangeScale (see page 6132)	Resize (see page 5780) and reposition children and self.
	Click (see page 5743)	Respond to user click.
	ConstrainedResize (see page 5746)	Notify control of resize with constraints.
	ConstrainedResize (see page 6133)	Generates an OnConstrainedResize (see page 5853) event.
	ControlsAligned (see page 6134)	This is ControlsAligned, a member of class TWinControl.
	CreateDockManager (see page 6134)	Creates the dock manager for the control.
	CreateHandle (see page 6135)	Creates underlying screen object.
	CreateParams (see page 6135)	Initializes a window-creation parameter data structure.
	CreateParams (see page 12537)	Initializes a window-creation parameter record passed in the Params parameter.
	CreateSubClass (see page 6136)	Creates a windowed control derived from an existing Windows window class.
	CreateWindowHandle (see page 6137)	Creates a Windows control to represent the control.
	CreateWnd (see page 6137)	Creates the underlying window.
	CustomAlignInsertBefore (see page 6137)	Returns placement order of custom-aligned child control.
	CustomAlignPosition (see page 6138)	Returns aligned position of custom-aligned child control.
	DblClick (see page 5747)	OnDblClick (see page 5854) event dispatcher.
	DefaultDockImage (see page 5747)	Handles the painting and erasing of a dock image.
	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	DefineProperties (see page 5748)	Provides methods to read and write the IsControl (see page 5829) property to a stream such as a form file.
	DefineProperties (see page 6139)	Provides methods to read and write the IsControl property to a stream such as a form file.
	DesignWndProc (see page 5749)	This is DesignWndProc, a member of class TControl.
	DestroyHandle (see page 6140)	Destroys the control's window without destroying the control.
	DestroyWindowHandle (see page 6140)	Destroys the window created in the CreateWindowHandle (see page 6137) method.
	DestroyWnd (see page 6141)	Destroys the control's window.
	DoAddDockClient (see page 6142)	Performs actions when a control is docked to the windowed control.
	DockOver (see page 6143)	Responds when a docking client is dragged over the windowed control.
	DockReplaceDockClient (see page 6143)	This is DockReplaceDockClient, a member of class TWinControl.
	DockTrackNoTarget (see page 5749)	Handles dragging of the control over an invalid docking target.
	DoContextPopup (see page 5750)	OnContextPopup (see page 5854) event dispatcher.

	DoDock (see page 5750)	Docking event dispatcher.
	DoDockOver (see page 6143)	Generates an OnDockOver (see page 6216) event.
	DoEndDock (see page 5750)	OnEndDock (see page 5859) event dispatcher.
	DoEndDrag (see page 5751)	OnEndDrag (see page 5860) event dispatcher.
	DoEnter (see page 6144)	Respond to receiving input focus.
	DoExit (see page 6144)	Respond to losing input focus
	DoFlipChildren (see page 6145)	Flips the control's children.
	DoKeyDown (see page 6145)	Performs some preprocessing before generating an OnKeyDown (see page 6225) event.
	DoKeyPress (see page 6146)	Performs some preprocessing before generating an OnKeyPress (see page 6227) event.
	DoKeyUp (see page 6146)	Performs some preprocessing before generating an OnKeyUp (see page 6228) event.
	DoMouseWheel (see page 5751)	Processes mouse wheel motion.
	DoMouseWheelDown (see page 5752)	OnMouseWheelDown (see page 5869) event dispatcher.
	DoMouseWheelUp (see page 5752)	OnMouseWheelUp (see page 5870) event dispatcher.
	DoRemoveDockClient (see page 6147)	Responds when a control is undocked from the windowed control.
	DoStartDock (see page 5753)	OnStartDock (see page 5871) event dispatcher.
	DoStartDrag (see page 5753)	OnStartDrag (see page 5871) event dispatcher.
	DoUnDock (see page 6147)	Undocks a control that is currently docked to the windowed control.
	DragCanceled (see page 5754)	Provides the interface for a method that responds to the cancellation of a drag.
	DragOver (see page 5755)	OnDragOver (see page 5857) event dispatcher.
	DrawDragDockImage (see page 5755)	Draws the dock image for the control.
	EraseDragDockImage (see page 5757)	Erases the dock image for the control.
	FindNextControl (see page 6149)	Returns the control's next child in the tab order after the specified control.
	FixupTabList (see page 6149)	Sorts the child controls by their tab order.
V	GetAction (see page 5758)	This is GetAction, a member of class TControl.
	GetActionLinkClass (see page 5758)	Returns the appropriate action link class that is associated with the control class.
V	GetActionLinkClass (see page 6152)	Returns the associated action link class.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetChildren (see page 6153)	Calls a specified method for each child of the control.
V	GetClientOrigin (see page 5758)	Returns the screen coordinates of the top-left corner of the control's client area.
V	GetClientOrigin (see page 6153)	Returns the value of the ClientOrigin (see page 5809) property.
V	GetClientRect (see page 5759)	Returns a rectangle defining the client area of the control.
V	GetClientRect (see page 6154)	Returns the value of the ClientRect (see page 5810) property.
V	GetControlExtents (see page 6154)	Returns the smallest rectangle in which all the control's children fit.
V	GetDeviceContext (see page 5760)	Returns a device context for the control.
V	GetDeviceContext (see page 6155)	Provides access to a device context for the control.
	GetDockEdge (see page 5763)	Returns the edge on which another control should be docked when it is dragged over the control.
V	GetDragImages (see page 5763)	Returns the control's image list containing the image to be displayed while dragging.
V	GetEnabled (see page 5763)	Returns the value of the Enabled (see page 5821) property.
V	GetFloating (see page 5764)	Returns the value of the Floating (see page 5823) property.
V	GetFloatingDockSiteClass (see page 5764)	Returns the class used for the control when it is floating.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetPalette (see page 5765)	Returns the handle to a palette for use by the control.
	GetParentHandle (see page 6157)	Returns the window handle for the window of the control's parent.
	GetPopupMenu (see page 5765)	Returns the pop-up menu associated with the control.
	GetSiteInfo (see page 6158)	Generates an OnGetSiteInfo (see page 6223) event

	GetTopParentHandle (see page 6159)	Returns the window handle of the first window not associated with a VCL control that contains the windowed control.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	InvalidateDockHostSite (see page 6162)	This is InvalidateDockHostSite, a member of class TWinControl.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsControlActivateMsg (see page 6162)	This is IsControlActivateMsg, a member of class TWinControl.
	IsControlMouseMsg (see page 6162)	Indicates whether a specified mouse message is directed to one of the windowed control's child controls.
	IsQualifyingSite (see page 6163)	This is IsQualifyingSite, a member of class TWinControl.
	KeyDown (see page 6163)	Respond to key press events.
	KeyPress (see page 6163)	Respond to keyboard input.
	KeyUp (see page 6164)	Respond to released key.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Loaded (see page 5771)	Initializes the control after it is loaded from a stream.
	MainWndProc (see page 6165)	Receives Windows messages for the control.
	MouseActivate (see page 5773)	This is MouseActivate, a member of class TControl.
	MouseDown (see page 5773)	OnMouseDown (see page 5862) event dispatcher.
	MouseMove (see page 5773)	Respond to mouse moving over control area..
	MouseUp (see page 5774)	OnMouseUp (see page 5867) event dispatcher.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	Notification (see page 5775)	Responds to notifications that components are being created or destroyed.
V	Notification (see page 6165)	Responds to notifications that components are being created or destroyed.
	NotifyControls (see page 6165)	Sends a message to all the child controls.
V	Paint (see page 5920)	Renders the image of a custom control.
V	Paint (see page 12538)	Renders the image of the panel.
	PaintControls (see page 6166)	Paints each of the child controls in a windowed control using the specified device context.
	PaintHandler (see page 6166)	Responds to WM_PAINT messages.
V	PaintWindow (see page 5920)	Renders the image of the control on a specified device context.
V	PaintWindow (see page 6169)	Renders the image of a windowed control.
	PaletteChanged (see page 5775)	Responds to changes in the system's palette by realizing the control's palette.
V	PaletteChanged (see page 6170)	Responds to changes in the system's palette by realizing the control's palette and the palette for each child control.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	PositionDockRect (see page 5777)	Positions the docking rectangle according to the current drag-and-dock state.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 5778)	Prepares the control for having its properties assigned values read from a stream.
V	ReadState (see page 6171)	Prepares the control for having its properties assigned values from a stream.
	RecreateWnd (see page 6171)	Recreate underlying Windows screen object.
	ReloadDockedControl (see page 6172)	Reloads a docked control.
	RemoveWindowProps (see page 6174)	This is RemoveWindowProps, a member of class TWinControl.
V	RequestAlign (see page 5780)	Instructs the parent of a control to reposition the control, enforcing its Align (see page 5798) property.
	ResetIme (see page 6174)	Restores the input method editor (IME) that was active when the application started.
	ResetImeComposition (see page 6175)	Directs the composition window of the input method editor (IME) to perform a specific action.
	Resize (see page 5780)	Respond to control resize.
	ScaleConstraints (see page 5781)	This is ScaleConstraints, a member of class TControl.
	ScaleControls (see page 6176)	Rescale child controls only.
	SelectFirst (see page 6177)	Locates first selectable child control.
	SelectNext (see page 6177)	Moves the input focus from the current child control to the next one in the tab order.

	SendCancelMode (see page 5781)	Cancels the modal state of the control.
	SendDockNotification (see page 5782)	Sends a Windows message to the control's host dock site.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
V	SetAutoSize (see page 5783)	This is SetAutoSize, a member of class TControl.
V	SetBiDiMode (see page 5783)	Sets the control's bi-directional mode.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
V	SetChildOrder (see page 6178)	Changes the order in which the child component appears in the list of child components returned by the GetChildren (see page 6153) method.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
V	SetDragMode (see page 5785)	Sets the drag mode for the control.
V	SetEnabled (see page 5785)	Sets the value of the Enabled (see page 5821) property.
	SetIme (see page 6181)	Activates an input method editor (IME) using the values specified by the ImeMode (see page 6207) and ImeName (see page 6208) properties.
	SetImeCompositionWindow (see page 6181)	Sets the position and font of the composition window.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
V	SetName (see page 5785)	Sets the name of the control.
V	SetParent (see page 5786)	Sets the parent of the control.
V	SetParent (see page 6182)	Sets the parent of the control.
V	SetParentBackground (see page 6182)	This is SetParentBackground, a member of class TWinControl.
V	SetParentBackground (see page 12539)	This is SetParentBackground, a member of class TCustomPanel.
V	SetParentBiDiMode (see page 5786)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 5787)	Sets the parent for the control.
	SetZOrder (see page 5788)	Repositions the control in its parent's control list, thereby changing position onscreen.
V	SetZOrder (see page 6182)	Moves the control to the top or bottom of the parent control's (or screen's) list of TWinControl (see page 6112) controls.
V	ShowControl (see page 6183)	Ensures that a specified child control is visible.
	UpdateBounds (see page 6185)	This is UpdateBounds, a member of class TWinControl.
	UpdateBoundsRect (see page 5789)	Changes the Top (see page 5844), Left (see page 5830), Width (see page 5849), and Height (see page 5825) properties of the control, but doesn't update its screen image and bypasses all resize events.
V	UpdateControlOriginalParentSize (see page 6186)	This is UpdateControlOriginalParentSize, a member of class TWinControl.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateExplicitBounds (see page 5789)	This is UpdateExplicitBounds, a member of class TControl.
	UpdateRecreatingFlag (see page 6186)	This is UpdateRecreatingFlag, a member of class TWinControl.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	UpdateUIState (see page 6186)	Updates form User Interface State as needed
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	VisibleChanging (see page 5791)	Provides the interface for a method that responds to changes in the control's visibility.
V	WndProc (see page 5791)	Provides specific message responses for the control.
V	WndProc (see page 6187)	Provides specific message responses for the control.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	ActionLink (see page 5798)	Contains the action link object associated with the control.
R	Canvas (see page 5921)	Specifies the TCanvas object that presents a drawing surface for the control.
	DefWndProc (see page 6199)	Specifies the default window procedure for the windowed control.
	DesktopFont (see page 5818)	Specifies whether the control uses the Windows icon font when writing text.
	ImeMode (see page 6207)	Determines the behavior of the input method editor (IME).
	ImeName (see page 6208)	Specifies the input method editor (IME) to use for converting keyboard input to Asian language characters.
	IsControl (see page 5829)	Determines whether a form stores its form-specific properties to a stream.
	MouseCapture (see page 5831)	Indicates whether the control has "captured" mouse events.
	ScalingFlags (see page 5840)	Reflects which attributes of the control have been scaled.
	Text (see page 5842)	Contains a text string associated with the control.
	WheelAccumulator (see page 5849)	Accumulates mouse wheel rotations.
	WindowHandle (see page 6212)	Provides access to a window handle for the control.
	WindowText (see page 5850)	Contains the text string of the control.

Public Events

	Name	Description
	WindowProc (see page 5872)	Points to the window procedure that responds to messages sent to the control.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	BeginDrag (see page 5740)	Starts the dragging of a control.
	BringToFront (see page 5740)	Puts the control in front of all other controls in its parent control.
	Broadcast (see page 6130)	Sends a message to each of the child controls.
	CanFocus (see page 6131)	Indicates whether a control can receive focus.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	ClientToParent (see page 5744)	Translates client coordinates to parent coordinates.
	ClientToScreen (see page 5744)	Translates a given point from client area coordinates to global screen coordinates.
	ContainsControl (see page 6133)	Indicates whether a specified control exists within the control.
	ControlAtPos (see page 6133)	Returns the child control located at a specified position within the control.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
V	Create (see page 5731)	Creates an instance of TControl (see page 5724).
V	Create (see page 5918)	Creates an instance of TCustomControl (see page 5908).
V	Create (see page 6123)	Creates an instance of TWinControl (see page 6112).
V	Create (see page 12536)	Creates and initializes an instance of TCustomPanel (see page 12525).
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	CreateParented (see page 6123)	Creates and initializes a control as the child of a specified non-VCL container.
	CreateParentedControl (see page 6136)	Creates and initializes a control as the child of a specified non-VCL window.
V	DefaultHandler (see page 5748)	Provides message handling for all messages that do not have specific handlers.

	DefaultHandler (see page 6139)	Provides message handling for all messages that the control does not fully process itself.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 2766)	Disposes of the component and its owned components.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 5732)	Destroys an instance of TControl (see page 5724).
	Destroy (see page 5919)	Destroys an instance of TCustomControl (see page 5908).
	Destroy (see page 6124)	Destroys an instance of TWinControl (see page 6112).
	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	DisableAlign (see page 6141)	Disables the realignment of child controls.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Dock (see page 5749)	Used internally to dock the control.
	DockDrop (see page 6142)	Generates an OnDockDrop (see page 6214) event.
	DragDrop (see page 5754)	OnDragDrop (see page 5855) event dispatcher.
	Dragging (see page 5754)	Indicates whether a control is being dragged.
	DrawTextBiDiModeFlags (see page 5756)	Returns the text flags that reflect the current setting of the BiDiMode (see page 5803) property.
	DrawTextBiDiModeFlagsReadingOnly (see page 5756)	Returns the text flag to add that indicates whether the control's text should read from right to left.
	EnableAlign (see page 6148)	Decrements the reference count incremented by the DisableAlign (see page 6141) method, eventually realigning the child controls.
	EndDrag (see page 5757)	Stops a control from being dragged any further.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindChildControl (see page 6148)	Returns a child control given its name.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FlipChildren (see page 6150)	Reverses the positions of child controls.
	Focused (see page 6150)	Determines whether the control has input focus.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetControlsAlignment (see page 5759)	Indicates how text is aligned within the control.
	GetControlsAlignment (see page 12538)	Returns the alignment of text in the panel.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetParentComponent (see page 5765)	Returns the parent of the control.
	GetTabOrderList (see page 6158)	Builds a list of controls in tab order.
	GetTextBuf (see page 5766)	Retrieves the control's text, copies it into a buffer, and returns the number of characters copied.
	GetTextLen (see page 5767)	Returns the length of the control's text.
	HandleAllocated (see page 6159)	Reports whether a screen object handle exists for the control.
	HandleNeeded (see page 6160)	Creates a screen object for the control if it doesn't already exist.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.

	HasParent (see page 5768)	Indicates whether the control has a parent.
	Hide (see page 5769)	Makes the control invisible.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitiateAction (see page 5769)	Calls the action link's Update (see page 5789) method if the control is associated with an action link.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InsertControl (see page 6160)	Inserts a control into the Controls (see page 6197) array property.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	Invalidate (see page 5770)	Completely repaint control.
	Invalidate (see page 6161)	Schedules a control repaint.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	IsRightToLeft (see page 5770)	Indicates whether the control should be reversed right to left.
	ManualDock (see page 5771)	Docks the control.
	ManualFloat (see page 5772)	Undocks the control.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	MouseWheelHandler (see page 5774)	Dispatches messages received from a mouse wheel.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	PaintTo (see page 6167)	This is the overview for the PaintTo method overload.
	ParentToClient (see page 5776)	Translate parent coordinates to client coordinates.
	Perform (see page 5776)	Responds as if the control received a specified Windows message.
	PreProcessMessage (see page 6170)	This is PreProcessMessage, a member of class TWinControl.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	Realign (see page 6171)	Forces the control to realign children.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	Refresh (see page 5779)	Repaints the control on the screen.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveControl (see page 6172)	Removes a specified control from the Controls (see page 6197) array.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
	Repaint (see page 5779)	Forces the control to repaint its image on the screen.
	Repaint (see page 6174)	Repaints the entire control.
	ReplaceDockedControl (see page 5779)	Docks the control in the place where another control is already docked.
	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	ScaleBy (see page 6175)	Rescale control and its children.
	ScreenToClient (see page 5781)	Converts the screen coordinates of a specified point on the screen to client coordinates.
	ScrollBy (see page 6176)	Scroll control contents.
	SendToBack (see page 5782)	Puts a windowed control behind all other windowed controls, or puts a non-windowed control behind all other non-windowed controls.
	SetBounds (see page 5783)	Sets the Left (see page 5830), Top (see page 5844), Width (see page 5849), and Height (see page 5825) properties all at once.
	SetBounds (see page 6178)	Sets the windowed control's boundary properties all at once.
	SetDesignVisible (see page 5784)	Makes a control visible at design time.
	SetDesignVisible (see page 6178)	Makes a control visible at design time.
	SetFocus (see page 6179)	Gives the input focus to the control.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	SetTextBuf (see page 5787)	Sets the text of the control.
	Show (see page 5788)	Makes a control visible.
	Update (see page 5789)	Processes any pending paint messages immediately.
	Update (see page 6183)	Forces the control to update.

	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	UpdateControlState (see page 6186)	Respond to state change.
	UseRightToLeftAlignment (see page 5790)	Specifies whether the control's alignment should be reversed right-to-left.
	UseRightToLeftReading (see page 5790)	Specifies whether the control is using a right-to-left reading order.
	UseRightToLeftScrollBar (see page 5791)	Specifies whether the vertical scroll bar appears on the left side of the control.

Public Properties

	Name	Description
	Action (see page 5797)	Designates the action associated with the control.
R	AlignDisabled (see page 6192)	Indicates child control realignment disabled.
	BoundsRect (see page 5803)	Specifies the bounding rectangle of the control, expressed in the coordinate system of the parent control.
R	Brush (see page 6195)	Determines the color and pattern used for painting the background of the control.
	ClientHeight (see page 5808)	Specifies the height of the control's client area in pixels.
R	ClientOrigin (see page 5809)	Specifies the screen coordinates (in pixels) of the top left corner of a control's client area.
R	ClientRect (see page 5810)	Specifies the size (in pixels) of a control's client area.
	ClientWidth (see page 5811)	Specifies the horizontal size of the control's client area in pixels.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
R	ControlCount (see page 6195)	Returns the number of child controls.
R	Controls (see page 6197)	Lists all child controls.
	ControlState (see page 5813)	Indicates the current state of a control at runtime.
	ControlStyle (see page 5814)	Determines style characteristics of the control.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	DockClientCount (see page 6199)	Specifies the number of controls that are docked on the windowed control.
R	DockClients (see page 6201)	Lists the controls that are docked to the windowed control.
	DockManager (see page 13060)	Specifies the control's docking manager interface.
	DockOrientation (see page 5818)	Specifies how the control is docked relative to other controls docked in the same parent.
	DoubleBuffered (see page 6205)	Determines whether the control's image is rendered directly to the window or painted to an in-memory bitmap first.
R	ExplicitHeight (see page 5821)	Specifies the explicit vertical size of the control in pixels.
R	ExplicitLeft (see page 5822)	Specifies the explicit horizontal pixel coordinate of the left edge of a component relative to its parent.
R	ExplicitTop (see page 5822)	Specifies the explicit vertical pixel coordinate of the top edge of a component relative to its parent.
R	ExplicitWidth (see page 5822)	Specifies the explicit horizontal size of the control in pixels.
R	Floating (see page 5823)	Indicates whether the control is floating.
	FloatingDockSiteClass (see page 5823)	Specifies the class of the temporary control that hosts the control when it is floating.
R	Handle (see page 6207)	Provides access to the underlying Windows screen object for the control.
	HostDockSite (see page 5829)	Specifies the control in which the control is docked.
	LRDockWidth (see page 5831)	Specifies the width of the control when it is docked horizontally.
R	MouseInClient (see page 6209)	This is MouseInClient, a member of class TWinControl.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Parent (see page 5832)	Indicates the parent of the control.
	ParentWindow (see page 6210)	Reference to parent's underlying control.
R	Showing (see page 6210)	Indicates whether the control is showing on the screen.
	TBDockHeight (see page 5842)	Specifies the height of the control when it is docked vertically.

	UndockHeight (see page 5845)	Specifies the height of the control when it is floating.
	UndockWidth (see page 5846)	Specifies the width of the control when it is floating.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
R	VisibleDockClientCount (see page 6212)	Specifies the number of visible controls that are docked on the windowed control.

Published Events

	Name	Description
	OnAlignInsertBefore (see page 13080)	Occurs when an object with custom alignment is aligned.
	OnAlignPosition (see page 13081)	Occurs when an object with custom alignment is aligned.
	OnCanResize (see page 13082)	Occurs when an attempt is made to resize the control.
	OnClick (see page 13082)	Occurs when the user clicks the control.
	OnConstrainedResize (see page 13084)	Adjust resize constraints.
	OnContextPopup (see page 13084)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnDblClick (see page 13085)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDockDrop (see page 13085)	Occurs when another control is docked to the control.
	OnDockOver (see page 13087)	Occurs when another control is dragged over the control.
	OnDragDrop (see page 13090)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 13092)	Occurs when the user drags an object over a control.
	OnEndDock (see page 13094)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 13095)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnEnter (see page 13096)	Occurs when a control receives the input focus.
	OnExit (see page 13098)	Occurs when the input focus shifts away from one control to another.
	OnGetSiteInfo (see page 13100)	Returns the control's docking information.
	OnMouseActivate (see page 13102)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 13103)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseEnter (see page 13105)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 13105)	Occurs when the user moves the mouse outside of a control.
	OnMouseMove (see page 13105)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 13108)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnResize (see page 13110)	Occurs immediately after the control is resized.
	OnStartDock (see page 13111)	Occurs when the user begins to drag a control with a DragKind of dkDock.
	OnStartDrag (see page 13111)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.
	OnUnDock (see page 13112)	Occurs when the application tries to undock a control that is docked to the windowed control.

Published Properties

	Name	Description
	Align (see page 13044)	Determines how the control aligns within its container (parent control).
	Alignment (see page 13048)	Determines how the caption is aligned within the panel.
	AlignWithMargins (see page 5802)	Indicates whether a control should be constrained by margins.
	Anchors (see page 13048)	Specifies how the control is anchored to its parent.
	AutoSize (see page 13049)	Specifies whether the control sizes itself automatically to accommodate its contents.
	BevelEdges (see page 13049)	Specifies which edges of the control are beveled.
	BevelInner (see page 13050)	Determines the style of the inner bevel of a panel.
	BevelKind (see page 13051)	Specifies the control's bevel style.
	BevelOuter (see page 13051)	Determines the style of the outer bevel of a panel.
	BevelWidth (see page 13052)	Determines the width, in pixels, of both the inner and outer bevels of a panel.
	BiDiMode (see page 13053)	Specifies the bi-directional mode for the control.

	BorderStyle (see page 13054)	Determines the style of the line drawn around the perimeter of the panel control.
	BorderWidth (see page 13054)	Specifies the distance, in pixels, between the outer and inner bevels.
	Caption (see page 13055)	Specifies a text string that identifies the control to the user.
	Color (see page 13058)	Specifies the background color of the control.
	Constraints (see page 13059)	Specifies the size constraints for the control.
	Ctl3D (see page 13059)	Determines whether a control has a three-dimensional (3-D) or two-dimensional look.
	Cursor (see page 5815)	Specifies the image used to represent the mouse pointer when it passes into the region covered by the control.
	DockSite (see page 13062)	Specifies whether the control can be the target of drag-and-dock operations.
	DragCursor (see page 13063)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 13063)	Specifies whether the control is being dragged normally or for docking.
	DragMode (see page 13063)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	Enabled (see page 13065)	Controls whether the control responds to mouse, keyboard, and timer events.
	Font (see page 13066)	Controls the attributes of text written on or in the control.
	FullRepaint (see page 13067)	Determines how the panel repaints itself when it is resized.
	Height (see page 5825)	Specifies the vertical size of the control in pixels.
	HelpContext (see page 5826)	Numeric ID for control's context-sensitive help topic
	HelpKeyword (see page 5826)	Keyword for control's context-sensitive help topic
	HelpType (see page 5827)	Indicates whether the control's context sensitive help topic is identified by context ID or by keyword.
	Hint (see page 5827)	Contains the text string that can appear when the user moves the mouse over the control.
	Left (see page 5830)	Specifies the horizontal coordinate of the left edge of a component relative to its parent.
	Locked (see page 13067)	Determines whether a panel that is used as a toolbar is replaced by a toolbar supplied by an OLE server.
	Margins (see page 5831)	Specifies the margins for the control.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Padding (see page 13067)	Specifies the padding of a control.
	ParentBackground (see page 13068)	Determines whether control uses parent's theme background.
	ParentBiDiMode (see page 13068)	Specifies whether the control uses its parent's BiDiMode.
	ParentColor (see page 13068)	Determines where a control looks for its color information.
	ParentCtl3D (see page 13069)	Determines where a component looks to determine if it should appear three dimensional.
	ParentFont (see page 13069)	Determines where a control looks for its font information.
	ParentShowHint (see page 13070)	Determines where a control looks to find out if its Help Hint should be shown.
	PopupMenu (see page 13070)	Identifies the pop-up menu associated with the control.
	ShowHint (see page 13075)	Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.
	TabOrder (see page 13076)	Indicates the position of the control in its parent's tab order.
	TabStop (see page 13077)	Determines if the user can tab to a control.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Top (see page 5844)	Specifies the Y coordinate of the top left corner of a control, relative to its parent or containing control in pixels.
	UseDockManager (see page 13077)	Specifies whether the docking manager is used in drag-and-dock operations.
	VerticalAlignment (see page 13078)	Sets the vertical position of the caption.
	Visible (see page 13078)	Determines whether the component appears onscreen.
	Width (see page 5849)	Specifies the horizontal size of the control or form in pixels.

68.1.30.2 TPanel Properties

The properties of the TPanel class are listed here.

Public Properties

	Name	Description
	DockManager (see page 13060)	Specifies the control's docking manager interface.

Published Properties

	Name	Description
	Align (see page 13044)	Determines how the control aligns within its container (parent control).
	Alignment (see page 13048)	Determines how the caption is aligned within the panel.
	Anchors (see page 13048)	Specifies how the control is anchored to its parent.
	AutoSize (see page 13049)	Specifies whether the control sizes itself automatically to accommodate its contents.
	BevelEdges (see page 13049)	Specifies which edges of the control are beveled.
	BevelInner (see page 13050)	Determines the style of the inner bevel of a panel.
	BevelKind (see page 13051)	Specifies the control's bevel style.
	BevelOuter (see page 13051)	Determines the style of the outer bevel of a panel.
	BevelWidth (see page 13052)	Determines the width, in pixels, of both the inner and outer bevels of a panel.
	BiDiMode (see page 13053)	Specifies the bi-directional mode for the control.
	BorderStyle (see page 13054)	Determines the style of the line drawn around the perimeter of the panel control.
	BorderWidth (see page 13054)	Specifies the distance, in pixels, between the outer and inner bevels.
	Caption (see page 13055)	Specifies a text string that identifies the control to the user.
	Color (see page 13058)	Specifies the background color of the control.
	Constraints (see page 13059)	Specifies the size constraints for the control.
	Ctl3D (see page 13059)	Determines whether a control has a three-dimensional (3-D) or two-dimensional look.
	DockSite (see page 13062)	Specifies whether the control can be the target of drag-and-dock operations.
	DragCursor (see page 13063)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 13063)	Specifies whether the control is being dragged normally or for docking.
	DragMode (see page 13063)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	Enabled (see page 13065)	Controls whether the control responds to mouse, keyboard, and timer events.
	Font (see page 13066)	Controls the attributes of text written on or in the control.
	FullRepaint (see page 13067)	Determines how the panel repaints itself when it is resized.
	Locked (see page 13067)	Determines whether a panel that is used as a toolbar is replaced by a toolbar supplied by an OLE server.
	Padding (see page 13067)	Specifies the padding of a control.
	ParentBackground (see page 13068)	Determines whether control uses parent's theme background.
	ParentBiDiMode (see page 13068)	Specifies whether the control uses its parent's BiDiMode.
	ParentColor (see page 13068)	Determines where a control looks for its color information.
	ParentCtl3D (see page 13069)	Determines where a component looks to determine if it should appear three dimensional.
	ParentFont (see page 13069)	Determines where a control looks for its font information.
	ParentShowHint (see page 13070)	Determines where a control looks to find out if its Help Hint should be shown.
	PopupMenu (see page 13070)	Identifies the pop-up menu associated with the control.
	ShowHint (see page 13075)	Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.
	TabOrder (see page 13076)	Indicates the position of the control in its parent's tab order.
	TabStop (see page 13077)	Determines if the user can tab to a control.
	UseDockManager (see page 13077)	Specifies whether the docking manager is used in drag-and-dock operations.
	VerticalAlignment (see page 13078)	Sets the vertical position of the caption.
	Visible (see page 13078)	Determines whether the component appears onscreen.

68.1.30.2.1 TPanel.Align Property

Determines how the control aligns within its container (parent control).

Pascal

```
property Align: TAlign;
```

C++

```
__property TAlign Align;
```

Description

Use Align to align a control to the top, bottom, left, or right of a form or panel and have it remain there even if the size of the form, panel, or component that contains the control changes. When the parent is resized, an aligned control also resizes so that it continues to span the top, bottom, left, or right edge of the parent.

For example, to use a panel component with various controls on it as a tool palette, change the panel's Align value to alLeft. The value of alLeft for the Align property of the panel guarantees that the tool palette remains on the left side of the form and always equals the client height of the form.

The default value of Align is alNone, which means a control remains where it is positioned on a form or panel.

Tip: If Align is set to alClient, the control fills the entire client area so that it is impossible to select the parent form by clicking on it. In this case, select the parent by selecting the control on the form and pressing Esc, or by using the Object Inspector.

Any number of child components within a single parent can have the same Align value, in which case they stack up along the edge of the parent. The child controls stack up in z-order. To adjust the order in which the controls stack up, drag the controls into their desired positions.

Note: To cause a control to maintain a specified relationship with an edge of its parent, but not necessarily lie along one edge of the parent, use the Anchors property instead.

C++ Examples:

```
/*
This example shows how to use a splitter to divide a form
into resizable panes.  All objects on the form are created
dynamically in the OnCreate event handler of the form. To
run this example, add ExtCtrls and FileCtrl to the uses
clause of the form’s implementation section.
Note that when creating a splitter dynamically at runtime,
it is important to set its position to the appropriate side
of the control it will resize.
*/
#include <Extctrls.hpp>
#include <Filectrl.hpp>

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  TSplitter* ps = new TSplitter(Form1);
  TFileListBox* pflb = new TFileListBox(Form1);
  TDirectoryListBox* pdlb = new TDirectoryListBox(Form1);

  // Line up the directory list box on the left of the form.
  pdlb->Parent = Form1;
  pdlb->Align = alLeft;
  pdlb->Width = Form1->ClientWidth/3;

  // Now use the splitter to divide the directory pane from the file pane.
  ps->Parent = Form1;
  ps->Left = pdlb->Left + pdlb->Width + 1; // Move to right of directory list.
  ps->Align = pdlb->Align; // Give same alignment as directory list.

  // Each pane must be at least one quarter of the form's width.
  ps->MinSize = Form1->ClientWidth/4;
```

```
  // Finally, create the last pane - a file list box.
  pflb->Parent = Form1;
  pflb->Align = alClient;
  pdlb->FileList = pflb; // Link the file list box to the directory list box.
}
/*
Dynamically create a TProgressBar control and align it to
the bottom of the form.
*/

#include <ComCtrls.hpp>
#include <Controls.hpp>

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  TProgressBar *ProgressBar = new TProgressBar(this);
  ProgressBar->Parent = this;
  ProgressBar->Align = alBottom;
  TButton *Button1 = new TButton(this);
  Button1->Parent = this;
}
/*
This example dynamically creates a Page Control, then a
series of Tab Sheets on the Page Control.
*/
#include <Comctrls.hpp>
TPageControl* ppc;
const int MAXTABS = 3;
TTabSheet* pts[MAXTABS];
const char * ppcTabTitles[] = { "ShortString", "Orders", "Items", "Parts" };
int iTabTitles = sizeof(ppcTabTitles)/sizeof(ppcTabTitles[0]);
const TColor colorPalette[12] = {
  clRed, clGreen, clYellow, clBlue, clWhite, clFuchsia,
  clTeal, clNavy, clMaroon, clLime, clOlive, clPurple};

{
    ppc = new TPageControl(this);
    ppc->Parent = this;
    ppc->Align = alClient;
    for (int i=0;i<iTabTitles;i++)
  {
        pts[i] = new TTabSheet(this);
        pts[i]->PageControl = ppc;
        pts[i]->Name = AnsiString("pts") + ppcTabTitles[i];
        pts[i]->Caption = ppcTabTitles[i];
        pts[i]->Brush->Color = colorPalette[i];
  }
}//---------------------------------------------------------------------------
void __fastcall TForm1::FormDestroy(TObject *Sender)
{
  for (int i=0;i<iTabTitles;i++)
        delete pts[i];
    delete ppc;
}
```

Delphi Examples:

```
{
This example shows how to use a splitter to divide a form
into resizable panes.  All objects on the form are created
dynamically in the OnCreate event handler of the form. To
run this example, add ExtCtrls and FileCtrl to the uses
clause of the form’s implementation section.
Note that when creating a splitter dynamically at runtime,
it is important to set its position to the appropriate side
```

```
of the control it will resize.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  Split: TSplitter;
  Files: TFileListBox;
  Dirs: TDirectoryListBox;
begin
  { first add a directory list box to the form }
  Dirs := TDirectoryListBox.Create(Form1);
  { line it up on the left of the form }
  Dirs.Parent := Form1;
  Dirs.Align := alLeft;
  Dirs.Width := Form1.ClientWidth div 3;
{ now add the splitter to divide the directory pane from the file pane }
  Split := TSplitter.Create(Form1);
  Split.Parent := Form1;
  { make sure the splitter is to the right of the directory list box! }
  Split.Left := Dirs.Left + Dirs.Width + 1;
  Split.Align := Dirs.Align; { give it the same alignment as the directory }
  { each pane must be at least one quarter of the form's width }
  Split.MinSize := Form1.ClientWidth div 4;
  { Finally, create the last pane – a file list box }
  Files := TFileListBox.Create(Form1);
  Files.Parent := Form1;
  Files.Align := alClient;
  Dirs.FileList := Files; { link the file list box to the directory list box }
end;
{
Dynamically create a TProgressBar control and align it to
the bottom of the form.

        Brush.Color := colorPalette[i];
     end;
    end;
  end;

  procedure TForm1.FormDestroy(Sender: TObject);
  var
    i: Integer;
  begin
    for i := Low(TabTitles) to High(TabTitles) do
    begin
      pts[i].Free;
    end;
    PageControl1.Free;
  end;
```

See Also

Parent (see page 5832)

Anchors (see page 5802)

68.1.30.2.2 TPanel.Alignment Property

Determines how the caption is aligned within the panel.

Pascal

```
property Alignment: TAlignment;
```

C++

```
__property TAlignment Alignment;
```

Description

Use the Alignment property to specify if the caption of a panel appears on the left, right, or center of the panel. For example, to use a panel as a status bar that displays the TApplication. ::Hint property as the panel's Caption property, set Alignment to taLeftJustify to place the hint text on the left side of the panel.

Note: Use the VerticalAlignment property to control the vertical position of the caption.

See Also

Hint (see page 13712)

Caption (see page 5806)

68.1.30.2.3 TPanel.Anchors Property

Specifies how the control is anchored to its parent.

Pascal

```
property Anchors: TAnchors;
```

C++

```
__property TAnchors Anchors;
```

Description

Use Anchors to ensure that a control maintains its current position relative to an edge of its parent, even if the parent is resized. When its parent is resized, the control holds its position relative to the edges to which it is anchored.

If a control is anchored to opposite edges of its parent, the control stretches when its parent is resized. For example, if a control has its Anchors property set to [akLeft, akRight], the control stretches when the width of its parent changes.

Anchors is enforced only when the parent is resized. Thus, for example, if a control is anchored to opposite edges of a form at design time and the form is created in a maximized state, the control is not stretched because the form is not resized after the control is created.

Note: If a control should maintain contact with three edges of its parent (hugging one side of the parent and stretching the length of that side), use the Align property instead. Unlike Anchors, Align allows controls to adjust to changes in the size of other aligned sibling controls as well as changes to the parent's size.

See Also

Parent (see page 5832)

Align (see page 5798)

68.1.30.2.4 TPanel.AutoSize Property

Specifies whether the control sizes itself automatically to accommodate its contents.

Pascal

```
property AutoSize: Boolean;
```

C++

```
__property Boolean AutoSize;
```

Description

Use AutoSize to specify whether the control sizes itself automatically. When AutoSize is true, the control resizes automatically when its contents change.

By default, AutoSize is false.

See Also

Constraints (see page 5812)

CanAutoSize (see page 5741)

68.1.30.2.5 TPanel.BevelEdges Property

Specifies which edges of the control are beveled.

Pascal

```
property BevelEdges: TBevelEdges;
```

C++

```
__property TBevelEdges BevelEdges;
```

Description

Use BevelEdges to get or set which edges of the control are beveled. The BevelInner, BevelOuter, and BevelKind properties determine the appearance of the specified edges.

See Also

BevelInner (see page 6193)

BevelOuter (see page 6194)

BevelKind (see page 6193)

68.1.30.2.6 TPanel.BevelInner Property

Determines the style of the inner bevel of a panel.

Pascal

```
property BevelInner: TBevelCut;
```

C++

```
__property TPanelBevel BevelInner;__property TBevelCut BevelInner;
```

Description

Use BevelInner to provide the panel with a three-dimensional beveled look. A panel component has two bevels, an outer bevel drawn next to the border of the control, and an inner bevel drawn inside the outer bevel, separated by the number of pixels specified in the BorderWidth property. The width of the bevels, if they are drawn, is the BevelWidth property.

C++ Examples:

```
/*
This example uses a panel component and a button named
CreateStatusLine on a form. The code moves the panel to the
bottom of the form when the user clicks the button and gives
the panel the appearance of a status line by changing the
value of the BevelInner, BevelOuter, BevelWidth, and
BorderWidth properties.
*/
void __fastcall TForm1::CreateStatusLineClick(TObject *Sender)
{
  Panel1->Align = alBottom;
  Panel1->BevelInner = bvLowered;
  Panel1->BevelOuter = bvRaised;
  Panel1->BorderWidth = 1;
  Panel1->BevelWidth = 1;
}
```

Delphi Examples:

```
{
This example uses a panel component and a button named
CreateStatusLine on a form. The code moves the panel to the
bottom of the form when the user clicks the button and gives
the panel the appearance of a status line by changing the
value of the BevelInner, BevelOuter, BevelWidth, and
BorderWidth properties.
}
procedure TForm1.CreateStatusLineClick(Sender: TObject);
begin
  with Panel1 do
  begin
    Align := alBottom;
    BevelInner := bvLowered;
```

```
      BevelOuter := bvRaised;
      BorderWidth := 1;
      BevelWidth := 1;
    end;
  end;
```

See Also

BevelOuter (see page 12541)

BevelWidth (see page 12542)

BorderWidth (see page 12543)

68.1.30.2.7 TPanel.BevelKind Property

Specifies the control's bevel style.

Pascal

```
property BevelKind: TBevelKind;
```

C++

```
__property TBevelKind BevelKind;
```

Description

Use BevelKind to modify the appearance of a bevel. BevelKind influences how sharply the bevel stands out.

BevelKind, in combination with BevelWidth and the cut of the bevel specified by BevelInner or BevelOuter, can create a variety of effects. Experiment with various combinations to get the look you want.

See Also

BevelEdges (see page 6192)

BevelOuter (see page 6194)

BevelInner (see page 6193)

BevelWidth (see page 6194)

68.1.30.2.8 TPanel.BevelOuter Property

Determines the style of the outer bevel of a panel.

Pascal

```
property BevelOuter: TBevelCut;
```

C++

```
__property TPanelBevel BevelOuter;__property TBevelCut BevelOuter;
```

Description

Use BevelOuter to provide the panel with a three-dimensional beveled look. A panel component has two bevels, an outer bevel drawn next to the border of the control, and an inner bevel drawn inside the outer bevel, separated by the number of pixels specified in the BorderWidth property. The width of the outer bevel is specified in the BevelWidth property in pixels.

C++ Examples:

```
/*
This example uses a panel component and a button named
CreateStatusLine on a form. The code moves the panel to the
bottom of the form when the user clicks the button and gives
```

```
the panel the appearance of a status line by changing the
value of the BevelInner, BevelOuter, BevelWidth, and
BorderWidth properties.
*/
void __fastcall TForm1::CreateStatusLineClick(TObject *Sender)
{
  Panel1->Align = alBottom;
  Panel1->BevelInner = bvLowered;
  Panel1->BevelOuter = bvRaised;
  Panel1->BorderWidth = 1;
  Panel1->BevelWidth = 1;
}
```

Delphi Examples:

```
{
This example uses a panel component and a button named
CreateStatusLine on a form. The code moves the panel to the
bottom of the form when the user clicks the button and gives
the panel the appearance of a status line by changing the
value of the BevelInner, BevelOuter, BevelWidth, and
BorderWidth properties.
}
procedure TForm1.CreateStatusLineClick(Sender: TObject);
begin
  with Panel1 do
  begin
    Align := alBottom;
    BevelInner := bvLowered;
    BevelOuter := bvRaised;
    BorderWidth := 1;
    BevelWidth := 1;
  end;
end;
```

See Also

BevelInner (see page 12540)

BevelWidth (see page 12542)

BorderWidth (see page 12543)

68.1.30.2.9 TPanel.BevelWidth Property

Determines the width, in pixels, of both the inner and outer bevels of a panel.

Pascal

```
property BevelWidth: TBevelWidth;
```

C++

```
__property TBevelWidth BevelWidth;__property TBevelWidth BevelWidth;
```

Description

Use BevelWidth to specify how wide the inner or outer bevel should be. Do not confuse BevelWidth, which is the width of the bevels, with BorderWidth, which is the space between the bevels.

If both the BevelInner and BevelOuter properties are bvNone, BevelWidth has no effect. To remove both bevels, set the BevelInner and BevelOuter properties to bvNone, rather than setting the BevelWidth to 0, as this involves less overhead when painting.

C++ Examples:

```
/*
```

```
This example uses a panel component and a button named
CreateStatusLine on a form. The code moves the panel to the
bottom of the form when the user clicks the button and gives
the panel the appearance of a status line by changing the
value of the BevelInner, BevelOuter, BevelWidth, and
BorderWidth properties.
*/
void __fastcall TForm1::CreateStatusLineClick(TObject *Sender)
{
  Panel1->Align = alBottom;
  Panel1->BevelInner = bvLowered;
  Panel1->BevelOuter = bvRaised;
  Panel1->BorderWidth = 1;
  Panel1->BevelWidth = 1;
}
```

Delphi Examples:

```
{
This example uses a panel component and a button named
CreateStatusLine on a form. The code moves the panel to the
bottom of the form when the user clicks the button and gives
the panel the appearance of a status line by changing the
value of the BevelInner, BevelOuter, BevelWidth, and
BorderWidth properties.
}
procedure TForm1.CreateStatusLineClick(Sender: TObject);
begin
  with Panel1 do
  begin
    Align := alBottom;
    BevelInner := bvLowered;
    BevelOuter := bvRaised;
    BorderWidth := 1;
    BevelWidth := 1;
  end;
end;
```

See Also

BevelInner (see page 12540)

BevelOuter (see page 12541)

BorderWidth (see page 12543)

68.1.30.2.10 TPanel.BiDiMode Property

Specifies the bi-directional mode for the control.

Pascal

```
property BiDiMode: TBiDiMode;
```

C++

```
__property TBiDiMode BiDiMode;
```

Description

Use BiDiMode to enable the control to adjust its appearance and behavior automatically when the application runs in a locale that reads from right to left instead of left to right. The bi-directional mode controls the reading order for the text, the placement of the vertical scroll bar, and whether the alignment is changed.

Alignment does not change for controls that are known to contain number, date, time, or currency values. For example, with data aware controls, the alignment does not change for the following field types: ftSmallint, ftInteger, ftWord, ftFloat, ftCurrency,

ftBCD, ftDate, ftTime, ftDateTime, ftAutoInc.

See Also

UseRightToLeftAlignment (see page 5790)

UseRightToLeftReading (see page 5790)

UseRightToLeftScrollBar (see page 5791)

Including Bi-directional Functionality in Applications

68.1.30.2.11 TPanel.BorderStyle Property

Determines the style of the line drawn around the perimeter of the panel control.

Pascal

```
property BorderStyle: TBorderStyle;
```

C++

```
__property TBorderStyle BorderStyle;
```

Description

Use BorderStyle to specify whether the panel has a single line drawn around it. These are the possible values:

Value	Meaning
bsNone	No visible border
bsSingle	Single-line border

Do not confuse the line drawn around the panel with the BorderWidth of the panel. The BorderWidth of the panel is the distance between the outer and inner bevels.

See Also

BorderWidth (see page 12543)

68.1.30.2.12 TPanel.BorderWidth Property

Specifies the distance, in pixels, between the outer and inner bevels.

Pascal

```
property BorderWidth: TBorderWidth;
```

C++

```
__property TBorderWidth BorderWidth;__property TBorderWidth BorderWidth;
```

Description

Use BorderWidth to specify how wide the border around the panel should be. A value of 0 (zero) means no border should appear.

The border of a panel is the area between the outer and inner bevels. It is visible only if the inner bevel is raised or lowered, but affects the inset of the caption within the panel even if BevelInner is bvNone. If the Alignment property is not taCenter, the Caption will be aligned to the inner edge of the border. This edge is BorderWidth pixels in from the outer bevel if BevelInner is bvNone. It is the inner edge of the inner bevel otherwise.

Do not confuse the border of the panel with line drawn around the panel itself. The line around the panel is specified by the BorderStyle property.

C++ Examples:

```
/*
This example uses a panel component and a button named
CreateStatusLine on a form. The code moves the panel to the
bottom of the form when the user clicks the button and gives
the panel the appearance of a status line by changing the
value of the BevelInner, BevelOuter, BevelWidth, and
BorderWidth properties.
*/
void __fastcall TForm1::CreateStatusLineClick(TObject *Sender)
{
  Panel1->Align = alBottom;
  Panel1->BevelInner = bvLowered;
  Panel1->BevelOuter = bvRaised;
  Panel1->BorderWidth = 1;
  Panel1->BevelWidth = 1;
}
```

Delphi Examples:

```
{
This example uses a panel component and a button named
CreateStatusLine on a form. The code moves the panel to the
bottom of the form when the user clicks the button and gives
the panel the appearance of a status line by changing the
value of the BevelInner, BevelOuter, BevelWidth, and
BorderWidth properties.
}
procedure TForm1.CreateStatusLineClick(Sender: TObject);
begin
  with Panel1 do
  begin
    Align := alBottom;
    BevelInner := bvLowered;
    BevelOuter := bvRaised;
    BorderWidth := 1;
    BevelWidth := 1;
  end;
end;
```

Caption (see page 5806)

68.1.30.2.13 TPanel.Caption Property

Specifies a text string that identifies the control to the user.

Pascal

```
property Caption: TCaption;
```

C++

```
__property TCaption Caption;
```

Description

Use Caption to specify the text string that labels the control.

To underline a character in a Caption that labels a component, include an ampersand (&) before the character. This type of

character is called an accelerator character. The user can then select the component by pressing Alt while typing the underlined character. To display an ampersand character in the caption, use two ampersands (&&).

Note: Controls that display text use either the Caption property or the Text property to specify the text value. Which property is used depends on the type of control. In general, Caption is used for text that appears as a window title or label, while Text is used for text that appears as the content of a control.

C++ Examples:

```
/*
The following code keeps the size of the label control
constant, even though the length of the label's caption
changes. As a result, the caption of the label is probably
too long to display in the label when the user clicks the
button:
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  Label1->AutoSize = false;
  Label1->Caption = "This string is too long as the caption of this label";
}
/*
This example requires a TPageControl populated by several
TabSheets, a TEdit and a TButton. When the button is
clicked, the caption of the active tab changes to that of
the TEdit.  These lines of code could also be written:
PageControl1.ActivePage.Caption := Edit1.Text;
This would make a TTabSheet variable unnecessary since
PageControl1.->ActivePage is already of type TTabSheet.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  TTabSheet *sheet = PageControl1->ActivePage;
  sheet->Caption = Edit1->Text;
}
/*
This example creates a ToolBar and adds ToolButtons to it.
Include ComCtlrs in the uses clause.
*/
#include <comctrls.hpp>

void AddButtons(TToolBar *toolBar, TStringList *captions)
{
  for (int i = 0; i < captions->Count; i++)
  {
    TToolButton *button = new TToolButton(toolBar);
    button->Parent = toolBar;
    button->Caption = captions->Strings[i];
    if (button->Caption == "|")
      button->Style = tbsSeparator;
    else
      button->Style = tbsButton;
  }
}

TToolBar *myToolBar;

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  myToolBar = new TToolBar(this);
  myToolBar->Parent = this;
  TStringList *captions = new TStringList();
  captions->Add("New");
  captions->Add("Save");
```

```
  captions->Add("|");
  captions->Add("Cut");
  captions->Add("Copy");
  captions->Add("Paste");
  AddButtons(myToolBar, captions);
  delete captions;
  myToolBar->ShowCaptions = True;
  myToolBar->Height = 40;
}

void __fastcall TForm1::FormDestroy(TObject *Sender)
{
  for (int I = myToolBar->ButtonCount - 1; I >= 0; I--)
    delete myToolBar->Buttons[I];
  delete myToolBar;
}
```

Delphi Examples:

```
{
The following code keeps the size of the label control
constant, even though the length of the label's caption
changes. As a result, the caption of the label is probably
too long to display in the label when the user clicks the
button:
}
procedure TForm1.Button1Click(Sender: TObject);
begin
  Label1.AutoSize := False;
  Label1.Caption :=
    'This string is too long as the caption of this label';
end;
{
This example requires a TPageControl populated by several
TabSheets, a TEdit and a TButton. When the button is
clicked, the caption of the active tab changes to that of
the TEdit.  These lines of code could also be written:
PageControl1.ActivePage.Caption := Edit1.Text;
This would obviate the need for a TTabSheet variable since
PageControl1.->ActivePage is already of type TTabSheet.
}
procedure TForm1.Button1Click(Sender: TObject);
var
  sheet: TTabSheet;
begin
  sheet := PageControl1.ActivePage;
  sheet.Caption := Edit1.Text;
end;
{
This example creates a ToolBar and adds ToolButtons to it.
Include ComCtlrs in the uses clause.
}
procedure AddButtons(ToolBar: TToolBar;
  Const ButtonCaptions: array of String);
var
  I: Integer;
begin
  for I := 0 to High(ButtonCaptions) do
    begin
      with TToolButton.Create(ToolBar) do
      begin
        Parent := ToolBar;
        Caption := ButtonCaptions[I];
        if (ButtonCaptions[I] = '|') then
          Style := tbsSeparator
        else
          Style := tbsButton;
```

```
      end;
    end;
end;

procedure TForm1.FormCreate(Sender: TObject);
begin
  ToolBar1 := TToolBar.Create(Self);
  ToolBar1.Parent := Self;
  AddButtons(ToolBar1, ['New', 'Save', '|', 'Cut', 'Copy', 'Paste']);
  ToolBar1.ShowCaptions := True;
  ToolBar1.Height := 40;
end;

procedure TForm1.FormDestroy(Sender: TObject);
var
  I: Integer;
begin
  for I := ToolBar1.ButtonCount - 1 downto 0 do
    ToolBar1.Buttons[I].Free;
  ToolBar1.Free;
end;
```

68.1.30.2.14 TPanel.Color Property

Specifies the background color of the control.

Pascal

```
property Color: TColor;
```

C++

```
__property TColor Color;
```

Description

Use Color to read or change the background color of the control.

If a control's ParentColor property is true, then changing the Color property of the control's parent automatically changes the Color property of the control. When the value of the Color property is changed, the control's ParentColor property is automatically set to false.

C++ Examples:

```
/*
The following code changes the color of a shape control
using the Color dialog box. The example displays the Color
dialog box when the Button1 button is clicked, allowing the
user to select a color with the dialog box. When a color
value is selected with the dialog box, it is assigned to
the shape control.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  if (ColorDialog1->Execute())
    Shape1->Brush->Color = ColorDialog1->Color;
}
```

Delphi Examples:

```
{
The following code changes the color of a shape control
using the Color dialog box. The example displays the Color
dialog box when the Button1 button is clicked, allowing the
user to select a color with the dialog box. When a color
value is selected with the dialog box, it is assigned to
the shape control.
```

```
}
procedure TForm1.Button1Click(Sender: TObject);
begin
  if ColorDialog1.Execute then
    Shape1.Brush.Color := ColorDialog1.Color;
end;
```

See Also

ParentColor (see page 5834)

68.1.30.2.15 TPanel.Constraints Property

Specifies the size constraints for the control.

Pascal

```
property Constraints: TSizeConstraints;
```

C++

```
__property TSizeConstraints Constraints;
```

Description

Use Constraints to specify the minimum and maximum width and height of the control. When Constraints contains maximum or minimum values, the control cannot be resized to violate those constraints.

Note: Constraints apply to the height of the form. However, the height of the form depends on how large Windows makes the title bar. For example, Windows XP uses much larger title bars than other windowing systems. To work around this, note the ClientHeight when you design your form and set the constraints in the FormCreate event. In the following example, ClientHeight is represented by x: `Constraints.MinHeight := x + Height - ClientHeight`.

Warning: Do not set up constraints that conflict with the value of the Align or Anchors property. When these properties conflict, the response of the control to resize attempts is not well-defined.

See Also

AutoSize (see page 5803)

Align (see page 5798)

Anchors (see page 5802)

OnConstrainedResize (see page 5853)

OnCanResize (see page 5851)

68.1.30.2.16 TPanel.Ctl3D Property

Determines whether a control has a three-dimensional (3-D) or two-dimensional look.

Pascal

```
property Ctl3D: Boolean;
```

C++

```
__property Boolean Ctl3D;
```

Description

Ctl3D is provided for backward compatibility. It is not used by 32-bit versions of Windows or NT4.0 and later, with the exception of Windows XP Home, where it is used on occasion.

On earlier platforms, Ctl3D controlled whether the control had a flat or beveled appearance.

See Also

ParentCtl3D (see page 6209)

BevelKind (see page 6193)

BevelInner (see page 6193)

BevelOuter (see page 6194)

BorderWidth (see page 6195)

68.1.30.2.17 TPanel.DockManager Property

Specifies the control's docking manager interface.

Pascal

```
property DockManager: IDockManager;
```

C++

```
__property IDockManager DockManager;
```

Description

Use DockManager to specify the control's docking manager. The docking manager handles the layout of docking zones (where controls are docked) and any painting associated with docking zones.

If you set DockSite and UseDockManager to true, but do not assign a value to DockManager, the windowed control generates a default docking manager, using the global DefaultDockTreeClass variable.

C++ Examples:

```
/*
The following example is taken from the docking demo. It
shows how set permissions to dock dockable objects onto a
docking site.
*/

void __fastcall TMainForm::LeftDockPanelDockDrop(TObject *Sender,
      TDragDockObject *Source, int X, int Y)
{
  //OnDockDrop gets called AFTER the client has actually docked,
  //so we check for DockClientCount = 1 before making the dock panel visible.
  TPanel *panel = dynamic_cast<TPanel *>(Sender);
  if (panel->DockClientCount == 1)
    ShowDockPanel(panel, True, NULL);
  panel->DockManager->ResetBounds(True);
  //Make DockManager repaints it's clients.
}

void __fastcall TMainForm::LeftDockPanelDockOver(TObject *Sender,
      TDragDockObject *Source, int X, int Y, TDragState State, bool &Accept)
{
  Accept = (dynamic_cast<TDockableForm*>(Source->Control) != NULL);
  if (Accept)
  {
    // Modify the DockRect to preview dock area.
    Types::TPoint TopLeft = LeftDockPanel->ClientToScreen(Point(0, 0));
    Types::TPoint BottomRight = LeftDockPanel->ClientToScreen(
      Point(this->ClientWidth/3, LeftDockPanel->Height));
    Source->DockRect = Types::TRect(TopLeft, BottomRight);
  }
}
```

```
void __fastcall TMainForm::LeftDockPanelUnDock(TObject *Sender,
      TControl *Client, TWinControl *NewTarget, bool &Allow)
{
  //OnUnDock gets called BEFORE the client is undocked, in order to optionally
  //disallow the undock. DockClientCount is never 0 when called from this event.
  TPanel *panel = dynamic_cast<TPanel *>(Sender);
  if (panel->DockClientCount == 1)
    ShowDockPanel(panel, False, NULL);
}

void __fastcall TMainForm::LeftDockPanelGetSiteInfo(TObject *Sender,
      TControl *DockClient, TRect &InfluenceRect, TPoint &MousePos,
      bool &CanDock)
{
  //if CanDock is true, the panel will not automatically draw the preview rect.
  CanDock = DockClient->ClassNameIs("TDockableForm");
  if (!CanDock)
  {
     ShowMessage("GetSiteInfo CanDock went bad!");
  }
}
```

Delphi Examples:

```
{
The following example is taken from the docking demo. It
shows how set permissions to dock dockable objects onto a
docking site.
}

procedure TMainForm.LeftDockPanelDockDrop(Sender: TObject;
  Source: TDragDockObject; X, Y: Integer);
begin
  //OnDockDrop gets called AFTER the client has actually docked,
  //so we check for DockClientCount = 1 before making the dock panel visible.
  if (Sender as TPanel).DockClientCount = 1 then
    ShowDockPanel(Sender as TPanel, True, nil);
  (Sender as TPanel).DockManager.ResetBounds(True);
  //Make DockManager repaints it's clients.
end;

procedure TMainForm.LeftDockPanelDockOver(Sender: TObject;
  Source: TDragDockObject; X, Y: Integer; State: TDragState;
  var Accept: Boolean);
var
  ARect: TRect;
begin
  Accept := Source.Control is TDockableForm;
  if Accept then
  begin
    //Modify the DockRect to preview dock area.
    ARect.TopLeft := LeftDockPanel.ClientToScreen(Point(0, 0));
    ARect.BottomRight := LeftDockPanel.ClientToScreen(
      Point(Self.ClientWidth div 3, LeftDockPanel.Height));
    Source.DockRect := ARect;
  end;
end;

procedure TMainForm.LeftDockPanelUnDock(Sender: TObject; Client: TControl;
  NewTarget: TWinControl; var Allow: Boolean);
begin
  //OnUnDock gets called BEFORE the client is undocked, in order to optionally
  //disallow the undock. DockClientCount is never 0 when called from this event.
  if (Sender as TPanel).DockClientCount = 1 then
    ShowDockPanel(Sender as TPanel, False, nil);
end;
```

```
procedure TMainForm.LeftDockPanelGetSiteInfo(Sender: TObject;
  DockClient: TControl; var InfluenceRect: TRect; MousePos: TPoint;
  var CanDock: Boolean);
begin
  //if CanDock is true, the panel will not automatically draw the preview rect.
  CanDock := DockClient is TDockableForm;
end;
```

See Also

DockSite (see page 6204)

UseDockManager (see page 6212)

DefaultDockTreeClass (see page 6321)

68.1.30.2.18 TPanel.DockSite Property

Specifies whether the control can be the target of drag-and-dock operations.

Pascal

```
property DockSite: Boolean;
```

C++

```
__property Boolean DockSite;
```

Description

Set DockSite to true to allow other controls to be docked to this windowed control.

C++ Examples:

```
/*
The following example is taken from the docking demo. It
shows how the OnUnDock event handler of the conjoinment
docking site re-enables docking in the control that is
undocked (if it is a dockable form). In addition, when the
next to last docked control is undocked, the conjoinment
docking site sends itself a close message so that the last
docked control is undocked to its old position and size.
*/
void __fastcall TConjoinDockHost::FormUnDock(TObject *Sender, TControl *Client,
      TWinControl *NewTarget, bool &Allow)
{
  // Only 2 dock clients means the host must be destroyed and
  // the remaining window undocked to its old position and size.
  // Recall that OnUnDock gets called before the undocking
  // actually occurs.
  if (Client->ClassNameIs("TDockableForm"))
    dynamic_cast<TDockableForm *>(Client)->DockSite = True;
  if ((DockClientCount == 2) && (NewTarget != this))        // Self?
    PostMessage(dynamic_cast<TConjoinDockHost *>(this)->Handle, WM_CLOSE, 0, 0);
  UpdateCaption(Client);
}
```

Delphi Examples:

```
{
The following example is taken from the docking demo. It
shows how the OnUnDock event handler of the conjoinment
docking site re-enables docking in the control that is
undocked (if it is a dockable form). In addition, when the
next to last docked control is undocked, the conjoinment
docking site sends itself a close message so that the last
docked control is undocked to its old position and size.
```

```
}
procedure TConjoinDockHost.FormUnDock(Sender: TObject; Client: TControl;
  NewTarget: TWinControl; var Allow: Boolean);
begin
  // Only 2 dock clients means the host must be destroyed and
  // the remaining window undocked to its old position and size.
  // Recall that OnUnDock gets called before the undocking
  // actually occurs.
  if Client is TDockableForm then
    TDockableForm(Client).DockSite := True;
  if (DockClientCount = 2) and (NewTarget <> Self) then
    PostMessage(Self.Handle, WM_CLOSE, 0, 0);
  UpdateCaption(Client);
end;
```

68.1.30.2.19 TPanel.DragCursor Property

Indicates the image used to represent the mouse pointer when the control is being dragged.

Pascal

```
property DragCursor: TCursor;
```

C++

```
__property TCursor DragCursor;
```

Description

Use the DragCursor property to change the cursor image presented when the control is being dragged.

Note: To make a custom cursor available for the DragCursor property, see the Cursor property.

See Also

Cursor (see page 5815)

DragKind (see page 5819)

DragMode (see page 5819)

68.1.30.2.20 TPanel.DragKind Property

Specifies whether the control is being dragged normally or for docking.

Pascal

```
property DragKind: TDragKind;
```

C++

```
__property TDragKind DragKind;
```

Description

Use DragKind to get or set whether the control participates in drag-and-drop operations, or drag-and-dock operations.

See Also

DragCursor (see page 5818)

DragMode (see page 5819)

68.1.30.2.21 TPanel.DragMode Property

Determines how the control initiates drag-and-drop or drag-and-dock operations.

Pascal

```
property DragMode: TDragMode;
```

C++

```
__property TDragMode DragMode;
```

Description

Use DragMode to control when the user can drag the control. Disable the drag-and-drop or drag-and-dock capability at runtime by setting the DragMode property value to dmManual. Enable automatic dragging by setting DragMode to dmAutomatic.

C++ Examples:

```
/*
The following code uses GetNodeAt to add a dragged node as a
child of the node under the mouse when it is dropped.  This
example requires a populated TreeView.  Also, the TTreeView
DragMode property set to dmAutomatic, and the TTreeView
OnDragOver event handler must be implemented to accept the
drop.
*/
void __fastcall TForm1::TreeView1DragDrop(TObject *Sender, TObject *Source,
      int X, int Y)
{
  if (Source != (TObject *)TreeView1 || TreeView1->Selected == NULL)
    return;
  THitTests HT = TreeView1->GetHitTestInfoAt(X, Y);
  TNodeAttachMode AttachMode;
  TTreeNode *Item = TreeView1->GetNodeAt(X, Y);
  if (HT.Contains(htOnItem) || HT.Contains(htOnIcon))
    AttachMode = naAddChild;
  else if (HT.Contains(htNowhere))
    AttachMode = naAdd;
  else if (HT.Contains(htOnIndent))
    AttachMode = naInsert;
  else
    return;
  TreeView1->Selected->MoveTo(Item, AttachMode);
}

void __fastcall TForm1::TreeView1DragOver(TObject *Sender, TObject *Source,
      int X, int Y, TDragState State, bool &Accept)
{
  Accept = (Source == (TObject *)TreeView1);
}
```

Delphi Examples:

```
{
The following code uses GetNodeAt to add a dragged node as a
child of the node under the mouse when it is dropped.  This
example requires a populated TreeView.  Also, the TTreeView
DragMode property set to dmAutomatic, and the TTreeView
OnDragOver event handler must be implemented to accept the
drop.
}
procedure TForm1.TreeView1DragDrop(Sender, Source: TObject; X, Y: Integer);
var
  AnItem: TTreeNode;
  AttachMode: TNodeAttachMode;
  HT: THitTests;
begin
  if TreeView1.Selected = nil then Exit;
  HT := TreeView1.GetHitTestInfoAt(X, Y);
  AnItem := TreeView1.GetNodeAt(X, Y);
  if (HT - [htOnItem, htOnIcon, htNowhere, htOnIndent] <> HT) then
```

```
    begin
      if (htOnItem in HT) or (htOnIcon in HT) then
        AttachMode := naAddChild
      else if htNowhere in HT then AttachMode := naAdd
      else if htOnIndent in HT then AttachMode := naInsert;
      TreeView1.Selected.MoveTo(AnItem, AttachMode);
    end;
  end;

  procedure TForm1.TreeView1DragOver(Sender, Source: TObject; X, Y: Integer;
    State: TDragState; var Accept: Boolean);
  begin
    Accept := Source is TTreeView;
  end;
```

DragKind (see page 5819)

Arranging the Order of Persistent Columns

68.1.30.2.22 TPanel.Enabled Property

Controls whether the control responds to mouse, keyboard, and timer events.

Pascal

```
property Enabled: Boolean;
```

C++

```
__property Boolean Enabled;
```

Description

Use Enabled to change the availability of the control to the user. To disable a control, set Enabled to false. Disabled controls appear dimmed. If Enabled is false, the control ignores mouse, keyboard, and timer events.

To re-enable a control, set Enabled to true. The control is no longer dimmed, and the user can use the control.

See Also

Visible (see page 5847)

DisableControls (see page 6925)

EnableControls (see page 6934)

Enabling Mouse

68.1.30.2.23 TPanel.Font Property

Controls the attributes of text written on or in the control.

Pascal

```
property Font: TFont;
```

C++

```
__property TFont Font;
```

Description

To change to a new font, specify a new TFont object. To modify a font, change the value of the Charset, Color, Height, Name, Pitch, Size, or Style of the TFont object.

C++ Examples:

```
/*
To use this example, place a TComboBox and TRichEdit or
TMemo on a form.  During form creation, a list of font names
is loaded into the combo box. When the combo box is clicked,
the memo or Rich Edit control font is set to the
corresponding font name in the combo box.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < Screen->Fonts->Count; i++)
   ComboBox1->Items->Add(Screen->Fonts->Strings[i]);
//  ComboBox1->Items = Screen->Fonts;  // Another way to do it.
}

void __fastcall TForm1::ComboBox1Change(TObject *Sender)
{
  RichEdit1->Font->Name = ComboBox1->Text;
}
```

Delphi Examples:

```
{
To use this example, place a TComboBox and TRichEdit or
TMemo on a form.  During form creation, a list of font names
is loaded into the combo box. When the combo box is clicked,
the memo or Rich Edit control font is set to the
corresponding font name in the combo box.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  i : Integer;
begin
  for i := 0 to Screen.Fonts.Count - 1 do
   ComboBox1.Items.Add(Screen.Fonts.Strings[i]);
//  ComboBox1.Items := Screen.Fonts;  // Another way to do it.
  RichEdit1.Lines.Text := 'How is it to be you?';
end;

procedure TForm1.ComboBox1Click(Sender: TObject);
begin
  RichEdit1.Font.Name := ComboBox1.Text;
end;
```

DesktopFont (see page 5818)

ParentFont (see page 5834)

Displaying and Editing Text in a Memo Control

68.1.30.2.24 TPanel.FullRepaint Property

Determines how the panel repaints itself when it is resized.

Pascal

```
property FullRepaint: Boolean;
```

C++

```
__property Boolean FullRepaint;
```

Description

FullRepaint controls how the panel responds when it is resized. When FullRepaint is true, the entire panel, including the beveled border repaints when the size changes. When FullRepaint is false, only the area inside the beveled border repaints.

See Also

Invalidate (see page 6161)

68.1.30.2.25 TPanel.Locked Property

Determines whether a panel that is used as a toolbar is replaced by a toolbar supplied by an OLE server.

Pascal

```
property Locked: Boolean;
```

C++

```
__property Boolean Locked;
```

Description

Set the Locked property to false when the panel is used as a toolbar by a TOleContainer component. Any panels aligned to a TOleContainer are assumed to be replaceable toolbars unless the Locked property is true. Prevent the panel from being replaced by an OLE server's toolbar by setting the panel's Locked property to true.

Note: An OLE application's toolbars must be in panels aligned to a side of the form (that is, their Align properties must be set to alTop, alBottom, alLeft, or alRight).

See Also

Align (see page 5798)

TOleContainer (see page 17921)

68.1.30.2.26 TPanel.Padding Property

Specifies the padding of a control.

Pascal

```
property Padding: TPadding;
```

C++

```
__property TPadding Padding;
```

Description

Use Padding to specify the padding of a control. This value is an instance of the class TPadding.

See Also

TPadding (see page 6103)

68.1.30.2.27 TPanel.ParentBackground Property

Determines whether control uses parent's theme background.

Pascal

```
property ParentBackground: Boolean;
```

C++

```
__property Boolean ParentBackground;
```

Description

If ParentBackground is true, the control uses the parent's theme background to draw its own background. ParentBackground has no effect unless XP themes are enabled.

68.1.30.2.28 TPanel.ParentBiDiMode Property

Specifies whether the control uses its parent's BiDiMode.

Pascal

```
property ParentBiDiMode: Boolean;
```

C++

```
__property Boolean ParentBiDiMode;
```

Description

Use ParentBiDiMode to get or set whether the control uses its parent's BiDiMode. When ParentBiDiMode is true, the control's BiDiMode property is always equal to that of its parent. If ParentBiDiMode is false, the control uses its own BiDiMode property.

Set ParentBiDiMode to true for all controls in a form in order to ensure that the entire user interface adjusts to Middle Eastern locales in a uniform manner.

When the value of the control's BiDiMode property changes, ParentBiDiMode becomes false automatically.

See Also

Parent (see page 5832)

BiDiMode (see page 5803)

68.1.30.2.29 TPanel.ParentColor Property

Determines where a control looks for its color information.

Pascal

```
property ParentColor: Boolean;
```

C++

```
__property Boolean ParentColor;
```

Description

To have a control use the same color as its parent control, set ParentColor to true. If ParentColor is false, the control uses its own Color property.

Set ParentColor to true for all controls in order to ensure that all the controls on a form have a uniform appearance. For example, if ParentColor is true for all controls in a form, changing the background color of the form to gray causes all the controls on the form to also have a gray background.

When the value of a control's Color property changes, ParentColor becomes false automatically.

See Also

Color (see page 5812)

Parent (see page 5832)

ParentFont (see page 5834)

ParentShowHint (see page 5835)

68.1.30.2.30 TPanel.ParentCtl3D Property

Determines where a component looks to determine if it should appear three dimensional.

Pascal

```
property ParentCtl3D: Boolean;
```

C++

```
__property Boolean ParentCtl3D;
```

Description

ParentCtl3D is provided for backwards compatibility. It has no effect on 32-bit versions of Windows or NT 4.0 and later.

ParentCtl3D determines whether the control uses its parent's Ctl3D property.

See Also

Ctl3D (see page 6198)

68.1.30.2.31 TPanel.ParentFont Property

Determines where a control looks for its font information.

Pascal

```
property ParentFont: Boolean;
```

C++

```
__property Boolean ParentFont;
```

Description

To have a control use the same font as its parent control, set ParentFont to true. If ParentFont is false, the control uses its own Font property. Many controls default ParentFont to true so that all the controls in a form or other container present a uniform appearance. When the value of a control's Font property changes, ParentFont becomes false automatically.

When ParentFont is true for a form, the form uses the default font.

See Also

Font (see page 5823)

Parent (see page 5832)

ParentColor (see page 5834)

ParentShowHint (see page 5835)

68.1.30.2.32 TPanel.ParentShowHint Property

Determines where a control looks to find out if its Help Hint should be shown.

Pascal

```
property ParentShowHint: Boolean;
```

C++

```
__property Boolean ParentShowHint;
```

Description

Use ParentShowHint to ensure that all the controls on a form either uniformly show their Help Hints or uniformly do not show them.

If ParentShowHint is true, the control uses the ShowHint property value of its parent. If ParentShowHint is false, the control uses the value of its own ShowHint property.

To provide Help Hints for only selected controls on a form, set the ShowHint property for those controls that should have Help Hints to true, and ParentShowHint becomes false automatically.

Note: Enable or disable all Help Hints for the entire application using the ShowHint property of the application object.

Hint (see page 5827)

Parent (see page 5832)

ParentColor (see page 5834)

ParentFont (see page 5834)

ShowHint (see page 5840)

68.1.30.2.33 TPanel.PopupMenu Property

Identifies the pop-up menu associated with the control.

Pascal

```
property PopupMenu: TPopupMenu;
```

C++

```
__property TPopupMenu PopupMenu;
```

Description

Assign a value to PopupMenu to make a pop-up menu appear when the user selects the control and clicks the right mouse button. If the TPopupMenu's AutoPopup property is true, the pop-up menu appears automatically. If the menu's AutoPopup property is false, display the menu with a call to its Popup method from the control's OnContextPopup event handler.

C++ Examples:

```
/*
This example uses two edit boxes and one pop-up menu on a form.
The pop-up menu contains Cut, Copy, and Paste commands. This code
makes the pop-up menu available to both edit boxes:
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  PopupMenu1->AutoPopup = true;
  Edit1->PopupMenu = PopupMenu1;
```

```
  Edit2->PopupMenu = PopupMenu1;
}

/*
These are the cut, copy, and paste OnClick events for the commands
on the pop-up menu. Double click on the pop-up menu and add three
TMenuItems.  Then set the captions to "Cut", "Copy" and "Paste".
The names will be automatically set to "Cut1", "Copy1", and
"Paste1".  Then double click on the OnClick events and they will
be named "Cut1Click", "Copy1Click" and "Paste1Click" respectively.
Note: only the selected portion of the string in the edit box will
be copied, cut or replaced.
*/
void __fastcall TForm1::Copy1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
    if (pComponent->ClassNameIs("TEdit"))
      ((TEdit *)pComponent)->CopyToClipboard();
    else
      MessageBeep(0);
  }
  else
    MessageBeep(0);
}

void __fastcall TForm1::Cut1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
    if (pComponent->ClassNameIs("TEdit"))
      ((TEdit *)pComponent)->CutToClipboard();
    else
      MessageBeep(0);
  }
  else
    MessageBeep(0);
}

void __fastcall TForm1::Paste1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
    if (pComponent->ClassNameIs("TEdit"))
      ((TEdit *)pComponent)->PasteFromClipboard();
    else
      MessageBeep(0);
  }
  else
    MessageBeep(0);
}
/*
This example demonstrates how to add and delete menu items
to a popup menu at runtime and assign an event handler to
the OnClick event.  Place a TPopupMenu and three buttons on
the form named "AddButton", "EditButton",  and
"DestroyButton" and add OnClick events to all three buttons.
Put the TPopupMenu in the PopupMenu property of the form.
Place the PopupMenuItemsClick procedure in the TForm1 type
declaration so that it can be used as the method call for
the menu item OnClick event.
*/
void __fastcall TForm1::AddButtonClick(TObject *Sender)
```

```
{
    const int num_items = 4;
    for (int index = 0; index < num_items; ++index)
    {
        TMenuItem *NewItem = new TMenuItem(PopupMenu1); // create the new item
        PopupMenu1->Items->Add(NewItem);// add it to the Popupmenu
        NewItem->Caption = "Menu Item " + IntToStr(index);
        NewItem->Tag = index;
        NewItem->OnClick = PopupMenuItemsClick;// assign it an event handler
        TNotifyEvent();
    }
}

void __fastcall TForm1::PopupMenuItemsClick(TObject *Sender)
{
    TMenuItem *ClickedItem = dynamic_cast<TMenuItem *>(Sender);
    if (ClickedItem)
    {
        switch (ClickedItem->Tag)
        {
            case 0:
            {
                ShowMessage("first item clicked");
                break;
            }
            case 1:
            {
                ShowMessage("second item clicked");
                break;
            }
            case 2:
            {
                ShowMessage("third item clicked");
                break;
            }
            case 3:
            {
                ShowMessage("fourth item clicked");
                break;
            }
        }
    }
}

/*
To edit or destroy an item, grab its pointer via the Items
property.
*/
void __fastcall TForm1::EditButtonClick(TObject *Sender)
{
    const int index = 1;
    TMenuItem *ItemToEdit = PopupMenu->Items->Items[index];
    ItemToEdit->Caption = "Changed Caption";
}

void __fastcall TForm1::DestroyButtonClick(TObject *Sender)
{
    const int index = 2;
    TMenuItem *ItemToDelete = PopupMenu->Items->Items[index];
    delete ItemToDelete;
}
```

Delphi Examples:

```
{
This example uses two edit boxes and one pop-up menu on a form.
The pop-up menu contains Cut, Copy, and Paste commands. This code
```

```
makes the pop-up menu available to both edit boxes:
}
procedure TForm1.FormCreate(Sender: TObject);
begin
  PopupMenu1.AutoPopup := True;
  Edit1.PopupMenu := PopupMenu1;
  Edit2.PopupMenu := PopupMenu1;
end;

{
These are the cut, copy, and paste OnClick events for the commands
on the pop-up menu. Double click on the pop-up menu and add three
TMenuItems.  Then set the captions to "Cut", "Copy" and "Paste".
The names will be automatically set to "Cut1", "Copy1", and
"Paste1".  Then double click on the OnClick events and they will
be named "Cut1Click", "Copy1Click" and "Paste1Click" respectively.
Note: only the selected portion of the string in the edit box will
be copied, cut or replaced.
}
procedure TForm1.Copy1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
   Edit1.CopyToClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.CopyToClipboard
  else
    Beep;
end;

procedure TForm1.Cut1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
    Edit1.CutToClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.CutToClipboard
  else
    Beep;
end;

procedure TForm1.Paste1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
    Edit1.PasteFromClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.PasteFromClipboard
  else
    Beep;
end;
{
This example demonstrates how to add and delete menu items
to a popup menu at runtime and assign an event handler to
the OnClick event.  Place a TPopupMenu and three buttons on
the form named "AddButton", "EditButton",  and
"DestroyButton" and add OnClick events to all three buttons.
Put the TPopupMenu in the PopupMenu property of the form.
Place the PopupMenuItemsClick procedure in the TForm1 type
declaration so that it can be used as the method call for
the menu item OnClick event.
}

type
  TForm1 = class(TForm)
    AddButton: TButton;
    EditButton: TButton;

68.1.30.2.34 TPanel.ShowHint Property

Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.

Pascal

```
property ShowHint: Boolean;
```

C++

```
__property Boolean ShowHint;
```

Description

The Help Hint is the value of the Hint property, which is displayed in a box just beneath the control. Use ShowHint to determine whether a Help Hint appears for the control.

To enable Help Hint for a particular control, the application ShowHint property must be true and either

the control's own ShowHint property must be true, or

the control's ParentShowHint property must be true and its parent's ShowHint property must be true.

For example, imagine a check box within a group box. If the ShowHint property of the group box is true and the ParentShowHint property of the check box is true, but the ShowHint property of the check box is false, the check box still displays its Help Hint.

Changing the ShowHint value automatically sets the ParentShowHint property to false.

C++ Examples:

```
/*
This example uses an edit box and a list box on a form.
Items are added to the list box and a Help Hint is assigned
to both controls. The last statement enables the Help Hints
for the entire application.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  Edit1->Hint = "Enter your name";
  Edit1->ShowHint = true;

  char string[10];
  char index[3];
  for(int i = 1; i <= 10; i++)
  {
    strcpy(string, "Item");
    itoa(i, index, 10);
    strcat(string, index);
    ListBox1->Items->Add(string);
  }
  ListBox1->Hint = "Select an item";
  ListBox1->ShowHint = true;
  Application->ShowHint = true;
}
/*
Note: To see an example that displays the hints of controls
in some place other than in a Help Hint box, see the OnHint
```

```
example.
*/
```

Delphi Examples:

```
{
This example uses an edit box and a list box on a form.
Items are added to the list box and a Help Hint is assigned
to both controls. The last statement enables the Help Hints
for the entire application.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  I: Integer;
begin
  Edit1.Hint := 'Enter your name';
  Edit1.ShowHint := True;
  with ListBox1 do
  begin
    for I := 1 to 10 do
      Items.Add('Item ' + IntToStr(I));
    Hint := 'Select an item';
    ShowHint := True;
  end;
  Application.ShowHint := True;
end;
{
Note: To see an example that displays the hints of controls
in some place other than in a Help Hint box, see the OnHint
example.
}

Displaying Fly-over Help

68.1.30.2.35 TPanel.TabOrder Property

Indicates the position of the control in its parent's tab order.

Pascal

```
property TabOrder: TTabOrder;
```

C++

```
__property TTabOrder TabOrder;
```

Description

TabOrder is the order in which child windows are visited when the user presses the Tab key. The control with the TabOrder value of 0 is the control that has the focus when the form first appears.

Initially, the tab order is always the order in which the controls were added to the form. The first control added to the form has a TabOrder value of 0, the second is 1, the third is 2, and so on. Change this by changing the TabOrder property.

Each control has a unique tab-order value within its parent. If you change the TabOrder property value of one control to be the same as the value of a second control, the TabOrder value for all the other controls changes. For example, suppose a control is sixth in the tab order. If you change the control's TabOrder property value to 3 (making the control fourth in the tab order), the control that was originally fourth in the tab order now becomes fifth, and the control that was fifth becomes sixth.

Assigning TabOrder a value greater than the number of controls contained in the parent control moves the control to the end of the tab order. The control does not take on the assigned value of TabOrder, but instead is given the number that assures the control is the last in the tab order.

Note: TabOrder is meaningful only if the TabStop property is true and if the control has a parent. (The TabOrder property of a form is not used unless the form is the child of another form.) A control with a TabOrder of -1 has no parent, and therefore cannot be reached by pressing the Tab key. To remove a parented control from the Tab order, set its TabStop property to false.

See Also

FindNextControl (see page 6149)

TabStop (see page 6211)

68.1.30.2.36 TPanel.TabStop Property

Determines if the user can tab to a control.

Pascal

```
property TabStop: Boolean;
```

C++

```
__property Boolean TabStop;
```

Description

Use the TabStop to allow or disallow access to the control using the Tab key.

If TabStop is true, the control is in the tab order. If TabStop is false, the control is not in the tab order and the user can't press the Tab key to move to the control.

Note: TabStop is not meaningful for a form unless the form assigns another form to be its parent.

See Also

TabOrder (see page 6211)

68.1.30.2.37 TPanel.UseDockManager Property

Specifies whether the docking manager is used in drag-and-dock operations.

Pascal

```
property UseDockManager: Boolean;
```

C++

```
__property Boolean UseDockManager;
```

Description

Use UseDockManager to get or set whether a docking manager is used in drag-and-dock operations.

The docking manager handles the positioning of docked controls and any painting of docking zones around those controls. If you do not use a docking manager, docked controls are aligned to the windowed control based on the closest edge to where they are released. When you do not use a docking manager, there is no region for a user to grab to automatically undock a docked control.

See Also

DockManager (see page 6202)

68.1.30.2.38 TPanel.VerticalAlignment Property

Sets the vertical position of the caption.

Pascal

```
property VerticalAlignment: TVerticalAlignment;
```

C++

```
__property TVerticalAlignment VerticalAlignment;
```

Description

Use the VerticalAlignment property to control the position of the caption within the panel. Choose one of the following values.

Value	Description
taAlignBottom	The caption displays at the bottom of the panel.
taAlignTop	The caption displays at the top of the panel.
taVerticalCenter	The caption displays at the center of the panel.

Note: Use the Alignment property to control the horizontal position of the caption.

See Also

Caption

68.1.30.2.39 TPanel.Visible Property

Determines whether the component appears onscreen.

Pascal

```
property Visible: Boolean;
```

C++

```
__property Boolean Visible;
```

Description

Use the Visible property to control the visibility of the control at runtime. If Visible is true, the control appears. If Visible is false, the control is not visible.

Calling the Show method sets the control's Visible property to true. Calling the Hide method sets it to false.

C++ Examples:

```
/*
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
*/
void __fastcall TForm1::PageControl1Change(TObject *Sender)
{
  CheckBox1->Checked = PageControl1->ActivePage->Visible;
}

void __fastcall TForm1::CheckBox1Click(TObject *Sender)
{
  PageControl1->ActivePage->Visible = CheckBox1->Checked;
```

```
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < 10; i++)
  {
    TTabSheet *pPage = new TTabSheet(this);
    pPage->PageControl = PageControl1;
    pPage->Caption = AnsiString("Page") + IntToStr(i);
    TEdit *pEdit = new TEdit(this);
    pEdit->Parent = pPage;
    pEdit->Left = random(pPage->ClientWidth - pEdit->Width);
    pEdit->Top = random(pPage->ClientHeight - pEdit->Height);
  }
  PageControl1Change(Sender);
}
```

Delphi Examples:

```
{
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
}
procedure TForm1.CheckBox1Click(Sender: TObject);
begin
  PageControl1.ActivePage.Visible := CheckBox1.Checked;
end;

procedure TForm1.PageControl1Change(Sender: TObject);
begin
  CheckBox1.Checked := PageControl1.ActivePage.Visible;
end;

procedure TForm1.FormCreate(Sender: TObject);
var
  i: Integer;
begin
  for i := 0 to 9 do
    with TTabSheet.Create(Self) do
    begin
      PageControl := PageControl1;
      Caption := 'TabSheet' + IntToStr(i);
      with TEdit.Create(Self) do
      begin
        Parent := PageControl1.Pages[i];
        Left := Random(PageControl1.ActivePage.ClientWidth - Width);
        Top := Random(PageControl1.ActivePage.ClientHeight - Height);
      end;
    end;
    PageControl1Change(Sender);
end;
```

68.1.30.3 TPanel Events

The events of the TPanel class are listed here.

Published Events

	Name	Description
	OnAlignInsertBefore (see page 13080)	Occurs when an object with custom alignment is aligned.
	OnAlignPosition (see page 13081)	Occurs when an object with custom alignment is aligned.
	OnCanResize (see page 13082)	Occurs when an attempt is made to resize the control.
	OnClick (see page 13082)	Occurs when the user clicks the control.
	OnConstrainedResize (see page 13084)	Adjust resize constraints.
	OnContextPopup (see page 13084)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnDblClick (see page 13085)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDockDrop (see page 13085)	Occurs when another control is docked to the control.
	OnDockOver (see page 13087)	Occurs when another control is dragged over the control.
	OnDragDrop (see page 13090)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 13092)	Occurs when the user drags an object over a control.
	OnEndDock (see page 13094)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 13095)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnEnter (see page 13096)	Occurs when a control receives the input focus.
	OnExit (see page 13098)	Occurs when the input focus shifts away from one control to another.
	OnGetSiteInfo (see page 13100)	Returns the control's docking information.
	OnMouseActivate (see page 13102)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 13103)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseEnter (see page 13105)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 13105)	Occurs when the user moves the mouse outside of a control.
	OnMouseMove (see page 13105)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 13108)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnResize (see page 13110)	Occurs immediately after the control is resized.
	OnStartDock (see page 13111)	Occurs when the user begins to drag a control with a DragKind of dkDock.
	OnStartDrag (see page 13111)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.
	OnUnDock (see page 13112)	Occurs when the application tries to undock a control that is docked to the windowed control.

68.1.30.3.1 TPanel.OnAlignInsertBefore Event

Occurs when an object with custom alignment is aligned.

Pascal

```
property OnAlignInsertBefore: TAlignInsertBeforeEvent;
```

C++

```
__property TAlignInsertBeforeEvent OnAlignInsertBefore;
```

Description

OnAlignInsertBefore occurs for each pair of child controls with an Align property of **alCustom**.

It can determine the order in which custom-aligned child controls are placed. OnAlignInsertBefore returns true if **C2** should be presented before **C1**, and false otherwise. It holds a TAlignInsertBeforeEvent type.

CustomAlignInsertBefore triggers the OnAlignInsertBefore event. If this event is defined, CustomAlignInsertBefore returns the value returned by OnAlignInsertBefore. Defining this event allows users to define the order of control alignment without overriding CustomAlignInsertBefore.

See Also

CustomAlignInsertBefore (see page 6137)

Align (see page 5798)

TAlignInsertBeforeEvent (see page 6293)

68.1.30.3.2 TPanel.OnAlignPosition Event

Occurs when an object with custom alignment is aligned.

Pascal

```
property OnAlignPosition: TAlignPositionEvent;
```

C++

```
__property TAlignPositionEvent OnAlignPosition;
```

Description

OnAlignPosition occurs when child controls with an Align property of **alCustom** are aligned.

CustomAlignPosition triggers the OnAlignPosition event. If this event is defined, CustomAlignPosition uses the alignment parameters it obtains from OnAlignPosition. Defining this event allows users to set the alignment parameters without overriding CustomAlignPosition. It holds a TAlignPositionEvent type.

These are the parameters:

Parameter	Meaning
NewLeft | NewTop | NewWidth | NewHeight	Location and size of child control, as determined by container's size and the Anchors TControl_Anchors constraints for the control. OnAlignPosition can modify these values to reposition the control.
AlignRect	The client area in which the control is aligned. OnAlignPosition can modify this value.
AlignInfo	Alignment information in a TAlignInfo.
As implemented in TWinControl, OnAlignPosition does nothing.

TAlignPositionEvent (see page 6293)

68.1.30.3.3 TPanel.OnCanResize Event

Occurs when an attempt is made to resize the control.

Pascal

```
property OnCanResize: TCanResizeEvent;
```

C++

```
__property TCanResizeEvent OnCanResize;
```

Description

Use OnCanResize to adjust the way a control is resized. If necessary, change the new width and height of the control in the OnCanResize event handler. The OnCanResize event handler also allows applications to indicate that the entire resize should be aborted.

If there is no OnCanResize event handler, or if the OnCanResize event handler indicates that the resize attempt can proceed, the OnCanResize event is followed immediately by an OnConstrainedResize event.

OnConstrainedResize (see page 5853)

SetBounds (see page 5783)

OnResize (see page 5870)

68.1.30.3.4 TPanel.OnClick Event

Occurs when the user clicks the control.

Pascal

```
property OnClick: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnClick;
```

Description

Use the OnClick event handler to respond when the user clicks the control. If the control has an associated action, and that action has an OnExecute method, the action's OnExecute method responds to click events unless it is superseded by an OnClick event handler.

Usually OnClick occurs when the user presses and releases the left mouse button with the mouse pointer over the control. This event can also occur when:

- The user selects an item in a grid, outline, list, or combo box by pressing an arrow key.
- The user presses Spacebar while a button or check box has focus.
- The user presses Enter when the active form has a default button (specified by the Default property).
- The user presses Esc when the active form has a cancel button (specified by the Cancel property).
- The user presses the accelerator key for a button or check box. For example, if the value of the Caption property of a check box is '&Bold', the B is underlined at runtime and the OnClick event of the check box is triggered when the user presses Alt+B. However, focus does not move to the control in these instances.
- The Checked property of a radio button is set to true.
- The value of the Checked property of a check box is changed.
- The Click method of a menu item is called.

For a form, an OnClick event occurs when the user clicks a blank area of the form or on a disabled component.

C++ Examples:

```
/*
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
*/
void __fastcall TForm1::PageControl1Change(TObject *Sender)
{
  CheckBox1->Checked = PageControl1->ActivePage->Visible;
}

void __fastcall TForm1::CheckBox1Click(TObject *Sender)
{
  PageControl1->ActivePage->Visible = CheckBox1->Checked;
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < 10; i++)
  {
    TTabSheet *pPage = new TTabSheet(this);
    pPage->PageControl = PageControl1;
    pPage->Caption = AnsiString("Page") + IntToStr(i);
    TEdit *pEdit = new TEdit(this);
    pEdit->Parent = pPage;
    pEdit->Left = random(pPage->ClientWidth - pEdit->Width);
    pEdit->Top = random(pPage->ClientHeight - pEdit->Height);
  }
  PageControl1Change(Sender);
}
```

Delphi Examples:

```
{
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
}
procedure TForm1.CheckBox1Click(Sender: TObject);
begin
  PageControl1.ActivePage.Visible := CheckBox1.Checked;
end;

procedure TForm1.PageControl1Change(Sender: TObject);
begin
  CheckBox1.Checked := PageControl1.ActivePage.Visible;
end;

procedure TForm1.FormCreate(Sender: TObject);
var
  i: Integer;
begin
  for i := 0 to 9 do
    with TTabSheet.Create(Self) do
    begin
      PageControl := PageControl1;
      Caption := 'TabSheet' + IntToStr(i);
      with TEdit.Create(Self) do
      begin
        Parent := PageControl1.Pages[i];
```

```
          Left := Random(PageControl1.ActivePage.ClientWidth - Width);
          Top := Random(PageControl1.ActivePage.ClientHeight - Height);
        end;
      end;
      PageControl1Change(Sender);
  end;
```

68.1.30.3.5 TPanel.OnConstrainedResize Event

Adjust resize constraints.

Pascal

```
property OnConstrainedResize: TConstrainedResizeEvent;
```

C++

```
__property TConstrainedResizeEvent OnConstrainedResize;
```

Description

Use OnConstrainedResize to adjust a control's constraints when an attempt is made to resize it. Upon entry to the OnConstrainedResize event handler, the parameters of the event handler are set to the corresponding properties of the control's Constraints object. The event handler can adjust those values before they are applied to the new height and width that is being applied to the control. (The CanAutoSize method or an OnCanResize event handler may already have adjusted this new height and width).

On exit from the OnConstrainedResize event handler, the constraints are applied to the attempted new height and width. Once the constraints are applied, the control's height and width are changed. After the control's height and width change, an OnResize event occurs to allow any final adjustments or responses.

Note: The OnConstrainedResize handler is called immediately after the OnCanResize handler.

68.1.30.3.6 TPanel.OnContextPopup Event

Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).

Pascal

```
property OnContextPopup: TContextPopupEvent;
```

C++

```
__property TContextPopupEvent OnContextPopup;
```

Description

The OnContextPopup handler is called when the user uses the mouse or keyboard to request a popup menu. The OnContextPopup event is generated by a WM_CONTEXTMENU message, which is itself generated by the user clicking the right mouse button or by pressing SHIFT+F10 or the Applications key.

This event is especially useful when the control does not have an associated popup menu (the PopupMenu property is not set) or if the AutoPopup property of the control's associated popup menu is false. However, the OnContextPopup can also be used to override the automatic context menu that appears when the control has an associated popup menu with an AutoPopup property of true. In this last case, if the event handler displays its own menu, it should set the Handled parameter to true to suppress the default context menu.

The handler's MousePos parameter indicates the position of the mouse, in client coordinates.. If the event was not generated by a mouse click, MousePos is (-1,-1).

Note: Parent controls receive an OnContextPopup event before their child controls. In addition, for many child controls, the default window procedure causes the parent control to receive an OnContextPopup event after the child control. As a result, when parent controls do not set Handled to true in an OnContextPopup event handler, the event handler may be called multiple times for each context menu invocation.

68.1.30.3.7 TPanel.OnDblClick Event

Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.

Pascal

```
property OnDblClick: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnDblClick;
```

Description

Use the OnDblClick event to respond to mouse double-clicks.

OnClick (see page 5851)

Responding to User Actions at Runtime

68.1.30.3.8 TPanel.OnDockDrop Event

Occurs when another control is docked to the control.

Pascal

```
property OnDockDrop: TDockDropEvent;
```

C++

```
__property TDockDropEvent OnDockDrop;
```

Description

Write code in the OnDockDrop event to perform actions when another control is docked on the control.

OnDockDrop can only occur if DockSite is true.

C++ Examples:

```
/*
The following example is taken from the docking demo. It
shows how set permissions to dock dockable objects onto a
docking site.
*/

void __fastcall TMainForm::LeftDockPanelDockDrop(TObject *Sender,
      TDragDockObject *Source, int X, int Y)
{
  //OnDockDrop gets called AFTER the client has actually docked,
  //so we check for DockClientCount = 1 before making the dock panel visible.
  TPanel *panel = dynamic_cast<TPanel *>(Sender);
  if (panel->DockClientCount == 1)
    ShowDockPanel(panel, True, NULL);
  panel->DockManager->ResetBounds(True);
  //Make DockManager repaints it's clients.
}

void __fastcall TMainForm::LeftDockPanelDockOver(TObject *Sender,
      TDragDockObject *Source, int X, int Y, TDragState State, bool &Accept)
{
  Accept = (dynamic_cast<TDockableForm*>(Source->Control) != NULL);
  if (Accept)
  {
    // Modify the DockRect to preview dock area.
    Types::TPoint TopLeft = LeftDockPanel->ClientToScreen(Point(0, 0));
    Types::TPoint BottomRight = LeftDockPanel->ClientToScreen(
      Point(this->ClientWidth/3, LeftDockPanel->Height));
    Source->DockRect = Types::TRect(TopLeft, BottomRight);
  }
}

void __fastcall TMainForm::LeftDockPanelUnDock(TObject *Sender,
      TControl *Client, TWinControl *NewTarget, bool &Allow)
{
  //OnUnDock gets called BEFORE the client is undocked, in order to optionally
  //disallow the undock. DockClientCount is never 0 when called from this event.
  TPanel *panel = dynamic_cast<TPanel *>(Sender);
  if (panel->DockClientCount == 1)
    ShowDockPanel(panel, False, NULL);
}

void __fastcall TMainForm::LeftDockPanelGetSiteInfo(TObject *Sender,
      TControl *DockClient, TRect &InfluenceRect, TPoint &MousePos,
      bool &CanDock)
{
  //if CanDock is true, the panel will not automatically draw the preview rect.
  CanDock = DockClient->ClassNameIs("TDockableForm");
  if (!CanDock)
  {
     ShowMessage("GetSiteInfo CanDock went bad!");
  }
```

```
}
```

Delphi Examples:

```
{
The following example is taken from the docking demo. It
shows how set permissions to dock dockable objects onto a
docking site.
}

procedure TMainForm.LeftDockPanelDockDrop(Sender: TObject;
  Source: TDragDockObject; X, Y: Integer);
begin
  //OnDockDrop gets called AFTER the client has actually docked,
  //so we check for DockClientCount = 1 before making the dock panel visible.
  if (Sender as TPanel).DockClientCount = 1 then
    ShowDockPanel(Sender as TPanel, True, nil);
  (Sender as TPanel).DockManager.ResetBounds(True);
  //Make DockManager repaints it's clients.
end;

procedure TMainForm.LeftDockPanelDockOver(Sender: TObject;
  Source: TDragDockObject; X, Y: Integer; State: TDragState;
  var Accept: Boolean);
var
  ARect: TRect;
begin
  Accept := Source.Control is TDockableForm;
  if Accept then
  begin
    //Modify the DockRect to preview dock area.
    ARect.TopLeft := LeftDockPanel.ClientToScreen(Point(0, 0));
    ARect.BottomRight := LeftDockPanel.ClientToScreen(
      Point(Self.ClientWidth div 3, LeftDockPanel.Height));
    Source.DockRect := ARect;
  end;
end;

procedure TMainForm.LeftDockPanelUnDock(Sender: TObject; Client: TControl;
  NewTarget: TWinControl; var Allow: Boolean);
begin
  //OnUnDock gets called BEFORE the client is undocked, in order to optionally
  //disallow the undock. DockClientCount is never 0 when called from this event.
  if (Sender as TPanel).DockClientCount = 1 then
    ShowDockPanel(Sender as TPanel, False, nil);
end;

procedure TMainForm.LeftDockPanelGetSiteInfo(Sender: TObject;
  DockClient: TControl; var InfluenceRect: TRect; MousePos: TPoint;
  var CanDock: Boolean);
begin
  //if CanDock is true, the panel will not automatically draw the preview rect.
  CanDock := DockClient is TDockableForm;
end;
```

DockSite (see page 6204)

OnDockOver (see page 6216)

68.1.30.3.9 TPanel.OnDockOver Event

Occurs when another control is dragged over the control.

Pascal

```
property OnDockOver: TDockOverEvent;
```

C++

```
__property TDockOverEvent OnDockOver;
```

Description

Write code in the OnDockOver event to indicate whether a dockable control that is dragged over the windowed control can be accepted as a dock client. OnDockOver occurs after the TDragDockObject has been initialized by an OnGetSiteInfo event.

OnDockOver occurs only if DockSite is true.

C++ Examples:

```
/*
The following example is taken from the docking demo. It
shows how set permissions to dock dockable objects onto a
docking site.
*/

void __fastcall TMainForm::LeftDockPanelDockDrop(TObject *Sender,
      TDragDockObject *Source, int X, int Y)
{
  //OnDockDrop gets called AFTER the client has actually docked,
  //so we check for DockClientCount = 1 before making the dock panel visible.
  TPanel *panel = dynamic_cast<TPanel *>(Sender);
  if (panel->DockClientCount == 1)
    ShowDockPanel(panel, True, NULL);
  panel->DockManager->ResetBounds(True);
  //Make DockManager repaints it's clients.
}

void __fastcall TMainForm::LeftDockPanelDockOver(TObject *Sender,
      TDragDockObject *Source, int X, int Y, TDragState State, bool &Accept)
{
  Accept = (dynamic_cast<TDockableForm*>(Source->Control) != NULL);
  if (Accept)
  {
    // Modify the DockRect to preview dock area.
    Types::TPoint TopLeft = LeftDockPanel->ClientToScreen(Point(0, 0));
    Types::TPoint BottomRight = LeftDockPanel->ClientToScreen(
      Point(this->ClientWidth/3, LeftDockPanel->Height));
    Source->DockRect = Types::TRect(TopLeft, BottomRight);
  }
}

void __fastcall TMainForm::LeftDockPanelUnDock(TObject *Sender,
      TControl *Client, TWinControl *NewTarget, bool &Allow)
{
  //OnUnDock gets called BEFORE the client is undocked, in order to optionally
  //disallow the undock. DockClientCount is never 0 when called from this event.
  TPanel *panel = dynamic_cast<TPanel *>(Sender);
  if (panel->DockClientCount == 1)
    ShowDockPanel(panel, False, NULL);
}

void __fastcall TMainForm::LeftDockPanelGetSiteInfo(TObject *Sender,
      TControl *DockClient, TRect &InfluenceRect, TPoint &MousePos,
      bool &CanDock)
{
  //if CanDock is true, the panel will not automatically draw the preview rect.
  CanDock = DockClient->ClassNameIs("TDockableForm");
  if (!CanDock)
  {
```

```
      ShowMessage("GetSiteInfo CanDock went bad!");
    }
  }
```

Delphi Examples:

```
{
The following example is taken from the docking demo. It
shows how set permissions to dock dockable objects onto a
docking site.
}

procedure TMainForm.LeftDockPanelDockDrop(Sender: TObject;
  Source: TDragDockObject; X, Y: Integer);
begin
  //OnDockDrop gets called AFTER the client has actually docked,
  //so we check for DockClientCount = 1 before making the dock panel visible.
  if (Sender as TPanel).DockClientCount = 1 then
    ShowDockPanel(Sender as TPanel, True, nil);
  (Sender as TPanel).DockManager.ResetBounds(True);
  //Make DockManager repaints it's clients.
end;

procedure TMainForm.LeftDockPanelDockOver(Sender: TObject;
  Source: TDragDockObject; X, Y: Integer; State: TDragState;
  var Accept: Boolean);
var
  ARect: TRect;
begin
  Accept := Source.Control is TDockableForm;
  if Accept then
  begin
    //Modify the DockRect to preview dock area.
    ARect.TopLeft := LeftDockPanel.ClientToScreen(Point(0, 0));
    ARect.BottomRight := LeftDockPanel.ClientToScreen(
      Point(Self.ClientWidth div 3, LeftDockPanel.Height));
    Source.DockRect := ARect;
  end;
end;

procedure TMainForm.LeftDockPanelUnDock(Sender: TObject; Client: TControl;
  NewTarget: TWinControl; var Allow: Boolean);
begin
  //OnUnDock gets called BEFORE the client is undocked, in order to optionally
  //disallow the undock. DockClientCount is never 0 when called from this event.
  if (Sender as TPanel).DockClientCount = 1 then
    ShowDockPanel(Sender as TPanel, False, nil);
end;

procedure TMainForm.LeftDockPanelGetSiteInfo(Sender: TObject;
  DockClient: TControl; var InfluenceRect: TRect; MousePos: TPoint;
  var CanDock: Boolean);
begin
  //if CanDock is true, the panel will not automatically draw the preview rect.
  CanDock := DockClient is TDockableForm;
end;
```

68.1.30.3.10 TPanel.OnDragDrop Event

Occurs when the user drops an object being dragged.

Pascal

```
property OnDragDrop: TDragDropEvent;
```

C++

```
__property TDragDropEvent OnDragDrop;
```

Description

Use the OnDragDrop event handler to specify what happens when the user drops an object. The Source parameter of the OnDragDrop event is the object being dropped, and the Sender is the control the object is being dropped on. The X and Y parameters are the coordinates of the mouse positioned over the control.

C++ Examples:

```
/*
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
*/

// This OnDragOver event handler permits the list box to
// accept a dropped label:
void __fastcall TForm1::ListBox1DragOver(TObject *Sender, TObject *Source, int X, int Y,
TDragState State, bool &Accept)
{
   Accept = Source->ClassNameIs("TLabel");
}

/*
This OnDragDrop event handler implements the drop behavior.
*/
void __fastcall TForm1::ListBox1DragDrop(TObject *Sender, TObject *Source, int X, int Y)
{
  if (Sender->ClassNameIs("TListBox") && Source->ClassNameIs("TLabel"))
  {
    TListBox *DestList = (TListBox *)Sender;
    DestList->Font = ((TLabel *)Source)->Font;
    DestList->Color = ((TLabel *)Source)->Color;
    DestList->DoubleBuffered = true;
    DestList->Color = clWindow;
  }
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  ListBox1->Items->Add("Not");
  ListBox1->Items->Add("In");
  ListBox1->Items->Add("Alphabetical");
  ListBox1->Items->Add("Order");

}
```

Delphi Examples:

```
{
This code is an OnDragOver event handler that won't allow a
label control to be dropped on a panel control and stops the
```

```
dragging of the label as soon as the user drags the label
onto the panel:
Note: Set the label's DragMode property to dmAutomatic.
}
procedure TForm1.FormDragDrop(Sender, Source: TObject; X, Y: Integer);
begin
  TForm1(Source).Left := X;
  TForm1(Source).Top := Y;
end;

procedure TForm1.FormDragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := Source is TLabel;
end;

procedure TForm1.Panel1DragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := False;
  if (Source is TLabel) and (State = dsDragEnter) then
    (Source as TLabel).EndDrag(False);
end;
{
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
}

procedure TForm1.FormCreate(Sender: TObject);
begin
  ListBox1.Items.Add('Not');
  ListBox1.Items.Add('In');
  ListBox1.Items.Add('Alphabetical');
  ListBox1.Items.Add('Order');
end;

// This OnDragOver event handler permits the list box to
// accept a dropped label:

procedure TForm1.ListBox1DragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := Source is TLabel;
end;

// This OnDragDrop event handler implements the drop behavior.

68.1.30.3.11 TPanel.OnDragOver Event

Occurs when the user drags an object over a control.

Pascal

```
property OnDragOver: TDragOverEvent;
```

C++

```
__property TDragOverEvent OnDragOver;
```

Description

Use an OnDragOver event to signal that the control can accept a dragged object so the user can drop or dock it.

Within the OnDragOver event handler, change the Accept parameter to false to reject the dragged object. Leave Accept as true to allow the user to drop or dock the dragged object on the control.

To change the shape of the cursor, indicating that the control can accept the dragged object, change the value of the DragCursor property for the control before the OnDragOver event occurs.

The Source is the object being dragged, the Sender is the potential drop or dock site, and X and Y are screen coordinates in pixels. The State parameter specifies how the dragged object is moving over the control.

Note: Within the OnDragOver event handler, the Accept parameter defaults to true. However, if an OnDragOver event handler is not supplied, the control rejects the dragged object, as if the Accept parameter were changed to false.

C++ Examples:

```
/*
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
*/

// This OnDragOver event handler permits the list box to
// accept a dropped label:
void __fastcall TForm1::ListBox1DragOver(TObject *Sender, TObject *Source, int X, int Y,
TDragState State, bool &Accept)
{
   Accept = Source->ClassNameIs("TLabel");
}
```

```
/*
This OnDragDrop event handler implements the drop behavior.
*/
void __fastcall TForm1::ListBox1DragDrop(TObject *Sender, TObject *Source, int X, int Y)
{
  if (Sender->ClassNameIs("TListBox") && Source->ClassNameIs("TLabel"))
  {
    TListBox *DestList = (TListBox *)Sender;
    DestList->Font = ((TLabel *)Source)->Font;
    DestList->Color = ((TLabel *)Source)->Color;
    DestList->DoubleBuffered = true;
    DestList->Color = clWindow;
  }
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  ListBox1->Items->Add("Not");
  ListBox1->Items->Add("In");
  ListBox1->Items->Add("Alphabetical");
  ListBox1->Items->Add("Order");

}
```

Delphi Examples:

```
{
This code is an OnDragOver event handler that won't allow a
label control to be dropped on a panel control and stops the
dragging of the label as soon as the user drags the label
onto the panel:
Note: Set the label's DragMode property to dmAutomatic.
}
procedure TForm1.FormDragDrop(Sender, Source: TObject; X, Y: Integer);
begin
  TForm1(Source).Left := X;
  TForm1(Source).Top := Y;
end;

procedure TForm1.FormDragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := Source is TLabel;
end;

procedure TForm1.Panel1DragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := False;
  if (Source is TLabel) and (State = dsDragEnter) then
    (Source as TLabel).EndDrag(False);
end;
{
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
}

procedure TForm1.FormCreate(Sender: TObject);
begin
  ListBox1.Items.Add('Not');
  ListBox1.Items.Add('In');
  ListBox1.Items.Add('Alphabetical');
```

```
    ListBox1.Items.Add('Order');
  end;

  // This OnDragOver event handler permits the list box to
  // accept a dropped label:

  procedure TForm1.ListBox1DragOver(Sender, Source: TObject; X, Y: Integer;
    State: TDragState; var Accept: Boolean);
  begin
    Accept := Source is TLabel;
  end;

  // This OnDragDrop event handler implements the drop behavior.

  procedure TForm1.ListBox1DragDrop(Sender, Source: TObject; X, Y: Integer);
  begin
    if (Sender is TListBox) and (Source is TLabel) then
    begin
      with Sender as TListBox do
      begin
        Font := (Source as TLabel).Font;
        Color := (Source as TLabel).Color;
        DoubleBuffered := true;
        Color := clWindow;
      end;
    end;
  end;

68.1.30.3.12 TPanel.OnEndDock Event

Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.

Pascal

```
property OnEndDock: TEndDragEvent;
```

C++

```
__property TEndDragEvent OnEndDock;
```

Description

Use OnEndDock to specify actions or special processing that when a drag-and-dock operation stops.

See Also

68.1.30.3.13 TPanel.OnEndDrag Event

Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.

Pascal

```
property OnEndDrag: TEndDragEvent;
```

C++

```
__property TEndDragEvent OnEndDrag;
```

Description

Use the OnEndDrag event handler to specify any special processing that occurs when dragging stops.

C++ Examples:

```
/*
This code displays a message in a label named Status. The
message displayed depends on whether the dragged label
control was successfully dropped into and accepted by a
another control.
*/
void __fastcall TForm1::Label1EndDrag(TObject *Sender, TObject *Target, int X,
      int Y)
{
  if (Sender->ClassNameIs("TLabel"))
  {
    AnsiString S = ((TLabel *)Sender)->Name + " was dropped and ";
    if (Target)
      S = S + "accepted!";
    else
      S = S + "rejected.";
    Status->Caption = S;
  }
}
```

Delphi Examples:

```
{
This code displays a message in a label named Status. The
message displayed depends on whether the dragged label
control was successfully dropped into and accepted by a
another control.
}
procedure TForm1.Label1EndDrag(Sender, Target: TObject; X, Y: Integer);
var
  S: string;
begin
  S := (Sender as TLabel).Name + ' was dropped... and ';
  if Target <> nil then
    S := S + 'accepted!'
  else
    S := S + 'rejected!';
  Status.Caption := S;
end;
```

68.1.30.3.14 TPanel.OnEnter Event

Occurs when a control receives the input focus.

Pascal

```
property OnEnter: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnEnter;
```

Description

Use the OnEnter event handler to cause any special processing to occur when a control becomes active.

The OnEnter event does not occur when switching between forms or between another application and the application that includes the control.

When switching between controls in separate container controls such as the TPanel and the TGroupBox controls, an OnEnter event occurs for the container before the OnEnter event of the contained control.

Similarly, an OnExit event of the container occurs after the OnExit event of the control in a container when focus moves to another control outside the container.

For example, consider a form with an OK button and a group box that contains three radio buttons, where focus is currently on the OK button. When the user clicks one of the radio buttons, an OnExit event of the button occurs, followed by an OnEnter event on the group box, and finally an OnEnter event on the radio button that was clicked. If the user then clicks on the OK button, an OnExit event for the radio button occurs followed by an OnExit event for the group box, and then the button's OnEnter event occurs.

C++ Examples:

```
/*
This example takes an edit control, a button, and a rich
edit control on a form.  When the user presses the button, a
Font dialog appears.  When the user clicks the Apply (not OK)
button in the Font dialog, the currently selected font is
applied to the active control. Clicking the button sets the
ActiveControl to the button.  That is why we need to save
the ActiveControl in a shared OnEnter procedure.  In the rich
edit, only the text selected converts.
*/
TWinControl *myActiveControl;

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  FontDialog1->Options << fdApplyButton;
  FontDialog1->Execute();
}

void __fastcall TForm1::FontDialog1Apply(TObject *Sender, HWND Wnd)
{
  if (myActiveControl->ClassNameIs("TEdit"))
   ((TEdit *)myActiveControl)->Font->Assign(FontDialog1->Font);
  else if (myActiveControl->ClassNameIs("TRichEdit"))
    ((TRichEdit *)myActiveControl)->SelAttributes->Assign(FontDialog1->Font);
  else
    MessageBeep(0);
```

```
}

void __fastcall TForm1::Edit1Enter(TObject *Sender)
{
  myActiveControl = ActiveControl;
}
/*
This example uses an edit box and a memo control on a form.
When either the edit box or the memo is the active control,
it is colored yellow. When the active control becomes
inactive, the color of the control returns to the Windows
system color for a window.  These event handlers could also
be shared.
*/
void __fastcall TForm1::Edit1Enter(TObject *Sender)
{
  Edit1->Color = clYellow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Edit1Exit(TObject *Sender)
{
  Edit1->Color = clWindow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Memo1Enter(TObject *Sender)
{
  Memo1->Color = clYellow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Memo1Exit(TObject *Sender)
{
  Memo1->Color = clWindow;
}
```

Delphi Examples:

```
{
This example takes an edit control, a button, and a rich
edit control on a form.  When the user presses the button, a
Font dialog appears.  When the user clicks the Apply (not OK)
button in the Font dialog, the currently selected font is
applied to the active control. Clicking the button sets the
ActiveControl to the button.  That is why we need to save
the ActiveControl in a shared OnEnter procedure.  In the rich
edit, only the text selected converts.
}
procedure TForm1.Button1Click(Sender: TObject);
begin
   FontDialog1.Options := FontDialog1.Options + [fdApplyButton];
   FontDialog1.Execute;
end;

procedure TForm1.Edit1Enter(Sender: TObject);
begin
  myActiveControl := ActiveControl;
end;

procedure TForm1.FontDialog1Apply(Sender: TObject; Wnd: HWND);
begin
  if myActiveControl is TEdit then
    with myActiveControl as TEdit do
       Font.Assign(TFontDialog(Sender).Font)
  else if myActiveControl is TRichEdit then
    with myActiveControl as TRichEdit do
      SelAttributes.Assign(TFontDialog(Sender).Font)
  else
    Beep;
```

```
end;
{
This example uses an edit box and a memo control on a form.
When either the edit box or the memo is the active control,
it is colored yellow. When the active control becomes
inactive, the color of the control returns to the Windows
system color for a window.  These event handlers could also
be shared.
}
procedure TForm1.Edit1Enter(Sender: TObject);
begin
  Edit1.Color := clYellow;
end;

procedure TForm1.Edit1Exit(Sender: TObject);
begin
  Edit1.Color := clWindow;
end;

procedure TForm1.Memo1Enter(Sender: TObject);
begin
  Memo1.Color := clYellow;
end;

procedure TForm1.Memo1Exit(Sender: TObject);
begin
  Memo1.Color := clWindow;
end;
```

68.1.30.3.15 TPanel.OnExit Event

Occurs when the input focus shifts away from one control to another.

Pascal

```
property OnExit: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnExit;
```

Description

Use the OnExit event handler to provide special processing when the control ceases to be active.

The OnExit event does not occur when switching between forms or between another application and your application.

When switching between controls in separate container controls such as the TPanel and the TGroupBox controls, an OnExit event occurs for the control inside the container before the OnExit event of the container.

Similarly, an OnEnter event of the container occurs before the OnEnter event of the control in a container when focus moves to a control inside a container.

For example, consider a form with an OK button and a group box that contains three radio buttons, where focus is currently on the OK button. When the user clicks one of the radio buttons, an OnExit event of the button occurs, followed by an OnEnter event on the group box, and finally an OnEnter event on the radio button that was clicked. If the user then clicks on the OK

button, an OnExit event for the radio button occurs followed by an OnExit event for the group box, and then the button's OnEnter event occurs.

Note: In some control classes the ActiveControl property updates before the OnExit event occurs.

C++ Examples:

```
/*
This example uses an edit box and a memo control on a form.
When either the edit box or the memo is the active control,
it is colored yellow. When the active control becomes
inactive, the color of the control returns to the Windows
system color for a window.  These event handlers could also
be shared.
*/
void __fastcall TForm1::Edit1Enter(TObject *Sender)
{
  Edit1->Color = clYellow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Edit1Exit(TObject *Sender)
{
  Edit1->Color = clWindow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Memo1Enter(TObject *Sender)
{
  Memo1->Color = clYellow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Memo1Exit(TObject *Sender)
{
  Memo1->Color = clWindow;
}
```

Delphi Examples:

```
{
This example uses an edit box and a memo control on a form.
When either the edit box or the memo is the active control,
it is colored yellow. When the active control becomes
inactive, the color of the control returns to the Windows
system color for a window.  These event handlers could also
be shared.
}
procedure TForm1.Edit1Enter(Sender: TObject);
begin
  Edit1.Color := clYellow;
end;

procedure TForm1.Edit1Exit(Sender: TObject);
begin
  Edit1.Color := clWindow;
end;

procedure TForm1.Memo1Enter(Sender: TObject);
begin
  Memo1.Color := clYellow;
end;

procedure TForm1.Memo1Exit(Sender: TObject);
begin
  Memo1.Color := clWindow;
end;
```

68.1.30.3.16 TPanel.OnGetSiteInfo Event

Returns the control's docking information.

Pascal

```
property OnGetSiteInfo: TGetSiteInfoEvent;
```

C++

```
__property TGetSiteInfoEvent OnGetSiteInfo;
```

Description

Write code in the OnGetSiteInfo event handler to initialize a TDragDockObject with information about where a dragged object can be docked, if at all. OnGetSiteInfo occurs before the OnDockOver event.

OnGetSiteInfo occurs only if DockSite is true.

C++ Examples:

```
/*
The following example is taken from the docking demo. It
shows how set permissions to dock dockable objects onto a
docking site.
*/

void __fastcall TMainForm::LeftDockPanelDockDrop(TObject *Sender,
      TDragDockObject *Source, int X, int Y)
{
  //OnDockDrop gets called AFTER the client has actually docked,
  //so we check for DockClientCount = 1 before making the dock panel visible.
  TPanel *panel = dynamic_cast<TPanel *>(Sender);
  if (panel->DockClientCount == 1)
    ShowDockPanel(panel, True, NULL);
  panel->DockManager->ResetBounds(True);
  //Make DockManager repaints it's clients.
}

void __fastcall TMainForm::LeftDockPanelDockOver(TObject *Sender,
      TDragDockObject *Source, int X, int Y, TDragState State, bool &Accept)
{
  Accept = (dynamic_cast<TDockableForm*>(Source->Control) != NULL);
  if (Accept)
  {
    // Modify the DockRect to preview dock area.
    Types::TPoint TopLeft = LeftDockPanel->ClientToScreen(Point(0, 0));
    Types::TPoint BottomRight = LeftDockPanel->ClientToScreen(
      Point(this->ClientWidth/3, LeftDockPanel->Height));
    Source->DockRect = Types::TRect(TopLeft, BottomRight);
  }
}

void __fastcall TMainForm::LeftDockPanelUnDock(TObject *Sender,
      TControl *Client, TWinControl *NewTarget, bool &Allow)
{
  //OnUnDock gets called BEFORE the client is undocked, in order to optionally
  //disallow the undock. DockClientCount is never 0 when called from this event.
  TPanel *panel = dynamic_cast<TPanel *>(Sender);
  if (panel->DockClientCount == 1)
```

```
    ShowDockPanel(panel, False, NULL);
}

void __fastcall TMainForm::LeftDockPanelGetSiteInfo(TObject *Sender,
      TControl *DockClient, TRect &InfluenceRect, TPoint &MousePos,
      bool &CanDock)
{
  //if CanDock is true, the panel will not automatically draw the preview rect.
  CanDock = DockClient->ClassNameIs("TDockableForm");
  if (!CanDock)
  {
     ShowMessage("GetSiteInfo CanDock went bad!");
  }
}
```

Delphi Examples:

```
{
The following example is taken from the docking demo. It
shows how set permissions to dock dockable objects onto a
docking site.
}

procedure TMainForm.LeftDockPanelDockDrop(Sender: TObject;
  Source: TDragDockObject; X, Y: Integer);
begin
  //OnDockDrop gets called AFTER the client has actually docked,
  //so we check for DockClientCount = 1 before making the dock panel visible.
  if (Sender as TPanel).DockClientCount = 1 then
    ShowDockPanel(Sender as TPanel, True, nil);
  (Sender as TPanel).DockManager.ResetBounds(True);
  //Make DockManager repaints it's clients.
end;

procedure TMainForm.LeftDockPanelDockOver(Sender: TObject;
  Source: TDragDockObject; X, Y: Integer; State: TDragState;
  var Accept: Boolean);
var
  ARect: TRect;
begin
  Accept := Source.Control is TDockableForm;
  if Accept then
  begin
    //Modify the DockRect to preview dock area.
    ARect.TopLeft := LeftDockPanel.ClientToScreen(Point(0, 0));
    ARect.BottomRight := LeftDockPanel.ClientToScreen(
      Point(Self.ClientWidth div 3, LeftDockPanel.Height));
    Source.DockRect := ARect;
  end;
end;

procedure TMainForm.LeftDockPanelUnDock(Sender: TObject; Client: TControl;
  NewTarget: TWinControl; var Allow: Boolean);
begin
  //OnUnDock gets called BEFORE the client is undocked, in order to optionally
  //disallow the undock. DockClientCount is never 0 when called from this event.
  if (Sender as TPanel).DockClientCount = 1 then
    ShowDockPanel(Sender as TPanel, False, nil);
end;

procedure TMainForm.LeftDockPanelGetSiteInfo(Sender: TObject;
  DockClient: TControl; var InfluenceRect: TRect; MousePos: TPoint;
  var CanDock: Boolean);
begin
  //if CanDock is true, the panel will not automatically draw the preview rect.
  CanDock := DockClient is TDockableForm;
end;
```

68.1.30.3.17 TPanel.OnMouseActivate Event

Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.

Pascal

```
property OnMouseActivate: TMouseActivateEvent;
```

C++

```
__property TMouseActivateEvent OnMouseActivate;
```

Description

Use the OnMouseActivate event handler to implement any special processing that should occur as a result of pressing a mouse button on a control when the parent top-level form is not active.

The event type is:

```
TMouseActivateEvent = procedure (Sender: TObject; Button: TMouseButton; ShiftState:
TShiftState;
X, Y: Integer; HitTest: Integer; var MouseActivate: TMouseActivate) of object;
```

When you click on a control and the parent top-level form is not active, this event fires on the control that the mouse cursor is over. MouseActivate is a protected virtual function in TControl. MouseActivate can be overridden in custom control descendants to provide special built-in processing of the OnMouseActivate events. If you leave the default value of MouseActivate as maDefault, the parent control fires the OnMouseActivate event and repeats the process all the way up to the top-level form. If no control in the chain sets the value of MouseActivate, the behavior is the same as if a control set TMouseActivate to maActivate. At any point, a control can set the value of TMouseActivate and the parent processing stops.

Some controls set focus to themselves when they get a button down message so, in some cases, setting maNoActivate appears to have no effect. For instance, a TButton control sets focus to itself in the WM_LBUTTONDOWN message regardless of whether or not TMouseActivate is set to maNoActivate. In this case, setting maNoActivateAndEat will work because the top-level form is not activated and the WM_LBUTTONDOWN message is suppressed.

The HitTest parameter is the hit test value obtained from the WM_NCHITTEST message. See Windows.pas for valid values and their meanings. In most cases this value will be HTCLIENT, which means that the user clicked in the client area of a control. However, in the case of a top-level form, this can take other values such as HTCAPTION, or HTBOTTOM. This allows the code to decide which value to set for MouseActivate, based on the HitTest code. For example, the following code in the OnMouseActivate event handler for a TForm forces the user to click into a non-client area to activate the form:

```
if HitTest = HTCLIENT then
    MouseActivate := maNoActivateAndEat;
```

Even though this event is tied to how Windows processes WM_MOUSEACTIVATE, the actual handling of the message is done at the TControl level, which is the point in the VCL hierarchy where the control has no window handle. The OnMouseActivate event is then simulated since the all TControl descendants also have OnMouseDown, OnMouseMove, and OnMouseUp events. This information is applicable to both VCL Win32 and VCL.NET.

68.1.30.3.18 TPanel.OnMouseDown Event

Occurs when the user presses a mouse button with the mouse pointer over a control.

Pascal

```
property OnMouseDown: TMouseEvent;
```

C++

```
__property TMouseEvent OnMouseDown;
```

Description

Use the OnMouseDown event handler to implement any special processing that should occur as a result of pressing a mouse button.

The OnMouseDown event handler can respond to left, right, or center mouse button presses and shift key plus mouse-button combinations. Shift keys are the Shift, Ctrl, and Alt keys. X and Y are the pixel coordinates of the mouse pointer in the client area of the Sender.

C++ Examples:

```
/*
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a
rectangle is drawn on the form. When the mouse button is
released, the rectangle appears on the form's canvas. Its
top-left and bottom-right corners are defined by the
location of the mouse pointer when the user pressed and
released the mouse button.  While the user drags the mouse,
the location of the top, left, bottom, and right sides of
the rectangle are displayed in the status bar.
*/
int StartX, StartY; // Declare at the top of the form's unit
// Use this code as the OnMouseDown event handler of the form:
void __fastcall TForm1::FormMouseDown(TObject *Sender, TMouseButton Button, TShiftState Shift,
int X, int Y)
{
  StartX = X;
  StartY = Y;
}

// Use this code as the OnMouseUp event handler of the form:
void __fastcall TForm1::FormMouseUp(TObject *Sender, TMouseButton Button, TShiftState Shift,
int X, int Y)
{
  Form1->Canvas->Rectangle(StartX, StartY, X, Y);
  StatusBar1->Panels->Items[0]->Text = "";
  StatusBar1->Panels->Items[1]->Text = "";
  StatusBar1->Panels->Items[2]->Text = "";
  StatusBar1->Panels->Items[3]->Text = "";
}

// Use this code as the OnMouseMove event handler of the form:
void __fastcall TForm1::FormMouseMove(TObject *Sender, TShiftState Shift, int X, int Y)
{
  if (Shift.Contains(ssLeft)) // make sure button is down
```

```
  {
    if (Y > StartY)
    {
      StatusBar1->Panels->Items[0]->Text = "Top: " + IntToStr(StartY);
      StatusBar1->Panels->Items[2]->Text = "Bottom: " + IntToStr(Y);
    }
    else
    {
      StatusBar1->Panels->Items[0]->Text = "Top: " + IntToStr(Y);
      StatusBar1->Panels->Items[2]->Text = "Bottom: " + IntToStr(StartY);
    }
    if (X > StartX)
    {
      StatusBar1->Panels->Items[1]->Text = "Left: " + IntToStr(StartX);
      StatusBar1->Panels->Items[3]->Text = "Right: " + IntToStr(X);
    }
    else
    {
      StatusBar1->Panels->Items[1]->Text = "Left: " + IntToStr(X);
      StatusBar1->Panels->Items[3]->Text = "Right: " + IntToStr(StartX);
    }
  }
}
```

Delphi Examples:

```
{
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a

68.1.30.3.19 TPanel.OnMouseEnter Event

Occurs when the user moves the mouse into a control.

Pascal

```
property OnMouseEnter: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnMouseEnter;
```

Description

Use the OnMouseEnter event handler to implement any special processing that should occur as a result of moving the mouse into a control when the parent top-level form is not active.

68.1.30.3.20 TPanel.OnMouseLeave Event

Occurs when the user moves the mouse outside of a control.

Pascal

```
property OnMouseLeave: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnMouseLeave;
```

Description

Use the OnMouseLeave event handler to implement any special processing that should occur as a result of moving the mouse outside of a control when the parent top-level form is not active.

68.1.30.3.21 TPanel.OnMouseMove Event

Occurs when the user moves the mouse pointer while the mouse pointer is over a control.

Pascal

```
property OnMouseMove: TMouseMoveEvent;
```

C++

```
__property TMouseMoveEvent OnMouseMove;
```

Description

Use the OnMouseMove event handler to respond when the mouse pointer moves after the control has captured the mouse.

Use the Shift parameter of the OnMouseDown event handler, to determine to the state of the shift keys and mouse buttons. Shift keys are the Shift, Ctrl, and Alt keys or shift key-mouse button combinations. X and Y are pixel coordinates of the new location of the mouse pointer in the client area of the Sender.

C++ Examples:

```
/*
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a
rectangle is drawn on the form. When the mouse button is
released, the rectangle appears on the form's canvas. Its
top-left and bottom-right corners are defined by the
location of the mouse pointer when the user pressed and
released the mouse button.  While the user drags the mouse,
the location of the top, left, bottom, and right sides of
the rectangle are displayed in the status bar.
*/

}

// Use this code as the OnMouseMove event handler of the form:
void __fastcall TForm1::FormMouseMove(TObject *Sender, TShiftState Shift, int X, int Y)
{
  if (Shift.Contains(ssLeft)) // make sure button is down
  {
    if (Y > StartY)
    {
      StatusBar1->Panels->Items[0]->Text = "Top: " + IntToStr(StartY);
      StatusBar1->Panels->Items[2]->Text = "Bottom: " + IntToStr(Y);
    }
    else
    {
      StatusBar1->Panels->Items[0]->Text = "Top: " + IntToStr(Y);
      StatusBar1->Panels->Items[2]->Text = "Bottom: " + IntToStr(StartY);
    }
    if (X > StartX)
```

```
    {
      StatusBar1->Panels->Items[1]->Text = "Left: " + IntToStr(StartX);
      StatusBar1->Panels->Items[3]->Text = "Right: " + IntToStr(X);
    }
    else
    {
      StatusBar1->Panels->Items[1]->Text = "Left: " + IntToStr(X);
      StatusBar1->Panels->Items[3]->Text = "Right: " + IntToStr(StartX);
    }
  }
}
```

Delphi Examples:

```
{
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a
rectangle is drawn on the form. When the mouse button is
released, the rectangle appears on the form's canvas. Its
top-left and bottom-right corners are defined by the
location of the mouse pointer when the user pressed and
released the mouse button.  While the user drags the mouse,
the location of the top, left, bottom, and right sides of
the rectangle are displayed in the status bar.
}
procedure TForm1.FormMouseDown(Sender: TObject; Button: TMouseButton; Shift: TShiftState; X,
Y: Integer);
begin
  StartX := X;
  StartY := Y;
end;

procedure TForm1.FormMouseUp(Sender: TObject; Button: TMouseButton; Shift: TShiftState; X, Y:
Integer);
begin
  Form1.Canvas.Rectangle(StartX, StartY, X, Y);
  StatusBar1.Panels[0].Text := '';
  StatusBar1.Panels[1].Text := '';
  StatusBar1.Panels[2].Text := '';
  StatusBar1.Panels[3].Text := '';
end;

procedure TForm1.FormMouseMove(Sender: TObject; Shift: TShiftState; X, Y: Integer);
begin
  if ssLeft in Shift then { make sure button is down }
  begin
    if Y > StartY then
      begin
      StatusBar1.Panels[0].Text := 'Top: ' + IntToStr(StartY);
      StatusBar1.Panels[2].Text := 'Bottom: ' + IntToStr(Y);
      end
    else
      begin
      StatusBar1.Panels[0].Text := 'Top: ' + IntToStr(Y);
      StatusBar1.Panels[2].Text := 'Bottom: ' + IntToStr(StartY);
      end;
    if X > StartX then
      begin
      StatusBar1.Panels[1].Text := 'Left: ' + IntToStr(StartX);
      StatusBar1.Panels[3].Text := 'Right: ' + IntToStr(X);
      end
    else
      begin
      StatusBar1.Panels[1].Text := 'Left: ' + IntToStr(X);
      StatusBar1.Panels[3].Text := 'Right: ' + IntToStr(StartX);
```

```
      end;
    end;
  end;
```

68.1.30.3.22 TPanel.OnMouseUp Event

Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.

Pascal

```
property OnMouseUp: TMouseEvent;
```

C++

```
__property TMouseEvent OnMouseUp;
```

Description

Use an OnMouseUp event handler to implement special processing when the user releases a mouse button.

The OnMouseUp event handler can respond to left, right, or center mouse button presses and shift key plus mouse-button combinations. Shift keys are the Shift, Ctrl, and Alt keys. X and Y are the pixel coordinates of the mouse pointer in the client area of the Sender.

C++ Examples:

```
/*
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a
rectangle is drawn on the form. When the mouse button is
released, the rectangle appears on the form's canvas. Its
top-left and bottom-right corners are defined by the
location of the mouse pointer when the user pressed and
released the mouse button.  While the user drags the mouse,
the location of the top, left, bottom, and right sides of
the rectangle are displayed in the status bar.
*/
int StartX, StartY; // Declare at the top of the form's unit
// Use this code as the OnMouseDown event handler of the form:
void __fastcall TForm1::FormMouseDown(TObject *Sender, TMouseButton Button, TShiftState Shift,
int X, int Y)
{
  StartX = X;
  StartY = Y;
}

// Use this code as the OnMouseUp event handler of the form:
void __fastcall TForm1::FormMouseUp(TObject *Sender, TMouseButton Button, TShiftState Shift,
int X, int Y)
{
  Form1->Canvas->Rectangle(StartX, StartY, X, Y);
  StatusBar1->Panels->Items[0]->Text = "";
  StatusBar1->Panels->Items[1]->Text = "";
  StatusBar1->Panels->Items[2]->Text = "";
  StatusBar1->Panels->Items[3]->Text = "";
}
```

```
// Use this code as the OnMouseMove event handler of the form:
void __fastcall TForm1::FormMouseMove(TObject *Sender, TShiftState Shift, int X, int Y)
{
  if (Shift.Contains(ssLeft)) // make sure button is down
  {
    if (Y > StartY)
    {
      StatusBar1->Panels->Items[0]->Text = "Top: " + IntToStr(StartY);
      StatusBar1->Panels->Items[2]->Text = "Bottom: " + IntToStr(Y);
    }
    else
    {
      StatusBar1->Panels->Items[0]->Text = "Top: " + IntToStr(Y);
      StatusBar1->Panels->Items[2]->Text = "Bottom: " + IntToStr(StartY);
    }
    if (X > StartX)
    {
      StatusBar1->Panels->Items[1]->Text = "Left: " + IntToStr(StartX);
      StatusBar1->Panels->Items[3]->Text = "Right: " + IntToStr(X);
    }
    else
    {
      StatusBar1->Panels->Items[1]->Text = "Left: " + IntToStr(X);
      StatusBar1->Panels->Items[3]->Text = "Right: " + IntToStr(StartX);
    }
  }
}
```

Responding to a Mouse-up Action

68.1.30.3.23 TPanel.OnResize Event

Occurs immediately after the control is resized.

Pascal

```
property OnResize: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnResize;
```

Description

Use OnResize to make any final adjustments after a control is resized.

To modify the way a control responds when an attempt is made to resize it, use OnCanResize or OnConstrainedResize.

Note: Some controls call this event handler when the control is first created.

Delphi Examples:

```
{
The following code keeps the right edge on Button1 against
the right edge of Form1 when Form1 is resized.
}
procedure TForm1.FormResize(Sender: TObject);
begin
  Button1.Left := Form1.ClientWidth-Button1.Width;
end;
```

OnConstrainedResize (see page 5853)

68.1.30.3.24 TPanel.OnStartDock Event

Occurs when the user begins to drag a control with a DragKind of dkDock.

Pascal

```
property OnStartDock: TStartDockEvent;
```

C++

```
__property TStartDockEvent OnStartDock;
```

Description

Use the OnStartDock event handler to implement special processing when the user starts a drag-and-dock operation by dragging the control.

The OnStartDock event handler can create a TDragDockObjectEx object for the DragObject parameter to specify the appearance of the dragging rectangle and how the dragged control interacts with potential docking sites. If you return TDragDockObjectEx as the drag object, there is no need to call the Free method for the DragObject when dragging is over. If you use TDragDockObject, your application is responsible for freeing the drag object.

If the OnStartDock event handler sets the DragObject parameter to nil (Delphi) or NULL (C++), a TDragDockObject object is automatically created.

Note: This information applies to Win32 applications only.

68.1.30.3.25 TPanel.OnStartDrag Event

Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.

Pascal

```
property OnStartDrag: TStartDragEvent;
```

C++

```
__property TStartDragEvent OnStartDrag;
```

Description

Use the OnStartDrag event handler to implement special processing when the user starts to drag the control or an object it contains. OnStartDrag only occurs if DragKind is dkDrag.

Sender is the control that is about to be dragged, or that contains the object about to be dragged.

The OnStartDrag event handler can create a TDragControlObjectEx instance for the DragObject parameter to specify the drag cursor, or, optionally, a drag image list. If you create a TDragControlObjectEx instance, there is no need to call the Free method for the DragObject when dragging is over. If you create, instead, a TDragControlObject instance, your application is responsible

for freeing the drag object instance.

If the OnStartDrag event handler sets the DragObject parameter to nil (Delphi) or NULL (C++), a TDragControlObject object is automatically created and dragging begins on the control itself.

Note: On some controls, such as TRichEdit, the underlying Windows control handles internal drag operations. For these controls, there are no OnStartDrag or OnEndDrag events for drag operations within the control.

68.1.30.3.26 TPanel.OnUnDock Event

Occurs when the application tries to undock a control that is docked to the windowed control.

Pascal

```
property OnUnDock: TUnDockEvent;
```

C++

```
__property TUnDockEvent OnUnDock;
```

Description

Write an OnUnDock event handler to adjust the windowed control when a dock client is undocked. The OnUnDock event handler can make any necessary adjustments, or it can block the undock attempt by setting the Allow parameter to false.

C++ Examples:

```
/*
The following example is taken from the docking demo. It
shows how the OnUnDock event handler of the conjoinment
docking site re-enables docking in the control that is
undocked (if it is a dockable form). In addition, when the
next to last docked control is undocked, the conjoinment
docking site sends itself a close message so that the last
docked control is undocked to its old position and size.
*/
void __fastcall TConjoinDockHost::FormUnDock(TObject *Sender, TControl *Client,
      TWinControl *NewTarget, bool &Allow)
{
  // Only 2 dock clients means the host must be destroyed and
  // the remaining window undocked to its old position and size.
  // Recall that OnUnDock gets called before the undocking
  // actually occurs.
  if (Client->ClassNameIs("TDockableForm"))
    dynamic_cast<TDockableForm *>(Client)->DockSite = True;
  if ((DockClientCount == 2) && (NewTarget != this))        // Self?
    PostMessage(dynamic_cast<TConjoinDockHost *>(this)->Handle, WM_CLOSE, 0, 0);
  UpdateCaption(Client);
}
/*
The following example is taken from the docking demo. It
shows how set permissions to dock dockable objects onto a
docking site.
*/
```

```
void __fastcall TMainForm::LeftDockPanelDockDrop(TObject *Sender,
      TDragDockObject *Source, int X, int Y)
{
  //OnDockDrop gets called AFTER the client has actually docked,
  //so we check for DockClientCount = 1 before making the dock panel visible.
  TPanel *panel = dynamic_cast<TPanel *>(Sender);
  if (panel->DockClientCount == 1)
    ShowDockPanel(panel, True, NULL);
  panel->DockManager->ResetBounds(True);
  //Make DockManager repaints it's clients.
}

void __fastcall TMainForm::LeftDockPanelDockOver(TObject *Sender,
      TDragDockObject *Source, int X, int Y, TDragState State, bool &Accept)
{
  Accept = (dynamic_cast<TDockableForm*>(Source->Control) != NULL);
  if (Accept)
  {
    // Modify the DockRect to preview dock area.
    Types::TPoint TopLeft = LeftDockPanel->ClientToScreen(Point(0, 0));
    Types::TPoint BottomRight = LeftDockPanel->ClientToScreen(
      Point(this->ClientWidth/3, LeftDockPanel->Height));
    Source->DockRect = Types::TRect(TopLeft, BottomRight);
  }
}

void __fastcall TMainForm::LeftDockPanelUnDock(TObject *Sender,
      TControl *Client, TWinControl *NewTarget, bool &Allow)
{
  //OnUnDock gets called BEFORE the client is undocked, in order to optionally
  //disallow the undock. DockClientCount is never 0 when called from this event.
  TPanel *panel = dynamic_cast<TPanel *>(Sender);
  if (panel->DockClientCount == 1)
    ShowDockPanel(panel, False, NULL);
}

void __fastcall TMainForm::LeftDockPanelGetSiteInfo(TObject *Sender,
      TControl *DockClient, TRect &InfluenceRect, TPoint &MousePos,
      bool &CanDock)
{
  //if CanDock is true, the panel will not automatically draw the preview rect.
  CanDock = DockClient->ClassNameIs("TDockableForm");
  if (!CanDock)
  {
     ShowMessage("GetSiteInfo CanDock went bad!");
  }
}
```

Delphi Examples:

```
{
The following example is taken from the docking demo. It
shows how the OnUnDock event handler of the conjoinment
docking site re-enables docking in the control that is
undocked (if it is a dockable form). In addition, when the
next to last docked control is undocked, the conjoinment
docking site sends itself a close message so that the last
docked control is undocked to its old position and size.
}

68.1.31 TRadioGroup Class

TRadioGroup represents a group of radio buttons that function together.

Class Hierarchy

Pascal

```
TRadioGroup = class(TCustomRadioGroup);
```

C++

```
class TRadioGroup : public TCustomRadioGroup;
```

File

ExtCtrls

Description

A TRadioGroup object is a special group box that contains only radio buttons. Radio buttons that are placed directly in the same control component are said to be "grouped." When the user checks a radio button, all other radio buttons in its group become unchecked. Hence, two radio buttons on a form can be checked at the same time only if they are placed in separate containers, such as group boxes.

To add radio buttons to a TRadioGroup, edit the Items (see page 13141) property in the Object Inspector. Each string in Items (see page 13141) makes a radio button appear in the group box with the string as its caption. The value of the ItemIndex (see page 13140) property determines which radio button is currently selected.

Display the radio buttons in a single column or in multiple columns by setting the Columns (see page 13135) property.

Note: Setting the radio group's BiDiMode (see page 13131) to bdRightToLeft automatically flips its radio buttons. The FlipChildren (see page 12559) method has no effect.

Group Boxes and Radio Groups

Grouping Controls

68.1.31.1 TRadioGroup Members

The following tables list the members exposed by TRadioGroup.

Protected Events

	Name	Description
	OnAlignInsertBefore (see page 6213)	Occurs when an object with custom alignment is aligned.
	OnAlignPosition (see page 6214)	Occurs when an object with custom alignment is aligned.
	OnCanResize (see page 5851)	Occurs when an attempt is made to resize the control.

	OnConstrainedResize (see page 5853)	Adjust resize constraints.
	OnDblClick (see page 5854)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDockDrop (see page 6214)	Occurs when another control is docked to the control.
	OnDockOver (see page 6216)	Occurs when another control is dragged over the control.
	OnGetSiteInfo (see page 6223)	Returns the control's docking information.
	OnKeyDown (see page 6225)	Occurs when a user presses any key while the control has focus.
	OnKeyPress (see page 6227)	Occurs when a key is pressed.
	OnKeyUp (see page 6228)	Occurs when the user releases a key that has been pressed.
	OnMouseActivate (see page 5861)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 5862)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseEnter (see page 5864)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 5864)	Occurs when the user moves the mouse outside of a control.
	OnMouseMove (see page 5865)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 5867)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnMouseWheel (see page 5869)	Occurs when the mouse wheel is rotated.
	OnMouseWheelDown (see page 5869)	Occurs when the mouse wheel is rotated downward.
	OnMouseWheelUp (see page 5870)	Occurs when the mouse wheel is rotated upward.
	OnResize (see page 5870)	Occurs immediately after the control is resized.
	OnUnDock (see page 6230)	Occurs when the application tries to undock a control that is docked to the windowed control.

Protected Fields

	Name	Description
	FAnchorMove (see page 5733)	This is FAnchorMove, a member of class TControl.
	FAnchorOrigin (see page 5734)	This is FAnchorOrigin, a member of class TControl.
	FAnchorRules (see page 5734)	This is FAnchorRules, a member of class TControl.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FDesignSize (see page 6124)	This is FDesignSize, a member of class TWinControl.
	FDoubleBuffered (see page 6124)	This is FDoubleBuffered, a member of class TWinControl.
	FExplicitHeight (see page 5734)	This is FExplicitHeight, a member of class TControl.
	FExplicitLeft (see page 5734)	This is FExplicitLeft, a member of class TControl.
	FExplicitTop (see page 5734)	This is FExplicitTop, a member of class TControl.
	FExplicitWidth (see page 5735)	This is FExplicitWidth, a member of class TControl.
	FInImeComposition (see page 6125)	This is FInImeComposition, a member of class TWinControl.
	FOriginalParentSize (see page 5735)	This is FOriginalParentSize, a member of class TControl.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	ActionChange (see page 5737)	Responds when the action associated with the control changes.
V	ActionChange (see page 6127)	Updates the control to reflect changes in its associated action.
	AddBiDiModeExStyle (see page 6128)	Sets control's window style according to its bi-directional support.
V	AdjustClientRect (see page 6128)	Provides the interface that adjusts the ClientRect (see page 5810) property for idiosyncrasies of the window.
V	AdjustClientRect (see page 21287)	Adjusts the ClientRect property for idiosyncrasies of the window.
	AdjustSize (see page 5738)	Sets the size of the control as determined by the AutoSize (see page 5803) property.
V	AdjustSize (see page 6129)	Adjusts the control's size according to its contents and constraints.
V	AlignControls (see page 6129)	Aligns any controls for which the control is the parent within a specified area of the control.
	ArrangeControl (see page 6130)	This is ArrangeControl, a member of class TWinControl.

	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	AssignTo (see page 5739)	Overrides the inherited AssignTo function to enable assignments to TAction objects.
	AssignTo (see page 6130)	Copies the properties of the windowed control to another object.
	BeginAutoDrag (see page 5739)	Begin Automatic Drag.
	CalcCursorPos (see page 5741)	This is CalcCursorPos, a member of class TControl.
	CanAutoSize (see page 5741)	Indicates whether the control can resize itself automatically to accommodate its contents.
	CanAutoSize (see page 6131)	Indicates how the control can be resized.
	CanModify (see page 12559)	Determines whether the user can select a different radio button in the group.
	CanResize (see page 5742)	OnCanResize (see page 5851) event dispatcher.
	CanResize (see page 6132)	Indicates how the control can respond to a resize attempt.
	Changed (see page 5742)	Sends a CM_CHANGED (see page 6330) message to the control.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	ChangeScale (see page 5743)	Rescaling event dispatcher.
	ChangeScale (see page 6132)	Resize (see page 5780) and reposition children and self.
	Click (see page 5743)	Respond to user click.
	ConstrainedResize (see page 5746)	Notify control of resize with constraints.
	ConstrainedResize (see page 6133)	Generates an OnConstrainedResize (see page 5853) event.
	ControlsAligned (see page 6134)	This is ControlsAligned, a member of class TWinControl.
	CreateDockManager (see page 6134)	Creates the dock manager for the control.
	CreateHandle (see page 6135)	Creates underlying screen object.
	CreateParams (see page 6135)	Initializes a window-creation parameter data structure.
	CreateParams (see page 21287)	Initializes a window-creation parameter record passed in the Params parameter.
	CreateSubClass (see page 6136)	Creates a windowed control derived from an existing Windows window class.
	CreateWindowHandle (see page 6137)	Creates a Windows control to represent the control.
	CreateWnd (see page 6137)	Creates the underlying window.
	CustomAlignInsertBefore (see page 6137)	Returns placement order of custom-aligned child control.
	CustomAlignPosition (see page 6138)	Returns aligned position of custom-aligned child control.
	DblClick (see page 5747)	OnDblClick (see page 5854) event dispatcher.
	DefaultDockImage (see page 5747)	Handles the painting and erasing of a dock image.
	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	DefineProperties (see page 5748)	Provides methods to read and write the IsControl (see page 5829) property to a stream such as a form file.
	DefineProperties (see page 6139)	Provides methods to read and write the IsControl property to a stream such as a form file.
	DesignWndProc (see page 5749)	This is DesignWndProc, a member of class TControl.
	DestroyHandle (see page 6140)	Destroys the control's window without destroying the control.
	DestroyWindowHandle (see page 6140)	Destroys the window created in the CreateWindowHandle (see page 6137) method.
	DestroyWnd (see page 6141)	Destroys the control's window.
	DoAddDockClient (see page 6142)	Performs actions when a control is docked to the windowed control.
	DockOver (see page 6143)	Responds when a docking client is dragged over the windowed control.
	DockReplaceDockClient (see page 6143)	This is DockReplaceDockClient, a member of class TWinControl.
	DockTrackNoTarget (see page 5749)	Handles dragging of the control over an invalid docking target.
	DoContextPopup (see page 5750)	OnContextPopup (see page 5854) event dispatcher.
	DoDock (see page 5750)	Docking event dispatcher.
	DoDockOver (see page 6143)	Generates an OnDockOver (see page 6216) event.
	DoEndDock (see page 5750)	OnEndDock (see page 5859) event dispatcher.
	DoEndDrag (see page 5751)	OnEndDrag (see page 5860) event dispatcher.
	DoEnter (see page 6144)	Respond to receiving input focus.
	DoExit (see page 6144)	Respond to losing input focus
	DoFlipChildren (see page 6145)	Flips the control's children.

	DoKeyDown (see page 6145)	Performs some preprocessing before generating an OnKeyDown (see page 6225) event.
	DoKeyPress (see page 6146)	Performs some preprocessing before generating an OnKeyPress (see page 6227) event.
	DoKeyUp (see page 6146)	Performs some preprocessing before generating an OnKeyUp (see page 6228) event.
	DoMouseWheel (see page 5751)	Processes mouse wheel motion.
	DoMouseWheelDown (see page 5752)	OnMouseWheelDown (see page 5869) event dispatcher.
	DoMouseWheelUp (see page 5752)	OnMouseWheelUp (see page 5870) event dispatcher.
	DoRemoveDockClient (see page 6147)	Responds when a control is undocked from the windowed control.
	DoStartDock (see page 5753)	OnStartDock (see page 5871) event dispatcher.
	DoStartDrag (see page 5753)	OnStartDrag (see page 5871) event dispatcher.
	DoUnDock (see page 6147)	Undocks a control that is currently docked to the windowed control.
	DragCanceled (see page 5754)	Provides the interface for a method that responds to the cancellation of a drag.
	DragOver (see page 5755)	OnDragOver (see page 5857) event dispatcher.
	DrawDragDockImage (see page 5755)	Draws the dock image for the control.
	EraseDragDockImage (see page 5757)	Erases the dock image for the control.
	FindNextControl (see page 6149)	Returns the control's next child in the tab order after the specified control.
	FixupTabList (see page 6149)	Sorts the child controls by their tab order.
V	GetAction (see page 5758)	This is GetAction, a member of class TControl.
	GetActionLinkClass (see page 5758)	Returns the appropriate action link class that is associated with the control class.
V	GetActionLinkClass (see page 6152)	Returns the associated action link class.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetChildren (see page 6153)	Calls a specified method for each child of the control.
V	GetChildren (see page 12560)	Prevents the streaming system from loading and saving child controls in the usual fashion.
V	GetClientOrigin (see page 5758)	Returns the screen coordinates of the top-left corner of the control's client area.
V	GetClientOrigin (see page 6153)	Returns the value of the ClientOrigin (see page 5809) property.
V	GetClientRect (see page 5759)	Returns a rectangle defining the client area of the control.
V	GetClientRect (see page 6154)	Returns the value of the ClientRect (see page 5810) property.
V	GetControlExtents (see page 6154)	Returns the smallest rectangle in which all the control's children fit.
V	GetDeviceContext (see page 5760)	Returns a device context for the control.
V	GetDeviceContext (see page 6155)	Provides access to a device context for the control.
	GetDockEdge (see page 5763)	Returns the edge on which another control should be docked when it is dragged over the control.
V	GetDragImages (see page 5763)	Returns the control's image list containing the image to be displayed while dragging.
V	GetEnabled (see page 5763)	Returns the value of the Enabled (see page 5821) property.
V	GetFloating (see page 5764)	Returns the value of the Floating (see page 5823) property.
V	GetFloatingDockSiteClass (see page 5764)	Returns the class used for the control when it is floating.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetPalette (see page 5765)	Returns the handle to a palette for use by the control.
	GetParentHandle (see page 6157)	Returns the window handle for the window of the control's parent.
	GetPopupMenu (see page 5765)	Returns the pop-up menu associated with the control.
	GetSiteInfo (see page 6158)	Generates an OnGetSiteInfo (see page 6223) event
	GetTopParentHandle (see page 6159)	Returns the window handle of the first window not associated with a VCL control that contains the windowed control.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	InvalidateDockHostSite (see page 6162)	This is InvalidateDockHostSite, a member of class TWinControl.

	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsControlActivateMsg (see page 6162)	This is IsControlActivateMsg, a member of class TWinControl.
	IsControlMouseMsg (see page 6162)	Indicates whether a specified mouse message is directed to one of the windowed control's child controls.
	IsQualifyingSite (see page 6163)	This is IsQualifyingSite, a member of class TWinControl.
	KeyDown (see page 6163)	Respond to key press events.
	KeyPress (see page 6163)	Respond to keyboard input.
	KeyUp (see page 6164)	Respond to released key.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Loaded (see page 5771)	Initializes the control after it is loaded from a stream.
V	Loaded (see page 12560)	Initializes the radio group after it is loaded into memory.
	MainWndProc (see page 6165)	Receives Windows messages for the control.
	MouseActivate (see page 5773)	This is MouseActivate, a member of class TControl.
	MouseDown (see page 5773)	OnMouseDown (see page 5862) event dispatcher.
	MouseMove (see page 5773)	Respond to mouse moving over control area..
	MouseUp (see page 5774)	OnMouseUp (see page 5867) event dispatcher.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	Notification (see page 5775)	Responds to notifications that components are being created or destroyed.
V	Notification (see page 6165)	Responds to notifications that components are being created or destroyed.
	NotifyControls (see page 6165)	Sends a message to all the child controls.
V	Paint (see page 5920)	Renders the image of a custom control.
V	Paint (see page 21287)	Renders the onscreen image of the group box.
	PaintControls (see page 6166)	Paints each of the child controls in a windowed control using the specified device context.
	PaintHandler (see page 6166)	Responds to WM_PAINT messages.
V	PaintWindow (see page 5920)	Renders the image of the control on a specified device context.
V	PaintWindow (see page 6169)	Renders the image of a windowed control.
	PaletteChanged (see page 5775)	Responds to changes in the system's palette by realizing the control's palette.
V	PaletteChanged (see page 6170)	Responds to changes in the system's palette by realizing the control's palette and the palette for each child control.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	PositionDockRect (see page 5777)	Positions the docking rectangle according to the current drag-and-dock state.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 5778)	Prepares the control for having its properties assigned values read from a stream.
V	ReadState (see page 6171)	Prepares the control for having its properties assigned values from a stream.
V	ReadState (see page 12560)	Prepares the control for having its properties assigned values from a stream.
	RecreateWnd (see page 6171)	Recreate underlying Windows screen object.
	ReloadDockedControl (see page 6172)	Reloads a docked control.
	RemoveWindowProps (see page 6174)	This is RemoveWindowProps, a member of class TWinControl.
V	RequestAlign (see page 5780)	Instructs the parent of a control to reposition the control, enforcing its Align (see page 5798) property.
	ResetIme (see page 6174)	Restores the input method editor (IME) that was active when the application started.
	ResetImeComposition (see page 6175)	Directs the composition window of the input method editor (IME) to perform a specific action.
	Resize (see page 5780)	Respond to control resize.
	ScaleConstraints (see page 5781)	This is ScaleConstraints, a member of class TControl.
	ScaleControls (see page 6176)	Rescale child controls only.
	SelectFirst (see page 6177)	Locates first selectable child control.
	SelectNext (see page 6177)	Moves the input focus from the current child control to the next one in the tab order.
	SendCancelMode (see page 5781)	Cancels the modal state of the control.
	SendDockNotification (see page 5782)	Sends a Windows message to the control's host dock site.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
V	SetAutoSize (see page 5783)	This is SetAutoSize, a member of class TControl.

	SetBiDiMode (see page 5783)	Sets the control's bi-directional mode.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetChildOrder (see page 6178)	Changes the order in which the child component appears in the list of child components returned by the GetChildren (see page 6153) method.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDragMode (see page 5785)	Sets the drag mode for the control.
	SetEnabled (see page 5785)	Sets the value of the Enabled (see page 5821) property.
	SetIme (see page 6181)	Activates an input method editor (IME) using the values specified by the ImeMode (see page 6207) and ImeName (see page 6208) properties.
	SetImeCompositionWindow (see page 6181)	Sets the position and font of the composition window.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetName (see page 5785)	Sets the name of the control.
	SetParent (see page 5786)	Sets the parent of the control.
	SetParent (see page 6182)	Sets the parent of the control.
	SetParentBackground (see page 6182)	This is SetParentBackground, a member of class TWinControl.
	SetParentBiDiMode (see page 5786)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	SetParentComponent (see page 5787)	Sets the parent for the control.
	SetZOrder (see page 5788)	Repositions the control in its parent's control list, thereby changing position onscreen.
	SetZOrder (see page 6182)	Moves the control to the top or bottom of the parent control's (or screen's) list of TWinControl (see page 6112) controls.
	ShowControl (see page 6183)	Ensures that a specified child control is visible.
	UpdateBounds (see page 6185)	This is UpdateBounds, a member of class TWinControl.
	UpdateBoundsRect (see page 5789)	Changes the Top (see page 5844), Left (see page 5830), Width (see page 5849), and Height (see page 5825) properties of the control, but doesn't update its screen image and bypasses all resize events.
	UpdateControlOriginalParentSize (see page 6186)	This is UpdateControlOriginalParentSize, a member of class TWinControl.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateExplicitBounds (see page 5789)	This is UpdateExplicitBounds, a member of class TControl.
	UpdateRecreatingFlag (see page 6186)	This is UpdateRecreatingFlag, a member of class TWinControl.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	UpdateUIState (see page 6186)	Updates form User Interface State as needed
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	VisibleChanging (see page 5791)	Provides the interface for a method that responds to changes in the control's visibility.
	WndProc (see page 5791)	Provides specific message responses for the control.
	WndProc (see page 6187)	Provides specific message responses for the control.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	ActionLink (see page 5798)	Contains the action link object associated with the control.
	AutoSize (see page 5803)	Specifies whether the control sizes itself automatically to accommodate its contents.
	BevelEdges (see page 6192)	Specifies which edges of the control are beveled.
	BevelInner (see page 6193)	Specifies the cut of the inner bevel.
	BevelKind (see page 6193)	Specifies the control's bevel style.

	BevelOuter (see page 6194)	Specifies the cut of the outer bevel.
	BevelWidth (see page 6194)	Specifies the width of the inner and outer bevels.
	BorderWidth (see page 6195)	Specifies the width of the control's border.
R	Canvas (see page 5921)	Specifies the TCanvas object that presents a drawing surface for the control.
	DefWndProc (see page 6199)	Specifies the default window procedure for the windowed control.
	DesktopFont (see page 5818)	Specifies whether the control uses the Windows icon font when writing text.
	ImeMode (see page 6207)	Determines the behavior of the input method editor (IME).
	ImeName (see page 6208)	Specifies the input method editor (IME) to use for converting keyboard input to Asian language characters.
	IsControl (see page 5829)	Determines whether a form stores its form-specific properties to a stream.
	MouseCapture (see page 5831)	Indicates whether the control has "captured" mouse events.
	ScalingFlags (see page 5840)	Reflects which attributes of the control have been scaled.
	Text (see page 5842)	Contains a text string associated with the control.
	WheelAccumulator (see page 5849)	Accumulates mouse wheel rotations.
	WindowHandle (see page 6212)	Provides access to a window handle for the control.
	WindowText (see page 5850)	Contains the text string of the control.

Public Events

	Name	Description
	WindowProc (see page 5872)	Points to the window procedure that responds to messages sent to the control.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	BeginDrag (see page 5740)	Starts the dragging of a control.
	BringToFront (see page 5740)	Puts the control in front of all other controls in its parent control.
	Broadcast (see page 6130)	Sends a message to each of the child controls.
	CanFocus (see page 6131)	Indicates whether a control can receive focus.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	ClientToParent (see page 5744)	Translates client coordinates to parent coordinates.
	ClientToScreen (see page 5744)	Translates a given point from client area coordinates to global screen coordinates.
	ContainsControl (see page 6133)	Indicates whether a specified control exists within the control.
	ControlAtPos (see page 6133)	Returns the child control located at a specified position within the control.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
V	Create (see page 5731)	Creates an instance of TControl (see page 5724).
V	Create (see page 5918)	Creates an instance of TCustomControl (see page 5908).
V	Create (see page 6123)	Creates an instance of TWinControl (see page 6112).
V	Create (see page 12558)	Creates and initializes a TCustomRadioGroup (see page 12547) instance.
V	Create (see page 21286)	Creates and initializes a TCustomGroupBox (see page 21275) instance.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	CreateParented (see page 6123)	Creates and initializes a control as the child of a specified non-VCL container.
	CreateParentedControl (see page 6136)	Creates and initializes a control as the child of a specified non-VCL window.
V	DefaultHandler (see page 5748)	Provides message handling for all messages that do not have specific handlers.

	DefaultHandler (see page 6139)	Provides message handling for all messages that the control does not fully process itself.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 2766)	Disposes of the component and its owned components.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 5732)	Destroys an instance of TControl (see page 5724).
	Destroy (see page 5919)	Destroys an instance of TCustomControl (see page 5908).
	Destroy (see page 6124)	Destroys an instance of TWinControl (see page 6112).
	Destroy (see page 12558)	Destroys the TCustomRadioGroup (see page 12547) instance and the radio buttons it contains.
	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	DisableAlign (see page 6141)	Disables the realignment of child controls.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Dock (see page 5749)	Used internally to dock the control.
	DockDrop (see page 6142)	Generates an OnDockDrop (see page 6214) event.
	DragDrop (see page 5754)	OnDragDrop (see page 5855) event dispatcher.
	Dragging (see page 5754)	Indicates whether a control is being dragged.
	DrawTextBiDiModeFlags (see page 5756)	Returns the text flags that reflect the current setting of the BiDiMode (see page 5803) property.
	DrawTextBiDiModeFlagsReadingOnly (see page 5756)	Returns the text flag to add that indicates whether the control's text should read from right to left.
	EnableAlign (see page 6148)	Decrements the reference count incremented by the DisableAlign (see page 6141) method, eventually realigning the child controls.
	EndDrag (see page 5757)	Stops a control from being dragged any further.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindChildControl (see page 6148)	Returns a child control given its name.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FlipChildren (see page 6150)	Reverses the positions of child controls.
	FlipChildren (see page 12559)	Prevents the default behavior of flipping the child radio buttons.
	Focused (see page 6150)	Determines whether the control has input focus.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetControlsAlignment (see page 5759)	Indicates how text is aligned within the control.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetParentComponent (see page 5765)	Returns the parent of the control.
	GetTabOrderList (see page 6158)	Builds a list of controls in tab order.
	GetTextBuf (see page 5766)	Retrieves the control's text, copies it into a buffer, and returns the number of characters copied.
	GetTextLen (see page 5767)	Returns the length of the control's text.
	HandleAllocated (see page 6159)	Reports whether a screen object handle exists for the control.
	HandleNeeded (see page 6160)	Creates a screen object for the control if it doesn't already exist.

	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 5768)	Indicates whether the control has a parent.
	Hide (see page 5769)	Makes the control invisible.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
V	InitiateAction (see page 5769)	Calls the action link's Update (see page 5789) method if the control is associated with an action link.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InsertControl (see page 6160)	Inserts a control into the Controls (see page 6197) array property.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
V	Invalidate (see page 5770)	Completely repaint control.
V	Invalidate (see page 6161)	Schedules a control repaint.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	IsRightToLeft (see page 5770)	Indicates whether the control should be reversed right to left.
	ManualDock (see page 5771)	Docks the control.
	ManualFloat (see page 5772)	Undocks the control.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	MouseWheelHandler (see page 5774)	Dispatches messages received from a mouse wheel.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	PaintTo (see page 6167)	This is the overview for the PaintTo method overload.
	ParentToClient (see page 5776)	Translate parent coordinates to client coordinates.
	Perform (see page 5776)	Responds as if the control received a specified Windows message.
	PreProcessMessage (see page 6170)	This is PreProcessMessage, a member of class TWinControl.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	Realign (see page 6171)	Forces the control to realign children.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	Refresh (see page 5779)	Repaints the control on the screen.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveControl (see page 6172)	Removes a specified control from the Controls (see page 6197) array.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	Repaint (see page 5779)	Forces the control to repaint its image on the screen.
V	Repaint (see page 6174)	Repaints the entire control.
	ReplaceDockedControl (see page 5779)	Docks the control in the place where another control is already docked.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	ScaleBy (see page 6175)	Rescale control and its children.
	ScreenToClient (see page 5781)	Converts the screen coordinates of a specified point on the screen to client coordinates.
	ScrollBy (see page 6176)	Scroll control contents.
	SendToBack (see page 5782)	Puts a windowed control behind all other windowed controls, or puts a non-windowed control behind all other non-windowed controls.
V	SetBounds (see page 5783)	Sets the Left (see page 5830), Top (see page 5844), Width (see page 5849), and Height (see page 5825) properties all at once.
V	SetBounds (see page 6178)	Sets the windowed control's boundary properties all at once.
	SetDesignVisible (see page 5784)	Makes a control visible at design time.
V	SetDesignVisible (see page 6178)	Makes a control visible at design time.
V	SetFocus (see page 6179)	Gives the input focus to the control.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	SetTextBuf (see page 5787)	Sets the text of the control.
	Show (see page 5788)	Makes a control visible.
V	Update (see page 5789)	Processes any pending paint messages immediately.

V	Update (see page 6183)	Forces the control to update.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	UpdateControlState (see page 6186)	Respond to state change.
	UseRightToLeftAlignment (see page 5790)	Specifies whether the control's alignment should be reversed right-to-left.
	UseRightToLeftReading (see page 5790)	Specifies whether the control is using a right-to-left reading order.
	UseRightToLeftScrollBar (see page 5791)	Specifies whether the vertical scroll bar appears on the left side of the control.

Public Properties

	Name	Description
	Action (see page 5797)	Designates the action associated with the control.
R	AlignDisabled (see page 6192)	Indicates child control realignment disabled.
	BoundsRect (see page 5803)	Specifies the bounding rectangle of the control, expressed in the coordinate system of the parent control.
R	Brush (see page 6195)	Determines the color and pattern used for painting the background of the control.
R	Buttons (see page 12561)	Access individual TRadioButton objects.
	ClientHeight (see page 5808)	Specifies the height of the control's client area in pixels.
R	ClientOrigin (see page 5809)	Specifies the screen coordinates (in pixels) of the top left corner of a control's client area.
R	ClientRect (see page 5810)	Specifies the size (in pixels) of a control's client area.
	ClientWidth (see page 5811)	Specifies the horizontal size of the control's client area in pixels.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
R	ControlCount (see page 6195)	Returns the number of child controls.
R	Controls (see page 6197)	Lists all child controls.
	ControlState (see page 5813)	Indicates the current state of a control at runtime.
	ControlStyle (see page 5814)	Determines style characteristics of the control.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	DockClientCount (see page 6199)	Specifies the number of controls that are docked on the windowed control.
R	DockClients (see page 6201)	Lists the controls that are docked to the windowed control.
	DockManager (see page 6202)	Specifies the control's docking manager interface.
	DockOrientation (see page 5818)	Specifies how the control is docked relative to other controls docked in the same parent.
	DockSite (see page 6204)	Specifies whether the control can be the target of drag-and-dock operations.
	DoubleBuffered (see page 6205)	Determines whether the control's image is rendered directly to the window or painted to an in-memory bitmap first.
R	ExplicitHeight (see page 5821)	Specifies the explicit vertical size of the control in pixels.
R	ExplicitLeft (see page 5822)	Specifies the explicit horizontal pixel coordinate of the left edge of a component relative to its parent.
R	ExplicitTop (see page 5822)	Specifies the explicit vertical pixel coordinate of the top edge of a component relative to its parent.
R	ExplicitWidth (see page 5822)	Specifies the explicit horizontal size of the control in pixels.
R	Floating (see page 5823)	Indicates whether the control is floating.
	FloatingDockSiteClass (see page 5823)	Specifies the class of the temporary control that hosts the control when it is floating.
R	Handle (see page 6207)	Provides access to the underlying Windows screen object for the control.
	HostDockSite (see page 5829)	Specifies the control in which the control is docked.
	LRDockWidth (see page 5831)	Specifies the width of the control when it is docked horizontally.
R	MouseInClient (see page 6209)	This is MouseInClient, a member of class TWinControl.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Padding (see page 6209)	Specifies the padding of a control.

	Parent (see page 5832)	Indicates the parent of the control.
	ParentWindow (see page 6210)	Reference to parent's underlying control.
R	Showing (see page 6210)	Indicates whether the control is showing on the screen.
	TBDockHeight (see page 5842)	Specifies the height of the control when it is docked vertically.
	UndockHeight (see page 5845)	Specifies the height of the control when it is floating.
	UndockWidth (see page 5846)	Specifies the width of the control when it is floating.
	UseDockManager (see page 6212)	Specifies whether the docking manager is used in drag-and-dock operations.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
R	VisibleDockClientCount (see page 6212)	Specifies the number of visible controls that are docked on the windowed control.

Published Events

	Name	Description
	OnClick (see page 13153)	Occurs when the user clicks the control.
	OnContextPopup (see page 13155)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnDragDrop (see page 13156)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 13158)	Occurs when the user drags an object over a control.
	OnEndDock (see page 13161)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 13161)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnEnter (see page 13162)	Occurs when a control receives the input focus.
	OnExit (see page 13164)	Occurs when the input focus shifts away from one control to another.
	OnStartDock (see page 13166)	Occurs when the user begins to drag a control with a DragKind of dkDock.
	OnStartDrag (see page 13167)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.

Published Properties

	Name	Description
	Align (see page 13127)	Determines how the control aligns within its container (parent control).
	AlignWithMargins (see page 5802)	Indicates whether a control should be constrained by margins.
	Anchors (see page 13130)	Specifies how the control is anchored to its parent.
	BiDiMode (see page 13131)	Specifies the bi-directional mode for the control.
	Caption (see page 13131)	Specifies a text string that identifies the control to the user.
	Color (see page 13134)	Specifies the background color of the control.
	Columns (see page 13135)	Specifies number of columns in the radio group.
	Constraints (see page 13135)	Specifies the size constraints for the control.
	Ctl3D (see page 13135)	Determines whether a control has a three-dimensional (3-D) or two-dimensional look.
	Cursor (see page 5815)	Specifies the image used to represent the mouse pointer when it passes into the region covered by the control.
	DragCursor (see page 13136)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 13136)	Specifies whether the control is being dragged normally or for docking.
	DragMode (see page 13137)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	Enabled (see page 13138)	Controls whether the control responds to mouse, keyboard, and timer events.
	Font (see page 13139)	Controls the attributes of text written on or in the control.
	Height (see page 5825)	Specifies the vertical size of the control in pixels.
	HelpContext (see page 5826)	Numeric ID for control's context-sensitive help topic
	HelpKeyword (see page 5826)	Keyword for control's context-sensitive help topic
	HelpType (see page 5827)	Indicates whether the control's context sensitive help topic is identified by context ID or by keyword.
	Hint (see page 5827)	Contains the text string that can appear when the user moves the mouse over the control.
	ItemIndex (see page 13140)	Indicates which radio button in the group is currently selected.
	Items (see page 13141)	Lists the radio buttons in the radio group.

	Left (see page 5830)	Specifies the horizontal coordinate of the left edge of a component relative to its parent.
	Margins (see page 5831)	Specifies the margins for the control.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	ParentBackground (see page 13142)	Determines whether control uses parent's theme background.
	ParentBiDiMode (see page 13142)	Specifies whether the control uses its parent's BiDiMode.
	ParentColor (see page 13143)	Determines where a control looks for its color information.
	ParentCtl3D (see page 13143)	Determines where a component looks to determine if it should appear three dimensional.
	ParentFont (see page 13143)	Determines where a control looks for its font information.
	ParentShowHint (see page 13144)	Determines where a control looks to find out if its Help Hint should be shown.
	PopupMenu (see page 13144)	Identifies the pop-up menu associated with the control.
	ShowHint (see page 13149)	Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.
	TabOrder (see page 13150)	Indicates the position of the control in its parent's tab order.
	TabStop (see page 13151)	Determines if the user can tab to a control.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Top (see page 5844)	Specifies the Y coordinate of the top left corner of a control, relative to its parent or containing control in pixels.
	Visible (see page 13151)	Determines whether the component appears onscreen.
	Width (see page 5849)	Specifies the horizontal size of the control or form in pixels.

68.1.31.2 TRadioGroup Properties

The properties of the TRadioGroup class are listed here.

Published Properties

	Name	Description
	Align (see page 13127)	Determines how the control aligns within its container (parent control).
	Anchors (see page 13130)	Specifies how the control is anchored to its parent.
	BiDiMode (see page 13131)	Specifies the bi-directional mode for the control.
	Caption (see page 13131)	Specifies a text string that identifies the control to the user.
	Color (see page 13134)	Specifies the background color of the control.
	Columns (see page 13135)	Specifies number of columns in the radio group.
	Constraints (see page 13135)	Specifies the size constraints for the control.
	Ctl3D (see page 13135)	Determines whether a control has a three-dimensional (3-D) or two-dimensional look.
	DragCursor (see page 13136)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 13136)	Specifies whether the control is being dragged normally or for docking.
	DragMode (see page 13137)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	Enabled (see page 13138)	Controls whether the control responds to mouse, keyboard, and timer events.
	Font (see page 13139)	Controls the attributes of text written on or in the control.
	ItemIndex (see page 13140)	Indicates which radio button in the group is currently selected.
	Items (see page 13141)	Lists the radio buttons in the radio group.
	ParentBackground (see page 13142)	Determines whether control uses parent's theme background.
	ParentBiDiMode (see page 13142)	Specifies whether the control uses its parent's BiDiMode.
	ParentColor (see page 13143)	Determines where a control looks for its color information.
	ParentCtl3D (see page 13143)	Determines where a component looks to determine if it should appear three dimensional.
	ParentFont (see page 13143)	Determines where a control looks for its font information.
	ParentShowHint (see page 13144)	Determines where a control looks to find out if its Help Hint should be shown.
	PopupMenu (see page 13144)	Identifies the pop-up menu associated with the control.
	ShowHint (see page 13149)	Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.
	TabOrder (see page 13150)	Indicates the position of the control in its parent's tab order.

	TabStop (see page 13151)	Determines if the user can tab to a control.
	Visible (see page 13151)	Determines whether the component appears onscreen.

68.1.31.2.1 TRadioGroup.Align Property

Determines how the control aligns within its container (parent control).

Pascal

```
property Align: TAlign;
```

C++

```
__property TAlign Align;
```

Description

Use Align to align a control to the top, bottom, left, or right of a form or panel and have it remain there even if the size of the form, panel, or component that contains the control changes. When the parent is resized, an aligned control also resizes so that it continues to span the top, bottom, left, or right edge of the parent.

For example, to use a panel component with various controls on it as a tool palette, change the panel's Align value to alLeft. The value of alLeft for the Align property of the panel guarantees that the tool palette remains on the left side of the form and always equals the client height of the form.

The default value of Align is alNone, which means a control remains where it is positioned on a form or panel.

Tip: If Align is set to alClient, the control fills the entire client area so that it is impossible to select the parent form by clicking on it. In this case, select the parent by selecting the control on the form and pressing Esc, or by using the Object Inspector.

Any number of child components within a single parent can have the same Align value, in which case they stack up along the edge of the parent. The child controls stack up in z-order. To adjust the order in which the controls stack up, drag the controls into their desired positions.

Note: To cause a control to maintain a specified relationship with an edge of its parent, but not necessarily lie along one edge of the parent, use the Anchors property instead.

C++ Examples:

```
/*
This example shows how to use a splitter to divide a form
into resizable panes.  All objects on the form are created
dynamically in the OnCreate event handler of the form. To
run this example, add ExtCtrls and FileCtrl to the uses
clause of the form’s implementation section.
Note that when creating a splitter dynamically at runtime,
it is important to set its position to the appropriate side
of the control it will resize.
*/
#include <Extctrls.hpp>
#include <Filectrl.hpp>

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  TSplitter* ps = new TSplitter(Form1);
  TFileListBox* pflb = new TFileListBox(Form1);
  TDirectoryListBox* pdlb = new TDirectoryListBox(Form1);

  // Line up the directory list box on the left of the form.
  pdlb->Parent = Form1;
  pdlb->Align = alLeft;
  pdlb->Width = Form1->ClientWidth/3;
```

```
  // Now use the splitter to divide the directory pane from the file pane.
  ps->Parent = Form1;
  ps->Left = pdlb->Left + pdlb->Width + 1; // Move to right of directory list.
  ps->Align = pdlb->Align; // Give same alignment as directory list.

  // Each pane must be at least one quarter of the form's width.
  ps->MinSize = Form1->ClientWidth/4;

  // Finally, create the last pane - a file list box.
  pflb->Parent = Form1;
  pflb->Align = alClient;
  pdlb->FileList = pflb; // Link the file list box to the directory list box.
}
/*
Dynamically create a TProgressBar control and align it to
the bottom of the form.
*/

#include <ComCtrls.hpp>
#include <Controls.hpp>

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  TProgressBar *ProgressBar = new TProgressBar(this);
  ProgressBar->Parent = this;
  ProgressBar->Align = alBottom;
  TButton *Button1 = new TButton(this);
  Button1->Parent = this;
}
/*
This example dynamically creates a Page Control, then a
series of Tab Sheets on the Page Control.
*/
#include <Comctrls.hpp>
TPageControl* ppc;
const int MAXTABS = 3;
TTabSheet* pts[MAXTABS];
const char * ppcTabTitles[] = { "ShortString", "Orders", "Items", "Parts" };
int iTabTitles = sizeof(ppcTabTitles)/sizeof(ppcTabTitles[0]);
const TColor colorPalette[12] = {
  clRed, clGreen, clYellow, clBlue, clWhite, clFuchsia,
  clTeal, clNavy, clMaroon, clLime, clOlive, clPurple};

void __fastcall TForm1::FormCreate(TObject *Sender)

Parent (see page 5832)

Anchors (see page 5802)

68.1.31.2.2 TRadioGroup.Anchors Property

Specifies how the control is anchored to its parent.

Pascal

```
property Anchors: TAnchors;
```

C++

```
__property TAnchors Anchors;
```

Description

Use Anchors to ensure that a control maintains its current position relative to an edge of its parent, even if the parent is resized. When its parent is resized, the control holds its position relative to the edges to which it is anchored.

If a control is anchored to opposite edges of its parent, the control stretches when its parent is resized. For example, if a control has its Anchors property set to [akLeft, akRight], the control stretches when the width of its parent changes.

Anchors is enforced only when the parent is resized. Thus, for example, if a control is anchored to opposite edges of a form at design time and the form is created in a maximized state, the control is not stretched because the form is not resized after the control is created.

Note: If a control should maintain contact with three edges of its parent (hugging one side of the parent and stretching the length of that side), use the Align property instead. Unlike Anchors, Align allows controls to adjust to changes in the size of other

aligned sibling controls as well as changes to the parent's size.

See Also

Parent (see page 5832)

Align (see page 5798)

68.1.31.2.3 TRadioGroup.BiDiMode Property

Specifies the bi-directional mode for the control.

Pascal

```
property BiDiMode: TBiDiMode;
```

C++

```
__property TBiDiMode BiDiMode;
```

Description

Use BiDiMode to enable the control to adjust its appearance and behavior automatically when the application runs in a locale that reads from right to left instead of left to right. The bi-directional mode controls the reading order for the text, the placement of the vertical scroll bar, and whether the alignment is changed.

Alignment does not change for controls that are known to contain number, date, time, or currency values. For example, with data aware controls, the alignment does not change for the following field types: ftSmallint, ftInteger, ftWord, ftFloat, ftCurrency, ftBCD, ftDate, ftTime, ftDateTime, ftAutoInc.

UseRightToLeftAlignment (see page 5790)

UseRightToLeftReading (see page 5790)

UseRightToLeftScrollBar (see page 5791)

Including Bi-directional Functionality in Applications

68.1.31.2.4 TRadioGroup.Caption Property

Specifies a text string that identifies the control to the user.

Pascal

```
property Caption: TCaption;
```

C++

```
__property TCaption Caption;
```

Description

Use Caption to specify the text string that labels the control.

To underline a character in a Caption that labels a component, include an ampersand (&) before the character. This type of character is called an accelerator character. The user can then select the component by pressing Alt while typing the underlined character. To display an ampersand character in the caption, use two ampersands (&&).

Note: Controls that display text use either the Caption property or the Text property to specify the text value. Which property is used depends on the type of control. In general, Caption is used for text that appears as a window title or label, while Text is used for text that appears as the content of a control.

C++ Examples:

```
/*
The following code keeps the size of the label control
constant, even though the length of the label's caption
changes. As a result, the caption of the label is probably
too long to display in the label when the user clicks the
button:
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  Label1->AutoSize = false;
  Label1->Caption = "This string is too long as the caption of this label";
}
/*
This example requires a TPageControl populated by several
TabSheets, a TEdit and a TButton. When the button is
clicked, the caption of the active tab changes to that of
the TEdit.  These lines of code could also be written:
PageControl1.ActivePage.Caption := Edit1.Text;
This would make a TTabSheet variable unnecessary since
PageControl1.->ActivePage is already of type TTabSheet.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  TTabSheet *sheet = PageControl1->ActivePage;
  sheet->Caption = Edit1->Text;
}
/*
This example creates a ToolBar and adds ToolButtons to it.
Include ComCtlrs in the uses clause.
*/
#include <comctrls.hpp>

void AddButtons(TToolBar *toolBar, TStringList *captions)
{
  for (int i = 0; i < captions->Count; i++)
  {
    TToolButton *button = new TToolButton(toolBar);
    button->Parent = toolBar;
    button->Caption = captions->Strings[i];
    if (button->Caption == "|")
      button->Style = tbsSeparator;
    else
      button->Style = tbsButton;
  }
}

TToolBar *myToolBar;

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  myToolBar = new TToolBar(this);
  myToolBar->Parent = this;
  TStringList *captions = new TStringList();
  captions->Add("New");
  captions->Add("Save");
  captions->Add("|");
  captions->Add("Cut");
  captions->Add("Copy");
  captions->Add("Paste");
  AddButtons(myToolBar, captions);
  delete captions;
  myToolBar->ShowCaptions = True;
  myToolBar->Height = 40;
}
```

```
void __fastcall TForm1::FormDestroy(TObject *Sender)
{
  for (int I = myToolBar->ButtonCount - 1; I >= 0; I--)
    delete myToolBar->Buttons[I];
  delete myToolBar;
}
```

Delphi Examples:

```
{
The following code keeps the size of the label control
constant, even though the length of the label's caption
changes. As a result, the caption of the label is probably
too long to display in the label when the user clicks the
button:
}
procedure TForm1.Button1Click(Sender: TObject);
begin
  Label1.AutoSize := False;
  Label1.Caption :=
    'This string is too long as the caption of this label';
end;
{
This example requires a TPageControl populated by several
TabSheets, a TEdit and a TButton. When the button is
clicked, the caption of the active tab changes to that of
the TEdit.  These lines of code could also be written:
PageControl1.ActivePage.Caption := Edit1.Text;
This would obviate the need for a TTabSheet variable since
PageControl1.->ActivePage is already of type TTabSheet.
}
procedure TForm1.Button1Click(Sender: TObject);
var
  sheet: TTabSheet;
begin
  sheet := PageControl1.ActivePage;
  sheet.Caption := Edit1.Text;
end;
{
This example creates a ToolBar and adds ToolButtons to it.
Include ComCtlrs in the uses clause.
}
procedure AddButtons(ToolBar: TToolBar;
  Const ButtonCaptions: array of String);
var
  I: Integer;
begin
  for I := 0 to High(ButtonCaptions) do
    begin
      with TToolButton.Create(ToolBar) do
      begin
        Parent := ToolBar;
        Caption := ButtonCaptions[I];
        if (ButtonCaptions[I] = '|') then
          Style := tbsSeparator
        else
          Style := tbsButton;
      end;
    end;
end;

procedure TForm1.FormCreate(Sender: TObject);
begin
  ToolBar1 := TToolBar.Create(Self);
  ToolBar1.Parent := Self;
  AddButtons(ToolBar1, ['New', 'Save', '|', 'Cut', 'Copy', 'Paste']);
```

```
    ToolBar1.ShowCaptions := True;
    ToolBar1.Height := 40;
  end;

  procedure TForm1.FormDestroy(Sender: TObject);
  var
    I: Integer;
  begin
    for I := ToolBar1.ButtonCount - 1 downto 0 do
      ToolBar1.Buttons[I].Free;
    ToolBar1.Free;
  end;
```

68.1.31.2.5 TRadioGroup.Color Property

Specifies the background color of the control.

Pascal

```
property Color: TColor;
```

C++

```
__property TColor Color;
```

Description

Use Color to read or change the background color of the control.

If a control's ParentColor property is true, then changing the Color property of the control's parent automatically changes the Color property of the control. When the value of the Color property is changed, the control's ParentColor property is automatically set to false.

C++ Examples:

```
/*
The following code changes the color of a shape control
using the Color dialog box. The example displays the Color
dialog box when the Button1 button is clicked, allowing the
user to select a color with the dialog box. When a color
value is selected with the dialog box, it is assigned to
the shape control.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  if (ColorDialog1->Execute())
    Shape1->Brush->Color = ColorDialog1->Color;
}
```

Delphi Examples:

```
{
The following code changes the color of a shape control
using the Color dialog box. The example displays the Color
dialog box when the Button1 button is clicked, allowing the
user to select a color with the dialog box. When a color
value is selected with the dialog box, it is assigned to
the shape control.
}
procedure TForm1.Button1Click(Sender: TObject);
begin
  if ColorDialog1.Execute then
    Shape1.Brush.Color := ColorDialog1.Color;
end;
```

See Also

ParentColor (see page 5834)

68.1.31.2.6 TRadioGroup.Columns Property

Specifies number of columns in the radio group.

Pascal

```
property Columns: Integer;
```

C++

```
__property int Columns;
```

Description

Columns determines the number of columns in the radio group if Orientation is orVertical (the default), and the number of rows if Orientation is orHorizontal. Its value can range from 1 to 16. The default value is 1, which means that the radio buttons are arranged in a single line.

68.1.31.2.7 TRadioGroup.Constraints Property

Specifies the size constraints for the control.

Pascal

```
property Constraints: TSizeConstraints;
```

C++

```
__property TSizeConstraints Constraints;
```

Description

Use Constraints to specify the minimum and maximum width and height of the control. When Constraints contains maximum or minimum values, the control cannot be resized to violate those constraints.

Note: Constraints apply to the height of the form. However, the height of the form depends on how large Windows makes the title bar. For example, Windows XP uses much larger title bars than other windowing systems. To work around this, note the ClientHeight when you design your form and set the constraints in the FormCreate event. In the following example, ClientHeight is represented by x: `Constraints.MinHeight := x + Height - ClientHeight`.

Warning: Do not set up constraints that conflict with the value of the Align or Anchors property. When these properties conflict, the response of the control to resize attempts is not well-defined.

See Also

AutoSize (see page 5803)

Align (see page 5798)

Anchors (see page 5802)

OnConstrainedResize (see page 5853)

OnCanResize (see page 5851)

68.1.31.2.8 TRadioGroup.Ctl3D Property

Determines whether a control has a three-dimensional (3-D) or two-dimensional look.

Pascal

```
property Ctl3D: Boolean;
```

C++

```
__property Boolean Ctl3D;
```

Description

Ctl3D is provided for backward compatibility. It is not used by 32-bit versions of Windows or NT4.0 and later, with the exception of Windows XP Home, where it is used on occasion.

On earlier platforms, Ctl3D controlled whether the control had a flat or beveled appearance.

See Also

ParentCtl3D (see page 6209)

BevelKind (see page 6193)

BevelInner (see page 6193)

BevelOuter (see page 6194)

BorderWidth (see page 6195)

68.1.31.2.9 TRadioGroup.DragCursor Property

Indicates the image used to represent the mouse pointer when the control is being dragged.

Pascal

```
property DragCursor: TCursor;
```

C++

```
__property TCursor DragCursor;
```

Description

Use the DragCursor property to change the cursor image presented when the control is being dragged.

Note: To make a custom cursor available for the DragCursor property, see the Cursor property.

See Also

Cursor (see page 5815)

DragKind (see page 5819)

DragMode (see page 5819)

68.1.31.2.10 TRadioGroup.DragKind Property

Specifies whether the control is being dragged normally or for docking.

Pascal

```
property DragKind: TDragKind;
```

C++

```
__property TDragKind DragKind;
```

Description

Use DragKind to get or set whether the control participates in drag-and-drop operations, or drag-and-dock operations.

See Also

DragCursor (see page 5818)

DragMode (see page 5819)

68.1.31.2.11 TRadioGroup.DragMode Property

Determines how the control initiates drag-and-drop or drag-and-dock operations.

Pascal

```
property DragMode: TDragMode;
```

C++

```
__property TDragMode DragMode;
```

Description

Use DragMode to control when the user can drag the control. Disable the drag-and-drop or drag-and-dock capability at runtime by setting the DragMode property value to dmManual. Enable automatic dragging by setting DragMode to dmAutomatic.

C++ Examples:

```
/*
The following code uses GetNodeAt to add a dragged node as a
child of the node under the mouse when it is dropped.  This
example requires a populated TreeView.  Also, the TTreeView
DragMode property set to dmAutomatic, and the TTreeView
OnDragOver event handler must be implemented to accept the
drop.
*/
void __fastcall TForm1::TreeView1DragDrop(TObject *Sender, TObject *Source,
      int X, int Y)
{
  if (Source != (TObject *)TreeView1 || TreeView1->Selected == NULL)
    return;
  THitTests HT = TreeView1->GetHitTestInfoAt(X, Y);
  TNodeAttachMode AttachMode;
  TTreeNode *Item = TreeView1->GetNodeAt(X, Y);
  if (HT.Contains(htOnItem) || HT.Contains(htOnIcon))
    AttachMode = naAddChild;
  else if (HT.Contains(htNowhere))
    AttachMode = naAdd;
  else if (HT.Contains(htOnIndent))
    AttachMode = naInsert;
  else
    return;
  TreeView1->Selected->MoveTo(Item, AttachMode);
}

void __fastcall TForm1::TreeView1DragOver(TObject *Sender, TObject *Source,
      int X, int Y, TDragState State, bool &Accept)
{
  Accept = (Source == (TObject *)TreeView1);
}
```

Delphi Examples:

```
{
The following code uses GetNodeAt to add a dragged node as a
child of the node under the mouse when it is dropped.  This
example requires a populated TreeView.  Also, the TTreeView
DragMode property set to dmAutomatic, and the TTreeView
OnDragOver event handler must be implemented to accept the
```

```
drop.
}
procedure TForm1.TreeView1DragDrop(Sender, Source: TObject; X, Y: Integer);
var
  AnItem: TTreeNode;
  AttachMode: TNodeAttachMode;
  HT: THitTests;
begin
  if TreeView1.Selected = nil then Exit;
  HT := TreeView1.GetHitTestInfoAt(X, Y);
  AnItem := TreeView1.GetNodeAt(X, Y);
  if (HT - [htOnItem, htOnIcon, htNowhere, htOnIndent] <> HT) then
  begin
    if (htOnItem in HT) or (htOnIcon in HT) then
      AttachMode := naAddChild
    else if htNowhere in HT then AttachMode := naAdd
    else if htOnIndent in HT then AttachMode := naInsert;
    TreeView1.Selected.MoveTo(AnItem, AttachMode);
  end;
end;

procedure TForm1.TreeView1DragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := Source is TTreeView;
end;
```

Arranging the Order of Persistent Columns

68.1.31.2.12 TRadioGroup.Enabled Property

Controls whether the control responds to mouse, keyboard, and timer events.

Pascal

```
property Enabled: Boolean;
```

C++

```
__property Boolean Enabled;
```

Description

Use Enabled to change the availability of the control to the user. To disable a control, set Enabled to false. Disabled controls appear dimmed. If Enabled is false, the control ignores mouse, keyboard, and timer events.

To re-enable a control, set Enabled to true. The control is no longer dimmed, and the user can use the control.

Enabling Mouse

68.1.31.2.13 TRadioGroup.Font Property

Controls the attributes of text written on or in the control.

Pascal

```
property Font: TFont;
```

C++

```
__property TFont Font;
```

Description

To change to a new font, specify a new TFont object. To modify a font, change the value of the Charset, Color, Height, Name, Pitch, Size, or Style of the TFont object.

C++ Examples:

```
/*
To use this example, place a TComboBox and TRichEdit or
TMemo on a form.  During form creation, a list of font names
is loaded into the combo box. When the combo box is clicked,
the memo or Rich Edit control font is set to the
corresponding font name in the combo box.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < Screen->Fonts->Count; i++)
   ComboBox1->Items->Add(Screen->Fonts->Strings[i]);
//  ComboBox1->Items = Screen->Fonts;  // Another way to do it.
}

void __fastcall TForm1::ComboBox1Change(TObject *Sender)
{
  RichEdit1->Font->Name = ComboBox1->Text;
}
```

Delphi Examples:

```
{
To use this example, place a TComboBox and TRichEdit or
TMemo on a form.  During form creation, a list of font names
is loaded into the combo box. When the combo box is clicked,
the memo or Rich Edit control font is set to the
corresponding font name in the combo box.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  i : Integer;
begin
  for i := 0 to Screen.Fonts.Count - 1 do
   ComboBox1.Items.Add(Screen.Fonts.Strings[i]);
//  ComboBox1.Items := Screen.Fonts;  // Another way to do it.
  RichEdit1.Lines.Text := 'How is it to be you?';
end;
```

```
procedure TForm1.ComboBox1Click(Sender: TObject);
begin
  RichEdit1.Font.Name := ComboBox1.Text;
end;
```

Displaying and Editing Text in a Memo Control

68.1.31.2.14 TRadioGroup.ItemIndex Property

Indicates which radio button in the group is currently selected.

Pascal

```
property ItemIndex: Integer;
```

C++

```
__property int ItemIndex;
```

Description

ItemIndex holds the index of the selected radio button in the Items list. (The first button is 0.) The value of ItemIndex changes at runtime as the user selects radio buttons. If you want one of the buttons to appear selected when the application starts, assign that button to ItemIndex at design time; otherwise, leave ItemIndex set to the default value of -1, which means that no button is selected.

C++ Examples:

```
/*
This example uses a radio group box and a scroll bar on a
form. When the user selects one of the radio buttons, the
scroll bar changes orientation accordingly.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  RadioGroup1->Items->Add("Vertical");
  RadioGroup1->Items->Add("Horizontal");
  RadioGroup1->ItemIndex = 2;
}

void __fastcall TForm1::RadioGroup1Click(TObject *Sender)
{
  if (RadioGroup1->Items->Strings[RadioGroup1->ItemIndex] == "Vertical")
    ScrollBar1->Kind = sbVertical;
  else if (RadioGroup1->Items->Strings[RadioGroup1->ItemIndex] == "Horizontal")
    ScrollBar1->Kind = sbHorizontal;
}
```

Delphi Examples:

```
{
This example uses a radio group box and a scroll bar on a
form. When the user selects one of the radio buttons, the
scroll bar changes orientation accordingly.
}
procedure TForm1.FormCreate(Sender: TObject);
begin
  RadioGroup1.Items.Add('Vertical');
  RadioGroup1.Items.Add('Horizontal');
  RadioGroup1.ItemIndex := 2;
```

```
end;

procedure TForm1.RadioGroup1Click(Sender: TObject);
begin
  if RadioGroup1.Items[RadioGroup1.ItemIndex] = 'Vertical' then
    ScrollBar1.Kind := sbVertical;
  if RadioGroup1.Items[RadioGroup1.ItemIndex] = 'Horizontal' then
    ScrollBar1.Kind := sbHorizontal;
end;
```

See Also

Items (see page 12563)

68.1.31.2.15 TRadioGroup.Items Property

Lists the radio buttons in the radio group.

Pascal

```
property Items: TStrings;
```

C++

```
__property TStrings Items;
```

Description

Items holds a TStrings object that lists the captions of the radio buttons in the group. In TCustomRadioGroup descendants, where this property is published, radio buttons can be added or removed by editing the Items list from the Object Inspector.

Note: A TRadioButton object is created automatically for each string in Items. You cannot directly add or remove TRadioButton objects, but you can access individual TButton objects through the Buttons property.

C++ Examples:

```
/*
This example uses a radio group box and a scroll bar on a
form. When the user selects one of the radio buttons, the
scroll bar changes orientation accordingly.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  RadioGroup1->Items->Add("Vertical");
  RadioGroup1->Items->Add("Horizontal");
  RadioGroup1->ItemIndex = 2;
}

void __fastcall TForm1::RadioGroup1Click(TObject *Sender)
{
  if (RadioGroup1->Items->Strings[RadioGroup1->ItemIndex] == "Vertical")
    ScrollBar1->Kind = sbVertical;
  else if (RadioGroup1->Items->Strings[RadioGroup1->ItemIndex] == "Horizontal")
    ScrollBar1->Kind = sbHorizontal;
}
```

Delphi Examples:

```
{
This example uses a radio group box and a scroll bar on a
form. When the user selects one of the radio buttons, the
scroll bar changes orientation accordingly.
}
procedure TForm1.FormCreate(Sender: TObject);
begin
```

```
    RadioGroup1.Items.Add('Vertical');
    RadioGroup1.Items.Add('Horizontal');
    RadioGroup1.ItemIndex := 2;
  end;

  procedure TForm1.RadioGroup1Click(Sender: TObject);
  begin
    if RadioGroup1.Items[RadioGroup1.ItemIndex] = 'Vertical' then
      ScrollBar1.Kind := sbVertical;
    if RadioGroup1.Items[RadioGroup1.ItemIndex] = 'Horizontal' then
      ScrollBar1.Kind := sbHorizontal;
  end;
```

See Also

ItemIndex (see page 12562)

TRadioButton (see page 21753)

Buttons (see page 12561)

68.1.31.2.16 TRadioGroup.ParentBackground Property

Determines whether control uses parent's theme background.

Pascal

```
property ParentBackground: Boolean;
```

C++

```
__property Boolean ParentBackground;
```

Description

If ParentBackground is true, the control uses the parent's theme background to draw its own background. ParentBackground has no effect unless XP themes are enabled.

68.1.31.2.17 TRadioGroup.ParentBiDiMode Property

Specifies whether the control uses its parent's BiDiMode.

Pascal

```
property ParentBiDiMode: Boolean;
```

C++

```
__property Boolean ParentBiDiMode;
```

Description

Use ParentBiDiMode to get or set whether the control uses its parent's BiDiMode. When ParentBiDiMode is true, the control's BiDiMode property is always equal to that of its parent. If ParentBiDiMode is false, the control uses its own BiDiMode property.

Set ParentBiDiMode to true for all controls in a form in order to ensure that the entire user interface adjusts to Middle Eastern locales in a uniform manner.

When the value of the control's BiDiMode property changes, ParentBiDiMode becomes false automatically.

See Also

Parent (see page 5832)

BiDiMode (see page 5803)

68.1.31.2.18 TRadioGroup.ParentColor Property

Determines where a control looks for its color information.

Pascal

```
property ParentColor: Boolean;
```

C++

```
__property Boolean ParentColor;
```

Description

To have a control use the same color as its parent control, set ParentColor to true. If ParentColor is false, the control uses its own Color property.

Set ParentColor to true for all controls in order to ensure that all the controls on a form have a uniform appearance. For example, if ParentColor is true for all controls in a form, changing the background color of the form to gray causes all the controls on the form to also have a gray background.

When the value of a control's Color property changes, ParentColor becomes false automatically.

See Also

Color (see page 5812)

Parent (see page 5832)

ParentFont (see page 5834)

ParentShowHint (see page 5835)

68.1.31.2.19 TRadioGroup.ParentCtl3D Property

Determines where a component looks to determine if it should appear three dimensional.

Pascal

```
property ParentCtl3D: Boolean;
```

C++

```
__property Boolean ParentCtl3D;
```

Description

ParentCtl3D is provided for backwards compatibility. It has no effect on 32-bit versions of Windows or NT 4.0 and later.

ParentCtl3D determines whether the control uses its parent's Ctl3D property.

See Also

Ctl3D (see page 6198)

68.1.31.2.20 TRadioGroup.ParentFont Property

Determines where a control looks for its font information.

Pascal

```
property ParentFont: Boolean;
```

C++

```
__property Boolean ParentFont;
```

Description

To have a control use the same font as its parent control, set ParentFont to true. If ParentFont is false, the control uses its own Font property. Many controls default ParentFont to true so that all the controls in a form or other container present a uniform appearance. When the value of a control's Font property changes, ParentFont becomes false automatically.

When ParentFont is true for a form, the form uses the default font.

See Also

Font (see page 5823)

Parent (see page 5832)

ParentColor (see page 5834)

ParentShowHint (see page 5835)

68.1.31.2.21 TRadioGroup.ParentShowHint Property

Determines where a control looks to find out if its Help Hint should be shown.

Pascal

```
property ParentShowHint: Boolean;
```

C++

```
__property Boolean ParentShowHint;
```

Description

Use ParentShowHint to ensure that all the controls on a form either uniformly show their Help Hints or uniformly do not show them.

If ParentShowHint is true, the control uses the ShowHint property value of its parent. If ParentShowHint is false, the control uses the value of its own ShowHint property.

To provide Help Hints for only selected controls on a form, set the ShowHint property for those controls that should have Help Hints to true, and ParentShowHint becomes false automatically.

Note: Enable or disable all Help Hints for the entire application using the ShowHint property of the application object.

See Also

Hint (see page 5827)

Parent (see page 5832)

ParentColor (see page 5834)

ParentFont (see page 5834)

ShowHint (see page 5840)

68.1.31.2.22 TRadioGroup.PopupMenu Property

Identifies the pop-up menu associated with the control.

Pascal

```
property PopupMenu: TPopupMenu;
```

C++

```
__property TPopupMenu PopupMenu;
```

Description

Assign a value to PopupMenu to make a pop-up menu appear when the user selects the control and clicks the right mouse button. If the TPopupMenu's AutoPopup property is true, the pop-up menu appears automatically. If the menu's AutoPopup property is false, display the menu with a call to its Popup method from the control's OnContextPopup event handler.

C++ Examples:

```
/*
This example uses two edit boxes and one pop-up menu on a form.
The pop-up menu contains Cut, Copy, and Paste commands. This code
makes the pop-up menu available to both edit boxes:
*/

```

Delphi Examples:

```
{
This example uses two edit boxes and one pop-up menu on a form.
The pop-up menu contains Cut, Copy, and Paste commands. This code
makes the pop-up menu available to both edit boxes:
}
procedure TForm1.FormCreate(Sender: TObject);
begin
  PopupMenu1.AutoPopup := True;
  Edit1.PopupMenu := PopupMenu1;
  Edit2.PopupMenu := PopupMenu1;
end;

{
These are the cut, copy, and paste OnClick events for the commands
on the pop-up menu. Double click on the pop-up menu and add three
TMenuItems.  Then set the captions to "Cut", "Copy" and "Paste".
The names will be automatically set to "Cut1", "Copy1", and
"Paste1".  Then double click on the OnClick events and they will
be named "Cut1Click", "Copy1Click" and "Paste1Click" respectively.
Note: only the selected portion of the string in the edit box will
be copied, cut or replaced.
}
procedure TForm1.Copy1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
   Edit1.CopyToClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.CopyToClipboard
  else
    Beep;
end;

procedure TForm1.Cut1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
    Edit1.CutToClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.CutToClipboard
  else
    Beep;
end;

procedure TForm1.Paste1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
    Edit1.PasteFromClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.PasteFromClipboard
```

```
    else
      Beep;
  end;
  {
  This example demonstrates how to add and delete menu items
  to a popup menu at runtime and assign an event handler to
  the OnClick event.  Place a TPopupMenu and three buttons on

68.1.31.2.23 TRadioGroup.ShowHint Property

Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.

Pascal

```
property ShowHint: Boolean;
```

C++

```
__property Boolean ShowHint;
```

Description

The Help Hint is the value of the Hint property, which is displayed in a box just beneath the control. Use ShowHint to determine whether a Help Hint appears for the control.

To enable Help Hint for a particular control, the application ShowHint property must be true and either

the control's own ShowHint property must be true, or

the control's ParentShowHint property must be true and its parent's ShowHint property must be true.

For example, imagine a check box within a group box. If the ShowHint property of the group box is true and the ParentShowHint property of the check box is true, but the ShowHint property of the check box is false, the check box still displays its Help Hint.

Changing the ShowHint value automatically sets the ParentShowHint property to false.

C++ Examples:

```
/*
This example uses an edit box and a list box on a form.
Items are added to the list box and a Help Hint is assigned
to both controls. The last statement enables the Help Hints
for the entire application.
*/
```

```
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  Edit1->Hint = "Enter your name";
  Edit1->ShowHint = true;

  char string[10];
  char index[3];
  for(int i = 1; i <= 10; i++)
  {
    strcpy(string, "Item");
    itoa(i, index, 10);
    strcat(string, index);
    ListBox1->Items->Add(string);
  }
  ListBox1->Hint = "Select an item";
  ListBox1->ShowHint = true;
  Application->ShowHint = true;
}
/*
Note: To see an example that displays the hints of controls
in some place other than in a Help Hint box, see the OnHint
example.
*/
```

Delphi Examples:

```
{
This example uses an edit box and a list box on a form.
Items are added to the list box and a Help Hint is assigned
to both controls. The last statement enables the Help Hints
for the entire application.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  I: Integer;
begin
  Edit1.Hint := 'Enter your name';
  Edit1.ShowHint := True;
  with ListBox1 do
  begin
    for I := 1 to 10 do
      Items.Add('Item ' + IntToStr(I));
    Hint := 'Select an item';
    ShowHint := True;
  end;
  Application.ShowHint := True;
end;
{
Note: To see an example that displays the hints of controls
in some place other than in a Help Hint box, see the OnHint
example.
}

Displaying Fly-over Help

68.1.31.2.24 TRadioGroup.TabOrder Property

Indicates the position of the control in its parent's tab order.

Pascal

```
property TabOrder: TTabOrder;
```

C++

```
__property TTabOrder TabOrder;
```

Description

TabOrder is the order in which child windows are visited when the user presses the Tab key. The control with the TabOrder value of 0 is the control that has the focus when the form first appears.

Initially, the tab order is always the order in which the controls were added to the form. The first control added to the form has a TabOrder value of 0, the second is 1, the third is 2, and so on. Change this by changing the TabOrder property.

Each control has a unique tab-order value within its parent. If you change the TabOrder property value of one control to be the same as the value of a second control, the TabOrder value for all the other controls changes. For example, suppose a control is sixth in the tab order. If you change the control's TabOrder property value to 3 (making the control fourth in the tab order), the control that was originally fourth in the tab order now becomes fifth, and the control that was fifth becomes sixth.

Assigning TabOrder a value greater than the number of controls contained in the parent control moves the control to the end of the tab order. The control does not take on the assigned value of TabOrder, but instead is given the number that assures the control is the last in the tab order.

Note: TabOrder is meaningful only if the TabStop property is true and if the control has a parent. (The TabOrder property of a form is not used unless the form is the child of another form.) A control with a TabOrder of -1 has no parent, and therefore cannot be reached by pressing the Tab key. To remove a parented control from the Tab order, set its TabStop property to false.

See Also

FindNextControl (see page 6149)

TabStop (see page 6211)

68.1.31.2.25 TRadioGroup.TabStop Property

Determines if the user can tab to a control.

Pascal

```
property TabStop: Boolean;
```

C++

```
__property Boolean TabStop;
```

Description

Use the TabStop to allow or disallow access to the control using the Tab key.

If TabStop is true, the control is in the tab order. If TabStop is false, the control is not in the tab order and the user can't press the Tab key to move to the control.

Note: TabStop is not meaningful for a form unless the form assigns another form to be its parent.

See Also

TabOrder (see page 6211)

68.1.31.2.26 TRadioGroup.Visible Property

Determines whether the component appears onscreen.

Pascal

```
property Visible: Boolean;
```

C++

```
__property Boolean Visible;
```

Description

Use the Visible property to control the visibility of the control at runtime. If Visible is true, the control appears. If Visible is false, the control is not visible.

Calling the Show method sets the control's Visible property to true. Calling the Hide method sets it to false.

C++ Examples:

```
/*
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
*/
void __fastcall TForm1::PageControl1Change(TObject *Sender)
{
  CheckBox1->Checked = PageControl1->ActivePage->Visible;
}

void __fastcall TForm1::CheckBox1Click(TObject *Sender)
{
  PageControl1->ActivePage->Visible = CheckBox1->Checked;
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < 10; i++)
  {
    TTabSheet *pPage = new TTabSheet(this);
    pPage->PageControl = PageControl1;
    pPage->Caption = AnsiString("Page") + IntToStr(i);
    TEdit *pEdit = new TEdit(this);
    pEdit->Parent = pPage;
    pEdit->Left = random(pPage->ClientWidth - pEdit->Width);
    pEdit->Top = random(pPage->ClientHeight - pEdit->Height);
  }
  PageControl1Change(Sender);
}
```

Delphi Examples:

```
{
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
}
procedure TForm1.CheckBox1Click(Sender: TObject);
begin
  PageControl1.ActivePage.Visible := CheckBox1.Checked;
end;

procedure TForm1.PageControl1Change(Sender: TObject);
begin
  CheckBox1.Checked := PageControl1.ActivePage.Visible;
end;
```

```
procedure TForm1.FormCreate(Sender: TObject);
var
  i: Integer;
begin
  for i := 0 to 9 do
    with TTabSheet.Create(Self) do
    begin
      PageControl := PageControl1;
      Caption := 'TabSheet' + IntToStr(i);
      with TEdit.Create(Self) do
      begin
        Parent := PageControl1.Pages[i];
        Left := Random(PageControl1.ActivePage.ClientWidth - Width);
        Top := Random(PageControl1.ActivePage.ClientHeight - Height);
      end;
    end;
    PageControl1Change(Sender);
end;
```

68.1.31.3 TRadioGroup Events

The events of the TRadioGroup class are listed here.

Published Events

	Name	Description
	OnClick (see page 13153)	Occurs when the user clicks the control.
	OnContextPopup (see page 13155)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnDragDrop (see page 13156)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 13158)	Occurs when the user drags an object over a control.
	OnEndDock (see page 13161)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 13161)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnEnter (see page 13162)	Occurs when a control receives the input focus.
	OnExit (see page 13164)	Occurs when the input focus shifts away from one control to another.
	OnStartDock (see page 13166)	Occurs when the user begins to drag a control with a DragKind of dkDock.
	OnStartDrag (see page 13167)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.

68.1.31.3.1 TRadioGroup.OnClick Event

Occurs when the user clicks the control.

Pascal

```
property OnClick: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnClick;
```

Description

Use the OnClick event handler to respond when the user clicks the control. If the control has an associated action, and that action has an OnExecute method, the action's OnExecute method responds to click events unless it is superseded by an OnClick event handler.

Usually OnClick occurs when the user presses and releases the left mouse button with the mouse pointer over the control. This event can also occur when:

- The user selects an item in a grid, outline, list, or combo box by pressing an arrow key.
- The user presses Spacebar while a button or check box has focus.
- The user presses Enter when the active form has a default button (specified by the Default property).
- The user presses Esc when the active form has a cancel button (specified by the Cancel property).
- The user presses the accelerator key for a button or check box. For example, if the value of the Caption property of a check box is '&Bold', the B is underlined at runtime and the OnClick event of the check box is triggered when the user presses Alt+B. However, focus does not move to the control in these instances.
- The Checked property of a radio button is set to true.
- The value of the Checked property of a check box is changed.
- The Click method of a menu item is called.

For a form, an OnClick event occurs when the user clicks a blank area of the form or on a disabled component.

C++ Examples:

```
/*
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
*/
void __fastcall TForm1::PageControl1Change(TObject *Sender)
{
  CheckBox1->Checked = PageControl1->ActivePage->Visible;
}

void __fastcall TForm1::CheckBox1Click(TObject *Sender)
{
  PageControl1->ActivePage->Visible = CheckBox1->Checked;
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < 10; i++)
  {
    TTabSheet *pPage = new TTabSheet(this);
    pPage->PageControl = PageControl1;
    pPage->Caption = AnsiString("Page") + IntToStr(i);
    TEdit *pEdit = new TEdit(this);
    pEdit->Parent = pPage;
    pEdit->Left = random(pPage->ClientWidth - pEdit->Width);
    pEdit->Top = random(pPage->ClientHeight - pEdit->Height);
  }
  PageControl1Change(Sender);
}
```

Delphi Examples:

```
{
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
```

```
  edit control placed somewhere on the client area of the
  sheet.  Unchecking the checkbox will cause the client area
  (not the tab area) of the Tab Control to become invisible.
  }
  procedure TForm1.CheckBox1Click(Sender: TObject);
  begin
    PageControl1.ActivePage.Visible := CheckBox1.Checked;
  end;

  procedure TForm1.PageControl1Change(Sender: TObject);
  begin
    CheckBox1.Checked := PageControl1.ActivePage.Visible;
  end;

  procedure TForm1.FormCreate(Sender: TObject);
  var
    i: Integer;
  begin
    for i := 0 to 9 do
      with TTabSheet.Create(Self) do
      begin
        PageControl := PageControl1;
        Caption := 'TabSheet' + IntToStr(i);
        with TEdit.Create(Self) do
        begin
          Parent := PageControl1.Pages[i];
          Left := Random(PageControl1.ActivePage.ClientWidth - Width);
          Top := Random(PageControl1.ActivePage.ClientHeight - Height);
        end;
      end;
      PageControl1Change(Sender);
  end;
```

68.1.31.3.2 TRadioGroup.OnContextPopup Event

Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).

Pascal

```
property OnContextPopup: TContextPopupEvent;
```

C++

```
__property TContextPopupEvent OnContextPopup;
```

Description

The OnContextPopup handler is called when the user uses the mouse or keyboard to request a popup menu. The OnContextPopup event is generated by a WM_CONTEXTMENU message, which is itself generated by the user clicking the right mouse button or by pressing SHIFT+F10 or the Applications key.

This event is especially useful when the control does not have an associated popup menu (the PopupMenu property is not set) or if the AutoPopup property of the control's associated popup menu is false. However, the OnContextPopup can also be used to override the automatic context menu that appears when the control has an associated popup menu with an AutoPopup property of true. In this last case, if the event handler displays its own menu, it should set the Handled parameter to true to suppress the default context menu.

The handler's MousePos parameter indicates the position of the mouse, in client coordinates.. If the event was not generated by a mouse click, MousePos is (-1,-1).

Note: Parent controls receive an OnContextPopup event before their child controls. In addition, for many child controls, the default window procedure causes the parent control to receive an OnContextPopup event after the child control. As a result, when parent controls do not set Handled to true in an OnContextPopup event handler, the event handler may be called multiple times for each context menu invocation.

TPopupMenu (see page 16169)

PopupMenu (see page 5835)

AutoPopup (see page 16178)

68.1.31.3.3 TRadioGroup.OnDragDrop Event

Occurs when the user drops an object being dragged.

Pascal

```
property OnDragDrop: TDragDropEvent;
```

C++

```
__property TDragDropEvent OnDragDrop;
```

Description

Use the OnDragDrop event handler to specify what happens when the user drops an object. The Source parameter of the OnDragDrop event is the object being dropped, and the Sender is the control the object is being dropped on. The X and Y parameters are the coordinates of the mouse positioned over the control.

C++ Examples:

```
/*
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
*/

// This OnDragOver event handler permits the list box to
// accept a dropped label:
void __fastcall TForm1::ListBox1DragOver(TObject *Sender, TObject *Source, int X, int Y,
TDragState State, bool &Accept)
{
   Accept = Source->ClassNameIs("TLabel");
}

/*
This OnDragDrop event handler implements the drop behavior.
*/
void __fastcall TForm1::ListBox1DragDrop(TObject *Sender, TObject *Source, int X, int Y)
{
```

```
  if (Sender->ClassNameIs("TListBox") && Source->ClassNameIs("TLabel"))
  {
    TListBox *DestList = (TListBox *)Sender;
    DestList->Font = ((TLabel *)Source)->Font;
    DestList->Color = ((TLabel *)Source)->Color;
    DestList->DoubleBuffered = true;
    DestList->Color = clWindow;
  }
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  ListBox1->Items->Add("Not");
  ListBox1->Items->Add("In");
  ListBox1->Items->Add("Alphabetical");
  ListBox1->Items->Add("Order");

}
```

Delphi Examples:

```
{
This code is an OnDragOver event handler that won't allow a
label control to be dropped on a panel control and stops the
dragging of the label as soon as the user drags the label
onto the panel:
Note: Set the label's DragMode property to dmAutomatic.
}
procedure TForm1.FormDragDrop(Sender, Source: TObject; X, Y: Integer);
begin
  TForm1(Source).Left := X;
  TForm1(Source).Top := Y;
end;

procedure TForm1.FormDragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := Source is TLabel;
end;

procedure TForm1.Panel1DragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := False;
  if (Source is TLabel) and (State = dsDragEnter) then
    (Source as TLabel).EndDrag(False);
end;
{
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
}

procedure TForm1.FormCreate(Sender: TObject);
begin
  ListBox1.Items.Add('Not');
  ListBox1.Items.Add('In');
  ListBox1.Items.Add('Alphabetical');
  ListBox1.Items.Add('Order');
end;

// This OnDragOver event handler permits the list box to
// accept a dropped label:
```

```
procedure TForm1.ListBox1DragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := Source is TLabel;
end;

// This OnDragDrop event handler implements the drop behavior.

procedure TForm1.ListBox1DragDrop(Sender, Source: TObject; X, Y: Integer);
begin
  if (Sender is TListBox) and (Source is TLabel) then
  begin
    with Sender as TListBox do
    begin
      Font := (Source as TLabel).Font;
      Color := (Source as TLabel).Color;
      DoubleBuffered := true;
      Color := clWindow;
    end;
  end;
end;
```

68.1.31.3.4 TRadioGroup.OnDragOver Event

Occurs when the user drags an object over a control.

Pascal

```
property OnDragOver: TDragOverEvent;
```

C++

```
__property TDragOverEvent OnDragOver;
```

Description

Use an OnDragOver event to signal that the control can accept a dragged object so the user can drop or dock it.

Within the OnDragOver event handler, change the Accept parameter to false to reject the dragged object. Leave Accept as true to allow the user to drop or dock the dragged object on the control.

To change the shape of the cursor, indicating that the control can accept the dragged object, change the value of the DragCursor property for the control before the OnDragOver event occurs.

The Source is the object being dragged, the Sender is the potential drop or dock site, and X and Y are screen coordinates in pixels. The State parameter specifies how the dragged object is moving over the control.

Note: Within the OnDragOver event handler, the Accept parameter defaults to true. However, if an OnDragOver event handler

is not supplied, the control rejects the dragged object, as if the Accept parameter were changed to false.

C++ Examples:

```
/*
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
*/

// This OnDragOver event handler permits the list box to
// accept a dropped label:
void __fastcall TForm1::ListBox1DragOver(TObject *Sender, TObject *Source, int X, int Y,
TDragState State, bool &Accept)
{
   Accept = Source->ClassNameIs("TLabel");
}

/*
This OnDragDrop event handler implements the drop behavior.
*/
void __fastcall TForm1::ListBox1DragDrop(TObject *Sender, TObject *Source, int X, int Y)
{
  if (Sender->ClassNameIs("TListBox") && Source->ClassNameIs("TLabel"))
  {
    TListBox *DestList = (TListBox *)Sender;
    DestList->Font = ((TLabel *)Source)->Font;
    DestList->Color = ((TLabel *)Source)->Color;
    DestList->DoubleBuffered = true;
    DestList->Color = clWindow;
  }
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  ListBox1->Items->Add("Not");
  ListBox1->Items->Add("In");
  ListBox1->Items->Add("Alphabetical");
  ListBox1->Items->Add("Order");

}
```

Delphi Examples:

```
{
This code is an OnDragOver event handler that won't allow a
label control to be dropped on a panel control and stops the
dragging of the label as soon as the user drags the label
onto the panel:

68.1.31.3.5 TRadioGroup.OnEndDock Event

Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.

Pascal

```
property OnEndDock: TEndDragEvent;
```

C++

```
__property TEndDragEvent OnEndDock;
```

Description

Use OnEndDock to specify actions or special processing that when a drag-and-dock operation stops.

See Also

DragKind (see page 5819)

OnDragOver (see page 5857)

OnDockDrop (see page 6214)

68.1.31.3.6 TRadioGroup.OnEndDrag Event

Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.

Pascal

```
property OnEndDrag: TEndDragEvent;
```

C++

```
__property TEndDragEvent OnEndDrag;
```

Description

Use the OnEndDrag event handler to specify any special processing that occurs when dragging stops.

C++ Examples:

```
/*
This code displays a message in a label named Status. The
message displayed depends on whether the dragged label
control was successfully dropped into and accepted by a
another control.
*/
void __fastcall TForm1::Label1EndDrag(TObject *Sender, TObject *Target, int X,
      int Y)
{
  if (Sender->ClassNameIs("TLabel"))
  {
    AnsiString S = ((TLabel *)Sender)->Name + " was dropped and ";
    if (Target)
      S = S + "accepted!";
    else
      S = S + "rejected.";
    Status->Caption = S;
  }
}
```

Delphi Examples:

```
{
This code displays a message in a label named Status. The
message displayed depends on whether the dragged label
control was successfully dropped into and accepted by a
another control.
}
procedure TForm1.Label1EndDrag(Sender, Target: TObject; X, Y: Integer);
var
  S: string;
begin
  S := (Sender as TLabel).Name + ' was dropped... and ';
  if Target <> nil then
    S := S + 'accepted!'
  else
    S := S + 'rejected!';
  Status.Caption := S;
end;
```

68.1.31.3.7 TRadioGroup.OnEnter Event

Occurs when a control receives the input focus.

Pascal

```
property OnEnter: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnEnter;
```

Description

Use the OnEnter event handler to cause any special processing to occur when a control becomes active.

The OnEnter event does not occur when switching between forms or between another application and the application that includes the control.

When switching between controls in separate container controls such as the TPanel and the TGroupBox controls, an OnEnter event occurs for the container before the OnEnter event of the contained control.

Similarly, an OnExit event of the container occurs after the OnExit event of the control in a container when focus moves to another control outside the container.

For example, consider a form with an OK button and a group box that contains three radio buttons, where focus is currently on the OK button. When the user clicks one of the radio buttons, an OnExit event of the button occurs, followed by an OnEnter event on the group box, and finally an OnEnter event on the radio button that was clicked. If the user then clicks on the OK button, an OnExit event for the radio button occurs followed by an OnExit event for the group box, and then the button's OnEnter event occurs.

C++ Examples:

```
/*
This example takes an edit control, a button, and a rich
edit control on a form.  When the user presses the button, a
Font dialog appears.  When the user clicks the Apply (not OK)
```

```
button in the Font dialog, the currently selected font is
applied to the active control. Clicking the button sets the
ActiveControl to the button.  That is why we need to save
the ActiveControl in a shared OnEnter procedure.  In the rich
edit, only the text selected converts.
*/
TWinControl *myActiveControl;

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  FontDialog1->Options << fdApplyButton;
  FontDialog1->Execute();
}

void __fastcall TForm1::FontDialog1Apply(TObject *Sender, HWND Wnd)
{
  if (myActiveControl->ClassNameIs("TEdit"))
   ((TEdit *)myActiveControl)->Font->Assign(FontDialog1->Font);
  else if (myActiveControl->ClassNameIs("TRichEdit"))
    ((TRichEdit *)myActiveControl)->SelAttributes->Assign(FontDialog1->Font);
  else
    MessageBeep(0);
}

void __fastcall TForm1::Edit1Enter(TObject *Sender)
{
  myActiveControl = ActiveControl;
}
/*
This example uses an edit box and a memo control on a form.
When either the edit box or the memo is the active control,
it is colored yellow. When the active control becomes
inactive, the color of the control returns to the Windows
system color for a window.  These event handlers could also
be shared.
*/
void __fastcall TForm1::Edit1Enter(TObject *Sender)
{
  Edit1->Color = clYellow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Edit1Exit(TObject *Sender)
{
  Edit1->Color = clWindow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Memo1Enter(TObject *Sender)
{
  Memo1->Color = clYellow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Memo1Exit(TObject *Sender)
{
  Memo1->Color = clWindow;
}
```

Delphi Examples:

```
{
This example takes an edit control, a button, and a rich
edit control on a form.  When the user presses the button, a
Font dialog appears.  When the user clicks the Apply (not OK)
button in the Font dialog, the currently selected font is
applied to the active control. Clicking the button sets the
ActiveControl to the button.  That is why we need to save
the ActiveControl in a shared OnEnter procedure.  In the rich
edit, only the text selected converts.
```

```
}
procedure TForm1.Button1Click(Sender: TObject);
begin
   FontDialog1.Options := FontDialog1.Options + [fdApplyButton];
   FontDialog1.Execute;
end;

procedure TForm1.Edit1Enter(Sender: TObject);
begin
  myActiveControl := ActiveControl;
end;

procedure TForm1.FontDialog1Apply(Sender: TObject; Wnd: HWND);
begin
  if myActiveControl is TEdit then
    with myActiveControl as TEdit do
       Font.Assign(TFontDialog(Sender).Font)
  else if myActiveControl is TRichEdit then
    with myActiveControl as TRichEdit do
      SelAttributes.Assign(TFontDialog(Sender).Font)
  else
    Beep;
end;
{
This example uses an edit box and a memo control on a form.
When either the edit box or the memo is the active control,
it is colored yellow. When the active control becomes
inactive, the color of the control returns to the Windows
system color for a window.  These event handlers could also
be shared.
}
procedure TForm1.Edit1Enter(Sender: TObject);
begin
  Edit1.Color := clYellow;
end;

procedure TForm1.Edit1Exit(Sender: TObject);
begin
  Edit1.Color := clWindow;
end;

procedure TForm1.Memo1Enter(Sender: TObject);
begin
  Memo1.Color := clYellow;
end;

procedure TForm1.Memo1Exit(Sender: TObject);
begin
  Memo1.Color := clWindow;
end;
```

68.1.31.3.8 TRadioGroup.OnExit Event

Occurs when the input focus shifts away from one control to another.

Pascal

```
property OnExit: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnExit;
```

Description

Use the OnExit event handler to provide special processing when the control ceases to be active.

The OnExit event does not occur when switching between forms or between another application and your application.

When switching between controls in separate container controls such as the TPanel and the TGroupBox controls, an OnExit event occurs for the control inside the container before the OnExit event of the container.

Similarly, an OnEnter event of the container occurs before the OnEnter event of the control in a container when focus moves to a control inside a container.

For example, consider a form with an OK button and a group box that contains three radio buttons, where focus is currently on the OK button. When the user clicks one of the radio buttons, an OnExit event of the button occurs, followed by an OnEnter event on the group box, and finally an OnEnter event on the radio button that was clicked. If the user then clicks on the OK button, an OnExit event for the radio button occurs followed by an OnExit event for the group box, and then the button's OnEnter event occurs.

Note: In some control classes the ActiveControl property updates before the OnExit event occurs.

C++ Examples:

```
/*
This example uses an edit box and a memo control on a form.
When either the edit box or the memo is the active control,
it is colored yellow. When the active control becomes
inactive, the color of the control returns to the Windows
system color for a window.  These event handlers could also
be shared.
*/
void __fastcall TForm1::Edit1Enter(TObject *Sender)
{
  Edit1->Color = clYellow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Edit1Exit(TObject *Sender)
{
  Edit1->Color = clWindow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Memo1Enter(TObject *Sender)
{
  Memo1->Color = clYellow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Memo1Exit(TObject *Sender)
{
  Memo1->Color = clWindow;
}
```

Delphi Examples:

```
{
This example uses an edit box and a memo control on a form.
When either the edit box or the memo is the active control,
it is colored yellow. When the active control becomes
```

```
inactive, the color of the control returns to the Windows
system color for a window.  These event handlers could also
be shared.
}
procedure TForm1.Edit1Enter(Sender: TObject);
begin
  Edit1.Color := clYellow;
end;

procedure TForm1.Edit1Exit(Sender: TObject);
begin
  Edit1.Color := clWindow;
end;

procedure TForm1.Memo1Enter(Sender: TObject);
begin
  Memo1.Color := clYellow;
end;

procedure TForm1.Memo1Exit(Sender: TObject);
begin
  Memo1.Color := clWindow;
end;
```

OnEnter (see page 6219)

ActiveControl (see page 13896)

68.1.31.3.9 TRadioGroup.OnStartDock Event

Occurs when the user begins to drag a control with a DragKind of dkDock.

Pascal

```
property OnStartDock: TStartDockEvent;
```

C++

```
__property TStartDockEvent OnStartDock;
```

Description

Use the OnStartDock event handler to implement special processing when the user starts a drag-and-dock operation by dragging the control.

The OnStartDock event handler can create a TDragDockObjectEx object for the DragObject parameter to specify the appearance of the dragging rectangle and how the dragged control interacts with potential docking sites. If you return TDragDockObjectEx as the drag object, there is no need to call the Free method for the DragObject when dragging is over. If you use TDragDockObject, your application is responsible for freeing the drag object.

If the OnStartDock event handler sets the DragObject parameter to nil (Delphi) or NULL (C++), a TDragDockObject object is automatically created.

Note: This information applies to Win32 applications only.

See Also

OnEndDock (see page 5859)

68.1.31.3.10 TRadioGroup.OnStartDrag Event

Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.

Pascal

```
property OnStartDrag: TStartDragEvent;
```

C++

```
__property TStartDragEvent OnStartDrag;
```

Description

Use the OnStartDrag event handler to implement special processing when the user starts to drag the control or an object it contains. OnStartDrag only occurs if DragKind is dkDrag.

Sender is the control that is about to be dragged, or that contains the object about to be dragged.

The OnStartDrag event handler can create a TDragControlObjectEx instance for the DragObject parameter to specify the drag cursor, or, optionally, a drag image list. If you create a TDragControlObjectEx instance, there is no need to call the Free method for the DragObject when dragging is over. If you create, instead, a TDragControlObject instance, your application is responsible for freeing the drag object instance.

If the OnStartDrag event handler sets the DragObject parameter to nil (Delphi) or NULL (C++), a TDragControlObject object is automatically created and dragging begins on the control itself.

Note: On some controls, such as TRichEdit, the underlying Windows control handles internal drag operations. For these controls, there are no OnStartDrag or OnEndDrag events for drag operations within the control.

68.1.32 TRowCollection Class

Controls (see page 5711) the **Collection Editor** for rows within a grid panel.

Class Hierarchy

Pascal

```
TRowCollection = class(TCellCollection);
```

C++

```
class TRowCollection : public TCellCollection;
```

File

ExtCtrls

Description

TRowCollection controls the **Collection Editor** for rows within a grid panel.

See Also

Collection Editor

68.1.32.1 TRowCollection Members

The following tables list the members exposed by TRowCollection.

Protected Methods

	Name	Description
V	Added (see page 2736)	Responds when items are added to the collection.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	Changed (see page 2740)	Responds when the collection or any of its items changes.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	Deleting (see page 2741)	Responds when items are deleted from the collection.
	GetAttr (see page 2743)	Returns the name of a custom attribute that can be retrieved using the GetItemAttr (see page 2745) method.
V	GetAttr (see page 12174)	Returns the name of a custom attribute that can be retrieved using the GetItemAttr method.
	GetAttrCount (see page 2744)	Returns the number of custom attributes associated with items in the collection.
V	GetAttrCount (see page 12175)	Returns the number of custom attributes associated with items in the collection.
	GetItem (see page 2744)	Returns a specified item in the collection.
	GetItem (see page 12175)	Returns a specified item in the collection.
V	GetItemAttr (see page 13170)	Returns the value of a custom attribute assigned to one of the collection's items.
V	GetOwner (see page 2915)	Returns the owner of an object.
	GetOwner (see page 2932)	Returns the owner of an object.
V	Notify (see page 13171)	Responds when items are added to or removed from the collection.
	SetItem (see page 2747)	Copies the properties of another item to a specified item in the collection.
	SetItem (see page 12176)	This is SetItem, a member of class TCellCollection.
V	SetItemName (see page 2747)	Initializes the name of a newly inserted collection item.
V	Update (see page 2747)	Updates the collection to reflect changes to its items.
V	Update (see page 12176)	Updates the collection to reflect changes to its items.

Protected Properties

	Name	Description
R	NextID (see page 2752)	Specifies a unique ID that can be assigned to the next added collection item.
	PropName (see page 2752)	Specifies the name of the property that the collection implements.
R	UpdateCount (see page 2753)	Counts the number of times BeginUpdate (see page 2739) was called without a corresponding call to EndUpdate (see page 2742).

Public Methods

	Name	Description
	Add (see page 13170)	Adds a row to the grid panel.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2736)	Copies the contents of another collection to the object where the method is executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.

V	BeginUpdate (see page 2739)	Suspends screen repainting.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Clear (see page 2741)	Deletes all items from the collection.
	Create (see page 13170)	This is Create, a member of class TRowCollection.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Delete (see page 2741)	Deletes a single item from the collection.
V	Destroy (see page 2735)	Destroys the collection and each item in it.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
V	EndUpdate (see page 2742)	Re-enables screen repainting.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindItemID (see page 2743)	Returns the item with the specified ID.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetEnumerator (see page 2744)	Returns a TCollection (see page 2731) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2745)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	Insert (see page 2746)	Creates a new TCollectionItem (see page 2755) instance and adds it to the Items (see page 2751) array.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	Owner (see page 2746)	Returns the Owner of the collection.
	Owner (see page 12176)	Returns the Owner of the cell collection.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
	Capacity (see page 2748)	Provides access to the internal TList (see page 2868) Capacity property.
R	Count (see page 2749)	Returns the number of items in the collection.
R	ItemClass (see page 2751)	Indicates the class to which the collection's items belong.
	Items (see page 2751)	Lists the items in the collection.
	Items (see page 12177)	Lists the items of the cell collection.

68.1.32.2 TRowCollection.Create Constructor

Pascal

```
constructor Create(AOwner: TPersistent);
```

C++

```
__fastcall TRowCollection(TPersistent * AOwner);
```

Description

This is Create, a member of class TRowCollection.

68.1.32.3 TRowCollection Methods

The methods of the TRowCollection class are listed here.

Protected Methods

	Name	Description
	GetItemAttr (see page 13170)	Returns the value of a custom attribute assigned to one of the collection's items.
	Notify (see page 13171)	Responds when items are added to or removed from the collection.

Public Methods

	Name	Description
	Add (see page 13170)	Adds a row to the grid panel.

68.1.32.3.1 TRowCollection.Add Method

Adds a row to the grid panel.

Pascal

```
function Add: TRowItem;
```

C++

```
__fastcall TRowItem Add();
```

Description

Use the Add method to add a row to the grid panel.

68.1.32.3.2 TRowCollection.GetItemAttr Method

Returns the value of a custom attribute assigned to one of the collection's items.

Pascal

```
function GetItemAttr(Index: Integer; ItemIndex: Integer): string; override;
```

C++

```
virtual __fastcall AnsiString GetItemAttr(int Index, int ItemIndex);
```

Description

TCollection descendants can associate user-defined attributes with the items in the collection. Each attribute has a name and, for each item in the collection, a value that is a string. GetItemAttr returns the value of one of these attributes for a specified item in the collection.

Index identifies which attribute's value is desired. This is a value between 0 and n-1, where n is the value returned by GetAttrCount.

ItemIndex identifies the item whose attribute value is desired. This is an index into the Items property array.

As implemented in TCollection, GetItemAttr always returns an empty string, because TCollection defines no custom attributes.

See Also

GetAttr (see page 2743)

GetAttrCount (see page 2744)

68.1.32.3.3 TRowCollection.Notify Method

Responds when items are added to or removed from the collection.

Pascal

```
procedure Notify(Item: TCollectionItem; Action: TCollectionNotification); override;
```

C++

```
virtual __fastcall Notify(TCollectionItem Item, TCollectionNotification Action);
```

Description

Notify is called automatically when the items in the collection change.

Item is the item that was just added to or that is about to be removed from the collection.

Action indicates whether item was added, is about to be removed, or is about to be deleted:

As implemented in TCollection, Notify calls Added when Action is cnAdded and calls Deleting when Action is cnDeleting. TCollection ignores the cnExtracting action. Descendant classes can override Notify to modify this behavior.

See Also

Added (see page 2736)

Deleting (see page 2741)

68.1.33 TRowItem Class

Class Hierarchy

Pascal

```
TRowItem = class(TCellItem);
```

C++

```
class TRowItem : public TCellItem;
```

File

ExtCtrls

Description

This is class ExtCtrls.TRowItem.

68.1.34 TShape Class

TShape represents a geometric shape that can be drawn on a form.

Class Hierarchy

Pascal

```
TShape = class(TGraphicControl);
```

C++

```
class TShape : public TGraphicControl;
```

File

ExtCtrls

Description

Add a TShape object to a form to draw a simple geometric shape on the form. TShape introduces properties to describe the pen used to outline the shape and the brush used to fill it.

If the shape is only part of the image of a custom control, use the methods of the control's canvas instead.

See Also

TBrush (see page 14430)

TCanvas (see page 14441)

TPen (see page 14571)

TBevel (see page 12105)

Graphic Controls

Shapes

68.1.34.1 TShape Members

The following tables list the members exposed by TShape.

Protected Events

	Name	Description
	OnCanResize (see page 5851)	Occurs when an attempt is made to resize the control.
	OnClick (see page 5851)	Occurs when the user clicks the control.
	OnConstrainedResize (see page 5853)	Adjust resize constraints.
	OnDblClick (see page 5854)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnMouseWheel (see page 5869)	Occurs when the mouse wheel is rotated.
	OnMouseWheelDown (see page 5869)	Occurs when the mouse wheel is rotated downward.
	OnMouseWheelUp (see page 5870)	Occurs when the mouse wheel is rotated upward.
	OnResize (see page 5870)	Occurs immediately after the control is resized.

Protected Fields

	Name	Description
	FAnchorMove (see page 5733)	This is FAnchorMove, a member of class TControl.
	FAnchorOrigin (see page 5734)	This is FAnchorOrigin, a member of class TControl.
	FAnchorRules (see page 5734)	This is FAnchorRules, a member of class TControl.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FExplicitHeight (see page 5734)	This is FExplicitHeight, a member of class TControl.
	FExplicitLeft (see page 5734)	This is FExplicitLeft, a member of class TControl.
	FExplicitTop (see page 5734)	This is FExplicitTop, a member of class TControl.
	FExplicitWidth (see page 5735)	This is FExplicitWidth, a member of class TControl.
	FOriginalParentSize (see page 5735)	This is FOriginalParentSize, a member of class TControl.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	ActionChange (see page 5737)	Responds when the action associated with the control changes.
	AdjustSize (see page 5738)	Sets the size of the control as determined by the AutoSize (see page 5803) property.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	AssignTo (see page 5739)	Overrides the inherited AssignTo function to enable assignments to TAction objects.
	BeginAutoDrag (see page 5739)	Begin Automatic Drag.
	CalcCursorPos (see page 5741)	This is CalcCursorPos, a member of class TControl.
V	CanAutoSize (see page 5741)	Indicates whether the control can resize itself automatically to accommodate its contents.
V	CanResize (see page 5742)	OnCanResize (see page 5851) event dispatcher.
	Changed (see page 5742)	Sends a CM_CHANGED (see page 6330) message to the control.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	ChangeScale (see page 5743)	Rescaling event dispatcher.
	Click (see page 5743)	Respond to user click.
V	ConstrainedResize (see page 5746)	Notify control of resize with constraints.
	DblClick (see page 5747)	OnDblClick (see page 5854) event dispatcher.
	DefaultDockImage (see page 5747)	Handles the painting and erasing of a dock image.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DefineProperties (see page 5748)	Provides methods to read and write the IsControl (see page 5829) property to a stream such as a form file.
	DesignWndProc (see page 5749)	This is DesignWndProc, a member of class TControl.
	DockTrackNoTarget (see page 5749)	Handles dragging of the control over an invalid docking target.
	DoContextPopup (see page 5750)	OnContextPopup (see page 5854) event dispatcher.
	DoDock (see page 5750)	Docking event dispatcher.
	DoEndDock (see page 5750)	OnEndDock (see page 5859) event dispatcher.
	DoEndDrag (see page 5751)	OnEndDrag (see page 5860) event dispatcher.
	DoMouseWheel (see page 5751)	Processes mouse wheel motion.
	DoMouseWheelDown (see page 5752)	OnMouseWheelDown (see page 5869) event dispatcher.
	DoMouseWheelUp (see page 5752)	OnMouseWheelUp (see page 5870) event dispatcher.
	DoStartDock (see page 5753)	OnStartDock (see page 5871) event dispatcher.
	DoStartDrag (see page 5753)	OnStartDrag (see page 5871) event dispatcher.
	DragCanceled (see page 5754)	Provides the interface for a method that responds to the cancellation of a drag.
	DragOver (see page 5755)	OnDragOver (see page 5857) event dispatcher.
	DrawDragDockImage (see page 5755)	Draws the dock image for the control.
	EraseDragDockImage (see page 5757)	Erases the dock image for the control.

	GetAction (see page 5758)	This is GetAction, a member of class TControl.
	GetActionLinkClass (see page 5758)	Returns the appropriate action link class that is associated with the control class.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetClientOrigin (see page 5758)	Returns the screen coordinates of the top-left corner of the control's client area.
	GetClientRect (see page 5759)	Returns a rectangle defining the client area of the control.
	GetDeviceContext (see page 5760)	Returns a device context for the control.
	GetDockEdge (see page 5763)	Returns the edge on which another control should be docked when it is dragged over the control.
	GetDragImages (see page 5763)	Returns the control's image list containing the image to be displayed while dragging.
	GetEnabled (see page 5763)	Returns the value of the Enabled (see page 5821) property.
	GetFloating (see page 5764)	Returns the value of the Floating (see page 5823) property.
	GetFloatingDockSiteClass (see page 5764)	Returns the class used for the control when it is floating.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetPalette (see page 5765)	Returns the handle to a palette for use by the control.
	GetPopupMenu (see page 5765)	Returns the pop-up menu associated with the control.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Loaded (see page 5771)	Initializes the control after it is loaded from a stream.
	MouseActivate (see page 5773)	This is MouseActivate, a member of class TControl.
	MouseDown (see page 5773)	OnMouseDown (see page 5862) event dispatcher.
	MouseMove (see page 5773)	Respond to mouse moving over control area..
	MouseUp (see page 5774)	OnMouseUp (see page 5867) event dispatcher.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	Notification (see page 5775)	Responds to notifications that components are being created or destroyed.
	Paint (see page 13180)	Render control surface.
	PaletteChanged (see page 5775)	Responds to changes in the system's palette by realizing the control's palette.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	PositionDockRect (see page 5777)	Positions the docking rectangle according to the current drag-and-dock state.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	ReadState (see page 5778)	Prepares the control for having its properties assigned values read from a stream.
	RequestAlign (see page 5780)	Instructs the parent of a control to reposition the control, enforcing its Align (see page 5798) property.
	Resize (see page 5780)	Respond to control resize.
	ScaleConstraints (see page 5781)	This is ScaleConstraints, a member of class TControl.
	SendCancelMode (see page 5781)	Cancels the modal state of the control.
	SendDockNotification (see page 5782)	Sends a Windows message to the control's host dock site.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetAutoSize (see page 5783)	This is SetAutoSize, a member of class TControl.
	SetBiDiMode (see page 5783)	Sets the control's bi-directional mode.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDragMode (see page 5785)	Sets the drag mode for the control.
	SetEnabled (see page 5785)	Sets the value of the Enabled (see page 5821) property.

	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
V	SetName (see page 5785)	Sets the name of the control.
V	SetParent (see page 5786)	Sets the parent of the control.
V	SetParentBiDiMode (see page 5786)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 5787)	Sets the parent for the control.
	SetZOrder (see page 5788)	Repositions the control in its parent's control list, thereby changing position onscreen.
	UpdateBoundsRect (see page 5789)	Changes the Top (see page 5844), Left (see page 5830), Width (see page 5849), and Height (see page 5825) properties of the control, but doesn't update its screen image and bypasses all resize events.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateExplicitBounds (see page 5789)	This is UpdateExplicitBounds, a member of class TControl.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	VisibleChanging (see page 5791)	Provides the interface for a method that responds to changes in the control's visibility.
V	WndProc (see page 5791)	Provides specific message responses for the control.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	ActionLink (see page 5798)	Contains the action link object associated with the control.
	AutoSize (see page 5803)	Specifies whether the control sizes itself automatically to accommodate its contents.
R	Canvas (see page 6053)	Provides the drawing surface used by the graphic control.
	Caption (see page 5806)	Specifies a text string that identifies the control to the user.
	Color (see page 5812)	Specifies the background color of the control.
	DesktopFont (see page 5818)	Specifies whether the control uses the Windows icon font when writing text.
	Font (see page 5823)	Controls (see page 5711) the attributes of text written on or in the control.
	IsControl (see page 5829)	Determines whether a form stores its form-specific properties to a stream.
	MouseCapture (see page 5831)	Indicates whether the control has "captured" mouse events.
	ParentBiDiMode (see page 5833)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	ParentColor (see page 5834)	Determines where a control looks for its color information.
	ParentFont (see page 5834)	Determines where a control looks for its font information.
	PopupMenu (see page 5835)	Identifies the pop-up menu associated with the control.
	ScalingFlags (see page 5840)	Reflects which attributes of the control have been scaled.
	Text (see page 5842)	Contains a text string associated with the control.
	WheelAccumulator (see page 5849)	Accumulates mouse wheel rotations.
	WindowText (see page 5850)	Contains the text string of the control.

Public Events

	Name	Description
	WindowProc (see page 5872)	Points to the window procedure that responds to messages sent to the control.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.

	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	BeginDrag (see page 5740)	Starts the dragging of a control.
	BringToFront (see page 5740)	Puts the control in front of all other controls in its parent control.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	ClientToParent (see page 5744)	Translates client coordinates to parent coordinates.
