	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
	Count (see page 15081)	Indicates the number of uploaded files in the collection.
	Items (see page 15081)	Lists the uploaded files in the collection.

77.1.8.2 TAbstractWebRequestFiles Methods

The methods of the TAbstractWebRequestFiles class are listed here.

Protected Methods

	Name	Description
	GetCount (see page 15080)	Returns the value of the Count (see page 15081) property.
	GetItem (see page 15080)	Returns the value of the Items (see page 15081) property.

77.1.8.2.1 TAbstractWebRequestFiles.GetCount Method

Returns the value of the Count (see page 15081) property.

Pascal

```
function GetCount: Integer; virtual; abstract;
```

C++

```
virtual __fastcall int GetCount() = 0;
```

Description

GetCount is the protected read implementation of the Count (see page 15081) property.

In TAbstractWebRequestFile (see page 15073), GetCount is abstract or, in C++ terminology, pure virtual, meaning it has no implementation. Descendant classes must override this method to provide an implementation for the Count (see page 15081) property.

See Also

Count (see page 15081)

77.1.8.2.2 TAbstractWebRequestFiles.GetItem Method

Returns the value of the Items (see page 15081) property.

Pascal

```
function GetItem(I: Integer): TAbstractWebRequestFile; virtual; abstract;
```

C++

```
virtual __fastcall TAbstractWebRequestFile GetItem(int I) = 0;
```

Description

GetItem is the protected read implementation of the Items (see page 15081) property.

I is the index of the Web request file object to return.

In TAbstractWebRequestFile (see page 15073), GetCount (see page 15080) is abstract or, in C++ terminology, pure virtual, meaning it has no implementation. Descendant classes must override this method to provide an implementation for the Count (see page 15081) property.

77.1.8.3 TAbstractWebRequestFiles Properties

The properties of the TAbstractWebRequestFiles class are listed here.

Public Properties

	Name	Description
	Count (see page 15081)	Indicates the number of uploaded files in the collection.
	Items (see page 15081)	Lists the uploaded files in the collection.

77.1.8.3.1 TAbstractWebRequestFiles.Count Property

Indicates the number of uploaded files in the collection.

Pascal

```
property Count: Integer;
```

C++

```
__property int Count;
```

Description

Read Count to determine the number of files in this collection. Count provides an upper bound to the index of the Items (see page 15081) property.

See Also

Items (see page 15081)

77.1.8.3.2 TAbstractWebRequestFiles.Items Property

Lists the uploaded files in the collection.

Pascal

```
property Items [I: Integer]: TAbstractWebRequestFile;
```

C++

```
__property TAbstractWebRequestFile Items[int I];
```

Description

Read Items to access the descriptions of the individual uploaded files in the collection.

I is the index of the file to access, where 0 indicates the first file, 1 indicates the second file, and so on. The value of I must be less than the value of the Count (see page 15081) property.

Note: Items is the default property of TAbstractWebRequestFiles (see page 15078). This means that the property name can be omitted when using this property. Thus, the line

Note: Upload := WebContext.Request.Files.Items[0];

Note: can also be written

Note: Upload := WebContext.Request.Files[0];

Count (see page 15081)

Files (see page 15182)

operator_sb

77.1.9 TAbstractWebSession Class

TAbstractWebSession is the base class for objects that represent a session in a WebSnap application.

Class Hierarchy

Pascal

```
TAbstractWebSession = class(TObject);
```

C++

```
class TAbstractWebSession : public TObject;
```

File

HTTPApp

Description

TAbstractWebSession is the base class for all Web session objects. These include active sessions, which are represented by TWebSession objects, and invalid sessions (TInvalidWebSession), which are used to represent sessions that can no longer be used because they have expired.

A Web session has an ID and a list of name/value pairs. The ID is a random number that uniquely identifies the session. The name/value pairs are used to associate information with the ID. The values are variants. You can use these named Variants (see page 23567) to store application-defined information that is associated with a single user. In this way, the information can persist over multiple calls from the same user.

The session ID is stored on the end user's computer using a cookie. When a request is received, the WebSnap application examines the cookie. If a session associated with this cookie exists, then it becomes the current session.

There is no need to instantiate session objects. A Session is created automatically when the WebSnap application receives an HTTP request message.

When the current session is terminated, its session ID and name/value pairs are discarded. For example, the current session is typically terminated when the user logs out. Sessions can also be terminated when they are not accessed within a specified time-out period, or when the application explicitly calls the session's Terminate (see page 15086) method. A new session is created after a session has been terminated.

See Also

TSessionsService (see page 25582)

TAbstractWebContext (see page 24644)

TWebSession (see page 24968)

77.1.9.1 TAbstractWebSession Members

The following tables list the members exposed by TAbstractWebSession.

Protected Methods

	Name	Description
	GetSessionID (see page 15084)	Returns the value of the SessionID (see page 15087) property.
	GetTimeoutMinutes (see page 15084)	Returns the value of the TimeoutMinutes (see page 15087) property.

	GetValue (see page 15084)	Returns the value associated with a specified name.
	SetTimeoutMinutes (see page 15085)	Sets the value of the TimoutMinutes property.
	SetValue (see page 15085)	Assigns a value to a specified name.

Public Methods

	Name	Description
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 22287)	Disposes of an object instance.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	Terminate (see page 15086)	Terminates the session.
	UpdateResponse (see page 15086)	Adds the session ID to a cookie in a response message.

Public Properties

	Name	Description
	SessionID (see page 15087)	Uniquely identifies the Session.
	TimeoutMinutes (see page 15087)	Indicates the time, in minutes, that a session can be idle before it terminates itself.
	Values (see page 15088)	Lists the named values that the session stores.

77.1.9.2 TAbstractWebSession Methods

The methods of the TAbstractWebSession class are listed here.

Protected Methods

	Name	Description
	GetSessionID (see page 15084)	Returns the value of the SessionID (see page 15087) property.
	GetTimeoutMinutes (see page 15084)	Returns the value of the TimeoutMinutes (see page 15087) property.

	GetValue (see page 15084)	Returns the value associated with a specified name.
	SetTimeoutMinutes (see page 15085)	Sets the value of the TimoutMinutes property.
	SetValue (see page 15085)	Assigns a value to a specified name.

Public Methods

	Name	Description
	Terminate (see page 15086)	Terminates the session.
	UpdateResponse (see page 15086)	Adds the session ID to a cookie in a response message.

77.1.9.2.1 TAbstractWebSession.GetSessionID Method

Returns the value of the SessionID (see page 15087) property.

Pascal

```
function GetSessionID: string; virtual; abstract;
```

C++

```
virtual __fastcall AnsiString GetSessionID() = 0;
```

Description

GetSessionID is the protected read implementation of the SessionID (see page 15087) property.

In TAbstractWebSession (see page 15082), GetSessionID is abstract or, in C++ terminology, pure virtual, meaning it has no implementation. Descendant classes must override this method to provide an implementation for the SessionID (see page 15087) property.

See Also

SessionID (see page 15087)

77.1.9.2.2 TAbstractWebSession.GetTimeoutMinutes Method

Returns the value of the TimeoutMinutes (see page 15087) property.

Pascal

```
function GetTimeoutMinutes: Integer; virtual; abstract;
```

C++

```
virtual __fastcall int GetTimeoutMinutes() = 0;
```

Description

GetTimeoutMinutes is the protected read implementation of the TimeoutMinutes (see page 15087) property.

In TAbstractWebSession (see page 15082), GetTimeoutMinutes is abstract or, in C++ terminology, pure virtual, meaning it has no implementation. Descendant classes must override this method to provide an implementation for the TimeoutMinutes (see page 15087) property.

See Also

TimeoutMinutes (see page 15087)

SetTimeoutMinutes (see page 15085)

77.1.9.2.3 TAbstractWebSession.GetValue Method

Returns the value associated with a specified name.

Pascal

```
function GetValue(const AName: string): Variant; virtual; abstract;
```

C++

```
virtual __fastcall Variant GetValue(const AnsiString AName) = 0;
```

Description

GetValue is the protected read implementation of the Values (see page 15088) property.

AName is the name of the value to return.

In TAbstractWebSession (see page 15082), GetValue is abstract or, in C++ terminology, pure virtual, meaning it has no implementation. Descendant classes must override this method to provide an implementation for the Values (see page 15088) property.

See Also

Values (see page 15088)

SetValue (see page 15085)

77.1.9.2.4 TAbstractWebSession.SetTimeoutMinutes Method

Sets the value of the TimoutMinutes property.

Pascal

```
procedure SetTimeoutMinutes(AValue: Integer); virtual; abstract;
```

C++

```
virtual __fastcall SetTimeoutMinutes(int AValue) = 0;
```

Description

SetTimeoutMinutes is the protected write implementation of the TimeoutMinutes (see page 15087) property.

AValue is the number of minutes that can elapse before the session terminates itself.

In TAbstractWebSession (see page 15082), SetTimeoutMinutes is abstract or, in C++ terminology, pure virtual, meaning it has no implementation. Descendant classes must override this method to provide an implementation for the TimeoutMinutes (see page 15087) property.

See Also

GetTimeoutMinutes (see page 15084)

TimeoutMinutes (see page 15087)

77.1.9.2.5 TAbstractWebSession.SetValue Method

Assigns a value to a specified name.

Pascal

```
procedure SetValue(const AName: string; const AValue: Variant); virtual; abstract;
```

C++

```
virtual __fastcall SetValue(const AnsiString AName, const Variant AValue) = 0;
```

Description

SetValue is the protected write implementation of the Value property.

AName is the name of the value to store.

AValue is the value to store under the specified name.

In TAbstractWebSession (see page 15082), SetValue is abstract or, in C++ terminology, pure virtual, meaning it has no implementation. Descendant classes must override this method to provide an implementation for the Values (see page 15088) property.

See Also

GetValue (see page 15084)

Values (see page 15088)

77.1.9.2.6 TAbstractWebSession.Terminate Method

Terminates the session.

Pascal

```
procedure Terminate; virtual; abstract;
```

C++

```
virtual __fastcall Terminate() = 0;
```

Description

Call Terminate to explicitly terminate a session. Once a session terminates, the application can no longer access its Values (see page 15088).

Sessions are terminated automatically when the application does not receive any requests for the session for TimoutMinutes minutes.

In TAbstractWebSession (see page 15082), Terminate is abstract or, in C++ terminology, pure virtual, meaning it has no implementation. Descendant classes must override this method to provide an implementation.

See Also

TimeoutMinutes (see page 15087)

Values (see page 15088)

77.1.9.2.7 TAbstractWebSession.UpdateResponse Method

Adds the session ID to a cookie in a response message.

Pascal

```
procedure UpdateResponse(AResponse: TWebResponse); virtual; abstract;
```

C++

```
virtual __fastcall UpdateResponse(TWebResponse AResponse) = 0;
```

Description

Call UpdateResponse to add the value of the SessionID (see page 15087) property to one of the response message's cookies. This allows the user's next request message to use the Values (see page 15088) stored in this session.

AResponse is the Web response message to which a cookie with the session ID should be added.

See Also

SessionID (see page 15087)

Values (see page 15088)

77.1.9.3 TAbstractWebSession Properties

The properties of the TAbstractWebSession class are listed here.

Public Properties

	Name	Description
R	SessionID (see page 15087)	Uniquely identifies the Session.
	TimeoutMinutes (see page 15087)	Indicates the time, in minutes, that a session can be idle before it terminates itself.
	Values (see page 15088)	Lists the named values that the session stores.

77.1.9.3.1 TAbstractWebSession.SessionID Property

Uniquely identifies the Session.

Pascal

```
property SessionID: string;
```

C++

```
__property AnsiString SessionID;
```

Description

SessionID is an automatically-generated identifier that uniquely identifies the session. The UpdateResponse (see page 15086) method adds this identifier to response messages, using a cookie. When the WebSnap application receives a request containing a cookie with a session ID, the WebSnap application uses the ID to recreate a copy of the previous session object.

See Also

UpdateResponse (see page 15086)

77.1.9.3.2 TAbstractWebSession.TimeoutMinutes Property

Indicates the time, in minutes, that a session can be idle before it terminates itself.

Pascal

```
property TimeoutMinutes: Integer;
```

C++

```
__property int TimeoutMinutes;
```

Description

Set TimeoutMinutes to specify the number of minutes that can elapse before a session times out. If this number of minutes elapses with no request messages that call for the session, the session is terminated.

If you do not specify a value for TimeoutMinutes, the session times out after the default time-out period associated with the application's sessions service (TSessionsService).

See Also

Terminate (see page 15086)

DefaultTimeout (see page 25580)

77.1.9.3.3 TAbstractWebSession.Values Property

Lists the named values that the session stores.

Pascal

```
property Values [const AName: string]: Variant;
```

C++

```
__property Variant Values[AnsiString const AName];
```

Description

Use Values to get or set the information that the session stores. Because sessions are associated with individual users, this information typically represents information about the user or choices the user makes. The Values property can be used to implement application-specific tasks, such as saving user preferences or maintaining a list user selections.

Each value is indexed by a name that indicates its meaning. The names can be any application-defined string.

See Also

TEndUserSessionAdapter (see page 24458)

77.1.10 TContentParser Class

TContentParser is the default parser for extracting named value strings and uploaded files from an HTTP request.

Class Hierarchy

Pascal

```
TContentParser = class(TAbstractContentParser);
```

C++

```
class TContentParser : public TAbstractContentParser;
```

File

HTTPApp

Description

Web request objects use a TContentParser object to parse the content of an HTTP request message when there is no other registered content parser that knows how to interpret that content. The Web request uses the content parser to assign values for its ContentFields and Files properties.

TContentParser does not know how to parse special request formats. It simply calls the Web request object's own ExtractContentFields method to extract named value strings for the request's ContentFields property. It does not parse uploaded files, but merely returns an empty list for the request's Files property.

See Also

TWebRequest (see page 15161)

TWebRequest (see page 15161)

TWebRequest (see page 15161)

TMultipartContentParser (see page 18710)

TWebRequest (see page 15161)

77.1.10.1 TContentParser Members

The following tables list the members exposed by TContentParser.

Protected Properties

	Name	Description
R	WebRequest (see page 15043)	Indicates the Web request object that uses this parser to parse its content.

Public Methods

	Name	Description
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
V	CanParse (see page 15090)	Indicates whether a specified request message contains information encoded in a way that this parser understands.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 15041)	Creates and initializes a new TAbstractContentParser (see page 15039) object.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 15090)	Frees the memory associated with the TContentParser (see page 15088) object.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
V	GetContentFields (see page 15091)	Returns the named value strings that are included in the content of the current Web request.
V	GetFiles (see page 15091)	Returns a set of uploaded files that the parser extracts from the current Web request.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

77.1.10.2 TContentParser.Destroy Destructor

Frees the memory associated with the TContentParser (see page 15088) object.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TContentParser();
```

Description

Do not free content parser instances. The Web request object frees the content parser when it no longer needs it.

See Also

Free (see page 22300)

77.1.10.3 TContentParser Methods

The methods of the TContentParser class are listed here.

Public Methods

	Name	Description
	CanParse (see page 15090)	Indicates whether a specified request message contains information encoded in a way that this parser understands.
	GetContentFields (see page 15091)	Returns the named value strings that are included in the content of the current Web request.
	GetFiles (see page 15091)	Returns a set of uploaded files that the parser extracts from the current Web request.

77.1.10.3.1 TContentParser.CanParse Method

Indicates whether a specified request message contains information encoded in a way that this parser understands.

Pascal

```
class function CanParse(AWebRequest: TWebRequest): Boolean; override;
```

C++

```
virtual __fastcall Boolean CanParse(TWebRequest AWebRequest);
```

Description

CanParse indicates whether a content parser class can handle parsing a specified request message. CanParse is a static class method, which means the Web request does not need an instantiated object to call this method. The Web request object calls the CanParse method of every registered content parser until it finds one that can parse its content.

AWebRequest is the current HTTP request message.

CanParse returns true if this class can parse AWebRequest, false if AWebRequest does not indicate an encoding that this class understands.

In TContentParser (see page 15088), CanParse always returns true. TContentParser (see page 15088) is always the last content parser that the Web request object checks, and provides the default parsing when no other parser is available.

See Also

GetContentFields (see page 15091)

GetFiles (see page 15091)

77.1.10.3.2 TContentParser.GetContentFields Method

Returns the named value strings that are included in the content of the current Web request.

Pascal

```
function GetContentFields: TStrings; override;
```

C++

```
virtual __fastcall TStrings GetContentFields();
```

Description

GetContentFields returns a list of strings with the form "Name=Value" that represent any name/value pairs that the parser identifies in the content of the current Web request.

In TContentParser (see page 15088), GetContentFields simply calls the ExtractContentFields method of the current Web request. This method assumes that fields are strings with the form "Name=Value", separated by ampersands (&).

Note: The content parser owns the string list it returns. The caller should not free the string list.

See Also

ContentFields (see page 15177)

ExtractContentFields (see page 15166)

77.1.10.3.3 TContentParser.GetFiles Method

Returns a set of uploaded files that the parser extracts from the current Web request.

Pascal

```
function GetFiles: TAbstractWebRequestFiles; override;
```

C++

```
virtual __fastcall TAbstractWebRequestFiles GetFiles();
```

Description

GetFiles returns a list of Web request file objects, each of which represents an uploaded file from the current Web request. Each Web request file object has properties to describe an uploaded file, including a stream object from which to read the content of the uploaded file.

In TContentParser (see page 15088), GetFiles always returns an empty list. That is, TContentParser (see page 15088) does not implement support for uploaded files in HTTP requests.

Note: The content parser owns the list it returns. The caller should not free this list.

See Also

Files (see page 15182)

TAbstractWebRequestFile (see page 15073)

77.1.11 TCookie Class

TCookie represents a Cookie header in an HTTP response message.

Class Hierarchy

Pascal

```
TCookie = class(TCollectionItem);
```

C++

```
class TCookie : public TCollectionItem;
```

File

HTTPApp

Description

Use TCookie to specify the cookie header that should be sent with a response message when responding to an HTTP request message. Cookie headers contain state information that the Web client passes on to other locations on the Internet or Intranet.

See Also

TCookieCollection (see page 15098)

TWebResponse (see page 15191)

77.1.11.1 TCookie Members

The following tables list the members exposed by TCookie.

Protected Methods

	Name	Description
	Changed (see page 2758)	Updates the collection to reflect changes to the collection item.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	GetDisplayName (see page 2758)	Returns the name of the collection item as it appears in the collection editor.
	GetHeaderValue (see page 15095)	This is GetHeaderValue, a member of class TCookie.
V	GetOwner (see page 2759)	Returns the collection to which this item belongs.
	GetOwner (see page 2932)	Returns the owner of an object.
V	SetCollection (see page 2759)	Sets the value of the Collection (see page 2761) property.
V	SetDisplayName (see page 2760)	Sets the name of the collection item as it appears in the collection editor.
V	SetIndex (see page 2760)	Moves the collection item to a specified position in the parent collection.

Public Methods

	Name	Description
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	AssignTo (see page 15094)	Copies the properties of the TCookie (see page 15092) object to another TCookie (see page 15092) object.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.

	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 15093)	Creates an instance of TCookie (see page 15092).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2757)	Destroys the TCollectionItem (see page 2755) instance and frees its memory.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2759)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
	Collection (see page 2761)	Specifies the TCollection (see page 2731) instance to which the TCollectionItem (see page 2755) belongs.
	DisplayName (see page 2761)	The name displayed in the Collection (see page 2761) editor.
	Domain (see page 15095)	Specifies the Domain field of the cookie header.
	Expires (see page 15095)	Specifies when the cookie is no longer valid.
R	HeaderValue (see page 15096)	Specifies the Cookie header string that represents this TCookie (see page 15092) object.
R	ID (see page 2761)	A unique, permanent index for the item.
	Index (see page 2762)	Returns the item's position in the Items array of TCollection (see page 2731).
	Name (see page 15096)	Specifies the name of the custom field represented by this Cookie header.
	Path (see page 15097)	Identifies the paths of URLs to which the Cookie should be sent.
	Secure (see page 15097)	Determines whether the Web client must use a secure connection to pass on the Cookie header.
	Value (see page 15097)	Specifies the value of the Cookie header field named by the Name (see page 15096) property.

77.1.11.2 TCookie.Create Constructor

Creates an instance of TCookie (see page 15092).

Pascal

```
constructor Create(Collection: TCollection); override;
```

C++

```
virtual __fastcall TCookie(TCollection Collection);
```

Description

It is seldom necessary to call the constructor for TCookie (see page 15092) directly. Instead, create TCookie (see page 15092) objects indirectly by calling the Add method of TCookieCollection (see page 15098).

After calling the inherited constructor, Create initializes the Expires (see page 15095) property to indicate no expiration date.

See Also

Add (see page 15100)

Expires (see page 15095)

77.1.11.3 TCookie Methods

The methods of the TCookie class are listed here.

Protected Methods

	Name	Description
	GetHeaderValue (see page 15095)	This is GetHeaderValue, a member of class TCookie.

Public Methods

	Name	Description
	AssignTo (see page 15094)	Copies the properties of the TCookie (see page 15092) object to another TCookie (see page 15092) object.

77.1.11.3.1 TCookie.AssignTo Method

Copies the properties of the TCookie (see page 15092) object to another TCookie (see page 15092) object.

Pascal

```
procedure AssignTo(Dest: TPersistent); override;
```

C++

```
virtual __fastcall AssignTo(TPersistent * Dest);
```

Description

Do not call the AssignTo method for TCookie (see page 15092). Instead, call the Assign method of the destination object. The Assign method of the destination object calls the AssignTo method if it does not contain code for copying the properties of a TCookie (see page 15092) object. If the destination object is a TCookie (see page 15092) object, AssignTo copies the Name (see page 15096), Value (see page 15097), Domain (see page 15095), Path (see page 15097), Expires (see page 15095), and Secure (see page 15097) properties so the destination cookie generates the same Cookie header string.

See Also

Assign (see page 2930)

77.1.11.3.2 TCookie.GetHeaderValue Method

Pascal

```
function GetHeaderValue: string;
```

C++

```
__fastcall AnsiString GetHeaderValue();
```

Description

This is GetHeaderValue, a member of class TCookie.

77.1.11.4 TCookie Properties

The properties of the TCookie class are listed here.

Public Properties

	Name	Description
	Domain (see page 15095)	Specifies the Domain field of the cookie header.
	Expires (see page 15095)	Specifies when the cookie is no longer valid.
R	HeaderValue (see page 15096)	Specifies the Cookie header string that represents this TCookie (see page 15092) object.
	Name (see page 15096)	Specifies the name of the custom field represented by this Cookie header.
	Path (see page 15097)	Identifies the paths of URLs to which the Cookie should be sent.
	Secure (see page 15097)	Determines whether the Web client must use a secure connection to pass on the Cookie header.
	Value (see page 15097)	Specifies the value of the Cookie header field named by the Name (see page 15096) property.

77.1.11.4.1 TCookie.Domain Property

Specifies the Domain field of the cookie header.

Pascal

```
property Domain: string;
```

C++

```
__property AnsiString Domain;
```

Description

Use Domain to limit the recipients of the cookie header to certain domains. The Web client will only send this cookie on to URIs in the specified domain. To limit the recipients to certain paths within the specified domain, use the Path (see page 15097) property.

See Also

Path (see page 15097)

77.1.11.4.2 TCookie.Expires Property

Specifies when the cookie is no longer valid.

Pascal

```
property Expires: TDateTime;
```

C++

```
__property TDateTime Expires;
```

Description

Set Expires to the date and time after which the Web client should not send the cookie on with HTTP messages.

See Also

Expires (see page 15212)

77.1.11.4.3 TCookie.HeaderValue Property

Specifies the Cookie header string that represents this TCookie (see page 15092) object.

Pascal

```
property HeaderValue: string;
```

C++

```
__property AnsiString HeaderValue;
```

Description

Read HeaderValue to determine the Cookie header that is added to the HTTP response message for this TCookie (see page 15092) object. HeaderValue combines the information specified by the Name (see page 15096) and Value (see page 15097) properties into a single Name (see page 15096)=Value (see page 15097) field, and then adds the Domain (see page 15095), Path (see page 15097), Expires (see page 15095), and Secure (see page 15097) fields based on the values of the properties with the corresponding names.

See Also

Name (see page 15096)

Value (see page 15097)

Domain (see page 15095)

Path (see page 15097)

Expires (see page 15095)

Secure (see page 15097)

77.1.11.4.4 TCookie.Name Property

Specifies the name of the custom field represented by this Cookie header.

Pascal

```
property Name: string;
```

C++

```
__property AnsiString Name;
```

Description

Set Name to the name that identifies the use of the Value (see page 15097) property in the Cookie header. The Value (see page 15097) property is combined with the Name property into a string of the form Name=Value (see page 15097). This string appears as one of the fields in the Cookie header represented by the HeaderValue (see page 15096) property.

See Also

HeaderValue (see page 15096)

Value (see page 15097)

77.1.11.4.5 TCookie.Path Property

Identifies the paths of URLs to which the Cookie should be sent.

Pascal

```
property Path: string;
```

C++

```
__property AnsiString Path;
```

Description

Use Path to limit the recipients of the cookie header to certain paths. The Web client will only send this cookie header on to URLs with the specified path. To limit the recipients to certain domains, use the Domain (see page 15095) property.

See Also

Domain (see page 15095)

PathInfo (see page 15185)

77.1.11.4.6 TCookie.Secure Property

Determines whether the Web client must use a secure connection to pass on the Cookie header.

Pascal

```
property Secure: Boolean;
```

C++

```
__property Boolean Secure;
```

Description

Set Secure to true if the Web client must use a secure connection when sending the Cookie header. Secure connections are connections where messages may not be stored on any permanent medium such as a back-up tape. If the message is stored temporarily in a file, the file must be deleted.

Set Secure to false if it does not matter whether the Cookie header is sent using a secure connection.

77.1.11.4.7 TCookie.Value Property

Specifies the value of the Cookie header field named by the Name (see page 15096) property.

Pascal

```
property Value: string;
```

C++

```
__property AnsiString Value;
```

Description

Set Value to the value associated with the field named by the Name (see page 15096) property. The Value property is combined with the Name (see page 15096) property into a string of the form Name (see page 15096)=Value. This string

appears as one of the fields in the Cookie header represented by the HeaderValue (see page 15096) property.

See Also

HeaderValue (see page 15096)

Name (see page 15096)

77.1.12 TCookieCollection Class

TCookieCollection is a collection of TCookie (see page 15092) objects.

Class Hierarchy

Pascal

```
TCookieCollection = class(TCollection);
```

C++

```
class TCookieCollection : public TCollection;
```

File

HTTPApp

Description

Use TCookieCollection to represent all the Cookie headers of an HTTP response message. Each Cookie header is represented by a single TCookie (see page 15092) object. A Cookie header includes a named field with an associated value, of the form Name=Value, plus a number of other, standard fields that specify the destination of the cookie, when the cookie is valid, and so on. Web clients pass Cookie headers on to the destinations specified by the fields of the Cookie header.

See Also

TCookie (see page 15092)

TWebResponse (see page 15191)

77.1.12.1 TCookieCollection Members

The following tables list the members exposed by TCookieCollection.

Protected Methods

	Name	Description
	Added (see page 2736)	Responds when items are added to the collection.
	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	Changed (see page 2740)	Responds when the collection or any of its items changes.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	Deleting (see page 2741)	Responds when items are deleted from the collection.
	GetAttr (see page 2743)	Returns the name of a custom attribute that can be retrieved using the GetItemAttr (see page 2745) method.
	GetAttrCount (see page 2744)	Returns the number of custom attributes associated with items in the collection.
	GetCookie (see page 15101)	This is GetCookie, a member of class TCookieCollection.
	GetItem (see page 2744)	Returns a specified item in the collection.
	GetItemAttr (see page 2745)	Returns the value of a custom attribute assigned to one of the collection's items.

	GetOwner (see page 2932)	Returns the owner of an object.
V	Notify (see page 2746)	Responds when items are added to or removed from the collection.
	SetCookie (see page 15101)	This is SetCookie, a member of class TCookieCollection.
	SetItem (see page 2747)	Copies the properties of another item to a specified item in the collection.
V	SetItemName (see page 2747)	Initializes the name of a newly inserted collection item.
V	Update (see page 2747)	Updates the collection to reflect changes to its items.

Protected Properties

	Name	Description
R	NextID (see page 2752)	Specifies a unique ID that can be assigned to the next added collection item.
	PropName (see page 2752)	Specifies the name of the property that the collection implements.
R	UpdateCount (see page 2753)	Counts the number of times BeginUpdate (see page 2739) was called without a corresponding call to EndUpdate (see page 2742).

Public Methods

	Name	Description
	Add (see page 15100)	Creates a new TCookie (see page 15092) object and adds it to the end of the Items (see page 15101) property array.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2736)	Copies the contents of another collection to the object where the method is executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
V	BeginUpdate (see page 2739)	Suspends screen repainting.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Clear (see page 2741)	Deletes all items from the collection.
	Create (see page 15100)	Creates and initializes a TCookieCollection (see page 15098) object.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Delete (see page 2741)	Deletes a single item from the collection.
V	Destroy (see page 2735)	Destroys the collection and each item in it.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
V	EndUpdate (see page 2742)	Re-enables screen repainting.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindItemID (see page 2743)	Returns the item with the specified ID.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetEnumerator (see page 2744)	Returns a TCollection (see page 2731) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2745)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.

	Insert (see page 2746)	Creates a new TCollectionItem (see page 2755) instance and adds it to the Items (see page 2751) array.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	Owner (see page 2746)	Returns the Owner of the collection.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
	Capacity (see page 2748)	Provides access to the internal TList (see page 2868) Capacity property.
R	Count (see page 2749)	Returns the number of items in the collection.
R	ItemClass (see page 2751)	Indicates the class to which the collection's items belong.
	Items (see page 15101)	Provides indexed access to the TCookie (see page 15092) objects in the collection.
R	WebResponse (see page 15102)	Indicates the TWebResponse (see page 15191) object that uses the cookie collection to represent all of its Cookie headers.

77.1.12.2 TCookieCollection.Create Constructor

Creates and initializes a TCookieCollection (see page 15098) object.

Pascal

```
constructor Create(WebResponse: TWebResponse; ItemClass: TCollectionItemClass);
```

C++

```
__fastcall TCookieCollection(TWebResponse WebResponse, TCollectionItemClass ItemClass);
```

Description

Applications should not need to call the Create method directly. The Web response object that uses the cookie collection to represent its Cookie headers creates the TCookieCollection (see page 15098) object from its own constructor.

77.1.12.3 TCookieCollection Methods

The methods of the TCookieCollection class are listed here.

Protected Methods

	Name	Description
	GetCookie (see page 15101)	This is GetCookie, a member of class TCookieCollection.
	SetCookie (see page 15101)	This is SetCookie, a member of class TCookieCollection.

Public Methods

	Name	Description
	Add (see page 15100)	Creates a new TCookie (see page 15092) object and adds it to the end of the Items (see page 15101) property array.

77.1.12.3.1 TCookieCollection.Add Method

Creates a new TCookie (see page 15092) object and adds it to the end of the Items (see page 15101) property array.

Pascal

```
function Add: TCookie;
```

C++

```
__fastcall TCookie Add();
```

Description

Call Add to add a new Cookie header to the set of cookie headers sent with the Web response message. Use Add when adding a Cookie header whose fields will be set at a later time. If the values of the TCookie (see page 15092) properties are known at the time of creation, use the SetCookieField method of the Web response object instead.

See Also

WebResponse (see page 15102)

SetCookieField (see page 15203)

Items (see page 15101)

77.1.12.3.2 TCookieCollection.GetCookie Method

Pascal

```
function GetCookie(Index: Integer): TCookie;
```

C++

```
__fastcall TCookie GetCookie(int Index);
```

Description

This is GetCookie, a member of class TCookieCollection.

77.1.12.3.3 TCookieCollection.SetCookie Method

Pascal

```
procedure SetCookie(Index: Integer; Cookie: TCookie);
```

C++

```
__fastcall SetCookie(int Index, TCookie Cookie);
```

Description

This is SetCookie, a member of class TCookieCollection.

77.1.12.4 TCookieCollection Properties

The properties of the TCookieCollection class are listed here.

Public Properties

	Name	Description
	Items (see page 15101)	Provides indexed access to the TCookie (see page 15092) objects in the collection.
R	WebResponse (see page 15102)	Indicates the TWebResponse (see page 15191) object that uses the cookie collection to represent all of its Cookie headers.

77.1.12.4.1 TCookieCollection.Items Property

Provides indexed access to the TCookie (see page 15092) objects in the collection.

Pascal

```
property Items [Index: Integer]: TCookie;
```

C++

```
__property TCookie Items[int Index];
```

Description

Use Items to access the properties of the TCookie (see page 15092) objects maintained by TCookieCollection (see page 15098).

Note: In Delphi, items is the default property of TCookieCollection (see page 15098), so the name of the Items property can be left off when using this property. Thus the line

Note: FirstCookie := TApacheResponse1.Cookies.Items[0];

Note: can be written

Note: FirstCookie := TApacheResponse1.Cookies[0];

See Also

Cookies (see page 15210)

operator_sb

77.1.12.4.2 TCookieCollection.WebResponse Property

Indicates the TWebResponse (see page 15191) object that uses the cookie collection to represent all of its Cookie headers.

Pascal

```
property WebResponse: TWebResponse;
```

C++

```
__property TWebResponse WebResponse;
```

Description

Read WebResponse to access the response object that is using the cookie collection. The response object is a descendant of TWebResponse (see page 15191), either TISAPIResponse, TWinCGIResponse,TCGIResponse, or TApacheResponse, depending on the type of Web server application.

Use the properties of the response object to obtain information about the other headers in the response message or the content of the response message. Many applications use this information to determine what field values to specify as Cookie headers.

77.1.13 TCustomContentProducer Class

TCustomContentProducer is the base class for all objects that produce the string that is sent as the contents of an HTTP response message.

Class Hierarchy

Pascal

```
TCustomContentProducer = class(TComponent, ISetAppDispatcher, IGetAppDispatcher,
IProduceContent, IProduceContentFrom);
```

C++

```
class TCustomContentProducer : public TComponent, public ISetAppDispatcher, public
IGetAppDispatcher, public IProduceContent, public IProduceContentFrom;
```

File

HTTPApp

Description

Use TCustomContentProducer as a base class when defining a class to produce the contents of an HTTP response message. In most cases, the content producer will assemble a string of HTML commands. However, descendants of TCustomContentProducer can be defined to produce any valid MIME type.

See Also

TDSTableProducer (see page 10290)

TPageProducer (see page 15309)

TWebResponse (see page 15191)

Generating the Content of Response Messages

The Web Module

77.1.13.1 TCustomContentProducer Members

The following tables list the members exposed by TCustomContentProducer.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.

	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetAppDispatcher (see page 15108)	This is GetAppDispatcher, a member of class TCustomContentProducer.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Notification (see page 15108)	Overrides the inherited method to respond to messages that the dispatcher is going away.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	ProduceContent (see page 15108)	Returns the content that the producer creates.
	ProduceContentFromStream (see page 15109)	This is ProduceContentFromStream, a member of class TCustomContentProducer.
	ProduceContentFromString (see page 15109)	This is ProduceContentFromString, a member of class TCustomContentProducer.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetAppDispatcher (see page 15109)	This is SetAppDispatcher, a member of class TCustomContentProducer.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.

	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Content (see page 15106)	Returns the content produced by the content producer.
V	ContentFromStream (see page 15107)	Returns the content produced in response to input read from a stream.
V	ContentFromString (see page 15107)	Returns the content produced in response to an input string.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.

V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	Dispatcher (see page 15109)	Provides access to the dispatcher for the Web server application that includes the TCustomContentProducer (see page 15102) object.
R	DispatcherComponent (see page 15110)	Provides access to the dispatcher component.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

77.1.13.2 TCustomContentProducer Methods

The methods of the TCustomContentProducer class are listed here.

Protected Methods

	Name	Description
	GetAppDispatcher (see page 15108)	This is GetAppDispatcher, a member of class TCustomContentProducer.
V	Notification (see page 15108)	Overrides the inherited method to respond to messages that the dispatcher is going away.
	ProduceContent (see page 15108)	Returns the content that the producer creates.
	ProduceContentFromStream (see page 15109)	This is ProduceContentFromStream, a member of class TCustomContentProducer.
	ProduceContentFromString (see page 15109)	This is ProduceContentFromString, a member of class TCustomContentProducer.
	SetAppDispatcher (see page 15109)	This is SetAppDispatcher, a member of class TCustomContentProducer.

Public Methods

	Name	Description
V	Content (see page 15106)	Returns the content produced by the content producer.
V	ContentFromStream (see page 15107)	Returns the content produced in response to input read from a stream.
V	ContentFromString (see page 15107)	Returns the content produced in response to an input string.

77.1.13.2.1 TCustomContentProducer.Content Method

Returns the content produced by the content producer.

Pascal

```
function Content: string; virtual;
```

C++

```
virtual __fastcall AnsiString Content();
```

Description

Call Content to retrieve the content for using in an HTTP response message. TCustomContentProducer (see page 15102) returns an empty string. Descendants of TCustomContentProducer (see page 15102) return the value of the content that they produce. In most cases, this content is a string of HTML commands, although it can be any valid MIME type.

See Also

ContentFromStream (see page 15107)

ContentFromString (see page 15107)

Content (see page 15207)

Responding to Request Messages with Action Items

77.1.13.2.2 TCustomContentProducer.ContentFromStream Method

Returns the content produced in response to input read from a stream.

Pascal

```
function ContentFromStream(Stream: TStream): string; virtual;
```

C++

```
virtual __fastcall AnsiString ContentFromStream(TStream Stream);
```

Description

Call ContentFromStream to retrieve the content produced by the content producer based on the information provided by the Stream parameter. TCustomContentProducer (see page 15102) ignores the Stream parameter and returns the value created by the Content (see page 15106) method.

Descendants of TCustomContentProducer (see page 15102) override this method to interpret streamed input in their own way.

See Also

Content (see page 15106)

ContentFromString (see page 15107)

Content (see page 15207)

77.1.13.2.3 TCustomContentProducer.ContentFromString Method

Returns the content produced in response to an input string.

Pascal

```
function ContentFromString(const S: string): string; virtual;
```

C++

```
virtual __fastcall AnsiString ContentFromString(const AnsiString S);
```

Description

Call ContentFromString to retrieve the content produced by the content producer based on the information provided by the S parameter. TCustomContentProducer (see page 15102) ignores the string and returns the value created by the Content (see page 15106) method.

Descendants of TCustomContentProducer (see page 15102) override this method to interpret the input string in their own way.

See Also

Content (see page 15106)

ContentFromStream (see page 15107)

Content (see page 15207)

77.1.13.2.4 TCustomContentProducer.GetAppDispatcher Method

Pascal

```
function GetAppDispatcher: TComponent;
```

C++

```
__fastcall TComponent * GetAppDispatcher();
```

Description

This is GetAppDispatcher, a member of class TCustomContentProducer.

77.1.13.2.5 TCustomContentProducer.Notification Method

Overrides the inherited method to respond to messages that the dispatcher is going away.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

After calling the inherited method, Notification checks whether this call was triggered by the removal of the dispatcher. If so, the Dispatcher (see page 15109) property is set to nil. NULL.

See Also

DispatcherComponent (see page 15110)

Dispatcher (see page 15109)

77.1.13.2.6 TCustomContentProducer.ProduceContent Method

Returns the content that the producer creates.

Pascal

```
function ProduceContent: string;
```

C++

```
__fastcall AnsiString ProduceContent();
```

Description

Call ProduceContent to retrieve the content for using in an HTTP response message. In most cases, this content is a string of HTML commands defining a Web page, although it can be any valid MIME type.

See Also

Content (see page 15106)

77.1.13.2.7 TCustomContentProducer.ProduceContentFromStream Method

Pascal

```
function ProduceContentFromStream(Stream: TStream): string;
```

C++

```
__fastcall AnsiString ProduceContentFromStream(TStream Stream);
```

Description

This is ProduceContentFromStream, a member of class TCustomContentProducer.

77.1.13.2.8 TCustomContentProducer.ProduceContentFromString Method

Pascal

```
function ProduceContentFromString(const S: string): string;
```

C++

```
__fastcall AnsiString ProduceContentFromString(const AnsiString S);
```

Description

This is ProduceContentFromString, a member of class TCustomContentProducer.

77.1.13.2.9 TCustomContentProducer.SetAppDispatcher Method

Pascal

```
procedure SetAppDispatcher(const ADispatcher: TComponent);
```

C++

```
__fastcall SetAppDispatcher(const TComponent * ADispatcher);
```

Description

This is SetAppDispatcher, a member of class TCustomContentProducer.

77.1.13.3 TCustomContentProducer Properties

The properties of the TCustomContentProducer class are listed here.

Public Properties

	Name	Description
R	Dispatcher (see page 15109)	Provides access to the dispatcher for the Web server application that includes the TCustomContentProducer (see page 15102) object.
R	DispatcherComponent (see page 15110)	Provides access to the dispatcher component.

77.1.13.3.1 TCustomContentProducer.Dispatcher Property

Provides access to the dispatcher for the Web server application that includes the TCustomContentProducer (see page 15102) object.

Pascal

```
property Dispatcher: IWebDispatcherAccess;
```

C++

```
__property IWebDispatcherAccess Dispatcher;
```

Description

Read Dispatcher to access the interface of the dispatcher. In Web Broker applications, this is the interface of a TWebDispatcher (see page 15147) or TWebModule (see page 15154) component. In WebSnap applications, this is the interface of a TWebAppComponents component.

The IWebDispatcherAccess (see page 15234) interface has two methods:

Request, which returns the HTTP request message to which this component responds.

Response, which returns the HTTP response message for which this component generates content.

See Also

TWebModule (see page 15154)

TWebDispatcher (see page 15147)

TWebAppComponents (see page 24958)

TWebRequest (see page 15161)

TWebResponse (see page 15191)

DispatcherComponent (see page 15110)

77.1.13.3.2 TCustomContentProducer.DispatcherComponent Property

Provides access to the dispatcher component.

Pascal

```
property DispatcherComponent: TComponent;
```

C++

```
__property TComponent * DispatcherComponent;
```

Description

Dispatcher (see page 15109) component is the component that implements the interface that is the value of the Dispatcher (see page 15109) property. The content producer uses this property so that it can respond to notifications when the component is freed. To use the dispatcher, use the Dispatcher (see page 15109) property instead.

See Also

Dispatcher (see page 15109)

77.1.14 TCustomWebDispatcher Class

TCustomWebDispatcher is the abstract base class for Web dispatcher objects.

Class Hierarchy

Pascal

```
TCustomWebDispatcher = class(TDataModule, IWebRequestHandler, IWebDispatchActions,
IWebDispatcherAccess, IMultiModuleSupport, IWebExceptionHandler);
```

C++

```
class TCustomWebDispatcher : public TDataModule, public IWebRequestHandler, public
IWebDispatchActions, public IWebDispatcherAccess, public IMultiModuleSupport, public
IWebExceptionHandler;
```

File

HTTPApp

Description

Add a descendant of TCustomWebDispatcher to a Web application to enable it to respond to HTTP request messages. When a Web application is created, it automatically includes a TWebModule (see page 15154) object, which is a descendant of TCustomWebDispatcher. Keep the default Web module, or replace it with another data module that contains a descendant of TCustomWebDispatcher, such as TWebDispatcher (see page 15147).

TCustomWebDispatcher manages the action items that assemble responses to HTTP request messages. When the TWebApplication object receives an HTTP request message, TCustomWebDispatcher passes the request on to the appropriate action item or action items to service the message.

TCustomWebDispatcher also keeps track of information about the current HTTP message for the benefit of TCustomContentProducer (see page 15102) objects.

See Also

TCustomContentProducer (see page 15102)

TWebActionItem (see page 15130)

TWebActionItems (see page 15140)

TWebApplication (see page 24618)

TWebDispatcher (see page 15147)

TWebModule (see page 15154)

TWebRequest (see page 15161)

TWebResponse (see page 15191)

The Web Module

77.1.14.1 TCustomWebDispatcher Members

The following tables list the members exposed by TCustomWebDispatcher.

Protected Events

	Name	Description
	AfterDispatch (see page 15123)	Occurs after the HTTP response message has been successfully filled out by the action items but not yet sent.
	BeforeDispatch (see page 15124)	Occurs before the dispatcher tries to match the HTTP request message with any of its action items.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	Access_Request (see page 15116)	This is Access_Request, a member of class TCustomWebDispatcher.
	Access_Response (see page 15117)	This is Access_Response, a member of class TCustomWebDispatcher.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2830)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	DispatchAction (see page 15117)	Passes an HTTP request message to the action items in Actions (see page 15122) until it is handled.
	DoAfterDispatch (see page 15118)	Generates an AfterDispatch (see page 15123) event and returns a value that indicates whether the Web application can send the response.
	DoBeforeDispatch (see page 15119)	Generates a BeforeDispatch (see page 15124) event and returns a value that indicates whether the dispatcher should look for action items to handle the request.
V	DoCreate (see page 2831)	This is DoCreate, a member of class TDataModule.
V	DoDestroy (see page 2831)	This is DoDestroy, a member of class TDataModule.
	FinishContext (see page 15119)	This is FinishContext, a member of class TCustomWebDispatcher.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetChildren (see page 2831)	This is GetChildren, a member of class TDataModule.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	HandleCreateException (see page 2831)	This is HandleCreateException, a member of class TDataModule.
	HandleException (see page 15119)	Provides default handling of exceptions for the web application.
	HandleRequest (see page 15120)	Processes an HTTP request message.
	InitContext (see page 15120)	This is InitContext, a member of class TCustomWebDispatcher.
	InitModule (see page 15120)	This is InitModule, a member of class TCustomWebDispatcher.

	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 15121)	Responds to notifications when objects are added to the module.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 2832)	This is ReadState, a member of class TDataModule.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Public Events

	Name	Description
	OnException (see page 15124)	Occurs when an unhandled exception occurs in the application.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	ActionByName (see page 15117)	Returns the action item identified by the AName parameter.
V	AfterConstruction (see page 2829)	Generates an OnCreate (see page 2833) event.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 2830)	Generates an OnDestroy (see page 2834) event.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 15115)	Creates an instance of TCustomWebDispatcher (see page 15110).
V	CreateNew (see page 2828)	Creates an instance of a data module and registers with the global screen object.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 15115)	Frees an instance of TCustomWebDispatcher (see page 15110).
	DestroyComponents (see page 2771)	Destroys all owned components.

	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	Action (see page 15121)	Provides indexed access to the action items managed by the TCustomWebDispatcher (see page 15110) object.
	Actions (see page 15122)	Represents the collection of action items managed by the TCustomWebDispatcher (see page 15110) object.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.

	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DesignOffset (see page 2832)	Specifies the design offset for the data module at design time.
	DesignSize (see page 2832)	Specifies the design size for the data module at design time.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
R	Request (see page 15122)	Provides access to the TWebRequest (see page 15161) object that the dispatcher is currently handling.
R	Response (see page 15122)	Provides access to the TWebResponse (see page 15191) object for the message the dispatcher is currently handling.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Events

	Name	Description
	OnCreate (see page 2833)	Occurs when an application instantiates a data module.
	OnDestroy (see page 2834)	Occurs when the data module is about to be destroyed.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	OldCreateOrder (see page 2833)	Specifies when OnCreate (see page 2833) and OnDestroy (see page 2834) events occur.
	Tag (see page 2808)	Stores an integer value as part of a component.

77.1.14.2 TCustomWebDispatcher.Create Constructor

Creates an instance of TCustomWebDispatcher (see page 15110).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomWebDispatcher(TComponent * AOwner);
```

Description

Do not call the constructor for TCustomWebDispatcher (see page 15110). Web applications automatically include a Web module. If the Web module is replaced by another data model, the Web dispatcher should be added to the new data module at design time. Objects placed at design time are created automatically. If an application tries to create a dispatcher object in a Web module, or in a data module that already has a Web dispatcher, an exception is raised.

Create creates the TWebActionItems (see page 15140) object that holds the action items managed by the dispatcher. If the Web dispatcher is included in another data module, it adds a reference to itself to any content producer in that data module.

After the Web dispatcher is created automatically at runtime, an OnCreate event occurs.

See Also

Actions (see page 15122)

OnCreate (see page 2833)

Dispatcher (see page 15109)

77.1.14.3 TCustomWebDispatcher.Destroy Destructor

Frees an instance of TCustomWebDispatcher (see page 15110).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TCustomWebDispatcher();
```

Description

Do not destroy the TCustomWebDispatcher (see page 15110) directly in an application. The dispatcher is freed automatically when the server application shuts down.

Destroy frees the TWebActionItems (see page 15140) object used to hold the collection of action items.

See Also

Actions (see page 15122)

Free (see page 22300)

77.1.14.4 TCustomWebDispatcher Methods

The methods of the TCustomWebDispatcher class are listed here.

Protected Methods

	Name	Description
	Access_Request (see page 15116)	This is Access_Request, a member of class TCustomWebDispatcher.
	Access_Response (see page 15117)	This is Access_Response, a member of class TCustomWebDispatcher.
	DispatchAction (see page 15117)	Passes an HTTP request message to the action items in Actions (see page 15122) until it is handled.
	DoAfterDispatch (see page 15118)	Generates an AfterDispatch (see page 15123) event and returns a value that indicates whether the Web application can send the response.
	DoBeforeDispatch (see page 15119)	Generates a BeforeDispatch (see page 15124) event and returns a value that indicates whether the dispatcher should look for action items to handle the request.
	FinishContext (see page 15119)	This is FinishContext, a member of class TCustomWebDispatcher.
	HandleException (see page 15119)	Provides default handling of exceptions for the web application.
	HandleRequest (see page 15120)	Processes an HTTP request message.
	InitContext (see page 15120)	This is InitContext, a member of class TCustomWebDispatcher.
	InitModule (see page 15120)	This is InitModule, a member of class TCustomWebDispatcher.
V	Notification (see page 15121)	Responds to notifications when objects are added to the module.

Public Methods

	Name	Description
	ActionByName (see page 15117)	Returns the action item identified by the AName parameter.

77.1.14.4.1 TCustomWebDispatcher.Access_Request Method

Pascal

```
function Access_Request: TWebRequest;
```

C++

```
__fastcall TWebRequest Access_Request();
```

Description

This is Access_Request, a member of class TCustomWebDispatcher.

77.1.14.4.2 TCustomWebDispatcher.Access_Response Method

Pascal

```
function Access_Response: TWebResponse;
```

C++

```
__fastcall TWebResponse Access_Response();
```

Description

This is Access_Response, a member of class TCustomWebDispatcher.

77.1.14.4.3 TCustomWebDispatcher.ActionByName Method

Returns the action item identified by the AName parameter.

Pascal

```
function ActionByName(const AName: string): TWebActionItem;
```

C++

```
__fastcall TWebActionItem ActionByName(const AnsiString AName);
```

Description

Call ActionByName to gain access to an individual action item when its name is known. Change the properties of the action item so that it handles different HTTP request messages, or invoke its OnAction event handler to respond to an HTTP request message.

See Also

Action (see page 15121)

Actions (see page 15122)

TWebActionItem (see page 15130)

Name (see page 15137)

77.1.14.4.4 TCustomWebDispatcher.DispatchAction Method

Passes an HTTP request message to the action items in Actions (see page 15122) until it is handled.

Pascal

```
function DispatchAction(Request: TWebRequest; Response: TWebResponse): Boolean;
```

C++

```
__fastcall Boolean DispatchAction(TWebRequest Request, TWebResponse Response);
```

Description

The Web application calls DispatchAction when it receives an HTTP request message so that the dispatcher can dispatch the request to any action items that can generate the response.

Before DispatchAction looks for action items to handle the HTTP request message represented by the Request (see page 15122) parameter, it generates a BeforeDispatch (see page 15124) event. If the BeforeDispatch (see page 15124) event handler handles the action, the dispatcher does not pass the request message to any of the action items.

If there is no BeforeDispatch (see page 15124) event handler, or of the BeforeDispatch (see page 15124) event handler does not handle the request, DispatchAction attempts to match the MethodType and PathInfo of the request with the

MethodType and PathInfo properties of each action item in the Actions (see page 15122) property. When an action item matches the MethodType and PathInfo of the request, DispatchAction calls its OnAction event handler.

The OnAction event handler can complete the response to the request, or indicate that the request is not fully handled and allow another action item to finish processing the request. If the OnAction event handler does not complete the request, DispatchAction continues checking the action items in the Actions (see page 15122) property and calling the OnAction event handler when a match is found.

If all of the action items are checked, and the request is still not fully handled, DispatchAction calls the OnAction event handler of the default action item.

Finally, if the request has been handled by the BeforeDispatch (see page 15124) event handler or any of the action items, DispatchAction generates an AfterDispatch (see page 15123) event. The AfterDispatch (see page 15123) event does not occur if the BeforeDispatch (see page 15124) event or any of the action items has already sent the response.

DispatchAction returns a Boolean value indicating whether the Web application should send the response message if it is not already sent. DispatchAction returns true if the action was handled by the action items and the AfterDispatch (see page 15123) event handler did not change its Handled parameter to false.

See Also

Actions (see page 15122)

AfterDispatch (see page 15123)

BeforeDispatch (see page 15124)

TWebActionItem (see page 15130)

OnAction (see page 15139)

HandleRequest (see page 25454)

TWebRequest (see page 15161)

TWebResponse (see page 15191)

77.1.14.4.5 TCustomWebDispatcher.DoAfterDispatch Method

Generates an AfterDispatch (see page 15123) event and returns a value that indicates whether the Web application can send the response.

Pascal

```
function DoAfterDispatch(Request: TWebRequest; Response: TWebResponse): Boolean;
```

C++

```
__fastcall Boolean DoAfterDispatch(TWebRequest Request, TWebResponse Response);
```

Description

Applications cannot call DoAfterDispatch. The DispatchAction (see page 15117) method calls DoAfterDispatch after sending the HTTP request message to any matching action items. The DispatchAction (see page 15117) method does not call DoAfterDispatch if the HTTP request message was not handled by the action items or by a BeforeDispatch (see page 15124) event handler. DoAfterDispatch is also not called if the message was already sent back to the Web client.

If the AfterDispatch (see page 15123) event handler indicates that the response should not be sent, DoAfterDispatch returns false, and the Web application drops the connection without sending the response message. Otherwise, DoAfterDispatch returns true, and the Web application sends the response message if it was not sent from within the AfterDispatch (see page 15123) event handler.

See Also

AfterDispatch (see page 15123)

BeforeDispatch (see page 15124)

DispatchAction (see page 15117)

77.1.14.4.6 TCustomWebDispatcher.DoBeforeDispatch Method

Generates a BeforeDispatch (see page 15124) event and returns a value that indicates whether the dispatcher should look for action items to handle the request.

Pascal

```
function DoBeforeDispatch(Request: TWebRequest; Response: TWebResponse): Boolean;
```

C++

```
__fastcall Boolean DoBeforeDispatch(TWebRequest Request, TWebResponse Response);
```

Description

Applications cannot call DoBeforeDispatch. The DispatchAction (see page 15117) method calls DoBeforeDispatch before trying to match the HTTP request message with any of its action items.

If the BeforeDispatch (see page 15124) event handler indicates that it has handled the request message, DoBeforeDispatch returns true, and the DispatchAction (see page 15117) method does not try to pass the request message to any of the action items. Otherwise, DoBeforeDispatch returns false, and unless the response message was sent from within the BeforeDispatch (see page 15124) event handler, the DispatchAction (see page 15117) method proceeds with looking for action items to handle the request message.

If DoBeforeDispatch returns true but the response has not been sent, DispatchAction (see page 15117) generates an AfterDispatch (see page 15123) event.

See Also

AfterDispatch (see page 15123)

BeforeDispatch (see page 15124)

DispatchAction (see page 15117)

77.1.14.4.7 TCustomWebDispatcher.FinishContext Method

Pascal

```
procedure FinishContext;
```

C++

```
__fastcall FinishContext();
```

Description

This is FinishContext, a member of class TCustomWebDispatcher.

77.1.14.4.8 TCustomWebDispatcher.HandleException Method

Provides default handling of exceptions for the web application.

Pascal

```
procedure HandleException(E: Exception; var Handled: Boolean);
```

C++

```
__fastcall HandleException(Exception E, Boolean Handled);
```

Description

If an exception passes through all the try blocks in the web application code, the application automatically calls HandleException, which displays a dialog box indicating an error occurred. Unless the exception object is EAbort, HandleException calls the OnException (see page 15124) event handler.

To assign other exception handling code for the web application, use the OnException (see page 15124) event handler.

See Also

OnException (see page 15124)

77.1.14.4.9 TCustomWebDispatcher.HandleRequest Method

Processes an HTTP request message.

Pascal

```
function HandleRequest(Request: TWebRequest; Response: TWebResponse): Boolean;
```

C++

```
__fastcall Boolean HandleRequest(TWebRequest Request, TWebResponse Response);
```

Description

Call HandleRequest to process an HTTP request message and obtain the response that should be sent back to the caller.

Request is the request object that describes the request to process.

Response is the response object that should be filled out when the request is processed.

77.1.14.4.10 TCustomWebDispatcher.InitContext Method

Pascal

```
procedure InitContext(Request: TWebRequest; Response: TWebResponse);
```

C++

```
__fastcall InitContext(TWebRequest Request, TWebResponse Response);
```

Description

This is InitContext, a member of class TCustomWebDispatcher.

77.1.14.4.11 TCustomWebDispatcher.InitModule Method

Pascal

```
procedure InitModule(AModule: TComponent);
```

C++

```
__fastcall InitModule(TComponent * AModule);
```

Description

This is InitModule, a member of class TCustomWebDispatcher.

77.1.14.4.12 TCustomWebDispatcher.Notification Method

Responds to notifications when objects are added to the module.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

Notification ensures that all TCustomContentProducer (see page 15102) objects have access to the dispatcher, by setting their Dispatcher property as they are added to the application.

See Also

Dispatcher (see page 15109)

77.1.14.5 TCustomWebDispatcher Properties

The properties of the TCustomWebDispatcher class are listed here.

Public Properties

	Name	Description
R	Action (see page 15121)	Provides indexed access to the action items managed by the TCustomWebDispatcher (see page 15110) object.
	Actions (see page 15122)	Represents the collection of action items managed by the TCustomWebDispatcher (see page 15110) object.
R	Request (see page 15122)	Provides access to the TWebRequest (see page 15161) object that the dispatcher is currently handling.
R	Response (see page 15122)	Provides access to the TWebResponse (see page 15191) object for the message the dispatcher is currently handling.

77.1.14.5.1 TCustomWebDispatcher.Action Property

Provides indexed access to the action items managed by the TCustomWebDispatcher (see page 15110) object.

Pascal

```
property Action [Index: Integer]: TWebActionItem;
```

C++

```
__property TWebActionItem Action[int Index];
```

Description

Use Action to iterate over all of the actions in the Actions (see page 15122) collection. Zero is the index of the first action item, one is the index of the second action item, and so on. To access individual actions by name, use the ActionByName (see page 15117) method.

See Also

Actions (see page 15122)

TWebActionItem (see page 15130)

77.1.14.5.2 TCustomWebDispatcher.Actions Property

Represents the collection of action items managed by the TCustomWebDispatcher (see page 15110) object.

Pascal

```
property Actions: TWebActionItems;
```

C++

```
__property TWebActionItems Actions;
```

Description

Use the methods of Actions to add action items for use by the dispatcher, to clear the set of action items managed by the dispatcher, or to access the attributes of the action items.

See Also

Action (see page 15121)

ActionByName (see page 15117)

TWebActionItems (see page 15140)

77.1.14.5.3 TCustomWebDispatcher.Request Property

Provides access to the TWebRequest (see page 15161) object that the dispatcher is currently handling.

Pascal

```
property Request: TWebRequest;
```

C++

```
__property TWebRequest Request;
```

Description

Use Request to obtain information about the current HTTP request message. The dispatcher matches this TWebRequest (see page 15161) object to an action item, and invokes the OnAction event handler of the action item to generate and send a response to the HTTP request message. OnAction event handlers often use descendants of TCustomContentProducer (see page 15102) to help generate the response to the request message. These content producers can use the Request property to correctly produce the content of the HTTP response.

See Also

DispatchAction (see page 15117)

Response (see page 15122)

TCustomContentProducer (see page 15102)

OnAction (see page 15139)

77.1.14.5.4 TCustomWebDispatcher.Response Property

Provides access to the TWebResponse (see page 15191) object for the message the dispatcher is currently handling.

Pascal

```
property Response: TWebResponse;
```

C++

```
__property TWebResponse Response;
```

Description

Use Response to obtain information about the emerging response to the current HTTP request message. The dispatcher matches the request object specified by the Request (see page 15122) property to an action item. It then invokes the OnAction event handler of the action item to fill in the TWebResponse (see page 15191) object specified by the Response property. OnAction event handlers often use descendants of TCustomContentProducer (see page 15102) to help generate the response. These content producers can use Response to determine the state of the emerging response that is being produced.

See Also

DispatchAction (see page 15117)

Request (see page 15122)

TCustomContentProducer (see page 15102)

OnAction (see page 15139)

77.1.14.6 TCustomWebDispatcher Events

The events of the TCustomWebDispatcher class are listed here.

Protected Events

	Name	Description
	AfterDispatch (see page 15123)	Occurs after the HTTP response message has been successfully filled out by the action items but not yet sent.
	BeforeDispatch (see page 15124)	Occurs before the dispatcher tries to match the HTTP request message with any of its action items.

Public Events

	Name	Description
	OnException (see page 15124)	Occurs when an unhandled exception occurs in the application.

77.1.14.6.1 TCustomWebDispatcher.AfterDispatch Event

Occurs after the HTTP response message has been successfully filled out by the action items but not yet sent.

Pascal

```
property AfterDispatch: THTTPMethodEvent;
```

C++

```
__property THTTPMethodEvent AfterDispatch;
```

Description

Write an AfterDispatch event handler to provide a final check of the HTTP response message before it is sent to the Web client. An AfterDispatch event handler can let a response stand as is, change the response, send the response, or change the Handled parameter to False to prevent the Web application from sending the response.

The AfterDispatch event does not occur if all of the action items indicate that the response was not handled, or if the response is sent by any of the action items.

See Also

Actions (see page 15122)

BeforeDispatch (see page 15124)

TWebResponse (see page 15191)

Dispatching Request Messages

77.1.14.6.2 TCustomWebDispatcher.BeforeDispatch Event

Occurs before the dispatcher tries to match the HTTP request message with any of its action items.

Pascal

```
property BeforeDispatch: THTTPMethodEvent;
```

C++

```
__property THTTPMethodEvent BeforeDispatch;
```

Description

Write a BeforeDispatch event handler to preprocess all HTTP request messages. A BeforeDispatch event handler can enable or disable the action items appropriate to the response, begin filling out the response object, or provide any other necessary preprocessing.

If the BeforeDispatch event handler finishes filling out the response object, it should change the Handled parameter to True so the dispatcher will not send the request on to any of the action items. If the BeforeDispatch event handler sends the response message, the dispatcher will not pass the request on to any of the action items, even if the Handled parameter is left as False.

If the BeforeDispatch event handler sets the Handled parameter to True but does not send the response, the Web dispatcher will generate an AfterDispatch (see page 15123) event.

See Also

Actions (see page 15122)

AfterDispatch (see page 15123)

TWebResponse (see page 15191)

Dispatching Request Messages

Enabling and Disabling Action Items

77.1.14.6.3 TCustomWebDispatcher.OnException Event

Occurs when an unhandled exception occurs in the application.

Pascal

```
property OnException: TWebExceptionEvent;
```

C++

```
__property TWebExceptionEvent OnException;
```

Description

Use OnException to change the default behavior that occurs when an exception is not handled by application code. The OnException event handler is called automatically in the HandleException (see page 15119) method.

OnException only handles exceptions that occur during message processing. Exceptions that occur before or after the execution of the application's Run method do not generate OnException events.

If an exception passes through the try blocks in the application code, the application automatically calls the HandleException (see page 15119) method. Unless the exception object is EAbort, HandleException (see page 15119) calls the OnException

handler, if one exists. Otherwise, it calls ShowException to display a message box indicating an error occurred.

See Also

Actions (see page 15122)

AfterDispatch (see page 15123)

TWebResponse (see page 15191)

77.1.15 TDefaultWebAppServices Class

Class Hierarchy

Pascal

```
TDefaultWebAppServices = class(TInterfacedObject, IWebAppServices);
```

C++

```
class TDefaultWebAppServices : public TInterfacedObject, public IWebAppServices;
```

File

HTTPApp

Description

This is class HTTPApp.TDefaultWebAppServices.

77.1.15.1 TDefaultWebAppServices Members

The following tables list the members exposed by TDefaultWebAppServices.

Protected Data Members

	Name	Description
	FRefCount (see page 22278)	This is FRefCount, a member of class TInterfacedObject.

Protected Methods

	Name	Description
	_AddRef (see page 22278)	Implements the IInterface (see page 22396) System::TInterfacedObject::_AddRef method.
	_Release (see page 22279)	Implements the IInterface (see page 22396) System::TInterfacedObject::_Release method.
V	FindRequestHandler (see page 15127)	This is FindRequestHandler, a member of class TDefaultWebAppServices.
	FinishContext (see page 15127)	Performs any final tasks after the WebSnap application has finished processing a request.
	GetExceptionHandler (see page 15127)	Returns the object that handles exceptions that arise in the WebSnap application.
	GetRequestHandler (see page 15128)	This is GetRequestHandler, a member of class TDefaultWebAppServices.
	HandleRequest (see page 15128)	Directs the processing of the current request message.
	InitContext (see page 15128)	Creates and initializes the Web context for the current Web request.
	InvokeDispatcher (see page 15129)	This is InvokeDispatcher, a member of class TDefaultWebAppServices.
	QueryInterface (see page 22280)	Implements the IInterface (see page 22396) System::TInterfacedObject::QueryInterface method.

Protected Properties

	Name	Description
R	Request (see page 15129)	This is Request, a member of class TDefaultWebAppServices.
R	RequestHandler (see page 15130)	This is RequestHandler, a member of class TDefaultWebAppServices.
R	Response (see page 15130)	This is Response, a member of class TDefaultWebAppServices.
R	WebModules (see page 15130)	This is WebModules, a member of class TDefaultWebAppServices.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22279)	Responds after the last constructor executes.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 22279)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22280)	Allocates memory for each instance of an interfaced object.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
R	ExceptionHandler (see page 15230)	Indicates the object that handles exceptions that arise when processing a request message.
R	RefCount (see page 22281)	Indicates the number of interface pointers currently dependent upon the object.

77.1.15.2 TDefaultWebAppServices Methods

The methods of the TDefaultWebAppServices class are listed here.

Protected Methods

	Name	Description
V	FindRequestHandler (see page 15127)	This is FindRequestHandler, a member of class TDefaultWebAppServices.
	FinishContext (see page 15127)	Performs any final tasks after the WebSnap application has finished processing a request.
	GetExceptionHandler (see page 15127)	Returns the object that handles exceptions that arise in the WebSnap application.
	GetRequestHandler (see page 15128)	This is GetRequestHandler, a member of class TDefaultWebAppServices.
	HandleRequest (see page 15128)	Directs the processing of the current request message.
	InitContext (see page 15128)	Creates and initializes the Web context for the current Web request.
	InvokeDispatcher (see page 15129)	This is InvokeDispatcher, a member of class TDefaultWebAppServices.

77.1.15.2.1 TDefaultWebAppServices.FindRequestHandler Method

Pascal

```
function FindRequestHandler: IWebRequestHandler; virtual;
```

C++

```
virtual __fastcall IWebRequestHandler FindRequestHandler();
```

Description

This is FindRequestHandler, a member of class TDefaultWebAppServices.

77.1.15.2.2 TDefaultWebAppServices.FinishContext Method

Performs any final tasks after the WebSnap application has finished processing a request.

Pascal

```
procedure FinishContext;
```

C++

```
__fastcall FinishContext();
```

Description

FinishContext is called as the last step before a WebSnap application sends a response message back to the caller. FinishContext performs any final tasks, and frees all the objects and components that were created to handle the request message (including the Web context).

See Also

InitContext (see page 15229)

WebContext (see page 24687)

77.1.15.2.3 TDefaultWebAppServices.GetExceptionHandler Method

Returns the object that handles exceptions that arise in the WebSnap application.

Pascal

```
function GetExceptionHandler: TObject;
```

C++

```
__fastcall TObject * GetExceptionHandler();
```

Description

GetExceptionHandler is the read implementation of the ExceptionHandler property.

See Also

ExceptionHandler (see page 15230)

77.1.15.2.4 TDefaultWebAppServices.GetRequestHandler Method

Pascal

```
function GetRequestHandler: IWebRequestHandler;
```

C++

```
__fastcall IWebRequestHandler GetRequestHandler();
```

Description

This is GetRequestHandler, a member of class TDefaultWebAppServices.

77.1.15.2.5 TDefaultWebAppServices.HandleRequest Method

Directs the processing of the current request message.

Pascal

```
function HandleRequest: Boolean;
```

C++

```
__fastcall Boolean HandleRequest();
```

Description

When the WebSnap application receives a request message, it makes the following calls:

1. The InitContext method is called to generate a Web context for the request.
2. HandleRequest is called to generate a response to the request.
3. FinishContext is called to perform any final cleanup.

HandleRequest locates the dispatcher components that handle the request and forwards the request to a dispatcher for processing.

HandleRequest returns true if the request is handled and the response should be sent back to the caller (if it was not already sent). It returns false if the WebSnap application could not handle the request.

See Also

InitContext (see page 15229)

FinishContext (see page 15228)

77.1.15.2.6 TDefaultWebAppServices.InitContext Method

Creates and initializes the Web context for the current Web request.

Pascal

```
procedure InitContext(WebModuleList: TAbstractWebModuleList; Request: TWebRequest; Response:
TWebResponse);
```

C++

```
__fastcall InitContext(TAbstractWebModuleList WebModuleList, TWebRequest Request, TWebResponse
Response);
```

Description

InitContext is called when the WebSnap application first receives a request message to set up the Web context before the application attempts to handle the request. It creates and sets up the global Web context, which can be accessed by calling the global WebContext function. It also performs any other initializations that ready the application for handling a new request message.

WebModuleList lists the currently active Web modules in the WebSnap application and provides access to all Web module factories so that the application can create any new modules it needs for processing the request message.

Request describes the new request message.

Response is the response object that the WebSnap application should fill out when handling the current request.

See Also

FinishContext (see page 15228)

WebContext (see page 24687)

77.1.15.2.7 TDefaultWebAppServices.InvokeDispatcher Method

Pascal

```
function InvokeDispatcher: Boolean;
```

C++

```
__fastcall Boolean InvokeDispatcher();
```

Description

This is InvokeDispatcher, a member of class TDefaultWebAppServices.

77.1.15.3 TDefaultWebAppServices Properties

The properties of the TDefaultWebAppServices class are listed here.

Protected Properties

	Name	Description
R	Request (see page 15129)	This is Request, a member of class TDefaultWebAppServices.
R	RequestHandler (see page 15130)	This is RequestHandler, a member of class TDefaultWebAppServices.
R	Response (see page 15130)	This is Response, a member of class TDefaultWebAppServices.
R	WebModules (see page 15130)	This is WebModules, a member of class TDefaultWebAppServices.

77.1.15.3.1 TDefaultWebAppServices.Request Property

Pascal

```
property Request: TWebRequest;
```

C++

```
__property TWebRequest Request;
```

Description

This is Request, a member of class TDefaultWebAppServices.

77.1.15.3.2 TDefaultWebAppServices.RequestHandler Property

Pascal

```
property RequestHandler: IWebRequestHandler;
```

C++

```
__property IWebRequestHandler RequestHandler;
```

Description

This is RequestHandler, a member of class TDefaultWebAppServices.

77.1.15.3.3 TDefaultWebAppServices.Response Property

Pascal

```
property Response: TWebResponse;
```

C++

```
__property TWebResponse Response;
```

Description

This is Response, a member of class TDefaultWebAppServices.

77.1.15.3.4 TDefaultWebAppServices.WebModules Property

Pascal

```
property WebModules: TAbstractWebModuleList;
```

C++

```
__property TAbstractWebModuleList WebModules;
```

Description

This is WebModules, a member of class TDefaultWebAppServices.

77.1.16 TWebActionItem Class

TWebActionItem allows a Web server application to create and send responses to HTTP request messages.

Class Hierarchy

Pascal

```
TWebActionItem = class(TCollectionItem);
```

C++

```
class TWebActionItem : public TCollectionItem;
```

File

HTTPApp

Description

Use TWebActionItem to assemble the response to a particular type of HTTP request message in a Web server application. Each action item is specific to a particular URI path and HTTP request method.

The web dispatcher chooses an appropriate action item to handle an HTTP request message by

matching the path portion of the URI requested by the Web client with the PathInfo (see page 15138) property in the TWebActionItem object

matching the method requested by the Web client with the method type the action item knows how to handle.

An action item handles an HTTP request message automatically using an associated content producer or using its OnAction (see page 15139) event handler. The OnAction (see page 15139) event handler can read the request message and assemble a response by setting the properties of a TWebResponse (see page 15191) object. It can tell the TWebResponse (see page 15191) object to send the response message back to the Web client, or allow the TWebApplication object to send the message after other action items have had a chance to add to the response.

See Also

TWebActionItems (see page 15140)

TWebDispatcher (see page 15147)

TWebRequest (see page 15161)

TWebResponse (see page 15191)

Action Items

77.1.16.1 TWebActionItem Members

The following tables list the members exposed by TWebActionItem.

Protected Methods

	Name	Description
	Changed (see page 2758)	Updates the collection to reflect changes to the collection item.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	GetDisplayName (see page 15134)	Returns the name of the collection item as it appears in the collection editor.
V	GetOwner (see page 2759)	Returns the collection to which this item belongs.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetPathInfo (see page 15135)	This is GetPathInfo, a member of class TWebActionItem.
V	SetCollection (see page 2759)	Sets the value of the Collection (see page 2761) property.
V	SetDisplayName (see page 15135)	Sets the name of the collection item as it appears in the collection editor.
V	SetIndex (see page 2760)	Moves the collection item to a specified position in the parent collection.

Public Methods

	Name	Description
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	AssignTo (see page 15134)	Copies the properties of the action item to another action item.

V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 15133)	Creates an instance of TWebActionItem (see page 15130).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 15133)	Destroys an instance of TWebActionItem (see page 15130).
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2759)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
	Collection (see page 2761)	Specifies the TCollection (see page 2731) instance to which the TCollectionItem (see page 2755) belongs.
	DisplayName (see page 2761)	The name displayed in the Collection (see page 2761) editor.
R	ID (see page 2761)	A unique, permanent index for the item.
	Index (see page 2762)	Returns the item's position in the Items array of TCollection (see page 2731).

Published Events

	Name	Description
	OnAction (see page 15139)	Occurs when TWebDispatcher (see page 15147) matches the action item to a newly-arrived HTTP request message.

Published Properties

	Name	Description
	Default (see page 15135)	Indicates whether the action item should handle any request that is not handled by another available action item.
	Enabled (see page 15136)	Indicates whether the action item can respond to HTTP request messages that match its MethodType (see page 15137) and PathInfo (see page 15138) properties.
	MethodType (see page 15137)	This is MethodType, a member of class TWebActionItem.
	Name (see page 15137)	Identifies an individual action item when it is referenced from other objects.
	PathInfo (see page 15138)	Indicates the path portion of the Uniform Resource Identifier (URI) for which the action item handles requests.

	Producer (see page 15138)	Specifies a content producer that generates the content of response messages when the action item executes.
	ProducerContent (see page 15139)	Specifies a content producer that generates the content of response messages when the action item executes.

77.1.16.2 TWebActionItem.Create Constructor

Creates an instance of TWebActionItem (see page 15130).

Pascal

```
constructor Create(Collection: TCollection); override;
```

C++

```
virtual __fastcall TWebActionItem(TCollection Collection);
```

Description

Call Create to create a TWebActionItem (see page 15130) object at runtime. Action items created in the action editor at design time are instantiated automatically.

After calling the inherited constructor, Create initializes the Enabled (see page 15136) property to True, and sets the action item so that it will match any HTTP request targeted to a URI with an empty PathInfo (see page 15138).

See Also

Enabled (see page 15136)

PathInfo (see page 15138)

Create (see page 2757)

77.1.16.3 TWebActionItem.Destroy Destructor

Destroys an instance of TWebActionItem (see page 15130).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TWebActionItem();
```

Description

Do not call Destroy directly in an application. Action items are destroyed when the TWebActionItems (see page 15140) object that manages them calls the Free method.

See Also

Free (see page 22300)

TWebActionItems (see page 15140)

77.1.16.4 TWebActionItem Methods

The methods of the TWebActionItem class are listed here.

Protected Methods

	Name	Description
	GetDisplayName (see page 15134)	Returns the name of the collection item as it appears in the collection editor.
	GetPathInfo (see page 15135)	This is GetPathInfo, a member of class TWebActionItem.
	SetDisplayName (see page 15135)	Sets the name of the collection item as it appears in the collection editor.

Public Methods

	Name	Description
	AssignTo (see page 15134)	Copies the properties of the action item to another action item.

77.1.16.4.1 TWebActionItem.AssignTo Method

Copies the properties of the action item to another action item.

Pascal

```
procedure AssignTo(Dest: TPersistent); override;
```

C++

```
virtual __fastcall AssignTo(TPersistent * Dest);
```

Description

To assign the value of one action item to another, use the Assign method of the target action item.

AssignTo enables the Assign method of a target action item to copy the properties of a source action item. AssignTo copies the values of the Default (see page 15135), Enabled (see page 15136), MethodType (see page 15137) and PathInfo (see page 15138) properties to the Dest parameter if it is an action item. If Dest is not an action item, AssignTo calls the inherited method.

See Also

Assign (see page 2930)

Default (see page 15135)

Enabled (see page 15136)

MethodType (see page 15137)

PathInfo (see page 15138)

AssignTo (see page 2931)

77.1.16.4.2 TWebActionItem.GetDisplayName Method

Returns the name of the collection item as it appears in the collection editor.

Pascal

```
function GetDisplayName: string; override;
```

C++

```
virtual __fastcall AnsiString GetDisplayName();
```

Description

GetDisplayName is the protected read implementation of the DisplayName property.

See Also

DisplayName (see page 2761)

GetNamePath (see page 2759)

77.1.16.4.3 TWebActionItem.GetPathInfo Method

Pascal

```
function GetPathInfo: string;
```

C++

```
__fastcall AnsiString GetPathInfo();
```

Description

This is GetPathInfo, a member of class TWebActionItem.

77.1.16.4.4 TWebActionItem.SetDisplayName Method

Sets the name of the collection item as it appears in the collection editor.

Pascal

```
procedure SetDisplayName(const Value: string); override;
```

C++

```
virtual __fastcall SetDisplayName(const AnsiString Value);
```

Description

SetDisplayName is the protected write implementation of the DisplayName property.

Value specifies the name for the item that should appear in the collection editor.

See Also

DisplayName (see page 2761)

77.1.16.5 TWebActionItem Properties

The properties of the TWebActionItem class are listed here.

Published Properties

	Name	Description
	Default (see page 15135)	Indicates whether the action item should handle any request that is not handled by another available action item.
	Enabled (see page 15136)	Indicates whether the action item can respond to HTTP request messages that match its MethodType (see page 15137) and PathInfo (see page 15138) properties.
	MethodType (see page 15137)	This is MethodType, a member of class TWebActionItem.
	Name (see page 15137)	Identifies an individual action item when it is referenced from other objects.
	PathInfo (see page 15138)	Indicates the path portion of the Uniform Resource Identifier (URI) for which the action item handles requests.
	Producer (see page 15138)	Specifies a content producer that generates the content of response messages when the action item executes.
	ProducerContent (see page 15139)	Specifies a content producer that generates the content of response messages when the action item executes.

77.1.16.5.1 TWebActionItem.Default Property

Indicates whether the action item should handle any request that is not handled by another available action item.

Pascal

```
property Default: Boolean;
```

C++

```
__property Boolean Default;
```

Description

Set Default to true to make this action item the default action in the list of action items maintained by the TWebDispatcher (see page 15147) object. TWebDispatcher (see page 15147) attempts to match HTTP request messages to action items by matching the MethodType (see page 15137) and PathInfo (see page 15138) of the target URI. If no match can be found, the TWebDispatcher (see page 15147) invokes the default action item, regardless of its MethodType (see page 15137) or PathInfo (see page 15138) properties.

When an action item is chosen as the default action item, the value of its Enabled (see page 15136) property is ignored. Thus, if an action item sets Enabled (see page 15136) to false and Default to true, TWebDispatcher (see page 15147) will first look for a match with any other action item, even if the PathInfo (see page 15138) and MethodType (see page 15137) of the default action item match the request perfectly. Then, only after all other action items have been rejected, TWebDispatcher (see page 15147) selects the default action item. If the default action item is enabled, it may be selected before all other action items have been considered because the MethodType (see page 15137) and PathInfo (see page 15138) match the request.

The default action item must be prepared to generate a response to any HTTP request, for any MethodType (see page 15137) and PathInfo (see page 15138). This may consist of simply setting a response status code of 404 (the URI could not be matched) or 405 (the requested method is not supported).

Setting Default to true sets the Default property of the previous default action item to false.

See Also

Enabled (see page 15136)

OnAction (see page 15139)

MethodType (see page 15137)

PathInfo (see page 15138)

TWebDispatcher (see page 15147)

StatusCode (see page 15215)

Choosing a Default Action Item

77.1.16.5.2 TWebActionItem.Enabled Property

Indicates whether the action item can respond to HTTP request messages that match its MethodType (see page 15137) and PathInfo (see page 15138) properties.

Pascal

```
property Enabled: Boolean;
```

C++

```
__property Boolean Enabled;
```

Description

Set Enabled to false to disable an action item. TWebDispatcher (see page 15147) will ignore disabled action items when it looks for an action item to handle a request.

When an action item is chosen as the default action item, the value of its Enabled property is ignored. Thus, if an action item sets

Enabled to false and Default (see page 15135) to true, TWebDispatcher (see page 15147) will first look for a match with any other action item, even if the PathInfo (see page 15138) and MethodType (see page 15137) of the default action item match the request perfectly. Then, only after all other action items have been rejected, the TWebDispatcher (see page 15147) selects the default action item. If the default action item is enabled, it may be selected before all other action items have been considered because the MethodType (see page 15137) and PathInfo (see page 15138) match the request.

See Also

Default (see page 15135)

MethodType (see page 15137)

OnAction (see page 15139)

PathInfo (see page 15138)

TWebDispatcher (see page 15147)

Choosing a Default Action Item

Enabling and Disabling Action Items

77.1.16.5.3 TWebActionItem.MethodType Property

Pascal

```
property MethodType: TMethodType;
```

C++

```
__property TMethodType MethodType;
```

Description

This is MethodType, a member of class TWebActionItem.

77.1.16.5.4 TWebActionItem.Name Property

Identifies an individual action item when it is referenced from other objects.

Pascal

```
property Name: string;
```

C++

```
__property AnsiString Name;
```

Description

Use Name to uniquely specify an individual action item in code anywhere in the application. For action items, Name is equivalent to the DisplayName property. Therefore, when setting the Name property, the new value must not match the DisplayName of any other action item in the list maintained by TCustomWebDispatcher (see page 15110). Trying to set the Name to a DisplayName that is already in use raises an exception.

See Also

DisplayName

Name (see page 2805)

77.1.16.5.5 TWebActionItem.PathInfo Property

Indicates the path portion of the Uniform Resource Identifier (URI) for which the action item handles requests.

Pascal

```
property PathInfo: string;
```

C++

```
__property AnsiString PathInfo;
```

Description

Set PathInfo to the path portion of the URI for the target of any request messages serviced by the action item. TWebDispatcher (see page 15147) matches action items to request messages by comparing PathInfo with the path portion of the URI specified as the target of the request. If the PathInfo properties match, and the MethodType (see page 15137) matches, TWebDispatcher (see page 15147) invokes the action item to respond to the request message.

If the action item has an associated content producer, the value of PathInfo is the name of the producer unless it is explicitly changed.

See Also

OnAction (see page 15139)

MethodType (see page 15137)

TWebDispatcher (see page 15147)

PathInfo (see page 15185)

Producer (see page 15138)

The Target URL

77.1.16.5.6 TWebActionItem.Producer Property

Specifies a content producer that generates the content of response messages when the action item executes.

Pascal

```
property Producer: TCustomContentProducer;
```

C++

```
__property TCustomContentProducer Producer;
```

Description

Set Producer to associate the action item with a content producer of the type TCustomContentProducer (see page 15102). (If a content producer of type IProduceContent (see page 15223) is used instead of TCustomContentProducer (see page 15102), then the property ProducerContent (see page 15139) should be set instead.) If Producer is not nil (Delphi) or NULL (C++), then when the web dispatcher passes a request message to the action item, the action item sets the Content property of the response message to the value returned by the producer's Content method. After the content producer has assigned the response's Content property, the action item receives an OnAction (see page 15139) event, where it can optionally set other response properties or send the response message.

If Producer is nil (Delphi) or NULL (C++), the action item must use the OnAction (see page 15139) event handler to influence the response message.

The properties Producer and ProducerContent (see page 15139) are mutually exclusive. If one is set, the other must not be.

Note: Each content producer can be associated with only one action item at a time. Setting the Producer property of one action

item causes the Web dispatcher that manages that item to check whether any other action item has its Producer property set to the same component. If another action item was associated with the same producer, its Producer property is changed to nil (Delphi) or NULL (C++).

ProducerContent (see page 15139)

Content (see page 15207)

Creating Web Pages with an InternetExpress Page Producer

Responding to Request Messages with Action Items

77.1.16.5.7 TWebActionItem.ProducerContent Property

Specifies a content producer that generates the content of response messages when the action item executes.

Pascal

```
property ProducerContent: TComponent;
```

C++

```
__property TComponent * ProducerContent;
```

Description

This property is identical to Producer (see page 15138) except for the type of content producer. ProducerContent is used when the producer is of type IProduceContent (see page 15223) instead of TCustomContentProducer (see page 15102). In the latter case, the property Producer (see page 15138) is set instead. Note that Producer (see page 15138) and ProducerContent are mutually exclusive; if one is set, the other must not be.

Producer (see page 15138)

77.1.16.6 TWebActionItem Events

The events of the TWebActionItem class are listed here.

Published Events

	Name	Description
	OnAction (see page 15139)	Occurs when TWebDispatcher (see page 15147) matches the action item to a newly-arrived HTTP request message.

77.1.16.6.1 TWebActionItem.OnAction Event

Occurs when TWebDispatcher (see page 15147) matches the action item to a newly-arrived HTTP request message.

Pascal

```
property OnAction: THTTPMethodEvent;
```

C++

```
__property THTTPMethodEvent OnAction;
```

Description

Write an OnAction event handler to respond to HTTP request messages that match the MethodType (see page 15137) and PathInfo (see page 15138) properties. OnAction occurs immediately after the response message's Content property has been initialized by the action item's Producer (see page 15138) property (if Producer (see page 15138) is set).

In an OnAction event handler, read Request and perform the requested Method if possible. Set the properties of the Response parameter as appropriate. If the OnAction event handler does not service the response, or if it only partially handles the request and must let another action item finish the response, set the Handled parameter to false.

An OnAction event handler can call the SendRedirect or SendResponse method of Response to send the HTTP response message to the Web client. If the OnAction event handler does not send the response, the Web application will send it after all action items have finished filling in the Response.

Tip: The OnAction event handler can use descendants of TCustomContentProducer (see page 15102) to help assemble the contents of the response message.

77.1.17 TWebActionItems Class

TWebActionItems is a collection of TWebActionItem (see page 15130) objects.

Class Hierarchy

Pascal

```
TWebActionItems = class(TCollection);
```

C++

```
class TWebActionItems : public TCollection;
```

File

HTTPApp

Description

TCustomWebDispatcher (see page 15110) uses TWebActionItems to store and manipulate the individual action items it manages. TWebActionItems provides properties and events to

Add (see page 15143) new action items to the collection.

Copy the list of action items from another TWebActionItems.

Get the attributes of specified action items in the collection.

Empty the collection of action items.

See Also

TCustomWebDispatcher (see page 15110)

TWebActionItem (see page 15130)

77.1.17.1 TWebActionItems Members

The following tables list the members exposed by TWebActionItems.

Protected Methods

	Name	Description
V	Added (see page 2736)	Responds when items are added to the collection.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	Changed (see page 2740)	Responds when the collection or any of its items changes.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	Deleting (see page 2741)	Responds when items are deleted from the collection.
V	GetAttr (see page 15144)	Returns the name of a custom attribute that can be retrieved using the GetItemAttr method.
V	GetAttrCount (see page 15144)	Returns the number of custom attributes associated with items in the collection.
	GetItem (see page 2744)	Returns a specified item in the collection.
V	GetItemAttr (see page 15144)	Returns the value of a custom attribute assigned to one of the collection's items.
V	GetOwner (see page 15145)	Returns the owner of an object.
V	Notify (see page 2746)	Responds when items are added to or removed from the collection.
	SetItem (see page 2747)	Copies the properties of another item to a specified item in the collection.
V	SetItemName (see page 15145)	Initializes the name of a newly inserted collection item.
V	Update (see page 15146)	Updates the collection to reflect changes to its items.

Protected Properties

	Name	Description
R	NextID (see page 2752)	Specifies a unique ID that can be assigned to the next added collection item.
	PropName (see page 2752)	Specifies the name of the property that the collection implements.
R	UpdateCount (see page 2753)	Counts the number of times BeginUpdate (see page 2739) was called without a corresponding call to EndUpdate (see page 2742).

Public Methods

	Name	Description
	Add (see page 15143)	Adds a new action item to the end of the collection.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2736)	Copies the contents of another collection to the object where the method is executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
V	BeginUpdate (see page 2739)	Suspends screen repainting.

	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Clear (see page 2741)	Deletes all items from the collection.
	Create (see page 15142)	Creates an instance of TWebActionItems (see page 15140).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Delete (see page 2741)	Deletes a single item from the collection.
V	Destroy (see page 2735)	Destroys the collection and each item in it.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
V	EndUpdate (see page 2742)	Re-enables screen repainting.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindItemID (see page 2743)	Returns the item with the specified ID.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetEnumerator (see page 2744)	Returns a TCollection (see page 2731) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2745)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	Insert (see page 2746)	Creates a new TCollectionItem (see page 2755) instance and adds it to the Items (see page 2751) array.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	Owner (see page 2746)	Returns the Owner of the collection.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
	Capacity (see page 2748)	Provides access to the internal TList (see page 2868) Capacity property.
R	Count (see page 2749)	Returns the number of items in the collection.
R	ItemClass (see page 2751)	Indicates the class to which the collection's items belong.
	Items (see page 15146)	Lists the TWebActionItem (see page 15130) objects stored by this TWebActionItems (see page 15140) object.
R	WebDispatcher (see page 15147)	Provides access to the dispatcher that uses TWebActionItems (see page 15140) to store and manipulate its action items.

77.1.17.2 TWebActionItems.Create Constructor

Creates an instance of TWebActionItems (see page 15140).

Pascal

```
constructor Create(WebDispatcher: TCustomWebDispatcher; ItemClass: TCollectionItemClass);
```

C++

```
__fastcall TWebActionItems(TCustomWebDispatcher WebDispatcher, TCollectionItemClass ItemClass);
```

Description

Do not call the constructor for TWebActionItems (see page 15140). TWebActionItems (see page 15140) is tailored to work with TCustomWebDispatcher (see page 15110). The TCustomWebDispatcher (see page 15110) object creates TWebActionItems (see page 15140) in its own constructor.

See Also

Create (see page 2734)

77.1.17.3 TWebActionItems Methods

The methods of the TWebActionItems class are listed here.

Protected Methods

	Name	Description
	GetAttr (see page 15144)	Returns the name of a custom attribute that can be retrieved using the GetItemAttr method.
	GetAttrCount (see page 15144)	Returns the number of custom attributes associated with items in the collection.
	GetItemAttr (see page 15144)	Returns the value of a custom attribute assigned to one of the collection's items.
	GetOwner (see page 15145)	Returns the owner of an object.
	SetItemName (see page 15145)	Initializes the name of a newly inserted collection item.
	Update (see page 15146)	Updates the collection to reflect changes to its items.

Public Methods

	Name	Description
	Add (see page 15143)	Adds a new action item to the end of the collection.

77.1.17.3.1 TWebActionItems.Add Method

Adds a new action item to the end of the collection.

Pascal

```
function Add: TWebActionItem;
```

C++

```
__fastcall TWebActionItem Add();
```

Description

Call Add to add an action item to the collection of action items managed by the dispatcher. The new item is added to the end of the Items (see page 15146) array. Add returns the action item so that its properties can be set to specify its use.

Because the dispatcher looks through the action items in order when it tries to find an action item to handle an HTTP request message, add any action items that preprocess HTTP requests first. Then add the most specific action items. This way, more general action items will not be matched to request messages before a closer match can be found.

See Also

Items (see page 15146)

77.1.17.3.2 TWebActionItems.GetAttr Method

Returns the name of a custom attribute that can be retrieved using the GetItemAttr method.

Pascal

```
function GetAttr(Index: Integer): string; override;
```

C++

```
virtual __fastcall AnsiString GetAttr(int Index);
```

Description

TCollection descendants can associate user-defined attributes with the items in the collection. Each attribute has a name and, for each item in the collection, a value that is a string. The GetAttr method returns the name of an attribute.

Index identifies the attribute whose name is requested. This is a value between 0 and n-1, where n is the value returned by GetAttrCount.

As implemented by TCollection, GetAttr always returns an empty string, because TCollection defines no custom attributes.

See Also

GetAttrCount (see page 2744)

GetItemAttr (see page 2745)

77.1.17.3.3 TWebActionItems.GetAttrCount Method

Returns the number of custom attributes associated with items in the collection.

Pascal

```
function GetAttrCount: Integer; override;
```

C++

```
virtual __fastcall int GetAttrCount();
```

Description

TCollection descendants can associate user-defined attributes with the items in the collection. Each attribute has a name and, for each item in the collection, a value that is a string. GetAttrCount returns the number of distinct attributes assigned to each item in the collection.

As implemented in TCollection, GetAttrCount always returns 0, because TCollection defines no custom attributes.

See Also

GetAttr (see page 2743)

GetItemAttr (see page 2745)

77.1.17.3.4 TWebActionItems.GetItemAttr Method

Returns the value of a custom attribute assigned to one of the collection's items.

Pascal

```
function GetItemAttr(Index: Integer; ItemIndex: Integer): string; override;
```

C++

```
virtual __fastcall AnsiString GetItemAttr(int Index, int ItemIndex);
```

Description

TCollection descendants can associate user-defined attributes with the items in the collection. Each attribute has a name and, for each item in the collection, a value that is a string. GetItemAttr returns the value of one of these attributes for a specified item in the collection.

Index identifies which attribute's value is desired. This is a value between 0 and n-1, where n is the value returned by GetAttrCount.

ItemIndex identifies the item whose attribute value is desired. This is an index into the Items property array.

As implemented in TCollection, GetItemAttr always returns an empty string, because TCollection defines no custom attributes.

See Also

GetAttr (see page 2743)

GetAttrCount (see page 2744)

77.1.17.3.5 TWebActionItems.GetOwner Method

Returns the owner of an object.

Pascal

```
function GetOwner: TPersistent; override;
```

C++

```
virtual __fastcall TPersistent * GetOwner();
```

Description

GetOwner is used by the GetNamePath method to find the owner of a persistent object. GetNamePath and GetOwner are introduced in TPersistent so descendants such as collections can appear in the Object Inspector. As implemented in TPersistent, GetOwner returns nil (Delphi) or NULL (C++).

For TCollection, GetOwner returns the owner of the collection. For collection items, it returns the collection object into which the collection item has been inserted. For TComponent it is the value of the Owner property.

See Also

GetNamePath (see page 2932)

TCollection (see page 2731)

TComponent (see page 2762)

Owner (see page 2807)

77.1.17.3.6 TWebActionItems.SetItemName Method

Initializes the name of a newly inserted collection item.

Pascal

```
procedure SetItemName(Item: TCollectionItem); override;
```

C++

```
virtual __fastcall SetItemName(TCollectionItem Item);
```

Description

The Insert method calls SetItemName to initialize the Name property of items when it inserts them into the collection.

As implemented in TCollection, SetItemName does nothing. Some TCollection descendants override this method to provide collection items with default names.

See Also

Insert (see page 2746)

Name (see page 2805)

77.1.17.3.7 TWebActionItems.Update Method

Updates the collection to reflect changes to its items.

Pascal

```
procedure Update(Item: TCollectionItem); override;
```

C++

```
virtual __fastcall Update(TCollectionItem Item);
```

Description

Override Update in a descendant class to make any necessary changes when the items in the collection change. This method is called automatically when an update is complete.

Item identifies the item that changed. If the Item parameter is nil (Delphi) or NULL (C++), then the change affects more than one item in the collection.

As implemented in TCollection, Update does nothing. Descendant classes override this method to make any necessary adjustments.

See Also

Changed (see page 2740)

Changed (see page 2758)

77.1.17.4 TWebActionItems Properties

The properties of the TWebActionItems class are listed here.

Public Properties

	Name	Description
	Items (see page 15146)	Lists the TWebActionItem (see page 15130) objects stored by this TWebActionItems (see page 15140) object.
R	WebDispatcher (see page 15147)	Provides access to the dispatcher that uses TWebActionItems (see page 15140) to store and manipulate its action items.

77.1.17.4.1 TWebActionItems.Items Property

Lists the TWebActionItem (see page 15130) objects stored by this TWebActionItems (see page 15140) object.

Pascal

```
property Items [Index: Integer]: TWebActionItem;
```

C++

```
__property TWebActionItem Items[int Index];
```

Description

Use Items to get access to the individual action items stored by the TWebActionItems (see page 15140) object. Items is an indexed array, where the first action item has index 0, the second action item has index 1, and so on. Use Items with the Count property to iterate over all the action items in the collection.

See Also

Count (see page 2749)

TWebActionItem (see page 15130)

operator_sb

77.1.17.4.2 TWebActionItems.WebDispatcher Property

Provides access to the dispatcher that uses TWebActionItems (see page 15140) to store and manipulate its action items.

Pascal

```
property WebDispatcher: TCustomWebDispatcher;
```

C++

```
__property TCustomWebDispatcher WebDispatcher;
```

Description

Read WebDispatcher to get access to the dispatcher object that uses the collection of action items to respond to HTTP request messages.

77.1.18 TWebDispatcher Class

TWebDispatcher passes HTTP request messages on to the appropriate action items that assemble a response.

Class Hierarchy

Pascal

```
TWebDispatcher = class(TCustomWebDispatcher);
```

C++

```
class TWebDispatcher : public TCustomWebDispatcher;
```

File

HTTPApp

Description

Use TWebDispatcher to convert an ordinary data module to a Web module. Add a TWebDispatcher object to an existing data module that contains other nonvisual components and business rules for the Web application. Then delete the automatically generated Web module from the Web application and replace it with the data module that now contains the Web dispatcher.

TWebDispatcher enables the Web server application to respond to HTTP request messages. Only one Web dispatcher can be added to an application. This is why the automatically generated Web module, which is a type of Web dispatcher, must be deleted from the Web application before the data module containing TWebDispatcher can be added.

The TWebDispatcher object manages a collection of action items which know how to respond to HTTP request messages. View, add, and delete the action items managed by the dispatcher using the Action (see page 15121) editor which is opened by double-clicking on the TWebDispatcher icon.

TWebDispatcher publishes some of the properties and events introduced by TCustomWebDispatcher (see page 15110), but introduces no new properties, events, or methods of its own.

The Web Dispatcher

The Web Module

77.1.18.1 TWebDispatcher Members

The following tables list the members exposed by TWebDispatcher.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	Access_Request (see page 15116)	This is Access_Request, a member of class TCustomWebDispatcher.
	Access_Response (see page 15117)	This is Access_Response, a member of class TCustomWebDispatcher.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2830)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	DispatchAction (see page 15117)	Passes an HTTP request message to the action items in Actions (see page 15122) until it is handled.
	DoAfterDispatch (see page 15118)	Generates an AfterDispatch (see page 15123) event and returns a value that indicates whether the Web application can send the response.
	DoBeforeDispatch (see page 15119)	Generates a BeforeDispatch (see page 15124) event and returns a value that indicates whether the dispatcher should look for action items to handle the request.
V	DoCreate (see page 2831)	This is DoCreate, a member of class TDataModule.
V	DoDestroy (see page 2831)	This is DoDestroy, a member of class TDataModule.
	FinishContext (see page 15119)	This is FinishContext, a member of class TCustomWebDispatcher.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.

	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetChildren (see page 2831)	This is GetChildren, a member of class TDataModule.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	HandleCreateException (see page 2831)	This is HandleCreateException, a member of class TDataModule.
	HandleException (see page 15119)	Provides default handling of exceptions for the web application.
	HandleRequest (see page 15120)	Processes an HTTP request message.
	InitContext (see page 15120)	This is InitContext, a member of class TCustomWebDispatcher.
	InitModule (see page 15120)	This is InitModule, a member of class TCustomWebDispatcher.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	Notification (see page 15121)	Responds to notifications when objects are added to the module.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 2832)	This is ReadState, a member of class TDataModule.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	ActionByName (see page 15117)	Returns the action item identified by the AName parameter.
V	AfterConstruction (see page 2829)	Generates an OnCreate (see page 2833) event.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 2830)	Generates an OnDestroy (see page 2834) event.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.

	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
V	Create (see page 2827)	Creates an instance of a data module.
V	Create (see page 15115)	Creates an instance of TCustomWebDispatcher (see page 15110).
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	CreateNew (see page 2828)	Creates an instance of a data module and registers with the global screen object.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2829)	Destroys the instance of the data module.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 15115)	Frees an instance of TCustomWebDispatcher (see page 15110).
V	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FinishContext (see page 15223)	This is FinishContext, a member of class IMultiModuleSupport.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	HandleException (see page 15236)	This is HandleException, a member of class IWebExceptionHandler.
	HandleRequest (see page 15238)	Processes an HTTP request message.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitContext (see page 15223)	This is InitContext, a member of class IMultiModuleSupport.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InitModule (see page 15223)	This is InitModule, a member of class IMultiModuleSupport.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.

V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
	Request (see page 15235)	Returns the Web request object for the HTTP request message to which the application is responding.
	Response (see page 15235)	Returns the Web response object for the HTTP response message that the application is assembling.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	Action (see page 15121)	Provides indexed access to the action items managed by the TCustomWebDispatcher (see page 15110) object.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DesignOffset (see page 2832)	Specifies the design offset for the data module at design time.
	DesignSize (see page 2832)	Specifies the design size for the data module at design time.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
R	Request (see page 15122)	Provides access to the TWebRequest (see page 15161) object that the dispatcher is currently handling.
R	Response (see page 15122)	Provides access to the TWebResponse (see page 15191) object for the message the dispatcher is currently handling.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Events

	Name	Description
	AfterDispatch (see page 15152)	Occurs after the HTTP response message has been successfully filled out by the action items but not yet sent.
	BeforeDispatch (see page 15153)	Occurs before the dispatcher tries to match the HTTP request message with any of its action items.
	OnCreate (see page 2833)	Occurs when an application instantiates a data module.
	OnDestroy (see page 2834)	Occurs when the data module is about to be destroyed.
	OnException (see page 15153)	Occurs when an unhandled exception occurs in the application.

Published Properties

	Name	Description
	Actions (see page 15152)	Represents the collection of action items managed by the TCustomWebDispatcher object.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	OldCreateOrder (see page 2833)	Specifies when OnCreate (see page 2833) and OnDestroy (see page 2834) events occur.
	Tag (see page 2808)	Stores an integer value as part of a component.

77.1.18.2 TWebDispatcher Properties

The properties of the TWebDispatcher class are listed here.

Published Properties

	Name	Description
	Actions (see page 15152)	Represents the collection of action items managed by the TCustomWebDispatcher object.

77.1.18.2.1 TWebDispatcher.Actions Property

Represents the collection of action items managed by the TCustomWebDispatcher object.

Pascal

```
property Actions: TWebActionItems;
```

C++

```
__property TWebActionItems Actions;
```

Description

Use the methods of Actions to add action items for use by the dispatcher, to clear the set of action items managed by the dispatcher, or to access the attributes of the action items.

See Also

Action (see page 15121)

ActionByName (see page 15117)

TWebActionItems (see page 15140)

77.1.18.3 TWebDispatcher Events

The events of the TWebDispatcher class are listed here.

Published Events

	Name	Description
	AfterDispatch (see page 15152)	Occurs after the HTTP response message has been successfully filled out by the action items but not yet sent.
	BeforeDispatch (see page 15153)	Occurs before the dispatcher tries to match the HTTP request message with any of its action items.
	OnException (see page 15153)	Occurs when an unhandled exception occurs in the application.

77.1.18.3.1 TWebDispatcher.AfterDispatch Event

Occurs after the HTTP response message has been successfully filled out by the action items but not yet sent.

Pascal

```
property AfterDispatch: THTTPMethodEvent;
```

C++

```
__property THTTPMethodEvent AfterDispatch;
```

Description

Write an AfterDispatch event handler to provide a final check of the HTTP response message before it is sent to the Web client. An AfterDispatch event handler can let a response stand as is, change the response, send the response, or change the Handled parameter to False to prevent the Web application from sending the response.

The AfterDispatch event does not occur if all of the action items indicate that the response was not handled, or if the response is sent by any of the action items.

See Also

Actions (see page 15122)

BeforeDispatch (see page 15124)

TWebResponse (see page 15191)

Dispatching Request Messages

77.1.18.3.2 TWebDispatcher.BeforeDispatch Event

Occurs before the dispatcher tries to match the HTTP request message with any of its action items.

Pascal

```
property BeforeDispatch: THTTPMethodEvent;
```

C++

```
__property THTTPMethodEvent BeforeDispatch;
```

Description

Write a BeforeDispatch event handler to preprocess all HTTP request messages. A BeforeDispatch event handler can enable or disable the action items appropriate to the response, begin filling out the response object, or provide any other necessary preprocessing.

If the BeforeDispatch event handler finishes filling out the response object, it should change the Handled parameter to True so the dispatcher will not send the request on to any of the action items. If the BeforeDispatch event handler sends the response message, the dispatcher will not pass the request on to any of the action items, even if the Handled parameter is left as False.

If the BeforeDispatch event handler sets the Handled parameter to True but does not send the response, the Web dispatcher will generate an AfterDispatch event.

See Also

Actions (see page 15122)

AfterDispatch (see page 15123)

TWebResponse (see page 15191)

Dispatching Request Messages

Enabling and Disabling Action Items

77.1.18.3.3 TWebDispatcher.OnException Event

Occurs when an unhandled exception occurs in the application.

Pascal

```
property OnException: TWebExceptionEvent;
```

C++

```
__property TWebExceptionEvent OnException;
```

Description

Use OnException to change the default behavior that occurs when an exception is not handled by application code. The OnException event handler is called automatically in the HandleException method.

OnException only handles exceptions that occur during message processing. Exceptions that occur before or after the execution of the application's Run method do not generate OnException events.

If an exception passes through the try blocks in the application code, the application automatically calls the HandleException method. Unless the exception object is EAbort, HandleException calls the OnException handler, if one exists. Otherwise, it calls ShowException to display a message box indicating an error occurred.

AfterDispatch (see page 15123)

TWebResponse (see page 15191)

77.1.19 TWebModule Class

TWebModule is the automatically generated Web module for a Web server application.

Class Hierarchy

Pascal

```
TWebModule = class(TCustomWebDispatcher);
```

C++

```
class TWebModule : public TCustomWebDispatcher;
```

File

HTTPApp

Description

When a new Web application is created, it automatically contains a Web module. The Web module serves as a repository for nonvisual components such as TPageProducer, TSQLDataSet, TDataSetTableProducer, etc. It also enables the Web server application to respond to HTTP request messages by passing the request and response objects to the appropriate action items. An application can have only one Web module.

The TWebModule object manages a collection of action items which know how to respond to HTTP request messages. View,

add and delete the action items managed by the Web module using the Action (see page 15121) editor which is opened by double clicking on the TWebModule icon.

If a data module already exists which contains many of the non-visual components and business rules for the application, the Web module can be replaced by that data module. Simply delete the Web module, add the new data module in its place, and add a TWebDispatcher (see page 15147) object to the new data module.

See the WebServ demo for an example of how to use TWebModule.

Note: When you create a new Apache module project and save it with a new name, it may be necessary to change the name of the apache_module (in the exports section of the project source code) by hand.

See Also

TDataSetTableProducer (see page 10277)

TPageProducer (see page 15309)

TSQLDataSet (see page 20265)

TWebActionItems (see page 15140)

TWebDispatcher (see page 15147)

The Web Module

77.1.19.1 TWebModule Members

The following tables list the members exposed by TWebModule.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	Access_Request (see page 15116)	This is Access_Request, a member of class TCustomWebDispatcher.
	Access_Response (see page 15117)	This is Access_Response, a member of class TCustomWebDispatcher.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2830)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	DispatchAction (see page 15117)	Passes an HTTP request message to the action items in Actions (see page 15122) until it is handled.
	DoAfterDispatch (see page 15118)	Generates an AfterDispatch (see page 15123) event and returns a value that indicates whether the Web application can send the response.
	DoBeforeDispatch (see page 15119)	Generates a BeforeDispatch (see page 15124) event and returns a value that indicates whether the dispatcher should look for action items to handle the request.
V	DoCreate (see page 2831)	This is DoCreate, a member of class TDataModule.
V	DoDestroy (see page 2831)	This is DoDestroy, a member of class TDataModule.
	FinishContext (see page 15119)	This is FinishContext, a member of class TCustomWebDispatcher.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.

	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetChildren (see page 2831)	This is GetChildren, a member of class TDataModule.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	HandleCreateException (see page 2831)	This is HandleCreateException, a member of class TDataModule.
	HandleException (see page 15119)	Provides default handling of exceptions for the web application.
	HandleRequest (see page 15120)	Processes an HTTP request message.
	InitContext (see page 15120)	This is InitContext, a member of class TCustomWebDispatcher.
	InitModule (see page 15120)	This is InitModule, a member of class TCustomWebDispatcher.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	Notification (see page 15121)	Responds to notifications when objects are added to the module.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 2832)	This is ReadState, a member of class TDataModule.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	ActionByName (see page 15117)	Returns the action item identified by the AName parameter.
V	AfterConstruction (see page 2829)	Generates an OnCreate (see page 2833) event.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 2830)	Generates an OnDestroy (see page 2834) event.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.

	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 15159)	Creates an instance of TWebModule (see page 15154).
V	CreateNew (see page 2828)	Creates an instance of a data module and registers with the global screen object.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2829)	Destroys the instance of the data module.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 15115)	Frees an instance of TCustomWebDispatcher (see page 15110).
V	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FinishContext (see page 15223)	This is FinishContext, a member of class IMultiModuleSupport.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	HandleException (see page 15236)	This is HandleException, a member of class IWebExceptionHandler.
	HandleRequest (see page 15238)	Processes an HTTP request message.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitContext (see page 15223)	This is InitContext, a member of class IMultiModuleSupport.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InitModule (see page 15223)	This is InitModule, a member of class IMultiModuleSupport.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.

	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
	Request (see page 15235)	Returns the Web request object for the HTTP request message to which the application is responding.
	Response (see page 15235)	Returns the Web response object for the HTTP response message that the application is assembling.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	Action (see page 15121)	Provides indexed access to the action items managed by the TCustomWebDispatcher (see page 15110) object.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DesignOffset (see page 2832)	Specifies the design offset for the data module at design time.
	DesignSize (see page 2832)	Specifies the design size for the data module at design time.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
R	Request (see page 15122)	Provides access to the TWebRequest (see page 15161) object that the dispatcher is currently handling.
R	Response (see page 15122)	Provides access to the TWebResponse (see page 15191) object for the message the dispatcher is currently handling.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Events

	Name	Description
	AfterDispatch (see page 15160)	Occurs after the HTTP response message has been successfully filled out by the action items but not yet sent.
	BeforeDispatch (see page 15160)	Occurs before the dispatcher tries to match the HTTP request message with any of its action items.
	OnCreate (see page 2833)	Occurs when an application instantiates a data module.
	OnDestroy (see page 2834)	Occurs when the data module is about to be destroyed.
	OnException (see page 15161)	Occurs when an unhandled exception occurs in the application.

Published Properties

	Name	Description
	Actions (see page 15159)	Represents the collection of action items managed by the TCustomWebDispatcher object.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	OldCreateOrder (see page 2833)	Specifies when OnCreate (see page 2833) and OnDestroy (see page 2834) events occur.
	Tag (see page 2808)	Stores an integer value as part of a component.

77.1.19.2 TWebModule.Create Constructor

Creates an instance of TWebModule (see page 15154).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TWebModule(TComponent * AOwner);
```

Description

Do not create instances at runtime. The Web module is created automatically when a Web application project is created at design time. Every time a Web server application is run in response to an HTTP request message, a new TWebModule (see page 15154) is created based on the Web module that was created at design time.

Create generates an OnCreate event, so that Web applications can initialize the Web module before the new HTTP request message is processed.

See Also

OnCreate (see page 2833)

Create_d

77.1.19.3 TWebModule Properties

The properties of the TWebModule class are listed here.

Published Properties

	Name	Description
	Actions (see page 15159)	Represents the collection of action items managed by the TCustomWebDispatcher object.

77.1.19.3.1 TWebModule.Actions Property

Represents the collection of action items managed by the TCustomWebDispatcher object.

Pascal

```
property Actions: TWebActionItems;
```

C++

```
__property TWebActionItems Actions;
```

Description

Use the methods of Actions to add action items for use by the dispatcher, to clear the set of action items managed by the dispatcher, or to access the attributes of the action items.

See Also

Action (see page 15121)

ActionByName (see page 15117)

TWebActionItems (see page 15140)

77.1.19.4 TWebModule Events

The events of the TWebModule class are listed here.

Published Events

	Name	Description
	AfterDispatch (see page 15160)	Occurs after the HTTP response message has been successfully filled out by the action items but not yet sent.
	BeforeDispatch (see page 15160)	Occurs before the dispatcher tries to match the HTTP request message with any of its action items.
	OnException (see page 15161)	Occurs when an unhandled exception occurs in the application.

77.1.19.4.1 TWebModule.AfterDispatch Event

Occurs after the HTTP response message has been successfully filled out by the action items but not yet sent.

Pascal

```
property AfterDispatch: THTTPMethodEvent;
```

C++

```
__property THTTPMethodEvent AfterDispatch;
```

Description

Write an AfterDispatch event handler to provide a final check of the HTTP response message before it is sent to the Web client. An AfterDispatch event handler can let a response stand as is, change the response, send the response, or change the Handled parameter to False to prevent the Web application from sending the response.

The AfterDispatch event does not occur if all of the action items indicate that the response was not handled, or if the response is sent by any of the action items.

See Also

Actions (see page 15122)

BeforeDispatch (see page 15124)

TWebResponse (see page 15191)

Dispatching Request Messages

77.1.19.4.2 TWebModule.BeforeDispatch Event

Occurs before the dispatcher tries to match the HTTP request message with any of its action items.

Pascal

```
property BeforeDispatch: THTTPMethodEvent;
```

C++

```
__property THTTPMethodEvent BeforeDispatch;
```

Description

Write a BeforeDispatch event handler to preprocess all HTTP request messages. A BeforeDispatch event handler can enable or disable the action items appropriate to the response, begin filling out the response object, or provide any other necessary preprocessing.

If the BeforeDispatch event handler finishes filling out the response object, it should change the Handled parameter to True so

the dispatcher will not send the request on to any of the action items. If the BeforeDispatch event handler sends the response message, the dispatcher will not pass the request on to any of the action items, even if the Handled parameter is left as False.

If the BeforeDispatch event handler sets the Handled parameter to True but does not send the response, the Web dispatcher will generate an AfterDispatch event.

See Also

Actions (see page 15122)

AfterDispatch (see page 15123)

TWebResponse (see page 15191)

Dispatching Request Messages

Enabling and Disabling Action Items

77.1.19.4.3 TWebModule.OnException Event

Occurs when an unhandled exception occurs in the application.

Pascal

```
property OnException: TWebExceptionEvent;
```

C++

```
__property TWebExceptionEvent OnException;
```

Description

Use OnException to change the default behavior that occurs when an exception is not handled by application code. The OnException event handler is called automatically in the HandleException method.

OnException only handles exceptions that occur during message processing. Exceptions that occur before or after the execution of the application's Run method do not generate OnException events.

If an exception passes through the try blocks in the application code, the application automatically calls the HandleException method. Unless the exception object is EAbort, HandleException calls the OnException handler, if one exists. Otherwise, it calls ShowException to display a message box indicating an error occurred.

Actions (see page 15122)

AfterDispatch (see page 15123)

TWebResponse (see page 15191)

77.1.20 TWebRequest Class

TWebRequest is the base class for all objects that represent client request information that is passed to a Web server application.

Class Hierarchy

Pascal

```
TWebRequest = class(TObject);
```

C++

```
class TWebRequest : public TObject;
```

File

HTTPApp

Description

Use a descendant of TWebRequest to interpret an HTTP request message.

Web application objects create TWebRequest objects to capture client requests. The properties of the TWebRequest objects are obtained from the HTTP request message. The Web application uses TWebRequest objects to create corresponding TWebResponse (see page 15191) objects. The TWebDispatcher (see page 15147) for the application then invokes the TWebActionItem (see page 15130) that is associated with the PathInfo (see page 15185) of the TWebRequest object.

TWebRequest has several descendants which represent client requests for different types of Web server applications. These descendants are

TApacheRequest objects for Apache server applications.

TCGIRequest objects for CGI server applications.

TISAPIRequest objects for DLLs that respond to the ISAPI or NSAPI servers (Windows only).

TWinCGIRequest objects for Windows-based CGI servers (Windows only).

77.1.20.1 TWebRequest Members

The following tables list the members exposed by TWebRequest.

Protected Methods

	Name	Description
	GetDateVariable (see page 15168)	Provides the abstract (pure virtual) prototype for a method to extract a date value from an indexed table of HTTP header variables.
	GetIntegerVariable (see page 15169)	Provides the abstract (pure virtual) prototype for a method to extract an integer value from an indexed table of HTTP header variables.

	GetInternalPathInfo (see page 15169)	This is GetInternalPathInfo, a member of class TWebRequest.
	GetInternalScriptName (see page 15169)	This is GetInternalScriptName, a member of class TWebRequest.
	GetStringVariable (see page 15169)	Provides the abstract (pure virtual) prototype for a method to extract a string value from an indexed table of HTTP header variables.
	UpdateMethodType (see page 15172)	Provides the abstract prototype for a method to write a pure virtual method for updating the client method type.

Public Methods

	Name	Description
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 15165)	Creates an instance of TWebRequest (see page 15161).
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 15165)	Destroys an instance of TWebRequest (see page 15161).
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExtractContentFields (see page 15166)	Parses the Content (see page 15176) property into its constituent fields.
	ExtractCookieFields (see page 15166)	Parses the Cookie (see page 15180) property into its constituent fields.
	ExtractFields (see page 15167)	Parses a multi-valued string into its constituent fields.
	ExtractQueryFields (see page 15167)	Parses the Query (see page 15186) property into its constituent fields.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetFieldByName (see page 15168)	Provides the abstract (pure virtual) prototype for a method that returns the value of the HTTP header variable specified by the Name parameter.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	ReadClient (see page 15170)	Provides the abstract (pure virtual) prototype for a method to read from the HTTP request into a buffer.
	ReadString (see page 15171)	Provides the abstract (pure virtual) prototype for a method to read Count bytes from the HTTP request into a string.
	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	TranslateURI (see page 15171)	Provides the abstract (pure virtual) prototype for a method to translate a Uniform Resource Identifier (URI) into an internal representation of a location on the server.
	WriteClient (see page 15172)	Provides the abstract (pure virtual) prototype for a method to write Count bytes from Buffer back to the HTTP client.
	WriteHeaders (see page 15172)	Provides the abstract (pure virtual) prototype for a method to write an HTTP header string.
	WriteString (see page 15173)	Provides the abstract (pure virtual) prototype for a method to write the string AString back to the HTTP client.

Public Properties

	Name	Description
R	Accept (see page 15174)	Reports the value of the Accept header of the HTTP request message.
R	Authorization (see page 15175)	Reports the value of the Authorization header of the HTTP request message.
R	CacheControl (see page 15175)	Reports the value of the Cache-Control header of the HTTP request message.
R	Connection (see page 15176)	Reports the value of the Connection header of the HTTP request message.
R	Content (see page 15176)	Represents the unparsed contents of the HTTP request message.
R	ContentEncoding (see page 15177)	Reports the value of the Content (see page 15176)-Encoding header of the HTTP request message.
R	ContentFields (see page 15177)	Reports the parsed content of a POST request message.
R	ContentLength (see page 15178)	Reports the value of the Content (see page 15176)-Length header of the HTTP request message.
R	ContentParser (see page 15178)	Refers to the object's content parser object.
R	ContentType (see page 15179)	Reports the value of the Content (see page 15176)-Type header of the HTTP request message.
R	ContentVersion (see page 15179)	Reports the value of the Content (see page 15176)-Version header of the HTTP request message.
R	Cookie (see page 15180)	Reports the value of the Cookie header of the HTTP request message.
R	CookieFields (see page 15180)	Represents the parsed contents of the Cookie (see page 15180) header of an HTTP request message.
R	Date (see page 15181)	Reports the value of the Date header of the HTTP request message.
R	DerivedFrom (see page 15181)	Reports the value of the Derived-From (see page 15182) header of the HTTP request message.
R	Expires (see page 15182)	Reports the value of the Expires header of the HTTP request message.
R	Files (see page 15182)	Provides access to the files uploaded in the HTTP request.
R	From (see page 15182)	Reports the value of the From header of the HTTP request message.
R	Host (see page 15183)	Reports the value of the Host header of the HTTP request message.
R	IfModifiedSince (see page 15183)	Reports the value of the If-Modified-Since header of the HTTP request message.
R	InternalPathInfo (see page 15184)	Returns the path info portion of the URL (see page 15190).
R	InternalScriptName (see page 15184)	Returns the ScriptName (see page 15189) part of the URL (see page 15190).
R	Method (see page 15185)	This is Method, a member of class TWebRequest.
R	MethodType (see page 15185)	This is MethodType, a member of class TWebRequest.
R	PathInfo (see page 15185)	Reports the value of the path information (if any) of the URL (see page 15190) specified in the HTTP request message.
R	PathTranslated (see page 15186)	Represents a translation of the PathInfo (see page 15185) property to a fully qualified path on the Web server.
R	ProtocolVersion (see page 15186)	Reports the version number of the HTTP protocol specified in the initial header of the HTTP request message.
R	Query (see page 15186)	Indicates the value of the query information (if any) of the URL (see page 15190) specified in the HTTP request message.
R	QueryFields (see page 15187)	Represents the parsed contents of the Query (see page 15186) in the URL (see page 15190) of the HTTP request message.
R	Referer (see page 15188)	Reports the value of the Referer header of the HTTP request message.
R	RemoteAddr (see page 15188)	Indicates the remote IP address of the client associated with the HTTP request message.
R	RemoteHost (see page 15188)	Reports the fully qualified reverse domain lookup of the client associated with the HTTP request message.
R	ScriptName (see page 15189)	Indicates the value of the script information (if any) of the URL (see page 15190) specified in the HTTP request message.
R	ServerPort (see page 15189)	Indicates the port number of the port on the Web server that receives the HTTP request message.
R	Title (see page 15190)	Reports the value of the Title header of the HTTP request message.
R	URL (see page 15190)	Reports the Uniform Resource Identifier (URI) specified by the HTTP request message to identify the target of the request.
R	UserAgent (see page 15191)	Reports the value of the User-Agent header of the HTTP request message.

77.1.20.2 TWebRequest.Create Constructor

Creates an instance of TWebRequest (see page 15161).

Pascal

```
constructor Create;
```

C++

```
__fastcall TWebRequest();
```

Description

Applications shouldn't need to call Create to instantiate a request object. The TWebApplication object creates a TWebRequest (see page 15161) object whenever it receives a client request.

See Also

TWebApplication (see page 24618)

77.1.20.3 TWebRequest.Destroy Destructor

Destroys an instance of TWebRequest (see page 15161).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TWebRequest();
```

Description

Do not call Destroy. When the request message is fully handled, TWebApplication destroys the request object by calling its Free method.

Destroy frees the TStrings objects used to represent the ContentFields (see page 15177), CookieFields (see page 15180), and QueryFields (see page 15187) properties.

See Also

ContentFields (see page 15177)

CookieFields (see page 15180)

Free (see page 22300)

QueryFields (see page 15187)

TWebApplication (see page 24618)

77.1.20.4 TWebRequest Methods

The methods of the TWebRequest class are listed here.

Protected Methods

	Name	Description
	GetDateVariable (see page 15168)	Provides the abstract (pure virtual) prototype for a method to extract a date value from an indexed table of HTTP header variables.

	GetIntegerVariable (see page 15169)	Provides the abstract (pure virtual) prototype for a method to extract an integer value from an indexed table of HTTP header variables.
	GetInternalPathInfo (see page 15169)	This is GetInternalPathInfo, a member of class TWebRequest.
	GetInternalScriptName (see page 15169)	This is GetInternalScriptName, a member of class TWebRequest.
	GetStringVariable (see page 15169)	Provides the abstract (pure virtual) prototype for a method to extract a string value from an indexed table of HTTP header variables.
	UpdateMethodType (see page 15172)	Provides the abstract prototype for a method to write a pure virtual method for updating the client method type.

Public Methods

	Name	Description
	ExtractContentFields (see page 15166)	Parses the Content (see page 15176) property into its constituent fields.
	ExtractCookieFields (see page 15166)	Parses the Cookie (see page 15180) property into its constituent fields.
	ExtractFields (see page 15167)	Parses a multi-valued string into its constituent fields.
	ExtractQueryFields (see page 15167)	Parses the Query (see page 15186) property into its constituent fields.
	GetFieldByName (see page 15168)	Provides the abstract (pure virtual) prototype for a method that returns the value of the HTTP header variable specified by the Name parameter.
	ReadClient (see page 15170)	Provides the abstract (pure virtual) prototype for a method to read from the HTTP request into a buffer.
	ReadString (see page 15171)	Provides the abstract (pure virtual) prototype for a method to read Count bytes from the HTTP request into a string.
	TranslateURI (see page 15171)	Provides the abstract (pure virtual) prototype for a method to translate a Uniform Resource Identifier (URI) into an internal representation of a location on the server.
	WriteClient (see page 15172)	Provides the abstract (pure virtual) prototype for a method to write Count bytes from Buffer back to the HTTP client.
	WriteHeaders (see page 15172)	Provides the abstract (pure virtual) prototype for a method to write an HTTP header string.
	WriteString (see page 15173)	Provides the abstract (pure virtual) prototype for a method to write the string AString back to the HTTP client.

77.1.20.4.1 TWebRequest.ExtractContentFields Method

Parses the Content (see page 15176) property into its constituent fields.

Pascal

```
procedure ExtractContentFields(Strings: TStrings);
```

C++

```
__fastcall ExtractContentFields(TStrings Strings);
```

Description

Call ExtractContentFields to fill the Strings parameter with the individual fields in the Content (see page 15176) property. ExtractContentFields assumes that fields are separated by ampersands (&). This is the format used when the MethodType (see page 15185) is mtPost. If the Content (see page 15176) property is not assigned, ExtractContentFields does nothing.

See Also

Content (see page 15176)

ContentFields (see page 15177)

MethodType (see page 15185)

TStrings (see page 3029)

77.1.20.4.2 TWebRequest.ExtractCookieFields Method

Parses the Cookie (see page 15180) property into its constituent fields.

Pascal

```
procedure ExtractCookieFields(Strings: TStrings);
```

C++

```
__fastcall ExtractCookieFields(TStrings Strings);
```

Description

Call ExtractCookieFields to fill the Strings parameter with the individual fields in the Cookie (see page 15180) property. ExtractCookieFields assumes that fields are separated by semicolons. If the Cookie (see page 15180) property is not assigned, ExtractCookieFields does nothing.

See Also

Cookie (see page 15180)

CookieFields (see page 15180)

TStrings (see page 3029)

77.1.20.4.3 TWebRequest.ExtractFields Method

Parses a multi-valued string into its constituent fields.

Pascal

```
procedure ExtractFields(Separators: TSysCharSet; WhiteSpace: TSysCharSet; Content: PChar;
Strings: TStrings);
```

C++

```
__fastcall ExtractFields(TSysCharSet Separators, TSysCharSet WhiteSpace, const char * Content,
TStrings Strings);
```

Description

Call ExtractFields to parse a multi-valued HTTP header into separate strings for each value. For example, if the separator character of the UserAgent (see page 15191) property is known, ExtractFields can parse this property into separate UserAgent (see page 15191) values.

Separators is a set of characters that are used to separate individual values within the multi-valued string. WhiteSpace is a set of characters that are to be ignored when parsing the string. Content (see page 15176) is the multi-valued string to be parsed. Strings is the TStrings object that receives the individual values that are parsed from Content (see page 15176).

See Also

ExtractContentFields (see page 15166)

ExtractCookieFields (see page 15166)

ExtractQueryFields (see page 15167)

TStrings (see page 3029)

77.1.20.4.4 TWebRequest.ExtractQueryFields Method

Parses the Query (see page 15186) property into its constituent fields.

Pascal

```
procedure ExtractQueryFields(Strings: TStrings);
```

C++

```
__fastcall ExtractQueryFields(TStrings Strings);
```

Description

Call ExtractQueryFields to fill the Strings parameter with the individual fields in the Query (see page 15186) property. ExtractQueryFields assumes that fields are separated by ampersands (&). If the Query (see page 15186) property is not assigned, ExtractQueryFields does nothing.

See Also

Query (see page 15186)

QueryFields (see page 15187)

TStrings (see page 3029)

77.1.20.4.5 TWebRequest.GetDateVariable Method

Provides the abstract (pure virtual) prototype for a method to extract a date value from an indexed table of HTTP header variables.

Pascal

```
function GetDateVariable(Index: Integer): TDateTime; virtual; abstract;
```

C++

```
virtual __fastcall TDateTime GetDateVariable(int Index) = 0;
```

Description

Descendants of TWebRequest (see page 15161) implement GetDateVariable to provide a method by which the date-time values are read from the header strings of the HTTP request message. The request object uses GetDateVariable to access the properties that represent dates from the HTTP request headers.

See Also

Date (see page 15181)

Expires (see page 15182)

IfModifiedSince (see page 15183)

77.1.20.4.6 TWebRequest.GetFieldByName Method

Provides the abstract (pure virtual) prototype for a method that returns the value of the HTTP header variable specified by the Name parameter.

Pascal

```
function GetFieldByName(const Name: string): string; virtual; abstract;
```

C++

```
virtual __fastcall AnsiString GetFieldByName(const AnsiString Name) = 0;
```

Description

Descendants of TWebRequest (see page 15161) implement GetFieldByName to provide access to arbitrary header fields in the HTTP request message. Use GetFieldByName to read the value of an HTTP header variable that is not surfaced as one of the properties of TWebRequest (see page 15161). For information on possible HTTP request header variables, see the current Internet standards documents.

See Also

GetStringVariable (see page 15169)

Properties That Contain Request Header Information

77.1.20.4.7 TWebRequest.GetIntegerVariable Method

Provides the abstract (pure virtual) prototype for a method to extract an integer value from an indexed table of HTTP header variables.

Pascal

```
function GetIntegerVariable(Index: Integer): Integer; virtual; abstract;
```

C++

```
virtual __fastcall int GetIntegerVariable(int Index) = 0;
```

Description

Descendants of TWebRequest (see page 15161) implement GetIntegerVariable to provide a method by which the integer values are read from the header strings of the HTTP request message. The request object uses GetIntegerVariable to access the properties that represent integers from the HTTP request headers.

See Also

ContentLength (see page 15178)

ServerPort (see page 15189)

77.1.20.4.8 TWebRequest.GetInternalPathInfo Method

Pascal

```
function GetInternalPathInfo: string; virtual;
```

C++

```
virtual __fastcall AnsiString GetInternalPathInfo();
```

Description

This is GetInternalPathInfo, a member of class TWebRequest.

77.1.20.4.9 TWebRequest.GetInternalScriptName Method

Pascal

```
function GetInternalScriptName: string; virtual;
```

C++

```
virtual __fastcall AnsiString GetInternalScriptName();
```

Description

This is GetInternalScriptName, a member of class TWebRequest.

77.1.20.4.10 TWebRequest.GetStringVariable Method

Provides the abstract (pure virtual) prototype for a method to extract a string value from an indexed table of HTTP header variables.

Pascal

```
function GetStringVariable(Index: Integer): string; virtual; abstract;
```

C++

```
virtual __fastcall AnsiString GetStringVariable(int Index) = 0;
```

Description

Descendants of TWebRequest (see page 15161) implement GetStringVariable to provide a method by which the string values are read from the header strings of the HTTP request message. The request object uses GetStringVariable to access the properties that represent strings from the HTTP request headers.

77.1.20.4.11 TWebRequest.ReadClient Method

Provides the abstract (pure virtual) prototype for a method to read from the HTTP request into a buffer.

Pascal

```
function ReadClient(var Buffer; Count: Integer): Integer; virtual; abstract;
```

C++

```
virtual __fastcall int ReadClient( Buffer, int Count) = 0;
```

Description

Descendants of TWebRequest (see page 15161) implement ReadClient. ReadClient is used to read content information from the HTTP request. Use ReadClient to get the next chunk of information when the content of the request message is too large for the Content (see page 15176) property.

Use Buffer to provide a buffer to contain the content information. Use Count to specify the number of bytes to read. ReadClient returns the number of bytes actually read.

See Also

Content (see page 15176)

ReadString (see page 15171)

WriteClient (see page 15172)

77.1.20.4.12 TWebRequest.ReadString Method

Provides the abstract (pure virtual) prototype for a method to read Count bytes from the HTTP request into a string.

Pascal

```
function ReadString(Count: Integer): string; virtual; abstract;
```

C++

```
virtual __fastcall AnsiString ReadString(int Count) = 0;
```

Description

Descendants of TWebRequest (see page 15161) implement ReadString. ReadString is used to load content information from the HTTP request into a string. Use ReadString to get the next chunk of information when the content of the request message is too large for the Content (see page 15176) property.

See Also

Content (see page 15176)

ReadClient (see page 15170)

WriteString (see page 15173)

77.1.20.4.13 TWebRequest.TranslateURI Method

Provides the abstract (pure virtual) prototype for a method to translate a Uniform Resource Identifier (URI) into an internal representation of a location on the server.

Pascal

```
function TranslateURI(const URI: string): string; virtual; abstract;
```

C++

```
virtual __fastcall AnsiString TranslateURI(const AnsiString URI) = 0;
```

Description

Descendants of TWebRequest (see page 15161) implement TranslateURI. TranslateURI is used to translate the URI specified in a client request into a format that can be used by the server application. TranslateURI is not relevant to CGI applications.

Note: On Windows, the internal format varies, depending on whether the server application is an ISAPI or NSAPI application.

See Also

PathTranslated (see page 15186)

URL (see page 15190)

77.1.20.4.14 TWebRequest.UpdateMethodType Method

Provides the abstract prototype for a method to write a pure virtual method for updating the client method type.

Pascal

```
procedure UpdateMethodType;
```

C++

```
__fastcall UpdateMethodType();
```

Description

Use UpdateMethodType to update the type of response that is requested by the Web client.

See Also

TWebRequest (see page 15161)

77.1.20.4.15 TWebRequest.WriteClient Method

Provides the abstract (pure virtual) prototype for a method to write Count bytes from Buffer back to the HTTP client.

Pascal

```
function WriteClient(var Buffer; Count: Integer): Integer; virtual; abstract;
```

C++

```
virtual __fastcall int WriteClient( Buffer, int Count) = 0;
```

Description

Descendants of TWebRequest (see page 15161) implement WriteClient. WriteClient is used by TWebResponse (see page 15191) to send the contents of a response to the Web client.

See Also

ReadClient (see page 15170)

TWebResponse (see page 15191)

WriteString (see page 15173)

77.1.20.4.16 TWebRequest.WriteHeaders Method

Provides the abstract (pure virtual) prototype for a method to write an HTTP header string.

Pascal

```
function WriteHeaders(StatusCode: Integer; const ReasonString: string; const Headers: string):
Boolean; virtual; abstract;
```

C++

```
virtual __fastcall Boolean WriteHeaders(int StatusCode, const AnsiString ReasonString, const
AnsiString Headers) = 0;
```

Description

Use WriteHeaders to write an HTTP header string.

See Also

WriteClient (see page 15172)

WriteString (see page 15173)

77.1.20.4.17 TWebRequest.WriteString Method

Provides the abstract (pure virtual) prototype for a method to write the string AString back to the HTTP client.

Pascal

```
function WriteString(const AString: string): Boolean; virtual; abstract;
```

C++

```
virtual __fastcall Boolean WriteString(const AnsiString AString) = 0;
```

Description

Descendants of TWebRequest (see page 15161) implement WriteString. WriteString is used by TWebResponse (see page 15191) to send the contents of a response to the Web client.

See Also

ReadString (see page 15171)

TWebResponse (see page 15191)

WriteClient (see page 15172)

77.1.20.5 TWebRequest Properties

The properties of the TWebRequest class are listed here.

Public Properties

	Name	Description
R	Accept (see page 15174)	Reports the value of the Accept header of the HTTP request message.
R	Authorization (see page 15175)	Reports the value of the Authorization header of the HTTP request message.
R	CacheControl (see page 15175)	Reports the value of the Cache-Control header of the HTTP request message.
R	Connection (see page 15176)	Reports the value of the Connection header of the HTTP request message.
R	Content (see page 15176)	Represents the unparsed contents of the HTTP request message.
R	ContentEncoding (see page 15177)	Reports the value of the Content (see page 15176)-Encoding header of the HTTP request message.
R	ContentFields (see page 15177)	Reports the parsed content of a POST request message.
R	ContentLength (see page 15178)	Reports the value of the Content (see page 15176)-Length header of the HTTP request message.
R	ContentParser (see page 15178)	Refers to the object's content parser object.

R	ContentType (see page 15179)	Reports the value of the Content (see page 15176)-Type header of the HTTP request message.
R	ContentVersion (see page 15179)	Reports the value of the Content (see page 15176)-Version header of the HTTP request message.
R	Cookie (see page 15180)	Reports the value of the Cookie header of the HTTP request message.
R	CookieFields (see page 15180)	Represents the parsed contents of the Cookie (see page 15180) header of an HTTP request message.
R	Date (see page 15181)	Reports the value of the Date header of the HTTP request message.
R	DerivedFrom (see page 15181)	Reports the value of the Derived-From (see page 15182) header of the HTTP request message.
R	Expires (see page 15182)	Reports the value of the Expires header of the HTTP request message.
R	Files (see page 15182)	Provides access to the files uploaded in the HTTP request.
R	From (see page 15182)	Reports the value of the From header of the HTTP request message.
R	Host (see page 15183)	Reports the value of the Host header of the HTTP request message.
R	IfModifiedSince (see page 15183)	Reports the value of the If-Modified-Since header of the HTTP request message.
R	InternalPathInfo (see page 15184)	Returns the path info portion of the URL (see page 15190).
R	InternalScriptName (see page 15184)	Returns the ScriptName (see page 15189) part of the URL (see page 15190).
R	Method (see page 15185)	This is Method, a member of class TWebRequest.
R	MethodType (see page 15185)	This is MethodType, a member of class TWebRequest.
R	PathInfo (see page 15185)	Reports the value of the path information (if any) of the URL (see page 15190) specified in the HTTP request message.
R	PathTranslated (see page 15186)	Represents a translation of the PathInfo (see page 15185) property to a fully qualified path on the Web server.
R	ProtocolVersion (see page 15186)	Reports the version number of the HTTP protocol specified in the initial header of the HTTP request message.
R	Query (see page 15186)	Indicates the value of the query information (if any) of the URL (see page 15190) specified in the HTTP request message.
R	QueryFields (see page 15187)	Represents the parsed contents of the Query (see page 15186) in the URL (see page 15190) of the HTTP request message.
R	Referer (see page 15188)	Reports the value of the Referer header of the HTTP request message.
R	RemoteAddr (see page 15188)	Indicates the remote IP address of the client associated with the HTTP request message.
R	RemoteHost (see page 15188)	Reports the fully qualified reverse domain lookup of the client associated with the HTTP request message.
R	ScriptName (see page 15189)	Indicates the value of the script information (if any) of the URL (see page 15190) specified in the HTTP request message.
R	ServerPort (see page 15189)	Indicates the port number of the port on the Web server that receives the HTTP request message.
R	Title (see page 15190)	Reports the value of the Title header of the HTTP request message.
R	URL (see page 15190)	Reports the Uniform Resource Identifier (URI) specified by the HTTP request message to identify the target of the request.
R	UserAgent (see page 15191)	Reports the value of the User-Agent header of the HTTP request message.

77.1.20.5.1 TWebRequest.Accept Property

Reports the value of the Accept header of the HTTP request message.

Pascal

```
property Accept: string;
```

C++

```
__property AnsiString Accept;
```

Description

Read Accept to determine the media types the Web client can accept in response to the request. Not every HTTP request message has an Accept header. If the Accept property is not set, then any media type is potentially acceptable in the response.

Accept headers usually indicate that the response should be limited to a small set of desired types. For example, a Web client

requesting an audio response might produce a TWebRequest (see page 15161) object with Accept set to the following string:

```
audio/*; q=0.2, audio/basic
```

This request indicates that the preferred response media type is audio/basic, but that any audio type is acceptable if it is the best available after an 80% markdown in quality.

For information on the format of Accept headers, see the current Internet standards documentation.

See Also

ContentType (see page 15209)

Properties That Describe the Expected Response

77.1.20.5.2 TWebRequest.Authorization Property

Reports the value of the Authorization header of the HTTP request message.

Pascal

```
property Authorization: string;
```

C++

```
__property AnsiString Authorization;
```

Description

Read Authorization to check whether the client that sent the request message has provided the correct authentication information. Authorization allows the Web application to provided limited access to the resource specified by the URL (see page 15190) property.

For more information about HTTP authentication schemes, see the Internet standards documentation.

See Also

WWWAuthenticate (see page 15218)

URL (see page 15190)

77.1.20.5.3 TWebRequest.CacheControl Property

Reports the value of the Cache-Control header of the HTTP request message.

Pascal

```
property CacheControl: string;
```

C++

```
__property AnsiString CacheControl;
```

Description

Read CacheControl to determine any Web client directives that must be obeyed by all caching mechanisms along the request/response chain. The CacheControl directives of the HTTP request need not apply to the corresponding HTTP response.

The HTTP 1.1 standard defines the following directives for CacheControl:

Value	Meaning
no-cache	The request may not be cached. The Web server validates the request before the TWebRequest (see page 15161) object is created.

no-store	The request contains sensitive information and may not be stored on any permanent medium such as a backup tape. If the request is stored temporarily in a file, the file must be deleted.
max-age=ss	The request is considered invalid if it is older than ss seconds. This directive takes precedence over the Expires (see page 15182) property, even if Expires (see page 15182) is more restrictive. Invalid requests are validated by the Web server before the TWebRequest (see page 15161) object is created.
max-stale or max-stale=ss	The client is willing to accept a response that has exceeded its expiration time. The max-stale directive can optionally specify the number of seconds by which the response can exceed its expiration time.
min-fresh=ss	The client is not willing to accept a response that expires in less than ss seconds.

See Also

Date (see page 15181)

Expires (see page 15182)

77.1.20.5.4 TWebRequest.Connection Property

Reports the value of the Connection header of the HTTP request message.

Pascal

```
property Connection: string;
```

C++

```
__property AnsiString Connection;
```

Description

Read Connection to determine the options requested by the Web client for its connection to the server application. The HTTP 1.1 standard specifies only one value for the Connection header. If the value of Connection is close, the connection should be closed after the completion of the response.

See Also

Host (see page 15183)

RemoteAddr (see page 15188)

RemoteHost (see page 15188)

ServerPort (see page 15189)

Connecting to a Data Store Using TADOConnection

77.1.20.5.5 TWebRequest.Content Property

Represents the unparsed contents of the HTTP request message.

Pascal

```
property Content: string;
```

C++

```
__property AnsiString Content;
```

Description

Use Content to read the contents of an HTTP request message that is sending information to the server. The value of Content depends on the Method (see page 15185) of the HTTP request. When the Method (see page 15185) is POST, Content is

the unparsed string giving the values to be posted with their associated fields. When the Method (see page 15185) is PUT, Content is the value that should replace the URL (see page 15190) given by the URL (see page 15190) property.

Tip: When the Method (see page 15185) is POST, the parsed version of the post request is available in the ContentFields (see page 15177) property.

Note: If the content of a message is particularly large, it is transferred in chunks. In this case, the Content property does not contain the entire message content. To read the rest of the content, use the ReadClient (see page 15170) method.

See Also

ContentEncoding (see page 15177)

ContentFields (see page 15177)

ContentLength (see page 15178)

ContentType (see page 15179)

ContentVersion (see page 15179)

ExtractContentFields (see page 15166)

TWebRequest (see page 15161)

The Content of HTTP Request Messages

77.1.20.5.6 TWebRequest.ContentEncoding Property

Reports the value of the Content (see page 15176)-Encoding header of the HTTP request message.

Pascal

```
property ContentEncoding: string;
```

C++

```
__property AnsiString ContentEncoding;
```

Description

Read ContentEncoding to determine what encoding mechanisms, if any, have been applied to the Content (see page 15176) of the HTTP request. The encoding mechanisms are listed in the order in which the Web client applied them, separated by commas. Typically, ContentEncoding indicates a compression method or an encoding scheme used to transfer extended ASCII characters over the net.

Reverse the ContentEncoding mechanisms to decode the Content (see page 15176) into the form indicated by the ContentType (see page 15179) property.

See Also

Content (see page 15176)

ContentType (see page 15179)

Properties That Describe the Content

77.1.20.5.7 TWebRequest.ContentFields Property

Reports the parsed content of a POST request message.

Pascal

```
property ContentFields: TStrings;
```

C++

```
__property TStrings ContentFields;
```

Description

Use ContentFields to read the fields of an HTTP request message when the MethodType (see page 15185) is mtPost. The Content (see page 15176) of the HTTP request is parsed, separating into fields at the ampersand character.

Each field appears as a separate string in the ContentFields list with the form Name=Value. As a TStrings object, ContentFields allows applications to manipulate the individual fields by name or value.

See Also

Content (see page 15176)

ExtractContentFields (see page 15166)

TWebRequest (see page 15161)

TStrings (see page 3029)

Names (see page 3075)

Values (see page 3086)

The Content of HTTP Request Messages

77.1.20.5.8 TWebRequest.ContentLength Property

Reports the value of the Content (see page 15176)-Length header of the HTTP request message.

Pascal

```
property ContentLength: Integer;
```

C++

```
__property int ContentLength;
```

Description

Read the ContentLength property to determine the length of the Content (see page 15176) property. ContentLength allows an application to determine the end of the Content (see page 15176) property when the ContentType (see page 15179) is not text/html. A ContentLength of 0 indicates that the length of the Content (see page 15176) property is not determined, either because the request does not include any Content (see page 15176), or because the Web client did not know the length.

Note: The length of the Content (see page 15176) may be less than ContentLength when the Content (see page 15176) is passed using chunked transfer coding.

See Also

Content (see page 15176)

ContentType (see page 15179)

TWebRequest (see page 15161)

Properties That Describe the Content

77.1.20.5.9 TWebRequest.ContentParser Property

Refers to the object's content parser object.

Pascal

```
property ContentParser: TAbstractContentParser;
```

C++

```
__property TAbstractContentParser ContentParser;
```

Description

Read ContentParser to locate the TWebRequest (see page 15161) instance's TAbstractContentParser (see page 15039) object. The TAbstractContentParser (see page 15039) is responsible for parsing the HTTP request.

77.1.20.5.10 TWebRequest.ContentType Property

Reports the value of the Content (see page 15176)-Type header of the HTTP request message.

Pascal

```
property ContentType: string;
```

C++

```
__property AnsiString ContentType;
```

Description

Read ContentType to determine the media type of the Content (see page 15176) of the HTTP request message. The ContentType is a string of the form Type/SubType.

Most HTTP requests do not require any Content (see page 15176) at all. For most requests with a Method (see page 15185) that requires a value for Content (see page 15176), the ContentType is text/html. However, HTTP requests for server-specific values of Method (see page 15185) can use any media type appropriate to the request.

See Also

Accept (see page 15174)

Content (see page 15176)

TWebRequest (see page 15161)

Properties That Describe the Content

77.1.20.5.11 TWebRequest.ContentVersion Property

Reports the value of the Content (see page 15176)-Version header of the HTTP request message.

Pascal

```
property ContentVersion: string;
```

C++

```
__property AnsiString ContentVersion;
```

Description

Read ContentVersion to determine the version of the Content (see page 15176) of the HTTP request message. Most HTTP requests do not require any Content (see page 15176) at all. When the Method (see page 15185) requires a value for Content (see page 15176), the ContentVersion may be set to indicate the version of the source of that content. The format of the ContentVersion depends on the ContentType (see page 15179) of the request.

See Also

Content (see page 15176)

ContentType (see page 15179)

Properties That Describe the Content

77.1.20.5.12 TWebRequest.Cookie Property

Reports the value of the Cookie header of the HTTP request message.

Pascal

```
property Cookie: string;
```

C++

```
__property AnsiString Cookie;
```

Description

Use Cookie to read the "cookie" strings provided in the Web client request. Cookie strings are used to track state information in a Web application. Cookie is the unparsed value of the Cookie header. The Cookie header can include multiple fields separated by semicolons. Use the CookieFields (see page 15180) property to work with the Cookie header on a field-by-field basis.

See Also

CookieFields (see page 15180)

ExtractCookieFields (see page 15166)

Cookies (see page 15210)

Properties That Describe the Expected Response

77.1.20.5.13 TWebRequest.CookieFields Property

Represents the parsed contents of the Cookie (see page 15180) header of an HTTP request message.

Pascal

```
property CookieFields: TStrings;
```

C++

```
__property TStrings CookieFields;
```

Description

Use CookieFields to work with individual "cookie" strings provided by the Web client request. The Cookie (see page 15180) property is parsed into separate fields by separating into substrings whenever a semicolon is encountered.

Cookie (see page 15180) strings are used to track state information in a Web application. Each field appears as a separate string in the CookieFields list with the form Name=Value. As a TStrings object, CookieFields allows applications to manipulate the individual fields by name or value.

Note: Applications can give state variables any name except one of the reserved cookie field names. See the Netscape documentation for a list of reserved cookie field names and their meanings.

See Also

Cookie (see page 15180)

ExtractCookieFields (see page 15166)

TStrings (see page 3029)

Names (see page 3075)

Values (see page 3086)

77.1.20.5.14 TWebRequest.Date Property

Reports the value of the Date header of the HTTP request message.

Pascal

```
property Date: TDateTime;
```

C++

```
__property TDateTime Date;
```

Description

Read Date to determine the date and time at which the HTTP request message originated. Date can be used to determine whether the Content (see page 15176) of the request is still valid. The value of Date is translated into local time as specified by the system clock from the time units set by the Web client.

For example, if an HTTP request message specifies a MethodType (see page 15185) of mtPost, and Date is older than the most recent values of the fields that are being posted, the server application may return a status code that indicates an error rather than overwriting more recent values.

Date is represented using the TDateTime type. The integral part of a TDateTime value is the number of days that have passed since Dec. 30 1899. The fractional part of a TDateTime value is the fraction of a 24-hour day that has elapsed.

See Also

Expires (see page 15182)

IfModifiedSince (see page 15183)

MethodType (see page 15185)

StatusCode (see page 15215)

77.1.20.5.15 TWebRequest.DerivedFrom Property

Reports the value of the Derived-From (see page 15182) header of the HTTP request message.

Pascal

```
property DerivedFrom: string;
```

C++

```
__property AnsiString DerivedFrom;
```

Description

Read DerivedFrom to determine the URI from which the value of Content (see page 15176) originated. DerivedFrom is only meaningful when the request includes a Content (see page 15176) property and the Content (see page 15176) did not originate with the Web client.

See Also

Content (see page 15176)

Referer (see page 15188)

Properties That Describe the Web Client

77.1.20.5.16 TWebRequest.Expires Property

Reports the value of the Expires header of the HTTP request message.

Pascal

```
property Expires: TDateTime;
```

C++

```
__property TDateTime Expires;
```

Description

Use Expires to determine whether the request is "stale." Expires is the date and time at which the request becomes invalid. The value of Expires is translated into local time as specified by the system clock from the time units set by the Web client.

If the request has a CacheControl (see page 15175) value with a max-age directive, the max-age directive overrides the value of Expires.

Expires is represented using the TDateTime type. The integral part of a TDateTime value is the number of days that have passed since Dec. 30, 1899. The fractional part of a TDateTime value is the fraction of a 24-hour day that has elapsed.

See Also

Date (see page 15181)

IfModifiedSince (see page 15183)

CacheControl (see page 15175)

77.1.20.5.17 TWebRequest.Files Property

Provides access to the files uploaded in the HTTP request.

Pascal

```
property Files: TAbstractWebRequestFiles;
```

C++

```
__property TAbstractWebRequestFiles Files;
```

Description

Use this property to find the specific instance of the object's TAbstractRequestFiles object. The TAbstractRequestFiles object contains uploaded files extracted from the HTTP request.

77.1.20.5.18 TWebRequest.From Property

Reports the value of the From header of the HTTP request message.

Pascal

```
property From: string;
```

C++

```
__property AnsiString From;
```

Description

Read From to determine the Internet e-mail address of the human user for whom the Web client sent the HTTP request message. This value can be used for logging purposes, or to contact the originator of the request if problems occur.

See Also

RemoteAddr (see page 15188)

RemoteHost (see page 15188)

UserAgent (see page 15191)

Properties That Describe the Web Client

77.1.20.5.19 TWebRequest.Host Property

Reports the value of the Host header of the HTTP request message.

Pascal

```
property Host: string;
```

C++

```
__property AnsiString Host;
```

Description

Read Host to determine the Internet host and port number of resource being requested. For example, if the client request specifies the following URL (see page 15190):

`http://www.TSite.com/art/gallery.cgi/mammals?animal=dog&color=black`

The value of Host would be

`www.TSite.com`

The value of Host can be used to differentiate between internally ambiguous URLs, such as the root "/" URL (see page 15190) of a server for multiple host names on a single IP address.

See Also

PathInfo (see page 15185)

ScriptName (see page 15189)

ServerPort (see page 15189)

URL (see page 15190)

Properties That Identify the Target

77.1.20.5.20 TWebRequest.IfModifiedSince Property

Reports the value of the If-Modified-Since header of the HTTP request message.

Pascal

```
property IfModifiedSince: TDateTime;
```

C++

```
__property TDateTime IfModifiedSince;
```

Description

Read IfModifiedSince on a request with a MethodType (see page 15185) of mtGet to determine whether the request is conditional. If the information requested by the Web client was not modified since the time indicated by IfModifiedSince, the response should be a not modified error rather than the information indicated by the URL (see page 15190) property.

The value of IfModifiedSince is given according to the local clock, not the clock of the Web client.

Note: On Windows, the value of the local clock is specified in the Windows Control Panel.

IfModifiedSince is represented using the TDateTime type. The integral part of a TDateTime value is the number of days that have passed since Dec. 30, 1899. The fractional part of a TDateTime value is the fraction of a 24-hour day that has elapsed.

Expires (see page 15182)

Date (see page 15181)

Properties That Describe the Expected Response

77.1.20.5.21 TWebRequest.InternalPathInfo Property

Returns the path info portion of the URL (see page 15190).

Pascal

```
property InternalPathInfo: string;
```

C++

```
__property AnsiString InternalPathInfo;
```

Description

InternalPathInfo contains the path information portion of the URL (see page 15190), which identifies the destination of the message. This property generally contains the same information as PathInfo.To ensure cross-platform code compatibility, use InternalPathInfo instead of PathInfo (see page 15185).

Note: On Windows, this property varies slightly from PathInfo (see page 15185) if the application has an embedded test server. In that case, information specific to the test server is contained in the InternalScriptName (see page 15184) instead of the InternalPathInfo.

See Also

PathInfo (see page 15185)

77.1.20.5.22 TWebRequest.InternalScriptName Property

Returns the ScriptName (see page 15189) part of the URL (see page 15190).

Pascal

```
property InternalScriptName: string;
```

C++

```
__property AnsiString InternalScriptName;
```

Description

InternalScriptName contains the script name portion of the URL (see page 15190), which specifies the name of a Web server application. This property generally contains the same information as ScriptName (see page 15189). To ensure cross platform code compatibility, use InternalScriptName instead of ScriptName (see page 15189).

Note: On Windows, this property varies slightly from ScriptName (see page 15189) if the application has an embedded test server. In that case, information specific to the test server is contained in the InternalScriptName instead of the InternalPathInfo (see page 15184).

See Also

ScriptName (see page 15189)

77.1.20.5.23 TWebRequest.Method Property

Pascal

```
property Method: string;
```

C++

```
__property AnsiString Method;
```

Description

This is Method, a member of class TWebRequest.

77.1.20.5.24 TWebRequest.MethodType Property

Pascal

```
property MethodType: TMethodType;
```

C++

```
__property TMethodType MethodType;
```

Description

This is MethodType, a member of class TWebRequest.

77.1.20.5.25 TWebRequest.PathInfo Property

Reports the value of the path information (if any) of the URL (see page 15190) specified in the HTTP request message.

Pascal

```
property PathInfo: string;
```

C++

```
__property AnsiString PathInfo;
```

Description

Read PathInfo to determine the path on the server machine where the target of the request is found. For example, given this URL (see page 15190):

`http://www.TSite.com/art/gallery.cgi/mammals?animal=dog&color=black`

the PathInfo portion is

`/mammals`

The TWebDispatcher (see page 15147) object uses the PathInfo to identify the appropriate TWebActionItem (see page 15130) for servicing the request message.

See Also

Host (see page 15183)

PathTranslated (see page 15186)

Query (see page 15186)

ScriptName (see page 15189)

TWebActionItem (see page 15130)

TWebDispatcher (see page 15147)

InternalPathInfo (see page 15184)

URL (see page 15190)

Dispatching Request Messages

Properties That Identify the Target

77.1.20.5.26 TWebRequest.PathTranslated Property

Represents a translation of the PathInfo (see page 15185) property to a fully qualified path on the Web server.

Pascal

```
property PathTranslated: string;
```

C++

```
__property AnsiString PathTranslated;
```

Description

Use PathTranslated to refer to the location of the target of the request in an HTTP response.

See Also

Host (see page 15183)

PathInfo (see page 15185)

TWebActionItem (see page 15130)

TWebResponse (see page 15191)

URL (see page 15190)

77.1.20.5.27 TWebRequest.ProtocolVersion Property

Reports the version number of the HTTP protocol specified in the initial header of the HTTP request message.

Pascal

```
property ProtocolVersion: string;
```

C++

```
__property AnsiString ProtocolVersion;
```

Description

Use ProtocolVersion to determine the protocol used by the Web client when generating the HTTP request message.

Some properties of the HTTP request may be interpreted differently depending on the ProtocolVersion. For example, if ProtocolVersion is 1.0, then the connection should not be considered persistent, even if the Connection (see page 15176) property does not specify the close option.

See Also

Connection (see page 15176)

77.1.20.5.28 TWebRequest.Query Property

Indicates the value of the query information (if any) of the URL (see page 15190) specified in the HTTP request message.

Pascal

```
property Query: string;
```

C++

```
__property AnsiString Query;
```

Description

Read Query to determine the details of a query specified in the URL (see page 15190) of the Web client request. For example, given this URL (see page 15190):

`http://www.TSite.com/art/gallery.cgi/mammals?animal=dog&color=black`

the Query portion is

`animal=dog&color=black`

Query is the unparsed query portion of the URL (see page 15190). The query may include multiple fields separated by ampersands. Use the QueryFields (see page 15187) property to work with the query on a field-by-field basis.

See Also

ExtractQueryFields (see page 15167)

Host (see page 15183)

PathInfo (see page 15185)

QueryFields (see page 15187)

ScriptName (see page 15189)

Properties That Identify the Target

77.1.20.5.29 TWebRequest.QueryFields Property

Represents the parsed contents of the Query (see page 15186) in the URL (see page 15190) of the HTTP request message.

Pascal

```
property QueryFields: TStrings;
```

C++

```
__property TStrings QueryFields;
```

Description

Use QueryFields to work with individual query values provided by the Web client request. The Query (see page 15186) property is parsed into separate fields by separating into substrings whenever an ampersand is encountered.

Each query field appears as a separate string in the QueryFields list with the form Name=Value. As a TStrings object, QueryFields allows applications to manipulate the individual fields by name or value.

See Also

ExtractQueryFields (see page 15167)

Query (see page 15186)

TStrings (see page 3029)

Names (see page 3075)

Values (see page 3086)

Properties That Identify the Target

77.1.20.5.30 TWebRequest.Referer Property

Reports the value of the Referer header of the HTTP request message.

Pascal

```
property Referer: string;
```

C++

```
__property AnsiString Referer;
```

Description

Read Referer to determine the URI of the resource where the HTTP request message originated. Referer allows the server application to generate back-links to the source of the request. If Referer is a partial URI, it should be interpreted as a relative path to the URL (see page 15190) property.

The Referer property is not set when the URL (see page 15190) of the HTTP request was obtained from a source that does not have its own URI, such as input from the user keyboard.

See Also

DerivedFrom (see page 15181)

From (see page 15182)

RemoteAddr (see page 15188)

RemoteHost (see page 15188)

UserAgent (see page 15191)

Properties That Describe the Web Client

77.1.20.5.31 TWebRequest.RemoteAddr Property

Indicates the remote IP address of the client associated with the HTTP request message.

Pascal

```
property RemoteAddr: string;
```

C++

```
__property AnsiString RemoteAddr;
```

Description

Read RemoteAddr to obtain the IP address of the source of the Web client request.

See Also

From (see page 15182)

RemoteHost (see page 15188)

UserAgent (see page 15191)

Properties That Describe the Web Client

77.1.20.5.32 TWebRequest.RemoteHost Property

Reports the fully qualified reverse domain lookup of the client associated with the HTTP request message.

Pascal

```
property RemoteHost: string;
```

C++

```
__property AnsiString RemoteHost;
```

Description

Use RemoteHost to compose URI values for back-links to the source of the request when the Referer (see page 15188) property is not specified. RemoteHost does not include any path information.

See Also

Referer (see page 15188)

RemoteAddr (see page 15188)

UserAgent (see page 15191)

Properties That Describe the Web Client

77.1.20.5.33 TWebRequest.ScriptName Property

Indicates the value of the script information (if any) of the URL (see page 15190) specified in the HTTP request message.

Pascal

```
property ScriptName: string;
```

C++

```
__property AnsiString ScriptName;
```

Description

Read ScriptName to determine the full path to the Web server application specified by the client request. For example, given this URL (see page 15190):

`http://www.TSite.com/art/gallery.cgi/mammals?animal=dog&color=black`

the ScriptName portion is:

`/art/gallery.cgi`

See Also

Host (see page 15183)

PathInfo (see page 15185)

Query (see page 15186)

URL (see page 15190)

Properties That Identify the Target

77.1.20.5.34 TWebRequest.ServerPort Property

Indicates the port number of the port on the Web server that receives the HTTP request message.

Pascal

```
property ServerPort: Integer;
```

C++

```
__property int ServerPort;
```

Description

Read ServerPort to determine the number of the port used in the connection to the Web server. The Host (see page 15183) property will include the ServerPort if it is specified as part of the URL (see page 15190) for the client request.

See Also

Host (see page 15183)

URL (see page 15190)

77.1.20.5.35 TWebRequest.Title Property

Reports the value of the Title header of the HTTP request message.

Pascal

```
property Title: string;
```

C++

```
__property AnsiString Title;
```

Description

Read Title to determine the Title of the information requested in the Web client request.

See Also

Cookie (see page 15180)

Title (see page 15217)

Properties That Describe the Content

77.1.20.5.36 TWebRequest.URL Property

Reports the Uniform Resource Identifier (URI) specified by the HTTP request message to identify the target of the request.

Pascal

```
property URL: string;
```

C++

```
__property AnsiString URL;
```

Description

Use the URL property to identify the resource the Web client identifies as the target of the request message. URL may be an HTML page to return, a resource to be created or deleted, or an object that provides some other service for the Web client.

The TWebRequest (see page 15161) object parses the URL into its constituent parts, yielding the Host (see page 15183), ScriptName (see page 15189), PathInfo (see page 15185), and Query (see page 15186) properties.

Note: Usually the URL property is a Uniform Resource Locator (URL) that can be parsed into host, script, path, and query portions. However, it is possible for HTTP request messages to specify the target in more general terms, as a Uniform Resource Identifier (URI).

See Also

Host (see page 15183)

PathInfo (see page 15185)

Query (see page 15186)

ScriptName (see page 15189)

Properties That Identify the Target

77.1.20.5.37 TWebRequest.UserAgent Property

Reports the value of the User-Agent header of the HTTP request message.

Pascal

```
property UserAgent: string;
```

C++

```
__property AnsiString UserAgent;
```

Description

Read UserAgent to obtain information about the user agent originating the client request. Use the UserAgent information for statistical purposes, for tracing protocol violations, and for tailoring responses to known limitations of specific applications that generate client requests. The UserAgent string contains one or more descriptors, in order of significance. Each descriptor gives the name of the product or application that generated the request, or a comment about the user agent.

Properties That Describe the Web Client

77.1.21 TWebResponse Class

TWebResponse is the base class for all objects that represent HTTP messages sent in response to an HTTP request message.

Class Hierarchy

Pascal

```
TWebResponse = class(TObject);
```

C++

```
class TWebResponse : public TObject;
```

File

HTTPApp

Description

Use a descendant of TWebResponse to specify the response to an HTTP request message.

A web application creates a TWebResponse object based on the TWebRequest (see page 15161) object for an incoming HTTP request message. The Web dispatcher for the application then passes the TWebResponse object to the TWebActionItem (see page 15130) associated with the TWebRequest (see page 15161) object, so that the response can be formulated.

TWebResponse has descendants that represent HTTP response messages in different types of web server applications. These descendants are

TApacheResponse objects in Apache server applications.

TCGIResponse objects in CGI server applications.

TISAPIResponse objects in server DLLs (Windows only).

TWinCGIResponse objects in Windows-based CGI servers (Windows only).

See Also

TApacheResponse

TCGIResponse (see page 2572)

Dispatching Requests and Responses

77.1.21.1 TWebResponse Members

The following tables list the members exposed by TWebResponse.

Protected Fields

	Name	Description
	FCustomHeaders (see page 15195)	This is FCustomHeaders, a member of class TWebResponse.
	FHTTPRequest (see page 15196)	This is FHTTPRequest, a member of class TWebResponse.

Protected Methods

	Name	Description
	AddCustomHeaders (see page 15197)	Appends the custom headers specified by the CustomHeaders (see page 15211) property to the Headers parameter.
	FormatAuthenticate (see page 15197)	Lists of one or more comma-separated challenges provided when the request fails with StatusCode (see page 15215) 401 (Unauthorized).
A	GetContent (see page 15198)	Provides the abstract (pure virtual) prototype of a method to access the Content (see page 15207) property.
A	GetDateVariable (see page 15198)	Provides the abstract (pure virtual) prototype of a method to extract a date value from an indexed table of HTTP header variables.
A	GetIntegerVariable (see page 15199)	Provides the abstract (in C++ terminology, pure vitrual) prototype of a method to extract an integer value from an indexed table of HTTP header variables.
A	GetLogMessage (see page 15199)	Provides the abstract (pure virtual) prototype of a method to access the LogMessage (see page 15214) property.
A	GetStatusCode (see page 15199)	Provides the abstract (pure virtual) prototype of a method to access the StatusCode (see page 15215) property.

	GetStringVariable (see page 15200)	Provides the prototype of a method to extract a string value from an indexed table of HTTP header variables.
	SetContent (see page 15202)	Provides the abstract (pure virtual) prototype of a method to set the Content (see page 15207) property.
	SetContentStream (see page 15203)	Sets the value of the ContentStream (see page 15209) property to the Value parameter.
	SetDateVariable (see page 15204)	Provides the abstract (pure virtual) prototype of a method to set a date-time valued HTTP header property.
	SetIntegerVariable (see page 15204)	Provides the abstract (pure virtual) prototype of a method to set an integer valued HTTP header property.
	SetLogMessage (see page 15205)	Provides the abstract (pure virtual) prototype of a method to set the value of the LogMessage (see page 15214) property.
	SetStatusCode (see page 15205)	Provides the abstract (pure virtual) prototype of a method to set the value of the StatusCode (see page 15215) property.
	SetStringVariable (see page 15205)	Provides the abstract (pure virtual) prototype of a method to set a string valued HTTP header property.

Public Methods

	Name	Description
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 15194)	Creates an instance of Create to represent the response to the HTTPRequest (see page 15213) parameter.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 15195)	Disposes of an object instance.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetCustomHeader (see page 15198)	Returns the value of the custom header with the specified name.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SendRedirect (see page 15201)	Provides the abstract (pure virtual) prototype of a method that sends the response with a StatusCode (see page 15215) of 301 (Moved Permanently) and a Location (see page 15214) of URI.
	SendResponse (see page 15201)	Provides the abstract (pure virtual) prototype of a method that sends the HTTP response message to the web client.
	SendStream (see page 15201)	Provides the abstract (pure virtual) prototype of a method that sends the HTTP response message with the contents set to the contents of AStream.

V	Sent (see page 15202)	Indicates whether the HTTP response message has already been sent.
	SetCookieField (see page 15203)	Adds a cookie header to the response message.
	SetCustomHeader (see page 15203)	Replaces the value of a specified custom header.

Public Properties

	Name	Description
	Allow (see page 15207)	Lists the HTTP request methods that the application can service.
	Content (see page 15207)	Contains the information sent to the web client in response to an HTTP request message.
	ContentEncoding (see page 15208)	Lists the mechanisms, if any, that are used to encode the content of the HTTP response message.
	ContentLength (see page 15208)	Specifies the length, in bytes, of the Content (see page 15207) property.
	ContentStream (see page 15209)	Specifies the stream object for writing the contents of the HTTP response message to the web client.
	ContentType (see page 15209)	Indicates the media type of the Content (see page 15207) of the HTTP response message.
	ContentVersion (see page 15210)	Represents the version associated with the Content (see page 15207) of the HTTP response message.
R	Cookies (see page 15210)	Lists all cookie headers that should be sent with the response.
	CustomHeaders (see page 15211)	Lists message header strings that are added to the response message before it is sent.
	Date (see page 15211)	Indicates the time and date when the HTTP response message is sent to the web client.
	DerivedFrom (see page 15212)	Specifies the URI of the resource where the Content (see page 15207) of the HTTP response originated.
	Expires (see page 15212)	Specifies the date and time after which the Content (see page 15207) of the HTTP response message should be considered invalid.
R	HTTPRequest (see page 15213)	Represents the HTTP request message for which this is a response.
	LastModified (see page 15213)	Indicates the date and time that the value of the Content (see page 15207) property was last updated.
	Location (see page 15214)	Specifies the URI of a resource the web client should point to for the completion of its request.
	LogMessage (see page 15214)	Describes the HTTP response message for event logging purposes.
	Realm (see page 15214)	Specifies the set of protected-access URIs that includes the URL specified by the HTTP request message.
	ReasonString (see page 15215)	Indicates the status of the response to the web client request as a human-readable string.
	Server (see page 15215)	Provides information about the software used by the server application to handle the request.
	StatusCode (see page 15215)	Indicates the status of the response to the HTTP request message as a 3-digit integer.
	Title (see page 15217)	Specifies a title for the Content (see page 15207) of the HTTP response message.
	Version (see page 15217)	Specifies the HTTP protocol version number that the web client is using.
	WWWAuthenticate (see page 15218)	Lists of one or more comma-separated challenges provided when the request fails with StatusCode (see page 15215) 401 (Unauthorized).

77.1.21.2 TWebResponse.Create Constructor

Creates an instance of Create to represent the response to the HTTPRequest (see page 15213) parameter.

Pascal

```
constructor Create(HTTPRequest: TWebRequest);
```

C++

```
__fastcall TWebResponse(TWebRequest HTTPRequest);
```

Description

Applications shouldn't need to call Create to instantiate a response object. The TWebApplication object creates a Create for

each TWebRequest (see page 15161) it creates.

See Also

TWebApplication (see page 24618)

TWebRequest (see page 15161)

77.1.21.3 TWebResponse.Destroy Destructor

Disposes of an object instance.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TWebResponse();
```

Description

Do not call System::TObject::Destroy directly. Call System::TObject::Free instead. Free verifies that the object reference is not nil before calling System::TObject::Destroy.

The System::TObject::Destroy method defined by System::TObject::TObject deallocates memory. Descendant objects usually define a destructor that is customized for that particular kind of object.

When declaring a System::TObject::Destroy method in a descendant, always add the override directive to the declaration and call the inherited System::TObject::Destroy as the last statement in the overriding method. Since System::TObject::Destroy is a virtual method, overriding it ensures that the proper inherited behavior occurs.

Note: If an exception escapes from the constructor, the destructor is called to destroy the partially constructed object instance that failed to initialize completely. Therefore, destructors should check that allocated resources, such as handles, were actually allocated before trying to release them, since their value might be zero.

System::TObject::Destroy should be implemented so that it calls System::TObject::Free on all subobjects created within the object's constructor (that is, allocated by the constructor). Unlike System::TObject::Destroy, System::TObject::Free provides a safeguard when destroying objects that are nil.

See Also

System::TObject::Free (see page 22300)

77.1.21.4 TWebResponse Fields

The fields of the TWebResponse class are listed here.

Protected Fields

	Name	Description
	FCustomHeaders (see page 15195)	This is FCustomHeaders, a member of class TWebResponse.
	FHTTPRequest (see page 15196)	This is FHTTPRequest, a member of class TWebResponse.

77.1.21.4.1 TWebResponse.FCustomHeaders Field

Pascal

```
FCustomHeaders: TStrings;
```

C++

```
TStrings FCustomHeaders;
```

Description

This is FCustomHeaders, a member of class TWebResponse.

77.1.21.4.2 TWebResponse.FHTTPRequest Field

Pascal

```
FHTTPRequest: TWebRequest;
```

C++

```
TWebRequest FHTTPRequest;
```

Description

This is FHTTPRequest, a member of class TWebResponse.

77.1.21.5 TWebResponse Methods

The methods of the TWebResponse class are listed here.

Protected Methods

	Name	Description
	AddCustomHeaders (see page 15197)	Appends the custom headers specified by the CustomHeaders (see page 15211) property to the Headers parameter.
	FormatAuthenticate (see page 15197)	Lists of one or more comma-separated challenges provided when the request fails with StatusCode (see page 15215) 401 (Unauthorized).
A	GetContent (see page 15198)	Provides the abstract (pure virtual) prototype of a method to access the Content (see page 15207) property.
A	GetDateVariable (see page 15198)	Provides the abstract (pure virtual) prototype of a method to extract a date value from an indexed table of HTTP header variables.
A	GetIntegerVariable (see page 15199)	Provides the abstract (in C++ terminology, pure vitrual) prototype of a method to extract an integer value from an indexed table of HTTP header variables.
A	GetLogMessage (see page 15199)	Provides the abstract (pure virtual) prototype of a method to access the LogMessage (see page 15214) property.
A	GetStatusCode (see page 15199)	Provides the abstract (pure virtual) prototype of a method to access the StatusCode (see page 15215) property.
A	GetStringVariable (see page 15200)	Provides the prototype of a method to extract a string value from an indexed table of HTTP header variables.
A	SetContent (see page 15202)	Provides the abstract (pure virtual) prototype of a method to set the Content (see page 15207) property.
V	SetContentStream (see page 15203)	Sets the value of the ContentStream (see page 15209) property to the Value parameter.
A	SetDateVariable (see page 15204)	Provides the abstract (pure virtual) prototype of a method to set a date-time valued HTTP header property.
A	SetIntegerVariable (see page 15204)	Provides the abstract (pure virtual) prototype of a method to set an integer valued HTTP header property.
A	SetLogMessage (see page 15205)	Provides the abstract (pure virtual) prototype of a method to set the value of the LogMessage (see page 15214) property.
A	SetStatusCode (see page 15205)	Provides the abstract (pure virtual) prototype of a method to set the value of the StatusCode (see page 15215) property.
A	SetStringVariable (see page 15205)	Provides the abstract (pure virtual) prototype of a method to set a string valued HTTP header property.

Public Methods

	Name	Description
	GetCustomHeader (see page 15198)	Returns the value of the custom header with the specified name.
A	SendRedirect (see page 15201)	Provides the abstract (pure virtual) prototype of a method that sends the response with a StatusCode (see page 15215) of 301 (Moved Permanently) and a Location (see page 15214) of URI.
A	SendResponse (see page 15201)	Provides the abstract (pure virtual) prototype of a method that sends the HTTP response message to the web client.
A	SendStream (see page 15201)	Provides the abstract (pure virtual) prototype of a method that sends the HTTP response message with the contents set to the contents of AStream.
V	Sent (see page 15202)	Indicates whether the HTTP response message has already been sent.
	SetCookieField (see page 15203)	Adds a cookie header to the response message.
	SetCustomHeader (see page 15203)	Replaces the value of a specified custom header.

77.1.21.5.1 TWebResponse.AddCustomHeaders Method

Appends the custom headers specified by the CustomHeaders (see page 15211) property to the Headers parameter.

Pascal

```
procedure AddCustomHeaders(var Headers: string);
```

C++

```
__fastcall AddCustomHeaders(AnsiString Headers);
```

Description

Call AddCustomHeaders to add the message headers described by the CustomHeaders (see page 15211) property to a string of message headers. Each header is added on its own line (separated by carriage return and line feed), in the format HeaderName: Value.

See Also

CustomHeaders (see page 15211)

GetCustomHeader (see page 15198)

77.1.21.5.2 TWebResponse.FormatAuthenticate Method

Lists of one or more comma-separated challenges provided when the request fails with StatusCode (see page 15215) 401 (Unauthorized).

Pascal

```
function FormatAuthenticate: string;
```

C++

```
__fastcall AnsiString FormatAuthenticate();
```

Description

FormatAuthenticate returns the value of WWWAuthenticate (see page 15218) if Realm (see page 15214) is an empty string. If it is not empty, it returns a name/value pair describing the realm of the WWWAuthenticate (see page 15218) property.

See Also

WWWAuthenticate (see page 15218)

Realm (see page 15214)

77.1.21.5.3 TWebResponse.GetContent Method

Provides the abstract (pure virtual) prototype of a method to access the Content (see page 15207) property.

Pascal

```
function GetContent: string; virtual; abstract;
```

C++

```
virtual __fastcall AnsiString GetContent() = 0;
```

Description

Descendants of TWebResponse (see page 15191) implement GetContent to provide an access method for their internal representation of the Content (see page 15207) property. This method is abstract (pure virtual) because response objects for different types of HTTP applications store the value of the Content (see page 15207) property differently.

See Also

Content (see page 15207)

SetContent (see page 15202)

77.1.21.5.4 TWebResponse.GetCustomHeader Method

Returns the value of the custom header with the specified name.

Pascal

```
function GetCustomHeader(const Name: string): String;
```

C++

```
__fastcall AnsiString GetCustomHeader(const AnsiString Name);
```

Description

Call GetCustomHeader to obtain the value of one of the custom headers specified in the CustomHeaders (see page 15211) property. The Name parameter specifies the name of the HTTP message header.

See Also

CustomHeaders (see page 15211)

SetCustomHeader (see page 15203)

77.1.21.5.5 TWebResponse.GetDateVariable Method

Provides the abstract (pure virtual) prototype of a method to extract a date value from an indexed table of HTTP header variables.

Pascal

```
function GetDateVariable(Index: Integer): TDateTime; virtual; abstract;
```

C++

```
virtual __fastcall TDateTime GetDateVariable(int Index) = 0;
```

Description

Descendants of TWebResponse (see page 15191) implement GetDateVariable to provide a method by which date-time values are read from the internal table used to store HTTP header variables. The response object uses GetDateVariable to access the properties that represent dates.

See Also

Date (see page 15211)

Expires (see page 15212)

LastModified (see page 15213)

SetDateVariable (see page 15204)

77.1.21.5.6 TWebResponse.GetIntegerVariable Method

Provides the abstract (in C++ terminology, pure vitrual) prototype of a method to extract an integer value from an indexed table of HTTP header variables.

Pascal

```
function GetIntegerVariable(Index: Integer): Integer; virtual; abstract;
```

C++

```
virtual __fastcall int GetIntegerVariable(int Index) = 0;
```

Description

Descendants of TWebResponse (see page 15191) implement GetIntegerVariable to provide a method by which integer values are read from the internal table used to store HTTP header variables. The response object uses GetIntegerVariable to access the properties that represent integers.

See Also

ContentLength (see page 15208)

SetIntegerVariable (see page 15204)

77.1.21.5.7 TWebResponse.GetLogMessage Method

Provides the abstract (pure virtual) prototype of a method to access the LogMessage (see page 15214) property.

Pascal

```
function GetLogMessage: string; virtual; abstract;
```

C++

```
virtual __fastcall AnsiString GetLogMessage() = 0;
```

Description

Descendants of TWebResponse (see page 15191) implement GetLogMessage to provide an access method for internal representation of the LogMessage (see page 15214) property. This method is abstract (pure virtual) because response objects for different types of HTTP applications store the value of the LogMessage (see page 15214) property differently.

See Also

LogMessage (see page 15214)

SetLogMessage (see page 15205)

77.1.21.5.8 TWebResponse.GetStatusCode Method

Provides the abstract (pure virtual) prototype of a method to access the StatusCode (see page 15215) property.

Pascal

```
function GetStatusCode: Integer; virtual; abstract;
```

C++

```
virtual __fastcall int GetStatusCode() = 0;
```

Description

Descendants of TWebResponse (see page 15191) implement GetStatusCode to provide an access method for internal representation of the StatusCode (see page 15215) property. This method is abstract (pure virtual) because response objects for different types of HTTP applications store the value of the StatusCode (see page 15215) property differently.

See Also

StatusCode (see page 15215)

SetStatusCode (see page 15205)

77.1.21.5.9 TWebResponse.GetStringVariable Method

Provides the prototype of a method to extract a string value from an indexed table of HTTP header variables.

Pascal

```
function GetStringVariable(Index: Integer): string; virtual; abstract;
```

C++

```
virtual __fastcall AnsiString GetStringVariable(int Index) = 0;
```

Description

GetStringVariable provides the abstract (pure virtual) prototype of a method to extract a string value from an indexed table of HTTP header variables. Descendants of TWebResponse (see page 15191) implement GetStringVariable to provide a method by which the string values are read from the internal table used to store HTTP header variables. The response object uses GetStringVariable to access the properties that represent strings.

See Also

Allow (see page 15207)

ContentEncoding (see page 15208)

ContentType (see page 15209)

ContentVersion (see page 15210)

DerivedFrom (see page 15212)

Location (see page 15214)

Realm (see page 15214)

ReasonString (see page 15215)

Server (see page 15215)

SetStringVariable (see page 15205)

Title (see page 15217)

Version (see page 15217)

WWWAuthenticate (see page 15218)

77.1.21.5.10 TWebResponse.SendRedirect Method

Provides the abstract (pure virtual) prototype of a method that sends the response with a StatusCode (see page 15215) of 301 (Moved Permanently) and a Location (see page 15214) of URI.

Pascal

```
procedure SendRedirect(const URI: string); virtual; abstract;
```

C++

```
virtual __fastcall SendRedirect(const AnsiString URI) = 0;
```

Description

Call SendRedirect to redirect the web client request to another URI that is the proper target of the request. SendRedirect does the same thing as setting the StatusCode (see page 15215) to 301, the Location (see page 15214) to URI, and calling SendResponse (see page 15201).

See Also

Location (see page 15214)

SendResponse (see page 15201)

StatusCode (see page 15215)

Sending the Response

77.1.21.5.11 TWebResponse.SendResponse Method

Provides the abstract (pure virtual) prototype of a method that sends the HTTP response message to the web client.

Pascal

```
procedure SendResponse; virtual; abstract;
```

C++

```
virtual __fastcall SendResponse() = 0;
```

Description

Call SendResponse after setting the properties of the HTTP response object to specify the response that should be made to the web client. If the request should be redirected to another URI, it is more efficient to call SendRedirect (see page 15201) instead.

See Also

SendRedirect (see page 15201)

Sending the Response

77.1.21.5.12 TWebResponse.SendStream Method

Provides the abstract (pure virtual) prototype of a method that sends the HTTP response message with the contents set to the contents of AStream.

Pascal

```
procedure SendStream(AStream: TStream); virtual; abstract;
```

C++

```
virtual __fastcall SendStream(TStream AStream) = 0;
```

Description

Only call SendStream after first calling SendResponse (see page 15201). Unlike SendStream, SendResponse (see page 15201) fills the header of the HTTP response message, based on the properties of the TWebResponse (see page 15191) object. If SendResponse (see page 15201) has not been called first to set the header of the HTTP response message, set the ContentStream (see page 15209) property to AStream, and call SendResponse (see page 15201).

See Also

ContentStream (see page 15209)

SendResponse (see page 15201)

Sent (see page 15202)

77.1.21.5.13 TWebResponse.Sent Method

Indicates whether the HTTP response message has already been sent.

Pascal

```
function Sent: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean Sent();
```

Description

Because SendRedirect (see page 15201) and SendStream (see page 15201) are abstract (pure virtual) methods for TWebResponse (see page 15191), Sent always returns false. Descendants of TWebResponse (see page 15191) override Sent to check whether the message was sent and return true or false as appropriate.

TWebApplication objects read Sent and send unsent responses to the web client.

See Also

SendRedirect (see page 15201)

SendStream (see page 15201)

TWebApplication (see page 24618)

77.1.21.5.14 TWebResponse.SetContent Method

Provides the abstract (pure virtual) prototype of a method to set the Content (see page 15207) property.

Pascal

```
procedure SetContent(const Value: string); virtual; abstract;
```

C++

```
virtual __fastcall SetContent(const AnsiString Value) = 0;
```

Description

Descendants of TWebResponse (see page 15191) implement SetContent to provide a method for setting the Content (see page 15207) property. This method is abstract (pure virtual) because response objects for different types of HTTP applications can store the value of the Content (see page 15207) property differently.

See Also

Content (see page 15207)

GetContent (see page 15198)

77.1.21.5.15 TWebResponse.SetContentStream Method

Sets the value of the ContentStream (see page 15209) property to the Value parameter.

Pascal

```
procedure SetContentStream(Value: TStream); virtual;
```

C++

```
virtual __fastcall SetContentStream(TStream Value);
```

Description

SetContentStream frees the previous value of ContentStream (see page 15209) and replaces the property with the Value parameter.

See Also

ContentStream (see page 15209)

77.1.21.5.16 TWebResponse.SetCookieField Method

Adds a cookie header to the response message.

Pascal

```
procedure SetCookieField(Values: TStrings; const ADomain: string; const APath: string;
AExpires: TDateTime; ASecure: Boolean);
```

C++

```
__fastcall SetCookieField(TStrings Values, const AnsiString ADomain, const AnsiString APath,
TDateTime AExpires, Boolean ASecure);
```

Description

Call SetCookieField to add a cookie header to the Cookies (see page 15210) property. Each cookie header contains a set of name/value pairs that can be passed on by the client application. Use the Values parameter to specify the name/value pairs as strings of the form Name=Value. Use the ADomain and APath parameters to indicate which URLs the cookie should be sent to. Use the AExpires parameter to indicate when the cookie is no longer valid. Use the ASecure property to indicate whether the cookie should only be passed on by the client if a secure connection is used.

See the documentation on the Netscape Web site for more information about cookies.

See Also

Cookies (see page 15210)

77.1.21.5.17 TWebResponse.SetCustomHeader Method

Replaces the value of a specified custom header.

Pascal

```
procedure SetCustomHeader(const Name: string; const Value: string);
```

C++

```
__fastcall SetCustomHeader(const AnsiString Name, const AnsiString Value);
```

Description

Call SetCustomHeader to add a new custom header to the list maintained by the CustomHeaders (see page 15211) property, or to change the value of one of the headers already in the list. SetCustomHeader locates the header in the list with the name specified by the Name parameter. If a header with that name is in the list, SetCustomHeader replaces the value of that header with the value specified as the Value parameter. If the name was not found, SetCustomHeader adds a new header to the list with the given name and value.

See Also

CustomHeaders (see page 15211)

GetCustomHeader (see page 15198)

77.1.21.5.18 TWebResponse.SetDateVariable Method

Provides the abstract (pure virtual) prototype of a method to set a date-time valued HTTP header property.

Pascal

```
procedure SetDateVariable(Index: Integer; const Value: TDateTime); virtual; abstract;
```

C++

```
virtual __fastcall SetDateVariable(int Index, const TDateTime Value) = 0;
```

Description

Descendants of TWebResponse (see page 15191) implement SetDateVariable to provide a method by which date-time values are written to the internal table used to store HTTP header variables. The response object uses SetDateVariable to set the properties that represent dates.

See Also

Date (see page 15211)

Expires (see page 15212)

GetDateVariable (see page 15198)

LastModified (see page 15213)

77.1.21.5.19 TWebResponse.SetIntegerVariable Method

Provides the abstract (pure virtual) prototype of a method to set an integer valued HTTP header property.

Pascal

```
procedure SetIntegerVariable(Index: Integer; Value: Integer); virtual; abstract;
```

C++

```
virtual __fastcall SetIntegerVariable(int Index, int Value) = 0;
```

Description

Descendants of TWebResponse (see page 15191) implement SetIntegerVariable to provide a method by which integer values are written to the internal table used to store HTTP header variables. The response object uses SetIntegerVariable to set the properties that represent integers.

See Also

ContentLength (see page 15208)

GetIntegerVariable (see page 15199)

77.1.21.5.20 TWebResponse.SetLogMessage Method

Provides the abstract (pure virtual) prototype of a method to set the value of the LogMessage (see page 15214) property.

Pascal

```
procedure SetLogMessage(const Value: string); virtual; abstract;
```

C++

```
virtual __fastcall SetLogMessage(const AnsiString Value) = 0;
```

Description

Descendants of TWebResponse (see page 15191) implement SetLogMessage to provide a method to set the internal representation of the LogMessage (see page 15214) property. This method is abstract (pure virtual) because response objects for different types of HTTP applications store the value of the LogMessage (see page 15214) property differently.

See Also

GetLogMessage (see page 15199)

LogMessage (see page 15214)

77.1.21.5.21 TWebResponse.SetStatusCode Method

Provides the abstract (pure virtual) prototype of a method to set the value of the StatusCode (see page 15215) property.

Pascal

```
procedure SetStatusCode(Value: Integer); virtual; abstract;
```

C++

```
virtual __fastcall SetStatusCode(int Value) = 0;
```

Description

Descendants of TWebResponse (see page 15191) implement SetStatusCode to provide a method to set the internal representation of the StatusCode (see page 15215) property. This method is abstract (pure virtual) because response objects for different types of HTTP applications store the value of the StatusCode (see page 15215) property differently.

See Also

GetStatusCode (see page 15199)

StatusCode (see page 15215)

77.1.21.5.22 TWebResponse.SetStringVariable Method

Provides the abstract (pure virtual) prototype of a method to set a string valued HTTP header property.

Pascal

```
procedure SetStringVariable(Index: Integer; const Value: string); virtual; abstract;
```

C++

```
virtual __fastcall SetStringVariable(int Index, const AnsiString Value) = 0;
```

Description

Descendants of TWebResponse (see page 15191) implement SetStringVariable to provide a method by which string values are written to the internal table used to store HTTP header variables. The response object uses SetStringVariable to set the properties that represent strings.

See Also

Allow (see page 15207)

ContentEncoding (see page 15208)

ContentType (see page 15209)

ContentVersion (see page 15210)

DerivedFrom (see page 15212)

GetStringVariable (see page 15200)

Location (see page 15214)

Realm (see page 15214)

Title (see page 15217)

Version (see page 15217)

WWWAuthenticate (see page 15218)

77.1.21.6 TWebResponse Properties

The properties of the TWebResponse class are listed here.

Public Properties

	Name	Description
	Allow (see page 15207)	Lists the HTTP request methods that the application can service.
	Content (see page 15207)	Contains the information sent to the web client in response to an HTTP request message.
	ContentEncoding (see page 15208)	Lists the mechanisms, if any, that are used to encode the content of the HTTP response message.
	ContentLength (see page 15208)	Specifies the length, in bytes, of the Content (see page 15207) property.
	ContentStream (see page 15209)	Specifies the stream object for writing the contents of the HTTP response message to the web client.
	ContentType (see page 15209)	Indicates the media type of the Content (see page 15207) of the HTTP response message.
	ContentVersion (see page 15210)	Represents the version associated with the Content (see page 15207) of the HTTP response message.
R	Cookies (see page 15210)	Lists all cookie headers that should be sent with the response.
	CustomHeaders (see page 15211)	Lists message header strings that are added to the response message before it is sent.
	Date (see page 15211)	Indicates the time and date when the HTTP response message is sent to the web client.
	DerivedFrom (see page 15212)	Specifies the URI of the resource where the Content (see page 15207) of the HTTP response originated.
	Expires (see page 15212)	Specifies the date and time after which the Content (see page 15207) of the HTTP response message should be considered invalid.
R	HTTPRequest (see page 15213)	Represents the HTTP request message for which this is a response.
	LastModified (see page 15213)	Indicates the date and time that the value of the Content (see page 15207) property was last updated.
	Location (see page 15214)	Specifies the URI of a resource the web client should point to for the completion of its request.
	LogMessage (see page 15214)	Describes the HTTP response message for event logging purposes.

	Realm (see page 15214)	Specifies the set of protected-access URIs that includes the URL specified by the HTTP request message.
	ReasonString (see page 15215)	Indicates the status of the response to the web client request as a human-readable string.
	Server (see page 15215)	Provides information about the software used by the server application to handle the request.
	StatusCode (see page 15215)	Indicates the status of the response to the HTTP request message as a 3-digit integer.
	Title (see page 15217)	Specifies a title for the Content (see page 15207) of the HTTP response message.
	Version (see page 15217)	Specifies the HTTP protocol version number that the web client is using.
	WWWAuthenticate (see page 15218)	Lists of one or more comma-separated challenges provided when the request fails with StatusCode (see page 15215) 401 (Unauthorized).

77.1.21.6.1 TWebResponse.Allow Property

Lists the HTTP request methods that the application can service.

Pascal

```
property Allow: string;
```

C++

```
__property AnsiString Allow;
```

Description

Use Allow to indicate what type of request methods the server application can respond to for the URI specified by HTTPRequest (see page 15213). Allow is a string of method names, separated by commas. The method names can include any pre-defined methods from the HTTP standard, or any additional methods implemented by the server application. At a minimum, the TWebResponse (see page 15191) object must allow GET and HEAD requests.

See Also

HTTPRequest (see page 15213)

TWebRequest (see page 15161)

URL (see page 15190)

Describing the Server Application

77.1.21.6.2 TWebResponse.Content Property

Contains the information sent to the web client in response to an HTTP request message.

Pascal

```
property Content: string;
```

C++

```
__property AnsiString Content;
```

Description

Use Content to send requested information to the web client. Not every HTTP request message requires content to be returned. For example, responses to requests with a Method of OPTIONS, HEAD, POST, PUT, DELETE, or TRACE should not include any Content. In all these cases, the response information is contained entirely in the response header, which is built from the other properties of the TWebResponse (see page 15191) object.

The response content can be a string of HTML commands, the name of an HTML file, graphic content such as a bit-stream, or any other MIME content type.

Note: If the ContentStream (see page 15209) property is set, it supersedes the value of the Content property. If both Content and ContentStream (see page 15209) are set, the web client is sent the value of the ContentStream (see page 15209), not the value of the Content property.

See Also

ContentEncoding (see page 15208)

ContentLength (see page 15208)

ContentStream (see page 15209)

ContentType (see page 15209)

ContentVersion (see page 15210)

DerivedFrom (see page 15212)

Expires (see page 15212)

TWebRequest (see page 15161)

Responding to Request Messages with Action Items

Setting the Response Content

77.1.21.6.3 TWebResponse.ContentEncoding Property

Lists the mechanisms, if any, that are used to encode the content of the HTTP response message.

Pascal

```
property ContentEncoding: string;
```

C++

```
__property AnsiString ContentEncoding;
```

Description

Set ContentEncoding when the value of Content (see page 15207) has been encoded before it is sent to the web client. The encoding mechanisms are listed in the order in which they are applied, separated by commas. Typically, ContentEncoding indicates a compression method or an encoding method used to transfer extended-ASCII characters over the net.

See Also

Content (see page 15207)

ContentType (see page 15209)

Describing the Content

77.1.21.6.4 TWebResponse.ContentLength Property

Specifies the length, in bytes, of the Content (see page 15207) property.

Pascal

```
property ContentLength: Integer;
```

C++

```
__property int ContentLength;
```

Description

Set ContentLength to the length of the Content (see page 15207) property, if it is known. If the length of the Content (see page 15207) property is unknown, or if the response message does not include any content, set ContentLength to 0. Web clients use the ContentLength when reading the contents of the HTTP response message.

If the contents of the response message are taken from a stream, the value of ContentLength is set from the stream.

See Also

Content (see page 15207)

ContentStream (see page 15209)

Describing the Content

77.1.21.6.5 TWebResponse.ContentStream Property

Specifies the stream object for writing the contents of the HTTP response message to the web client.

Pascal

```
property ContentStream: TStream;
```

C++

```
__property TStream ContentStream;
```

Description

Use ContentStream to set the contents of the HTTP response message to a value that can be written from a stream. ContentStream allows the response object to write its contents directly from a stream.

The stream specified by ContentStream can access a string of HTML commands, the contents of a BLOB database field, or any MIME content type.

Note: ContentStream supersedes the Content (see page 15207) property. If both Content (see page 15207) and ContentStream are set, the web client is sent the value of the ContentStream, not the value of the Content (see page 15207) property.

See Also

Content (see page 15207)

ContentType (see page 15209)

ContentVersion (see page 15210)

DerivedFrom (see page 15212)

Expires (see page 15212)

Setting the Response Content

77.1.21.6.6 TWebResponse.ContentType Property

Indicates the media type of the Content (see page 15207) of the HTTP response message.

Pascal

```
property ContentType: string;
```

C++

```
__property AnsiString ContentType;
```

Description

Set ContentType to indicate the media type of the Content (see page 15207) of the HTTP response message. The value of ContentType must specify a valid MIME content type. The ContentType string has the form Type/SubType.

For example, if the HTTP response message sends a string of HTML commands to the web client in response to a GET request, the ContentType is text/html.

Note: If the HTTP request message includes an Accept header, ContentType should be one of the content types listed in the Accept property of TWebRequest (see page 15161).

See Also

Content (see page 15207)

Accept (see page 15174)

Describing the Content

77.1.21.6.7 TWebResponse.ContentVersion Property

Represents the version associated with the Content (see page 15207) of the HTTP response message.

Pascal

```
property ContentVersion: string;
```

C++

```
__property AnsiString ContentVersion;
```

Description

Use ContentVersion to specify a version associated with the Content (see page 15207) of the HTTP response. The meaning of ContentVersion depends on the type of information that is sent in the HTTP response. For example, if the Content (see page 15207) of the HTTP response has a ContentType (see page 15209) of text/html, ContentVersion would be the version of HTML used.

Server (see page 15215) applications that introduce meanings for the ContentVersion property should document the interpretation they assign to ContentVersion.

See Also

Content (see page 15207)

ContentType (see page 15209)

Describing the Content

77.1.21.6.8 TWebResponse.Cookies Property

Lists all cookie headers that should be sent with the response.

Pascal

```
property Cookies: TCookieCollection;
```

C++

```
__property TCookieCollection Cookies;
```

Description

Use Cookies to obtain direct access to the individual TCookie (see page 15092) objects that represent the fields of the cookie headers in the response message. Each TCookie (see page 15092) object represents in individual cookie header that is

included with the response message.

Use the Add method of the cookie collection to add a single cookie to the collection, or use the SetCookieField (see page 15203) method to add multiple related cookie headers to this collection. SetCookieField (see page 15203) creates and adds new cookies that share a common set of values for the domain, path, expires, and secure fields. Use the HeaderValue property of the individual entries in Cookies to determine the actual response header string that is sent for each cookie header.

Note: For more information about the use of cookies, see the documentation on Netscape's Web site.

See Also

SetCookieField (see page 15203)

Cookie (see page 15180)

TCookie (see page 15092)

Describing the Server Application

77.1.21.6.9 TWebResponse.CustomHeaders Property

Lists message header strings that are added to the response message before it is sent.

Pascal

```
property CustomHeaders: TStrings;
```

C++

```
__property TStrings CustomHeaders;
```

Description

Use CustomHeaders to add header information to the response that can not be specified using the other properties of TWebResponse (see page 15191). Each string in the CustomHeaders property has the form HeaderName=Value, where HeaderName specifies the name of the header, and Value is the value for that header, formatted as a string.

Note: Setting the CustomHeaders property assigns a set of strings to the custom headers list. It does not replace the TStrings object that is the value of CustomHeaders.

Warning: CustomHeaders includes at most one value for each HeaderName. If the HTTP message includes multiple headers with the same name, only the first header's value will appear in CustomHeaders.

See Also

GetCustomHeader (see page 15198)

SetCustomHeader (see page 15203)

TStrings (see page 3029)

Assign (see page 3043)

77.1.21.6.10 TWebResponse.Date Property

Indicates the time and date when the HTTP response message is sent to the web client.

Pascal

```
property Date: TDateTime;
```

C++

```
__property TDateTime Date;
```

Description

Set Date to the current date and time immediately before sending the HTTP response message to the web client. The Web client uses Date to determine the age of the information returned.

Date is represented using the TDateTime type. The integral part of a TDateTime value is the number of days that have passed since December 30, 1899. The fractional part of a TDateTime value is the fraction of a 24-hour day that has elapsed.

See Also

Expires (see page 15212)

LastModified (see page 15213)

77.1.21.6.11 TWebResponse.DerivedFrom Property

Specifies the URI of the resource where the Content (see page 15207) of the HTTP response originated.

Pascal

```
property DerivedFrom: string;
```

C++

```
__property AnsiString DerivedFrom;
```

Description

Set DerivedFrom to the URI where the value of Content (see page 15207) originates. It is especially important to set DerivedFrom when the Content (see page 15207) of the HTTP response did not originate from the resource indicated by the URL property of the request object.

See Also

Content (see page 15207)

URL (see page 15190)

Describing the Content

77.1.21.6.12 TWebResponse.Expires Property

Specifies the date and time after which the Content (see page 15207) of the HTTP response message should be considered invalid.

Pascal

```
property Expires: TDateTime;
```

C++

```
__property TDateTime Expires;
```

Description

Set Expires when the Content (see page 15207) of the HTTP response message contains information that may become invalid with the passage of time. Setting an Expires value does not imply that the information or its source will necessarily change or cease to exist when the Expires date and time is reached. Web clients are simply warned to check the freshness of the information after the Expires date and time.

The value of Expires is specified in Greenwich Mean Time.

Expires is represented using the TDateTime type. The integral part of a TDateTime value is the number of days that have passed since December 30, 1899. The fractional part of a TDateTime value is the fraction of a 24-hour day that has elapsed.

See Also

Date (see page 15211)

LastModified (see page 15213)

Describing the Content

77.1.21.6.13 TWebResponse.HTTPRequest Property

Represents the HTTP request message for which this is a response.

Pascal

```
property HTTPRequest: TWebRequest;
```

C++

```
__property TWebRequest HTTPRequest;
```

Description

Read HTTPRequest to determine the header and contents of the HTTP request message that spawned this response message. The properties of HTTPRequest give access to the information sent in the web client request message.

See Also

TWebRequest (see page 15161)

77.1.21.6.14 TWebResponse.LastModified Property

Indicates the date and time that the value of the Content (see page 15207) property was last updated.

Pascal

```
property LastModified: TDateTime;
```

C++

```
__property TDateTime LastModified;
```

Description

Set LastModified to indicate the last time the Content (see page 15207) of the response was modified. This allows web clients to determine whether their local version of that information is up-to-date. When the HTTP request is a HEAD message, this may allow the web client and server to skip a potentially expensive transfer of information.

The value of LastModified is specified in the local time of the machine. The HTTP response message translates this value to the date encoding used by HTTP.

LastModified is represented using the TDateTime type. The integral part of a TDateTime value is the number of days that have passed since December 30, 1899. The fractional part of a TDateTime value is the fraction of a 24-hour day that has elapsed.

See Also

Expires (see page 15212)

Date (see page 15211)

IfModifiedSince (see page 15183)

Describing the Content

77.1.21.6.15 TWebResponse.Location Property

Specifies the URI of a resource the web client should point to for the completion of its request.

Pascal

```
property Location: string;
```

C++

```
__property AnsiString Location;
```

Description

Set Location when the TWebResponse (see page 15191) created a new resource in response to the HTTP request message, or when servicing of the request must be delegated to another URI than the one specified in the HTTP request message.

See Also

URL (see page 15190)

Indicating the Need for Client Action

77.1.21.6.16 TWebResponse.LogMessage Property

Describes the HTTP response message for event logging purposes.

Pascal

```
property LogMessage: string;
```

C++

```
__property AnsiString LogMessage;
```

Description

Set LogMessage to a description of the action carried out by the TWebActionItem (see page 15130) object that services this HTTP response. Usually, LogMessage includes the URI that handled the request message, along with date and time information.

See Also

TWebActionItem (see page 15130)

TWebRequest (see page 15161)

77.1.21.6.17 TWebResponse.Realm Property

Specifies the set of protected-access URIs that includes the URL specified by the HTTP request message.

Pascal

```
property Realm: string;
```

C++

```
__property AnsiString Realm;
```

Description

Set Realm when the response message returns 401 (Unauthorized) or 402 (Payment required). Realm is the name of a set of URIs that require a password or payment before the web client can access them. All the URIs in the realm, including the URL specified in the request message, are made available as soon as the Web client provides the password or payment for the realm. The server application should keep track, internally, of the passwords or payments the client has provided, using the client information provided by the TWebRequest (see page 15161) object.

See Also

StatusCode (see page 15215)

TWebRequest (see page 15161)

URL (see page 15190)

WWWAuthenticate (see page 15218)

77.1.21.6.18 TWebResponse.ReasonString Property

Indicates the status of the response to the web client request as a human-readable string.

Pascal

```
property ReasonString: string;
```

C++

```
__property AnsiString ReasonString;
```

Description

Set ReasonString to inform the human web client of the success or failure of the HTTP request message. Each reason string is associated with a 3-digit status code whose value indicates the status of the response. The HTTP standard defines a number of stock status codes and corresponding reason strings. In addition, server applications can define new reason strings and associate them with unused status codes.

See Also

StatusCode (see page 15215)

Indicating the Response Status

77.1.21.6.19 TWebResponse.Server Property

Provides information about the software used by the server application to handle the request.

Pascal

```
property Server: string;
```

C++

```
__property AnsiString Server;
```

Description

Set Server to a string giving the name and version number of the application that provides the Content (see page 15207) of the response message. The value of Server can contain multiple product identifiers and comments, listed in order of significance and separated by spaces. Product identifiers take the form ProductName/VersionNumber.

See Also

Content (see page 15207)

UserAgent (see page 15191)

Describing the Server Application

77.1.21.6.20 TWebResponse.StatusCode Property

Indicates the status of the response to the HTTP request message as a 3-digit integer.

Pascal

```
property StatusCode: Integer;
```

C++

```
__property int StatusCode;
```

Description

Set StatusCode to inform the web client the status of the HTTP request message. Status codes are standard return values that can be interpreted by all web clients. Each status code has a corresponding reason string that provides a human web client with a more understandable indication of the status.

The following tables lists the standard status codes and their corresponding reason strings.

StatusCode	ReasonString (see page 15215)
100	Continue
101	Switching Protocols
200	OK
201	Created
202	Accepted
203	Non-Authoritative Information
204	No Content (see page 15207)
205	Reset Content (see page 15207)
206	Partial Content (see page 15207)
300	Multiple Choices
301	Moved Permanently
302	Moved Temporarily
303	See Other
304	Not Modified
305	Use Proxy
400	Bad Request
401	Unauthorized
402	Payment Required
403	Forbidden
404	Not Found
405	Method Not Allowed
406	Not Acceptable
407	Proxy Authentication Required
408	Request Time-out
409	Conflict
410	Gone
411	Length Required
412	Precondition Failed
413	Request Entity Too Large

414	Request-URI Too Large
415	Unsupported Media Type
500	Internal Server (see page 15215) Error
501	Not Implemented
502	Bad Gateway
503	Service Unavailable
504	Gateway Time-out
505	HTTP Version (see page 15217) not supported

Status codes not in the table can be created by the server application. When creating a new status code, the most significant digit should indicate the class of response, as follows:

1xx: Informational (Request received, continuing process)

2xx: Success (Request received, understood, and accepted)

3xx: Redirection (Further action needed to complete the request)

4xx: Client Error (Request contains bad syntax or cannot be serviced)

5xx: Server (see page 15215) Error (Server (see page 15215) failed to handle a valid request)

See Also

ReasonString (see page 15215)

Indicating the Response Status

77.1.21.6.21 TWebResponse.Title Property

Specifies a title for the Content (see page 15207) of the HTTP response message.

Pascal

```
property Title: string;
```

C++

```
__property AnsiString Title;
```

Description

Set the Title property to add a Title header to the HTTP response message. Title is an optional application-specific title associated with the information included in the message.

See Also

Title (see page 15190)

Describing the Content

77.1.21.6.22 TWebResponse.Version Property

Specifies the HTTP protocol version number that the web client is using.

Pascal

```
property Version: string;
```

C++

```
__property AnsiString Version;
```

Description

Read Version to ensure that the properties set in the TWebResponse (see page 15191) object will be understood by the Web client. The value of Version is taken from the ProtocolVersion property of the TWebRequest (see page 15161) object.

For more information on the different HTTP protocol versions, see the Internet standards documentation.

See Also

ProtocolVersion (see page 15186)

77.1.21.6.23 TWebResponse.WWWAuthenticate Property

Lists of one or more comma-separated challenges provided when the request fails with StatusCode (see page 15215) 401 (Unauthorized).

Pascal

```
property WWWAuthenticate: string;
```

C++

```
__property AnsiString WWWAuthenticate;
```

Description

Set WWWAuthenticate when the HTTP request fails because it requires access to a URI in a realm for which the Web client has not provided a password. WWWAuthenticate consists of an authentication scheme name, followed by a comma-separated list of parameter/value pairs that specify the parameters to the authentication scheme. The first parameter/value pair indicates the realm.

For more information about HTTP authentication schemes, see the Internet standards documents.

See Also

Realm (see page 15214)

StatusCode (see page 15215)

Indicating the Need for Client Action

77.2 Interfaces

The following table lists interfaces in this documentation.

Interfaces

	Name	Description
	IGetAppDispatcher (see page 15219)	This is class HTTPApp.IGetAppDispatcher.
	IGetWebAppServices (see page 15220)	This is class HTTPApp.IGetWebAppServices.
	IGetWebRequestHandler (see page 15221)	This is class HTTPApp.IGetWebRequestHandler.
	IMultiModuleSupport (see page 15222)	This is class HTTPApp.IMultiModuleSupport.
	IProduceContent (see page 15223)	IProduceContent is the interface for generating the content of a Web page.
	IProduceContentFrom (see page 15225)	This is class HTTPApp.IProduceContentFrom.
	ISetAppDispatcher (see page 15226)	This is class HTTPApp.ISetAppDispatcher.
	IWebAppServices (see page 15227)	IWebAppServices is the interface for setting up and finishing the processing of HTTP request messages.
	IWebDispatch (see page 15230)	
	IWebDispatchActions (see page 15233)	IWebDispatchActions is the interface for components that dispatch HTTP request messages using action items.
	IWebDispatcherAccess (see page 15234)	IWebDispatcherAccess provides access to the current HTTP request and response object.
	IWebExceptionHandler (see page 15236)	This is class HTTPApp.IWebExceptionHandler.
	IWebRequestHandler (see page 15237)	IWebRequestHandler is the interface for objects that dispatch HTTP request messages.

77.2.1 IGetAppDispatcher Interface

Class Hierarchy

HTTPApp.IGetAppDispatcher

Pascal

```
IGetAppDispatcher = interface;
```

C++

```
__interface IGetAppDispatcher;
```

File

HTTPApp

Description

This is class HTTPApp.IGetAppDispatcher.

77.2.1.1 IGetAppDispatcher Members

The following tables list the members exposed by IGetAppDispatcher.

Public Methods

	Name	Description
	GetAppDispatcher (see page 15220)	This is GetAppDispatcher, a member of class IGetAppDispatcher.

77.2.1.2 IGetAppDispatcher Methods

The methods of the IGetAppDispatcher class are listed here.

Public Methods

	Name	Description
	GetAppDispatcher (see page 15220)	This is GetAppDispatcher, a member of class IGetAppDispatcher.

77.2.1.2.1 IGetAppDispatcher.GetAppDispatcher Method

Pascal

```
function GetAppDispatcher: TComponent;
```

C++

```
__fastcall TComponent * GetAppDispatcher();
```

Description

This is GetAppDispatcher, a member of class IGetAppDispatcher.

77.2.2 IGetWebAppServices Interface

Class Hierarchy

HTTPApp.IGetWebAppServices

Pascal

```
IGetWebAppServices = interface;
```

C++

```
__interface IGetWebAppServices;
```

File

HTTPApp

Description

This is class HTTPApp.IGetWebAppServices.

77.2.2.1 IGetWebAppServices Members

The following tables list the members exposed by IGetWebAppServices.

Public Methods

	Name	Description
	GetWebAppServices (see page 15221)	This is GetWebAppServices, a member of class IGetWebAppServices.

77.2.2.2 IGetWebAppServices Methods

The methods of the IGetWebAppServices class are listed here.

Public Methods

	Name	Description
	GetWebAppServices (see page 15221)	This is GetWebAppServices, a member of class IGetWebAppServices.

77.2.2.2.1 IGetWebAppServices.GetWebAppServices Method

Pascal

```
function GetWebAppServices: IWebAppServices;
```

C++

```
__fastcall IWebAppServices GetWebAppServices();
```

Description

This is GetWebAppServices, a member of class IGetWebAppServices.

77.2.3 IGetWebRequestHandler Interface

Class Hierarchy

HTTPApp.IGetWebRequestHandler

Pascal

```
IGetWebRequestHandler = interface;
```

C++

```
__interface IGetWebRequestHandler;
```

File

HTTPApp

Description

This is class HTTPApp.IGetWebRequestHandler.

77.2.3.1 IGetWebRequestHandler Members

The following tables list the members exposed by IGetWebRequestHandler.

Public Methods

	Name	Description
	GetWebRequestHandler (see page 15222)	This is GetWebRequestHandler, a member of class IGetWebRequestHandler.

77.2.3.2 IGetWebRequestHandler Methods

The methods of the IGetWebRequestHandler class are listed here.

Public Methods

	Name	Description
	GetWebRequestHandler (see page 15222)	This is GetWebRequestHandler, a member of class IGetWebRequestHandler.

77.2.3.2.1 IGetWebRequestHandler.GetWebRequestHandler Method

Pascal

```
function GetWebRequestHandler: IWebRequestHandler;
```

C++

```
__fastcall IWebRequestHandler GetWebRequestHandler();
```

Description

This is GetWebRequestHandler, a member of class IGetWebRequestHandler.

77.2.4 IMultiModuleSupport Interface

Class Hierarchy

HTTPApp.IMultiModuleSupport

Pascal

```
IMultiModuleSupport = interface;
```

C++

```
__interface IMultiModuleSupport;
```

File

HTTPApp

Description

This is class HTTPApp.IMultiModuleSupport.

77.2.4.1 IMultiModuleSupport Members

The following tables list the members exposed by IMultiModuleSupport.

Public Methods

	Name	Description
	FinishContext (see page 15223)	This is FinishContext, a member of class IMultiModuleSupport.
	InitContext (see page 15223)	This is InitContext, a member of class IMultiModuleSupport.
	InitModule (see page 15223)	This is InitModule, a member of class IMultiModuleSupport.

77.2.4.2 IMultiModuleSupport Methods

The methods of the IMultiModuleSupport class are listed here.

Public Methods

	Name	Description
	FinishContext (see page 15223)	This is FinishContext, a member of class IMultiModuleSupport.
	InitContext (see page 15223)	This is InitContext, a member of class IMultiModuleSupport.
	InitModule (see page 15223)	This is InitModule, a member of class IMultiModuleSupport.

77.2.4.2.1 IMultiModuleSupport.FinishContext Method

Pascal

```
procedure FinishContext;
```

C++

```
__fastcall FinishContext();
```

Description

This is FinishContext, a member of class IMultiModuleSupport.

77.2.4.2.2 IMultiModuleSupport.InitContext Method

Pascal

```
procedure InitContext(Request: TWebRequest; Response: TWebResponse);
```

C++

```
__fastcall InitContext(TWebRequest Request, TWebResponse Response);
```

Description

This is InitContext, a member of class IMultiModuleSupport.

77.2.4.2.3 IMultiModuleSupport.InitModule Method

Pascal

```
procedure InitModule(AModule: TComponent);
```

C++

```
__fastcall InitModule(TComponent * AModule);
```

Description

This is InitModule, a member of class IMultiModuleSupport.

77.2.5 IProduceContent Interface

IProduceContent is the interface for generating the content of a Web page.

Class Hierarchy

HTTPApp.IProduceContent

Pascal

```
IProduceContent = interface;
```

C++

```
__interface IProduceContent;
```

File

HTTPApp

Description

Content producers (such as TAdapaterPageProducer) implement the IProduceContent interface. This interface defines a single method, ProduceContent (see page 15224), which returns the content to assign to an HTTP response message in a WebSnap application.

Note: In C++, method declarations that use IProduceContent use the _di_IProduceContent type instead. This type is a DelphiInterface wrapper around the IProduceContent interface:

Note: typedef System::DelphiInterface (see page 22167)< IProduceContent > _di_IProduceContent;

See Also

TCustomContentProducer (see page 15102)

TCustomWebPageModule (see page 25357)

TAdapterPagePRoducer

TWebResponse (see page 15191)

77.2.5.1 IProduceContent Members

The following tables list the members exposed by IProduceContent.

Public Methods

	Name	Description
	ProduceContent (see page 15224)	Returns the content that the producer creates.

77.2.5.2 IProduceContent Methods

The methods of the IProduceContent class are listed here.

Public Methods

	Name	Description
	ProduceContent (see page 15224)	Returns the content that the producer creates.

77.2.5.2.1 IProduceContent.ProduceContent Method

Returns the content that the producer creates.

Pascal

```
function ProduceContent: string;
```

C++

```
__fastcall AnsiString ProduceContent();
```

Description

Call ProduceContent to retrieve the content for using in an HTTP response message. In most cases, this content is a string of HTML commands defining a Web page, although it can be any valid MIME type.

See Also

Content (see page 15106)

77.2.6 IProduceContentFrom Interface

Class Hierarchy

HTTPApp.IProduceContentFrom

Pascal

```
IProduceContentFrom = interface;
```

C++

```
__interface IProduceContentFrom;
```

File

HTTPApp

Description

This is class HTTPApp.IProduceContentFrom.

77.2.6.1 IProduceContentFrom Members

The following tables list the members exposed by IProduceContentFrom.

Public Methods

	Name	Description
	ProduceContentFromStream (see page 15225)	This is ProduceContentFromStream, a member of class IProduceContentFrom.
	ProduceContentFromString (see page 15226)	This is ProduceContentFromString, a member of class IProduceContentFrom.

77.2.6.2 IProduceContentFrom Methods

The methods of the IProduceContentFrom class are listed here.

Public Methods

	Name	Description
	ProduceContentFromStream (see page 15225)	This is ProduceContentFromStream, a member of class IProduceContentFrom.
	ProduceContentFromString (see page 15226)	This is ProduceContentFromString, a member of class IProduceContentFrom.

77.2.6.2.1 IProduceContentFrom.ProduceContentFromStream Method

Pascal

```
function ProduceContentFromStream(Stream: TStream): string;
```

C++

```
__fastcall AnsiString ProduceContentFromStream(TStream Stream);
```

Description

This is ProduceContentFromStream, a member of class IProduceContentFrom.

77.2.6.2.2 IProduceContentFrom.ProduceContentFromString Method

Pascal

```
function ProduceContentFromString(const S: string): string;
```

C++

```
__fastcall AnsiString ProduceContentFromString(const AnsiString S);
```

Description

This is ProduceContentFromString, a member of class IProduceContentFrom.

77.2.7 ISetAppDispatcher Interface

Class Hierarchy

HTTPApp.ISetAppDispatcher

Pascal

```
ISetAppDispatcher = interface;
```

C++

```
__interface ISetAppDispatcher;
```

File

HTTPApp

Description

This is class HTTPApp.ISetAppDispatcher.

77.2.7.1 ISetAppDispatcher Members

The following tables list the members exposed by ISetAppDispatcher.

Public Methods

	Name	Description
	SetAppDispatcher (see page 15227)	This is SetAppDispatcher, a member of class ISetAppDispatcher.

77.2.7.2 ISetAppDispatcher Methods

The methods of the ISetAppDispatcher class are listed here.

Public Methods

	Name	Description
	SetAppDispatcher (see page 15227)	This is SetAppDispatcher, a member of class ISetAppDispatcher.

77.2.7.2.1 ISetAppDispatcher.SetAppDispatcher Method

Pascal

```
procedure SetAppDispatcher(const ADispatcher: TComponent);
```

C++

```
__fastcall SetAppDispatcher(const TComponent * ADispatcher);
```

Description

This is SetAppDispatcher, a member of class ISetAppDispatcher.

77.2.8 IWebAppServices Interface

IWebAppServices is the interface for setting up and finishing the processing of HTTP request messages.

Class Hierarchy

HTTPApp.IWebAppServices

Pascal

```
IWebAppServices = interface;
```

C++

```
__interface IWebAppServices;
```

File

HTTPApp

Description

WebSnap applications use the IWebAppServices interface to drive the processing of incoming request messages. When the WebSnap application receives an HTTP request message it

1. Calls InitContext (see page 15229) to set up a Web context for the request.
2. Calls HandleRequest (see page 15229) to forward the request to the components that process it.
3. Calls FinishContext (see page 15228) to shut down the Web context in an orderly fashion.

In addition to providing access to these core methods of the application, IWebAppServices introduces the ExceptionHandler (see page 15230) property. The ExceptionHandler (see page 15230) property allows the application access to the component that handles any exceptions that escape all of the try blocks in the application while processing the message.

Note: Method declarations that use IWebAppServices use the _di_IWebAppServices type instead. This type is a DelphiInterface wrapper around the IWebAppServices interface:

Note: typedef System::DelphiInterface (see page 22167)< IWebAppServices > _di_IWebAppServices;

See Also

TMultiModuleWebAppServices (see page 24933)

AppServices

WebContext

77.2.8.1 IWebAppServices Members

The following tables list the members exposed by IWebAppServices.

Public Methods

	Name	Description
	FinishContext (see page 15228)	Performs any final tasks after the WebSnap application has finished processing a request.
	GetExceptionHandler (see page 15229)	Returns the object that handles exceptions that arise in the WebSnap application.
	HandleRequest (see page 15229)	Directs the processing of the current request message.
	InitContext (see page 15229)	Creates and initializes the Web context for the current Web request.

Public Properties

	Name	Description
R	ExceptionHandler (see page 15230)	Indicates the object that handles exceptions that arise when processing a request message.

77.2.8.2 IWebAppServices Methods

The methods of the IWebAppServices class are listed here.

Public Methods

	Name	Description
	FinishContext (see page 15228)	Performs any final tasks after the WebSnap application has finished processing a request.
	GetExceptionHandler (see page 15229)	Returns the object that handles exceptions that arise in the WebSnap application.
	HandleRequest (see page 15229)	Directs the processing of the current request message.
	InitContext (see page 15229)	Creates and initializes the Web context for the current Web request.

77.2.8.2.1 IWebAppServices.FinishContext Method

Performs any final tasks after the WebSnap application has finished processing a request.

Pascal

```
procedure FinishContext;
```

C++

```
__fastcall FinishContext();
```

Description

FinishContext is called as the last step before a WebSnap application sends a response message back to the caller. FinishContext performs any final tasks, and frees all the objects and components that were created to handle the request message (including the Web context).

See Also

InitContext (see page 15229)

WebContext (see page 24687)

77.2.8.2.2 IWebAppServices.GetExceptionHandler Method

Returns the object that handles exceptions that arise in the WebSnap application.

Pascal

```
function GetExceptionHandler: TObject;
```

C++

```
__fastcall TObject * GetExceptionHandler();
```

Description

GetExceptionHandler is the read implementation of the ExceptionHandler (see page 15230) property.

See Also

ExceptionHandler (see page 15230)

77.2.8.2.3 IWebAppServices.HandleRequest Method

Directs the processing of the current request message.

Pascal

```
function HandleRequest: Boolean;
```

C++

```
__fastcall Boolean HandleRequest();
```

Description

When the WebSnap application receives a request message, it makes the following calls:

1. The InitContext (see page 15229) method is called to generate a Web context for the request.
2. HandleRequest is called to generate a response to the request.
3. FinishContext (see page 15228) is called to perform any final cleanup.

HandleRequest locates the dispatcher components that handle the request and forwards the request to a dispatcher for processing.

HandleRequest returns true if the request is handled and the response should be sent back to the caller (if it was not already sent). It returns false if the WebSnap application could not handle the request.

See Also

InitContext (see page 15229)

FinishContext (see page 15228)

77.2.8.2.4 IWebAppServices.InitContext Method

Creates and initializes the Web context for the current Web request.

Pascal

```
procedure InitContext(WebModuleList: TAbstractWebModuleList; Request: TWebRequest; Response:
TWebResponse);
```

C++

```
__fastcall InitContext(TAbstractWebModuleList WebModuleList, TWebRequest Request, TWebResponse Response);
```

Description

InitContext is called when the WebSnap application first receives a request message to set up the Web context before the application attempts to handle the request. It creates and sets up the global Web context, which can be accessed by calling the global WebContext function. It also performs any other initializations that ready the application for handling a new request message.

WebModuleList lists the currently active Web modules in the WebSnap application and provides access to all Web module factories so that the application can create any new modules it needs for processing the request message.

Request describes the new request message.

Response is the response object that the WebSnap application should fill out when handling the current request.

See Also

FinishContext (see page 15228)

WebContext (see page 24687)

77.2.8.3 IWebAppServices Properties

The properties of the IWebAppServices class are listed here.

Public Properties

	Name	Description
R	ExceptionHandler (see page 15230)	Indicates the object that handles exceptions that arise when processing a request message.

77.2.8.3.1 IWebAppServices.ExceptionHandler Property

Indicates the object that handles exceptions that arise when processing a request message.

Pascal

```
property ExceptionHandler: TObject;
```

C++

```
__property TObject * ExceptionHandler;
```

Description

ExceptionHandler is the object that the WebSnap application calls when an exception is raised while trying to process a request message. The request handler must implement the IWebExceptionHandler (see page 15236) interface, which includes only a single method: HandleException.

77.2.9 IWebDispatch Interface

Class Hierarchy

HTTPApp.IWebDispatch

Pascal

```
IWebDispatch = interface;
```

C++

```
__interface IWebDispatch;
```

File

HTTPApp

See Also

TCustomWebDispatcher (see page 15110)

77.2.9.1 IWebDispatch Members

The following tables list the members exposed by IWebDispatch.

Public Methods

	Name	Description
	DispatchEnabled (see page 15231)	
	DispatchMask (see page 15232)	
	DispatchMethodType (see page 15232)	
	DispatchRequest (see page 15232)	

Public Properties

	Name	Description
R	Enabled (see page 15232)	
R	Mask (see page 15233)	
R	MethodType (see page 15233)	This is MethodType, a member of class IWebDispatch.

77.2.9.2 IWebDispatch Methods

The methods of the IWebDispatch class are listed here.

Public Methods

	Name	Description
	DispatchEnabled (see page 15231)	
	DispatchMask (see page 15232)	
	DispatchMethodType (see page 15232)	
	DispatchRequest (see page 15232)	

77.2.9.2.1 IWebDispatch.DispatchEnabled Method

Pascal

```
function DispatchEnabled: Boolean;
```

C++

```
__fastcall Boolean DispatchEnabled();
```

See Also

Enabled (see page 15232)

77.2.9.2.2 IWebDispatch.DispatchMask Method

Pascal

```
function DispatchMask: TMask;
```

C++

```
__fastcall TMask DispatchMask();
```

See Also

Mask (see page 15233)

77.2.9.2.3 IWebDispatch.DispatchMethodType Method

Pascal

```
function DispatchMethodType: TMethodType;
```

C++

```
__fastcall TMethodType DispatchMethodType();
```

See Also

MethodType (see page 15233)

77.2.9.2.4 IWebDispatch.DispatchRequest Method

Pascal

```
function DispatchRequest(Sender: TObject; Request: TWebRequest; Response: TWebResponse):
Boolean;
```

C++

```
__fastcall Boolean DispatchRequest(TObject * Sender, TWebRequest Request, TWebResponse
Response);
```

77.2.9.3 IWebDispatch Properties

The properties of the IWebDispatch class are listed here.

Public Properties

	Name	Description
R	Enabled (see page 15232)	
R	Mask (see page 15233)	
R	MethodType (see page 15233)	This is MethodType, a member of class IWebDispatch.

77.2.9.3.1 IWebDispatch.Enabled Property

Pascal

```
property Enabled: Boolean;
```

C++

```
__property Boolean Enabled;
```

See Also

DispatchEnabled (see page 15231)

77.2.9.3.2 IWebDispatch.Mask Property

Pascal

```
property Mask: TMask;
```

C++

```
__property TMask Mask;
```

See Also

DispatchMask (see page 15232)

77.2.9.3.3 IWebDispatch.MethodType Property

Pascal

```
property MethodType: TMethodType;
```

C++

```
__property TMethodType MethodType;
```

Description

This is MethodType, a member of class IWebDispatch.

77.2.10 IWebDispatchActions Interface

IWebDispatchActions is the interface for components that dispatch HTTP request messages using action items.

Class Hierarchy

Pascal

```
IWebDispatchActions = interface;
```

C++

```
__interface IWebDispatchActions;
```

File

HTTPApp

Description

Web dispatcher components (TWebDispatcher (see page 15147) and TWebModule (see page 15154)) implement the IWebDispatchActions interface. This interface serves primarily to identify components that use action items to handle HTTP request messages.

To obtain an IWebDispatchActions interface, use the DispatchActions property of a TWebAppComponents object.

Note: In C++, method declarations that use IWebDispatchActions use the _di_IWebDispatchActions type instead. This type is a DelphiInterface wrapper around the IWebDispatchActions interface:

Note: typedef System::DelphiInterface (see page 22167)< IWebDispatchActions > _di_IWebDispatchActions;

See Also

TWebDispatcher (see page 15147)

TWEbModule

TWebAppComponents (see page 24958)

TCustomWebAppComponents (see page 24906)

77.2.11 IWebDispatcherAccess Interface

IWebDispatcherAccess provides access to the current HTTP request and response object.

Class Hierarchy

HTTPApp.IWebDispatcherAccess

Pascal

```
IWebDispatcherAccess = interface;
```

C++

```
__interface IWebDispatcherAccess;
```

File

HTTPApp

Description

The IWebDispatcherAccess interface declares two methods, Request (see page 15235) and Response (see page 15235). These return the objects that represent the current HTTP request message that is being processed and the emerging HTTP response message that will be sent back to the caller.

In Web Broker applications, a TWebDispatcher (see page 15147) or TWebModule (see page 15154) component implements this interface. In WebSnap applications, a TWebAppComponents component implements this interface.

Note: In C++, method declarations that use IWebDispatcherAccess use the _di_IWebDispatcherAccess type instead. This type is a DelphiInterface wrapper around the IWebDispatcherAccess interface:

Note: typedef System::DelphiInterface (see page 22167)< IWebDispatcherAccess > _di_IWebDispatcherAccess;

See Also

TCustomContentProducer (see page 15102)

TWebDispatcher (see page 15147)

TWebAppComponents (see page 24958)

TWebModule (see page 15154)

77.2.11.1 IWebDispatcherAccess Members

The following tables list the members exposed by IWebDispatcherAccess.

Public Methods

	Name	Description
	Request (see page 15235)	Returns the Web request object for the HTTP request message to which the application is responding.
	Response (see page 15235)	Returns the Web response object for the HTTP response message that the application is assembling.

77.2.11.2 IWebDispatcherAccess Methods

The methods of the IWebDispatcherAccess class are listed here.

Public Methods

	Name	Description
	Request (see page 15235)	Returns the Web request object for the HTTP request message to which the application is responding.
	Response (see page 15235)	Returns the Web response object for the HTTP response message that the application is assembling.

77.2.11.2.1 IWebDispatcherAccess.Request Method

Returns the Web request object for the HTTP request message to which the application is responding.

Pascal

```
function Request: TWebRequest;
```

C++

```
__fastcall TWebRequest Request();
```

Description

Call Request to obtain access to the current Web request object. The request object provides access to the headers of the request message, as well as the content of the message.

See Also

Response (see page 15235)

77.2.11.2.2 IWebDispatcherAccess.Response Method

Returns the Web response object for the HTTP response message that the application is assembling.

Pascal

```
function Response: TWebResponse;
```

C++

```
__fastcall TWebResponse Response();
```

Description

Call Response to obtain access to the current Web response object. The response object provides access to the headers of the response message, as well as the content of the message.

See Also

Request (see page 15235)

77.2.12 IWebExceptionHandler Interface

Class Hierarchy

HTTPApp.IWebExceptionHandler

Pascal

```
IWebExceptionHandler = interface;
```

C++

```
__interface IWebExceptionHandler;
```

File

HTTPApp

Description

This is class HTTPApp.IWebExceptionHandler.

77.2.12.1 IWebExceptionHandler Members

The following tables list the members exposed by IWebExceptionHandler.

Public Methods

	Name	Description
	HandleException (see page 15236)	This is HandleException, a member of class IWebExceptionHandler.

77.2.12.2 IWebExceptionHandler Methods

The methods of the IWebExceptionHandler class are listed here.

Public Methods

	Name	Description
	HandleException (see page 15236)	This is HandleException, a member of class IWebExceptionHandler.

77.2.12.2.1 IWebExceptionHandler.HandleException Method

Pascal

```
procedure HandleException(E: Exception; var Handled: Boolean);
```

C++

```
__fastcall HandleException(Exception E, Boolean Handled);
```

Description

This is HandleException, a member of class IWebExceptionHandler.

77.2.13 IWebRequestHandler Interface

IWebRequestHandler is the interface for objects that dispatch HTTP request messages.

Class Hierarchy

HTTPApp.IWebRequestHandler

Pascal

```
IWebRequestHandler = interface;
```

C++

```
__interface IWebRequestHandler;
```

File

HTTPApp

Description

Dispatcher components such as TPageDispatcher , TAdapterDispatcher, and TWebDispatcher (see page 15147) implement the IWebRequestHandler interface. This interface includes only a single method, HandleRequest (see page 15238), which processes an HTTP request message, filling out the corresponding response, which can then be returned to the caller.

Note: In C++, method declarations that use IWebRequestHandler use the _di_IWebRequestHandler type instead. This type is a DelphiInterface wrapper around the IWebRequestHandler interface:

Note: typedef System::DelphiInterface (see page 22167)< IWebRequestHandler > _di_IWebRequestHandler;

See Also

TWebRequest (see page 15161)

TWebResponse (see page 15191)

TMultiModuleWebAppServices (see page 24933)

TPageDispatcher (see page 24949)

TAdapterDispatcher (see page 24840)

TWebDispatcher (see page 15147)

77.2.13.1 IWebRequestHandler Members

The following tables list the members exposed by IWebRequestHandler.

Public Methods

	Name	Description
	HandleRequest (see page 15238)	Processes an HTTP request message.

77.2.13.2 IWebRequestHandler Methods

The methods of the IWebRequestHandler class are listed here.

Public Methods

	Name	Description
	HandleRequest (see page 15238)	Processes an HTTP request message.

77.2.13.2.1 IWebRequestHandler.HandleRequest Method

Processes an HTTP request message.

Pascal

```
function HandleRequest(Request: TWebRequest; Response: TWebResponse): Boolean;
```

C++

```
__fastcall Boolean HandleRequest(TWebRequest Request, TWebResponse Response);
```

Description

Call HandleRequest to process an HTTP request message and obtain the response that should be sent back to the caller.

Request is the request object that describes the request to process.

Response is the response object that should be filled out when the request is processed.

77.3 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	DayOfWeekStr (see page 15239)	Converts a TDateTime into a string representing the day of the week.
	DosPathToUnixPath (see page 15240)	Converts a DOS-compatible path specification to a Unix-compatible path specification.
	ExtractHeaderFields (see page 15240)	Parses a multi-valued string into its constituent fields.
	ExtractHTTPFields (see page 15241)	Parses a multi-valued string into its constituent fields.
	HTMLDecode (see page 15241)	This is function HTTPApp.HTMLDecode.
	HTMLEncode (see page 15242)	This is function HTTPApp.HTMLEncode.
	HTTPDecode (see page 15242)	Decodes a string that includes HTTP escape characters.
	HTTPEncode (see page 15243)	Converts a string into a form that contains no values that are illegal in an HTTP message header.
	MonthStr (see page 15243)	Converts a TDateTime into a string representing the month.
	ParseDate (see page 15244)	Converts a date value from an HTTP message header into a TDateTime.
	RegisterContentParser (see page 15244)	This is function HTTPApp.RegisterContentParser.
	StatusString (see page 15244)	Returns the explanatory string associated with one of the predefined HTTP response status codes.
	UnixPathToDosPath (see page 15245)	Converts a Unix-compatible path specification to a Dos-compatible path specification.

77.3.1 HTTPApp.DayOfWeekStr Function

Converts a TDateTime into a string representing the day of the week.

Pascal

```
function DayOfWeekStr(DateTime: TDateTime): string;
```

C++

```
AnsiString DayOfWeekStr(TDateTime DateTime);
```

File

HTTPApp

Description

HTTP message headers permit several formats for the representation of date and time values. DayOfWeekStr converts a TDateTime into a string representing the day of the week. DayOfWeekStr allows server applications to work with date values taken from HTTP request messages, without worrying about the details of how they are formatted.

See Also

MonthStr (see page 15243)

77.3.2 HTTPApp.DosPathToUnixPath Function

Converts a DOS-compatible path specification to a Unix-compatible path specification.

Pascal

```
function DosPathToUnixPath(const Path: string): string;
```

C++

```
AnsiString DosPathToUnixPath(const AnsiString Path);
```

File

HTTPApp

Description

Use DosPathToUnixPath to convert a path name on the local machine to a path name that can be sent in an HTTP message, or that will be used by a Unix-based application. DosPathToUnixPath converts all backslash characters (\) to forward slashes (/).

The Path parameter is the Dos-compatible path. The return value is the corresponding Unix-compatible path.

See Also

UnixPathToDosPath (see page 15245)

77.3.3 HTTPApp.ExtractHeaderFields Function

Parses a multi-valued string into its constituent fields.

Pascal

```
procedure ExtractHeaderFields(Separators: TSysCharSet; WhiteSpace: TSysCharSet; Content:
PChar; Strings: TStrings; Decode: Boolean; StripQuotes: Boolean = False);
```

C++

```
ExtractHeaderFields(TSysCharSet Separators, TSysCharSet WhiteSpace, const char * Content,
TStrings Strings, Boolean Decode, Boolean StripQuotes = False);
```

File

HTTPApp

Description

ExtractHeaderFields is a general utility to parse multi-valued HTTP header strings into separate substrings.

Separators is a set of characters that are used to separate individual values within the multi-valued string.

WhiteSpace is a set of characters that are to be ignored when parsing the string.

Content is the multi-valued string to be parsed.

Strings is the TStrings object that receives the individual values that are parsed from Content.

StripQuotes determines whether the surrounding quotes are removed from the resulting items. When StripQuotes is true, surrounding quotes are removed before substrings are added to Strings.

Note: Characters contained in Separators or WhiteSpace are treated as part of a value substring if the substring is surrounded by single or double quote marks. HTTP escape characters are converted using the HTTPDecode (see page 15242) function.

See Also

HTTPDecode (see page 15242)

TStrings

77.3.4 HTTPApp.ExtractHTTPFields Function

Parses a multi-valued string into its constituent fields.

Pascal

```
procedure ExtractHTTPFields(Separators: TSysCharSet; WhiteSpace: TSysCharSet; Content: PChar;
Strings: TStrings; StripQuotes: Boolean = False);
```

C++

```
ExtractHTTPFields(TSysCharSet Separators, TSysCharSet WhiteSpace, const char * Content,
TStrings Strings, Boolean StripQuotes = False);
```

File

HTTPApp

Description

ExtractHTTPFields is a general utility to parse multi-valued HTTP header strings into separate substrings.

Separators is a set of characters that are used to separate individual values within the multi-valued string.

WhiteSpace is a set of characters that are to be ignored when parsing the string.

Content is the multi-valued string to be parsed.

Strings is the TStrings object that receives the individual values that are parsed from Content.

StripQuotes determines whether the surrounding quotes are removed from the resulting items. When StripQuotes is true, surrounding quotes are removed before substrings are added to Strings.

Note: Characters contained in Separators or WhiteSpace are treated as part of a value substring if the substring is surrounded by single or double quote marks. HTTP escape characters are converted using the HTTPDecode (see page 15242) function.

See Also

HTTPDecode (see page 15242)

TStrings

77.3.5 HTTPApp.HTMLDecode Function

Pascal

```
function HTMLDecode(const AStr: String): String;
```

C++

```
AnsiString HTMLDecode(const AnsiString AStr);
```

File

HTTPApp

Description

This is function HTTPApp.HTMLDecode.

77.3.6 HTTPApp.HTMLEncode Function

Pascal

```
function HTMLEncode(const AStr: String): String;
```

C++

```
AnsiString HTMLEncode(const AnsiString AStr);
```

File

HTTPApp

Description

This is function HTTPApp.HTMLEncode.

77.3.7 HTTPApp.HTTPDecode Function

Decodes a string that includes HTTP escape characters.

Pascal

```
function HTTPDecode(const AStr: String): string;
```

C++

```
AnsiString HTTPDecode(const AnsiString AStr);
```

File

HTTPApp

Description

HTTPDecode decodes the escape characters (+ and %) in a string that comes from an HTTP message header. Plus characters (+) are converted into spaces. Percent signs (%) indicate that the next two characters are the hex representation of a character. If a percent sign is followed by another percent sign (%%), it is converted into a single percent sign.

For example, the string

%%+%3f

is converted into

% ?

The AStr parameter is the undecoded string. The return value is the converted version of the string.

See Also

ExtractHTTPFields (see page 15241)

HTTPEncode (see page 15243)

77.3.8 HTTPApp.HTTPEncode Function

Converts a string into a form that contains no values that are illegal in an HTTP message header.

Pascal

```
function HTTPEncode(const AStr: String): string;
```

C++

```
AnsiString HTTPEncode(const AnsiString AStr);
```

File

HTTPApp

Description

HTTPEncode converts all characters in the AStr parameter except for the letters A through Z (and a through z), numerals 0 through 9, the asterisk (*), dollar sign ($), exclamation point (!), at sign (@), period (.), underscore (_), single quote ('), comma (,) parentheses, and hyphen (-). Spaces are converted to plus characters (+), and all other characters are converted into hex values preceded by the percent sign (%).

For example, the string

% ?

is converted into

%%+%3f

HTTPEncode returns the converted string.

See Also

HTTPDecode (see page 15242)

77.3.9 HTTPApp.MonthStr Function

Converts a TDateTime into a string representing the month.

Pascal

```
function MonthStr(DateTime: TDateTime): string;
```

C++

```
AnsiString MonthStr(TDateTime DateTime);
```

File

HTTPApp

Description

HTTP message headers permit several formats for the representation of date and time values. MonthStr converts a TDateTime into a string representing the month. MonthStr allows server applications to work with date values taken from HTTP request messages, without worrying about the details of how they are formatted.

See Also

DayOfWeekStr (see page 15239)

77.3.10 HTTPApp.ParseDate Function

Converts a date value from an HTTP message header into a TDateTime.

Pascal

```
function ParseDate(const DateStr: string): TDateTime;
```

C++

```
TDateTime ParseDate(const AnsiString DateStr);
```

File

HTTPApp

Description

HTTP message headers permit several formats for the representation of date and time values. ParseDate converts from any of these formats into a TDateTime. ParseDate allows server applications to work with date values taken from HTTP request messages, without worrying about the details of how they are formatted.

Use ParseDate when interpreting temporal header values in HTTP request messages when they are not already parsed as a property of TWebRequest (see page 15161). TWebRequest (see page 15161) parses the Date header and Expires header automatically.

See Also

TWebRequest (see page 15161)

77.3.11 HTTPApp.RegisterContentParser Function

Pascal

```
procedure RegisterContentParser(AClass: TContentParserClass);
```

C++

```
RegisterContentParser(TContentParserClass AClass);
```

File

HTTPApp

Description

This is function HTTPApp.RegisterContentParser.

77.3.12 HTTPApp.StatusString Function

Returns the explanatory string associated with one of the predefined HTTP response status codes.

Pascal

```
function StatusString(StatusCode: Integer): string;
```

C++

```
AnsiString StatusString(int StatusCode);
```

File

HTTPApp

Description

The HTTP protocol specification defines a number of standard status codes that indicate the status of an HTTP request message. HTTP applications interpret these status codes, but for human beings, each of these codes has a corresponding string that provides a more understandable indication of the status of the HTTP request.

Call StatusString to obtain the string that corresponds to a standard status code. If the StatusCode parameter is not one of the codes defined in the HTTP standard, StatusString returns an empty string.

See Also

TWebResponse (see page 15191)

77.3.13 HTTPApp.UnixPathToDosPath Function

Converts a Unix-compatible path specification to a Dos-compatible path specification.

Pascal

```
function UnixPathToDosPath(const Path: string): string;
```

C++

```
AnsiString UnixPathToDosPath(const AnsiString Path);
```

File

HTTPApp

Description

Use UnixPathToDosPath to convert a path name obtained from an HTTP message or other Unix-based application to a path name that can be used by Windows. UnixPathToDosPath converts all forward slashes (/) to backslash characters (\).

The Path parameter is the Unix-compatible path. The return value is the corresponding Dos-compatible path.

See Also

DosPathToUnixPath (see page 15240)

77.4 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TMethodType (see page 15246)	This is record HTTPApp.TMethodType.
	TWebModuleCacheMode (see page 15246)	This is record HTTPApp.TWebModuleCacheMode.
	TWebModuleCreateMode (see page 15247)	This is record HTTPApp.TWebModuleCreateMode.

77.4.1 HTTPApp.TMethodType Enumeration

Pascal

```
TMethodType = (
  mtAny,
  mtGet,
  mtPut,
  mtPost,
  mtHead
);
```

C++

```
enum TMethodType {
  mtAny,
  mtGet,
  mtPut,
  mtPost,
  mtHead
};
```

File

HTTPApp

Description

This is record HTTPApp.TMethodType.

77.4.2 HTTPApp.TWebModuleCacheMode Enumeration

Pascal

```
TWebModuleCacheMode = (
  caCache,
  caDestroy
);
```

C++

```
enum TWebModuleCacheMode {
  caCache,
  caDestroy
```

```
};
```

File

HTTPApp

Description

This is record HTTPApp.TWebModuleCacheMode.

77.4.3 HTTPApp.TWebModuleCreateMode Enumeration

Pascal

```
TWebModuleCreateMode = (
  crOnDemand,
  crAlways
);
```

C++

```
enum TWebModuleCreateMode {
  crOnDemand,
  crAlways
};
```

File

HTTPApp

Description

This is record HTTPApp.TWebModuleCreateMode.

77.5 Types

The following table lists types in this documentation.

Types

Name	Description
TContentParserClass (see page 15248)	This is type HTTPApp.TContentParserClass.
THTTPMethodEvent (see page 15248)	This is type HTTPApp.THTTPMethodEvent.
TModuleAddedProc (see page 15249)	This is type HTTPApp.TModuleAddedProc.
TWebExceptionEvent (see page 15249)	This is type HTTPApp.TWebExceptionEvent.
TWebModuleContext (see page 15249)	This is type HTTPApp.TWebModuleContext.

77.5.1 HTTPApp.TContentParserClass Type

Pascal

```
TContentParserClass = class of TAbstractContentParser;
```

C++

```
TAbstractContentParser TContentParserClass;
```

File

HTTPApp

Description

This is type HTTPApp.TContentParserClass.

77.5.2 HTTPApp.THTTPMethodEvent Type

Pascal

```
THTTPMethodEvent = procedure (Sender: TObject; Request: TWebRequest; Response: TWebResponse;
var Handled: Boolean) of object;
```

C++

```
(Sender: TObject; Request: TWebRequest; Response: TWebResponse; var Handled: Boolean) (
THTTPMethodEvent)();
```

File

HTTPApp

Description

This is type HTTPApp.THTTPMethodEvent.

77.5.3 HTTPApp.TModuleAddedProc Type

Pascal

```
TModuleAddedProc = procedure (AWebModule: TComponent) of object;
```

C++

```
(AWebModule: TComponent) ( TModuleAddedProc)();
```

File

HTTPApp

Description

This is type HTTPApp.TModuleAddedProc.

77.5.4 HTTPApp.TWebExceptionEvent Type

Pascal

```
TWebExceptionEvent = procedure (Sender: TObject; E: Exception; var Handled: Boolean) of object;
```

C++

```
(Sender: TObject; E: Exception; var Handled: Boolean) ( TWebExceptionEvent)();
```

File

HTTPApp

Description

This is type HTTPApp.TWebExceptionEvent.

77.5.5 HTTPApp.TWebModuleContext Type

Pascal

```
TWebModuleContext = TObject;
```

C++

```
TObject * TWebModuleContext;
```

File

HTTPApp

Description

This is type HTTPApp.TWebModuleContext.

77.6 Constants

The following table lists constants in this documentation.

Constants

Name	Description
MAX_DATETIMES (see page 15250)	This is constant HTTPApp.MAX_DATETIMES.
MAX_INTEGERS (see page 15250)	This is constant HTTPApp.MAX_INTEGERS.
MAX_STRINGS (see page 15251)	This is constant HTTPApp.MAX_STRINGS.
sDateFormat (see page 15251)	This is constant HTTPApp.sDateFormat.

77.6.1 HTTPApp.MAX_DATETIMES Constant

Pascal

```
MAX_DATETIMES = 3;
```

C++

```
MAX_DATETIMES = 3;
```

File

HTTPApp

Description

This is constant HTTPApp.MAX_DATETIMES.

77.6.2 HTTPApp.MAX_INTEGERS Constant

Pascal

```
MAX_INTEGERS = 1;
```

C++

```
MAX_INTEGERS = 1;
```

File

HTTPApp

Description

This is constant HTTPApp.MAX_INTEGERS.

77.6.3 HTTPApp.MAX_STRINGS Constant

Pascal

```
MAX_STRINGS = 12;
```

C++

```
MAX_STRINGS = 12;
```

File

HTTPApp

Description

This is constant HTTPApp.MAX_STRINGS.

77.6.4 HTTPApp.sDateFormat Constant

Pascal

```
sDateFormat = '"%s", dd "%s" yyyy hh:nn:ss';
```

C++

```
sDateFormat = '"%s", dd "%s" yyyy hh:nn:ss';
```

File

HTTPApp

Description

This is constant HTTPApp.sDateFormat.

78 HTTPProd Namespace

This is namespace HTTPProd.

Topics

Name	Description
Classes (see page 15255)	The following table lists classes in this documentation.
Interfaces (see page 15317)	The following table lists interfaces in this documentation.
Functions (see page 15333)	The following table lists functions in this documentation.
Structs, Records, Enums (see page 15336)	The following table lists structs, records, enums in this documentation.
Types (see page 15338)	The following table lists types in this documentation.
Variables (see page 15340)	The following table lists variables in this documentation.
Constants (see page 15341)	The following table lists constants in this documentation.

Classes

	Name	Description
	EScriptError (see page 15255)	This is class HTTPProd.EScriptError.
	TAbstractScriptEnginesList (see page 15258)	This is class HTTPProd.TAbstractScriptEnginesList.
	TAbstractScriptError (see page 15260)	This is class HTTPProd.TAbstractScriptError.
	TAbstractScriptErrors (see page 15264)	This is class HTTPProd.TAbstractScriptErrors.
	TAbstractScriptProducer (see page 15267)	
	TBasePageProducer (see page 15269)	TBasePageProducer is a base class for objects that produce a string of HTML commands based on an input template.
	TCustomPageProducer (see page 15281)	TCustomPageProducer is the base class for objects that produce a string of HTML commands based on an input template.
	THTMLTableAttributes (see page 15288)	THTMLTableAttributes represents the display attributes of an HTML table tag.
	THTMLTableCellAttributes (see page 15295)	THTMLTableCellAttributes represents the display attributes of an HTML table cell tag.
	THTMLTableElementAttributes (see page 15295)	THTMLTableElementAttributes is the common base class for objects that describe the display attributes of parts of an HTML table.
	THTMLTableHeaderAttributes (see page 15300)	THTMLTableHeaderAttributes represents the display attributes of the header tag in an HTML table.
	THTMLTableRowAttributes (see page 15304)	THTMLTableRowAttributes represents the display attributes of the row tag in an HTML table.
	THTMLTagAttributes (see page 15304)	THTMLTagAttributes is the base class for all objects that represent the attributes of an HTML tag.
	TPageProducer (see page 15309)	TPageProducer produces a string of HTML commands based on an input template.

Constants

Name	Description
HTMLAlign (see page 15341)	This is constant HTTPProd.HTMLAlign.
HTMLVAlign (see page 15341)	This is constant HTTPProd.HTMLVAlign.

Functions

	Name	Description
	ContentFromScriptFile (see page 15333)	This is function HTTPProd.ContentFromScriptFile.
	ContentFromScriptStream (see page 15333)	This is function HTTPProd.ContentFromScriptStream.
	ContentFromStream (see page 15334)	This is function HTTPProd.ContentFromStream.
	ContentFromString (see page 15334)	This is function HTTPProd.ContentFromString.
	FindComponentWebModuleContext (see page 15334)	This is function HTTPProd.FindComponentWebModuleContext.
	GetTagID (see page 15335)	This is function HTTPProd.GetTagID.

Interfaces

	Name	Description
	IDesignerFileManager (see page 15317)	This is class HTTPProd.IDesignerFileManager.
	IGetLocateFileService (see page 15318)	This is class HTTPProd.IGetLocateFileService.
	IGetProducerTemplate (see page 15319)	This is class HTTPProd.IGetProducerTemplate.
	ILocateFileService (see page 15320)	This is class HTTPProd.ILocateFileService.
	IScriptContext (see page 15321)	This is class HTTPProd.IScriptContext.
	IScriptProducer (see page 15323)	This is class HTTPProd.IScriptProducer.
	IWebVariableName (see page 15328)	This is class HTTPProd.IWebVariableName.
	IWebVariablesContainer (see page 15329)	This is class HTTPProd.IWebVariablesContainer.

Structs, Records, Enums

	Name	Description
	THTMLAlign (see page 15336)	This is record HTTPProd.THTMLAlign.
	THTMLVAlign (see page 15336)	This is record HTTPProd.THTMLVAlign.
	TTag (see page 15337)	This is record HTTPProd.TTag.

Types

Name	Description
THandledTagProc (see page 15338)	This is type HTTPProd.THandledTagProc.
THandleTagProc (see page 15338)	This is type HTTPProd.THandleTagProc.
THTMLBgColor (see page 15339)	This is type HTTPProd.THTMLBgColor.
THTMLTagEvent (see page 15339)	This is type HTTPProd.THTMLTagEvent.
TScriptProducerClass (see page 15339)	This is type HTTPProd.TScriptProducerClass.

Variables

Name	Description
DesignerFileManager (see page 15340)	This is variable HTTPProd.DesignerFileManager.
ScriptEnginesList (see page 15340)	This is variable HTTPProd.ScriptEnginesList.

78.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	EScriptError (see page 15255)	This is class HTTPProd.EScriptError.
	TAbstractScriptEnginesList (see page 15258)	This is class HTTPProd.TAbstractScriptEnginesList.
	TAbstractScriptError (see page 15260)	This is class HTTPProd.TAbstractScriptError.
	TAbstractScriptErrors (see page 15264)	This is class HTTPProd.TAbstractScriptErrors.
	TAbstractScriptProducer (see page 15267)	
	TBasePageProducer (see page 15269)	TBasePageProducer is a base class for objects that produce a string of HTML commands based on an input template.
	TCustomPageProducer (see page 15281)	TCustomPageProducer is the base class for objects that produce a string of HTML commands based on an input template.
	THTMLTableAttributes (see page 15288)	THTMLTableAttributes represents the display attributes of an HTML table tag.
	THTMLTableCellAttributes (see page 15295)	THTMLTableCellAttributes represents the display attributes of an HTML table cell tag.
	THTMLTableElementAttributes (see page 15295)	THTMLTableElementAttributes is the common base class for objects that describe the display attributes of parts of an HTML table.
	THTMLTableHeaderAttributes (see page 15300)	THTMLTableHeaderAttributes represents the display attributes of the header tag in an HTML table.
	THTMLTableRowAttributes (see page 15304)	THTMLTableRowAttributes represents the display attributes of the row tag in an HTML table.
	THTMLTagAttributes (see page 15304)	THTMLTagAttributes is the base class for all objects that represent the attributes of an HTML tag.
	TPageProducer (see page 15309)	TPageProducer produces a string of HTML commands based on an input template.

78.1.1 EScriptError Class

Class Hierarchy

Pascal

```
EScriptError = class(EWebBrokerException);
```

C++

```
class EScriptError : public EWebBrokerException;
```

File

HTTPProd

Description

This is class HTTPProd.EScriptError.

78.1.1.1 EScriptError Members

The following tables list the members exposed by EScriptError.

Public Methods

	Name	Description
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 15257)	This is Create, a member of class EScriptError.
	CreateFmt (see page 22754)	Instantiates an instance of an exception with a formatted message string.
	CreateFmtHelp (see page 22755)	Instantiates an instance of an exception with a formatted message string and a help-context ID.
	CreateHelp (see page 22755)	Creates an instance of an exception with a simple message string and a help-context ID.
	CreateRes (see page 22756)	This is the overview for the CreateRes constructor overload.
	CreateResFmt (see page 22756)	This is the overview for the CreateResFmt constructor overload.
	CreateResFmtHelp (see page 22757)	This is the overview for the CreateResFmtHelp constructor overload.
	CreateResHelp (see page 22759)	This is the overview for the CreateResHelp constructor overload.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 15257)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
R	Content (see page 15258)	This is Content, a member of class EScriptError.
R	Errors (see page 15258)	This is Errors, a member of class EScriptError.
	HelpContext (see page 22760)	Indicates the context ID number for context-sensitive online help associated with the exception.
	Message (see page 22760)	Message contains the text string to display in the exception dialog box when the exception is raised.

78.1.1.2 EScriptError.Create Constructor

Pascal

```
constructor Create(const AErrors: TAbstractScriptErrors; const AContent: string);
```

C++

```
__fastcall EScriptError(const TAbstractScriptErrors AErrors, const AnsiString AContent);
```

Description

This is Create, a member of class EScriptError.

78.1.1.3 EScriptError.Destroy Destructor

Disposes of an object instance.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~EScriptError();
```

Description

Do not call System::TObject::Destroy directly. Call System::TObject::Free instead. Free verifies that the object reference is not nil before calling System::TObject::Destroy.

The System::TObject::Destroy method defined by System::TObject::TObject deallocates memory. Descendant objects usually define a destructor that is customized for that particular kind of object.

When declaring a System::TObject::Destroy method in a descendant, always add the override directive to the declaration and call the inherited System::TObject::Destroy as the last statement in the overriding method. Since System::TObject::Destroy is a virtual method, overriding it ensures that the proper inherited behavior occurs.

Note: If an exception escapes from the constructor, the destructor is called to destroy the partially constructed object instance that failed to initialize completely. Therefore, destructors should check that allocated resources, such as handles, were actually allocated before trying to release them, since their value might be zero.

System::TObject::Destroy should be implemented so that it calls System::TObject::Free on all subobjects created within the object's constructor (that is, allocated by the constructor). Unlike System::TObject::Destroy, System::TObject::Free provides a safeguard when destroying objects that are nil.

See Also

System::TObject::Free (see page 22300)

78.1.1.4 EScriptError Properties

The properties of the EScriptError class are listed here.

Public Properties

	Name	Description
R	Content (see page 15258)	This is Content, a member of class EScriptError.
R	Errors (see page 15258)	This is Errors, a member of class EScriptError.

78.1.1.4.1 EScriptError.Content Property

Pascal

```
property Content: string;
```

C++

```
__property AnsiString Content;
```

Description

This is Content, a member of class EScriptError.

78.1.1.4.2 EScriptError.Errors Property

Pascal

```
property Errors: TAbstractScriptErrors;
```

C++

```
__property TAbstractScriptErrors Errors;
```

Description

This is Errors, a member of class EScriptError.

78.1.2 TAbstractScriptEnginesList Class

Class Hierarchy

Pascal

```
TAbstractScriptEnginesList = class(TObject);
```

C++

```
class TAbstractScriptEnginesList : public TObject;
```

File

HTTPProd

Description

This is class HTTPProd.TAbstractScriptEnginesList.

78.1.2.1 TAbstractScriptEnginesList Members

The following tables list the members exposed by TAbstractScriptEnginesList.

Public Methods

	Name	Description
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.

	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 15259)	Constructs an object and initializes its data before the object is first used.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
A	FindScriptProducerClass (see page 15260)	This is FindScriptProducerClass, a member of class TAbstractScriptEnginesList.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

78.1.2.2 TAbstractScriptEnginesList.Create Constructor

Constructs an object and initializes its data before the object is first used.

Pascal

```
constructor Create;
```

C++

```
__fastcall TAbstractScriptEnginesList();
```

Description

System::TObject::Create constructs an object. The purpose, size, and behavior of objects differ greatly. The System::TObject::Create constructor defined by System::TObject::TObject allocates memory but does not initialize data.

Descendant objects usually define a constructor that creates the particular kind of object and initializes its data.

Note: If an exception escapes from a constructor, the object's destructor is called to clean up the failed instance.

See Also

System::TObject::Destroy (see page 22287)

System::TObject::Free (see page 22300)

78.1.2.3 TAbstractScriptEnginesList Methods

The methods of the TAbstractScriptEnginesList class are listed here.

Public Methods

	Name	Description
	FindScriptProducerClass (see page 15260)	This is FindScriptProducerClass, a member of class TAbstractScriptEnginesList.

78.1.2.3.1 TAbstractScriptEnginesList.FindScriptProducerClass Method

Pascal

```
function FindScriptProducerClass(const ALanguageName: string): TScriptProducerClass; virtual;
abstract;
```

C++

```
virtual __fastcall TScriptProducerClass FindScriptProducerClass(const AnsiString
ALanguageName) = 0;
```

Description

This is FindScriptProducerClass, a member of class TAbstractScriptEnginesList.

78.1.3 TAbstractScriptError Class

Class Hierarchy

Pascal

```
TAbstractScriptError = class(TObject);
```

C++

```
class TAbstractScriptError : public TObject;
```

File

HTTPProd

Description

This is class HTTPProd.TAbstractScriptError.

78.1.3.1 TAbstractScriptError Members

The following tables list the members exposed by TAbstractScriptError.

Protected Methods

	Name	Description
	GetCharPos (see page 15262)	This is GetCharPos, a member of class TAbstractScriptError.
	GetDescription (see page 15262)	This is GetDescription, a member of class TAbstractScriptError.
	GetFileName (see page 15262)	This is GetFileName, a member of class TAbstractScriptError.
	GetLine (see page 15262)	This is GetLine, a member of class TAbstractScriptError.

	GetSourceLine (see page 15263)	This is GetSourceLine, a member of class TAbstractScriptError.
	SetDescription (see page 15263)	This is SetDescription, a member of class TAbstractScriptError.

Public Methods

	Name	Description
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 22287)	Disposes of an object instance.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
	CharPos (see page 15263)	This is CharPos, a member of class TAbstractScriptError.
	Description (see page 15263)	This is Description, a member of class TAbstractScriptError.
	FileName (see page 15264)	This is FileName, a member of class TAbstractScriptError.
	Line (see page 15264)	This is Line, a member of class TAbstractScriptError.
	SourceLine (see page 15264)	This is SourceLine, a member of class TAbstractScriptError.

78.1.3.2 TAbstractScriptError Methods

The methods of the TAbstractScriptError class are listed here.

Protected Methods

	Name	Description
	GetCharPos (see page 15262)	This is GetCharPos, a member of class TAbstractScriptError.
	GetDescription (see page 15262)	This is GetDescription, a member of class TAbstractScriptError.
	GetFileName (see page 15262)	This is GetFileName, a member of class TAbstractScriptError.

	GetLine (see page 15262)	This is GetLine, a member of class TAbstractScriptError.
	GetSourceLine (see page 15263)	This is GetSourceLine, a member of class TAbstractScriptError.
	SetDescription (see page 15263)	This is SetDescription, a member of class TAbstractScriptError.

78.1.3.2.1 TAbstractScriptError.GetCharPos Method

Pascal

```
function GetCharPos: Integer; virtual; abstract;
```

C++

```
virtual __fastcall int GetCharPos() = 0;
```

Description

This is GetCharPos, a member of class TAbstractScriptError.

78.1.3.2.2 TAbstractScriptError.GetDescription Method

Pascal

```
function GetDescription: string; virtual; abstract;
```

C++

```
virtual __fastcall AnsiString GetDescription() = 0;
```

Description

This is GetDescription, a member of class TAbstractScriptError.

78.1.3.2.3 TAbstractScriptError.GetFileName Method

Pascal

```
function GetFileName: string; virtual; abstract;
```

C++

```
virtual __fastcall AnsiString GetFileName() = 0;
```

Description

This is GetFileName, a member of class TAbstractScriptError.

78.1.3.2.4 TAbstractScriptError.GetLine Method

Pascal

```
function GetLine: Integer; virtual; abstract;
```

C++

```
virtual __fastcall int GetLine() = 0;
```

Description

This is GetLine, a member of class TAbstractScriptError.

78.1.3.2.5 TAbstractScriptError.GetSourceLine Method

Pascal

```
function GetSourceLine: string; virtual; abstract;
```

C++

```
virtual __fastcall AnsiString GetSourceLine() = 0;
```

Description

This is GetSourceLine, a member of class TAbstractScriptError.

78.1.3.2.6 TAbstractScriptError.SetDescription Method

Pascal

```
procedure SetDescription(const AValue: string); virtual; abstract;
```

C++

```
virtual __fastcall SetDescription(const AnsiString AValue) = 0;
```

Description

This is SetDescription, a member of class TAbstractScriptError.

78.1.3.3 TAbstractScriptError Properties

The properties of the TAbstractScriptError class are listed here.

Public Properties

	Name	Description
R	CharPos (see page 15263)	This is CharPos, a member of class TAbstractScriptError.
	Description (see page 15263)	This is Description, a member of class TAbstractScriptError.
R	FileName (see page 15264)	This is FileName, a member of class TAbstractScriptError.
R	Line (see page 15264)	This is Line, a member of class TAbstractScriptError.
R	SourceLine (see page 15264)	This is SourceLine, a member of class TAbstractScriptError.

78.1.3.3.1 TAbstractScriptError.CharPos Property

Pascal

```
property CharPos: Integer;
```

C++

```
__property int CharPos;
```

Description

This is CharPos, a member of class TAbstractScriptError.

78.1.3.3.2 TAbstractScriptError.Description Property

Pascal

```
property Description: string;
```

C++

```
__property AnsiString Description;
```

Description

This is Description, a member of class TAbstractScriptError.

78.1.3.3.3 TAbstractScriptError.FileName Property

Pascal

```
property FileName: string;
```

C++

```
__property AnsiString FileName;
```

Description

This is FileName, a member of class TAbstractScriptError.

78.1.3.3.4 TAbstractScriptError.Line Property

Pascal

```
property Line: Integer;
```

C++

```
__property int Line;
```

Description

This is Line, a member of class TAbstractScriptError.

78.1.3.3.5 TAbstractScriptError.SourceLine Property

Pascal

```
property SourceLine: string;
```

C++

```
__property AnsiString SourceLine;
```

Description

This is SourceLine, a member of class TAbstractScriptError.

78.1.4 TAbstractScriptErrors Class

Class Hierarchy

Pascal

```
TAbstractScriptErrors = class(TObject);
```

C++

```
class TAbstractScriptErrors : public TObject;
```

File

HTTPProd

Description

This is class HTTPProd.TAbstractScriptErrors.

78.1.4.1 TAbstractScriptErrors Members

The following tables list the members exposed by TAbstractScriptErrors.

Protected Methods

	Name	Description
	GetError (see page 15266)	This is GetError, a member of class TAbstractScriptErrors.
	GetErrorCount (see page 15266)	This is GetErrorCount, a member of class TAbstractScriptErrors.

Public Methods

	Name	Description
	Add (see page 15266)	This is Add, a member of class TAbstractScriptErrors.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 22287)	Disposes of an object instance.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
	Count (see page 15267)	This is Count, a member of class TAbstractScriptErrors.

	Errors (see page 15267)	This is Errors, a member of class TAbstractScriptErrors.

78.1.4.2 TAbstractScriptErrors Methods

The methods of the TAbstractScriptErrors class are listed here.

Protected Methods

	Name	Description
	GetError (see page 15266)	This is GetError, a member of class TAbstractScriptErrors.
	GetErrorCount (see page 15266)	This is GetErrorCount, a member of class TAbstractScriptErrors.

Public Methods

	Name	Description
	Add (see page 15266)	This is Add, a member of class TAbstractScriptErrors.

78.1.4.2.1 TAbstractScriptErrors.Add Method

Pascal

```
procedure Add(const AError: TAbstractScriptError); virtual; abstract;
```

C++

```
virtual __fastcall Add(const TAbstractScriptError AError) = 0;
```

Description

This is Add, a member of class TAbstractScriptErrors.

78.1.4.2.2 TAbstractScriptErrors.GetError Method

Pascal

```
function GetError(I: Integer): TAbstractScriptError; virtual; abstract;
```

C++

```
virtual __fastcall TAbstractScriptError GetError(int I) = 0;
```

Description

This is GetError, a member of class TAbstractScriptErrors.

78.1.4.2.3 TAbstractScriptErrors.GetErrorCount Method

Pascal

```
function GetErrorCount: Integer; virtual; abstract;
```

C++

```
virtual __fastcall int GetErrorCount() = 0;
```

Description

This is GetErrorCount, a member of class TAbstractScriptErrors.

78.1.4.3 TAbstractScriptErrors Properties

The properties of the TAbstractScriptErrors class are listed here.

Public Properties

	Name	Description
R	Count (see page 15267)	This is Count, a member of class TAbstractScriptErrors.
R	Errors (see page 15267)	This is Errors, a member of class TAbstractScriptErrors.

78.1.4.3.1 TAbstractScriptErrors.Count Property

Pascal

```
property Count: Integer;
```

C++

```
__property int Count;
```

Description

This is Count, a member of class TAbstractScriptErrors.

78.1.4.3.2 TAbstractScriptErrors.Errors Property

Pascal

```
property Errors [I: Integer]: TAbstractScriptError;
```

C++

```
__property TAbstractScriptError Errors[int I];
```

Description

This is Errors, a member of class TAbstractScriptErrors.

78.1.5 TAbstractScriptProducer Class

Class Hierarchy

Pascal

```
TAbstractScriptProducer = class(TInterfacedObject);
```

C++

```
class TAbstractScriptProducer : public TInterfacedObject;
```

File

HTTPProd

78.1.5.1 TAbstractScriptProducer Members

The following tables list the members exposed by TAbstractScriptProducer.

Protected Data Members

	Name	Description
	FRefCount (see page 22278)	This is FRefCount, a member of class TInterfacedObject.

Protected Methods

	Name	Description
	_AddRef (see page 22278)	Implements the IInterface (see page 22396) System::TInterfacedObject::_AddRef method.
	_Release (see page 22279)	Implements the IInterface (see page 22396) System::TInterfacedObject::_Release method.
	QueryInterface (see page 22280)	Implements the IInterface (see page 22396) System::TInterfacedObject::QueryInterface method.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22279)	Responds after the last constructor executes.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 22279)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 15269)	Constructs an object and initializes its data before the object is first used.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22280)	Allocates memory for each instance of an interfaced object.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.

	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
R	RefCount (see page 22281)	Indicates the number of interface pointers currently dependent upon the object.

78.1.5.2 TAbstractScriptProducer.Create Constructor

Constructs an object and initializes its data before the object is first used.

Pascal

```
constructor Create(AWebModuleContext: TWebModuleContext; AStripParamQuotes: Boolean;
AHandleTag: THandleTagProc; const AScriptEngine: string; ALocateFileService:
ILocateFileService); virtual;
```

C++

```
virtual __fastcall TAbstractScriptProducer(TWebModuleContext AWebModuleContext, Boolean
AStripParamQuotes, THandleTagProc AHandleTag, const AnsiString AScriptEngine,
ILocateFileService ALocateFileService);
```

Description

Do not create instances of Create. Instead, construct descendants of Create using the new keyword, passing any arguments for the descendant object's constructor.

Descendant objects usually define a constructor that creates the particular kind of object and initializes its data.

Note: If an exception escapes from a constructor, the object's destructor is called to clean up the failed instance.

78.1.6 TBasePageProducer Class

TBasePageProducer is a base class for objects that produce a string of HTML commands based on an input template.

Class Hierarchy

Pascal

```
TBasePageProducer = class(TCustomContentProducer, IGetProducerTemplate);
```

C++

```
class TBasePageProducer : public TCustomContentProducer, public IGetProducerTemplate;
```

File

HTTPProd

Description

Do not create instances of TBasePageProducer. Instead, use TBasePageProducer as a base class when defining a page producer. TBasePageProducer has two descendants,

TCustomPageProducer (see page 15281), which is the base class for page producers that produce content based primarily on the content of HTTP messages and an OnHTML event handler. Examples include TPageProducer (see page 15309) and TDataSetPageProducer.

TComponentsPageProducer, which is the base class for page producers that assemble content from components that generate HTML. Examples include TAdapterPageProducer.

A page producer is an object that converts an HTML template into a string of HTML commands which can be interpreted by a client application such as a Web browser. HTML templates include HTML commands and HTML-transparent tags that are replaced with customized content by the page producer.

See Also

TDSTableProducer (see page 10290)

TCustomPageProducer (see page 15281)

TPageProducer (see page 15309)

TWebResponse (see page 15191)

TDataSetPageProducer (see page 11807)

TPageItemsProducer (see page 18383)

TInetXPageProducer (see page 17145)

TAdapterPageProducer (see page 19802)

78.1.6.1 TBasePageProducer Members

The following tables list the members exposed by TBasePageProducer.

Protected Events

	Name	Description
	OnHTMLTag (see page 15280)	Occurs when the page producer needs to interpret the value of an HTML-transparent tag in the HTML template.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.

	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	DoTagEvent (see page 15276)	This is DoTagEvent, a member of class TBasePageProducer.
	GetAppDispatcher (see page 15108)	This is GetAppDispatcher, a member of class TCustomContentProducer.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetProducerTemplateFileName (see page 15276)	This is GetProducerTemplateFileName, a member of class TBasePageProducer.
	GetProducerTemplateStream (see page 15276)	This is GetProducerTemplateStream, a member of class TBasePageProducer.
V	GetScriptEngine (see page 15277)	This is GetScriptEngine, a member of class TBasePageProducer.
	GetTagID (see page 15277)	This is GetTagID, a member of class TBasePageProducer.
V	GetTemplateFileName (see page 15277)	This is GetTemplateFileName, a member of class TBasePageProducer.
V	GetTemplateStream (see page 15277)	This is GetTemplateStream, a member of class TBasePageProducer.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
V	HandleScriptTag (see page 15277)	This is HandleScriptTag, a member of class TBasePageProducer.
V	HandleTag (see page 15278)	This is HandleTag, a member of class TBasePageProducer.
	ImplHandleTag (see page 15278)	This is ImplHandleTag, a member of class TBasePageProducer.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	Notification (see page 15108)	Overrides the inherited method to respond to messages that the dispatcher is going away.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	ProduceContent (see page 15108)	Returns the content that the producer creates.
	ProduceContentFromStream (see page 15109)	This is ProduceContentFromStream, a member of class TCustomContentProducer.
	ProduceContentFromString (see page 15109)	This is ProduceContentFromString, a member of class TCustomContentProducer.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	ServerScriptFromStream (see page 15278)	This is ServerScriptFromStream, a member of class TBasePageProducer.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetAppDispatcher (see page 15109)	This is SetAppDispatcher, a member of class TCustomContentProducer.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.

	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	UseScriptEngine (see page 15278)	This is UseScriptEngine, a member of class TBasePageProducer.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Content (see page 15274)	Returns the content produced by the content producer.
	ContentFromStream (see page 15275)	Returns the content produced in response to input read from a stream.
	ContentFromString (see page 15275)	Returns the content produced in response to an input string.
	Create (see page 15274)	Creates an instance of TBasePageProducer (see page 15269).
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 2766)	Disposes of the component and its owned components.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetAppDispatcher (see page 15220)	This is GetAppDispatcher, a member of class IGetAppDispatcher.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.

	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	ProduceContent (see page 15224)	Returns the content that the producer creates.
	ProduceContentFromStream (see page 15225)	This is ProduceContentFromStream, a member of class IProduceContentFrom.
	ProduceContentFromString (see page 15226)	This is ProduceContentFromString, a member of class IProduceContentFrom.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetAppDispatcher (see page 15227)	This is SetAppDispatcher, a member of class ISetAppDispatcher.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	Dispatcher (see page 15109)	Provides access to the dispatcher for the Web server application that includes the TCustomContentProducer (see page 15102) object.
R	DispatcherComponent (see page 15110)	Provides access to the dispatcher component.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	ScriptEngine (see page 15279)	Names the script engine that generates or interprets script embedded in the documents that this producer creates.
	StripParamQuotes (see page 15279)	Specifies whether to strip quotation marks when extracting the parameters from an HTML-transparent tag.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
R	WebModuleContext (see page 15279)	Provides access to the Web module context object.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

78.1.6.2 TBasePageProducer.Create Constructor

Creates an instance of TBasePageProducer (see page 15269).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TBasePageProducer(TComponent * AOwner);
```

Description

Call Create to create and initialize an instance of TBasePageProducer (see page 15269).

AOwner is a component, typically a Web module, that is responsible for freeing the page producer.

See Also

Owner (see page 2807)

78.1.6.3 TBasePageProducer Methods

The methods of the TBasePageProducer class are listed here.

Protected Methods

	Name	Description
	DoTagEvent (see page 15276)	This is DoTagEvent, a member of class TBasePageProducer.
	GetProducerTemplateFileName (see page 15276)	This is GetProducerTemplateFileName, a member of class TBasePageProducer.
	GetProducerTemplateStream (see page 15276)	This is GetProducerTemplateStream, a member of class TBasePageProducer.
V	GetScriptEngine (see page 15277)	This is GetScriptEngine, a member of class TBasePageProducer.
	GetTagID (see page 15277)	This is GetTagID, a member of class TBasePageProducer.
V	GetTemplateFileName (see page 15277)	This is GetTemplateFileName, a member of class TBasePageProducer.
V	GetTemplateStream (see page 15277)	This is GetTemplateStream, a member of class TBasePageProducer.
V	HandleScriptTag (see page 15277)	This is HandleScriptTag, a member of class TBasePageProducer.
V	HandleTag (see page 15278)	This is HandleTag, a member of class TBasePageProducer.
	ImplHandleTag (see page 15278)	This is ImplHandleTag, a member of class TBasePageProducer.
	ServerScriptFromStream (see page 15278)	This is ServerScriptFromStream, a member of class TBasePageProducer.
V	UseScriptEngine (see page 15278)	This is UseScriptEngine, a member of class TBasePageProducer.

Public Methods

	Name	Description
V	Content (see page 15274)	Returns the content produced by the content producer.
V	ContentFromStream (see page 15275)	Returns the content produced in response to input read from a stream.
V	ContentFromString (see page 15275)	Returns the content produced in response to an input string.

78.1.6.3.1 TBasePageProducer.Content Method

Returns the content produced by the content producer.

Pascal

```
function Content: string; override;
```

C++

```
virtual __fastcall AnsiString Content();
```

Description

Call Content to retrieve the content for using in an HTTP response message. TBasePageProducer (see page 15269) attempts to locate a default template and uses that to generate the resulting content.

See Also

ContentFromStream (see page 15275)

ContentFromString (see page 15275)

Content (see page 15207)

Specifying the HTML Template

78.1.6.3.2 TBasePageProducer.ContentFromStream Method

Returns the content produced in response to input read from a stream.

Pascal

```
function ContentFromStream(Stream: TStream): string; override;
```

C++

```
virtual __fastcall AnsiString ContentFromStream(TStream Stream);
```

Description

Call ContentFromStream to retrieve the content produced by the content producer based on the information provided by the Stream parameter.

When the ScriptEngine (see page 15279) property is assigned, the page producer generates its content using a special script-producer component. When ScriptEngine (see page 15279) is not assigned, the page producer uses only the OnHTMLTag (see page 15280) event, plus any other built-in translations provided by a descendant class.

See Also

Content (see page 15274)

ContentFromString (see page 15275)

Content (see page 15207)

ScriptEngine (see page 15279)

OnHTMLTag (see page 15280)

Specifying the HTML Template

78.1.6.3.3 TBasePageProducer.ContentFromString Method

Returns the content produced in response to an input string.

Pascal

```
function ContentFromString(const S: string): string; override;
```

C++

```
virtual __fastcall AnsiString ContentFromString(const AnsiString S);
```

Description

Call ContentFromString to retrieve the content produced by the content producer based on the information provided by the S parameter.

When the ScriptEngine (see page 15279) property is assigned, the page producer generates its content using a special script-producer component. When ScriptEngine (see page 15279) is not assigned, the page producer uses only the OnHTMLTag (see page 15280) event, plus any other built-in translations provided by a descendant class.

Content (see page 15274)

ContentFromStream (see page 15275)

Content (see page 15207)

Chaining Page Producers Together

Specifying the HTML Template

78.1.6.3.4 TBasePageProducer.DoTagEvent Method

Pascal

```
procedure DoTagEvent(Tag: TTag; const TagString: string; TagParams: TStrings; var ReplaceText:
string); dynamic;
```

C++

```
__fastcall DoTagEvent(TTag Tag, const AnsiString TagString, TStrings TagParams, AnsiString
ReplaceText);
```

Description

This is DoTagEvent, a member of class TBasePageProducer.

78.1.6.3.5 TBasePageProducer.GetProducerTemplateFileName Method

Pascal

```
function GetProducerTemplateFileName: string;
```

C++

```
__fastcall AnsiString GetProducerTemplateFileName();
```

Description

This is GetProducerTemplateFileName, a member of class TBasePageProducer.

78.1.6.3.6 TBasePageProducer.GetProducerTemplateStream Method

Pascal

```
function GetProducerTemplateStream(out AOwned: Boolean): TStream;
```

C++

```
__fastcall TStream GetProducerTemplateStream(Boolean AOwned);
```

Description

This is GetProducerTemplateStream, a member of class TBasePageProducer.

78.1.6.3.7 TBasePageProducer.GetScriptEngine Method

Pascal

```
function GetScriptEngine: string; virtual;
```

C++

```
virtual __fastcall AnsiString GetScriptEngine();
```

Description

This is GetScriptEngine, a member of class TBasePageProducer.

78.1.6.3.8 TBasePageProducer.GetTagID Method

Pascal

```
function GetTagID(const TagString: string): TTag;
```

C++

```
__fastcall TTag GetTagID(const AnsiString TagString);
```

Description

This is GetTagID, a member of class TBasePageProducer.

78.1.6.3.9 TBasePageProducer.GetTemplateFileName Method

Pascal

```
function GetTemplateFileName: string; virtual;
```

C++

```
virtual __fastcall AnsiString GetTemplateFileName();
```

Description

This is GetTemplateFileName, a member of class TBasePageProducer.

78.1.6.3.10 TBasePageProducer.GetTemplateStream Method

Pascal

```
function GetTemplateStream(out AOwned: Boolean): TStream; virtual;
```

C++

```
virtual __fastcall TStream GetTemplateStream(Boolean AOwned);
```

Description

This is GetTemplateStream, a member of class TBasePageProducer.

78.1.6.3.11 TBasePageProducer.HandleScriptTag Method

Pascal

```
function HandleScriptTag(const TagString: string; TagParams: TStrings; var ReplaceString:
string): Boolean; virtual;
```

C++

```
virtual __fastcall Boolean HandleScriptTag(const AnsiString TagString, TStrings TagParams,
AnsiString ReplaceString);
```

Description

This is HandleScriptTag, a member of class TBasePageProducer.

78.1.6.3.12 TBasePageProducer.HandleTag Method

Pascal

```
function HandleTag(const TagString: string; TagParams: TStrings): string; virtual;
```

C++

```
virtual __fastcall AnsiString HandleTag(const AnsiString TagString, TStrings TagParams);
```

Description

This is HandleTag, a member of class TBasePageProducer.

78.1.6.3.13 TBasePageProducer.ImplHandleTag Method

Pascal

```
function ImplHandleTag(const TagString: string; TagParams: TStrings): string;
```

C++

```
__fastcall AnsiString ImplHandleTag(const AnsiString TagString, TStrings TagParams);
```

Description

This is ImplHandleTag, a member of class TBasePageProducer.

78.1.6.3.14 TBasePageProducer.ServerScriptFromStream Method

Pascal

```
function ServerScriptFromStream(Stream: TStream): string;
```

C++

```
__fastcall AnsiString ServerScriptFromStream(TStream Stream);
```

Description

This is ServerScriptFromStream, a member of class TBasePageProducer.

78.1.6.3.15 TBasePageProducer.UseScriptEngine Method

Pascal

```
function UseScriptEngine: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean UseScriptEngine();
```

Description

This is UseScriptEngine, a member of class TBasePageProducer.

78.1.6.4 TBasePageProducer Properties

The properties of the TBasePageProducer class are listed here.

Public Properties

	Name	Description
	ScriptEngine (see page 15279)	Names the script engine that generates or interprets script embedded in the documents that this producer creates.
	StripParamQuotes (see page 15279)	Specifies whether to strip quotation marks when extracting the parameters from an HTML-transparent tag.
R	WebModuleContext (see page 15279)	Provides access to the Web module context object.

78.1.6.4.1 TBasePageProducer.ScriptEngine Property

Names the script engine that generates or interprets script embedded in the documents that this producer creates.

Pascal

```
property ScriptEngine: string;
```

C++

```
__property AnsiString ScriptEngine;
```

Description

ScriptEngine indicates the scripting language that the producer uses in its generated documents. For example, if the producer generates code that includes jscript, the value of ScriptEngine is 'JSCRIPT'.

When ScriptEngine is defined, the page producer generates its content using a special script-producer component. When ScriptEngine is not defined, the page producer uses only the OnHTMLTag (see page 15280) event, plus any other built-in translations provided by a descendant class.

See Also

OnHTMLTag (see page 15280)

78.1.6.4.2 TBasePageProducer.StripParamQuotes Property

Specifies whether to strip quotation marks when extracting the parameters from an HTML-transparent tag.

Pascal

```
property StripParamQuotes: Boolean;
```

C++

```
__property Boolean StripParamQuotes;
```

Description

Set StripParamQuotes to indicate whether the page producer should strip quotation marks from the parameters of HTML-transparent tags before handling the tags. By setting StripParamQuotes to true, the page producer compensates for HTML editors that automatically insert quotation marks around the values of tag options.

78.1.6.4.3 TBasePageProducer.WebModuleContext Property

Provides access to the Web module context object.

Pascal

```
property WebModuleContext: TWebModuleContext;
```

C++

```
__property TWebModuleContext WebModuleContext;
```

Description

Use WebModuleContext to get access to the TWebModuleContext object. The TWebModuleContext object maintains a list of named variables that the producer uses when translating HTML-transparent tags.

78.1.6.5 TBasePageProducer Events

The events of the TBasePageProducer class are listed here.

Protected Events

	Name	Description
	OnHTMLTag (see page 15280)	Occurs when the page producer needs to interpret the value of an HTML-transparent tag in the HTML template.

78.1.6.5.1 TBasePageProducer.OnHTMLTag Event

Occurs when the page producer needs to interpret the value of an HTML-transparent tag in the HTML template.

Pascal

```
property OnHTMLTag: THTMLTagEvent;
```

C++

```
__property THTMLTagEvent OnHTMLTag;
```

Description

Write an OnHTMLTag event handler to convert an HTML-transparent tag into the corresponding HTML commands that can be interpreted by a Web browser. If an OnHTMLTag event is not supplied, the HTML-transparent tags in the HTML template will be replaced by empty strings.

Note: The sequence of HTML that the event handler produces for an HTML-transparent tag can contain HTML-transparent tags for another page producer to convert. For example, one page producer might have a template that represents the format of the final HTTP response. It could read the HTTP request and for each section in the request assemble a set of HTML-transparent tags with parameters based on the request. Another page producer might take the content of the first page producer, and interpret those parameters.

Customizing the InternetExpress Page Producer Template

Chaining Page Producers Together

Converting HTML-transparent Tags

78.1.7 TCustomPageProducer Class

TCustomPageProducer is the base class for objects that produce a string of HTML commands based on an input template.

Class Hierarchy

Pascal

```
TCustomPageProducer = class(TBasePageProducer);
```

C++

```
class TCustomPageProducer : public TBasePageProducer;
```

File

HTTPProd

Description

Use TCustomPageProducer as a base class when defining an object that converts an HTML template into a string of HTML commands which can be interpreted by a client application such as a Web browser. HTML templates include HTML commands and HTML-transparent tags that are replaced with customized content by the page producer.

See Also

TDSTableProducer (see page 10290)

TPageProducer (see page 15309)

78.1.7.1 TCustomPageProducer Members

The following tables list the members exposed by TCustomPageProducer.

Protected Events

	Name	Description
	OnHTMLTag (see page 15280)	Occurs when the page producer needs to interpret the value of an HTML-transparent tag in the HTML template.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.

	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	DoTagEvent (see page 15276)	This is DoTagEvent, a member of class TBasePageProducer.
	GetAppDispatcher (see page 15108)	This is GetAppDispatcher, a member of class TCustomContentProducer.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetProducerTemplateFileName (see page 15276)	This is GetProducerTemplateFileName, a member of class TBasePageProducer.
	GetProducerTemplateStream (see page 15276)	This is GetProducerTemplateStream, a member of class TBasePageProducer.
V	GetScriptEngine (see page 15277)	This is GetScriptEngine, a member of class TBasePageProducer.
	GetTagID (see page 15277)	This is GetTagID, a member of class TBasePageProducer.
V	GetTemplateFileName (see page 15286)	This is GetTemplateFileName, a member of class TCustomPageProducer.
V	GetTemplateStream (see page 15286)	This is GetTemplateStream, a member of class TCustomPageProducer.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
V	HandleScriptTag (see page 15277)	This is HandleScriptTag, a member of class TBasePageProducer.
V	HandleTag (see page 15286)	This is HandleTag, a member of class TCustomPageProducer.
	ImplHandleTag (see page 15278)	This is ImplHandleTag, a member of class TBasePageProducer.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	Notification (see page 15108)	Overrides the inherited method to respond to messages that the dispatcher is going away.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	ProduceContent (see page 15108)	Returns the content that the producer creates.
	ProduceContentFromStream (see page 15109)	This is ProduceContentFromStream, a member of class TCustomContentProducer.
	ProduceContentFromString (see page 15109)	This is ProduceContentFromString, a member of class TCustomContentProducer.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	ServerScriptFromStream (see page 15278)	This is ServerScriptFromStream, a member of class TBasePageProducer.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetAppDispatcher (see page 15109)	This is SetAppDispatcher, a member of class TCustomContentProducer.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.

	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	UseScriptEngine (see page 15278)	This is UseScriptEngine, a member of class TBasePageProducer.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Content (see page 15106)	Returns the content produced by the content producer.
	Content (see page 15274)	Returns the content produced by the content producer.
	ContentFromStream (see page 15107)	Returns the content produced in response to input read from a stream.
	ContentFromStream (see page 15275)	Returns the content produced in response to input read from a stream.
	ContentFromString (see page 15107)	Returns the content produced in response to an input string.
	ContentFromString (see page 15275)	Returns the content produced in response to an input string.
	Create (see page 15285)	Creates an instance of TCustomPageProducer (see page 15281).
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 15285)	Destroys an instance of TCustomPageProducer (see page 15281).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetAppDispatcher (see page 15220)	This is GetAppDispatcher, a member of class IGetAppDispatcher.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.

	GetParentComponent (see page 2778)	Returns the containing Component.
	GetProducerTemplateFileName (see page 15320)	This is GetProducerTemplateFileName, a member of class IGetProducerTemplate.
	GetProducerTemplateStream (see page 15320)	This is GetProducerTemplateStream, a member of class IGetProducerTemplate.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	ProduceContent (see page 15224)	Returns the content that the producer creates.
	ProduceContentFromStream (see page 15225)	This is ProduceContentFromStream, a member of class IProduceContentFrom.
	ProduceContentFromString (see page 15226)	This is ProduceContentFromString, a member of class IProduceContentFrom.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetAppDispatcher (see page 15227)	This is SetAppDispatcher, a member of class ISetAppDispatcher.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	Dispatcher (see page 15109)	Provides access to the dispatcher for the Web server application that includes the TCustomContentProducer (see page 15102) object.
R	DispatcherComponent (see page 15110)	Provides access to the dispatcher component.
	HTMLDoc (see page 15287)	Specifies the HTML template used to generate the value returned by the Content (see page 15274) method.
	HTMLFile (see page 15287)	Specifies the name of a file that contains the HTML template used to generate the value returned by the Content (see page 15274) method.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	ScriptEngine (see page 15279)	Names the script engine that generates or interprets script embedded in the documents that this producer creates.
	StripParamQuotes (see page 15279)	Specifies whether to strip quotation marks when extracting the parameters from an HTML-transparent tag.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
R	WebModuleContext (see page 15279)	Provides access to the Web module context object.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

78.1.7.2 TCustomPageProducer.Create Constructor

Creates an instance of TCustomPageProducer (see page 15281).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomPageProducer(TComponent * AOwner);
```

Description

Call Create to create and initialize an instance of TCustomPageProducer (see page 15281).

After calling the inherited constructor, Create allocates the TStrings object that implements the HTMLDoc (see page 15287) property.

See Also

HTMLDoc (see page 15287)

Create (see page 2766)

78.1.7.3 TCustomPageProducer.Destroy Destructor

Destroys an instance of TCustomPageProducer (see page 15281).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TCustomPageProducer();
```

Description

Do not call Destroy directly in an application. Instead, call Free. Free checks that the page producer reference is not nil, and only then calls Destroy.

Destroy frees the TStrings object implements the HTMLDoc (see page 15287) property before calling the inherited destructor.

See Also

Free (see page 22300)

HTMLDoc (see page 15287)

78.1.7.4 TCustomPageProducer Methods

The methods of the TCustomPageProducer class are listed here.

Protected Methods

	Name	Description
	GetTemplateFileName (see page 15286)	This is GetTemplateFileName, a member of class TCustomPageProducer.
	GetTemplateStream (see page 15286)	This is GetTemplateStream, a member of class TCustomPageProducer.
	HandleTag (see page 15286)	This is HandleTag, a member of class TCustomPageProducer.

78.1.7.4.1 TCustomPageProducer.GetTemplateFileName Method

Pascal

```
function GetTemplateFileName: string; override;
```

C++

```
virtual __fastcall AnsiString GetTemplateFileName();
```

Description

This is GetTemplateFileName, a member of class TCustomPageProducer.

78.1.7.4.2 TCustomPageProducer.GetTemplateStream Method

Pascal

```
function GetTemplateStream(out AOwned: Boolean): TStream; override;
```

C++

```
virtual __fastcall TStream GetTemplateStream(Boolean AOwned);
```

Description

This is GetTemplateStream, a member of class TCustomPageProducer.

78.1.7.4.3 TCustomPageProducer.HandleTag Method

Pascal

```
function HandleTag(const TagString: string; TagParams: TStrings): string; override;
```

C++

```
virtual __fastcall AnsiString HandleTag(const AnsiString TagString, TStrings TagParams);
```

Description

This is HandleTag, a member of class TCustomPageProducer.

78.1.7.5 TCustomPageProducer Properties

The properties of the TCustomPageProducer class are listed here.

Public Properties

	Name	Description
	HTMLDoc (see page 15287)	Specifies the HTML template used to generate the value returned by the Content (see page 15274) method.
	HTMLFile (see page 15287)	Specifies the name of a file that contains the HTML template used to generate the value returned by the Content (see page 15274) method.

78.1.7.5.1 TCustomPageProducer.HTMLDoc Property

Specifies the HTML template used to generate the value returned by the Content (see page 15274) method.

Pascal

```
property HTMLDoc: TStrings;
```

C++

```
__property TStrings HTMLDoc;
```

Description

Set HTMLDoc to a set of strings that make up the HTML template. Each string is a sequence of one or more HTML commands or HTML-transparent tags. An HTML-transparent tag has the form

```
<#TagName Param1=Value1 Param2=Value2 ...>
```

A pound sign (#) immediately follows the opening angle bracket (<) with no spaces separating it from the angle bracket. The pound sign identifies the string to the page producer as an HTML-transparent tag. The tag name immediately follows the pound sign with no spaces separating it from the pound sign. The page producer converts the entire HTML-transparent tag into true HTML commands based on the value of the tag name. Following the tag name, the HTML-transparent tag can optionally include parameters that specify details of the conversion to be performed. Each parameter is of the form ParamName=Value, where there is no space between the parameter name, the equals symbol (=) and the value. Each parameter is delimited by white space.

The angle brackets (< >) make the tag transparent to HTML browsers that do not recognize the #TagName construct.

Note: Setting HTMLDoc clears the HTMLFile (see page 15287) property.

See Also

Content (see page 15274)

HTMLFile (see page 15287)

Specifying the HTML Template

78.1.7.5.2 TCustomPageProducer.HTMLFile Property

Specifies the name of a file that contains the HTML template used to generate the value returned by the Content (see page 15274) method.

Pascal

```
property HTMLFile: TFileName;
```

C++

```
__property TFileName HTMLFile;
```

Description

Set HTMLFile to the name of the file that contains an HTML template. The HTML template is a sequence of HTML commands and HTML-transparent tags. An HTML-transparent tag has the form

```
<#TagName Param1=Value1 Param2=Value2 ...>
```

A pound sign (#) immediately follows the opening angle bracket (<) with no spaces separating it from the angle bracket. The pound sign identifies the string to the page producer as an HTML-transparent tag. The tag name immediately follows the pound sign with no spaces separating it from the pound sign. The page producer converts the entire HTML-transparent tag into true HTML commands based on the value of the tag name. Following the tag name, the HTML-transparent tag can optionally include parameters that specify details of the conversion to be performed. Each parameter is of the form ParamName=Value, where

there is no space between the parameter name, the equals symbol (=) and the value. Each parameter is delimited by white space.

The angle brackets (< >) make the tag transparent to HTML browsers that do not recognize the #TagName construct.

Note: Setting HTMLFile clears the HTMLDoc (see page 15287) property.

Note: When distributing applications that contain page producers which use the HTMLFile property, be sure to distribute the file along with the application. Also, be sure that the value of HTMLFile does not include a hard-coded path name that will not be available on the user's disk.

Specifying the HTML Template

78.1.8 THTMLTableAttributes Class

THTMLTableAttributes represents the display attributes of an HTML table tag.

Class Hierarchy

Pascal

```
THTMLTableAttributes = class(THTMLTagAttributes);
```

C++

```
class THTMLTableAttributes : public THTMLTagAttributes;
```

File

HTTPProd

Description

Use THTMLTableAttributes to describe the desired appearance of an HTML table. The properties of the THTMLTableAttributes object correspond to the options that can be added to the HTML table tag. When the attributes of all the parts of the HTML table have been specified, an HTML producer object creates the HTML commands to specify the table as described.

See Also

TCustomContentProducer (see page 15102)

TDSTableProducer (see page 10290)

THTMLTableCellAttributes (see page 15295)

THTMLTableColumn (see page 10318)

THTMLTableHeaderAttributes (see page 15300)

THTMLTableRowAttributes (see page 15304)

Specifying the Table Attributes

78.1.8.1 THTMLTableAttributes Members

The following tables list the members exposed by THTMLTableAttributes.

Protected Methods

	Name	Description
	AssignTo (see page 15291)	Copies the properties of a THTMLTableAttributes (see page 15288) object to another THTMLTableAttributes (see page 15288) object.
	Changed (see page 15307)	Generates an OnChange (see page 15308) event.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetOwner (see page 2932)	Returns the owner of an object.

Public Events

	Name	Description
	OnChange (see page 15308)	Occurs immediately after a tag attributes property changes.

Public Methods

	Name	Description
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 15290)	Creates an instance of THTMLTableAttributes (see page 15288).
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 22287)	Disposes of an object instance.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	RestoreDefaults (see page 15291)	Changes all properties of the table attributes object back to their initial settings.
	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
R	Producer (see page 15308)	Indicates the content producer that uses the THTMLTagAttributes (see page 15304) object to represent the options for one of the HTML tags in the content it produces.

Published Properties

	Name	Description
	Align (see page 15292)	Specifies the alignment of the table within the HTML document.
	BgColor (see page 15293)	Specifies the background color of the HTML table.
	Border (see page 15293)	Specifies the thickness of the border drawn around the HTML table.
	CellPadding (see page 15294)	Specifies the amount of space to leave around the contents of each cell in the HTML table.
	CellSpacing (see page 15294)	Specifies the amount of space to leave between cells in the HTML table.
	Custom (see page 15307)	Represents a tag option and its value in an HTML tag.
	Width (see page 15294)	Specifies the width of the entire HTML table.

78.1.8.2 THTMLTableAttributes.Create Constructor

Creates an instance of THTMLTableAttributes (see page 15288).

Pascal

```
constructor Create(Producer: TCustomContentProducer);
```

C++

```
__fastcall THTMLTableAttributes(TCustomContentProducer Producer);
```

Description

Call Create to create and initialize a THTMLTableAttributes (see page 15288) object. The Producer (see page 15308) parameter specifies the HTML producer that is using the THTMLTableAttributes (see page 15288) object to specify the attributes of an HTML table that makes up part of its output.

After calling the inherited constructor, Create initializes

Width (see page 15294) to a value of 100.

Border (see page 15293) to a value of -1.

CellPadding (see page 15294) to a value of -1.

CellSpacing (see page 15294) to a value of -1.

See Also

Border (see page 15293)

CellPadding (see page 15294)

CellSpacing (see page 15294)

Create (see page 15306)

Width (see page 15294)

78.1.8.3 THTMLTableAttributes Methods

The methods of the THTMLTableAttributes class are listed here.

Protected Methods

	Name	Description
	AssignTo (see page 15291)	Copies the properties of a THTMLTableAttributes (see page 15288) object to another THTMLTableAttributes (see page 15288) object.

Public Methods

	Name	Description
	RestoreDefaults (see page 15291)	Changes all properties of the table attributes object back to their initial settings.

78.1.8.3.1 THTMLTableAttributes.AssignTo Method

Copies the properties of a THTMLTableAttributes (see page 15288) object to another THTMLTableAttributes (see page 15288) object.

Pascal

```
procedure AssignTo(Dest: TPersistent); override;
```

C++

```
virtual __fastcall AssignTo(TPersistent * Dest);
```

Description

Applications cannot call the protected AssignTo method. To assign the properties of a THTMLTableAttributes (see page 15288) object to another object, use the Assign method of the destination object.

When the Assign method of another object specifies a THTMLTableAttributes (see page 15288) object as the source of the assignment, the AssignTo method of the THTMLTableAttributes (see page 15288) object is called. AssignTo checks whether the Dest parameter is another THTMLTableAttributes (see page 15288) object, and if so, copies the values of the Align (see page 15292), Border (see page 15293), CellSpacing (see page 15294), CellPadding (see page 15294), and Width (see page 15294) properties. If Dest is any other class of object, the inherited method is called.

Note: AssignTo does not copy the Custom (see page 15307) property.

See Also

Align (see page 15292)

Border (see page 15293)

CellPadding (see page 15294)

CellSpacing (see page 15294)

Assign (see page 2930)

Width (see page 15294)

78.1.8.3.2 THTMLTableAttributes.RestoreDefaults Method

Changes all properties of the table attributes object back to their initial settings.

Pascal

```
procedure RestoreDefaults; override;
```

C++

```
virtual __fastcall RestoreDefaults();
```

Description

Call RestoreDefaults to undo any changes that were made to the table attributes either programmatically, or using the response editor at design time. RestoreAttributes sets

Align (see page 15292) to haDefault. (Delphi) or haDefault; (C++)

Border (see page 15293), CellPadding (see page 15294), and CellSpacing (see page 15294) to –1. (Delphi) or -1; (C++)

Custom (see page 15307) to an empty string.

Width (see page 15294) to 100. (Delphi) or 100; (C++)

See Also

Align (see page 15292)

Border (see page 15293)

CellPadding (see page 15294)

CellSpacing (see page 15294)

Custom (see page 15307)

Width (see page 15294)

78.1.8.4 THTMLTableAttributes Properties

The properties of the THTMLTableAttributes class are listed here.

Published Properties

	Name	Description
	Align (see page 15292)	Specifies the alignment of the table within the HTML document.
	BgColor (see page 15293)	Specifies the background color of the HTML table.
	Border (see page 15293)	Specifies the thickness of the border drawn around the HTML table.
	CellPadding (see page 15294)	Specifies the amount of space to leave around the contents of each cell in the HTML table.
	CellSpacing (see page 15294)	Specifies the amount of space to leave between cells in the HTML table.
	Width (see page 15294)	Specifies the width of the entire HTML table.

78.1.8.4.1 THTMLTableAttributes.Align Property

Specifies the alignment of the table within the HTML document.

Pascal

```
property Align: THTMLAlign;
```

C++

```
__property THTMLAlign Align;
```

Description

Set Align to indicate the desired alignment of the table within the HTML document, or within the cell of a surrounding HTML table object. Align indicates the desired value of the Align option of the HTML table tag.

The default value of Align is haDefault, which means the web browser that reads the HTML document positions the HTML table where it wants.

See Also

CellPadding (see page 15294)

Width (see page 15294)

78.1.8.4.2 THTMLTableAttributes.BgColor Property

Specifies the background color of the HTML table.

Pascal

```
property BgColor: THTMLBgColor;
```

C++

```
__property THTMLBgColor BgColor;
```

Description

Use BgColor to indicate the desired background color of the HTML table. The value of BgColor is the name of color. This can be one of the following strings:

Aqua	Black	Blue	Fuschia
Gray	Green	Lime	Maroon
Navy	Olive	Purple	Red
Silver	Teal	White	Yellow

Use the BgColor property of the HTML attributes objects for the pieces of the table for more involved color effects.

See Also

BgColor (see page 10325)

BgColor (see page 15299)

78.1.8.4.3 THTMLTableAttributes.Border Property

Specifies the thickness of the border drawn around the HTML table.

Pascal

```
property Border: Integer;
```

C++

```
__property int Border;
```

Description

Set Border to specify whether a border should be drawn around the table, and if so, how thick it should be. The thickness specified by any particular value of border depends on the web browser that views the HTML table. For any browser, however, larger numbers indicate thicker borders. A value of -1 indicates that no border should be drawn around the table.

See Also

CellSpacing (see page 15294)

78.1.8.4.4 THTMLTableAttributes.CellPadding Property

Specifies the amount of space to leave around the contents of each cell in the HTML table.

Pascal

```
property CellPadding: Integer;
```

C++

```
__property int CellPadding;
```

Description

Set CellPadding to specify how many pixels of whitespace should appear between a cell's contents and the edges of the cell. A value of -1 indicates that the web browser should decide how to pad the cells of the HTML table.

See Also

CellSpacing (see page 15294)

78.1.8.4.5 THTMLTableAttributes.CellSpacing Property

Specifies the amount of space to leave between cells in the HTML table.

Pascal

```
property CellSpacing: Integer;
```

C++

```
__property int CellSpacing;
```

Description

Set CellSpacing to specify how many pixels of whitespace should appear between the cells in the table. A value of -1 indicates that the web browser should decide how to separate the cells of the HTML table.

Note: CellSpacing refers to the whitespace between cells in an HTML table, not the thickness of the lines drawn to separate rows and columns.

See Also

Border (see page 15293)

CellPadding (see page 15294)

78.1.8.4.6 THTMLTableAttributes.Width Property

Specifies the width of the entire HTML table.

Pascal

```
property Width: Integer;
```

C++

```
__property int Width;
```

Description

Set Width to indicate the desired width of the HTML table as a percentage of the width of the web browser window. If the value of Width is too small for the contents of the table, the web browser will ignore this property.

The default value of Width is 100, meaning the table will span the entire browser window. In this case, the value of the Align (

see page 15292) property is meaningless.

See Also

Align (see page 15292)

CellSpacing (see page 15294)

78.1.9 THTMLTableCellAttributes Class

THTMLTableCellAttributes represents the display attributes of an HTML table cell tag.

Class Hierarchy

Pascal

```
THTMLTableCellAttributes = class(THTMLTableElementAttributes);
```

C++

```
class THTMLTableCellAttributes : public THTMLTableElementAttributes;
```

File

HTTPProd

Description

Use THTMLTableCellAttributes to describe the desired appearance of a cell in an HTML table. The properties of the THTMLTableCellAttributes object correspond to the options that can be added to the HTML table data tag (TD). When the attributes of all the parts of the HTML table have been specified, an HTML producer object creates the HTML commands to specify the table as described.

See Also

TCustomContentProducer (see page 15102)

THTMLTableAttributes (see page 15288)

THTMLTableColumn (see page 10318)

THTMLTableHeaderAttributes (see page 15300)

THTMLTableRowAttributes (see page 15304)

78.1.10 THTMLTableElementAttributes Class

THTMLTableElementAttributes is the common base class for objects that describe the display attributes of parts of an HTML table.

Class Hierarchy

Pascal

```
THTMLTableElementAttributes = class(THTMLTagAttributes);
```

C++

```
class THTMLTableElementAttributes : public THTMLTagAttributes;
```

File

HTTPProd

Description

Use the properties of THTMLTableElementAttributes to describe the desired appearance of a piece of an HTML table. The properties of THTMLTableElementAttributes correspond to the common options that can be added to the tags for the parts of the HTML table. When the attributes of all the parts of the HTML table have been specified, an HTML producer object creates the HTML commands to specify the table as described.

See Also

TCustomContentProducer (see page 15102)

TDSTableProducer (see page 10290)

THTMLTableCellAttributes (see page 15295)

THTMLTableHeaderAttributes (see page 15300)

THTMLTableRowAttributes (see page 15304)

78.1.10.1 THTMLTableElementAttributes Members

The following tables list the members exposed by THTMLTableElementAttributes.

Protected Methods

	Name	Description
	AssignTo (see page 15297)	Copies the properties of a THTMLTableElementAttributes (see page 15295) object to another THTMLTableElementAttributes (see page 15295) object.
	Changed (see page 15307)	Generates an OnChange (see page 15308) event.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetOwner (see page 2932)	Returns the owner of an object.

Public Events

	Name	Description
	OnChange (see page 15308)	Occurs immediately after a tag attributes property changes.

Public Methods

	Name	Description
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 15306)	Creates an instance of THTMLTagAttributes (see page 15304).
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.

	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 22287)	Disposes of an object instance.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	RestoreDefaults (see page 15298)	Changes all properties of the attributes object back to their initial settings.
	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
	Producer (see page 15308)	Indicates the content producer that uses the THTMLTagAttributes (see page 15304) object to represent the options for one of the HTML tags in the content it produces.

Published Properties

	Name	Description
	Align (see page 15299)	Specifies the horizontal alignment of the contents of the HTML table element.
	BgColor (see page 15299)	Specifies the background color of the HTML table element.
	Custom (see page 15307)	Represents a tag option and its value in an HTML tag.
	VAlign (see page 15300)	Specifies the vertical alignment of the contents of the HTML table element.

78.1.10.2 THTMLTableElementAttributes Methods

The methods of the THTMLTableElementAttributes class are listed here.

Protected Methods

	Name	Description
	AssignTo (see page 15297)	Copies the properties of a THTMLTableElementAttributes (see page 15295) object to another THTMLTableElementAttributes (see page 15295) object.

Public Methods

	Name	Description
	RestoreDefaults (see page 15298)	Changes all properties of the attributes object back to their initial settings.

78.1.10.2.1 THTMLTableElementAttributes.AssignTo Method

Copies the properties of a THTMLTableElementAttributes (see page 15295) object to another THTMLTableElementAttributes (see page 15295) object.

Pascal

```
procedure AssignTo(Dest: TPersistent); override;
```

C++

```
virtual __fastcall AssignTo(TPersistent * Dest);
```

Description

Applications can not call the protected AssignTo method. To assign the properties of a THTMLTableElementAttributes (see page 15295) object to another object, use the Assign method of the destination object.

When the Assign method of another object specifies a THTMLTableElementAttributes (see page 15295) object as the source of the assignment, the AssignTo method of the THTMLTableElementAttributes (see page 15295) object is called. AssignTo checks whether the Dest parameter is another THTMLTableElementAttributes (see page 15295) object, and if so, copies the values of the BgColor (see page 15299), Align (see page 15299), and VAlign (see page 15300) properties. If Dest is any other class of object, the inherited method is called.

Note: AssignTo does not copy the Custom (see page 15307) property.

See Also

Align (see page 15299)

Assign (see page 2930)

VAlign (see page 15300)

78.1.10.2.2 THTMLTableElementAttributes.RestoreDefaults Method

Changes all properties of the attributes object back to their initial settings.

Pascal

```
procedure RestoreDefaults; override;
```

C++

```
virtual __fastcall RestoreDefaults();
```

Description

Call RestoreDefaults to undo any changes that were made to the table element attributes either programmatically, or using the Object Inspector at design time. RestoreAttributes sets

Align (see page 15299) to haDefault, and VAlign (see page 15300) to haVDefault.

BgColor (see page 15299) to an empty string.

Custom (see page 15307) to an empty string.

See Also

Align (see page 15299)

BgColor (see page 15299)

Custom (see page 15307)

VAlign (see page 15300)

78.1.10.3 THTMLTableElementAttributes Properties

The properties of the THTMLTableElementAttributes class are listed here.

Published Properties

	Name	Description
	Align (see page 15299)	Specifies the horizontal alignment of the contents of the HTML table element.
	BgColor (see page 15299)	Specifies the background color of the HTML table element.
	VAlign (see page 15300)	Specifies the vertical alignment of the contents of the HTML table element.

78.1.10.3.1 THTMLTableElementAttributes.Align Property

Specifies the horizontal alignment of the contents of the HTML table element.

Pascal

```
property Align: THTMLAlign;
```

C++

```
__property THTMLAlign Align;
```

Description

Set Align to indicate the desired horizontal alignment of the contents of the cell or cells indicated by the table element. Align indicates the desired value of the Align option of the HTML tag for the table element.

The default value of Align is haDefault, which means the web browser that reads the HTML document horizontally positions the contents of the table element wherever it wishes.

The Align property of table data cells or header cells overrides the Align property of the table row in which they appear.

See Also

VAlign (see page 15300)

78.1.10.3.2 THTMLTableElementAttributes.BgColor Property

Specifies the background color of the HTML table element.

Pascal

```
property BgColor: THTMLBgColor;
```

C++

```
__property THTMLBgColor BgColor;
```

Description

Use BgColor to indicate the desired background color of the HTML table element. The value of BgColor is the name of color. This can be one of the following strings:

Use the BgColor property of the THTMLTableAttributes (see page 15288) object to set a background color for the entire table. Use the BgColor property of the table element attributes object to make a table element stand out from the rest of the table.

See Also

BgColor (see page 15293)

78.1.10.3.3 THTMLTableElementAttributes.VAlign Property

Specifies the vertical alignment of the contents of the HTML table element.

Pascal

```
property VAlign: THTMLVAlign;
```

C++

```
__property THTMLVAlign VAlign;
```

Description

Set VAlign to indicate the desired vertical alignment of the contents of the HTML table element. VAlign indicates the desired value of the VAlign option of the HTML tag for the table element.

The default value of VAlign is haVDefault, which means the web browser that reads the HTML document positions the contents of cells in the table element wherever it wishes vertically.

The VAlign property of table data cells or header cells overrides the VAlign property of the table row in which they appear.

See Also

Align (see page 15299)

78.1.11 THTMLTableHeaderAttributes Class

THTMLTableHeaderAttributes represents the display attributes of the header tag in an HTML table.

Class Hierarchy

Pascal

```
THTMLTableHeaderAttributes = class(THTMLTableElementAttributes);
```

C++

```
class THTMLTableHeaderAttributes : public THTMLTableElementAttributes;
```

File

HTTPProd

Description

Use THTMLTableHeaderAttributes to describe the desired appearance of a header cell in an HTML table. The properties of the THTMLTableHeaderAttributes object correspond to the options that can be added to the HTML header tag (TH). When the attributes of all the parts of the HTML table have been specified, the HTML content producer creates the HTML commands to specify the table as described.

See Also

THTMLTableCellAttributes (see page 15295)

78.1.11.1 THTMLTableHeaderAttributes Members

The following tables list the members exposed by THTMLTableHeaderAttributes.

Protected Methods

	Name	Description
	AssignTo (see page 15302)	Copies the properties of a THTMLTableElementAttributes object to another THTMLTableElementAttributes object.
	Changed (see page 15307)	Generates an OnChange (see page 15308) event.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetOwner (see page 2932)	Returns the owner of an object.

Public Events

	Name	Description
	OnChange (see page 15308)	Occurs immediately after a tag attributes property changes.

Public Methods

	Name	Description
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 15306)	Creates an instance of THTMLTagAttributes (see page 15304).
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 22287)	Disposes of an object instance.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	RestoreDefaults (see page 15303)	Changes all properties of the attributes object back to their initial settings.
	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
R	Producer (see page 15308)	Indicates the content producer that uses the THTMLTagAttributes (see page 15304) object to represent the options for one of the HTML tags in the content it produces.

Published Properties

	Name	Description
	Align (see page 15299)	Specifies the horizontal alignment of the contents of the HTML table element.
	BgColor (see page 15299)	Specifies the background color of the HTML table element.
	Caption (see page 15303)	Represents the text that appears in the header cell.
	Custom (see page 15307)	Represents a tag option and its value in an HTML tag.
	VAlign (see page 15300)	Specifies the vertical alignment of the contents of the HTML table element.

78.1.11.2 THTMLTableHeaderAttributes Methods

The methods of the THTMLTableHeaderAttributes class are listed here.

Protected Methods

	Name	Description
V	AssignTo (see page 15302)	Copies the properties of a THTMLTableElementAttributes object to another THTMLTableElementAttributes object.

Public Methods

	Name	Description
V	RestoreDefaults (see page 15303)	Changes all properties of the attributes object back to their initial settings.

78.1.11.2.1 THTMLTableHeaderAttributes.AssignTo Method

Copies the properties of a THTMLTableElementAttributes object to another THTMLTableElementAttributes object.

Pascal

```
procedure AssignTo(Dest: TPersistent); override;
```

C++

```
virtual __fastcall AssignTo(TPersistent * Dest);
```

Description

Applications can not call the protected AssignTo method. To assign the properties of a THTMLTableElementAttributes object to another object, use the Assign method of the destination object.

When the Assign method of another object specifies a THTMLTableElementAttributes object as the source of the assignment, the AssignTo method of the THTMLTableElementAttributes object is called. AssignTo checks whether the Dest parameter is another THTMLTableElementAttributes object, and if so, copies the values of the BgColor, Align, and VAlign properties. If Dest is any other class of object, the inherited method is called.

Note: AssignTo does not copy the Custom property.

See Also

Align (see page 15299)

Assign (see page 2930)

VAlign (see page 15300)

78.1.11.2.2 THTMLTableHeaderAttributes.RestoreDefaults Method

Changes all properties of the attributes object back to their initial settings.

Pascal

```
procedure RestoreDefaults; override;
```

C++

```
virtual __fastcall RestoreDefaults();
```

Description

Call RestoreDefaults to undo any changes that were made to the table element attributes either programmatically, or using the Object Inspector at design time. RestoreAttributes sets

Align (see page 15299) to haDefault, and VAlign (see page 15300) to haVDefault.

BgColor (see page 15299) to an empty string.

Caption (see page 15303) to an empty string.

Custom (see page 15307) to an empty string.

See Also

Align (see page 15299)

BgColor (see page 15299)

Caption (see page 15303)

Custom (see page 15307)

VAlign (see page 15300)

78.1.11.3 THTMLTableHeaderAttributes Properties

The properties of the THTMLTableHeaderAttributes class are listed here.

Published Properties

	Name	Description
	Caption (see page 15303)	Represents the text that appears in the header cell.

78.1.11.3.1 THTMLTableHeaderAttributes.Caption Property

Represents the text that appears in the header cell.

Pascal

```
property Caption: string;
```

C++

```
__property AnsiString Caption;
```

Description

Set the Caption property to provide a caption for the column that contains the header cell. If the header cell is used by a dataset table producer or a query table producer, the Caption property overrides the field name that would label the column by default.

See Also

TDataSetTableProducer (see page 10277)

TQueryTableProducer (see page 8152)

TSQLQueryTableProducer (see page 10842)

78.1.12 THTMLTableRowAttributes Class

THTMLTableRowAttributes represents the display attributes of the row tag in an HTML table.

Class Hierarchy

Pascal

```
THTMLTableRowAttributes = class(THTMLTableElementAttributes);
```

C++

```
class THTMLTableRowAttributes : public THTMLTableElementAttributes;
```

File

HTTPProd

Description

Use THTMLTableRowAttributes to describe the desired appearance of a row of an HTML table. The properties of the THTMLTableRowAttributes object correspond to the options that can be added to the HTML row tag (TR). When the attributes of all the parts of the HTML table have been specified, the content producer creates the HTML commands to specify the table as described.

See Also

TDSTableProducer (see page 10290)

THTMLTableHeaderAttributes (see page 15300)

Specifying the Row Attributes

78.1.13 THTMLTagAttributes Class

THTMLTagAttributes is the base class for all objects that represent the attributes of an HTML tag.

Class Hierarchy

Pascal

```
THTMLTagAttributes = class(TPersistent);
```

C++

```
class THTMLTagAttributes : public TPersistent;
```

File

HTTPProd

Description

Descendants of TCustomContentProducer use THTMLTagAttributes objects to encapsulate the options added to the HTML tags in the HTML commands that they produce. When the TCustomContentProducer object generates HTML commands, it looks up the tag attributes represented by the properties of its tag attributes objects, and generates the appropriate tag options.

See Also

TCustomContentProducer (see page 15102)

78.1.13.1 THTMLTagAttributes Members

The following tables list the members exposed by THTMLTagAttributes.

Protected Methods

	Name	Description
	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	Changed (see page 15307)	Generates an OnChange (see page 15308) event.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetOwner (see page 2932)	Returns the owner of an object.

Public Events

	Name	Description
	OnChange (see page 15308)	Occurs immediately after a tag attributes property changes.

Public Methods

	Name	Description
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 15306)	Creates an instance of THTMLTagAttributes (see page 15304).
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 22287)	Disposes of an object instance.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.

	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	RestoreDefaults (see page 15307)	Changes all properties of the tag attributes object back to their initial settings.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
R	Producer (see page 15308)	Indicates the content producer that uses the THTMLTagAttributes (see page 15304) object to represent the options for one of the HTML tags in the content it produces.

Published Properties

	Name	Description
	Custom (see page 15307)	Represents a tag option and its value in an HTML tag.

78.1.13.2 THTMLTagAttributes.Create Constructor

Creates an instance of THTMLTagAttributes (see page 15304).

Pascal

```
constructor Create(Producer: TCustomContentProducer);
```

C++

```
__fastcall THTMLTagAttributes(TCustomContentProducer Producer);
```

Description

Call Create to create and initialize an instance of THTMLTagAttributes (see page 15304) at runtime. After calling the inherited constructor, Create sets the Producer (see page 15308) property to the value of the Producer (see page 15308) parameter.

See Also

Producer (see page 15308)

Create (see page 22287)

78.1.13.3 THTMLTagAttributes Methods

The methods of the THTMLTagAttributes class are listed here.

Protected Methods

	Name	Description
	Changed (see page 15307)	Generates an OnChange (see page 15308) event.

Public Methods

	Name	Description
V	RestoreDefaults (see page 15307)	Changes all properties of the tag attributes object back to their initial settings.

78.1.13.3.1 THTMLTagAttributes.Changed Method

Generates an OnChange (see page 15308) event.

Pascal

```
procedure Changed;
```

C++

```
__fastcall Changed();
```

Description

Call Changed from a descendant of THTMLTagAttributes (see page 15304) after a tag option introduced by that descendant changes. Changed is exposed as a protected method so that component writers can create descendants of THTMLTagAttributes (see page 15304) which correctly trigger the OnChange (see page 15308) event handler.

See Also

OnChange (see page 15308)

78.1.13.3.2 THTMLTagAttributes.RestoreDefaults Method

Changes all properties of the tag attributes object back to their initial settings.

Pascal

```
procedure RestoreDefaults; virtual;
```

C++

```
virtual __fastcall RestoreDefaults();
```

Description

Call RestoreDefaults to undo any changes that were made to the tag attributes either programmatically, or at design time. RestoreAttributes sets the Custom (see page 15307) property to an empty string.

See Also

Custom (see page 15307)

78.1.13.4 THTMLTagAttributes Properties

The properties of the THTMLTagAttributes class are listed here.

Public Properties

	Name	Description
R	Producer (see page 15308)	Indicates the content producer that uses the THTMLTagAttributes (see page 15304) object to represent the options for one of the HTML tags in the content it produces.

Published Properties

	Name	Description
	Custom (see page 15307)	Represents a tag option and its value in an HTML tag.

78.1.13.4.1 THTMLTagAttributes.Custom Property

Represents a tag option and its value in an HTML tag.

Pascal

```
property Custom: string;
```

C++

```
__property AnsiString Custom;
```

Description

Use Custom to represent one or more options to be added to an HTML tag. Each option and its value should have the form

`OPTIONNAME=Value`

The options specified by Custom should be separated by spaces. For example, to merge a cell in an HTML table with the three adjacent cells to the left and below, the table data tag for the cell requires the ROWSPAN and COLSPAN options to be set. The value of Custom to specify these values would be the string

`ROWSPAN=2 COLSPAN=2`

The HTML producer inserts the Custom string into the HTML tag when it generates its Content.

See Also

Producer (see page 15308)

Content (see page 15106)

78.1.13.4.2 THTMLTagAttributes.Producer Property

Indicates the content producer that uses the THTMLTagAttributes (see page 15304) object to represent the options for one of the HTML tags in the content it produces.

Pascal

```
property Producer: TCustomContentProducer;
```

C++

```
__property TCustomContentProducer Producer;
```

Description

Use Producer to gain access to the HTML producer object that is using the THTMLTagAttributes (see page 15304) object. The THTMLTagAttributes (see page 15304) object can use the Producer property in an OnChange (see page 15308) event handler to notify the TCustomContentProducer object of changes to the attributes it represents.

See Also

OnChange (see page 15308)

78.1.13.5 THTMLTagAttributes Events

The events of the THTMLTagAttributes class are listed here.

Public Events

	Name	Description
	OnChange (see page 15308)	Occurs immediately after a tag attributes property changes.

78.1.13.5.1 THTMLTagAttributes.OnChange Event

Occurs immediately after a tag attributes property changes.

Pascal

```
property OnChange: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnChange;
```

Description

Write an OnChange event handler to take specific action whenever any of the properties of the tag attributes object changes. When OnChange occurs, the tag attributes object already has the new property setting. Use an OnChange event handler to inform the HTML content producer whenever the attributes of a tag change so that the content producer can update the content it is producing.

See Also

Producer (see page 15308)

78.1.14 TPageProducer Class

TPageProducer produces a string of HTML commands based on an input template.

Class Hierarchy

Pascal

```
TPageProducer = class(TCustomPageProducer);
```

C++

```
class TPageProducer : public TCustomPageProducer;
```

File

HTTPProd

Description

Use TPageProducer to convert an HTML template into a string of HTML commands that can be interpreted by a client application such as a Web browser. In Web Broker applications, HTML templates include HTML commands and HTML-transparent tags that are replaced with customized content by the OnHTMLTag (see page 15316) event. WebSnap application page templates often include server-side scripting (such as JScript or JavaScript) to dynamically generate content.

The Web Module

Using Page Producer Components

78.1.14.1 TPageProducer Members

The following tables list the members exposed by TPageProducer.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	DoTagEvent (see page 15276)	This is DoTagEvent, a member of class TBasePageProducer.
	GetAppDispatcher (see page 15108)	This is GetAppDispatcher, a member of class TCustomContentProducer.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetProducerTemplateFileName (see page 15276)	This is GetProducerTemplateFileName, a member of class TBasePageProducer.
	GetProducerTemplateStream (see page 15276)	This is GetProducerTemplateStream, a member of class TBasePageProducer.
V	GetScriptEngine (see page 15277)	This is GetScriptEngine, a member of class TBasePageProducer.
	GetTagID (see page 15277)	This is GetTagID, a member of class TBasePageProducer.
V	GetTemplateFileName (see page 15277)	This is GetTemplateFileName, a member of class TBasePageProducer.
V	GetTemplateFileName (see page 15286)	This is GetTemplateFileName, a member of class TCustomPageProducer.
V	GetTemplateStream (see page 15277)	This is GetTemplateStream, a member of class TBasePageProducer.
V	GetTemplateStream (see page 15286)	This is GetTemplateStream, a member of class TCustomPageProducer.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
V	HandleScriptTag (see page 15277)	This is HandleScriptTag, a member of class TBasePageProducer.
V	HandleTag (see page 15278)	This is HandleTag, a member of class TBasePageProducer.
V	HandleTag (see page 15286)	This is HandleTag, a member of class TCustomPageProducer.
	ImplHandleTag (see page 15278)	This is ImplHandleTag, a member of class TBasePageProducer.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2783)	Forwards notification messages to all owned components.

	Notification (see page 15108)	Overrides the inherited method to respond to messages that the dispatcher is going away.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	ProduceContent (see page 15108)	Returns the content that the producer creates.
	ProduceContentFromStream (see page 15109)	This is ProduceContentFromStream, a member of class TCustomContentProducer.
	ProduceContentFromString (see page 15109)	This is ProduceContentFromString, a member of class TCustomContentProducer.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	ServerScriptFromStream (see page 15278)	This is ServerScriptFromStream, a member of class TBasePageProducer.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetAppDispatcher (see page 15109)	This is SetAppDispatcher, a member of class TCustomContentProducer.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	UseScriptEngine (see page 15278)	This is UseScriptEngine, a member of class TBasePageProducer.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Content (see page 15106)	Returns the content produced by the content producer.
	Content (see page 15274)	Returns the content produced by the content producer.
	ContentFromStream (see page 15107)	Returns the content produced in response to input read from a stream.
	ContentFromStream (see page 15275)	Returns the content produced in response to input read from a stream.
	ContentFromString (see page 15107)	Returns the content produced in response to an input string.
	ContentFromString (see page 15275)	Returns the content produced in response to an input string.
	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 15274)	Creates an instance of TBasePageProducer (see page 15269).

	Create (see page 15285)	Creates an instance of TCustomPageProducer (see page 15281).
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 2766)	Disposes of the component and its owned components.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 15285)	Destroys an instance of TCustomPageProducer (see page 15281).
	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetAppDispatcher (see page 15220)	This is GetAppDispatcher, a member of class IGetAppDispatcher.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetProducerTemplateFileName (see page 15320)	This is GetProducerTemplateFileName, a member of class IGetProducerTemplate.
	GetProducerTemplateStream (see page 15320)	This is GetProducerTemplateStream, a member of class IGetProducerTemplate.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	ProduceContent (see page 15224)	Returns the content that the producer creates.
	ProduceContentFromStream (see page 15225)	This is ProduceContentFromStream, a member of class IProduceContentFrom.
	ProduceContentFromString (see page 15226)	This is ProduceContentFromString, a member of class IProduceContentFrom.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetAppDispatcher (see page 15227)	This is SetAppDispatcher, a member of class ISetAppDispatcher.

	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	Dispatcher (see page 15109)	Provides access to the dispatcher for the Web server application that includes the TCustomContentProducer (see page 15102) object.
R	DispatcherComponent (see page 15110)	Provides access to the dispatcher component.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
R	WebModuleContext (see page 15279)	Provides access to the Web module context object.

Published Events

	Name	Description
	OnHTMLTag (see page 15316)	Occurs when the page producer needs to interpret the value of an HTML-transparent tag in the HTML template.

Published Properties

	Name	Description
	HTMLDoc (see page 15314)	Specifies the HTML template used to generate the value returned by the Content method.
	HTMLFile (see page 15314)	Specifies the name of a file that contains the HTML template used to generate the value returned by the Content method.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	ScriptEngine (see page 15315)	Names the script engine that generates or interprets script embedded in the documents that this producer creates.
	StripParamQuotes (see page 15315)	Specifies whether to strip quotation marks when extracting the parameters from an HTML-transparent tag.
	Tag (see page 2808)	Stores an integer value as part of a component.

78.1.14.2 TPageProducer Properties

The properties of the TPageProducer class are listed here.

Published Properties

	Name	Description
	HTMLDoc (see page 15314)	Specifies the HTML template used to generate the value returned by the Content method.
	HTMLFile (see page 15314)	Specifies the name of a file that contains the HTML template used to generate the value returned by the Content method.
	ScriptEngine (see page 15315)	Names the script engine that generates or interprets script embedded in the documents that this producer creates.
	StripParamQuotes (see page 15315)	Specifies whether to strip quotation marks when extracting the parameters from an HTML-transparent tag.

78.1.14.2.1 TPageProducer.HTMLDoc Property

Specifies the HTML template used to generate the value returned by the Content method.

Pascal

```
property HTMLDoc: TStrings;
```

C++

```
__property TStrings HTMLDoc;
```

Description

Set HTMLDoc to a set of strings that make up the HTML template. Each string is a sequence of one or more HTML commands or HTML-transparent tags. An HTML-transparent tag has the form

```
<#TagName Param1=Value1 Param2=Value2 ...>
```

A pound sign (#) immediately follows the opening angle bracket (<) with no spaces separating it from the angle bracket. The pound sign identifies the string to the page producer as an HTML-transparent tag. The tag name immediately follows the pound sign with no spaces separating it from the pound sign. The page producer converts the entire HTML-transparent tag into true HTML commands based on the value of the tag name. Following the tag name, the HTML-transparent tag can optionally include parameters that specify details of the conversion to be performed. Each parameter is of the form ParamName=Value, where there is no space between the parameter name, the equals symbol (=) and the value. Each parameter is delimited by white space.

The angle brackets (< >) make the tag transparent to HTML browsers that do not recognize the #TagName construct.

Note: Setting HTMLDoc clears the HTMLFile property.

Content (see page 15274)

HTMLFile (see page 15287)

Specifying the HTML Template

78.1.14.2.2 TPageProducer.HTMLFile Property

Specifies the name of a file that contains the HTML template used to generate the value returned by the Content method.

Pascal

```
property HTMLFile: TFileName;
```

C++

```
__property TFileName HTMLFile;
```

Description

Set HTMLFile to the name of the file that contains an HTML template. The HTML template is a sequence of HTML commands and HTML-transparent tags. An HTML-transparent tag has the form

```
<#TagName Param1=Value1 Param2=Value2 ...>
```

A pound sign (#) immediately follows the opening angle bracket (<) with no spaces separating it from the angle bracket. The pound sign identifies the string to the page producer as an HTML-transparent tag. The tag name immediately follows the pound sign with no spaces separating it from the pound sign. The page producer converts the entire HTML-transparent tag into true HTML commands based on the value of the tag name. Following the tag name, the HTML-transparent tag can optionally include parameters that specify details of the conversion to be performed. Each parameter is of the form ParamName=Value, where there is no space between the parameter name, the equals symbol (=) and the value. Each parameter is delimited by white

space.

The angle brackets (< >) make the tag transparent to HTML browsers that do not recognize the #TagName construct.

Note: Setting HTMLFile clears the HTMLDoc property.

Note: When distributing applications that contain page producers which use the HTMLFile property, be sure to distribute the file along with the application. Also, be sure that the value of HTMLFile does not include a hard-coded path name that will not be available on the user's disk.

See Also

Content (see page 15274)

HTMLDoc (see page 15287)

Specifying the HTML Template

78.1.14.2.3 TPageProducer.ScriptEngine Property

Names the script engine that generates or interprets script embedded in the documents that this producer creates.

Pascal

```
property ScriptEngine: string;
```

C++

```
__property AnsiString ScriptEngine;
```

Description

ScriptEngine indicates the scripting language that the producer uses in its generated documents. For example, if the producer generates code that includes jscript, the value of ScriptEngine is 'JSCRIPT'.

When ScriptEngine is defined, the page producer generates its content using a special script-producer component. When ScriptEngine is not defined, the page producer uses only the OnHTMLTag event, plus any other built-in translations provided by a descendant class.

See Also

OnHTMLTag (see page 15280)

78.1.14.2.4 TPageProducer.StripParamQuotes Property

Specifies whether to strip quotation marks when extracting the parameters from an HTML-transparent tag.

Pascal

```
property StripParamQuotes: Boolean;
```

C++

```
__property Boolean StripParamQuotes;
```

Description

Set StripParamQuotes to indicate whether the page producer should strip quotation marks from the parameters of HTML-transparent tags before handling the tags. By setting StripParamQuotes to true, the page producer compensates for HTML editors that automatically insert quotation marks around the values of tag options.

78.1.14.3 TPageProducer Events

The events of the TPageProducer class are listed here.

Published Events

	Name	Description
	OnHTMLTag (see page 15316)	Occurs when the page producer needs to interpret the value of an HTML-transparent tag in the HTML template.

78.1.14.3.1 TPageProducer.OnHTMLTag Event

Occurs when the page producer needs to interpret the value of an HTML-transparent tag in the HTML template.

Pascal

```
property OnHTMLTag: THTMLTagEvent;
```

C++

```
__property THTMLTagEvent OnHTMLTag;
```

Description

Write an OnHTMLTag event handler to convert an HTML-transparent tag into the corresponding HTML commands that can be interpreted by a Web browser. If an OnHTMLTag event is not supplied, the HTML-transparent tags in the HTML template will be replaced by empty strings.

Note: The sequence of HTML that the event handler produces for an HTML-transparent tag can contain HTML-transparent tags for another page producer to convert. For example, one page producer might have a template that represents the format of the final HTTP response. It could read the HTTP request and for each section in the request assemble a set of HTML-transparent tags with parameters based on the request. Another page producer might take the content of the first page producer, and interpret those parameters.

78.2 Interfaces

The following table lists interfaces in this documentation.

Interfaces

	Name	Description
	IDesignerFileManager (see page 15317)	This is class HTTPProd.IDesignerFileManager.
	IGetLocateFileService (see page 15318)	This is class HTTPProd.IGetLocateFileService.
	IGetProducerTemplate (see page 15319)	This is class HTTPProd.IGetProducerTemplate.
	ILocateFileService (see page 15320)	This is class HTTPProd.ILocateFileService.
	IScriptContext (see page 15321)	This is class HTTPProd.IScriptContext.
	IScriptProducer (see page 15323)	This is class HTTPProd.IScriptProducer.
	IWebVariableName (see page 15328)	This is class HTTPProd.IWebVariableName.
	IWebVariablesContainer (see page 15329)	This is class HTTPProd.IWebVariablesContainer.

78.2.1 IDesignerFileManager Interface

Class Hierarchy

HTTPProd.IDesignerFileManager

Pascal

```
IDesignerFileManager = interface;
```

C++

```
__interface IDesignerFileManager;
```

File

HTTPProd

Description

This is class HTTPProd.IDesignerFileManager.

78.2.1.1 IDesignerFileManager Members

The following tables list the members exposed by IDesignerFileManager.

Public Methods

	Name	Description
	GetStream (see page 15318)	This is GetStream, a member of class IDesignerFileManager.
	QualifyFileName (see page 15318)	This is QualifyFileName, a member of class IDesignerFileManager.

78.2.1.2 IDesignerFileManager Methods

The methods of the IDesignerFileManager class are listed here.

Public Methods

	Name	Description
	GetStream (see page 15318)	This is GetStream, a member of class IDesignerFileManager.
	QualifyFileName (see page 15318)	This is QualifyFileName, a member of class IDesignerFileManager.

78.2.1.2.1 IDesignerFileManager.GetStream Method

Pascal

```
function GetStream(const AFileName: string; var AOwned: Boolean): TStream;
```

C++

```
__fastcall TStream GetStream(const AnsiString AFileName, Boolean AOwned);
```

Description

This is GetStream, a member of class IDesignerFileManager.

78.2.1.2.2 IDesignerFileManager.QualifyFileName Method

Pascal

```
function QualifyFileName(const AFileName: string): string;
```

C++

```
__fastcall AnsiString QualifyFileName(const AnsiString AFileName);
```

Description

This is QualifyFileName, a member of class IDesignerFileManager.

78.2.2 IGetLocateFileService Interface

Class Hierarchy

Pascal

```
IGetLocateFileService = interface;
```

C++

```
__interface IGetLocateFileService;
```

File

HTTPProd

Description

This is class HTTPProd.IGetLocateFileService.

78.2.2.1 IGetLocateFileService Members

The following tables list the members exposed by IGetLocateFileService.

Public Methods

	Name	Description
	GetLocateFileService (see page 15319)	This is GetLocateFileService, a member of class IGetLocateFileService.

78.2.2.2 IGetLocateFileService Methods

The methods of the IGetLocateFileService class are listed here.

Public Methods

	Name	Description
	GetLocateFileService (see page 15319)	This is GetLocateFileService, a member of class IGetLocateFileService.

78.2.2.2.1 IGetLocateFileService.GetLocateFileService Method

Pascal

```
function GetLocateFileService: ILocateFileService;
```

C++

```
__fastcall ILocateFileService GetLocateFileService();
```

Description

This is GetLocateFileService, a member of class IGetLocateFileService.

78.2.3 IGetProducerTemplate Interface

Class Hierarchy

HTTPProd.IGetProducerTemplate

Pascal

```
IGetProducerTemplate = interface;
```

C++

```
__interface IGetProducerTemplate;
```

File

HTTPProd

Description

This is class HTTPProd.IGetProducerTemplate.

78.2.3.1 IGetProducerTemplate Members

The following tables list the members exposed by IGetProducerTemplate.

Public Methods

	Name	Description
	GetProducerTemplateFileName (see page 15320)	This is GetProducerTemplateFileName, a member of class IGetProducerTemplate.

	GetProducerTemplateStream (see page 15320)	This is GetProducerTemplateStream, a member of class IGetProducerTemplate.

78.2.3.2 IGetProducerTemplate Methods

The methods of the IGetProducerTemplate class are listed here.

Public Methods

	Name	Description
	GetProducerTemplateFileName (see page 15320)	This is GetProducerTemplateFileName, a member of class IGetProducerTemplate.
	GetProducerTemplateStream (see page 15320)	This is GetProducerTemplateStream, a member of class IGetProducerTemplate.

78.2.3.2.1 IGetProducerTemplate.GetProducerTemplateFileName Method

Pascal

```
function GetProducerTemplateFileName: string;
```

C++

```
__fastcall AnsiString GetProducerTemplateFileName();
```

Description

This is GetProducerTemplateFileName, a member of class IGetProducerTemplate.

78.2.3.2.2 IGetProducerTemplate.GetProducerTemplateStream Method

Pascal

```
function GetProducerTemplateStream(out AOwned: Boolean): TStream;
```

C++

```
__fastcall TStream GetProducerTemplateStream(Boolean AOwned);
```

Description

This is GetProducerTemplateStream, a member of class IGetProducerTemplate.

78.2.4 ILocateFileService Interface

Class Hierarchy

Pascal

```
ILocateFileService = interface;
```

C++

```
__interface ILocateFileService;
```

File

HTTPProd

Description

This is class HTTPProd.ILocateFileService.

78.2.4.1 ILocateFileService Members

The following tables list the members exposed by ILocateFileService.

Public Methods

	Name	Description
	GetTemplateStream (see page 15321)	This is GetTemplateStream, a member of class ILocateFileService.

78.2.4.2 ILocateFileService Methods

The methods of the ILocateFileService class are listed here.

Public Methods

	Name	Description
	GetTemplateStream (see page 15321)	This is GetTemplateStream, a member of class ILocateFileService.

78.2.4.2.1 ILocateFileService.GetTemplateStream Method

Pascal

```
function GetTemplateStream(AComponent: TComponent; AFileName: string; out AOwned: Boolean):
TStream;
```

C++

```
__fastcall TStream GetTemplateStream(TComponent * AComponent, AnsiString AFileName, Boolean
AOwned);
```

Description

This is GetTemplateStream, a member of class ILocateFileService.

78.2.5 IScriptContext Interface

Class Hierarchy

Pascal

```
IScriptContext = interface;
```

C++

```
__interface IScriptContext;
```

File

HTTPProd

Description

This is class HTTPProd.IScriptContext.

78.2.5.1 IScriptContext Members

The following tables list the members exposed by IScriptContext.

Public Methods

	Name	Description
	GetWebModuleContext (see page 15322)	This is GetWebModuleContext, a member of class IScriptContext.

Public Properties

	Name	Description
R	WebModuleContext (see page 15322)	This is WebModuleContext, a member of class IScriptContext.

78.2.5.2 IScriptContext Methods

The methods of the IScriptContext class are listed here.

Public Methods

	Name	Description
	GetWebModuleContext (see page 15322)	This is GetWebModuleContext, a member of class IScriptContext.

78.2.5.2.1 IScriptContext.GetWebModuleContext Method

Pascal

```
function GetWebModuleContext: TWebModuleContext;
```

C++

```
__fastcall TWebModuleContext GetWebModuleContext();
```

Description

This is GetWebModuleContext, a member of class IScriptContext.

78.2.5.3 IScriptContext Properties

The properties of the IScriptContext class are listed here.

Public Properties

	Name	Description
R	WebModuleContext (see page 15322)	This is WebModuleContext, a member of class IScriptContext.

78.2.5.3.1 IScriptContext.WebModuleContext Property

Pascal

```
property WebModuleContext: TWebModuleContext;
```

C++

```
__property TWebModuleContext WebModuleContext;
```

Description

This is WebModuleContext, a member of class IScriptContext.

78.2.6 IScriptProducer Interface

Class Hierarchy

Pascal

```
IScriptProducer = interface(IScriptContext);
```

C++

```
__interface IScriptProducer : public IScriptContext;
```

File

HTTPProd

Description

This is class HTTPProd.IScriptProducer.

78.2.6.1 IScriptProducer Members

The following tables list the members exposed by IScriptProducer.

Public Methods

	Name	Description
	Evaluate (see page 15324)	This is Evaluate, a member of class IScriptProducer.
	GetContent (see page 15324)	This is GetContent, a member of class IScriptProducer.
	GetErrors (see page 15324)	This is GetErrors, a member of class IScriptProducer.
	GetHTMLBlock (see page 15325)	This is GetHTMLBlock, a member of class IScriptProducer.
	GetHTMLBlockCount (see page 15325)	This is GetHTMLBlockCount, a member of class IScriptProducer.
	GetWebModuleContext (see page 15322)	This is GetWebModuleContext, a member of class IScriptContext.
	HandleScriptError (see page 15325)	This is HandleScriptError, a member of class IScriptProducer.
	ParseStream (see page 15325)	This is ParseStream, a member of class IScriptProducer.
	ParseString (see page 15325)	This is ParseString, a member of class IScriptProducer.
	ReplaceTags (see page 15326)	This is ReplaceTags, a member of class IScriptProducer.
	SetContent (see page 15326)	This is SetContent, a member of class IScriptProducer.
	Write (see page 15326)	This is the overview for the Write method overload.
	WriteItem (see page 15327)	This is WriteItem, a member of class IScriptProducer.

Public Properties

	Name	Description
	Content (see page 15327)	This is Content, a member of class IScriptProducer.
R	Errors (see page 15327)	This is Errors, a member of class IScriptProducer.
R	HTMLBlockCount (see page 15328)	This is HTMLBlockCount, a member of class IScriptProducer.
R	HTMLBlocks (see page 15328)	This is HTMLBlocks, a member of class IScriptProducer.
R	WebModuleContext (see page 15322)	This is WebModuleContext, a member of class IScriptContext.

78.2.6.2 IScriptProducer Methods

The methods of the IScriptProducer class are listed here.

Public Methods

	Name	Description
	Evaluate (see page 15324)	This is Evaluate, a member of class IScriptProducer.
	GetContent (see page 15324)	This is GetContent, a member of class IScriptProducer.
	GetErrors (see page 15324)	This is GetErrors, a member of class IScriptProducer.
	GetHTMLBlock (see page 15325)	This is GetHTMLBlock, a member of class IScriptProducer.
	GetHTMLBlockCount (see page 15325)	This is GetHTMLBlockCount, a member of class IScriptProducer.
	HandleScriptError (see page 15325)	This is HandleScriptError, a member of class IScriptProducer.
	ParseStream (see page 15325)	This is ParseStream, a member of class IScriptProducer.
	ParseString (see page 15325)	This is ParseString, a member of class IScriptProducer.
	ReplaceTags (see page 15326)	This is ReplaceTags, a member of class IScriptProducer.
	SetContent (see page 15326)	This is SetContent, a member of class IScriptProducer.
	Write (see page 15326)	This is the overview for the Write method overload.
	WriteItem (see page 15327)	This is WriteItem, a member of class IScriptProducer.

78.2.6.2.1 IScriptProducer.Evaluate Method

Pascal

```
function Evaluate: string;
```

C++

```
__fastcall AnsiString Evaluate();
```

Description

This is Evaluate, a member of class IScriptProducer.

78.2.6.2.2 IScriptProducer.GetContent Method

Pascal

```
function GetContent: string;
```

C++

```
__fastcall AnsiString GetContent();
```

Description

This is GetContent, a member of class IScriptProducer.

78.2.6.2.3 IScriptProducer.GetErrors Method

Pascal

```
function GetErrors: TAbstractScriptErrors;
```

C++

```
__fastcall TAbstractScriptErrors GetErrors();
```

Description

This is GetErrors, a member of class IScriptProducer.

78.2.6.2.4 IScriptProducer.GetHTMLBlock Method

Pascal

```
function GetHTMLBlock(I: Integer): string;
```

C++

```
__fastcall AnsiString GetHTMLBlock(int I);
```

Description

This is GetHTMLBlock, a member of class IScriptProducer.

78.2.6.2.5 IScriptProducer.GetHTMLBlockCount Method

Pascal

```
function GetHTMLBlockCount: Integer;
```

C++

```
__fastcall int GetHTMLBlockCount();
```

Description

This is GetHTMLBlockCount, a member of class IScriptProducer.

78.2.6.2.6 IScriptProducer.HandleScriptError Method

Pascal

```
function HandleScriptError(const ScriptError: IUnknown): HRESULT;
```

C++

```
__fastcall HRESULT HandleScriptError(const IUnknown ScriptError);
```

Description

This is HandleScriptError, a member of class IScriptProducer.

78.2.6.2.7 IScriptProducer.ParseStream Method

Pascal

```
procedure ParseStream(Stream: TStream; Owned: Boolean = False);
```

C++

```
__fastcall ParseStream(TStream Stream, Boolean Owned = False);
```

Description

This is ParseStream, a member of class IScriptProducer.

78.2.6.2.8 IScriptProducer.ParseString Method

Pascal

```
procedure ParseString(const S: string);
```

C++

```
__fastcall ParseString(const AnsiString S);
```

Description

This is ParseString, a member of class IScriptProducer.

78.2.6.2.9 IScriptProducer.ReplaceTags Method

Pascal

```
function ReplaceTags(const S: string): string;
```

C++

```
__fastcall AnsiString ReplaceTags(const AnsiString S);
```

Description

This is ReplaceTags, a member of class IScriptProducer.

78.2.6.2.10 IScriptProducer.SetContent Method

Pascal

```
procedure SetContent(const Value: string);
```

C++

```
__fastcall SetContent(const AnsiString Value);
```

Description

This is SetContent, a member of class IScriptProducer.

78.2.6.2.11 Write Method

This is the overview for the Write method overload.

Overload List

	Name	Description
	IScriptProducer.Write (PWideChar, Integer) (see page 15326)	This is Write, a member of class IScriptProducer.
	IScriptProducer.Write (string) (see page 15326)	This is Write, a member of class IScriptProducer.

78.2.6.2.11.1 IScriptProducer.Write Method (PWideChar, Integer)

Pascal

```
procedure Write(const Value: PWideChar; ALength: Integer); overload;
```

C++

```
__fastcall Write(const PWideChar Value, int ALength);
```

Description

This is Write, a member of class IScriptProducer.

78.2.6.2.11.2 IScriptProducer.Write Method (string)

Pascal

```
procedure Write(const Value: string); overload;
```

C++

```
__fastcall Write(const AnsiString Value);
```

Description

This is Write, a member of class IScriptProducer.

78.2.6.2.12 IScriptProducer.WriteItem Method

Pascal

```
procedure WriteItem(Index: Integer);
```

C++

```
__fastcall WriteItem(int Index);
```

Description

This is WriteItem, a member of class IScriptProducer.

78.2.6.3 IScriptProducer Properties

The properties of the IScriptProducer class are listed here.

Public Properties

	Name	Description
	Content (see page 15327)	This is Content, a member of class IScriptProducer.
R	Errors (see page 15327)	This is Errors, a member of class IScriptProducer.
R	HTMLBlockCount (see page 15328)	This is HTMLBlockCount, a member of class IScriptProducer.
R	HTMLBlocks (see page 15328)	This is HTMLBlocks, a member of class IScriptProducer.

78.2.6.3.1 IScriptProducer.Content Property

Pascal

```
property Content: string;
```

C++

```
__property AnsiString Content;
```

Description

This is Content, a member of class IScriptProducer.

78.2.6.3.2 IScriptProducer.Errors Property

Pascal

```
property Errors: TAbstractScriptErrors;
```

C++

```
__property TAbstractScriptErrors Errors;
```

Description

This is Errors, a member of class IScriptProducer.

78.2.6.3.3 IScriptProducer.HTMLBlockCount Property

Pascal

```
property HTMLBlockCount: Integer;
```

C++

```
__property int HTMLBlockCount;
```

Description

This is HTMLBlockCount, a member of class IScriptProducer.

78.2.6.3.4 IScriptProducer.HTMLBlocks Property

Pascal

```
property HTMLBlocks [I: Integer]: string;
```

C++

```
__property AnsiString HTMLBlocks[int I];
```

Description

This is HTMLBlocks, a member of class IScriptProducer.

78.2.7 IWebVariableName Interface

Class Hierarchy

HTTPProd.IWebVariableName

Pascal

```
IWebVariableName = interface;
```

C++

```
__interface IWebVariableName;
```

File

HTTPProd

Description

This is class HTTPProd.IWebVariableName.

78.2.7.1 IWebVariableName Members

The following tables list the members exposed by IWebVariableName.

Public Methods

	Name	Description
	GetVariableName (see page 15329)	This is GetVariableName, a member of class IWebVariableName.

Public Properties

	Name	Description
	VariableName (see page 15329)	This is VariableName, a member of class IWebVariableName.

78.2.7.2 IWebVariableName Methods

The methods of the IWebVariableName class are listed here.

Public Methods

	Name	Description
	GetVariableName (see page 15329)	This is GetVariableName, a member of class IWebVariableName.

78.2.7.2.1 IWebVariableName.GetVariableName Method

Pascal

```
function GetVariableName: string;
```

C++

```
__fastcall AnsiString GetVariableName();
```

Description

This is GetVariableName, a member of class IWebVariableName.

78.2.7.3 IWebVariableName Properties

The properties of the IWebVariableName class are listed here.

Public Properties

	Name	Description
	VariableName (see page 15329)	This is VariableName, a member of class IWebVariableName.

78.2.7.3.1 IWebVariableName.VariableName Property

Pascal

```
property VariableName: string;
```

C++

```
__property AnsiString VariableName;
```

Description

This is VariableName, a member of class IWebVariableName.

78.2.8 IWebVariablesContainer Interface

Class Hierarchy

HTTPProd.IWebVariablesContainer

Pascal

```
IWebVariablesContainer = interface;
```

C++

```
__interface IWebVariablesContainer;
```

File

HTTPProd

Description

This is class HTTPProd.IWebVariablesContainer.

78.2.8.1 IWebVariablesContainer Members

The following tables list the members exposed by IWebVariablesContainer.

Public Methods

	Name	Description
	FindVariable (see page 15330)	This is FindVariable, a member of class IWebVariablesContainer.
	FindVariableContainer (see page 15331)	This is FindVariableContainer, a member of class IWebVariablesContainer.
	GetVariable (see page 15331)	This is GetVariable, a member of class IWebVariablesContainer.
	GetVariableCount (see page 15331)	This is GetVariableCount, a member of class IWebVariablesContainer.

Public Properties

	Name	Description
R	VariableCount (see page 15331)	This is VariableCount, a member of class IWebVariablesContainer.
R	Variables (see page 15332)	This is Variables, a member of class IWebVariablesContainer.

78.2.8.2 IWebVariablesContainer Methods

The methods of the IWebVariablesContainer class are listed here.

Public Methods

	Name	Description
	FindVariable (see page 15330)	This is FindVariable, a member of class IWebVariablesContainer.
	FindVariableContainer (see page 15331)	This is FindVariableContainer, a member of class IWebVariablesContainer.
	GetVariable (see page 15331)	This is GetVariable, a member of class IWebVariablesContainer.
	GetVariableCount (see page 15331)	This is GetVariableCount, a member of class IWebVariablesContainer.

78.2.8.2.1 IWebVariablesContainer.FindVariable Method

Pascal

```
function FindVariable(const AName: string): TComponent;
```

C++

```
__fastcall TComponent * FindVariable(const AnsiString AName);
```

Description

This is FindVariable, a member of class IWebVariablesContainer.

78.2.8.2.2 IWebVariablesContainer.FindVariableContainer Method

Pascal

```
function FindVariableContainer(const AName: string): TComponent;
```

C++

```
__fastcall TComponent * FindVariableContainer(const AnsiString AName);
```

Description

This is FindVariableContainer, a member of class IWebVariablesContainer.

78.2.8.2.3 IWebVariablesContainer.GetVariable Method

Pascal

```
function GetVariable(I: Integer): TComponent;
```

C++

```
__fastcall TComponent * GetVariable(int I);
```

Description

This is GetVariable, a member of class IWebVariablesContainer.

78.2.8.2.4 IWebVariablesContainer.GetVariableCount Method

Pascal

```
function GetVariableCount: Integer;
```

C++

```
__fastcall int GetVariableCount();
```

Description

This is GetVariableCount, a member of class IWebVariablesContainer.

78.2.8.3 IWebVariablesContainer Properties

The properties of the IWebVariablesContainer class are listed here.

Public Properties

	Name	Description
R	VariableCount (see page 15331)	This is VariableCount, a member of class IWebVariablesContainer.
R	Variables (see page 15332)	This is Variables, a member of class IWebVariablesContainer.

78.2.8.3.1 IWebVariablesContainer.VariableCount Property

Pascal

```
property VariableCount: Integer;
```

C++

```
__property int VariableCount;
```

Description

This is VariableCount, a member of class IWebVariablesContainer.

78.2.8.3.2 IWebVariablesContainer.Variables Property

Pascal

```
property Variables [I: Integer]: TComponent;
```

C++

```
__property TComponent * Variables[int I];
```

Description

This is Variables, a member of class IWebVariablesContainer.

78.3 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	ContentFromScriptFile (see page 15333)	This is function HTTPProd.ContentFromScriptFile.
	ContentFromScriptStream (see page 15333)	This is function HTTPProd.ContentFromScriptStream.
	ContentFromStream (see page 15334)	This is function HTTPProd.ContentFromStream.
	ContentFromString (see page 15334)	This is function HTTPProd.ContentFromString.
	FindComponentWebModuleContext (see page 15334)	This is function HTTPProd.FindComponentWebModuleContext.
	GetTagID (see page 15335)	This is function HTTPProd.GetTagID.

78.3.1 HTTPProd.ContentFromScriptFile Function

Pascal

```
function ContentFromScriptFile(const AFileName: TFileName; AWebModuleContext:
TWebModuleContext; AStripParamQuotes: Boolean; AHandleTag: THandleTagProc; AHandleScriptTag:
THandledTagProc; const AScriptEngine: string; ALocateFileService: ILocateFileService): string;
```

C++

```
AnsiString ContentFromScriptFile(const TFileName AFileName, TWebModuleContext
AWebModuleContext, Boolean AStripParamQuotes, THandleTagProc AHandleTag, THandledTagProc
AHandleScriptTag, const AnsiString AScriptEngine, ILocateFileService ALocateFileService);
```

File

HTTPProd

Description

This is function HTTPProd.ContentFromScriptFile.

78.3.2 HTTPProd.ContentFromScriptStream Function

Pascal

```
function ContentFromScriptStream(AStream: TStream; AWebModuleContext: TWebModuleContext;
AStripParamQuotes: Boolean; AHandleTag: THandleTagProc; AHandleScriptTag: THandledTagProc;
const AScriptEngine: string; ALocateFileService: ILocateFileService): string;
```

C++

```
AnsiString ContentFromScriptStream(TStream AStream, TWebModuleContext AWebModuleContext,
Boolean AStripParamQuotes, THandleTagProc AHandleTag, THandledTagProc AHandleScriptTag, const
AnsiString AScriptEngine, ILocateFileService ALocateFileService);
```

File

HTTPProd

Description

This is function HTTPProd.ContentFromScriptStream.

78.3.3 HTTPProd.ContentFromStream Function

Pascal

```
function ContentFromStream(AStream: TStream; AStripParamQuotes: Boolean; AHandleTag:
THandleTagProc; AHandledTag: THandledTagProc): string;
```

C++

```
AnsiString ContentFromStream(TStream AStream, Boolean AStripParamQuotes, THandleTagProc
AHandleTag, THandledTagProc AHandledTag);
```

File

HTTPProd

Description

This is function HTTPProd.ContentFromStream.

78.3.4 HTTPProd.ContentFromString Function

Pascal

```
function ContentFromString(const AValue: string; AStripParamQuotes: Boolean; AHandleTag:
THandleTagProc; AHandledTag: THandledTagProc): string;
```

C++

```
AnsiString ContentFromString(const AnsiString AValue, Boolean AStripParamQuotes,
THandleTagProc AHandleTag, THandledTagProc AHandledTag);
```

File

HTTPProd

Description

This is function HTTPProd.ContentFromString.

78.3.5 HTTPProd.FindComponentWebModuleContext Function

Pascal

```
function FindComponentWebModuleContext(AComponent: TComponent): TWebModuleContext;
```

C++

```
TWebModuleContext FindComponentWebModuleContext(TComponent * AComponent);
```

File

HTTPProd

Description

This is function HTTPProd.FindComponentWebModuleContext.

78.3.6 HTTPProd.GetTagID Function

Pascal

```
function GetTagID(const TagString: string): TTag;
```

C++

```
TTag GetTagID(const AnsiString TagString);
```

File

HTTPProd

Description

This is function HTTPProd.GetTagID.

78.4 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	THTMLAlign (see page 15336)	This is record HTTPProd.THTMLAlign.
	THTMLVAlign (see page 15336)	This is record HTTPProd.THTMLVAlign.
	TTag (see page 15337)	This is record HTTPProd.TTag.

78.4.1 HTTPProd.THTMLAlign Enumeration

Pascal

```
THTMLAlign = (
  haDefault,
  haLeft,
  haRight,
  haCenter
);
```

C++

```
enum THTMLAlign {
  haDefault,
  haLeft,
  haRight,
  haCenter
};
```

File

HTTPProd

Description

This is record HTTPProd.THTMLAlign.

78.4.2 HTTPProd.THTMLVAlign Enumeration

Pascal

```
THTMLVAlign = (
  haVDefault,
  haTop,
  haMiddle,
  haBottom,
  haBaseline
);
```

C++

```
enum THTMLVAlign {
  haVDefault,
```

```
    haTop,
    haMiddle,
    haBottom,
    haBaseline
  };
```

File

HTTPProd

Description

This is record HTTPProd.THTMLVAlign.

78.4.3 HTTPProd.TTag Enumeration

Pascal

```
  TTag = (
    tgCustom,
    tgLink,
    tgImage,
    tgTable,
    tgImageMap,
    tgObject,
    tgEmbed
  );
```

C++

```
  enum TTag {
    tgCustom,
    tgLink,
    tgImage,
    tgTable,
    tgImageMap,
    tgObject,
    tgEmbed
  };
```

File

HTTPProd

Description

This is record HTTPProd.TTag.

78.5 Types

The following table lists types in this documentation.

Types

Name	Description
THandledTagProc (see page 15338)	This is type HTTPProd.THandledTagProc.
THandleTagProc (see page 15338)	This is type HTTPProd.THandleTagProc.
THTMLBgColor (see page 15339)	This is type HTTPProd.THTMLBgColor.
THTMLTagEvent (see page 15339)	This is type HTTPProd.THTMLTagEvent.
TScriptProducerClass (see page 15339)	This is type HTTPProd.TScriptProducerClass.

78.5.1 HTTPProd.THandledTagProc Type

Pascal

```
THandledTagProc = function (const TagString: string; TagParams: TStrings; var ReplaceString:
string): Boolean of object;
```

C++

```
(const TagString: string; TagParams: TStrings; var ReplaceString: string): Boolean (
THandledTagProc)();
```

File

HTTPProd

Description

This is type HTTPProd.THandledTagProc.

78.5.2 HTTPProd.THandleTagProc Type

Pascal

```
THandleTagProc = function (const TagString: string; TagParams: TStrings): string of object;
```

C++

```
(const TagString: string; TagParams: TStrings): string ( THandleTagProc)();
```

File

HTTPProd

Description

This is type HTTPProd.THandleTagProc.

78.5.3 HTTPProd.THTMLBgColor Type

Pascal

```
THTMLBgColor = type string;
```

C++

```
type string THTMLBgColor;
```

File

HTTPProd

Description

This is type HTTPProd.THTMLBgColor.

78.5.4 HTTPProd.THTMLTagEvent Type

Pascal

```
THTMLTagEvent = procedure (Sender: TObject; Tag: TTag; const TagString: string; TagParams:
TStrings; var ReplaceText: string) of object;
```

C++

```
(Sender: TObject; Tag: TTag; const TagString: string; TagParams: TStrings; var ReplaceText:
string) ( THTMLTagEvent)();
```

File

HTTPProd

Description

This is type HTTPProd.THTMLTagEvent.

78.5.5 HTTPProd.TScriptProducerClass Type

Pascal

```
TScriptProducerClass = class of TAbstractScriptProducer;
```

C++

```
TAbstractScriptProducer TScriptProducerClass;
```

File

HTTPProd

Description

This is type HTTPProd.TScriptProducerClass.

78.6 Variables

The following table lists variables in this documentation.

Variables

Name	Description
DesignerFileManager (see page 15340)	This is variable HTTPProd.DesignerFileManager.
ScriptEnginesList (see page 15340)	This is variable HTTPProd.ScriptEnginesList.

78.6.1 HTTPProd.DesignerFileManager Variable

Pascal

```
DesignerFileManager: IDesignerFileManager = nil;
```

C++

```
IDesignerFileManager DesignerFileManager = nil;
```

File

HTTPProd

Description

This is variable HTTPProd.DesignerFileManager.

78.6.2 HTTPProd.ScriptEnginesList Variable

Pascal

```
ScriptEnginesList: TAbstractScriptEnginesList = nil;
```

C++

```
TAbstractScriptEnginesList ScriptEnginesList = nil;
```

File

HTTPProd

Description

This is variable HTTPProd.ScriptEnginesList.

78.7 Constants

The following table lists constants in this documentation.

Constants

Name	Description
HTMLAlign (see page 15341)	This is constant HTTPProd.HTMLAlign.
HTMLVAlign (see page 15341)	This is constant HTTPProd.HTMLVAlign.

78.7.1 HTTPProd.HTMLAlign Constant

Pascal

```
HTMLAlign: array[THTMLAlign] of string = ('', ' Align="left"', ' Align="right"', '
Align="center"');
```

C++

```
array[THTMLAlign] of string HTMLAlign = ('', ' Align="left"', ' Align="right"', '
Align="center"');
```

File

HTTPProd

Description

This is constant HTTPProd.HTMLAlign.

78.7.2 HTTPProd.HTMLVAlign Constant

Pascal

```
HTMLVAlign: array[THTMLVAlign] of string = ('', ' VAlign="top"', ' VAlign="middle"', '
VAlign="bottom"', ' VAlign="baseline"');
```

C++

```
array[THTMLVAlign] of string HTMLVAlign = ('', ' VAlign="top"', ' VAlign="middle"', '
VAlign="bottom"', ' VAlign="baseline"');
```

File

HTTPProd

Description

This is constant HTTPProd.HTMLVAlign.

79 HTTPUtil Namespace

This is namespace HTTPUtil.

Topics

Name	Description
Interfaces (see page 15344)	The following table lists interfaces in this documentation.
Functions (see page 15353)	The following table lists functions in this documentation.

Functions

	Name	Description
	FirstDelimiter (see page 15353)	This is function HTTPUtil.FirstDelimiter.
	FirstDelimiter (see page 15353)	This is function HTTPUtil.FirstDelimiter.
	GetDefaultStreamLoader (see page 15354)	This is function HTTPUtil.GetDefaultStreamLoader.
	HTMLEscape (see page 15354)	This is function HTTPUtil.HTMLEscape.
	StartsWith (see page 15354)	This is function HTTPUtil.StartsWith.
	StringTokenizer (see page 15355)	This is function HTTPUtil.StringTokenizer.
	StringToStringArray (see page 15355)	This is function HTTPUtil.StringToStringArray.

Interfaces

	Name	Description
	IStreamLoader (see page 15344)	IStreamLoader is the interface for loading a WSDL document into a memory stream.
	IStringTokenizer (see page 15350)	A string tokenizer breaks a string into tokens.

79.1 Interfaces

The following table lists interfaces in this documentation.

Interfaces

	Name	Description
	IStreamLoader (see page 15344)	IStreamLoader is the interface for loading a WSDL document into a memory stream.
	IStringTokenizer (see page 15350)	A string tokenizer breaks a string into tokens.

79.1.1 IStreamLoader Interface

IStreamLoader is the interface for loading a WSDL document into a memory stream.

Class Hierarchy

HTTPUtil.IStreamLoader

Pascal

```
IStreamLoader = interface;
```

C++

```
__interface IStreamLoader;
```

File

HTTPUtil

Description

IStreamLoader is an interface for objects that load WSDL documents. The properties specify information needed to connect to the server that hosts the WSDL document. In addition, IStreamLoader defines a Load (see page 15346) method, which loads a WSDL document into a memory stream. TWSDLItems uses the IStreamLoader interface to load its WSDL document.

Note: C++ method declarations that use IStreamLoader use the _di_IStreamLoader type instead. This type is a DelphiInterface wrapper around the IStreamLoader interface:

```
typedef System::DelphiInterfaceDelphiInterface_object< IStreamLoaders >  _di_IStreamLoader;
```

See Also

TWSDLItems (see page 25951)

TMemoryStream (see page 2902)

79.1.1.1 IStreamLoader Members

The following tables list the members exposed by IStreamLoader.

Public Methods

	Name	Description
	GetPassword (see page 15345)	Returns the value of the Password (see page 15348) property.
	GetProxy (see page 15346)	Returns the value of the Proxy (see page 15349) property.
	GetTimeout (see page 15346)	This is GetTimeout, a member of class IStreamLoader.
	GetUserName (see page 15346)	Returns the value of the UserName (see page 15349) property.
	Load (see page 15346)	Loads a WSDL document into a memory stream.
	SetPassword (see page 15347)	Sets the value of the Password (see page 15348) property.
	SetProxy (see page 15347)	Sets the value of the Proxy (see page 15349) property.
	SetTimeout (see page 15348)	This is SetTimeout, a member of class IStreamLoader.
	SetUserName (see page 15348)	Sets the value of the UserName (see page 15349) property.

Public Properties

	Name	Description
	Password (see page 15348)	Specifies the password to use when logging on if the WSDL document is on a server that requires authentication.
	Proxy (see page 15349)	Lists any proxy servers that are required to connect to a server that hosts the WSDL document.
	Timeout (see page 15349)	This is Timeout, a member of class IStreamLoader.
	UserName (see page 15349)	Specifies the user name to use when logging on if the WSDL document is on a server that requires authentication.

79.1.1.2 IStreamLoader Methods

The methods of the IStreamLoader class are listed here.

Public Methods

	Name	Description
	GetPassword (see page 15345)	Returns the value of the Password (see page 15348) property.
	GetProxy (see page 15346)	Returns the value of the Proxy (see page 15349) property.
	GetTimeout (see page 15346)	This is GetTimeout, a member of class IStreamLoader.
	GetUserName (see page 15346)	Returns the value of the UserName (see page 15349) property.
	Load (see page 15346)	Loads a WSDL document into a memory stream.
	SetPassword (see page 15347)	Sets the value of the Password (see page 15348) property.
	SetProxy (see page 15347)	Sets the value of the Proxy (see page 15349) property.
	SetTimeout (see page 15348)	This is SetTimeout, a member of class IStreamLoader.
	SetUserName (see page 15348)	Sets the value of the UserName (see page 15349) property.

79.1.1.2.1 IStreamLoader.GetPassword Method

Returns the value of the Password (see page 15348) property.

Pascal

```
function GetPassword: string;
```

C++

```
__fastcall AnsiString GetPassword();
```

Description

GetPassword is the read implementation for the Password (see page 15348) property.

See Also

Password (see page 15348)

79.1.1.2.2 IStreamLoader.GetProxy Method

Returns the value of the Proxy (see page 15349) property.

Pascal

```
function GetProxy: string;
```

C++

```
__fastcall AnsiString GetProxy();
```

Description

GetProxy is the read implementation for the Proxy (see page 15349) property.

See Also

Proxy (see page 15349)

79.1.1.2.3 IStreamLoader.GetTimeout Method

Pascal

```
function GetTimeout: Integer;
```

C++

```
__fastcall int GetTimeout();
```

Description

This is GetTimeout, a member of class IStreamLoader.

79.1.1.2.4 IStreamLoader.GetUserName Method

Returns the value of the UserName (see page 15349) property.

Pascal

```
function GetUserName: string;
```

C++

```
__fastcall AnsiString GetUserName();
```

Description

GetUserName is the read implementation for the UserName (see page 15349) property.

See Also

UserName (see page 15349)

79.1.1.2.5 IStreamLoader.Load Method

Loads a WSDL document into a memory stream.

Pascal

```
procedure Load(const WSDLFileName: WideString; Stream: TMemoryStream);
```

C++

```
__fastcall Load(const BSTR WSDLFileName, TMemoryStream Stream);
```

Description

Load reads the specified WSDL document into the specified memory stream.

WSDLFileName is the name of a WSDL document file, an XML schema file, or the URL where such a document can be found. If WSDLFileName is an URL, you may need to use the UserName (see page 15349), Password (see page 15348), and Proxy (see page 15349) properties to indicate how the stream loader can connect to the host identified in that URL.

Stream is a memory stream to which the stream loader writes the contents of the WSDL document.

See Also

UserName (see page 15349)

Password (see page 15348)

Proxy (see page 15349)

79.1.1.2.6 IStreamLoader.SetPassword Method

Sets the value of the Password (see page 15348) property.

Pascal

```
procedure SetPassword(const Password: string);
```

C++

```
__fastcall SetPassword(const AnsiString Password);
```

Description

SetPassword is the write implementation for the Password (see page 15348) property.

Password (see page 15348) is the password to use when connecting to the server that hosts the WSDL document.

See Also

Password (see page 15348)

79.1.1.2.7 IStreamLoader.SetProxy Method

Sets the value of the Proxy (see page 15349) property.

Pascal

```
procedure SetProxy(const Proxy: string);
```

C++

```
__fastcall SetProxy(const AnsiString Proxy);
```

Description

SetProxy is the write implementation for the Proxy (see page 15349) property.

Proxy (see page 15349) lists any proxy servers to use when connecting to the server that hosts the WSDL document.

See Also

Proxy (see page 15349)

79.1.1.2.8 IStreamLoader.SetTimeout Method

Pascal

```
procedure SetTimeout(ATimeOut: Integer);
```

C++

```
__fastcall SetTimeout(int ATimeOut);
```

Description

This is SetTimeout, a member of class IStreamLoader.

79.1.1.2.9 IStreamLoader.SetUserName Method

Sets the value of the UserName (see page 15349) property.

Pascal

```
procedure SetUserName(const UserName: string);
```

C++

```
__fastcall SetUserName(const AnsiString UserName);
```

Description

SetUserName is the write implementation for the UserName (see page 15349) property.

UserName (see page 15349) is the user name to use when connecting to the server that hosts the WSDL document.

See Also

UserName (see page 15349)

79.1.1.3 IStreamLoader Properties

The properties of the IStreamLoader class are listed here.

Public Properties

	Name	Description
	Password (see page 15348)	Specifies the password to use when logging on if the WSDL document is on a server that requires authentication.
	Proxy (see page 15349)	Lists any proxy servers that are required to connect to a server that hosts the WSDL document.
	Timeout (see page 15349)	This is Timeout, a member of class IStreamLoader.
	UserName (see page 15349)	Specifies the user name to use when logging on if the WSDL document is on a server that requires authentication.

79.1.1.3.1 IStreamLoader.Password Property

Specifies the password to use when logging on if the WSDL document is on a server that requires authentication.

Pascal

```
property Password: string;
```

C++

```
__property AnsiString Password;
```

Description

Use Password to provide a password that the stream loader can use if the WSDL document is on a server that requires authentication or if it needs to use a proxy server that requires authentication. Password is the password for the user specified by the UserName (see page 15349) property.

See Also

UserName (see page 15349)

Proxy (see page 15349)

79.1.1.3.2 IStreamLoader.Proxy Property

Lists any proxy servers that are required to connect to a server that hosts the WSDL document.

Pascal

```
property Proxy: string;
```

C++

```
__property AnsiString Proxy;
```

Description

Use Proxy if the stream loader can't resolve the host portion of an URL for the WSDL document locally. If the server that hosts the WSDL document is registered locally or if the WSDL document is a file on the local machine, Proxy can be a null string. Otherwise, Proxy lists the host names of any proxy servers that can forward request messages on to the intended server machine.

See Also

Password (see page 15348)

UserName (see page 15349)

Load (see page 15346)

79.1.1.3.3 IStreamLoader.Timeout Property

Pascal

```
property Timeout: integer;
```

C++

```
__property int Timeout;
```

Description

This is Timeout, a member of class IStreamLoader.

79.1.1.3.4 IStreamLoader.UserName Property

Specifies the user name to use when logging on if the WSDL document is on a server that requires authentication.

Pascal

```
property UserName: string;
```

C++

```
__property AnsiString UserName;
```

Description

Use UserName to specify the user name that the stream loader can use if the WSDL document is on a server that requires authentication or if it needs to use a proxy server that requires authentication. The password for this user name is specified by the Password (see page 15348) property.

See Also

Password (see page 15348)

Proxy (see page 15349)

79.1.2 IStringTokenizer Interface

A string tokenizer breaks a string into tokens.

Class Hierarchy

HTTPUtil.IStringTokenizer

Pascal

```
IStringTokenizer = interface;
```

C++

```
__interface IStringTokenizer;
```

File

HTTPUtil

Description

IStringTokenizer is implemented by string tokenizers, objects which iterate through the tokens in a string. To obtain a simple string tokenizer, call StringTokenizer (see page 15355).

A tokenizer is created from two strings: a source string and a delimiter string. In the source string, any characters in the delimiter string separate tokens, while any other characters are part of the tokens themselves. Thus in the following calls:

StringTokenizer (see page 15355)('This is a token/So+is+this', '/'); // Delphi example

StringTokenizer (see page 15355)("This is a token/So+is+this', '/'); // C++ example

StringTokenizer (see page 15355) creates a tokenizer that produces two tokens, consisting of the strings "This is a token" and "So+is+this".

Use the nextToken (see page 15351) method to iterate through the tokens.

See Also

StringTokenizer (see page 15355)

79.1.2.1 IStringTokenizer Members

The following tables list the members exposed by IStringTokenizer.

Public Methods

	Name	Description
	getTokenCounts (see page 15351)	Implements countTokens (see page 15352) property.

	hasMoreTokens (see page 15351)	Returns true if more tokens available.
	nextToken (see page 15351)	Returns next available token.

Public Properties

	Name	Description
R	countTokens (see page 15352)	Contains number of tokens in string.

79.1.2.2 IStringTokenizer Methods

The methods of the IStringTokenizer class are listed here.

Public Methods

	Name	Description
	getTokenCounts (see page 15351)	Implements countTokens (see page 15352) property.
	hasMoreTokens (see page 15351)	Returns true if more tokens available.
	nextToken (see page 15351)	Returns next available token.

79.1.2.2.1 IStringTokenizer.getTokenCounts Method

Implements countTokens (see page 15352) property.

Pascal

```
function getTokenCounts: integer;
```

C++

```
__fastcall int getTokenCounts();
```

Description

The getTokenCounts method returns the value of the countTokens (see page 15352) property.

See Also

counttokens (see page 15352)

79.1.2.2.2 IStringTokenizer.hasMoreTokens Method

Returns true if more tokens available.

Pascal

```
function hasMoreTokens: boolean;
```

C++

```
__fastcall boolean hasMoreTokens();
```

Description

The hasMoreTokens method returns true if unretrieved tokens remain, false otherwise.

See Also

nextToken

79.1.2.2.3 IStringTokenizer.nextToken Method

Returns next available token.

Pascal

```
function nextToken: WideString;
```

C++

```
__fastcall BSTR nextToken();
```

Description

The nextToken method returns the next available token. If no more tokens are available (hasMoreTokens (see page 15351) returns false), nextToken returns an empty string.

See Also

nextToken

79.1.2.3 IStringTokenizer Properties

The properties of the IStringTokenizer class are listed here.

Public Properties

	Name	Description
R	countTokens (see page 15352)	Contains number of tokens in string.

79.1.2.3.1 IStringTokenizer.countTokens Property

Contains number of tokens in string.

Pascal

```
property countTokens: integer;
```

C++

```
__property int countTokens;
```

Description

The countTokens property contains the number of tokens in the string.

See Also

AbsoluteIndex (see page 5252)

operator_sb

79.2 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	FirstDelimiter (see page 15353)	This is function HTTPUtil.FirstDelimiter.
	FirstDelimiter (see page 15353)	This is function HTTPUtil.FirstDelimiter.
	GetDefaultStreamLoader (see page 15354)	This is function HTTPUtil.GetDefaultStreamLoader.
	HTMLEscape (see page 15354)	This is function HTTPUtil.HTMLEscape.
	StartsWith (see page 15354)	This is function HTTPUtil.StartsWith.
	StringTokenizer (see page 15355)	This is function HTTPUtil.StringTokenizer.
	StringToStringArray (see page 15355)	This is function HTTPUtil.StringToStringArray.

79.2.1 HTTPUtil.FirstDelimiter Function

Pascal

```
function FirstDelimiter(const delimiters: WideString; const Str: WideString): integer;
overload;
```

C++

```
int FirstDelimiter(const BSTR delimiters, const BSTR Str);
```

File

HTTPUtil

Description

This is function HTTPUtil.FirstDelimiter.

79.2.2 HTTPUtil.FirstDelimiter Function

Pascal

```
function FirstDelimiter(const delimiters: string; const Str: String): integer; overload;
```

C++

```
int FirstDelimiter(const AnsiString delimiters, const AnsiString Str);
```

File

HTTPUtil

Description

This is function HTTPUtil.FirstDelimiter.

79.2.3 HTTPUtil.GetDefaultStreamLoader Function

Pascal

```
function GetDefaultStreamLoader: IStreamLoader;
```

C++

```
IStreamLoader GetDefaultStreamLoader();
```

File

HTTPUtil

Description

This is function HTTPUtil.GetDefaultStreamLoader.

79.2.4 HTTPUtil.HTMLEscape Function

Pascal

```
function HTMLEscape(const Str: string): string;
```

C++

```
AnsiString HTMLEscape(const AnsiString Str);
```

File

HTTPUtil

Description

This is function HTTPUtil.HTMLEscape.

79.2.5 HTTPUtil.StartsWith Function

Pascal

```
function StartsWith(const str: string; const sub: string): Boolean;
```

C++

```
Boolean StartsWith(const AnsiString str, const AnsiString sub);
```

File

HTTPUtil

Description

This is function HTTPUtil.StartsWith.

79.2.6 HTTPUtil.StringTokenizer Function

Pascal

```
function StringTokenizer(const str: string; const delim: string): IStringTokenizer;
```

C++

```
IStringTokenizer StringTokenizer(const AnsiString str, const AnsiString delim);
```

File

HTTPUtil

Description

This is function HTTPUtil.StringTokenizer.

79.2.7 HTTPUtil.StringToStringArray Function

Pascal

```
function StringToStringArray(const str: string; const delim: string): TStringDynArray;
```

C++

```
TStringDynArray StringToStringArray(const AnsiString str, const AnsiString delim);
```

File

HTTPUtil

Description

This is function HTTPUtil.StringToStringArray.

80 ImgList Namespace

This is namespace ImgList.

Topics

Name	Description
Classes (see page 15358)	The following table lists classes in this documentation.
Structs, Records, Enums (see page 15394)	The following table lists structs, records, enums in this documentation.
Types (see page 15397)	The following table lists types in this documentation.

Classes

	Name	Description
	TChangeLink (see page 15358)	The TImageList component uses TChangeLink internally to notify other objects when changes are made to the image list.
	TCustomImageList (see page 15361)	TCustomImageList is the base class for collections of same-sized images, each of which can be referred to by its index.

Structs, Records, Enums

	Name	Description
	TDrawingStyle (see page 15394)	TDrawingStyle indicates the style to use when rendering an image from an image list.
	TImageType (see page 15395)	TImageType indicates whether to use a mask when rendering an image from an image list.
	TLoadResource (see page 15395)	TLoadResource and TLoadResources (see page 15397) determine how a resource is loaded into an image list.
	TResType (see page 15396)	TResType identifies a type of graphical resource to an image list.

Types

Name	Description
TImageIndex (see page 15397)	This is type ImgList.TImageIndex.
TLoadResources (see page 15397)	This is type ImgList.TLoadResources.
TOverlay (see page 15397)	This is type ImgList.TOverlay.

80.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TChangeLink (see page 15358)	The TImageList component uses TChangeLink internally to notify other objects when changes are made to the image list.
	TCustomImageList (see page 15361)	TCustomImageList is the base class for collections of same-sized images, each of which can be referred to by its index.

80.1.1 TChangeLink Class

The TImageList component uses TChangeLink internally to notify other objects when changes are made to the image list.

Class Hierarchy

Pascal

```
TChangeLink = class(TObject);
```

C++

```
class TChangeLink : public TObject;
```

File

ImgList

Description

A TImageList keeps a list of its TChangeLink objects. Each is associated with a particular component, such as a tree view or list view control. A component can register its change link with an image list by calling the image list's RegisterChanges method. Before destruction, the component should then call the UnRegisterChanges method.

Component writers can use the change link object to receive notification when changes are made to an image list that a control uses. Use the OnChange (see page 15361) event of the change link to execute some code when the image list changes. For example, the tree view control uses a change link object to know when its image list has changed.

See Also

TImageList (see page 6078)

TTreeView (see page 5293)

TListView (see page 4285)

TCustomImageList (see page 15361)

80.1.1.1 TChangeLink Members

The following tables list the members exposed by TChangeLink.

Public Events

	Name	Description
	OnChange (see page 15361)	Occurs when there's a change in any of the images stored in the associated image list.

Public Methods

	Name	Description
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	Change (see page 15360)	Generates an OnChange (see page 15361) event.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 15359)	Destroys the change link object and releases the memory allocated to it.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
	Sender (see page 15360)	Specifies which image list component notifies the change link object of changes.

80.1.1.2 TChangeLink.Destroy Destructor

Destroys the change link object and releases the memory allocated to it.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TChangeLink();
```

Description

Do not call Destroy directly in an application. Instead, call Free. Free verifies that the change link is not nil before calling Destroy.

Before freeing the memory for the change link, Destroy first calls the image list's UnRegisterChanges method to unregister itself from receiving notification when the image list changes.

See Also

Free (see page 22300)

UnRegisterChanges (see page 15386)

80.1.1.3 TChangeLink Methods

The methods of the TChangeLink class are listed here.

Public Methods

	Name	Description
	Change (see page 15360)	Generates an OnChange (see page 15361) event.

80.1.1.3.1 TChangeLink.Change Method

Generates an OnChange (see page 15361) event.

Pascal

```
procedure Change; dynamic;
```

C++

```
__fastcall Change();
```

Description

Use the Change method to trigger the OnChange (see page 15361) event handler of the change link object.

See Also

OnChange (see page 15361)

80.1.1.4 TChangeLink Properties

The properties of the TChangeLink class are listed here.

Public Properties

	Name	Description
	Sender (see page 15360)	Specifies which image list component notifies the change link object of changes.

80.1.1.4.1 TChangeLink.Sender Property

Specifies which image list component notifies the change link object of changes.

Pascal

```
property Sender: TCustomImageList;
```

C++

```
__property TCustomImageList Sender;
```

Description

Use Sender to access the image list that has changed. The TImageList automatically sets this property when a call to RegisterChanges is made.

See Also

RegisterChanges (see page 15383)

80.1.1.5 TChangeLink Events

The events of the TChangeLink class are listed here.

Public Events

	Name	Description
	OnChange (see page 15361)	Occurs when there's a change in any of the images stored in the associated image list.

80.1.1.5.1 TChangeLink.OnChange Event

Occurs when there's a change in any of the images stored in the associated image list.

Pascal

```
property OnChange: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnChange;
```

Description

Use the OnChange event to notify a control when the image list that it's using changes. Specify any special processing to occur at that time in the OnChange event handler.

See Also

Change (see page 15360)

80.1.2 TCustomImageList Class

TCustomImageList is the base class for collections of same-sized images, each of which can be referred to by its index.

Class Hierarchy

Pascal

```
TCustomImageList = class(TComponent);
```

C++

```
class TCustomImageList : public TComponent;
```

File

ImgList

Description

Image lists manage large sets of icons or bitmaps. All images in an image list are contained in a single, wide bitmap in screen device format. An image list may also include a monochrome bitmap that contains masks that are combined with the images to produce a transparent effect such as is common in icons.

See Also

TPicture (see page 14584)

TImage (see page 12777)

80.1.2.1 TCustomImageList Members

The following tables list the members exposed by TCustomImageList.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 15370)	Copies the image list's properties to another image list.
	Change (see page 15371)	Generates an OnChange (see page 15393) event.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 15371)	Allows bitmap data to be saved and loaded.
V	DoDraw (see page 15372)	Draws the specified image onto the provided Canvas in the indicated style.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetImages (see page 15378)	Returns a specified image and its mask as bitmaps.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	HandleNeeded (see page 15381)	This is HandleNeeded, a member of class TCustomImageList.
V	Initialize (see page 15381)	Initializes a newly allocated image list.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadData (see page 15383)	This is ReadData, a member of class TCustomImageList.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.

	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteData (see page 15386)	This is WriteData, a member of class TCustomImageList.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Public Events

	Name	Description
	OnChange (see page 15393)	Occurs when the image list changes.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	Add (see page 15368)	Adds an Image and its Mask (see page 15797) to the image list object.
	AddIcon (see page 15368)	Adds an icon to the image list object.
	AddImage (see page 15368)	Adds single image from another image list.
	AddImages (see page 15369)	Adds all images from another image list.
	AddMasked (see page 15369)	Adds an image to the image list along with a color which is used to generate the transparent mask.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 15370)	Copies the information from one image list to another.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Clear (see page 15371)	Clears all images from the image list.
V	Create (see page 15365)	Creates an empty image list.
	CreateSize (see page 15366)	Creates an empty image list of a specified size.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Delete (see page 15372)	Deletes a particular image from the image list.
V	Destroy (see page 15366)	Destroys the image list and releases the memory allocated to it.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.

	Draw (see page 15373)	This is the overview for the Draw method overload.
	DrawOverlay (see page 15374)	This is the overview for the DrawOverlay method overload.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FileLoad (see page 15375)	Loads a resourced image into the image list.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetBitmap (see page 15376)	Retrieves a specified image as a bitmap.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
V	GetHotSpot (see page 15376)	Returns the hot spot location associated with the current drag image.
	GetIcon (see page 15377)	This is the overview for the GetIcon method overload.
	GetImageBitmap (see page 15378)	Returns a handle to a bitmap containing all of the images in the image list.
	GetInstRes (see page 15378)	This is the overview for the GetInstRes method overload.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetMaskBitmap (see page 15379)	Returns a handle to a bitmap containing all masks for images in the image list.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetResource (see page 15380)	Loads the specified bitmap, cursor, or icon resource into the image list.
	HandleAllocated (see page 15380)	Indicates whether a window handle exists for the image list.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	Insert (see page 15381)	Inserts a bitmap and its mask into the image list following a specified image.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InsertIcon (see page 15382)	Inserts an icon at a specified position in the image list.
	InsertMasked (see page 15382)	Inserts a bitmap at a specified position, creating the mask from a specified transparent color.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	Move (see page 15382)	Moves a specified image to another position.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	Overlay (see page 15383)	Identifies an image in the list as an image that can be used as an overlay mask.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RegisterChanges (see page 15383)	Registers an object to be notified when changes occur in the image list.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
	Replace (see page 15384)	Replaces an image in the image list with a new image and mask.
	ReplaceIcon (see page 15384)	Replaces an image in the image list with an icon.

	ReplaceMasked (see page 15384)	Replaces an image in the image list with a new image and automatically-generated mask.
	ResInstLoad (see page 15385)	Loads a resource into the image list.
	ResourceLoad (see page 15385)	Loads a resource into the image list.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UnRegisterChanges (see page 15386)	Removes an object from the list of objects to be notified when the image list changes.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
	AllocBy (see page 15387)	Sets the number of images by which the image list grows when it needs to make room for new images.
	BkColor (see page 15387)	Determines which background color to use when drawing an image.
	BlendColor (see page 15387)	Determines which foreground color to use when drawing an image.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
R	Count (see page 15388)	Indicates the number of images in the image list.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DrawingStyle (see page 15390)	Specifies the style to be used when the image list is drawing an image.
	Handle (see page 15390)	Designates the handle for the image list.
	Height (see page 15391)	Specifies the height of images within the image list.
	ImageType (see page 15391)	Determines whether the image list uses the associated mask when drawing.
	Masked (see page 15392)	Specifies whether the image list includes masks that can be combined with the images.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	ShareImages (see page 15392)	Specifies whether the image list destroys its handle when the image list is destroyed.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	Width (see page 15392)	Specifies the width of all images within the image list.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

80.1.2.2 TCustomImageList.Create Constructor

Creates an empty image list.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomImageList(TComponent * AOwner);
```

Description

Call Create to instantiate an image list at runtime. ImageLists placed on forms or data modules at design time are created automatically. Specify the owner of the new imagelist using the AOwner parameter.

The new image list contains no images and has a default size of 16 by 16 pixels.

See Also

CreateSize (see page 15366)

80.1.2.3 TCustomImageList.CreateSize Constructor

Creates an empty image list of a specified size.

Pascal

```
constructor CreateSize(AWidth: Integer; AHeight: Integer);
```

C++

```
__fastcall TCustomImageList(int AWidth, int AHeight);
```

Description

Use CreateSize to create an image list object at runtime with an image size other than the default of 16 x 16 pixels. The initial size of the image list is determined by the AHeight and AWidth parameters. The height and width can be altered after the image list has been created using the Width (see page 15392) and Height (see page 15391) properties.

See Also

Create (see page 15365)

Height (see page 15391)

Width (see page 15392)

80.1.2.4 TCustomImageList.Destroy Destructor

Destroys the image list and releases the memory allocated to it.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TCustomImageList();
```

Description

Destroy first calls UnRegisterChanges (see page 15386) to unregister any objects registered to receive notification when the image list changed, and frees all helper objects associated with the image list.

Destroy seldom needs to be called. However, when an image list is constructed without an owner by the Create (see page 15365) or CreateSize (see page 15366) method, call Free to release memory and dispose of the object. Free checks to see if the pointer is nil before calling Destroy.

See Also

Free (see page 22300)

UnRegisterChanges (see page 15386)

80.1.2.5 TCustomImageList Methods

The methods of the TCustomImageList class are listed here.

Protected Methods

	Name	Description
	AssignTo (see page 15370)	Copies the image list's properties to another image list.
	Change (see page 15371)	Generates an OnChange (see page 15393) event.
	DefineProperties (see page 15371)	Allows bitmap data to be saved and loaded.
	DoDraw (see page 15372)	Draws the specified image onto the provided Canvas in the indicated style.
	GetImages (see page 15378)	Returns a specified image and its mask as bitmaps.
	HandleNeeded (see page 15381)	This is HandleNeeded, a member of class TCustomImageList.
	Initialize (see page 15381)	Initializes a newly allocated image list.
	ReadData (see page 15383)	This is ReadData, a member of class TCustomImageList.
	WriteData (see page 15386)	This is WriteData, a member of class TCustomImageList.

Public Methods

	Name	Description
	Add (see page 15368)	Adds an Image and its Mask (see page 15797) to the image list object.
	AddIcon (see page 15368)	Adds an icon to the image list object.
	AddImage (see page 15368)	Adds single image from another image list.
	AddImages (see page 15369)	Adds all images from another image list.
	AddMasked (see page 15369)	Adds an image to the image list along with a color which is used to generate the transparent mask.
	Assign (see page 15370)	Copies the information from one image list to another.
	Clear (see page 15371)	Clears all images from the image list.
	Delete (see page 15372)	Deletes a particular image from the image list.
	Draw (see page 15373)	This is the overview for the Draw method overload.
	DrawOverlay (see page 15374)	This is the overview for the DrawOverlay method overload.
	FileLoad (see page 15375)	Loads a resourced image into the image list.
	GetBitmap (see page 15376)	Retrieves a specified image as a bitmap.
	GetHotSpot (see page 15376)	Returns the hot spot location associated with the current drag image.
	GetIcon (see page 15377)	This is the overview for the GetIcon method overload.
	GetImageBitmap (see page 15378)	Returns a handle to a bitmap containing all of the images in the image list.
	GetInstRes (see page 15378)	This is the overview for the GetInstRes method overload.
	GetMaskBitmap (see page 15379)	Returns a handle to a bitmap containing all masks for images in the image list.
	GetResource (see page 15380)	Loads the specified bitmap, cursor, or icon resource into the image list.
	HandleAllocated (see page 15380)	Indicates whether a window handle exists for the image list.
	Insert (see page 15381)	Inserts a bitmap and its mask into the image list following a specified image.
	InsertIcon (see page 15382)	Inserts an icon at a specified position in the image list.
	InsertMasked (see page 15382)	Inserts a bitmap at a specified position, creating the mask from a specified transparent color.
	Move (see page 15382)	Moves a specified image to another position.
	Overlay (see page 15383)	Identifies an image in the list as an image that can be used as an overlay mask.
	RegisterChanges (see page 15383)	Registers an object to be notified when changes occur in the image list.
	Replace (see page 15384)	Replaces an image in the image list with a new image and mask.
	ReplaceIcon (see page 15384)	Replaces an image in the image list with an icon.
	ReplaceMasked (see page 15384)	Replaces an image in the image list with a new image and automatically-generated mask.
	ResInstLoad (see page 15385)	Loads a resource into the image list.
	ResourceLoad (see page 15385)	Loads a resource into the image list.
	UnRegisterChanges (see page 15386)	Removes an object from the list of objects to be notified when the image list changes.

80.1.2.5.1 TCustomImageList.Add Method

Adds an Image and its Mask (see page 15797) to the image list object.

Pascal

```
function Add(Image: TBitmap; Mask: TBitmap): Integer;
```

C++

```
__fastcall int Add(TBitmap Image, TBitmap Mask);
```

Description

Use the Add method to add images with their masks to an image list. It returns the index of the added image, or -1 if it fails. When the Masked (see page 15392) property of the image list is false, the second bitmap is ignored; it can be set to nil (Delphi) or NULL (C++).

See Also

AddIcon (see page 15368)

AddImages (see page 15369)

AddMasked (see page 15369)

Masked (see page 15392)

80.1.2.5.2 TCustomImageList.AddIcon Method

Adds an icon to the image list object.

Pascal

```
function AddIcon(Image: TIcon): Integer;
```

C++

```
__fastcall int AddIcon(TIcon Image);
```

Description

Use the AddIcon method to add the icon specified by the Image parameter to an image list. AddIcon returns the index of the added image, or -1 if it fails.

See Also

Add (see page 15368)

AddImages (see page 15369)

AddMasked (see page 15369)

80.1.2.5.3 TCustomImageList.AddImage Method

Adds single image from another image list.

Pascal

```
function AddImage(Value: TCustomImageList; Index: Integer): Integer;
```

C++

```
__fastcall int AddImage(TCustomImageList Value, int Index);
```

Description

Use AddImage to add a single image from another image list. Values specifies the source image list. Index indicates the specific image, where images are numbered from 0.

AddImage returns the new size of the image list.

See Also

Add (see page 15368)

AddIcon (see page 15368)

AddMasked (see page 15369)

AddImages (see page 15369)

80.1.2.5.4 TCustomImageList.AddImages Method

Adds all images from another image list.

Pascal

```
procedure AddImages(Value: TCustomImageList);
```

C++

```
__fastcall AddImages(TCustomImageList Value);
```

Description

Use AddImages to add all the images from another image list. Value specifies the source image list.

See Also

Add (see page 15368)

AddIcon (see page 15368)

AddMasked (see page 15369)

AddImage (see page 15368)

80.1.2.5.5 TCustomImageList.AddMasked Method

Adds an image to the image list along with a color which is used to generate the transparent mask.

Pascal

```
function AddMasked(Image: TBitmap; MaskColor: TColor): Integer;
```

C++

```
__fastcall int AddMasked(TBitmap Image, TColor MaskColor);
```

Description

AddMasked is similar to Add (see page 15368) except that a mask bitmap is not specified. Instead, a color that can be used to automatically generate the masks is specified. Each pixel of the specified color in the image bitmap is changed to black, and the corresponding bit in the mask is set to one. As a result, any pixel in the image that matches the specified color is transparent when the image is drawn. AddMasked returns -1 if it fails, 0 if it's successful.

See Also

Add (see page 15368)

AddIcon (see page 15368)

AddImages (see page 15369)

Masked (see page 15392)

80.1.2.5.6 TCustomImageList.Assign Method

Copies the information from one image list to another.

Pascal

```
procedure Assign(Source: TPersistent); override;
```

C++

```
virtual __fastcall Assign(TPersistent * Source);
```

Description

Use this method to copy another object's information to the image list.

If Source is another image list (TCustomImageList (see page 15361) descendant), Assign discards any current image information and replaces it with the information from Source.

If Source is nil (Delphi) or NULL (C++), Assign clears the image list.

If Source is any other type of object, Assign calls its inherited method, which can copy from any source object that implements a way to copy to an image list in its AssignTo (see page 15370) method.

See Also

AddImages (see page 15369)

Add (see page 15368)

AssignTo (see page 2931)

80.1.2.5.7 TCustomImageList.AssignTo Method

Copies the image list's properties to another image list.

Pascal

```
procedure AssignTo(Dest: TPersistent); override;
```

C++

```
virtual __fastcall AssignTo(TPersistent * Dest);
```

Description

Applications do not call the protected AssignTo method. Instead, call the public Assign (see page 15370) method of the destination image list. AssignTo is called when the image list is passed as the Source parameter of another object's Assign (see page 15370) method and that Assign (see page 15370) method can't copy information to the image list. The object whose Assign (see page 15370) method was called is passed as the Dest parameter. AssignTo gives the image list an opportunity to copy properties to objects that were not created with the image list in mind.

See Also

AddImages (see page 15369)

Add (see page 15368)

Assign (see page 15370)

80.1.2.5.8 TCustomImageList.Change Method

Generates an OnChange (see page 15393) event.

Pascal

```
procedure Change; dynamic;
```

C++

```
__fastcall Change();
```

Description

Change calls the OnChange (see page 15393) event handler if it is assigned. Override Change to block this event or provide additional responses to changes in the image list.

See Also

RegisterChanges (see page 15383)

OnChange (see page 15393)

80.1.2.5.9 TCustomImageList.Clear Method

Clears all images from the image list.

Pascal

```
procedure Clear;
```

C++

```
__fastcall Clear();
```

Description

Use the Clear method to remove all images from the image list. Use the Delete (see page 15372) method to delete one image from the image list.

See Also

Delete (see page 15372)

80.1.2.5.10 TCustomImageList.DefineProperties Method

Allows bitmap data to be saved and loaded.

Pascal

```
procedure DefineProperties(Filer: TFiler); override;
```

C++

```
virtual __fastcall DefineProperties(TFiler Filer);
```

Description

DefineProperties allows the image list to create pseudo properties that are loaded and saved with the image list. TCustomImageList (see page 15361) overrides the inherited method to save or load the bitmap image in addition to the other published properties.

See Also

DefineBinaryProperty (see page 2837)

DefineProperties (see page 2931)

80.1.2.5.11 TCustomImageList.Delete Method

Deletes a particular image from the image list.

Pascal

```
procedure Delete(Index: Integer);
```

C++

```
__fastcall Delete(int Index);
```

Description

Use the Delete method to delete an image specified by Index in the image list. Use the Clear (see page 15371) method to delete all images in the image list.

See Also

Clear (see page 15371)

80.1.2.5.12 TCustomImageList.DoDraw Method

Draws the specified image onto the provided Canvas in the indicated style.

Pascal

```
procedure DoDraw(Index: Integer; Canvas: TCanvas; X: Integer; Y: Integer; Style: Cardinal;
Enabled: Boolean = True); virtual;
```

C++

```
virtual __fastcall DoDraw(int Index, TCanvas Canvas, int X, int Y, unsigned Style, Boolean
Enabled = True);
```

Description

Applications can't call the protected DoDraw method. It provides the underlying implementation of the public Draw (see page 15373) method.

Index specifies an image to draw.

Canvas indicates the drawing surface on which the image is rendered.

X and Y specify the top-left corner of the image on Canvas.

Style encodes how the image blends color or uses a mask (the DrawingStyle (see page 15390) and ImageType (see page 15391)).

Enabled indicates whether the image appears as a gray-mapped image. If Enabled is false, DoDraw renders a gray-mapped version of the image.

See Also

Draw (see page 15373)

DrawingStyle (see page 15390)

ImageType (see page 15391)

80.1.2.5.13 Draw Method

This is the overview for the Draw method overload.

Overload List

	Name	Description
	TCustomImageList.Draw (TCanvas, Integer, Integer, Integer, Boolean) (see page 15373)	Draws the image specified by the Index parameter onto the provided Canvas.
	TCustomImageList.Draw (TCanvas, Integer, Integer, Integer, TDrawingStyle, TImageType, Boolean) (see page 15373)	Draws the image specified by the Index parameter onto the provided Canvas.

80.1.2.5.13.1 TCustomImageList.Draw Method (TCanvas, Integer, Integer, Integer, Boolean)

Draws the image specified by the Index parameter onto the provided Canvas.

Pascal

```
procedure Draw(Canvas: TCanvas; X: Integer; Y: Integer; Index: Integer; Enabled: Boolean =
True); overload;
procedure Draw(Canvas: TCanvas; X: Integer; Y: Integer; Index: Integer; ADrawingStyle:
TDrawingStyle; AImageType: TImageType; Enabled: Boolean = True); overload;
```

C++

```
__fastcall Draw(TCanvas Canvas, int X, int Y, int Index, Boolean Enabled = True);
__fastcall Draw(TCanvas Canvas, int X, int Y, int Index, TDrawingStyle ADrawingStyle,
TImageType AImageType, Boolean Enabled = True);
```

Description

Use the Draw method to draw one of the images in the image list onto a specified canvas.

Canvas is the drawing surface on which to render the image.

X and Y specify the location where the top-left corner should appear on Canvas.

Index indicates which image to draw, where 0 specifies the first image, 1 specifies the second image, and so on.

ADrawingStyle indicates how the color of the image may be altered. If this parameter is not specified, Draw uses the value of the DrawingStyle (see page 15390) property.

AImageType indicates whether to draw the image or its associated mask. If this parameter is not specified, Draw uses the value of the ImageType (see page 15391) property.

Enabled indicates whether the image appears as a gray-mapped image. If Enabled is false, Draw renders a gray-mapped version of the image. Because Enabled has a default value of true, this parameter can be omitted if the image should not be grayed.

C++ Examples:

```
/*
The following code is the OnDrawPanel event handler of a
status bar.  It draws each panel of the status bar, adding
text and icons stored in ImageList1. The image list contains
as many icons as there are header sections.  This example
requires a populated image list and a statusbar with several
panels added to the Panels property.  Select each panel and
set the Style property to psOwnerDraw.
*/
void __fastcall TForm1::StatusBar1DrawPanel(TStatusBar *StatusBar,
```

```
        TStatusPanel *Panel, const TRect &Rect)
{
  TCanvas *canvas = StatusBar->Canvas;
  canvas->Brush->Color = clRed;
  canvas->FillRect(Rect);
  canvas->Font->Color = clYellow;
  ImageList1->Draw(canvas,Rect.Left,Rect.Top, Panel->Index, true);
  canvas->TextOut(Rect.left + 30, Rect.top + 2, "Panel" + IntToStr(Panel->Index));
}
```

Delphi Examples:

```
{
The following code is the OnDrawPanel event handler of a
status bar.  It draws each panel of the status bar, adding
text and icons stored in ImageList1. The image list contains
as many icons as there are header sections.  This example
requires a populated image list and a statusbar with several
panels added to the Panels property.  Select each panel and
set the Style property to psOwnerDraw.
}
procedure TForm1.StatusBar1DrawPanel(StatusBar: TStatusBar;
  Panel: TStatusPanel; const Rect: TRect);
begin
with StatusBar1.Canvas do
  begin
    Brush.Color := clRed;
    FillRect(Rect);
    Font.Color := clYellow;
    ImageList1.Draw(StatusBar1.Canvas,Rect.Left,Rect.Top,Panel.Index);
    TextOut(Rect.left + 30, Rect.top + 2, 'Panel' + IntToStr(Panel.Index));
  end;
end;
```

GetImages (see page 15378)

ImageType (see page 15391)

80.1.2.5.14 DrawOverlay Method

This is the overview for the DrawOverlay method overload.

Overload List

	Name	Description
	TCustomImageList.DrawOverlay (TCanvas, Integer, Integer, Integer, TOverlay, Boolean) (see page 15375)	Draws an image and an overlay onto the provided Canvas.
	TCustomImageList.DrawOverlay (TCanvas, Integer, Integer, Integer, TOverlay, TDrawingStyle, TImageType, Boolean) (see page 15375)	Draws an image and an overlay onto the provided Canvas.

80.1.2.5.14.1 TCustomImageList.DrawOverlay Method (TCanvas, Integer, Integer, Integer, TOverlay, Boolean)

Draws an image and an overlay onto the provided Canvas.

Pascal

```
procedure DrawOverlay(Canvas: TCanvas; X: Integer; Y: Integer; ImageIndex: Integer; Overlay:
TOverlay; Enabled: Boolean = True); overload;
procedure DrawOverlay(Canvas: TCanvas; X: Integer; Y: Integer; ImageIndex: Integer; Overlay:
TOverlay; ADrawingStyle: TDrawingStyle; AImageType: TImageType; Enabled: Boolean = True);
overload;
```

C++

```
__fastcall DrawOverlay(TCanvas Canvas, int X, int Y, int ImageIndex, TOverlay Overlay, Boolean
Enabled = True);
__fastcall DrawOverlay(TCanvas Canvas, int X, int Y, int ImageIndex, TOverlay Overlay,
TDrawingStyle ADrawingStyle, TImageType AImageType, Boolean Enabled = True);
```

Description

An overlay mask is an image drawn transparently over another image. Any image can be used as an overlay mask. To draw an overlay mask over an image use the DrawOverlay method with the index of the overlay mask.

Canvas is the drawing surface on which to draw the overlay.

X and Y specify the location where the top-left corner should appear on Canvas.

ImageIndex indicates which image to draw, where 0 specifies the first image, 1 specifies the second image, and so on.

Overlay (see page 15383) specifies the index of the overlay mask to use. This index is assigned to the image that is used as an overlay mask by calling the Overlay (see page 15383) method.

ADrawingStyle indicates how the color of the image may be altered. If this parameter is not specified, Draw (see page 15373) uses the value of the DrawingStyle (see page 15390) property.

AImageType indicates whether to draw the image or its associated mask. If this parameter is not specified, Draw (see page 15373) uses the value of the ImageType (see page 15391) property.

Enabled indicates whether the image appears as a gray-mapped image. If Enabled is false, DoDraw (see page 15372) renders a gray-mapped version of the image. Because Enabled has a default value of true, this parameter can be omitted if the image should not be grayed.

See Also

Overlay (see page 15383)

Draw (see page 15373)

SetDragImage (see page 6029)

80.1.2.5.15 TCustomImageList.FileLoad Method

Loads a resourced image into the image list.

Pascal

```
function FileLoad(ResType: TResType; const Name: string; MaskColor: TColor): Boolean;
```

C++

```
__fastcall Boolean FileLoad(TResType ResType, const AnsiString Name, TColor MaskColor);
```

Description

Use the FileLoad method to load a bitmap, cursor, or icon from a resource file. Use ResType to specify the type of resource. Use Name to identify the resource by name. Use MaskColor to set the transparent color for the images. FileLoad returns true if successful.

Note: Within a package, FileLoad returns an error. GetInstRes (see page 15379) must be used to load a resource from within a package.

See Also

GetResource (see page 15380)

ResourceLoad (see page 15385)

GetInstRes (see page 15379)

80.1.2.5.16 TCustomImageList.GetBitmap Method

Retrieves a specified image as a bitmap.

Pascal

```
function GetBitmap(Index: Integer; Image: TBitmap): Boolean;
```

C++

```
__fastcall Boolean GetBitmap(int Index, TBitmap Image);
```

Description

Use the GetBitmap method to obtain a particular image in the image list as a bitmap object. Index denotes the index of the image. GetBitmap assigns the image to the TBitmap object passed in as the Image parameter.

Delphi Examples:

```
{
This example assigns a bitmap contained in an ImageList to
an Image component's Picture's Bitmap property and displays
the bitmap.  TImage Stretch will fit the bitmap to the image
size.
}
procedure TForm1.Button1Click(Sender: TObject);
begin
   ImageList1.GetBitmap(2,Image1.Picture.Bitmap);
   Image1.Stretch := True;
end;
```

See Also

GetMaskBitmap (see page 15379)

80.1.2.5.17 TCustomImageList.GetHotSpot Method

Returns the hot spot location associated with the current drag image.

Pascal

```
function GetHotSpot: TPoint; virtual;
```

C++

```
virtual __fastcall TPoint GetHotSpot();
```

Description

Use the GetHotSpot method to obtain the position of the hot spot of the current drag image.

See Also

DragMove (see page 6027)

SetDragImage (see page 6029)

80.1.2.5.18 GetIcon Method

This is the overview for the GetIcon method overload.

Overload List

	Name	Description
	TCustomImageList.GetIcon (Integer, TIcon) (see page 15377)	Returns the image specified by Index as an icon into the Image parameter.
	TCustomImageList.GetIcon (Integer, TIcon, TDrawingStyle, TImageType) (see page 15377)	Returns the image specified by Index as an icon into the Image parameter.

80.1.2.5.18.1 TCustomImageList.GetIcon Method (Integer, TIcon)

Returns the image specified by Index as an icon into the Image parameter.

Pascal

```
procedure GetIcon(Index: Integer; Image: TIcon); overload;
procedure GetIcon(Index: Integer; Image: TIcon; ADrawingStyle: TDrawingStyle; AImageType:
TImageType); overload;
```

C++

```
__fastcall GetIcon(int Index, TIcon Image);
__fastcall GetIcon(int Index, TIcon Image, TDrawingStyle ADrawingStyle, TImageType AImageType);
```

Description

Call GetIcon to obtain a particular image in the image list as an icon.

Index identifies the desired image, where 0 specifies the first image, 1 specifies the second image, and so on.

Image is a TIcon object that receives the new image.

ADrawingStyle specifies the amount of color that is blended with the image to achieve various affects. When GetIcon is called using the version that does not take an ADrawingStyle parameter, it uses the value of the DrawingStyle (see page 15390) property.

AImageType specifies whether the image is rendered using a mask. When GetIcon is called using the version that does not take an AImageType parameter, it uses the value of the ImageType (see page 15391) property.

See Also

GetImageBitmap (see page 15378)

DrawingStyle (see page 15390)

ImageType (see page 15391)

80.1.2.5.19 TCustomImageList.GetImageBitmap Method

Returns a handle to a bitmap containing all of the images in the image list.

Pascal

```
function GetImageBitmap: HBITMAP;
```

C++

```
__fastcall HBITMAP GetImageBitmap();
```

Description

Use the GetImageBitmap method to obtain a Windows handle for the bitmap that contains all images in the image list. GetImageBitmap returns 0 if unsuccessful.

See Also

GetImages (see page 15378)

GetBitmap (see page 15376)

80.1.2.5.20 TCustomImageList.GetImages Method

Returns a specified image and its mask as bitmaps.

Pascal

```
procedure GetImages(Index: Integer; Image: TBitmap; Mask: TBitmap);
```

C++

```
__fastcall GetImages(int Index, TBitmap Image, TBitmap Mask);
```

Description

Use GetImages to obtain the image (and its mask) identified by the Index parameter.

Index specifies the image (and mask) to return, where 0 identifies the first image, 1 the second image, and so on.

Image is a TBitmap object that receives the image of the bitmap.

Mask (see page 15797) is a TBitmap object that receives the image of the mask.

See Also

GetImageBitmap (see page 15378)

GetMaskBitmap (see page 15379)

GetBitmap (see page 15376)

80.1.2.5.21 GetInstRes Method

This is the overview for the GetInstRes method overload.

Overload List

	Name	Description
	TCustomImageList.GetInstRes (THandle, TResType, DWORD, Integer, TLoadResources, TColor) (see page 15379)	Loads a specified bitmap, cursor, or icon resource into the image list.

	TCustomImageList.GetInstRes (THandle, TResType, string, Integer, TLoadResources, TColor) (see page 15379)	Loads a specified bitmap, cursor, or icon resource into the image list.

80.1.2.5.21.1 TCustomImageList.GetInstRes Method (THandle, TResType, DWORD, Integer, TLoadResources, TColor)

Loads a specified bitmap, cursor, or icon resource into the image list.

Pascal

```
function GetInstRes(Instance: THandle; ResType: TResType; const Name: string; Width: Integer;
LoadFlags: TLoadResources; MaskColor: TColor): Boolean; overload;
function GetInstRes(Instance: THandle; ResType: TResType; ResID: DWORD; Width: Integer;
LoadFlags: TLoadResources; MaskColor: TColor): Boolean; overload;
```

C++

```
__fastcall Boolean GetInstRes(THandle Instance, TResType ResType, const AnsiString Name, int
Width, TLoadResources LoadFlags, TColor MaskColor);
__fastcall Boolean GetInstRes(THandle Instance, TResType ResType, DWORD ResID, int Width,
TLoadResources LoadFlags, TColor MaskColor);
```

Description

Use the GetInstRes method to load bitmap, cursor, or icon resource into an image list.

Instance is the instance handle of the resource module.

ResType indicates the type of resource (rtBitmap, rtCursor or rtIcon).

Name or ResID identifies the resource by name or ID, respectively.

Width (see page 15392) specifies the width, in pixels, of the image.

LoadFlags specifies how to load the image.

MaskColor sets the transparent color for the image.

Note: GetInstRes must be used to load a resource from within a package. Within a package, GetResource (see page 15380) or FileLoad (see page 15375) returns an error.

See Also

ResInstLoad (see page 15385)

ResourceLoad (see page 15385)

FileLoad (see page 15375)

GetResource (see page 15380)

80.1.2.5.22 TCustomImageList.GetMaskBitmap Method

Returns a handle to a bitmap containing all masks for images in the image list.

Pascal

```
function GetMaskBitmap: HBITMAP;
```

C++

```
__fastcall HBITMAP GetMaskBitmap();
```

Description

Use the GetMaskBitmap to obtain a bitmap that contains all masks in the image list. GetMaskBitmap returns 0 if unsuccessful.

See Also

GetImageBitmap (see page 15378)

GetImages (see page 15378)

80.1.2.5.23 TCustomImageList.GetResource Method

Loads the specified bitmap, cursor, or icon resource into the image list.

Pascal

```
function GetResource(ResType: TResType; const Name: string; Width: Integer; LoadFlags:
TLoadResources; MaskColor: TColor): Boolean;
```

C++

```
__fastcall Boolean GetResource(TResType ResType, const AnsiString Name, int Width,
TLoadResources LoadFlags, TColor MaskColor);
```

Description

Use the GetResource method to load bitmap, cursor, or icon resource into an image list.

Note: Within a package, GetResource returns an error. GetInstRes (see page 15379) must be used to load a resource from within a package.

ResType specifies the type of graphical resource that is to be loaded into the image list and can be rtBitmap, rtCursor or rtIcon.

Name identifies the resource by name.

Width (see page 15392) specifies the width, in pixels, of the image.

LoadFlags specifies how to load the image.

MaskColor sets the transparent color for the images in the file.

See Also

ResourceLoad (see page 15385)

FileLoad (see page 15375)

GetInstRes (see page 15379)

80.1.2.5.24 TCustomImageList.HandleAllocated Method

Indicates whether a window handle exists for the image list.

Pascal

```
function HandleAllocated: Boolean;
```

C++

```
__fastcall Boolean HandleAllocated();
```

Description

Use HandleAllocated to determine if a handle exists for the image list. HandleAllocated returns true if the Windows image list has been created and a handle is available, false otherwise. HandleAllocated doesn't create a handle if it doesn't already exist.

Note: Getting the Handle (see page 15390) property of creates the Windows image list automatically if it didn't previously

exist, and returns the resulting handle.

See Also

Handle (see page 15390)

80.1.2.5.25 TCustomImageList.HandleNeeded Method

Pascal

```
procedure HandleNeeded;
```

C++

```
__fastcall HandleNeeded();
```

Description

This is HandleNeeded, a member of class TCustomImageList.

80.1.2.5.26 TCustomImageList.Initialize Method

Initializes a newly allocated image list.

Pascal

```
procedure Initialize; virtual;
```

C++

```
virtual __fastcall Initialize();
```

Description

Initialize is called from the constructor of the image list. It sets numerous image list properties to their default values and creates instances of helper objects used internally.

See Also

Create (see page 15365)

CreateSize (see page 15366)

80.1.2.5.27 TCustomImageList.Insert Method

Inserts a bitmap and its mask into the image list following a specified image.

Pascal

```
procedure Insert(Index: Integer; Image: TBitmap; Mask: TBitmap);
```

C++

```
__fastcall Insert(int Index, TBitmap Image, TBitmap Mask);
```

Description

Use the Insert method to insert a bitmap and its mask into the image list. The image is inserted following the image specified by Index.

See Also

Add (see page 15368)

AddMasked (see page 15369)

80.1.2.5.28 TCustomImageList.InsertIcon Method

Inserts an icon at a specified position in the image list.

Pascal

```
procedure InsertIcon(Index: Integer; Image: TIcon);
```

C++

```
__fastcall InsertIcon(int Index, TIcon Image);
```

Description

Use the InsertIcon method to insert an icon into the image list. The icon is inserted following the image specified by Index.

See Also

AddIcon (see page 15368)

80.1.2.5.29 TCustomImageList.InsertMasked Method

Inserts a bitmap at a specified position, creating the mask from a specified transparent color.

Pascal

```
procedure InsertMasked(Index: Integer; Image: TBitmap; MaskColor: TColor);
```

C++

```
__fastcall InsertMasked(int Index, TBitmap Image, TColor MaskColor);
```

Description

Use the InsertMasked method to insert a masked image into the image list. The new image is inserted following the image specified by Index. Use MaskColor to identify the color in the image used to generate the Mask (see page 15797).

See Also

AddMasked (see page 15369)

Insert (see page 15381)

80.1.2.5.30 TCustomImageList.Move Method

Moves a specified image to another position.

Pascal

```
procedure Move(CurIndex: Integer; NewIndex: Integer);
```

C++

```
__fastcall Move(int CurIndex, int NewIndex);
```

Description

Use the Move method to move an image to another position in the image list. Specify the current position using CurIndex, and the new position using NewIndex.

See Also

Insert (see page 15381)

80.1.2.5.31 TCustomImageList.Overlay Method

Identifies an image in the list as an image that can be used as an overlay mask.

Pascal

```
function Overlay(ImageIndex: Integer; Overlay: TOverlay): Boolean;
```

C++

```
__fastcall Boolean Overlay(int ImageIndex, TOverlay Overlay);
```

Description

Use Overlay to assign an overlay index to one of the images in the list. Once an image has an overlay index, it can be used as an overlay mask. An overlay mask is an image drawn transparently over another image.

ImageIndex identifies the image that can act as an overlay mask.

Overlay is the overlay index to assign to that image. It must be a value between 0 and 3 (inclusive). Note that this means at most four images can be used as overlay masks.

If successful, Overlay returns true.

To draw an overlay mask over an image use the DrawOverlaymethodwith the index of the overlay mask.

See Also

DrawOverlay (see page 15375)

80.1.2.5.32 TCustomImageList.ReadData Method

Pascal

```
procedure ReadData(Stream: TStream); virtual;
```

C++

```
virtual __fastcall ReadData(TStream Stream);
```

Description

This is ReadData, a member of class TCustomImageList.

80.1.2.5.33 TCustomImageList.RegisterChanges Method

Registers an object to be notified when changes occur in the image list.

Pascal

```
procedure RegisterChanges(Value: TChangeLink);
```

C++

```
__fastcall RegisterChanges(TChangeLink Value);
```

Description

Use the RegisterChanges method to have an object notified whenever changes occur in the image list. The TChangeLink (see page 15358)'s OnChange (see page 15393) event is called whenever a change in the image list occurs.

Create (see page 15365) a change link object for each object that should be notified of changes. Register each object by calling RegisterChanges and passing its change link object as the Value parameter. The OnChange (see page 15393) event of all registered change link objects is then triggered when a change occurs in the image list. Any code assigned to the OnChange (see page 15393) event handlers will execute.

See Also

UnRegisterChanges (see page 15386)

OnChange (see page 15361)

80.1.2.5.34 TCustomImageList.Replace Method

Replaces an image in the image list with a new image and mask.

Pascal

```
procedure Replace(Index: Integer; Image: TBitmap; Mask: TBitmap);
```

C++

```
__fastcall Replace(int Index, TBitmap Image, TBitmap Mask);
```

Description

Use the Replace method to replace the image at the Index position in the image list with a new Image and overlay Mask (see page 15797).

See Also

Insert (see page 15381)

ReplaceIcon (see page 15384)

ReplaceMasked (see page 15384)

80.1.2.5.35 TCustomImageList.ReplaceIcon Method

Replaces an image in the image list with an icon.

Pascal

```
procedure ReplaceIcon(Index: Integer; Image: TIcon);
```

C++

```
__fastcall ReplaceIcon(int Index, TIcon Image);
```

Description

Use the ReplaceIcon method to replace the Image at the Index position in the image list with a new icon.

See Also

Replace (see page 15384)

InsertIcon (see page 15382)

80.1.2.5.36 TCustomImageList.ReplaceMasked Method

Replaces an image in the image list with a new image and automatically-generated mask.

Pascal

```
procedure ReplaceMasked(Index: Integer; NewImage: TBitmap; MaskColor: TColor);
```

C++

```
__fastcall ReplaceMasked(int Index, TBitmap NewImage, TColor MaskColor);
```

Description

Use the ReplaceMasked method to replace the image at Index position within the image list specified by NewImage and the mask generated from NewImage by masking out all pixels of the color specified by MaskColor.

See Also

Replace (see page 15384)

InsertMasked (see page 15382)

80.1.2.5.37 TCustomImageList.ResInstLoad Method

Loads a resource into the image list.

Pascal

```
function ResInstLoad(Instance: THandle; ResType: TResType; const Name: string; MaskColor:
TColor): Boolean;
```

C++

```
__fastcall Boolean ResInstLoad(THandle Instance, TResType ResType, const AnsiString Name,
TColor MaskColor);
```

Description

Use the ResoInstLoad method to load a resource of type TResType (see page 15396) into the image list. Use Instance to specify the instance handle of the resource module, and Name to identify the resource within that module. MaskColor is used to create the mask for the resulting image. ResInstLoad should be used rather than ResourceLoad (see page 15385) to load a resource from within a package.

ResInstLoad returns true if it is successful, false otherwise.

See Also

GetInstRes (see page 15379)

GetResource (see page 15380)

80.1.2.5.38 TCustomImageList.ResourceLoad Method

Loads a resource into the image list.

Pascal

```
function ResourceLoad(ResType: TResType; const Name: string; MaskColor: TColor): Boolean;
```

C++

```
__fastcall Boolean ResourceLoad(TResType ResType, const AnsiString Name, TColor MaskColor);
```

Description

Use the ResourceLoad method to load a resource of type TResType (see page 15396) into the image list. Use Name to identify the resource. MaskColor is used to create the mask for the resulting image. ResourceLoad returns true if successful, false otherwise.

Note: Within a package, use ResInstLoad (see page 15385) instead of ResourceLoad. ResourceLoad returns an error when called from within a package.

See Also

GetResource (see page 15380)

ResInstLoad (see page 15385)

80.1.2.5.39 TCustomImageList.UnRegisterChanges Method

Removes an object from the list of objects to be notified when the image list changes.

Pascal

```
procedure UnRegisterChanges(Value: TChangeLink);
```

C++

```
__fastcall UnRegisterChanges(TChangeLink Value);
```

Description

Use the UnRegisterChanges method to unregister a TChangeLink (see page 15358) object. The object will no longer receive notification when the image list changes.

See Also

RegisterChanges (see page 15383)

80.1.2.5.40 TCustomImageList.WriteData Method

Pascal

```
procedure WriteData(Stream: TStream); virtual;
```

C++

```
virtual __fastcall WriteData(TStream Stream);
```

Description

This is WriteData, a member of class TCustomImageList.

80.1.2.6 TCustomImageList Properties

The properties of the TCustomImageList class are listed here.

Public Properties

	Name	Description
	AllocBy (see page 15387)	Sets the number of images by which the image list grows when it needs to make room for new images.
	BkColor (see page 15387)	Determines which background color to use when drawing an image.
	BlendColor (see page 15387)	Determines which foreground color to use when drawing an image.
R	Count (see page 15388)	Indicates the number of images in the image list.
	DrawingStyle (see page 15390)	Specifies the style to be used when the image list is drawing an image.
	Handle (see page 15390)	Designates the handle for the image list.
	Height (see page 15391)	Specifies the height of images within the image list.
	ImageType (see page 15391)	Determines whether the image list uses the associated mask when drawing.
	Masked (see page 15392)	Specifies whether the image list includes masks that can be combined with the images.
	ShareImages (see page 15392)	Specifies whether the image list destroys its handle when the image list is destroyed.
	Width (see page 15392)	Specifies the width of all images within the image list.

80.1.2.6.1 TCustomImageList.AllocBy Property

Sets the number of images by which the image list grows when it needs to make room for new images.

Pascal

```
property AllocBy: Integer;
```

C++

```
__property int AllocBy;
```

Description

Use the AllocBy method to specify the number of new images that can be added to the resized image list.

See Also

Count (see page 15388)

Add (see page 15368)

AddIcon (see page 15368)

AddImages (see page 15369)

AddMasked (see page 15369)

80.1.2.6.2 TCustomImageList.BkColor Property

Determines which background color to use when drawing an image.

Pascal

```
property BkColor: TColor;
```

C++

```
__property TColor BkColor;
```

Description

Use BkColor to specify the color used for the masked regions of the images in the list. When BkColor is clNone, the image is drawn transparently using the mask to define the transparent areas. Otherwise, the value of BkColor appears in the masked out portions.

Note: BkColor has no effect when the Masked (see page 15392) property is false.

See Also

BlendColor (see page 15387)

Masked (see page 15392)

ImageType (see page 15391)

80.1.2.6.3 TCustomImageList.BlendColor Property

Determines which foreground color to use when drawing an image.

Pascal

```
property BlendColor: TColor;
```

C++

```
__property TColor BlendColor;
```

Description

Set BlendColor to cause the images in the list to be combined with the specified color when the DrawingStyle (see page 15390) is dsFocus or dsSelected. More of BlendColor is combined with the images when DrawingStyle (see page 15390) is dsSelected. clNone specifies no blend color while clDefault specifies the system highlight .

See Also

BkColor (see page 15387)

DrawingStyle (see page 15390)

80.1.2.6.4 TCustomImageList.Count Property

Indicates the number of images in the image list.

Pascal

```
property Count: Integer;
```

C++

```
__property int Count;
```

Description

Use Count when iterating through the images in the image list. Retrieve the individual images using the GetBitmap (see page 15376) method. Draw (see page 15373) individual images using the Draw (see page 15373) method.

C++ Examples:

```
/*
This example requires a TListView, a TImageList and a
TComboBox. You will need to double click the image list and
add several images to the image list prior to running the
project. During the form's OnCreate event
handler, items for the List View control are created for
each image in the Image List and the ImageIndex is assigned
the number of the image within the ImageList. Two columns are
created so that when ViewStyle is vsReport, you will have
columns to view.  Also within the form's OnCreate event
handler assign the ComboBox each of the four TViewStyle
constants to the Items' Objects property. You could also
simply code this within a series of OnClick event handlers
as, for instance, ListView1.->ViewStyle := vsIcon.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  TListItem *Item;
  TListColumn *Column;
  const char imagenames[3][20] = {"C++ Image", "Borland Image", "Delphi Image"};
  const char Col2Array[3][40] = {"Documentation for the C++ icon.", "Borland icon.", "Delphi
icon."};
  // Create a ListView item for each image in the ImageList
  ListView1->SmallImages = ImageList1;
  ListView1->LargeImages = ImageList1;
  for (int i = 0; i < ImageList1->Count; i++)
  {
    Item = ListView1->Items->Add();
    Item->Caption = imagenames[i];
    Item->ImageIndex = i;
    Item->SubItems->Add(Col2Array[i]);
```

```
  }
  // Create two columns to show during viewing as vsReport
  Column = ListView1->Columns->Add();
  Column->Caption = "Column 1";
  Column->Width = 200;
  Column = ListView1->Columns->Add();
  Column->Caption = "Column 2";
  Column->Width = 200;
  // Add View styles and constants to the Combo Box
  ComboBox1->Items->AddObject("vsIcon", (TObject *)vsIcon);
  ComboBox1->Items->AddObject("vsList", (TObject *)vsList);
  ComboBox1->Items->AddObject("vsReport", (TObject *)vsReport);
  ComboBox1->Items->AddObject("vsSmallIcon", (TObject *)vsSmallIcon);
  // Display first item in the Combo Box
  ComboBox1->ItemIndex = 0;
}

void __fastcall TForm1::ComboBox1Click(TObject *Sender)
{
  ListView1->ViewStyle = (TViewStyle) ComboBox1->Items->Objects[ComboBox1->ItemIndex];
}
```

Delphi Examples:

```
{
This example requires a TListView, a TImageList and a
TComboBox. You will need to double click the image list and
add several images to the image list prior to running the
project. You can use *.bmp or *.ico files from the
\Images\Icons directory. During the form's OnCreate event
handler, items for the List View control are created for
each image in the Image List and the ImageIndex is assigned
the number of the image within the ImageList. Two columns are
created so that when ViewStyle is vsReport, you will have
columns to view.  Also within the form's OnCreate event
handler assign the ComboBox each of the four TViewStyle
constants to the Items' Objects property. You could also
simply code this within a series of OnClick event handlers
as, for instance, ListView1.->ViewStyle := vsIcon.
}

procedure TComboForm.FormCreate(Sender: TObject);
var
  I: Integer;
  ListItem: TListItem;
  NewColumn: TListColumn;
begin
  Col2Array[0]:= 'Documentation for Image0.';
  Col2Array[1]:= 'Documentation for Image1.';
  Col2Array[2]:= 'Documentation for Image2.';
  // Create a ListView item for each image in the ImageList
  with ListView1 do
  begin
    SmallImages := ImageList1;
    LargeImages := ImageList1;
    for I := 0 to ImageList1.Count - 1 do
    begin
      ListItem := Items.Add;
      Listitem.Caption := 'Image' + IntToStr(I);
      ListItem.ImageIndex := I;
      Listitem.SubItems.Add(Col2Array[I]);
    end;
    // Create two columns to show during viewing as vsReport
    NewColumn := Columns.Add;
    NewColumn.Caption := 'Column 1';
    NewColumn.Width := 200;
    NewColumn := Columns.Add;
```

```
      NewColumn.Caption := 'Column 2';
      NewColumn.Width := 200;
      // Add View styles and constants to the Combo Box
      ComboBox1.Items.AddObject('vsIcon', TObject(vsIcon));
      ComboBox1.Items.AddObject('vsList', TObject(vsList));
      ComboBox1.Items.AddObject('vsReport', TObject(vsReport));
      ComboBox1.Items.AddObject(
        'vsSmallIcon', TObject(vsSmallIcon));
      // Display first item in the Combo Box
      ComboBox1.ItemIndex := 0;
    end;
  end;

  procedure TComboForm.ComboBox1Click(Sender: TObject);
  begin
    with ComboBox1 do
      ListView1.ViewStyle := TViewStyle(Items.Objects[ItemIndex]);

  end;
```

See Also

AllocBy (see page 15387)

GetBitmap (see page 15376)

Draw (see page 15373)

80.1.2.6.5 TCustomImageList.DrawingStyle Property

Specifies the style to be used when the image list is drawing an image.

Pascal

```
property DrawingStyle: TDrawingStyle;
```

C++

```
__property TDrawingStyle DrawingStyle;
```

Description

Use the DrawingStyle property to control how the image is to appear. DrawingStyle controls how much of the blend color specified by BlendColor (see page 15387) is combined with the foreground, or what background color to use.

See Also

Draw (see page 15373)

DrawOverlay (see page 15375)

ImageType (see page 15391)

BlendColor (see page 15387)

BkColor (see page 15387)

80.1.2.6.6 TCustomImageList.Handle Property

Designates the handle for the image list.

Pascal

```
property Handle: HImageList;
```

C++

```
__property HImageList Handle;
```

Description

Handle is the Windows image list object handle. Use this handle when calling Windows API functions that require it.

See Also

HandleAllocated (see page 15380)

80.1.2.6.7 TCustomImageList.Height Property

Specifies the height of images within the image list.

Pascal

```
property Height: Integer;
```

C++

```
__property int Height;
```

Description

Use the Height property to specify the height of images before any are added to the image list. The image list is cleared when this value changes.

See Also

Width (see page 15392)

CreateSize (see page 15366)

Create (see page 15365)

80.1.2.6.8 TCustomImageList.ImageType Property

Determines whether the image list uses the associated mask when drawing.

Pascal

```
property ImageType: TImageType;
```

C++

```
__property TImageType ImageType;
```

Description

Use the ImageType property to control whether the images are drawn using the image mask (itMask), or without the mask (itImage).

See Also

DrawingStyle (see page 15390)

Draw (see page 15373)

Masked (see page 15392)

DrawOverlay (see page 15375)

80.1.2.6.9 TCustomImageList.Masked Property

Specifies whether the image list includes masks that can be combined with the images.

Pascal

```
property Masked: Boolean;
```

C++

```
__property Boolean Masked;
```

Description

Set the Masked property to true to combine the images with masks. The masked portion of the bitmap is drawn transparently, or replaced by the color specified by the BkColor (see page 15387) property.

Masked indicates whether the image list stores masks to combine with the images. To use those masks, the ImageType (see page 15391) property indicates whether to draw the image or the mask.

See Also

AddMasked (see page 15369)

InsertMasked (see page 15382)

BkColor (see page 15387)

ImageType (see page 15391)

80.1.2.6.10 TCustomImageList.ShareImages Property

Specifies whether the image list destroys its handle when the image list is destroyed.

Pascal

```
property ShareImages: Boolean;
```

C++

```
__property Boolean ShareImages;
```

Description

Set the ShareImages property to false to ensure that the handle to the image list is freed when the image list is destroyed.

See Also

Destroy (see page 15366)

Handle (see page 15390)

80.1.2.6.11 TCustomImageList.Width Property

Specifies the width of all images within the image list.

Pascal

```
property Width: Integer;
```

C++

```
__property int Width;
```

Description

Use the Width property to specify the width of images before any are added to the image list. The image list is cleared when this

value changes.

See Also

Height (see page 15391)

Create (see page 15365)

CreateSize (see page 15366)

80.1.2.7 TCustomImageList Events

The events of the TCustomImageList class are listed here.

Public Events

	Name	Description
	OnChange (see page 15393)	Occurs when the image list changes.

80.1.2.7.1 TCustomImageList.OnChange Event

Occurs when the image list changes.

Pascal

```
property OnChange: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnChange;
```

Description

Write an OnChange event handler to execute code when the image list changes. Any objects registered with the RegisterChanges (see page 15383) method will also be notified.

See Also

RegisterChanges (see page 15383)

80.2 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TDrawingStyle (see page 15394)	TDrawingStyle indicates the style to use when rendering an image from an image list.
	TImageType (see page 15395)	TImageType indicates whether to use a mask when rendering an image from an image list.
	TLoadResource (see page 15395)	TLoadResource and TLoadResources (see page 15397) determine how a resource is loaded into an image list.
	TResType (see page 15396)	TResType identifies a type of graphical resource to an image list.

80.2.1 ImgList.TDrawingStyle Enumeration

TDrawingStyle indicates the style to use when rendering an image from an image list.

Pascal

```
TDrawingStyle = (
  dsFocus,
  dsSelected,
  dsNormal,
  dsTransparent
);
```

C++

```
enum TDrawingStyle {
  dsFocus,
  dsSelected,
  dsNormal,
  dsTransparent
};
```

File

ImgList

Description

TDrawingStyle describes how to render an image from an image list component. The following table describes the possible values:

Value	Meaning
dsFocus	Draws the image blending 25% with the color specified by the BlendColor property. This only affects image lists that contain masks.
dsSelected	Draws the image blending 50% with the color specified by the BlendColor property. This only affects image lists that contain masks.
dsNormal	Draws the image using the color specified in the BkColor property. If the BkColor is clNone, the image is drawn transparently using the mask.
dsTransparent	Draws using the mask regardless of the BkColor setting.

80.2.2 ImgList.TImageType Enumeration

TImageType indicates whether to use a mask when rendering an image from an image list.

Pascal

```
TImageType = (
  itImage,
  itMask
);
```

C++

```
enum TImageType {
  itImage,
  itMask
};
```

File

ImgList

Description

TImageType indicates whether to use a mask when rendering an image in an image list. It includes the following values:

Value	Meaning
itImage	Image does not include a mask.
itMask	Image uses a mask.

80.2.3 ImgList.TLoadResource Enumeration

TLoadResource and TLoadResources (see page 15397) determine how a resource is loaded into an image list.

Pascal

```
TLoadResource = (
  lrDefaultColor,
  lrDefaultSize,
  lrFromFile,
  lrMap3DColors,
  lrTransparent,
  lrMonoChrome
);
```

C++

```
enum TLoadResource {
  lrDefaultColor,
  lrDefaultSize,
  lrFromFile,
  lrMap3DColors,
  lrTransparent,
  lrMonoChrome
};
```

File

ImgList

Description

TLoadResources (see page 15397) is a set of flags (TLoadResource values) the govern the way an image list loads image resources. The following table lists the possible TLoadResource values:

Value	Meaning
lrDefaultColor	Use the color format of the display.
lrDefaultSize	Use system metrics for Height and Width if the Width parameter to GetResource is 0. If the Width parameter is 0 and this option is not specified for cursors and icons, the resources width and height will be used.
lrFromFile	Loads the resource from a specified file.
lrMap3DColors	Replaces the images' gray shades with the 3D windows colors.
lrTransparent	Replaces the color table entry for the first pixel of the resource with the default window color (COLOR_WINDOW). This applies only to images with color tables.
lrMonoChrome	Loads the resource as black and white.

See Also

SelectDirectory (see page 13619)

80.2.4 ImgList.TResType Enumeration

TResType identifies a type of graphical resource to an image list.

Pascal

```
TResType = (
  rtBitmap,
  rtCursor,
  rtIcon
);
```

C++

```
enum TResType {
  rtBitmap,
  rtCursor,
  rtIcon
};
```

File

ImgList

Description

TResTypes is used by the image list methods ResourceLoad, GetResource and FileLoad to specify the type of graphical resource that is to be loaded or retrieved from an image list.

Value	Meaning
rtBitmap	Loads or retrieves a bitmap
rtCursor	Loads or retrieves a cursor
rtIcon	Loads or retrieves an icon

80.3 Types

The following table lists types in this documentation.

Types

Name	Description
TImageIndex (see page 15397)	This is type ImgList.TImageIndex.
TLoadResources (see page 15397)	This is type ImgList.TLoadResources.
TOverlay (see page 15397)	This is type ImgList.TOverlay.

80.3.1 ImgList.TImageIndex Type

Pascal

```
TImageIndex = type Integer;
```

C++

```
type Integer TImageIndex;
```

File

ImgList

Description

This is type ImgList.TImageIndex.

80.3.2 ImgList.TLoadResources Type

Pascal

```
TLoadResources = set of TLoadResource;
```

C++

```
TLoadResource TLoadResources;
```

File

ImgList

Description

This is type ImgList.TLoadResources.

80.3.3 ImgList.TOverlay Type

Pascal

```
TOverlay = 0..3;
```

C++

```
0..3 TOverlay;
```

File

ImgList

Description

This is type ImgList.TOverlay.

81 IMouse Namespace

This is namespace IMouse.

Topics

Name	Description
Classes (see page 15401)	The following table lists classes in this documentation.
Functions (see page 15423)	The following table lists functions in this documentation.
Structs, Records, Enums (see page 15424)	The following table lists structs, records, enums in this documentation.
Types (see page 15426)	The following table lists types in this documentation.
Constants (see page 15428)	The following table lists constants in this documentation.

Classes

	Name	Description
	TPanningWindow (see page 15401)	This is a class of TCustomPanningWindow.

Constants

Name	Description
crPanAll (see page 15428)	This is constant IMouse.crPanAll.
crPanDown (see page 15428)	This is constant IMouse.crPanDown.
crPanDownLeft (see page 15429)	This is constant IMouse.crPanDownLeft.
crPanDownRight (see page 15429)	This is constant IMouse.crPanDownRight.
crPanLeft (see page 15429)	This is constant IMouse.crPanLeft.
crPanLeftRight (see page 15430)	This is constant IMouse.crPanLeftRight.
crPanRight (see page 15430)	This is constant IMouse.crPanRight.
crPanUp (see page 15430)	This is constant IMouse.crPanUp.
crPanUpDown (see page 15431)	This is constant IMouse.crPanUpDown.
crPanUpLeft (see page 15431)	This is constant IMouse.crPanUpLeft.
crPanUpRight (see page 15431)	This is constant IMouse.crPanUpRight.

Functions

	Name	Description
	StartPan (see page 15423)	This is function IMouse.StartPan.

Structs, Records, Enums

	Name	Description
	TPanDirection (see page 15424)	The type describes the panning direction.

	TPanOption (see page 15424)	This is record IMouse.TPanOption.

Types

Name	Description
TPanDirections (see page 15426)	Set of TPanDirection (see page 15424). .
TPanOptions (see page 15426)	This is type IMouse.TPanOptions.
TUpdateEvent (see page 15426)	Initiates the cursor update.

81.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TPanningWindow (see page 15401)	This is a class of TCustomPanningWindow.

81.1.1 TPanningWindow Class

This is a class of TCustomPanningWindow.

Class Hierarchy

Pascal

```
TPanningWindow = class(TCustomPanningWindow);
```

C++

```
class TPanningWindow : public TCustomPanningWindow;
```

File

imouse

Description

Use this type if you are creating a specialized version of TPanningWindowClass.

81.1.1.1 TPanningWindow Members

The following tables list the members exposed by TPanningWindow.

Protected Events

	Name	Description
	OnAlignInsertBefore (see page 6213)	Occurs when an object with custom alignment is aligned.
	OnAlignPosition (see page 6214)	Occurs when an object with custom alignment is aligned.
	OnCanResize (see page 5851)	Occurs when an attempt is made to resize the control.
	OnClick (see page 5851)	Occurs when the user clicks the control.
	OnConstrainedResize (see page 5853)	Adjust resize constraints.
	OnContextPopup (see page 5854)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnDblClick (see page 5854)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDockDrop (see page 6214)	Occurs when another control is docked to the control.
	OnDockOver (see page 6216)	Occurs when another control is dragged over the control.
	OnDragDrop (see page 5855)	Occurs when the user drops an object being dragged.

	OnDragOver (see page 5857)	Occurs when the user drags an object over a control.
	OnEndDock (see page 5859)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 5860)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnEnter (see page 6219)	Occurs when a control receives the input focus.
	OnExit (see page 6221)	Occurs when the input focus shifts away from one control to another.
	OnGetSiteInfo (see page 6223)	Returns the control's docking information.
	OnKeyDown (see page 6225)	Occurs when a user presses any key while the control has focus.
	OnKeyPress (see page 6227)	Occurs when a key is pressed.
	OnKeyUp (see page 6228)	Occurs when the user releases a key that has been pressed.
	OnMouseActivate (see page 5861)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 5862)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseEnter (see page 5864)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 5864)	Occurs when the user moves the mouse outside of a control.
	OnMouseMove (see page 5865)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 5867)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnMouseWheel (see page 5869)	Occurs when the mouse wheel is rotated.
	OnMouseWheelDown (see page 5869)	Occurs when the mouse wheel is rotated downward.
	OnMouseWheelUp (see page 5870)	Occurs when the mouse wheel is rotated upward.
	OnResize (see page 5870)	Occurs immediately after the control is resized.
	OnStartDock (see page 5871)	Occurs when the user begins to drag a control with a DragKind (see page 5819) of dkDock.
	OnStartDrag (see page 5871)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.
	OnUnDock (see page 6230)	Occurs when the application tries to undock a control that is docked to the windowed control.

Protected Fields

	Name	Description
	FAnchorMove (see page 5733)	This is FAnchorMove, a member of class TControl.
	FAnchorOrigin (see page 5734)	This is FAnchorOrigin, a member of class TControl.
	FAnchorRules (see page 5734)	This is FAnchorRules, a member of class TControl.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FDesignSize (see page 6124)	This is FDesignSize, a member of class TWinControl.
	FDoubleBuffered (see page 6124)	This is FDoubleBuffered, a member of class TWinControl.
	FExplicitHeight (see page 5734)	This is FExplicitHeight, a member of class TControl.
	FExplicitLeft (see page 5734)	This is FExplicitLeft, a member of class TControl.
	FExplicitTop (see page 5734)	This is FExplicitTop, a member of class TControl.
	FExplicitWidth (see page 5735)	This is FExplicitWidth, a member of class TControl.
	FInImeComposition (see page 6125)	This is FInImeComposition, a member of class TWinControl.
	FOriginalParentSize (see page 5735)	This is FOriginalParentSize, a member of class TControl.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	ActionChange (see page 5737)	Responds when the action associated with the control changes.
V	ActionChange (see page 6127)	Updates the control to reflect changes in its associated action.
	AddBiDiModeExStyle (see page 6128)	Sets control's window style according to its bi-directional support.
V	AdjustClientRect (see page 6128)	Provides the interface that adjusts the ClientRect (see page 5810) property for idiosyncrasies of the window.
	AdjustSize (see page 5738)	Sets the size of the control as determined by the AutoSize (see page 5803) property.

	AdjustSize (see page 6129)	Adjusts the control's size according to its contents and constraints.
	AlignControls (see page 6129)	Aligns any controls for which the control is the parent within a specified area of the control.
	ArrangeControl (see page 6130)	This is ArrangeControl, a member of class TWinControl.
	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	AssignTo (see page 5739)	Overrides the inherited AssignTo function to enable assignments to TAction objects.
	AssignTo (see page 6130)	Copies the properties of the windowed control to another object.
	BeginAutoDrag (see page 5739)	Begin Automatic Drag.
	CalcCursorPos (see page 5741)	This is CalcCursorPos, a member of class TControl.
	CanAutoSize (see page 5741)	Indicates whether the control can resize itself automatically to accommodate its contents.
	CanAutoSize (see page 6131)	Indicates how the control can be resized.
	CanResize (see page 5742)	OnCanResize (see page 5851) event dispatcher.
	CanResize (see page 6132)	Indicates how the control can respond to a resize attempt.
	Changed (see page 5742)	Sends a CM_CHANGED (see page 6330) message to the control.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	ChangeScale (see page 5743)	Rescaling event dispatcher.
	ChangeScale (see page 6132)	Resize (see page 5780) and reposition children and self.
	Click (see page 5743)	Respond to user click.
	ConstrainedResize (see page 5746)	Notify control of resize with constraints.
	ConstrainedResize (see page 6133)	Generates an OnConstrainedResize (see page 5853) event.
	ControlsAligned (see page 6134)	This is ControlsAligned, a member of class TWinControl.
	CreateDockManager (see page 6134)	Creates the dock manager for the control.
	CreateHandle (see page 6135)	Creates underlying screen object.
	CreateParams (see page 15413)	Initializes a window-creation parameter data structure.
	CreateSubClass (see page 6136)	Creates a windowed control derived from an existing Windows window class.
	CreateWindowHandle (see page 6137)	Creates a Windows control to represent the control.
	CreateWnd (see page 6137)	Creates the underlying window.
	CustomAlignInsertBefore (see page 6137)	Returns placement order of custom-aligned child control.
	CustomAlignPosition (see page 6138)	Returns aligned position of custom-aligned child control.
	DblClick (see page 5747)	OnDblClick (see page 5854) event dispatcher.
	DefaultDockImage (see page 5747)	Handles the painting and erasing of a dock image.
	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	DefineProperties (see page 5748)	Provides methods to read and write the IsControl (see page 5829) property to a stream such as a form file.
	DefineProperties (see page 6139)	Provides methods to read and write the IsControl property to a stream such as a form file.
	DesignWndProc (see page 5749)	This is DesignWndProc, a member of class TControl.
	DestroyHandle (see page 6140)	Destroys the control's window without destroying the control.
	DestroyWindowHandle (see page 6140)	Destroys the window created in the CreateWindowHandle (see page 6137) method.
	DestroyWnd (see page 6141)	Destroys the control's window.
	DoAddDockClient (see page 6142)	Performs actions when a control is docked to the windowed control.
	DockOver (see page 6143)	Responds when a docking client is dragged over the windowed control.
	DockReplaceDockClient (see page 6143)	This is DockReplaceDockClient, a member of class TWinControl.
	DockTrackNoTarget (see page 5749)	Handles dragging of the control over an invalid docking target.
	DoContextPopup (see page 5750)	OnContextPopup (see page 5854) event dispatcher.
	DoDock (see page 5750)	Docking event dispatcher.
	DoDockOver (see page 6143)	Generates an OnDockOver (see page 6216) event.
	DoEndDock (see page 5750)	OnEndDock (see page 5859) event dispatcher.
	DoEndDrag (see page 5751)	OnEndDrag (see page 5860) event dispatcher.
	DoEnter (see page 6144)	Respond to receiving input focus.

	DoExit (see page 6144)	Respond to losing input focus
	DoFlipChildren (see page 6145)	Flips the control's children.
	DoKeyDown (see page 6145)	Performs some preprocessing before generating an OnKeyDown (see page 6225) event.
	DoKeyPress (see page 6146)	Performs some preprocessing before generating an OnKeyPress (see page 6227) event.
	DoKeyUp (see page 6146)	Performs some preprocessing before generating an OnKeyUp (see page 6228) event.
	DoMouseWheel (see page 5751)	Processes mouse wheel motion.
	DoMouseWheelDown (see page 5752)	OnMouseWheelDown (see page 5869) event dispatcher.
	DoMouseWheelUp (see page 5752)	OnMouseWheelUp (see page 5870) event dispatcher.
	DoRemoveDockClient (see page 6147)	Responds when a control is undocked from the windowed control.
	DoStartDock (see page 5753)	OnStartDock (see page 5871) event dispatcher.
	DoStartDrag (see page 5753)	OnStartDrag (see page 5871) event dispatcher.
	DoUnDock (see page 6147)	Undocks a control that is currently docked to the windowed control.
	DoUpdate (see page 15414)	This is DoUpdate, a member of class TPanningWindow.
	DragCanceled (see page 5754)	Provides the interface for a method that responds to the cancellation of a drag.
	DragOver (see page 5755)	OnDragOver (see page 5857) event dispatcher.
	DrawDragDockImage (see page 5755)	Draws the dock image for the control.
	EraseDragDockImage (see page 5757)	Erases the dock image for the control.
	FindNextControl (see page 6149)	Returns the control's next child in the tab order after the specified control.
	FixupTabList (see page 6149)	Sorts the child controls by their tab order.
V	GetAction (see page 5758)	This is GetAction, a member of class TControl.
	GetActionLinkClass (see page 5758)	Returns the appropriate action link class that is associated with the control class.
V	GetActionLinkClass (see page 6152)	Returns the associated action link class.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetChildren (see page 6153)	Calls a specified method for each child of the control.
V	GetClientOrigin (see page 5758)	Returns the screen coordinates of the top-left corner of the control's client area.
V	GetClientOrigin (see page 6153)	Returns the value of the ClientOrigin (see page 5809) property.
V	GetClientRect (see page 5759)	Returns a rectangle defining the client area of the control.
V	GetClientRect (see page 6154)	Returns the value of the ClientRect (see page 5810) property.
V	GetControlExtents (see page 6154)	Returns the smallest rectangle in which all the control's children fit.
V	GetDeviceContext (see page 5760)	Returns a device context for the control.
V	GetDeviceContext (see page 6155)	Provides access to a device context for the control.
	GetDockEdge (see page 5763)	Returns the edge on which another control should be docked when it is dragged over the control.
V	GetDragImages (see page 5763)	Returns the control's image list containing the image to be displayed while dragging.
V	GetEnabled (see page 5763)	Returns the value of the Enabled (see page 5821) property.
V	GetFloating (see page 5764)	Returns the value of the Floating (see page 5823) property.
V	GetFloatingDockSiteClass (see page 5764)	Returns the class used for the control when it is floating.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetPalette (see page 5765)	Returns the handle to a palette for use by the control.
V	GetPanOptions (see page 15414)	This is GetPanOptions, a member of class TPanningWindow.
	GetParentHandle (see page 6157)	Returns the window handle for the window of the control's parent.
	GetPopupMenu (see page 5765)	Returns the pop-up menu associated with the control.
	GetSiteInfo (see page 6158)	Generates an OnGetSiteInfo (see page 6223) event
	GetTopParentHandle (see page 6159)	Returns the window handle of the first window not associated with a VCL control that contains the windowed control.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.

	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	InvalidateDockHostSite (see page 6162)	This is InvalidateDockHostSite, a member of class TWinControl.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsControlActivateMsg (see page 6162)	This is IsControlActivateMsg, a member of class TWinControl.
	IsControlMouseMsg (see page 6162)	Indicates whether a specified mouse message is directed to one of the windowed control's child controls.
	IsQualifyingSite (see page 6163)	This is IsQualifyingSite, a member of class TWinControl.
	KeyDown (see page 6163)	Respond to key press events.
	KeyPress (see page 6163)	Respond to keyboard input.
	KeyUp (see page 6164)	Respond to released key.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Loaded (see page 5771)	Initializes the control after it is loaded from a stream.
	MainWndProc (see page 6165)	Receives Windows messages for the control.
	MouseActivate (see page 5773)	This is MouseActivate, a member of class TControl.
	MouseDown (see page 5773)	OnMouseDown (see page 5862) event dispatcher.
V	MouseMove (see page 15414)	Respond to mouse moving over control area..
	MouseUp (see page 5774)	OnMouseUp (see page 5867) event dispatcher.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	Notification (see page 5775)	Responds to notifications that components are being created or destroyed.
V	Notification (see page 6165)	Responds to notifications that components are being created or destroyed.
	NotifyControls (see page 6165)	Sends a message to all the child controls.
V	Paint (see page 15415)	Renders the image of a custom control.
	PaintControls (see page 6166)	Paints each of the child controls in a windowed control using the specified device context.
	PaintHandler (see page 6166)	Responds to WM_PAINT messages.
V	PaintWindow (see page 5920)	Renders the image of the control on a specified device context.
V	PaintWindow (see page 6169)	Renders the image of a windowed control.
	PaletteChanged (see page 5775)	Responds to changes in the system's palette by realizing the control's palette.
V	PaletteChanged (see page 6170)	Responds to changes in the system's palette by realizing the control's palette and the palette for each child control.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	PositionDockRect (see page 5777)	Positions the docking rectangle according to the current drag-and-dock state.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 5778)	Prepares the control for having its properties assigned values read from a stream.
V	ReadState (see page 6171)	Prepares the control for having its properties assigned values from a stream.
	RecreateWnd (see page 6171)	Recreate underlying Windows screen object.
	ReloadDockedControl (see page 6172)	Reloads a docked control.
	RemoveWindowProps (see page 6174)	This is RemoveWindowProps, a member of class TWinControl.
V	RequestAlign (see page 5780)	Instructs the parent of a control to reposition the control, enforcing its Align (see page 5798) property.
	ResetIme (see page 6174)	Restores the input method editor (IME) that was active when the application started.
	ResetImeComposition (see page 6175)	Directs the composition window of the input method editor (IME) to perform a specific action.
	Resize (see page 5780)	Respond to control resize.
	ScaleConstraints (see page 5781)	This is ScaleConstraints, a member of class TControl.
	ScaleControls (see page 6176)	Rescale child controls only.
	SelectFirst (see page 6177)	Locates first selectable child control.
	SelectNext (see page 6177)	Moves the input focus from the current child control to the next one in the tab order.
	SendCancelMode (see page 5781)	Cancels the modal state of the control.
	SendDockNotification (see page 5782)	Sends a Windows message to the control's host dock site.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
V	SetAutoSize (see page 5783)	This is SetAutoSize, a member of class TControl.

	SetBiDiMode (see page 5783)	Sets the control's bi-directional mode.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetChildOrder (see page 6178)	Changes the order in which the child component appears in the list of child components returned by the GetChildren (see page 6153) method.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDragMode (see page 5785)	Sets the drag mode for the control.
	SetEnabled (see page 5785)	Sets the value of the Enabled (see page 5821) property.
	SetIme (see page 6181)	Activates an input method editor (IME) using the values specified by the ImeMode (see page 6207) and ImeName (see page 6208) properties.
	SetImeCompositionWindow (see page 6181)	Sets the position and font of the composition window.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetName (see page 5785)	Sets the name of the control.
	SetPanCursor (see page 15415)	This is SetPanCursor, a member of class TPanningWindow.
	SetParent (see page 5786)	Sets the parent of the control.
	SetParent (see page 6182)	Sets the parent of the control.
	SetParentBackground (see page 6182)	This is SetParentBackground, a member of class TWinControl.
	SetParentBiDiMode (see page 5786)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	SetParentComponent (see page 5787)	Sets the parent for the control.
	SetZOrder (see page 5788)	Repositions the control in its parent's control list, thereby changing position onscreen.
	SetZOrder (see page 6182)	Moves the control to the top or bottom of the parent control's (or screen's) list of TWinControl (see page 6112) controls.
	ShowControl (see page 6183)	Ensures that a specified child control is visible.
	UpdateBounds (see page 6185)	This is UpdateBounds, a member of class TWinControl.
	UpdateBoundsRect (see page 5789)	Changes the Top (see page 5844), Left (see page 5830), Width (see page 5849), and Height (see page 5825) properties of the control, but doesn't update its screen image and bypasses all resize events.
	UpdateControlOriginalParentSize (see page 6186)	This is UpdateControlOriginalParentSize, a member of class TWinControl.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateExplicitBounds (see page 5789)	This is UpdateExplicitBounds, a member of class TControl.
	UpdateRecreatingFlag (see page 6186)	This is UpdateRecreatingFlag, a member of class TWinControl.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	UpdateScroll (see page 15416)	This is UpdateScroll, a member of class TPanningWindow.
	UpdateUIState (see page 6186)	Updates form User Interface State as needed
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	VisibleChanging (see page 5791)	Provides the interface for a method that responds to changes in the control's visibility.
	WndProc (see page 15416)	Provides specific message responses for the control.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	ActionLink (see page 5798)	Contains the action link object associated with the control.
	AutoSize (see page 5803)	Specifies whether the control sizes itself automatically to accommodate its contents.
	BevelEdges (see page 6192)	Specifies which edges of the control are beveled.
	BevelInner (see page 6193)	Specifies the cut of the inner bevel.

	BevelKind (see page 6193)	Specifies the control's bevel style.
	BevelOuter (see page 6194)	Specifies the cut of the outer bevel.
	BevelWidth (see page 6194)	Specifies the width of the inner and outer bevels.
	BorderWidth (see page 6195)	Specifies the width of the control's border.
R	Canvas (see page 5921)	Specifies the TCanvas object that presents a drawing surface for the control.
	Caption (see page 5806)	Specifies a text string that identifies the control to the user.
	Color (see page 5812)	Specifies the background color of the control.
	Ctl3D (see page 6198)	Determines whether a control has a three-dimensional (3-D) or two-dimensional look.
	DefWndProc (see page 6199)	Specifies the default window procedure for the windowed control.
	DesktopFont (see page 5818)	Specifies whether the control uses the Windows icon font when writing text.
	DragCursor (see page 5818)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 5819)	Specifies whether the control is being dragged normally or for docking.
	DragMode (see page 5819)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	Font (see page 5823)	Controls (see page 5711) the attributes of text written on or in the control.
	ImeMode (see page 6207)	Determines the behavior of the input method editor (IME).
	ImeName (see page 6208)	Specifies the input method editor (IME) to use for converting keyboard input to Asian language characters.
	IsControl (see page 5829)	Determines whether a form stores its form-specific properties to a stream.
	MouseCapture (see page 5831)	Indicates whether the control has "captured" mouse events.
	ParentBackground (see page 6209)	Determines whether control uses parent's theme background.
	ParentBiDiMode (see page 5833)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	ParentColor (see page 5834)	Determines where a control looks for its color information.
	ParentCtl3D (see page 6209)	Determines where a component looks to determine if it should appear three dimensional.
	ParentFont (see page 5834)	Determines where a control looks for its font information.
	ParentShowHint (see page 5835)	Determines where a control looks to find out if its Help Hint (see page 5827) should be shown.
	PopupMenu (see page 5835)	Identifies the pop-up menu associated with the control.
	ScalingFlags (see page 5840)	Reflects which attributes of the control have been scaled.
	Text (see page 5842)	Contains a text string associated with the control.
	WheelAccumulator (see page 5849)	Accumulates mouse wheel rotations.
	WindowHandle (see page 6212)	Provides access to a window handle for the control.
	WindowText (see page 5850)	Contains the text string of the control.

Public Events

	Name	Description
	OnUpdate (see page 15422)	This is OnUpdate, a member of class TPanningWindow.
	WindowProc (see page 5872)	Points to the window procedure that responds to messages sent to the control.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	BeginDrag (see page 5740)	Starts the dragging of a control.
	BringToFront (see page 5740)	Puts the control in front of all other controls in its parent control.
	Broadcast (see page 6130)	Sends a message to each of the child controls.
	CanFocus (see page 6131)	Indicates whether a control can receive focus.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).

	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	ClientToParent (see page 5744)	Translates client coordinates to parent coordinates.
	ClientToScreen (see page 5744)	Translates a given point from client area coordinates to global screen coordinates.
	ContainsControl (see page 6133)	Indicates whether a specified control exists within the control.
	ControlAtPos (see page 6133)	Returns the child control located at a specified position within the control.
V	Create (see page 15412)	Creates an instance of TCustomControl.
	CreateParented (see page 6123)	Creates and initializes a control as the child of a specified non-VCL container.
	CreateParentedControl (see page 6136)	Creates and initializes a control as the child of a specified non-VCL window.
V	DefaultHandler (see page 5748)	Provides message handling for all messages that do not have specific handlers.
V	DefaultHandler (see page 6139)	Provides message handling for all messages that the control does not fully process itself.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 15412)	Destroys an instance of TCustomControl.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	DisableAlign (see page 6141)	Disables the realignment of child controls.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Dock (see page 5749)	Used internally to dock the control.
	DockDrop (see page 6142)	Generates an OnDockDrop (see page 6214) event.
	DragDrop (see page 5754)	OnDragDrop (see page 5855) event dispatcher.
	Dragging (see page 5754)	Indicates whether a control is being dragged.
	DrawTextBiDiModeFlags (see page 5756)	Returns the text flags that reflect the current setting of the BiDiMode (see page 5803) property.
	DrawTextBiDiModeFlagsReadingOnly (see page 5756)	Returns the text flag to add that indicates whether the control's text should read from right to left.
	EnableAlign (see page 6148)	Decrements the reference count incremented by the DisableAlign (see page 6141) method, eventually realigning the child controls.
	EndDrag (see page 5757)	Stops a control from being dragged any further.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindChildControl (see page 6148)	Returns a child control given its name.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FlipChildren (see page 6150)	Reverses the positions of child controls.
	Focused (see page 6150)	Determines whether the control has input focus.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetControlsAlignment (see page 5759)	Indicates how text is aligned within the control.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetIsPanning (see page 15414)	Returns whether or not the mouse is actively panning.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.

	GetParentComponent (see page 5765)	Returns the parent of the control.
	GetTabOrderList (see page 6158)	Builds a list of controls in tab order.
	GetTextBuf (see page 5766)	Retrieves the control's text, copies it into a buffer, and returns the number of characters copied.
	GetTextLen (see page 5767)	Returns the length of the control's text.
	HandleAllocated (see page 6159)	Reports whether a screen object handle exists for the control.
	HandleNeeded (see page 6160)	Creates a screen object for the control if it doesn't already exist.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	HasParent (see page 5768)	Indicates whether the control has a parent.
	Hide (see page 5769)	Makes the control invisible.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitiateAction (see page 5769)	Calls the action link's Update (see page 5789) method if the control is associated with an action link.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InsertControl (see page 6160)	Inserts a control into the Controls (see page 6197) array property.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	Invalidate (see page 5770)	Completely repaint control.
	Invalidate (see page 6161)	Schedules a control repaint.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	IsRightToLeft (see page 5770)	Indicates whether the control should be reversed right to left.
	ManualDock (see page 5771)	Docks the control.
	ManualFloat (see page 5772)	Undocks the control.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	MouseWheelHandler (see page 5774)	Dispatches messages received from a mouse wheel.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	PaintTo (see page 6167)	This is the overview for the PaintTo method overload.
	ParentToClient (see page 5776)	Translate parent coordinates to client coordinates.
	Perform (see page 5776)	Responds as if the control received a specified Windows message.
	PreProcessMessage (see page 6170)	This is PreProcessMessage, a member of class TWinControl.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	Realign (see page 6171)	Forces the control to realign children.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	Refresh (see page 5779)	Repaints the control on the screen.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveControl (see page 6172)	Removes a specified control from the Controls (see page 6197) array.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
	Repaint (see page 5779)	Forces the control to repaint its image on the screen.
	Repaint (see page 6174)	Repaints the entire control.
	ReplaceDockedControl (see page 5779)	Docks the control in the place where another control is already docked.
	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	ScaleBy (see page 6175)	Rescale control and its children.
	ScreenToClient (see page 5781)	Converts the screen coordinates of a specified point on the screen to client coordinates.
	ScrollBy (see page 6176)	Scroll control contents.
	SendToBack (see page 5782)	Puts a windowed control behind all other windowed controls, or puts a non-windowed control behind all other non-windowed controls.
	SetBounds (see page 5783)	Sets the Left (see page 5830), Top (see page 5844), Width (see page 5849), and Height (see page 5825) properties all at once.
	SetBounds (see page 6178)	Sets the windowed control's boundary properties all at once.

	SetDesignVisible (see page 5784)	Makes a control visible at design time.
V	SetDesignVisible (see page 6178)	Makes a control visible at design time.
V	SetFocus (see page 6179)	Gives the input focus to the control.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	SetTextBuf (see page 5787)	Sets the text of the control.
	Show (see page 5788)	Makes a control visible.
V	StartPanning (see page 15416)	Tells the panning window to start the panning operation.
V	StopPanning (see page 15416)	Tells the panning window to stop the panning operation.
V	Update (see page 5789)	Processes any pending paint messages immediately.
V	Update (see page 6183)	Forces the control to update.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	UpdateControlState (see page 6186)	Respond to state change.
	UseRightToLeftAlignment (see page 5790)	Specifies whether the control's alignment should be reversed right-to-left.
	UseRightToLeftReading (see page 5790)	Specifies whether the control is using a right-to-left reading order.
	UseRightToLeftScrollBar (see page 5791)	Specifies whether the vertical scroll bar appears on the left side of the control.

Public Properties

	Name	Description
	Action (see page 5797)	Designates the action associated with the control.
	Align (see page 5798)	Determines how the control aligns within its container (parent control).
R	AlignDisabled (see page 6192)	Indicates child control realignment disabled.
	Anchors (see page 5802)	Specifies how the control is anchored to its parent.
	BiDiMode (see page 5803)	Specifies the bi-directional mode for the control.
	BoundsRect (see page 5803)	Specifies the bounding rectangle of the control, expressed in the coordinate system of the parent control.
R	Brush (see page 6195)	Determines the color and pattern used for painting the background of the control.
	ClientHeight (see page 5808)	Specifies the height of the control's client area in pixels.
R	ClientOrigin (see page 5809)	Specifies the screen coordinates (in pixels) of the top left corner of a control's client area.
R	ClientRect (see page 5810)	Specifies the size (in pixels) of a control's client area.
	ClientWidth (see page 5811)	Specifies the horizontal size of the control's client area in pixels.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Constraints (see page 5812)	Specifies the size constraints for the control.
R	ControlCount (see page 6195)	Returns the number of child controls.
R	Controls (see page 6197)	Lists all child controls.
	ControlState (see page 5813)	Indicates the current state of a control at runtime.
	ControlStyle (see page 5814)	Determines style characteristics of the control.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	DockClientCount (see page 6199)	Specifies the number of controls that are docked on the windowed control.
R	DockClients (see page 6201)	Lists the controls that are docked to the windowed control.
	DockManager (see page 6202)	Specifies the control's docking manager interface.
	DockOrientation (see page 5818)	Specifies how the control is docked relative to other controls docked in the same parent.
	DockSite (see page 6204)	Specifies whether the control can be the target of drag-and-dock operations.
	DoubleBuffered (see page 6205)	Determines whether the control's image is rendered directly to the window or painted to an in-memory bitmap first.
	Enabled (see page 5821)	Controls (see page 5711) whether the control responds to mouse, keyboard, and timer events.
R	ExplicitHeight (see page 5821)	Specifies the explicit vertical size of the control in pixels.

R	ExplicitLeft (see page 5822)	Specifies the explicit horizontal pixel coordinate of the left edge of a component relative to its parent.
R	ExplicitTop (see page 5822)	Specifies the explicit vertical pixel coordinate of the top edge of a component relative to its parent.
R	ExplicitWidth (see page 5822)	Specifies the explicit horizontal size of the control in pixels.
R	Floating (see page 5823)	Indicates whether the control is floating.
	FloatingDockSiteClass (see page 5823)	Specifies the class of the temporary control that hosts the control when it is floating.
R	Handle (see page 6207)	Provides access to the underlying Windows screen object for the control.
	HostDockSite (see page 5829)	Specifies the control in which the control is docked.
R	IsPanning (see page 15421)	This is IsPanning, a member of class TPanningWindow.
	LRDockWidth (see page 5831)	Specifies the width of the control when it is docked horizontally.
R	MouseInClient (see page 6209)	This is MouseInClient, a member of class TWinControl.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Padding (see page 6209)	Specifies the padding of a control.
R	PanControl (see page 15421)	This is PanControl, a member of class TPanningWindow.
	PanInterval (see page 15421)	This is PanInterval, a member of class TPanningWindow.
R	PanOptions (see page 15422)	This is PanOptions, a member of class TPanningWindow.
	Parent (see page 5832)	Indicates the parent of the control.
	ParentWindow (see page 6210)	Reference to parent's underlying control.
	ShowHint (see page 5840)	Determines whether the control displays a Help Hint (see page 5827) when the mouse pointer rests momentarily on the control.
R	Showing (see page 6210)	Indicates whether the control is showing on the screen.
	TabOrder (see page 6211)	Indicates the position of the control in its parent's tab order.
	TabStop (see page 6211)	Determines if the user can tab to a control.
	TBDockHeight (see page 5842)	Specifies the height of the control when it is docked vertically.
	UndockHeight (see page 5845)	Specifies the height of the control when it is floating.
	UndockWidth (see page 5846)	Specifies the width of the control when it is floating.
	UseDockManager (see page 6212)	Specifies whether the docking manager is used in drag-and-dock operations.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	Visible (see page 5847)	Determines whether the component appears onscreen.
R	VisibleDockClientCount (see page 6212)	Specifies the number of visible controls that are docked on the windowed control.

Published Properties

	Name	Description
	AlignWithMargins (see page 5802)	Indicates whether a control should be constrained by margins.
	Cursor (see page 5815)	Specifies the image used to represent the mouse pointer when it passes into the region covered by the control.
	Height (see page 5825)	Specifies the vertical size of the control in pixels.
	HelpContext (see page 5826)	Numeric ID for control's context-sensitive help topic
	HelpKeyword (see page 5826)	Keyword for control's context-sensitive help topic
	HelpType (see page 5827)	Indicates whether the control's context sensitive help topic is identified by context ID or by keyword.
	Hint (see page 5827)	Contains the text string that can appear when the user moves the mouse over the control.
	Left (see page 5830)	Specifies the horizontal coordinate of the left edge of a component relative to its parent.
	Margins (see page 5831)	Specifies the margins for the control.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Top (see page 5844)	Specifies the Y coordinate of the top left corner of a control, relative to its parent or containing control in pixels.
	Width (see page 5849)	Specifies the horizontal size of the control or form in pixels.

81.1.1.2 TPanningWindow.Create Constructor

Creates an instance of TCustomControl.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TPanningWindow(TComponent * AOwner);
```

Description

Calling Create constructs and initializes an instance of TCustomControl. However, you should never attempt to instantiate a TCustomControl. This class is intended solely as a base class from which other control classes descend and you should only call Create to instantiate one of these descendants. Controls placed on forms at design time are created automatically.

After calling the inherited constructor, Create initializes the control, including the following property settings:

Initializes a TCanvas object for its Canvas property.

When overriding Create, always call the inherited Create method first, then proceed with the control's initialization. Remember to specify the override directive when overriding the Create method.

Note: If a component's constructor allocates resources or memory, also override the destructor to free those resources.

See Also

Create (see page 6123)

Destroy (see page 5919)

Canvas (see page 5921)

Owner (see page 2807)

81.1.1.3 TPanningWindow.Destroy Destructor

Destroys an instance of TCustomControl.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TPanningWindow();
```

Description

Do not call Destroy directly in an application. Instead, call Free. Free verifies that the control is not nil, and only then calls Destroy.

Applications should only free controls explicitly when the constructor was called without assigning an owner to the control.

As the control is destroyed, it:

Destroys the TCanvas object in its Canvas property.

Override Destroy to free any memory or resources allocated in the Create method. When declaring a Destroy method in a descendant control type, always add the override directive to the declaration and call the inherited Destroy as the last statement in the redeclared method.

When a control is created, Delphi automatically provides exception handling around the constructor call. The destructor is called if an exception escapes from the constructor. This means that the destructor code must be prepared to clean up a partially constructed instance. Check all data fields for zero before disposing of their contents.

81.1.1.4 TPanningWindow Methods

The methods of the TPanningWindow class are listed here.

Protected Methods

	Name	Description
	CreateParams (see page 15413)	Initializes a window-creation parameter data structure.
	DoUpdate (see page 15414)	This is DoUpdate, a member of class TPanningWindow.
	GetPanOptions (see page 15414)	This is GetPanOptions, a member of class TPanningWindow.
	MouseMove (see page 15414)	Respond to mouse moving over control area..
	Paint (see page 15415)	Renders the image of a custom control.
	SetPanCursor (see page 15415)	This is SetPanCursor, a member of class TPanningWindow.
	UpdateScroll (see page 15416)	This is UpdateScroll, a member of class TPanningWindow.
	WndProc (see page 15416)	Provides specific message responses for the control.

Public Methods

	Name	Description
	GetIsPanning (see page 15414)	Returns whether or not the mouse is actively panning.
	StartPanning (see page 15416)	Tells the panning window to start the panning operation.
	StopPanning (see page 15416)	Tells the panning window to stop the panning operation.

81.1.1.4.1 TPanningWindow.CreateParams Method

Initializes a window-creation parameter data structure.

Pascal

```
procedure CreateParams(var Params: TCreateParams); override;
```

C++

```
virtual __fastcall CreateParams(TCreateParams Params);
```

Description

The CreateWnd method calls CreateParams to initialize the parameters it passes to CreateWindowHandle. Override CreateParams to customize the way a control creates its Windows representation. When overriding CreateParams, always call the inherited method first to set the default values, then make any desired adjustments.

CreateParams fills in the parameter that is passed as the value of the Params parameter. This data structure holds information needed when telling Windows to create a window handle. The fields of a TCreateParams record become the parameters to a call to the CreateWindowEx API function.

TWinControl implements CreateParams by setting all the fields of Params to generic base values. A number of the standard controls override CreateParams to change one or more of the default values in Params.

See Also

CreateWindowHandle (see page 6137)

CreateWnd (see page 6137)

AddBiDiModeExStyle (see page 6128)

81.1.1.4.2 TPanningWindow.DoUpdate Method

Pascal

```
procedure DoUpdate(var Delta: TPoint; var CursorDirection: TPanDirections); dynamic;
```

C++

```
__fastcall DoUpdate(TPoint Delta, TPanDirections CursorDirection);
```

Description

This is DoUpdate, a member of class TPanningWindow.

81.1.1.4.3 TPanningWindow.GetIsPanning Method

Returns whether or not the mouse is actively panning.

Pascal

```
function GetIsPanning: Boolean; override;
```

C++

```
virtual __fastcall Boolean GetIsPanning();
```

Description

This method brings back a boolean value. True means that the mouse is actively panning; False indicates that no panning is occurring.

81.1.1.4.4 TPanningWindow.GetPanOptions Method

Pascal

```
function GetPanOptions: TPanOptions; virtual;
```

C++

```
virtual __fastcall TPanOptions GetPanOptions();
```

Description

This is GetPanOptions, a member of class TPanningWindow.

81.1.1.4.5 TPanningWindow.MouseMove Method

Respond to mouse moving over control area..

Pascal

```
procedure MouseMove(Shift: TShiftState; X: Integer; Y: Integer); override;
```

C++

```
virtual __fastcall MouseMove(TShiftState Shift, int X, int Y);
```

Description

Override the protected MouseMove method to provide other responses in addition to calling the OnMouseMove event handler when the user moves the mouse.

A control calls MouseMove in response to any of the Windows mouse-move messages (WM_MOUSEMOVE), decoding the message parameters into the shift-key state and position, which it passes in the Shift, X, and Y parameters, respectively.

As the mouse cursor moves across a control, this method is called repeatedly. Each time it is called, it is with the new coordinates that reflect the continuous path of the mouse cursor across the screen real estate covered by the control's visual representation.

See Also

MouseDown (see page 5773)

MouseUp (see page 5774)

OnMouseMove (see page 5865)

81.1.1.4.6 TPanningWindow.Paint Method

Renders the image of a custom control.

Pascal

```
procedure Paint; override;
```

C++

```
virtual __fastcall Paint();
```

Description

The Paint method for TCustomControl does nothing other than provide the interface for a method that responds to WM_PAINT messages. Paint is called by the PaintWindow method, after that method has supplied the Canvas with the handle to a device context. When creating a custom control, always override Paint to draw the image of the control.

Tip: To determine which portions of the control's canvas need to be repainted when Paint is called, use the ClipRect property of the canvas.

See Also

Canvas (see page 5921)

PaintWindow (see page 5920)

GetDeviceContext (see page 6155)

ClipRect (see page 14486)

81.1.1.4.7 TPanningWindow.SetPanCursor Method

Pascal

```
procedure SetPanCursor(ADirection: TPanDirections); virtual;
```

C++

```
virtual __fastcall SetPanCursor(TPanDirections ADirection);
```

Description

This is SetPanCursor, a member of class TPanningWindow.

81.1.1.4.8 TPanningWindow.StartPanning Method

Tells the panning window to start the panning operation.

Pascal

```
function StartPanning(AHandle: THandle; AControl: TControl): Boolean; override;
```

C++

```
virtual __fastcall Boolean StartPanning(THandle AHandle, TControl * AControl);
```

Description

Include this method in your code where you want the panning window to start the panning operation.

81.1.1.4.9 TPanningWindow.StopPanning Method

Tells the panning window to stop the panning operation.

Pascal

```
procedure StopPanning; override;
```

C++

```
virtual __fastcall StopPanning();
```

Description

Add this method to your code where you want the panning window to stop the panning operation.

81.1.1.4.10 TPanningWindow.UpdateScroll Method

Pascal

```
procedure UpdateScroll(Pt: TPoint); virtual;
```

C++

```
virtual __fastcall UpdateScroll(TPoint Pt);
```

Description

This is UpdateScroll, a member of class TPanningWindow.

81.1.1.4.11 TPanningWindow.WndProc Method

Provides specific message responses for the control.

Pascal

```
procedure WndProc(var Msg: TMessage); override;
```

C++

```
virtual __fastcall WndProc(TMessage Msg);
```

Description

Override WndProc to change the initial Windows message handler for the control. The WindowProc property is initialized to point to the WndProc method.

WndProc for TWinControl overrides the inherited method to define responses for focus, mouse, and keyboard messages. It sends all others to its inherited WndProc.

When overriding WndProc to provide specialized responses to messages, call the inherited WndProc at the end to dispatch any unhandled messages.

C++ Examples:

```
/*
This example shows how to use the WndProc method and the
WindowProc property to subclass a custom control's window
procedure.  This example subclasses the window procedure of
a TListBox descendant to respond to a user-defined message
called WM_STYLEMESSAGE. The subclassed window procedure can
be turned on or off by pressing a radio button.
*/
class TMyListBoxDescendant : public TListBox
{
__published:    // IDE-managed Components
    void __fastcall SubClassWndProc(Messages::TMessage &Message);
    void __fastcall ToggleSubClass(bool On);
    void __fastcall OnDrawItemProc(
      TWinControl *Control, int Index, const TRect &Rect,
      TOwnerDrawState State);
private:    // User declarations
public:     // User declarations
    __fastcall TMyListBoxDescendant(TComponent* Owner);
};

WndProc (see page 5791)

WindowProc (see page 5872)

81.1.1.5 TPanningWindow Properties

The properties of the TPanningWindow class are listed here.

Public Properties

	Name	Description
R	IsPanning (see page 15421)	This is IsPanning, a member of class TPanningWindow.
R	PanControl (see page 15421)	This is PanControl, a member of class TPanningWindow.
	PanInterval (see page 15421)	This is PanInterval, a member of class TPanningWindow.
R	PanOptions (see page 15422)	This is PanOptions, a member of class TPanningWindow.

81.1.1.5.1 TPanningWindow.IsPanning Property

Pascal

```
property IsPanning: Boolean;
```

C++

```
__property Boolean IsPanning;
```

Description

This is IsPanning, a member of class TPanningWindow.

81.1.1.5.2 TPanningWindow.PanControl Property

Pascal

```
property PanControl: TControl;
```

C++

```
__property TControl * PanControl;
```

Description

This is PanControl, a member of class TPanningWindow.

81.1.1.5.3 TPanningWindow.PanInterval Property

Pascal

```
property PanInterval: Integer;
```

C++

```
__property int PanInterval;
```

Description

This is PanInterval, a member of class TPanningWindow.

81.1.1.5.4 TPanningWindow.PanOptions Property

Pascal

```
property PanOptions: TPanOptions;
```

C++

```
__property TPanOptions PanOptions;
```

Description

This is PanOptions, a member of class TPanningWindow.

81.1.1.6 TPanningWindow Events

The events of the TPanningWindow class are listed here.

Public Events

	Name	Description
	OnUpdate (see page 15422)	This is OnUpdate, a member of class TPanningWindow.

81.1.1.6.1 TPanningWindow.OnUpdate Event

Pascal

```
property OnUpdate: TUpdateEvent;
```

C++

```
__property TUpdateEvent OnUpdate;
```

Description

This is OnUpdate, a member of class TPanningWindow.

81.2 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	StartPan (see page 15423)	This is function IMouse.StartPan.

81.2.1 IMouse.StartPan Function

Pascal

```
function StartPan(WndHandle: THandle; AControl: TControl): Boolean;
```

C++

```
Boolean StartPan(THandle WndHandle, TControl * AControl);
```

File

imouse

Description

This is function IMouse.StartPan.

81.3 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TPanDirection (see page 15424)	The type describes the panning direction.
	TPanOption (see page 15424)	This is record IMouse.TPanOption.

81.3.1 IMouse.TPanDirection Enumeration

The type describes the panning direction.

Pascal

```
TPanDirection = (
  pdUp,
  pdDown,
  pdLeft,
  pdRight
);
```

C++

```
enum TPanDirection {
  pdUp,
  pdDown,
  pdLeft,
  pdRight
};
```

File

imouse

Description

The possible panning values are: pdUp, pdDown, pdLeft, pdRight.

81.3.2 IMouse.TPanOption Enumeration

Pascal

```
TPanOption = (
  poVertical,
  poHorizontal
);
```

C++

```
enum TPanOption {
  poVertical,
  poHorizontal
};
```

File

imouse

Description

This is record IMouse.TPanOption.

81.4 Types

The following table lists types in this documentation.

Types

Name	Description
TPanDirections (see page 15426)	Set of TPanDirection (see page 15424). .
TPanOptions (see page 15426)	This is type IMouse.TPanOptions.
TUpdateEvent (see page 15426)	Initiates the cursor update.

81.4.1 IMouse.TPanDirections Type

Set of TPanDirection (see page 15424). .

Pascal

```
TPanDirections = set of TPanDirection;
```

C++

```
TPanDirection TPanDirections;
```

File

imouse

Description

Set of TPanDirection (see page 15424).

81.4.2 IMouse.TPanOptions Type

Pascal

```
TPanOptions = set of TPanOption;
```

C++

```
TPanOption TPanOptions;
```

File

imouse

Description

This is type IMouse.TPanOptions.

81.4.3 IMouse.TUpdateEvent Type

Initiates the cursor update.

Pascal

```
TUpdateEvent = procedure (Sender: TObject; var Delta: TPoint; var CursorDirection:
TPanDirections) of object;
```

C++

```
(Sender: TObject; var Delta: TPoint; var CursorDirection: TPanDirections) ( TUpdateEvent)();
```

File

imouse

Description

This event is called when the cursor is to be updated.

81.5 Constants

The following table lists constants in this documentation.

Constants

Name	Description
crPanAll (see page 15428)	This is constant IMouse.crPanAll.
crPanDown (see page 15428)	This is constant IMouse.crPanDown.
crPanDownLeft (see page 15429)	This is constant IMouse.crPanDownLeft.
crPanDownRight (see page 15429)	This is constant IMouse.crPanDownRight.
crPanLeft (see page 15429)	This is constant IMouse.crPanLeft.
crPanLeftRight (see page 15430)	This is constant IMouse.crPanLeftRight.
crPanRight (see page 15430)	This is constant IMouse.crPanRight.
crPanUp (see page 15430)	This is constant IMouse.crPanUp.
crPanUpDown (see page 15431)	This is constant IMouse.crPanUpDown.
crPanUpLeft (see page 15431)	This is constant IMouse.crPanUpLeft.
crPanUpRight (see page 15431)	This is constant IMouse.crPanUpRight.

81.5.1 IMouse.crPanAll Constant

Pascal

```
crPanAll = TCursor(-50);
```

C++

```
crPanAll = TCursor(-50);
```

File

imouse

Description

This is constant IMouse.crPanAll.

81.5.2 IMouse.crPanDown Constant

Pascal

```
crPanDown = TCursor(-51);
```

C++

```
crPanDown = TCursor(-51);
```

File

imouse

Description

This is constant IMouse.crPanDown.

81.5.3 IMouse.crPanDownLeft Constant

Pascal

```
crPanDownLeft = TCursor(-52);
```

C++

```
crPanDownLeft = TCursor(-52);
```

File

imouse

Description

This is constant IMouse.crPanDownLeft.

81.5.4 IMouse.crPanDownRight Constant

Pascal

```
crPanDownRight = TCursor(-53);
```

C++

```
crPanDownRight = TCursor(-53);
```

File

imouse

Description

This is constant IMouse.crPanDownRight.

81.5.5 IMouse.crPanLeft Constant

Pascal

```
crPanLeft = TCursor(-54);
```

C++

```
crPanLeft = TCursor(-54);
```

File

imouse

Description

This is constant IMouse.crPanLeft.

81.5.6 IMouse.crPanLeftRight Constant

Pascal

```
crPanLeftRight = TCursor(-55);
```

C++

```
crPanLeftRight = TCursor(-55);
```

File

imouse

Description

This is constant IMouse.crPanLeftRight.

81.5.7 IMouse.crPanRight Constant

Pascal

```
crPanRight = TCursor(-56);
```

C++

```
crPanRight = TCursor(-56);
```

File

imouse

Description

This is constant IMouse.crPanRight.

81.5.8 IMouse.crPanUp Constant

Pascal

```
crPanUp = TCursor(-57);
```

C++

```
crPanUp = TCursor(-57);
```

File

imouse

Description

This is constant IMouse.crPanUp.

81.5.9 IMouse.crPanUpDown Constant

Pascal

```
crPanUpDown = TCursor(-58);
```

C++

```
crPanUpDown = TCursor(-58);
```

File

imouse

Description

This is constant IMouse.crPanUpDown.

81.5.10 IMouse.crPanUpLeft Constant

Pascal

```
crPanUpLeft = TCursor(-59);
```

C++

```
crPanUpLeft = TCursor(-59);
```

File

imouse

Description

This is constant IMouse.crPanUpLeft.

81.5.11 IMouse.crPanUpRight Constant

Pascal

```
crPanUpRight = TCursor(-60);
```

C++

```
crPanUpRight = TCursor(-60);
```

File

imouse

Description

This is constant IMouse.crPanUpRight.

82 IniFiles Namespace

This is namespace IniFiles.

Topics

Name	Description
Classes (see page 15434)	The following table lists classes in this documentation.
Structs, Records, Enums (see page 15475)	The following table lists structs, records, enums in this documentation.
Types (see page 15476)	The following table lists types in this documentation.

Classes

	Name	Description
	EIniFileException (see page 15434)	EIniFileException is the exception class for errors that occur when working with INI files using TIniFile (see page 15455).
	TCustomIniFile (see page 15434)	TCustomIniFile is the base class for components that encapsulate access to .ini files and the Windows system registry.
	THashedStringList (see page 15450)	THashedStringList maintains a list of strings using an internal hash table.
	TIniFile (see page 15455)	TIniFile stores and retrieves application-specific information and settings from INI files.
	TMemIniFile (see page 15462)	TMemIniFile enables buffered storage and retrieval of application-specific information and settings in an INI file.
	TStringHash (see page 15471)	This is class IniFiles.TStringHash.

Structs, Records, Enums

	Name	Description
	THashItem (see page 15475)	This is record IniFiles.THashItem.

Types

Name	Description
PHashItem (see page 15476)	This is type IniFiles.PHashItem.
PPHashItem (see page 15476)	This is type IniFiles.PPHashItem.

82.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	EIniFileException (see page 15434)	EIniFileException is the exception class for errors that occur when working with INI files using TIniFile (see page 15455).
	TCustomIniFile (see page 15434)	TCustomIniFile is the base class for components that encapsulate access to .ini files and the Windows system registry.
	THashedStringList (see page 15450)	THashedStringList maintains a list of strings using an internal hash table.
	TIniFile (see page 15455)	TIniFile stores and retrieves application-specific information and settings from INI files.
	TMemIniFile (see page 15462)	TMemIniFile enables buffered storage and retrieval of application-specific information and settings in an INI file.
	TStringHash (see page 15471)	This is class IniFiles.TStringHash.

82.1.1 EIniFileException Class

EIniFileException is the exception class for errors that occur when working with INI files using TIniFile (see page 15455).

Class Hierarchy

Pascal

```
EIniFileException = class(Exception);
```

C++

```
class EIniFileException : public Exception;
```

File

IniFiles

Description

EIniFileException is raised when TIniFile (see page 15455) fails in an attempt to modify its associated INI file.

See Also

TIniFile (see page 15455)

82.1.2 TCustomIniFile Class

TCustomIniFile is the base class for components that encapsulate access to .ini files and the Windows system registry.

Class Hierarchy

Pascal

```
TCustomIniFile = class(TObject);
```

C++

```
class TCustomIniFile : public TObject;
```

File

IniFiles

Description

Note: Use TCustomIniFile as a base class when defining components that access ini files. Ini files are text files that are divided into sections with variable assignments in each section. TCustomIniFile introduces properties and methods to handle storage and retrieval of application-specific information and settings in a standard ini file.

Note: On Windows, TCustomIniFile is also the base class for TRegistryIniFile, which allows applications that use both ini files and the system registry to handle both media in a unified manner. This differs from the features of TRegistry, which corresponds more directly to Windows system registry native semantics.

Do not create instances of TCustomIniFile. Instead, use or create descendants of TCustomIniFile, such as TIniFile (see page 15455), TRegistryIniFile, and TMemIniFile (see page 15462).

See Also

TIniFile (see page 15455)

TMemIniFile (see page 15462)

TRegistry (see page 18645)

TRegistryIniFile (see page 18675)

82.1.2.1 TCustomIniFile Members

The following tables list the members exposed by TCustomIniFile.

Public Methods

	Name	Description
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 15436)	Creates a TCustomIniFile (see page 15434) object for an application.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
A	DeleteKey (see page 15437)	Erases the data value associated with an ini file entry.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
A	EraseSection (see page 15438)	Erases an entire section of an ini file.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.

V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	ReadBinaryStream (see page 15438)	Retrieves a binary value from the ini file.
V	ReadBool (see page 15439)	Retrieves a Boolean value from an ini file.
V	ReadDate (see page 15439)	Retrieves a date value from an ini file.
V	ReadDateTime (see page 15440)	Retrieves a date-time value from an ini file.
V	ReadFloat (see page 15440)	Retrieves a float value from an ini file.
V	ReadInteger (see page 15441)	Retrieves an integer value from an ini file.
A	ReadSection (see page 15442)	Reads all the key names from a specified section of an ini file into a string list.
A	ReadSections (see page 15442)	This is the overview for the ReadSections method overload.
A	ReadSectionValues (see page 15443)	Reads the values from all keys in a section of an ini file into a string list.
A	ReadString (see page 15443)	Retrieves a string value from an ini file.
V	ReadTime (see page 15444)	Retrieves a time value from an ini file.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SectionExists (see page 15444)	Indicates whether a section exists in the ini file.
A	UpdateFile (see page 15445)	Flushes buffered ini file data to disk.
V	ValueExists (see page 15445)	Indicates whether a key exists in the ini file.
V	WriteBinaryStream (see page 15446)	This is WriteBinaryStream, a member of class TCustomIniFile.
V	WriteBool (see page 15446)	Writes a Boolean value to an ini file.
V	WriteDate (see page 15446)	Writes a date value to an ini file.
V	WriteDateTime (see page 15447)	Writes a date-time value to an ini file.
V	WriteFloat (see page 15447)	Writes a float value to an ini file.
V	WriteInteger (see page 15448)	Writes an integer value to an ini file.
A	WriteString (see page 15448)	Writes a string value to an ini file.
V	WriteTime (see page 15449)	Writes a time value to an ini file.

Public Properties

	Name	Description
R	FileName (see page 15450)	Contains the name of the ini file from which to read and to which to write information.

82.1.2.2 TCustomIniFile.Create Constructor

Creates a TCustomIniFile (see page 15434) object for an application.

Pascal

```
constructor Create(const FileName: string);
```

C++

```
__fastcall TCustomIniFile(const AnsiString FileName);
```

Description

Create constructs a TCustomIniFile (see page 15434) object for an application. Create assigns the FileName (see page

15450) parameter to the FileName (see page 15450) property, which is used to specify the name of the ini file to use.

See Also

FileName (see page 15450)

Create (see page 22287)

82.1.2.3 TCustomIniFile Methods

The methods of the TCustomIniFile class are listed here.

Public Methods

	Name	Description
	DeleteKey (see page 15437)	Erases the data value associated with an ini file entry.
	EraseSection (see page 15438)	Erases an entire section of an ini file.
	ReadBinaryStream (see page 15438)	Retrieves a binary value from the ini file.
	ReadBool (see page 15439)	Retrieves a Boolean value from an ini file.
	ReadDate (see page 15439)	Retrieves a date value from an ini file.
	ReadDateTime (see page 15440)	Retrieves a date-time value from an ini file.
	ReadFloat (see page 15440)	Retrieves a float value from an ini file.
	ReadInteger (see page 15441)	Retrieves an integer value from an ini file.
	ReadSection (see page 15442)	Reads all the key names from a specified section of an ini file into a string list.
	ReadSections (see page 15442)	This is the overview for the ReadSections method overload.
	ReadSectionValues (see page 15443)	Reads the values from all keys in a section of an ini file into a string list.
	ReadString (see page 15443)	Retrieves a string value from an ini file.
	ReadTime (see page 15444)	Retrieves a time value from an ini file.
	SectionExists (see page 15444)	Indicates whether a section exists in the ini file.
	UpdateFile (see page 15445)	Flushes buffered ini file data to disk.
	ValueExists (see page 15445)	Indicates whether a key exists in the ini file.
	WriteBinaryStream (see page 15446)	This is WriteBinaryStream, a member of class TCustomIniFile.
	WriteBool (see page 15446)	Writes a Boolean value to an ini file.
	WriteDate (see page 15446)	Writes a date value to an ini file.
	WriteDateTime (see page 15447)	Writes a date-time value to an ini file.
	WriteFloat (see page 15447)	Writes a float value to an ini file.
	WriteInteger (see page 15448)	Writes an integer value to an ini file.
	WriteString (see page 15448)	Writes a string value to an ini file.
	WriteTime (see page 15449)	Writes a time value to an ini file.

82.1.2.3.1 TCustomIniFile.DeleteKey Method

Erases the data value associated with an ini file entry.

Pascal

```
procedure DeleteKey(const Section: String; const Ident: String); virtual; abstract;
```

C++

```
virtual __fastcall DeleteKey(const AnsiString Section, const AnsiString Ident) = 0;
```

Description

Call DeleteKey to erase a data value associated with an ini file entry. Section is string containing the name of an ini file section, and Ident is a string containing the name of the key for which to set a nil (Delphi) or NULL (C++) value.

Note: Attempting to erase a data value in a nonexistent section or attempting to erase data from a nonexistent key are not errors. In these cases, DeleteKey creates the section and key and sets its initial value to an empty value.

See Also

EraseSection (see page 15438)

82.1.2.3.2 TCustomIniFile.EraseSection Method

Erases an entire section of an ini file.

Pascal

```
procedure EraseSection(const Section: string); virtual; abstract;
```

C++

```
virtual __fastcall EraseSection(const AnsiString Section) = 0;
```

Description

Call EraseSection to remove a section, all its keys, and their data values from an ini file. Section identifies the ini file section to remove. If a section cannot be removed, an exception is raised.

See Also

SectionExists (see page 15444)

DeleteKey (see page 15437)

82.1.2.3.3 TCustomIniFile.ReadBinaryStream Method

Retrieves a binary value from the ini file.

Pascal

```
function ReadBinaryStream(const Section: string; const Name: string; Value: TStream): Integer;
virtual;
```

C++

```
virtual __fastcall int ReadBinaryStream(const AnsiString Section, const AnsiString Name,
TStream Value);
```

Description

Call ReadBinaryStream to read a binary value into a specified stream. After reading the binary value, which it converts from a series of hexadecimal characters, from the ini file into the current position of the stream, ReadBinaryStream returns the number of bytes written to the stream. If the stream is a memory stream (TMemoryStream or one of its descendants), the stream is left positioned to the same byte as it was before the call to ReadBinaryStream (immediately before the new binary value).

Section is the section that contains the desired key.

Name is the key under which the binary data is stored.

Value is a stream to which the binary value is written.

Note: When used with a Windows .ini file, ReadBinaryStream is limited to 1023 characters,

See Also

ReadString (see page 15443)

writebinarystream (see page 15446)

82.1.2.3.4 TCustomIniFile.ReadBool Method

Retrieves a Boolean value from an ini file.

Pascal

```
function ReadBool(const Section: string; const Ident: string; Default: Boolean): Boolean;
virtual;
```

C++

```
virtual __fastcall Boolean ReadBool(const AnsiString Section, const AnsiString Ident, Boolean
Default);
```

Description

Call ReadBool to read a Boolean value from an ini file. Section identifies the section in the file that contains the desired key. Ident is the name of the key from which to retrieve the Boolean value. Default is the Boolean value to return if the:

Section does not exist.

Key does not exist.

Data value for the key is not assigned.

See Also

ReadDate (see page 15439)

ReadDateTime (see page 15440)

ReadFloat (see page 15440)

ReadInteger (see page 15441)

ReadString (see page 15443)

ReadTime (see page 15444)

82.1.2.3.5 TCustomIniFile.ReadDate Method

Retrieves a date value from an ini file.

Pascal

```
function ReadDate(const Section: string; const Name: string; Default: TDateTime): TDateTime;
virtual;
```

C++

```
virtual __fastcall TDateTime ReadDate(const AnsiString Section, const AnsiString Name,
TDateTime Default);
```

Description

Call ReadDate to read a date value from an ini file. Section identifies the section in the file that contains the desired key. Ident is the name of the key from which to retrieve the date value. Default is the date value to return if the:

Section does not exist.

Key does not exist.

Data value for the key is not assigned.

See Also

ReadBool (see page 15439)

ReadDateTime (see page 15440)

ReadFloat (see page 15440)

ReadInteger (see page 15441)

ReadString (see page 15443)

ReadTime (see page 15444)

82.1.2.3.6 TCustomIniFile.ReadDateTime Method

Retrieves a date-time value from an ini file.

Pascal

```
function ReadDateTime(const Section: string; const Name: string; Default: TDateTime):
TDateTime; virtual;
```

C++

```
virtual __fastcall TDateTime ReadDateTime(const AnsiString Section, const AnsiString Name,
TDateTime Default);
```

Description

Call ReadDateTime to read a date-time value from an ini file. Section identifies the section in the file that contains the desired key. Ident is the name of the key from which to retrieve the date-time value. Default is the date-time value to return if the:

Section does not exist.

Key does not exist.

Data value for the key is not assigned.

See Also

ReadBool (see page 15439)

ReadDate (see page 15439)

ReadDateTime

ReadFloat (see page 15440)

ReadInteger (see page 15441)

ReadString (see page 15443)

ReadTime (see page 15444)

82.1.2.3.7 TCustomIniFile.ReadFloat Method

Retrieves a float value from an ini file.

Pascal

```
function ReadFloat(const Section: string; const Name: string; Default: Double): Double;
virtual;
```

C++

```
virtual __fastcall Double ReadFloat(const AnsiString Section, const AnsiString Name, Double
Default);
```

Description

Call ReadFloat to read a float value from an ini file. Section identifies the section in the file that contains the desired key. Ident is the name of the key from which to retrieve the float value. Default is the float value to return if the:

Section does not exist.

Key does not exist.

Data value for the key is not assigned.

ReadTime (see page 15444)

82.1.2.3.8 TCustomIniFile.ReadInteger Method

Retrieves an integer value from an ini file.

Pascal

```
function ReadInteger(const Section: string; const Ident: string; Default: Longint): Longint;
virtual;
```

C++

```
virtual __fastcall Longint ReadInteger(const AnsiString Section, const AnsiString Ident,
Longint Default);
```

Description

Call ReadInteger to read an integer value from an ini file. Section identifies the section in the file that contains the desired key. Ident is the name of the key from which to retrieve the value. Default is the integer value to return if the:

Section does not exist.

Key does not exist.

Data value for the key is not assigned.

ReadDateTime (see page 15440)

ReadFloat (see page 15440)

ReadString (see page 15443)

ReadTime (see page 15444)

82.1.2.3.9 TCustomIniFile.ReadSection Method

Reads all the key names from a specified section of an ini file into a string list.

Pascal

```
procedure ReadSection(const Section: string; Strings: TStrings); virtual; abstract;
```

C++

```
virtual __fastcall ReadSection(const AnsiString Section, TStrings Strings) = 0;
```

Description

Call ReadSection to retrieve the names of all keys within a specified section of an ini file into a string list object.

Section identifies the section from which to retrieve a list of key names. Strings specifies the string object to hold the retrieved names. Strings can point to a TStrings descendant such as a string list, or to a component property, such as Items for a TListBox component.

ReadSectionValues (see page 15443)

82.1.2.3.10 ReadSections Method

This is the overview for the ReadSections method overload.

Overload List

	Name	Description
	TCustomIniFile.ReadSections (string, TStrings) (see page 15442)	Reads the names of all sections in an ini file into a string list.
	TCustomIniFile.ReadSections (TStrings) (see page 15442)	Reads the names of all sections in an ini file into a string list.

82.1.2.3.10.1 TCustomIniFile.ReadSections Method (TStrings)

Reads the names of all sections in an ini file into a string list.

Pascal

```
procedure ReadSections(Strings: TStrings); virtual; abstract; overload;
procedure ReadSections(const Section: string; Strings: TStrings); virtual; overload;
```

C++

```
virtual __fastcall ReadSections(TStrings Strings) = 0;
virtual __fastcall ReadSections(const AnsiString Section, TStrings Strings);
```

Description

Call ReadSections to retrieve the names of all sections in an ini file into a string list.

Strings specifies the string object to hold the retrieved names. Strings can point to a TStrings descendant, or to a component property, such as Items for a TListBox component.

Section identifies the section from which to retrieve a list of key names.

See Also

ReadSection (see page 15442)

ReadSectionValues (see page 15443)

82.1.2.3.11 TCustomIniFile.ReadSectionValues Method

Reads the values from all keys in a section of an ini file into a string list.

Pascal

```
procedure ReadSectionValues(const Section: string; Strings: TStrings); virtual; abstract;
```

C++

```
virtual __fastcall ReadSectionValues(const AnsiString Section, TStrings Strings) = 0;
```

Description

Call ReadSectionValues to read the values from all keys in a specified section of an ini file into a string list object. The values are added to the string list as strings of the form KeyName=ValueName.

Section identifies the section in the file from which to read key values.

Strings is the string list object into which to read the values. Strings can point to a TStrings object, or to a component property, such as Items for a TListBox component.

SectionExists (see page 15444)

ReadSection (see page 15442)

ReadSections (see page 15442)

82.1.2.3.12 TCustomIniFile.ReadString Method

Retrieves a string value from an ini file.

Pascal

```
function ReadString(const Section: string; const Ident: string; const Default: string):
string; virtual; abstract;
```

C++

```
virtual __fastcall AnsiString ReadString(const AnsiString Section, const AnsiString Ident,
const AnsiString Default) = 0;
```

Description

Call ReadString to read a string value from a .ini file. Section identifies the section in the file that contains the desired key. Ident is the name of the key from which to retrieve the value. Default is the string value to return if the:

Section does not exist.

Key does not exist.

Data value for the key is not assigned.

Note: On Windows, if the string in the .ini file is surrounded by quotation marks, the return value has those marks stripped away. On Linux, the quotation marks are preserved.

ReadTime (see page 15444)

ReadBinaryStream (see page 15438)

82.1.2.3.13 TCustomIniFile.ReadTime Method

Retrieves a time value from an ini file.

Pascal

```
function ReadTime(const Section: string; const Name: string; Default: TDateTime): TDateTime;
virtual;
```

C++

```
virtual __fastcall TDateTime ReadTime(const AnsiString Section, const AnsiString Name,
TDateTime Default);
```

Description

Call ReadTime to read a time value from an ini file. Section identifies the section in the file that contains the desired key. Ident is the name of the key from which to retrieve the time value. Default is the time value to return if the:

Section does not exist.

Key does not exist.

Data value for the key is not assigned.

ReadString (see page 15443)

82.1.2.3.14 TCustomIniFile.SectionExists Method

Indicates whether a section exists in the ini file.

Pascal

```
function SectionExists(const Section: string): Boolean;
```

C++

```
__fastcall Boolean SectionExists(const AnsiString Section);
```

Description

Use SectionExists to determine whether a section exists within the ini file specified in FileName (see page 15450).

Section is the ini file section SectionExists determines the existence of.

SectionExists returns a Boolean value that indicates whether the section in question exists.

See Also

FileName (see page 15450)

ValueExists (see page 15445)

82.1.2.3.15 TCustomIniFile.UpdateFile Method

Flushes buffered ini file data to disk.

Pascal

```
procedure UpdateFile; virtual; abstract;
```

C++

```
virtual __fastcall UpdateFile() = 0;
```

Description

Call UpdateFile to flush buffered reads from and writes to the ini file to disk. [SK comment -- UpdateFile is useful under Windows95but has no effect under Windows NT as NT does not buffer ini file reads and writes. do not delete!]

See Also

FileName (see page 15450)

82.1.2.3.16 TCustomIniFile.ValueExists Method

Indicates whether a key exists in the ini file.

Pascal

```
function ValueExists(const Section: string; const Ident: string): Boolean; virtual;
```

C++

```
virtual __fastcall Boolean ValueExists(const AnsiString Section, const AnsiString Ident);
```

Description

Use ValueExists to determine whether a key exists in the ini file specified in FileName (see page 15450).

Section is the section in the ini file in which to search for the key.

Ident is the name of the key to search for.

ValueExists returns a boolean value that indicates whether the key exists in the specified section.

See Also

FileName (see page 15450)

SectionExists (see page 15444)

82.1.2.3.17 TCustomIniFile.WriteBinaryStream Method

Pascal

```
procedure WriteBinaryStream(const Section: string; const Name: string; Value: TStream);
virtual;
```

C++

```
virtual __fastcall WriteBinaryStream(const AnsiString Section, const AnsiString Name, TStream
Value);
```

Description

This is WriteBinaryStream, a member of class TCustomIniFile.

82.1.2.3.18 TCustomIniFile.WriteBool Method

Writes a Boolean value to an ini file.

Pascal

```
procedure WriteBool(const Section: string; const Ident: string; Value: Boolean); virtual;
```

C++

```
virtual __fastcall WriteBool(const AnsiString Section, const AnsiString Ident, Boolean Value);
```

Description

Call WriteBool to write a Boolean value to an ini file. Section identifies the section in the file that contain the key to which to write. Ident is the name of the key for which to set a value. Value is the Boolean value to write.

Note: Attempting to write a data value to a nonexistent section or attempting to write data to a nonexistent key are not errors. In these cases, WriteBool creates the section and key and sets its initial value to Value.

See Also

WriteDate (see page 15446)

WriteDateTime (see page 15447)

WriteFloat (see page 15447)

WriteInteger (see page 15448)

WriteString (see page 15448)

WriteTime (see page 15449)

82.1.2.3.19 TCustomIniFile.WriteDate Method

Writes a date value to an ini file.

Pascal

```
procedure WriteDate(const Section: string; const Name: string; Value: TDateTime); virtual;
```

C++

```
virtual __fastcall WriteDate(const AnsiString Section, const AnsiString Name, TDateTime Value);
```

Description

Call WriteDate to write a date value to an ini file. Section identifies the section in the file that contain the key to which to write. Ident is the name of the key for which to set a value. Value is the date value to write.

Note: Attempting to write a data value to a nonexistent section or attempting to write data to a nonexistent key are not errors. In these cases, WriteDate creates the section and key and sets its initial value to Value.

See Also

WriteBool (see page 15446)

WriteInteger (see page 15448)

WriteString (see page 15448)

WriteTime (see page 15449)

82.1.2.3.20 TCustomIniFile.WriteDateTime Method

Writes a date-time value to an ini file.

Pascal

```
procedure WriteDateTime(const Section: string; const Name: string; Value: TDateTime); virtual;
```

C++

```
virtual __fastcall WriteDateTime(const AnsiString Section, const AnsiString Name, TDateTime
Value);
```

Description

Call WriteDateTime to write a date-time value to an ini file. Section identifies the section in the file that contain the key to which to write. Ident is the name of the key for which to set a value. Value is the date-time value to write.

Note: Attempting to write a data value to a nonexistent section or attempting to write data to a nonexistent key are not errors. In these cases, WriteDateTime creates the section and key and sets its initial value to Value.

See Also

WriteBool (see page 15446)

WriteTime (see page 15449)

82.1.2.3.21 TCustomIniFile.WriteFloat Method

Writes a float value to an ini file.

Pascal

```
procedure WriteFloat(const Section: string; const Name: string; Value: Double); virtual;
```

C++

```
virtual __fastcall WriteFloat(const AnsiString Section, const AnsiString Name, Double Value);
```

Description

Call WriteFloat to write a float value to an ini file. Section identifies the section in the file that contain the key to which to write.

Ident is the name of the key for which to set a value. Value is the float value to write.

Note: Attempting to write a data value to a nonexistent section or attempting to write data to a nonexistent key are not errors. In these cases, WriteFloat creates the section and key and sets its initial value to Value.

See Also

WriteBool (see page 15446)

WriteTime (see page 15449)

82.1.2.3.22 TCustomIniFile.WriteInteger Method

Writes an integer value to an ini file.

Pascal

```
procedure WriteInteger(const Section: string; const Ident: string; Value: Longint); virtual;
```

C++

```
virtual __fastcall WriteInteger(const AnsiString Section, const AnsiString Ident, Longint
Value);
```

Description

Call WriteInteger to write an integer value to an ini file. Section identifies the section in the file that contain the key to which to write. Ident is the name of the key for which to set a value. Value is the integer value to write.

Note: Attempting to write a data value to a nonexistent section or attempting to write data to a nonexistent key are not errors. In these cases, WriteInteger creates the section and key and sets its initial value to Value.

WriteTime (see page 15449)

82.1.2.3.23 TCustomIniFile.WriteString Method

Writes a string value to an ini file.

Pascal

```
procedure WriteString(const Section: String; const Ident: String; const Value: String);
virtual; abstract;
```

C++

```
virtual __fastcall WriteString(const AnsiString Section, const AnsiString Ident, const
```

```
AnsiString Value) = 0;
```

Description

Call WriteString to write a string value to an ini file. Section identifies the section in the file that contain the key to which to write. Ident is the name of the key for which to set a value. Value is the string value to write.

Note: Attempting to write a data value to a nonexistent section or attempting to write data to a nonexistent key are not errors. In these cases, WriteString creates the section and key and sets its initial value to Value.

WriteTime (see page 15449)

82.1.2.3.24 TCustomIniFile.WriteTime Method

Writes a time value to an ini file.

Pascal

```
procedure WriteTime(const Section: string; const Name: string; Value: TDateTime); virtual;
```

C++

```
virtual __fastcall WriteTime(const AnsiString Section, const AnsiString Name, TDateTime Value);
```

Description

Call WriteTime to write a time value to an ini file. Section identifies the section in the file that contain the key to which to write. Ident is the name of the key for which to set a value. Value is the time value to write.

Note: Attempting to write a data value to a nonexistent section or attempting to write data to a nonexistent key are not errors. In these cases, WriteTime creates the section and key and sets its initial value to Value.

82.1.2.4 TCustomIniFile Properties

The properties of the TCustomIniFile class are listed here.

Public Properties

	Name	Description
R	FileName (see page 15450)	Contains the name of the ini file from which to read and to which to write information.

82.1.2.4.1 TCustomIniFile.FileName Property

Contains the name of the ini file from which to read and to which to write information.

Pascal

```
property FileName: string;
```

C++

```
__property AnsiString FileName;
```

Description

Read FileName to retrieve the name of the ini file that this object can be used to access. The methods that read and write ini file information automatically handle opening and closing the file specified by FileName.

FileName is read-only. The name of the ini file the object uses is supplied as the parameter for the constructor.

Create (see page 15436)

82.1.3 THashedStringList Class

THashedStringList maintains a list of strings using an internal hash table.

Class Hierarchy

Pascal

```
THashedStringList = class(TStringList);
```

C++

```
class THashedStringList : public TStringList;
```

File

IniFiles

Description

THashedStringList is a string list that uses a hash table internally to speed the process of locating strings. It is used internally by TMemIniFile (see page 15462) to manage the strings from an INI file, but can be used in the same way as any other string list. By using THashedStringList instead of TStringList, you can improve performance when the list contains a large number of strings.

See Also

TStringList (see page 3006)

TMemIniFile (see page 15462)

Working with Lists

82.1.3.1 THashedStringList Members

The following tables list the members exposed by THashedStringList.

Protected Methods

	Name	Description
	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	Changed (see page 15454)	This is Changed, a member of class THashedStringList.
	Changing (see page 3013)	This is Changing, a member of class TStringList.
	CompareStrings (see page 3014)	Compares two strings.
	CompareStrings (see page 3048)	Compares two strings.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	DefineProperties (see page 3049)	Reads and writes the Strings (see page 3080) property as if it were published.
	Error (see page 3052)	This is the overview for the Error method overload.
	ExtractName (see page 3053)	Returns the name portion of a string that is a name value pair.
	Get (see page 3017)	Returns a string given its index.
	Get (see page 3053)	Returns a string given its index.
	GetCapacity (see page 3017)	Returns the currently allocated size of the list of strings.
	GetCapacity (see page 3054)	Returns the currently allocated size of the list of strings.
	GetCount (see page 3018)	Returns the number of strings in the list
	GetCount (see page 3054)	Returns the number of strings in the list
	GetObject (see page 3018)	Returns the object associated with the string at a specified index.
	GetObject (see page 3055)	Returns the object associated with the string at a specified index.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTextStr (see page 3056)	Returns the value of the Text (see page 3084) property.
	InsertItem (see page 3020)	This is InsertItem, a member of class TStringList.
	Put (see page 3022)	Changes the value of the string with a specified index.
	Put (see page 3064)	Changes the value of the string with a specified index.
	PutObject (see page 3022)	Changes the object associated with the string at a specified index.
	PutObject (see page 3065)	Changes the object associated with the string at a specified index.
	SetCapacity (see page 3022)	Changes the amount of memory allocated to hold strings in the list.
	SetCapacity (see page 3068)	Changes the amount of memory allocated to hold strings in the list.
	SetTextStr (see page 3069)	Sets the Text (see page 3084) property.
	SetUpdateState (see page 3023)	Performs internal adjustments before or after a series of updates.
	SetUpdateState (see page 3069)	Performs internal adjustments before or after a series of updates.

Protected Properties

	Name	Description
	UpdateCount (see page 3085)	Indicates the number of calls to BeginUpdate (see page 3045) that have not been matched by a call to EndUpdate (see page 3050).

Public Events

	Name	Description
	OnChange (see page 3028)	Occurs immediately after the list of strings changes.
	OnChanging (see page 3028)	Occurs immediately before the list of strings changes.

Public Methods

	Name	Description
	Add (see page 3010)	Adds a new string to the list.
	Add (see page 3033)	Adds a string at the end of the list.
	AddObject (see page 3012)	Adds a string to the list, and associates an object with the string.
	AddObject (see page 3036)	Adds a string to the list, and associates an object with the string.
	AddStrings (see page 3039)	Adds a group of strings to the list.

V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Append (see page 3041)	Adds a string to the list.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	Assign (see page 3043)	Sets the strings in the list, and possibly associated objects, from a source object.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	BeginUpdate (see page 3045)	Enables the TStrings (see page 3029) object to track when the list of strings is changing.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Clear (see page 3013)	Deletes all the strings from the list.
A	Clear (see page 3047)	Introduces an abstract (Delphi) or pure virtual (C++) method to empty the list and any associated objects.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	CustomSort (see page 3014)	Sorts the strings in the list in a customized order.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Delete (see page 3015)	Removes the string specified by the Index parameter.
A	Delete (see page 3049)	Introduces an abstract (Delphi) or pure virtual (C++) method to delete a specified string from the list.
V	Destroy (see page 15453)	Destroys an instance of THashedStringList (see page 15450).
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	EndUpdate (see page 3050)	Enables the TStrings (see page 3029) object to keep track of when the list of strings has finished changing.
	Equals (see page 3051)	Compares the list of strings to the list from another TStrings (see page 3029) object and returns true if the two lists match.
V	Exchange (see page 3015)	Swaps the position of two strings in the list.
V	Exchange (see page 3053)	Swaps the position of two strings in the list.
	FieldAddress (see page 22299)	Returns the address of a published object field.
V	Find (see page 3016)	Locates the index for a string in a sorted list and indicates whether a string with that value already exists in the list.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetEnumerator (see page 3054)	Returns a TStrings (see page 3029) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
V	GetText (see page 3055)	Allocates a text buffer and fills it with the value of the Text (see page 3084) property.
V	IndexOf (see page 15454)	Returns the position of a string in the list.
V	IndexOfName (see page 15455)	Returns the position of the first string with the form Name=Value with the specified name part.
V	IndexOfObject (see page 3059)	Returns the index of the first string in the list associated with a given object.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
V	Insert (see page 3019)	Inserts a string to the list at the position specified by Index.
A	Insert (see page 3059)	Introduces abstract (Delphi) or pure virtual (C++) method to insert a string at a specified position.
V	InsertObject (see page 3020)	Inserts a string into the list at the specified position, and associates it with an object.

V	InsertObject (see page 3060)	Inserts a string into the list at the specified position, and associates it with an object.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
V	LoadFromFile (see page 3061)	Fills the list with the lines of text in a specified file.
V	LoadFromStream (see page 3062)	Fills the list with lines of text read from a stream.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	Move (see page 3063)	Changes the position of a string in the list.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
V	SaveToFile (see page 3065)	Saves the strings in the list to the specified file.
V	SaveToStream (see page 3067)	Writes the value of the Text (see page 3084) property to a stream object.
V	SetText (see page 3068)	Sets the Text (see page 3084) property.
V	Sort (see page 3023)	Sorts the strings in the list in ascending order.

Public Properties

	Name	Description
	Capacity (see page 3070)	Indicates the number of strings the TStrings (see page 3029) object can hold.
	CaseSensitive (see page 3025)	Controls (see page 5711) whether strings are located, sorted, and identified as duplicates in a case-sensitive or case-insensitive manner.
	CommaText (see page 3070)	Lists the strings in the TStrings (see page 3029) object in system data format (SDF).
R	Count (see page 3071)	Introduces an abstract property to represent the number of strings in the list.
	DelimitedText (see page 3074)	Represents all the strings in the TStrings (see page 3029) object as a single delimited string.
	Delimiter (see page 3074)	Specifies the delimiter used by the DelimitedText (see page 3074) property.
	Duplicates (see page 3025)	Specifies whether duplicate strings can be added to sorted lists.
	LineBreak (see page 3075)	Defines the line break character(s).
R	Names (see page 3075)	Indicates the name part of strings that are name-value pairs.
	NameValueSeparator (see page 3077)	Indicates the character used to separate names from values.
	Objects (see page 3077)	Represents a set of objects that are associated one with each of the strings in the Strings (see page 3080) property.
	QuoteChar (see page 3080)	Specifies the quote character used by the DelimitedText (see page 3074) property.
	Sorted (see page 3026)	Specifies whether the strings in the list should be automatically sorted.
	StrictDelimiter (see page 3080)	Determines how the Delimiter (see page 3074) property is used.
	Strings (see page 3080)	References the strings in the list by their positions.
	StringsAdapter (see page 3084)	Implements an IStringsAdapter (see page 3208) interface for the TStrings (see page 3029) object.
	Text (see page 3084)	Lists the strings in the TStrings (see page 3029) object as a single string with the individual strings delimited by carriage returns and line feeds.
	ValueFromIndex (see page 3085)	Represents the value part of a string with a given index, on strings that are name-value pairs.
	Values (see page 3086)	Represents the value part of a string associated with a given name, on strings that are name-value pairs.

82.1.3.2 THashedStringList.Destroy Destructor

Destroys an instance of THashedStringList (see page 15450).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~THashedStringList();
```

Description

Do not call Destroy directly in an application. Instead, call Free. Free verifies that the THashedStringList (see page 15450) reference is not nil and only then calls Destroy.

See Also

Free (see page 22300)

82.1.3.3 THashedStringList Methods

The methods of the THashedStringList class are listed here.

Protected Methods

	Name	Description
	Changed (see page 15454)	This is Changed, a member of class THashedStringList.

Public Methods

	Name	Description
	IndexOf (see page 15454)	Returns the position of a string in the list.
	IndexOfName (see page 15455)	Returns the position of the first string with the form Name=Value with the specified name part.

82.1.3.3.1 THashedStringList.Changed Method

Pascal

```
procedure Changed; override;
```

C++

```
virtual __fastcall Changed();
```

Description

This is Changed, a member of class THashedStringList.

82.1.3.3.2 THashedStringList.IndexOf Method

Returns the position of a string in the list.

Pascal

```
function IndexOf(const S: string): Integer; override;
```

C++

```
virtual __fastcall int IndexOf(const AnsiString S);
```

Description

Call IndexOf to obtain the position of the first occurrence of a string that matches S. A string matches S if it is identical to S or differs only in case.

IndexOf returns the 0-based index of the string. Thus, if S matches the first string in the list, IndexOf returns 0, if S is the second string, IndexOf returns 1, and so on. If the string does not have a match in the string list, IndexOf returns -1.

See Also

Find (see page 3016)

IndexOfName (see page 15455)

IndexOfObject (see page 3059)

Strings

82.1.3.3.3 THashedStringList.IndexOfName Method

Returns the position of the first string with the form Name=Value with the specified name part.

Pascal

```
function IndexOfName(const Name: string): Integer; override;
```

C++

```
virtual __fastcall int IndexOfName(const AnsiString Name);
```

Description

Call IndexOfName to locate the first occurrence of a string with the form Name=Value where the name part is equal to the Name parameter or differs only in case. IndexOfName returns the 0-based index of the string. If no string in the list has the indicated name, IndexOfName returns -1.

The Name that identifies the string is to the left of the equal sign (=), and the current Value of the Name identifier is on the right side. There should be no spaces present before or after the equal sign.

Note: If there is more than one string with a name portion matching the Name parameter, IndexOfName returns the position of the first such string.

See Also

IndexOf (see page 15454)

Names (see page 3075)

Values (see page 3086)

IndexOfObject (see page 3059)

82.1.4 TIniFile Class

TIniFile stores and retrieves application-specific information and settings from INI files.

Class Hierarchy

Pascal

```
TIniFile = class(TCustomIniFile);
```

C++

```
class TIniFile : public TCustomIniFile;
```

File

IniFiles

Description

TIniFile enables handling the storage and retrieval of application-specific information and settings in a standard INI file. An INI file stores information in logical groupings, called "sections." Within each section, actual data values are stored in named keys. Keys take the form:

```
<keyname>=<value>
```

A FileName (see page 15450) is passed to the TIniFile constructor and identifies the INI file that the object accesses.

Note: On Windows, a related object, TMemIniFile (see page 15462), works the same way as TIniFile, but buffers writes in memory to minimize disk access.

Note: On Linux, TIniFile is the same as TMemIniFile (see page 15462).

See Also

TRegistry (see page 18645)

TRegistryIniFile (see page 18675)

82.1.4.1 TIniFile Members

The following tables list the members exposed by TIniFile.

Public Methods

	Name	Description
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 15436)	Creates a TCustomIniFile (see page 15434) object for an application.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	DeleteKey (see page 15458)	Removes an INI file entry for a specified key value.
	Destroy (see page 15457)	Disposes of an object instance.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	EraseSection (see page 15458)	Erases an entire section of an INI file.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	ReadBinaryStream (see page 15438)	Retrieves a binary value from the ini file.

	ReadBool (see page 15439)	Retrieves a Boolean value from an ini file.
	ReadDate (see page 15439)	Retrieves a date value from an ini file.
	ReadDateTime (see page 15440)	Retrieves a date-time value from an ini file.
	ReadFloat (see page 15440)	Retrieves a float value from an ini file.
	ReadInteger (see page 15441)	Retrieves an integer value from an ini file.
	ReadSection (see page 15459)	Reads all the key names from a specified section of an INI file into a string list.
	ReadSections (see page 15459)	Reads the names of all sections in an INI file into a string list.
	ReadSections (see page 15442)	This is the overview for the ReadSections method overload.
	ReadSectionValues (see page 15460)	Reads the values from all keys within a section of an INI file into a string list.
	ReadString (see page 15460)	Retrieves a string value from an INI file.
	ReadTime (see page 15444)	Retrieves a time value from an ini file.
	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SectionExists (see page 15444)	Indicates whether a section exists in the ini file.
	UpdateFile (see page 15461)	Flushes buffered INI file data to disk.
	ValueExists (see page 15445)	Indicates whether a key exists in the ini file.
	WriteBinaryStream (see page 15446)	This is WriteBinaryStream, a member of class TCustomIniFile.
	WriteBool (see page 15446)	Writes a Boolean value to an ini file.
	WriteDate (see page 15446)	Writes a date value to an ini file.
	WriteDateTime (see page 15447)	Writes a date-time value to an ini file.
	WriteFloat (see page 15447)	Writes a float value to an ini file.
	WriteInteger (see page 15448)	Writes an integer value to an ini file.
	WriteString (see page 15461)	Writes a string value to an INI file.
	WriteTime (see page 15449)	Writes a time value to an ini file.

Public Properties

	Name	Description
	FileName (see page 15450)	Contains the name of the ini file from which to read and to which to write information.

82.1.4.2 TIniFile.Destroy Destructor

Disposes of an object instance.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TIniFile();
```

Description

Do not call System::TObject::Destroy directly. Call System::TObject::Free instead. Free verifies that the object reference is not nil before calling System::TObject::Destroy.

The System::TObject::Destroy method defined by System::TObject::TObject deallocates memory. Descendant objects usually define a destructor that is customized for that particular kind of object.

When declaring a System::TObject::Destroy method in a descendant, always add the override directive to the declaration and call the inherited System::TObject::Destroy as the last statement in the overriding method. Since System::TObject::Destroy is a virtual method, overriding it ensures that the proper inherited behavior occurs.

Note: If an exception escapes from the constructor, the destructor is called to destroy the partially constructed object instance that failed to initialize completely. Therefore, destructors should check that allocated resources, such as handles, were actually allocated before trying to release them, since their value might be zero.

System::TObject::Destroy should be implemented so that it calls System::TObject::Free on all subobjects created within the

object's constructor (that is, allocated by the constructor). Unlike System::TObject::Destroy, System::TObject::Free provides a safeguard when destroying objects that are nil.

See Also

System::TObject::Free (see page 22300)

82.1.4.3 TIniFile Methods

The methods of the TIniFile class are listed here.

Public Methods

	Name	Description
	DeleteKey (see page 15458)	Removes an INI file entry for a specified key value.
	EraseSection (see page 15458)	Erases an entire section of an INI file.
	ReadSection (see page 15459)	Reads all the key names from a specified section of an INI file into a string list.
	ReadSections (see page 15459)	Reads the names of all sections in an INI file into a string list.
	ReadSectionValues (see page 15460)	Reads the values from all keys within a section of an INI file into a string list.
	ReadString (see page 15460)	Retrieves a string value from an INI file.
	UpdateFile (see page 15461)	Flushes buffered INI file data to disk.
	WriteString (see page 15461)	Writes a string value to an INI file.

82.1.4.3.1 TIniFile.DeleteKey Method

Removes an INI file entry for a specified key value.

Pascal

```
procedure DeleteKey(const Section: String; const Ident: String); override;
```

C++

```
virtual __fastcall DeleteKey(const AnsiString Section, const AnsiString Ident);
```

Description

Call DeleteKey to erase an INI file entry. Section is string containing the name of an INI file section, and Ident is a string containing the name of the key from for which to set a nil (Delphi) or NULL (C++) value.

This version of DeleteKey is only available if the application is compiled for Windows. On Linux, DeleteKey is inherited from TMemIniFile (see page 15462).

Note: Attempting to delete a key in a nonexistent section or attempting to delete a nonexistent key are not errors. In these cases, DeleteKey does nothing.

See Also

EraseSection (see page 15458)

82.1.4.3.2 TIniFile.EraseSection Method

Erases an entire section of an INI file.

Pascal

```
procedure EraseSection(const Section: string); override;
```

C++

```
virtual __fastcall EraseSection(const AnsiString Section);
```

Description

Call EraseSection to remove a section, all its keys, and their data values from an INI file. Section identifies the INI file section to remove. If a section cannot be removed, an exception is raised.

This version of EraseSection is only available if the application is compiled for Windows. On Linux, EraseSection is inherited from TMemIniFile (see page 15462).

See Also

DeleteKey (see page 15458)

82.1.4.3.3 TIniFile.ReadSection Method

Reads all the key names from a specified section of an INI file into a string list.

Pascal

```
procedure ReadSection(const Section: string; Strings: TStrings); override;
```

C++

```
virtual __fastcall ReadSection(const AnsiString Section, TStrings Strings);
```

Description

Call ReadSection to retrieve the names of all keys within a specified section of an INI file into a string list object.

Section identifies the section from which to retrieve a list of key names. Strings specifies the TStrings descendant to hold the retrieved names. Strings can point to a TStrings descendant such as a string list (TStringList), or to a component property that is of type TStrings, such as the Items property of TListBox.

This version of ReadSection is only available if the application is compiled for Windows. On Linux, ReadSection is inherited from TMemIniFile (see page 15462).

See Also

ReadSections (see page 15459)

ReadSectionValues (see page 15460)

82.1.4.3.4 TIniFile.ReadSections Method

Reads the names of all sections in an INI file into a string list.

Pascal

```
procedure ReadSections(Strings: TStrings); override;
```

C++

```
virtual __fastcall ReadSections(TStrings Strings);
```

Description

Call ReadSections to retrieve the names of all sections in an INI file into a string list object.

Strings specifies the string object to hold the retrieved names. Strings can point to a TStrings object, or to a component property, such as Items for a TListBox component.

This version of ReadSections is only available if the application is compiled for Windows. On Linux, ReadSections is inherited from TMemIniFile (see page 15462).

See Also

ReadSection (see page 15459)

ReadSectionValues (see page 15460)

82.1.4.3.5 TIniFile.ReadSectionValues Method

Reads the values from all keys within a section of an INI file into a string list.

Pascal

```
procedure ReadSectionValues(const Section: string; Strings: TStrings); override;
```

C++

```
virtual __fastcall ReadSectionValues(const AnsiString Section, TStrings Strings);
```

Description

Call ReadSectionValues to read the keys, and the values from all keys, within a specified section of an INI file into a string list object (TStrings descendant). The key names and values are added to the string list as strings of the form KeyName=ValueName.

Section identifies the section in the file from which to read key values.

Strings is the string list object into which to read the values. Strings can point to a TStrings object, or to a component property, such as Items for a TListBox component, that is a TStrings object itself.

This version of ReadSectionValues is only available if the application is compiled for Windows. On Linux, ReadSectionValues is inherited from TMemIniFile (see page 15462).

See Also

ReadSection (see page 15459)

ReadSections (see page 15459)

82.1.4.3.6 TIniFile.ReadString Method

Retrieves a string value from an INI file.

Pascal

```
function ReadString(const Section: string; const Ident: string; const Default: string):
string; override;
```

C++

```
virtual __fastcall AnsiString ReadString(const AnsiString Section, const AnsiString Ident,
const AnsiString Default);
```

Description

Call ReadString to read a string value from an INI file. Section identifies the section in the file that contains the desired key. Ident is the name of the key from which to retrieve the value. Default is the string value to return if the:

Section does not exist.

Key does not exist.

Data value for the key is not assigned.

This version of ReadString is only available if the application is compiled for Windows. On Linux, ReadString is inherited from TMemIniFile (see page 15462).

See Also

ReadBool (see page 15439)

ReadInteger (see page 15441)

82.1.4.3.7 TIniFile.UpdateFile Method

Flushes buffered INI file data to disk.

Pascal

```
procedure UpdateFile; override;
```

C++

```
virtual __fastcall UpdateFile();
```

Description

Call UpdateFile to flush buffered reads from and writes to the INI file to disk. UpdateFile is useful under Windows9x, but has no effect under Windows NT because NT does not buffer INI file reads and writes.

This version of UpdateFile is only available if the application is compiled for Windows. On Linux, Update is inherited from TMemIniFile (see page 15462).

See Also

FileName (see page 15450)

TMemIniFile (see page 15462)

82.1.4.3.8 TIniFile.WriteString Method

Writes a string value to an INI file.

Pascal

```
procedure WriteString(const Section: String; const Ident: String; const Value: String);
override;
```

C++

```
virtual __fastcall WriteString(const AnsiString Section, const AnsiString Ident, const
AnsiString Value);
```

Description

Call WriteString to write a string value to an INI file. Section identifies the section in the file that contain the key to which to write. Ident is the name of the key for which to set a value. Value is the string value to write.

Note: Attempting to write a data value to a nonexistent section or attempting to write data to a nonexistent key are not errors. In these cases, WriteString creates the section and key and sets its initial value to Value.

This version of WriteString is only available if the application is compiled for Windows. On Linux, WriteString is inherited from TMemIniFile (see page 15462).

See Also

WriteBool (see page 15446)

WriteInteger (see page 15448)

82.1.5 TMemIniFile Class

TMemIniFile enables buffered storage and retrieval of application-specific information and settings in an INI file.

Class Hierarchy

Pascal

```
TMemIniFile = class(TCustomIniFile);
```

C++

```
class TMemIniFile : public TCustomIniFile;
```

File

IniFiles

Description

Use TMemIniFile to store and retrieve application-specific information and settings in a Windows INI file. An INI file stores information in logical groupings, called "sections." Within each section, actual data values are stored in named keys. Keys take the form:

```
<keyname>=<value>
```

TMemIniFile buffers all changes to the INI file. The INI file is read once, when the object is first created. Data from the INI file is stored in nested string lists. Each section in the INI file occupies one element in the top-most string list, and each element in this may itself contain a string list. Each element in each of the contained string list represents a key within the section. After the data is read, any changes to the data are stored in memory. To write the data from memory back to the associated INI file, call the UpdateFile (see page 15470) method.

All TMemIniFile methods to read, write, and erase sections, keys, and values operate on the in-memory copy of the INI file.

See Also

TStrings (see page 3029)

TIniFile (see page 15455)

TCustomIniFile (see page 15434)

TRegistry (see page 18645)

TRegistryIniFile (see page 18675)

82.1.5.1 TMemIniFile Members

The following tables list the members exposed by TMemIniFile.

Public Methods

	Name	Description
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).

	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Clear (see page 15465)	Erases all data from the INI file in memory.
	Create (see page 15464)	Creates a TMemIniFile (see page 15462) object for an application.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	DeleteKey (see page 15465)	Deletes a specified entry from the .ini file.
V	Destroy (see page 15464)	Frees the memory associated with the TMemIniFile (see page 15462) object.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
V	EraseSection (see page 15466)	Erases an entire section of the INI file.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetStrings (see page 15466)	Populates a string list with INI file data.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	ReadBinaryStream (see page 15438)	Retrieves a binary value from the ini file.
V	ReadBool (see page 15439)	Retrieves a Boolean value from an ini file.
V	ReadDate (see page 15439)	Retrieves a date value from an ini file.
V	ReadDateTime (see page 15440)	Retrieves a date-time value from an ini file.
V	ReadFloat (see page 15440)	Retrieves a float value from an ini file.
V	ReadInteger (see page 15441)	Retrieves an integer value from an ini file.
V	ReadSection (see page 15467)	Reads all the key names from a specified section of an INI file into a string list.
V	ReadSections (see page 15467)	Reads the names of all sections in an INI file into a string list.
A	ReadSections (see page 15442)	This is the overview for the ReadSections method overload.
V	ReadSectionValues (see page 15468)	Reads the values from all keys within a section of an INI file into a string list.
V	ReadString (see page 15468)	Retrieves a string value from the INI file.
V	ReadTime (see page 15444)	Retrieves a time value from an ini file.
	Rename (see page 15469)	Associates the TMemIniFile (see page 15462) with a different INI file.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SectionExists (see page 15444)	Indicates whether a section exists in the ini file.
	SetStrings (see page 15469)	Populates the memory buffer with contents of a string list.
V	UpdateFile (see page 15470)	Flushes buffered INI file data to disk.
V	ValueExists (see page 15445)	Indicates whether a key exists in the ini file.
V	WriteBinaryStream (see page 15446)	This is WriteBinaryStream, a member of class TCustomIniFile.
V	WriteBool (see page 15446)	Writes a Boolean value to an ini file.
V	WriteDate (see page 15446)	Writes a date value to an ini file.
V	WriteDateTime (see page 15447)	Writes a date-time value to an ini file.
V	WriteFloat (see page 15447)	Writes a float value to an ini file.
V	WriteInteger (see page 15448)	Writes an integer value to an ini file.
V	WriteString (see page 15470)	Writes a string value to an INI file.
V	WriteTime (see page 15449)	Writes a time value to an ini file.

Public Properties

	Name	Description
	CaseSensitive (see page 15471)	Controls (see page 5711) whether section and key names are handled in a case-sensitive manner.
R	FileName (see page 15450)	Contains the name of the ini file from which to read and to which to write information.

82.1.5.2 TMemIniFile.Create Constructor

Creates a TMemIniFile (see page 15462) object for an application.

Pascal

```
constructor Create(const FileName: string);
```

C++

```
__fastcall TMemIniFile(const AnsiString FileName);
```

Description

Call Create to instantiate a TMemIniFile (see page 15462) object for an application. Create sets the FileName (see page 15450) property, and loads a copy of the INI file into memory, in an internal string list.

FileName (see page 15450) is the name of the INI file the TMemIniFile (see page 15462) uses.

Note: On Windows, INI files are meant to be stored in the \WINDOWS directory or the application's directory. To work with an INI file in another location, specify the full path name of the file in FileName (see page 15450).

See Also

FileName (see page 15450)

Create (see page 22287)

82.1.5.3 TMemIniFile.Destroy Destructor

Frees the memory associated with the TMemIniFile (see page 15462) object.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TMemIniFile();
```

Description

Do not call Destroy directly; instead call Free.

Warning: The destructor does not write the current memory image to disk. Be sure to save changes made to TMemIniFile (see page 15462) by calling UpdateFile (see page 15470) before destroying a TMemIniFile (see page 15462) instance.

See Also

Free (see page 22300)

UpdateFile (see page 15470)

Create (see page 15464)

82.1.5.4 TMemIniFile Methods

The methods of the TMemIniFile class are listed here.

Public Methods

	Name	Description
	Clear (see page 15465)	Erases all data from the INI file in memory.
V	DeleteKey (see page 15465)	Deletes a specified entry from the .ini file.
V	EraseSection (see page 15466)	Erases an entire section of the INI file.
	GetStrings (see page 15466)	Populates a string list with INI file data.
V	ReadSection (see page 15467)	Reads all the key names from a specified section of an INI file into a string list.
V	ReadSections (see page 15467)	Reads the names of all sections in an INI file into a string list.
V	ReadSectionValues (see page 15468)	Reads the values from all keys within a section of an INI file into a string list.
V	ReadString (see page 15468)	Retrieves a string value from the INI file.
	Rename (see page 15469)	Associates the TMemIniFile (see page 15462) with a different INI file.
	SetStrings (see page 15469)	Populates the memory buffer with contents of a string list.
V	UpdateFile (see page 15470)	Flushes buffered INI file data to disk.
V	WriteString (see page 15470)	Writes a string value to an INI file.

82.1.5.4.1 TMemIniFile.Clear Method

Erases all data from the INI file in memory.

Pascal

```
procedure Clear;
```

C++

```
__fastcall Clear();
```

Description

Call Clear to erase all data from the INI file that is currently buffered in memory. All sections, keys, and values are erased.

Warning: No exception is generated when using Clear and the data has not been saved to the INI file with the UpdateFile (see page 15470) method.

See Also

UpdateFile (see page 15470)

SetStrings (see page 15469)

82.1.5.4.2 TMemIniFile.DeleteKey Method

Deletes a specified entry from the .ini file.

Pascal

```
procedure DeleteKey(const Section: String; const Ident: String); override;
```

C++

```
virtual __fastcall DeleteKey(const AnsiString Section, const AnsiString Ident);
```

Description

Call DeleteKey to erase .ini file entry. Section is string containing the name of a .ini file section, and Ident is a string containing the name of the key to remove.

Note: Attempting to erase a key in a nonexistent section or attempting to erase a nonexistent key are not errors. In these cases, DeleteKey does nothing.

DeleteKey only affects the in-memory copy of the .ini file, not the copy on disk. The change is not written to disk until you call UpdateFile (see page 15470).

See Also

SectionExists (see page 15444)

ValueExists (see page 15445)

EraseSection (see page 15466)

UpdateFile (see page 15445)

CaseSensitive (see page 15471)

82.1.5.4.3 TMemIniFile.EraseSection Method

Erases an entire section of the INI file.

Pascal

```
procedure EraseSection(const Section: string); override;
```

C++

```
virtual __fastcall EraseSection(const AnsiString Section);
```

Description

Call EraseSection to remove a section, all its keys, and their data values from an INI file. Section identifies the INI file section to remove. If a section cannot be removed, an exception is raised.

EraseSection only affects the in-memory copy of the INI file, not the copy on disk. The change is not written to disk until you call UpdateFile (see page 15470).

See Also

SectionExists (see page 15444)

DeleteKey (see page 15465)

UpdateFile (see page 15470)

CaseSensitive (see page 15471)

82.1.5.4.4 TMemIniFile.GetStrings Method

Populates a string list with INI file data.

Pascal

```
procedure GetStrings(List: TStrings);
```

C++

```
__fastcall GetStrings(TStrings List);
```

Description

Call GetStrings to copy the INI file data currently stored in memory into a pre-existing string list.

List is a string list object, created and maintained by the application, into which the INI file data is copied.

See Also

SetStrings (see page 15469)

82.1.5.4.5 TMemIniFile.ReadSection Method

Reads all the key names from a specified section of an INI file into a string list.

Pascal

```
procedure ReadSection(const Section: string; Strings: TStrings); override;
```

C++

```
virtual __fastcall ReadSection(const AnsiString Section, TStrings Strings);
```

Description

Call ReadSection to retrieve the names of all keys within a specified section of an INI file into a string list.

Section identifies the section from which to retrieve a list of key names. Strings specifies the string to hold the retrieved names. Strings can point to a TStrings descendant such as a string list, or to a component property, such as Items for a TListBox component.

Data read by ReadSection comes from the in-memory copy of the INI file, not the copy on disk.

See Also

SectionExists (see page 15444)

ReadSections (see page 15467)

ReadSectionValues (see page 15468)

CaseSensitive (see page 15471)

82.1.5.4.6 TMemIniFile.ReadSections Method

Reads the names of all sections in an INI file into a string list.

Pascal

```
procedure ReadSections(Strings: TStrings); override;
```

C++

```
virtual __fastcall ReadSections(TStrings Strings);
```

Description

Call ReadSections to retrieve the names of all sections in an INI file into a string list.

Strings specifies the string object to hold the retrieved names. Strings can point to a TStrings descendant, or to a component property, such as Items for a TListBox component.

Data read by ReadSections comes from the in-memory copy of the INI file, not the copy on disk.

See Also

ReadSection (see page 15467)

ReadSectionValues (see page 15468)

82.1.5.4.7 TMemIniFile.ReadSectionValues Method

Reads the values from all keys within a section of an INI file into a string list.

Pascal

```
procedure ReadSectionValues(const Section: string; Strings: TStrings); override;
```

C++

```
virtual __fastcall ReadSectionValues(const AnsiString Section, TStrings Strings);
```

Description

Call ReadSectionValues to read the values from all keys within a specified section of an INI file into a string list object. The values are added to the string list as strings of the form KeyName=ValueName.

Section identifies the section in the file from which to read key values.

Strings is the string list object into which to read the values. Strings can point to a TStrings descendant, or to a component property, such as Items for a TListBox component.

Data read by ReadSectionValues comes from the in-memory copy of the INI file, not the copy on disk.

See Also

SectionExists (see page 15444)

ReadSection (see page 15467)

ReadSections (see page 15467)

CaseSensitive (see page 15471)

82.1.5.4.8 TMemIniFile.ReadString Method

Retrieves a string value from the INI file.

Pascal

```
function ReadString(const Section: string; const Ident: string; const Default: string):
string; override;
```

C++

```
virtual __fastcall AnsiString ReadString(const AnsiString Section, const AnsiString Ident,
const AnsiString Default);
```

Description

Call ReadString to read a string value from an INI file. Section identifies the section in the file that contains the desired key. Ident is the name of the key from which to retrieve the value. Default is the string value to return if the:

Section does not exist.

Key does not exist.

Data value for the key is not assigned.

The ReadString method inherited from TCustomIniFile (see page 15434) is modified to operate on the in-memory copy of the INI file data. The read methods for all other data types use ReadString internally and then translate to the appropriate data type.

See Also

ReadBool (see page 15439)

ReadDate (see page 15439)

ReadDateTime (see page 15440)

ReadFloat (see page 15440)

ReadInteger (see page 15441)

ReadTime (see page 15444)

CaseSensitive (see page 15471)

82.1.5.4.9 TMemIniFile.Rename Method

Associates the TMemIniFile (see page 15462) with a different INI file.

Pascal

```
procedure Rename(const FileName: string; Reload: Boolean);
```

C++

```
__fastcall Rename(const AnsiString FileName, Boolean Reload);
```

Description

Call Rename to change the INI file used by the TMemIniFile (see page 15462) object to a file other than the one specified when the object was created.

FileName (see page 15450) is name of the new INI file to use.

Reload determines whether data is immediately loaded into memory from the INI file specified in FileName (see page 15450). When Reload is true, the TMemIniFile (see page 15462) object is repopulated with the data from the specified file. When Reload is false, the in-memory image is unchanged. This is useful, for example, when copying the data from one INI file to another file.

See Also

FileName (see page 15450)

Create (see page 15464)

82.1.5.4.10 TMemIniFile.SetStrings Method

Populates the memory buffer with contents of a string list.

Pascal

```
procedure SetStrings(List: TStrings);
```

C++

```
__fastcall SetStrings(TStrings List);
```

Description

Call SetStrings to populate the in-memory copy of the INI file data with the contents of a string list.

List is a string list object, created and maintained by the application, from which the INI file data is copied.

SetStrings uses the Clear (see page 15465) method to erase any existing INI file data prior to copying the new data.

SetStrings can be used to reread data from the INI file from disk after it is erased with the Clear (see page 15465) method. The LoadFromFile method of a string list can be used to retrieve the contents of the INI file and then SetStrings can copy the data into the memory buffer.

See Also

LoadFromFile (see page 3061)

Clear (see page 15465)

GetStrings (see page 15466)

82.1.5.4.11 TMemIniFile.UpdateFile Method

Flushes buffered INI file data to disk.

Pascal

```
procedure UpdateFile; override;
```

C++

```
virtual __fastcall UpdateFile();
```

Description

Call UpdateFile to copy INI file data stored in memory to the copy of the INI file on disk UpdateFile overwrites all data in the disk copy of the INI file with the INI file data stored in memory.

If the Rename (see page 15469) method is used to change the INI file the TMemIniFile (see page 15462) uses, UpdateFile copies the INI file data in memory to a file of the new name. If the file does not already exist, it is created. If the new file already exists, it is overwritten.

See Also

FileName (see page 15450)

82.1.5.4.12 TMemIniFile.WriteString Method

Writes a string value to an INI file.

Pascal

```
procedure WriteString(const Section: String; const Ident: String; const Value: String);
override;
```

C++

```
virtual __fastcall WriteString(const AnsiString Section, const AnsiString Ident, const
AnsiString Value);
```

Description

Call WriteString to write a string value to an INI file. Section identifies the section in the file that contain the key to which to write. Ident is the name of the key for which to set a value. Value is the string value to write.

The WriteString method inherited from TCustomIniFile (see page 15434) is modified to operate on the in-memory copy of the INI file data. The write methods for all other data types use WriteString internally after data values are translated from the original data type.

Note: Attempting to write a data value to a nonexistent section or attempting to write data to a nonexistent key are not errors. In these cases, WriteString creates the section and key and sets its initial value to Value.

See Also

WriteBool (see page 15446)

WriteDate (see page 15446)

WriteDateTime (see page 15447)

WriteFloat (see page 15447)

WriteInteger (see page 15448)

WriteTime (see page 15449)

CaseSensitive (see page 15471)

82.1.5.5 TMemIniFile Properties

The properties of the TMemIniFile class are listed here.

Public Properties

	Name	Description
	CaseSensitive (see page 15471)	Controls (see page 5711) whether section and key names are handled in a case-sensitive manner.

82.1.5.5.1 TMemIniFile.CaseSensitive Property

Controls (see page 5711) whether section and key names are handled in a case-sensitive manner.

Pascal

```
property CaseSensitive: Boolean;
```

C++

```
__property Boolean CaseSensitive;
```

Description

Use CaseSensitive to indicate whether the names of sections and keys should be treated in a case-sensitive or case-insensitive manner. Set CaseSensitive to true to allow multiple sections or keys that differ only based on case. Set CaseSensitive to false to treat names that differ only by case as the same.

See Also

ReadSection (see page 15467)

ReadString (see page 15468)

SectionExists (see page 15444)

ValueExists (see page 15445)

82.1.6 TStringHash Class

Class Hierarchy

IniFiles.TStringHash

Pascal

```
TStringHash = class;
```

C++

```
class TStringHash;
```

File

IniFiles

Description

This is class IniFiles.TStringHash.

82.1.6.1 TStringHash Members

The following tables list the members exposed by TStringHash.

Protected Methods

	Name	Description
	Find (see page 15473)	This is Find, a member of class TStringHash.
	HashOf (see page 15474)	This is HashOf, a member of class TStringHash.

Public Methods

	Name	Description
	Add (see page 15473)	This is Add, a member of class TStringHash.
	Clear (see page 15473)	This is Clear, a member of class TStringHash.
	Create (see page 15472)	This is Create, a member of class TStringHash.
	Destroy (see page 15472)	This is Destroy, a member of class TStringHash.
	Modify (see page 15474)	This is Modify, a member of class TStringHash.
	Remove (see page 15474)	This is Remove, a member of class TStringHash.
	ValueOf (see page 15474)	This is ValueOf, a member of class TStringHash.

82.1.6.2 TStringHash.Create Constructor

Pascal

```
constructor Create(Size: Cardinal = 256);
```

C++

```
__fastcall TStringHash(unsigned Size = 256);
```

Description

This is Create, a member of class TStringHash.

82.1.6.3 TStringHash.Destroy Destructor

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TStringHash();
```

Description

This is Destroy, a member of class TStringHash.

82.1.6.4 TStringHash Methods

The methods of the TStringHash class are listed here.

Protected Methods

	Name	Description
	Find (see page 15473)	This is Find, a member of class TStringHash.
	HashOf (see page 15474)	This is HashOf, a member of class TStringHash.

Public Methods

	Name	Description
	Add (see page 15473)	This is Add, a member of class TStringHash.
	Clear (see page 15473)	This is Clear, a member of class TStringHash.
	Modify (see page 15474)	This is Modify, a member of class TStringHash.
	Remove (see page 15474)	This is Remove, a member of class TStringHash.
	ValueOf (see page 15474)	This is ValueOf, a member of class TStringHash.

82.1.6.4.1 TStringHash.Add Method

Pascal

```
procedure Add(const Key: string; Value: Integer);
```

C++

```
__fastcall Add(const AnsiString Key, int Value);
```

Description

This is Add, a member of class TStringHash.

82.1.6.4.2 TStringHash.Clear Method

Pascal

```
procedure Clear;
```

C++

```
__fastcall Clear();
```

Description

This is Clear, a member of class TStringHash.

82.1.6.4.3 TStringHash.Find Method

Pascal

```
function Find(const Key: string): PPHashItem;
```

C++

```
__fastcall PPHashItem Find(const AnsiString Key);
```

Description

This is Find, a member of class TStringHash.

82.1.6.4.4 TStringHash.HashOf Method

Pascal

```
function HashOf(const Key: string): Cardinal; virtual;
```

C++

```
virtual __fastcall unsigned HashOf(const AnsiString Key);
```

Description

This is HashOf, a member of class TStringHash.

82.1.6.4.5 TStringHash.Modify Method

Pascal

```
function Modify(const Key: string; Value: Integer): Boolean;
```

C++

```
__fastcall Boolean Modify(const AnsiString Key, int Value);
```

Description

This is Modify, a member of class TStringHash.

82.1.6.4.6 TStringHash.Remove Method

Pascal

```
procedure Remove(const Key: string);
```

C++

```
__fastcall Remove(const AnsiString Key);
```

Description

This is Remove, a member of class TStringHash.

82.1.6.4.7 TStringHash.ValueOf Method

Pascal

```
function ValueOf(const Key: string): Integer;
```

C++

```
__fastcall int ValueOf(const AnsiString Key);
```

Description

This is ValueOf, a member of class TStringHash.

82.2 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Records

	Name	Description
	THashItem (see page 15475)	This is record IniFiles.THashItem.

82.2.1 IniFiles.THashItem Record

Pascal

```
THashItem = record
  Next: PHashItem;
  Key: string;
  Value: Integer;
end;
```

C++

```
struct THashItem {
  PHashItem Next;
  AnsiString Key;
  int Value;
};
```

File

IniFiles

Description

This is record IniFiles.THashItem.

82.3 Types

The following table lists types in this documentation.

Types

Name	Description
PHashItem (see page 15476)	This is type IniFiles.PHashItem.
PPHashItem (see page 15476)	This is type IniFiles.PPHashItem.

82.3.1 IniFiles.PHashItem Type

Pascal

```
PHashItem = ^THashItem;
```

C++

```
^THashItem PHashItem;
```

File

IniFiles

Description

This is type IniFiles.PHashItem.

82.3.2 IniFiles.PPHashItem Type

Pascal

```
PPHashItem = ^PHashItem;
```

C++

```
^PHashItem PPHashItem;
```

File

IniFiles

Description

This is type IniFiles.PPHashItem.

83 IntfInfo Namespace

This is namespace IntfInfo.

Topics

Name	Description
Classes (see page 15479)	The following table lists classes in this documentation.
Functions (see page 15480)	The following table lists functions in this documentation.
Structs, Records, Enums (see page 15485)	The following table lists structs, records, enums in this documentation.
Types (see page 15488)	The following table lists types in this documentation.
Constants (see page 15491)	The following table lists constants in this documentation.

Classes

	Name	Description
	EInterfaceRTTIException (see page 15479)	EInterfaceRTTIException is the exception raised when an interface does not have RTTI.

Constants

Name	Description
CallingConventionName (see page 15491)	This is constant IntfInfo.CallingConventionName.
TypeInfoNames (see page 15491)	This is constant IntfInfo.TypeInfoNames.

Functions

	Name	Description
	GetClsMemberTypeInfo (see page 15480)	This is function IntfInfo.GetClsMemberTypeInfo.
	GetDynArrayElTypeInfo (see page 15480)	This is function IntfInfo.GetDynArrayElTypeInfo.
	GetDynArrayNextInfo (see page 15481)	This is function IntfInfo.GetDynArrayNextInfo.
	GetDynArrayNextInfo2 (see page 15481)	This is function IntfInfo.GetDynArrayNextInfo2.
	GetIntfMetaData (see page 15481)	This is function IntfInfo.GetIntfMetaData.
	GetIntfMetaData (see page 15482)	This is function IntfInfo.GetIntfMetaData.
	GetMethNum (see page 15482)	This is function IntfInfo.GetMethNum.
	GetPropListFlat (see page 15482)	This is function IntfInfo.GetPropListFlat.
	IsStoredPropConst (see page 15483)	This is function IntfInfo.IsStoredPropConst.
	OtherTypeName (see page 15483)	This is function IntfInfo.OtherTypeName.
	SameTypeInfo (see page 15483)	This is function IntfInfo.SameTypeInfo.
	TypeNamesMatch (see page 15484)	This is function IntfInfo.TypeNamesMatch.

Structs, Records, Enums

	Name	Description
	TCallConv (see page 15485)	This is record IntfInfo.TCallConv.
	TFillMethodArrayOpt (see page 15485)	This is record IntfInfo.TFillMethodArrayOpt.
	TIntfMetaData (see page 15486)	This is record IntfInfo.TIntfMetaData.
	TIntfMethEntry (see page 15486)	This is record IntfInfo.TIntfMethEntry.
	TIntfParamEntry (see page 15487)	This is record IntfInfo.TIntfParamEntry.

Types

Name	Description
PIntfMetaData (see page 15488)	This is type IntfInfo.PIntfMetaData.
PIntfMethEntry (see page 15488)	This is type IntfInfo.PIntfMethEntry.
PIntfParamEntry (see page 15489)	This is type IntfInfo.PIntfParamEntry.
TIntfMethEntryArray (see page 15489)	This is type IntfInfo.TIntfMethEntryArray.
TIntfParamEntryArray (see page 15489)	This is type IntfInfo.TIntfParamEntryArray.
TPIntfMethEntryArray (see page 15490)	This is type IntfInfo.TPIntfMethEntryArray.

83.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	EInterfaceRTTIException (see page 15479)	EInterfaceRTTIException is the exception raised when an interface does not have RTTI.

83.1.1 EInterfaceRTTIException Class

EInterfaceRTTIException is the exception raised when an interface does not have RTTI.

Class Hierarchy

System::TObject → SysUtils.Exception → IntfInfo.EInterfaceRTTIException

Pascal

```
EInterfaceRTTIException = class(Exception);
```

C++

```
class EInterfaceRTTIException : public Exception;
```

File

IntfInfo

Description

EInterfaceRTTIException is thrown when an application expects an interface to be invokable but discovers that it does not include any runtime type information (RTTI). For example, the invocation registry raises an EInterfaceRTTIException exception when an application tries to register an interface that is not compiled with RTTI. Invoker components raise an EInterfaceRTTIException exception when an incoming request includes a call to an interface that does not include RTTI.

See Also

TInvokableClassRegistry (see page 15526)

TSoapPascalInvoker (see page 20020)

IInvokable (see page 22398)

83.2 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	GetClsMemberTypeInfo (see page 15480)	This is function IntfInfo.GetClsMemberTypeInfo.
	GetDynArrayElTypeInfo (see page 15480)	This is function IntfInfo.GetDynArrayElTypeInfo.
	GetDynArrayNextInfo (see page 15481)	This is function IntfInfo.GetDynArrayNextInfo.
	GetDynArrayNextInfo2 (see page 15481)	This is function IntfInfo.GetDynArrayNextInfo2.
	GetIntfMetaData (see page 15481)	This is function IntfInfo.GetIntfMetaData.
	GetIntfMetaData (see page 15482)	This is function IntfInfo.GetIntfMetaData.
	GetMethNum (see page 15482)	This is function IntfInfo.GetMethNum.
	GetPropListFlat (see page 15482)	This is function IntfInfo.GetPropListFlat.
	IsStoredPropConst (see page 15483)	This is function IntfInfo.IsStoredPropConst.
	OtherTypeName (see page 15483)	This is function IntfInfo.OtherTypeName.
	SameTypeInfo (see page 15483)	This is function IntfInfo.SameTypeInfo.
	TypeNamesMatch (see page 15484)	This is function IntfInfo.TypeNamesMatch.

83.2.1 IntfInfo.GetClsMemberTypeInfo Function

Pascal

```
function GetClsMemberTypeInfo(const ObjectTypeInfo: PTypeInfo; const MemberName: string = ''):
PTypeInfo;
```

C++

```
PTypeInfo GetClsMemberTypeInfo(const PTypeInfo ObjectTypeInfo, const AnsiString MemberName =
'');
```

File

IntfInfo

Description

This is function IntfInfo.GetClsMemberTypeInfo.

83.2.2 IntfInfo.GetDynArrayElTypeInfo Function

Pascal

```
procedure GetDynArrayElTypeInfo(typeInfo: PTypeInfo; var EltInfo: PTypeInfo; var Dims:
Integer);
```

C++

```
GetDynArrayElTypeInfo(PTypeInfo typeInfo, PTypeInfo EltInfo, int Dims);
```

File

IntfInfo

Description

This is function IntfInfo.GetDynArrayElTypeInfo.

83.2.3 IntfInfo.GetDynArrayNextInfo Function

Pascal

```
function GetDynArrayNextInfo(typeInfo: PTypeInfo): PTypeInfo;
```

C++

```
PTypeInfo GetDynArrayNextInfo(PTypeInfo typeInfo);
```

File

IntfInfo

Description

This is function IntfInfo.GetDynArrayNextInfo.

83.2.4 IntfInfo.GetDynArrayNextInfo2 Function

Pascal

```
function GetDynArrayNextInfo2(typeInfo: PTypeInfo; var Name: string): PTypeInfo;
```

C++

```
PTypeInfo GetDynArrayNextInfo2(PTypeInfo typeInfo, AnsiString Name);
```

File

IntfInfo

Description

This is function IntfInfo.GetDynArrayNextInfo2.

83.2.5 IntfInfo.GetIntfMetaData Function

Pascal

```
procedure GetIntfMetaData(Info: PTypeInfo; var IntfMD: TIntfMetaData; IncludeAllAncMethods:
Boolean = False); overload;
```

C++

```
GetIntfMetaData(PTypeInfo Info, TIntfMetaData IntfMD, Boolean IncludeAllAncMethods = False);
```

File

IntfInfo

Description

This is function IntfInfo.GetIntfMetaData.

83.2.6 IntfInfo.GetIntfMetaData Function

Pascal

```
procedure GetIntfMetaData(Info: PTypeInfo; var IntfMD: TIntfMetaData; MethodArrayOpt:
TFillMethodArrayOpt); overload;
```

C++

```
GetIntfMetaData(PTypeInfo Info, TIntfMetaData IntfMD, TFillMethodArrayOpt MethodArrayOpt);
```

File

IntfInfo

Description

This is function IntfInfo.GetIntfMetaData.

83.2.7 IntfInfo.GetMethNum Function

Pascal

```
function GetMethNum(const IntfMD: TIntfMetaData; const MethName: string; ParamCount: Integer =
-1): Integer;
```

C++

```
int GetMethNum(const TIntfMetaData IntfMD, const AnsiString MethName, int ParamCount = -1);
```

File

IntfInfo

Description

This is function IntfInfo.GetMethNum.

83.2.8 IntfInfo.GetPropListFlat Function

Pascal

```
function GetPropListFlat(TypeInfo: PTypeInfo; out PropList: PPropList): Integer;
```

C++

```
int GetPropListFlat(PTypeInfo TypeInfo, PPropList PropList);
```

File

IntfInfo

Description

This is function IntfInfo.GetPropListFlat.

83.2.9 IntfInfo.IsStoredPropConst Function

Pascal

```
function IsStoredPropConst(Instance: TObject; PropInfo: PPropInfo): Boolean;
```

C++

```
Boolean IsStoredPropConst(TObject * Instance, PPropInfo PropInfo);
```

File

IntfInfo

Description

This is function IntfInfo.IsStoredPropConst.

83.2.10 IntfInfo.OtherTypeName Function

Pascal

```
function OtherTypeName(const TypeName: string): string;
```

C++

```
AnsiString OtherTypeName(const AnsiString TypeName);
```

File

IntfInfo

Description

This is function IntfInfo.OtherTypeName.

83.2.11 IntfInfo.SameTypeInfo Function

Pascal

```
function SameTypeInfo(const RegInfo: PTypeInfo; const OtherInfo: PTypeInfo): boolean;
```

C++

```
boolean SameTypeInfo(const PTypeInfo RegInfo, const PTypeInfo OtherInfo);
```

File

IntfInfo

Description

This is function IntfInfo.SameTypeInfo.

83.2.12 IntfInfo.TypeNamesMatch Function

Pascal

```
function TypeNamesMatch(const RegName: string; const OtherName: string): boolean;
```

C++

```
boolean TypeNamesMatch(const AnsiString RegName, const AnsiString OtherName);
```

File

IntfInfo

Description

This is function IntfInfo.TypeNamesMatch.

83.3 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TCallConv (see page 15485)	This is record IntfInfo.TCallConv.
	TFillMethodArrayOpt (see page 15485)	This is record IntfInfo.TFillMethodArrayOpt.

Records

	Name	Description
	TIntfMetaData (see page 15486)	This is record IntfInfo.TIntfMetaData.
	TIntfMethEntry (see page 15486)	This is record IntfInfo.TIntfMethEntry.
	TIntfParamEntry (see page 15487)	This is record IntfInfo.TIntfParamEntry.

83.3.1 IntfInfo.TCallConv Enumeration

Pascal

```
TCallConv = (
  ccReg,
  ccCdecl,
  ccPascal,
  ccStdCall,
  ccSafeCall
);
```

C++

```
enum TCallConv {
  ccReg,
  ccCdecl,
  ccPascal,
  ccStdCall,
  ccSafeCall
};
```

File

IntfInfo

Description

This is record IntfInfo.TCallConv.

83.3.2 IntfInfo.TFillMethodArrayOpt Enumeration

Pascal

```
TFillMethodArrayOpt = (
  fmoAllBaseMethods,
  fmoRTTIBaseMethods,
```

```
    fmoNoBaseMethods
  );
```

C++

```
  enum TFillMethodArrayOpt {
    fmoAllBaseMethods,
    fmoRTTIBaseMethods,
    fmoNoBaseMethods
  };
```

File

IntfInfo

Description

This is record IntfInfo.TFillMethodArrayOpt.

83.3.3 IntfInfo.TIntfMetaData Record

Pascal

```
  TIntfMetaData = record
    Name: string;
    UnitName: string;
    MDA: TIntfMethEntryArray;
    IID: TGUID;
    Info: PTypeInfo;
    AncInfo: PTypeInfo;
    NumAnc: Integer;
  end;
```

C++

```
  struct TIntfMetaData {
    AnsiString Name;
    AnsiString UnitName;
    TIntfMethEntryArray MDA;
    TGUID IID;
    PTypeInfo Info;
    PTypeInfo AncInfo;
    int NumAnc;
  };
```

File

IntfInfo

Description

This is record IntfInfo.TIntfMetaData.

83.3.4 IntfInfo.TIntfMethEntry Record

Pascal

```
  TIntfMethEntry = record
    Name: string;
    CC: TCallConv;
    Pos: Integer;
    ParamCount: Integer;
```

```
    ResultInfo: PTypeInfo;
    SelfInfo: PTypeInfo;
    Params: TIntfParamEntryArray;
    HasRTTI: Boolean;
  end;
```

C++

```
  struct TIntfMethEntry {
    AnsiString Name;
    TCallConv CC;
    int Pos;
    int ParamCount;
    PTypeInfo ResultInfo;
    PTypeInfo SelfInfo;
    TIntfParamEntryArray Params;
    Boolean HasRTTI;
  };
```

File

IntfInfo

Description

This is record IntfInfo.TIntfMethEntry.

83.3.5 IntfInfo.TIntfParamEntry Record

Pascal

```
  TIntfParamEntry = record
    Flags: TParamFlags;
    Name: string;
    Info: PTypeInfo;
  end;
```

C++

```
  struct TIntfParamEntry {
    TParamFlags Flags;
    AnsiString Name;
    PTypeInfo Info;
  };
```

File

IntfInfo

Description

This is record IntfInfo.TIntfParamEntry.

83.4 Types

The following table lists types in this documentation.

Types

Name	Description
PIntfMetaData (see page 15488)	This is type IntfInfo.PIntfMetaData.
PIntfMethEntry (see page 15488)	This is type IntfInfo.PIntfMethEntry.
PIntfParamEntry (see page 15489)	This is type IntfInfo.PIntfParamEntry.
TIntfMethEntryArray (see page 15489)	This is type IntfInfo.TIntfMethEntryArray.
TIntfParamEntryArray (see page 15489)	This is type IntfInfo.TIntfParamEntryArray.
TPIntfMethEntryArray (see page 15490)	This is type IntfInfo.TPIntfMethEntryArray.

83.4.1 IntfInfo.PIntfMetaData Type

Pascal

```
PIntfMetaData = ^TIntfMetaData;
```

C++

```
^TIntfMetaData PIntfMetaData;
```

File

IntfInfo

Description

This is type IntfInfo.PIntfMetaData.

83.4.2 IntfInfo.PIntfMethEntry Type

Pascal

```
PIntfMethEntry = ^TIntfMethEntry;
```

C++

```
^TIntfMethEntry PIntfMethEntry;
```

File

IntfInfo

Description

This is type IntfInfo.PIntfMethEntry.

83.4.3 IntfInfo.PIntfParamEntry Type

Pascal

```
PIntfParamEntry = ^TIntfParamEntry;
```

C++

```
^TIntfParamEntry PIntfParamEntry;
```

File

IntfInfo

Description

This is type IntfInfo.PIntfParamEntry.

83.4.4 IntfInfo.TIntfMethEntryArray Type

Pascal

```
TIntfMethEntryArray = array of TIntfMethEntry;
```

C++

```
array of TIntfMethEntry TIntfMethEntryArray;
```

File

IntfInfo

Description

This is type IntfInfo.TIntfMethEntryArray.

83.4.5 IntfInfo.TIntfParamEntryArray Type

Pascal

```
TIntfParamEntryArray = array of TIntfParamEntry;
```

C++

```
array of TIntfParamEntry TIntfParamEntryArray;
```

File

IntfInfo

Description

This is type IntfInfo.TIntfParamEntryArray.

83.4.6 IntfInfo.TPIntfMethEntryArray Type

Pascal

```
TPIntfMethEntryArray = array of PIntfMethEntry;
```

C++

```
array of PIntfMethEntry TPIntfMethEntryArray;
```

File

IntfInfo

Description

This is type IntfInfo.TPIntfMethEntryArray.

83.5 Constants

The following table lists constants in this documentation.

Constants

Name	Description
CallingConventionName (see page 15491)	This is constant IntfInfo.CallingConventionName.
TypeInfoNames (see page 15491)	This is constant IntfInfo.TypeInfoNames.

83.5.1 IntfInfo.CallingConventionName Constant

Pascal

```
CallingConventionName: array[ccReg..ccSafeCall] of string = ('REGISTER', 'CDECL', 'PASCAL',
'STDCALL', 'SAFECALL');
```

C++

```
array[ccReg..ccSafeCall] of string CallingConventionName = ('REGISTER', 'CDECL', 'PASCAL',
'STDCALL', 'SAFECALL');
```

File

IntfInfo

Description

This is constant IntfInfo.CallingConventionName.

83.5.2 IntfInfo.TypeInfoNames Constant

Pascal

```
TypeInfoNames: array[0..33] of string = ( 'Boolean', 'bool', 'Char', 'char', 'Char', 'signed
char', 'Byte', 'unsigned char', 'SmallInt', 'short', 'Word', 'unsigned short', 'Integer',
'int', 'Cardinal', 'unsigned int', 'Integer', 'long', 'Cardinal', 'unsigned long', 'Int64',
'__int64', 'Int64', 'unsigned __int64', 'Single', 'float', 'Double', 'double', 'Extended',
'long double', 'String', 'AnsiString', 'WideString', 'WideString');
```

C++

```
array[0..33] of string TypeInfoNames = ( 'Boolean', 'bool', 'Char', 'char', 'Char', 'signed
char', 'Byte', 'unsigned char', 'SmallInt', 'short', 'Word', 'unsigned short', 'Integer',
'int', 'Cardinal', 'unsigned int', 'Integer', 'long', 'Cardinal', 'unsigned long', 'Int64',
'__int64', 'Int64', 'unsigned __int64', 'Single', 'float', 'Double', 'double', 'Extended',
'long double', 'String', 'AnsiString', 'WideString', 'WideString');
```

File

IntfInfo

Description

This is constant IntfInfo.TypeInfoNames.

84 InvokeRegistry Namespace

This is namespace InvokeRegistry.

Topics

Name	Description
Classes (see page 15496)	The following table lists classes in this documentation.
Interfaces (see page 15609)	The following table lists interfaces in this documentation.
Functions (see page 15619)	The following table lists functions in this documentation.
Structs, Records, Enums (see page 15624)	The following table lists structs, records, enums in this documentation.
Types (see page 15636)	The following table lists types in this documentation.
Variables (see page 15644)	The following table lists variables in this documentation.
Constants (see page 15645)	The following table lists constants in this documentation.

Classes

	Name	Description
	ERemotableException (see page 15496)	ERemotableException is the class for exceptions that can be communicated from a Web Service application to a client application.
	ETypeRegistryException (see page 15500)	ETypeRegistryException is the exception raised when the invocation registry or the invokable type registry encounters an invalid type.
	TDataContext (see page 15501)	TDataContext stores temporary information about a set of objects, Variants (see page 23567), and other related values.
	THeaderList (see page 15509)	THeaderList maintains a list of SOAP headers.
	TInvContext (see page 15516)	TInvContext stores information about a method call on an invokeable interface.
	TInvokableClass (see page 15520)	TInvokableClass is the base class for the implementation classes of invokable interfaces.
	TInvokableClassRegistry (see page 15526)	TInvokableClassRegistry is the type of the invocation registry.
	TRemotable (see page 15556)	TRemotable is the base class for classes that can be passed as parameters or return values in a Web Service application.
	TRemotableTypeRegistry (see page 15562)	TRemotableTypeRegistry is the type of the remotable type registry.
	TRemotableXS (see page 15580)	TRemotableXS is the base class for classes that represent a non-native scalar type on an invokable interface in a Web Service application.
	TSOAPAttachment (see page 15583)	TSOAPAttachment represents an attachment that is included with SOAP messages that represent method calls in a Web Service application.
	TSOAPHeader (see page 15596)	TSOAPHeader represents a header on the SOAP envelope that contains an encoded message in a Web Service application.
	TSOAPHeaders (see page 15600)	TSOAPHeaders is a helper object for implementing the ISOAPHeaders (see page 15613) interface.
	TSOAPHeadersBase (see page 15605)	TSOAPHeadersBase is the base class for classes that maintain lists of SOAP headers.

Constants

Name	Description
AS_ATTRIBUTE (see page 15645)	Identifies a property of a remotable class as one that corresponds to an attribute in the SOAP encoding.
XMLBase64Types (see page 15645)	This is constant InvokeRegistry.XMLBase64Types.
XMLSchemaInstNamepspaces (see page 15646)	This is constant InvokeRegistry.XMLSchemaInstNamepspaces.
XMLSchemaNamepspaces (see page 15646)	This is constant InvokeRegistry.XMLSchemaNamepspaces.

Functions

	Name	Description
	GetRemotableDataContext (see page 15619)	Returns the TDataContext (see page 15501) object that provides temporary storage during a call to an invokable interface.
	InvRegistry (see page 15620)	Provides access to the invocation registry.
	RemClassRegistry (see page 15620)	Provides access to the remotable class registry.
	RemTypeRegistry (see page 15621)	Provides access to the remotable type registry.
	SetRemotableDataContext (see page 15622)	Sets the data context that provides temporary storage during a call to an invokable interface.
	SubstituteStrings (see page 15623)	This is function InvokeRegistry.SubstituteStrings.

Interfaces

	Name	Description
	IHeadersSetter (see page 15609)	This is class InvokeRegistry.IHeadersSetter.
	IObjConverter (see page 15610)	IObjConverter is the interface for converting between a remotable class and its SOAP representation.
	ISOAPHeaders (see page 15613)	ISOAPHeaders is the interface for accessing the headers that accompany a message encoded using SOAP.

Structs, Records, Enums

	Name	Description
	eHeaderMethodType (see page 15624)	eHeaderMethodType and THeaderMethodTypeArray (see page 15638) indicate the types of messages that should include a given header type.
	ExtNameMapItem (see page 15625)	This is record InvokeRegistry.ExtNameMapItem.
	IntfExceptionItem (see page 15625)	IntfExceptionItem and TExceptionItemArray (see page 15638) describe the association between a remotable exception and an interface that can raise it.
	IntfHeaderItem (see page 15626)	IntfHeaderItem and THeaderItemArray (see page 15638) describe the association between a header and the SOAP messages that include it.
	InvRegClassEntry (see page 15627)	This is record InvokeRegistry.InvRegClassEntry.
	InvRegIntfEntry (see page 15627)	InvRegIntfEntry stores information about an invokable interface.
	MethParamNameMapItem (see page 15629)	This is record InvokeRegistry.MethParamNameMapItem.
	ObjectConvertOptions (see page 15629)	ObjectConvertOptions and TObjectConvertOptions (see page 15640) are flags that customize how to convert a remotable object to or from its SOAP representation.
	SerializationOptions (see page 15630)	SerializationOptions and TSerializationOptions (see page 15642) are flags that customize how to convert a remotable object to or from its SOAP representation.
	TDynToClear (see page 15631)	This is record InvokeRegistry.TDynToClear.
	TIntfInvokeOption (see page 15632)	TIntfInvokeOption and TIntfInvokeOptions (see page 15639) represent flags that customize how to handle calls to an invokable interface.
	TObjMultiOptions (see page 15633)	TObjMultiOptions indicates how multiple references to the same remotable class should be translated into a SOAP representation.
	TRemHeaderEntry (see page 15634)	This is record InvokeRegistry.TRemHeaderEntry.
	TRemRegEntry (see page 15634)	TRemRegEntry stores information for the remotable type registry.

Types

Name	Description
ERemotableExceptionClass (see page 15636)	This is type InvokeRegistry.ERemotableExceptionClass.
InvString (see page 15637)	This is type InvokeRegistry.InvString.
PTRemotable (see page 15637)	This is type InvokeRegistry.PTRemotable.

TCreateInstanceProc (see page 15637)	TCreateInstanceProc is the type of the factory routine that returns an instance of an invokable class.
TExceptionItemArray (see page 15638)	This is type InvokeRegistry.TExceptionItemArray.
THeaderItemArray (see page 15638)	This is type InvokeRegistry.THeaderItemArray.
THeaderMethodTypeArray (see page 15638)	This is type InvokeRegistry.THeaderMethodTypeArray.
TIntfInvokeOptions (see page 15639)	This is type InvokeRegistry.TIntfInvokeOptions.
TInvokableClassClass (see page 15639)	This is type InvokeRegistry.TInvokableClassClass.
TInvRegIntfEntryArray (see page 15639)	This is type InvokeRegistry.TInvRegIntfEntryArray.
TObjectConvertOptions (see page 15640)	This is type InvokeRegistry.TObjectConvertOptions.
TPascalRemotableClassRegistry (see page 15640)	TPascalRemotableClassRegistry is the type of the remotable class registry.
TPascalRemotableTypeRegistry (see page 15640)	TPascalRemotableTypeRegistry is the type of the remotable type registry.
TRemotableClass (see page 15641)	This is type InvokeRegistry.TRemotableClass.
TRemotableClassRegistry (see page 15641)	This is type InvokeRegistry.TRemotableClassRegistry.
TRemotableXSClass (see page 15641)	This is type InvokeRegistry.TRemotableXSClass.
TRemRegEntryArray (see page 15642)	This is type InvokeRegistry.TRemRegEntryArray.
TRequiredArray (see page 15642)	TRequiredArray is a dynamic array of boolean values.
TSerializationOptions (see page 15642)	This is type InvokeRegistry.TSerializationOptions.
TSOAPAttachmentClass (see page 15643)	This is type InvokeRegistry.TSOAPAttachmentClass.
TSOAPHeaderClass (see page 15643)	This is type InvokeRegistry.TSOAPHeaderClass.

Variables

Name	Description
AppNameSpacePrefix (see page 15644)	Supplies a unique prefix to use for automatically generated namespaces given to invokable interfaces and remotable types.

84.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	ERemotableException (see page 15496)	ERemotableException is the class for exceptions that can be communicated from a Web Service application to a client application.
	ETypeRegistryException (see page 15500)	ETypeRegistryException is the exception raised when the invocation registry or the invokable type registry encounters an invalid type.
	TDataContext (see page 15501)	TDataContext stores temporary information about a set of objects, Variants (see page 23567), and other related values.
	THeaderList (see page 15509)	THeaderList maintains a list of SOAP headers.
	TInvContext (see page 15516)	TInvContext stores information about a method call on an invokeable interface.
	TInvokableClass (see page 15520)	TInvokableClass is the base class for the implementation classes of invokable interfaces.
	TInvokableClassRegistry (see page 15526)	TInvokableClassRegistry is the type of the invocation registry.
	TRemotable (see page 15556)	TRemotable is the base class for classes that can be passed as parameters or return values in a Web Service application.
	TRemotableTypeRegistry (see page 15562)	TRemotableTypeRegistry is the type of the remotable type registry.
	TRemotableXS (see page 15580)	TRemotableXS is the base class for classes that represent a non-native scalar type on an invokable interface in a Web Service application.
	TSOAPAttachment (see page 15583)	TSOAPAttachment represents an attachment that is included with SOAP messages that represent method calls in a Web Service application.
	TSOAPHeader (see page 15596)	TSOAPHeader represents a header on the SOAP envelope that contains an encoded message in a Web Service application.
	TSOAPHeaders (see page 15600)	TSOAPHeaders is a helper object for implementing the ISOAPHeaders (see page 15613) interface.
	TSOAPHeadersBase (see page 15605)	TSOAPHeadersBase is the base class for classes that maintain lists of SOAP headers.

84.1.1 ERemotableException Class

ERemotableException is the class for exceptions that can be communicated from a Web Service application to a client application.

Class Hierarchy

Pascal

```
ERemotableException = class(Exception);
```

C++

```
class ERemotableException : public Exception;
```

File

InvokeRegistry

Description

ERemotableException is the exception class for exceptions that a client raises based on a SOAP fault packet that it receives from a Web Service application. The ERemotableException properties represent standard elements of the SOAP fault packet.

Create (see page 15498) an ERemotableException descendant to define a custom exception class for problems encountered when executing the methods of an invokable interface in a Web Service application. When a Web Service application raises an ERemotableException descendant in the course of executing a request from a client application, it adds the values of any published properties to the fault packet, in addition to the value of the Message property. Note that these published properties must be remotable types: that is, the value must be a scalar type, or it must be a registered descendant of TRemotable (see page 15556).

Before the properties of an ERemotableException descendant can be transmitted in a fault packet, it must be registered with the remotable type registry (RemTypeRegistry (see page 15621)). Call the RegisterXSClass method of the remotable type registry, on both the client and the server application, to enable your exception class to be transmitted.

Creating Custom Exception Classes for Web Services

84.1.1.1 ERemotableException Members

The following tables list the members exposed by ERemotableException.

Public Methods

	Name	Description
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 15498)	This is the overview for the Create constructor overload.
	CreateFmt (see page 22754)	Instantiates an instance of an exception with a formatted message string.
	CreateFmtHelp (see page 22755)	Instantiates an instance of an exception with a formatted message string and a help-context ID.
	CreateHelp (see page 22755)	Creates an instance of an exception with a simple message string and a help-context ID.
	CreateRes (see page 22756)	This is the overview for the CreateRes constructor overload.
	CreateResFmt (see page 22756)	This is the overview for the CreateResFmt constructor overload.
	CreateResFmtHelp (see page 22757)	This is the overview for the CreateResFmtHelp constructor overload.
	CreateResHelp (see page 22759)	This is the overview for the CreateResHelp constructor overload.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.

	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
	FaultActor (see page 15499)	Indicates the agent that raised the fault.
	FaultCode (see page 15499)	Indicates where the fault was encountered.
	FaultDetail (see page 15500)	Provides application-specific details about the exception that occurred.
	HelpContext (see page 22760)	Indicates the context ID number for context-sensitive online help associated with the exception.
	Message (see page 22760)	Message contains the text string to display in the exception dialog box when the exception is raised.

84.1.1.2 Create Constructor

This is the overview for the Create constructor overload.

Overload List

	Name	Description
	ERemotableException.Create () (see page 15498)	Creates and initializes an instance of ERemotableException (see page 15496).
	ERemotableException.Create (string, WideString, WideString) (see page 15498)	Creates and initializes an instance of ERemotableException (see page 15496).

84.1.1.2.1 ERemotableException.Create Constructor ()

Creates and initializes an instance of ERemotableException (see page 15496).

Pascal

```
constructor Create; virtual; overload;
constructor Create(const Msg: string; const AFaultCode: WideString = ''; const AFaultActor:
WideString = ''); virtual; overload;
```

C++

```
virtual __fastcall ERemotableException();
virtual __fastcall ERemotableException(const AnsiString Msg, const BSTR AFaultCode = '', const
BSTR AFaultActor = '');
```

Description

Create generates an ERemotableException (see page 15496) object.

Msg is the error message associated with the exception. It becomes the value of the Message property.

AFaultCode indicates where the fault that gave rise to the exception was encountered. It becomes the value of the FaultCode (see page 15499) property.

AFaultActor indicates the agent that gave rise to the fault. It becomes the value of the FaultActor (see page 15499) property.

See Also

Message (see page 22760)

FaultCode (see page 15499)

FaultActor (see page 15499)

84.1.1.3 ERemotableException Properties

The properties of the ERemotableException class are listed here.

Public Properties

	Name	Description
	FaultActor (see page 15499)	Indicates the agent that raised the fault.
	FaultCode (see page 15499)	Indicates where the fault was encountered.
	FaultDetail (see page 15500)	Provides application-specific details about the exception that occurred.

84.1.1.3.1 ERemotableException.FaultActor Property

Indicates the agent that raised the fault.

Pascal

```
property FaultActor: WideString;
```

C++

```
__property BSTR FaultActor;
```

Description

FaultActor is the URI of the agent that caused the fault. This is used when the SOAP request passes through multiple agents when processed. The FaultActor can be a proxy server, the Web Service application to which the request was addressed, or another agent that the target Web Service application calls on when processing the request.

This property is only set if the Web Service provider specifies a FaultActor in its SOAP fault packet.

See Also

FaultCode (see page 15499)

84.1.1.3.2 ERemotableException.FaultCode Property

Indicates where the fault was encountered.

Pascal

```
property FaultCode: WideString;
```

C++

```
__property BSTR FaultCode;
```

Description

FaultCode is one of the following strings:

Value	Meaning
Server	The Web Service application raised the exception before it was able to begin processing the content of the SOAP request packet. For example, if the server can't process a request because it is out of memory, it specifies a FaultCode of 'Server'.
Client	The Web Service application raised the exception because of an error in the SOAP request packet that the client provided. For example, if the SOAP request packet specified a nonexistent method or invalid parameter, the server specifies a FaultCode of 'Client'.
VersionMismatch	The Web Service application is a different version than the one that the SOAP request packet specifies.
MustUnderstand	The Web Service application did not understand one of the SOAP headers in the request packet and the request packet set its MustUnderstand header to indicate that the server must handle all of its SOAP headers.

See Also

FaultActor (see page 15499)

84.1.1.3.3 ERemotableException.FaultDetail Property

Provides application-specific details about the exception that occurred.

Pascal

```
property FaultDetail: WideString;
```

C++

```
__property BSTR FaultDetail;
```

Description

FaultDetail is a fragment of XML that the server generates to provide detailed information about the exception that occurred. FaultDetail provides context information in addition to the fault message that becomes the value of the Message property.

Each server defines the structure and meaning of FaultDetail in an application-specific way. When an ERemotableException (see page 15496) descendant includes published properties, their values are added to FaultDetail.

See Also

Message (see page 22760)

84.1.2 ETypeRegistryException Class

ETypeRegistryException is the exception raised when the invocation registry or the invokable type registry encounters an invalid type.

Class Hierarchy

Pascal

```
ETypeRegistryException = class(Exception);
```

C++

```
class ETypeRegistryException : public Exception;
```

File

InvokeRegistry

Description

ETypeRegistryException is thrown when

An application tries to register an implementation class with the invocation registry and that class does not implement any interfaces.

An application tries to look up a type in the remotable type registry that is not remotable.

See Also

TInvokableClassRegistry (see page 15526)

TRemotableTypeRegistry (see page 15562)

84.1.3 TDataContext Class

TDataContext stores temporary information about a set of objects, Variants (see page 23567), and other related values.

Class Hierarchy

Pascal

```
TDataContext = class;
```

C++

```
class TDataContext;
```

File

InvokeRegistry

Description

TDataContext is a repository for information that belongs together. It introduces a number of methods for storing different types of information, including objects, Variants (see page 23567), pointers, and raw data (untyped bytes). When the TDataContext object is freed, it performs all necessary cleanup of the information it stores, freeing the objects, clearing the Variants (see page 23567), and so on.

Do not use TDataContext directly. It is intended as a base class for classes that need a temporary repository that serves a specific purpose. TDataContext does not allocate the internal dynamic arrays that store pointers and raw data: This task is left to descendant classes, such as TInvContext (see page 15516).

See Also

TInvContext (see page 15516)

84.1.3.1 TDataContext Members

The following tables list the members exposed by TDataContext.

Protected Fields

	Name	Description
	Data (see page 15503)	This is Data, a member of class TDataContext.
	DataOffset (see page 15503)	This is DataOffset, a member of class TDataContext.
	DataP (see page 15503)	This is DataP, a member of class TDataContext.
	DynArrayToClear (see page 15504)	This is DynArrayToClear, a member of class TDataContext.
	FObjsToDestroy (see page 15504)	This is FObjsToDestroy, a member of class TDataContext.
	StrToClear (see page 15504)	This is StrToClear, a member of class TDataContext.
	VarToClear (see page 15504)	This is VarToClear, a member of class TDataContext.
	WStrToClear (see page 15504)	This is WStrToClear, a member of class TDataContext.

Public Methods

	Name	Description
	AddDynArrayToClear (see page 15505)	Stores a dynamic array that can be cleared when the data context is finished.
	AddObjectToDestroy (see page 15506)	Stores an object that can be freed when the data context is finished.
	AddStrToClear (see page 15506)	Stores a string that can be cleared when the data context is finished.
	AddVariantToClear (see page 15507)	Stores the value of a Variant that can be cleared when the data context is finished.
	AddWStrToClear (see page 15507)	Stores a wide string that can be cleared when the data context is finished.
	AllocData (see page 15508)	Returns a pointer to the data context's cache of raw memory.
	Create (see page 15502)	Creates an instance of TDataContext (see page 15501).
V	Destroy (see page 15502)	Destroys an instance of TDataContext (see page 15501).
	GetDataPointer (see page 15508)	Returns a pointer from the internal cache of pointers.
	RemoveObjectToDestroy (see page 15508)	Remove an object from the list of objects to free when the data context is freed.
	SetDataPointer (see page 15509)	Stores a pointer in the internal cache of pointers.

84.1.3.2 TDataContext.Create Constructor

Creates an instance of TDataContext (see page 15501).

Pascal

```
constructor Create;
```

C++

```
__fastcall TDataContext();
```

Description

Call Create to instantiate a TDataContext (see page 15501) object.

84.1.3.3 TDataContext.Destroy Destructor

Destroys an instance of TDataContext (see page 15501).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TDataContext();
```

Description

Destroy frees all the temporary data stored in the TDataContext (see page 15501) instance.

See Also

delete

84.1.3.4 TDataContext Fields

The fields of the TDataContext class are listed here.

Protected Fields

	Name	Description
	Data (see page 15503)	This is Data, a member of class TDataContext.
	DataOffset (see page 15503)	This is DataOffset, a member of class TDataContext.
	DataP (see page 15503)	This is DataP, a member of class TDataContext.
	DynArrayToClear (see page 15504)	This is DynArrayToClear, a member of class TDataContext.
	FObjsToDestroy (see page 15504)	This is FObjsToDestroy, a member of class TDataContext.
	StrToClear (see page 15504)	This is StrToClear, a member of class TDataContext.
	VarToClear (see page 15504)	This is VarToClear, a member of class TDataContext.
	WStrToClear (see page 15504)	This is WStrToClear, a member of class TDataContext.

84.1.3.4.1 TDataContext.Data Field

Pascal

```
Data: array of Byte;
```

C++

```
array of Byte Data;
```

Description

This is Data, a member of class TDataContext.

84.1.3.4.2 TDataContext.DataOffset Field

Pascal

```
DataOffset: Integer;
```

C++

```
int DataOffset;
```

Description

This is DataOffset, a member of class TDataContext.

84.1.3.4.3 TDataContext.DataP Field

Pascal

```
DataP: array of Pointer;
```

C++

```
array of Pointer DataP;
```

Description

This is DataP, a member of class TDataContext.

84.1.3.4.4 TDataContext.DynArrayToClear Field

Pascal

```
DynArrayToClear: array of TDynToClear;
```

C++

```
array of TDynToClear DynArrayToClear;
```

Description

This is DynArrayToClear, a member of class TDataContext.

84.1.3.4.5 TDataContext.FObjsToDestroy Field

Pascal

```
FObjsToDestroy: array of TObject;
```

C++

```
array of TObject FObjsToDestroy;
```

Description

This is FObjsToDestroy, a member of class TDataContext.

84.1.3.4.6 TDataContext.StrToClear Field

Pascal

```
StrToClear: array of Pointer;
```

C++

```
array of Pointer StrToClear;
```

Description

This is StrToClear, a member of class TDataContext.

84.1.3.4.7 TDataContext.VarToClear Field

Pascal

```
VarToClear: array of Pointer;
```

C++

```
array of Pointer VarToClear;
```

Description

This is VarToClear, a member of class TDataContext.

84.1.3.4.8 TDataContext.WStrToClear Field

Pascal

```
WStrToClear: array of Pointer;
```

C++

```
array of Pointer WStrToClear;
```

Description

This is WStrToClear, a member of class TDataContext.

84.1.3.5 TDataContext Methods

The methods of the TDataContext class are listed here.

Public Methods

	Name	Description
	AddDynArrayToClear (see page 15505)	Stores a dynamic array that can be cleared when the data context is finished.
	AddObjectToDestroy (see page 15506)	Stores an object that can be freed when the data context is finished.
	AddStrToClear (see page 15506)	Stores a string that can be cleared when the data context is finished.
	AddVariantToClear (see page 15507)	Stores the value of a Variant that can be cleared when the data context is finished.
	AddWStrToClear (see page 15507)	Stores a wide string that can be cleared when the data context is finished.
	AllocData (see page 15508)	Returns a pointer to the data context's cache of raw memory.
	GetDataPointer (see page 15508)	Returns a pointer from the internal cache of pointers.
	RemoveObjectToDestroy (see page 15508)	Remove an object from the list of objects to free when the data context is freed.
	SetDataPointer (see page 15509)	Stores a pointer in the internal cache of pointers.

84.1.3.5.1 TDataContext.AddDynArrayToClear Method

Stores a dynamic array that can be cleared when the data context is finished.

Pascal

```
procedure AddDynArrayToClear(P: Pointer; Info: PTypeInfo);
```

C++

```
__fastcall AddDynArrayToClear(void * P, PTypeInfo Info);
```

Description

Call AddDynArrayToClear to add a dynamic array to the list of temporary dynamic arrays that TDataContext (see page 15501) maintains. When the TDataContext (see page 15501) instance is freed, it clears all dynamic arrays in this list of temporary arrays.

P is a pointer to the dynamic array.

Info is the TypeInfo pointer for the dynamic array.

Note: TDataContext (see page 15501) does not provide access to this list. The caller must keep a reference to the dynamic arrays for use while the TDataContext (see page 15501) instance exists.

See Also

Destroy (see page 15502)

AddObjectToDestroy (see page 15506)

AddVariantToClear (see page 15507)

AddStrToClear (see page 15506)

AddWStrToClear (see page 15507)

84.1.3.5.2 TDataContext.AddObjectToDestroy Method

Stores an object that can be freed when the data context is finished.

Pascal

```
procedure AddObjectToDestroy(Obj: TObject);
```

C++

```
__fastcall AddObjectToDestroy(TObject * Obj);
```

Description

Call AddObjectToDestroy to add an object instance to the list of temporary objects that TDataContext (see page 15501) maintains. When the TDataContext (see page 15501) instance is freed, it frees all the objects in this list of temporary objects.

Note: TDataContext (see page 15501) does not provide access to this list. The caller must keep a reference to the object for use while the TDataContext (see page 15501) instance exists.

See Also

Destroy (see page 15502)

AddDynArrayToClear (see page 15505)

AddVariantToClear (see page 15507)

RemoveObjectToDestroy (see page 15508)

AddStrToClear (see page 15506)

84.1.3.5.3 TDataContext.AddStrToClear Method

Stores a string that can be cleared when the data context is finished.

Pascal

```
procedure AddStrToClear(P: Pointer);
```

C++

```
__fastcall AddStrToClear(void * P);
```

Description

Call AddStrToClear to add a string to the list of temporary strings that TDataContext (see page 15501) maintains. When the TDataContext (see page 15501) instance is freed, it clears all strings in this list.

P is a pointer to the string.

Note: TDataContext (see page 15501) does not provide access to this list. The caller must keep a reference to the string for use while the TDataContext (see page 15501) instance exists.

See Also

Destroy (see page 15502)

AddObjectToDestroy (see page 15506)

AddVariantToClear (see page 15507)

AddDynArrayToClear (see page 15505)

AddWStrToClear (see page 15507)

84.1.3.5.4 TDataContext.AddVariantToClear Method

Stores the value of a Variant that can be cleared when the data context is finished.

Pascal

```
procedure AddVariantToClear(P: PVarData);
```

C++

```
__fastcall AddVariantToClear(PVarData P);
```

Description

Call AddVariantToClear to add a Variant to the list of temporary Variant values that TDataContext (see page 15501) maintains. When the TDataContext (see page 15501) instance is freed, it clears all the Variants (see page 23567) in this list of temporary Variant values.

Note: TDataContext (see page 15501) does not provide access to this list. The caller must keep a reference to the Variant for use while the TDataContext (see page 15501) instance exists.

See Also

Destroy (see page 15502)

AddStrToClear (see page 15506)

AddWStrToClear (see page 15507)

84.1.3.5.5 TDataContext.AddWStrToClear Method

Stores a wide string that can be cleared when the data context is finished.

Pascal

```
procedure AddWStrToClear(P: Pointer);
```

C++

```
__fastcall AddWStrToClear(void * P);
```

Description

Call AddWStrToClear to add a wide string to the list of temporary wide strings that TDataContext (see page 15501) maintains. When the TDataContext (see page 15501) instance is freed, it clears all strings in this list.

P is a pointer to the WideString.

Note: TDataContext (see page 15501) does not provide access to this list. The caller must keep a reference to the string for use while the TDataContext (see page 15501) instance exists.

See Also

Destroy (see page 15502)

AddObjectToDestroy (see page 15506)

AddVariantToClear (see page 15507)

AddDynArrayToClear (see page 15505)

AddStrToClear (see page 15506)

84.1.3.5.6 TDataContext.AllocData Method

Returns a pointer to the data context's cache of raw memory.

Pascal

```
function AllocData(Size: Integer): Pointer;
```

C++

```
__fastcall void * AllocData(int Size);
```

Description

Use AllocData to obtain a pointer to a chunk of temporary memory.

Size is the number of bytes desired.

AllocData returns a pointer to Size bytes.

Note: TDataContext (see page 15501) does not actually allocate the memory that AllocData returns. Descendant classes must initialize the internal cache that the returned pointer addresses.

See Also

GetDataPointer (see page 15508)

84.1.3.5.7 TDataContext.GetDataPointer Method

Returns a pointer from the internal cache of pointers.

Pascal

```
function GetDataPointer(Index: Integer): Pointer;
```

C++

```
__fastcall void * GetDataPointer(int Index);
```

Description

GetDataPointer returns a pointer from the internal cache of pointers. This value is assigned by a call to the SetDataPointer (see page 15509) method.

Index is the index of the desired pointer, where 0 is the first pointer, 1 is the second pointer, and so on.

Note: TDataContext (see page 15501) does not actually allocate the memory to store these pointers. Descendant classes must initialize the internal dynamic array that TDataContext (see page 15501) uses to store pointers.

See Also

SetDataPointer (see page 15509)

84.1.3.5.8 TDataContext.RemoveObjectToDestroy Method

Remove an object from the list of objects to free when the data context is freed.

Pascal

```
procedure RemoveObjectToDestroy(Obj: TObject);
```

C++

```
__fastcall RemoveObjectToDestroy(TObject * Obj);
```

Description

Call RemoveObjectToDestroy to remove an object instance from the list of temporary objects that TDataContext (see page 15501) maintains. This prevents TDataContext (see page 15501) from freeing the object when it is itself freed.

For example, TRemotable (see page 15556) descendants that are created by a Web Service application when it executes an invokable interface call are automatically added to a data context that persists for the length of the method call. When an application changes the remotable object's DataContext property, it automatically calls RemoveObjectToDestroy so that the object is not automatically freed when the method call is complete.

See Also

DataContext (see page 15561)

AddObjectToDestroy (see page 15506)

84.1.3.5.9 TDataContext.SetDataPointer Method

Stores a pointer in the internal cache of pointers.

Pascal

```
procedure SetDataPointer(Index: Integer; P: Pointer);
```

C++

```
__fastcall SetDataPointer(int Index, void * P);
```

Description

SetDataPointer stores a pointer that can later be retrieved by a call to GetDataPointer (see page 15508). TDataContext (see page 15501) owns only the pointer, not the data to which it points. When you free the TDataContext (see page 15501) instance, it frees its list of pointers, but not the memory to which they point, unless they are first obtained by a call to the AllocData (see page 15508) method.

Index is the index of the pointer in the internal cache of pointers, where 0 specifies the first pointer, 1 specifies the second pointer, and so on.

P is the pointer to store.

Note: TDataContext (see page 15501) does not actually allocate the memory to store these pointers. Descendant classes must initialize the internal dynamic array that TDataContext (see page 15501) uses to store pointers.

See Also

GetDataPointer (see page 15508)

AllocData (see page 15508)

84.1.4 THeaderList Class

THeaderList maintains a list of SOAP headers.

Class Hierarchy

Pascal

```
THeaderList = class;
```

C++

```
class THeaderList;
```

File

InvokeRegistry

Description

Use THeaderList to store and maintain a list of SOAP headers (TSOAPHeader (see page 15596) descendants).

See Also

TSoapHeader

84.1.4.1 THeaderList Members

The following tables list the members exposed by THeaderList.

Protected Methods

	Name	Description
	GetCount (see page 15513)	This is GetCount, a member of class THeaderList.
	GetHeader (see page 15513)	This is GetHeader, a member of class THeaderList.
	GetOwnsObjects (see page 15513)	This is GetOwnsObjects, a member of class THeaderList.
	SetOwnsObjects (see page 15514)	This is SetOwnsObjects, a member of class THeaderList.

Public Methods

	Name	Description
	Add (see page 15511)	This is the overview for the Add method overload.
	Clear (see page 15512)	Empties the list and frees the TSOAPHeader (see page 15596) objects.
	Create (see page 15510)	Creates and initializes a THeaderList (see page 15509) instance.
V	Destroy (see page 15511)	Destroys an instance of THeaderList (see page 15509).
	Extract (see page 15512)	Removes a specified header from the list without freeing it.
	IndexOf (see page 15513)	This is IndexOf, a member of class THeaderList.

Public Properties

	Name	Description
R	Count (see page 15514)	Indicates the number of headers in the list.
R	Headers (see page 15515)	Lists the headers.
	OwnsObjects (see page 15515)	Allows THeaderList (see page 15509) to free objects when they the list is cleared or destroyed.

84.1.4.2 THeaderList.Create Constructor

Creates and initializes a THeaderList (see page 15509) instance.

Pascal

```
constructor Create;
```

C++

```
__fastcall THeaderList();
```

Description

Create creates a THeaderList (see page 15509) instance.

84.1.4.3 THeaderList.Destroy Destructor

Destroys an instance of THeaderList (see page 15509).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~THeaderList();
```

Description

Do not call Destroy directly. Instead, call Free. Free verifies that the THeaderList (see page 15509) reference is not nil, and only then calls Destroy.

Destroy frees the THeaderList (see page 15509) instance. If the OwnsObjects (see page 15515) property is true, it also frees the header objects in the list.

See Also

Free (see page 22300)

OwnsObjects (see page 15515)

84.1.4.4 THeaderList Methods

The methods of the THeaderList class are listed here.

Protected Methods

	Name	Description
	GetCount (see page 15513)	This is GetCount, a member of class THeaderList.
	GetHeader (see page 15513)	This is GetHeader, a member of class THeaderList.
	GetOwnsObjects (see page 15513)	This is GetOwnsObjects, a member of class THeaderList.
	SetOwnsObjects (see page 15514)	This is SetOwnsObjects, a member of class THeaderList.

Public Methods

	Name	Description
	Add (see page 15511)	This is the overview for the Add method overload.
	Clear (see page 15512)	Empties the list and frees the TSOAPHeader (see page 15596) objects.
	Extract (see page 15512)	Removes a specified header from the list without freeing it.
	IndexOf (see page 15513)	This is IndexOf, a member of class THeaderList.

84.1.4.4.1 Add Method

This is the overview for the Add method overload.

Overload List

	Name	Description
	THeaderList.Add (TObject) (see page 15512)	Adds a new header to the end of the list.
	THeaderList.Add (TSOAPHeader) (see page 15512)	Adds a new header to the end of the list.

84.1.4.4.1.1 THeaderList.Add Method (TObject)

Adds a new header to the end of the list.

Pascal

```
procedure Add(Header: TSOAPHeader); overload;
procedure Add(Header: TObject); overload;
```

C++

```
__fastcall Add(TSOAPHeader Header);
__fastcall Add(TObject * Header);
```

Description

Call Add to add a header to the end of the Headers (see page 15515) property array. When you call Add, the new Header is added to the end of the array and the value of the Count (see page 15514) property is incremented.

Header is the TSOAPHeader (see page 15596) descendants that is added to the list.

See Also

Headers (see page 15515)

Count (see page 15514)

Clear (see page 15512)

84.1.4.4.2 THeaderList.Clear Method

Empties the list and frees the TSOAPHeader (see page 15596) objects.

Pascal

```
procedure Clear;
```

C++

```
__fastcall Clear();
```

Description

Clear removes all of the headers from the list and, if the OwnsObjects (see page 15515) property is true, frees each one . After a call to Clear, the value of the Count (see page 15514) property is 0.

See Also

Headers (see page 15515)

Count (see page 15514)

OwnsObjects (see page 15515)

84.1.4.4.3 THeaderList.Extract Method

Removes a specified header from the list without freeing it.

Pascal

```
function Extract(Obj: TObject): TObject;
```

C++

```
__fastcall TObject * Extract(TObject * Obj);
```

Description

Call Extract to remove a header from the list without freeing the header object. After a header is removed, all the headers that follow it are moved up in index position and Count (see page 15514) is decremented.

See Also

Add (see page 15512)

Count (see page 15514)

Headers (see page 15515)

OwnsObjects (see page 15515)

84.1.4.4.4 THeaderList.GetCount Method

Pascal

```
function GetCount: Integer;
```

C++

```
__fastcall int GetCount();
```

Description

This is GetCount, a member of class THeaderList.

84.1.4.4.5 THeaderList.GetHeader Method

Pascal

```
function GetHeader(Index: Integer): TObject;
```

C++

```
__fastcall TObject * GetHeader(int Index);
```

Description

This is GetHeader, a member of class THeaderList.

84.1.4.4.6 THeaderList.GetOwnsObjects Method

Pascal

```
function GetOwnsObjects: Boolean;
```

C++

```
__fastcall Boolean GetOwnsObjects();
```

Description

This is GetOwnsObjects, a member of class THeaderList.

84.1.4.4.7 THeaderList.IndexOf Method

Pascal

```
function IndexOf(Obj: TObject): Integer;
```

C++

```
__fastcall int IndexOf(TObject * Obj);
```

Description

This is IndexOf, a member of class THeaderList.

84.1.4.4.8 THeaderList.SetOwnsObjects Method

Pascal

```
procedure SetOwnsObjects(Val: Boolean);
```

C++

```
__fastcall SetOwnsObjects(Boolean Val);
```

Description

This is SetOwnsObjects, a member of class THeaderList.

84.1.4.5 THeaderList Properties

The properties of the THeaderList class are listed here.

Public Properties

	Name	Description
R	Count (see page 15514)	Indicates the number of headers in the list.
R	Headers (see page 15515)	Lists the headers.
	OwnsObjects (see page 15515)	Allows THeaderList (see page 15509) to free objects when they the list is cleared or destroyed.

84.1.4.5.1 THeaderList.Count Property

Indicates the number of headers in the list.

Pascal

```
property Count: Integer;
```

C++

```
__property int Count;
```

Description

Count indicates the number of headers that the Headers (see page 15515) property lists. To change the value of Count, you can add headers using the Add (see page 15512) method, remove them using the Extract (see page 15512) method, or remove all headers using the Clear (see page 15512) method.

See Also

Headers (see page 15515)

Add (see page 15512)

Clear (see page 15512)

Extract (see page 15512)

84.1.4.5.2 THeaderList.Headers Property

Lists the headers.

Pascal

```
property Headers [Index: Integer]: TObject;
```

C++

```
__property TObject * Headers[int Index];
```

Description

Use Headers to access headers in the list. Headers is a zero-based array of TSOAPHeader (see page 15596) descendants: The first header is indexed as 0, the second header is indexed as 1, and so forth. You can read the value at a specific index, or use Headers with the Count (see page 15514) property to iterate through the list.

Note: In Delphi, Headers is the default property of THeaderList (see page 15509). This means you can omit the property name.

Note: In C++, you can use the subscript operator to achieve a similar effect.

See Also

OwnsObjects (see page 15515)

Add (see page 15512)

Extract (see page 15512)

Count (see page 15514)

Clear (see page 15512)

operator_sb

84.1.4.5.3 THeaderList.OwnsObjects Property

Allows THeaderList (see page 15509) to free objects when they the list is cleared or destroyed.

Pascal

```
property OwnsObjects: Boolean;
```

C++

```
__property Boolean OwnsObjects;
```

Description

OwnsObjects allows THeaderList (see page 15509) to control the memory of its TSOAPHeader (see page 15596) objects. If OwnsObjects is true,

calling Clear (see page 15512) frees all the headers in the list in addition to emptying the list.

freeing the THeaderList (see page 15509) object frees all the objects in the list in addition to destroying the THeaderList (see page 15509) itself.

Note: Even if OwnsObjects is true, the Extract (see page 15512) method removes objects from the list without freeing them.

See Also

Headers (see page 15515)

Clear (see page 2874)

Destroy (see page 15511)

Extract (see page 15512)

84.1.5 TInvContext Class

TInvContext stores information about a method call on an invokeable interface.

Class Hierarchy

Pascal

```
TInvContext = class(TDataContext);
```

C++

```
class TInvContext : public TDataContext;
```

File

InvokeRegistry

Description

TInvContext is a helper object created and used by TRIO and TSoapPascalInvoker for generating calls to the methods on an invokeable interface. It stores temporary data needed when making the method call. TInvContext introduces methods for retrieving and setting information about the method being called, including its type signature, parameter values, and so on.

Component writers implementing their own classes to implement the IOPConvert interface must translate between the information stored in a TInvContext object and their class-specific encoding of a method call.

See Also

IOPConvert (see page 18122)

TSOAPPascalInvoker

84.1.5.1 TInvContext Members

The following tables list the members exposed by TInvContext.

Protected Fields

	Name	Description
	Data (see page 15503)	This is Data, a member of class TDataContext.
	DataOffset (see page 15503)	This is DataOffset, a member of class TDataContext.
	DataP (see page 15503)	This is DataP, a member of class TDataContext.
	DynArrayToClear (see page 15504)	This is DynArrayToClear, a member of class TDataContext.
	FObjsToDestroy (see page 15504)	This is FObjsToDestroy, a member of class TDataContext.
	StrToClear (see page 15504)	This is StrToClear, a member of class TDataContext.
	VarToClear (see page 15504)	This is VarToClear, a member of class TDataContext.
	WStrToClear (see page 15504)	This is WStrToClear, a member of class TDataContext.

Public Methods

	Name	Description
	AddDynArrayToClear (see page 15505)	Stores a dynamic array that can be cleared when the data context is finished.
	AddObjectToDestroy (see page 15506)	Stores an object that can be freed when the data context is finished.
	AddStrToClear (see page 15506)	Stores a string that can be cleared when the data context is finished.
	AddVariantToClear (see page 15507)	Stores the value of a Variant that can be cleared when the data context is finished.
	AddWStrToClear (see page 15507)	Stores a wide string that can be cleared when the data context is finished.
	AllocData (see page 15508)	Returns a pointer to the data context's cache of raw memory.
	AllocServerData (see page 15517)	Allocates memory for the parameters and result values of a specified method and sets up the parameter and result pointers.
	Create (see page 15502)	Creates an instance of TDataContext (see page 15501).
V	Destroy (see page 15502)	Destroys an instance of TDataContext (see page 15501).
	GetDataPointer (see page 15508)	Returns a pointer from the internal cache of pointers.
	GetParamPointer (see page 15518)	Returns a pointer to the value of a parameter on the called method.
	GetResultPointer (see page 15518)	Returns a pointer to the return value of the method call.
	RemoveObjectToDestroy (see page 15508)	Remove an object from the list of objects to free when the data context is freed.
	SetDataPointer (see page 15509)	Stores a pointer in the internal cache of pointers.
	SetMethodInfo (see page 15518)	Initializes the TInvContext (see page 15516) for a particular method on the invokeable interface.
	SetParamPointer (see page 15519)	Sets the value of a specified parameter.
	SetResultPointer (see page 15519)	This is SetResultPointer, a member of class TInvContext.

84.1.5.2 TInvContext Methods

The methods of the TInvContext class are listed here.

Public Methods

	Name	Description
	AllocServerData (see page 15517)	Allocates memory for the parameters and result values of a specified method and sets up the parameter and result pointers.
	GetParamPointer (see page 15518)	Returns a pointer to the value of a parameter on the called method.
	GetResultPointer (see page 15518)	Returns a pointer to the return value of the method call.
	SetMethodInfo (see page 15518)	Initializes the TInvContext (see page 15516) for a particular method on the invokeable interface.
	SetParamPointer (see page 15519)	Sets the value of a specified parameter.
	SetResultPointer (see page 15519)	This is SetResultPointer, a member of class TInvContext.

84.1.5.2.1 TInvContext.AllocServerData Method

Allocates memory for the parameters and result values of a specified method and sets up the parameter and result pointers.

Pascal

```
procedure AllocServerData(const MD: TIntfMethEntry);
```

C++

```
__fastcall AllocServerData(const TIntfMethEntry MD);
```

Description

AllocServerData suballocates the memory that the SetMethodInfo (see page 15518) method allocates so that it can represent the parameters and return value of a method. It looks up the types of each parameter and of the return type for the method, allocates memory for their values using the AllocData (see page 15508) method, and stores the pointers to that memory by calling the SetParamPointer (see page 15519) and SetResultPointer (see page 15519) methods.

MD is a description of the method, including its type, calling convention, and parameter signature.

Note: AllocServerData must come after a call to SetMethodInfo (see page 15518) so that the pool of memory is available. After calling AllocServerData, an application can call GetParamPointer (see page 15518) and GetResultPointer (see page 15518) to obtain pointers to the memory allocated for each parameter and for the return value of the method.

See Also

AllocData (see page 15508)

SetParamPointer (see page 15519)

setresultpointer (see page 15519)

SetMethodInfo (see page 15518)

84.1.5.2.2 TInvContext.GetParamPointer Method

Returns a pointer to the value of a parameter on the called method.

Pascal

```
function GetParamPointer(Param: Integer): Pointer;
```

C++

```
__fastcall void * GetParamPointer(int Param);
```

Description

GetParamPointer returns a pointer to the value of a specified parameter.

Param is the index of the desired parameter, where 0 is the first parameter, 1 is the second parameter, and so on.

This value is assigned by a call to the SetParamPointer (see page 15519) method.

See Also

SetParamPointer (see page 15519)

84.1.5.2.3 TInvContext.GetResultPointer Method

Returns a pointer to the return value of the method call.

Pascal

```
function GetResultPointer: Pointer;
```

C++

```
__fastcall void * GetResultPointer();
```

Description

GetResultPointer returns a pointer to the return value of the method call. This value is assigned by a call to the SetResultPointer (see page 15519) method.

See Also

setresultpointer (see page 15519)

84.1.5.2.4 TInvContext.SetMethodInfo Method

Initializes the TInvContext (see page 15516) for a particular method on the invokeable interface.

Pascal

```
procedure SetMethodInfo(const MD: TIntfMethEntry);
```

C++

```
__fastcall SetMethodInfo(const TIntfMethEntry MD);
```

Description

SetMethodInfo initializes the invocation context so that it represents a particular method. Objects that implement the IOPConvert interface call this method to initialize an invocation context when implementing their MsgToInvContext method.

MD is a description of the method, including its type, calling convention, and parameter signature.

Note: SetMethodInfo allocates the memory used internally to store pointers and raw data. An application must call this method before any calls to the AllocData (see page 15508), SetDataPointer (see page 15509), or SetParamPointer (see page 15519) methods.

See Also

IOPConvert (see page 18122)

MsgToInvContext (see page 18127)

AllocData (see page 15508)

SetDataPointer (see page 15509)

SetParamPointer (see page 15519)

84.1.5.2.5 TInvContext.SetParamPointer Method

Sets the value of a specified parameter.

Pascal

```
procedure SetParamPointer(Param: Integer; P: Pointer);
```

C++

```
__fastcall SetParamPointer(int Param, void * P);
```

Description

SetParamPointer associates a pointer with a specified parameter.

Param identifies the parameter whose value is to be set, where 0 specifies the first parameter, 1 specifies the second parameter, and so on.

P is a pointer to the value of the parameter. Memory to contain the value of P can be allocated using the AllocData (see page 15508) method.

See Also

GetParamPointer (see page 15518)

AllocData (see page 15508)

84.1.5.2.6 TInvContext.SetResultPointer Method

Pascal

```
procedure SetResultPointer(P: Pointer);
```

C++

```
__fastcall SetResultPointer(void * P);
```

Description

This is SetResultPointer, a member of class TInvContext.

84.1.6 TInvokableClass Class

TInvokableClass is the base class for the implementation classes of invokable interfaces.

Class Hierarchy

Pascal

```
TInvokableClass = class(TObject, IInterface);
```

C++

```
class TInvokableClass : public TObject, public IInterface;
```

File

InvokeRegistry

Description

Use TInvokableClass as a base class when writing the implementation class of an invokable interface. TInvokableClass has the following important attributes:

The invocation registry (InvRegistry (see page 15620)) knows how to create instances of TInvokableClass and (because it has a virtual constructor) its descendants. This allows the registry to supply an invoker in a Web Service application with an instance of the invokable class that can handle an incoming request.

TInvokableClass is an interfaced object that frees itself when the reference count on its interface drops to zero. Invoker components do not know when to free the implementation classes of the interfaces they call. Because TInvokableClass knows when to free itself, you do not need to supply your own lifetime management for this object.

TInvokableClass supports the ISOAPHeaders (see page 15613) interface so that your server can process the headers that accompany requests and add headers to outgoing responses.

To use a TInvokableClass descendant in a Web Service application, you must register it with the invocation registry. Use the RegisterInvokableClass method of the invocation registry to register your TInvokableClass descendant.

Note: If you do not use TInvokableClass as a base class when writing the implementation class for an invokable interface, you must supply the invocation registry with a method to retrieve instances of your class and you must handle the lifetime management of your class. If you are sending or receiving SOAP headers, you must use the global GetSOAPHeaders function to obtain an ISOAPHeaders (see page 15613) interface instead of obtaining one from the implementation class.

Adding New Web Services

84.1.6.1 TInvokableClass Members

The following tables list the members exposed by TInvokableClass.

Protected Fields

	Name	Description
	FRefCount (see page 15522)	This is FRefCount, a member of class TInvokableClass.
	FSOAPHeaders (see page 15523)	This is FSOAPHeaders, a member of class TInvokableClass.

Protected Methods

	Name	Description
	_AddRef (see page 15523)	Increments the reference count for this interface.
	_Release (see page 15524)	Decrements the reference count for this interface.
	QueryInterface (see page 15525)	Implements the IInterface QueryInterface method.

Public Methods

	Name	Description
V	AfterConstruction (see page 15524)	Responds after the last constructor executes.
V	BeforeDestruction (see page 15524)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 15522)	Creates and initializes a TInvokableClass (see page 15520) object.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 15525)	Allocates memory for each instance of an invokable object.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
	RefCount (see page 15526)	Indicates the number of interface pointers currently dependent upon the object.

84.1.6.2 TInvokableClass.Create Constructor

Creates and initializes a TInvokableClass (see page 15520) object.

Pascal

```
constructor Create; virtual;
```

C++

```
virtual __fastcall TInvokableClass();
```

Description

The TInvokableClass (see page 15520) constructor does nothing special. It exists primarily because

The TInvokableClass (see page 15520) constructor exists primarily because

The invocation registry knows how to call it.

It is virtual, so that the invocation registry can also instantiate descendant classes.

In addition, the constructor initializes the invokable class so that it can support the ISOAPHeaders (see page 15613) interface.

See Also

InvRegistry (see page 15620)

ISOAPHeaders (see page 15613)

84.1.6.3 TInvokableClass Fields

The fields of the TInvokableClass class are listed here.

Protected Fields

	Name	Description
	FRefCount (see page 15522)	This is FRefCount, a member of class TInvokableClass.
	FSOAPHeaders (see page 15523)	This is FSOAPHeaders, a member of class TInvokableClass.

84.1.6.3.1 TInvokableClass.FRefCount Field

Pascal

```
FRefCount: Integer;
```

C++

```
int FRefCount;
```

Description

This is FRefCount, a member of class TInvokableClass.

84.1.6.3.2 TInvokableClass.FSOAPHeaders Field

Pascal

```
FSOAPHeaders: TSOAPHeaders;
```

C++

```
TSOAPHeaders FSOAPHeaders;
```

Description

This is FSOAPHeaders, a member of class TInvokableClass.

84.1.6.4 TInvokableClass Methods

The methods of the TInvokableClass class are listed here.

Protected Methods

	Name	Description
	_AddRef (see page 15523)	Increments the reference count for this interface.
	_Release (see page 15524)	Decrements the reference count for this interface.
	QueryInterface (see page 15525)	Implements the IInterface QueryInterface method.

Public Methods

	Name	Description
	AfterConstruction (see page 15524)	Responds after the last constructor executes.
	BeforeDestruction (see page 15524)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
	NewInstance (see page 15525)	Allocates memory for each instance of an invokable object.

84.1.6.4.1 TInvokableClass._AddRef Method

Increments the reference count for this interface.

Pascal

```
function _AddRef: Integer; stdcall;
```

C++

```
__fastcall __stdcall int _AddRef();
```

Description

The Delphi compiler automatically generates a call to __AddRef for every reference to this interface. For most implementations, __AddRef increments the reference count for the interface and returns the new reference count. When the caller is through with the interface, the compiler generates a call to the _Release method, which decrements the reference count. When the reference count drops to zero, the object is automatically freed.

Note: Implementation objects can implement __AddRef and _Release so that they do not perform any reference counting. For such objects, the reference count never drops to zero and the object is not automatically freed. In these cases, it is the application's responsibility to free the object.

See Also

_Release (see page 22397)

84.1.6.4.2 TInvokableClass._Release Method

Decrements the reference count for this interface.

Pascal

```
function _Release: Integer; stdcall;
```

C++

```
__fastcall __stdcall int _Release();
```

Description

The Delphi compiler automatically generates a call to __Release whenever a reference to this interface goes out of scope. For most implementations, __Release decrements the reference count for the interface and returns the new reference count. When the reference count drops to zero, the object is automatically freed.

Note: Implementation objects can implement __Release so that it does not perform any reference counting. For such objects, the reference count never drops to zero and the object is not automatically freed. In these cases, it is the application's responsibility to free the object.

See Also

_AddRef (see page 22397)

84.1.6.4.3 TInvokableClass.AfterConstruction Method

Responds after the last constructor executes.

Pascal

```
procedure AfterConstruction; override;
```

C++

```
virtual __fastcall AfterConstruction();
```

Description

AfterConstruction is called automatically after the object's last constructor has executed. Do not call it explicitly in your applications.

When an instance of TInvokableClass (see page 15520) is allocated, RefCount (see page 15526) is incremented to prevent its destruction while processing the constructor. AfterConstruction decrements that RefCount (see page 15526) to re-establish the correct reference count after all constructors have executed.

See Also

BeforeDestruction (see page 15524)

NewInstance (see page 15525)

RefCount (see page 15526)

84.1.6.4.4 TInvokableClass.BeforeDestruction Method

Checks that the reference count is zero before allowing the interfaced object to be destroyed.

Pascal

```
procedure BeforeDestruction; override;
```

C++

```
virtual __fastcall BeforeDestruction();
```

Description

BeforeDestruction is called automatically immediately before the interfaced object's destructor. It checks that the reference count is zero, and, if it is not, raises an exception.

See Also

RefCount (see page 15526)

Free (see page 22300)

84.1.6.4.5 TInvokableClass.NewInstance Method

Allocates memory for each instance of an invokable object.

Pascal

```
class function NewInstance: TObject; override;
```

C++

```
virtual __fastcall TObject * NewInstance();
```

Description

Constructors call NewInstance automatically. NewInstance calls InstanceSize to determine how much memory to allocate from the heap to contain a particular instance. Do not call NewInstance directly.

TInvokableClass (see page 15520) overrides NewInstance to increment the reference count when a new instance is created. This prevents any constructor from accidentally deleting the instance due to a RefCount (see page 15526) of zero. The AfterConstruction (see page 15524) method decrements the value of RefCount (see page 15526) after all constructors have executed.

See Also

RefCount (see page 15526)

NewInstance (see page 22306)

InstanceSize (see page 22306)

AfterConstruction (see page 15524)

84.1.6.4.6 TInvokableClass.QueryInterface Method

Implements the IInterface QueryInterface method.

Pascal

```
function QueryInterface(const IID: TGUID; out Obj): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT QueryInterface(const TGUID IID,  Obj);
```

Description

Do not call the protected QueryInterface method directly. QueryInterface is called through the IInterface interface to obtain an interface pointer for the interface identified by the IID parameter. If the object supports the requested interface, it is returned in the Obj parameter and QueryInterface returns S_OK. If the object does not support the interface, QueryInterface returns E_NOINTERFACE.

If QueryInterface successfully returns an interface pointer, it automatically increments the reference count.

See Also

_addref (see page 15523)

84.1.6.5 TInvokableClass Properties

The properties of the TInvokableClass class are listed here.

Public Properties

	Name	Description
R	RefCount (see page 15526)	Indicates the number of interface pointers currently dependent upon the object.

84.1.6.5.1 TInvokableClass.RefCount Property

Indicates the number of interface pointers currently dependent upon the object.

Pascal

```
property RefCount: Integer;
```

C++

```
__property int RefCount;
```

Description

RefCount defines the lifetime of the object. When RefCount is zero, the object is destroyed.

RefCount is incremented by calls to the _AddRef (see page 15523) method and decremented by the _Release (see page 15524) method.

Note:

See Also

_addref (see page 15523)

_release (see page 15524)

84.1.7 TInvokableClassRegistry Class

TInvokableClassRegistry is the type of the invocation registry.

Class Hierarchy

Pascal

```
TInvokableClassRegistry = class(TInterfacedObject);
```

C++

```
class TInvokableClassRegistry : public TInterfacedObject;
```

File

InvokeRegistry

Description

TInvokableClassRegistry manages information about invokable interfaces and the classes that implement them. Invokable interfaces are used in applications that work with Web Services.

Server applications that implement Web Services need to register both the invokable interfaces and the implementation classes. The invoker component (such as THTTPSoapPascalInvoker or THTTPSoapCppInvoker) can then use the invocation registry to locate invokable interfaces and execute calls made to them. In addition, server applications should register the headers that are used with calls to the methods of the invokable interface and the exceptions that such calls can raise.

Client applications that call on Web Services register the invokable interfaces that they call. The remote interfaced object component (THTTPRio) can then use the invocation registry to generate a dynamic vtable for calling the invokable interfaces.

Do not create instances of TInvokableClassRegistry. Instead, use the global InvRegistry (see page 15620) function to access the invocation registry. Most applications need only call the RegisterInterface (see page 15552) and (if a server) the RegisterInvokableClass (see page 15553) methods. The other TInvokableClassRegistry methods are used by invoker components, remote interfaced object components, and the WSDL document importer. The allow these components to look up information about invokable interfaces and their implementation classes, access invokable interfaces, and so on.

84.1.7.1 TInvokableClassRegistry Members

The following tables list the members exposed by TInvokableClassRegistry.

Protected Data Members

	Name	Description
	FRefCount (see page 22278)	This is FRefCount, a member of class TInterfacedObject.

Protected Methods

	Name	Description
	_AddRef (see page 22278)	Implements the IInterface (see page 22396) System::TInterfacedObject::_AddRef method.
	_Release (see page 22279)	Implements the IInterface (see page 22396) System::TInterfacedObject::_Release method.
	QueryInterface (see page 22280)	Implements the IInterface (see page 22396) System::TInterfacedObject::QueryInterface method.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22279)	Responds after the last constructor executes.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.

	BeforeDestruction (see page 22279)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 15529)	Creates and initializes a TInvokableClassRegistry (see page 15526) object.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 15530)	Frees the memory associated with the TInvokableClassRegistry (see page 15526) object.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetActionURIOfIID (see page 15531)	Returns the SOAP Action header associated with the interface with a specified GUID.
	GetActionURIOfInfo (see page 15532)	Returns the SOAP Action header associated with the type info of a registered interface.
	GetClassFromIntfInfo (see page 15532)	Retrieves the implementation class that corresponds to the type info of an invokable interface.
	GetExceptionInfoForInterface (see page 15533)	Retrieves an array of exceptions that are registered as associated with an invokable interface.
	GetHeaderClass (see page 15533)	Returns the class reference for a header type, given its name and namespace.
	GetHeaderInfoForInterface (see page 15534)	Retrieves an array of headers that are registered as associated with an invokable interface.
	GetHeaderName (see page 15534)	Returns the name of a header that is identified by a specified class reference.
	GetHeaderNamespace (see page 15535)	This is the overview for the GetHeaderNamespace method overload.
	GetInfoForURI (see page 15536)	Retrieves information about a registered invokable interface that is identified by a SOAP action header or the path of an HTTP message.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceCount (see page 15536)	Returns the number of registered invokable interfaces.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceExternalName (see page 15537)	This is the overview for the GetInterfaceExternalName method overload.
	GetInterfaceInfoFromName (see page 15538)	Returns information about a registered invokable interface given its name.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetInterfaceTypeInfo (see page 15538)	Returns the runtime type information (RTTI) of an invokable interface.
	GetIntfInvokeOptions (see page 15538)	This is the overview for the GetIntfInvokeOptions method overload.
	GetInvokableObjectFromClass (see page 15539)	Returns an instance of the implementation class for a registered invokable interface.
	GetMethExternalName (see page 15540)	Returns the name of the operation that corresponds to a method on an invokable interface.
	GetMethInternalName (see page 15540)	Returns the name of the method that corresponds to an operation in a WSDL document.
	GetNamespaceByGUID (see page 15541)	Returns a namespace that is uniquely associated with a registered interface.
	GetParamExternalName (see page 15541)	Returns the name of the part that corresponds to a parameter on a method of an invokable interface.
	GetParamInternalName (see page 15541)	Returns the name of the parameter that corresponds to a part on a message of an operation in a WSDL document.
	GetRegInterfaceEntry (see page 15542)	Returns the internal data that TInvokableClassRegistry (see page 15526) maintains for one of its registered interfaces.
	GetRequestHeaderInfoForInterface (see page 15542)	Retrieves an array of headers that are registered as associated with requests to an invokable interface.

	GetResponseHeaderInfoForInterface (see page 15543)	Retrieves an array of headers that are registered as associated with responses to invocations of an invokable interface.
	GetReturnParamNames (see page 15544)	Returns the list of parameter names that map to return values of interface methods.
	GetUDDIInfo (see page 15544)	This is the overview for the GetUDDIInfo method overload.
	GetWSDLEncoding (see page 15545)	This is the overview for the GetWSDLEncoding method overload.
	HasRegInterfaceImpl (see page 15546)	Indicates whether there is a registered implementation class for an invokable interface.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22280)	Allocates memory for each instance of an interfaced object.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	RegisterAllSOAPActions (see page 15546)	Supplies a set of SOAP Action headers to use for an already-registered interface.
	RegisterDefaultSOAPAction (see page 15547)	Supplies a SOAP Action header to use for an already-registered interface.
	RegisterException (see page 15547)	Registers the remotable exception classes that calls to an invokable interface can raise.
	RegisterExceptionMethod (see page 15548)	Registers methods of an invokable interface that can raise a registered exception class.
	RegisterExternalMethName (see page 15548)	Registers the correspondence between a method name on an invokable interface and the corresponding operation name in a WSDL document.
	RegisterExternalParamName (see page 15549)	Registers the correspondence between a parameter name on an invokable interface and the corresponding part name in a WSDL document.
	RegisterHeaderClass (see page 15549)	This is the overview for the RegisterHeaderClass method overload.
	RegisterHeaderMethod (see page 15551)	Registers methods of an invokable interface that make use of a registered header.
	RegisterInterface (see page 15552)	Registers an invokable interface.
	RegisterInvokableClass (see page 15553)	This is the overview for the RegisterInvokableClass method overload.
	RegisterInvokeOptions (see page 15553)	This is the overview for the RegisterInvokeOptions method overload.
	RegisterReturnParamNames (see page 15554)	Registers a list of parameter names that map to return values of interface methods.
	RegisterUDDIInfo (see page 15555)	Registers the location of the UDDI description that can be used to import the location of a Web Service.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	UnRegisterInterface (see page 15555)	Unregisters an invokable interface.
	UnRegisterInvokableClass (see page 15556)	Unregisters the implementation class for an invokable interface.

Public Properties

	Name	Description
R	RefCount (see page 22281)	Indicates the number of interface pointers currently dependent upon the object.

84.1.7.2 TInvokableClassRegistry.Create Constructor

Creates and initializes a TInvokableClassRegistry (see page 15526) object.

Pascal

```
constructor Create;
```

C++

```
__fastcall TInvokableClassRegistry();
```

Description

Do not create your own instances of TInvokableClassRegistry (see page 15526). Instead, use the global InvRegistry (see

page 15620) function, which provides access to a single global instance of TInvokableClassRegistry (see page 15526).

See Also

InvRegistry (see page 15620)

84.1.7.3 TInvokableClassRegistry.Destroy Destructor

Frees the memory associated with the TInvokableClassRegistry (see page 15526) object.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TInvokableClassRegistry();
```

Description

Do not destroy the global TInvokableClassRegistry (see page 15526) instance that is available through the InvRegistry (see page 15620) function. This object is freed automatically when the application unloads the InvokeRegistry (see page 15493) unit.

See Also

InvRegistry (see page 15620)

84.1.7.4 TInvokableClassRegistry Methods

The methods of the TInvokableClassRegistry class are listed here.

Public Methods

	Name	Description
	GetActionURIOfIID (see page 15531)	Returns the SOAP Action header associated with the interface with a specified GUID.
	GetActionURIOfInfo (see page 15532)	Returns the SOAP Action header associated with the type info of a registered interface.
	GetClassFromIntfInfo (see page 15532)	Retrieves the implementation class that corresponds to the type info of an invokable interface.
	GetExceptionInfoForInterface (see page 15533)	Retrieves an array of exceptions that are registered as associated with an invokable interface.
	GetHeaderClass (see page 15533)	Returns the class reference for a header type, given its name and namespace.
	GetHeaderInfoForInterface (see page 15534)	Retrieves an array of headers that are registered as associated with an invokable interface.
	GetHeaderName (see page 15534)	Returns the name of a header that is identified by a specified class reference.
	GetHeaderNamespace (see page 15535)	This is the overview for the GetHeaderNamespace method overload.
	GetInfoForURI (see page 15536)	Retrieves information about a registered invokable interface that is identified by a SOAP action header or the path of an HTTP message.
	GetInterfaceCount (see page 15536)	Returns the number of registered invokable interfaces.
	GetInterfaceExternalName (see page 15537)	This is the overview for the GetInterfaceExternalName method overload.
	GetInterfaceInfoFromName (see page 15538)	Returns information about a registered invokable interface given its name.
	GetInterfaceTypeInfo (see page 15538)	Returns the runtime type information (RTTI) of an invokable interface.
	GetIntfInvokeOptions (see page 15538)	This is the overview for the GetIntfInvokeOptions method overload.
	GetInvokableObjectFromClass (see page 15539)	Returns an instance of the implementation class for a registered invokable interface.
	GetMethExternalName (see page 15540)	Returns the name of the operation that corresponds to a method on an invokable interface.
	GetMethInternalName (see page 15540)	Returns the name of the method that corresponds to an operation in a WSDL document.

	GetNamespaceByGUID (see page 15541)	Returns a namespace that is uniquely associated with a registered interface.
	GetParamExternalName (see page 15541)	Returns the name of the part that corresponds to a parameter on a method of an invokable interface.
	GetParamInternalName (see page 15541)	Returns the name of the parameter that corresponds to a part on a message of an operation in a WSDL document.
	GetRegInterfaceEntry (see page 15542)	Returns the internal data that TInvokableClassRegistry (see page 15526) maintains for one of its registered interfaces.
	GetRequestHeaderInfoForInterface (see page 15542)	Retrieves an array of headers that are registered as associated with requests to an invokable interface.
	GetResponseHeaderInfoForInterface (see page 15543)	Retrieves an array of headers that are registered as associated with responses to invocations of an invokable interface.
	GetReturnParamNames (see page 15544)	Returns the list of parameter names that map to return values of interface methods.
	GetUDDIInfo (see page 15544)	This is the overview for the GetUDDIInfo method overload.
	GetWSDLEncoding (see page 15545)	This is the overview for the GetWSDLEncoding method overload.
	HasRegInterfaceImpl (see page 15546)	Indicates whether there is a registered implementation class for an invokable interface.
	RegisterAllSOAPActions (see page 15546)	Supplies a set of SOAP Action headers to use for an already-registered interface.
	RegisterDefaultSOAPAction (see page 15547)	Supplies a SOAP Action header to use for an already-registered interface.
	RegisterException (see page 15547)	Registers the remotable exception classes that calls to an invokable interface can raise.
	RegisterExceptionMethod (see page 15548)	Registers methods of an invokable interface that can raise a registered exception class.
	RegisterExternalMethName (see page 15548)	Registers the correspondence between a method name on an invokable interface and the corresponding operation name in a WSDL document.
	RegisterExternalParamName (see page 15549)	Registers the correspondence between a parameter name on an invokable interface and the corresponding part name in a WSDL document.
	RegisterHeaderClass (see page 15549)	This is the overview for the RegisterHeaderClass method overload.
	RegisterHeaderMethod (see page 15551)	Registers methods of an invokable interface that make use of a registered header.
	RegisterInterface (see page 15552)	Registers an invokable interface.
	RegisterInvokableClass (see page 15553)	This is the overview for the RegisterInvokableClass method overload.
	RegisterInvokeOptions (see page 15553)	This is the overview for the RegisterInvokeOptions method overload.
	RegisterReturnParamNames (see page 15554)	Registers a list of parameter names that map to return values of interface methods.
	RegisterUDDIInfo (see page 15555)	Registers the location of the UDDI description that can be used to import the location of a Web Service.
	UnRegisterInterface (see page 15555)	Unregisters an invokable interface.
	UnRegisterInvokableClass (see page 15556)	Unregisters the implementation class for an invokable interface.

84.1.7.4.1 TInvokableClassRegistry.GetActionURIOfIID Method

Returns the SOAP Action header associated with the interface with a specified GUID.

Pascal

```
function GetActionURIOfIID(const AGUID: TGUID): string;
```

C++

```
__fastcall AnsiString GetActionURIOfIID(const TGUID AGUID);
```

Description

Typically, applications do not need to call GetActionURIOfIID. This method is called by remote interfaced objects (THTTPRIO) when generating the SOAP Action header of messages that call a method on a registered interface.

AGUID is the globally unique identifier (GUID) of the interface to call. The interface must be previously registered by a call to the RegisterInterface (see page 15552) method.

GetActionURIOfIID returns the string that should appear as the SOAP Action header on request messages to that interface.

See Also

GetActionURIOfInfo (see page 15532)

RegisterDefaultSOAPAction (see page 15547)

RegisterInterface (see page 15552)

THTTPRIO (see page 19928)

84.1.7.4.2 TInvokableClassRegistry.GetActionURIOfInfo Method

Returns the SOAP Action header associated with the type info of a registered interface.

Pascal

```
function GetActionURIOfInfo(const IntfInfo: PTypeInfo; const MethodName: WideString;
MethodIndex: Integer): string;
```

C++

```
__fastcall AnsiString GetActionURIOfInfo(const PTypeInfo IntfInfo, const BSTR MethodName, int
MethodIndex);
```

Description

GetActionURIOfInfo looks up or generates the SOAP Action header that should be used with messages that call a specified method on an invokable interface.

IntfInfo (see page 15477) is the runtime type information (RTTI) that is compiled for the invokable interface. The interface must have been previously registered by a call to the RegisterInterface (see page 15552) method.

MethodName is the name of the method to call on the specified interface.

MethodIndex indicates which method to use when the interface includes an overload of the method that MethodName specifies. 0 indicates the overload that is declared first, 1 the overload that is declared second, and so on.

GetActionURIOfInfo returns the string that should appear as the SOAP Action header on request messages to the specified method of the specified interface.

See Also

GetActionURIOfIID (see page 15531)

RegisterDefaultSOAPAction (see page 15547)

RegisterInterface (see page 15552)

THTTPRIO (see page 19928)

84.1.7.4.3 TInvokableClassRegistry.GetClassFromIntfInfo Method

Retrieves the implementation class that corresponds to the type info of an invokable interface.

Pascal

```
procedure GetClassFromIntfInfo(Info: PTypeInfo; var AClass: TClass);
```

C++

```
__fastcall GetClassFromIntfInfo(PTypeInfo Info, TClass AClass);
```

Description

Typically, applications do not need to call GetClassFromIntfInfo. This method allows the invoker component

(THTTPSoapPascalInvoker or THTTPSoapCppInvoker) to look up the implementation class for an interface it is invoking.

Info is the runtime type information (RTTI) from a registered invokable interface. The interface must have been previously registered by a call to the RegisterInterface (see page 15552) method.

AClass returns a class reference for the class that implements the invokable interface identified by Info. It can be passed to the GetInvokableObjectFromClass (see page 15539) method to obtain an instance of the implementation class.

See Also

GetInvokableObjectFromClass (see page 15539)

RegisterInvokableClass (see page 15553)

RegisterInterface (see page 15552)

THTTPSoapPascalInvoker (see page 19951)

THTTPSoapCppInvoker (see page 19950)

84.1.7.4.4 TInvokableClassRegistry.GetExceptionInfoForInterface Method

Retrieves an array of exceptions that are registered as associated with an invokable interface.

Pascal

```
function GetExceptionInfoForInterface(Info: PTypeInfo): TExceptionItemArray;
```

C++

```
__fastcall TExceptionItemArray GetExceptionInfoForInterface(PTypeInfo Info);
```

Description

Typically, applications do not need to call GetExceptionInfoForInterface. This method is used internally by the WSDL publisher to generate the WSDL that describes the exceptions that an invokable interface can raise.

Info is the runtime type information (RTTI) from a registered invokable interface. The interface must have been previously registered by a call to the RegisterInterface (see page 15552) method.

GetExceptionInfoForInterface returns an array of IntfExceptionItem (see page 15625) values, each of which describes a remotable exception that was registered for the invokable interface by a call to the RegisterException (see page 15547) method.

See Also

RegisterException (see page 15547)

TWSDLHTMLPublish (see page 26024)

RegisterInterface (see page 15552)

84.1.7.4.5 TInvokableClassRegistry.GetHeaderClass Method

Returns the class reference for a header type, given its name and namespace.

Pascal

```
function GetHeaderClass(Name: WideString; Namespace: WideString): TClass;
```

C++

```
__fastcall TClass GetHeaderClass(BSTR Name, BSTR Namespace);
```

Description

Typically, applications do not need to call GetHeaderClass. This method is used internally to look up the class of a header that is identified by name.

Name is the name of the header node.

Namespace is the URI of the namespace in which Name is defined.

GetHeaderClass returns the class reference for the TSOAPHeader (see page 15596) descendant that represents the identified header.

See Also

RegisterHeaderClass (see page 15550)

TSOAPHeader (see page 15596)

GetHeaderName (see page 15534)

GetHeaderNamespace (see page 15535)

84.1.7.4.6 TInvokableClassRegistry.GetHeaderInfoForInterface Method

Retrieves an array of headers that are registered as associated with an invokable interface.

Pascal

```
function GetHeaderInfoForInterface(Info: PTypeInfo; MethodType: eHeaderMethodType = hmtAll):
THeaderItemArray;
```

C++

```
__fastcall THeaderItemArray GetHeaderInfoForInterface(PTypeInfo Info, eHeaderMethodType
MethodType = hmtAll);
```

Description

Typically, applications do not need to call GetHeaderInfoForInterface. This method is used internally by the WSDL publisher to generate the WSDL that describes the headers that are used in messages about an invokable interface.

Info is the runtime type information (RTTI) from a registered invokable interface. The interface must have been previously registered by a call to the RegisterInterface (see page 15552) method.

MethodType indicates whether to retrieve information about the headers to use on request messages, the headers to use on response messages, or both.

GetHeaderInfoForInterface returns an array of IntfHeaderItem (see page 15626) values, each of which describes a header that was registered for the invokable interface by a call to the RegisterHeaderClass (see page 15550) method.

See Also

RegisterHeaderClass (see page 15550)

TWSDLHTMLPublish (see page 26024)

RegisterInterface (see page 15552)

84.1.7.4.7 TInvokableClassRegistry.GetHeaderName Method

Returns the name of a header that is identified by a specified class reference.

Pascal

```
function GetHeaderName(Info: PTypeInfo; AClass: TClass): WideString;
```

C++

```
__fastcall BSTR GetHeaderName(PTypeInfo Info, TClass AClass);
```

Description

GetHeaderName returns the name of a header given the class that represents it. This is the name supplied to a call to RegisterHeaderClass (see page 15550) when the header was registered. If the header was registered without supplying a name, this is the same name as the type name supplied for the header when it is registered with the remotable type registry.

Info is the runtime type information for the interface associated with the header.

AClass is a class reference to the TSOAPHeader (see page 15596) descendant that represents the header.

GetHeaderName returns the name of the header. This name is defined within the namespace that the GetHeaderNamespace (see page 15535) method returns.

See Also

RegisterHeaderClass (see page 15550)

TSOAPHeader (see page 15596)

GetHeaderNamespace (see page 15535)

GetHeaderClass (see page 15533)

84.1.7.4.8 GetHeaderNamespace Method

This is the overview for the GetHeaderNamespace method overload.

Overload List

	Name	Description
	TInvokableClassRegistry.GetHeaderNamespace (PTypeInfo, TClass) (see page 15535)	Returns the namespace URI for a header that is identified by a specified class reference.
	TInvokableClassRegistry.GetHeaderNamespace (TClass) (see page 15535)	Returns the namespace URI for a header that is identified by a specified class reference.

84.1.7.4.8.1 TInvokableClassRegistry.GetHeaderNamespace Method (PTypeInfo, TClass)

Returns the namespace URI for a header that is identified by a specified class reference.

Pascal

```
function GetHeaderNamespace(Info: PTypeInfo; AClass: TClass): WideString; overload;
function GetHeaderNamespace(AClass: TClass): WideString; overload;
```

C++

```
__fastcall BSTR GetHeaderNamespace(PTypeInfo Info, TClass AClass);
__fastcall BSTR GetHeaderNamespace(TClass AClass);
```

Description

GetHeaderNamespace returns the namespace in which a header's name is defined. This is the namespace URI supplied to a call to RegisterHeaderClass (see page 15550) when the header was registered. If the header was registered without supplying a namespace URI, this is the same namespace as the one associated with the interface that uses the header.

Info is the runtime type information for the interface associated with the header.

AClass is a class reference to the TSOAPHeader (see page 15596) descendant that represents the header.

GetHeaderNamespace returns the namespace URI to use for resolving the name of the header.

See Also

RegisterHeaderClass (see page 15550)

TSOAPHeader (see page 15596)

GetHeaderName (see page 15534)

GetHeaderClass (see page 15533)

84.1.7.4.9 TInvokableClassRegistry.GetInfoForURI Method

Retrieves information about a registered invokable interface that is identified by a SOAP action header or the path of an HTTP message.

Pascal

```
function GetInfoForURI(const PathURI: string; const ActionURI: string; var AClass: TClass; var
IntfInfo: PTypeInfo; var AMeth: string): Boolean;
```

C++

```
__fastcall Boolean GetInfoForURI(const AnsiString PathURI, const AnsiString ActionURI, TClass
AClass, PTypeInfo IntfInfo, AnsiString AMeth);
```

Description

Typically, applications do not need to call GetInfoForURI. This method is called by the invoker component (THTTPSoapPascalInvoker or THTTPSoapCppInvoker) to look up the target of a SOAP message that it is invoking.

PathURI is the path portion of the target URI on the SOAP message. When using a path to identify an invokable interface, the path portion must end in the name of the unit followed by the name of the interface. It is only used if ActionURI is an empty string.

ActionURI is the SOAP action header of the SOAP message. It identifies an interface based on the namespace in the SOAP action header. This namespace must match the namespace supplied to the RegisterInterface (see page 15552) method (or generated by that method if the caller did not supply a namespace). If ActionURI is an empty string, GetInfoForURI uses PathURI instead to identify the target interface.

AClass returns a class reference for the class that implements the invokable interface identified by PathURI or ActionURI.

IntfInfo (see page 15477) returns the runtime type information (RTTI) of the invokable interface identified by PathURI or ActionURI.

AMeth is not currently used.

See Also

DispatchSOAP (see page 19947)

RegisterInterface (see page 15552)

84.1.7.4.10 TInvokableClassRegistry.GetInterfaceCount Method

Returns the number of registered invokable interfaces.

Pascal

```
function GetInterfaceCount: Integer;
```

C++

```
__fastcall int GetInterfaceCount();
```

Description

GetInterfaceCount returns the number of invokable interfaces that have been registered. Each invokable interface is registered by a call to the RegisterInterface (see page 15552) method.

See Also

RegisterInterface (see page 15552)

84.1.7.4.11 GetInterfaceExternalName Method

This is the overview for the GetInterfaceExternalName method overload.

Overload List

	Name	Description
	TInvokableClassRegistry.GetInterfaceExternalName (PTypeInfo) (see page 15537)	Returns the name of the port type that corresponds to an invokable interface.
	TInvokableClassRegistry.GetInterfaceExternalName (PTypeInfo, string) (see page 15537)	Returns the name of the port type that corresponds to an invokable interface.
	TInvokableClassRegistry.GetInterfaceExternalName (PTypeInfo, string, string) (see page 15537)	Returns the name of the port type that corresponds to an invokable interface.

84.1.7.4.11.1 TInvokableClassRegistry.GetInterfaceExternalName Method (PTypeInfo)

Returns the name of the port type that corresponds to an invokable interface.

Pascal

```
function GetInterfaceExternalName(Info: PTypeInfo; const Namespace: string; const
InternalIntfName: string): InvString; overload;
function GetInterfaceExternalName(Info: PTypeInfo; const Namespace: string): InvString;
overload;
function GetInterfaceExternalName(Info: PTypeInfo): InvString; overload;
```

C++

```
__fastcall InvString GetInterfaceExternalName(PTypeInfo Info, const AnsiString Namespace,
const AnsiString InternalIntfName);
__fastcall InvString GetInterfaceExternalName(PTypeInfo Info, const AnsiString Namespace);
__fastcall InvString GetInterfaceExternalName(PTypeInfo Info);
```

Description

GetInterfaceExternalName returns the name of the port type that corresponds to a specified invokable interface. This is the name given to the corresponding port type in a WSDL document. The association between the external name and the interface name is established by the RegisterInterface (see page 15552) method.

Info is the type information pointer for the invokable interface.

Namespace is the namespace assigned to the invokable interface when it was registered by a call to the RegisterInterface (see page 15552) method. If the interface was registered using the automatically-generated namespace, this parameter can be omitted or you can supply an empty string.

InternalIntfName is the name of the invokable interface.

See Also

RegisterInterface (see page 15552)

84.1.7.4.12 TInvokableClassRegistry.GetInterfaceInfoFromName Method

Returns information about a registered invokable interface given its name.

Pascal

```
procedure GetInterfaceInfoFromName(const UnitName: string; const IntfName: string; var Info:
PTypeInfo; var IID: TGUID);
```

C++

```
__fastcall GetInterfaceInfoFromName(const AnsiString UnitName, const AnsiString IntfName,
PTypeInfo Info, TGUID IID);
```

Description

GetInterfaceInfoFromName looks up a registered interface given its name and the name of the unit in which it is declared.

UnitName is the name of the unit that contains the interface definition.

IntfName is the name of the interface.

Info returns the type information that is compiled with the specified interface.

IID returns the globally unique identifier for the specified interface.

See Also

GetInterfaceTypeInfo (see page 15538)

GetInfoForURI (see page 15536)

84.1.7.4.13 TInvokableClassRegistry.GetInterfaceTypeInfo Method

Returns the runtime type information (RTTI) of an invokable interface.

Pascal

```
function GetInterfaceTypeInfo(const AGUID: TGUID): Pointer;
```

C++

```
__fastcall void * GetInterfaceTypeInfo(const TGUID AGUID);
```

Description

GetInterfaceTypeInfo returns a pointer to the RTTI that is compiled with an invokable interface.

AGUID is the globally unique identifier that specifies the desired interface.

See Also

GetInterfaceInfoFromName (see page 15538)

GetInfoForURI (see page 15536)

84.1.7.4.14 GetIntfInvokeOptions Method

This is the overview for the GetIntfInvokeOptions method overload.

Overload List

	Name	Description
	TInvokableClassRegistry.GetIntfInvokeOptions (PTypeInfo) (see page 15539)	Retrieves any flags that customize the way calls to a registered interface are made.
	TInvokableClassRegistry.GetIntfInvokeOptions (TGUID) (see page 15539)	Retrieves any flags that customize the way calls to a registered interface are made.

84.1.7.4.14.1 TInvokableClassRegistry.GetIntfInvokeOptions Method (PTypeInfo)

Retrieves any flags that customize the way calls to a registered interface are made.

Pascal

```
function GetIntfInvokeOptions(const IntfInfo: PTypeInfo): TIntfInvokeOptions; overload;
function GetIntfInvokeOptions(const AGUID: TGUID): TIntfInvokeOptions; overload;
```

C++

```
__fastcall TIntfInvokeOptions GetIntfInvokeOptions(const PTypeInfo IntfInfo);
__fastcall TIntfInvokeOptions GetIntfInvokeOptions(const TGUID AGUID);
```

Description

GetIntfInvokeOptions retrieves any invocation options that have been registered for an interface using the RegisterInvokeOptions (see page 15554) method. Invocation options customize the way a registered interface is called, especially the way such calls are marshaled or unmarshaled. Remote interfaced objects (THTTPRIO) call this method to determine what options they need to set on the component that is the value of their Converter property.

AGUID identifies the registered interface using its GUID.

IntfInfo (see page 15477) identifies the registered interface using its runtime type information (RTTI). You can obtain the type information from an invokable interface by calling the TypeInfo function (delphi) or the __delphirtti operator (C++).

GetIntfInvokeOptions returns a set of flags that indicate how to make calls to the specified interface.

See Also

RegisterInvokeOptions (see page 15554)

Converter (see page 19935)

Options (see page 18176)

RegisterInterface (see page 15552)

84.1.7.4.15 TInvokableClassRegistry.GetInvokableObjectFromClass Method

Returns an instance of the implementation class for a registered invokable interface.

Pascal

```
function GetInvokableObjectFromClass(AClass: TClass): TObject;
```

C++

```
__fastcall TObject * GetInvokableObjectFromClass(TClass AClass);
```

Description

Typically, applications do not need to call GetInvokableObjectFromClass. This method is called by the invoker component (THTTPSoapPascalInvoker or THTTPSoapCppInvoker) to obtain an instance of the class that implements a registered invokable interface. When the invoker is finished with the object, it calls GetWSDLEncoding (see page 15545) to free the instance.

AClass identifies the class whose instance is desired. It must be registered by a call to RegisterInvokableClass (see page 15553). The invoker obtains this class reference by calling the GetInfoForURI (see page 15536) method.

See Also

GetInfoForURI (see page 15536)

RegisterInvokableClass (see page 15553)

GetWSDLEncoding (see page 15545)

84.1.7.4.16 TInvokableClassRegistry.GetMethExternalName Method

Returns the name of the operation that corresponds to a method on an invokable interface.

Pascal

```
function GetMethExternalName(Info: PTypeInfo; const MethodIntName: string): InvString;
```

C++

```
__fastcall InvString GetMethExternalName(PTypeInfo Info, const AnsiString MethodIntName);
```

Description

GetMethExternalName returns the name of the operation that corresponds to a specified method. This is the name used to define the operation for that method in a WSDL document. The association between the external name and the method name is established by the RegisterExternalMethName (see page 15548) method.

Info is the type information pointer for the invokable interface that includes the method.

MethodIntName is the name of the method on that invokable interface.

See Also

RegisterExternalMethName (see page 15548)

GetMethInternalName (see page 15540)

84.1.7.4.17 TInvokableClassRegistry.GetMethInternalName Method

Returns the name of the method that corresponds to an operation in a WSDL document.

Pascal

```
function GetMethInternalName(Info: PTypeInfo; const MethodExtName: InvString): string;
```

C++

```
__fastcall AnsiString GetMethInternalName(PTypeInfo Info, const InvString MethodExtName);
```

Description

GetMethInternalName returns the name of a method on a registered invokable interface that corresponds to a specified operation. The operation name comes from a WSDL document that describes the invokable interface and its methods. The association between the operation name and the method name is established by the RegisterExternalMethName (see page 15548) method.

Info is the type information pointer for the invokable interface that includes the method.

MethodExtName is the name of the operation for which you want the corresponding method name.

See Also

RegisterExternalMethName (see page 15548)

GetMethExternalName (see page 15540)

84.1.7.4.18 TInvokableClassRegistry.GetNamespaceByGUID Method

Returns a namespace that is uniquely associated with a registered interface.

Pascal

```
function GetNamespaceByGUID(const AGUID: TGUID): string;
```

C++

```
__fastcall AnsiString GetNamespaceByGUID(const TGUID AGUID);
```

Description

GetNamespaceByGUID returns the namespace URI that identifies the specified interface. The namespace is originally associated with the interface when it is registered by a call to the RegisterInterface (see page 15552) method. This namespace can be supplied when the interface is registered, or automatically generated by the RegisterInterface (see page 15552) method.

AGUID is the globally unique identifier that identifies the interface whose namespace is desired..

See Also

GetInfoForURI (see page 15536)

RegisterInterface (see page 15552)

84.1.7.4.19 TInvokableClassRegistry.GetParamExternalName Method

Returns the name of the part that corresponds to a parameter on a method of an invokable interface.

Pascal

```
function GetParamExternalName(Info: PTypeInfo; const MethodName: string; const
InternalParamName: string): InvString;
```

C++

```
__fastcall InvString GetParamExternalName(PTypeInfo Info, const AnsiString MethodName, const
AnsiString InternalParamName);
```

Description

GetParamExternalName returns the name of the part that corresponds to a specified method parameter. This is the name used to define the part for that parameter in a WSDL document. The association between the external name and the parameter name is established by the RegisterExternalParamName (see page 15549) method.

Info is the type information pointer for the invokable interface that includes the method.

MethodName is the name of the method on that invokable interface.

InternalParamName is the name of the parameter on the method of the invokable interface.

See Also

RegisterExternalParamName (see page 15549)

GetParamInternalName (see page 15541)

84.1.7.4.20 TInvokableClassRegistry.GetParamInternalName Method

Returns the name of the parameter that corresponds to a part on a message of an operation in a WSDL document.

Pascal

```
function GetParamInternalName(Info: PTypeInfo; const MethodName: string; const
ExternalParamName: InvString): string;
```

C++

```
__fastcall AnsiString GetParamInternalName(PTypeInfo Info, const AnsiString MethodName, const
InvString ExternalParamName);
```

Description

GetParamInternalName returns the name of the method parameter that corresponds to a specified part. This is the parameter of a method on an invokable interface that is registered to correspond to a part that is defined in a WSDL document. The association between the parameter name and the part name is established by the RegisterExternalParamName (see page 15549) method.

Info is the type information pointer for the invokable interface that includes the method.

MethodName is the name of the method on that invokable interface.

ExternalParamName is the name of a part on one of the messages in the operation that corresponds to MethodName. GetParamInternalName returns the corresponding parameter name.

See Also

RegisterExternalParamName (see page 15549)

GetParamExternalName (see page 15541)

84.1.7.4.21 TInvokableClassRegistry.GetRegInterfaceEntry Method

Returns the internal data that TInvokableClassRegistry (see page 15526) maintains for one of its registered interfaces.

Pascal

```
function GetRegInterfaceEntry(Index: Integer): InvRegIntfEntry;
```

C++

```
__fastcall InvRegIntfEntry GetRegInterfaceEntry(int Index);
```

Description

TInvokableClassRegistry (see page 15526) maintains an InvRegIntfEntry (see page 15627) value for every registered invokable interface. GetRegInterfaceEntry provides indexed access to this information.

The InvRegIntfEntry (see page 15627) value for a registered interface is intended for internal use by the invocation registry and the components that use it.

See Also

GetInfoForURI (see page 15536)

GetInterfaceCount (see page 15536)

RegisterDefaultSOAPAction (see page 15547)

84.1.7.4.22 TInvokableClassRegistry.GetRequestHeaderInfoForInterface Method

Retrieves an array of headers that are registered as associated with requests to an invokable interface.

Pascal

```
function GetRequestHeaderInfoForInterface(Info: PTypeInfo): THeaderItemArray;
```

C++

```
__fastcall THeaderItemArray GetRequestHeaderInfoForInterface(PTypeInfo Info);
```

Description

Typically, applications do not need to call GetRequestHeaderInfoForInterface. This method is used internally by the WSDL publisher to generate the WSDL that describes the headers that are used in messages that invoke a method on an invokable interface.

Info is the runtime type information (RTTI) from a registered invokable interface. The interface must have been previously registered by a call to the RegisterInterface (see page 15552) method.

GetRequestHeaderInfoForInterface returns an array of IntfHeaderItem (see page 15626) values, each of which describes a header that was registered for request messages on the invokable interface by a call to the RegisterHeaderClass (see page 15550) method.

See Also

RegisterHeaderClass (see page 15550)

TWSDLHTMLPublish (see page 26024)

RegisterInterface (see page 15552)

GetHeaderInfoForInterface (see page 15534)

84.1.7.4.23 TInvokableClassRegistry.GetResponseHeaderInfoForInterface Method

Retrieves an array of headers that are registered as associated with responses to invocations of an invokable interface.

Pascal

```
function GetResponseHeaderInfoForInterface(Info: PTypeInfo): THeaderItemArray;
```

C++

```
__fastcall THeaderItemArray GetResponseHeaderInfoForInterface(PTypeInfo Info);
```

Description

Typically, applications do not need to call GetResponseHeaderInfoForInterface. This method is used internally by the WSDL publisher to generate the WSDL that describes the headers that are used in response messages that return the results of executing a method on an invokable interface.

Info is the runtime type information (RTTI) from a registered invokable interface. The interface must have been previously registered by a call to the RegisterInterface (see page 15552) method.

GetResponseHeaderInfoForInterface returns an array of IntfHeaderItem (see page 15626) values, each of which describes a header that was registered for response messages on the invokable interface by a call to the RegisterHeaderClass (see page 15550) method.

See Also

RegisterHeaderClass (see page 15550)

TWSDLHTMLPublish (see page 26024)

RegisterInterface (see page 15552)

GetHeaderInfoForInterface (see page 15534)

84.1.7.4.24 TInvokableClassRegistry.GetReturnParamNames Method

Returns the list of parameter names that map to return values of interface methods.

Pascal

```
function GetReturnParamNames(const IntfInfo: PTypeInfo): string;
```

C++

```
__fastcall AnsiString GetReturnParamNames(const PTypeInfo IntfInfo);
```

Description

GetReturnParamNames returns the list of parameter names that have been registered as mapping to return values of methods on a specified interface. Any out messages in a port type with these names are identified as the return value of a method on the corresponding interface. If the application does not explicitly register output parameter names by a call to RegisterReturnParamNames (see page 15554), GetReturnParamNames returns the default list, 'Result;Return'.

IntfInfo (see page 15477) is the type information pointer for the invokable interface for which you want the registered parameter names.

GetReturnParamNames returns the list of parameter names as a semicolon delimited list.

See Also

RegisterReturnParamNames (see page 15554)

84.1.7.4.25 GetUDDIInfo Method

This is the overview for the GetUDDIInfo method overload.

Overload List

	Name	Description
	TInvokableClassRegistry.GetUDDIInfo (PTypeInfo, string, string) (see page 15544)	Retrieves the description of the UDDI location that describes a registered interface.
	TInvokableClassRegistry.GetUDDIInfo (TGUID, string, string) (see page 15544)	Retrieves the description of the UDDI location that describes a registered interface.

84.1.7.4.25.1 TInvokableClassRegistry.GetUDDIInfo Method (PTypeInfo, string, string)

Retrieves the description of the UDDI location that describes a registered interface.

Pascal

```
function GetUDDIInfo(const IntfInfo: PTypeInfo; var Operator: string; var BindingKey: string):
Boolean; overload;
function GetUDDIInfo(const AGUID: TGUID; var Operator: string; var BindingKey: string):
Boolean; overload;
```

C++

```
__fastcall Boolean GetUDDIInfo(const PTypeInfo IntfInfo, AnsiString Operator, AnsiString
BindingKey);
__fastcall Boolean GetUDDIInfo(const TGUID AGUID, AnsiString Operator, AnsiString BindingKey);
```

Description

Typically, applications do not need to call GetUDDIInfo. This method is used internally to provide fail-over support when a

registered interface was imported using the UDDI browser. It retrieves the information that identifies the UDDI entry for a Web Service, so that the application can re-fetch the target URL for a registered interface. The UDDI information is previously registered by a call to the RegisterUDDIInfo (see page 15555) method.

IntfInfo (see page 15477) is the runtime type information (RTTI) from a registered invokable interface. The interface must have been previously registered by a call to the RegisterInterface (see page 15552) method.

AGUID is a GUID that identifies the registered interface. The interface must have been previously registered by a call to the RegisterInterface (see page 15552) method.

Operator returns the URL of the UDDI registry that was used to import the interface definition.

BindingKey is the unique identifier for the TModel that describes the Web Service to which the interface belongs.

GetUDDIInfo returns true if it successfully locates and returns values for the Operator and BindingKey parameters. It returns false if there is no registered UDDI information for the specified interface.

See Also

RegisterUDDIInfo (see page 15555)

RegisterInterface (see page 15552)

84.1.7.4.26 GetWSDLEncoding Method

This is the overview for the GetWSDLEncoding method overload.

Overload List

	Name	Description
	TInvokableClassRegistry.GetWSDLEncoding (PTypeInfo) (see page 15545)	Returns the encoding attribute of the xml header of a document that defines the port type to which the interface corresponds.
	TInvokableClassRegistry.GetWSDLEncoding (PTypeInfo, string) (see page 15545)	Returns the encoding attribute of the xml header of a document that defines the port type to which the interface corresponds.
	TInvokableClassRegistry.GetWSDLEncoding (PTypeInfo, string, string) (see page 15545)	Returns the encoding attribute of the xml header of a document that defines the port type to which the interface corresponds.

84.1.7.4.26.1 TInvokableClassRegistry.GetWSDLEncoding Method (PTypeInfo)

Returns the encoding attribute of the xml header of a document that defines the port type to which the interface corresponds.

Pascal

```
function GetWSDLEncoding(Info: PTypeInfo; const Namespace: string; const InternalIntfName:
string): InvString; overload;
function GetWSDLEncoding(Info: PTypeInfo; const Namespace: string): InvString; overload;
function GetWSDLEncoding(Info: PTypeInfo): InvString; overload;
```

C++

```
__fastcall InvString GetWSDLEncoding(PTypeInfo Info, const AnsiString Namespace, const
AnsiString InternalIntfName);
__fastcall InvString GetWSDLEncoding(PTypeInfo Info, const AnsiString Namespace);
__fastcall InvString GetWSDLEncoding(PTypeInfo Info);
```

Description

GetWSDLEncoding returns the encoding attribute, if any, that is registered with the interface by a call to the RegisterInterface (

see page 15552) method. The encoding attribute is an attribute of the xml header of a WSDL document, and describes the character set that should be used with all the elements that the document defines.

Info points to the type information of the registered interface.

Namespace specifies the namespace that was registered for the interface by the RegisterInterface (see page 15552) method. It can be an empty string.

InternalIntfName is the name of the interface (which may differ from the port type to which it corresponds).

See Also

RegisterInterface (see page 15552)

84.1.7.4.27 TInvokableClassRegistry.HasRegInterfaceImpl Method

Indicates whether there is a registered implementation class for an invokable interface.

Pascal

```
function HasRegInterfaceImpl(Index: Integer): Boolean;
```

C++

```
__fastcall Boolean HasRegInterfaceImpl(int Index);
```

Description

Typically, applications do not need to call HasRegInterfaceImpl. This method is used internally to determine whether an implementation class has been registered for an invokable interface. The RegisterInvokableClass (see page 15553) method registers these implementation classes.

Index identifies the invokable interface for which an implementation class is sought. This index is the same as the index used in the GetRegInterfaceEntry (see page 15542) method, and reflects the order in which interfaces are registered.

HasRegInterfaceImpl returns true if there is a registered implementation class for the specified interface, false otherwise.

See Also

GetInterfaceCount (see page 15536)

GetRegInterfaceEntry (see page 15542)

RegisterInterface (see page 15552)

RegisterInvokableClass (see page 15553)

84.1.7.4.28 TInvokableClassRegistry.RegisterAllSOAPActions Method

Supplies a set of SOAP Action headers to use for an already-registered interface.

Pascal

```
procedure RegisterAllSOAPActions(Info: PTypeInfo; const AllSOAPActions: InvString);
```

C++

```
__fastcall RegisterAllSOAPActions(PTypeInfo Info, const InvString AllSOAPActions);
```

Description

RegisterDefaultSOAPAction (see page 15547) associates a registered invokable interface with a set of SOAP Action headers. A default SOAP Action header is generated (based on the namespace) when you register the interface by a call to the RegisterInterface (see page 15552) method. RegisterAllSOAPActions lets you supply or change the SOAP Action header to a set of headers after the interface is already registered.

Info is the runtime type information (RTTI) for the interface for which you are supplying a set of SOAP Action headers.

AllSOAPActions is a string that includes the SOAP headers to use for calls to the interface that Info identifies. The individual header strings are delimited by a character that is given by the first character in the string.

See Also

RegisterInterface (see page 15552)

RegisterDefaultSOAPAction (see page 15547)

84.1.7.4.29 TInvokableClassRegistry.RegisterDefaultSOAPAction Method

Supplies a SOAP Action header to use for an already-registered interface.

Pascal

```
procedure RegisterDefaultSOAPAction(Info: PTypeInfo; const DefSOAPAction: InvString);
```

C++

```
__fastcall RegisterDefaultSOAPAction(PTypeInfo Info, const InvString DefSOAPAction);
```

Description

RegisterDefaultSOAPAction associates a registered invokable interface with a SOAP Action header. A default SOAP Action header is generated (based on the namespace) when you register the interface by a call to the RegisterInterface (see page 15552) method. RegisterDefaultSOAPAction lets you supply or change the SOAP Action header after the interface is already registered.

Info is the runtime type information (RTTI) for the interface for which you are supplying a default SOAP Action header.

DefSOAPAction is the SOAP Action header to use for calls to the interface that Info identifies. If this is an empty string, the server automatically generates a SOAP Action header based on the namespace in which the corresponding port type is defined.

See Also

RegisterInterface (see page 15552)

THTTPRIO (see page 19928)

RegisterAllSOAPActions (see page 15546)

84.1.7.4.30 TInvokableClassRegistry.RegisterException Method

Registers the remotable exception classes that calls to an invokable interface can raise.

Pascal

```
procedure RegisterException(Info: PTypeInfo; AClass: TClass);
```

C++

```
__fastcall RegisterException(PTypeInfo Info, TClass AClass);
```

Description

Use RegisterException to register a remotable exception class. When an exception class is registered, its definition is exported to WSDL documents so that it can be used to communicate exception information between clients and servers.

Info points to the type information of the invokable interface that can raise the exception. If more than one interface can raise the exception, you must call this method once for each interface type.

AClass describes the exception class. This must be the class reference for an ERemotableException (see page 15496) descendant.

Note: After a call to RegisterException, the exception class is registered so that it is associated with all methods of the specified interface. If only a subset of the interface's methods raise the exception, you can indicate this by calling the RegisterExceptionMethod (see page 15548) method for each method that can raise the exception.

See Also

RegisterInterface (see page 15552)

ERemotableException (see page 15496)

RegisterExceptionMethod (see page 15548)

Creating Custom Exception Classes for Web Services

84.1.7.4.31 TInvokableClassRegistry.RegisterExceptionMethod Method

Registers methods of an invokable interface that can raise a registered exception class.

Pascal

```
procedure RegisterExceptionMethod(Info: PTypeInfo; AClass: TClass; const MethodName: string);
```

C++

```
__fastcall RegisterExceptionMethod(PTypeInfo Info, TClass AClass, const AnsiString MethodName);
```

Description

Call RegisterExceptionMethod for each method of an invokable interface that can raise a registered exception class. The exception class must be previously registered by a call to the RegisterException (see page 15547) method. If you do not call RegisterExceptionMethod, then the WSDL document for the interface treats the exception as associated with all methods of the interface. If you want to limit the use of the exception to a subset of the methods, call RegisterExceptionMethod for each method that can raise the exception. After the first method is registered this way, the exception becomes limited to that method alone (and to any method subsequently registered by another call to RegisterExceptionMethod).

Info points to the type information of the invokable interface that can raise the exception.

AClass describes the exception class. This must be the class reference used to register the exception previously by a call to the RegisterException (see page 15547) method.

MethodName is the name of a method that can raise the exception.

See Also

RegisterInterface (see page 15552)

ERemotableException (see page 15496)

RegisterException (see page 15547)

84.1.7.4.32 TInvokableClassRegistry.RegisterExternalMethName Method

Registers the correspondence between a method name on an invokable interface and the corresponding operation name in a WSDL document.

Pascal

```
procedure RegisterExternalMethName(Info: PTypeInfo; const InternalName: string; const
ExternalName: InvString);
```

C++

```
__fastcall RegisterExternalMethName(PTypeInfo Info, const AnsiString InternalName, const
InvString ExternalName);
```

Description

Use RegisterExternalMethName to create an association between the name of an operation in a WSDL document and the corresponding method of the invokable interface that corresponds to that operation's port type. This allows the invokable interface to represent a port type that includes operations with names that are not legal in Object Pascal (for example, keywords).

Info points to the type information of the invokable interface.

InternalName is the name used for the method of the invokable interface that corresponds to the operation.

ExternalName is the name of the operation that is defined in the WSDL document.

See Also

RegisterExternalParamName (see page 15549)

RegisterInterface (see page 15552)

84.1.7.4.33 TInvokableClassRegistry.RegisterExternalParamName Method

Registers the correspondence between a parameter name on an invokable interface and the corresponding part name in a WSDL document.

Pascal

```
procedure RegisterExternalParamName(Info: PTypeInfo; const MethodName: string; const
InternalName: string; const ExternalName: InvString);
```

C++

```
__fastcall RegisterExternalParamName(PTypeInfo Info, const AnsiString MethodName, const
AnsiString InternalName, const InvString ExternalName);
```

Description

Use RegisterExternalParamName to create an association between the name of a part in a WSDL document and the corresponding parameter on a method of an invokable interface. This allows the invokable interface to handle definitions that have names that are not legal in Object Pascal (for example, keywords).

Info points to the type information of the invokable interface.

MethodName is the name of the method on the invokable interface.

InternalName is the name used for the parameter of the specified method that corresponds to the part with the name specified by ExternalName.

ExternalName is the name of the part that is defined in the WSDL document.

See Also

RegisterExternalMethName (see page 15548)

RegisterInterface (see page 15552)

84.1.7.4.34 RegisterHeaderClass Method

This is the overview for the RegisterHeaderClass method overload.

Overload List

	Name	Description
	TInvokableClassRegistry.RegisterHeaderClass (PTypeInfo, TClass, eHeaderMethodType, Boolean) (see page 15550)	Registers a class that represents a headers which accompanies calls to an invokable interface.
	TInvokableClassRegistry.RegisterHeaderClass (PTypeInfo, TClass, WideString, WideString, eHeaderMethodType, Boolean) (see page 15550)	Registers a class that represents a headers which accompanies calls to an invokable interface.

84.1.7.4.34.1 TInvokableClassRegistry.RegisterHeaderClass Method (PTypeInfo, TClass, WideString, WideString, eHeaderMethodType, Boolean)

Registers a class that represents a headers which accompanies calls to an invokable interface.

Pascal

```
procedure RegisterHeaderClass(Info: PTypeInfo; AClass: TClass; const HeaderName: WideString;
const HeaderNamespace: WideString; DefaultMethodType: eHeaderMethodType = hmtAll; Required:
Boolean = False); overload;
procedure RegisterHeaderClass(Info: PTypeInfo; AClass: TClass; DefaultMethodType:
eHeaderMethodType = hmtAll; Required: Boolean = False); overload;
```

C++

```
__fastcall RegisterHeaderClass(PTypeInfo Info, TClass AClass, const BSTR HeaderName, const
BSTR HeaderNamespace, eHeaderMethodType DefaultMethodType = hmtAll, Boolean Required = False);
__fastcall RegisterHeaderClass(PTypeInfo Info, TClass AClass, eHeaderMethodType
DefaultMethodType = hmtAll, Boolean Required = False);
```

Description

Use RegisterHeaderClass to register a TSOAPHeader (see page 15596) descendant. Registering a TSOAPHeader (see page 15596) descendant serves two purposes:

On servers, when a TSOAPHeader (see page 15596) descendant is registered, its definition is exported to WSDL documents so that applications using that WSDL document can recognize and process the header.

On both servers and clients, registering associates the TSOAPHeader (see page 15596) descendant with a header name and the namespace in which that name is defined.

Info points to the type information of the invokable interface that the header should accompany. If the header should be included in messages invoking more than one interface or in the responses to more than one interface, you must call this method once for each interface type.

AClass describes the TSOAPHeader (see page 15596) descendant that represents the header.

HeaderName is the name of the header, as defined within the header's namespace. If HeaderName is not supplied, the header's name is assumed to be the same as the type name under which it is registered in the remotable type registry.

HeaderNamespace is the URI for the namespace in which the header's name is defined. If HeaderName and HeaderNamespace are not supplied, the header is assumed to be defined in the same namespace as the interface with which it is associated.

DefaultMethodType indicates whether the header is to be used on request messages, response messages, or both. This default value is associated with the interface as a whole. It can be changed for individual methods of the interface by subsequent calls to the RegisterHeaderMethod (see page 15551) method.

Required indicates whether the header must be included in messages about the interface. When Required is true, the header must be included and understood by the recipient of the message. When Required is false, the header is optional. Note that if

the header is required by some but not all messages, you must set this Required parameter to false, and then add the requirement to individual methods by subsequent calls to the RegisterHeaderMethod (see page 15551) method.

Note: After a call to RegisterHeaderClass, the header class is registered so that it is associated with all methods of the specified interface. If only a subset of the interface's methods use the header, or if the header should have a different method type for some of the methods on the interface, or if the header is required by a subset of the methods on the interface, you can indicate this by calling the RegisterHeaderMethod (see page 15551) method for each method that the header accompanies.

RegisterInterface (see page 15552)

TSOAPHeader (see page 15596)

RegisterHeaderMethod (see page 15551)

84.1.7.4.35 TInvokableClassRegistry.RegisterHeaderMethod Method

Registers methods of an invokable interface that make use of a registered header.

Pascal

```
procedure RegisterHeaderMethod(Info: PTypeInfo; AClass: TClass; const MethodName: string;
MethodType: eHeaderMethodType = hmtAll; Required: Boolean = False); overload;
```

C++

```
__fastcall RegisterHeaderMethod(PTypeInfo Info, TClass AClass, const AnsiString MethodName,
eHeaderMethodType MethodType = hmtAll, Boolean Required = False);
```

Description

Call RegisterHeaderMethod for each method of an invokable interface that uses a registered header type. The header class must be previously registered by a call to the RegisterHeaderClass (see page 15550) method. If you do not call RegisterHeaderMethod, then the WSDL document for the interface treats the header as associated with all methods of the interface. Use RegisterHeaderMethod if you want to

Limit the use of the header to a subset of the methods.

Specify whether the header is used for request messages, response messages, or both in a way that varies from method to method.

Indicate that the header is required for some methods but not others.

Call RegisterHeaderMethod for each method that uses the header. After the first method is registered this way, the header becomes limited to that method alone (and to any method subsequently registered by another call to RegisterHeaderMethod).

Info points to the type information of the invokable interface that the header should accompany.

AClass describes the TSOAPHeader (see page 15596) descendant that represents the header. This class must be previously registered by a call to RegisterHeaderClass (see page 15550).

MethodName is the name of a method that uses the header.

MethodType indicates whether the header is to be used on request messages, response messages, or both.

Required indicates whether the header must be included in messages about the specified method. When Required is true, the header must be included and understood by the recipient of the message. When Required is false, the header is optional.

TSOAPHeader (see page 15596)

RegisterHeaderClass (see page 15550)

84.1.7.4.36 TInvokableClassRegistry.RegisterInterface Method

Registers an invokable interface.

Pascal

```
procedure RegisterInterface(Info: PTypeInfo; const Namespace: InvString = ''; const
WSDLEncoding: InvString = ''; const Doc: string = ''; const ExtName: InvString = '');
```

C++

```
__fastcall RegisterInterface(PTypeInfo Info, const InvString Namespace = '', const InvString
WSDLEncoding = '', const AnsiString Doc = '', const InvString ExtName = '');
```

Description

Call RegisterInterface to register an invokable interface with the invocation registry. Typically, the call to RegisterInterface is added by the WSDL importer or Web Service wizard. In Delphi, this call goes in the initialization section of the unit that defines the invokable interface. In C++, it is called within a RegTypes method that uses the pragma startup directive.

Once the invokable interface is registered, client applications can statically bind to it using THTTPRio. On the server side, you must also register the implementation class (using the RegisterInvokableClass (see page 15553) method) before the server can respond to incoming SOAP requests.

PInfo is a pointer to the type information for the interface. You can obtain the type information from an invokable interface by calling the TypeInfo function (Delphi) or __delphirtti (C++).

Namespace specifies a namespace URI that uniquely identifies the interface. If Namespace is set to an empty string, RegisterInterface automatically generates a unique string to use as a namespace URI. Note that RegisterInterface generates a SOAP Action header to use based on the Namespace of the interface. You can change this SOAP Action header using the RegisterDefaultSoapAction method.

WSDLEncoding specifies a encoding attribute that appears on the xml header of any WSDL document that includes the definition of this interface (or rather, the port type to which it corresponds). The encoding attribute describes the character set to use in the WSDL document.

Doc is a descriptive string that describes the purpose or use of the interface. It is used if the application publishes a WSDL document that defines this interface.

ExtName is the name of the port type that corresponds to this interface in a WSDL document. This can be an empty string if the port type and interface have the same name. It is useful when a port type in a WSDL document has a name that is not a valid Object Pascal identifier (for example, a keyword).

DefSOAPAction is the SOAP Action header that should be used for messages that represent calls to the methods on this interface. If you do not supply a default SOAP Action header, your application uses an automatically-generated header that is based on the namespace of the interface.

84.1.7.4.37 RegisterInvokableClass Method

This is the overview for the RegisterInvokableClass method overload.

Overload List

	Name	Description
	TInvokableClassRegistry.RegisterInvokableClass (TClass) (see page 15553)	Registers the implementation class for an invokable interface.
	TInvokableClassRegistry.RegisterInvokableClass (TClass, TCreateInstanceProc) (see page 15553)	Registers the implementation class for an invokable interface.

84.1.7.4.37.1 TInvokableClassRegistry.RegisterInvokableClass Method (TClass)

Registers the implementation class for an invokable interface.

Pascal

```
procedure RegisterInvokableClass(AClass: TClass; CreateProc: TCreateInstanceProc); overload;
procedure RegisterInvokableClass(AClass: TClass); overload;
```

C++

```
__fastcall RegisterInvokableClass(TClass AClass, TCreateInstanceProc CreateProc);
__fastcall RegisterInvokableClass(TClass AClass);
```

Description

RegisterInvokableClass registers the class that implements an already-registered invokable interface. It is only needed on server applications that implement Web Services. The interface itself is registered by the RegisterInterface (see page 15552) method.

The invocation registry must be able to instantiate the implementation class. If the class has a virtual constructor that takes no arguments, you do not need to supply a method to create the class instance. If the constructor takes any arguments, of if it is not virtual, you must supply a method to instantiate the class as the value of the CreateProc argument.

AClass is a class reference to the class being registered. In Delphi code, you need only supply the class name. In C++, you can obtain a class reference for a class using the __classid operator.

CreateProc is a procedure that returns an instance of AClass. If CreateProc is nil (Delphi) or NULL (C++), then AClass must be a descendant of TInvokableClass (see page 15520).

See Also

RegisterInterface (see page 15552)

UnRegisterInvokableClass (see page 15556)

TInvokableClass (see page 15520)

84.1.7.4.38 RegisterInvokeOptions Method

This is the overview for the RegisterInvokeOptions method overload.

Overload List

	Name	Description
	TInvokableClassRegistry.RegisterInvokeOptions (PTypeInfo, TIntfInvokeOption) (see page 15554)	Registers flags that customize the way calls to a registered interface are made.
	TInvokableClassRegistry.RegisterInvokeOptions (PTypeInfo, TIntfInvokeOptions) (see page 15554)	Registers flags that customize the way calls to a registered interface are made.

84.1.7.4.38.1 TInvokableClassRegistry.RegisterInvokeOptions Method (PTypeInfo, TIntfInvokeOption)

Registers flags that customize the way calls to a registered interface are made.

Pascal

```
procedure RegisterInvokeOptions(Info: PTypeInfo; const InvokeOption: TIntfInvokeOption);
overload;
procedure RegisterInvokeOptions(Info: PTypeInfo; const InvokeOptions: TIntfInvokeOptions);
overload;
```

C++

```
__fastcall RegisterInvokeOptions(PTypeInfo Info, const TIntfInvokeOption InvokeOption);
__fastcall RegisterInvokeOptions(PTypeInfo Info, const TIntfInvokeOptions InvokeOptions);
```

Description

RegisterInvokeOptions associates the specified invocation flag or flags with a registered interface. The interface must be previously registered by a call to the RegisterInterface (see page 15552) method. Invocation flags customize the way a registered interface is called, especially the way such calls are marshaled or unmarshaled.

Info identifies the registered interface using its runtime type information (RTTI). You can obtain the type information from an invokable interface by calling the TypeInfo function (delphi) or __delphirtti (C++).

InvokeOption specifies a single invocation option to associate with the interface.

InvokeOptions specifies a set of invocation options to associate with the interface.

Note: RegisterInvokeOptions adds the specified option or options to the set of invocation flags already registered for the interface. It does not remove any previously registered options.

See Also

GetIntfInvokeOptions (see page 15539)

Converter (see page 19935)

Options (see page 18176)

RegisterInterface (see page 15552)

84.1.7.4.39 TInvokableClassRegistry.RegisterReturnParamNames Method

Registers a list of parameter names that map to return values of interface methods.

Pascal

```
procedure RegisterReturnParamNames(Info: PTypeInfo; const RetParamNames: string);
```

C++

```
__fastcall RegisterReturnParamNames(PTypeInfo Info, const AnsiString RetParamNames);
```

Description

RegisterReturnParamNames registers a list of parameter names that correspond to the return value of methods on a specified interface. Typically, this method is called by the WSDL importer. It is important that these names correspond exactly to those that the WSDL importer uses if the interface was imported from a WSDL document.

Info is the type information pointer for the invokable interface whose method return values map to the names in the list.

RetParamNames is a semicolon delimited list of parameter names that map to return values of methods on the specified interface. If RetParamNames is an empty string, the methods of the interface never have a return value (only output parameters). If no return parameter names are registered for an interface, the default list, 'Result;Return', is used.

See Also

GetReturnParamNames (see page 15544)

84.1.7.4.40 TInvokableClassRegistry.RegisterUDDIInfo Method

Registers the location of the UDDI description that can be used to import the location of a Web Service.

Pascal

```
procedure RegisterUDDIInfo(Info: PTypeInfo; const Operator: String; const BindingKey: string);
```

C++

```
__fastcall RegisterUDDIInfo(PTypeInfo Info, const AnsiString Operator, const AnsiString
BindingKey);
```

Description

Typically, applications do not need to call RegisterUDDIInfo. This method is called internally when a registered interface is imported using the UDDI browser. It associates the location of the imported UDDI entry with a registered interface so that the application can later provide fail-over support by re-fetching the location of the Web Service.

Info is the runtime type information (RTTI) from a registered invokable interface. The interface must have been previously registered by a call to the RegisterInterface (see page 15552) method.

Operator is the URL of the UDDI registry that was used to import the interface definition.

BindingKey is the unique identifier for the TModel that describes the Web Service to which the interface belongs.

See Also

GetUDDIInfo (see page 15544)

RegisterInterface (see page 15552)

84.1.7.4.41 TInvokableClassRegistry.UnRegisterInterface Method

Unregisters an invokable interface.

Pascal

```
procedure UnRegisterInterface(Info: PTypeInfo);
```

C++

```
__fastcall UnRegisterInterface(PTypeInfo Info);
```

Description

Call UnRegisterInterface to unregister an invokable interface from the invocation registry. In Delphi, this call goes in the finalization section of the unit that defines the invokable interface. In C++, it is called from a method that uses the pragma exit directive.

Once an invokable interface is unregistered, client applications can no longer call it and server applications can't respond to calls directed at the interface methods.

Info is a pointer to the runtime type information for the interface. You can obtain the type information from an invokable interface by calling the TypeInfo function in Delphi or __delphirtti in C++.

See Also

UnRegisterInvokableClass (see page 15556)

IInvokable (see page 22398)

RegisterInterface (see page 15552)

84.1.7.4.42 TInvokableClassRegistry.UnRegisterInvokableClass Method

Unregisters the implementation class for an invokable interface.

Pascal

```
procedure UnRegisterInvokableClass(AClass: TClass);
```

C++

```
__fastcall UnRegisterInvokableClass(TClass AClass);
```

Description

UnRegisterInvokableClass unregisters an implementation class that was previously registered by a call to RegisterInvokableClass (see page 15553). Once a class is unregistered, the invocation registry can no longer create and use instances of the specified class to handle incoming method calls to its corresponding invokable interface.

AClass is a class reference to the class being unregistered.

See Also

UnRegisterInterface (see page 15555)

RegisterInvokableClass (see page 15553)

84.1.8 TRemotable Class

TRemotable is the base class for classes that can be passed as parameters or return values in a Web Service application.

Class Hierarchy

Pascal

```
TRemotable = class;
```

C++

```
class TRemotable;
```

File

InvokeRegistry

Description

Use TRemotable as a base class when defining a class that can be used for parameters or return values on an invokable interface. TRemotable descendants can represent non-scalar types, or scalar types that do not correspond to Object Pascal types. TRemotable is compiled with runtime type information (RTTI) and has a virtual constructor that the remotable class registry recognizes and uses to supply class instances.

Note: To create a class that represents scalar values that do not correspond directly to an Object Pascal type, use TRemotableXS (see page 15580) as a base class instead. TRemotableXS (see page 15580) is a descendant of the TRemotable class.

Note: When writing a TRemotable descendant, you can control whether a property is encoded as an element node or as an attribute node by using the stored directive. Properties declared with a stored directive set to AS_ATTRIBUTE (see page 15645) are encoded as attribute nodes. Properties that are declared without a stored directive, or with a stored directive set to anything other than AS_ATTRIBUTE (see page 15645) are encoded as element nodes.

Both the client application and server application must register a TRemotable descendant with the remotable class registry before they can use it. To register a remotable class, use the RegisterXSClass method of the object that the global RemTypeRegistry (see page 15621) function returns.

On server applications, instances of TRemotable descendants that are input parameters on an invokable interface are automatically created when the method call is unmarshaled and automatically freed after any output parameters or return value are marshaled so that they can be sent to the client. When a TRemotable descendant is created in a method that was called remotely using an invokable interface, the instance is automatically freed after the value of the TRemotable descendant is marshaled for transport back to the client application.

The caller of an invokable interface (client) is responsible for creating any TRemotable instances that it passes as input parameters, and for freeing any TRemotable instances it creates or that are returned as output parameters or method results.

Using Remotable Objects

84.1.8.1 TRemotable Members

The following tables list the members exposed by TRemotable.

Protected Fields

	Name	Description
	FSerializationOptions (see page 15559)	This is FSerializationOptions, a member of class TRemotable.

Public Methods

	Name	Description
	Create (see page 15558)	Creates and initializes a TRemotable (see page 15556) object.

	Destroy (see page 15558)	Frees the memory associated with the TRemotable (see page 15556) object.
	ObjectToSOAP (see page 15559)	Converts this remotable object to its SOAP representation.
	SOAPToObject (see page 15560)	Initializes this TRemotable (see page 15556) instance to represent the value of its SOAP representation.

Public Properties

	Name	Description
	DataContext (see page 15561)	Specifies the object that controls the lifetime of a TRemotable (see page 15556) instance.
	SerializationOptions (see page 15561)	Indicates how the value of the TRemotable (see page 15556) descendant encodes its value.

84.1.8.2 TRemotable.Create Constructor

Creates and initializes a TRemotable (see page 15556) object.

Pascal

```
constructor Create; virtual;
```

C++

```
virtual __fastcall TRemotable();
```

Description

The TRemotable (see page 15556) constructor does nothing special. It exists primarily because

The remotable type registry knows how to call it.

It is virtual, so that the remotable type registry can also instantiate descendant classes.

See Also

RemTypeRegistry (see page 15621)

84.1.8.3 TRemotable.Destroy Destructor

Frees the memory associated with the TRemotable (see page 15556) object.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TRemotable();
```

Description

Use the Free method to free a TRemotable (see page 15556) instance. Free checks that the object is not nil before calling Destroy.

On server applications, there is typically no need to explicitly free a TRemotable (see page 15556) instance (for example, one created as a return value or output parameter). By default, when a TRemotable (see page 15556) descendant is created in a method that was called remotely using an invokable interface, it is added to a data context (the value of the DataContext (see page 15561) property). As long as the remotable object belongs to the data context, the data context handles freeing the object. Similarly, TRemotable (see page 15556) instances that are passed in as a parameter belong to the data context.

On client applications, TRemotable (see page 15556) instances created and passed to an invokable interface or returned as a parameter or result of an invokable interface must be freed by the calling application.

See Also

Free (see page 22300)

DataContext (see page 15561)

84.1.8.4 TRemotable Fields

The fields of the TRemotable class are listed here.

Protected Fields

	Name	Description
	FSerializationOptions (see page 15559)	This is FSerializationOptions, a member of class TRemotable.

84.1.8.4.1 TRemotable.FSerializationOptions Field

Pascal

```
FSerializationOptions: TSerializationOptions;
```

C++

```
TSerializationOptions FSerializationOptions;
```

Description

This is FSerializationOptions, a member of class TRemotable.

84.1.8.5 TRemotable Methods

The methods of the TRemotable class are listed here.

Public Methods

	Name	Description
	ObjectToSOAP (see page 15559)	Converts this remotable object to its SOAP representation.
	SOAPToObject (see page 15560)	Initializes this TRemotable (see page 15556) instance to represent the value of its SOAP representation.

84.1.8.5.1 TRemotable.ObjectToSOAP Method

Converts this remotable object to its SOAP representation.

Pascal

```
function ObjectToSOAP(RootNode: IXMLNode; ParentNode: IXMLNode; const ObjConverter:
IObjConverter; const Name: InvString; const URI: InvString; ObjConvOpts:
TObjectConvertOptions; out RefID: InvString): IXMLNode; virtual;
```

C++

```
virtual __fastcall IXMLNode ObjectToSOAP(IXMLNode RootNode, IXMLNode ParentNode, const
IObjConverter ObjConverter, const InvString Name, const InvString URI, TObjectConvertOptions
ObjConvOpts, InvString RefID);
```

Description

Override ObjectToSOAP to customize the way your application converts a TRemotable (see page 15556) descendant to its SOAP representation. In TRemotable (see page 15556), ObjectToSOAP simply calls the ObjInstanceToSOAP method of the converter that is supplied by the ObjConverter parameter.

RootNode is an ancestor of the generated node to which information about the generated node can be added as attributes.

ParentNode is the node in the SOAP representation that should act as a parent to the node that ObjectToSOAP generates.

ObjConverter is the interface of the default converter that translates between remotable objects and their SOAP representation. This is the interface to a TOPToSoapDomConvert instance.

Name is the name of the node that is generated.

URI is the URI for the namespace in which Name is defined.

ObjConvOpts are flags that customize the way the node is serialized.

RefID returns a reference ID for the node. This is used if the node is multi-referenced.

ObjectToSOAP returns the XML for the newly generated node.

See Also

ObjInstanceToSOAP (see page 15612)

SOAPToObject (see page 15560)

84.1.8.5.2 TRemotable.SOAPToObject Method

Initializes this TRemotable (see page 15556) instance to represent the value of its SOAP representation.

Pascal

```
procedure SOAPToObject(const RootNode: IXMLNode; const Node: IXMLNode; const ObjConverter:
IObjConverter); virtual;
```

C++

```
virtual __fastcall SOAPToObject(const IXMLNode RootNode, const IXMLNode Node, const
IObjConverter ObjConverter);
```

Description

SOAPToObject initializes the published properties of this object instance so that they reflect the header's SOAP representation. Override this method to customize the way your application creates a specific remotable type from its XML representation.

RootNode is an ancestor node of the node for this object that can contain information about the remotable type's value.

Node is the node in the SOAP envelope that represents the remotable type's value.

ObjConverter is the interface of the default converter that translates between remotable objects and their SOAP representation. This is the interface to a TOPToSoapDomConvert instance.

In TRemotable (see page 15556), SOAPToObject simply calls the InitObjectFromSOAP method of the converter supplied by the ObjConverter parameter.

See Also

ObjectToSOAP (see page 15559)

InitObjectFromSOAP (see page 15612)

84.1.8.6 TRemotable Properties

The properties of the TRemotable class are listed here.

Public Properties

	Name	Description
	DataContext (see page 15561)	Specifies the object that controls the lifetime of a TRemotable (see page 15556) instance.
R	SerializationOptions (see page 15561)	Indicates how the value of the TRemotable (see page 15556) descendant encodes its value.

84.1.8.6.1 TRemotable.DataContext Property

Specifies the object that controls the lifetime of a TRemotable (see page 15556) instance.

Pascal

```
property DataContext: TDataContext;
```

C++

```
__property TDataContext DataContext;
```

Description

By default, when a Web Service application creates an instance of a remotable object, that object exists only for the time it takes to marshal the information it represents or to unmarshal that information into the TRemotable (see page 15556) instance and then make a method call that uses the instance. The object specified by DataContext handles the freeing of the TRemotable (see page 15556) instance.

There are times when a server may not want the TRemotable (see page 15556) instance to be so transient. For example, if the object contains state information, it may be more efficient to have a single instance that is used for every message call. If you change DataContext, the TRemotable (see page 15556) instance is removed from the data context, and is not freed when the data context goes away at the end of the method call.

Note: If DataContext is nil (Delphi) or NULL (C++), the application is responsible for freeing the TRemotable (see page 15556) instance. For example, TRemotable (see page 15556) objects created on client applications are created with a nil (Delphi) or NULL (C++) value for DataContext and must be freed by the client application.

See Also

Using Remotable Objects

84.1.8.6.2 TRemotable.SerializationOptions Property

Indicates how the value of the TRemotable (see page 15556) descendant encodes its value.

Pascal

```
property SerializationOptions: TSerializationOptions;
```

C++

```
__property TSerializationOptions SerializationOptions;
```

Description

SerializationOptions is used internally when an instance of TRemotable (see page 15556) is converted to or from its SOAP encoding. The value of this property is a set of flags that configure the mapping between the published properties of the TRemotable (see page 15556) descendant and the corresponding SOAP encoding.

Typically, the value of this read-only property is set by the constructor of a TRemotable (see page 15556) descendant or by the WSDL importer when it registers a remotable class.

See Also

SerializeOptions (see page 15575)

RegisterSerializeOptions (see page 15572)

84.1.9 TRemotableTypeRegistry Class

TRemotableTypeRegistry is the type of the remotable type registry.

Class Hierarchy

InvokeRegistry.TRemotableTypeRegistry

Pascal

```
TRemotableTypeRegistry = class;
```

C++

```
class TRemotableTypeRegistry;
```

File

InvokeRegistry

Description

TRemotableTypeRegistry manages information about remotable classes and types that can be communicated between client applications and a Web Service provider. Remotable classes can be used to represent non-scalar types for parameters and return values, or they can represent exceptions that occur when the Web Service application is trying to execute a request. All remotable classes are compiled with runtime type information (RTTI) and have a virtual constructor that the remotable type registry recognizes and uses to supply class instances. Remotable types include dynamic arrays, enumerated types, and boolean types, which can be used in an invokable interface without resorting to a remotable class representation, but which must be registered because their values require special marshaling.

Both the client application and server application must register remotable classes and types with the remotable type registry before they can use them. Use the RegisterXSClass (see page 15573) method to register a remotable class. Use the RegiterXSInfo method to register a dynamic array type or enumerated type.

Do not create instances of TRemotableTypeRegistry. Instead, use the global RemTypeRegistry (see page 15621) function to access the remotable type registry. Most applications need only call the RegisterXSClass (see page 15573) or RegisterXSInfo (see page 15574) methods. The other TRemotableTypeRegistry methods are used internally to create or look up information about remotable classes and types.

See Also

RemTypeRegistry (see page 15621)

TRemotable (see page 15556)

IInvokable (see page 22398)

ERemotableException (see page 15496)

TInvokableClassRegistry (see page 15526)

84.1.9.1 TRemotableTypeRegistry Members

The following tables list the members exposed by TRemotableTypeRegistry.

Protected Methods

	Name	Description
	Lock (see page 15570)	Prevents other threads from accessing the type registry.
	UnLock (see page 15576)	Allows other threads to access the type registry after it was locked.

Public Methods

	Name	Description
	ClassOptions (see page 15565)	Indicates how to handle multiple references to the same object when converting a specified remotable class to its SOAP representation.
	ClassToURI (see page 15566)	This is the overview for the ClassToURI method overload.
	Create (see page 15563)	Creates and initializes a TRemotableTypeRegistry (see page 15562) object.
	Destroy (see page 15564)	Frees the memory associated with the TRemotableTypeRegistry (see page 15562) object.
	GetExternalPropName (see page 15566)	Returns the name of the XML element that corresponds to a property of a registered remotable class.
	GetInternalPropName (see page 15567)	Returns the name of the property on a remotable class that corresponds to a specified XML element.
	GetURICount (see page 15567)	Returns the number of entries in the remotable type registry.
	GetURIMap (see page 15568)	This is the overview for the GetURIMap method overload.
	GetVarTypeFromXSD (see page 15569)	Returns the variant type that corresponds to a registered remotable type.
	GetXSDInfoForClass (see page 15569)	Returns type name and namespace URI that correspond to a remotable class.
	InfoToURI (see page 15569)	Returns the namespace URI and type name for a registered type.
	IsClassScalar (see page 15570)	Indicates whether a registered class represents a scalar type.
	RegisterExternalPropName (see page 15571)	Registers the correspondence between a property name on a remotable class and the corresponding element name in an XML schema.
	RegisterHolderClsMember (see page 15571)	Registers a remotable type whose type information must be extracted from a holder class.
	RegisterSerializeOptions (see page 15572)	This is the overview for the RegisterSerializeOptions method overload.
	RegisterXSClass (see page 15573)	Registers a remotable class.
	RegisterXSInfo (see page 15574)	Registers a remotable type.
	SerializeOptions (see page 15574)	This is the overview for the SerializeOptions method overload.
	TypeInfoToXSD (see page 15575)	Returns the type name and namespace URI registered with a remotable class or type.
	UnRegisterXSClass (see page 15576)	Unregisters a remotable class.
	UnRegisterXSInfo (see page 15577)	Unregisters a remotable type.
	URIToClass (see page 15577)	This is the overview for the URIToClass method overload.
	URIToInfo (see page 15578)	Returns the type information pointer for a registered remotable class or type.
	VariantToInfo (see page 15578)	Returns the TypeInfo pointer for the type of a specified Variant's data.
	XSDToTypeInfo (see page 15579)	Returns the type information pointer associated with a specified type name.

Public Properties

	Name	Description
	AutoRegisterNativeTypes (see page 15579)	Specifies whether types that are used in an invokable interface or by a remotable class are automatically registered.

84.1.9.2 TRemotableTypeRegistry.Create Constructor

Creates and initializes a TRemotableTypeRegistry (see page 15562) object.

Pascal

```
constructor Create;
```

C++

```
__fastcall TRemotableTypeRegistry();
```

Description

Do not create your own instances of TRemotableTypeRegistry (see page 15562). Instead, use the global RemTypeRegistry (see page 15621) function, which provides access to a single global instance of TRemotableTypeRegistry (see page 15562).

See Also

RemTypeRegistry (see page 15621)

84.1.9.3 TRemotableTypeRegistry.Destroy Destructor

Frees the memory associated with the TRemotableTypeRegistry (see page 15562) object.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TRemotableTypeRegistry();
```

Description

Do not destroy the global TRemotableTypeRegistry (see page 15562) instance that is available through the RemClassRegistry (see page 15620) function. This object is freed automatically when the application unloads the InvokeRegistry (see page 15493) unit.

See Also

RemClassRegistry (see page 15620)

84.1.9.4 TRemotableTypeRegistry Methods

The methods of the TRemotableTypeRegistry class are listed here.

Protected Methods

	Name	Description
	Lock (see page 15570)	Prevents other threads from accessing the type registry.
	UnLock (see page 15576)	Allows other threads to access the type registry after it was locked.

Public Methods

	Name	Description
	ClassOptions (see page 15565)	Indicates how to handle multiple references to the same object when converting a specified remotable class to its SOAP representation.
	ClassToURI (see page 15566)	This is the overview for the ClassToURI method overload.
	GetExternalPropName (see page 15566)	Returns the name of the XML element that corresponds to a property of a registered remotable class.
	GetInternalPropName (see page 15567)	Returns the name of the property on a remotable class that corresponds to a specified XML element.
	GetURICount (see page 15567)	Returns the number of entries in the remotable type registry.
	GetURIMap (see page 15568)	This is the overview for the GetURIMap method overload.
	GetVarTypeFromXSD (see page 15569)	Returns the variant type that corresponds to a registered remotable type.
	GetXSDInfoForClass (see page 15569)	Returns type name and namespace URI that correspond to a remotable class.
	InfoToURI (see page 15569)	Returns the namespace URI and type name for a registered type.
	IsClassScalar (see page 15570)	Indicates whether a registered class represents a scalar type.
	RegisterExternalPropName (see page 15571)	Registers the correspondence between a property name on a remotable class and the corresponding element name in an XML schema.
	RegisterHolderClsMember (see page 15571)	Registers a remotable type whose type information must be extracted from a holder class.

	RegisterSerializeOptions (see page 15572)	This is the overview for the RegisterSerializeOptions method overload.
	RegisterXSClass (see page 15573)	Registers a remotable class.
	RegisterXSInfo (see page 15574)	Registers a remotable type.
	SerializeOptions (see page 15574)	This is the overview for the SerializeOptions method overload.
	TypeInfoToXSD (see page 15575)	Returns the type name and namespace URI registered with a remotable class or type.
	UnRegisterXSClass (see page 15576)	Unregisters a remotable class.
	UnRegisterXSInfo (see page 15577)	Unregisters a remotable type.
	URIToClass (see page 15577)	This is the overview for the URIToClass method overload.
	URIToInfo (see page 15578)	Returns the type information pointer for a registered remotable class or type.
	VariantToInfo (see page 15578)	Returns the TypeInfo pointer for the type of a specified Variant's data.
	XSDToTypeInfo (see page 15579)	Returns the type information pointer associated with a specified type name.

84.1.9.4.1 TRemotableTypeRegistry.ClassOptions Method

Indicates how to handle multiple references to the same object when converting a specified remotable class to its SOAP representation.

Pascal

```
function ClassOptions(AClass: TClass): TObjMultiOptions;
```

C++

```
__fastcall TObjMultiOptions ClassOptions(TClass AClass);
```

Description

When an application converts a remotable class to its SOAP representation, it can convert multiple references to the same object in one of two ways. It can treat the object as if its properties have meaning, but not the reference itself. (That is, two references to the same object are equivalent values, but not the same thing.) Alternately, if the object reference itself has meaning, it can encode the fact that these are multiple references to the same entity in the SOAP packet.

Individual remotable classes can specify how they want this conversion to be handled, overriding any defaults that would otherwise be used. For example, THTTPRIO, THTTPSoapPascalInvoker, and THTTPSoapCppInvoker use TOPToSoapDomConvert to convert between remotable classes and their SOAP representation. TOPToSoapDomConvert has an Options property that specifies, among other things, whether to encode multiple references to the same object by value or as references. Individual remotable classes can supply an override to this default strategy when they are registered using the RegisterXSClass (see page 15573) method.

ClassOptions returns how to handle multiple references of a specified class.

AClass is a class reference for the registered class that you want to know how to convert.

RegisterXSClass (see page 15573)

Options (see page 18176)

IOPConvert (see page 18122)

THTTPSoapCppInvoker (see page 19950)

THTTPSoapPascalInvoker (see page 19951)

THTTPRIO (see page 19928)

TOPToSoapDomConvert (see page 18137)

84.1.9.4.2 ClassToURI Method

This is the overview for the ClassToURI method overload.

Overload List

	Name	Description
	TRemotableTypeRegistry.ClassToURI (TClass, WideString, WideString) (see page 15566)	Returns the namespace URI associated with a specified remotable class.
	TRemotableTypeRegistry.ClassToURI (TClass, WideString, WideString, Boolean, Boolean) (see page 15566)	Returns the namespace URI associated with a specified remotable class.

84.1.9.4.2.1 TRemotableTypeRegistry.ClassToURI Method (TClass, WideString, WideString)

Returns the namespace URI associated with a specified remotable class.

Pascal

```
function ClassToURI(AClass: TClass; var URI: WideString; var Name: WideString; var IsScalar:
Boolean; tryToRegister: Boolean = True): Boolean; overload;
function ClassToURI(AClass: TClass; var URI: WideString; var Name: WideString): Boolean;
overload;
```

C++

```
__fastcall Boolean ClassToURI(TClass AClass, BSTR URI, BSTR Name, Boolean IsScalar, Boolean
tryToRegister = True);
__fastcall Boolean ClassToURI(TClass AClass, BSTR URI, BSTR Name);
```

Description

ClassToURI looks up a registered remotable class and retrieves its namespace URI and typename. The association of the class and its namespace URI and typename is established when you call RegisterXSClass (see page 15573) to register the remotable class.

AClass is a class reference for the remotable class you want to look up.

URI returns the namespace URI that is associated with the class.

Name returns the registered name of the type the class represents.

IsScalar indicates whether the class corresponds to a scalar type in a WSDL document.

tryToRegister indicates whether the remotable type registry should auto-register the class that AClass specifies if it is not already registered. This parameter is only used if the AutoRegisterNativeTypes (see page 15579) property is true.

See Also

RegisterXSClass (see page 15573)

URIToClass (see page 15577)

AutoRegisterNativeTypes (see page 15579)

84.1.9.4.3 TRemotableTypeRegistry.GetExternalPropName Method

Returns the name of the XML element that corresponds to a property of a registered remotable class.

Pascal

```
function GetExternalPropName(Info: PTypeInfo; InternalName: string): InvString;
```

C++

```
__fastcall InvString GetExternalPropName(PTypeInfo Info, AnsiString InternalName);
```

Description

Use GetExternalPropName to obtain the name of the XML element that was registered as the XML schema analog of a property on a registered remotable class. The association between the element and the property must be previously registered by the RegisterExternalPropname method.

Info points to the type information of the remotable class that has the property.

InternalName is the name of the property from which you want to obtain the corresponding XML element name.

See Also

GetInternalPropName (see page 15567)

RegisterExternalPropName (see page 15571)

84.1.9.4.4 TRemotableTypeRegistry.GetInternalPropName Method

Returns the name of the property on a remotable class that corresponds to a specified XML element.

Pascal

```
function GetInternalPropName(Info: PTypeInfo; ExternalName: InvString): string;
```

C++

```
__fastcall AnsiString GetInternalPropName(PTypeInfo Info, InvString ExternalName);
```

Description

Use GetInternalPropName to obtain the name of the property on a registered remotable class that corresponds to a specified XML element. The association between the element and the property must be previously registered by the RegisterExternalPropname method.

Info points to the type information of the remotable class that has the property.

ExternalName is the name of an XML element that is part of a complex type defined in an XML schema. The remotable class identified by Info must represent the complex type that includes ExternalName.

See Also

GetExternalPropName (see page 15566)

RegisterExternalPropName (see page 15571)

84.1.9.4.5 TRemotableTypeRegistry.GetURICount Method

Returns the number of entries in the remotable type registry.

Pascal

```
function GetURICount: Integer;
```

C++

```
__fastcall int GetURICount();
```

Description

GetURICount returns the number of entries in the remotable type registry. This value can be used as an upper bound for the index parameter of the GetURIMap (see page 15568) method.

Each entry in the remotable type registry represents a registered class or a registered type. The RegisterXSClass (see page 15573) method adds entries for classes, and the The RegisterXSInfo (see page 15574) method adds entries for types. Each entry associates the class or type with a unique namespace URI.

See Also

GetURIMap (see page 15568)

RegisterXSClass (see page 15573)

RegisterXSInfo (see page 15574)

84.1.9.4.6 GetURIMap Method

This is the overview for the GetURIMap method overload.

Overload List

	Name	Description
	TRemotableTypeRegistry.GetURIMap (Integer) (see page 15568)	Returns an entry from the remotable type registry.
	TRemotableTypeRegistry.GetURIMap (Integer, TRemRegEntry) (see page 15568)	Returns an entry from the remotable type registry.

84.1.9.4.6.1 TRemotableTypeRegistry.GetURIMap Method (Integer)

Returns an entry from the remotable type registry.

Pascal

```
function GetURIMap(Index: Integer): TRemRegEntry; overload;
function GetURIMap(Index: Integer; out RegEntry: TRemRegEntry): boolean; overload;
```

C++

```
__fastcall TRemRegEntry GetURIMap(int Index);
__fastcall boolean GetURIMap(int Index, TRemRegEntry RegEntry);
```

Description

GetURIMap returns an entry from the remotable type registry that is identified by its index. It is useful for operations that iterate over all the registered entries. Use the GetURICount (see page 15567) method to obtain an upper bound for the index.

Index is the index of the entry you want to see.

Using the first syntax, GetURIMap returns a TRemRegEntry (see page 15634) value that describes a registered class or type.

Using the second syntax, the RegEntry parameter returns the TRemRegEntry (see page 15634) at the specified index. Using this syntax, GetURIMap returns true if Index is a valid index, false if Index is out of range.

The TRemRegEntry (see page 15634) value that this method returns is used to represent both remotable classes, which are added using the RegisterXSClass (see page 15573) method, and remotable types, which are added using the RegisterXSInfo (see page 15574) method.

See Also

GetURICount (see page 15567)

RegisterXSClass (see page 15573)

84.1.9.4.7 TRemotableTypeRegistry.GetVarTypeFromXSD Method

Returns the variant type that corresponds to a registered remotable type.

Pascal

```
function GetVarTypeFromXSD(const URI: InvString; const TypeName: InvString): TVarType;
```

C++

```
__fastcall TVarType GetVarTypeFromXSD(const InvString URI, const InvString TypeName);
```

Description

GetVarTypeFromXSD returns the built-in Variant type that corresponds most naturally to a remotable type that was registered by a call to the RegisterXSInfo (see page 15574) method.

URI is the namespace URI associated with the type when it was registered.

TypeName is the type name associated with the type when it was registered.

See Also

VariantToInfo (see page 15578)

XSDToTypeInfo (see page 15579)

URIToInfo (see page 15578)

RegisterXSInfo (see page 15574)

84.1.9.4.8 TRemotableTypeRegistry.GetXSDInfoForClass Method

Returns type name and namespace URI that correspond to a remotable class.

Pascal

```
procedure GetXSDInfoForClass(Info: PTypeInfo; var URI: WideString; var TypeName: WideString);
```

C++

```
__fastcall GetXSDInfoForClass(PTypeInfo Info, BSTR URI, BSTR TypeName);
```

Description

GetXSDInfoForClass returns the type name under which a remotable class is registered, along with the namespace URI in which that type name is defined. The class must be previously registered by a call to the RegisterXSClass (see page 15573) method.

Info is the type info pointer for the registered remotable class.

URI returns the namespace URI that was associated with the class when it was registered.

TypeName returns the type name that was associated with the class when it was registered.

See Also

RegisterXSClass (see page 15573)

XSDToTypeInfo (see page 15579)

84.1.9.4.9 TRemotableTypeRegistry.InfoToURI Method

Returns the namespace URI and type name for a registered type.

Pascal

```
function InfoToURI(Info: PTypeInfo; var URI: WideString; var Name: WideString; var IsScalar:
Boolean; tryToRegister: Boolean = True): Boolean;
```

C++

```
__fastcall Boolean InfoToURI(PTypeInfo Info, BSTR URI, BSTR Name, Boolean IsScalar, Boolean
tryToRegister = True);
```

Description

InfoToURI returns the namespace URI and type name that is associated with the specified type description. This association is established when you register a type by calling the RegisterXSInfo (see page 15574) method.

Info is a pointer to the runtime type information (RTTI) for the registered type.

URI returns the namespace URI that is associated with the type.

Name returns the registered name of the type.

IsScalar indicates whether the type corresponds to a scalar type in a WSDL document.

tryToRegister indicates whether the remotable type registry should auto-register the type that Info specifies if it is not already registered. This parameter is only used if the AutoRegisterNativeTypes (see page 15579) property is true.

See Also

RegisterXSInfo (see page 15574)

AutoRegisterNativeTypes (see page 15579)

84.1.9.4.10 TRemotableTypeRegistry.IsClassScalar Method

Indicates whether a registered class represents a scalar type.

Pascal

```
function IsClassScalar(AClass: TClass): Boolean;
```

C++

```
__fastcall Boolean IsClassScalar(TClass AClass);
```

Description

IsClassScalar returns true if the specified class represents a scalar type. Classes (see page 2685) that represent scalar types descend from the TRemotableXS (see page 15580) class, and can convert their value to or from a string.

AClass identifes the class to check. It must be previously registered by a call to RegisterXSClass (see page 15573).

See Also

RegisterXSClass (see page 15573)

TRemotableXS (see page 15580)

84.1.9.4.11 TRemotableTypeRegistry.Lock Method

Prevents other threads from accessing the type registry.

Pascal

```
procedure Lock; virtual;
```

C++

```
virtual __fastcall Lock();
```

Description

Lock uses a critical section to prevent simultaneous use of the type registry by multiple threads in the same application. Once one thread has called Lock to obtain access to the type registry, no other thread can return from the Lock method until the first thread has called the UnLock (see page 15576) method to release its lock.

Lock is called automatically by the methods of TRemotableTypeRegistry (see page 15562).

See Also

UnLock (see page 15576)

84.1.9.4.12 TRemotableTypeRegistry.RegisterExternalPropName Method

Registers the correspondence between a property name on a remotable class and the corresponding element name in an XML schema.

Pascal

```
procedure RegisterExternalPropName(Info: PTypeInfo; const InternalName: string; const
ExternalName: InvString);
```

C++

```
__fastcall RegisterExternalPropName(PTypeInfo Info, const AnsiString InternalName, const
InvString ExternalName);
```

Description

Use RegisterExternalPropName to create an association between the name of an element in an XML schema complex type and the corresponding property of the remotable class that represents that type. This allows the remotable class to represent complex types that include elements with names that are not valid (for example, keywords).

Info points to the type information of the remotable class that corresponds to a complex type defined in an XML schema.

InternalName is the name used for the property of the remotable class that corresponds to the element.

ExternalName is the name of the element that is part of the complex type that the XML schema defines.

84.1.9.4.13 TRemotableTypeRegistry.RegisterHolderClsMember Method

Registers a remotable type whose type information must be extracted from a holder class.

Pascal

```
procedure RegisterHolderClsMember(ClsTypeInfo: PTypeInfo; const URI: WideString = ''; const
Name: WideString = ''; const ExtName: WideString = '');
```

C++

```
__fastcall RegisterHolderClsMember(PTypeInfo ClsTypeInfo, const BSTR URI = '', const BSTR Name
= '', const BSTR ExtName = '');
```

Description

Use RegisterHolderClsMember to register a type that is used as the type of the only published property of a holder class. This method is used primarily for C++ applications, which can contain types that require a holder class so that the compiler can extract their runtime type information (RTTI). If the holder class contains more than one published property, use the RegisterXSInfo (see page 15574) method after extracting the type information from the property using the global GetClsMemberTypeInfo function.

Info points to the type information of the holder class that has a single published member whose type you want to register.

URI is the namespace URI to associate with the type that is registered. This should uniquely identify the type. If you omit this parameter or supply an empty string, RegisterXSInfo (see page 15574) generates a namespace URI for you, based on the name of the type, the name of the unit in which it is declared, and the value of the global AppNameSpacePrefix (see page 15644) variable. Note that the namespace URI must be the same in both client and server applications. In Delphi, if you do not explicitly supply a namespace URI, the class must be declared in a unit with the same name, and the value of AppNameSpacePrefix (see page 15644) must be the same in both applications. In C++, the client application must always explicitly supply a namespace.

Name is the name of the type as it appears in native code.

ExtName is the name of the type as it appears in encoded method calls and WSDL documents.

See Also

GetClsMemberTypeInfo

RegisterXSInfo (see page 15574)

84.1.9.4.14 RegisterSerializeOptions Method

This is the overview for the RegisterSerializeOptions method overload.

Overload List

	Name	Description
	TRemotableTypeRegistry.RegisterSerializeOptions (PTypeInfo, TSerializationOptions) (see page 15572)	Registers a set of serialization options that should be used with a registered remotable class or type.
	TRemotableTypeRegistry.RegisterSerializeOptions (TClass, TSerializationOptions) (see page 15572)	Registers a set of serialization options that should be used with a registered remotable class or type.

84.1.9.4.14.1 TRemotableTypeRegistry.RegisterSerializeOptions Method (PTypeInfo, TSerializationOptions)

Registers a set of serialization options that should be used with a registered remotable class or type.

Pascal

```
procedure RegisterSerializeOptions(Info: PTypeInfo; SerialOpt: TSerializationOptions);
overload;
procedure RegisterSerializeOptions(AClass: TClass; SerialOpt: TSerializationOptions); overload;
```

C++

```
__fastcall RegisterSerializeOptions(PTypeInfo Info, TSerializationOptions SerialOpt);
__fastcall RegisterSerializeOptions(TClass AClass, TSerializationOptions SerialOpt);
```

Description

RegisterSerializeOptions associates a registered remotable class or type with a set of flags that indicate how to encode or decode its value. Typically, this method is called by the WSDL importer.

AClass identifes the class for which you are supplying serialization options. It must be previously registered by a call to RegisterXSClass (see page 15573).

Info is the runtime type information for a type when you are supplying serialization options for a type rather than a class. It must be previously registered by a call to RegisterXSInfo (see page 15574).

SerialOpt is the set of flags that customize how the class is encoded or decoded.

See Also

SerializationOptions (see page 15561)

SerializeOptions (see page 15575)

RegisterXSClass (see page 15573)

RegisterXSInfo (see page 15574)

Defining and Using SOAP Headers

84.1.9.4.15 TRemotableTypeRegistry.RegisterXSClass Method

Registers a remotable class.

Pascal

```
procedure RegisterXSClass(AClass: TClass; const URI: WideString = ''; const Name: WideString =
''; const ExtName: WideString = ''; IsScalar: Boolean = False; MultiRefOpt: TObjMultiOptions =
ocDefault);
```

C++

```
__fastcall RegisterXSClass(TClass AClass, const BSTR URI = '', const BSTR Name = '', const
BSTR ExtName = '', Boolean IsScalar = False, TObjMultiOptions MultiRefOpt = ocDefault);
```

Description

Call RegisterXSClass to register a remotable class so that it can be communicated between client applications and a Web Service provider. All remotable classes are compiled with runtime type information (RTTI) and have a virtual constructor that the remotable type registry recognizes and uses to supply class instances.

When the remotable class is a TRemotable (see page 15556) descendant, it can be used to represent non-scalar types for parameters and return values on an invokable interface. When it is an ERemotableException (see page 15496) descendant, it allows the Web Service application to send clients a fault packet that includes all the published properties of the exception class.

AClass is the class reference for the remotable class. In Delphi, you specify this in code using the class name. In C++, you can obtain this class reference for a class using the __classid keyword.

URI is the namespace URI to associate with that class. This should uniquely identify the class. If you omit this parameter (or supply an empty string), RegisterXSClass generates a namespace URI for you, based on the name of the class, the name of the unit in which it is declared, and the value of the global AppNameSpacePrefix (see page 15644) variable. Note that the namespace URI must be the same in both client and server applications. Thus, if you do not explicitly supply a namespace URI, the class must be declared in a unit with the same name, and the value of AppNameSpacePrefix (see page 15644) must be the same in both applications.

Name is the name of a type that the class represents. This is used for the mapping between the class and its definition in a WSDL document.

ExtName is the same as Name.

IsScalar indicates whether the class represents a scalar type. Remotable classes that represent scalar types must implement the XSToNative and NativeToXS methods.

MultiRefOpt indicates how multiple references to the same instance of the class should be handled when converting them to their SOAP representation. For more information, see the ClassOptions (see page 15565) method.

Creating Custom Exception Classes for Web Services

Registering Nonscalar Types

84.1.9.4.16 TRemotableTypeRegistry.RegisterXSInfo Method

Registers a remotable type.

Pascal

```
procedure RegisterXSInfo(Info: PTypeInfo; const URI: WideString = ''; const Name: WideString =
''; const ExtName: WideString = '');
```

C++

```
__fastcall RegisterXSInfo(PTypeInfo Info, const BSTR URI = '', const BSTR Name = '', const
BSTR ExtName = '');
```

Description

Call RegisterXSInfo to register a type that requires special marshaling but does not need to be represented by a TRemotable (see page 15556) descendant before it can be marshaled for transport to or from a Web Services provider. Such types include dynamic arrays such as the dynamic array types defined in the Types (see page 23293) unit (Delphi) or sysdyn.h (C++), enumerated types, and boolean types (Delphi) or types defined using a typedef statement (C++).

Info is the TypeInfo pointer for the type. It can be obtained using the global TypeInfo function (Delphi) or the __delphirtti keyword (C++). In C++, it is sometimes obtained from a global function such as GetClsMemberTypeInfo, which extracts the type information from a holder class.

URI is the namespace URI to associate with that type. This should uniquely identify the type. If you omit this parameter or supply an empty string, RegisterXSInfo generates a namespace URI for you, based on the name of the type, the name of the unit in which it is declared, and the value of the global AppNameSpacePrefix (see page 15644) variable. Note that the namespace URI must be the same in both client and server applications. In Delphi, if you do not explicitly supply a namespace URI, the class must be declared in a unit with the same name, and the value of AppNameSpacePrefix (see page 15644) must be the same in both applications. In C++, the client application must always explicitly supply a namespace.

Name is the name of the type as it appears in native code.

ExtName is the name of the type as it appears in encoded method calls and WSDL documents.

Registering Nonscalar Types

84.1.9.4.17 SerializeOptions Method

This is the overview for the SerializeOptions method overload.

Overload List

	Name	Description
	TRemotableTypeRegistry.SerializeOptions (PTypeInfo) (see page 15575)	Returns the serialization options for a registered remotable class or type.
	TRemotableTypeRegistry.SerializeOptions (TClass) (see page 15575)	Returns the serialization options for a registered remotable class or type.

84.1.9.4.17.1 TRemotableTypeRegistry.SerializeOptions Method (PTypeInfo)

Returns the serialization options for a registered remotable class or type.

Pascal

```
function SerializeOptions(Info: PTypeInfo): TSerializationOptions; overload;
function SerializeOptions(AClass: TClass): TSerializationOptions; overload;
```

C++

```
__fastcall TSerializationOptions SerializeOptions(PTypeInfo Info);
__fastcall TSerializationOptions SerializeOptions(TClass AClass);
```

Description

SerializeOptions is used internally to retrieve the flags that describe how a remotable class or type is encoded and decoded. These flags are associated with the remotable class or type by calling the RegisterSerializeOptions (see page 15572) method.

AClass is the registered class for which you want to retrieve serialization options.

Info is the runtime type information for the registered type for which you want to retrieve serialization options.

SerializeOptions returns the value of SerializationOptions (see page 15630) for the class that AClass specifies or the registered options for the type that Info specifies..

See Also

SerializationOptions (see page 15561)

RegisterSerializeOptions (see page 15572)

84.1.9.4.18 TRemotableTypeRegistry.TypeInfoToXSD Method

Returns the type name and namespace URI registered with a remotable class or type.

Pascal

```
function TypeInfoToXSD(Info: PTypeInfo; var URI: WideString; var TypeName: WideString):
Boolean;
```

C++

```
__fastcall Boolean TypeInfoToXSD(PTypeInfo Info, BSTR URI, BSTR TypeName);
```

Description

TypInfoToXSD returns a type name and namespace URI from a type information pointer. The type information can describe either a remotable class that was previously registered by a call to RegisterXSClass (see page 15573), or a remotable type that was previously registered by a call to RegisterXSInfo (see page 15574).

Info is the type information pointer that describes the class or type.

URI returns the namespace URI that was associated with the class or type when it was registered.

TypeName returns the type name that was associated with the class or type when it was registered.

See Also

XSDToTypeInfo (see page 15579)

RegisterXSInfo (see page 15574)

RegisterXSClass (see page 15573)

InfoToURI (see page 15569)

84.1.9.4.19 TRemotableTypeRegistry.UnLock Method

Allows other threads to access the type registry after it was locked.

Pascal

```
procedure UnLock; virtual;
```

C++

```
virtual __fastcall UnLock();
```

Description

UnLock exits the critical section that the Lock (see page 15570) method entered. It reenables other threads access to the type registry after a call to the Lock (see page 15570) method.

Every call to the Lock (see page 15570) method must be paired by a call to UnLock when the locking thread is finished with the type registry. The methods of TRemotableTypeRegistry (see page 15562) that call the Lock (see page 15570) method also call the UnLock method when they are finished.

See Also

Lock (see page 15570)

84.1.9.4.20 TRemotableTypeRegistry.UnRegisterXSClass Method

Unregisters a remotable class.

Pascal

```
procedure UnRegisterXSClass(AClass: TClass);
```

C++

```
__fastcall UnRegisterXSClass(TClass AClass);
```

Description

Call UnRegisterXSClass to Unregister a remotable class that was previously registered by a call to the RegisterXSClass (see page 15573) method. In Delphi, this call is made in the finalization section of the unit that implements the remotable class. In C++, it is made from a method that uses the pragma exit directive in the unit that implements the remotable class.

AClass is the class reference for the remotable class. In Delphi code, you specify this using the class name. In C++, you can obtain this class reference for a class using the __classid keyword.

See Also

TRemotable (see page 15556)

ERemotableException (see page 15496)

RegisterXSClass (see page 15573)

84.1.9.4.21 TRemotableTypeRegistry.UnRegisterXSInfo Method

Unregisters a remotable type.

Pascal

```
procedure UnRegisterXSInfo(Info: PTypeInfo);
```

C++

```
__fastcall UnRegisterXSInfo(PTypeInfo Info);
```

Description

Call UnRegisterXSInfo to unregister a type that was previously registered (directly or indirectly) by a call to the RegisterXSInfo (see page 15574) method.

Info is the TypeInfo pointer for the type. It is the same as the Info parameter of the RegisterXSInfo (see page 15574) method.

See Also

RegisterXSInfo (see page 15574)

84.1.9.4.22 URIToClass Method

This is the overview for the URIToClass method overload.

Overload List

	Name	Description
	TRemotableTypeRegistry.URIToClass (WideString, WideString) (see page 15577)	Returns the class associated with a specified namespace URI.
	TRemotableTypeRegistry.URIToClass (WideString, WideString, Boolean) (see page 15577)	Returns the class associated with a specified namespace URI.

84.1.9.4.22.1 TRemotableTypeRegistry.URIToClass Method (WideString, WideString)

Returns the class associated with a specified namespace URI.

Pascal

```
function URIToClass(const URI: WideString; const Name: WideString; var IsScalar: Boolean):
TClass; overload;
function URIToClass(const URI: WideString; const Name: WideString): TClass; overload;
```

C++

```
__fastcall TClass URIToClass(const BSTR URI, const BSTR Name, Boolean IsScalar);
__fastcall TClass URIToClass(const BSTR URI, const BSTR Name);
```

Description

URIToClass looks up a registered remotable class given its namespace URI and typename.

URI is the namespace URI associated with the class. This association is established by the RegisterXSClass (see page 15573) method.

Name is the name of the type that the class represents. If the class does not have a corresponding type name, Name should be an empty string.

IsScalar returns true if the class represents a scalar type, false otherwise.

URIToClass returns the class reference for the class identified by URI (and Name).

See Also

RegisterXSClass (see page 15573)

ClassToURI (see page 15566)

84.1.9.4.23 TRemotableTypeRegistry.URIToInfo Method

Returns the type information pointer for a registered remotable class or type.

Pascal

```
function URIToInfo(const URI: WideString; const Name: WideString): PTypeInfo;
```

C++

```
__fastcall PTypeInfo URIToInfo(const BSTR URI, const BSTR Name);
```

Description

URIToInfo looks up a registered remotable class or type given its namespace URI and typename. It returns the type information pointer that describes the type or class.

URI is the namespace URI associated with the class or type. This association is established by the RegisterXSClass (see page 15573) or RegisterXSInfo (see page 15574) method.

Name is the type name that was associated with the class or type when it was registered.

Tip: To look up the type information for a namespace and type that may possibly represent a built-in XML schema type, use the XSDToTypeInfo (see page 15579) method instead.

See Also

RegisterXSClass (see page 15573)

InfoToURI (see page 15569)

RegisterXSInfo (see page 15574)

84.1.9.4.24 TRemotableTypeRegistry.VariantToInfo Method

Returns the TypeInfo pointer for the type of a specified Variant's data.

Pascal

```
function VariantToInfo(const V: Variant; TryAllSchema: Boolean): PTypeInfo;
```

C++

```
__fastcall PTypeInfo VariantToInfo(const Variant V, Boolean TryAllSchema);
```

Description

VariantToInfo returns the TypeInfo pointer of the scalar type that represents the value of a Variant. If the Variant's value is not a scalar type that can be marshaled without using a registered object or type, VariantToInfo raises an ETypeRegistryException (see page 15500) exception.

V is the Variant for which you want the corresponding TypeInfo pointer.

TryAllSchema specifies whether VariantToInfo should check for corresponding scalar type definitions in the XML schema associated with this application, or whether it should check all the possible sets of XML schema types that are defined in the xmlschema unit.

See Also

VarType (see page 23667)

ETypeRegistryException (see page 15500)

84.1.9.4.25 TRemotableTypeRegistry.XSDToTypeInfo Method

Returns the type information pointer associated with a specified type name.

Pascal

```
function XSDToTypeInfo(const URI: WideString; const TypeName: WideString): PTypeInfo;
```

C++

```
__fastcall PTypeInfo XSDToTypeInfo(const BSTR URI, const BSTR TypeName);
```

Description

XSDToTypeInfo looks up a namespace URI and typename, and returns the type information pointer that describes the corresponding Object Pascal type or class. Unlike the URIToInfo (see page 15578) method, XSDToTypeInfo can look up built-in type correspondences that do not need to be registered.

URI is the namespace URI for the type.

TypeName is the type name to look up.

See Also

RegisterXSClass (see page 15573)

URIToInfo (see page 15578)

RegisterXSInfo (see page 15574)

84.1.9.5 TRemotableTypeRegistry Properties

The properties of the TRemotableTypeRegistry class are listed here.

Public Properties

	Name	Description
	AutoRegisterNativeTypes (see page 15579)	Specifies whether types that are used in an invokable interface or by a remotable class are automatically registered.

84.1.9.5.1 TRemotableTypeRegistry.AutoRegisterNativeTypes Property

Specifies whether types that are used in an invokable interface or by a remotable class are automatically registered.

Pascal

```
property AutoRegisterNativeTypes: Boolean;
```

C++

```
__property Boolean AutoRegisterNativeTypes;
```

Description

When AutoRegisterNativeTypes is true (the default), type definitions are automatically registered when the invokable interface or remotable class that uses them is registered. That is, when you register an invokable interface with the invocation registry or when you register a remotable class with the remotable type registry, the registry checks whether it makes use of types that are

not yet registered, and if so, registers them as well. Note that you can still provide your own registration (for example, to control the external name or namespace) by registering the type before the call that registers the interface or remotable class.

See Also

RegisterXSInfo (see page 15574)

RegisterXSClass (see page 15573)

84.1.10 TRemotableXS Class

TRemotableXS is the base class for classes that represent a non-native scalar type on an invokable interface in a Web Service application.

Class Hierarchy

Pascal

```
TRemotableXS = class(TRemotable);
```

C++

```
class TRemotableXS : public TRemotable;
```

File

InvokeRegistry

Description

Use TRemotableXS as a base class when defining a class to represent scalar values from a WSDL document that have no corresponding Object Pascal type. When creating a TRemotableXS descendant, override the XSToNative (see page 15583) and NativeToXS (see page 15581) methods to indicate how the value of the class can be converted to and from the string representation that is used to encode the value for transport.

Both the client application and server application must register a TRemotableXS descendant with the remotable class registry before they can use it. To register a remotable class, use the RegisterXSClass method of the object that the global RemTypeRegistry (see page 15621) function returns.

On server applications, instances of TRemotableXS descendants that are input parameters on an invokable interface are automatically created when the method call is unmarshaled and automatically freed after any output parameters or return value are marshaled so that they can be sent to the client. When a TRemotableXS descendant is created in a method that was called remotely using an invokable interface, the instance is automatically freed after the value of the TRemotable (see page 15556) descendant is marshaled for transport back to the client application.

The caller of an invokable interface (client) is responsible for creating any TRemotableXS instances that it passes as input parameters, and for freeing any TRemotableXS instances it creates or that are returned as output parameters or method results.

Using Remotable Objects

84.1.10.1 TRemotableXS Members

The following tables list the members exposed by TRemotableXS.

Protected Fields

	Name	Description
	FSerializationOptions (see page 15559)	This is FSerializationOptions, a member of class TRemotable.

Public Methods

	Name	Description
V	Create (see page 15558)	Creates and initializes a TRemotable (see page 15556) object.
V	Destroy (see page 15558)	Frees the memory associated with the TRemotable (see page 15556) object.
A	NativeToXS (see page 15581)	Returns a string that represents the value of a TRemotableXS (see page 15580) instance.
V	ObjectToSOAP (see page 15582)	Converts this remotable object to its SOAP representation.
V	SOAPToObject (see page 15582)	Initializes this TRemotableXS (see page 15580) instance to represent the value of its SOAP representation.
A	XSToNative (see page 15583)	Assigns the value of a string to the TRemotableXS (see page 15580) instance.

Public Properties

	Name	Description
	DataContext (see page 15561)	Specifies the object that controls the lifetime of a TRemotable (see page 15556) instance.
R	SerializationOptions (see page 15561)	Indicates how the value of the TRemotable (see page 15556) descendant encodes its value.

84.1.10.2 TRemotableXS Methods

The methods of the TRemotableXS class are listed here.

Public Methods

	Name	Description
A	NativeToXS (see page 15581)	Returns a string that represents the value of a TRemotableXS (see page 15580) instance.
V	ObjectToSOAP (see page 15582)	Converts this remotable object to its SOAP representation.
V	SOAPToObject (see page 15582)	Initializes this TRemotableXS (see page 15580) instance to represent the value of its SOAP representation.
A	XSToNative (see page 15583)	Assigns the value of a string to the TRemotableXS (see page 15580) instance.

84.1.10.2.1 TRemotableXS.NativeToXS Method

Returns a string that represents the value of a TRemotableXS (see page 15580) instance.

Pascal

```
function NativeToXS: WideString; virtual; abstract;
```

C++

```
virtual __fastcall BSTR NativeToXS() = 0;
```

Description

Override NativeToXS when implementing a TRemotableXS (see page 15580) descendant that represents a non-native scalar type. NativeToXS returns a string that represents the value of the TRemotableXS (see page 15580) instance. This string is used when marshaling the value of the TRemotableXS (see page 15580) descendant.

Classes (see page 2685) that implement NativeToXS must also override the XSToNative (see page 15583) method so that it performs the converse transformation.

See Also

XSToNative (see page 15583)

Using Remotable Objects

84.1.10.2.2 TRemotableXS.ObjectToSOAP Method

Converts this remotable object to its SOAP representation.

Pascal

```
function ObjectToSOAP(RootNode: IXMLNode; ParentNode: IXMLNode; const ObjConverter:
IObjConverter; const Name: InvString; const URI: InvString; ObjConvOpts:
TObjectConvertOptions; out RefID: InvString): IXMLNode; override;
```

C++

```
virtual __fastcall IXMLNode ObjectToSOAP(IXMLNode RootNode, IXMLNode ParentNode, const
IObjConverter ObjConverter, const InvString Name, const InvString URI, TObjectConvertOptions
ObjConvOpts, InvString RefID);
```

Description

Override ObjectToSOAP to customize the way your application converts a TRemotableXS (see page 15580) descendant to its SOAP representation. In TRemotableXS (see page 15580), ObjectToSOAP uses the default conversion, replacing the text of the node with the value that the NativeToXS (see page 15581) method supplies.

RootNode is an ancestor of the generated node to which information about the generated node can be added as attributes.

ParentNode is the node in the SOAP representation that should act as a parent to the node that ObjectToSOAP generates.

ObjConverter is the interface of the default converter that translates between remotable objects and their SOAP representation. This is the interface to a TOPToSoapDomConvert instance.

Name is the name of the node that is generated.

URI is the URI for the namespace in which Name is defined.

ObjConvOpts are flags that customize the way the node is serialized.

RefID returns a reference ID for the node. This is used if the node is multi-referenced.

ObjectToSOAP returns the XML for the newly generated node.

See Also

SOAPToObject (see page 15582)

NativeToXS (see page 15581)

84.1.10.2.3 TRemotableXS.SOAPToObject Method

Initializes this TRemotableXS (see page 15580) instance to represent the value of its SOAP representation.

Pascal

```
procedure SOAPToObject(const RootNode: IXMLNode; const Node: IXMLNode; const ObjConverter:
IObjConverter); override;
```

C++

```
virtual __fastcall SOAPToObject(const IXMLNode RootNode, const IXMLNode Node, const
```

```
IObjConverter ObjConverter);
```

Description

SOAPToObject initializes the published properties of this object instance so that they reflect the header's SOAP representation. Override this method to customize the way your application creates a scalar value from its XML representation.

RootNode is an ancestor node of the node for this object that can contain information about the remotable type's value.

Node is the node in the SOAP envelope that represents the remotable type's value.

ObjConverter is the interface of the default converter that translates between remotable objects and their SOAP representation. This is the interface to a TOPToSoapDomConvert instance.

In TRemotableXS (see page 15580), SOAPToObject calls the XSToNative (see page 15583) method, passing in the text of the specified node.

See Also

ObjectToSOAP (see page 15582)

XSToNative (see page 15583)

84.1.10.2.4 TRemotableXS.XSToNative Method

Assigns the value of a string to the TRemotableXS (see page 15580) instance.

Pascal

```
procedure XSToNative(Data: WideString); virtual; abstract;
```

C++

```
virtual __fastcall XSToNative(BSTR Data) = 0;
```

Description

Override XSToNative when implementing a TRemotableXS (see page 15580) descendant that represents a non-native scalar type. NativeToXS (see page 15581) interprets a string that represents the value of the TRemotableXS (see page 15580) instance and uses it to make any necessary changes so that the TRemotableXS (see page 15580) object reflects that value. It reverses the transformation that the NativeToXS (see page 15581) method performs.

Data is a string that represents the value of the TRemotableXS (see page 15580) instance.

See Also

NativeToXS (see page 15581)

Using Remotable Objects

84.1.11 TSOAPAttachment Class

TSOAPAttachment represents an attachment that is included with SOAP messages that represent method calls in a Web Service application.

Class Hierarchy

Pascal

```
TSOAPAttachment = class(TRemotable);
```

C++

```
class TSOAPAttachment : public TRemotable;
```

File

InvokeRegistry

Description

Use TSOAPAttachment to receive or send an attachment as a parameter or return value of a method on an invokable interface. When a SOAP method call requires an attachment, it is marshaled as a MIME multipart form, where any attachments are included as additional parts.

Warning: Some Web Services (such as .Net) use DIME multipart forms rather than MIME multipart forms for attachments. TSOAPAttachment will not work with such services.

Note: Only use TSOAPAttachment and its descendants as the type for parameters or the return value of a method of an invokable interface. TSOAPAttachment can't be used as part of a more complex type, such as the type of a published property on a remotable object.

When sending an attachment, use the SourceString (see page 15596) property or the SetSourceFile (see page 15590) or SetSourceStream (see page 15591) method to supply the attachment data. Use the ContentType (see page 15593) property to indicate the type (encoding) of the attachment data.

When receiving an attachment, the attachment is automatically stored in a temporary file, whose name is given by the CacheFile (see page 15592) property. You can copy the contents of this temporary file using the SaveToFile (see page 15589) or SaveToStream (see page 15589) method. To determine the format of the data, read the ContentType (see page 15593) property. You can read any of the other headers for the part of the multipart form that contained the attachment using the Headers (see page 15594) property. By default, when the TSOAPAttachment object is freed, it deletes the temporary file that contains the attachment data that was received. You can use the CacheFilePersist (see page 15593) property to prevent this file from being deleted.

Note: If you use TSOAPAttachment as a base class for a customized attachment class, it is marshaled as a TSOAPAttachment value. That is, the application that receives the attachment sees it only as a TSOAPAttachment instance, not as an instance of the descendant class.

The application must register TSOAPAttachment with the remotable class registry before it can use this class. To register TSOAPAttachment or one of its descendants, use the RegisterXSClass method of the object that the global RemTypeRegistry (see page 15621) function returns. When you import a WSDL document, the call to register TSOAPAttachment is automatically added if any of the interfaces use attachments.

The caller of an invokable interface (client) is responsible for creating any TSOAPAttachment instances that it passes as input parameters, and for freeing any TSOAPAttachment instances it creates or that are returned as output parameters or method results.

In Web Service applications (servers), any TSOAPAttachment instances that represent parameters or return values are added to the data context, which frees them as necessary.

RemTypeRegistry (see page 15621)

TRemotableTypeRegistry (see page 15562)

IInvokable (see page 22398)

Using Remotable Objects

84.1.11.1 TSOAPAttachment Members

The following tables list the members exposed by TSOAPAttachment.

Protected Fields

	Name	Description
	FSerializationOptions (see page 15559)	This is FSerializationOptions, a member of class TRemotable.

Protected Methods

	Name	Description
V	GetSourceStream (see page 15587)	This is GetSourceStream, a member of class TSOAPAttachment.
V	InternalSetCacheFile (see page 15588)	This is InternalSetCacheFile, a member of class TSOAPAttachment.
	InternalSetSourceStream (see page 15588)	This is InternalSetSourceStream, a member of class TSOAPAttachment.
V	SetOwnership (see page 15590)	This is SetOwnership, a member of class TSOAPAttachment.
V	SetSourceString (see page 15591)	This is SetSourceString, a member of class TSOAPAttachment.

Public Methods

	Name	Description
V	Create (see page 15585)	Creates and initializes a TSOAPAttachment (see page 15583) object.
V	Destroy (see page 15586)	Frees the memory associated with the TSOAPAttachment (see page 15583) object.
	Init (see page 15587)	Initializes the properties of a TSOAPAttachment (see page 15583) instance.
V	ObjectToSOAP (see page 15588)	Converts this attachment object to its SOAP representation.
	SaveToFile (see page 15589)	Saves the contents of the attachment to a specified file.
	SaveToStream (see page 15589)	Saves the contents of the attachment to a specified file.
V	SetSourceFile (see page 15590)	Specifies a file from which TSOAPAttachment (see page 15583) can read the content of the attachment.
V	SetSourceStream (see page 15591)	Specifies a stream from which TSOAPAttachment (see page 15583) can read the content of the attachment.
V	SOAPToObject (see page 15591)	Initializes this TSOAPAttachment (see page 15583) instance to represent the value of its SOAP representation.

Public Properties

	Name	Description
R	CacheFile (see page 15592)	Identifies the temporary file where the attachment is saved.
	CacheFilePersist (see page 15593)	Indicates whether the temporary file that contains the attachment data is deleted when TSOAPAttachment (see page 15583) is freed.
	ContentType (see page 15593)	Specifies the MIME type of the attachment data.
	DataContext (see page 15561)	Specifies the object that controls the lifetime of a TRemotable (see page 15556) instance.
	Encoding (see page 15594)	Indicates the encoding (character set) of the body of the attachment.
R	Headers (see page 15594)	Indicates the values of the headers received with the attachment.
	Ownership (see page 15595)	Indicates whether the TSOAPAttachment (see page 15583) object should free its source stream.
R	SerializationOptions (see page 15561)	Indicates how the value of the TRemotable (see page 15556) descendant encodes its value.
R	SourceStream (see page 15595)	Indicates a stream from which to read the content of an attachment that the application sends.
	SourceString (see page 15596)	Specifies a string that is sent as the value of the attachment.

84.1.11.2 TSOAPAttachment.Create Constructor

Creates and initializes a TSOAPAttachment (see page 15583) object.

Pascal

```
constructor Create; override;
```

C++

```
virtual __fastcall TSOAPAttachment();
```

Description

Call Create to instantiate a TSOAPAttachment (see page 15583) object for an attachment you wish to send. When an application receives a SOAP attachment, an instance of TSOAPAttachment (see page 15583) is created automatically to represent that attachment.

84.1.11.3 TSOAPAttachment.Destroy Destructor

Frees the memory associated with the TSOAPAttachment (see page 15583) object.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TSOAPAttachment();
```

Description

Do not call Destroy to free a TSOAPAttachment (see page 15583) object. Instead, use the Free method, which checks for a nil reference before calling Destroy.

On server applications, there is typically no need to explicitly free a TSOAPAttachment (see page 15583) instance (for example, one created as a return value or output parameter). By default, when a TSOAPAttachment (see page 15583) descendant is created in a method that was called remotely using an invokable interface, it is added to a data context (the value of the DataContext (see page 15561) property). As long as the remotable object belongs to the data context, the data context handles freeing the object. Similarly, TSOAPAttachment (see page 15583) instances that are passed in as a parameter belong to the data context.

On client applications, TSOAPAttachment (see page 15583) instances created and passed to an invokable interface or returned as a parameter or result of an invokable interface must be freed by the calling application.

See Also

DataContext (see page 15561)

Free (see page 22300)

84.1.11.4 TSOAPAttachment Methods

The methods of the TSOAPAttachment class are listed here.

Protected Methods

	Name	Description
	GetSourceStream (see page 15587)	This is GetSourceStream, a member of class TSOAPAttachment.
	InternalSetCacheFile (see page 15588)	This is InternalSetCacheFile, a member of class TSOAPAttachment.
	InternalSetSourceStream (see page 15588)	This is InternalSetSourceStream, a member of class TSOAPAttachment.
	SetOwnership (see page 15590)	This is SetOwnership, a member of class TSOAPAttachment.
	SetSourceString (see page 15591)	This is SetSourceString, a member of class TSOAPAttachment.

Public Methods

	Name	Description
	Init (see page 15587)	Initializes the properties of a TSOAPAttachment (see page 15583) instance.
V	ObjectToSOAP (see page 15588)	Converts this attachment object to its SOAP representation.
	SaveToFile (see page 15589)	Saves the contents of the attachment to a specified file.
	SaveToStream (see page 15589)	Saves the contents of the attachment to a specified file.
V	SetSourceFile (see page 15590)	Specifies a file from which TSOAPAttachment (see page 15583) can read the content of the attachment.
V	SetSourceStream (see page 15591)	Specifies a stream from which TSOAPAttachment (see page 15583) can read the content of the attachment.
V	SOAPToObject (see page 15591)	Initializes this TSOAPAttachment (see page 15583) instance to represent the value of its SOAP representation.

84.1.11.4.1 TSOAPAttachment.GetSourceStream Method

Pascal

```
function GetSourceStream: TStream; virtual;
```

C++

```
virtual __fastcall TStream GetSourceStream();
```

Description

This is GetSourceStream, a member of class TSOAPAttachment.

84.1.11.4.2 TSOAPAttachment.Init Method

Initializes the properties of a TSOAPAttachment (see page 15583) instance.

Pascal

```
procedure Init(ATempLocation: string; AHeaders: TStrings; AContentType: String; AEncoding:
WideString);
```

C++

```
__fastcall Init(AnsiString ATempLocation, TStrings AHeaders, AnsiString AContentType, BSTR
AEncoding);
```

Description

Init sets the values of the CacheFile (see page 15592), Headers (see page 15594), ContentType (see page 15593), and Encoding (see page 15594) properties to the values supplied as parameters. It is used internally to initialize a TSOAPAttachment (see page 15583) instance to describe an attachment that the application received.

ATempLocation is the name of the temporary file where the attachment has been stored. It becomes the value of the CacheFile (see page 15592) property.

AHeaders lists the headers from the portion of the multipart form that represented this attachment. It becomes the value of the Headers (see page 15594) property.

AContentType is the content-type of the attachment. It becomes the value of the ContentType (see page 15593) property.

AEncoding is the character set encoding used for the attachment. It becomes the value of the Encoding (see page 15594) property.

See Also

CacheFile (see page 15592)

Headers (see page 15594)

ContentType (see page 15593)

Encoding (see page 15594)

84.1.11.4.3 TSOAPAttachment.InternalSetCacheFile Method

Pascal

```
procedure InternalSetCacheFile(const Value: string); virtual;
```

C++

```
virtual __fastcall InternalSetCacheFile(const AnsiString Value);
```

Description

This is InternalSetCacheFile, a member of class TSOAPAttachment.

84.1.11.4.4 TSOAPAttachment.InternalSetSourceStream Method

Pascal

```
procedure InternalSetSourceStream(const Value: TStream; const Ownership: TStreamOwnership =
soReference);
```

C++

```
__fastcall InternalSetSourceStream(const TStream Value, const TStreamOwnership Ownership =
soReference);
```

Description

This is InternalSetSourceStream, a member of class TSOAPAttachment.

84.1.11.4.5 TSOAPAttachment.ObjectToSOAP Method

Converts this attachment object to its SOAP representation.

Pascal

```
function ObjectToSOAP(RootNode: IXMLNode; ParentNode: IXMLNode; const ObjConverter:
IObjConverter; const Name: InvString; const URI: InvString; ObjConvOpts:
TObjectConvertOptions; out RefID: InvString): IXMLNode; override;
```

C++

```
virtual __fastcall IXMLNode ObjectToSOAP(IXMLNode RootNode, IXMLNode ParentNode, const
IObjConverter ObjConverter, const InvString Name, const InvString URI, TObjectConvertOptions
ObjConvOpts, InvString RefID);
```

Description

ObjectToSOAP customizes the way an application converts a TSOAPAttachment (see page 15583) object to its SOAP representation. In TSOAPAttachment (see page 15583), ObjectToSOAP calls the inherited method, adding ocoDontSerializeProps and ocoDontPutTypeAttr to the ObjConvOpts flags so that the converter ignores the published properties and does not add type information to the generated node. It then generates a unique identifier for the attachment and calls the converter's AddAttachment method to properly generate the SOAP representation of the attachment.

RootNode is an ancestor of the generated node to which information about the node can be added as attributes.

ParentNode is the node in the SOAP representation that should act as a parent to the node that ObjectToSOAP generates.

ObjConverter is the interface of the default converter that translates between remotable objects and their SOAP representation. This is the interface to a TOPToSoapDomConvert instance.

Name is the name of the node that is generated for the attachment.

URI is the URI for the namespace in which Name is defined.

ObjConvOpts are flags that customize the way the node is serialized.

RefID returns a reference ID for the node. This is used if the node is multi-referenced.

ObjectToSOAP returns the XML for the newly generated node.

See Also

ObjInstanceToSOAP (see page 15612)

AddAttachment (see page 15611)

SOAPToObject (see page 15591)

84.1.11.4.6 TSOAPAttachment.SaveToFile Method

Saves the contents of the attachment to a specified file.

Pascal

```
procedure SaveToFile(AFileName: string);
```

C++

```
__fastcall SaveToFile(AnsiString AFileName);
```

Description

Call SaveToFile to save the contents of the attachment to a specified file. This content can come from

The temporary file that the CacheFile (see page 15592) property indicates.

The stream that the SourceStream (see page 15595) property specifies.

The file that the SetSourceFile (see page 15590) method supplies.

The string that the SourceString (see page 15596) property specifies.

AFileName is the name of the file to which SaveToFile writes the content of the attachment.

See Also

CacheFile (see page 15592)

SourceStream (see page 15595)

SourceString (see page 15596)

SaveToStream (see page 15589)

84.1.11.4.7 TSOAPAttachment.SaveToStream Method

Saves the contents of the attachment to a specified file.

Pascal

```
procedure SaveToStream(AStream: TStream);
```

C++

```
__fastcall SaveToStream(TStream AStream);
```

Description

Call SaveToStream to write the contents of the attachment to a specified stream. This content can come from

The temporary file that the CacheFile (see page 15592) property indicates.

The stream that the SourceStream (see page 15595) property specifies.

The file that the SetSourceFile (see page 15590) method supplies.

The string that the SourceString (see page 15596) property specifies.

AStream is the stream to which SaveToStream writes the content of the attachment.

See Also

CacheFile (see page 15592)

SourceStream (see page 15595)

SourceString (see page 15596)

SaveToStream

SetSourceFile (see page 15590)

84.1.11.4.8 TSOAPAttachment.SetOwnership Method

Pascal

```
procedure SetOwnership(const Value: TStreamOwnership); virtual;
```

C++

```
virtual __fastcall SetOwnership(const TStreamOwnership Value);
```

Description

This is SetOwnership, a member of class TSOAPAttachment.

84.1.11.4.9 TSOAPAttachment.SetSourceFile Method

Specifies a file from which TSOAPAttachment (see page 15583) can read the content of the attachment.

Pascal

```
procedure SetSourceFile(const Value: string); virtual;
```

C++

```
virtual __fastcall SetSourceFile(const AnsiString Value);
```

Description

Call SetSourceFile to supply the content of an attachment that the application sends from a file. SetSourceFile reads the content from the specified file, clears the SourceStream (see page 15595) and SourceString (see page 15596) properties, and sets the ContentType (see page 15593) property to 'Application/binary'. If another MIME type string better describes the data, reset the ContentType (see page 15593) property after calling SetSourceFile.

Value is the fully-qualified file name for the file whose content should be sent as an attachment.

See Also

ContentType (see page 15593)

SetSourceStream (see page 15591)

SourceString (see page 15596)

84.1.11.4.10 TSOAPAttachment.SetSourceStream Method

Specifies a stream from which TSOAPAttachment (see page 15583) can read the content of the attachment.

Pascal

```
procedure SetSourceStream(const Value: TStream; const Ownership: TStreamOwnership =
soReference); virtual;
```

C++

```
virtual __fastcall SetSourceStream(const TStream Value, const TStreamOwnership Ownership =
soReference);
```

Description

Call SetSourceStream to supply the content of an attachment that the application sends from a stream object. SetSourceStream assigns the specified stream as the value of the SourceStream (see page 15595) property, clears the FileName and SourceString (see page 15596) properties, and sets the ContentType (see page 15593) property to 'Application/binary'. If another MIME type string better describes the data, reset the ContentType (see page 15593) property after calling SetSourceStream.

Value is a stream from which TSOAPAttachment (see page 15583) can read the content of the attachment.

Ownership (see page 15595) indicates whether the TSOAPAttachment (see page 15583) object should free the stream (Value) when it no longer needs it. It becomes the value of the Ownership (see page 15595) property.

See Also

SourceStream (see page 15595)

ContentType (see page 15593)

Ownership (see page 15595)

SourceString (see page 15596)

SetSourceFile (see page 15590)

84.1.11.4.11 TSOAPAttachment.SetSourceString Method

Pascal

```
procedure SetSourceString(const Value: string); virtual;
```

C++

```
virtual __fastcall SetSourceString(const AnsiString Value);
```

Description

This is SetSourceString, a member of class TSOAPAttachment.

84.1.11.4.12 TSOAPAttachment.SOAPToObject Method

Initializes this TSOAPAttachment (see page 15583) instance to represent the value of its SOAP representation.

Pascal

```
procedure SOAPToObject(const RootNode: IXMLNode; const Node: IXMLNode; const ObjConverter:
IObjConverter); override;
```

C++

```
virtual __fastcall SOAPToObject(const IXMLNode RootNode, const IXMLNode Node, const
IObjConverter ObjConverter);
```

Description

SOAPToObject initializes the published properties of this object instance so that they reflect the header's SOAP representation. In TSOAPAttachment (see page 15583), this method calls the converter's FindAttachment method to locate information about the attachment, and then calls the Init (see page 15587) method to initialize this object from the located information.

RootNode is an ancestor node of the attachment node that can contain information about the attachment node.

Node is the node in the SOAP envelope that represents a reference to the attachment.

ObjConverter is the interface of the default converter that translates between remotable objects and their SOAP representation. This is the interface to a TOPToSoapDomConvert instance.

In TSOAPAttachment (see page 15583), SOAPToObject simply calls the InitObjectFromSOAP method of the converter supplied by the ObjConverter parameter.

See Also

ObjectToSOAP (see page 15588)

FindAttachment (see page 15612)

Init (see page 15587)

84.1.11.5 TSOAPAttachment Properties

The properties of the TSOAPAttachment class are listed here.

Public Properties

	Name	Description
R	CacheFile (see page 15592)	Identifies the temporary file where the attachment is saved.
	CacheFilePersist (see page 15593)	Indicates whether the temporary file that contains the attachment data is deleted when TSOAPAttachment (see page 15583) is freed.
	ContentType (see page 15593)	Specifies the MIME type of the attachment data.
	Encoding (see page 15594)	Indicates the encoding (character set) of the body of the attachment.
R	Headers (see page 15594)	Indicates the values of the headers received with the attachment.
	Ownership (see page 15595)	Indicates whether the TSOAPAttachment (see page 15583) object should free its source stream.
R	SourceStream (see page 15595)	Indicates a stream from which to read the content of an attachment that the application sends.
	SourceString (see page 15596)	Specifies a string that is sent as the value of the attachment.

84.1.11.5.1 TSOAPAttachment.CacheFile Property

Identifies the temporary file where the attachment is saved.

Pascal

```
property CacheFile: string;
```

C++

```
__property AnsiString CacheFile;
```

Description

CacheFile is set automatically when the application receives an attachment along with a SOAP message. This is the name of the

temporary file where the application stores the contents of the attachment.

To save this temporary file to another file of your choosing, use the SaveToFile (see page 15589) method. You can also save its contents to a stream, using the SaveToStream (see page 15589) method.

The ContentType (see page 15593) property indicates the format of the data in this temporary file.

By default, when the TSOAPAttachment (see page 15583) object is freed, it deletes the temporary file that CacheFile indicates. Use the CacheFilePersist (see page 15593) property to prevent this file from being deleted.

See Also

CacheFilePersist (see page 15593)

ContentType (see page 15593)

Data

SaveToFile (see page 15589)

SaveToStream (see page 15589)

84.1.11.5.2 TSOAPAttachment.CacheFilePersist Property

Indicates whether the temporary file that contains the attachment data is deleted when TSOAPAttachment (see page 15583) is freed.

Pascal

```
property CacheFilePersist: Boolean;
```

C++

```
__property Boolean CacheFilePersist;
```

Description

When CacheFilePersist is false (the default), the temporary file that the CacheFile (see page 15592) property identifies is automatically deleted when the TSOAPAttachment (see page 15583) instance is freed. You can save the information from the cache file using the SaveToFile (see page 15589) or SaveToStream (see page 15589) method before freeing the TSOAPAttachment (see page 15583) instance.

When CacheFilePersist is true, the temporary file is not deleted when the TSOAPAttachment (see page 15583) instance is freed.

See Also

CacheFile (see page 15592)

SaveToFile (see page 15589)

SaveToStream (see page 15589)

84.1.11.5.3 TSOAPAttachment.ContentType Property

Specifies the MIME type of the attachment data.

Pascal

```
property ContentType: string;
```

C++

```
__property AnsiString ContentType;
```

Description

Use ContentType to determine the MIME type (format) used for the data in the attachment.

When receiving an attachment, the ContentType property is automatically set to reflect the value of the content-type header of the part of the multipart form that holds the attachment. You can read this property to determine how to interpret the contents of the file that the CacheFile (see page 15592) property indicates.

When sending an attachment, set ContentType to indicate the MIME type for the data you are sending. This property should not be set until after setting the SourceString (see page 15596) property calling the SetSourceFile (see page 15590) or SetSourceStream (see page 15591) method. That is because calling SetSourceStream (see page 15591) or SetSourceFile (see page 15590) automatically sets ContentType to 'Application/binary', and setting SourceString (see page 15596) automatically sets ContentType to 'Text/simple'. There is no need to reset ContentType if these values are correct.

See Also

CacheFile (see page 15592)

SourceString (see page 15596)

SetSourceFile (see page 15590)

SetSourceStream (see page 15591)

Data

84.1.11.5.4 TSOAPAttachment.Encoding Property

Indicates the encoding (character set) of the body of the attachment.

Pascal

```
property Encoding: WideString;
```

C++

```
__property BSTR Encoding;
```

Description

Use Encoding to look up or set the encoding type of the attachment's content. When sending an attachment, set this property to indicate the encoding that was used for the source you supply.

If you supply the attachment data as a string by setting the SourceString (see page 15596) property, TSOAPAttachment (see page 15583) assumes an encoding of UTF-8 if you do not set the Encoding property. If you supply the attachment data by calling SetSourceFile (see page 15590) or SetSourceStream (see page 15591), you must set the Encoding property, as TSOAPAttachment (see page 15583) does not have a meaningful default encoding.

Note: Encoding indicates the encoding of the data that the SOAP attachment contains. The application does not automatically use this information to encode or decode that data.

See Also

ContentType (see page 15593)

84.1.11.5.5 TSOAPAttachment.Headers Property

Indicates the values of the headers received with the attachment.

Pascal

```
property Headers: TStrings;
```

C++

```
__property TStrings Headers;
```

Description

Read Headers to determine the headers that appeared in the part of the multipart form that contained the attachment. Headers is only intended for attachments that the application receives. When sending attachments, the application automatically generates the headers that accompany the attachment.

Headers is a string list where each string has the form HeaderName=Value. HeaderName is the name of the header, such as Content-Id, Content-Location, Content-Size, and so on. Value is the string that is the header value. Note that if you are only interested in the content type, you can use the ContentType (see page 15593) property instead.

Note: Although the MIME specification states that the Content-Length header is optional, TSoapAttachment requires this header and raises an exception if it is not present.

See Also

ContentType (see page 15593)

CacheFile (see page 15592)

84.1.11.5.6 TSOAPAttachment.Ownership Property

Indicates whether the TSOAPAttachment (see page 15583) object should free its source stream.

Pascal

```
property Ownership: TStreamOwnership;
```

C++

```
__property TStreamOwnership Ownership;
```

Description

Ownership indicates whether TSOAPAttachment (see page 15583) needs to free the stream that supplied the content of the attachment when the application supplied this data using the SetSourceStream (see page 15591) method.

See Also

SourceStream (see page 15595)

SetSourceStream (see page 15591)

84.1.11.5.7 TSOAPAttachment.SourceStream Property

Indicates a stream from which to read the content of an attachment that the application sends.

Pascal

```
property SourceStream: TStream;
```

C++

```
__property TStream SourceStream;
```

Description

Read SourceStream to access the content of an attachment that the application is sending. When SourceStream is not nil (Delphi) or NULL (C++), the content of the attachment is read from this stream and the SourceString (see page 15596) property is not set. Depending on the value of the Ownership (see page 15595) property, SourceStream can be owned by the TSOAPAttachment (see page 15583) object (in which case TSOAPAttachment (see page 15583) frees the stream object

when it is no longer needed) or can exist as an independent object that TSOAPAttachment (see page 15583) does not free.

SourceStream is a read-only property. To specify a stream from which TSOAPAttachment (see page 15583) reads its data, use the SetSourceStream (see page 15591) method.

See Also

SourceString (see page 15596)

SetSourceStream (see page 15591)

Ownership (see page 15595)

ContentType (see page 15593)

84.1.11.5.8 TSOAPAttachment.SourceString Property

Specifies a string that is sent as the value of the attachment.

Pascal

```
property SourceString: string;
```

C++

```
__property AnsiString SourceString;
```

Description

Use SourceString to supply the content of an attachment as a string.

Setting the SourceString property causes TSOAPAttachment (see page 15583) to clear the SourceStream (see page 15595) property and to set the ContentType (see page 15593) property to 'Text/simple'. If another MIME type string better describes the data, reset the ContentType (see page 15593) property after setting SourceString.

See Also

Data

SourceStream (see page 15595)

SetSourceStream (see page 15591)

ContentType (see page 15593)

SetSourceFile (see page 15590)

84.1.12 TSOAPHeader Class

TSOAPHeader represents a header on the SOAP envelope that contains an encoded message in a Web Service application.

Class Hierarchy

Pascal

```
TSOAPHeader = class(TRemotable);
```

C++

```
class TSOAPHeader : public TRemotable;
```

File

InvokeRegistry

Description

TSOAPHeader is the base class for classes that represent SOAP headers. Each type of header has an associated TSOAPHeader descendant, which is registered with the remotable type registry. Register a TSOAPHeader descendant like any other remotable type, using the name of the header as the type name. If you import a WSDL document, the code to define and register the TSOAPHeader descendant is generated automtically.

You can also register the TSOAPHeader descendant with the invocation registry. The invocation registry's RegisterHeaderClass method associates the header class and the invokable interfaces with which it should be included. Registering the header with the invocation registry serves two purposes:

When a server publishes WSDL information about the Web Service, information about the header type is included in the resulting WSDL document.

On both servers and clients, the invocation registry associates the header class with a header name and a namespace in which that name is defined. This is important if the namespace for the header type is different than the namespace for the invokable interface that uses the header.

A SOAP header is a special remotable type that represents a node in the header section of a SOAP envelope. As with any other remotable type, the published properties of the TSOAPHeader descendant correspond to the child nodes and attributes of the corresponding header node. TSOAPHeader introduces two properties for common attributes of SOAP headers: MustUnderstand (see page 15600) and Actor (see page 15599). Typically, SOAP headers represent information that is associated with an entire invokable interface (port type) rather than just the method that is the focus of a single message.

When an application receives a SOAP message (that is, when a server receives a request to execute a method on an invokable interface or when a client receives a response after sending such a request), the headers on that message are automatically converted to the corresponding TSOAPHeader descendants that are registered with the remotable type registry. You can access these TSOAPHeader descendants using the ISOAPHeaders (see page 15613) interface, which can be obtained from the implementation class of the invokable interface or from the invokable interface of a remote interfaced object.

When an application sends a SOAP message (either a client sending a request or a server sending a response), supply the headers that should appear on that outgoing message by creating TSOAPHeader descendants and calling the Send method of an ISOAPHeaders (see page 15613) interface.

See Also

ISOAPHeaders (see page 15613)

TRemotableTypeRegistry (see page 15562)

TInvokableClassRegistry (see page 15526)

84.1.12.1 TSOAPHeader Members

The following tables list the members exposed by TSOAPHeader.

Protected Fields

	Name	Description
	FSerializationOptions (see page 15559)	This is FSerializationOptions, a member of class TRemotable.

Public Methods

	Name	Description
	Create (see page 15558)	Creates and initializes a TRemotable (see page 15556) object.

V	Destroy (see page 15558)	Frees the memory associated with the TRemotable (see page 15556) object.
V	ObjectToSOAP (see page 15598)	Converts this TSOAPHeader (see page 15596) object to its SOAP representation.
V	SOAPToObject (see page 15599)	Initializes this TSOAPHeader (see page 15596) instance to represent the value of its SOAP representation.

Public Properties

	Name	Description
	Actor (see page 15599)	Identifies the agent to which the header is directed.
	DataContext (see page 15561)	Specifies the object that controls the lifetime of a TRemotable (see page 15556) instance.
	MustUnderstand (see page 15600)	Indicates whether an application is required to recognize and handle the header on received messages.
R	SerializationOptions (see page 15561)	Indicates how the value of the TRemotable (see page 15556) descendant encodes its value.

84.1.12.2 TSOAPHeader Methods

The methods of the TSOAPHeader class are listed here.

Public Methods

	Name	Description
V	ObjectToSOAP (see page 15598)	Converts this TSOAPHeader (see page 15596) object to its SOAP representation.
V	SOAPToObject (see page 15599)	Initializes this TSOAPHeader (see page 15596) instance to represent the value of its SOAP representation.

84.1.12.2.1 TSOAPHeader.ObjectToSOAP Method

Converts this TSOAPHeader (see page 15596) object to its SOAP representation.

Pascal

```
function ObjectToSOAP(RootNode: IXMLNode; ParentNode: IXMLNode; const ObjConverter:
IObjConverter; const Name: InvString; const URI: InvString; ObjConvOpts:
TObjectConvertOptions; out RefID: InvString): IXMLNode; override;
```

C++

```
virtual __fastcall IXMLNode ObjectToSOAP(IXMLNode RootNode, IXMLNode ParentNode, const
IObjConverter ObjConverter, const InvString Name, const InvString URI, TObjectConvertOptions
ObjConvOpts, InvString RefID);
```

Description

Override ObjectToSOAP to customize the way your application converts a TSOAPHeader (see page 15596) descendant to its SOAP representation. In TSOAPHeader (see page 15596), ObjectToSOAP uses the default conversion (supplied by the ObjConverter parameter), adding a MustUnderstand (see page 15600) attribute whose value reflects the value of the MustUnderstand (see page 15600) property.

RootNode is an ancestor of the generated node to which information about the generated node can be added as attributes.

ParentNode is the node in the SOAP representation that should act as a parent to the node that ObjectToSOAP generates.

ObjConverter is the interface of the default converter that translates between remotable objects and their SOAP representation. This is the interface to a TOPToSoapDomConvert instance.

Name is the name of the node that is generated.

URI is the URI for the namespace in which Name is defined.

ObjConvOpts are flags that customize the way the node is serialized.

RefID returns a reference ID for the node. This is used if the node is multi-referenced.

ObjectToSOAP returns the XML for the newly generated node.

See Also

MustUnderstand (see page 15600)

ObjInstanceToSOAP (see page 15612)

SOAPToObject (see page 15599)

84.1.12.2.2 TSOAPHeader.SOAPToObject Method

Initializes this TSOAPHeader (see page 15596) instance to represent the value of its SOAP representation.

Pascal

```
procedure SOAPToObject(const RootNode: IXMLNode; const Node: IXMLNode; const ObjConverter:
IObjConverter); override;
```

C++

```
virtual __fastcall SOAPToObject(const IXMLNode RootNode, const IXMLNode Node, const
IObjConverter ObjConverter);
```

Description

SOAPToObject initializes the published properties of this object instance so that they reflect the header's SOAP representation. Override this method to customize the way your application creates a specific type of header from its XML representation.

RootNode is an ancestor node of the header node that can contain information about the header node.

Node is the node in the SOAP envelope that represents the header.

ObjConverter is the interface of the default converter that translates between remotable objects and their SOAP representation. This is the interface to a TOPToSoapDomConvert instance.

See Also

ObjectToSOAP (see page 15598)

InitObjectFromSOAP (see page 15612)

MustUnderstand (see page 15600)

84.1.12.3 TSOAPHeader Properties

The properties of the TSOAPHeader class are listed here.

Public Properties

	Name	Description
	Actor (see page 15599)	Identifies the agent to which the header is directed.
	MustUnderstand (see page 15600)	Indicates whether an application is required to recognize and handle the header on received messages.

84.1.12.3.1 TSOAPHeader.Actor Property

Identifies the agent to which the header is directed.

Pascal

```
property Actor: WideString;
```

C++

```
__property BSTR Actor;
```

Description

Actor is the URI to which the header is directed. Set Actor to indicate the ultimate target of a header you are sending. Read Actor to determine whether a header the application receives is supposed to be handled by the application rather than merely passed on to the next processor.

Note: When the Actor property of a received header identifies this application and the application raises an exception concerning that header (such as a MustUnderstand (see page 15600) fault for a header that it does not know how to handle), the value of Actor should become the value of the FaultActor property on the ERemotableException (see page 15496) object.

See Also

MustUnderstand (see page 15600)

FaultActor (see page 15499)

84.1.12.3.2 TSOAPHeader.MustUnderstand Property

Indicates whether an application is required to recognize and handle the header on received messages.

Pascal

```
property MustUnderstand: Boolean;
```

C++

```
__property Boolean MustUnderstand;
```

Description

When MustUnderstand is false, applications can ignore this header if they do not recognize it and know how to handle it.

When MustUnderstand is true, applications that receive messages with this header but that do not recognize or handle it must throw a MustUnderstand fault.

See Also

Actor (see page 15599)

84.1.13 TSOAPHeaders Class

TSOAPHeaders is a helper object for implementing the ISOAPHeaders (see page 15613) interface.

Class Hierarchy

Pascal

```
TSOAPHeaders = class(TSOAPHeadersBase, ISOAPHeaders, IHeadersSetter);
```

C++

```
class TSOAPHeaders : public TSOAPHeadersBase, public ISOAPHeaders, public IHeadersSetter;
```

File

InvokeRegistry

Description

TSOAPHeaders implements the ISOAPHeaders (see page 15613) interface for a class that needs to provide access to the headers of SOAP messages that the application sends and receives Typically, an application does not work directly with instances of TSOAPHeaders. Rather, it uses the ISOAPHeaders (see page 15613) interface that this object implements for another class, such as TRIO or TInvokableClass (see page 15520).

See Also

ISOAPHeaders (see page 15613)

TSOAPHeader (see page 15596)

TRIO (see page 18718)

TInvokableClass (see page 15520)

84.1.13.1 TSOAPHeaders Members

The following tables list the members exposed by TSOAPHeaders.

Protected Fields

	Name	Description
	FHeadersInbound (see page 15607)	This is FHeadersInbound, a member of class TSOAPHeadersBase.
	FHeadersOutBound (see page 15608)	This is FHeadersOutBound, a member of class TSOAPHeadersBase.

Protected Methods

	Name	Description
	_AddRef (see page 22250)	This is _AddRef, a member of class TAggregatedObject.
	_Release (see page 22250)	This is _Release, a member of class TAggregatedObject.
	QueryInterface (see page 22250)	This is QueryInterface, a member of class TAggregatedObject.
V	QueryInterface (see page 22255)	Returns a reference to a specified interface if the object supports that interface.
	SetHeadersInOut (see page 15608)	Sets the lists of incoming and outgoing headers.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.

	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 22249)	Instantiates an aggregated object.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	Get (see page 15614)	This is the overview for the Get method overload.
	Get (see page 15603)	This is the overview for the Get method overload.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetOwnsSentHeaders (see page 15603)	Indicates whether the TSOAPHeaders (see page 15600) object frees headers that are added using the Send (see page 15604) method
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	Send (see page 15604)	Adds a header to an outgoing message.
	SendAt (see page 15604)	Retrieves a header from an outgoing message, given its position.
	SendCount (see page 15605)	Indicates the number of headers that have been added to an outgoing message.
	SetHeadersInOut (see page 15610)	This is SetHeadersInOut, a member of class IHeadersSetter.
	SetOwnsSentHeaders (see page 15605)	Sets a flag that indicates who should free outgoing header objects.

Public Properties

	Name	Description
R	Controller (see page 22251)	Provides access to the controlling interface of the aggregate.
	OwnsSentHeaders (see page 15617)	Indicates who is responsible for freeing header objects that are included in outbound messages.

84.1.13.2 TSOAPHeaders Methods

The methods of the TSOAPHeaders class are listed here.

Public Methods

	Name	Description
	Get (see page 15603)	This is the overview for the Get method overload.
	GetOwnsSentHeaders (see page 15603)	Indicates whether the TSOAPHeaders (see page 15600) object frees headers that are added using the Send (see page 15604) method
	Send (see page 15604)	Adds a header to an outgoing message.
	SendAt (see page 15604)	Retrieves a header from an outgoing message, given its position.
	SendCount (see page 15605)	Indicates the number of headers that have been added to an outgoing message.
	SetOwnsSentHeaders (see page 15605)	Sets a flag that indicates who should free outgoing header objects.

84.1.13.2.1 Get Method

This is the overview for the Get method overload.

Overload List

	Name	Description
	TSOAPHeaders.Get (TClass) (see page 15603)	Retrieves a header from an incoming message.
	TSOAPHeaders.Get (TClass, TSOAPHeader) (see page 15603)	Retrieves a header from an incoming message.
	TSOAPHeaders.Get (WideString, WideString) (see page 15603)	Retrieves a header from an incoming message.

84.1.13.2.1.1 TSOAPHeaders.Get Method (TClass)

Retrieves a header from an incoming message.

Pascal

```
procedure Get(Cls: TClass; out Hdr: TSOAPHeader); overload;
function Get(Cls: TClass): TSOAPHeader; overload;
function Get(const Name: WideString; const URI: WideString): TSOAPHeader; overload;
```

C++

```
__fastcall Get(TClass Cls, TSOAPHeader Hdr);
__fastcall TSOAPHeader Get(TClass Cls);
__fastcall TSOAPHeader Get(const BSTR Name, const BSTR URI);
```

Description

Call Get to access the header object that is automatically created to represent one of the headers on an incoming messages. On the server, this is a header on the request message. On the client, this is a header on the response message.

Cls is the class reference that indicates the type of header class you want to retrieve. Each header class corresponds to a type of header, where the type name under which the class is registered corresponds to the name of the header node.

Hdr returns a TSOAPHeader (see page 15596) descendant that represents the header of the incoming message. If this syntax is not used, Get returns the header instance.

Name is the name of the header (the node name for the header node) that you want to retrieve.

URI is the URI for the namespace in which Name is defined.

See Also

Send (see page 15604)

DataContext (see page 15561)

84.1.13.2.2 TSOAPHeaders.GetOwnsSentHeaders Method

Indicates whether the TSOAPHeaders (see page 15600) object frees headers that are added using the Send (see page 15604) method

Pascal

```
function GetOwnsSentHeaders: Boolean;
```

C++

```
__fastcall Boolean GetOwnsSentHeaders();
```

Description

GetOwnsSentHeaders returns true if the TSOAPHeaders (see page 15600) instance frees any header objects added using the Send (see page 15604) method. It returns false if the caller is responsible for freeing these header objects.

See Also

Send (see page 15604)

84.1.13.2.3 TSOAPHeaders.Send Method

Adds a header to an outgoing message.

Pascal

```
procedure Send(const Hdr: TSOAPHeader);
```

C++

```
__fastcall Send(const TSOAPHeader Hdr);
```

Description

Call Send to add a header to an outgoing message. On the client, call Send before executing a method on an invokable interface. On the server, call Send before returning from the method that the client invoked.

Hdr is the header object instance that represents the header you want to add to the outgoing message.

Note: The SetOwnsSentHeaders (see page 15605) method controls whether you must free the object that is supplied as the Hdr parameter after sending the message.

See Also

SendAt (see page 15604)

SendCount (see page 15605)

SetOwnsSentHeaders (see page 15605)

84.1.13.2.4 TSOAPHeaders.SendAt Method

Retrieves a header from an outgoing message, given its position.

Pascal

```
function SendAt(Index: Integer): TSOAPHeader;
```

C++

```
__fastcall TSOAPHeader SendAt(int Index);
```

Description

Call SendAt to retrieve the header object for a header you have already added to an outgoing message using the Send (see page 15604) method.

Index is the position of the header you want to retrieve, where 0 specifies the first header, 1 specifies the second header, and so on. The SendCount (see page 15605) property provides an upper bound for this index.

SendAt returns the header at the specified position.

See Also

Send (see page 15604)

SendCount (see page 15605)

84.1.13.2.5 TSOAPHeaders.SendCount Method

Indicates the number of headers that have been added to an outgoing message.

Pascal

```
function SendCount: Integer;
```

C++

```
__fastcall int SendCount();
```

Description

Call SendCount to determine the number of headers that have been added to an outgoing message. These headers are added by previous calls to the Send (see page 15604) method.

See Also

Send (see page 15604)

SendAt (see page 15604)

84.1.13.2.6 TSOAPHeaders.SetOwnsSentHeaders Method

Sets a flag that indicates who should free outgoing header objects.

Pascal

```
procedure SetOwnsSentHeaders(Flag: Boolean);
```

C++

```
__fastcall SetOwnsSentHeaders(Boolean Flag);
```

Description

Call SetOwnsSentHeaders to specify who should free header objects that are added using the Send (see page 15604) method.

Flag indicates whether this TSOAPHeaders (see page 15600) frees the outgoing headers. If Flag is true, TSOAPHeaders (see page 15600) frees the headers that are added by calling Send (see page 15604). If Flag is false, the caller is responsible for freeing these header objects.

See Also

Send (see page 15604)

84.1.14 TSOAPHeadersBase Class

TSOAPHeadersBase is the base class for classes that maintain lists of SOAP headers.

Class Hierarchy

Pascal

```
TSOAPHeadersBase = class(TContainedObject, IHeadersSetter);
```

C++

```
class TSOAPHeadersBase : public TContainedObject, public IHeadersSetter;
```

File

InvokeRegistry

Description

TSOAPHeadersBase provides support for maintaining two lists of TSOAPHeader (see page 15596) descendants. One list is for the headers that an application sends and the other is for the headers that are it receives with an incoming message.

TSOAPHeadersBase is a descendant of TContainedObject. As such, it is designed to be used as a helper object in supporting an interface for working with SOAP headers. TSOAPHeadersBase is intended only as a base class. For working with SOAP headers, use a TSOAPHeadersBase descendant such as TSOAPHeaders (see page 15600).

See Also

TSOAPHeaders (see page 15600)

TSOAPHeader (see page 15596)

84.1.14.1 TSOAPHeadersBase Members

The following tables list the members exposed by TSOAPHeadersBase.

Protected Fields

	Name	Description
	FHeadersInbound (see page 15607)	This is FHeadersInbound, a member of class TSOAPHeadersBase.
	FHeadersOutBound (see page 15608)	This is FHeadersOutBound, a member of class TSOAPHeadersBase.

Protected Methods

	Name	Description
	_AddRef (see page 22250)	This is _AddRef, a member of class TAggregatedObject.
	_Release (see page 22250)	This is _Release, a member of class TAggregatedObject.
	QueryInterface (see page 22250)	This is QueryInterface, a member of class TAggregatedObject.
V	QueryInterface (see page 22255)	Returns a reference to a specified interface if the object supports that interface.
	SetHeadersInOut (see page 15608)	Sets the lists of incoming and outgoing headers.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.

	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 22249)	Instantiates an aggregated object.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
R	Controller (see page 22251)	Provides access to the controlling interface of the aggregate.

84.1.14.2 TSOAPHeadersBase Fields

The fields of the TSOAPHeadersBase class are listed here.

Protected Fields

	Name	Description
	FHeadersInbound (see page 15607)	This is FHeadersInbound, a member of class TSOAPHeadersBase.
	FHeadersOutBound (see page 15608)	This is FHeadersOutBound, a member of class TSOAPHeadersBase.

84.1.14.2.1 TSOAPHeadersBase.FHeadersInbound Field

Pascal

```
FHeadersInbound: THeaderList;
```

C++

```
THeaderList FHeadersInbound;
```

Description

This is FHeadersInbound, a member of class TSOAPHeadersBase.

84.1.14.2.2 TSOAPHeadersBase.FHeadersOutBound Field

Pascal

```
FHeadersOutBound: THeaderList;
```

C++

```
THeaderList FHeadersOutBound;
```

Description

This is FHeadersOutBound, a member of class TSOAPHeadersBase.

84.1.14.3 TSOAPHeadersBase Methods

The methods of the TSOAPHeadersBase class are listed here.

Protected Methods

	Name	Description
	SetHeadersInOut (see page 15608)	Sets the lists of incoming and outgoing headers.

84.1.14.3.1 TSOAPHeadersBase.SetHeadersInOut Method

Sets the lists of incoming and outgoing headers.

Pascal

```
procedure SetHeadersInOut(var InHdrs: THeaderList; var OutHdrs: THeaderList);
```

C++

```
__fastcall SetHeadersInOut(THeaderList InHdrs, THeaderList OutHdrs);
```

Description

Applications can't call the protected SetHeadersInOut method. It is used by descendant classes to initialize the lists of incoming and outgoing header objects.

InHdrs is a list of TSoapHeader descendants that represent the headers received in a SOAP message.

OutHdrs is a list of TSoapHeader descendants that represent the headers sent in a SOAP message.

See Also

TSoapHeader

84.2 Interfaces

The following table lists interfaces in this documentation.

Interfaces

	Name	Description
	IHeadersSetter (see page 15609)	This is class InvokeRegistry.IHeadersSetter.
	IObjConverter (see page 15610)	IObjConverter is the interface for converting between a remotable class and its SOAP representation.
	ISOAPHeaders (see page 15613)	ISOAPHeaders is the interface for accessing the headers that accompany a message encoded using SOAP.

84.2.1 IHeadersSetter Interface

Class Hierarchy

InvokeRegistry.IHeadersSetter

Pascal

```
IHeadersSetter = interface;
```

C++

```
__interface IHeadersSetter;
```

File

InvokeRegistry

Description

This is class InvokeRegistry.IHeadersSetter.

84.2.1.1 IHeadersSetter Members

The following tables list the members exposed by IHeadersSetter.

Public Methods

	Name	Description
	SetHeadersInOut (see page 15610)	This is SetHeadersInOut, a member of class IHeadersSetter.

84.2.1.2 IHeadersSetter Methods

The methods of the IHeadersSetter class are listed here.

Public Methods

	Name	Description
	SetHeadersInOut (see page 15610)	This is SetHeadersInOut, a member of class IHeadersSetter.

84.2.1.2.1 IHeadersSetter.SetHeadersInOut Method

Pascal

```
procedure SetHeadersInOut(var InHdrs: THeaderList; var OutHdrs: THeaderList);
```

C++

```
__fastcall SetHeadersInOut(THeaderList InHdrs, THeaderList OutHdrs);
```

Description

This is SetHeadersInOut, a member of class IHeadersSetter.

84.2.2 IObjConverter Interface

IObjConverter is the interface for converting between a remotable class and its SOAP representation.

Class Hierarchy

Pascal

```
IObjConverter = interface;
```

C++

```
__interface IObjConverter;
```

File

InvokeRegistry

Description

IObjConverter defines methods that aid in the conversion between remotable classes (classes that descend from TRemotable (see page 15556)) and their representation in the messages that pass between clients and Web Service providers. That is, this interface provides methods that are used when converting between a remotable class, whether it represents a complex type in an invokable interface, an attachment, or a SOAP header, and its SOAP representation. The TSOAPDomConv class implements this interface.

Note: C++ method declarations that use IObjConverter use the _di_IObjConverter type instead. This type is a DelphiInterface wrapper around the IObjConverter interface:

Note: typedef System::DelphiInterface (see page 22167)< IObjConverter > _di_IObjConverter;

See Also

TSOAPDomCOnv

TRemotable (see page 15556)

TSoapHeader

TSoapAttachment

84.2.2.1 IObjConverter Members

The following tables list the members exposed by IObjConverter.

Public Methods

	Name	Description
	AddAttachment (see page 15611)	Stores information about a SOAP attachment so that it is included in the final message that is created.
	FindAttachment (see page 15612)	Returns a TSOAPAttachment (see page 15583) instance that represent the attachment with a specified ID.
	InitObjectFromSOAP (see page 15612)	Initializes an instance of a remotable object to reflect the values in its SOAP representation.
	ObjInstanceToSOAP (see page 15612)	Returns the SOAP representation of a remotable object.

84.2.2.2 IObjConverter Methods

The methods of the IObjConverter class are listed here.

Public Methods

	Name	Description
	AddAttachment (see page 15611)	Stores information about a SOAP attachment so that it is included in the final message that is created.
	FindAttachment (see page 15612)	Returns a TSOAPAttachment (see page 15583) instance that represent the attachment with a specified ID.
	InitObjectFromSOAP (see page 15612)	Initializes an instance of a remotable object to reflect the values in its SOAP representation.
	ObjInstanceToSOAP (see page 15612)	Returns the SOAP representation of a remotable object.

84.2.2.2.1 IObjConverter.AddAttachment Method

Stores information about a SOAP attachment so that it is included in the final message that is created.

Pascal

```
procedure AddAttachment(Attachment: TSOAPAttachment; const AContentId: string);
```

C++

```
__fastcall AddAttachment(TSOAPAttachment Attachment, const AnsiString AContentId);
```

Description

AddAttachment stores a SOAP attachment so that it can be used to generate part of the multipart form that includes the SOAP envelope as another of its parts.

Attachment is the attachment that should be added to the multipart form.

AContentId is a string that uniquely identifies the attachment. It is added as a header to the part of the form that contains the attachment so that XML in the SOAP envelope can refer to the attachment. When interpreting the encoded SOAP envelope, this value is passed to the FindAttachment (see page 15612) method so that the information in the attachment part can be used to recreate the TSOAPAttachment (see page 15583) instance.

See Also

FindAttachment (see page 15612)

84.2.2.2.2 IObjConverter.FindAttachment Method

Returns a TSOAPAttachment (see page 15583) instance that represent the attachment with a specified ID.

Pascal

```
function FindAttachment(const AContentId: string): TSOAPAttachment;
```

C++

```
__fastcall TSOAPAttachment FindAttachment(const AnsiString AContentId);
```

Description

FindAttachment locates the attachment that is identified by a specified content ID (HREF).

AContentId is the unique identifier for the attachment that was supplied to the AddAttachment (see page 15611) method when the attachment was first added to the multipart form.

FindAttachment returns a TSOAPAttachment (see page 15583) instance that represents the attachment.

See Also

AddAttachment (see page 15611)

84.2.2.2.3 IObjConverter.InitObjectFromSOAP Method

Initializes an instance of a remotable object to reflect the values in its SOAP representation.

Pascal

```
procedure InitObjectFromSOAP(Instance: TObject; RootNode: IXMLNode; Node: IXMLNode);
```

C++

```
__fastcall InitObjectFromSOAP(TObject * Instance, IXMLNode RootNode, IXMLNode Node);
```

Description

InitObjectFromSOAP assigns values to the published properties of a remotable object that represents a node from the SOAP envelope.

Instance is the remotable object to initialize from its SOAP representation.

RootNode is an ancestor node of the node for the remotable object that can contain information needed for initializing the remotable object.

Node is the node in the SOAP envelope that represents the remotable object.

See Also

ObjInstanceToSOAP (see page 15612)

84.2.2.2.4 IObjConverter.ObjInstanceToSOAP Method

Returns the SOAP representation of a remotable object.

Pascal

```
function ObjInstanceToSOAP(Instance: TObject; RootNode: IXMLNode; ParentNode: IXMLNode; const
NodeName: InvString; const NodeNamespace: InvString; ObjConvOpts: TObjectConvertOptions; out
RefID: InvString): IXMLNode;
```

C++

```
__fastcall IXMLNode ObjInstanceToSOAP(TObject * Instance, IXMLNode RootNode, IXMLNode
```

```
ParentNode, const InvString NodeName, const InvString NodeNamespace, TObjectConvertOptions
ObjConvOpts, InvString RefID);
```

Description

ObjInstanceToSOAP adds a node to represent the value of a remotable object.

Instance is the remotable object to encode as its SOAP representation.

RootNode is an ancestor of the node to which information about the node can be added as attributes.

ParentNode is the node in the SOAP representation that should act as a parent to the node that ObjInstanceToSOAP generates.

NodeName is the name of the node that is generated.

NodeNamespace is the URI for the namespace in which NodeName is defined.

ObjConvOpts are flags that customize the way the node is serialized.

RefID returns a reference ID for the node. This is used if the node is multi-referenced.

ObjInstanceToSOAP returns the XML for the newly generated node.

See Also

InitObjectFromSOAP (see page 15612)

84.2.3 ISOAPHeaders Interface

ISOAPHeaders is the interface for accessing the headers that accompany a message encoded using SOAP.

Class Hierarchy

Pascal

```
ISOAPHeaders = interface;
```

C++

```
__interface ISOAPHeaders;
```

File

InvokeRegistry

Description

ISOAPHeaders is the interface for accessing the headers of a SOAP envelope. It defines methods for adding headers that are sent with an outgoing message and for retrieving the headers that were included in an incoming message.

On the server, the implementation class for in invokable interface supports this interface. You can obtain a reference to the ISOAPHeaders interface from the implementation class (a TInvokableClass (see page 15520) descendant). You can then use this interface to retrieve the headers that were included in an incoming request or to add headers to an outgoing response message. If your implementation class does not descend from TInvokableClass (see page 15520), you can obtain a reference to this interface using the global GetSOAPHeaders function.

For client-side header support, TRIO implements the ISOAPHeaders interface. However, you can't obtain an ISOAPHeaders interface directly from a remote interfaced object, because when you try to obtain an interface from TRIO or one of its descendants, it assumes that you are trying to obtain an invokable interface for a server object and generates an in-memory vtable. Instead, you must access the ISOAPHeaders interface from the invokable interface that the remote interface object supports.

Note: C++ method declarations that use ISOAPHeaders use the _di_ISOAPHeaders type instead. This type is a DelphiInterface wrapper around the ISOAPHeaders interface:

Note: typedef System::DelphiInterface (see page 22167)< ISOAPHeaders > _di_ISOAPHeaders;

84.2.3.1 ISOAPHeaders Members

The following tables list the members exposed by ISOAPHeaders.

Public Methods

	Name	Description
	Get (see page 15614)	This is the overview for the Get method overload.
	GetOwnsSentHeaders (see page 15615)	Returns the value of the OwnsSentHeaders (see page 15617) property.
	Send (see page 15616)	Adds a header to an outgoing message.
	SendAt (see page 15616)	Retrieves a header from an outgoing message, given its position.
	SendCount (see page 15617)	Indicates the number of headers that have been added to an outgoing message.
	SetOwnsSentHeaders (see page 15617)	Sets the value of the OwnsSentHeaders (see page 15617) property.

Public Properties

	Name	Description
	OwnsSentHeaders (see page 15617)	Indicates who is responsible for freeing header objects that are included in outbound messages.

84.2.3.2 ISOAPHeaders Methods

The methods of the ISOAPHeaders class are listed here.

Public Methods

	Name	Description
	Get (see page 15614)	This is the overview for the Get method overload.
	GetOwnsSentHeaders (see page 15615)	Returns the value of the OwnsSentHeaders (see page 15617) property.
	Send (see page 15616)	Adds a header to an outgoing message.
	SendAt (see page 15616)	Retrieves a header from an outgoing message, given its position.
	SendCount (see page 15617)	Indicates the number of headers that have been added to an outgoing message.
	SetOwnsSentHeaders (see page 15617)	Sets the value of the OwnsSentHeaders (see page 15617) property.

84.2.3.2.1 Get Method

This is the overview for the Get method overload.

Overload List

	Name	Description
	ISOAPHeaders.Get (TClass) (see page 15615)	Retrieves a header from an incoming message.
	ISOAPHeaders.Get (TClass, TSOAPHeader) (see page 15615)	Retrieves a header from an incoming message.
	ISOAPHeaders.Get (WideString, WideString) (see page 15615)	Retrieves a header from an incoming message.

84.2.3.2.1.1 ISOAPHeaders.Get Method (TClass)

Retrieves a header from an incoming message.

Pascal

```
procedure Get(Cls: TClass; out Hdr: TSOAPHeader); overload;
function Get(Cls: TClass): TSOAPHeader; overload;
function Get(const Name: WideString; const URI: WideString): TSOAPHeader; overload;
```

C++

```
__fastcall Get(TClass Cls, TSOAPHeader Hdr);
__fastcall TSOAPHeader Get(TClass Cls);
__fastcall TSOAPHeader Get(const BSTR Name, const BSTR URI);
```

Description

Call Get to access the header object that is automatically created to represent one of the headers on an incoming messages. On the server, this is a header on the request message. On the client, this is a header on the response message.

Cls is the class reference that indicates the type of header class you want to retrieve. Each header class corresponds to a type of header, where the type name under which the class is registered corresponds to the name of the header node.

Hdr returns a TSOAPHeader (see page 15596) descendant that represents the header of the incoming message. If this syntax is not used, Get returns the header instance.

Name is the name of the header (the node name for the header node) that you want to retrieve.

URI is the URI for the namespace in which Name is defined.

See Also

Send (see page 15616)

DataContext (see page 15561)

84.2.3.2.2 ISOAPHeaders.GetOwnsSentHeaders Method

Returns the value of the OwnsSentHeaders (see page 15617) property.

Pascal

```
function GetOwnsSentHeaders: Boolean;
```

C++

```
__fastcall Boolean GetOwnsSentHeaders();
```

Description

GetOwnsSentHeaders is the read implementation for the OwnsSentHeaders (see page 15617) property.

See Also

OwnsSentHeaders (see page 15617)

84.2.3.2.3 ISOAPHeaders.Send Method

Adds a header to an outgoing message.

Pascal

```
procedure Send(const Hdr: TSOAPHeader);
```

C++

```
__fastcall Send(const TSOAPHeader Hdr);
```

Description

Call Send to add a header to an outgoing message. On the client, call Send before executing a method on an invokable interface. On the server, call Send before returning from the method that the client invoked.

Hdr is the header object instance that represents the header you want to add to the outgoing message.

Note: The OwnsSentHeaders (see page 15617) property controls whether you must free the object that is supplied as the Hdr parameter after sending the message.

See Also

SendAt (see page 15616)

SendCount (see page 15617)

OwnsSentHeaders (see page 15617)

84.2.3.2.4 ISOAPHeaders.SendAt Method

Retrieves a header from an outgoing message, given its position.

Pascal

```
function SendAt(Index: Integer): TSOAPHeader;
```

C++

```
__fastcall TSOAPHeader SendAt(int Index);
```

Description

Call SendAt to retrieve the header object for a header you have already added to an outgoing message using the Send (see page 15616) method.

Index is the position of the header you want to retrieve, where 0 specifies the first header, 1 specifies the second header, and so on. The SendCount (see page 15617) property provides an upper bound for this index.

SendAt returns the header at the specified position.

See Also

Send (see page 15616)

SendCount (see page 15617)

84.2.3.2.5 ISOAPHeaders.SendCount Method

Indicates the number of headers that have been added to an outgoing message.

Pascal

```
function SendCount: Integer;
```

C++

```
__fastcall int SendCount();
```

Description

Call SendCount to determine the number of headers that have been added to an outgoing message. These headers are added by previous calls to the Send (see page 15616) method.

See Also

Send (see page 15616)

SendAt (see page 15616)

84.2.3.2.6 ISOAPHeaders.SetOwnsSentHeaders Method

Sets the value of the OwnsSentHeaders (see page 15617) property.

Pascal

```
procedure SetOwnsSentHeaders(Flag: Boolean);
```

C++

```
__fastcall SetOwnsSentHeaders(Boolean Flag);
```

Description

SetOwnsSentHeaders is the write implementation for the OwnsSentHeaders (see page 15617) property.

Flag is the new value of the OwnsSentHeaders (see page 15617) property.

See Also

OwnsSentHeaders (see page 15617)

84.2.3.3 ISOAPHeaders Properties

The properties of the ISOAPHeaders class are listed here.

Public Properties

	Name	Description
	OwnsSentHeaders (see page 15617)	Indicates who is responsible for freeing header objects that are included in outbound messages.

84.2.3.3.1 ISOAPHeaders.OwnsSentHeaders Property

Indicates who is responsible for freeing header objects that are included in outbound messages.

Pascal

```
property OwnsSentHeaders: Boolean;
```

C++

```
__property Boolean OwnsSentHeaders;
```

Description

Use OwnsSentHeaders to indicate whether the header object instances you create and add to messages by calling the Send (see page 15616) or SendAt (see page 15616) method should be freed by the object that implements this interface. When OwnsSentHeaders is true, the object implementing ISOAPHeaders (see page 15613) frees the header objects after sending them. When OwnsSentHeaders is false, the caller is responsible for freeing the header objects.

Note: For inbound headers (headers retrieved from incoming messages), the object that implements always frees them unless you call the Get (see page 15615) method. After a call to Get (see page 15615), the caller is responsible for freeing the header, except on the server, where the header object is freed by the header object's DataContext.

See Also

Send (see page 15616)

SendAt (see page 15616)

DataContext (see page 15561)

84.3 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	GetRemotableDataContext (see page 15619)	Returns the TDataContext (see page 15501) object that provides temporary storage during a call to an invokable interface.
	InvRegistry (see page 15620)	Provides access to the invocation registry.
	RemClassRegistry (see page 15620)	Provides access to the remotable class registry.
	RemTypeRegistry (see page 15621)	Provides access to the remotable type registry.
	SetRemotableDataContext (see page 15622)	Sets the data context that provides temporary storage during a call to an invokable interface.
	SubstituteStrings (see page 15623)	This is function InvokeRegistry.SubstituteStrings.

84.3.1 InvokeRegistry.GetRemotableDataContext Function

Returns the TDataContext (see page 15501) object that provides temporary storage during a call to an invokable interface.

Pascal

```
function GetRemotableDataContext: Pointer;
```

C++

```
void * GetRemotableDataContext();
```

File

InvokeRegistry

Description

GetRemotableDataContext returns a pointer to the data context object that stores all the temporary objects and values needed for implementing a call to an invokable interface. When a client application calls an invokable interface on a Web Service application, the Web Service application automatically creates a data context for the call. Any objects or variables that are needed for marshaling the interface call are automatically added to the data context for the duration of the call. In addition, any remotable objects (TRemotable (see page 15556) descendants) that are created while there is a remotable data context available are automatically added to the data context. When the interface call is complete, the data context is freed, and it automatically frees the stored objects and variables.

See Also

SetRemotableDataContext (see page 15622)

TRemotable (see page 15556)

TDataContext (see page 15501)

84.3.2 InvokeRegistry.InvRegistry Function

Provides access to the invocation registry.

Pascal

```
function InvRegistry: TInvokableClassRegistry;
```

C++

```
TInvokableClassRegistry InvRegistry();
```

File

InvokeRegistry

Description

Call InvRegistry to access the invocation registry. The returned object has two methods, RegisterInterface and RegisterInvokableClass, that you can use for registering invokable interfaces (interfaces compiled with RTTI) and the classes that implement them.

Server applications that implement Web Services need to register both the invokable interfaces and the implementation classes. The invoker component can then use the invocation registry to locate invokable interfaces and identify classes that implement them.

Client applications that call on Web Services register the invokable interfaces that they call. The remote interfaced object component can then use the invocation registry to generate a dynamic method table for calling the invokable interfaces.

Note: Both client and server applications must register invokable interfaces using the same namespace. You can either supply this namespace explicitly when you register an interface, or you can use the automatically generated namespace. If you use the automatically generated interface, the interface must be defined in the same unit on both client and server, and both client and server must have the same value set for the global AppNameSpacePrefix (see page 15644) variable.

See Also

IInvokable

THTTPSoapPascalInvoker

THTTPRio

AppNamespacePrefix

RemTypeRegistry (see page 15621)

84.3.3 InvokeRegistry.RemClassRegistry Function

Provides access to the remotable class registry.

Pascal

```
function RemClassRegistry: TRemotableClassRegistry;
```

C++

```
TRemotableClassRegistry RemClassRegistry();
```

File

InvokeRegistry

Description

RemClassRegistry returns the object that implements the remotable class registry. Use its RegisterXSClass method to register a remotable class in an application that publishes or uses Web Services.

Remotable classes are classes that can be transmitted between the client of a Web Services application and the server that implements the service. They can be used to represent non-scalar types for parameters and return values, or they can represent exceptions that occur when trying to execute a request to a Web Service application. All remotable classes are compiled with runtime type information (RTTI) and have a virtual constructor that the remotable class registry recognizes and uses to obtain class instances.

Both the client application and server application must register remotable classes before they can use them. They must register them to use the same namespace. You can either supply this namespace explicitly when you register the class, or you can use the automatically generated namespace. If you use the automatically generated interface, the class must be defined in the same unit on both client and server, and both client and server must have the same value set for the global AppNameSpacePrefix (see page 15644) variable.

Note: The remotable class registry is the same thing as the remotable type registry. You can use RemClassRegistry interchangeably with the RemTypeRegistry (see page 15621) function.

See Also

TRemotable (see page 15556)

ERemotableException (see page 15496)

AppNameSpacePrefix (see page 15644)

InvRegistry (see page 15620)

RemTypeRegistry (see page 15621)

84.3.4 InvokeRegistry.RemTypeRegistry Function

Provides access to the remotable type registry.

Pascal

```
function RemTypeRegistry: TRemotableTypeRegistry;
```

C++

```
TRemotableTypeRegistry RemTypeRegistry();
```

File

InvokeRegistry

Description

Call RemTypeRegistry to access to the remotable type registry. Use the RegisterXSClass method of the returned object to register a remotable class in an application that publishes or uses Web Services. Use its RegisterXSInfo method to register a remotable type.

Remotable classes are classes that can be transmitted between the client of a Web Services application and the server that implements the service. They can be used to represent non-scalar types for parameters and return values, or they can represent exceptions that occur when trying to execute a request to a Web Service application. All remotable classes are compiled with

runtime type information (RTTI) and have a virtual constructor that the remotable class registry recognizes and uses to obtain class instances.

Remotable types include dynamic arrays, enumerated types, and boolean types, which can be used in an invokable interface without resorting to a remotable class representation, but which must be registered because their values require special marshaling.

Both the client application and server application must register remotable classes and types before they can use them. They must register them to use the same namespace. You can either supply this namespace explicitly when you register the class or type, or you can use the automatically generated namespace. If you use the automatically generated interface, the class must be defined in the same unit on both client and server, and both client and server must have the same value set for the global AppNameSpacePrefix (see page 15644) variable.

Note: The remotable type registry is the same thing as the remotable class registry. You can use RemTypeRegistry interchangeably with the RemClassRegistry (see page 15620) function.

See Also

TRemotable (see page 15556)

ERemotableException (see page 15496)

AppNameSpacePrefix (see page 15644)

InvRegistry (see page 15620)

84.3.5 InvokeRegistry.SetRemotableDataContext Function

Sets the data context that provides temporary storage during a call to an invokable interface.

Pascal

```
procedure SetRemotableDataContext(Value: Pointer);
```

C++

```
SetRemotableDataContext(void * Value);
```

File

InvokeRegistry

Description

SetRemotableDataContext assigns a data context for a remote call to an invokable interface. Once a data context is assigned, it is available to store the temporary objects and values needed for implementing a call to an invokable interface. If the application creates a TRemotable (see page 15556) descendant while there is a remotable data context, that remotable object is automatically added to the data context and freed when the application frees the data context.

Note: The invoker component in a Web Services application automatically calls SetRemotableDataContext to set up a data context for incoming SOAP requests. Thus, there is typically no need to call this method in server applications.

Value is a pointer to a TDataContext (see page 15501) descendant that temporarily stores information for remote interface calls.

See Also

GetRemotableDataContext (see page 15619)

TRemotable (see page 15556)

TDataContext (see page 15501)

84.3.6 InvokeRegistry.SubstituteStrings Function

Pascal

```
function SubstituteStrings(const InputString: WideString; const SubString: WideString; const
Replacement: WideString): WideString;
```

C++

```
BSTR SubstituteStrings(const BSTR InputString, const BSTR SubString, const BSTR Replacement);
```

File

InvokeRegistry

Description

This is function InvokeRegistry.SubstituteStrings.

84.4 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	eHeaderMethodType (see page 15624)	eHeaderMethodType and THeaderMethodTypeArray (see page 15638) indicate the types of messages that should include a given header type.
	ObjectConvertOptions (see page 15629)	ObjectConvertOptions and TObjectConvertOptions (see page 15640) are flags that customize how to convert a remotable object to or from its SOAP representation.
	SerializationOptions (see page 15630)	SerializationOptions and TSerializationOptions (see page 15642) are flags that customize how to convert a remotable object to or from its SOAP representation.
	TIntfInvokeOption (see page 15632)	TIntfInvokeOption and TIntfInvokeOptions (see page 15639) represent flags that customize how to handle calls to an invokable interface.
	TObjMultiOptions (see page 15633)	TObjMultiOptions indicates how multiple references to the same remotable class should be translated into a SOAP representation.

Records

	Name	Description
	ExtNameMapItem (see page 15625)	This is record InvokeRegistry.ExtNameMapItem.
	IntfExceptionItem (see page 15625)	IntfExceptionItem and TExceptionItemArray (see page 15638) describe the association between a remotable exception and an interface that can raise it.
	IntfHeaderItem (see page 15626)	IntfHeaderItem and THeaderItemArray (see page 15638) describe the association between a header and the SOAP messages that include it.
	InvRegClassEntry (see page 15627)	This is record InvokeRegistry.InvRegClassEntry.
	InvRegIntfEntry (see page 15627)	InvRegIntfEntry stores information about an invokable interface.
	MethParamNameMapItem (see page 15629)	This is record InvokeRegistry.MethParamNameMapItem.
	TDynToClear (see page 15631)	This is record InvokeRegistry.TDynToClear.
	TRemHeaderEntry (see page 15634)	This is record InvokeRegistry.TRemHeaderEntry.
	TRemRegEntry (see page 15634)	TRemRegEntry stores information for the remotable type registry.

84.4.1 InvokeRegistry.eHeaderMethodType Enumeration

eHeaderMethodType and THeaderMethodTypeArray (see page 15638) indicate the types of messages that should include a given header type.

Pascal

```
eHeaderMethodType = (
  hmtAll,
  hmtRequest,
  hmtResponse
);
```

C++

```
enum eHeaderMethodType {
  hmtAll,
  hmtRequest,
  hmtResponse
};
```

File

InvokeRegistry

Description

THeaderMethodTypeArray (see page 15638) is a dynamic array of eHeaderMethodType values. The following table describes the possible eHeaderMethodType values:

Value	Meaning
hmtAll	The header should be included in all messages pertaining to the invokable interface.
hmtRequest	The header should be included in request messages in which the client attempts to invoke the invokable interface.
hmtResponse	The header should be included in response message that the server returns after executing a method on the invokable interface.

84.4.2 InvokeRegistry.ExtNameMapItem Record

Pascal

```
ExtNameMapItem = record
  Name: string;
  ExtName: WideString;
end;
```

C++

```
struct ExtNameMapItem {
  AnsiString Name;
  BSTR ExtName;
};
```

File

InvokeRegistry

Description

This is record InvokeRegistry.ExtNameMapItem.

84.4.3 InvokeRegistry.IntfExceptionItem Record

IntfExceptionItem and TExceptionItemArray (see page 15638) describe the association between a remotable exception and an interface that can raise it.

Pascal

```
IntfExceptionItem = record
  ClassType: TClass;
  MethodNames: string;
end;
```

C++

```
struct IntfExceptionItem {
  TClass ClassType;
  AnsiString MethodNames;
```

```
};
```

File

InvokeRegistry

Description

IntfExceptionItem describes a single remotable exception type. TExceptionItemArray (see page 15638) is an array of IntfExceptionItem descriptors. Typically, this array describes the set of exceptions associated with an invokable interface.

ClassType is the class reference for the remotable exception class.

MethodNames is a comma-delimited list of method names. If MethodNames is an empty string, the exception is associated with all the methods on an interface. If MethodNames is nonempty, the exception is associated only with those methods of the interface that the MethodNames field lists.

84.4.4 InvokeRegistry.IntfHeaderItem Record

IntfHeaderItem and THeaderItemArray (see page 15638) describe the association between a header and the SOAP messages that include it.

Pascal

```
IntfHeaderItem = record
  Info: PTypeInfo;
  ClassType: TClass;
  Namespace: WideString;
  Name: WideString;
  DefaultMethodType: eHeaderMethodType;
  DefaultRequired: Boolean;
  MethodNames: string;
  MethodTypes: THeaderMethodTypeArray;
  HeaderRequired: TRequiredArray;
end;
```

C++

```
struct IntfHeaderItem {
  PTypeInfo Info;
  TClass ClassType;
  BSTR Namespace;
  BSTR Name;
  eHeaderMethodType DefaultMethodType;
  Boolean DefaultRequired;
  AnsiString MethodNames;
  THeaderMethodTypeArray MethodTypes;
  TRequiredArray HeaderRequired;
};
```

File

InvokeRegistry

Description

IntfHeaderItem describes a single header type. THeaderItemArray (see page 15638) is an array of IntfHeaderItem descriptors. Typically, this array describes the set of headers associated with an invokable interface.

Info is a pointer to the type description for the interface that the header is associated with.

ClassType is the class reference for the header class (a TSOAPHeader (see page 15596) descendant).

NameSpace is the namespace in which the header's name is defined.

Name is the name of the header node.

DefaultMethodType indicates whether the header is included in request messages, response messages, or both. This value is only used if the MethodNames field is an empty string. If MethodNames is nonempty, use the MethodTypes field instead.

DefaultRequired indicates whether the header must appear in messages about the interface that Info describes. If DefaultRequired is false, the header is optional. This value is only used if the MethodNames field is an empty string. If MethodNames is nonempty, use the HeaderRequired field instead.

MethodNames is a comma-delimited list of method names. If empty, the header is associated with all methods on the interface. If MethodNames includes one or more names, the header is only associated with those methods of the interface that are contained in the list.

MethodTypes is a dynamic array of values that indicate whether the header is included in request messages, response messages, or both. Each value is associated with a method listed in the MethodNames field in the same position. If MethodNames is an empty string, MethodTypes is not used.

HeaderRequired is a dynamic array of values that indicate whether the header is required or optional. Each value is associated with a method listed in the MethodNames field in the same position. If MethodNames is an empty string, HeaderRequired is not used.

84.4.5 InvokeRegistry.InvRegClassEntry Record

Pascal

```
InvRegClassEntry = record
  ClassType: TClass;
  Proc: TCreateInstanceProc;
  URI: string;
end;
```

C++

```
struct InvRegClassEntry {
  TClass ClassType;
  TCreateInstanceProc Proc;
  AnsiString URI;
};
```

File

InvokeRegistry

Description

This is record InvokeRegistry.InvRegClassEntry.

84.4.6 InvokeRegistry.InvRegIntfEntry Record

InvRegIntfEntry stores information about an invokable interface.

Pascal

```
InvRegIntfEntry = record
  Name: string;
  ExtName: Widestring;
  UnitName: string;
  GUID: TGUID;
```

```
    Info: PTypeInfo;
    DefImpl: TClass;
    Namespace: Widestring;
    WSDLEncoding: WideString;
    Documentation: string;
    SOAPAction: string;
    ReturnParamNames: string;
    InvokeOptions: TIntfInvokeOptions;
    MethNameMap: array of ExtNameMapItem;
    MethParamNameMap: array of MethParamNameMapItem;
    IntfHeaders: array of IntfHeaderItem;
    IntfExceptions: array of IntfExceptionItem;
    UDDIOperator: String;
    UDDIBindingKey: String;
  end;
```

C++

```
  struct InvRegIntfEntry {
    AnsiString Name;
    BSTR ExtName;
    AnsiString UnitName;
    TGUID GUID;
    PTypeInfo Info;
    TClass DefImpl;
    BSTR Namespace;
    BSTR WSDLEncoding;
    AnsiString Documentation;
    AnsiString SOAPAction;
    AnsiString ReturnParamNames;
    TIntfInvokeOptions InvokeOptions;
    array of ExtNameMapItem MethNameMap;
    array of MethParamNameMapItem MethParamNameMap;
    array of IntfHeaderItem IntfHeaders;
    array of IntfExceptionItem IntfExceptions;
    AnsiString UDDIOperator;
    AnsiString UDDIBindingKey;
  };
```

File

InvokeRegistry

Description

InvRegIntfEntry is used by the invocation registry to store information about a registered invokable interface.

Name is the name of the registered invokable interface.

ExtName is the name of the corresponding port type that appears in the WSDL document describing this Web Service. ExtName can be an empty string if the interface and port type have the same name.

UnitName is the name of the unit in which the interface is defined.

GUID is the globally unique identifier for the interface.

Info points to the runtime type information (RTTI) compiled with the interface.

DefImpl is the default implementation class for the interface.

Namespace is the namespace that is uniquely associated with the interface.

WSDLEncoding is the encoding attribute, if any, of the xml header on a WSDL document that defines the port type to which the invokable interface corresponds.

Documentation is a brief description that documents the interface.

DefaultSOAPAction is the SOAP Action header (or set of SOAP Action headers) to use on messages directed to this interface. If

this is an empty string, the application generates a SOAP Action header that is based on the Namespace field. Assign SOAP Action headers using the RegisterDefaultSOAPAction or RegisterAllSOAPActions method. Note that if you have more than one interface with the same namespace URI, you must register them with different SOAP Action headers so that the server can distinguish them.

ReturnParamNames is a semicolon-delimited list of parameter names that map to the return value of a function.

InvokeOptions are the options for the interface that have been registered using the RegisterInvokeOptions method. These options customize the way the interface is called.

MethNameMap is an array of entries that describe the relationship between methods on the invokable interface and the operation names to which they correspond (if different).

MethParamNameMap is an array of entries that describe the relationship between parameters on a method of the invokable interface and the part names to which they correspond (if different).

IntfHeaders is an array of entries that describe the SOAP headers that should accompany requests directed at the invokable interface.

IntfExceptions is an array of entries that describe the exceptions that the interface can raise.

UDDIOperator is the URL of the UDDI registry, if any, that was used to import the interface definition.

UDDIBindingKey is the unique identifier for the TModel from UDDIOperator that describes the Web Service to which the interface belongs.

84.4.7 InvokeRegistry.MethParamNameMapItem Record

Pascal

```
MethParamNameMapItem = record
  MethName: string;
  ParamNameMap: array of ExtNameMapItem;
end;
```

C++

```
struct MethParamNameMapItem {
  AnsiString MethName;
  array of ExtNameMapItem ParamNameMap;
};
```

File

InvokeRegistry

Description

This is record InvokeRegistry.MethParamNameMapItem.

84.4.8 InvokeRegistry.ObjectConvertOptions Enumeration

ObjectConvertOptions and TObjectConvertOptions (see page 15640) are flags that customize how to convert a remotable object to or from its SOAP representation.

Pascal

```
ObjectConvertOptions = (
```

```
    ocoDontPrefixNode,
    ocoDontSerializeProps,
    ocoDontPutTypeAttr
  );
```

C++

```
  enum ObjectConvertOptions {
    ocoDontPrefixNode,
    ocoDontSerializeProps,
    ocoDontPutTypeAttr
  };
```

File

InvokeRegistry

Description

TObjectConvertOptions (see page 15640) is a set of ObjectConvertOptions values. ObjectConvertOptions values are flags that can be supplied when customizing the conversion between an object and its SOAP representation.

Value	Meaning
ocoDontPrefixNode	When set, the SOAP representation does not include a namespace prefix on node names.
ocoDontSerializeProps	When set, the SOAP representation does not include any representation for the published properties of the remotable object.
ocoDontPutTypeAttr	When set, nodes do not include an xsi:type attribute that indicates their type.

84.4.9 InvokeRegistry.SerializationOptions Enumeration

SerializationOptions and TSerializationOptions (see page 15642) are flags that customize how to convert a remotable object to or from its SOAP representation.

Pascal

```
  SerializationOptions = (
    xoHolderClass,
    xoAttributeOnLastMember,
    xoInlineArrays,
    xoLiteralParam,
    xoSimpleTypeWrapper,
    xoOption6,
    xoOption7,
    xoOption8,
    xoOption9,
    xoOptionA,
    xoOptionB,
    xoOptionC,
    xoOptionD,
    xoOptionE,
    xoOptionF,
    xoOptionG,
    xoOptionH,
    xoOptionI
  );
```

C++

```
  enum SerializationOptions {
    xoHolderClass,
    xoAttributeOnLastMember,
```

```
    xoInlineArrays,
    xoLiteralParam,
    xoSimpleTypeWrapper,
    xoOption6,
    xoOption7,
    xoOption8,
    xoOption9,
    xoOptionA,
    xoOptionB,
    xoOptionC,
    xoOptionD,
    xoOptionE,
    xoOptionF,
    xoOptionG,
    xoOptionH,
    xoOptionI
  };
```

File

InvokeRegistry

Description

TSerializationOptions (see page 15642) is a set of SerializationOptions values. SerializationOptions values are flags that can be registered with an invokable interface to indicate how it should be called. The following table lists the possible values.

Value	Meaning
xoHolderClass	The remotable object corresponds to a "holder" class. That is, the SOAP representation does not include a node for the class itself, just for its members. This is used when a type that would otherwise not require a remotable class uses a feature only available on remotable classes (such as attributes).
xoAttributeOnLastMember	Attributes of the remotable class are stored on the last member of the class that maps to an element node rather than on the node that corresponds to the class itself. This is necessary if a holder class has attributes.
xoInlineArrays	If the remotable class contains class members that are array types, the encoding of those members omits the type name of the array types. This results in more efficient encoding of holder classes that represent array types.
xoLiteralParam	The remotable class represents one of the two top-level nodes (the input or output value) of a document-literal encoding. The class is treated as a holder class if it is used as the direct input or output parameter of a function.
xoSimpleTypeWrapper	The remotable class is a wrapper for a simple type such as a string or integer. The value that the class represents is represented as a single published property of the remotable class.
xoOption5 - xoOptionI	The remaining options are reserved for future use.

84.4.10 InvokeRegistry.TDynToClear Record

Pascal

```
  TDynToClear = record
    P: Pointer;
    Info: PTypeInfo;
  end;
```

C++

```
  struct TDynToClear {
    void * P;
```

```
  PTypeInfo Info;
};
```

File

InvokeRegistry

Description

This is record InvokeRegistry.TDynToClear.

84.4.11 InvokeRegistry.TIntfInvokeOption Enumeration

TIntfInvokeOption and TIntfInvokeOptions (see page 15639) represent flags that customize how to handle calls to an invokable interface.

Pascal

```
TIntfInvokeOption = (
  ioDefault,
  ioDocument,
  ioLiteral,
  ioHasDefaultSOAPAction,
  ioHasReturnParamNames,
  ioHasNamespace,
  ioIsAppServerSOAP,
  ioHasUDDIInfo,
  ioHasAllSOAPActions
);
```

C++

```
enum TIntfInvokeOption {
  ioDefault,
  ioDocument,
  ioLiteral,
  ioHasDefaultSOAPAction,
  ioHasReturnParamNames,
  ioHasNamespace,
  ioIsAppServerSOAP,
  ioHasUDDIInfo,
  ioHasAllSOAPActions
};
```

File

InvokeRegistry

Description

TIntfInvokeOptions (see page 15639) is a set of TIntfInvokeOption values. TIntfInvokeOption values are flags that can be registered with an invokable interface to indicate how it should be called. The following table lists the possible values.

Value	Meaning
ioDefault	Calls to the interface use the default options unless overridden by other options. (RPC-based SOAP encoding and HTTP as a transport protocol).
ioDocument	The Web Services server uses document-style encoding.
ioLiteral	The Web Services server uses document-literal style and the types for input and output values have not been unwound to create a method call.
ioHasDefaultSOAPAction	A default SOAP action header has been registered for use with the interface.

ioHasReturnParamNames	A set of parameter names have been registered for use with the interface that are reserved for the return value of function calls. If this option is not set, the strings 'Return' and 'Result' are used.
ioHasNamespace	A namespace was explicitly provided when the interface was registered, rather than using an automatically-generated namespace.
ioIsAppServerSOAP	The interface descends from IAppServerSOAP. Such interfaces are used in multi-tier database applications to interact with the application server.
ioHasUDDIInfo	UDDI information has been registered for the interface. This option is set when the Web Service description is imported using the UDDI browser.
ioHasAllSOAPActions	The SOAPAction headers could not be collapsed into a single string. When representing the SOAP action headers, a single string is created where the first character represents a delimiter that marks the boundary between the various SOAP action headers.

84.4.12 InvokeRegistry.TObjMultiOptions Enumeration

TObjMultiOptions indicates how multiple references to the same remotable class should be translated into a SOAP representation.

Pascal

```
TObjMultiOptions = (
  ocDefault,
  ocMultiRef,
  ocNoMultiRef
);
```

C++

```
enum TObjMultiOptions {
  ocDefault,
  ocMultiRef,
  ocNoMultiRef
};
```

File

InvokeRegistry

Description

TObjMultiOptions indicates a class-specific override to the default strategy for converting multiple references to the same object instance into the corresponding SOAP representation. It indicates whether a remotable object should be treated by value (like a structure) or by reference (where object identity is meaningful).

Value	Meaning
ocDefault	Use the default strategy for handling multiple references.
ocMultiRef	Always indicate in the SOAP packet when multiple references refer to the same instance of the specified class.
ocNoMultiRef	Never indicate in the SOAP packet when multiple references refer to the same instance of the specified class. That is, always treat it "by value".

84.4.13 InvokeRegistry.TRemHeaderEntry Record

Pascal

```
TRemHeaderEntry = record
  Name: WideString;
  ExtName: WideString;
  URI: WideString;
end;
```

C++

```
struct TRemHeaderEntry {
  BSTR Name;
  BSTR ExtName;
  BSTR URI;
};
```

File

InvokeRegistry

Description

This is record InvokeRegistry.TRemHeaderEntry.

84.4.14 InvokeRegistry.TRemRegEntry Record

TRemRegEntry stores information for the remotable type registry.

Pascal

```
TRemRegEntry = record
  ClassType: TClass;
  Info: PTypeInfo;
  URI: WideString;
  Name: WideString;
  ExtName: WideString;
  IsScalar: Boolean;
  MultiRefOpt: TObjMultiOptions;
  SerializationOpt: TSerializationOptions;
  PropNameMap: array of ExtNameMapItem;
end;
```

C++

```
struct TRemRegEntry {
  TClass ClassType;
  PTypeInfo Info;
  BSTR URI;
  BSTR Name;
  BSTR ExtName;
  Boolean IsScalar;
  TObjMultiOptions MultiRefOpt;
  TSerializationOptions SerializationOpt;
  array of ExtNameMapItem PropNameMap;
};
```

File

InvokeRegistry

Description

TRemRegEntry is the type that the remotable type registry uses to store information about a registered type. The TRemRegEntry type is used to represent both remotable classes and remotable types. It contains the following members:

ClassType is the class reference for the class. It is not used for entries that represent types that are not classes.

Info is the type info pointer for a registered class or type.

URI is the namespace URI that the registry associates with the class or type.

Name is the type name of the class or type, as it appears in encoded method calls or WSDL documents.

ExtName is the same as Name.

IsScalar indicates whether the entry describes a class or type that is marshaled as a scalar type.

MultiRefOpt indicates how to marshal multiple instances of a registered class. It is not used for entries that represent types.

SerializationOpt indicates how to convert between a registered class and its encoded representation.

PropNameMap is an array of entries that describe the relationship between properties on the invokable interface and the external names to which they correspond (if different).

84.5 Types

The following table lists types in this documentation.

Types

Name	Description
ERemotableExceptionClass (see page 15636)	This is type InvokeRegistry.ERemotableExceptionClass.
InvString (see page 15637)	This is type InvokeRegistry.InvString.
PTRemotable (see page 15637)	This is type InvokeRegistry.PTRemotable.
TCreateInstanceProc (see page 15637)	TCreateInstanceProc is the type of the factory routine that returns an instance of an invokable class.
TExceptionItemArray (see page 15638)	This is type InvokeRegistry.TExceptionItemArray.
THeaderItemArray (see page 15638)	This is type InvokeRegistry.THeaderItemArray.
THeaderMethodTypeArray (see page 15638)	This is type InvokeRegistry.THeaderMethodTypeArray.
TIntfInvokeOptions (see page 15639)	This is type InvokeRegistry.TIntfInvokeOptions.
TInvokableClassClass (see page 15639)	This is type InvokeRegistry.TInvokableClassClass.
TInvRegIntfEntryArray (see page 15639)	This is type InvokeRegistry.TInvRegIntfEntryArray.
TObjectConvertOptions (see page 15640)	This is type InvokeRegistry.TObjectConvertOptions.
TPascalRemotableClassRegistry (see page 15640)	TPascalRemotableClassRegistry is the type of the remotable class registry.
TPascalRemotableTypeRegistry (see page 15640)	TPascalRemotableTypeRegistry is the type of the remotable type registry.
TRemotableClass (see page 15641)	This is type InvokeRegistry.TRemotableClass.
TRemotableClassRegistry (see page 15641)	This is type InvokeRegistry.TRemotableClassRegistry.
TRemotableXSClass (see page 15641)	This is type InvokeRegistry.TRemotableXSClass.
TRemRegEntryArray (see page 15642)	This is type InvokeRegistry.TRemRegEntryArray.
TRequiredArray (see page 15642)	TRequiredArray is a dynamic array of boolean values.
TSerializationOptions (see page 15642)	This is type InvokeRegistry.TSerializationOptions.
TSOAPAttachmentClass (see page 15643)	This is type InvokeRegistry.TSOAPAttachmentClass.
TSOAPHeaderClass (see page 15643)	This is type InvokeRegistry.TSOAPHeaderClass.

84.5.1 InvokeRegistry.ERemotableExceptionClass Type

Pascal

```
ERemotableExceptionClass = class of ERemotableException;
```

C++

```
ERemotableException ERemotableExceptionClass;
```

File

InvokeRegistry

Description

This is type InvokeRegistry.ERemotableExceptionClass.

84.5.2 InvokeRegistry.InvString Type

Pascal

```
InvString = WideString;
```

C++

```
BSTR InvString;
```

File

InvokeRegistry

Description

This is type InvokeRegistry.InvString.

84.5.3 InvokeRegistry.PTRemotable Type

Pascal

```
PTRemotable = ^TRemotable;
```

C++

```
^TRemotable PTRemotable;
```

File

InvokeRegistry

Description

This is type InvokeRegistry.PTRemotable.

84.5.4 InvokeRegistry.TCreateInstanceProc Type

TCreateInstanceProc is the type of the factory routine that returns an instance of an invokable class.

Pascal

```
TCreateInstanceProc = procedure (out obj: TObject);
```

C++

```
(out obj: TObject) ( TCreateInstanceProc)();
```

File

InvokeRegistry

Description

TCreateInstanceProc is the type for procedures that return an instance of an invokable class on behalf of the invocation registry. When the class that implements an invokable interface is not a descendant of TInvokableClass (see page 15520), or when you want to control the instantiation of the implementation class (for example to use a single shared instance for all incoming requests), supply a procedure of this type when registering the implementation class.

obj returns an instance of the invokable class, which can handle the current incoming request.

84.5.5 InvokeRegistry.TExceptionItemArray Type

Pascal

```
TExceptionItemArray = array of IntfExceptionItem;
```

C++

```
array of IntfExceptionItem TExceptionItemArray;
```

File

InvokeRegistry

Description

This is type InvokeRegistry.TExceptionItemArray.

84.5.6 InvokeRegistry.THeaderItemArray Type

Pascal

```
THeaderItemArray = array of IntfHeaderItem;
```

C++

```
array of IntfHeaderItem THeaderItemArray;
```

File

InvokeRegistry

Description

This is type InvokeRegistry.THeaderItemArray.

84.5.7 InvokeRegistry.THeaderMethodTypeArray Type

Pascal

```
THeaderMethodTypeArray = array of eHeaderMethodType;
```

C++

```
array of eHeaderMethodType THeaderMethodTypeArray;
```

File

InvokeRegistry

Description

This is type InvokeRegistry.THeaderMethodTypeArray.

84.5.8 InvokeRegistry.TIntfInvokeOptions Type

Pascal

```
TIntfInvokeOptions = set of TIntfInvokeOption;
```

C++

```
TIntfInvokeOption TIntfInvokeOptions;
```

File

InvokeRegistry

Description

This is type InvokeRegistry.TIntfInvokeOptions.

84.5.9 InvokeRegistry.TInvokableClassClass Type

Pascal

```
TInvokableClassClass = class of TInvokableClass;
```

C++

```
TInvokableClass TInvokableClassClass;
```

File

InvokeRegistry

Description

This is type InvokeRegistry.TInvokableClassClass.

84.5.10 InvokeRegistry.TInvRegIntfEntryArray Type

Pascal

```
TInvRegIntfEntryArray = array of InvRegIntfEntry;
```

C++

```
array of InvRegIntfEntry TInvRegIntfEntryArray;
```

File

InvokeRegistry

Description

This is type InvokeRegistry.TInvRegIntfEntryArray.

84.5.11 InvokeRegistry.TObjectConvertOptions Type

Pascal

```
TObjectConvertOptions = set of ObjectConvertOptions;
```

C++

```
ObjectConvertOptions TObjectConvertOptions;
```

File

InvokeRegistry

Description

This is type InvokeRegistry.TObjectConvertOptions.

84.5.12 InvokeRegistry.TPascalRemotableClassRegistry Type

TPascalRemotableClassRegistry is the type of the remotable class registry.

Pascal

```
TPascalRemotableClassRegistry = TRemotableTypeRegistry;
```

C++

```
TRemotableTypeRegistry TPascalRemotableClassRegistry;
```

File

InvokeRegistry

Description

TPascalRemotableClassRegistry is a synonym for TRemotableTypeRegistry (see page 15562). It is defined for compatibility with Delphi 6.

See Also

RemClassRegistry (see page 15620)

TRemotable (see page 15556)

84.5.13 InvokeRegistry.TPascalRemotableTypeRegistry Type

TPascalRemotableTypeRegistry is the type of the remotable type registry.

Pascal

```
TPascalRemotableTypeRegistry = TRemotableTypeRegistry;
```

C++

```
TRemotableTypeRegistry TPascalRemotableTypeRegistry;
```

File

InvokeRegistry

Description

TPascalRemotableTypeRegistry is a synonym for TRemotableTypeRegistry (see page 15562). It is defined for compatibility with Delphi 6.

See Also

RemTypeRegistry (see page 15621)

TRemotable (see page 15556)

84.5.14 InvokeRegistry.TRemotableClass Type

Pascal

```
TRemotableClass = class of TRemotable;
```

C++

```
TRemotable TRemotableClass;
```

File

InvokeRegistry

Description

This is type InvokeRegistry.TRemotableClass.

84.5.15 InvokeRegistry.TRemotableClassRegistry Type

Pascal

```
TRemotableClassRegistry = TRemotableTypeRegistry;
```

C++

```
TRemotableTypeRegistry TRemotableClassRegistry;
```

File

InvokeRegistry

Description

This is type InvokeRegistry.TRemotableClassRegistry.

84.5.16 InvokeRegistry.TRemotableXSClass Type

Pascal

```
TRemotableXSClass = class of TRemotableXS;
```

C++

```
TRemotableXS TRemotableXSClass;
```

File

InvokeRegistry

Description

This is type InvokeRegistry.TRemotableXSClass.

84.5.17 InvokeRegistry.TRemRegEntryArray Type

Pascal

```
TRemRegEntryArray = array of TRemRegEntry;
```

C++

```
array of TRemRegEntry TRemRegEntryArray;
```

File

InvokeRegistry

Description

This is type InvokeRegistry.TRemRegEntryArray.

84.5.18 InvokeRegistry.TRequiredArray Type

TRequiredArray is a dynamic array of boolean values.

Pascal

```
TRequiredArray = array of Boolean;
```

C++

```
array of Boolean TRequiredArray;
```

File

InvokeRegistry

Description

TRequiredArray is a dynamic array of boolean values. Each value indicates whether a corresponding item is required (true) or optional (false).

84.5.19 InvokeRegistry.TSerializationOptions Type

Pascal

```
TSerializationOptions = set of SerializationOptions;
```

C++

```
SerializationOptions TSerializationOptions;
```

File

InvokeRegistry

Description

This is type InvokeRegistry.TSerializationOptions.

84.5.20 InvokeRegistry.TSOAPAttachmentClass Type

Pascal

```
TSOAPAttachmentClass = class of TSOAPAttachment;
```

C++

```
TSOAPAttachment TSOAPAttachmentClass;
```

File

InvokeRegistry

Description

This is type InvokeRegistry.TSOAPAttachmentClass.

84.5.21 InvokeRegistry.TSOAPHeaderClass Type

Pascal

```
TSOAPHeaderClass = class of TSOAPHeader;
```

C++

```
TSOAPHeader TSOAPHeaderClass;
```

File

InvokeRegistry

Description

This is type InvokeRegistry.TSOAPHeaderClass.

84.6 Variables

The following table lists variables in this documentation.

Variables

Name	Description
AppNameSpacePrefix (see page 15644)	Supplies a unique prefix to use for automatically generated namespaces given to invokable interfaces and remotable types.

84.6.1 InvokeRegistry.AppNameSpacePrefix Variable

Supplies a unique prefix to use for automatically generated namespaces given to invokable interfaces and remotable types.

Pascal

```
AppNameSpacePrefix: string;
```

C++

```
AnsiString AppNameSpacePrefix;
```

File

InvokeRegistry

Description

Set AppNameSpacePrefix to a unique string that the invocation registry and remotable type registry use when generating namespaces. These generated namespaces must be unique strings that identify invokable interfaces and remotable classes in a Web Service application. They are generated by the RegisterInterface method of the invocation registry and the RegisterXSClass and RegisterXSInfo methods of the remotable class registry if the application does not explicitly supply a namespace.

The invocation registry and remotable type registry generate namespaces using the value of AppNameSpacePrefix, the name of the unit in which the interface or class is defined, and the name of the class, type, or interface. If your unit and interface or class names are at all generic, it is a good idea to supply a unique value to AppNameSpacePrefix to guard against the possibility of another interface, type, or class with the same name that is registered in another unit with the same name.

Both client and server applications must register invokable interfaces and remotable types and classes using the same namespace. If you rely on automatically-generated namespaces, be sure to use the same value of AppNameSpacePrefix in both the client and the server applications.

See Also

InvRegistry (see page 15620)

TInvokableClassRegistry (see page 15526)

TRemotableTypeRegistry (see page 15562)

RemTypeRegistry (see page 15621)

84.7 Constants

The following table lists constants in this documentation.

Constants

Name	Description
AS_ATTRIBUTE (see page 15645)	Identifies a property of a remotable class as one that corresponds to an attribute in the SOAP encoding.
XMLBase64Types (see page 15645)	This is constant InvokeRegistry.XMLBase64Types.
XMLSchemaInstNamepspaces (see page 15646)	This is constant InvokeRegistry.XMLSchemaInstNamepspaces.
XMLSchemaNamepspaces (see page 15646)	This is constant InvokeRegistry.XMLSchemaNamepspaces.

84.7.1 InvokeRegistry.AS_ATTRIBUTE Constant

Identifies a property of a remotable class as one that corresponds to an attribute in the SOAP encoding.

Pascal

```
AS_ATTRIBUTE = False;
```

C++

```
AS_ATTRIBUTE = False;
```

File

InvokeRegistry

Description

Assign AS_ATTRIBUTE as the value of the stored directive on a property declaration in a TRemotable (see page 15556) descendant to indicate that the property is encoded as an attribute node rather than as an element node. If a property declaration does not include a stored directive with a value of AS_ATTRIBUTE, it is encoded as an element node instead.

Note: Note:AS_ATTRIBUTE must be used directly. If you set the stored directive to a function that returns AS_ATTRIBUTE (false), the property is still encoded as an element node.

See Also

TRemotable (see page 15556)

TRemotableXS (see page 15580)

84.7.2 InvokeRegistry.XMLBase64Types Constant

Pascal

```
XMLBase64Types: array[0..1] of InvString = ('base64Binary', 'bin.base64');
```

C++

```
array[0..1] of InvString XMLBase64Types = ('base64Binary', 'bin.base64');
```

File

InvokeRegistry

Description

This is constant InvokeRegistry.XMLBase64Types.

84.7.3 InvokeRegistry.XMLSchemaInstNamepspaces Constant

Pascal

```
XMLSchemaInstNamepspaces: array[0..2] of InvString = (SXMLSchemaInstURI_1999,
SXMLSchemaInstURI_2000_10, SXMLSchemaInstURI);
```

C++

```
array[0..2] of InvString XMLSchemaInstNamepspaces = (SXMLSchemaInstURI_1999,
SXMLSchemaInstURI_2000_10, SXMLSchemaInstURI);
```

File

InvokeRegistry

Description

This is constant InvokeRegistry.XMLSchemaInstNamepspaces.

84.7.4 InvokeRegistry.XMLSchemaNamepspaces Constant

Pascal

```
XMLSchemaNamepspaces: array[0..2] of InvString = (SXMLSchemaURI_1999, SXMLSchemaURI_2000_10,
SXMLSchemaURI_2001);
```

C++

```
array[0..2] of InvString XMLSchemaNamepspaces = (SXMLSchemaURI_1999, SXMLSchemaURI_2000_10,
SXMLSchemaURI_2001);
```

File

InvokeRegistry

Description

This is constant InvokeRegistry.XMLSchemaNamepspaces.

85 ISAPIApp Namespace

This is namespace ISAPIApp.

Topics

Name	Description
Classes (see page 15648)	The following table lists classes in this documentation.
Functions (see page 15657)	The following table lists functions in this documentation.
Variables (see page 15659)	The following table lists variables in this documentation.

Classes

	Name	Description
	TISAPIApplication (see page 15648)	TISAPIApplication encapsulates an ISAPI or NSAPI server application.
	TISAPIFactory (see page 15654)	

Functions

	Name	Description
	GetExtensionVersion (see page 15657)	Returns the name and version number of an ISAPI or NSAPI application.
	HttpExtensionProc (see page 15657)	Receives an HTTP request message for an ISAPI or NSAPI application.
	TerminateExtension (see page 15658)	Indicates whether an ISAPI or NSAPI application is ready to be shut down.

Variables

Name	Description
DispatchThread (see page 15659)	This is variable ISAPIApp.DispatchThread.

85.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TISAPIApplication (see page 15648)	TISAPIApplication encapsulates an ISAPI or NSAPI server application.
	TISAPIFactory (see page 15654)	

85.1.1 TISAPIApplication Class

TISAPIApplication encapsulates an ISAPI or NSAPI server application.

Class Hierarchy

Pascal

```
TISAPIApplication = class(TWebApplication);
```

C++

```
class TISAPIApplication : public TWebApplication;
```

File

ISAPIApp

Description

TISAPIApplication provides the fundamental behavior of an ISAPI or NSAPI server application. The HTTP server calls the methods of TISAPIApplication when it receives an HTTP request message. TISAPIApplication creates a thread to manage the request message, and a creates a new instance of the Web module for that thread, or reuses an old instance that was deactivated after a previous response was sent.

TISAPIApplication creates TISAPIRequest and TISAPIResponse objects to represent the request message and any response that should be sent in return, passes these to the dispatcher so that the response can be filled in, and sends the response if it was not already sent by a TWebActionItem.

Each ISAPI server project automatically declares an Application variable of type TISAPIApplication as the instance of the application. This declaration overrides the Application variable declared in the Forms (see page 13657) unit if the ISAPIApp (see page 15647) unit is declared last in the uses list of the project file. Every ISAPI server application must include the ISAPIApp (see page 15647) unit.

To work with an Apache server, use the TApacheApplication object. To work with a CGI server, use the TCGIApplication object instead.

See Also

TCGIApplication (see page 2554)

TISAPIRequest (see page 15662)

TISAPIResponse (see page 15670)

TWebActionItem (see page 15130)

TWebDispatcher (see page 15147)

85.1.1.1 TISAPIApplication Members

The following tables list the members exposed by TISAPIApplication.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	ActivateWebModules (see page 25453)	Activates a Web module for the application and returns it.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	DeactivateWebModules (see page 25453)	Deactivates the Web module of the application.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	HandleRequest (see page 25454)	Responds to an HTTP request message received by the server.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.

	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AddWebModuleFactory (see page 25453)	Adds a Web module factory to the request handler.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 15652)	Creates an instance of TWebApplication.
V	CreateForm (see page 24623)	Registers the single Web module with the Web application.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 15652)	Destroys an instance of TWebApplication.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetExtensionVersion (see page 15652)	Returns the application name and version number.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.

	HandleException (see page 25454)	Responds to exceptions related to TWebRequestHandler (see page 25448) objects.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	HttpExtensionProc (see page 15653)	Responds to an HTTP request message.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
V	Initialize (see page 24623)	Introduces an interface for a method that initializes the application.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	Run (see page 24623)	Executes the Web application.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	TerminateExtension (see page 15653)	Returns true.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	ActiveCount (see page 25455)	Indicates the number of active connections currently being serviced by the application.
	CacheConnections (see page 25455)	Determines whether the Web modules used by the application are cached for re-use.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	InactiveCount (see page 25456)	Indicates the number of Web modules cached for later reuse.
	MaxConnections (see page 25457)	Sets or returns the MaxConnections used by the socket.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Title (see page 24624)	Specifies a title for the Web application.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	WebModuleClass (see page 25457)	Contains a reference to a Web module.
R	WebModuleFactory (see page 25457)	A list of Web module factory objects.
R	WebModuleFactoryCount (see page 25458)	The number of Web module factories in use by the request handler.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

85.1.1.2 TISAPIApplication.Create Constructor

Creates an instance of TWebApplication.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TISAPIApplication(TComponent * AOwner);
```

Description

Do not call Create. The single Web application object named Application is instantiated automatically when the CGIApp unit, the ISAPIApp unit, or the ApacheApp unit is included in the uses list of the project.

Create allocates the helper objects used by TWebApplication.

See Also

Create (see page 2766)

85.1.1.3 TISAPIApplication.Destroy Destructor

Destroys an instance of TWebApplication.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TISAPIApplication();
```

Description

Never call the Destroy or Free method. The application is freed automatically when the application stops running.

Destroy frees the helper objects that were created at startup, as well as all Web modules created by the application.

See Also

Free (see page 22300)

Run (see page 24623)

85.1.1.4 TISAPIApplication Methods

The methods of the TISAPIApplication class are listed here.

Public Methods

	Name	Description
	GetExtensionVersion (see page 15652)	Returns the application name and version number.
	HttpExtensionProc (see page 15653)	Responds to an HTTP request message.
	TerminateExtension (see page 15653)	Returns true.

85.1.1.4.1 TISAPIApplication.GetExtensionVersion Method

Returns the application name and version number.

Pascal

```
function GetExtensionVersion(var Ver: THSE_VERSION_INFO): BOOL;
```

C++

```
__fastcall BOOL GetExtensionVersion(THSE_VERSION_INFO Ver);
```

Description

The HTTP server calls GetExtensionVersion to obtain the application name and version number. GetExtensionVersion returns the version number for the HTTP functions in the runtime library, and the Title property of the ISAPI application object.

See Also

Title (see page 24624)

85.1.1.4.2 TISAPIApplication.HttpExtensionProc Method

Responds to an HTTP request message.

Pascal

```
function HttpExtensionProc(var ECB: TEXTENSION_CONTROL_BLOCK): DWORD;
```

C++

```
__fastcall DWORD HttpExtensionProc(TEXTENSION_CONTROL_BLOCK ECB);
```

Description

The HTTP server calls HttpExtensionProc when it receives an HTTP request message. HttpExtensionProc creates the TISAPIRequest and TISAPIResponse objects for the HTTP request message, and calls the HandleRequest message so that the response can be filled out and sent. Finally, HttpExtensionProc frees the request and response objects.

If the response is filled out and sent, HttpExtensionProc returns HSE_STATUS_SUCCESS. Otherwise it returns HSE_STATUS_ERROR.

See Also

TISAPIRequest (see page 15662)

TISAPIResponse (see page 15670)

HandleRequest (see page 25454)

TWebDispatcher (see page 15147)

85.1.1.4.3 TISAPIApplication.TerminateExtension Method

Returns true.

Pascal

```
function TerminateExtension(dwFlags: DWORD): BOOL;
```

C++

```
__fastcall BOOL TerminateExtension(DWORD dwFlags);
```

Description

The HTTP server calls TerminateExtension when it wants to shut down the ISAPI application. TerminateExtension always returns true, allowing the server to shut down.

85.1.2 TISAPIFactory Class

Class Hierarchy

System::TObject → ISAPIApp.TISAPIFactory

Pascal

```
TISAPIFactory = class(TObject);
```

C++

```
class TISAPIFactory : public TObject;
```

File

ISAPIApp

See Also

TCGIApplication (see page 2554)

85.1.2.1 TISAPIFactory Members

The following tables list the members exposed by TISAPIFactory.

Protected Methods

	Name	Description
	NewRequest (see page 15655)	This is NewRequest, a member of class TISAPIFactory.
	NewResponse (see page 15655)	This is NewResponse, a member of class TISAPIFactory.

Public Methods

	Name	Description
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 15655)	Creates an instance of Create. {Placeholder—Update for BCB}
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 22287)	Disposes of an object instance.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.

	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

85.1.2.2 TISAPIFactory.Create Constructor

Creates an instance of Create. {Placeholder—Update for BCB}

Pascal

```
constructor Create;
```

C++

```
__fastcall TISAPIFactory();
```

Description

Do not create instances of Create. Instead, use the new keyword, passing any arguments for the Create's constructor.

See Also

Destroy (see page 22287)

new

85.1.2.3 TISAPIFactory Methods

The methods of the TISAPIFactory class are listed here.

Protected Methods

	Name	Description
V	NewRequest (see page 15655)	This is NewRequest, a member of class TISAPIFactory.
V	NewResponse (see page 15655)	This is NewResponse, a member of class TISAPIFactory.

85.1.2.3.1 TISAPIFactory.NewRequest Method

Pascal

```
function NewRequest(var AECB: TEXTENSION_CONTROL_BLOCK): TISAPIRequest; virtual;
```

C++

```
virtual __fastcall TISAPIRequest NewRequest(TEXTENSION_CONTROL_BLOCK AECB);
```

Description

This is NewRequest, a member of class TISAPIFactory.

85.1.2.3.2 TISAPIFactory.NewResponse Method

Pascal

```
function NewResponse(ISAPIRequest: TISAPIRequest): TISAPIResponse; virtual;
```

C++

```
virtual __fastcall TISAPIResponse NewResponse(TISAPIRequest ISAPIRequest);
```

Description

This is NewResponse, a member of class TISAPIFactory.

85.2 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	GetExtensionVersion (see page 15657)	Returns the name and version number of an ISAPI or NSAPI application.
	HttpExtensionProc (see page 15657)	Receives an HTTP request message for an ISAPI or NSAPI application.
	TerminateExtension (see page 15658)	Indicates whether an ISAPI or NSAPI application is ready to be shut down.

85.2.1 ISAPIApp.GetExtensionVersion Function

Returns the name and version number of an ISAPI or NSAPI application.

Pascal

```
function GetExtensionVersion(var Ver: THSE_VERSION_INFO): BOOL; stdcall;
```

C++

```
__stdcall BOOL GetExtensionVersion(THSE_VERSION_INFO Ver);
```

File

ISAPIApp

Description

Do not call GetExtensionVersion. ISAPI and NSAPI DLLs export GetExtension to provide an entry point that is called by ISAPI or NSAPI Web servers. This allows the Web server to obtain version information about the web server application.

See Also

HttpExtensionProc (see page 15657)

TerminateExtension (see page 15658)

TIsapiapplication

85.2.2 ISAPIApp.HttpExtensionProc Function

Receives an HTTP request message for an ISAPI or NSAPI application.

Pascal

```
function HttpExtensionProc(var ECB: TEXTENSION_CONTROL_BLOCK): DWORD; stdcall;
```

C++

```
__stdcall DWORD HttpExtensionProc(TEXTENSION_CONTROL_BLOCK ECB);
```

File

ISAPIApp

Description

Do not call HttpExtensionProc. ISAPI and NSAPI DLLs export HttpExtensionProc to provide an entry point that is called by ISAPI or NSAPI Web servers when they receive HTTP request messages.

See Also

GetExtensionVersion (see page 15657)

TerminateExtension (see page 15658)

85.2.3 ISAPIApp.TerminateExtension Function

Indicates whether an ISAPI or NSAPI application is ready to be shut down.

Pascal

```
function TerminateExtension(dwFlags: DWORD): BOOL; stdcall;
```

C++

```
__stdcall BOOL TerminateExtension(DWORD dwFlags);
```

File

ISAPIApp

Description

Do not call TerminateExtension. TerminateExtension is exported by ISAPI and NSAPI DLLs. It provides an entry point that is called by ISAPI or NSAPI Web servers, when they are ready to shut down the ISAPI or NSAPI application, to check whether it would cause problems to do so.

See Also

HttpExtensionProc (see page 15657)

85.3 Variables

The following table lists variables in this documentation.

Variables

Name	Description
DispatchThread (see page 15659)	This is variable ISAPIApp.DispatchThread.

85.3.1 ISAPIApp.DispatchThread Variable

Pascal

```
DispatchThread: function (AECB: PEXTENSION_CONTROL_BLOCK): Boolean of object;
```

C++

```
function (AECB: PEXTENSION_CONTROL_BLOCK): Boolean of object DispatchThread;
```

File

ISAPIApp

Description

This is variable ISAPIApp.DispatchThread.

86 IsapiHTTP Namespace

This is namespace IsapiHTTP.

Topics

Name	Description
Classes (see page 15662)	The following table lists classes in this documentation.

Classes

	Name	Description
	TISAPIRequest (see page 15662)	TISAPIRequest represents client request information that is passed to a server application DLL.
	TISAPIResponse (see page 15670)	TISAPIResponse represents HTTP messages sent by an ISAPI application in response to an HTTP request message.

86.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TISAPIRequest (see page 15662)	TISAPIRequest represents client request information that is passed to a server application DLL.
	TISAPIResponse (see page 15670)	TISAPIResponse represents HTTP messages sent by an ISAPI application in response to an HTTP request message.

86.1.1 TISAPIRequest Class

TISAPIRequest represents client request information that is passed to a server application DLL.

Class Hierarchy

Pascal

```
TISAPIRequest = class(TWebRequest);
```

C++

```
class TISAPIRequest : public TWebRequest;
```

File

IsapiHTTP

Description

Use TISAPIRequest to interpret a client request to a server application DLL.

ISAPI application objects create TISAPIRequest objects to capture client requests. The properties of the TISAPIRequest objects are obtained from the Web server. The ISAPI application uses TISAPIRequest objects to create corresponding TISAPIResponse (see page 15670) objects. The TWebDispatcher for the application then invokes the TWebActionItem that is associated with the path portion of the URL of the TISAPIRequest object.

See Also

TISAPIApplication (see page 15648)

TISAPIResponse (see page 15670)

TWebActionItem (see page 15130)

TWebDispatcher (see page 15147)

Accessing Client Request Information

86.1.1.1 TISAPIRequest Members

The following tables list the members exposed by TISAPIRequest.

Protected Methods

	Name	Description
	GetDateVariable (see page 15665)	Extracts a date value from the extension control block.
	GetIntegerVariable (see page 15666)	Extracts an integer value from the extension control block.
	GetInternalPathInfo (see page 15169)	This is GetInternalPathInfo, a member of class TWebRequest.
	GetInternalScriptName (see page 15169)	This is GetInternalScriptName, a member of class TWebRequest.
	GetStringVariable (see page 15666)	Extracts a string value from the extension control block.
	UpdateMethodType (see page 15172)	Provides the abstract prototype for a method to write a pure virtual method for updating the client method type.

Public Methods

	Name	Description
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 15665)	Creates an instance of TISAPIRequest (see page 15662) to represent the request message information contained in the AECB parameter.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 15165)	Destroys an instance of TWebRequest (see page 15161).
	Destroy (see page 22287)	Disposes of an object instance.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExtractContentFields (see page 15166)	Parses the Content (see page 15176) property into its constituent fields.
	ExtractCookieFields (see page 15166)	Parses the Cookie (see page 15180) property into its constituent fields.
	ExtractFields (see page 15167)	Parses a multi-valued string into its constituent fields.
	ExtractQueryFields (see page 15167)	Parses the Query (see page 15186) property into its constituent fields.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetFieldByName (see page 15666)	Returns the value of the HTTP header variable specified by the Name parameter.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	ReadClient (see page 15667)	Reads Count bytes from the HTTP request into Buffer.
	ReadString (see page 15668)	Reads Count bytes from the HTTP request into a string.
	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	TranslateURI (see page 15668)	Translates a Uniform Resource Identifier (URI) into the internal representation of a location on the server.
	WriteClient (see page 15669)	Writes Count bytes from Buffer back to the HTTP client.
	WriteHeaders (see page 15669)	Writes the header contents back to the HTTP client.

V	WriteString (see page 15670)	Writes the string AString back to the HTTP client.

Public Properties

	Name	Description
R	Accept (see page 15174)	Reports the value of the Accept header of the HTTP request message.
R	Authorization (see page 15175)	Reports the value of the Authorization header of the HTTP request message.
R	CacheControl (see page 15175)	Reports the value of the Cache-Control header of the HTTP request message.
R	Connection (see page 15176)	Reports the value of the Connection header of the HTTP request message.
R	Content (see page 15176)	Represents the unparsed contents of the HTTP request message.
R	ContentEncoding (see page 15177)	Reports the value of the Content (see page 15176)-Encoding header of the HTTP request message.
R	ContentFields (see page 15177)	Reports the parsed content of a POST request message.
R	ContentLength (see page 15178)	Reports the value of the Content (see page 15176)-Length header of the HTTP request message.
R	ContentParser (see page 15178)	Refers to the object's content parser object.
R	ContentType (see page 15179)	Reports the value of the Content (see page 15176)-Type header of the HTTP request message.
R	ContentVersion (see page 15179)	Reports the value of the Content (see page 15176)-Version header of the HTTP request message.
R	Cookie (see page 15180)	Reports the value of the Cookie header of the HTTP request message.
R	CookieFields (see page 15180)	Represents the parsed contents of the Cookie (see page 15180) header of an HTTP request message.
R	Date (see page 15181)	Reports the value of the Date header of the HTTP request message.
R	DerivedFrom (see page 15181)	Reports the value of the Derived-From (see page 15182) header of the HTTP request message.
R	ECB (see page 15670)	Indicates the extension control block structure used by the server application DLL to communicate with the Web server.
R	Expires (see page 15182)	Reports the value of the Expires header of the HTTP request message.
R	Files (see page 15182)	Provides access to the files uploaded in the HTTP request.
R	From (see page 15182)	Reports the value of the From header of the HTTP request message.
R	Host (see page 15183)	Reports the value of the Host header of the HTTP request message.
R	IfModifiedSince (see page 15183)	Reports the value of the If-Modified-Since header of the HTTP request message.
R	InternalPathInfo (see page 15184)	Returns the path info portion of the URL (see page 15190).
R	InternalScriptName (see page 15184)	Returns the ScriptName (see page 15189) part of the URL (see page 15190).
R	Method (see page 15185)	This is Method, a member of class TWebRequest.
R	MethodType (see page 15185)	This is MethodType, a member of class TWebRequest.
R	PathInfo (see page 15185)	Reports the value of the path information (if any) of the URL (see page 15190) specified in the HTTP request message.
R	PathTranslated (see page 15186)	Represents a translation of the PathInfo (see page 15185) property to a fully qualified path on the Web server.
R	ProtocolVersion (see page 15186)	Reports the version number of the HTTP protocol specified in the initial header of the HTTP request message.
R	Query (see page 15186)	Indicates the value of the query information (if any) of the URL (see page 15190) specified in the HTTP request message.
R	QueryFields (see page 15187)	Represents the parsed contents of the Query (see page 15186) in the URL (see page 15190) of the HTTP request message.
R	Referer (see page 15188)	Reports the value of the Referer header of the HTTP request message.
R	RemoteAddr (see page 15188)	Indicates the remote IP address of the client associated with the HTTP request message.
R	RemoteHost (see page 15188)	Reports the fully qualified reverse domain lookup of the client associated with the HTTP request message.
R	ScriptName (see page 15189)	Indicates the value of the script information (if any) of the URL (see page 15190) specified in the HTTP request message.
R	ServerPort (see page 15189)	Indicates the port number of the port on the Web server that receives the HTTP request message.
R	Title (see page 15190)	Reports the value of the Title header of the HTTP request message.
R	URL (see page 15190)	Reports the Uniform Resource Identifier (URI) specified by the HTTP request message to identify the target of the request.
R	UserAgent (see page 15191)	Reports the value of the User-Agent header of the HTTP request message.

86.1.1.2 TISAPIRequest.Create Constructor

Creates an instance of TISAPIRequest (see page 15662) to represent the request message information contained in the AECB parameter.

Pascal

```
constructor Create(AECB: PEXTENSION_CONTROL_BLOCK);
```

C++

```
__fastcall TISAPIRequest(PEXTENSION_CONTROL_BLOCK AECB);
```

Description

Applications don't need to call Create to instantiate an ISAPI request object. TISAPIApplication creates a TISAPIRequest (see page 15662) object whenever it receives a client request.

See Also

ECB (see page 15670)

TISAPIApplication (see page 15648)

86.1.1.3 TISAPIRequest Methods

The methods of the TISAPIRequest class are listed here.

Protected Methods

	Name	Description
	GetDateVariable (see page 15665)	Extracts a date value from the extension control block.
	GetIntegerVariable (see page 15666)	Extracts an integer value from the extension control block.
	GetStringVariable (see page 15666)	Extracts a string value from the extension control block.

Public Methods

	Name	Description
	GetFieldByName (see page 15666)	Returns the value of the HTTP header variable specified by the Name parameter.
	ReadClient (see page 15667)	Reads Count bytes from the HTTP request into Buffer.
	ReadString (see page 15668)	Reads Count bytes from the HTTP request into a string.
	TranslateURI (see page 15668)	Translates a Uniform Resource Identifier (URI) into the internal representation of a location on the server.
	WriteClient (see page 15669)	Writes Count bytes from Buffer back to the HTTP client.
	WriteHeaders (see page 15669)	Writes the header contents back to the HTTP client.
	WriteString (see page 15670)	Writes the string AString back to the HTTP client.

86.1.1.3.1 TISAPIRequest.GetDateVariable Method

Extracts a date value from the extension control block.

Pascal

```
function GetDateVariable(Index: Integer): TDateTime; override;
```

C++

```
virtual __fastcall TDateTime GetDateVariable(int Index);
```

Description

GetDateVariable reads date-time values from the extension control block specified by the ECB (see page 15670) property.

The ISAPI request object uses GetDateVariable to access the properties that represent dates from the HTTP request headers.

See Also

Date (see page 15181)

ECB (see page 15670)

Expires (see page 15182)

IfModifiedSince (see page 15183)

86.1.1.3.2 TISAPIRequest.GetFieldByName Method

Returns the value of the HTTP header variable specified by the Name parameter.

Pascal

```
function GetFieldByName(const Name: string): string; override;
```

C++

```
virtual __fastcall AnsiString GetFieldByName(const AnsiString Name);
```

Description

Use GetFieldByName to read the value of an HTTP header variable that is not surfaced as one of the properties of TISAPIRequest (see page 15662). For information on possible HTTP request header variables, see the current Internet standards documents.

See Also

ECB (see page 15670)

GetStringVariable (see page 15666)

86.1.1.3.3 TISAPIRequest.GetIntegerVariable Method

Extracts an integer value from the extension control block.

Pascal

```
function GetIntegerVariable(Index: Integer): Integer; override;
```

C++

```
virtual __fastcall int GetIntegerVariable(int Index);
```

Description

GetIntegerVariable reads integer values from the extension control block specified by the ECB (see page 15670) property. The ISAPI request object uses GetIntegerVariable to access the properties that represent integers from the HTTP request headers.

See Also

ContentLength (see page 15178)

ECB (see page 15670)

ServerPort (see page 15189)

86.1.1.3.4 TISAPIRequest.GetStringVariable Method

Extracts a string value from the extension control block.

Pascal

```
function GetStringVariable(Index: Integer): string; override;
```

C++

```
virtual __fastcall AnsiString GetStringVariable(int Index);
```

Description

GetStringVariable reads string values from the extension control block specified by the ECB (see page 15670) property. The ISAPI request object uses GetStringVariable to access the properties that represent strings from the HTTP request headers.

See Also

Accept (see page 15174)

CacheControl (see page 15175)

Connection (see page 15176)

Content (see page 15176)

ContentEncoding (see page 15177)

ContentType (see page 15179)

ContentVersion (see page 15179)

Cookie (see page 15180)

DerivedFrom (see page 15181)

ECB (see page 15670)

From (see page 15182)

Host (see page 15183)

TISAPIRequest (see page 15662)

PathInfo (see page 15185)

PathTranslated (see page 15186)

ProtocolVersion (see page 15186)

Query (see page 15186)

Referer (see page 15188)

RemoteAddr (see page 15188)

RemoteHost (see page 15188)

ScriptName (see page 15189)

Title (see page 15190)

URL (see page 15190)

UserAgent (see page 15191)

86.1.1.3.5 TISAPIRequest.ReadClient Method

Reads Count bytes from the HTTP request into Buffer.

Pascal

```
function ReadClient(var Buffer; Count: Integer): Integer; override;
```

C++

```
virtual __fastcall int ReadClient( Buffer, int Count);
```

Description

Use ReadClient to load a chunk of information from the contents of an HTTP request into a buffer. ReadClient allows the server application to get the next chunk of information when the content of the request message is too large for the Content property. ReadClient returns the number of bytes actually read. If no more content is available, ReadClient returns -1.

See Also

ReadString (see page 15668)

WriteClient (see page 15669)

86.1.1.3.6 TISAPIRequest.ReadString Method

Reads Count bytes from the HTTP request into a string.

Pascal

```
function ReadString(Count: Integer): string; override;
```

C++

```
virtual __fastcall AnsiString ReadString(int Count);
```

Description

Use ReadString to load the next chunk of content information form the HTTP request into a string. ReadString allows the server application to get the next chunk of information when the content of the request message is too large for the Content property.

See Also

GetStringVariable (see page 15666)

ReadClient (see page 15667)

WriteString (see page 15670)

86.1.1.3.7 TISAPIRequest.TranslateURI Method

Translates a Uniform Resource Identifier (URI) into the internal representation of a location on the server.

Pascal

```
function TranslateURI(const URI: string): string; override;
```

C++

```
virtual __fastcall AnsiString TranslateURI(const AnsiString URI);
```

Description

Use TranslateURI is used to translate the URI specified in a client request into a format that can be used by the server application.

See Also

PathTranslated (see page 15186)

URL (see page 15190)

86.1.1.3.8 TISAPIRequest.WriteClient Method

Writes Count bytes from Buffer back to the HTTP client.

Pascal

```
function WriteClient(var Buffer; Count: Integer): Integer; override;
```

C++

```
virtual __fastcall int WriteClient( Buffer, int Count);
```

Description

Use WriteClient to write the contents of a response back to the Web client.

See Also

ReadClient (see page 15667)

TISAPIResponse (see page 15670)

WriteString (see page 15670)

WriteHeaders (see page 15669)

86.1.1.3.9 TISAPIRequest.WriteHeaders Method

Writes the header contents back to the HTTP client.

Pascal

```
function WriteHeaders(StatusCode: Integer; const StatusString: string; const Headers: string):
Boolean; override;
```

C++

```
virtual __fastcall Boolean WriteHeaders(int StatusCode, const AnsiString StatusString, const
AnsiString Headers);
```

Description

WriteHeaders writes the HTTP headers of a response message before a call to the WriteClient (see page 15669) method. These headers are used on the HTTP message that the WriteClient (see page 15669) method sends in response to this request.

StatusCode is the status code of the response. This informs the client of the status of the request. For a list of status code values, see the StatusCode property of TWebResponse.

StatusString is a text string that describes the status that StatusCode indicates.

Headers is a formatted string that includes any other HTTP headers to add. It represents each header as a string of the form 'Headername: Value', where name/value pairs are separated by line breaks.

WriteHeaders returns true if it succeeds in writing the specified headers.

See Also

WriteClient (see page 15669)

StatusCode (see page 15215)

86.1.1.3.10 TISAPIRequest.WriteString Method

Writes the string AString back to the HTTP client.

Pascal

```
function WriteString(const AString: string): Boolean; override;
```

C++

```
virtual __fastcall Boolean WriteString(const AnsiString AString);
```

Description

Use WriteString to write the contents of a response back to the Web client.

See Also

ReadString (see page 15668)

TISAPIResponse (see page 15670)

WriteClient (see page 15669)

86.1.1.4 TISAPIRequest Properties

The properties of the TISAPIRequest class are listed here.

Public Properties

	Name	Description
	ECB (see page 15670)	Indicates the extension control block structure used by the server application DLL to communicate with the Web server.

86.1.1.4.1 TISAPIRequest.ECB Property

Indicates the extension control block structure used by the server application DLL to communicate with the Web server.

Pascal

```
property ECB: PEXTENSION_CONTROL_BLOCK;
```

C++

```
__property PEXTENSION_CONTROL_BLOCK ECB;
```

Description

Read ECB to gain direct access to the extension control block that the server application DLL uses to represent the client request message. Most applications will not need to use the ECB property because the header fields values can be read using the GetFieldByName (see page 15666) method.

See Also

GetFieldByName (see page 15666)

86.1.2 TISAPIResponse Class

TISAPIResponse represents HTTP messages sent by an ISAPI application in response to an HTTP request message.

Class Hierarchy

System::TObject → HTTPApp.TWebResponse → IsapiHTTP.TISAPIResponse

Pascal

```
TISAPIResponse = class(TWebResponse);
```

C++

```
class TISAPIResponse : public TWebResponse;
```

File

IsapiHTTP

Description

Use TISAPIResponse to specify the response to an HTTP request message.

An ISAPI application creates a TISAPIResponse object based on the TISAPIRequest (see page 15662) object for an incoming HTTP request message. TWebDispatcher then passes the TISAPIResponse object to the TWebActionItem associated with the TISAPIRequest (see page 15662) object. The TWebActionItem sets the properties of the TISAPIResponse object.

See Also

TISAPIApplication (see page 15648)

TISAPIRequest (see page 15662)

TWebActionItem (see page 15130)

TWebDispatcher (see page 15147)

Creating HTTP Response Messages

86.1.2.1 TISAPIResponse Members

The following tables list the members exposed by TISAPIResponse.

Protected Fields

	Name	Description
	FCustomHeaders (see page 15195)	This is FCustomHeaders, a member of class TWebResponse.
	FHTTPRequest (see page 15196)	This is FHTTPRequest, a member of class TWebResponse.

Protected Methods

	Name	Description
	AddCustomHeaders (see page 15197)	Appends the custom headers specified by the CustomHeaders (see page 15211) property to the Headers parameter.
	FormatAuthenticate (see page 15197)	Lists of one or more comma-separated challenges provided when the request fails with StatusCode (see page 15215) 401 (Unauthorized).
V	GetContent (see page 15674)	Reads the value of the Content property.
V	GetDateVariable (see page 15674)	Extracts a date from the internal table of HTTP header variables.
V	GetIntegerVariable (see page 15675)	Extracts an integer value from the internal table of HTTP header variables.
V	GetLogMessage (see page 15675)	Reads the value of the LogMessage property.
V	GetStatusCode (see page 15675)	Reads the value of the StatusCode property.
V	GetStringVariable (see page 15676)	Extracts a string value from the internal table of HTTP header variables.
V	InitResponse (see page 15676)	This is InitResponse, a member of class TISAPIResponse.
V	SetContent (see page 15678)	Sets the Content property.
V	SetContentStream (see page 15203)	Sets the value of the ContentStream (see page 15209) property to the Value parameter.

	SetDateVariable (see page 15678)	Sets a date-time valued HTTP header property.
	SetIntegerVariable (see page 15679)	Sets an integer valued HTTP header property.
	SetLogMessage (see page 15679)	Sets the value of the LogMessage property.
	SetStatusCode (see page 15680)	Sets the StatusCode property.
	SetStringVariable (see page 15680)	Sets a string valued HTTP header property.

Public Methods

	Name	Description
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 15673)	Creates an instance of TISAPIResponse (see page 15670) to represent the response to the HTTPRequest parameter.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 15195)	Disposes of an object instance.
	Destroy (see page 22287)	Disposes of an object instance.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetCustomHeader (see page 15198)	Returns the value of the custom header with the specified name.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SendRedirect (see page 15677)	Sends the response with a StatusCode of 301 (Moved Permanently) and with Location set to the URI parameter.
	SendResponse (see page 15677)	Sends the ISAPI response message to the web client.
	SendStream (see page 15677)	Sends the ISAPI response message with the contents set to the contents of AStream.
	Sent (see page 15678)	Indicates whether the ISAPI response message has been sent.
	SetCookieField (see page 15203)	Adds a cookie header to the response message.
	SetCustomHeader (see page 15203)	Replaces the value of a specified custom header.

Public Properties

	Name	Description
	Allow (see page 15207)	Lists the HTTP request methods that the application can service.
	Content (see page 15207)	Contains the information sent to the web client in response to an HTTP request message.

	ContentEncoding (see page 15208)	Lists the mechanisms, if any, that are used to encode the content of the HTTP response message.
	ContentLength (see page 15208)	Specifies the length, in bytes, of the Content (see page 15207) property.
	ContentStream (see page 15209)	Specifies the stream object for writing the contents of the HTTP response message to the web client.
	ContentType (see page 15209)	Indicates the media type of the Content (see page 15207) of the HTTP response message.
	ContentVersion (see page 15210)	Represents the version associated with the Content (see page 15207) of the HTTP response message.
R	Cookies (see page 15210)	Lists all cookie headers that should be sent with the response.
	CustomHeaders (see page 15211)	Lists message header strings that are added to the response message before it is sent.
	Date (see page 15211)	Indicates the time and date when the HTTP response message is sent to the web client.
	DerivedFrom (see page 15212)	Specifies the URI of the resource where the Content (see page 15207) of the HTTP response originated.
	Expires (see page 15212)	Specifies the date and time after which the Content (see page 15207) of the HTTP response message should be considered invalid.
R	HTTPRequest (see page 15213)	Represents the HTTP request message for which this is a response.
	LastModified (see page 15213)	Indicates the date and time that the value of the Content (see page 15207) property was last updated.
	Location (see page 15214)	Specifies the URI of a resource the web client should point to for the completion of its request.
	LogMessage (see page 15214)	Describes the HTTP response message for event logging purposes.
	Realm (see page 15214)	Specifies the set of protected-access URIs that includes the URL specified by the HTTP request message.
	ReasonString (see page 15215)	Indicates the status of the response to the web client request as a human-readable string.
	Server (see page 15215)	Provides information about the software used by the server application to handle the request.
	StatusCode (see page 15215)	Indicates the status of the response to the HTTP request message as a 3-digit integer.
	Title (see page 15217)	Specifies a title for the Content (see page 15207) of the HTTP response message.
	Version (see page 15217)	Specifies the HTTP protocol version number that the web client is using.
	WWWAuthenticate (see page 15218)	Lists of one or more comma-separated challenges provided when the request fails with StatusCode (see page 15215) 401 (Unauthorized).

86.1.2.2 TISAPIResponse.Create Constructor

Creates an instance of TISAPIResponse (see page 15670) to represent the response to the HTTPRequest parameter.

Pascal

```
constructor Create(HTTPRequest: TWebRequest);
```

C++

```
__fastcall TISAPIResponse(TWebRequest HTTPRequest);
```

Description

Applications don't need to call Create to instantiate a ISAPI response object. TISAPIApplication creates a TISAPIResponse (see page 15670) for each TISAPIRequest (see page 15662) it creates.

See Also

TISAPIApplication (see page 15648)

TISAPIRequest (see page 15662)

86.1.2.3 TISAPIResponse Methods

The methods of the TISAPIResponse class are listed here.

Protected Methods

	Name	Description
	GetContent (see page 15674)	Reads the value of the Content property.
	GetDateVariable (see page 15674)	Extracts a date from the internal table of HTTP header variables.
	GetIntegerVariable (see page 15675)	Extracts an integer value from the internal table of HTTP header variables.
	GetLogMessage (see page 15675)	Reads the value of the LogMessage property.
	GetStatusCode (see page 15675)	Reads the value of the StatusCode property.
	GetStringVariable (see page 15676)	Extracts a string value from the internal table of HTTP header variables.
	InitResponse (see page 15676)	This is InitResponse, a member of class TISAPIResponse.
	SetContent (see page 15678)	Sets the Content property.
	SetDateVariable (see page 15678)	Sets a date-time valued HTTP header property.
	SetIntegerVariable (see page 15679)	Sets an integer valued HTTP header property.
	SetLogMessage (see page 15679)	Sets the value of the LogMessage property.
	SetStatusCode (see page 15680)	Sets the StatusCode property.
	SetStringVariable (see page 15680)	Sets a string valued HTTP header property.

Public Methods

	Name	Description
	SendRedirect (see page 15677)	Sends the response with a StatusCode of 301 (Moved Permanently) and with Location set to the URI parameter.
	SendResponse (see page 15677)	Sends the ISAPI response message to the web client.
	SendStream (see page 15677)	Sends the ISAPI response message with the contents set to the contents of AStream.
	Sent (see page 15678)	Indicates whether the ISAPI response message has been sent.

86.1.2.3.1 TISAPIResponse.GetContent Method

Reads the value of the Content property.

Pascal

```
function GetContent: string; override;
```

C++

```
virtual __fastcall AnsiString GetContent();
```

Description

GetContent is the protected access function for the Content property.

See Also

Content (see page 15207)

SetContent (see page 15678)

86.1.2.3.2 TISAPIResponse.GetDateVariable Method

Extracts a date from the internal table of HTTP header variables.

Pascal

```
function GetDateVariable(Index: Integer): TDateTime; override;
```

C++

```
virtual __fastcall TDateTime GetDateVariable(int Index);
```

Description

The ISAPI response object uses GetDateVariable to access the properties that represent dates.

See Also

Date (see page 15211)

Expires (see page 15212)

LastModified (see page 15213)

SetDateVariable (see page 15678)

86.1.2.3.3 TISAPIResponse.GetIntegerVariable Method

Extracts an integer value from the internal table of HTTP header variables.

Pascal

```
function GetIntegerVariable(Index: Integer): Integer; override;
```

C++

```
virtual __fastcall int GetIntegerVariable(int Index);
```

Description

The ISAPI response object uses GetIntegerVariable to access the properties that represent integers.

See Also

ContentLength (see page 15208)

SetIntegerVariable (see page 15679)

86.1.2.3.4 TISAPIResponse.GetLogMessage Method

Reads the value of the LogMessage property.

Pascal

```
function GetLogMessage: string; override;
```

C++

```
virtual __fastcall AnsiString GetLogMessage();
```

Description

GetLogMessage is the protected access function for LogMessage property.

See Also

LogMessage (see page 15214)

SetLogMessage (see page 15679)

86.1.2.3.5 TISAPIResponse.GetStatusCode Method

Reads the value of the StatusCode property.

Pascal

```
function GetStatusCode: Integer; override;
```

C++

```
virtual __fastcall int GetStatusCode();
```

Description

GetStatusCode is the protected access function for the StatusCode property.

See Also

StatusCode (see page 15215)

SetStatusCode (see page 15205)

86.1.2.3.6 TISAPIResponse.GetStringVariable Method

Extracts a string value from the internal table of HTTP header variables.

Pascal

```
function GetStringVariable(Index: Integer): string; override;
```

C++

```
virtual __fastcall AnsiString GetStringVariable(int Index);
```

Description

The ISAPI response object uses GetStringVariable to access the properties that represent strings.

See Also

Allow (see page 15207)

ContentEncoding (see page 15208)

ContentType (see page 15209)

ContentVersion (see page 15210)

DerivedFrom (see page 15212)

Location (see page 15214)

Realm (see page 15214)

Server (see page 15215)

SetStringVariable (see page 15680)

Title (see page 15217)

Version (see page 15217)

WWWAuthenticate (see page 15218)

86.1.2.3.7 TISAPIResponse.InitResponse Method

Pascal

```
procedure InitResponse; virtual;
```

C++

```
virtual __fastcall InitResponse();
```

Description

This is InitResponse, a member of class TISAPIResponse.

86.1.2.3.8 TISAPIResponse.SendRedirect Method

Sends the response with a StatusCode of 301 (Moved Permanently) and with Location set to the URI parameter.

Pascal

```
procedure SendRedirect(const URI: string); override;
```

C++

```
virtual __fastcall SendRedirect(const AnsiString URI);
```

Description

Call SendRedirect to redirect the web client request to another URI that is the proper target of the request. SendRedirect does the same thing as setting the StatusCode to 301, the Location to URI, and calling SendResponse (see page 15677).

See Also

Location (see page 15214)

SendResponse (see page 15677)

StatusCode (see page 15215)

86.1.2.3.9 TISAPIResponse.SendResponse Method

Sends the ISAPI response message to the web client.

Pascal

```
procedure SendResponse; override;
```

C++

```
virtual __fastcall SendResponse();
```

Description

Call SendResponse after setting the properties of the HTTP response object to specify the response that should be made to the web client. If the request should be redirected to another URI, it is more efficient to call SendRedirect (see page 15677).

See Also

SendRedirect (see page 15677)

86.1.2.3.10 TISAPIResponse.SendStream Method

Sends the ISAPI response message with the contents set to the contents of AStream.

Pascal

```
procedure SendStream(AStream: TStream); override;
```

C++

```
virtual __fastcall SendStream(TStream AStream);
```

Description

Only call SendStream after first calling SendResponse (see page 15677). Unlike SendStream, SendResponse (see page 15677) fills the header of the HTTP response message, based on the properties of the TISAPIResponse (see page 15670) object. If SendResponse (see page 15677) has not been called first to set the header of the HTTP response message, set the ContentStream property to AStream, and call SendResponse (see page 15677).

See Also

ContentStream (see page 15209)

SendResponse (see page 15677)

Sent (see page 15678)

86.1.2.3.11 TISAPIResponse.Sent Method

Indicates whether the ISAPI response message has been sent.

Pascal

```
function Sent: Boolean; override;
```

C++

```
virtual __fastcall Boolean Sent();
```

Description

Sent returns true if the SendRedirect (see page 15677) or SendStream (see page 15677) method has been called. TISAPIApplication objects read Sent to determine whether they should send a response to the web client.

See Also

SendRedirect (see page 15677)

SendStream (see page 15677)

86.1.2.3.12 TISAPIResponse.SetContent Method

Sets the Content property.

Pascal

```
procedure SetContent(const Value: string); override;
```

C++

```
virtual __fastcall SetContent(const AnsiString Value);
```

Description

SetContent is the protected method used by ISAPI response objects to set the Content property.

See Also

Content (see page 15207)

GetContent (see page 15674)

86.1.2.3.13 TISAPIResponse.SetDateVariable Method

Sets a date-time valued HTTP header property.

Pascal

```
procedure SetDateVariable(Index: Integer; const Value: TDateTime); override;
```

C++

```
virtual __fastcall SetDateVariable(int Index, const TDateTime Value);
```

Description

SetDateVariable writes date-time to the internal table used to store HTTP header variables. The ISAPI response object uses SetDateVariable to set the properties that represent dates.

See Also

Date (see page 15211)

Expires (see page 15212)

GetDateVariable (see page 15674)

LastModified (see page 15213)

86.1.2.3.14 TISAPIResponse.SetIntegerVariable Method

Sets an integer valued HTTP header property.

Pascal

```
procedure SetIntegerVariable(Index: Integer; Value: Integer); override;
```

C++

```
virtual __fastcall SetIntegerVariable(int Index, int Value);
```

Description

SetIntegerVariable writes integer values to the internal table used to store HTTP header variables. The ISAPI response object uses SetIntegerVariable to set the properties that represent integers.

See Also

ContentLength (see page 15208)

GetIntegerVariable (see page 15675)

86.1.2.3.15 TISAPIResponse.SetLogMessage Method

Sets the value of the LogMessage property.

Pascal

```
procedure SetLogMessage(const Value: string); override;
```

C++

```
virtual __fastcall SetLogMessage(const AnsiString Value);
```

Description

SetLogMessage is the protected method used by ISAPI response objects to set the LogMessage property.

See Also

GetLogMessage (see page 15675)

LogMessage (see page 15214)

86.1.2.3.16 TISAPIResponse.SetStatusCode Method

Sets the StatusCode property.

Pascal

```
procedure SetStatusCode(Value: Integer); override;
```

C++

```
virtual __fastcall SetStatusCode(int Value);
```

Description

SetStatusCode is the protected method used by ISAPI response objects to set the StatusCode property.

See Also

StatusCode (see page 15215)

GetStatusCode (see page 15199)

86.1.2.3.17 TISAPIResponse.SetStringVariable Method

Sets a string valued HTTP header property.

Pascal

```
procedure SetStringVariable(Index: Integer; const Value: string); override;
```

C++

```
virtual __fastcall SetStringVariable(int Index, const AnsiString Value);
```

Description

SetStringVariable writes string values to the internal table used to store HTTP header variables. The ISAPI response object uses SetStringVariable to set the properties that represent strings.

87 Java Namespace

This is namespace Java.

Namespaces

Name	Description
Sql (see page 15682)	This is namespace Java.Sql.

87.1 Java.Sql Namespace

This is namespace Java.Sql.

Topics

Name	Description
Classes (see page 15682)	The following table lists classes in this documentation.

Classes

	Name	Description
	SQLException (see page 15682)	This is class Java.Sql.SQLException.

87.1.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	SQLException (see page 15682)	This is class Java.Sql.SQLException.

87.1.1.1 SQLException Class

Class Hierarchy

Pascal

```
SQLException = class(System.Exception);
```

C++

```
class SQLException : public System.Exception;
```

File

SQLException.cs

Description

This is class Java.Sql.SQLException.

87.1.1.1.1 SQLException Members

The following tables list the members exposed by SQLException.

Internal Methods

	Name	Description
	getErrorCode (see page 15684)	This is getErrorCode, a member of class SQLException.
	getSQLState (see page 15684)	This is getSQLState, a member of class SQLException.

Public Methods

	Name	Description
	SQLException (see page 15683)	This is the overview for the SQLException constructor overload.

Public Properties

	Name	Description
	ErrorCode (see page 15684)	This is ErrorCode, a member of class SQLException.
	SQLState (see page 15684)	This is SQLState, a member of class SQLException.

87.1.1.1.2 SQLException Constructor

This is the overview for the SQLException constructor overload.

Overload List

	Name	Description
	SQLException.SQLException (string) (see page 15683)	This is SQLException, a member of class SQLException.
	SQLException.SQLException (string, string, int, Exception) (see page 15683)	This is SQLException, a member of class SQLException.

87.1.1.1.2.1 SQLException.SQLException Constructor (string)

Pascal

```
constructor Create(reason: string);
```

C++

```
SQLException(string reason);
```

Description

This is SQLException, a member of class SQLException.

87.1.1.1.2.2 SQLException.SQLException Constructor (string, string, int, Exception)

Pascal

```
constructor Create(reason: string; SQLState: string; vendorCode: Integer; cause: Exception);
```

C++

```
SQLException(string reason, string SQLState, int vendorCode, Exception cause);
```

Description

This is SQLException, a member of class SQLException.

87.1.1.1.3 SQLException Methods

The methods of the SQLException class are listed here.

Internal Methods

	Name	Description
	getErrorCode (see page 15684)	This is getErrorCode, a member of class SQLException.
	getSQLState (see page 15684)	This is getSQLState, a member of class SQLException.

87.1.1.1.3.1 SQLException.getErrorCode Method

Pascal

```
function getErrorCode: Integer;
```

C++

```
int getErrorCode();
```

Description

This is getErrorCode, a member of class SQLException.

87.1.1.1.3.2 SQLException.getSQLState Method

Pascal

```
function getSQLState: string;
```

C++

```
string getSQLState();
```

Description

This is getSQLState, a member of class SQLException.

87.1.1.1.4 SQLException Properties

The properties of the SQLException class are listed here.

Public Properties

	Name	Description
	ErrorCode (see page 15684)	This is ErrorCode, a member of class SQLException.
	SQLState (see page 15684)	This is SQLState, a member of class SQLException.

87.1.1.1.4.1 SQLException.ErrorCode Property

Pascal

```
property ErrorCode: Integer;
```

C++

```
__property int ErrorCode;
```

Description

This is ErrorCode, a member of class SQLException.

87.1.1.1.4.2 SQLException.SQLState Property

Pascal

```
property SQLState: string;
```

C++

```
__property string SQLState;
```

Description

This is SQLState, a member of class SQLException.

88 jpeg Namespace

This is namespace jpeg.

Topics

Name	Description
Classes (see page 15686)	The following table lists classes in this documentation.
Structs, Records, Enums (see page 15706)	The following table lists structs, records, enums in this documentation.
Types (see page 15709)	The following table lists types in this documentation.
Variables (see page 15710)	The following table lists variables in this documentation.

Classes

	Name	Description
	TJPEGData (see page 15686)	TJPEGData encapsulates the compressed file that contains the data source for the original compressed jpeg image used by a TJPEGImage (see page 15688) object.
	TJPEGImage (see page 15688)	TJPEGImage encapsulates a jpeg graphic.

Structs, Records, Enums

	Name	Description
	TJPEGDefaults (see page 15706)	This is record jpeg.TJPEGDefaults.
	TJPEGPerformance (see page 15707)	TJPEGPerformance represents the type of optimization to use when displaying a JPEG image.
	TJPEGPixelFormat (see page 15707)	TJPEGPixelFormat indicates the format used to display a JPEG image.
	TJPEGScale (see page 15708)	TJPEGScale represents the display size of a JPEG image.

Types

Name	Description
TJPEGQualityRange (see page 15709)	TJPEGQualityRange represents the trade-off ratio between image quality and file size in a JPEG image.

Variables

Name	Description
JPEGDefaults (see page 15710)	This is variable jpeg.JPEGDefaults.

88.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TJPEGData (see page 15686)	TJPEGData encapsulates the compressed file that contains the data source for the original compressed jpeg (see page 15685) image used by a TJPEGImage (see page 15688) object.
	TJPEGImage (see page 15688)	TJPEGImage encapsulates a jpeg (see page 15685) graphic.

88.1.1 TJPEGData Class

TJPEGData encapsulates the compressed file that contains the data source for the original compressed jpeg (see page 15685) image used by a TJPEGImage (see page 15688) object.

Class Hierarchy

Pascal

```
TJPEGData = class(TSharedImage);
```

C++

```
class TJPEGData : public TSharedImage;
```

File

jpeg

Description

TJPEGData is used for the internal implementation of TJPEGImage (see page 15688). TJPEGData is created automatically by the TJPEGImage (see page 15688) object when that image object is created.

TJPEGData owns the file handle to the jpeg (see page 15685) data source. Thus, TJPEGData implements how TJPEGImage (see page 15688) does reference counting and handle sharing. When a jpeg (see page 15685) image object is copied using the Assign method, those multiple instances of the image object refer to the same TJPEGData object.

The TJPEGData file itself is never modified. Each TJPEGImage (see page 15688) instance that shares it has its own properties that determine how this data is decompressed into its own internal, local bitmap representation. However, if a TJPEGImage (see page 15688) needs to modify the actual jpeg (see page 15685) data, it breaks its link to that particular TJPEGData instance and creates a new one.

See Also

TJPEGImage (see page 15688)

TJPEGImage (see page 15688)

88.1.1.1 TJPEGData Members

The following tables list the members exposed by TJPEGData.

Protected Methods

	Name	Description
	FreeHandle (see page 15687)	This is FreeHandle, a member of class TJPEGData.
	Reference (see page 14604)	This is Reference, a member of class TSharedImage.
	Release (see page 14604)	This is Release, a member of class TSharedImage.

Protected Properties

	Name	Description
	RefCount (see page 14605)	This is RefCount, a member of class TSharedImage.

Public Methods

	Name	Description
	Destroy (see page 15687)	Destroys of an instance of a jpeg (see page 15685) data object.

88.1.1.2 TJPEGData.Destroy Destructor

Destroys of an instance of a jpeg (see page 15685) data object.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TJPEGData();
```

Description

The jpeg (see page 15685) data object is automatically destroyed by the jpeg (see page 15685) image object that uses it. It is not necessary to call Destroy or to directly access the jpeg (see page 15685) data object.

The Destroy method of a jpeg (see page 15685) data object handles the freeing of the data.

See Also

Free (see page 22300)

Destroy (see page 22287)

88.1.1.3 TJPEGData Methods

The methods of the TJPEGData class are listed here.

Protected Methods

	Name	Description
	FreeHandle (see page 15687)	This is FreeHandle, a member of class TJPEGData.

88.1.1.3.1 TJPEGData.FreeHandle Method

Pascal

```
procedure FreeHandle; override;
```

C++

```
virtual __fastcall FreeHandle();
```

Description

This is FreeHandle, a member of class TJPEGData.

88.1.2 TJPEGImage Class

TJPEGImage encapsulates a jpeg (see page 15685) graphic.

Class Hierarchy

Pascal

```
TJPEGImage = class(TGraphic);
```

C++

```
class TJPEGImage : public TGraphic;
```

File

jpeg

Description

Use TJPEGImage to read and write jpeg (see page 15685) compressed image data. TJPEGImage handles the digital compression and decompression of still images for use in computer systems. It uses the data from an instance of TJPEGData (see page 15686), which contains the actual jpeg (see page 15685) data source and is never modified. Each jpeg (see page 15685) image object may share its TJPEGData (see page 15686) object with other instances of a jpeg (see page 15685) image by creating copies using the Assign (see page 15693) method. The jpeg (see page 15685) data source handles reference counting for the jpeg (see page 15685) image objects that are linked to it.

TJPEGImage has an internal bitmap that represents the jpeg (see page 15685) image. This internal image and the original source of the jpeg (see page 15685) image are read only. TJPEGImage has properties that determine how each instance will handle color conversion, compression, decompression, performance, and so on.

The following are characteristics of this object. A TJPEGImage object:

Has no canvas (so it cannot draw onto a canvas). However, TJPEGImage implements the protected Draw (see page 15696) method introduced in TGraphic, so it can draw itself on the canvas of another object.

Provides no access to the internal bitmap image that it creates for the JPEG image.

Performs reference counting and handle sharing by means of the TJPEGData (see page 15686) object. Multiple instances can refer to the same TJPEGData (see page 15686) image. TJPEGData (see page 15686) is the actual owner of the file handle to the jpeg (see page 15685) data source.

See Also

TJPEGData (see page 15686)

TBitmap (see page 14396)

88.1.2.1 TJPEGImage Members

The following tables list the members exposed by TJPEGImage.

Protected Methods

	Name	Description
	_AddRef (see page 2853)	Increments the reference count for the interfaced object's interface.
	_Release (see page 2854)	Decrements the reference count for the interfaced object's interface.
V	AssignTo (see page 15694)	Copies the properties of an object to a destination object.
V	Changed (see page 15695)	This is Changed, a member of class TJPEGImage.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DefineProperties (see page 14520)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	Draw (see page 15696)	This is Draw, a member of class TJPEGImage.
V	Equals (see page 15696)	This is Equals, a member of class TJPEGImage.
	FreeBitmap (see page 15696)	This is FreeBitmap, a member of class TJPEGImage.
V	GetEmpty (see page 15697)	This is GetEmpty, a member of class TJPEGImage.
V	GetHeight (see page 15697)	This is GetHeight, a member of class TJPEGImage.
	GetOwner (see page 2932)	Returns the owner of an object.
V	GetPalette (see page 15697)	This is GetPalette, a member of class TJPEGImage.
V	GetTransparent (see page 14522)	This is GetTransparent, a member of class TGraphic.
V	GetWidth (see page 15697)	This is GetWidth, a member of class TJPEGImage.
	NewBitmap (see page 15699)	This is NewBitmap, a member of class TJPEGImage.
	NewImage (see page 15699)	This is NewImage, a member of class TJPEGImage.
	Progress (see page 14524)	This is Progress, a member of class TGraphic.
V	ReadData (see page 15699)	This is ReadData, a member of class TJPEGImage.
	ReadStream (see page 15699)	This is ReadStream, a member of class TJPEGImage.
V	SetHeight (see page 15700)	This is SetHeight, a member of class TJPEGImage.
V	SetPalette (see page 15701)	This is SetPalette, a member of class TJPEGImage.
V	SetTransparent (see page 14527)	This is SetTransparent, a member of class TGraphic.
V	SetWidth (see page 15701)	This is SetWidth, a member of class TJPEGImage.
V	WriteData (see page 15701)	This is WriteData, a member of class TJPEGImage.

Protected Properties

	Name	Description
R	Bitmap (see page 15702)	This is Bitmap, a member of class TJPEGImage.

Public Events

	Name	Description
	OnChange (see page 14531)	Occurs whenever a graphical image changes.
	OnProgress (see page 14531)	Occurs when a graphical image is in the process of changing.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 2854)	Obtains a reference to the Owner's interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 15693)	Copies the jpeg (see page 15685) image object and creates a new reference to the internal data source object.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.

	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Compress (see page 15695)	Forces the action of compression.
V	Create (see page 15691)	Instantiates a JPEG image object.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 15692)	Destroys of an instance of a jpeg (see page 15685) image object.
	DIBNeeded (see page 15696)	Decompress the jpeg (see page 15685) image into a bitmap.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	JPEGNeeded (see page 15697)	Creates a new TJPEGData (see page 15686) object if the jpeg (see page 15685) image only has a bitmap and a jpeg (see page 15685) is needed.
V	LoadFromClipboardFormat (see page 15698)	Reads in a jpeg (see page 15685) image from the Clipboard into the jpeg (see page 15685) image object.
V	LoadFromFile (see page 14523)	Loads a graphic image stored in a file.
V	LoadFromStream (see page 15698)	Loads the jpeg (see page 15685) image from a stream.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	QueryInterface (see page 2854)	Returns a reference to a specified interface if the object supports that interface.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
V	SaveToClipboardFormat (see page 15700)	Writes a jpeg (see page 15685) image to a variable in Clipboard format.
V	SaveToFile (see page 14525)	Saves a graphics image to a file.
V	SaveToStream (see page 15700)	Writes the jpeg (see page 15685) data to a stream.
V	SetSize (see page 14527)	Specifies the size of the graphic.

Public Properties

	Name	Description
	CompressionQuality (see page 15702)	Indicates the trade-off ratio between the image quality and the file size.
R	Empty (see page 14528)	Indicates whether the graphics object contains a graphic.
	Grayscale (see page 15702)	Determines whether the image output of a JPEG image is black and white, or color.
	Height (see page 14528)	Specifies the vertical size of the graphic in pixels.
	Modified (see page 14528)	Indicates whether the graphics object has been changed or edited.
	Palette (see page 14529)	Indicates the color palette of the graphical image.
	PaletteModified (see page 14529)	Indicates whether the palette has changed.
	Performance (see page 15703)	Controls (see page 5711) the trade-off between color quality and speed of decompression.
	PixelFormat (see page 15703)	Determines whether the JPEG image is displayed in 24 or 8-bit format.

	ProgressiveDisplay (see page 15703)	Controls (see page 5711) how the image is displayed when decompressing files.
	ProgressiveEncoding (see page 15704)	Determines whether an image can be progressively displayed when it is decompressed.
	Scale (see page 15704)	Determines the size of the JPEG image when it is displayed.
	Smoothing (see page 15704)	Determines whether the jpeg (see page 15685) image displays in blocks or with blurred edges.
	Transparent (see page 14529)	Indicates whether the image covers its rectangular area.
	Width (see page 14530)	Determines the maximum width of the graphics object in pixels.

88.1.2.2 TJPEGImage.Create Constructor

Instantiates a JPEG image object.

Pascal

```
constructor Create; override;
```

C++

```
virtual __fastcall TJPEGImage();
```

Description

Call Create to instantiate a jpeg (see page 15685) image object at runtime.

Create allocates memory for a jpeg (see page 15685) image object, and then initializes its properties.

After the jpeg (see page 15685) is loaded from a file, an internal bitmap is created of the image.

C++ Examples:

```
/*
This example converts a bitmap image to a jpeg file by using
the Assign method.  This example requires a button and two
images.  One image must have it's Picture property loaded
with a bitmap at design time.
*/

#include <Jpeg.hpp>

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  //Requires "jpeg.hpp" to be included in the source file
  TJPEGImage *jp = new TJPEGImage();
  try
  {
    jp->Assign(Image1->Picture->Bitmap);
    jp->SaveToFile("..\\factory.jpg");
    Image2->Stretch = True;
    Image2->Picture->LoadFromFile("..\\factory.jpg");
  }
  __finally
  {
    delete jp;
  }
}
```

Delphi Examples:

```
{
This example converts a bitmap image to a jpeg file by using
the Assign method.  This example requires a button and two
images.  One image must have it's Picture property loaded
with a bitmap at design time.
}
```

```
uses Jpeg;

procedure TForm1.Button1Click(Sender: TObject);
var
  jp: TJPEGImage;  //Requires the "jpeg" unit added to "uses" clause.
begin
  jp := TJPEGImage.Create;
  try
    with jp do
    begin
      Assign(Image1.Picture.Bitmap);
      SaveToFile('factory.jpg');
      Image2.Stretch := True;
      Image2.Picture.LoadFromFile('factory.jpg');
    end;
  finally
    jp.Free;
  end;
end;
```

See Also

Create (see page 22287)

88.1.2.3 TJPEGImage.Destroy Destructor

Destroys of an instance of a jpeg (see page 15685) image object.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TJPEGImage();
```

Description

Do not call Destroy directly in an application. Instead, call Free. Free verifies that the TJPEGImage (see page 15688) reference is not nil before it calls Destroy.

Destroy handles the freeing of the internal bitmap image and decrements the reference count on the jpeg (see page 15685) data source to which it was linked.

See Also

Free (see page 22300)

TJPEGData (see page 15686)

Destroy (see page 22287)

88.1.2.4 TJPEGImage Methods

The methods of the TJPEGImage class are listed here.

Protected Methods

	Name	Description
	AssignTo (see page 15694)	Copies the properties of an object to a destination object.
	Changed (see page 15695)	This is Changed, a member of class TJPEGImage.
	Draw (see page 15696)	This is Draw, a member of class TJPEGImage.
	Equals (see page 15696)	This is Equals, a member of class TJPEGImage.

	FreeBitmap (see page 15696)	This is FreeBitmap, a member of class TJPEGImage.
V	GetEmpty (see page 15697)	This is GetEmpty, a member of class TJPEGImage.
V	GetHeight (see page 15697)	This is GetHeight, a member of class TJPEGImage.
V	GetPalette (see page 15697)	This is GetPalette, a member of class TJPEGImage.
V	GetWidth (see page 15697)	This is GetWidth, a member of class TJPEGImage.
	NewBitmap (see page 15699)	This is NewBitmap, a member of class TJPEGImage.
	NewImage (see page 15699)	This is NewImage, a member of class TJPEGImage.
V	ReadData (see page 15699)	This is ReadData, a member of class TJPEGImage.
	ReadStream (see page 15699)	This is ReadStream, a member of class TJPEGImage.
V	SetHeight (see page 15700)	This is SetHeight, a member of class TJPEGImage.
V	SetPalette (see page 15701)	This is SetPalette, a member of class TJPEGImage.
V	SetWidth (see page 15701)	This is SetWidth, a member of class TJPEGImage.
V	WriteData (see page 15701)	This is WriteData, a member of class TJPEGImage.

Public Methods

	Name	Description
V	Assign (see page 15693)	Copies the jpeg (see page 15685) image object and creates a new reference to the internal data source object.
	Compress (see page 15695)	Forces the action of compression.
	DIBNeeded (see page 15696)	Decompress the jpeg (see page 15685) image into a bitmap.
	JPEGNeeded (see page 15697)	Creates a new TJPEGData (see page 15686) object if the jpeg (see page 15685) image only has a bitmap and a jpeg (see page 15685) is needed.
V	LoadFromClipboardFormat (see page 15698)	Reads in a jpeg (see page 15685) image from the Clipboard into the jpeg (see page 15685) image object.
V	LoadFromStream (see page 15698)	Loads the jpeg (see page 15685) image from a stream.
V	SaveToClipboardFormat (see page 15700)	Writes a jpeg (see page 15685) image to a variable in Clipboard format.
V	SaveToStream (see page 15700)	Writes the jpeg (see page 15685) data to a stream.

88.1.2.4.1 TJPEGImage.Assign Method

Copies the jpeg (see page 15685) image object and creates a new reference to the internal data source object.

Pascal

```
procedure Assign(Source: TPersistent); override;
```

C++

```
virtual __fastcall Assign(TPersistent * Source);
```

Description

Assign copies the jpeg (see page 15685) image contained in Source to the jpeg (see page 15685) image object. Assign then calls the inherited Assign. Assign creates a new link to the internal jpeg (see page 15685) data source by which the jpeg (see page 15685) image objects do reference counting and handle sharing.

Tip: To draw on a jpeg (see page 15685) image, Assign the jpeg (see page 15685) image to a bitmap, and then draw on that.

Note: An object of one type can always be assigned to another object of the same type. Also, the Source can be of type TPicture if the Graphic property of the picture is a jpeg (see page 15685) image or a bitmap.

C++ Examples:

```
/*
This example converts a bitmap image to a jpeg file by using
the Assign method.  This example requires a button and two
```

```
images.  One image must have it's Picture property loaded
with a bitmap at design time.
*/

#include <Jpeg.hpp>

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  //Requires "jpeg.hpp" to be included in the source file
  TJPEGImage *jp = new TJPEGImage();
  try
  {
    jp->Assign(Image1->Picture->Bitmap);
    jp->SaveToFile("..\\factory.jpg");
    Image2->Stretch = True;
    Image2->Picture->LoadFromFile("..\\factory.jpg");
  }
  __finally
  {
    delete jp;
  }
}
```

Delphi Examples:

```
{
This example converts a bitmap image to a jpeg file by using
the Assign method.  This example requires a button and two
images.  One image must have it's Picture property loaded
with a bitmap at design time.
}
uses Jpeg;

procedure TForm1.Button1Click(Sender: TObject);
var
  jp: TJPEGImage;  //Requires the "jpeg" unit added to "uses" clause.
begin
  jp := TJPEGImage.Create;
  try
    with jp do
    begin
      Assign(Image1.Picture.Bitmap);
      SaveToFile('factory.jpg');
      Image2.Stretch := True;
      Image2.Picture.LoadFromFile('factory.jpg');
    end;
  finally
    jp.Free;
  end;
end;
```

See Also

TJPEGData (see page 15686)

Assign (see page 2930)

Graphic (see page 14600)

88.1.2.4.2 TJPEGImage.AssignTo Method

Copies the properties of an object to a destination object.

Pascal

```
procedure AssignTo(Dest: TPersistent); override;
```

C++

```
virtual __fastcall AssignTo(TPersistent * Dest);
```

Description

Override the AssignTo method to extend the functionality of the Assign method of destination objects so that they handle newly created object classes. When defining a new object class, override the Assign method for every existing object class that should be able to copy its properties to the new class. Override the AssignTo method for every existing class to which the new class can copy.

The Assign method of TPersistent calls AssignTo if the descendant object does not succeed in copying the properties of a source object. The AssignTo method defined by TPersistent raises an EConvertError exception.

For example, given the following code in which A and B are instance variables:

```
A.Assign(B); {Delphi}
A->Assign(B); // C++
```

if A knows how to handle B, then it does so and returns. If A doesn't know how to handle B's type, execution will trickle to the TPersistent version of Assign, which calls:

```
B.AssignTo(A); {Delphi}
B->AssignTo(A); // C++
```

If B knows how to copy to A, the assignment succeeds. Otherwise, TPersistent raises an exception.

See Also

Assign (see page 2930)

EConvertError (see page 22724)

88.1.2.4.3 TJPEGImage.Changed Method

Pascal

```
procedure Changed(Sender: TObject); override;
```

C++

```
virtual __fastcall Changed(TObject * Sender);
```

Description

This is Changed, a member of class TJPEGImage.

88.1.2.4.4 TJPEGImage.Compress Method

Forces the action of compression.

Pascal

```
procedure Compress;
```

C++

```
__fastcall Compress();
```

Description

Call Compress to compress for optimization, such as before streaming out when assigning a bitmap to a jpeg (see page 15685). Changing properties like CompressionQuality (see page 15702) does not force compression. To force compression, call Compress.

See Also

CompressionQuality (see page 15702)

88.1.2.4.5 TJPEGImage.DIBNeeded Method

Decompress the jpeg (see page 15685) image into a bitmap.

Pascal

```
procedure DIBNeeded;
```

C++

```
__fastcall DIBNeeded();
```

Description

DIBNeeded is used when the jpeg (see page 15685) image needs a bitmap representation of its image. Call DIBNeeded just before drawing rather than while drawing for optimization.

See Also

JPEGNeeded (see page 15697)

88.1.2.4.6 TJPEGImage.Draw Method

Pascal

```
procedure Draw(ACanvas: TCanvas; const Rect: TRect); override;
```

C++

```
virtual __fastcall Draw(TCanvas ACanvas, const TRect Rect);
```

Description

This is Draw, a member of class TJPEGImage.

88.1.2.4.7 TJPEGImage.Equals Method

Pascal

```
function Equals(Graphic: TGraphic): Boolean; override;
```

C++

```
virtual __fastcall Boolean Equals(TGraphic Graphic);
```

Description

This is Equals, a member of class TJPEGImage.

88.1.2.4.8 TJPEGImage.FreeBitmap Method

Pascal

```
procedure FreeBitmap;
```

C++

```
__fastcall FreeBitmap();
```

Description

This is FreeBitmap, a member of class TJPEGImage.

88.1.2.4.9 TJPEGImage.GetEmpty Method

Pascal

```
function GetEmpty: Boolean; override;
```

C++

```
virtual __fastcall Boolean GetEmpty();
```

Description

This is GetEmpty, a member of class TJPEGImage.

88.1.2.4.10 TJPEGImage.GetHeight Method

Pascal

```
function GetHeight: Integer; override;
```

C++

```
virtual __fastcall int GetHeight();
```

Description

This is GetHeight, a member of class TJPEGImage.

88.1.2.4.11 TJPEGImage.GetPalette Method

Pascal

```
function GetPalette: HPALETTE; override;
```

C++

```
virtual __fastcall HPALETTE GetPalette();
```

Description

This is GetPalette, a member of class TJPEGImage.

88.1.2.4.12 TJPEGImage.GetWidth Method

Pascal

```
function GetWidth: Integer; override;
```

C++

```
virtual __fastcall int GetWidth();
```

Description

This is GetWidth, a member of class TJPEGImage.

88.1.2.4.13 TJPEGImage.JPEGNeeded Method

Creates a new TJPEGData (see page 15686) object if the jpeg (see page 15685) image only has a bitmap and a jpeg (

see page 15685) is needed.

Pascal

```
procedure JPEGNeeded;
```

C++

```
__fastcall JPEGNeeded();
```

Description

Call JPEGNeeded to create a new jpeg (see page 15685) data source when the jpeg (see page 15685) image has thrown away the jpeg (see page 15685) data and only has an internal bitmap. JPEGNeeded creates a new jpeg (see page 15685) data source. The SaveToStream (see page 15700) method uses JPEGNeeded.

See Also

SaveToStream (see page 15700)

TJPEGData (see page 15686)

88.1.2.4.14 TJPEGImage.LoadFromClipboardFormat Method

Reads in a jpeg (see page 15685) image from the Clipboard into the jpeg (see page 15685) image object.

Pascal

```
procedure LoadFromClipboardFormat(AFormat: Word; AData: THandle; APalette: HPALETTE); override;
```

C++

```
virtual __fastcall LoadFromClipboardFormat(Word AFormat, THandle AData, HPALETTE APalette);
```

Description

LoadFromClipboardFormat is called if the jpeg (see page 15685) image is registered with the TPicture object using the RegisterClipboardFormat method. LoadFromClipboardFormat can also recognize, and supports, a bitmap format on the Clipboard.

LoadFromClipboardFormat replaces the current image with the data pointed to by the AData parameter. The palette for the jpeg (see page 15685) image is specified by the APalette parameter.

See Also

TBitmap (see page 14396)

TClipboard (see page 3328)

TPicture (see page 14584)

RegisterClipboardFormat (see page 14592)

88.1.2.4.15 TJPEGImage.LoadFromStream Method

Loads the jpeg (see page 15685) image from a stream.

Pascal

```
procedure LoadFromStream(Stream: TStream); override;
```

C++

```
virtual __fastcall LoadFromStream(TStream Stream);
```

Description

Use LoadFromStream by specifying the stream from which the jpeg (see page 15685) image is loaded as the value of Stream. LoadFromStream reads a jpeg (see page 15685) data source from a stream and replaces the current image with it.

See Also

SaveToStream (see page 15700)

TJPEGData (see page 15686)

88.1.2.4.16 TJPEGImage.NewBitmap Method

Pascal

```
procedure NewBitmap;
```

C++

```
__fastcall NewBitmap();
```

Description

This is NewBitmap, a member of class TJPEGImage.

88.1.2.4.17 TJPEGImage.NewImage Method

Pascal

```
procedure NewImage;
```

C++

```
__fastcall NewImage();
```

Description

This is NewImage, a member of class TJPEGImage.

88.1.2.4.18 TJPEGImage.ReadData Method

Pascal

```
procedure ReadData(Stream: TStream); override;
```

C++

```
virtual __fastcall ReadData(TStream Stream);
```

Description

This is ReadData, a member of class TJPEGImage.

88.1.2.4.19 TJPEGImage.ReadStream Method

Pascal

```
procedure ReadStream(Size: Longint; Stream: TStream);
```

C++

```
__fastcall ReadStream(Longint Size, TStream Stream);
```

Description

This is ReadStream, a member of class TJPEGImage.

88.1.2.4.20 TJPEGImage.SaveToClipboardFormat Method

Writes a jpeg (see page 15685) image to a variable in Clipboard format.

Pascal

```
procedure SaveToClipboardFormat(var AFormat: Word; var AData: THandle; var APalette:
HPALETTE); override;
```

C++

```
virtual __fastcall SaveToClipboardFormat(Word AFormat, THandle AData, HPALETTE APalette);
```

Description

Use SaveToClipboardFormat to save the jpeg (see page 15685) image to a variable. The palette is returned as the APalette parameter, the format as the Aformat parameter, and the data as the AData parameter. Before the jpeg (see page 15685) image can be saved, an application must have registered the format with the TJPEGImage (see page 15688) object using the RegisterClipboardFormat method.

See Also

RegisterClipboardFormat (see page 14592)

88.1.2.4.21 TJPEGImage.SaveToStream Method

Writes the jpeg (see page 15685) data to a stream.

Pascal

```
procedure SaveToStream(Stream: TStream); override;
```

C++

```
virtual __fastcall SaveToStream(TStream Stream);
```

Description

Use SaveToStream to save the jpeg (see page 15685) data to the stream specified by the Stream parameter. SaveToStream expects jpeg (see page 15685) image data and may incur overhead of a compression cycle if the source is a bitmap.

See Also

LoadFromStream (see page 15698)

88.1.2.4.22 TJPEGImage.SetHeight Method

Pascal

```
procedure SetHeight(Value: Integer); override;
```

C++

```
virtual __fastcall SetHeight(int Value);
```

Description

This is SetHeight, a member of class TJPEGImage.

88.1.2.4.23 TJPEGImage.SetPalette Method

Pascal

```
procedure SetPalette(Value: HPalette); override;
```

C++

```
virtual __fastcall SetPalette(HPalette Value);
```

Description

This is SetPalette, a member of class TJPEGImage.

88.1.2.4.24 TJPEGImage.SetWidth Method

Pascal

```
procedure SetWidth(Value: Integer); override;
```

C++

```
virtual __fastcall SetWidth(int Value);
```

Description

This is SetWidth, a member of class TJPEGImage.

88.1.2.4.25 TJPEGImage.WriteData Method

Pascal

```
procedure WriteData(Stream: TStream); override;
```

C++

```
virtual __fastcall WriteData(TStream Stream);
```

Description

This is WriteData, a member of class TJPEGImage.

88.1.2.5 TJPEGImage Properties

The properties of the TJPEGImage class are listed here.

Protected Properties

	Name	Description
	Bitmap (see page 15702)	This is Bitmap, a member of class TJPEGImage.

Public Properties

	Name	Description
	CompressionQuality (see page 15702)	Indicates the trade-off ratio between the image quality and the file size.
	Grayscale (see page 15702)	Determines whether the image output of a JPEG image is black and white, or color.
	Performance (see page 15703)	Controls (see page 5711) the trade-off between color quality and speed of decompression.
	PixelFormat (see page 15703)	Determines whether the JPEG image is displayed in 24 or 8-bit format.
	ProgressiveDisplay (see page 15703)	Controls (see page 5711) how the image is displayed when decompressing files.

	ProgressiveEncoding (see page 15704)	Determines whether an image can be progressively displayed when it is decompressed.
	Scale (see page 15704)	Determines the size of the JPEG image when it is displayed.
	Smoothing (see page 15704)	Determines whether the jpeg (see page 15685) image displays in blocks or with blurred edges.

88.1.2.5.1 TJPEGImage.Bitmap Property

Pascal

```
property Bitmap: TBitmap;
```

C++

```
__property TBitmap Bitmap;
```

Description

This is Bitmap, a member of class TJPEGImage.

88.1.2.5.2 TJPEGImage.CompressionQuality Property

Indicates the trade-off ratio between the image quality and the file size.

Pascal

```
property CompressionQuality: TJPEGQualityRange;
```

C++

```
__property TJPEGQualityRange CompressionQuality;
```

Description

Use CompressionQuality to set the compression quality of the JPEG image when writing out a jpeg (see page 15685) image. Higher compression results in a poorer picture quality, but a smaller file size. This property is not used for reading in files.

TJPEGQualityRange (see page 15709) is the type of the CompressionQuality property. The higher the TJPEGQualityRange (see page 15709) value (up to a maximum of 100), the better the image quality, but the larger the file size. The lower the TJPEGQualityRange (see page 15709) value (to a minimum of 1), the smaller the resulting file size, but at the expense of picture quality.

88.1.2.5.3 TJPEGImage.Grayscale Property

Determines whether the image output of a JPEG image is black and white, or color.

Pascal

```
property Grayscale: Boolean;
```

C++

```
__property Boolean Grayscale;
```

Description

Use GrayScale for reading in and writing out, that is, for decompressing and compressing, a jpeg (see page 15685) image. This property affects how the image is displayed.

GrayScale is used for speed in output optimization. When GrayScale is set to true, the color is separated from luminosity. Color takes the most time to decompress, so for previewing the image, GrayScale can be set to true for speed. The output then contains 255 shades of gray.

88.1.2.5.4 TJPEGImage.Performance Property

Controls (see page 5711) the trade-off between color quality and speed of decompression.

Pascal

```
property Performance: TJPEGPerformance;
```

C++

```
__property TJPEGPerformance Performance;
```

Description

Use Performance to set the performance of the jpeg (see page 15685) image when reading, that is, for decompressing files. This property is not used for writing out files.

Performance affects the display of the internal bitmap image. This image is a 256-color bitmap. Setting Performance to jpBestSpeed may cause some dithering in the bitmap image.

88.1.2.5.5 TJPEGImage.PixelFormat Property

Determines whether the JPEG image is displayed in 24 or 8-bit format.

Pascal

```
property PixelFormat: TJPEGPixelFormat;
```

C++

```
__property TJPEGPixelFormat PixelFormat;
```

Description

Use PixelFormat to set the pixel format of the jpeg (see page 15685) image to 8-bit for video drivers that cannot display 24-bit. The native format of a jpeg (see page 15685) image is 24-bit. PixelFormat is used for decompression, that is, for reading in files. PixelFormat will also apply to a bitmap if the image is copied to it.

88.1.2.5.6 TJPEGImage.ProgressiveDisplay Property

Controls (see page 5711) how the image is displayed when decompressing files.

Pascal

```
property ProgressiveDisplay: Boolean;
```

C++

```
__property Boolean ProgressiveDisplay;
```

Description

Use ProgressiveDisplay to turn on or off the incremental display of an image when reading in files. For example, if the jpeg (see page 15685) data source file is on the hard drive, progressively displaying it slows down the display time: in this case setting ProgressiveDisplay to false speeds up the displaying of the image. If the file must be downloaded, set ProgressiveDisplay to true if the downloading process will take as long as the progressive displaying of the image.

ProgressiveDisplay is used only for decompression, but is affected by the manner in which the image was compressed. Images that were compressed with ProgressiveEncoding (see page 15704) set to false cannot take advantage of ProgressiveDisplay. Setting ProgressiveDisplay to true for these images has no effect.

See Also

ProgressiveEncoding (see page 15704)

Smoothing (see page 15704)

88.1.2.5.7 TJPEGImage.ProgressiveEncoding Property

Determines whether an image can be progressively displayed when it is decompressed.

Pascal

```
property ProgressiveEncoding: Boolean;
```

C++

```
__property Boolean ProgressiveEncoding;
```

Description

Use ProgressiveEncoding to compress an image when writing out files, so that it can be progressively displayed when it is decompressed. Setting the ProgressiveDisplay (see page 15703) property to true has no effect if ProgressiveEncoding was not set to true when the image was compressed.

See Also

ProgressiveDisplay (see page 15703)

88.1.2.5.8 TJPEGImage.Scale Property

Determines the size of the JPEG image when it is displayed.

Pascal

```
property Scale: TJPEGScale;
```

C++

```
__property TJPEGScale Scale;
```

Description

Use Scale to optimize performance for previewing an image. jsFullSize displays the image as maximum size, whereas jsEighth displays an eighth of the image size, but 8 times faster.

TJPEGScale (see page 15708) is the type of the Scale property.

Scale it used for reading in files, that is, for decompression.

88.1.2.5.9 TJPEGImage.Smoothing Property

Determines whether the jpeg (see page 15685) image displays in blocks or with blurred edges.

Pascal

```
property Smoothing: Boolean;
```

C++

```
__property Boolean Smoothing;
```

Description

Smoothing is used if ProgressiveDisplay (see page 15703) is true, to determine whether the jpeg (see page 15685) image is displayed in small blocks or with blurred edges. If Smoothing is true, the edges are blurred during progressive displaying of the image. If Smoothing is false, raw blocks of color are used to display the image.

See Also

ProgressiveDisplay (see page 15703)

88.2 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TJPEGPerformance (see page 15707)	TJPEGPerformance represents the type of optimization to use when displaying a JPEG image.
	TJPEGPixelFormat (see page 15707)	TJPEGPixelFormat indicates the format used to display a JPEG image.
	TJPEGScale (see page 15708)	TJPEGScale represents the display size of a JPEG image.

Records

	Name	Description
	TJPEGDefaults (see page 15706)	This is record jpeg.TJPEGDefaults.

88.2.1 jpeg.TJPEGDefaults Record

Pascal

```
TJPEGDefaults = record
  CompressionQuality: TJPEGQualityRange;
  Grayscale: Boolean;
  Performance: TJPEGPerformance;
  PixelFormat: TJPEGPixelFormat;
  ProgressiveDisplay: Boolean;
  ProgressiveEncoding: Boolean;
  Scale: TJPEGScale;
  Smoothing: Boolean;
end;
```

C++

```
struct TJPEGDefaults {
  TJPEGQualityRange CompressionQuality;
  Boolean Grayscale;
  TJPEGPerformance Performance;
  TJPEGPixelFormat PixelFormat;
  Boolean ProgressiveDisplay;
  Boolean ProgressiveEncoding;
  TJPEGScale Scale;
  Boolean Smoothing;
};
```

File

jpeg

Description

This is record jpeg.TJPEGDefaults.

88.2.2 jpeg.TJPEGPerformance Enumeration

TJPEGPerformance represents the type of optimization to use when displaying a JPEG image.

Pascal

```
TJPEGPerformance = (
  jpBestQuality,
  jpBestSpeed
);
```

C++

```
enum TJPEGPerformance {
  jpBestQuality,
  jpBestSpeed
};
```

File

jpeg

Description

The following table lists the possible values:

Value	Meaning
jpBestQuality	Optimize for image quality. This results in slower rendering of the image.
jpBestSpeed	Optimize for speed of display. This may result in some dithering in the image.

88.2.3 jpeg.TJPEGPixelFormat Enumeration

TJPEGPixelFormat indicates the format used to display a JPEG image.

Pascal

```
TJPEGPixelFormat = (
  jf24Bit,
  jf8Bit
);
```

C++

```
enum TJPEGPixelFormat {
  jf24Bit,
  jf8Bit
};
```

File

jpeg

Description

The following table lists the possible values:

Value	Meaning
jf24Bit	Use the native 24-bit jpeg (see page 15685) image format.

jf8Bit	Use an 8-bit format (for video drivers that do not support the 24-bit format)

88.2.4 jpeg.TJPEGScale Enumeration

TJPEGScale represents the display size of a JPEG image.

Pascal

```
TJPEGScale = (
  jsFullSize,
  jsHalf,
  jsQuarter,
  jsEighth
);
```

C++

```
enum TJPEGScale {
  jsFullSize,
  jsHalf,
  jsQuarter,
  jsEighth
};
```

File

jpeg

Description

The following table lists the values of TJPEGScale:

Value	Meaning
jsFullSize	Displays a full-sized image.
jsHalf	Displays a half-size image in half the time it takes to display a full-sized image.
jsQuarter	Displays a quarter-size image in a quarter of the time it takes to display a full-sized image.
jsEighth	Displays an eighth-size image in an eighth of the time it takes to display a full-sized image.

88.3 Types

The following table lists types in this documentation.

Types

Name	Description
TJPEGQualityRange (see page 15709)	TJPEGQualityRange represents the trade-off ratio between image quality and file size in a JPEG image.

88.3.1 jpeg.TJPEGQualityRange Type

TJPEGQualityRange represents the trade-off ratio between image quality and file size in a JPEG image.

Pascal

```
TJPEGQualityRange = 1..100;
```

C++

```
1..100 TJPEGQualityRange;
```

File

jpeg

Description

TJPEGQualityRange represents a scale of 1 to 100, where higher values represent better image quality (but larger file size) and lower values represent smaller file sizes but with a loss of picture quality.

88.4 Variables

The following table lists variables in this documentation.

Variables

Name	Description
JPEGDefaults (see page 15710)	This is variable jpeg.JPEGDefaults.

88.4.1 jpeg.JPEGDefaults Variable

Pascal

```
JPEGDefaults: TJPEGDefaults = ( CompressionQuality: 90; Grayscale: False; Performance:
jpBestQuality; PixelFormat: jf24Bit; ProgressiveDisplay: False; ProgressiveEncoding: False;
Scale: jsFullSize; Smoothing: True; );
```

C++

```
TJPEGDefaults JPEGDefaults = ( CompressionQuality: 90; Grayscale: False; Performance:
jpBestQuality; PixelFormat: jf24Bit; ProgressiveDisplay: False; ProgressiveEncoding: False;
Scale: jsFullSize; Smoothing: True; );
```

File

jpeg

Description

This is variable jpeg.JPEGDefaults.

89 ListActns Namespace

This is namespace ListActns.

Topics

Name	Description
Classes (see page 15713)	The following table lists classes in this documentation.
Structs, Records, Enums (see page 15792)	The following table lists structs, records, enums in this documentation.
Types (see page 15793)	The following table lists types in this documentation.

Classes

	Name	Description
	TCustomListAction (see page 15713)	TCustomListAction is the base class for action objects that provide items to client controls.
	TCustomStaticListAction (see page 15724)	This is class ListActns.TCustomStaticListAction.
	TCustomVirtualListAction (see page 15738)	This is class ListActns.TCustomVirtualListAction.
	TListActionLink (see page 15744)	This is class ListActns.TListActionLink.
	TListControlItem (see page 15750)	TListControlItem represents an item with a text value, an image, and a data pointer.
	TListControlItems (see page 15757)	TListControlItems manages a collection of TListControlItem (see page 15750) objects.
	TStaticListAction (see page 15765)	TStaticListAction provides items to client controls.
	TStaticListItems (see page 15777)	TStaticListItems represents the items that TStaticListAction (see page 15765) supplies to client controls.
	TVirtualListAction (see page 15780)	TVirtualListAction provides items to a client controls.

Structs, Records, Enums

	Name	Description
	TListItemsSortType (see page 15792)	This is record ListActns.TListItemsSortType.

Types

Name	Description
TGetItemCountEvent (see page 15793)	This is type ListActns.TGetItemCountEvent.
TGetItemEvent (see page 15793)	This is type ListActns.TGetItemEvent.
TGetVirtualItemEvent (see page 15794)	This is type ListActns.TGetVirtualItemEvent.
TItemSelectedEvent (see page 15794)	This is type ListActns.TItemSelectedEvent.
TListCompareEvent (see page 15794)	This is type ListActns.TListCompareEvent.
TListControlItemClass (see page 15795)	This is type ListActns.TListControlItemClass.

TListItemsCompare (see page 15795)	This is type ListActns.TListItemsCompare.

89.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TCustomListAction (see page 15713)	TCustomListAction is the base class for action objects that provide items to client controls.
	TCustomStaticListAction (see page 15724)	This is class ListActns.TCustomStaticListAction.
	TCustomVirtualListAction (see page 15738)	This is class ListActns.TCustomVirtualListAction.
	TListActionLink (see page 15744)	This is class ListActns.TListActionLink.
	TListControlItem (see page 15750)	TListControlItem represents an item with a text value, an image, and a data pointer.
	TListControlItems (see page 15757)	TListControlItems manages a collection of TListControlItem (see page 15750) objects.
	TStaticListAction (see page 15765)	TStaticListAction provides items to client controls.
	TStaticListItems (see page 15777)	TStaticListItems represents the items that TStaticListAction (see page 15765) supplies to client controls.
	TVirtualListAction (see page 15780)	TVirtualListAction provides items to a client controls.

89.1.1 TCustomListAction Class

TCustomListAction is the base class for action objects that provide items to client controls.

Class Hierarchy

Pascal

```
TCustomListAction = class(TCustomAction);
```

C++

```
class TCustomListAction : public TCustomAction;
```

File

ListActns

Description

TCustomListAction implements the common behavior for actions that supply the items to a list view, list box or combo box.

When an application sets the Active (see page 15721) property of a list action to true, the action fills all client list boxes and combo boxes with items. Each item may include information such as a text caption, an image, and a pointer to data.

When the user selects an item in one of the client controls, the client "executes" the list action, which causes it to generate an OnItemSelected (see page 15724) event.

When a TCustomListAction is added to an action manager, it uses the action to generate a drop-down list on a tool bar.

See Also

TStaticListAction (see page 15765)

TVirtualListAction (see page 15780)

89.1.1.1 TCustomListAction Members

The following tables list the members exposed by TCustomListAction.

Protected Events

	Name	Description
	OnChange (see page 2716)	Occurs when one of the action's properties changes.
	OnGetItemCount (see page 15723)	Occurs when the list action needs to determine the number of items it supplies to client controls.
	OnItemSelected (see page 15724)	Occurs when a client control executes the action because a user selected one of the items.

Protected Fields

	Name	Description
	FClients (see page 2711)	This is FClients, a member of class TBasicAction.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FImage (see page 302)	This is FImage, a member of class TCustomAction.
	FMask (see page 303)	This is FMask, a member of class TCustomAction.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 303)	Copies the properties of this action to a destination object.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	Change (see page 2712)	Generates an OnChange (see page 2716) event.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetCount (see page 15719)	This is GetCount, a member of class TCustomListAction.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
V	GetString (see page 15719)	Returns the value of the Strings (see page 15723) property.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
V	HandleShortCut (see page 306)	Executes the action when the user types on of its short cuts.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 15720)	Initializes the action after it is loaded into memory.
V	Notification (see page 2713)	Responds when components are created or destroyed.

V	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 294)	This is ReadState, a member of class TContainedAction.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
V	SetHelpContext (see page 306)	This is SetHelpContext, a member of class TCustomAction.
V	SetHelpKeyword (see page 306)	This is SetHelpKeyword, a member of class TCustomAction.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 307)	Sets the value of the Name property.
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
V	SetOnExecute (see page 2714)	Assigns an OnExecute (see page 2716) event handler.
V	SetParentComponent (see page 294)	This is SetParentComponent, a member of class TContainedAction.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetString (see page 15720)	Sets the value of the Strings (see page 15723) property.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	Images (see page 15722)	Lists the images that the list action supplies along with items.
R	Loading (see page 15723)	Indicates whether the action is currently adding items to client controls.
	SavedEnabledState (see page 313)	Saves the value of the Enabled (see page 310) property when the action is suspended.

Public Events

	Name	Description
	OnExecute (see page 2716)	Occurs when the client event that is linked to it fires.
	OnHint (see page 315)	Occurs when the mouse pauses over a client control or menu item.
	OnUpdate (see page 2718)	Occurs when the application is idle or when the action list updates.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.

	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 15718)	Creates an instance of TCustomListAction (see page 15713).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 292)	Destroys the instance of the contained action.
V	Destroy (see page 302)	Frees an instance of TCustomAction (see page 297).
V	Destroy (see page 2711)	Disposes of an instance of a TBasicAction (see page 2707) object.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DoHint (see page 303)	Generates an OnHint (see page 315) event.
V	Execute (see page 293)	Responds when the client control "fires".
V	Execute (see page 304)	Responds when a client control "fires".
	Execute (see page 2712)	Generates an OnExecute (see page 2716) event.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
V	ExecuteTarget (see page 15718)	Generates an OnItemSelected (see page 15724) event.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
V	GetParentComponent (see page 293)	Returns the action list or action manager that contains the action.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	HandlesTarget (see page 15719)	Indicates whether the action can execute its function.
V	HasParent (see page 294)	Indicates whether the action is contained in an action list or action manager.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.

	RegisterChanges (see page 2713)	Associates the action with an action link.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UnRegisterChanges (see page 2714)	Breaks the association between the action and the action link.
V	Update (see page 295)	Indicates whether the action updates itself.
V	Update (see page 2714)	Provides an opportunity to execute centralized code when an application is idle.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
V	UpdateTarget (see page 2715)	Introduces an interface for a method of notifying a client when the action updates itself.

Public Properties

	Name	Description
	ActionComponent (see page 2715)	Indicates the client component that caused this action to execute.
	ActionList (see page 295)	Indicates the action list or action manager that contains the action.
	Active (see page 15721)	Indicates whether the list action has supplied items to its client controls.
	AutoCheck (see page 308)	Controls (see page 5711) whether the Checked (see page 308) property toggles when the action executes.
	Caption (see page 308)	Represents the caption of client controls and menu items.
	Checked (see page 308)	Indicates whether client controls and menu items appear checked.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
R	Count (see page 15722)	This is Count, a member of class TCustomListAction.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DisableIfNoHandler (see page 310)	Indicates whether client components should be disabled if no handler is found.
	Enabled (see page 310)	Indicates whether client controls and menu items are enabled.
	GroupIndex (see page 311)	Indicates whether the action acts like a radio button with other actions in the same action list.
	HelpContext (see page 311)	Indicates the help context ID for client controls and menu items.
	HelpKeyword (see page 311)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 312)	Indicates the mechanism for client controls and menu items to use when invoking help.
	Hint (see page 312)	Indicates the Help hint for client controls and menu items.
	ImageIndex (see page 313)	Indicates the ImageIndex property for client controls and menu items.
	Index (see page 296)	Specifies the index of the action in its action list or action manager.
	ItemIndex (see page 15722)	Specifies the index of the selected item.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	SecondaryShortCuts (see page 314)	Specifies the short cuts (in addition to ShortCut (see page 314)) for triggering clients.
	ShortCut (see page 314)	Specifies the ShortCut property for client menu items.
	Strings (see page 15723)	This is Strings, a member of class TCustomListAction.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	Visible (see page 314)	Specifies the Visible property for client controls and menu items.

Published Properties

	Name	Description
	Category (see page 296)	Specifies the category under which the action appears in its action list or action manager.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

89.1.1.2 TCustomListAction.Create Constructor

Creates an instance of TCustomListAction (see page 15713).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomListAction(TComponent * AOwner);
```

Description

Most applications do not need to call the TCustomListAction (see page 15713) constructor because actions are added at design time to an action list or action manager.

AOwner specifies the Owner for the action. This is the component that is responsible for freeing the TCustomListAction (see page 15713) instance.

See Also

Owner (see page 2807)

89.1.1.3 TCustomListAction Methods

The methods of the TCustomListAction class are listed here.

Protected Methods

	Name	Description
	GetCount (see page 15719)	This is GetCount, a member of class TCustomListAction.
	GetString (see page 15719)	Returns the value of the Strings (see page 15723) property.
	Loaded (see page 15720)	Initializes the action after it is loaded into memory.
	SetString (see page 15720)	Sets the value of the Strings (see page 15723) property.

Public Methods

	Name	Description
	ExecuteTarget (see page 15718)	Generates an OnItemSelected (see page 15724) event.
	HandlesTarget (see page 15719)	Indicates whether the action can execute its function.

89.1.1.3.1 TCustomListAction.ExecuteTarget Method

Generates an OnItemSelected (see page 15724) event.

Pascal

```
procedure ExecuteTarget(Target: TObject); override;
```

C++

```
virtual __fastcall ExecuteTarget(TObject * Target);
```

Description

ExecuteTarget is called automatically when the user selects one of the items that the list action supplies to a client list box or combo box.

Target is the control whose item was selected.

ExecuteTarget updates the ItemIndex (see page 15722) property of all client controls that descend from TCustomListControl, and then generates an OnItemSelected (see page 15724) event, where your application can respond to the user's selection.

See Also

OnItemSelected (see page 15724)

ItemIndex (see page 15722)

89.1.1.3.2 TCustomListAction.GetCount Method

Pascal

```
function GetCount: Integer; virtual;
```

C++

```
virtual __fastcall int GetCount();
```

Description

This is GetCount, a member of class TCustomListAction.

89.1.1.3.3 TCustomListAction.GetString Method

Returns the value of the Strings (see page 15723) property.

Pascal

```
function GetString(Index: Integer): String; virtual;
```

C++

```
virtual __fastcall AnsiString GetString(int Index);
```

Description

GetString is the protected read implementation of the Strings (see page 15723) property.

In TCustomListAction (see page 15713), GetString always returns an empty string.

Override GetString to provide a more meaningful value to the Strings (see page 15723) property. For example, TStaticListAction (see page 15765) overrides GetString to return the caption of the specified item.

See Also

strings (see page 15723)

89.1.1.3.4 TCustomListAction.HandlesTarget Method

Indicates whether the action can execute its function.

Pascal

```
function HandlesTarget(Target: TObject): Boolean; override;
```

C++

```
virtual __fastcall Boolean HandlesTarget(TObject * Target);
```

Description

Do not call the HandlesTarget method. This method is called automatically when the user invokes an object that is linked to this action. The HandlesTarget method provides the action object with an opportunity to indicate whether it is appropriate to execute at this time with the object specified by the Target parameter as a "target".

Target is the currently active object.

HandlesTarget always returns true because the list action's ability to perform its function is not dependant on any particular target.

See Also

ExecuteTarget (see page 15718)

UpdateTarget (see page 2715)

89.1.1.3.5 TCustomListAction.Loaded Method

Initializes the action after it is loaded into memory.

Pascal

```
procedure Loaded; override;
```

C++

```
virtual __fastcall Loaded();
```

Description

Loaded is called automatically when the form or data module containing the action has been completely loaded into memory. TCustomListAction (see page 15713) overrides the inherited method to set Active (see page 15721) and Images (see page 15722) properties now that the other components involved (the client controls whose items are set when Active (see page 15721) becomes true and the image list component that is the value of Images (see page 15722)) are known to be loaded into memory.

See Also

Loaded (see page 2782)

Images (see page 15722)

Active (see page 15721)

89.1.1.3.6 TCustomListAction.SetString Method

Sets the value of the Strings (see page 15723) property.

Pascal

```
procedure SetString(Index: Integer; const Value: String); virtual;
```

C++

```
virtual __fastcall SetString(int Index, const AnsiString Value);
```

Description

SetString is the protected write implementation of the Strings (see page 15723) property.

In TCustomListAction (see page 15713), SetString does nothing.

Override SetString to provide a more meaningful value to the Strings (see page 15723) property. For example, TStaticListAction (see page 15765) overrides SetString to set the caption of the specified item.

See Also

strings (see page 15723)

89.1.1.4 TCustomListAction Properties

The properties of the TCustomListAction class are listed here.

Protected Properties

	Name	Description
	Images (see page 15722)	Lists the images that the list action supplies along with items.
R	Loading (see page 15723)	Indicates whether the action is currently adding items to client controls.

Public Properties

	Name	Description
	Active (see page 15721)	Indicates whether the list action has supplied items to its client controls.
R	Count (see page 15722)	This is Count, a member of class TCustomListAction.
	ItemIndex (see page 15722)	Specifies the index of the selected item.
	Strings (see page 15723)	This is Strings, a member of class TCustomListAction.

89.1.1.4.1 TCustomListAction.Active Property

Indicates whether the list action has supplied items to its client controls.

Pascal

```
property Active: Boolean;
```

C++

```
__property Boolean Active;
```

Description

Set Active to true to cause the list action to fill all client controls with the items. These Items are supplied by calling the GetItem method, iterating over every index from 0 to Count (see page 15722).

See Also

GetItem

getitem

Items (see page 21348)

items

Items (see page 21187)

count (see page 15722)

Items (see page 3814)

strings (see page 15723)

89.1.1.4.2 TCustomListAction.Count Property

Pascal

```
property Count: Integer;
```

C++

```
__property int Count;
```

Description

This is Count, a member of class TCustomListAction.

89.1.1.4.3 TCustomListAction.Images Property

Lists the images that the list action supplies along with items.

Pascal

```
property Images: TCustomImageList;
```

C++

```
__property TCustomImageList Images;
```

Description

For each item that the list action supplies to clients, it can supply an image index along with other information such as the text value. The supplied image index refers to an image in the Images property.

Note: List actions do not supply images to all clients. The Images property controls the SmallImages property of a list view or the Images property of a TComboBoxEx descendant.

See Also

SmallImages (see page 3825)

Images (see page 3700)

89.1.1.4.4 TCustomListAction.ItemIndex Property

Specifies the index of the selected item.

Pascal

```
property ItemIndex: Integer;
```

C++

```
__property int ItemIndex;
```

Description

ItemIndex represents the index of the selected item in all client controls that descend from TCustomListControl. Setting ItemIndex causes these clients to change their selection. When the user updates the selection using one of these clients, TCustomListAction (see page 15713) automatically updates the others so that they select the same item.

Note: List actions do not supply ItemIndex to all clients. The ItemIndex property controls only the ItemIndex property of clients that descend from TCustomListControl.

See Also

OnItemSelected (see page 15724)

ItemIndex (see page 5944)

89.1.1.4.5 TCustomListAction.Loading Property

Indicates whether the action is currently adding items to client controls.

Pascal

```
property Loading: Boolean;
```

C++

```
__property Boolean Loading;
```

Description

Loading is used internally to detect when the list action is in the process of supplying client controls with items.

See Also

Active (see page 15721)

89.1.1.4.6 TCustomListAction.Strings Property

Pascal

```
property Strings [Index: Integer]: String;
```

C++

```
__property AnsiString Strings[int Index];
```

Description

This is Strings, a member of class TCustomListAction.

89.1.1.5 TCustomListAction Events

The events of the TCustomListAction class are listed here.

Protected Events

	Name	Description
	OnGetItemCount (see page 15723)	Occurs when the list action needs to determine the number of items it supplies to client controls.
	OnItemSelected (see page 15724)	Occurs when a client control executes the action because a user selected one of the items.

89.1.1.5.1 TCustomListAction.OnGetItemCount Event

Occurs when the list action needs to determine the number of items it supplies to client controls.

Pascal

```
property OnGetItemCount: TGetItemCountEvent;
```

C++

```
__property TGetItemCountEvent OnGetItemCount;
```

Description

The GetCount (see page 15719) method generates an OnGetItemCount event to supply the value of the Count (see page 15722) property. Write an OnGetItemCount event handler to indicate the number of items for which you are supplying values in

the OnGetItem event handler.

Sender is the list action that is supplying data to client controls.

Count (see page 15722) returns the number of items this list action supplies to client controls.

See Also

getcount (see page 15719)

count (see page 15722)

89.1.1.5.2 TCustomListAction.OnItemSelected Event

Occurs when a client control executes the action because a user selected one of the items.

Pascal

```
property OnItemSelected: TItemSelectedEvent;
```

C++

```
__property TItemSelectedEvent OnItemSelected;
```

Description

Write an OnItemSelected event handler to respond when the user selects one of the items supplied to client controls. Before this event is called, the list action first updates the ItemIndex (see page 15722) property of any client controls that descend from TCustomListControl.

Sender is the list action that supplies items to the control in which an item was selected.

Control is the control in which the user selected an item.

See Also

ExecuteTarget (see page 15718)

ItemIndex (see page 15722)

89.1.2 TCustomStaticListAction Class

Class Hierarchy

Pascal

```
TCustomStaticListAction = class(TCustomListAction);
```

C++

```
class TCustomStaticListAction : public TCustomListAction;
```

File

ListActns

Description

This is class ListActns.TCustomStaticListAction.

89.1.2.1 TCustomStaticListAction Members

The following tables list the members exposed by TCustomStaticListAction.

Protected Events

	Name	Description
	OnChange (see page 2716)	Occurs when one of the action's properties changes.
	OnGetItemCount (see page 15723)	Occurs when the list action needs to determine the number of items it supplies to client controls.

Protected Fields

	Name	Description
	FClients (see page 2711)	This is FClients, a member of class TBasicAction.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FImage (see page 302)	This is FImage, a member of class TCustomAction.
	FMask (see page 303)	This is FMask, a member of class TCustomAction.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 303)	Copies the properties of this action to a destination object.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	Change (see page 2712)	Generates an OnChange (see page 2716) event.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetCount (see page 15730)	This is GetCount, a member of class TCustomStaticListAction.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
	GetItem (see page 15730)	This is GetItem, a member of class TCustomStaticListAction.
V	GetItemClass (see page 15730)	This is GetItemClass, a member of class TCustomStaticListAction.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
V	GetString (see page 15730)	Returns the value of the Strings property.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
V	HandleShortCut (see page 306)	Executes the action when the user types on of its short cuts.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Loaded (see page 15720)	Initializes the action after it is loaded into memory.
V	Notification (see page 2713)	Responds when components are created or destroyed.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 294)	This is ReadState, a member of class TContainedAction.

	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetHelpContext (see page 306)	This is SetHelpContext, a member of class TCustomAction.
	SetHelpKeyword (see page 306)	This is SetHelpKeyword, a member of class TCustomAction.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 307)	Sets the value of the Name property.
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetOnExecute (see page 2714)	Assigns an OnExecute (see page 2716) event handler.
	SetParentComponent (see page 294)	This is SetParentComponent, a member of class TContainedAction.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	SetString (see page 15731)	Sets the value of the Strings property.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	Loading (see page 15723)	Indicates whether the action is currently adding items to client controls.
	SavedEnabledState (see page 313)	Saves the value of the Enabled (see page 310) property when the action is suspended.

Public Events

	Name	Description
	OnExecute (see page 2716)	Occurs when the client event that is linked to it fires.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 15729)	Creates an instance of TCustomListAction.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 15729)	Frees an instance of TCustomAction.

	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DoHint (see page 303)	Generates an OnHint (see page 315) event.
V	Execute (see page 293)	Responds when the client control "fires".
V	Execute (see page 304)	Responds when a client control "fires".
	Execute (see page 2712)	Generates an OnExecute (see page 2716) event.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
V	ExecuteTarget (see page 2712)	Introduces an interface for invoking an action on a target client component or control.
V	ExecuteTarget (see page 15718)	Generates an OnItemSelected (see page 15724) event.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
V	GetParentComponent (see page 293)	Returns the action list or action manager that contains the action.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	HandlesTarget (see page 2713)	Introduces an interface for verifying that the type, and state, of a target component or control are appropriate for the action.
V	HandlesTarget (see page 15719)	Indicates whether the action can execute its function.
V	HasParent (see page 294)	Indicates whether the action is contained in an action list or action manager.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RegisterChanges (see page 2713)	Associates the action with an action link.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UnRegisterChanges (see page 2714)	Breaks the association between the action and the action link.

V	Update (see page 295)	Indicates whether the action updates itself.
V	Update (see page 2714)	Provides an opportunity to execute centralized code when an application is idle.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
V	UpdateTarget (see page 2715)	Introduces an interface for a method of notifying a client when the action updates itself.

Public Properties

	Name	Description
	ActionComponent (see page 2715)	Indicates the client component that caused this action to execute.
	ActionList (see page 295)	Indicates the action list or action manager that contains the action.
	AutoCheck (see page 308)	Controls (see page 5711) whether the Checked (see page 308) property toggles when the action executes.
	Checked (see page 308)	Indicates whether client controls and menu items appear checked.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Count (see page 15732)	This is Count, a member of class TCustomStaticListAction.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DisableIfNoHandler (see page 310)	Indicates whether client components should be disabled if no handler is found.
	GroupIndex (see page 311)	Indicates whether the action acts like a radio button with other actions in the same action list.
	HelpKeyword (see page 311)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 312)	Indicates the mechanism for client controls and menu items to use when invoking help.
	ImageIndex (see page 313)	Indicates the ImageIndex property for client controls and menu items.
	Index (see page 296)	Specifies the index of the action in its action list or action manager.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Strings (see page 15723)	This is Strings, a member of class TCustomListAction.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Events

	Name	Description
	OnGetItem (see page 15736)	This is OnGetItem, a member of class TCustomStaticListAction.
	OnHint (see page 15736)	Occurs when the mouse pauses over a client control or menu item.
	OnItemSelected (see page 15736)	Occurs when a client control executes the action because a user selected one of the items.
	OnUpdate (see page 15737)	Occurs when the application is idle or when the action list updates.

Published Properties

	Name	Description
	Active (see page 15731)	Indicates whether the list action has supplied items to its client controls.
	Caption (see page 15732)	Represents the caption of client controls and menu items.
	Category (see page 296)	Specifies the category under which the action appears in its action list or action manager.
	Enabled (see page 15733)	Indicates whether client controls and menu items are enabled.
	HelpContext (see page 15733)	Indicates the help context ID for client controls and menu items.
	Hint (see page 15733)	Indicates the Help hint for client controls and menu items.
	Images (see page 15734)	Lists the images that the list action supplies along with items.
	ItemIndex (see page 15734)	Specifies the index of the selected item.
	Items (see page 15734)	This is Items, a member of class TCustomStaticListAction.
	Name (see page 2805)	Specifies the name of the component as referenced in code.

	SecondaryShortCuts (see page 15735)	Specifies the short cuts (in addition to ShortCut) for triggering clients.
	ShortCut (see page 15735)	Specifies the ShortCut property for client menu items.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Visible (see page 15735)	Specifies the Visible property for client controls and menu items.

89.1.2.2 TCustomStaticListAction.Create Constructor

Creates an instance of TCustomListAction.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomStaticListAction(TComponent * AOwner);
```

Description

Most applications do not need to call the TCustomListAction constructor because actions are added at design time to an action list or action manager.

AOwner specifies the Owner for the action. This is the component that is responsible for freeing the TCustomListAction instance.

See Also

Owner (see page 2807)

89.1.2.3 TCustomStaticListAction.Destroy Destructor

Frees an instance of TCustomAction.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TCustomStaticListAction();
```

Description

Do not call the destructor directly in an application. Instead, call Free. Free ensures that the action is not nil before calling the destructor.

If the action is contained in an action list or action manager, Destroy removes the action from that list.

See Also

Create (see page 301)

Actions (see page 325)

89.1.2.4 TCustomStaticListAction Methods

The methods of the TCustomStaticListAction class are listed here.

Protected Methods

	Name	Description
	GetCount (see page 15730)	This is GetCount, a member of class TCustomStaticListAction.

	GetItem (see page 15730)	This is GetItem, a member of class TCustomStaticListAction.
V	GetItemClass (see page 15730)	This is GetItemClass, a member of class TCustomStaticListAction.
V	GetString (see page 15730)	Returns the value of the Strings property.
V	SetString (see page 15731)	Sets the value of the Strings property.

89.1.2.4.1 TCustomStaticListAction.GetCount Method

Pascal

```
function GetCount: Integer; override;
```

C++

```
virtual __fastcall int GetCount();
```

Description

This is GetCount, a member of class TCustomStaticListAction.

89.1.2.4.2 TCustomStaticListAction.GetItem Method

Pascal

```
function GetItem(const Index: Integer; AnItem: TListControlItem): Boolean;
```

C++

```
__fastcall Boolean GetItem(const int Index, TListControlItem AnItem);
```

Description

This is GetItem, a member of class TCustomStaticListAction.

89.1.2.4.3 TCustomStaticListAction.GetItemClass Method

Pascal

```
function GetItemClass: TListControlItemClass; virtual;
```

C++

```
virtual __fastcall TListControlItemClass GetItemClass();
```

Description

This is GetItemClass, a member of class TCustomStaticListAction.

89.1.2.4.4 TCustomStaticListAction.GetString Method

Returns the value of the Strings property.

Pascal

```
function GetString(Index: Integer): String; override;
```

C++

```
virtual __fastcall AnsiString GetString(int Index);
```

Description

GetString is the protected read implementation of the Strings property.

In TCustomListAction, GetString always returns an empty string.

Override GetString to provide a more meaningful value to the Strings property. For example, TStaticListAction overrides GetString to return the caption of the specified item.

See Also

strings (see page 15723)

89.1.2.4.5 TCustomStaticListAction.SetString Method

Sets the value of the Strings property.

Pascal

```
procedure SetString(Index: Integer; const Value: String); override;
```

C++

```
virtual __fastcall SetString(int Index, const AnsiString Value);
```

Description

SetString is the protected write implementation of the Strings property.

In TCustomListAction, SetString does nothing.

Override SetString to provide a more meaningful value to the Strings property. For example, TStaticListAction overrides SetString to set the caption of the specified item.

See Also

strings (see page 15723)

89.1.2.5 TCustomStaticListAction Properties

The properties of the TCustomStaticListAction class are listed here.

Public Properties

	Name	Description
	Count (see page 15732)	This is Count, a member of class TCustomStaticListAction.

Published Properties

	Name	Description
	Active (see page 15731)	Indicates whether the list action has supplied items to its client controls.
	Caption (see page 15732)	Represents the caption of client controls and menu items.
	Enabled (see page 15733)	Indicates whether client controls and menu items are enabled.
	HelpContext (see page 15733)	Indicates the help context ID for client controls and menu items.
	Hint (see page 15733)	Indicates the Help hint for client controls and menu items.
	Images (see page 15734)	Lists the images that the list action supplies along with items.
	ItemIndex (see page 15734)	Specifies the index of the selected item.
	Items (see page 15734)	This is Items, a member of class TCustomStaticListAction.
	SecondaryShortCuts (see page 15735)	Specifies the short cuts (in addition to ShortCut) for triggering clients.
	ShortCut (see page 15735)	Specifies the ShortCut property for client menu items.
	Visible (see page 15735)	Specifies the Visible property for client controls and menu items.

89.1.2.5.1 TCustomStaticListAction.Active Property

Indicates whether the list action has supplied items to its client controls.

Pascal

```
property Active: Boolean;
```

C++

```
__property Boolean Active;
```

Description

Set Active to true to cause the list action to fill all client controls with the items. These Items are supplied by calling the GetItem method, iterating over every index from 0 to Count.

See Also

GetItem

getitem

Items (see page 21348)

items

Items (see page 21187)

count (see page 15722)

Items (see page 3814)

strings (see page 15723)

89.1.2.5.2 TCustomStaticListAction.Caption Property

Represents the caption of client controls and menu items.

Pascal

```
property Caption: string;
```

C++

```
__property AnsiString Caption;
```

Description

Caption holds the string that is the caption for the action when it is set. The value of Caption is propagated to client controls and menu items.

See Also

Caption (see page 5806)

Caption (see page 16136)

89.1.2.5.3 TCustomStaticListAction.Count Property

Pascal

```
property Count: Integer;
```

C++

```
__property int Count;
```

Description

This is Count, a member of class TCustomStaticListAction.

89.1.2.5.4 TCustomStaticListAction.Enabled Property

Indicates whether client controls and menu items are enabled.

Pascal

```
property Enabled: Boolean;
```

C++

```
__property Boolean Enabled;
```

Description

Enabled specifies the enabled state for the action. The value of Enabled is propagated to client controls and menu items.

See Also

Enabled (see page 5821)

Enabled (see page 16145)

89.1.2.5.5 TCustomStaticListAction.HelpContext Property

Indicates the help context ID for client controls and menu items.

Pascal

```
property HelpContext: THelpContext;
```

C++

```
__property THelpContext HelpContext;
```

Description

HelpContext specifies the help context for the action when it is set. This value is propagated to client controls and menu items.

When a client control has focus and the user presses the F1 key, the control uses the value of HelpContext for this associated action to invoke the online help targeting a specific topic. The target topic is uniquely identified by a nonzero HelpContext value. Leave the HelpContext property of the client control at its default value of zero. This allows multiple controls (and multiple types of controls) to be associated with the same help topic through the one action object.

Note: HelpContext is only used when the HelpType property of this action or the client control is htInteger.

See Also

HelpType (see page 312)

HelpKeyword (see page 311)

89.1.2.5.6 TCustomStaticListAction.Hint Property

Indicates the Help hint for client controls and menu items.

Pascal

```
property Hint: string;
```

C++

```
__property AnsiString Hint;
```

Description

Hint holds the string that is the hint for that action when it is set. This value is propagated to client controls and menu items.

See Also

Hint (see page 5827)

Hint (see page 16148)

89.1.2.5.7 TCustomStaticListAction.Images Property

Lists the images that the list action supplies along with items.

Pascal

```
property Images: TCustomImageList;
```

C++

```
__property TCustomImageList Images;
```

Description

For each item that the list action supplies to clients, it can supply an image index along with other information such as the text value. The supplied image index refers to an image in the Images property.

Note: List actions do not supply images to all clients. The Images property controls the SmallImages property of a list view or the Images property of a TComboBoxEx descendant.

See Also

SmallImages (see page 3825)

Images (see page 3700)

89.1.2.5.8 TCustomStaticListAction.ItemIndex Property

Specifies the index of the selected item.

Pascal

```
property ItemIndex: Integer;
```

C++

```
__property int ItemIndex;
```

Description

ItemIndex represents the index of the selected item in all client controls that descend from TCustomListControl. Setting ItemIndex causes these clients to change their selection. When the user updates the selection using one of these clients, TCustomListAction automatically updates the others so that they select the same item.

Note: List actions do not supply ItemIndex to all clients. The ItemIndex property controls only the ItemIndex property of clients that descend from TCustomListControl.

See Also

OnItemSelected (see page 15724)

ItemIndex (see page 5944)

89.1.2.5.9 TCustomStaticListAction.Items Property

Pascal

```
property Items: TStaticListItems;
```

C++

```
__property TStaticListItems Items;
```

Description

This is Items, a member of class TCustomStaticListAction.

89.1.2.5.10 TCustomStaticListAction.SecondaryShortCuts Property

Specifies the short cuts (in addition to ShortCut) for triggering clients.

Pascal

```
property SecondaryShortCuts: TShortCutList;
```

C++

```
__property TShortCutList SecondaryShortCuts;
```

Description

Actions can execute in response to multiple short cut key combinations. SecondaryShortCuts lists all the short cut key combinations (other than the one specified by the ShortCut property) that can trigger the action. This lets you specify shortcuts for clients that do not have a ShortCut property or provide additional, secondary shortcuts.

When the user types one of the key combinations listed in SecondaryShortCuts, the action's Execute method is called.

See Also

ShortCut (see page 314)

Execute (see page 304)

89.1.2.5.11 TCustomStaticListAction.ShortCut Property

Specifies the ShortCut property for client menu items.

Pascal

```
property ShortCut: TShortCut;
```

C++

```
__property TShortCut ShortCut;
```

Description

ShortCut holds the value that is the shortcut for the action when it is set. This value is propagated to client menu items.

See Also

ShortCut (see page 16152)

SecondaryShortCuts (see page 314)

89.1.2.5.12 TCustomStaticListAction.Visible Property

Specifies the Visible property for client controls and menu items.

Pascal

```
property Visible: Boolean;
```

C++

```
__property Boolean Visible;
```

Description

Visible specifies the visible state for the action. This value is propagated to client controls and menu items.

See Also

Visible (see page 16153)

Visible (see page 5847)

89.1.2.6 TCustomStaticListAction Events

The events of the TCustomStaticListAction class are listed here.

Published Events

	Name	Description
	OnGetItem (see page 15736)	This is OnGetItem, a member of class TCustomStaticListAction.
	OnHint (see page 15736)	Occurs when the mouse pauses over a client control or menu item.
	OnItemSelected (see page 15736)	Occurs when a client control executes the action because a user selected one of the items.
	OnUpdate (see page 15737)	Occurs when the application is idle or when the action list updates.

89.1.2.6.1 TCustomStaticListAction.OnGetItem Event

Pascal

```
property OnGetItem: TGetItemEvent;
```

C++

```
__property TGetItemEvent OnGetItem;
```

Description

This is OnGetItem, a member of class TCustomStaticListAction.

89.1.2.6.2 TCustomStaticListAction.OnHint Event

Occurs when the mouse pauses over a client control or menu item.

Pascal

```
property OnHint: THintEvent;
```

C++

```
__property THintEvent OnHint;
```

Description

Use OnHint to override the default hint that appears when the user pauses the mouse over a client control or menu item. The OnHint event handler can change the hint that appears (by changing the HintStr parameter), or display the hint in some application-specific way.

89.1.2.6.3 TCustomStaticListAction.OnItemSelected Event

Occurs when a client control executes the action because a user selected one of the items.

Pascal

```
property OnItemSelected: TItemSelectedEvent;
```

C++

```
__property TItemSelectedEvent OnItemSelected;
```

Description

Write an OnItemSelected event handler to respond when the user selects one of the items supplied to client controls. Before this event is called, the list action first updates the ItemIndex property of any client controls that descend from TCustomListControl.

Sender is the list action that supplies items to the control in which an item was selected.

Control is the control in which the user selected an item.

See Also

ExecuteTarget (see page 15718)

ItemIndex (see page 15722)

89.1.2.6.4 TCustomStaticListAction.OnUpdate Event

Occurs when the application is idle or when the action list updates.

Pascal

```
property OnUpdate: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnUpdate;
```

Description

Write an OnUpdate event handler to execute centralized code while an application is idle. For example, actions may want to update enabling and disabling, or checking and unchecking of client targets.

C++ Examples:

```
/*
When the application is idle, the OnUpdate event occurs for
every action that is linked to a visible control or menu
item that is showing. This provides an opportunity for
applications to execute centralized code for enabling and
disabling, checking and unchecking, and so on. For example,
the following code illustrates the OnUpdate event handler
for an action that is "checked" when the toolbar is visible.
This example requires a TActionList (with one TAction) and a
TToolBar on a form. This example requires a TActionList
(with one TAction) and a TToolBar on a form.  Double click
on the TActionList and create an TAction named Action1.  The
TAction has an OnUpdate event handler called Action1Update.
Then set an object's (such as a button or menu item) Action
to Action1.
*/
void __fastcall TForm1::Action1Update(TObject *Sender)
{
   // Indicate whether ToolBar1 is currently visible.
   TAction* pa = dynamic_cast<TAction*>(Sender);
   if (pa)
   {
     if (pa->Checked != ToolBar1->Visible)
     {
       lbOther->Items->Add("Event Action1Update: toolbar visibility changed");
```

```
      }
      pa->Checked = ToolBar1->Visible;
    }
}
```

Delphi Examples:

```
{
When the application is idle, the OnUpdate event occurs for
every action that is linked to a visible control or menu
item that is showing. This provides an opportunity for
applications to execute centralized code for enabling and
disabling, checking and unchecking, and so on. For example,
the following code illustrates the OnUpdate event handler
for an action that is "checked" when the toolbar is visible.
This example requires a TActionList (with one TAction) and a
TToolBar on a form. This example requires a TActionList
(with one TAction) and a TToolBar on a form.  Double click
on the TActionList and create an TAction named Action1.  The
TAction has an OnUpdate event handler called Action1Update.
Then set an object's (such as a button or menu item) Action
to Action1.
}
procedure TMainForm.Action1Update(Sender: TObject);
begin
  if ((Sender as TAction).Checked <> ToolBar1.Visible) then
    lbOther.Items.Add('Event Action1Update: toolbar visibility changed');
    { Indicate whether ToolBar1 is currently visible }
    (Sender as TAction).Checked := ToolBar1.Visible;
end;
```

See Also

UpdateAction (see page 2790)

89.1.3 TCustomVirtualListAction Class

Class Hierarchy

Pascal

```
TCustomVirtualListAction = class(TCustomListAction);
```

C++

```
class TCustomVirtualListAction : public TCustomListAction;
```

File

ListActns

Description

This is class ListActns.TCustomVirtualListAction.

89.1.3.1 TCustomVirtualListAction Members

The following tables list the members exposed by TCustomVirtualListAction.

Protected Events

	Name	Description
	OnChange (see page 2716)	Occurs when one of the action's properties changes.
	OnGetItemCount (see page 15723)	Occurs when the list action needs to determine the number of items it supplies to client controls.
	OnItemSelected (see page 15724)	Occurs when a client control executes the action because a user selected one of the items.

Protected Fields

	Name	Description
	FClients (see page 2711)	This is FClients, a member of class TBasicAction.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FImage (see page 302)	This is FImage, a member of class TCustomAction.
	FMask (see page 303)	This is FMask, a member of class TCustomAction.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 303)	Copies the properties of this action to a destination object.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	Change (see page 2712)	Generates an OnChange (see page 2716) event.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetCount (see page 15719)	This is GetCount, a member of class TCustomListAction.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetItem (see page 15743)	This is GetItem, a member of class TCustomVirtualListAction.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
V	GetString (see page 15743)	Returns the value of the Strings property.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
V	HandleShortCut (see page 306)	Executes the action when the user types on of its short cuts.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Loaded (see page 15720)	Initializes the action after it is loaded into memory.
V	Notification (see page 2713)	Responds when components are created or destroyed.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 294)	This is ReadState, a member of class TContainedAction.

	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetHelpContext (see page 306)	This is SetHelpContext, a member of class TCustomAction.
	SetHelpKeyword (see page 306)	This is SetHelpKeyword, a member of class TCustomAction.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 307)	Sets the value of the Name property.
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetOnExecute (see page 2714)	Assigns an OnExecute (see page 2716) event handler.
	SetParentComponent (see page 294)	This is SetParentComponent, a member of class TContainedAction.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	SetString (see page 15720)	Sets the value of the Strings (see page 15723) property.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	Images (see page 15722)	Lists the images that the list action supplies along with items.
R	Loading (see page 15723)	Indicates whether the action is currently adding items to client controls.
	SavedEnabledState (see page 313)	Saves the value of the Enabled (see page 310) property when the action is suspended.

Public Events

	Name	Description
	OnExecute (see page 2716)	Occurs when the client event that is linked to it fires.
	OnGetItem (see page 15744)	This is OnGetItem, a member of class TCustomVirtualListAction.
	OnHint (see page 315)	Occurs when the mouse pauses over a client control or menu item.
	OnUpdate (see page 2718)	Occurs when the application is idle or when the action list updates.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.

	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 301)	Instantiates and initializes a TCustomAction (see page 297) object.
V	Create (see page 2710)	Instantiates and initializes a TBasicAction (see page 2707) object.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
V	Create (see page 15718)	Creates an instance of TCustomListAction (see page 15713).
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 292)	Destroys the instance of the contained action.
V	Destroy (see page 302)	Frees an instance of TCustomAction (see page 297).
V	Destroy (see page 2711)	Disposes of an instance of a TBasicAction (see page 2707) object.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DoHint (see page 303)	Generates an OnHint (see page 315) event.
V	Execute (see page 293)	Responds when the client control "fires".
V	Execute (see page 304)	Responds when a client control "fires".
	Execute (see page 2712)	Generates an OnExecute (see page 2716) event.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
V	ExecuteTarget (see page 2712)	Introduces an interface for invoking an action on a target client component or control.
V	ExecuteTarget (see page 15718)	Generates an OnItemSelected (see page 15724) event.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
V	GetParentComponent (see page 293)	Returns the action list or action manager that contains the action.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	HandlesTarget (see page 2713)	Introduces an interface for verifying that the type, and state, of a target component or control are appropriate for the action.
V	HandlesTarget (see page 15719)	Indicates whether the action can execute its function.
V	HasParent (see page 294)	Indicates whether the action is contained in an action list or action manager.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.

	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RegisterChanges (see page 2713)	Associates the action with an action link.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UnRegisterChanges (see page 2714)	Breaks the association between the action and the action link.
V	Update (see page 295)	Indicates whether the action updates itself.
V	Update (see page 2714)	Provides an opportunity to execute centralized code when an application is idle.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
V	UpdateTarget (see page 2715)	Introduces an interface for a method of notifying a client when the action updates itself.

Public Properties

	Name	Description
	ActionComponent (see page 2715)	Indicates the client component that caused this action to execute.
	ActionList (see page 295)	Indicates the action list or action manager that contains the action.
	Active (see page 15721)	Indicates whether the list action has supplied items to its client controls.
	AutoCheck (see page 308)	Controls (see page 5711) whether the Checked (see page 308) property toggles when the action executes.
	Caption (see page 308)	Represents the caption of client controls and menu items.
	Checked (see page 308)	Indicates whether client controls and menu items appear checked.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Count (see page 15744)	This is Count, a member of class TCustomVirtualListAction.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DisableIfNoHandler (see page 310)	Indicates whether client components should be disabled if no handler is found.
	Enabled (see page 310)	Indicates whether client controls and menu items are enabled.
	GroupIndex (see page 311)	Indicates whether the action acts like a radio button with other actions in the same action list.
	HelpContext (see page 311)	Indicates the help context ID for client controls and menu items.
	HelpKeyword (see page 311)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 312)	Indicates the mechanism for client controls and menu items to use when invoking help.
	Hint (see page 312)	Indicates the Help hint for client controls and menu items.
	ImageIndex (see page 313)	Indicates the ImageIndex property for client controls and menu items.
	Index (see page 296)	Specifies the index of the action in its action list or action manager.
	ItemIndex (see page 15722)	Specifies the index of the selected item.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	SecondaryShortCuts (see page 314)	Specifies the short cuts (in addition to ShortCut (see page 314)) for triggering clients.
	ShortCut (see page 314)	Specifies the ShortCut property for client menu items.
	Strings (see page 15723)	This is Strings, a member of class TCustomListAction.

	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	Visible (see page 314)	Specifies the Visible property for client controls and menu items.

Published Properties

	Name	Description
	Category (see page 296)	Specifies the category under which the action appears in its action list or action manager.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

89.1.3.2 TCustomVirtualListAction Methods

The methods of the TCustomVirtualListAction class are listed here.

Protected Methods

	Name	Description
	GetItem (see page 15743)	This is GetItem, a member of class TCustomVirtualListAction.
	GetString (see page 15743)	Returns the value of the Strings property.

89.1.3.2.1 TCustomVirtualListAction.GetItem Method

Pascal

```
function GetItem(const Index: Integer; var Value: String; var ImageIndex: Integer; var Data:
Pointer): Boolean;
```

C++

```
__fastcall Boolean GetItem(const int Index, AnsiString Value, int ImageIndex, void * Data);
```

Description

This is GetItem, a member of class TCustomVirtualListAction.

89.1.3.2.2 TCustomVirtualListAction.GetString Method

Returns the value of the Strings property.

Pascal

```
function GetString(Index: Integer): String; override;
```

C++

```
virtual __fastcall AnsiString GetString(int Index);
```

Description

GetString is the protected read implementation of the Strings property.

In TCustomListAction, GetString always returns an empty string.

Override GetString to provide a more meaningful value to the Strings property. For example, TStaticListAction overrides GetString to return the caption of the specified item.

See Also

strings (see page 15723)

89.1.3.3 TCustomVirtualListAction Properties

The properties of the TCustomVirtualListAction class are listed here.

Public Properties

	Name	Description
	Count (see page 15744)	This is Count, a member of class TCustomVirtualListAction.

89.1.3.3.1 TCustomVirtualListAction.Count Property

Pascal

```
property Count: Integer;
```

C++

```
__property int Count;
```

Description

This is Count, a member of class TCustomVirtualListAction.

89.1.3.4 TCustomVirtualListAction Events

The events of the TCustomVirtualListAction class are listed here.

Public Events

	Name	Description
	OnGetItem (see page 15744)	This is OnGetItem, a member of class TCustomVirtualListAction.

89.1.3.4.1 TCustomVirtualListAction.OnGetItem Event

Pascal

```
property OnGetItem: TGetVirtualItemEvent;
```

C++

```
__property TGetVirtualItemEvent OnGetItem;
```

Description

This is OnGetItem, a member of class TCustomVirtualListAction.

89.1.4 TListActionLink Class

Class Hierarchy

System::TObject → Classes.TBasicActionLink → ActnList.TActionLink → Controls.TControlActionLink → Controls.TWinControlActionLink → ListActns.TListActionLink

Pascal

```
TListActionLink = class(TWinControlActionLink);
```

C++

```
class TListActionLink : public TWinControlActionLink;
```

File

ListActns

Description

This is class ListActns.TListActionLink.

89.1.4.1 TListActionLink Members

The following tables list the members exposed by TListActionLink.

Protected Fields

	Name	Description
	FAction (see page 2722)	This is FAction, a member of class TBasicActionLink.
	FClient (see page 5894)	This is FClient, a member of class TControlActionLink.
	FClient (see page 6236)	This is FClient, a member of class TWinControlActionLink.

Protected Methods

	Name	Description
	AddItem (see page 15747)	This is the overview for the AddItem method overload.
	AssignClient (see page 2723)	This is AssignClient, a member of class TBasicActionLink.
	AssignClient (see page 5895)	Assigns a client control that is linked to the associated action.
	AssignClient (see page 6236)	Specifies the client control.
	Change (see page 2723)	This is Change, a member of class TBasicActionLink.
	DoShowHint (see page 5896)	Indicates whether the hint is shown, and modified.
	IsActiveLinked (see page 15748)	This is IsActiveLinked, a member of class TListActionLink.
	IsCaptionLinked (see page 268)	Indicates whether the Caption properties for the action and client are linked.
	IsCaptionLinked (see page 5896)	Indicates whether the caption for the action and the client are linked.
	IsCheckedLinked (see page 269)	Indicates whether the Checked properties for the action and client are linked.
	IsDropdownMenuLinked (see page 5896)	This is IsDropdownMenuLinked, a member of class TControlActionLink.
	IsEnabledLinked (see page 269)	Indicates whether the Enabled properties for the action and client are linked.
	IsEnabledLinked (see page 5897)	Indicates whether the enabled state for the action and the client are linked.
	IsEnableDropdownLinked (see page 5897)	This is IsEnableDropdownLinked, a member of class TControlActionLink.
	IsGroupIndexLinked (see page 270)	Indicates whether the GroupIndex property for the action controls client behavior.
	IsHelpContextLinked (see page 270)	Indicates whether the HelpContext properties for the action and client controls are linked.
	IsHelpContextLinked (see page 6236)	Indicates whether the Help context for the action and the client are linked.
	IsHelpLinked (see page 271)	Indicates whether the help properties for the action and client are linked.
	IsHelpLinked (see page 5897)	Indicates whether the help properties for the action and the client are linked.
	IsHintLinked (see page 271)	Indicates whether the Hint properties for the action and client are linked.
	IsHintLinked (see page 5898)	Indicates whether the Hint property for the action and the client are linked.
	IsImageIndexLinked (see page 272)	Indicates whether the image index for the action and the client are linked.
	IsImagesLinked (see page 15748)	This is IsImagesLinked, a member of class TListActionLink.
	IsOnExecuteLinked (see page 2723)	This is IsOnExecuteLinked, a member of class TBasicActionLink.
	IsOnExecuteLinked (see page 5898)	Indicates whether the OnExecute event handler for the action and the client are linked.
	IsPopupMenuLinked (see page 5898)	This is IsPopupMenuLinked, a member of class TControlActionLink.
	IsShortCutLinked (see page 272)	Indicates whether the ShortCut properties for the action and client are linked.
	IsVisibleLinked (see page 273)	Indicates whether the Visible properties for the action and client are linked.
	IsVisibleLinked (see page 5899)	Indicates whether the visible state for the action and the client are linked.
	RefreshControl (see page 15748)	This is RefreshControl, a member of class TListActionLink.

	SetAction (see page 15749)	This is SetAction, a member of class TListActionLink.
	SetActive (see page 15749)	This is SetActive, a member of class TListActionLink.
	SetAutoCheck (see page 274)	Introduces an interface for setting the AutoCheck property of a client.
	SetCaption (see page 274)	Introduces an interface for setting the caption on a client.
	SetCaption (see page 5899)	Sets the caption of a control if the client is linked to the action for this event.
	SetChecked (see page 274)	Introduces an interface for setting the checked state of a client.
	SetDropdownMenu (see page 5899)	This is SetDropdownMenu, a member of class TControlActionLink.
	SetEnabled (see page 275)	Introduces an interface for setting the enabled state of a client.
	SetEnabled (see page 5900)	Sets the enabled state of a control if the client is linked to the action for this event.
	SetEnableDropdown (see page 5900)	This is SetEnableDropdown, a member of class TControlActionLink.
	SetGroupIndex (see page 275)	Introduces an interface for setting the GroupIndex property of a client.
	SetHelpContext (see page 276)	Introduces an interface for setting the help context of a client.
	SetHelpContext (see page 5900)	Sets the HelpContext of a control if the client is linked to the action help properties.
	SetHelpContext (see page 6237)	Sets the Help context of a windowed control if the client is linked to the action for this event.
	SetHelpKeyword (see page 276)	Introduces an interface for setting the help keyword of a client.
	SetHelpKeyword (see page 5901)	Sets the HelpKeyword of a control if the client is linked to the action help properties.
	SetHelpType (see page 277)	Introduces an interface for setting the HelpType property of a client.
	SetHelpType (see page 5901)	Sets the HelpType of a control if the client is linked to the action help properties.
	SetHint (see page 278)	Introduces an interface for setting the hint for a client.
	SetHint (see page 5901)	Sets the hint of a control if the client is linked to the action for this event.
	SetImageIndex (see page 278)	Introduces an interface for setting the image index for a client.
	SetImages (see page 15749)	This is SetImages, a member of class TListActionLink.
	SetItemIndex (see page 15749)	This is SetItemIndex, a member of class TListActionLink.
	SetOnExecute (see page 2724)	This is SetOnExecute, a member of class TBasicActionLink.
	SetOnExecute (see page 5902)	Sets the execution event handler for a control if the client is linked to the action for this event.
	SetPopupMenu (see page 5902)	This is SetPopupMenu, a member of class TControlActionLink.
	SetShortCut (see page 279)	Introduces an interface for setting the shortcut for a client.
	SetVisible (see page 279)	Introduces an interface for setting the visible state of a client.
	SetVisible (see page 5902)	Sets the visible state of a control if the client is linked to the action for this event.

Public Events

	Name	Description
	OnChange (see page 2725)	Occurs when an OnChange event is triggered on the action.

Public Methods

	Name	Description
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 2721)	Instantiates and initializes a TBasicActionLink (see page 2720) object.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 2722)	Destroys an instance of an action link object.
	Destroy (see page 22287)	Disposes of an object instance.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.

	Execute (see page 2723)	Invokes the action's Execute method.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	Update (see page 2724)	Invokes the action's Update method.

Public Properties

	Name	Description
	Action (see page 2725)	Indicates which action the link connects to its client.

89.1.4.2 TListActionLink Methods

The methods of the TListActionLink class are listed here.

Protected Methods

	Name	Description
	AddItem (see page 15747)	This is the overview for the AddItem method overload.
	IsActiveLinked (see page 15748)	This is IsActiveLinked, a member of class TListActionLink.
	IsImagesLinked (see page 15748)	This is IsImagesLinked, a member of class TListActionLink.
	RefreshControl (see page 15748)	This is RefreshControl, a member of class TListActionLink.
	SetAction (see page 15749)	This is SetAction, a member of class TListActionLink.
	SetActive (see page 15749)	This is SetActive, a member of class TListActionLink.
	SetImages (see page 15749)	This is SetImages, a member of class TListActionLink.
	SetItemIndex (see page 15749)	This is SetItemIndex, a member of class TListActionLink.

89.1.4.2.1 AddItem Method

This is the overview for the AddItem method overload.

Overload List

	Name	Description
	TListActionLink.AddItem (String, Integer, Pointer) (see page 15748)	This is AddItem, a member of class TListActionLink.
	TListActionLink.AddItem (TListControlItem) (see page 15748)	This is AddItem, a member of class TListActionLink.

89.1.4.2.1.1 TListActionLink.AddItem Method (String, Integer, Pointer)

Pascal

```
procedure AddItem(ACaption: String; AImageIndex: Integer; DataPtr: Pointer); virtual; overload;
```

C++

```
virtual __fastcall AddItem(AnsiString ACaption, int AImageIndex, void * DataPtr);
```

Description

This is AddItem, a member of class TListActionLink.

89.1.4.2.1.2 TListActionLink.AddItem Method (TListControlItem)

Pascal

```
procedure AddItem(AnItem: TListControlItem); virtual; overload;
```

C++

```
virtual __fastcall AddItem(TListControlItem AnItem);
```

Description

This is AddItem, a member of class TListActionLink.

89.1.4.2.2 TListActionLink.IsActiveLinked Method

Pascal

```
function IsActiveLinked: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean IsActiveLinked();
```

Description

This is IsActiveLinked, a member of class TListActionLink.

89.1.4.2.3 TListActionLink.IsImagesLinked Method

Pascal

```
function IsImagesLinked: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean IsImagesLinked();
```

Description

This is IsImagesLinked, a member of class TListActionLink.

89.1.4.2.4 TListActionLink.RefreshControl Method

Pascal

```
procedure RefreshControl;
```

C++

```
__fastcall RefreshControl();
```

Description

This is RefreshControl, a member of class TListActionLink.

89.1.4.2.5 TListActionLink.SetAction Method

Pascal

```
procedure SetAction(Value: TBasicAction); override;
```

C++

```
virtual __fastcall SetAction(TBasicAction Value);
```

Description

This is SetAction, a member of class TListActionLink.

89.1.4.2.6 TListActionLink.SetActive Method

Pascal

```
procedure SetActive(const Value: Boolean); virtual;
```

C++

```
virtual __fastcall SetActive(const Boolean Value);
```

Description

This is SetActive, a member of class TListActionLink.

89.1.4.2.7 TListActionLink.SetImages Method

Pascal

```
procedure SetImages(Value: TCustomImageList); virtual;
```

C++

```
virtual __fastcall SetImages(TCustomImageList Value);
```

Description

This is SetImages, a member of class TListActionLink.

89.1.4.2.8 TListActionLink.SetItemIndex Method

Pascal

```
procedure SetItemIndex(const Value: Integer); virtual;
```

C++

```
virtual __fastcall SetItemIndex(const int Value);
```

Description

This is SetItemIndex, a member of class TListActionLink.

89.1.5 TListControlItem Class

TListControlItem represents an item with a text value, an image, and a data pointer.

Class Hierarchy

Pascal

```
TListControlItem = class(TCollectionItem);
```

C++

```
class TListControlItem : public TCollectionItem;
```

File

ListActns

Description

TListControlItem represents a single item in a control that lists items. TListControlItem objects are used by TStaticListAction (see page 15765) to represent the items in a variety of client controls such as list views, list boxes, and combo boxes. In addition, TListControlItem is the base class for TComboExItem, which is specialized to work with the TComboBoxEx control.

Each TListControlItem has

A text value, which it stores as the Caption (see page 15756) property.

An associated image, which is identified by the ImageIndex (see page 15757) property.

A data pointer, which it stores as the Data (see page 15756) property.

See Also

TListControlItems (see page 15757)

TComboExItem (see page 3546)

89.1.5.1 TListControlItem Members

The following tables list the members exposed by TListControlItem.

Protected Fields

	Name	Description
	FCaption (see page 15752)	This is FCaption, a member of class TListControlItem.
	FData (see page 15752)	This is FData, a member of class TListControlItem.
	FImageIndex (see page 15753)	This is FImageIndex, a member of class TListControlItem.

Protected Methods

	Name	Description
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	Changed (see page 15754)	Responds when any of the item's properties changes.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	GetDisplayName (see page 15754)	Specifies the name of the item as it appears in the Object Inspector.
V	GetOwner (see page 2759)	Returns the collection to which this item belongs.

	GetOwner (see page 2932)	Returns the owner of an object.
V	SetCaption (see page 15755)	Sets the value of the Caption (see page 15756) property.
V	SetCollection (see page 2759)	Sets the value of the Collection (see page 2761) property.
V	SetData (see page 15755)	Sets the value of the Data (see page 15756) property.
V	SetDisplayName (see page 2760)	Sets the name of the collection item as it appears in the collection editor.
V	SetImageIndex (see page 15755)	Sets the value of the ImageIndex (see page 15757) property.
V	SetIndex (see page 2760)	Moves the collection item to a specified position in the parent collection.

Public Methods

	Name	Description
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 15753)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 15752)	Creates and initializes a TListControlItem (see page 15750) instance.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2757)	Destroys the TCollectionItem (see page 2755) instance and frees its memory.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2759)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
	Collection (see page 2761)	Specifies the TCollection (see page 2731) instance to which the TCollectionItem (see page 2755) belongs.
	Data (see page 15756)	Points to user-defined data associated with the control.
	DisplayName (see page 2761)	The name displayed in the Collection (see page 2761) editor.
R	ID (see page 2761)	A unique, permanent index for the item.
	Index (see page 2762)	Returns the item's position in the Items array of TCollection (see page 2731).

Published Properties

	Name	Description
	Caption (see page 15756)	Specifies the text value of the item.
	ImageIndex (see page 15757)	Identifies the image associated with this item.

89.1.5.2 TListControlItem.Create Constructor

Creates and initializes a TListControlItem (see page 15750) instance.

Pascal

```
constructor Create(Collection: TCollection); override;
```

C++

```
virtual __fastcall TListControlItem(TCollection Collection);
```

Description

Do not call the constructor to create a TListControlItem (see page 15750) instance. Instead, use the collection's Add method to create a new list control item.

Collection is the collection object that owns and manages this list control item.

See Also

Add (see page 2736)

89.1.5.3 TListControlItem Fields

The fields of the TListControlItem class are listed here.

Protected Fields

	Name	Description
	FCaption (see page 15752)	This is FCaption, a member of class TListControlItem.
	FData (see page 15752)	This is FData, a member of class TListControlItem.
	FImageIndex (see page 15753)	This is FImageIndex, a member of class TListControlItem.

89.1.5.3.1 TListControlItem.FCaption Field

Pascal

```
FCaption: String;
```

C++

```
AnsiString FCaption;
```

Description

This is FCaption, a member of class TListControlItem.

89.1.5.3.2 TListControlItem.FData Field

Pascal

```
FData: Pointer;
```

C++

```
void * FData;
```

Description

This is FData, a member of class TListControlItem.

89.1.5.3.3 TListControlItem.FImageIndex Field

Pascal

```
FImageIndex: TImageIndex;
```

C++

```
TImageIndex FImageIndex;
```

Description

This is FImageIndex, a member of class TListControlItem.

89.1.5.4 TListControlItem Methods

The methods of the TListControlItem class are listed here.

Protected Methods

	Name	Description
	Changed (see page 15754)	Responds when any of the item's properties changes.
V	GetDisplayName (see page 15754)	Specifies the name of the item as it appears in the Object Inspector.
V	SetCaption (see page 15755)	Sets the value of the Caption (see page 15756) property.
V	SetData (see page 15755)	Sets the value of the Data (see page 15756) property.
V	SetImageIndex (see page 15755)	Sets the value of the ImageIndex (see page 15757) property.

Public Methods

	Name	Description
V	Assign (see page 15753)	Copies the contents of another, similar object.

89.1.5.4.1 TListControlItem.Assign Method

Copies the contents of another, similar object.

Pascal

```
procedure Assign(Source: TPersistent); override;
```

C++

```
virtual __fastcall Assign(TPersistent * Source);
```

Description

Call Assign to copy the properties or other attributes of one object from another. The standard form of a call to Assign is

```
Destination.Assign(Source); {Delphi}
Destination->Assign(Source); // C++
```

which tells the Destination object to copy the contents of the Source object to itself.

Most objects override Assign to handle the assignment of properties from similar objects. When overriding Assign, call the inherited method if the destination object can't handle the assignment of properties from the class of the Source parameter.

If no overridden Assign method can handle the assignment of properties from Source, the method implemented in TPersistent calls the source object's AssignTo method. This allows the source object to handle the assignment. If the Source object is nil (Delphi) or NULL (C++), Assign raises an EConvertError exception.

In general, the statement

```
Destination := Source; {Delphi}
Destination = Source; // C++
```

is not the same as the statement

```
Destination.Assign(Source); {Delphi}
Destination->Assign(Source); // C++
```

The assignment operator makes Destination reference the same object as Source, whereas the Assign method copies the contents of the object referenced by Source into the object referenced by Destination.

Note: The types of some properties are also objects. If these properties have write methods that use Assign to set the value of the property, then in these cases the assignment operator does the same thing as the Assign method.

See Also

AssignTo (see page 2931)

EConvertError (see page 22724)

89.1.5.4.2 TListControlItem.Changed Method

Responds when any of the item's properties changes.

Pascal

```
procedure Changed;
```

C++

```
__fastcall Changed();
```

Description

Changed is called automatically when the item's properties change. It calls the Update method of the corresponding TListControlItems (see page 15757) object, so that the collection can perform any necessary adjustments.

See Also

Update (see page 2747)

89.1.5.4.3 TListControlItem.GetDisplayName Method

Specifies the name of the item as it appears in the Object Inspector.

Pascal

```
function GetDisplayName: String; override;
```

C++

```
virtual __fastcall AnsiString GetDisplayName();
```

Description

GetDisplayName returns the string that represents the item in the Collection editor and the Object Inspector.

GetDisplayName returns the value of the Caption (see page 15756) if it is set. Otherwise, it returns the class name of the TListControlItem (see page 15750) descendant for which this is an instance, with a number added to ensure uniqueness.

See Also

Caption (see page 15756)

89.1.5.4.4 TListControlItem.SetCaption Method

Sets the value of the Caption (see page 15756) property.

Pascal

```
procedure SetCaption(const Value: String); virtual;
```

C++

```
virtual __fastcall SetCaption(const AnsiString Value);
```

Description

SetCaption is the protected write implementation of the Caption (see page 15756) property. It sets the Caption (see page 15756) property to Value, and then calls the Changed (see page 15754) method so that the collection can update itself.

See Also

Caption (see page 15756)

Changed (see page 15754)

89.1.5.4.5 TListControlItem.SetData Method

Sets the value of the Data (see page 15756) property.

Pascal

```
procedure SetData(const Value: Pointer); virtual;
```

C++

```
virtual __fastcall SetData(const void * Value);
```

Description

SetData is the protected write implementation of the Data (see page 15756) property. It sets the Data (see page 15756) property to Value, and then calls the Changed (see page 15754) method so that the collection can update itself.

See Also

Data (see page 15756)

Changed (see page 15754)

89.1.5.4.6 TListControlItem.SetImageIndex Method

Sets the value of the ImageIndex (see page 15757) property.

Pascal

```
procedure SetImageIndex(const Value: TImageIndex); virtual;
```

C++

```
virtual __fastcall SetImageIndex(const TImageIndex Value);
```

Description

SetImageIndex is the protected write implementation of the ImageIndex (see page 15757) property. It sets the ImageIndex (see page 15757) property to Value, and then calls the Changed (see page 15754) method so that the collection can update

itself.

See Also

ImageIndex (see page 15757)

Changed (see page 15754)

89.1.5.5 TListControlItem Properties

The properties of the TListControlItem class are listed here.

Public Properties

	Name	Description
	Data (see page 15756)	Points to user-defined data associated with the control.

Published Properties

	Name	Description
	Caption (see page 15756)	Specifies the text value of the item.
	ImageIndex (see page 15757)	Identifies the image associated with this item.

89.1.5.5.1 TListControlItem.Caption Property

Specifies the text value of the item.

Pascal

```
property Caption: String;
```

C++

```
__property AnsiString Caption;
```

Description

Set Caption to provide the item with a text value. This is the value that appears in list boxes or combo boxes, or which labels items in list view controls.

See Also

ImageIndex (see page 15757)

Data (see page 15756)

89.1.5.5.2 TListControlItem.Data Property

Points to user-defined data associated with the control.

Pascal

```
property Data: Pointer;
```

C++

```
__property void * Data;
```

Description

Set Data to associate this item with application-specific data. Data has no predefined meaning, although it is used for sorting items when the managing collection's SortType property is stData.

See Also

SortType (see page 15764)

ImageIndex (see page 15757)

Caption (see page 15756)

89.1.5.5.3 TListControlItem.ImageIndex Property

Identifies the image associated with this item.

Pascal

```
property ImageIndex: TImageIndex;
```

C++

```
__property TImageIndex ImageIndex;
```

Description

Set ImageIndex to associate this item with an image. ImageIndex is an index into the Images property of the component that uses this TListControlItem (see page 15750) object to represent one of its items.

See Also

Images (see page 15722)

Images (see page 3700)

89.1.6 TListControlItems Class

TListControlItems manages a collection of TListControlItem (see page 15750) objects.

Class Hierarchy

Pascal

```
TListControlItems = class(TOwnedCollection);
```

C++

```
class TListControlItems : public TOwnedCollection;
```

File

ListActns

Description

TListControlItems manages a collection of items that each include a text value, associated image, and a data pointer.

Use the properties and methods of TListControlItems to:

Access a specific item.

Add (see page 15760) or delete items from the collection.

Find out how many items are in the collection.

Sort (see page 15762) the items in the collection.

Although TListControlItems can be used on its own, it also acts as a base class to classes that manage the items for a specific component. TListControlItems descendants include TComboExItems, which manages the items of a TComboBoxEx control, and TStaticListItems (see page 15777), which manages items for a list action component.

See Also

TListControlItem (see page 15750)

TStaticListItems (see page 15777)

TComboExItems (see page 3552)

89.1.6.1 TListControlItems Members

The following tables list the members exposed by TListControlItems.

Protected Methods

	Name	Description
V	Added (see page 2736)	Responds when items are added to the collection.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	Changed (see page 2740)	Responds when the collection or any of its items changes.
V	CompareItems (see page 15761)	Returns the relative order of two items in the collection.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	Deleting (see page 2741)	Responds when items are deleted from the collection.
	GetAttr (see page 2743)	Returns the name of a custom attribute that can be retrieved using the GetItemAttr (see page 2745) method.
	GetAttrCount (see page 2744)	Returns the number of custom attributes associated with items in the collection.
	GetItem (see page 2744)	Returns a specified item in the collection.
	GetItemAttr (see page 2745)	Returns the value of a custom attribute assigned to one of the collection's items.
V	GetOwner (see page 2915)	Returns the owner of an object.
	GetOwner (see page 2932)	Returns the owner of an object.
V	Notify (see page 2746)	Responds when items are added to or removed from the collection.
	SetItem (see page 2747)	Copies the properties of another item to a specified item in the collection.
V	SetItemName (see page 2747)	Initializes the name of a newly inserted collection item.
V	Update (see page 2747)	Updates the collection to reflect changes to its items.

Protected Properties

	Name	Description
R	NextID (see page 2752)	Specifies a unique ID that can be assigned to the next added collection item.
	PropName (see page 2752)	Specifies the name of the property that the collection implements.
R	UpdateCount (see page 2753)	Counts the number of times BeginUpdate (see page 2739) was called without a corresponding call to EndUpdate (see page 2742).

Public Methods

	Name	Description
	Add (see page 15760)	Adds a new item to the collection.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2736)	Copies the contents of another collection to the object where the method is executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
V	BeginUpdate (see page 2739)	Suspends screen repainting.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).

	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Clear (see page 2741)	Deletes all items from the collection.
	Create (see page 15760)	Creates and initializes a TOwnedCollection instance.
	CustomSort (see page 15761)	Sorts the items in the collection using a specified comparison function.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Delete (see page 2741)	Deletes a single item from the collection.
V	Destroy (see page 2735)	Destroys the collection and each item in it.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
V	EndUpdate (see page 2742)	Re-enables screen repainting.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindItemID (see page 2743)	Returns the item with the specified ID.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetEnumerator (see page 2744)	Returns a TCollection (see page 2731) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2745)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	Insert (see page 2746)	Creates a new TCollectionItem (see page 2755) instance and adds it to the Items (see page 2751) array.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	Owner (see page 2746)	Returns the Owner of the collection.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	Sort (see page 15762)	Sorts the items in the collection.

Public Properties

	Name	Description
	Capacity (see page 2748)	Provides access to the internal TList (see page 2868) Capacity property.
R	Count (see page 2749)	Returns the number of items in the collection.
R	ItemClass (see page 2751)	Indicates the class to which the collection's items belong.
R	Items (see page 15763)	Lists the items in the collection.

Published Events

	Name	Description
	OnCompare (see page 15764)	Occurs to when two items need to be compared for sorting the collection.

Published Properties

	Name	Description
	CaseSensitive (see page 15762)	Controls (see page 5711) whether items are sorted in a case-sensitive or case-insensitive manner.

	SortType (see page 15764)	Indicates how the items should be sorted.

89.1.6.2 TListControlItems.Create Constructor

Creates and initializes a TOwnedCollection instance.

Pascal

```
constructor Create(AOwner: TPersistent; ItemClass: TCollectionItemClass);
```

C++

```
__fastcall TListControlItems(TPersistent * AOwner, TCollectionItemClass ItemClass);
```

Description

The Create method takes two parameters: the name of an instance object descended from TPersistent and the name of a TCollectionItem descendant class. The first parameter is the owner of the TOwnedCollection instance. The second parameter determines the class of the items created by the Add method.

See Also

Add (see page 2736)

89.1.6.3 TListControlItems Methods

The methods of the TListControlItems class are listed here.

Protected Methods

	Name	Description
	CompareItems (see page 15761)	Returns the relative order of two items in the collection.

Public Methods

	Name	Description
	Add (see page 15760)	Adds a new item to the collection.
	CustomSort (see page 15761)	Sorts the items in the collection using a specified comparison function.
	Sort (see page 15762)	Sorts the items in the collection.

89.1.6.3.1 TListControlItems.Add Method

Adds a new item to the collection.

Pascal

```
function Add: TListControlItem;
```

C++

```
__fastcall TListControlItem Add();
```

Description

Call Add to add a new item to the collection. Add instantiates an object of the type that was specified when the TListControlItems (see page 15757) instance was created. It returns the newly created object.

See Also

Items (see page 15763)

Delete (see page 2741)

89.1.6.3.2 TListControlItems.CompareItems Method

Returns the relative order of two items in the collection.

Pascal

```
function CompareItems(I1: TListControlItem; I2: TListControlItem): Integer; virtual;
```

C++

```
virtual __fastcall int CompareItems(TListControlItem I1, TListControlItem I2);
```

Description

CompareItems is used internally to provide the default sort order for items in the list. It is used when the SortType (see page 15764) property is not stNone. The Sort (see page 15762) method also uses this as a comparison function.

If I1 is greater than I2, CompareItems returns a value greater than 0. If I1 is the same as I2, CompareItems returns 0. If I1 is less than I2, CompareItems returns a value less than 0.

CompareItems always uses an OnCompare (see page 15764) event handler if it is assigned. Otherwise, it compares the captions of the items, taking into account the CaseSensitive (see page 15762) property. Descendant classes can override CompareItems to provide a different default sort order.

See Also

SortType (see page 15764)

CustomSort (see page 15761)

Sort (see page 15762)

CaseSensitive (see page 15762)

OnCompare (see page 15764)

89.1.6.3.3 TListControlItems.CustomSort Method

Sorts the items in the collection using a specified comparison function.

Pascal

```
procedure CustomSort(Compare: TListItemsCompare);
```

C++

```
__fastcall CustomSort(TListItemsCompare Compare);
```

Description

Call Sort (see page 15762) to sort the items in the collection based on the comparison function that is the value of the Compare parameter.

Compare is a function that compares two items in the list. Its List parameter is this TListControlItems (see page 15757) object. The Index1 and Index2 parameters are the indexes of the items to compare in the Items (see page 15763) property array. This comparison function should return a value less than 0 if the first item is less than the second, a value greater than 0 if it is greater than the second, and 0 if the two items are equivalent.

Note: CustomSort sorts the items in the list, but does not maintain the sort order when new items are added. To provide a custom sort order that persists when new items are added, set the SortType (see page 15764) property to stData and supply an OnCompare (see page 15764) event handler.

See Also

SortType (see page 15764)

Sort (see page 15762)

OnCompare (see page 15764)

Items (see page 15763)

89.1.6.3.4 TListControlItems.Sort Method

Sorts the items in the collection.

Pascal

```
procedure Sort;
```

C++

```
__fastcall Sort();
```

Description

Call Sort to sort the items in the collection. Sort uses the comparison function specified by the protected CompareItems (see page 15761) method to determine the sort order.

Note: Sort sorts the items in the list, but does not maintain the sort order when new items are added. To impose a sort order that persists when new items are added, set the SortType (see page 15764) property to a value other than stNone and, if desired, supply an OnCompare (see page 15764) event handler.

See Also

SortType (see page 15764)

CustomSort (see page 15761)

OnCompare (see page 15764)

Items (see page 15763)

CompareItems (see page 15761)

89.1.6.4 TListControlItems Properties

The properties of the TListControlItems class are listed here.

Public Properties

	Name	Description
R	Items (see page 15763)	Lists the items in the collection.

Published Properties

	Name	Description
	CaseSensitive (see page 15762)	Controls (see page 5711) whether items are sorted in a case-sensitive or case-insensitive manner.
	SortType (see page 15764)	Indicates how the items should be sorted.

89.1.6.4.1 TListControlItems.CaseSensitive Property

Controls (see page 5711) whether items are sorted in a case-sensitive or case-insensitive manner.

Pascal

```
property CaseSensitive: Boolean;
```

C++

```
__property Boolean CaseSensitive;
```

Description

Use CaseSensitive to indicate whether the case of item captions should be considered when sorting the items in the list.

See Also

Items (see page 15763)

SortType (see page 15764)

Caption (see page 15756)

89.1.6.4.2 TListControlItems.Items Property

Lists the items in the collection.

Pascal

```
property Items [const Index: Integer]: TListControlItem;
```

C++

```
__property TListControlItem Items[int const Index];
```

Description

Use Items to access the items in this collection.

Index indicates the item to access, where 0 is the index of the first item, 1 is the index of the second item, and so on. The Count property indicates the maximum number of items.

Note: In Delphi code, Items is the default property for TListControlItems (see page 15757). This means that the property name can be omitted when using the Items property. For example,

```
StaticListAction.Items.Items[0].Caption := Edit1.Text;
```

Note: can also be written

```
StaticListAction.Items[0].Caption := Edit1.Text;
```

Note: Items is a read-only property. To add or delete items from the collection, use the Add (see page 15760) and Delete methods.

See Also

Add (see page 15760)

Delete (see page 2741)

Count (see page 2749)

operator_[]

89.1.6.4.3 TListControlItems.SortType Property

Indicates how the items should be sorted.

Pascal

```
property SortType: TListItemsSortType;
```

C++

```
__property TListItemsSortType SortType;
```

Description

Use SortType to indicate how you want the items sorted, if at all. The following table lists the possible values:

Value	Meaning
stNone	Items (see page 15763) are not automatically sorted. You can still sort the items explicitly by calling the Sort (see page 15762) or CustomSort (see page 15761) method.
stData	Items (see page 15763) are sorted based on the value of their Data property. You must supply an OnCompare (see page 15764) event handler to specify the sort order.
stText	Items (see page 15763) are sorted base on the value of their Caption property. The CaseSensitive (see page 15762) property specifies whether comparisons are case-sensitive.
stBoth	Items (see page 15763) are sorted based on an OnCompare (see page 15764) event handler if one is assigned, otherwise based on the value of their Caption property.

See Also

Items (see page 15763)

OnCompare (see page 15764)

Data (see page 15756)

CaseSensitive (see page 15762)

CustomSort (see page 15761)

Sort (see page 15762)

89.1.6.5 TListControlItems Events

The events of the TListControlItems class are listed here.

Published Events

	Name	Description
	OnCompare (see page 15764)	Occurs to when two items need to be compared for sorting the collection.

89.1.6.5.1 TListControlItems.OnCompare Event

Occurs to when two items need to be compared for sorting the collection.

Pascal

```
property OnCompare: TListCompareEvent;
```

C++

```
__property TListCompareEvent OnCompare;
```

Description

Write an OnCompare event handler to indicate the sort order when the SortType (see page 15764) property is stData or stBoth.

The OnCompare event handler compares the items passed as the Item1 and Item2 parameters. If Item1 is the same as Item2 in the sort order, the event handler should return 0. If Item1 is less than Item2, the event handler should return a value less than 0. If Item1 is greater than Item2, the event handler should return value greater than 0.

See Also

SortType (see page 15764)

89.1.7 TStaticListAction Class

TStaticListAction provides items to client controls.

Class Hierarchy

Pascal

```
TStaticListAction = class(TCustomStaticListAction);
```

C++

```
class TStaticListAction : public TCustomStaticListAction;
```

File

ListActns

Description

TStaticListAction supplies items to client controls such as list views, list boxes, or combo boxes. TStaticListAction maintains a list of items in its Items (see page 15773) property. This lets you specify, at design time, the items it supplies to clients.

When an application sets the Active (see page 15770) property of a list action to true, the action fills all client controls with items. Each item may include text, an image, and a pointer to data. Each client control determines which of these features of the item it accepts.

When the user selects an item in one of the client controls, the client "executes" the list action, which causes it to generate an OnItemSelected (see page 15775) event.

When a TStaticListAction is added to an action manager, it uses the action to generate a drop-down list on a tool bar.

See Also

TVirtualListAction (see page 15780)

TCustomListView (see page 3757)

TCustomListBox (see page 21308)

TCustomComboBox (see page 21201)

89.1.7.1 TStaticListAction Members

The following tables list the members exposed by TStaticListAction.

Protected Events

	Name	Description
	OnChange (see page 2716)	Occurs when one of the action's properties changes.
	OnGetItemCount (see page 15723)	Occurs when the list action needs to determine the number of items it supplies to client controls.

Protected Fields

	Name	Description
	FClients (see page 2711)	This is FClients, a member of class TBasicAction.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FImage (see page 302)	This is FImage, a member of class TCustomAction.
	FMask (see page 303)	This is FMask, a member of class TCustomAction.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 303)	Copies the properties of this action to a destination object.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	Change (see page 2712)	Generates an OnChange (see page 2716) event.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetCount (see page 15719)	This is GetCount, a member of class TCustomListAction.
V	GetCount (see page 15730)	This is GetCount, a member of class TCustomStaticListAction.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetItem (see page 15730)	This is GetItem, a member of class TCustomStaticListAction.
V	GetItemClass (see page 15730)	This is GetItemClass, a member of class TCustomStaticListAction.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
V	GetString (see page 15719)	Returns the value of the Strings (see page 15723) property.
V	GetString (see page 15730)	Returns the value of the Strings property.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
V	HandleShortCut (see page 306)	Executes the action when the user types on of its short cuts.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Loaded (see page 15720)	Initializes the action after it is loaded into memory.
V	Notification (see page 2713)	Responds when components are created or destroyed.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.

	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 294)	This is ReadState, a member of class TContainedAction.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetHelpContext (see page 306)	This is SetHelpContext, a member of class TCustomAction.
	SetHelpKeyword (see page 306)	This is SetHelpKeyword, a member of class TCustomAction.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 307)	Sets the value of the Name property.
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetOnExecute (see page 2714)	Assigns an OnExecute (see page 2716) event handler.
	SetParentComponent (see page 294)	This is SetParentComponent, a member of class TContainedAction.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	SetString (see page 15720)	Sets the value of the Strings (see page 15723) property.
	SetString (see page 15731)	Sets the value of the Strings property.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	Loading (see page 15723)	Indicates whether the action is currently adding items to client controls.
	SavedEnabledState (see page 313)	Saves the value of the Enabled (see page 310) property when the action is suspended.

Public Events

	Name	Description
	OnExecute (see page 2716)	Occurs when the client event that is linked to it fires.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.

	Create (see page 301)	Instantiates and initializes a TCustomAction (see page 297) object.
	Create (see page 2710)	Instantiates and initializes a TBasicAction (see page 2707) object.
	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 15718)	Creates an instance of TCustomListAction (see page 15713).
	Create (see page 15729)	Creates an instance of TCustomListAction.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 292)	Destroys the instance of the contained action.
	Destroy (see page 302)	Frees an instance of TCustomAction (see page 297).
	Destroy (see page 2711)	Disposes of an instance of a TBasicAction (see page 2707) object.
	Destroy (see page 2766)	Disposes of the component and its owned components.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 15729)	Frees an instance of TCustomAction.
	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DoHint (see page 303)	Generates an OnHint (see page 315) event.
	Execute (see page 293)	Responds when the client control "fires".
	Execute (see page 304)	Responds when a client control "fires".
	Execute (see page 2712)	Generates an OnExecute (see page 2716) event.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	ExecuteTarget (see page 2712)	Introduces an interface for invoking an action on a target client component or control.
	ExecuteTarget (see page 15718)	Generates an OnItemSelected (see page 15724) event.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 293)	Returns the action list or action manager that contains the action.
	GetParentComponent (see page 2778)	Returns the containing Component.
	HandlesTarget (see page 2713)	Introduces an interface for verifying that the type, and state, of a target component or control are appropriate for the action.
	HandlesTarget (see page 15719)	Indicates whether the action can execute its function.
	HasParent (see page 294)	Indicates whether the action is contained in an action list or action manager.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.

	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RegisterChanges (see page 2713)	Associates the action with an action link.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UnRegisterChanges (see page 2714)	Breaks the association between the action and the action link.
V	Update (see page 295)	Indicates whether the action updates itself.
V	Update (see page 2714)	Provides an opportunity to execute centralized code when an application is idle.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
V	UpdateTarget (see page 2715)	Introduces an interface for a method of notifying a client when the action updates itself.

Public Properties

	Name	Description
	ActionComponent (see page 2715)	Indicates the client component that caused this action to execute.
	ActionList (see page 295)	Indicates the action list or action manager that contains the action.
	AutoCheck (see page 308)	Controls (see page 5711) whether the Checked (see page 308) property toggles when the action executes.
	Checked (see page 308)	Indicates whether client controls and menu items appear checked.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
R	Count (see page 15722)	This is Count, a member of class TCustomListAction.
	Count (see page 15732)	This is Count, a member of class TCustomStaticListAction.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DisableIfNoHandler (see page 310)	Indicates whether client components should be disabled if no handler is found.
	GroupIndex (see page 311)	Indicates whether the action acts like a radio button with other actions in the same action list.
	HelpKeyword (see page 311)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 312)	Indicates the mechanism for client controls and menu items to use when invoking help.
	ImageIndex (see page 313)	Indicates the ImageIndex property for client controls and menu items.
	Index (see page 296)	Specifies the index of the action in its action list or action manager.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Strings (see page 15723)	This is Strings, a member of class TCustomListAction.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Events

	Name	Description
	OnGetItem (see page 15775)	This is OnGetItem, a member of class TStaticListAction.
	OnHint (see page 15775)	Occurs when the mouse pauses over a client control or menu item.
	OnItemSelected (see page 15775)	Occurs when a client control executes the action because a user selected one of the items.

	OnUpdate (see page 15776)	Occurs when the application is idle or when the action list updates.

Published Properties

	Name	Description
	Active (see page 15770)	Indicates whether the list action has supplied items to its client controls.
	Caption (see page 15771)	Represents the caption of client controls and menu items.
	Category (see page 296)	Specifies the category under which the action appears in its action list or action manager.
	Enabled (see page 15771)	Indicates whether client controls and menu items are enabled.
	HelpContext (see page 15771)	Indicates the help context ID for client controls and menu items.
	Hint (see page 15772)	Indicates the Help hint for client controls and menu items.
	Images (see page 15772)	Lists the images that the list action supplies along with items.
	ItemIndex (see page 15773)	Specifies the index of the selected item.
	Items (see page 15773)	Lists the items that this list action supplies to clients.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	SecondaryShortCuts (see page 15773)	Specifies the short cuts (in addition to ShortCut) for triggering clients.
	ShortCut (see page 15774)	Specifies the ShortCut property for client menu items.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Visible (see page 15774)	Specifies the Visible property for client controls and menu items.

89.1.7.2 TStaticListAction Properties

The properties of the TStaticListAction class are listed here.

Published Properties

	Name	Description
	Active (see page 15770)	Indicates whether the list action has supplied items to its client controls.
	Caption (see page 15771)	Represents the caption of client controls and menu items.
	Enabled (see page 15771)	Indicates whether client controls and menu items are enabled.
	HelpContext (see page 15771)	Indicates the help context ID for client controls and menu items.
	Hint (see page 15772)	Indicates the Help hint for client controls and menu items.
	Images (see page 15772)	Lists the images that the list action supplies along with items.
	ItemIndex (see page 15773)	Specifies the index of the selected item.
	Items (see page 15773)	Lists the items that this list action supplies to clients.
	SecondaryShortCuts (see page 15773)	Specifies the short cuts (in addition to ShortCut) for triggering clients.
	ShortCut (see page 15774)	Specifies the ShortCut property for client menu items.
	Visible (see page 15774)	Specifies the Visible property for client controls and menu items.

89.1.7.2.1 TStaticListAction.Active Property

Indicates whether the list action has supplied items to its client controls.

Pascal

```
property Active: Boolean;
```

C++

```
__property Boolean Active;
```

Description

Set Active to true to cause the list action to fill all client controls with the items. These Items are supplied by calling the GetItem method, iterating over every index from 0 to Count.

See Also

GetItem

getitem

Items (see page 21348)

items

Items (see page 21187)

count (see page 15722)

Items (see page 3814)

strings (see page 15723)

89.1.7.2.2 TStaticListAction.Caption Property

Represents the caption of client controls and menu items.

Pascal

```
property Caption: string;
```

C++

```
__property AnsiString Caption;
```

Description

Caption holds the string that is the caption for the action when it is set. The value of Caption is propagated to client controls and menu items.

See Also

Caption (see page 5806)

Caption (see page 16136)

89.1.7.2.3 TStaticListAction.Enabled Property

Indicates whether client controls and menu items are enabled.

Pascal

```
property Enabled: Boolean;
```

C++

```
__property Boolean Enabled;
```

Description

Enabled specifies the enabled state for the action. The value of Enabled is propagated to client controls and menu items.

See Also

Enabled (see page 5821)

Enabled (see page 16145)

89.1.7.2.4 TStaticListAction.HelpContext Property

Indicates the help context ID for client controls and menu items.

Pascal

```
property HelpContext: THelpContext;
```

C++

```
__property THelpContext HelpContext;
```

Description

HelpContext specifies the help context for the action when it is set. This value is propagated to client controls and menu items.

When a client control has focus and the user presses the F1 key, the control uses the value of HelpContext for this associated action to invoke the online help targeting a specific topic. The target topic is uniquely identified by a nonzero HelpContext value. Leave the HelpContext property of the client control at its default value of zero. This allows multiple controls (and multiple types of controls) to be associated with the same help topic through the one action object.

Note: HelpContext is only used when the HelpType property of this action or the client control is htInteger.

See Also

HelpType (see page 312)

HelpKeyword (see page 311)

89.1.7.2.5 TStaticListAction.Hint Property

Indicates the Help hint for client controls and menu items.

Pascal

```
property Hint: string;
```

C++

```
__property AnsiString Hint;
```

Description

Hint holds the string that is the hint for that action when it is set. This value is propagated to client controls and menu items.

See Also

Hint (see page 5827)

Hint (see page 16148)

89.1.7.2.6 TStaticListAction.Images Property

Lists the images that the list action supplies along with items.

Pascal

```
property Images: TCustomImageList;
```

C++

```
__property TCustomImageList Images;
```

Description

For each item that the list action supplies to clients, it can supply an image index along with other information such as the text value. The supplied image index refers to an image in the Images property.

Note: List actions do not supply images to all clients. The Images property controls the SmallImages property of a list view or the Images property of a TComboBoxEx descendant.

See Also

SmallImages (see page 3825)

Images (see page 3700)

89.1.7.2.7 TStaticListAction.ItemIndex Property

Specifies the index of the selected item.

Pascal

```
property ItemIndex: Integer;
```

C++

```
__property int ItemIndex;
```

Description

ItemIndex represents the index of the selected item in all client controls that descend from TCustomListControl. Setting ItemIndex causes these clients to change their selection. When the user updates the selection using one of these clients, TCustomListAction automatically updates the others so that they select the same item.

Note: List actions do not supply ItemIndex to all clients. The ItemIndex property controls only the ItemIndex property of clients that descend from TCustomListControl.

See Also

OnItemSelected (see page 15724)

ItemIndex (see page 5944)

89.1.7.2.8 TStaticListAction.Items Property

Lists the items that this list action supplies to clients.

Pascal

```
property Items: TStaticListItems;
```

C++

```
__property TStaticListItems Items;
```

Description

Set Items to indicate the items that this action supplies to clients. At design time, you can use the collection editor to add items to the list and set their properties.

See Also

Count

strings

89.1.7.2.9 TStaticListAction.SecondaryShortCuts Property

Specifies the short cuts (in addition to ShortCut) for triggering clients.

Pascal

```
property SecondaryShortCuts: TShortCutList;
```

C++

```
__property TShortCutList SecondaryShortCuts;
```

Description

Actions can execute in response to multiple short cut key combinations. SecondaryShortCuts lists all the short cut key combinations (other than the one specified by the ShortCut property) that can trigger the action. This lets you specify shortcuts for clients that do not have a ShortCut property or provide additional, secondary shortcuts.

When the user types one of the key combinations listed in SecondaryShortCuts, the action's Execute method is called.

See Also

ShortCut (see page 314)

Execute (see page 304)

89.1.7.2.10 TStaticListAction.ShortCut Property

Specifies the ShortCut property for client menu items.

Pascal

```
property ShortCut: TShortCut;
```

C++

```
__property TShortCut ShortCut;
```

Description

ShortCut holds the value that is the shortcut for the action when it is set. This value is propagated to client menu items.

See Also

ShortCut (see page 16152)

SecondaryShortCuts (see page 314)

89.1.7.2.11 TStaticListAction.Visible Property

Specifies the Visible property for client controls and menu items.

Pascal

```
property Visible: Boolean;
```

C++

```
__property Boolean Visible;
```

Description

Visible specifies the visible state for the action. This value is propagated to client controls and menu items.

See Also

Visible (see page 16153)

Visible (see page 5847)

89.1.7.3 TStaticListAction Events

The events of the TStaticListAction class are listed here.

Published Events

	Name	Description
	OnGetItem (see page 15775)	This is OnGetItem, a member of class TStaticListAction.
	OnHint (see page 15775)	Occurs when the mouse pauses over a client control or menu item.
	OnItemSelected (see page 15775)	Occurs when a client control executes the action because a user selected one of the items.
	OnUpdate (see page 15776)	Occurs when the application is idle or when the action list updates.

89.1.7.3.1 TStaticListAction.OnGetItem Event

Pascal

```
property OnGetItem: TGetItemEvent;
```

C++

```
__property TGetItemEvent OnGetItem;
```

Description

This is OnGetItem, a member of class TStaticListAction.

89.1.7.3.2 TStaticListAction.OnHint Event

Occurs when the mouse pauses over a client control or menu item.

Pascal

```
property OnHint: THintEvent;
```

C++

```
__property THintEvent OnHint;
```

Description

Use OnHint to override the default hint that appears when the user pauses the mouse over a client control or menu item. The OnHint event handler can change the hint that appears (by changing the HintStr parameter), or display the hint in some application-specific way.

89.1.7.3.3 TStaticListAction.OnItemSelected Event

Occurs when a client control executes the action because a user selected one of the items.

Pascal

```
property OnItemSelected: TItemSelectedEvent;
```

C++

```
__property TItemSelectedEvent OnItemSelected;
```

Description

Write an OnItemSelected event handler to respond when the user selects one of the items supplied to client controls. Before this event is called, the list action first updates the ItemIndex property of any client controls that descend from TCustomListControl.

Sender is the list action that supplies items to the control in which an item was selected.

Control is the control in which the user selected an item.

See Also

ExecuteTarget (see page 15718)

ItemIndex (see page 15722)

89.1.7.3.4 TStaticListAction.OnUpdate Event

Occurs when the application is idle or when the action list updates.

Pascal

```
property OnUpdate: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnUpdate;
```

Description

Write an OnUpdate event handler to execute centralized code while an application is idle. For example, actions may want to update enabling and disabling, or checking and unchecking of client targets.

C++ Examples:

```
/*
When the application is idle, the OnUpdate event occurs for
every action that is linked to a visible control or menu
item that is showing. This provides an opportunity for
applications to execute centralized code for enabling and
disabling, checking and unchecking, and so on. For example,
the following code illustrates the OnUpdate event handler
for an action that is "checked" when the toolbar is visible.
This example requires a TActionList (with one TAction) and a
TToolBar on a form. This example requires a TActionList
(with one TAction) and a TToolBar on a form.  Double click
on the TActionList and create an TAction named Action1.  The
TAction has an OnUpdate event handler called Action1Update.
Then set an object's (such as a button or menu item) Action
to Action1.
*/
void __fastcall TForm1::Action1Update(TObject *Sender)
{
   // Indicate whether ToolBar1 is currently visible.
   TAction* pa = dynamic_cast<TAction*>(Sender);
   if (pa)
   {
     if (pa->Checked != ToolBar1->Visible)
     {
       lbOther->Items->Add("Event Action1Update: toolbar visibility changed");
     }
     pa->Checked = ToolBar1->Visible;
   }
}
```

Delphi Examples:

```
{
When the application is idle, the OnUpdate event occurs for
every action that is linked to a visible control or menu
item that is showing. This provides an opportunity for
applications to execute centralized code for enabling and
disabling, checking and unchecking, and so on. For example,
the following code illustrates the OnUpdate event handler
for an action that is "checked" when the toolbar is visible.
This example requires a TActionList (with one TAction) and a
TToolBar on a form. This example requires a TActionList
(with one TAction) and a TToolBar on a form.  Double click
on the TActionList and create an TAction named Action1.  The
TAction has an OnUpdate event handler called Action1Update.
Then set an object's (such as a button or menu item) Action
```

```
to Action1.
}
procedure TMainForm.Action1Update(Sender: TObject);
begin
  if ((Sender as TAction).Checked <> ToolBar1.Visible) then
    lbOther.Items.Add('Event Action1Update: toolbar visibility changed');
    { Indicate whether ToolBar1 is currently visible }
    (Sender as TAction).Checked := ToolBar1.Visible;
end;
```

UpdateAction (see page 2790)

89.1.8 TStaticListItems Class

TStaticListItems represents the items that TStaticListAction (see page 15765) supplies to client controls.

Class Hierarchy

Pascal

```
TStaticListItems = class(TListControlItems);
```

C++

```
class TStaticListItems : public TListControlItems;
```

File

ListActns

Description

TStaticListItems manages a collection of items for a TStaticListAction (see page 15765) component. Each item in the collection can include a text value, associated image, and a data pointer. If the associated TStaticListAction (see page 15765) is active, then when items are added to or deleted from TStaticListItems, the list action's clients are updated so that they reflect the current set of items.

See Also

TStaticListAction (see page 15765)

89.1.8.1 TStaticListItems Members

The following tables list the members exposed by TStaticListItems.

Protected Methods

	Name	Description
	Added (see page 2736)	Responds when items are added to the collection.
	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	Changed (see page 2740)	Responds when the collection or any of its items changes.
	CompareItems (see page 15761)	Returns the relative order of two items in the collection.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	Deleting (see page 2741)	Responds when items are deleted from the collection.

	GetAttr (see page 2743)	Returns the name of a custom attribute that can be retrieved using the GetItemAttr (see page 2745) method.
	GetAttrCount (see page 2744)	Returns the number of custom attributes associated with items in the collection.
	GetItem (see page 2744)	Returns a specified item in the collection.
	GetItemAttr (see page 2745)	Returns the value of a custom attribute assigned to one of the collection's items.
V	GetOwner (see page 2915)	Returns the owner of an object.
	GetOwner (see page 2932)	Returns the owner of an object.
V	Notify (see page 15779)	Responds when items are added to or removed from the collection.
	SetItem (see page 2747)	Copies the properties of another item to a specified item in the collection.
V	SetItemName (see page 2747)	Initializes the name of a newly inserted collection item.
V	Update (see page 15780)	Updates the collection to reflect changes to its items.

Protected Properties

	Name	Description
R	NextID (see page 2752)	Specifies a unique ID that can be assigned to the next added collection item.
	PropName (see page 2752)	Specifies the name of the property that the collection implements.
R	UpdateCount (see page 2753)	Counts the number of times BeginUpdate (see page 2739) was called without a corresponding call to EndUpdate (see page 2742).

Public Methods

	Name	Description
	Add (see page 2736)	Creates a new TCollectionItem (see page 2755) instance and adds it to the Items (see page 2751) array.
	Add (see page 15760)	Adds a new item to the collection.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2736)	Copies the contents of another collection to the object where the method is executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
V	BeginUpdate (see page 2739)	Suspends screen repainting.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Clear (see page 2741)	Deletes all items from the collection.
	Create (see page 2734)	Creates and initializes a collection.
	Create (see page 2914)	Creates and initializes a TOwnedCollection (see page 2912) instance.
	Create (see page 15760)	Creates and initializes a TOwnedCollection instance.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	CustomSort (see page 15761)	Sorts the items in the collection using a specified comparison function.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Delete (see page 2741)	Deletes a single item from the collection.
V	Destroy (see page 2735)	Destroys the collection and each item in it.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
V	EndUpdate (see page 2742)	Re-enables screen repainting.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindItemID (see page 2743)	Returns the item with the specified ID.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.

	GetEnumerator (see page 2744)	Returns a TCollection (see page 2731) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2745)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	Insert (see page 2746)	Creates a new TCollectionItem (see page 2755) instance and adds it to the Items (see page 2751) array.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	Owner (see page 2746)	Returns the Owner of the collection.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	Sort (see page 15762)	Sorts the items in the collection.

Public Properties

	Name	Description
	Capacity (see page 2748)	Provides access to the internal TList (see page 2868) Capacity property.
R	Count (see page 2749)	Returns the number of items in the collection.
R	ItemClass (see page 2751)	Indicates the class to which the collection's items belong.
	Items (see page 2751)	Lists the items in the collection.
R	Items (see page 15763)	Lists the items in the collection.

Published Events

	Name	Description
	OnCompare (see page 15764)	Occurs to when two items need to be compared for sorting the collection.

Published Properties

	Name	Description
	CaseSensitive (see page 15762)	Controls (see page 5711) whether items are sorted in a case-sensitive or case-insensitive manner.
	SortType (see page 15764)	Indicates how the items should be sorted.

89.1.8.2 TStaticListItems Methods

The methods of the TStaticListItems class are listed here.

Protected Methods

	Name	Description
V	Notify (see page 15779)	Responds when items are added to or removed from the collection.
V	Update (see page 15780)	Updates the collection to reflect changes to its items.

89.1.8.2.1 TStaticListItems.Notify Method

Responds when items are added to or removed from the collection.

Pascal

```
procedure Notify(Item: TCollectionItem; Action: TCollectionNotification); override;
```

C++

```
virtual __fastcall Notify(TCollectionItem Item, TCollectionNotification Action);
```

Description

Notify is called automatically when the items in the collection change.

Item is the item that was just added to or that is about to be removed from the collection.

Action indicates whether item was added, is about to be removed, or is about to be deleted:

As implemented in TCollection, Notify calls Added when Action is cnAdded and calls Deleting when Action is cnDeleting. TCollection ignores the cnExtracting action. Descendant classes can override Notify to modify this behavior.

See Also

Added (see page 2736)

Deleting (see page 2741)

89.1.8.2.2 TStaticListItems.Update Method

Updates the collection to reflect changes to its items.

Pascal

```
procedure Update(Item: TCollectionItem); override;
```

C++

```
virtual __fastcall Update(TCollectionItem Item);
```

Description

Override Update in a descendant class to make any necessary changes when the items in the collection change. This method is called automatically when an update is complete.

Item identifies the item that changed. If the Item parameter is nil (Delphi) or NULL (C++), then the change affects more than one item in the collection.

As implemented in TCollection, Update does nothing. Descendant classes override this method to make any necessary adjustments.

See Also

Changed (see page 2740)

Changed (see page 2758)

89.1.9 TVirtualListAction Class

TVirtualListAction provides items to a client controls.

Class Hierarchy

Pascal

```
TVirtualListAction = class(TCustomVirtualListAction);
```

C++

```
class TVirtualListAction : public TCustomVirtualListAction;
```

File

ListActns

Description

TVirtualListAction supplies items dynamically at runtime to client controls such as list views, list boxes, or combo boxes. These items are supplied by the code you supply to an OnGetItem (see page 15790) event handler.

When an application sets the Active (see page 15786) property of a list action to true, the action fills all client controls with items. Each item may include text, an image, and a pointer to data. Each client control determines which of these features of the item it accepts.

When the user selects an item in one of the client controls, the client "executes" the list action, which causes it to generate an OnItemSelected (see page 15791) event.

When a TVirtualListAction is added to an action manager, it uses the action to generate a drop-down list on a tool bar.

See Also

TStaticListAction (see page 15765)

TCustomCombo (see page 21154)

TCustomListView (see page 3757)

TCustomListBox (see page 21308)

TCustomComboBox (see page 21201)

89.1.9.1 TVirtualListAction Members

The following tables list the members exposed by TVirtualListAction.

Protected Events

	Name	Description
	OnChange (see page 2716)	Occurs when one of the action's properties changes.

Protected Fields

	Name	Description
	FClients (see page 2711)	This is FClients, a member of class TBasicAction.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FImage (see page 302)	This is FImage, a member of class TCustomAction.
	FMask (see page 303)	This is FMask, a member of class TCustomAction.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 303)	Copies the properties of this action to a destination object.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	Change (see page 2712)	Generates an OnChange (see page 2716) event.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetCount (see page 15719)	This is GetCount, a member of class TCustomListAction.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetItem (see page 15743)	This is GetItem, a member of class TCustomVirtualListAction.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
V	GetString (see page 15719)	Returns the value of the Strings (see page 15723) property.
V	GetString (see page 15743)	Returns the value of the Strings property.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
V	HandleShortCut (see page 306)	Executes the action when the user types on of its short cuts.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Loaded (see page 15720)	Initializes the action after it is loaded into memory.
V	Notification (see page 2713)	Responds when components are created or destroyed.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 294)	This is ReadState, a member of class TContainedAction.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
V	SetHelpContext (see page 306)	This is SetHelpContext, a member of class TCustomAction.
V	SetHelpKeyword (see page 306)	This is SetHelpKeyword, a member of class TCustomAction.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 307)	Sets the value of the Name property.
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
V	SetOnExecute (see page 2714)	Assigns an OnExecute (see page 2716) event handler.
V	SetParentComponent (see page 294)	This is SetParentComponent, a member of class TContainedAction.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetString (see page 15720)	Sets the value of the Strings (see page 15723) property.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.

	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	Loading (see page 15723)	Indicates whether the action is currently adding items to client controls.
	SavedEnabledState (see page 313)	Saves the value of the Enabled (see page 310) property when the action is suspended.

Public Events

	Name	Description
	OnExecute (see page 2716)	Occurs when the client event that is linked to it fires.
	OnUpdate (see page 2718)	Occurs when the application is idle or when the action list updates.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 301)	Instantiates and initializes a TCustomAction (see page 297) object.
	Create (see page 2710)	Instantiates and initializes a TBasicAction (see page 2707) object.
	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 15718)	Creates an instance of TCustomListAction (see page 15713).
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 292)	Destroys the instance of the contained action.
	Destroy (see page 302)	Frees an instance of TCustomAction (see page 297).
	Destroy (see page 2711)	Disposes of an instance of a TBasicAction (see page 2707) object.
	Destroy (see page 2766)	Disposes of the component and its owned components.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DoHint (see page 303)	Generates an OnHint (see page 315) event.
	Execute (see page 293)	Responds when the client control "fires".

	Execute (see page 304)	Responds when a client control "fires".
	Execute (see page 2712)	Generates an OnExecute (see page 2716) event.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	ExecuteTarget (see page 2712)	Introduces an interface for invoking an action on a target client component or control.
	ExecuteTarget (see page 15718)	Generates an OnItemSelected (see page 15724) event.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 293)	Returns the action list or action manager that contains the action.
	GetParentComponent (see page 2778)	Returns the containing Component.
	HandlesTarget (see page 2713)	Introduces an interface for verifying that the type, and state, of a target component or control are appropriate for the action.
	HandlesTarget (see page 15719)	Indicates whether the action can execute its function.
	HasParent (see page 294)	Indicates whether the action is contained in an action list or action manager.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RegisterChanges (see page 2713)	Associates the action with an action link.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UnRegisterChanges (see page 2714)	Breaks the association between the action and the action link.
	Update (see page 295)	Indicates whether the action updates itself.
	Update (see page 2714)	Provides an opportunity to execute centralized code when an application is idle.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	UpdateTarget (see page 2715)	Introduces an interface for a method of notifying a client when the action updates itself.

Public Properties

	Name	Description
	ActionComponent (see page 2715)	Indicates the client component that caused this action to execute.
	ActionList (see page 295)	Indicates the action list or action manager that contains the action.
	AutoCheck (see page 308)	Controls (see page 5711) whether the Checked (see page 308) property toggles when the action executes.
	Checked (see page 308)	Indicates whether client controls and menu items appear checked.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
R	Count (see page 15722)	This is Count, a member of class TCustomListAction.
	Count (see page 15744)	This is Count, a member of class TCustomVirtualListAction.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DisableIfNoHandler (see page 310)	Indicates whether client components should be disabled if no handler is found.
	GroupIndex (see page 311)	Indicates whether the action acts like a radio button with other actions in the same action list.
	HelpKeyword (see page 311)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 312)	Indicates the mechanism for client controls and menu items to use when invoking help.
	ImageIndex (see page 313)	Indicates the ImageIndex property for client controls and menu items.
	Index (see page 296)	Specifies the index of the action in its action list or action manager.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Strings (see page 15723)	This is Strings, a member of class TCustomListAction.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Events

	Name	Description
	OnGetItem (see page 15790)	This is OnGetItem, a member of class TVirtualListAction.
	OnGetItemCount (see page 15790)	Occurs when the list action needs to determine the number of items it supplies to client controls.
	OnHint (see page 15791)	Occurs when the mouse pauses over a client control or menu item.
	OnItemSelected (see page 15791)	Occurs when a client control executes the action because a user selected one of the items.

Published Properties

	Name	Description
	Active (see page 15786)	Indicates whether the list action has supplied items to its client controls.
	Caption (see page 15786)	Represents the caption of client controls and menu items.
	Category (see page 296)	Specifies the category under which the action appears in its action list or action manager.
	Enabled (see page 15787)	Indicates whether client controls and menu items are enabled.
	HelpContext (see page 15787)	Indicates the help context ID for client controls and menu items.
	Hint (see page 15788)	Indicates the Help hint for client controls and menu items.
	Images (see page 15788)	Lists the images that the list action supplies along with items.
	ItemIndex (see page 15788)	Specifies the index of the selected item.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	SecondaryShortCuts (see page 15789)	Specifies the short cuts (in addition to ShortCut) for triggering clients.
	ShortCut (see page 15789)	Specifies the ShortCut property for client menu items.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Visible (see page 15789)	Specifies the Visible property for client controls and menu items.

89.1.9.2 TVirtualListAction Properties

The properties of the TVirtualListAction class are listed here.

Published Properties

	Name	Description
	Active (see page 15786)	Indicates whether the list action has supplied items to its client controls.
	Caption (see page 15786)	Represents the caption of client controls and menu items.
	Enabled (see page 15787)	Indicates whether client controls and menu items are enabled.
	HelpContext (see page 15787)	Indicates the help context ID for client controls and menu items.
	Hint (see page 15788)	Indicates the Help hint for client controls and menu items.
	Images (see page 15788)	Lists the images that the list action supplies along with items.
	ItemIndex (see page 15788)	Specifies the index of the selected item.
	SecondaryShortCuts (see page 15789)	Specifies the short cuts (in addition to ShortCut) for triggering clients.
	ShortCut (see page 15789)	Specifies the ShortCut property for client menu items.
	Visible (see page 15789)	Specifies the Visible property for client controls and menu items.

89.1.9.2.1 TVirtualListAction.Active Property

Indicates whether the list action has supplied items to its client controls.

Pascal

```
property Active: Boolean;
```

C++

```
__property Boolean Active;
```

Description

Set Active to true to cause the list action to fill all client controls with the items. These Items are supplied by calling the GetItem method, iterating over every index from 0 to Count.

See Also

GetItem

getitem

Items (see page 21348)

items

Items (see page 21187)

count (see page 15722)

Items (see page 3814)

strings (see page 15723)

89.1.9.2.2 TVirtualListAction.Caption Property

Represents the caption of client controls and menu items.

Pascal

```
property Caption: string;
```

C++

```
__property AnsiString Caption;
```

Description

Caption holds the string that is the caption for the action when it is set. The value of Caption is propagated to client controls and menu items.

See Also

Caption (see page 5806)

Caption (see page 16136)

89.1.9.2.3 TVirtualListAction.Enabled Property

Indicates whether client controls and menu items are enabled.

Pascal

```
property Enabled: Boolean;
```

C++

```
__property Boolean Enabled;
```

Description

Enabled specifies the enabled state for the action. The value of Enabled is propagated to client controls and menu items.

See Also

Enabled (see page 5821)

Enabled (see page 16145)

89.1.9.2.4 TVirtualListAction.HelpContext Property

Indicates the help context ID for client controls and menu items.

Pascal

```
property HelpContext: THelpContext;
```

C++

```
__property THelpContext HelpContext;
```

Description

HelpContext specifies the help context for the action when it is set. This value is propagated to client controls and menu items.

When a client control has focus and the user presses the F1 key, the control uses the value of HelpContext for this associated action to invoke the online help targeting a specific topic. The target topic is uniquely identified by a nonzero HelpContext value. Leave the HelpContext property of the client control at its default value of zero. This allows multiple controls (and multiple types of controls) to be associated with the same help topic through the one action object.

Note: HelpContext is only used when the HelpType property of this action or the client control is htInteger.

See Also

HelpType (see page 312)

HelpKeyword (see page 311)

89.1.9.2.5 TVirtualListAction.Hint Property

Indicates the Help hint for client controls and menu items.

Pascal

```
property Hint: string;
```

C++

```
__property AnsiString Hint;
```

Description

Hint holds the string that is the hint for that action when it is set. This value is propagated to client controls and menu items.

See Also

Hint (see page 5827)

Hint (see page 16148)

89.1.9.2.6 TVirtualListAction.Images Property

Lists the images that the list action supplies along with items.

Pascal

```
property Images: TCustomImageList;
```

C++

```
__property TCustomImageList Images;
```

Description

For each item that the list action supplies to clients, it can supply an image index along with other information such as the text value. The supplied image index refers to an image in the Images property.

Note: List actions do not supply images to all clients. The Images property controls the SmallImages property of a list view or the Images property of a TComboBoxEx descendant.

See Also

SmallImages (see page 3825)

Images (see page 3700)

89.1.9.2.7 TVirtualListAction.ItemIndex Property

Specifies the index of the selected item.

Pascal

```
property ItemIndex: Integer;
```

C++

```
__property int ItemIndex;
```

Description

ItemIndex represents the index of the selected item in all client controls that descend from TCustomListControl. Setting ItemIndex causes these clients to change their selection. When the user updates the selection using one of these clients, TCustomListAction automatically updates the others so that they select the same item.

Note: List actions do not supply ItemIndex to all clients. The ItemIndex property controls only the ItemIndex property of clients that descend from TCustomListControl.

See Also

OnItemSelected (see page 15724)

ItemIndex (see page 5944)

89.1.9.2.8 TVirtualListAction.SecondaryShortCuts Property

Specifies the short cuts (in addition to ShortCut) for triggering clients.

Pascal

```
property SecondaryShortCuts: TShortCutList;
```

C++

```
__property TShortCutList SecondaryShortCuts;
```

Description

Actions can execute in response to multiple short cut key combinations. SecondaryShortCuts lists all the short cut key combinations (other than the one specified by the ShortCut property) that can trigger the action. This lets you specify shortcuts for clients that do not have a ShortCut property or provide additional, secondary shortcuts.

When the user types one of the key combinations listed in SecondaryShortCuts, the action's Execute method is called.

See Also

ShortCut (see page 314)

Execute (see page 304)

89.1.9.2.9 TVirtualListAction.ShortCut Property

Specifies the ShortCut property for client menu items.

Pascal

```
property ShortCut: TShortCut;
```

C++

```
__property TShortCut ShortCut;
```

Description

ShortCut holds the value that is the shortcut for the action when it is set. This value is propagated to client menu items.

See Also

ShortCut (see page 16152)

SecondaryShortCuts (see page 314)

89.1.9.2.10 TVirtualListAction.Visible Property

Specifies the Visible property for client controls and menu items.

Pascal

```
property Visible: Boolean;
```

C++

```
__property Boolean Visible;
```

Description

Visible specifies the visible state for the action. This value is propagated to client controls and menu items.

See Also

Visible (see page 16153)

Visible (see page 5847)

89.1.9.3 TVirtualListAction Events

The events of the TVirtualListAction class are listed here.

Published Events

	Name	Description
	OnGetItem (see page 15790)	This is OnGetItem, a member of class TVirtualListAction.
	OnGetItemCount (see page 15790)	Occurs when the list action needs to determine the number of items it supplies to client controls.
	OnHint (see page 15791)	Occurs when the mouse pauses over a client control or menu item.
	OnItemSelected (see page 15791)	Occurs when a client control executes the action because a user selected one of the items.

89.1.9.3.1 TVirtualListAction.OnGetItem Event

Pascal

```
property OnGetItem: TGetVirtualItemEvent;
```

C++

```
__property TGetVirtualItemEvent OnGetItem;
```

Description

This is OnGetItem, a member of class TVirtualListAction.

89.1.9.3.2 TVirtualListAction.OnGetItemCount Event

Occurs when the list action needs to determine the number of items it supplies to client controls.

Pascal

```
property OnGetItemCount: TGetItemCountEvent;
```

C++

```
__property TGetItemCountEvent OnGetItemCount;
```

Description

The GetCount method generates an OnGetItemCount event to supply the value of the Count property. Write an OnGetItemCount event handler to indicate the number of items for which you are supplying values in the OnGetItem event handler.

Sender is the list action that is supplying data to client controls.

Count returns the number of items this list action supplies to client controls.

See Also

getcount (see page 15719)

count (see page 15722)

89.1.9.3.3 TVirtualListAction.OnHint Event

Occurs when the mouse pauses over a client control or menu item.

Pascal

```
property OnHint: THintEvent;
```

C++

```
__property THintEvent OnHint;
```

Description

Use OnHint to override the default hint that appears when the user pauses the mouse over a client control or menu item. The OnHint event handler can change the hint that appears (by changing the HintStr parameter), or display the hint in some application-specific way.

89.1.9.3.4 TVirtualListAction.OnItemSelected Event

Occurs when a client control executes the action because a user selected one of the items.

Pascal

```
property OnItemSelected: TItemSelectedEvent;
```

C++

```
__property TItemSelectedEvent OnItemSelected;
```

Description

Write an OnItemSelected event handler to respond when the user selects one of the items supplied to client controls. Before this event is called, the list action first updates the ItemIndex property of any client controls that descend from TCustomListControl.

Sender is the list action that supplies items to the control in which an item was selected.

Control is the control in which the user selected an item.

See Also

ExecuteTarget (see page 15718)

ItemIndex (see page 15722)

89.2 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TListItemsSortType (see page 15792)	This is record ListActns.TListItemsSortType.

89.2.1 ListActns.TListItemsSortType Enumeration

Pascal

```
TListItemsSortType = (
  stNone,
  stData,
  stText,
  stBoth
);
```

C++

```
enum TListItemsSortType {
  stNone,
  stData,
  stText,
  stBoth
};
```

File

ListActns

Description

This is record ListActns.TListItemsSortType.

89.3 Types

The following table lists types in this documentation.

Types

Name	Description
TGetItemCountEvent (see page 15793)	This is type ListActns.TGetItemCountEvent.
TGetItemEvent (see page 15793)	This is type ListActns.TGetItemEvent.
TGetVirtualItemEvent (see page 15794)	This is type ListActns.TGetVirtualItemEvent.
TItemSelectedEvent (see page 15794)	This is type ListActns.TItemSelectedEvent.
TListCompareEvent (see page 15794)	This is type ListActns.TListCompareEvent.
TListControlItemClass (see page 15795)	This is type ListActns.TListControlItemClass.
TListItemsCompare (see page 15795)	This is type ListActns.TListItemsCompare.

89.3.1 ListActns.TGetItemCountEvent Type

Pascal

```
TGetItemCountEvent = procedure (Sender: TCustomListAction; var Count: Integer) of object;
```

C++

```
(Sender: TCustomListAction; var Count: Integer) ( TGetItemCountEvent)();
```

File

ListActns

Description

This is type ListActns.TGetItemCountEvent.

89.3.2 ListActns.TGetItemEvent Type

Pascal

```
TGetItemEvent = procedure (Sender: TCustomListAction; const Index: Integer; var Item:
TListControlItem) of object;
```

C++

```
(Sender: TCustomListAction; const Index: Integer; var Item: TListControlItem) (
TGetItemEvent)();
```

File

ListActns

Description

This is type ListActns.TGetItemEvent.

89.3.3 ListActns.TGetVirtualItemEvent Type

Pascal

```
TGetVirtualItemEvent = procedure (Sender: TCustomListAction; const Index: Integer; var Value:
String; var ImageIndex: Integer; var Data: Pointer) of object;
```

C++

```
(Sender: TCustomListAction; const Index: Integer; var Value: String; var ImageIndex: Integer;
var Data: Pointer) ( TGetVirtualItemEvent)();
```

File

ListActns

Description

This is type ListActns.TGetVirtualItemEvent.

89.3.4 ListActns.TItemSelectedEvent Type

Pascal

```
TItemSelectedEvent = procedure (Sender: TCustomListAction; Control: TControl) of object;
```

C++

```
(Sender: TCustomListAction; Control: TControl) ( TItemSelectedEvent)();
```

File

ListActns

Description

This is type ListActns.TItemSelectedEvent.

89.3.5 ListActns.TListCompareEvent Type

Pascal

```
TListCompareEvent = function (List: TListControlItems; Item1, Item2: TListControlItem):
Integer of object;
```

C++

```
(List: TListControlItems; Item1, Item2: TListControlItem): Integer ( TListCompareEvent)();
```

File

ListActns

Description

This is type ListActns.TListCompareEvent.

89.3.6 ListActns.TListControlItemClass Type

Pascal

```
TListControlItemClass = class of TListControlItem;
```

C++

```
TListControlItem TListControlItemClass;
```

File

ListActns

Description

This is type ListActns.TListControlItemClass.

89.3.7 ListActns.TListItemsCompare Type

Pascal

```
TListItemsCompare = function (List: TListControlItems; Index1, Index2: Integer): Integer;
```

C++

```
(List: TListControlItems; Index1, Index2: Integer): Integer ( TListItemsCompare)();
```

File

ListActns

Description

This is type ListActns.TListItemsCompare.

90 Mask Namespace

This is namespace Mask.

Topics

Name	Description
Classes (see page 15798)	The following table lists classes in this documentation.
Types (see page 15895)	The following table lists types in this documentation.

Classes

	Name	Description
	EDBEditError (see page 15798)	EDBEditError is the exception class for data that are incompatible with a specified mask.
	TCustomMaskEdit (see page 15798)	TCustomMaskEdit is the base type for edit controls that provide a mask for checking the validity of text typed into the control.
	TMaskEdit (see page 15824)	TMaskEdit implements a generic masked edit control.

Types

Name	Description
TMaskedState (see page 15895)	TMaskedState is a set of flags that describe the current state of a masked edit control.

90.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	EDBEditError (see page 15798)	EDBEditError is the exception class for data that are incompatible with a specified mask.
	TCustomMaskEdit (see page 15798)	TCustomMaskEdit is the base type for edit controls that provide a mask for checking the validity of text typed into the control.
	TMaskEdit (see page 15824)	TMaskEdit implements a generic masked edit control.

90.1.1 EDBEditError Class

EDBEditError is the exception class for data that are incompatible with a specified mask.

Class Hierarchy

Pascal

```
EDBEditError = class(Exception);
```

C++

```
class EDBEditError : public Exception;
```

File

Mask

Description

EDBEditError is raised when an application attempts to use data that are incompatible with the mask specified for a field.

A mask restricts the data that can be put into an edit box or data field. Use the EditMask property to specify a mask.

See Also

TCustomMaskEdit (see page 15798)

EditMask

90.1.2 TCustomMaskEdit Class

TCustomMaskEdit is the base type for edit controls that provide a mask for checking the validity of text typed into the control.

Class Hierarchy

Pascal

```
TCustomMaskEdit = class(TCustomEdit);
```

C++

```
class TCustomMaskEdit : public TCustomEdit;
```

File

Mask

Description

TCustomMaskEdit introduces new properties and methods to expand the capabilities of TCustomEdit for validity checking using an edit mask. To create an edit control that takes advantage of the masking capabilities of TCustomMaskEdit, use a TMaskEdit (see page 15824) object. To create an edit control that does not validate the input, use the TEdit object instead.

Do not create instances of TCustomMaskEdit. Use TCustomMaskEdit as a base class when declaring control objects that implement a masked edit control. Properties and methods of TCustomMaskEdit provide basic behavior that descendant classes inherit as well as behavior that components can override to customize their behavior.

See Also

EDBEditError (see page 15798)

TDBEdit (see page 8735)

TEdit (see page 21402)

TMaskEdit (see page 15824)

90.1.2.1 TCustomMaskEdit Members

The following tables list the members exposed by TCustomMaskEdit.

Protected Events

	Name	Description
	OnAlignInsertBefore (see page 6213)	Occurs when an object with custom alignment is aligned.
	OnAlignPosition (see page 6214)	Occurs when an object with custom alignment is aligned.
	OnCanResize (see page 5851)	Occurs when an attempt is made to resize the control.
	OnChange (see page 21275)	Occurs when the text for the edit control may have changed.
	OnClick (see page 5851)	Occurs when the user clicks the control.
	OnConstrainedResize (see page 5853)	Adjust resize constraints.
	OnContextPopup (see page 5854)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnDblClick (see page 5854)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDockDrop (see page 6214)	Occurs when another control is docked to the control.
	OnDockOver (see page 6216)	Occurs when another control is dragged over the control.
	OnDragDrop (see page 5855)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 5857)	Occurs when the user drags an object over a control.
	OnEndDock (see page 5859)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 5860)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnEnter (see page 6219)	Occurs when a control receives the input focus.
	OnExit (see page 6221)	Occurs when the input focus shifts away from one control to another.
	OnGetSiteInfo (see page 6223)	Returns the control's docking information.
	OnKeyDown (see page 6225)	Occurs when a user presses any key while the control has focus.

	OnKeyPress (see page 6227)	Occurs when a key is pressed.
	OnKeyUp (see page 6228)	Occurs when the user releases a key that has been pressed.
	OnMouseActivate (see page 5861)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 5862)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseEnter (see page 5864)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 5864)	Occurs when the user moves the mouse outside of a control.
	OnMouseMove (see page 5865)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 5867)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnMouseWheel (see page 5869)	Occurs when the mouse wheel is rotated.
	OnMouseWheelDown (see page 5869)	Occurs when the mouse wheel is rotated downward.
	OnMouseWheelUp (see page 5870)	Occurs when the mouse wheel is rotated upward.
	OnResize (see page 5870)	Occurs immediately after the control is resized.
	OnStartDock (see page 5871)	Occurs when the user begins to drag a control with a DragKind (see page 5819) of dkDock.
	OnStartDrag (see page 5871)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.
	OnUnDock (see page 6230)	Occurs when the application tries to undock a control that is docked to the windowed control.

Protected Fields

	Name	Description
	FAnchorMove (see page 5733)	This is FAnchorMove, a member of class TControl.
	FAnchorOrigin (see page 5734)	This is FAnchorOrigin, a member of class TControl.
	FAnchorRules (see page 5734)	This is FAnchorRules, a member of class TControl.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FDesignSize (see page 6124)	This is FDesignSize, a member of class TWinControl.
	FDoubleBuffered (see page 6124)	This is FDoubleBuffered, a member of class TWinControl.
	FExplicitHeight (see page 5734)	This is FExplicitHeight, a member of class TControl.
	FExplicitLeft (see page 5734)	This is FExplicitLeft, a member of class TControl.
	FExplicitTop (see page 5734)	This is FExplicitTop, a member of class TControl.
	FExplicitWidth (see page 5735)	This is FExplicitWidth, a member of class TControl.
	FInImeComposition (see page 6125)	This is FInImeComposition, a member of class TWinControl.
	FOriginalParentSize (see page 5735)	This is FOriginalParentSize, a member of class TControl.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	ActionChange (see page 5737)	Responds when the action associated with the control changes.
V	ActionChange (see page 6127)	Updates the control to reflect changes in its associated action.
	AddBiDiModeExStyle (see page 6128)	Sets control's window style according to its bi-directional support.
V	AdjustClientRect (see page 6128)	Provides the interface that adjusts the ClientRect (see page 5810) property for idiosyncrasies of the window.
	AdjustSize (see page 5738)	Sets the size of the control as determined by the AutoSize (see page 5803) property.
V	AdjustSize (see page 6129)	Adjusts the control's size according to its contents and constraints.
V	AlignControls (see page 6129)	Aligns any controls for which the control is the parent within a specified area of the control.
	ArrangeControl (see page 6130)	This is ArrangeControl, a member of class TWinControl.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	AssignTo (see page 5739)	Overrides the inherited AssignTo function to enable assignments to TAction objects.
V	AssignTo (see page 6130)	Copies the properties of the windowed control to another object.
	BeginAutoDrag (see page 5739)	Begin Automatic Drag.

	CalcCursorPos (see page 5741)	This is CalcCursorPos, a member of class TControl.
	CanAutoSize (see page 5741)	Indicates whether the control can resize itself automatically to accommodate its contents.
	CanAutoSize (see page 6131)	Indicates how the control can be resized.
	CanResize (see page 5742)	OnCanResize (see page 5851) event dispatcher.
	CanResize (see page 6132)	Indicates how the control can respond to a resize attempt.
	Change (see page 21245)	Generates an OnChange (see page 21275) event.
	Changed (see page 5742)	Sends a CM_CHANGED (see page 6330) message to the control.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	ChangeScale (see page 5743)	Rescaling event dispatcher.
	ChangeScale (see page 6132)	Resize (see page 5780) and reposition children and self.
	CheckCursor (see page 15811)	Moves the cursor to the closest editable character and selects it if nothing is currently selected.
	Click (see page 5743)	Respond to user click.
	ConstrainedResize (see page 5746)	Notify control of resize with constraints.
	ConstrainedResize (see page 6133)	Generates an OnConstrainedResize (see page 5853) event.
	ControlsAligned (see page 6134)	This is ControlsAligned, a member of class TWinControl.
	CreateDockManager (see page 6134)	Creates the dock manager for the control.
	CreateHandle (see page 6135)	Creates underlying screen object.
	CreateParams (see page 6135)	Initializes a window-creation parameter data structure.
	CreateParams (see page 21248)	Initializes a window-creation parameter record passed in the Params parameter.
	CreateSubClass (see page 6136)	Creates a windowed control derived from an existing Windows window class.
	CreateWindowHandle (see page 6137)	Creates a Windows control to represent the control.
	CreateWindowHandle (see page 21248)	Creates a Windows control to represent the control.
	CreateWnd (see page 6137)	Creates the underlying window.
	CreateWnd (see page 21248)	Creates a Windows control corresponding to the edit control.
	CustomAlignInsertBefore (see page 6137)	Returns placement order of custom-aligned child control.
	CustomAlignPosition (see page 6138)	Returns aligned position of custom-aligned child control.
	DblClick (see page 5747)	OnDblClick (see page 5854) event dispatcher.
	DefaultDockImage (see page 5747)	Handles the painting and erasing of a dock image.
	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	DefineProperties (see page 5748)	Provides methods to read and write the IsControl (see page 5829) property to a stream such as a form file.
	DefineProperties (see page 6139)	Provides methods to read and write the IsControl property to a stream such as a form file.
	DesignWndProc (see page 5749)	This is DesignWndProc, a member of class TControl.
	DestroyHandle (see page 6140)	Destroys the control's window without destroying the control.
	DestroyWindowHandle (see page 6140)	Destroys the window created in the CreateWindowHandle (see page 6137) method.
	DestroyWnd (see page 6141)	Destroys the control's window.
	DestroyWnd (see page 21251)	Destroys the Windows control that corresponds to the edit control.
	DoAddDockClient (see page 6142)	Performs actions when a control is docked to the windowed control.
	DockOver (see page 6143)	Responds when a docking client is dragged over the windowed control.
	DockReplaceDockClient (see page 6143)	This is DockReplaceDockClient, a member of class TWinControl.
	DockTrackNoTarget (see page 5749)	Handles dragging of the control over an invalid docking target.
	DoContextPopup (see page 5750)	OnContextPopup (see page 5854) event dispatcher.
	DoDock (see page 5750)	Docking event dispatcher.
	DoDockOver (see page 6143)	Generates an OnDockOver (see page 6216) event.
	DoEndDock (see page 5750)	OnEndDock (see page 5859) event dispatcher.
	DoEndDrag (see page 5751)	OnEndDrag (see page 5860) event dispatcher.
	DoEnter (see page 6144)	Respond to receiving input focus.
	DoExit (see page 6144)	Respond to losing input focus
	DoFlipChildren (see page 6145)	Flips the control's children.

	DoKeyDown (see page 6145)	Performs some preprocessing before generating an OnKeyDown (see page 6225) event.
	DoKeyPress (see page 6146)	Performs some preprocessing before generating an OnKeyPress (see page 6227) event.
	DoKeyUp (see page 6146)	Performs some preprocessing before generating an OnKeyUp (see page 6228) event.
	DoMouseWheel (see page 5751)	Processes mouse wheel motion.
	DoMouseWheelDown (see page 5752)	OnMouseWheelDown (see page 5869) event dispatcher.
	DoMouseWheelUp (see page 5752)	OnMouseWheelUp (see page 5870) event dispatcher.
	DoRemoveDockClient (see page 6147)	Responds when a control is undocked from the windowed control.
	DoSetMaxLength (see page 21251)	Sets the MaxLength (see page 21263) property.
	DoStartDock (see page 5753)	OnStartDock (see page 5871) event dispatcher.
	DoStartDrag (see page 5753)	OnStartDrag (see page 5871) event dispatcher.
	DoUnDock (see page 6147)	Undocks a control that is currently docked to the windowed control.
	DragCanceled (see page 5754)	Provides the interface for a method that responds to the cancellation of a drag.
	DragOver (see page 5755)	OnDragOver (see page 5857) event dispatcher.
	DrawDragDockImage (see page 5755)	Draws the dock image for the control.
	EditCanModify (see page 15812)	Permits the user to edit control contents.
	EraseDragDockImage (see page 5757)	Erases the dock image for the control.
	FindNextControl (see page 6149)	Returns the control's next child in the tab order after the specified control.
	FixupTabList (see page 6149)	Sorts the child controls by their tab order.
	GetAction (see page 5758)	This is GetAction, a member of class TControl.
	GetActionLinkClass (see page 5758)	Returns the appropriate action link class that is associated with the control class.
	GetActionLinkClass (see page 6152)	Returns the associated action link class.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetChildren (see page 6153)	Calls a specified method for each child of the control.
	GetClientOrigin (see page 5758)	Returns the screen coordinates of the top-left corner of the control's client area.
	GetClientOrigin (see page 6153)	Returns the value of the ClientOrigin (see page 5809) property.
	GetClientRect (see page 5759)	Returns a rectangle defining the client area of the control.
	GetClientRect (see page 6154)	Returns the value of the ClientRect (see page 5810) property.
	GetControlExtents (see page 6154)	Returns the smallest rectangle in which all the control's children fit.
	GetDeviceContext (see page 5760)	Returns a device context for the control.
	GetDeviceContext (see page 6155)	Provides access to a device context for the control.
	GetDockEdge (see page 5763)	Returns the edge on which another control should be docked when it is dragged over the control.
	GetDragImages (see page 5763)	Returns the control's image list containing the image to be displayed while dragging.
	GetEnabled (see page 5763)	Returns the value of the Enabled (see page 5821) property.
	GetFirstEditChar (see page 15813)	Returns the index in the EditMask (see page 15821) of the first nonliteral character.
	GetFloating (see page 5764)	Returns the value of the Floating (see page 5823) property.
	GetFloatingDockSiteClass (see page 5764)	Returns the class used for the control when it is floating.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
	GetLastEditChar (see page 15813)	Returns the index in the EditMask (see page 15821) of the last nonliteral character.
	GetMaxChars (see page 15814)	Returns the length of the EditText (see page 15821).
	GetNextEditChar (see page 15814)	Returns the first index of a nonliteral character equal to or greater than an offset.
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetPalette (see page 5765)	Returns the handle to a palette for use by the control.
	GetParentHandle (see page 6157)	Returns the window handle for the window of the control's parent.
	GetPopupMenu (see page 5765)	Returns the pop-up menu associated with the control.
	GetPriorEditChar (see page 15815)	Returns the first index of a nonliteral character equal to or less than an offset.

	GetSel (see page 15815)	Returns the endpoints of the current selection in the EditText (see page 15821).
V	GetSelLength (see page 21252)	Returns the SelLength (see page 21265) property.
V	GetSelStart (see page 21252)	Returns the SelStart (see page 21269) property.
V	GetSelText (see page 21252)	Returns the SelText (see page 21272) property.
	GetSiteInfo (see page 6158)	Generates an OnGetSiteInfo (see page 6223) event
	GetTopParentHandle (see page 6159)	Returns the window handle of the first window not associated with a VCL control that contains the windowed control.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	InvalidateDockHostSite (see page 6162)	This is InvalidateDockHostSite, a member of class TWinControl.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsControlActivateMsg (see page 6162)	This is IsControlActivateMsg, a member of class TWinControl.
	IsControlMouseMsg (see page 6162)	Indicates whether a specified mouse message is directed to one of the windowed control's child controls.
	IsQualifyingSite (see page 6163)	This is IsQualifyingSite, a member of class TWinControl.
V	KeyDown (see page 15816)	Supplements the inherited KeyDown to process navigation keys and the Delete key.
V	KeyPress (see page 15816)	Supplements the inherited method to process the Esc and Enter keys.
V	KeyUp (see page 15817)	Key up event dispatcher.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Loaded (see page 5771)	Initializes the control after it is loaded from a stream.
	MainWndProc (see page 6165)	Receives Windows messages for the control.
	MouseActivate (see page 5773)	This is MouseActivate, a member of class TControl.
	MouseDown (see page 5773)	OnMouseDown (see page 5862) event dispatcher.
	MouseMove (see page 5773)	Respond to mouse moving over control area..
	MouseUp (see page 5774)	OnMouseUp (see page 5867) event dispatcher.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	Notification (see page 5775)	Responds to notifications that components are being created or destroyed.
V	Notification (see page 6165)	Responds to notifications that components are being created or destroyed.
	NotifyControls (see page 6165)	Sends a message to all the child controls.
	PaintControls (see page 6166)	Paints each of the child controls in a windowed control using the specified device context.
	PaintHandler (see page 6166)	Responds to WM_PAINT messages.
V	PaintWindow (see page 6169)	Renders the image of a windowed control.
	PaletteChanged (see page 5775)	Responds to changes in the system's palette by realizing the control's palette.
V	PaletteChanged (see page 6170)	Responds to changes in the system's palette by realizing the control's palette and the palette for each child control.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	PositionDockRect (see page 5777)	Positions the docking rectangle according to the current drag-and-dock state.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 5778)	Prepares the control for having its properties assigned values read from a stream.
V	ReadState (see page 6171)	Prepares the control for having its properties assigned values from a stream.
	RecreateWnd (see page 6171)	Recreate underlying Windows screen object.
	ReformatText (see page 15817)	Applies the mask NewMask to the underlying text, and updates the internal representation of the mask.
	ReloadDockedControl (see page 6172)	Reloads a docked control.
	RemoveWindowProps (see page 6174)	This is RemoveWindowProps, a member of class TWinControl.
V	RequestAlign (see page 5780)	Instructs the parent of a control to reposition the control, enforcing its Align (see page 5798) property.
V	Reset (see page 15818)	Returns the EditText (see page 15821) to its value at the time when the edit control last lost focus.
	ResetIme (see page 6174)	Restores the input method editor (IME) that was active when the application started.

	ResetImeComposition (see page 6175)	Directs the composition window of the input method editor (IME) to perform a specific action.
	Resize (see page 5780)	Respond to control resize.
	ScaleConstraints (see page 5781)	This is ScaleConstraints, a member of class TControl.
	ScaleControls (see page 6176)	Rescale child controls only.
	SelectFirst (see page 6177)	Locates first selectable child control.
	SelectNext (see page 6177)	Moves the input focus from the current child control to the next one in the tab order.
	SendCancelMode (see page 5781)	Cancels the modal state of the control.
	SendDockNotification (see page 5782)	Sends a Windows message to the control's host dock site.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
V	SetAutoSize (see page 5783)	This is SetAutoSize, a member of class TControl.
V	SetAutoSize (see page 21257)	Sets the AutoSize (see page 21260) property.
V	SetBiDiMode (see page 5783)	Sets the control's bi-directional mode.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
V	SetChildOrder (see page 6178)	Changes the order in which the child component appears in the list of child components returned by the GetChildren (see page 6153) method.
	SetCursor (see page 15818)	Moves the cursor to the first editable character at or before Pos, and selects that character.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
V	SetDragMode (see page 5785)	Sets the drag mode for the control.
V	SetEnabled (see page 5785)	Sets the value of the Enabled (see page 5821) property.
	SetIme (see page 6181)	Activates an input method editor (IME) using the values specified by the ImeMode (see page 6207) and ImeName (see page 6208) properties.
	SetImeCompositionWindow (see page 6181)	Sets the position and font of the composition window.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
V	SetName (see page 5785)	Sets the name of the control.
V	SetParent (see page 5786)	Sets the parent of the control.
V	SetParent (see page 6182)	Sets the parent of the control.
V	SetParentBackground (see page 6182)	This is SetParentBackground, a member of class TWinControl.
V	SetParentBiDiMode (see page 5786)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 5787)	Sets the parent for the control.
	SetSel (see page 15819)	Selects character range.
V	SetSelLength (see page 21257)	Sets the SelLength (see page 21265) property.
V	SetSelStart (see page 21257)	Sets the SelStart (see page 21269) property.
	SetZOrder (see page 5788)	Repositions the control in its parent's control list, thereby changing position onscreen.
V	SetZOrder (see page 6182)	Moves the control to the top or bottom of the parent control's (or screen's) list of TWinControl (see page 6112) controls.
V	ShowControl (see page 6183)	Ensures that a specified child control is visible.
	UpdateBounds (see page 6185)	This is UpdateBounds, a member of class TWinControl.
	UpdateBoundsRect (see page 5789)	Changes the Top (see page 5844), Left (see page 5830), Width (see page 5849), and Height (see page 5825) properties of the control, but doesn't update its screen image and bypasses all resize events.
V	UpdateControlOriginalParentSize (see page 6186)	This is UpdateControlOriginalParentSize, a member of class TWinControl.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateExplicitBounds (see page 5789)	This is UpdateExplicitBounds, a member of class TControl.
	UpdateRecreatingFlag (see page 6186)	This is UpdateRecreatingFlag, a member of class TWinControl.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	UpdateUIState (see page 6186)	Updates form User Interface State as needed
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.

	Validate (see page 15819)	Validates a specified string against the current mask.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateError (see page 15820)	Beeps and raises an EDBEditError (see page 15798) exception.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	VisibleChanging (see page 5791)	Provides the interface for a method that responds to changes in the control's visibility.
	WndProc (see page 5791)	Provides specific message responses for the control.
	WndProc (see page 6187)	Provides specific message responses for the control.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	ActionLink (see page 5798)	Contains the action link object associated with the control.
	AutoSelect (see page 21260)	Determines whether all the text in the edit control is automatically selected when the control gets focus.
	AutoSize (see page 5803)	Specifies whether the control sizes itself automatically to accommodate its contents.
	AutoSize (see page 21260)	Determines whether the height of the edit control automatically resizes to accommodate the text.
	BevelEdges (see page 6192)	Specifies which edges of the control are beveled.
	BevelInner (see page 6193)	Specifies the cut of the inner bevel.
	BevelKind (see page 6193)	Specifies the control's bevel style.
	BevelOuter (see page 6194)	Specifies the cut of the outer bevel.
	BevelWidth (see page 6194)	Specifies the width of the inner and outer bevels.
	BorderStyle (see page 21261)	Determines whether the edit control has a single line border around the client area.
	BorderWidth (see page 6195)	Specifies the width of the control's border.
	Caption (see page 5806)	Specifies a text string that identifies the control to the user.
	CharCase (see page 21262)	Determines the case of the text within the edit control.
	Color (see page 5812)	Specifies the background color of the control.
	Ctl3D (see page 6198)	Determines whether a control has a three-dimensional (3-D) or two-dimensional look.
	DefWndProc (see page 6199)	Specifies the default window procedure for the windowed control.
	DesktopFont (see page 5818)	Specifies whether the control uses the Windows icon font when writing text.
	DragCursor (see page 5818)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 5819)	Specifies whether the control is being dragged normally or for docking.
	DragMode (see page 5819)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	EditMask (see page 15821)	Specifies the mask that represents what text is valid for the masked edit control.
	Font (see page 5823)	Controls (see page 5711) the attributes of text written on or in the control.
	HideSelection (see page 21262)	Determines whether the visual indication of the selected text remains when focus shifts to another control.
	ImeMode (see page 6207)	Determines the behavior of the input method editor (IME).
	ImeName (see page 6208)	Specifies the input method editor (IME) to use for converting keyboard input to Asian language characters.
	IsControl (see page 5829)	Determines whether a form stores its form-specific properties to a stream.
	MaskState (see page 15822)	Indicates state information about how the mask is being applied.
	MaxLength (see page 15822)	Specifies the maximum number of characters that can appear in the edit control.
	MouseCapture (see page 5831)	Indicates whether the control has "captured" mouse events.
	OEMConvert (see page 21264)	Determines whether characters typed in the edit control are converted from ANSI to OEM and then back to ANSI.
	ParentBackground (see page 6209)	Determines whether control uses parent's theme background.
	ParentBiDiMode (see page 5833)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	ParentColor (see page 5834)	Determines where a control looks for its color information.
	ParentColor (see page 21264)	Determines where a control looks for its color information.

	ParentCtl3D (see page 6209)	Determines where a component looks to determine if it should appear three dimensional.
	ParentFont (see page 5834)	Determines where a control looks for its font information.
	ParentShowHint (see page 5835)	Determines where a control looks to find out if its Help Hint (see page 5827) should be shown.
	PasswordChar (see page 21265)	Indicates the character, if any, to display in place of the actual characters typed in the control.
	PopupMenu (see page 5835)	Identifies the pop-up menu associated with the control.
	ScalingFlags (see page 5840)	Reflects which attributes of the control have been scaled.
	WheelAccumulator (see page 5849)	Accumulates mouse wheel rotations.
	WindowHandle (see page 6212)	Provides access to a window handle for the control.
	WindowText (see page 5850)	Contains the text string of the control.

Public Events

	Name	Description
	WindowProc (see page 5872)	Points to the window procedure that responds to messages sent to the control.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	BeginDrag (see page 5740)	Starts the dragging of a control.
	BringToFront (see page 5740)	Puts the control in front of all other controls in its parent control.
	Broadcast (see page 6130)	Sends a message to each of the child controls.
	CanFocus (see page 6131)	Indicates whether a control can receive focus.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Clear (see page 15812)	Sets the Text (see page 15823) property to an empty string.
	ClearSelection (see page 21245)	Removes the selected text from the edit control.
	ClearUndo (see page 21246)	Clears the undo buffer so that no changes to the text can be backed out.
	ClientToParent (see page 5744)	Translates client coordinates to parent coordinates.
	ClientToScreen (see page 5744)	Translates a given point from client area coordinates to global screen coordinates.
	ContainsControl (see page 6133)	Indicates whether a specified control exists within the control.
	ControlAtPos (see page 6133)	Returns the child control located at a specified position within the control.
	CopyToClipboard (see page 21246)	Copies the selected text in the edit control to the Clipboard in CF_TEXT format.
V	Create (see page 15810)	Creates an instance of TCustomMaskEdit (see page 15798).
	CreateParented (see page 6123)	Creates and initializes a control as the child of a specified non-VCL container.
	CreateParentedControl (see page 6136)	Creates and initializes a control as the child of a specified non-VCL window.
	CutToClipboard (see page 21249)	Copies the selected text to the Clipboard in CF_TEXT format and then deletes the selection.
V	DefaultHandler (see page 5748)	Provides message handling for all messages that do not have specific handlers.
V	DefaultHandler (see page 6139)	Provides message handling for all messages that the control does not fully process itself.
V	DefaultHandler (see page 21250)	Provides message handling for all messages that the control does not fully process itself.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.

	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 5732)	Destroys an instance of TControl (see page 5724).
	Destroy (see page 6124)	Destroys an instance of TWinControl (see page 6112).
	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	DisableAlign (see page 6141)	Disables the realignment of child controls.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Dock (see page 5749)	Used internally to dock the control.
	DockDrop (see page 6142)	Generates an OnDockDrop (see page 6214) event.
	DragDrop (see page 5754)	OnDragDrop (see page 5855) event dispatcher.
	Dragging (see page 5754)	Indicates whether a control is being dragged.
	DrawTextBiDiModeFlags (see page 5756)	Returns the text flags that reflect the current setting of the BiDiMode (see page 5803) property.
	DrawTextBiDiModeFlagsReadingOnly (see page 5756)	Returns the text flag to add that indicates whether the control's text should read from right to left.
	EnableAlign (see page 6148)	Decrements the reference count incremented by the DisableAlign (see page 6141) method, eventually realigning the child controls.
	EndDrag (see page 5757)	Stops a control from being dragged any further.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindChildControl (see page 6148)	Returns a child control given its name.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FlipChildren (see page 6150)	Reverses the positions of child controls.
	Focused (see page 6150)	Determines whether the control has input focus.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetControlsAlignment (see page 5759)	Indicates how text is aligned within the control.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetParentComponent (see page 5765)	Returns the parent of the control.
	GetSelTextBuf (see page 21253)	Copies the selected text into a buffer and returns the number of characters copied.
	GetTabOrderList (see page 6158)	Builds a list of controls in tab order.
	GetTextBuf (see page 5766)	Retrieves the control's text, copies it into a buffer, and returns the number of characters copied.
	GetTextLen (see page 15816)	Returns the length of the underlying text.
	HandleAllocated (see page 6159)	Reports whether a screen object handle exists for the control.
	HandleNeeded (see page 6160)	Creates a screen object for the control if it doesn't already exist.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	HasParent (see page 5768)	Indicates whether the control has a parent.
	Hide (see page 5769)	Makes the control invisible.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitiateAction (see page 5769)	Calls the action link's Update (see page 5789) method if the control is associated with an action link.

	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InsertControl (see page 6160)	Inserts a control into the Controls (see page 6197) array property.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
V	Invalidate (see page 5770)	Completely repaint control.
V	Invalidate (see page 6161)	Schedules a control repaint.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	IsRightToLeft (see page 5770)	Indicates whether the control should be reversed right to left.
	ManualDock (see page 5771)	Docks the control.
	ManualFloat (see page 5772)	Undocks the control.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	MouseWheelHandler (see page 5774)	Dispatches messages received from a mouse wheel.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	PaintTo (see page 6167)	This is the overview for the PaintTo method overload.
	ParentToClient (see page 5776)	Translate parent coordinates to client coordinates.
	PasteFromClipboard (see page 21254)	Pastes the contents of the Clipboard into edit control, replacing the current selection.
	Perform (see page 5776)	Responds as if the control received a specified Windows message.
	PreProcessMessage (see page 6170)	This is PreProcessMessage, a member of class TWinControl.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	Realign (see page 6171)	Forces the control to realign children.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	Refresh (see page 5779)	Repaints the control on the screen.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveControl (see page 6172)	Removes a specified control from the Controls (see page 6197) array.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	Repaint (see page 5779)	Forces the control to repaint its image on the screen.
V	Repaint (see page 6174)	Repaints the entire control.
	ReplaceDockedControl (see page 5779)	Docks the control in the place where another control is already docked.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	ScaleBy (see page 6175)	Rescale control and its children.
	ScreenToClient (see page 5781)	Converts the screen coordinates of a specified point on the screen to client coordinates.
	ScrollBy (see page 6176)	Scroll control contents.
	SelectAll (see page 21255)	Selects all text in the edit control.
	SendToBack (see page 5782)	Puts a windowed control behind all other windowed controls, or puts a non-windowed control behind all other non-windowed controls.
V	SetBounds (see page 5783)	Sets the Left (see page 5830), Top (see page 5844), Width (see page 5849), and Height (see page 5825) properties all at once.
V	SetBounds (see page 6178)	Sets the windowed control's boundary properties all at once.
	SetDesignVisible (see page 5784)	Makes a control visible at design time.
V	SetDesignVisible (see page 6178)	Makes a control visible at design time.
V	SetFocus (see page 6179)	Gives the input focus to the control.
	SetSelTextBuf (see page 21258)	Replaces the selected text with a null-terminated string.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	SetTextBuf (see page 5787)	Sets the text of the control.
	Show (see page 5788)	Makes a control visible.
	Undo (see page 21259)	Backs out all changes in the undo buffer.
V	Update (see page 5789)	Processes any pending paint messages immediately.
V	Update (see page 6183)	Forces the control to update.

	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	UpdateControlState (see page 6186)	Respond to state change.
	UseRightToLeftAlignment (see page 5790)	Specifies whether the control's alignment should be reversed right-to-left.
	UseRightToLeftReading (see page 5790)	Specifies whether the control is using a right-to-left reading order.
	UseRightToLeftScrollBar (see page 5791)	Specifies whether the vertical scroll bar appears on the left side of the control.
V	ValidateEdit (see page 15819)	Validates the EditText (see page 15821) against the current mask.

Public Properties

	Name	Description
	Action (see page 5797)	Designates the action associated with the control.
	Align (see page 5798)	Determines how the control aligns within its container (parent control).
R	AlignDisabled (see page 6192)	Indicates child control realignment disabled.
	Anchors (see page 5802)	Specifies how the control is anchored to its parent.
	BiDiMode (see page 5803)	Specifies the bi-directional mode for the control.
	BoundsRect (see page 5803)	Specifies the bounding rectangle of the control, expressed in the coordinate system of the parent control.
R	Brush (see page 6195)	Determines the color and pattern used for painting the background of the control.
R	CanUndo (see page 21262)	Indicates whether the edit control contains changes that can be backed out.
	ClientHeight (see page 5808)	Specifies the height of the control's client area in pixels.
R	ClientOrigin (see page 5809)	Specifies the screen coordinates (in pixels) of the top left corner of a control's client area.
R	ClientRect (see page 5810)	Specifies the size (in pixels) of a control's client area.
	ClientWidth (see page 5811)	Specifies the horizontal size of the control's client area in pixels.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Constraints (see page 5812)	Specifies the size constraints for the control.
R	ControlCount (see page 6195)	Returns the number of child controls.
R	Controls (see page 6197)	Lists all child controls.
	ControlState (see page 5813)	Indicates the current state of a control at runtime.
	ControlStyle (see page 5814)	Determines style characteristics of the control.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	DockClientCount (see page 6199)	Specifies the number of controls that are docked on the windowed control.
R	DockClients (see page 6201)	Lists the controls that are docked to the windowed control.
	DockManager (see page 6202)	Specifies the control's docking manager interface.
	DockOrientation (see page 5818)	Specifies how the control is docked relative to other controls docked in the same parent.
	DockSite (see page 6204)	Specifies whether the control can be the target of drag-and-dock operations.
	DoubleBuffered (see page 6205)	Determines whether the control's image is rendered directly to the window or painted to an in-memory bitmap first.
	EditText (see page 15821)	Specifies the text that appears in the window of the masked edit control.
	Enabled (see page 5821)	Controls (see page 5711) whether the control responds to mouse, keyboard, and timer events.
R	ExplicitHeight (see page 5821)	Specifies the explicit vertical size of the control in pixels.
R	ExplicitLeft (see page 5822)	Specifies the explicit horizontal pixel coordinate of the left edge of a component relative to its parent.
R	ExplicitTop (see page 5822)	Specifies the explicit vertical pixel coordinate of the top edge of a component relative to its parent.
R	ExplicitWidth (see page 5822)	Specifies the explicit horizontal size of the control in pixels.
R	Floating (see page 5823)	Indicates whether the control is floating.
	FloatingDockSiteClass (see page 5823)	Specifies the class of the temporary control that hosts the control when it is floating.

R	Handle (see page 6207)	Provides access to the underlying Windows screen object for the control.
	HostDockSite (see page 5829)	Specifies the control in which the control is docked.
R	IsMasked (see page 15822)	Indicates whether a mask exists for the edit control.
	LRDockWidth (see page 5831)	Specifies the width of the control when it is docked horizontally.
	Modified (see page 21263)	Indicates whether the user edited the text of the edit control.
R	MouseInClient (see page 6209)	This is MouseInClient, a member of class TWinControl.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Padding (see page 6209)	Specifies the padding of a control.
	Parent (see page 5832)	Indicates the parent of the control.
	ParentWindow (see page 6210)	Reference to parent's underlying control.
	ReadOnly (see page 21265)	Determines whether the user can change the text of the edit control.
	SelLength (see page 21265)	Specifies the number of characters (bytes) that are selected.
	SelStart (see page 21269)	Specifies the position of the first selected character in the text.
	SelText (see page 21272)	Specifies the selected portion of the edit control's text.
	ShowHint (see page 5840)	Determines whether the control displays a Help Hint (see page 5827) when the mouse pointer rests momentarily on the control.
R	Showing (see page 6210)	Indicates whether the control is showing on the screen.
	TabOrder (see page 6211)	Indicates the position of the control in its parent's tab order.
	TabStop (see page 6211)	Determines if the user can tab to a control.
	TBDockHeight (see page 5842)	Specifies the height of the control when it is docked vertically.
	Text (see page 15823)	Denotes the underlying text for the masked edit control before the mask has been applied.
	UndockHeight (see page 5845)	Specifies the height of the control when it is floating.
	UndockWidth (see page 5846)	Specifies the width of the control when it is floating.
	UseDockManager (see page 6212)	Specifies whether the docking manager is used in drag-and-dock operations.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	Visible (see page 5847)	Determines whether the component appears onscreen.
R	VisibleDockClientCount (see page 6212)	Specifies the number of visible controls that are docked on the windowed control.

Published Properties

	Name	Description
	AlignWithMargins (see page 5802)	Indicates whether a control should be constrained by margins.
	Cursor (see page 5815)	Specifies the image used to represent the mouse pointer when it passes into the region covered by the control.
	Height (see page 5825)	Specifies the vertical size of the control in pixels.
	HelpContext (see page 5826)	Numeric ID for control's context-sensitive help topic
	HelpKeyword (see page 5826)	Keyword for control's context-sensitive help topic
	HelpType (see page 5827)	Indicates whether the control's context sensitive help topic is identified by context ID or by keyword.
	Hint (see page 5827)	Contains the text string that can appear when the user moves the mouse over the control.
	Left (see page 5830)	Specifies the horizontal coordinate of the left edge of a component relative to its parent.
	Margins (see page 5831)	Specifies the margins for the control.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	TabStop (see page 21273)	Determines if the user can tab to a control.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Top (see page 5844)	Specifies the Y coordinate of the top left corner of a control, relative to its parent or containing control in pixels.
	Width (see page 5849)	Specifies the horizontal size of the control or form in pixels.

90.1.2.2 TCustomMaskEdit.Create Constructor

Creates an instance of TCustomMaskEdit (see page 15798).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomMaskEdit(TComponent * AOwner);
```

Description

Call Create to instantiate a masked edit control at runtime. AOwner is the component that is responsible for freeing the masked edit control (typically the form). It becomes the value of the Owner property.

See Also

Owner (see page 2807)

90.1.2.3 TCustomMaskEdit Methods

The methods of the TCustomMaskEdit class are listed here.

Protected Methods

	Name	Description
	CheckCursor (see page 15811)	Moves the cursor to the closest editable character and selects it if nothing is currently selected.
V	EditCanModify (see page 15812)	Permits the user to edit control contents.
	GetFirstEditChar (see page 15813)	Returns the index in the EditMask (see page 15821) of the first nonliteral character.
	GetLastEditChar (see page 15813)	Returns the index in the EditMask (see page 15821) of the last nonliteral character.
	GetMaxChars (see page 15814)	Returns the length of the EditText (see page 15821).
	GetNextEditChar (see page 15814)	Returns the first index of a nonliteral character equal to or greater than an offset.
	GetPriorEditChar (see page 15815)	Returns the first index of a nonliteral character equal to or less than an offset.
	GetSel (see page 15815)	Returns the endpoints of the current selection in the EditText (see page 15821).
V	KeyDown (see page 15816)	Supplements the inherited KeyDown to process navigation keys and the Delete key.
V	KeyPress (see page 15816)	Supplements the inherited method to process the Esc and Enter keys.
V	KeyUp (see page 15817)	Key up event dispatcher.
	ReformatText (see page 15817)	Applies the mask NewMask to the underlying text, and updates the internal representation of the mask.
V	Reset (see page 15818)	Returns the EditText (see page 15821) to its value at the time when the edit control last lost focus.
	SetCursor (see page 15818)	Moves the cursor to the first editable character at or before Pos, and selects that character.
	SetSel (see page 15819)	Selects character range.
V	Validate (see page 15819)	Validates a specified string against the current mask.
V	ValidateError (see page 15820)	Beeps and raises an EDBEditError (see page 15798) exception.

Public Methods

	Name	Description
V	Clear (see page 15812)	Sets the Text (see page 15823) property to an empty string.
	GetTextLen (see page 15816)	Returns the length of the underlying text.
V	ValidateEdit (see page 15819)	Validates the EditText (see page 15821) against the current mask.

90.1.2.3.1 TCustomMaskEdit.CheckCursor Method

Moves the cursor to the closest editable character and selects it if nothing is currently selected.

Pascal

```
procedure CheckCursor;
```

C++

```
__fastcall CheckCursor();
```

Description

CheckCursor is called whenever the position of the cursor may have changed. It ensures that at least one character is always selected. Because editing a masked edit control consists of replacing the blank characters in the mask, there must always be a selection to replace. The selection corresponds to one or more nonliteral characters in the mask, which are either blank or contain characters for the user to reenter.

See Also

GetSel (see page 15815)

SetCursor (see page 15818)

SetSel (see page 15819)

90.1.2.3.2 TCustomMaskEdit.Clear Method

Sets the Text (see page 15823) property to an empty string.

Pascal

```
procedure Clear; override;
```

C++

```
virtual __fastcall Clear();
```

Description

Use Clear to remove all text that was entered into the masked edit control. Clear sets the value of Text (see page 15823) to an empty string. It does not clear the EditMask (see page 15821). If the edit control has a mask, EditText (see page 15821) is not empty, but has all non-literal characters replaced by blanks.

See Also

EditMask (see page 15821)

EditText (see page 15821)

IsMasked (see page 15822)

Reset (see page 15818)

Text (see page 15823)

90.1.2.3.3 TCustomMaskEdit.EditCanModify Method

Permits the user to edit control contents.

Pascal

```
function EditCanModify: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean EditCanModify();
```

Description

The EditCanModify method defined by TCustomMaskEdit (see page 15798) always returns true, allowing the Text (see page 15823) to be edited. EditCanModify exists primarily to provide an interface for a method that can conditionally disallow changes to the Text (see page 15823) by returning false.

See Also

Text (see page 15823)

90.1.2.3.4 TCustomMaskEdit.GetFirstEditChar Method

Returns the index in the EditMask (see page 15821) of the first nonliteral character.

Pascal

```
function GetFirstEditChar: Integer;
```

C++

```
__fastcall int GetFirstEditChar();
```

Description

Use GetFirstEditChar to find the first position of the EditMask (see page 15821) where the user can modify the EditText (see page 15821). 0 specifies the first character, 1 the second character, and so on. If there is no mask, GetFirstEditChar returns zero.

Use GetFirstEditChar as a starting point for programmatically processing all the nonliteral characters in the EditText (see page 15821). Use GetNextEditChar (see page 15814) to continue to loop through the editable characters in the EditText (see page 15821), and GetLastEditChar (see page 15813) to determine when all nonliteral characters have been processed.

See Also

EditMask (see page 15821)

EditText (see page 15821)

GetLastEditChar (see page 15813)

GetNextEditChar (see page 15814)

GetPriorEditChar (see page 15815)

90.1.2.3.5 TCustomMaskEdit.GetLastEditChar Method

Returns the index in the EditMask (see page 15821) of the last nonliteral character.

Pascal

```
function GetLastEditChar: Integer;
```

C++

```
__fastcall int GetLastEditChar();
```

Description

Use GetLastEditChar to find the last position of the EditMask (see page 15821) where the user can modify the EditText (see page 15821). 0 specifies the first character, 1 the second character, and so on. If there is no mask, GetLastEditChar returns the length of the text.

See Also

EditMask (see page 15821)

EditText (see page 15821)

GetFirstEditChar (see page 15813)

GetMaxChars (see page 15814)

GetNextEditChar (see page 15814)

GetPriorEditChar (see page 15815)

90.1.2.3.6 TCustomMaskEdit.GetMaxChars Method

Returns the length of the EditText (see page 15821).

Pascal

```
function GetMaxChars: Integer;
```

C++

```
__fastcall int GetMaxChars();
```

Description

If there is a mask, GetMaxChars returns the length of the EditText (see page 15821), including all blanks. This is the same as MaxLength (see page 15822), because editing in a masked edit control consists of replacing nonliteral characters. If there is no mask, GetMaxChars returns the length of the text in the window. In this case, the value returned by GetMaxChars may be less than MaxLength (see page 15822), which is the maximum number of characters that can be entered into the edit control.

See Also

EditText (see page 15821)

GetLastEditChar (see page 15813)

MaxLength (see page 15822)

Text (see page 15823)

90.1.2.3.7 TCustomMaskEdit.GetNextEditChar Method

Returns the first index of a nonliteral character equal to or greater than an offset.

Pascal

```
function GetNextEditChar(Offset: Integer): Integer;
```

C++

```
__fastcall int GetNextEditChar(int Offset);
```

Description

Call GetNextEditChar to find the first position of the EditMask (see page 15821) at or following Offset where the user can modify the EditText (see page 15821). 0 specifies the first character, 1 the second character, and so on. If there is no nonliteral character at or following Offset, GetNextEditChar returns MaxLength (see page 15822).

Use GetNextEditChar to loop through the editable characters in the EditText (see page 15821), starting with the value returned by GetFirstEditChar (see page 15813) and using GetLastEditChar (see page 15813) to determine when all nonliteral characters have been processed.

See Also

EditMask (see page 15821)

EditText (see page 15821)

GetFirstEditChar (see page 15813)

GetLastEditChar (see page 15813)

GetPriorEditChar (see page 15815)

90.1.2.3.8 TCustomMaskEdit.GetPriorEditChar Method

Returns the first index of a nonliteral character equal to or less than an offset.

Pascal

```
function GetPriorEditChar(Offset: Integer): Integer;
```

C++

```
__fastcall int GetPriorEditChar(int Offset);
```

Description

Call GetPriorEditChar to find the first position of the EditMask (see page 15821) at or preceding Offset, where the user can modify the EditText (see page 15821). 0 specifies the first character, 1 the second character, and so on. If there is no nonliteral character at or preceding Offset, GetPriorEditChar returns the index of the first editable character following Offset.

See Also

EditMask (see page 15821)

EditText (see page 15821)

GetFirstEditChar (see page 15813)

GetLastEditChar (see page 15813)

GetNextEditChar (see page 15814)

90.1.2.3.9 TCustomMaskEdit.GetSel Method

Returns the endpoints of the current selection in the EditText (see page 15821).

Pascal

```
procedure GetSel(var SelStart: Integer; var SelStop: Integer);
```

C++

```
__fastcall GetSel(int SelStart, int SelStop);
```

Description

Use GetSel to obtain the indexes of the first and last selected characters of the EditText (see page 15821), where 0 is the index of the first character. Not all the characters in the selection will necessarily be editable, if the mask contains literal characters. Do not use the resulting indexes on the Text (see page 15823) property if there is a mask, because the EditText (see page 15821) may contain blanks or nonliteral characters not found in the Text (see page 15823).

To programmatically change the selected text, use GetNextEditChar (see page 15814) to cycle through the editable characters of the selection from SelStart to SelStop.

See Also

EditText (see page 15821)

GetNextEditChar (see page 15814)

SelText (see page 21272)

SetSel (see page 15819)

Text (see page 15823)

90.1.2.3.10 TCustomMaskEdit.GetTextLen Method

Returns the length of the underlying text.

Pascal

```
function GetTextLen: Integer;
```

C++

```
__fastcall int GetTextLen();
```

Description

Use GetTextLen to determine the length of the underlying text for the masked edit control. The underlying text has not been formatted for display by the mask, and may differ from the EditText (see page 15821) that appears in the window of the control.

See Also

EditText (see page 15821)

GetTextBuf (see page 5766)

MaxLength (see page 15822)

Text (see page 15823)

90.1.2.3.11 TCustomMaskEdit.KeyDown Method

Supplements the inherited KeyDown to process navigation keys and the Delete key.

Pascal

```
procedure KeyDown(var Key: Word; Shift: TShiftState); override;
```

C++

```
virtual __fastcall KeyDown(Word Key, TShiftState Shift);
```

Description

After calling the inherited KeyDown, KeyDown ensures that moving the cursor within the masked edit control places the cursor on an editable character, and that deleting the current selection replaces nonliteral characters with blanks. Derived objects can override this method to further supplement the processing that takes place when the user presses a key down.

See Also

CheckCursor (see page 15811)

KeyPress (see page 15816)

KeyUp (see page 15817)

SetSel (see page 15819)

90.1.2.3.12 TCustomMaskEdit.KeyPress Method

Supplements the inherited method to process the Esc and Enter keys.

Pascal

```
procedure KeyPress(var Key: Char); override;
```

C++

```
virtual __fastcall KeyPress(Char Key);
```

Description

After calling the inherited method, KeyPress calls the Reset (see page 15818) method in response to the Esc key, or calls the ValidateEdit (see page 15819) method in response to the Enter key. Derived classes can override this method to further supplement the processing of specific keystrokes.

See Also

KeyDown (see page 15816)

Reset (see page 15818)

ValidateEdit (see page 15819)

90.1.2.3.13 TCustomMaskEdit.KeyUp Method

Key up event dispatcher.

Pascal

```
procedure KeyUp(var Key: Word; Shift: TShiftState); override;
```

C++

```
virtual __fastcall KeyUp(Word Key, TShiftState Shift);
```

Description

After calling the inherited method, KeyUp makes sure that selection using the Ctrl+Left and Ctrl+Right key combinations ends with an editable selection in the edit window. Derived classes can override this method to further supplement the processing that takes place when the user releases a key.

See Also

CheckCursor (see page 15811)

KeyDown (see page 15816)

KeyPress (see page 15816)

SetSel (see page 15819)

90.1.2.3.14 TCustomMaskEdit.ReformatText Method

Applies the mask NewMask to the underlying text, and updates the internal representation of the mask.

Pascal

```
procedure ReformatText(const NewMask: string);
```

C++

```
__fastcall ReformatText(const AnsiString NewMask);
```

Description

ReformatText does the bulk of the work of setting the EditMask (see page 15821) property at runtime. ReformatText should not be used in place of the EditMask (see page 15821) property, however, as it does not deal with the MaskState (see page

15822) property or the positioning of the cursor.

See Also

CheckCursor (see page 15811)

EditMask (see page 15821)

EditText (see page 15821)

MaskState (see page 15822)

Text (see page 15823)

90.1.2.3.15 TCustomMaskEdit.Reset Method

Returns the EditText (see page 15821) to its value at the time when the edit control last lost focus.

Pascal

```
procedure Reset; virtual;
```

C++

```
virtual __fastcall Reset();
```

Description

Reset cancels the most recent edits to the masked edit control. The EditText (see page 15821) returns to the value at the time the control last lost focus, not the time when it first regained focus. Thus, any changes to the EditText (see page 15821) that occurred programmatically while the edit control did not have focus are also discarded.

See Also

Clear (see page 15812)

EditText (see page 15821)

KeyPress (see page 15816)

90.1.2.3.16 TCustomMaskEdit.SetCursor Method

Moves the cursor to the first editable character at or before Pos, and selects that character.

Pascal

```
procedure SetCursor(Pos: Integer);
```

C++

```
__fastcall SetCursor(int Pos);
```

Description

SetCursor handles positioning of the cursor within the EditText (see page 15821) so that it is always on an editable character. It also ensures that at least one character is always selected. Because editing a masked edit control consists of replacing the blank characters in the mask, there must always be a selection to replace. The selection corresponds to one or more nonliteral characters in the mask, which are either blank or contain characters for the user to reenter.

See Also

CheckCursor (see page 15811)

GetPriorEditChar (see page 15815)

SetSel (see page 15819)

90.1.2.3.17 TCustomMaskEdit.SetSel Method

Selects character range.

Pascal

```
procedure SetSel(SelStart: Integer; SelStop: Integer);
```

C++

```
__fastcall SetSel(int SelStart, int SelStop);
```

Description

SetSel selects the indicated range of characters in the EditText (see page 15821), regardless of whether any of them are editable. If SelStart is the same as SelStop, SetSel positions the cursor at the SelStart character. When using SetSel, leave the cursor in an editable position if the intent is to create a selection for the user to replace.

SetSel can be used to select non-editable characters that can then be captured by using the SelText property or by copying to the Clipboard. Once the selection has been captured, return the cursor to an editable position by calling CheckCursor (see page 15811).

See Also

CheckCursor (see page 15811)

EditText (see page 15821)

GetSel (see page 15815)

SelText (see page 21272)

SetCursor (see page 15818)

90.1.2.3.18 TCustomMaskEdit.Validate Method

Validates a specified string against the current mask.

Pascal

```
function Validate(const Value: string; var Pos: Integer): Boolean; virtual;
```

C++

```
virtual __fastcall Boolean Validate(const AnsiString Value, int Pos);
```

Description

The ValidateEdit (see page 15819) method calls Validate to perform the actual validation of the current text against the edit mask. It returns true if the string specified by Value is consistent with the edit mask, false if it detects an invalid character. If ValidateEdit (see page 15819) returns false, it returns the position of the invalid character as the Pos parameter.

See Also

EditMask (see page 15821)

ValidateEdit (see page 15819)

90.1.2.3.19 TCustomMaskEdit.ValidateEdit Method

Validates the EditText (see page 15821) against the current mask.

Pascal

```
procedure ValidateEdit; virtual;
```

C++

```
virtual __fastcall ValidateEdit();
```

Description

ValidateEdit attempts to validate the EditText (see page 15821) after each keystroke, and when the user attempts to leave the masked edit field. If the EditText (see page 15821) does not match the specifications of the EditMask (see page 15821), ValidateEdit calls ValidateError (see page 15820) to raise an exception, and returns the cursor to the first position where the EditText (see page 15821) did not comply with the EditMask (see page 15821).

See Also

EditMask (see page 15821)

EditText (see page 15821)

KeyPress (see page 15816)

ValidateError (see page 15820)

90.1.2.3.20 TCustomMaskEdit.ValidateError Method

Beeps and raises an EDBEditError (see page 15798) exception.

Pascal

```
procedure ValidateError; virtual;
```

C++

```
virtual __fastcall ValidateError();
```

Description

ValidateEdit (see page 15819) calls ValidateError when the EditText (see page 15821) fails to comply with the EditMask (see page 15821).

See Also

EditMask (see page 15821)

EditText (see page 15821)

ValidateEdit (see page 15819)

90.1.2.4 TCustomMaskEdit Properties

The properties of the TCustomMaskEdit class are listed here.

Protected Properties

	Name	Description
	EditMask (see page 15821)	Specifies the mask that represents what text is valid for the masked edit control.
	MaskState (see page 15822)	Indicates state information about how the mask is being applied.
	MaxLength (see page 15822)	Specifies the maximum number of characters that can appear in the edit control.

Public Properties

	Name	Description
	EditText (see page 15821)	Specifies the text that appears in the window of the masked edit control.
R	IsMasked (see page 15822)	Indicates whether a mask exists for the edit control.
	Text (see page 15823)	Denotes the underlying text for the masked edit control before the mask has been applied.

90.1.2.4.1 TCustomMaskEdit.EditMask Property

Specifies the mask that represents what text is valid for the masked edit control.

Pascal

```
property EditMask: TEditMask;
```

C++

```
__property TEditMask EditMask;
```

Description

Use EditMask to restrict the characters a user can enter into the masked edit control to valid characters and formats. If the user attempts to enter an invalid character, the edit control does not accept the character. Validation is performed on a character-by-character basis by the ValidateEdit (see page 15819) method.

Setting EditMask to an empty string removes the mask.

See Also

EditText (see page 15821)

IsMasked (see page 15822)

MaskState (see page 15822)

Text (see page 15823)

ValidateEdit (see page 15819)

ValidateError (see page 15820)

90.1.2.4.2 TCustomMaskEdit.EditText Property

Specifies the text that appears in the window of the masked edit control.

Pascal

```
property EditText: string;
```

C++

```
__property AnsiString EditText;
```

Description

EditText is the value of the text for the edit control after it is formatted using the EditMask (see page 15821). Before the text is fully entered into a masked edit control, the EditText includes a blank character for each unentered character. As characters are entered, the blank characters in the EditText are replaced by the values that the user types.

If literal mask characters are included in the text, and no character is substituted for blanks, the values of EditText and Text (see page 15823) are the same.

Note: EditText only applies at runtime.

See Also

EditMask (see page 15821)

Text (see page 15823)

90.1.2.4.3 TCustomMaskEdit.IsMasked Property

Indicates whether a mask exists for the edit control.

Pascal

```
property IsMasked: Boolean;
```

C++

```
__property Boolean IsMasked;
```

Description

Read IsMasked to determine whether the EditMask (see page 15821) property has been set. If IsMasked is true, the control has a mask, and input is validated at runtime. If IsMasked is false, the control does not restrict editing at runtime.

See Also

EditMask (see page 15821)

90.1.2.4.4 TCustomMaskEdit.MaskState Property

Indicates state information about how the mask is being applied.

Pascal

```
property MaskState: TMaskedState;
```

C++

```
__property TMaskedState MaskState;
```

Description

MaskState is used internally to determine appropriate actions based on how the mask is currently being applied. MaskState is a set drawn from among the following values:

Value	Meaning
msMasked	A mask has been assigned. MaskState includes msMasked when IsMasked (see page 15822) is true.
msReEnter	An invalid character has been rejected and the next edit should be a valid replacement character.
msDBSetText	The text comes from a database field and should not be validated.

MaskState is exposed as a protected property so that derived classes can maintain and use this state information in the implementation of properties and methods.

See Also

IsMasked (see page 15822)

ValidateEdit (see page 15819)

90.1.2.4.5 TCustomMaskEdit.MaxLength Property

Specifies the maximum number of characters that can appear in the edit control.

Pascal

```
property MaxLength: Integer;
```

C++

```
__property int MaxLength;
```

Description

MaxLength is the length of the EditText (see page 15821). Set MaxLength to limit the number of characters that can appear in the edit control when there is no EditMask (see page 15821). If there is an EditMask (see page 15821), MaxLength is implied by the mask itself, and cannot be changed. The EditText (see page 15821) contains blank characters for each character that has not been entered, padding the end or beginning of every optional section, so it remains constant in length.

See Also

EditMask (see page 15821)

EditText (see page 15821)

IsMasked (see page 15822)

Text (see page 15823)

90.1.2.4.6 TCustomMaskEdit.Text Property

Denotes the underlying text for the masked edit control before the mask has been applied.

Pascal

```
property Text: TMaskedText;
```

C++

```
__property TMaskedText Text;
```

Description

Use Text to determine the underlying value of the text before it has been formatted by the mask. Text may differ from the EditText (see page 15821) visible in the masked edit control if the mask specifies that literal characters should be removed, if the mask includes spaces, or if the mask includes characters that have not yet been filled in by the user. Text will not contain the blank characters, spaces will not be replaced by _, and literal characters in the mask will be removed if the mask indicates they should be.

When setting Text, the value of the text is formatted using the mask, and the resulting EditText (see page 15821) is used to update the window.

If there is no mask, Text is the text that appears in the edit control.

See Also

EditMask (see page 15821)

EditText (see page 15821)

GetTextLen (see page 15816)

IsMasked (see page 15822)

ReformatText (see page 15817)

90.1.3 TMaskEdit Class

TMaskEdit implements a generic masked edit control.

Class Hierarchy

Pascal

```
TMaskEdit = class(TCustomMaskEdit);
```

C++

```
class TMaskEdit : public TCustomMaskEdit;
```

File

Mask

Description

Use a TMaskEdit object to put a masked edit control on your form. Masked edit controls validate the text the user enters against a mask that encodes the valid forms the text can take. The mask can also format text that is displayed to the user.

TMaskEdit implements the generic behavior introduced in TCustomMaskEdit (see page 15798). TMaskEdit publishes many of the properties and methods inherited from TCustomMaskEdit (see page 15798), but does not introduce any new behavior.

See Also

TDBEdit (see page 8735)

TEdit (see page 21402)

TCustomMaskEdit (see page 15798)

Edit Controls

90.1.3.1 TMaskEdit Members

The following tables list the members exposed by TMaskEdit.

Protected Events

	Name	Description
	OnAlignInsertBefore (see page 6213)	Occurs when an object with custom alignment is aligned.
	OnAlignPosition (see page 6214)	Occurs when an object with custom alignment is aligned.
	OnCanResize (see page 5851)	Occurs when an attempt is made to resize the control.
	OnConstrainedResize (see page 5853)	Adjust resize constraints.
	OnContextPopup (see page 5854)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnDockDrop (see page 6214)	Occurs when another control is docked to the control.
	OnDockOver (see page 6216)	Occurs when another control is dragged over the control.
	OnGetSiteInfo (see page 6223)	Returns the control's docking information.
	OnMouseWheel (see page 5869)	Occurs when the mouse wheel is rotated.
	OnMouseWheelDown (see page 5869)	Occurs when the mouse wheel is rotated downward.

	OnMouseWheelUp (see page 5870)	Occurs when the mouse wheel is rotated upward.
	OnResize (see page 5870)	Occurs immediately after the control is resized.
	OnUnDock (see page 6230)	Occurs when the application tries to undock a control that is docked to the windowed control.

Protected Fields

	Name	Description
	FAnchorMove (see page 5733)	This is FAnchorMove, a member of class TControl.
	FAnchorOrigin (see page 5734)	This is FAnchorOrigin, a member of class TControl.
	FAnchorRules (see page 5734)	This is FAnchorRules, a member of class TControl.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FDesignSize (see page 6124)	This is FDesignSize, a member of class TWinControl.
	FDoubleBuffered (see page 6124)	This is FDoubleBuffered, a member of class TWinControl.
	FExplicitHeight (see page 5734)	This is FExplicitHeight, a member of class TControl.
	FExplicitLeft (see page 5734)	This is FExplicitLeft, a member of class TControl.
	FExplicitTop (see page 5734)	This is FExplicitTop, a member of class TControl.
	FExplicitWidth (see page 5735)	This is FExplicitWidth, a member of class TControl.
	FInImeComposition (see page 6125)	This is FInImeComposition, a member of class TWinControl.
	FOriginalParentSize (see page 5735)	This is FOriginalParentSize, a member of class TControl.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	ActionChange (see page 5737)	Responds when the action associated with the control changes.
V	ActionChange (see page 6127)	Updates the control to reflect changes in its associated action.
	AddBiDiModeExStyle (see page 6128)	Sets control's window style according to its bi-directional support.
V	AdjustClientRect (see page 6128)	Provides the interface that adjusts the ClientRect (see page 5810) property for idiosyncrasies of the window.
	AdjustSize (see page 5738)	Sets the size of the control as determined by the AutoSize (see page 5803) property.
V	AdjustSize (see page 6129)	Adjusts the control's size according to its contents and constraints.
V	AlignControls (see page 6129)	Aligns any controls for which the control is the parent within a specified area of the control.
	ArrangeControl (see page 6130)	This is ArrangeControl, a member of class TWinControl.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	AssignTo (see page 5739)	Overrides the inherited AssignTo function to enable assignments to TAction objects.
V	AssignTo (see page 6130)	Copies the properties of the windowed control to another object.
	BeginAutoDrag (see page 5739)	Begin Automatic Drag.
	CalcCursorPos (see page 5741)	This is CalcCursorPos, a member of class TControl.
V	CanAutoSize (see page 5741)	Indicates whether the control can resize itself automatically to accommodate its contents.
V	CanAutoSize (see page 6131)	Indicates how the control can be resized.
V	CanResize (see page 5742)	OnCanResize (see page 5851) event dispatcher.
V	CanResize (see page 6132)	Indicates how the control can respond to a resize attempt.
	Change (see page 21245)	Generates an OnChange (see page 21275) event.
	Changed (see page 5742)	Sends a CM_CHANGED (see page 6330) message to the control.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	ChangeScale (see page 5743)	Rescaling event dispatcher.
V	ChangeScale (see page 6132)	Resize (see page 5780) and reposition children and self.
	CheckCursor (see page 15811)	Moves the cursor to the closest editable character and selects it if nothing is currently selected.
	Click (see page 5743)	Respond to user click.
V	ConstrainedResize (see page 5746)	Notify control of resize with constraints.
V	ConstrainedResize (see page 6133)	Generates an OnConstrainedResize (see page 5853) event.

	ControlsAligned (see page 6134)	This is ControlsAligned, a member of class TWinControl.
	CreateDockManager (see page 6134)	Creates the dock manager for the control.
V	CreateHandle (see page 6135)	Creates underlying screen object.
V	CreateParams (see page 6135)	Initializes a window-creation parameter data structure.
V	CreateParams (see page 21248)	Initializes a window-creation parameter record passed in the Params parameter.
	CreateSubClass (see page 6136)	Creates a windowed control derived from an existing Windows window class.
V	CreateWindowHandle (see page 6137)	Creates a Windows control to represent the control.
V	CreateWindowHandle (see page 21248)	Creates a Windows control to represent the control.
V	CreateWnd (see page 6137)	Creates the underlying window.
V	CreateWnd (see page 21248)	Creates a Windows control corresponding to the edit control.
V	CustomAlignInsertBefore (see page 6137)	Returns placement order of custom-aligned child control.
V	CustomAlignPosition (see page 6138)	Returns aligned position of custom-aligned child control.
	DblClick (see page 5747)	OnDblClick (see page 5854) event dispatcher.
	DefaultDockImage (see page 5747)	Handles the painting and erasing of a dock image.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DefineProperties (see page 5748)	Provides methods to read and write the IsControl (see page 5829) property to a stream such as a form file.
V	DefineProperties (see page 6139)	Provides methods to read and write the IsControl property to a stream such as a form file.
	DesignWndProc (see page 5749)	This is DesignWndProc, a member of class TControl.
V	DestroyHandle (see page 6140)	Destroys the control's window without destroying the control.
V	DestroyWindowHandle (see page 6140)	Destroys the window created in the CreateWindowHandle (see page 6137) method.
V	DestroyWnd (see page 6141)	Destroys the control's window.
V	DestroyWnd (see page 21251)	Destroys the Windows control that corresponds to the edit control.
	DoAddDockClient (see page 6142)	Performs actions when a control is docked to the windowed control.
	DockOver (see page 6143)	Responds when a docking client is dragged over the windowed control.
V	DockReplaceDockClient (see page 6143)	This is DockReplaceDockClient, a member of class TWinControl.
	DockTrackNoTarget (see page 5749)	Handles dragging of the control over an invalid docking target.
	DoContextPopup (see page 5750)	OnContextPopup (see page 5854) event dispatcher.
	DoDock (see page 5750)	Docking event dispatcher.
	DoDockOver (see page 6143)	Generates an OnDockOver (see page 6216) event.
	DoEndDock (see page 5750)	OnEndDock (see page 5859) event dispatcher.
	DoEndDrag (see page 5751)	OnEndDrag (see page 5860) event dispatcher.
	DoEnter (see page 6144)	Respond to receiving input focus.
	DoExit (see page 6144)	Respond to losing input focus
	DoFlipChildren (see page 6145)	Flips the control's children.
	DoKeyDown (see page 6145)	Performs some preprocessing before generating an OnKeyDown (see page 6225) event.
	DoKeyPress (see page 6146)	Performs some preprocessing before generating an OnKeyPress (see page 6227) event.
	DoKeyUp (see page 6146)	Performs some preprocessing before generating an OnKeyUp (see page 6228) event.
	DoMouseWheel (see page 5751)	Processes mouse wheel motion.
	DoMouseWheelDown (see page 5752)	OnMouseWheelDown (see page 5869) event dispatcher.
	DoMouseWheelUp (see page 5752)	OnMouseWheelUp (see page 5870) event dispatcher.
	DoRemoveDockClient (see page 6147)	Responds when a control is undocked from the windowed control.
V	DoSetMaxLength (see page 21251)	Sets the MaxLength (see page 21263) property.
	DoStartDock (see page 5753)	OnStartDock (see page 5871) event dispatcher.
	DoStartDrag (see page 5753)	OnStartDrag (see page 5871) event dispatcher.
	DoUnDock (see page 6147)	Undocks a control that is currently docked to the windowed control.
	DragCanceled (see page 5754)	Provides the interface for a method that responds to the cancellation of a drag.
	DragOver (see page 5755)	OnDragOver (see page 5857) event dispatcher.
	DrawDragDockImage (see page 5755)	Draws the dock image for the control.

	EditCanModify (see page 15812)	Permits the user to edit control contents.
	EraseDragDockImage (see page 5757)	Erases the dock image for the control.
	FindNextControl (see page 6149)	Returns the control's next child in the tab order after the specified control.
	FixupTabList (see page 6149)	Sorts the child controls by their tab order.
	GetAction (see page 5758)	This is GetAction, a member of class TControl.
	GetActionLinkClass (see page 5758)	Returns the appropriate action link class that is associated with the control class.
	GetActionLinkClass (see page 6152)	Returns the associated action link class.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetChildren (see page 6153)	Calls a specified method for each child of the control.
	GetClientOrigin (see page 5758)	Returns the screen coordinates of the top-left corner of the control's client area.
	GetClientOrigin (see page 6153)	Returns the value of the ClientOrigin (see page 5809) property.
	GetClientRect (see page 5759)	Returns a rectangle defining the client area of the control.
	GetClientRect (see page 6154)	Returns the value of the ClientRect (see page 5810) property.
	GetControlExtents (see page 6154)	Returns the smallest rectangle in which all the control's children fit.
	GetDeviceContext (see page 5760)	Returns a device context for the control.
	GetDeviceContext (see page 6155)	Provides access to a device context for the control.
	GetDockEdge (see page 5763)	Returns the edge on which another control should be docked when it is dragged over the control.
	GetDragImages (see page 5763)	Returns the control's image list containing the image to be displayed while dragging.
	GetEnabled (see page 5763)	Returns the value of the Enabled (see page 5821) property.
	GetFirstEditChar (see page 15813)	Returns the index in the EditMask (see page 15821) of the first nonliteral character.
	GetFloating (see page 5764)	Returns the value of the Floating (see page 5823) property.
	GetFloatingDockSiteClass (see page 5764)	Returns the class used for the control when it is floating.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
	GetLastEditChar (see page 15813)	Returns the index in the EditMask (see page 15821) of the last nonliteral character.
	GetMaxChars (see page 15814)	Returns the length of the EditText (see page 15821).
	GetNextEditChar (see page 15814)	Returns the first index of a nonliteral character equal to or greater than an offset.
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetPalette (see page 5765)	Returns the handle to a palette for use by the control.
	GetParentHandle (see page 6157)	Returns the window handle for the window of the control's parent.
	GetPopupMenu (see page 5765)	Returns the pop-up menu associated with the control.
	GetPriorEditChar (see page 15815)	Returns the first index of a nonliteral character equal to or less than an offset.
	GetSel (see page 15815)	Returns the endpoints of the current selection in the EditText (see page 15821).
	GetSelLength (see page 21252)	Returns the SelLength (see page 21265) property.
	GetSelStart (see page 21252)	Returns the SelStart (see page 21269) property.
	GetSelText (see page 21252)	Returns the SelText (see page 21272) property.
	GetSiteInfo (see page 6158)	Generates an OnGetSiteInfo (see page 6223) event
	GetTopParentHandle (see page 6159)	Returns the window handle of the first window not associated with a VCL control that contains the windowed control.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	InvalidateDockHostSite (see page 6162)	This is InvalidateDockHostSite, a member of class TWinControl.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsControlActivateMsg (see page 6162)	This is IsControlActivateMsg, a member of class TWinControl.
	IsControlMouseMsg (see page 6162)	Indicates whether a specified mouse message is directed to one of the windowed control's child controls.
	IsQualifyingSite (see page 6163)	This is IsQualifyingSite, a member of class TWinControl.

	KeyDown (see page 6163)	Respond to key press events.
	KeyDown (see page 15816)	Supplements the inherited KeyDown to process navigation keys and the Delete key.
	KeyPress (see page 6163)	Respond to keyboard input.
	KeyPress (see page 15816)	Supplements the inherited method to process the Esc and Enter keys.
	KeyUp (see page 6164)	Respond to released key.
	KeyUp (see page 15817)	Key up event dispatcher.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Loaded (see page 5771)	Initializes the control after it is loaded from a stream.
	MainWndProc (see page 6165)	Receives Windows messages for the control.
	MouseActivate (see page 5773)	This is MouseActivate, a member of class TControl.
	MouseDown (see page 5773)	OnMouseDown (see page 5862) event dispatcher.
	MouseMove (see page 5773)	Respond to mouse moving over control area..
	MouseUp (see page 5774)	OnMouseUp (see page 5867) event dispatcher.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	Notification (see page 5775)	Responds to notifications that components are being created or destroyed.
	Notification (see page 6165)	Responds to notifications that components are being created or destroyed.
	NotifyControls (see page 6165)	Sends a message to all the child controls.
	PaintControls (see page 6166)	Paints each of the child controls in a windowed control using the specified device context.
	PaintHandler (see page 6166)	Responds to WM_PAINT messages.
	PaintWindow (see page 6169)	Renders the image of a windowed control.
	PaletteChanged (see page 5775)	Responds to changes in the system's palette by realizing the control's palette.
	PaletteChanged (see page 6170)	Responds to changes in the system's palette by realizing the control's palette and the palette for each child control.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	PositionDockRect (see page 5777)	Positions the docking rectangle according to the current drag-and-dock state.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	ReadState (see page 5778)	Prepares the control for having its properties assigned values read from a stream.
	ReadState (see page 6171)	Prepares the control for having its properties assigned values from a stream.
	RecreateWnd (see page 6171)	Recreate underlying Windows screen object.
	ReformatText (see page 15817)	Applies the mask NewMask to the underlying text, and updates the internal representation of the mask.
	ReloadDockedControl (see page 6172)	Reloads a docked control.
	RemoveWindowProps (see page 6174)	This is RemoveWindowProps, a member of class TWinControl.
	RequestAlign (see page 5780)	Instructs the parent of a control to reposition the control, enforcing its Align (see page 5798) property.
	Reset (see page 15818)	Returns the EditText (see page 15821) to its value at the time when the edit control last lost focus.
	ResetIme (see page 6174)	Restores the input method editor (IME) that was active when the application started.
	ResetImeComposition (see page 6175)	Directs the composition window of the input method editor (IME) to perform a specific action.
	Resize (see page 5780)	Respond to control resize.
	ScaleConstraints (see page 5781)	This is ScaleConstraints, a member of class TControl.
	ScaleControls (see page 6176)	Rescale child controls only.
	SelectFirst (see page 6177)	Locates first selectable child control.
	SelectNext (see page 6177)	Moves the input focus from the current child control to the next one in the tab order.
	SendCancelMode (see page 5781)	Cancels the modal state of the control.
	SendDockNotification (see page 5782)	Sends a Windows message to the control's host dock site.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetAutoSize (see page 5783)	This is SetAutoSize, a member of class TControl.
	SetAutoSize (see page 21257)	Sets the AutoSize (see page 21260) property.
	SetBiDiMode (see page 5783)	Sets the control's bi-directional mode.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.

	SetChildOrder (see page 6178)	Changes the order in which the child component appears in the list of child components returned by the GetChildren (see page 6153) method.
	SetCursor (see page 15818)	Moves the cursor to the first editable character at or before Pos, and selects that character.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDragMode (see page 5785)	Sets the drag mode for the control.
	SetEnabled (see page 5785)	Sets the value of the Enabled (see page 5821) property.
	SetIme (see page 6181)	Activates an input method editor (IME) using the values specified by the ImeMode (see page 6207) and ImeName (see page 6208) properties.
	SetImeCompositionWindow (see page 6181)	Sets the position and font of the composition window.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetName (see page 5785)	Sets the name of the control.
	SetParent (see page 5786)	Sets the parent of the control.
	SetParent (see page 6182)	Sets the parent of the control.
	SetParentBackground (see page 6182)	This is SetParentBackground, a member of class TWinControl.
	SetParentBiDiMode (see page 5786)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	SetParentComponent (see page 5787)	Sets the parent for the control.
	SetSel (see page 15819)	Selects character range.
	SetSelLength (see page 21257)	Sets the SelLength (see page 21265) property.
	SetSelStart (see page 21257)	Sets the SelStart (see page 21269) property.
	SetZOrder (see page 5788)	Repositions the control in its parent's control list, thereby changing position onscreen.
	SetZOrder (see page 6182)	Moves the control to the top or bottom of the parent control's (or screen's) list of TWinControl (see page 6112) controls.
	ShowControl (see page 6183)	Ensures that a specified child control is visible.
	UpdateBounds (see page 6185)	This is UpdateBounds, a member of class TWinControl.
	UpdateBoundsRect (see page 5789)	Changes the Top (see page 5844), Left (see page 5830), Width (see page 5849), and Height (see page 5825) properties of the control, but doesn't update its screen image and bypasses all resize events.
	UpdateControlOriginalParentSize (see page 6186)	This is UpdateControlOriginalParentSize, a member of class TWinControl.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateExplicitBounds (see page 5789)	This is UpdateExplicitBounds, a member of class TControl.
	UpdateRecreatingFlag (see page 6186)	This is UpdateRecreatingFlag, a member of class TWinControl.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	UpdateUIState (see page 6186)	Updates form User Interface State as needed
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	Validate (see page 15819)	Validates a specified string against the current mask.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateError (see page 15820)	Beeps and raises an EDBEditError (see page 15798) exception.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	VisibleChanging (see page 5791)	Provides the interface for a method that responds to changes in the control's visibility.
	WndProc (see page 5791)	Provides specific message responses for the control.
	WndProc (see page 6187)	Provides specific message responses for the control.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	ActionLink (see page 5798)	Contains the action link object associated with the control.

	BorderWidth (see page 6195)	Specifies the width of the control's border.
	Caption (see page 5806)	Specifies a text string that identifies the control to the user.
	DefWndProc (see page 6199)	Specifies the default window procedure for the windowed control.
	DesktopFont (see page 5818)	Specifies whether the control uses the Windows icon font when writing text.
	HideSelection (see page 21262)	Determines whether the visual indication of the selected text remains when focus shifts to another control.
	IsControl (see page 5829)	Determines whether a form stores its form-specific properties to a stream.
	MaskState (see page 15822)	Indicates state information about how the mask is being applied.
	MouseCapture (see page 5831)	Indicates whether the control has "captured" mouse events.
	OEMConvert (see page 21264)	Determines whether characters typed in the edit control are converted from ANSI to OEM and then back to ANSI.
	ParentBackground (see page 6209)	Determines whether control uses parent's theme background.
	ScalingFlags (see page 5840)	Reflects which attributes of the control have been scaled.
	WheelAccumulator (see page 5849)	Accumulates mouse wheel rotations.
	WindowHandle (see page 6212)	Provides access to a window handle for the control.
	WindowText (see page 5850)	Contains the text string of the control.

Public Events

	Name	Description
	WindowProc (see page 5872)	Points to the window procedure that responds to messages sent to the control.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	BeginDrag (see page 5740)	Starts the dragging of a control.
	BringToFront (see page 5740)	Puts the control in front of all other controls in its parent control.
	Broadcast (see page 6130)	Sends a message to each of the child controls.
	CanFocus (see page 6131)	Indicates whether a control can receive focus.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Clear (see page 15812)	Sets the Text (see page 15823) property to an empty string.
V	Clear (see page 21245)	Deletes all text from the edit control.
	ClearSelection (see page 21245)	Removes the selected text from the edit control.
	ClearUndo (see page 21246)	Clears the undo buffer so that no changes to the text can be backed out.
	ClientToParent (see page 5744)	Translates client coordinates to parent coordinates.
	ClientToScreen (see page 5744)	Translates a given point from client area coordinates to global screen coordinates.
	ContainsControl (see page 6133)	Indicates whether a specified control exists within the control.
	ControlAtPos (see page 6133)	Returns the child control located at a specified position within the control.
	CopyToClipboard (see page 21246)	Copies the selected text in the edit control to the Clipboard in CF_TEXT format.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
V	Create (see page 5731)	Creates an instance of TControl (see page 5724).
V	Create (see page 6123)	Creates an instance of TWinControl (see page 6112).
V	Create (see page 15810)	Creates an instance of TCustomMaskEdit (see page 15798).
V	Create (see page 21244)	Creates an instance of TCustomEdit (see page 21232).
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.

	CreateParented (see page 6123)	Creates and initializes a control as the child of a specified non-VCL container.
	CreateParentedControl (see page 6136)	Creates and initializes a control as the child of a specified non-VCL window.
	CutToClipboard (see page 21249)	Copies the selected text to the Clipboard in CF_TEXT format and then deletes the selection.
V	DefaultHandler (see page 5748)	Provides message handling for all messages that do not have specific handlers.
V	DefaultHandler (see page 6139)	Provides message handling for all messages that the control does not fully process itself.
V	DefaultHandler (see page 21250)	Provides message handling for all messages that the control does not fully process itself.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 5732)	Destroys an instance of TControl (see page 5724).
V	Destroy (see page 6124)	Destroys an instance of TWinControl (see page 6112).
V	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	DisableAlign (see page 6141)	Disables the realignment of child controls.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Dock (see page 5749)	Used internally to dock the control.
	DockDrop (see page 6142)	Generates an OnDockDrop (see page 6214) event.
	DragDrop (see page 5754)	OnDragDrop (see page 5855) event dispatcher.
	Dragging (see page 5754)	Indicates whether a control is being dragged.
	DrawTextBiDiModeFlags (see page 5756)	Returns the text flags that reflect the current setting of the BiDiMode (see page 5803) property.
	DrawTextBiDiModeFlagsReadingOnly (see page 5756)	Returns the text flag to add that indicates whether the control's text should read from right to left.
	EnableAlign (see page 6148)	Decrements the reference count incremented by the DisableAlign (see page 6141) method, eventually realigning the child controls.
	EndDrag (see page 5757)	Stops a control from being dragged any further.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindChildControl (see page 6148)	Returns a child control given its name.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FlipChildren (see page 6150)	Reverses the positions of child controls.
	Focused (see page 6150)	Determines whether the control has input focus.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetControlsAlignment (see page 5759)	Indicates how text is aligned within the control.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 5765)	Returns the parent of the control.
V	GetSelTextBuf (see page 21253)	Copies the selected text into a buffer and returns the number of characters copied.
	GetTabOrderList (see page 6158)	Builds a list of controls in tab order.

	GetTextBuf (see page 5766)	Retrieves the control's text, copies it into a buffer, and returns the number of characters copied.
	GetTextLen (see page 5767)	Returns the length of the control's text.
	GetTextLen (see page 15816)	Returns the length of the underlying text.
	HandleAllocated (see page 6159)	Reports whether a screen object handle exists for the control.
	HandleNeeded (see page 6160)	Creates a screen object for the control if it doesn't already exist.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 5768)	Indicates whether the control has a parent.
	Hide (see page 5769)	Makes the control invisible.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
V	InitiateAction (see page 5769)	Calls the action link's Update (see page 5789) method if the control is associated with an action link.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InsertControl (see page 6160)	Inserts a control into the Controls (see page 6197) array property.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
V	Invalidate (see page 5770)	Completely repaint control.
V	Invalidate (see page 6161)	Schedules a control repaint.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	IsRightToLeft (see page 5770)	Indicates whether the control should be reversed right to left.
	ManualDock (see page 5771)	Docks the control.
	ManualFloat (see page 5772)	Undocks the control.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	MouseWheelHandler (see page 5774)	Dispatches messages received from a mouse wheel.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	PaintTo (see page 6167)	This is the overview for the PaintTo method overload.
	ParentToClient (see page 5776)	Translate parent coordinates to client coordinates.
	PasteFromClipboard (see page 21254)	Pastes the contents of the Clipboard into edit control, replacing the current selection.
	Perform (see page 5776)	Responds as if the control received a specified Windows message.
	PreProcessMessage (see page 6170)	This is PreProcessMessage, a member of class TWinControl.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	Realign (see page 6171)	Forces the control to realign children.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	Refresh (see page 5779)	Repaints the control on the screen.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveControl (see page 6172)	Removes a specified control from the Controls (see page 6197) array.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	Repaint (see page 5779)	Forces the control to repaint its image on the screen.
V	Repaint (see page 6174)	Repaints the entire control.
	ReplaceDockedControl (see page 5779)	Docks the control in the place where another control is already docked.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	ScaleBy (see page 6175)	Rescale control and its children.
	ScreenToClient (see page 5781)	Converts the screen coordinates of a specified point on the screen to client coordinates.
	ScrollBy (see page 6176)	Scroll control contents.
	SelectAll (see page 21255)	Selects all text in the edit control.
	SendToBack (see page 5782)	Puts a windowed control behind all other windowed controls, or puts a non-windowed control behind all other non-windowed controls.
V	SetBounds (see page 5783)	Sets the Left (see page 5830), Top (see page 5844), Width (see page 5849), and Height (see page 5825) properties all at once.

V	SetBounds (see page 6178)	Sets the windowed control's boundary properties all at once.
	SetDesignVisible (see page 5784)	Makes a control visible at design time.
V	SetDesignVisible (see page 6178)	Makes a control visible at design time.
V	SetFocus (see page 6179)	Gives the input focus to the control.
	SetSelTextBuf (see page 21258)	Replaces the selected text with a null-terminated string.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	SetTextBuf (see page 5787)	Sets the text of the control.
	Show (see page 5788)	Makes a control visible.
	Undo (see page 21259)	Backs out all changes in the undo buffer.
V	Update (see page 5789)	Processes any pending paint messages immediately.
V	Update (see page 6183)	Forces the control to update.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	UpdateControlState (see page 6186)	Respond to state change.
	UseRightToLeftAlignment (see page 5790)	Specifies whether the control's alignment should be reversed right-to-left.
	UseRightToLeftReading (see page 5790)	Specifies whether the control is using a right-to-left reading order.
	UseRightToLeftScrollBar (see page 5791)	Specifies whether the vertical scroll bar appears on the left side of the control.
V	ValidateEdit (see page 15819)	Validates the EditText (see page 15821) against the current mask.

Public Properties

	Name	Description
	Action (see page 5797)	Designates the action associated with the control.
R	AlignDisabled (see page 6192)	Indicates child control realignment disabled.
	BoundsRect (see page 5803)	Specifies the bounding rectangle of the control, expressed in the coordinate system of the parent control.
R	Brush (see page 6195)	Determines the color and pattern used for painting the background of the control.
R	CanUndo (see page 21262)	Indicates whether the edit control contains changes that can be backed out.
	ClientHeight (see page 5808)	Specifies the height of the control's client area in pixels.
R	ClientOrigin (see page 5809)	Specifies the screen coordinates (in pixels) of the top left corner of a control's client area.
R	ClientRect (see page 5810)	Specifies the size (in pixels) of a control's client area.
	ClientWidth (see page 5811)	Specifies the horizontal size of the control's client area in pixels.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
R	ControlCount (see page 6195)	Returns the number of child controls.
R	Controls (see page 6197)	Lists all child controls.
	ControlState (see page 5813)	Indicates the current state of a control at runtime.
	ControlStyle (see page 5814)	Determines style characteristics of the control.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	DockClientCount (see page 6199)	Specifies the number of controls that are docked on the windowed control.
R	DockClients (see page 6201)	Lists the controls that are docked to the windowed control.
	DockManager (see page 6202)	Specifies the control's docking manager interface.
	DockOrientation (see page 5818)	Specifies how the control is docked relative to other controls docked in the same parent.
	DockSite (see page 6204)	Specifies whether the control can be the target of drag-and-dock operations.
	DoubleBuffered (see page 6205)	Determines whether the control's image is rendered directly to the window or painted to an in-memory bitmap first.
	EditText (see page 15821)	Specifies the text that appears in the window of the masked edit control.
R	ExplicitHeight (see page 5821)	Specifies the explicit vertical size of the control in pixels.
R	ExplicitLeft (see page 5822)	Specifies the explicit horizontal pixel coordinate of the left edge of a component relative to its parent.

R	ExplicitTop (see page 5822)	Specifies the explicit vertical pixel coordinate of the top edge of a component relative to its parent.
R	ExplicitWidth (see page 5822)	Specifies the explicit horizontal size of the control in pixels.
R	Floating (see page 5823)	Indicates whether the control is floating.
	FloatingDockSiteClass (see page 5823)	Specifies the class of the temporary control that hosts the control when it is floating.
R	Handle (see page 6207)	Provides access to the underlying Windows screen object for the control.
	HostDockSite (see page 5829)	Specifies the control in which the control is docked.
R	IsMasked (see page 15822)	Indicates whether a mask exists for the edit control.
	LRDockWidth (see page 5831)	Specifies the width of the control when it is docked horizontally.
	Modified (see page 21263)	Indicates whether the user edited the text of the edit control.
R	MouseInClient (see page 6209)	This is MouseInClient, a member of class TWinControl.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Padding (see page 6209)	Specifies the padding of a control.
	Parent (see page 5832)	Indicates the parent of the control.
	ParentWindow (see page 6210)	Reference to parent's underlying control.
	SelLength (see page 21265)	Specifies the number of characters (bytes) that are selected.
	SelStart (see page 21269)	Specifies the position of the first selected character in the text.
	SelText (see page 21272)	Specifies the selected portion of the edit control's text.
R	Showing (see page 6210)	Indicates whether the control is showing on the screen.
	TBDockHeight (see page 5842)	Specifies the height of the control when it is docked vertically.
	UndockHeight (see page 5845)	Specifies the height of the control when it is floating.
	UndockWidth (see page 5846)	Specifies the width of the control when it is floating.
	UseDockManager (see page 6212)	Specifies whether the docking manager is used in drag-and-dock operations.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
R	VisibleDockClientCount (see page 6212)	Specifies the number of visible controls that are docked on the windowed control.

Published Events

	Name	Description
	OnChange (see page 15866)	Occurs when the text for the edit control may have changed.
	OnClick (see page 15866)	Occurs when the user clicks the control.
	OnDblClick (see page 15868)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDragDrop (see page 15869)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 15871)	Occurs when the user drags an object over a control.
	OnEndDock (see page 15873)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 15874)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnEnter (see page 15875)	Occurs when a control receives the input focus.
	OnExit (see page 15877)	Occurs when the input focus shifts away from one control to another.
	OnKeyDown (see page 15879)	Occurs when a user presses any key while the control has focus.
	OnKeyPress (see page 15882)	Occurs when a key is pressed.
	OnKeyUp (see page 15883)	Occurs when the user releases a key that has been pressed.
	OnMouseActivate (see page 15884)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 15885)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseEnter (see page 15888)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 15888)	Occurs when the user moves the mouse outside of a control.
	OnMouseMove (see page 15888)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 15890)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnStartDock (see page 15893)	Occurs when the user begins to drag a control with a DragKind of dkDock.
	OnStartDrag (see page 15893)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.

Published Properties

	Name	Description
	Align (see page 15837)	Determines how the control aligns within its container (parent control).
	AlignWithMargins (see page 5802)	Indicates whether a control should be constrained by margins.
	Anchors (see page 15840)	Specifies how the control is anchored to its parent.
	AutoSelect (see page 15841)	Determines whether all the text in the edit control is automatically selected when the control gets focus.
	AutoSize (see page 15841)	Determines whether the height of the edit control automatically resizes to accommodate the text.
	BevelEdges (see page 15842)	Specifies which edges of the control are beveled.
	BevelInner (see page 15843)	Specifies the cut of the inner bevel.
	BevelKind (see page 15843)	Specifies the control's bevel style.
	BevelOuter (see page 15843)	Specifies the cut of the outer bevel.
	BevelWidth (see page 15844)	Specifies the width of the inner and outer bevels.
	BiDiMode (see page 15844)	Specifies the bi-directional mode for the control.
	BorderStyle (see page 15845)	Determines whether the edit control has a single line border around the client area.
	CharCase (see page 15845)	Determines the case of the text within the edit control.
	Color (see page 15845)	Specifies the background color of the control.
	Constraints (see page 15846)	Specifies the size constraints for the control.
	Ctl3D (see page 15847)	Determines whether a control has a three-dimensional (3-D) or two-dimensional look.
	Cursor (see page 5815)	Specifies the image used to represent the mouse pointer when it passes into the region covered by the control.
	DragCursor (see page 15847)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 15848)	Specifies whether the control is being dragged normally or for docking.
	DragMode (see page 15848)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	EditMask (see page 15850)	Specifies the mask that represents what text is valid for the masked edit control.
	Enabled (see page 15850)	Controls whether the control responds to mouse, keyboard, and timer events.
	Font (see page 15851)	Controls the attributes of text written on or in the control.
	Height (see page 5825)	Specifies the vertical size of the control in pixels.
	HelpContext (see page 5826)	Numeric ID for control's context-sensitive help topic
	HelpKeyword (see page 5826)	Keyword for control's context-sensitive help topic
	HelpType (see page 5827)	Indicates whether the control's context sensitive help topic is identified by context ID or by keyword.
	Hint (see page 5827)	Contains the text string that can appear when the user moves the mouse over the control.
	ImeMode (see page 15852)	Determines the behavior of the input method editor (IME).
	ImeName (see page 15852)	Specifies the input method editor (IME) to use for converting keyboard input to Asian language characters.
	Left (see page 5830)	Specifies the horizontal coordinate of the left edge of a component relative to its parent.
	Margins (see page 5831)	Specifies the margins for the control.
	MaxLength (see page 15853)	Specifies the maximum number of characters that can appear in the edit control.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	ParentBiDiMode (see page 15853)	Specifies whether the control uses its parent's BiDiMode.
	ParentColor (see page 15854)	Determines where a control looks for its color information.
	ParentCtl3D (see page 15854)	Determines where a component looks to determine if it should appear three dimensional.
	ParentFont (see page 15854)	Determines where a control looks for its font information.
	ParentShowHint (see page 15855)	Determines where a control looks to find out if its Help Hint should be shown.
	PasswordChar (see page 15856)	Indicates the character, if any, to display in place of the actual characters typed in the control.
	PopupMenu (see page 15856)	Identifies the pop-up menu associated with the control.
	ReadOnly (see page 15861)	Determines whether the user can change the text of the edit control.
	ShowHint (see page 15861)	Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.

	TabOrder (see page 15862)	Indicates the position of the control in its parent's tab order.
	TabStop (see page 15863)	Determines if the user can tab to a control.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Text (see page 15863)	Denotes the underlying text for the masked edit control before the mask has been applied.
	Top (see page 5844)	Specifies the Y coordinate of the top left corner of a control, relative to its parent or containing control in pixels.
	Visible (see page 15864)	Determines whether the component appears onscreen.
	Width (see page 5849)	Specifies the horizontal size of the control or form in pixels.

90.1.3.2 TMaskEdit Properties

The properties of the TMaskEdit class are listed here.

Published Properties

	Name	Description
	Align (see page 15837)	Determines how the control aligns within its container (parent control).
	Anchors (see page 15840)	Specifies how the control is anchored to its parent.
	AutoSelect (see page 15841)	Determines whether all the text in the edit control is automatically selected when the control gets focus.
	AutoSize (see page 15841)	Determines whether the height of the edit control automatically resizes to accommodate the text.
	BevelEdges (see page 15842)	Specifies which edges of the control are beveled.
	BevelInner (see page 15843)	Specifies the cut of the inner bevel.
	BevelKind (see page 15843)	Specifies the control's bevel style.
	BevelOuter (see page 15843)	Specifies the cut of the outer bevel.
	BevelWidth (see page 15844)	Specifies the width of the inner and outer bevels.
	BiDiMode (see page 15844)	Specifies the bi-directional mode for the control.
	BorderStyle (see page 15845)	Determines whether the edit control has a single line border around the client area.
	CharCase (see page 15845)	Determines the case of the text within the edit control.
	Color (see page 15845)	Specifies the background color of the control.
	Constraints (see page 15846)	Specifies the size constraints for the control.
	Ctl3D (see page 15847)	Determines whether a control has a three-dimensional (3-D) or two-dimensional look.
	DragCursor (see page 15847)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 15848)	Specifies whether the control is being dragged normally or for docking.
	DragMode (see page 15848)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	EditMask (see page 15850)	Specifies the mask that represents what text is valid for the masked edit control.
	Enabled (see page 15850)	Controls whether the control responds to mouse, keyboard, and timer events.
	Font (see page 15851)	Controls the attributes of text written on or in the control.
	ImeMode (see page 15852)	Determines the behavior of the input method editor (IME).
	ImeName (see page 15852)	Specifies the input method editor (IME) to use for converting keyboard input to Asian language characters.
	MaxLength (see page 15853)	Specifies the maximum number of characters that can appear in the edit control.
	ParentBiDiMode (see page 15853)	Specifies whether the control uses its parent's BiDiMode.
	ParentColor (see page 15854)	Determines where a control looks for its color information.
	ParentCtl3D (see page 15854)	Determines where a component looks to determine if it should appear three dimensional.
	ParentFont (see page 15854)	Determines where a control looks for its font information.
	ParentShowHint (see page 15855)	Determines where a control looks to find out if its Help Hint should be shown.
	PasswordChar (see page 15856)	Indicates the character, if any, to display in place of the actual characters typed in the control.
	PopupMenu (see page 15856)	Identifies the pop-up menu associated with the control.
	ReadOnly (see page 15861)	Determines whether the user can change the text of the edit control.

	ShowHint (see page 15861)	Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.
	TabOrder (see page 15862)	Indicates the position of the control in its parent's tab order.
	TabStop (see page 15863)	Determines if the user can tab to a control.
	Text (see page 15863)	Denotes the underlying text for the masked edit control before the mask has been applied.
	Visible (see page 15864)	Determines whether the component appears onscreen.

90.1.3.2.1 TMaskEdit.Align Property

Determines how the control aligns within its container (parent control).

Pascal

```
property Align: TAlign;
```

C++

```
__property TAlign Align;
```

Description

Use Align to align a control to the top, bottom, left, or right of a form or panel and have it remain there even if the size of the form, panel, or component that contains the control changes. When the parent is resized, an aligned control also resizes so that it continues to span the top, bottom, left, or right edge of the parent.

For example, to use a panel component with various controls on it as a tool palette, change the panel's Align value to alLeft. The value of alLeft for the Align property of the panel guarantees that the tool palette remains on the left side of the form and always equals the client height of the form.

The default value of Align is alNone, which means a control remains where it is positioned on a form or panel.

Tip: If Align is set to alClient, the control fills the entire client area so that it is impossible to select the parent form by clicking on it. In this case, select the parent by selecting the control on the form and pressing Esc, or by using the Object Inspector.

Any number of child components within a single parent can have the same Align value, in which case they stack up along the edge of the parent. The child controls stack up in z-order. To adjust the order in which the controls stack up, drag the controls into their desired positions.

Note: To cause a control to maintain a specified relationship with an edge of its parent, but not necessarily lie along one edge of the parent, use the Anchors property instead.

C++ Examples:

```
/*
This example shows how to use a splitter to divide a form
into resizable panes.  All objects on the form are created
dynamically in the OnCreate event handler of the form. To
run this example, add ExtCtrls and FileCtrl to the uses
clause of the form’s implementation section.
Note that when creating a splitter dynamically at runtime,
it is important to set its position to the appropriate side
of the control it will resize.
*/
#include <Extctrls.hpp>
#include <Filectrl.hpp>

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  TSplitter* ps = new TSplitter(Form1);
  TFileListBox* pflb = new TFileListBox(Form1);
  TDirectoryListBox* pdlb = new TDirectoryListBox(Form1);
```

```
  // Line up the directory list box on the left of the form.
  pdlb->Parent = Form1;
  pdlb->Align = alLeft;
  pdlb->Width = Form1->ClientWidth/3;

  // Now use the splitter to divide the directory pane from the file pane.
  ps->Parent = Form1;
  ps->Left = pdlb->Left + pdlb->Width + 1; // Move to right of directory list.
  ps->Align = pdlb->Align; // Give same alignment as directory list.

  // Each pane must be at least one quarter of the form's width.
  ps->MinSize = Form1->ClientWidth/4;

  // Finally, create the last pane - a file list box.
  pflb->Parent = Form1;
  pflb->Align = alClient;
  pdlb->FileList = pflb; // Link the file list box to the directory list box.
}
/*
Dynamically create a TProgressBar control and align it to
the bottom of the form.
*/

#include <ComCtrls.hpp>
#include <Controls.hpp>

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  TProgressBar *ProgressBar = new TProgressBar(this);
  ProgressBar->Parent = this;
  ProgressBar->Align = alBottom;
  TButton *Button1 = new TButton(this);
  Button1->Parent = this;
}
/*
This example dynamically creates a Page Control, then a
series of Tab Sheets on the Page Control.
*/
#include <Comctrls.hpp>
TPageControl* ppc;
const int MAXTABS = 3;
TTabSheet* pts[MAXTABS];

    colorpalette: Array[0..11] of TColor = (
      clRed, clGreen, clYellow, clBlue, clWhite, clFuchsia, clTeal,
      clNavy, clMaroon, clLime, clOlive, clPurple);
  var
    i: Integer;
  begin
    PageControl1 := TPageControl.Create(Self);
    PageControl1.Parent := Self;
    PageControl1.Align := alClient;
    for i := Low(TabTitles) to High(TabTitles) do
    begin
      pts[i]:= TTabSheet.Create(PageControl1);
      with pts[i] do
      begin
        PageControl := PageControl1;
        Name := 'ts' + TabTitles[i];
        Caption := TabTitles[i];
        Brush.Color := colorPalette[i];
     end;
    end;
  end;

  procedure TForm1.FormDestroy(Sender: TObject);
  var
    i: Integer;
  begin
    for i := Low(TabTitles) to High(TabTitles) do
    begin
      pts[i].Free;
    end;
    PageControl1.Free;
  end;
```

See Also

Parent (see page 5832)

Anchors (see page 5802)

90.1.3.2.2 TMaskEdit.Anchors Property

Specifies how the control is anchored to its parent.

Pascal

```
property Anchors: TAnchors;
```

C++

```
__property TAnchors Anchors;
```

Description

Use Anchors to ensure that a control maintains its current position relative to an edge of its parent, even if the parent is resized. When its parent is resized, the control holds its position relative to the edges to which it is anchored.

If a control is anchored to opposite edges of its parent, the control stretches when its parent is resized. For example, if a control has its Anchors property set to [akLeft, akRight], the control stretches when the width of its parent changes.

Anchors is enforced only when the parent is resized. Thus, for example, if a control is anchored to opposite edges of a form at

design time and the form is created in a maximized state, the control is not stretched because the form is not resized after the control is created.

Note: If a control should maintain contact with three edges of its parent (hugging one side of the parent and stretching the length of that side), use the Align property instead. Unlike Anchors, Align allows controls to adjust to changes in the size of other aligned sibling controls as well as changes to the parent's size.

See Also

Parent (see page 5832)

Align (see page 5798)

90.1.3.2.3 TMaskEdit.AutoSelect Property

Determines whether all the text in the edit control is automatically selected when the control gets focus.

Pascal

```
property AutoSelect: Boolean;
```

C++

```
__property Boolean AutoSelect;
```

Description

Set AutoSelect to select all the text when the edit control gets focus. AutoSelect only applies to single-line edit controls.

Use AutoSelect when the user is more likely to replace the text in the edit control than to append to it.

See Also

SelectAll (see page 21255)

SelLength (see page 21265)

SelStart (see page 21269)

SelText (see page 21272)

SetSelTextBuf (see page 21258)

90.1.3.2.4 TMaskEdit.AutoSize Property

Determines whether the height of the edit control automatically resizes to accommodate the text.

Pascal

```
property AutoSize: Boolean;
```

C++

```
__property Boolean AutoSize;__property Boolean AutoSize;
```

Description

Use AutoSize to make the edit control adjust its size automatically so the client area accommodates the height of the text. When AutoSize is false, the edit control has a fixed height. When AutoSize is true, the size of the control is readjusted whenever a change occurs that could affect the height of the control, such as a change to the font or border style.

Note: AutoSize only adjusts the height of the edit control. Even with AutoSize set to true, text in the edit control may appear truncated if it extends beyond the width of the control.

C++ Examples:

```
/*
This example uses an edit box and a button on a form. When
the user clicks the button, the font in the edit box
enlarges, and the edit box enlarges also to accommodate the
larger font size.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  Edit1->AutoSize = true;
  Edit1->Font->Size = 20;
  Edit1->Text = "The edit box is taller now";
}
```

Delphi Examples:

```
{
{
This example uses an edit box and a button on a form. When
the user clicks the button, the font in the edit box
enlarges, and the edit box enlarges also to accommodate the
larger font size.
}
procedure TForm1.Button1Click(Sender: TObject);
begin
  Edit1.AutoSize := True;
  Edit1.Font.Size := 20;
  Edit1.Text := 'The edit box is taller now';
end;
```

BorderStyle (see page 21261)

ClientHeight (see page 5808)

ControlStyle (see page 5814)

Height (see page 5825)

90.1.3.2.5 TMaskEdit.BevelEdges Property

Specifies which edges of the control are beveled.

Pascal

```
property BevelEdges: TBevelEdges;
```

C++

```
__property TBevelEdges BevelEdges;
```

Description

Use BevelEdges to get or set which edges of the control are beveled. The BevelInner, BevelOuter, and BevelKind properties determine the appearance of the specified edges.

See Also

BevelInner (see page 6193)

BevelOuter (see page 6194)

BevelKind (see page 6193)

90.1.3.2.6 TMaskEdit.BevelInner Property

Specifies the cut of the inner bevel.

Pascal

```
property BevelInner: TBevelCut;
```

C++

```
__property TBevelCut BevelInner;
```

Description

Use BevelInner to specify whether the inner bevel has a raised, lowered, or flat look.

The inner bevel appears immediately inside the outer bevel. If there is no outer bevel (BevelOuter is bvNone), the inner bevel appears immediately inside the border.

See Also

BevelEdges (see page 6192)

BevelOuter (see page 6194)

BevelKind (see page 6193)

BevelWidth (see page 6194)

BorderWidth (see page 6195)

90.1.3.2.7 TMaskEdit.BevelKind Property

Specifies the control's bevel style.

Pascal

```
property BevelKind: TBevelKind;
```

C++

```
__property TBevelKind BevelKind;
```

Description

Use BevelKind to modify the appearance of a bevel. BevelKind influences how sharply the bevel stands out.

BevelKind, in combination with BevelWidth and the cut of the bevel specified by BevelInner or BevelOuter, can create a variety of effects. Experiment with various combinations to get the look you want.

See Also

BevelEdges (see page 6192)

BevelOuter (see page 6194)

BevelInner (see page 6193)

BevelWidth (see page 6194)

90.1.3.2.8 TMaskEdit.BevelOuter Property

Specifies the cut of the outer bevel.

Pascal

```
property BevelOuter: TBevelCut;
```

C++

```
__property TBevelCut BevelOuter;
```

Description

Use BevelInner to specify whether the outer bevel has a raised, lowered, or flat look.

The outer bevel appears immediately inside the border and outside the inner bevel.

See Also

BevelEdges (see page 6192)

BevelInner (see page 6193)

BevelKind (see page 6193)

BevelWidth (see page 6194)

90.1.3.2.9 TMaskEdit.BevelWidth Property

Specifies the width of the inner and outer bevels.

Pascal

```
property BevelWidth: TBevelWidth;
```

C++

```
__property TBevelWidth BevelWidth;
```

Description

Use BevelWidth to specify the width, in pixels, of the inner and outer bevels.

See Also

BevelEdges (see page 6192)

BevelInner (see page 6193)

BevelKind (see page 6193)

BevelOuter (see page 6194)

90.1.3.2.10 TMaskEdit.BiDiMode Property

Specifies the bi-directional mode for the control.

Pascal

```
property BiDiMode: TBiDiMode;
```

C++

```
__property TBiDiMode BiDiMode;
```

Description

Use BiDiMode to enable the control to adjust its appearance and behavior automatically when the application runs in a locale that reads from right to left instead of left to right. The bi-directional mode controls the reading order for the text, the placement of the vertical scroll bar, and whether the alignment is changed.

Alignment does not change for controls that are known to contain number, date, time, or currency values. For example, with data aware controls, the alignment does not change for the following field types: ftSmallint, ftInteger, ftWord, ftFloat, ftCurrency, ftBCD, ftDate, ftTime, ftDateTime, ftAutoInc.

See Also

UseRightToLeftAlignment (see page 5790)

UseRightToLeftReading (see page 5790)

UseRightToLeftScrollBar (see page 5791)

Including Bi-directional Functionality in Applications

90.1.3.2.11 TMaskEdit.BorderStyle Property

Determines whether the edit control has a single line border around the client area.

Pascal

```
property BorderStyle: TBorderStyle;
```

C++

```
__property TBorderStyle BorderStyle;
```

Description

Use BorderStyle to affect the sharpness with which the client area of the edit control stands out. BorderStyle can have a value of either bsSingle or bsNone. If BorderStyle is bsSingle, the edit control has a single-line border around the client area. If BorderStyle is bsNone, there will be no border.

90.1.3.2.12 TMaskEdit.CharCase Property

Determines the case of the text within the edit control.

Pascal

```
property CharCase: TEditCharCase;
```

C++

```
__property TEditCharCase CharCase;
```

Description

Use CharCase to force the contents of the edit control to assume a particular case.

When CharCase is set to ecLowerCase or ecUpperCase, the case of characters is converted as the user types them into the edit control. Changing the CharCase property to ecLowerCase or ecUpperCase changes the actual contents of the text, not just the appearance. Any case information is lost and can't be recaptured by changing CharCase to ecNormal.

See Also

Text (see page 5842)

90.1.3.2.13 TMaskEdit.Color Property

Specifies the background color of the control.

Pascal

```
property Color: TColor;
```

C++

```
__property TColor Color;
```

Description

Use Color to read or change the background color of the control.

If a control's ParentColor property is true, then changing the Color property of the control's parent automatically changes the Color property of the control. When the value of the Color property is changed, the control's ParentColor property is automatically set to false.

C++ Examples:

```
/*
The following code changes the color of a shape control
using the Color dialog box. The example displays the Color
dialog box when the Button1 button is clicked, allowing the
user to select a color with the dialog box. When a color
value is selected with the dialog box, it is assigned to
the shape control.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  if (ColorDialog1->Execute())
    Shape1->Brush->Color = ColorDialog1->Color;
}
```

Delphi Examples:

```
{
The following code changes the color of a shape control
using the Color dialog box. The example displays the Color
dialog box when the Button1 button is clicked, allowing the
user to select a color with the dialog box. When a color
value is selected with the dialog box, it is assigned to
the shape control.
}
procedure TForm1.Button1Click(Sender: TObject);
begin
  if ColorDialog1.Execute then
    Shape1.Brush.Color := ColorDialog1.Color;
end;
```

See Also

ParentColor (see page 5834)

90.1.3.2.14 TMaskEdit.Constraints Property

Specifies the size constraints for the control.

Pascal

```
property Constraints: TSizeConstraints;
```

C++

```
__property TSizeConstraints Constraints;
```

Description

Use Constraints to specify the minimum and maximum width and height of the control. When Constraints contains maximum or minimum values, the control cannot be resized to violate those constraints.

Note: Constraints apply to the height of the form. However, the height of the form depends on how large Windows makes the title bar. For example, Windows XP uses much larger title bars than other windowing systems. To work around this, note the

ClientHeight when you design your form and set the constraints in the FormCreate event. In the following example, ClientHeight is represented by x: `Constraints.MinHeight := x + Height - ClientHeight`.

Warning: Do not set up constraints that conflict with the value of the Align or Anchors property. When these properties conflict, the response of the control to resize attempts is not well-defined.

See Also

AutoSize (see page 5803)

Align (see page 5798)

Anchors (see page 5802)

OnConstrainedResize (see page 5853)

OnCanResize (see page 5851)

90.1.3.2.15 TMaskEdit.Ctl3D Property

Determines whether a control has a three-dimensional (3-D) or two-dimensional look.

Pascal

```
property Ctl3D: Boolean;
```

C++

```
__property Boolean Ctl3D;
```

Description

Ctl3D is provided for backward compatibility. It is not used by 32-bit versions of Windows or NT4.0 and later, with the exception of Windows XP Home, where it is used on occasion.

On earlier platforms, Ctl3D controlled whether the control had a flat or beveled appearance.

See Also

ParentCtl3D (see page 6209)

BevelKind (see page 6193)

BevelInner (see page 6193)

BevelOuter (see page 6194)

BorderWidth (see page 6195)

90.1.3.2.16 TMaskEdit.DragCursor Property

Indicates the image used to represent the mouse pointer when the control is being dragged.

Pascal

```
property DragCursor: TCursor;
```

C++

```
__property TCursor DragCursor;
```

Description

Use the DragCursor property to change the cursor image presented when the control is being dragged.

Note: To make a custom cursor available for the DragCursor property, see the Cursor property.

See Also

Cursor (see page 5815)

DragKind (see page 5819)

DragMode (see page 5819)

90.1.3.2.17 TMaskEdit.DragKind Property

Specifies whether the control is being dragged normally or for docking.

Pascal

```
property DragKind: TDragKind;
```

C++

```
__property TDragKind DragKind;
```

Description

Use DragKind to get or set whether the control participates in drag-and-drop operations, or drag-and-dock operations.

See Also

DragCursor (see page 5818)

DragMode (see page 5819)

90.1.3.2.18 TMaskEdit.DragMode Property

Determines how the control initiates drag-and-drop or drag-and-dock operations.

Pascal

```
property DragMode: TDragMode;
```

C++

```
__property TDragMode DragMode;
```

Description

Use DragMode to control when the user can drag the control. Disable the drag-and-drop or drag-and-dock capability at runtime by setting the DragMode property value to dmManual. Enable automatic dragging by setting DragMode to dmAutomatic.

C++ Examples:

```
/*
The following code uses GetNodeAt to add a dragged node as a
child of the node under the mouse when it is dropped.  This
example requires a populated TreeView.  Also, the TTreeView
DragMode property set to dmAutomatic, and the TTreeView
OnDragOver event handler must be implemented to accept the
drop.
*/
void __fastcall TForm1::TreeView1DragDrop(TObject *Sender, TObject *Source,
      int X, int Y)
{
  if (Source != (TObject *)TreeView1 || TreeView1->Selected == NULL)
    return;
  THitTests HT = TreeView1->GetHitTestInfoAt(X, Y);
  TNodeAttachMode AttachMode;
  TTreeNode *Item = TreeView1->GetNodeAt(X, Y);
```

```
    if (HT.Contains(htOnItem) || HT.Contains(htOnIcon))
      AttachMode = naAddChild;
    else if (HT.Contains(htNowhere))
      AttachMode = naAdd;
    else if (HT.Contains(htOnIndent))
      AttachMode = naInsert;
    else
      return;
    TreeView1->Selected->MoveTo(Item, AttachMode);
  }

  void __fastcall TForm1::TreeView1DragOver(TObject *Sender, TObject *Source,
        int X, int Y, TDragState State, bool &Accept)
  {
    Accept = (Source == (TObject *)TreeView1);
  }
```

Delphi Examples:

```
{
The following code uses GetNodeAt to add a dragged node as a
child of the node under the mouse when it is dropped.  This
example requires a populated TreeView.  Also, the TTreeView
DragMode property set to dmAutomatic, and the TTreeView
OnDragOver event handler must be implemented to accept the
drop.
}
procedure TForm1.TreeView1DragDrop(Sender, Source: TObject; X, Y: Integer);
var
  AnItem: TTreeNode;
  AttachMode: TNodeAttachMode;
  HT: THitTests;
begin
  if TreeView1.Selected = nil then Exit;
  HT := TreeView1.GetHitTestInfoAt(X, Y);
  AnItem := TreeView1.GetNodeAt(X, Y);
  if (HT - [htOnItem, htOnIcon, htNowhere, htOnIndent] <> HT) then
  begin
    if (htOnItem in HT) or (htOnIcon in HT) then
      AttachMode := naAddChild
    else if htNowhere in HT then AttachMode := naAdd
    else if htOnIndent in HT then AttachMode := naInsert;
    TreeView1.Selected.MoveTo(AnItem, AttachMode);
  end;
end;

procedure TForm1.TreeView1DragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := Source is TTreeView;
end;
```

Arranging the Order of Persistent Columns

90.1.3.2.19 TMaskEdit.EditMask Property

Specifies the mask that represents what text is valid for the masked edit control.

Pascal

```
property EditMask: TEditMask;
```

C++

```
__property TEditMask EditMask;
```

Description

Use EditMask to restrict the characters a user can enter into the masked edit control to valid characters and formats. If the user attempts to enter an invalid character, the edit control does not accept the character. Validation is performed on a character-by-character basis by the ValidateEdit method.

Setting EditMask to an empty string removes the mask.

See Also

EditText (see page 15821)

IsMasked (see page 15822)

MaskState (see page 15822)

Text (see page 15823)

ValidateEdit (see page 15819)

ValidateError (see page 15820)

90.1.3.2.20 TMaskEdit.Enabled Property

Controls whether the control responds to mouse, keyboard, and timer events.

Pascal

```
property Enabled: Boolean;
```

C++

```
__property Boolean Enabled;
```

Description

Use Enabled to change the availability of the control to the user. To disable a control, set Enabled to false. Disabled controls appear dimmed. If Enabled is false, the control ignores mouse, keyboard, and timer events.

To re-enable a control, set Enabled to true. The control is no longer dimmed, and the user can use the control.

See Also

Visible (see page 5847)

DisableControls (see page 6925)

EnableControls (see page 6934)

Enabling Mouse

90.1.3.2.21 TMaskEdit.Font Property

Controls the attributes of text written on or in the control.

Pascal

```
property Font: TFont;
```

C++

```
__property TFont Font;
```

Description

To change to a new font, specify a new TFont object. To modify a font, change the value of the Charset, Color, Height, Name, Pitch, Size, or Style of the TFont object.

C++ Examples:

```
/*
To use this example, place a TComboBox and TRichEdit or
TMemo on a form.  During form creation, a list of font names
is loaded into the combo box. When the combo box is clicked,
the memo or Rich Edit control font is set to the
corresponding font name in the combo box.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < Screen->Fonts->Count; i++)
   ComboBox1->Items->Add(Screen->Fonts->Strings[i]);
//  ComboBox1->Items = Screen->Fonts;  // Another way to do it.
}

void __fastcall TForm1::ComboBox1Change(TObject *Sender)
{
  RichEdit1->Font->Name = ComboBox1->Text;
}
```

Delphi Examples:

```
{
To use this example, place a TComboBox and TRichEdit or
TMemo on a form.  During form creation, a list of font names
is loaded into the combo box. When the combo box is clicked,
the memo or Rich Edit control font is set to the
corresponding font name in the combo box.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  i : Integer;
begin
  for i := 0 to Screen.Fonts.Count - 1 do
   ComboBox1.Items.Add(Screen.Fonts.Strings[i]);
//  ComboBox1.Items := Screen.Fonts;  // Another way to do it.
  RichEdit1.Lines.Text := 'How is it to be you?';
end;

procedure TForm1.ComboBox1Click(Sender: TObject);
begin
  RichEdit1.Font.Name := ComboBox1.Text;
end;
```

Displaying and Editing Text in a Memo Control

90.1.3.2.22 TMaskEdit.ImeMode Property

Determines the behavior of the input method editor (IME).

Pascal

```
property ImeMode: TImeMode;
```

C++

```
__property TImeMode ImeMode;
```

Description

Set ImeMode to configure the way an IME processes user keystrokes. An IME is a front-end input processor for Asian language characters. The IME hooks all keyboard input, converts it to Asian characters in a conversion window, and sends the converted characters or strings on to the application.

ImeMode allows a control to influence the type of conversion performed by the IME so that it is appropriate for the input expected by the control. For example, a control that only accepts numeric input might specify an ImeMode of imClose, as no conversion is necessary for numeric input.

Note: The value of ImeMode only takes effect when the control receives focus. To change the value of ImeMode when the control already has input focus, call the SetIme method.

See Also

ImeName (see page 6208)

ResetIme (see page 6174)

ResetImeComposition (see page 6175)

SetIme (see page 6181)

SetImeCompositionWindow (see page 6181)

90.1.3.2.23 TMaskEdit.ImeName Property

Specifies the input method editor (IME) to use for converting keyboard input to Asian language characters.

Pascal

```
property ImeName: TImeName;
```

C++

```
__property TImeName ImeName;
```

Description

Set ImeName to specify which IME to use for converting keystrokes. An IME is a front-end input processor for Asian language characters. The IME hooks all keyboard input, converts it to Asian characters in a conversion window, and sends the converted characters or strings on to the application.

ImeName must specify one of the IMEs that has been installed through the Windows control panel. The property inspector provides a drop-down list of all currently installed IMEs on the system. At runtime, applications can obtain a list of currently installed IMEs from the global Screen variable.

If ImeName specifies an unavailable IME, the IME that was active when the application started is used instead. No exception is generated.

Note: The value of ImeName only takes effect when the control receives focus. To change the value of ImeName after the control has input focus, call the SetIme method.

See Also

ImeMode (see page 6207)

ResetIme (see page 6174)

SetIme (see page 6181)

DefaultIme (see page 14216)

Imes (see page 14227)

90.1.3.2.24 TMaskEdit.MaxLength Property

Specifies the maximum number of characters that can appear in the edit control.

Pascal

```
property MaxLength: Integer;
```

C++

```
__property int MaxLength;__property int MaxLength;
```

Description

MaxLength is the length of the EditText. Set MaxLength to limit the number of characters that can appear in the edit control when there is no EditMask. If there is an EditMask, MaxLength is implied by the mask itself, and cannot be changed. The EditText contains blank characters for each character that has not been entered, padding the end or beginning of every optional section, so it remains constant in length.

See Also

EditMask (see page 15821)

EditText (see page 15821)

IsMasked (see page 15822)

Text (see page 15823)

90.1.3.2.25 TMaskEdit.ParentBiDiMode Property

Specifies whether the control uses its parent's BiDiMode.

Pascal

```
property ParentBiDiMode: Boolean;
```

C++

```
__property Boolean ParentBiDiMode;
```

Description

Use ParentBiDiMode to get or set whether the control uses its parent's BiDiMode. When ParentBiDiMode is true, the control's BiDiMode property is always equal to that of its parent. If ParentBiDiMode is false, the control uses its own BiDiMode property.

Set ParentBiDiMode to true for all controls in a form in order to ensure that the entire user interface adjusts to Middle Eastern locales in a uniform manner.

When the value of the control's BiDiMode property changes, ParentBiDiMode becomes false automatically.

See Also

Parent (see page 5832)

BiDiMode (see page 5803)

90.1.3.2.26 TMaskEdit.ParentColor Property

Determines where a control looks for its color information.

Pascal

```
property ParentColor: Boolean;
```

C++

```
__property Boolean ParentColor;
```

Description

To have a control use the same color as its parent control, set ParentColor to true. If ParentColor is false, the control uses its own Color property.

Set ParentColor to true for all controls in order to ensure that all the controls on a form have a uniform appearance. For example, if ParentColor is true for all controls in a form, changing the background color of the form to gray causes all the controls on the form to also have a gray background.

When the value of a control's Color property changes, ParentColor becomes false automatically.

See Also

Color (see page 5812)

Parent (see page 5832)

ParentFont (see page 5834)

ParentShowHint (see page 5835)

90.1.3.2.27 TMaskEdit.ParentCtl3D Property

Determines where a component looks to determine if it should appear three dimensional.

Pascal

```
property ParentCtl3D: Boolean;
```

C++

```
__property Boolean ParentCtl3D;
```

Description

ParentCtl3D is provided for backwards compatibility. It has no effect on 32-bit versions of Windows or NT 4.0 and later.

ParentCtl3D determines whether the control uses its parent's Ctl3D property.

See Also

Ctl3D (see page 6198)

90.1.3.2.28 TMaskEdit.ParentFont Property

Determines where a control looks for its font information.

Pascal

```
property ParentFont: Boolean;
```

C++

```
__property Boolean ParentFont;
```

Description

To have a control use the same font as its parent control, set ParentFont to true. If ParentFont is false, the control uses its own Font property. Many controls default ParentFont to true so that all the controls in a form or other container present a uniform appearance. When the value of a control's Font property changes, ParentFont becomes false automatically.

When ParentFont is true for a form, the form uses the default font.

See Also

Font (see page 5823)

Parent (see page 5832)

ParentColor (see page 5834)

ParentShowHint (see page 5835)

90.1.3.2.29 TMaskEdit.ParentShowHint Property

Determines where a control looks to find out if its Help Hint should be shown.

Pascal

```
property ParentShowHint: Boolean;
```

C++

```
__property Boolean ParentShowHint;
```

Description

Use ParentShowHint to ensure that all the controls on a form either uniformly show their Help Hints or uniformly do not show them.

If ParentShowHint is true, the control uses the ShowHint property value of its parent. If ParentShowHint is false, the control uses the value of its own ShowHint property.

To provide Help Hints for only selected controls on a form, set the ShowHint property for those controls that should have Help Hints to true, and ParentShowHint becomes false automatically.

Note: Enable or disable all Help Hints for the entire application using the ShowHint property of the application object.

See Also

Hint (see page 5827)

Parent (see page 5832)

ParentColor (see page 5834)

ParentFont (see page 5834)

ShowHint (see page 5840)

90.1.3.2.30 TMaskEdit.PasswordChar Property

Indicates the character, if any, to display in place of the actual characters typed in the control.

Pascal

```
property PasswordChar: Char;
```

C++

```
__property Char PasswordChar;
```

Description

Use the PasswordChar property to create an edit control that displays a special character in place of any entered text. If PasswordChar is set to the null character (ANSI character zero), the edit control displays its text normally. If PasswordChar is any other character, the edit control displays PasswordChar in place of each character typed. PasswordChar affects the appearance of the edit control only. The value of the Text property reflects the actual characters that are typed.

Text (see page 5842)

90.1.3.2.31 TMaskEdit.PopupMenu Property

Identifies the pop-up menu associated with the control.

Pascal

```
property PopupMenu: TPopupMenu;
```

C++

```
__property TPopupMenu PopupMenu;
```

Description

Assign a value to PopupMenu to make a pop-up menu appear when the user selects the control and clicks the right mouse button. If the TPopupMenu's AutoPopup property is true, the pop-up menu appears automatically. If the menu's AutoPopup property is false, display the menu with a call to its Popup method from the control's OnContextPopup event handler.

C++ Examples:

```
/*
This example uses two edit boxes and one pop-up menu on a form.
The pop-up menu contains Cut, Copy, and Paste commands. This code
makes the pop-up menu available to both edit boxes:
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  PopupMenu1->AutoPopup = true;
  Edit1->PopupMenu = PopupMenu1;
  Edit2->PopupMenu = PopupMenu1;
}

/*
These are the cut, copy, and paste OnClick events for the commands
on the pop-up menu. Double click on the pop-up menu and add three
TMenuItems.  Then set the captions to "Cut", "Copy" and "Paste".
The names will be automatically set to "Cut1", "Copy1", and
"Paste1".  Then double click on the OnClick events and they will
be named "Cut1Click", "Copy1Click" and "Paste1Click" respectively.
Note: only the selected portion of the string in the edit box will
be copied, cut or replaced.
*/
```

```
void __fastcall TForm1::Copy1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
    if (pComponent->ClassNameIs("TEdit"))
      ((TEdit *)pComponent)->CopyToClipboard();
    else
      MessageBeep(0);
  }
  else
    MessageBeep(0);
}

void __fastcall TForm1::Cut1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
    if (pComponent->ClassNameIs("TEdit"))
      ((TEdit *)pComponent)->CutToClipboard();
    else
      MessageBeep(0);
  }
  else
    MessageBeep(0);
}

void __fastcall TForm1::Paste1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
    if (pComponent->ClassNameIs("TEdit"))
      ((TEdit *)pComponent)->PasteFromClipboard();
    else
      MessageBeep(0);
  }
  else
    MessageBeep(0);
}
/*
This example demonstrates how to add and delete menu items
to a popup menu at runtime and assign an event handler to
the OnClick event.  Place a TPopupMenu and three buttons on
the form named "AddButton", "EditButton",  and
"DestroyButton" and add OnClick events to all three buttons.
Put the TPopupMenu in the PopupMenu property of the form.
Place the PopupMenuItemsClick procedure in the TForm1 type
declaration so that it can be used as the method call for
the menu item OnClick event.
*/
void __fastcall TForm1::AddButtonClick(TObject *Sender)
{
    const int num_items = 4;
    for (int index = 0; index < num_items; ++index)
    {
        TMenuItem *NewItem = new TMenuItem(PopupMenu1); // create the new item
        PopupMenu1->Items->Add(NewItem);// add it to the Popupmenu
        NewItem->Caption = "Menu Item " + IntToStr(index);
        NewItem->Tag = index;
        NewItem->OnClick = PopupMenuItemsClick;// assign it an event handler
        TNotifyEvent();
    }
}
```

```
void __fastcall TForm1::PopupMenuItemsClick(TObject *Sender)
{
    TMenuItem *ClickedItem = dynamic_cast<TMenuItem *>(Sender);
    if (ClickedItem)
    {
        switch (ClickedItem->Tag)
        {
            case 0:
            {
                ShowMessage("first item clicked");
                break;
            }
            case 1:
            {
                ShowMessage("second item clicked");
                break;
            }
            case 2:
            {
                ShowMessage("third item clicked");
                break;
            }
            case 3:
            {
                ShowMessage("fourth item clicked");
                break;
            }
        }
    }
}

/*
To edit or destroy an item, grab its pointer via the Items
property.
*/
void __fastcall TForm1::EditButtonClick(TObject *Sender)
{
    const int index = 1;
    TMenuItem *ItemToEdit = PopupMenu->Items->Items[index];
    ItemToEdit->Caption = "Changed Caption";
}

void __fastcall TForm1::DestroyButtonClick(TObject *Sender)
{
    const int index = 2;
    TMenuItem *ItemToDelete = PopupMenu->Items->Items[index];
    delete ItemToDelete;
}
```

Delphi Examples:

```
{
This example uses two edit boxes and one pop-up menu on a form.
The pop-up menu contains Cut, Copy, and Paste commands. This code
makes the pop-up menu available to both edit boxes:
}
procedure TForm1.FormCreate(Sender: TObject);
begin
  PopupMenu1.AutoPopup := True;
  Edit1.PopupMenu := PopupMenu1;
  Edit2.PopupMenu := PopupMenu1;
end;

{
These are the cut, copy, and paste OnClick events for the commands
on the pop-up menu. Double click on the pop-up menu and add three
TMenuItems.  Then set the captions to "Cut", "Copy" and "Paste".
```

```
The names will be automatically set to "Cut1", "Copy1", and
"Paste1".  Then double click on the OnClick events and they will
be named "Cut1Click", "Copy1Click" and "Paste1Click" respectively.
Note: only the selected portion of the string in the edit box will
be copied, cut or replaced.
}
procedure TForm1.Copy1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
   Edit1.CopyToClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.CopyToClipboard
  else
    Beep;
end;

procedure TForm1.Cut1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
    Edit1.CutToClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.CutToClipboard
  else
    Beep;
end;

procedure TForm1.Paste1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
    Edit1.PasteFromClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.PasteFromClipboard
  else
    Beep;
end;
{
This example demonstrates how to add and delete menu items
to a popup menu at runtime and assign an event handler to
the OnClick event.  Place a TPopupMenu and three buttons on
the form named "AddButton", "EditButton",  and
"DestroyButton" and add OnClick events to all three buttons.
Put the TPopupMenu in the PopupMenu property of the form.
Place the PopupMenuItemsClick procedure in the TForm1 type
declaration so that it can be used as the method call for
the menu item OnClick event.
}

90.1.3.2.32 TMaskEdit.ReadOnly Property

Determines whether the user can change the text of the edit control.

Pascal

```
property ReadOnly: Boolean;
```

C++

```
__property Boolean ReadOnly;
```

Description

To restrict the edit control to display only, set the ReadOnly property to true. Set ReadOnly to false to allow the contents of the edit control to be edited.

Setting ReadOnly to true ensures that the text is not altered, while still allowing the user to select text. The selected text can then be manipulated by the application, or copied to the Clipboard.

See Also

CopyToClipboard (see page 21246)

GetSelTextBuf (see page 21253)

90.1.3.2.33 TMaskEdit.ShowHint Property

Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.

Pascal

```
property ShowHint: Boolean;
```

C++

```
__property Boolean ShowHint;
```

Description

The Help Hint is the value of the Hint property, which is displayed in a box just beneath the control. Use ShowHint to determine whether a Help Hint appears for the control.

To enable Help Hint for a particular control, the application ShowHint property must be true and either

the control's own ShowHint property must be true, or

the control's ParentShowHint property must be true and its parent's ShowHint property must be true.

For example, imagine a check box within a group box. If the ShowHint property of the group box is true and the ParentShowHint property of the check box is true, but the ShowHint property of the check box is false, the check box still displays its Help Hint.

Changing the ShowHint value automatically sets the ParentShowHint property to false.

C++ Examples:

```
/*
This example uses an edit box and a list box on a form.
Items are added to the list box and a Help Hint is assigned
to both controls. The last statement enables the Help Hints
for the entire application.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  Edit1->Hint = "Enter your name";
  Edit1->ShowHint = true;
```

```
    char string[10];
    char index[3];
    for(int i = 1; i <= 10; i++)
    {
      strcpy(string, "Item");
      itoa(i, index, 10);
      strcat(string, index);
      ListBox1->Items->Add(string);
    }
    ListBox1->Hint = "Select an item";
    ListBox1->ShowHint = true;
    Application->ShowHint = true;
  }
  /*
  Note: To see an example that displays the hints of controls
  in some place other than in a Help Hint box, see the OnHint
  example.
  */
```

Delphi Examples:

```
{
This example uses an edit box and a list box on a form.
Items are added to the list box and a Help Hint is assigned
to both controls. The last statement enables the Help Hints
for the entire application.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  I: Integer;
begin
  Edit1.Hint := 'Enter your name';
  Edit1.ShowHint := True;
  with ListBox1 do
  begin
    for I := 1 to 10 do
      Items.Add('Item ' + IntToStr(I));
    Hint := 'Select an item';
    ShowHint := True;
  end;
  Application.ShowHint := True;
end;
{
Note: To see an example that displays the hints of controls
in some place other than in a Help Hint box, see the OnHint
example.
}

Displaying Fly-over Help

90.1.3.2.34 TMaskEdit.TabOrder Property

Indicates the position of the control in its parent's tab order.

Pascal

```
property TabOrder: TTabOrder;
```

C++

```
__property TTabOrder TabOrder;
```

Description

TabOrder is the order in which child windows are visited when the user presses the Tab key. The control with the TabOrder value of 0 is the control that has the focus when the form first appears.

Initially, the tab order is always the order in which the controls were added to the form. The first control added to the form has a TabOrder value of 0, the second is 1, the third is 2, and so on. Change this by changing the TabOrder property.

Each control has a unique tab-order value within its parent. If you change the TabOrder property value of one control to be the same as the value of a second control, the TabOrder value for all the other controls changes. For example, suppose a control is sixth in the tab order. If you change the control's TabOrder property value to 3 (making the control fourth in the tab order), the control that was originally fourth in the tab order now becomes fifth, and the control that was fifth becomes sixth.

Assigning TabOrder a value greater than the number of controls contained in the parent control moves the control to the end of the tab order. The control does not take on the assigned value of TabOrder, but instead is given the number that assures the control is the last in the tab order.

Note: TabOrder is meaningful only if the TabStop property is true and if the control has a parent. (The TabOrder property of a form is not used unless the form is the child of another form.) A control with a TabOrder of -1 has no parent, and therefore cannot be reached by pressing the Tab key. To remove a parented control from the Tab order, set its TabStop property to false.

See Also

FindNextControl (see page 6149)

TabStop (see page 6211)

90.1.3.2.35 TMaskEdit.TabStop Property

Determines if the user can tab to a control.

Pascal

```
property TabStop: Boolean;
```

C++

```
__property Boolean TabStop;
```

Description

Use the TabStop to allow or disallow access to the control using the Tab key.

If TabStop is true, the control is in the tab order. If TabStop is false, the control is not in the tab order and the user can't press the Tab key to move to the control.

Note: TabStop is not meaningful for a form unless the form assigns another form to be its parent.

See Also

TabOrder (see page 6211)

90.1.3.2.36 TMaskEdit.Text Property

Denotes the underlying text for the masked edit control before the mask has been applied.

Pascal

```
property Text: TCaption;
```

C++

```
__property TMaskedText Text;__property TCaption Text;
```

Description

Use Text to determine the underlying value of the text before it has been formatted by the mask. Text may differ from the EditText visible in the masked edit control if the mask specifies that literal characters should be removed, if the mask includes spaces, or if the mask includes characters that have not yet been filled in by the user. Text will not contain the blank characters, spaces will not be replaced by _, and literal characters in the mask will be removed if the mask indicates they should be.

When setting Text, the value of the text is formatted using the mask, and the resulting EditText is used to update the window.

If there is no mask, Text is the text that appears in the edit control.

See Also

EditMask (see page 15821)

EditText (see page 15821)

GetTextLen (see page 15816)

IsMasked (see page 15822)

ReformatText (see page 15817)

90.1.3.2.37 TMaskEdit.Visible Property

Determines whether the component appears onscreen.

Pascal

```
property Visible: Boolean;
```

C++

```
__property Boolean Visible;
```

Description

Use the Visible property to control the visibility of the control at runtime. If Visible is true, the control appears. If Visible is false, the control is not visible.

Calling the Show method sets the control's Visible property to true. Calling the Hide method sets it to false.

C++ Examples:

```
/*
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
*/
void __fastcall TForm1::PageControl1Change(TObject *Sender)
{
  CheckBox1->Checked = PageControl1->ActivePage->Visible;
}

void __fastcall TForm1::CheckBox1Click(TObject *Sender)
{
  PageControl1->ActivePage->Visible = CheckBox1->Checked;
}

void __fastcall TForm1::FormCreate(TObject *Sender)
```

```
{
  for (int i = 0; i < 10; i++)
  {
    TTabSheet *pPage = new TTabSheet(this);
    pPage->PageControl = PageControl1;
    pPage->Caption = AnsiString("Page") + IntToStr(i);
    TEdit *pEdit = new TEdit(this);
    pEdit->Parent = pPage;
    pEdit->Left = random(pPage->ClientWidth - pEdit->Width);
    pEdit->Top = random(pPage->ClientHeight - pEdit->Height);
  }
  PageControl1Change(Sender);
}
```

Delphi Examples:

```
{
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
}
procedure TForm1.CheckBox1Click(Sender: TObject);
begin
  PageControl1.ActivePage.Visible := CheckBox1.Checked;
end;

procedure TForm1.PageControl1Change(Sender: TObject);
begin
  CheckBox1.Checked := PageControl1.ActivePage.Visible;
end;

procedure TForm1.FormCreate(Sender: TObject);
var
  i: Integer;
begin
  for i := 0 to 9 do
    with TTabSheet.Create(Self) do
    begin
      PageControl := PageControl1;
      Caption := 'TabSheet' + IntToStr(i);
      with TEdit.Create(Self) do
      begin
        Parent := PageControl1.Pages[i];
        Left := Random(PageControl1.ActivePage.ClientWidth - Width);
        Top := Random(PageControl1.ActivePage.ClientHeight - Height);
      end;
    end;
    PageControl1Change(Sender);
end;
```

90.1.3.3 TMaskEdit Events

The events of the TMaskEdit class are listed here.

Published Events

	Name	Description
	OnChange (see page 15866)	Occurs when the text for the edit control may have changed.
	OnClick (see page 15866)	Occurs when the user clicks the control.
	OnDblClick (see page 15868)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDragDrop (see page 15869)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 15871)	Occurs when the user drags an object over a control.
	OnEndDock (see page 15873)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 15874)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnEnter (see page 15875)	Occurs when a control receives the input focus.
	OnExit (see page 15877)	Occurs when the input focus shifts away from one control to another.
	OnKeyDown (see page 15879)	Occurs when a user presses any key while the control has focus.
	OnKeyPress (see page 15882)	Occurs when a key is pressed.
	OnKeyUp (see page 15883)	Occurs when the user releases a key that has been pressed.
	OnMouseActivate (see page 15884)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 15885)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseEnter (see page 15888)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 15888)	Occurs when the user moves the mouse outside of a control.
	OnMouseMove (see page 15888)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 15890)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnStartDock (see page 15893)	Occurs when the user begins to drag a control with a DragKind of dkDock.
	OnStartDrag (see page 15893)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.

90.1.3.3.1 TMaskEdit.OnChange Event

Occurs when the text for the edit control may have changed.

Pascal

```
property OnChange: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnChange;
```

Description

Write an OnChange event handler to take specific action whenever the text for the edit control may have changed. Use the Modified property to see if a change actually occurred. The Text property of the edit control will already be updated to reflect any changes. This event provides the first opportunity to respond to modifications that the user types into the edit control.

See Also

Change (see page 21245)

Text (see page 5842)

90.1.3.3.2 TMaskEdit.OnClick Event

Occurs when the user clicks the control.

Pascal

```
property OnClick: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnClick;
```

Description

Use the OnClick event handler to respond when the user clicks the control. If the control has an associated action, and that action has an OnExecute method, the action's OnExecute method responds to click events unless it is superseded by an OnClick event handler.

Usually OnClick occurs when the user presses and releases the left mouse button with the mouse pointer over the control. This event can also occur when:

- The user selects an item in a grid, outline, list, or combo box by pressing an arrow key.
- The user presses Spacebar while a button or check box has focus.
- The user presses Enter when the active form has a default button (specified by the Default property).
- The user presses Esc when the active form has a cancel button (specified by the Cancel property).
- The user presses the accelerator key for a button or check box. For example, if the value of the Caption property of a check box is '&Bold', the B is underlined at runtime and the OnClick event of the check box is triggered when the user presses Alt+B. However, focus does not move to the control in these instances.
- The Checked property of a radio button is set to true.
- The value of the Checked property of a check box is changed.
- The Click method of a menu item is called.

For a form, an OnClick event occurs when the user clicks a blank area of the form or on a disabled component.

C++ Examples:

```
/*
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
*/
void __fastcall TForm1::PageControl1Change(TObject *Sender)
{
  CheckBox1->Checked = PageControl1->ActivePage->Visible;
}

void __fastcall TForm1::CheckBox1Click(TObject *Sender)
{
  PageControl1->ActivePage->Visible = CheckBox1->Checked;
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < 10; i++)
  {
    TTabSheet *pPage = new TTabSheet(this);
    pPage->PageControl = PageControl1;
    pPage->Caption = AnsiString("Page") + IntToStr(i);
    TEdit *pEdit = new TEdit(this);
    pEdit->Parent = pPage;
    pEdit->Left = random(pPage->ClientWidth - pEdit->Width);
    pEdit->Top = random(pPage->ClientHeight - pEdit->Height);
  }
  PageControl1Change(Sender);
```

```
}
```

Delphi Examples:

```
{
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
}
procedure TForm1.CheckBox1Click(Sender: TObject);
begin
  PageControl1.ActivePage.Visible := CheckBox1.Checked;
end;

procedure TForm1.PageControl1Change(Sender: TObject);
begin
  CheckBox1.Checked := PageControl1.ActivePage.Visible;
end;

procedure TForm1.FormCreate(Sender: TObject);
var
  i: Integer;
begin
  for i := 0 to 9 do
    with TTabSheet.Create(Self) do
    begin
      PageControl := PageControl1;
      Caption := 'TabSheet' + IntToStr(i);
      with TEdit.Create(Self) do
      begin
        Parent := PageControl1.Pages[i];
        Left := Random(PageControl1.ActivePage.ClientWidth - Width);
        Top := Random(PageControl1.ActivePage.ClientHeight - Height);
      end;
    end;
    PageControl1Change(Sender);
end;
```

90.1.3.3.3 TMaskEdit.OnDblClick Event

Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.

Pascal

```
property OnDblClick: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnDblClick;
```

Description

Use the OnDblClick event to respond to mouse double-clicks.

See Also

OnClick (see page 5851)

Responding to User Actions at Runtime

90.1.3.3.4 TMaskEdit.OnDragDrop Event

Occurs when the user drops an object being dragged.

Pascal

```
property OnDragDrop: TDragDropEvent;
```

C++

```
__property TDragDropEvent OnDragDrop;
```

Description

Use the OnDragDrop event handler to specify what happens when the user drops an object. The Source parameter of the OnDragDrop event is the object being dropped, and the Sender is the control the object is being dropped on. The X and Y parameters are the coordinates of the mouse positioned over the control.

C++ Examples:

```
/*
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
*/

// This OnDragOver event handler permits the list box to
// accept a dropped label:
void __fastcall TForm1::ListBox1DragOver(TObject *Sender, TObject *Source, int X, int Y,
TDragState State, bool &Accept)
{
   Accept = Source->ClassNameIs("TLabel");
}

/*
This OnDragDrop event handler implements the drop behavior.
*/
void __fastcall TForm1::ListBox1DragDrop(TObject *Sender, TObject *Source, int X, int Y)
{
  if (Sender->ClassNameIs("TListBox") && Source->ClassNameIs("TLabel"))
  {
    TListBox *DestList = (TListBox *)Sender;
    DestList->Font = ((TLabel *)Source)->Font;
    DestList->Color = ((TLabel *)Source)->Color;
    DestList->DoubleBuffered = true;
    DestList->Color = clWindow;
  }
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  ListBox1->Items->Add("Not");
  ListBox1->Items->Add("In");
```

```
    ListBox1->Items->Add("Alphabetical");
    ListBox1->Items->Add("Order");

  }
```

Delphi Examples:

```
{
This code is an OnDragOver event handler that won't allow a
label control to be dropped on a panel control and stops the
dragging of the label as soon as the user drags the label
onto the panel:
Note: Set the label's DragMode property to dmAutomatic.
}
procedure TForm1.FormDragDrop(Sender, Source: TObject; X, Y: Integer);
begin
  TForm1(Source).Left := X;
  TForm1(Source).Top := Y;
end;

procedure TForm1.FormDragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := Source is TLabel;
end;

procedure TForm1.Panel1DragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := False;
  if (Source is TLabel) and (State = dsDragEnter) then
    (Source as TLabel).EndDrag(False);
end;
{
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
}

procedure TForm1.FormCreate(Sender: TObject);
begin
  ListBox1.Items.Add('Not');
  ListBox1.Items.Add('In');
  ListBox1.Items.Add('Alphabetical');
  ListBox1.Items.Add('Order');
end;

// This OnDragOver event handler permits the list box to
// accept a dropped label:

procedure TForm1.ListBox1DragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := Source is TLabel;
end;

// This OnDragDrop event handler implements the drop behavior.

procedure TForm1.ListBox1DragDrop(Sender, Source: TObject; X, Y: Integer);
begin
  if (Sender is TListBox) and (Source is TLabel) then
  begin
    with Sender as TListBox do
    begin
```

```
        Font := (Source as TLabel).Font;
        Color := (Source as TLabel).Color;
        DoubleBuffered := true;
        Color := clWindow;
      end;
    end;
  end;
```

90.1.3.3.5 TMaskEdit.OnDragOver Event

Occurs when the user drags an object over a control.

Pascal

```
property OnDragOver: TDragOverEvent;
```

C++

```
__property TDragOverEvent OnDragOver;
```

Description

Use an OnDragOver event to signal that the control can accept a dragged object so the user can drop or dock it.

Within the OnDragOver event handler, change the Accept parameter to false to reject the dragged object. Leave Accept as true to allow the user to drop or dock the dragged object on the control.

To change the shape of the cursor, indicating that the control can accept the dragged object, change the value of the DragCursor property for the control before the OnDragOver event occurs.

The Source is the object being dragged, the Sender is the potential drop or dock site, and X and Y are screen coordinates in pixels. The State parameter specifies how the dragged object is moving over the control.

Note: Within the OnDragOver event handler, the Accept parameter defaults to true. However, if an OnDragOver event handler is not supplied, the control rejects the dragged object, as if the Accept parameter were changed to false.

C++ Examples:

```
/*
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
*/
```

```
// This OnDragOver event handler permits the list box to
// accept a dropped label:
void __fastcall TForm1::ListBox1DragOver(TObject *Sender, TObject *Source, int X, int Y,
TDragState State, bool &Accept)
{
   Accept = Source->ClassNameIs("TLabel");
}

/*
This OnDragDrop event handler implements the drop behavior.
*/
void __fastcall TForm1::ListBox1DragDrop(TObject *Sender, TObject *Source, int X, int Y)
{
  if (Sender->ClassNameIs("TListBox") && Source->ClassNameIs("TLabel"))
  {
    TListBox *DestList = (TListBox *)Sender;
    DestList->Font = ((TLabel *)Source)->Font;
    DestList->Color = ((TLabel *)Source)->Color;
    DestList->DoubleBuffered = true;
    DestList->Color = clWindow;
  }
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  ListBox1->Items->Add("Not");
  ListBox1->Items->Add("In");
  ListBox1->Items->Add("Alphabetical");
  ListBox1->Items->Add("Order");

}
```

Delphi Examples:

```
{
This code is an OnDragOver event handler that won't allow a
label control to be dropped on a panel control and stops the
dragging of the label as soon as the user drags the label
onto the panel:
Note: Set the label's DragMode property to dmAutomatic.
}
procedure TForm1.FormDragDrop(Sender, Source: TObject; X, Y: Integer);
begin
  TForm1(Source).Left := X;
  TForm1(Source).Top := Y;
end;

procedure TForm1.FormDragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := Source is TLabel;
end;

procedure TForm1.Panel1DragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := False;
  if (Source is TLabel) and (State = dsDragEnter) then
    (Source as TLabel).EndDrag(False);
end;
{
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
```

```
}

procedure TForm1.FormCreate(Sender: TObject);
begin
  ListBox1.Items.Add('Not');
  ListBox1.Items.Add('In');
  ListBox1.Items.Add('Alphabetical');
  ListBox1.Items.Add('Order');
end;

// This OnDragOver event handler permits the list box to
// accept a dropped label:

procedure TForm1.ListBox1DragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := Source is TLabel;
end;

// This OnDragDrop event handler implements the drop behavior.

procedure TForm1.ListBox1DragDrop(Sender, Source: TObject; X, Y: Integer);
begin
  if (Sender is TListBox) and (Source is TLabel) then
  begin
    with Sender as TListBox do
    begin
      Font := (Source as TLabel).Font;
      Color := (Source as TLabel).Color;
      DoubleBuffered := true;
      Color := clWindow;
    end;
  end;
end;
```

90.1.3.3.6 TMaskEdit.OnEndDock Event

Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.

Pascal

```
property OnEndDock: TEndDragEvent;
```

C++

```
__property TEndDragEvent OnEndDock;
```

Description

Use OnEndDock to specify actions or special processing that when a drag-and-dock operation stops.

90.1.3.3.7 TMaskEdit.OnEndDrag Event

Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.

Pascal

```
property OnEndDrag: TEndDragEvent;
```

C++

```
__property TEndDragEvent OnEndDrag;
```

Description

Use the OnEndDrag event handler to specify any special processing that occurs when dragging stops.

C++ Examples:

```
/*
This code displays a message in a label named Status. The
message displayed depends on whether the dragged label
control was successfully dropped into and accepted by a
another control.
*/
void __fastcall TForm1::Label1EndDrag(TObject *Sender, TObject *Target, int X,
      int Y)
{
  if (Sender->ClassNameIs("TLabel"))
  {
    AnsiString S = ((TLabel *)Sender)->Name + " was dropped and ";
    if (Target)
      S = S + "accepted!";
    else
      S = S + "rejected.";
    Status->Caption = S;
  }
}
```

Delphi Examples:

```
{
This code displays a message in a label named Status. The
message displayed depends on whether the dragged label
control was successfully dropped into and accepted by a
another control.
}
procedure TForm1.Label1EndDrag(Sender, Target: TObject; X, Y: Integer);
var
  S: string;
begin
  S := (Sender as TLabel).Name + ' was dropped... and ';
  if Target <> nil then
    S := S + 'accepted!'
```

```
    else
      S := S + 'rejected!';
    Status.Caption := S;
  end;
```

90.1.3.3.8 TMaskEdit.OnEnter Event

Occurs when a control receives the input focus.

Pascal

```
property OnEnter: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnEnter;
```

Description

Use the OnEnter event handler to cause any special processing to occur when a control becomes active.

The OnEnter event does not occur when switching between forms or between another application and the application that includes the control.

When switching between controls in separate container controls such as the TPanel and the TGroupBox controls, an OnEnter event occurs for the container before the OnEnter event of the contained control.

Similarly, an OnExit event of the container occurs after the OnExit event of the control in a container when focus moves to another control outside the container.

For example, consider a form with an OK button and a group box that contains three radio buttons, where focus is currently on the OK button. When the user clicks one of the radio buttons, an OnExit event of the button occurs, followed by an OnEnter event on the group box, and finally an OnEnter event on the radio button that was clicked. If the user then clicks on the OK button, an OnExit event for the radio button occurs followed by an OnExit event for the group box, and then the button's OnEnter event occurs.

C++ Examples:

```
/*
This example takes an edit control, a button, and a rich
edit control on a form.  When the user presses the button, a
Font dialog appears.  When the user clicks the Apply (not OK)
button in the Font dialog, the currently selected font is
applied to the active control. Clicking the button sets the
ActiveControl to the button.  That is why we need to save
the ActiveControl in a shared OnEnter procedure.  In the rich
edit, only the text selected converts.
*/
TWinControl *myActiveControl;

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  FontDialog1->Options << fdApplyButton;
  FontDialog1->Execute();
}
```

```
void __fastcall TForm1::FontDialog1Apply(TObject *Sender, HWND Wnd)
{
  if (myActiveControl->ClassNameIs("TEdit"))
   ((TEdit *)myActiveControl)->Font->Assign(FontDialog1->Font);
  else if (myActiveControl->ClassNameIs("TRichEdit"))
    ((TRichEdit *)myActiveControl)->SelAttributes->Assign(FontDialog1->Font);
  else
    MessageBeep(0);
}

void __fastcall TForm1::Edit1Enter(TObject *Sender)
{
  myActiveControl = ActiveControl;
}
/*
This example uses an edit box and a memo control on a form.
When either the edit box or the memo is the active control,
it is colored yellow. When the active control becomes
inactive, the color of the control returns to the Windows
system color for a window.  These event handlers could also
be shared.
*/
void __fastcall TForm1::Edit1Enter(TObject *Sender)
{
  Edit1->Color = clYellow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Edit1Exit(TObject *Sender)
{
  Edit1->Color = clWindow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Memo1Enter(TObject *Sender)
{
  Memo1->Color = clYellow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Memo1Exit(TObject *Sender)
{
  Memo1->Color = clWindow;
}
```

Delphi Examples:

```
{
This example takes an edit control, a button, and a rich
edit control on a form.  When the user presses the button, a
Font dialog appears.  When the user clicks the Apply (not OK)
button in the Font dialog, the currently selected font is
applied to the active control. Clicking the button sets the
ActiveControl to the button.  That is why we need to save
the ActiveControl in a shared OnEnter procedure.  In the rich
edit, only the text selected converts.
}
procedure TForm1.Button1Click(Sender: TObject);
begin
   FontDialog1.Options := FontDialog1.Options + [fdApplyButton];
   FontDialog1.Execute;
end;

procedure TForm1.Edit1Enter(Sender: TObject);
begin
  myActiveControl := ActiveControl;
end;

procedure TForm1.FontDialog1Apply(Sender: TObject; Wnd: HWND);
```

```
begin
  if myActiveControl is TEdit then
    with myActiveControl as TEdit do
       Font.Assign(TFontDialog(Sender).Font)
  else if myActiveControl is TRichEdit then
    with myActiveControl as TRichEdit do
      SelAttributes.Assign(TFontDialog(Sender).Font)
  else
    Beep;
end;
{
This example uses an edit box and a memo control on a form.
When either the edit box or the memo is the active control,
it is colored yellow. When the active control becomes
inactive, the color of the control returns to the Windows
system color for a window.  These event handlers could also
be shared.
}
procedure TForm1.Edit1Enter(Sender: TObject);
begin
  Edit1.Color := clYellow;
end;

procedure TForm1.Edit1Exit(Sender: TObject);
begin
  Edit1.Color := clWindow;
end;

procedure TForm1.Memo1Enter(Sender: TObject);
begin
  Memo1.Color := clYellow;
end;

procedure TForm1.Memo1Exit(Sender: TObject);
begin
  Memo1.Color := clWindow;
end;
```

90.1.3.3.9 TMaskEdit.OnExit Event

Occurs when the input focus shifts away from one control to another.

Pascal

```
property OnExit: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnExit;
```

Description

Use the OnExit event handler to provide special processing when the control ceases to be active.

The OnExit event does not occur when switching between forms or between another application and your application.

When switching between controls in separate container controls such as the TPanel and the TGroupBox controls, an OnExit

event occurs for the control inside the container before the OnExit event of the container.

Similarly, an OnEnter event of the container occurs before the OnEnter event of the control in a container when focus moves to a control inside a container.

For example, consider a form with an OK button and a group box that contains three radio buttons, where focus is currently on the OK button. When the user clicks one of the radio buttons, an OnExit event of the button occurs, followed by an OnEnter event on the group box, and finally an OnEnter event on the radio button that was clicked. If the user then clicks on the OK button, an OnExit event for the radio button occurs followed by an OnExit event for the group box, and then the button's OnEnter event occurs.

Note: In some control classes the ActiveControl property updates before the OnExit event occurs.

C++ Examples:

```
/*
This example uses an edit box and a memo control on a form.
When either the edit box or the memo is the active control,
it is colored yellow. When the active control becomes
inactive, the color of the control returns to the Windows
system color for a window.  These event handlers could also
be shared.
*/
void __fastcall TForm1::Edit1Enter(TObject *Sender)
{
  Edit1->Color = clYellow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Edit1Exit(TObject *Sender)
{
  Edit1->Color = clWindow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Memo1Enter(TObject *Sender)
{
  Memo1->Color = clYellow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Memo1Exit(TObject *Sender)
{
  Memo1->Color = clWindow;
}
```

Delphi Examples:

```
{
This example uses an edit box and a memo control on a form.
When either the edit box or the memo is the active control,
it is colored yellow. When the active control becomes
inactive, the color of the control returns to the Windows
system color for a window.  These event handlers could also
be shared.
}
procedure TForm1.Edit1Enter(Sender: TObject);
begin
  Edit1.Color := clYellow;
end;

procedure TForm1.Edit1Exit(Sender: TObject);
begin
  Edit1.Color := clWindow;
end;

procedure TForm1.Memo1Enter(Sender: TObject);
```

```
begin
  Memo1.Color := clYellow;
end;

procedure TForm1.Memo1Exit(Sender: TObject);
begin
  Memo1.Color := clWindow;
end;
```

OnEnter (see page 6219)

ActiveControl (see page 13896)

90.1.3.3.10 TMaskEdit.OnKeyDown Event

Occurs when a user presses any key while the control has focus.

Pascal

```
property OnKeyDown: TKeyEvent;
```

C++

```
__property TKeyEvent OnKeyDown;
```

Description

Use the OnKeyDown event handler to specify special processing to occur when a key is pressed. The OnKeyDown handler can respond to keyboard keys, including function keys and keys combined with the `Shift`, `Alt`, and `Ctrl` keys, and pressed mouse buttons.

Note: TCheckBox does not fire OnKeyDown events for arrow keys.

The TKeyEvent type points to a method that handles keyboard events.

The Key parameter is the key on the keyboard. For non-alphanumeric keys, use virtual key codes to determine the key pressed. For more information, see Virtual Key codes.

The Shift parameter indicates whether the Shift, Alt, or Ctrl keys are combined with the keystroke.

An application gets Windows WM_KEYDOWN messages for all keys when the user presses a key. These messages indirectly fire the OnKeyDown event. If you set the Key to 0 there you prevent only any further processing of this message. But for keys that generate characters Windows also produces WM_CHAR. At the time your OnKeyDown event fires, the WM_CHAR message for the key will already be in the message queue. Setting Key to 0 does not stop it from being delivered, so it fires the OnKeyPress event. You must set the Key to #0 to prevent the control from intercepting the WM_CHAR message.

This method of organizing key processing has advantages. Code that only deals with characters, including control characters like #13 for carriage return, #3 for Ctrl-C and so on, should go into the OnKeyPress event. Code that deals with keys that do not generate characters should be put into the OnKeyDown event.

C++ Examples:

```
/*
This example changes a form's color to aqua when the user
presses the F1 key, even when a control on the form has the
focus. When the user releases the key, the form returns to
its original color.  Set the KeyPreview on the form to True.
Set the OnKeyDown event to FormKeyDown and set the OnKeyUp
event to FormKeyUp.  Set the KeyPreview on the form to True.
*/
void __fastcall TForm1::FormKeyDown(TObject *Sender, WORD &Key,
      TShiftState Shift)
{
```

```
  if (Key == VK_F1)
  {
    FormColor = Form1->Color;
    Form1->Color = clAqua;
    if (ComboBox1->Text == "KeyDown")
      ComboBox1->Text = "KeyDown2";
    else
      ComboBox1->Text = "KeyDown";
    Form1->Refresh();
    Memo1->Lines->Add(ComboBox1->Text);
  }
}

void __fastcall TForm1::FormKeyUp(TObject *Sender, WORD &Key, TShiftState Shift)
{
  if (Key == VK_F1)
  {
    Form1->Color = FormColor;
    if (ComboBox1->Text == "KeyUp")
      ComboBox1->Text = "KeyUp2";
    else
      ComboBox1->Text = "KeyUp";
    Form1->Refresh();
    Memo1->Lines->Add(ComboBox1->Text);
  }
}
```

Delphi Examples:

```
{
This example changes a form's color to aqua when the user
presses the F1 key, even when a control on the form has the
focus. When the user releases the key, the form returns to
its original color.  Set the KeyPreview on the form to True.
Set the OnKeyDown event to FormKeyDown and set the OnKeyUp
event to FormKeyUp.  Set the KeyPreview on the form to True.
}
var
  FormColor: TColor;
procedure TForm1.FormCreate(Sender: TObject);
begin
  KeyPreview := True;
  FormColor := Form1.Color;
end;

procedure TForm1.FormKeyDown(
  Sender: TObject; var Key: Word; Shift: TShiftState);
begin
  if Key = VK_F1 then
  begin
    Form1.Color := clAqua;
    if (ComboBox1.Text = 'KeyDown') then
      ComboBox1.Text := 'KeyDown2'
    else
      ComboBox1.Text := 'KeyDown';
    WriteLn(ComboBox1.Text);
  end;
end;

procedure TForm1.FormKeyUp(
  Sender: TObject; var Key: Word; Shift: TShiftState);
begin
  if Key = VK_F1 then
  begin
    Form1.Color := FormColor;
    if (ComboBox1.Text = 'KeyUp') then
      ComboBox1.Text := 'KeyUp2'
```

```
      else
        ComboBox1.Text := 'KeyUp';
      WriteLn(ComboBox1.Text);
    end;
  end;
  {
  The following code aborts a print job if the user presses
  Esc. Note that you should set KeyPreview to true to ensure
  that the OnKeyDown event handler of Form1 is called.
  }

  uses Printers;

  procedure TForm1.Button1Click(Sender: TObject);
  var
    I, X, Y: Integer;
    Memo1 : TMemo;
    r: TRect;
  begin
    Memo1 := TMemo.Create(Form1);

90.1.3.3.11 TMaskEdit.OnKeyPress Event

Occurs when a key is pressed.

Pascal

```
property OnKeyPress: TKeyPressEvent;
```

C++

```
__property TKeyPressEvent OnKeyPress;
```

Description

Use the OnKeyPress event handler to make something happen as a result of a single character key press.

The Key parameter in the OnKeyPress event handler is of type Char; therefore, the OnKeyPress event registers the ASCII character of the key pressed. Keys that don't correspond to an ASCII Char value (Shift or F1, for example) don't generate an OnKeyPress event. Key combinations (such as Shift+A), generate only one OnKeyPress event (for this example, Shift+A results in a Key value of "A" if Caps Lock is off). To respond to non-ASCII keys or key combinations, use the OnKeyDown or OnKeyUp event handlers.

An application gets Windows WM_KEYDOWN messages for all keys when the user presses a key. These messages indirectly fire the OnKeyDown event. If you set the Key to 0 there you prevent only any further processing of this message. But for keys that generate characters Windows also produces WM_CHAR. At the time your OnKeyDown event fires, the WM_CHAR message for the key will already be in the message queue. Setting Key to 0 does not stop it from being delivered, so it fires the OnKeyPress event. You must set the Key to #0 to prevent the control from intercepting the WM_CHAR message.

This method of organizing key processing has advantages. Code that only deals with characters, including control characters like #13 for carriage return, #3 for Ctrl-C and so on, should go into the OnKeyPress event. Code that deals with keys that do not generate characters should be put into the OnKeyDown event.

C++ Examples:

```
/*
This event handler displays a message dialog box specifying
which key was pressed:
*/

void __fastcall TForm1::FormKeyPress(TObject *Sender, char &Key)
{
  char keyString[25];
  keyString[0] = Key;
  strcpy(&keyString[1], " Was Pressed");
  TMsgDlgButtons() << mbOK;
  MessageDlg(AnsiString(keyString), TMsgDlgType(mtInformation), TMsgDlgButtons() << mbOK, 0);
}
```

Delphi Examples:

```
{
This event handler displays a message dialog box specifying
which key was pressed:
}
procedure TForm1.FormKeyPress(Sender: TObject; var Key: Char);
begin
  MessageDlg(Key + ' has been pressed', mtInformation, [mbOK], 0)
end;
```

90.1.3.3.12 TMaskEdit.OnKeyUp Event

Occurs when the user releases a key that has been pressed.

Pascal

```
property OnKeyUp: TKeyEvent;
```

C++

```
__property TKeyEvent OnKeyUp;
```

Description

Use the OnKeyUp event handler to provide special processing that occurs when a key is released. The OnKeyUp handler can respond to all keyboard keys, including function keys and keys combined with the Shift, Alt, and Ctrl keys.

The TKeyEvent type points to a method that handles keyboard events. The Key parameter is the key on the keyboard. For non-alphanumeric keys, you must use virtual key codes to determine the key pressed. For more information, see Virtual Key codes.

The Shift parameter indicates whether the Shift, Alt, or Ctrl keys are combined with the keystroke.

C++ Examples:

```
/*
This example changes a form's color to aqua when the user
presses the F1 key, even when a control on the form has the
focus. When the user releases the key, the form returns to
its original color.  Set the KeyPreview on the form to True.
Set the OnKeyDown event to FormKeyDown and set the OnKeyUp
event to FormKeyUp.  Set the KeyPreview on the form to True.
*/
void __fastcall TForm1::FormKeyDown(TObject *Sender, WORD &Key,
      TShiftState Shift)
{
  if (Key == VK_F1)
  {
    FormColor = Form1->Color;
    Form1->Color = clAqua;
    if (ComboBox1->Text == "KeyDown")
      ComboBox1->Text = "KeyDown2";
    else
      ComboBox1->Text = "KeyDown";
    Form1->Refresh();
    Memo1->Lines->Add(ComboBox1->Text);
  }
}

void __fastcall TForm1::FormKeyUp(TObject *Sender, WORD &Key, TShiftState Shift)
{
  if (Key == VK_F1)
  {
    Form1->Color = FormColor;
    if (ComboBox1->Text == "KeyUp")
      ComboBox1->Text = "KeyUp2";
    else
      ComboBox1->Text = "KeyUp";
    Form1->Refresh();
    Memo1->Lines->Add(ComboBox1->Text);
  }
}
```

Delphi Examples:

```
{
This example changes a form's color to aqua when the user
presses the F1 key, even when a control on the form has the
focus. When the user releases the key, the form returns to
its original color.  Set the KeyPreview on the form to True.
Set the OnKeyDown event to FormKeyDown and set the OnKeyUp
event to FormKeyUp.  Set the KeyPreview on the form to True.
}
var
  FormColor: TColor;
procedure TForm1.FormCreate(Sender: TObject);
begin
  KeyPreview := True;
  FormColor := Form1.Color;
end;

procedure TForm1.FormKeyDown(
  Sender: TObject; var Key: Word; Shift: TShiftState);
begin
  if Key = VK_F1 then
  begin
    Form1.Color := clAqua;
    if (ComboBox1.Text = 'KeyDown') then
      ComboBox1.Text := 'KeyDown2'
    else
      ComboBox1.Text := 'KeyDown';
    WriteLn(ComboBox1.Text);
  end;
end;

procedure TForm1.FormKeyUp(
  Sender: TObject; var Key: Word; Shift: TShiftState);
begin
  if Key = VK_F1 then
  begin
    Form1.Color := FormColor;
    if (ComboBox1.Text = 'KeyUp') then
      ComboBox1.Text := 'KeyUp2'
    else
      ComboBox1.Text := 'KeyUp';
    WriteLn(ComboBox1.Text);
  end;
end;

90.1.3.3.13 TMaskEdit.OnMouseActivate Event

Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.

Pascal

```
property OnMouseActivate: TMouseActivateEvent;
```

C++

```
__property TMouseActivateEvent OnMouseActivate;
```

Description

Use the OnMouseActivate event handler to implement any special processing that should occur as a result of pressing a mouse button on a control when the parent top-level form is not active.

The event type is:

```
TMouseActivateEvent = procedure (Sender: TObject; Button: TMouseButton; ShiftState:
TShiftState;
X, Y: Integer; HitTest: Integer; var MouseActivate: TMouseActivate) of object;
```

When you click on a control and the parent top-level form is not active, this event fires on the control that the mouse cursor is over. MouseActivate is a protected virtual function in TControl. MouseActivate can be overridden in custom control descendants to provide special built-in processing of the OnMouseActivate events. If you leave the default value of MouseActivate as maDefault, the parent control fires the OnMouseActivate event and repeats the process all the way up to the top-level form. If no control in the chain sets the value of MouseActivate, the behavior is the same as if a control set TMouseActivate to maActivate. At any point, a control can set the value of TMouseActivate and the parent processing stops.

Some controls set focus to themselves when they get a button down message so, in some cases, setting maNoActivate appears to have no effect. For instance, a TButton control sets focus to itself in the WM_LBUTTONDOWN message regardless of whether or not TMouseActivate is set to maNoActivate. In this case, setting maNoActivateAndEat will work because the top-level form is not activated and the WM_LBUTTONDOWN message is suppressed.

The HitTest parameter is the hit test value obtained from the WM_NCHITTEST message. See Windows.pas for valid values and their meanings. In most cases this value will be HTCLIENT, which means that the user clicked in the client area of a control. However, in the case of a top-level form, this can take other values such as HTCAPTION, or HTBOTTOM. This allows the code to decide which value to set for MouseActivate, based on the HitTest code. For example, the following code in the OnMouseActivate event handler for a TForm forces the user to click into a non-client area to activate the form:

```
if HitTest = HTCLIENT then
    MouseActivate := maNoActivateAndEat;
```

Even though this event is tied to how Windows processes WM_MOUSEACTIVATE, the actual handling of the message is done at the TControl level, which is the point in the VCL hierarchy where the control has no window handle. The OnMouseActivate event is then simulated since the all TControl descendants also have OnMouseDown, OnMouseMove, and OnMouseUp events. This information is applicable to both VCL Win32 and VCL.NET.

90.1.3.3.14 TMaskEdit.OnMouseDown Event

Occurs when the user presses a mouse button with the mouse pointer over a control.

Pascal

```
property OnMouseDown: TMouseEvent;
```

C++

```
__property TMouseEvent OnMouseDown;
```

Description

Use the OnMouseDown event handler to implement any special processing that should occur as a result of pressing a mouse button.

The OnMouseDown event handler can respond to left, right, or center mouse button presses and shift key plus mouse-button combinations. Shift keys are the Shift, Ctrl, and Alt keys. X and Y are the pixel coordinates of the mouse pointer in the client area of the Sender.

C++ Examples:

```
/*
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a
rectangle is drawn on the form. When the mouse button is
released, the rectangle appears on the form’s canvas. Its
top-left and bottom-right corners are defined by the
location of the mouse pointer when the user pressed and
released the mouse button.  While the user drags the mouse,
the location of the top, left, bottom, and right sides of
the rectangle are displayed in the status bar.
*/
int StartX, StartY; // Declare at the top of the form’s unit
// Use this code as the OnMouseDown event handler of the form:
void __fastcall TForm1::FormMouseDown(TObject *Sender, TMouseButton Button, TShiftState Shift,
int X, int Y)
{
  StartX = X;
  StartY = Y;
}

// Use this code as the OnMouseUp event handler of the form:
void __fastcall TForm1::FormMouseUp(TObject *Sender, TMouseButton Button, TShiftState Shift,
int X, int Y)
{
  Form1->Canvas->Rectangle(StartX, StartY, X, Y);
  StatusBar1->Panels->Items[0]->Text = "";
  StatusBar1->Panels->Items[1]->Text = "";
  StatusBar1->Panels->Items[2]->Text = "";
  StatusBar1->Panels->Items[3]->Text = "";
}

// Use this code as the OnMouseMove event handler of the form:
void __fastcall TForm1::FormMouseMove(TObject *Sender, TShiftState Shift, int X, int Y)
{
  if (Shift.Contains(ssLeft)) // make sure button is down
  {
    if (Y > StartY)
    {
      StatusBar1->Panels->Items[0]->Text = "Top: " + IntToStr(StartY);
      StatusBar1->Panels->Items[2]->Text = "Bottom: " + IntToStr(Y);
    }
    else
    {
      StatusBar1->Panels->Items[0]->Text = "Top: " + IntToStr(Y);
      StatusBar1->Panels->Items[2]->Text = "Bottom: " + IntToStr(StartY);
    }
    if (X > StartX)
    {
      StatusBar1->Panels->Items[1]->Text = "Left: " + IntToStr(StartX);
      StatusBar1->Panels->Items[3]->Text = "Right: " + IntToStr(X);

90.1.3.3.15 TMaskEdit.OnMouseEnter Event

Occurs when the user moves the mouse into a control.

Pascal

```
property OnMouseEnter: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnMouseEnter;
```

Description

Use the OnMouseEnter event handler to implement any special processing that should occur as a result of moving the mouse into a control when the parent top-level form is not active.

90.1.3.3.16 TMaskEdit.OnMouseLeave Event

Occurs when the user moves the mouse outside of a control.

Pascal

```
property OnMouseLeave: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnMouseLeave;
```

Description

Use the OnMouseLeave event handler to implement any special processing that should occur as a result of moving the mouse outside of a control when the parent top-level form is not active.

90.1.3.3.17 TMaskEdit.OnMouseMove Event

Occurs when the user moves the mouse pointer while the mouse pointer is over a control.

Pascal

```
property OnMouseMove: TMouseMoveEvent;
```

C++

```
__property TMouseMoveEvent OnMouseMove;
```

Description

Use the OnMouseMove event handler to respond when the mouse pointer moves after the control has captured the mouse.

Use the Shift parameter of the OnMouseDown event handler, to determine to the state of the shift keys and mouse buttons. Shift keys are the Shift, Ctrl, and Alt keys or shift key-mouse button combinations. X and Y are pixel coordinates of the new location of the mouse pointer in the client area of the Sender.

C++ Examples:

```
/*
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a

90.1.3.3.19 TMaskEdit.OnStartDock Event

Occurs when the user begins to drag a control with a DragKind of dkDock.

Pascal

```
property OnStartDock: TStartDockEvent;
```

C++

```
__property TStartDockEvent OnStartDock;
```

Description

Use the OnStartDock event handler to implement special processing when the user starts a drag-and-dock operation by dragging the control.

The OnStartDock event handler can create a TDragDockObjectEx object for the DragObject parameter to specify the appearance of the dragging rectangle and how the dragged control interacts with potential docking sites. If you return TDragDockObjectEx as the drag object, there is no need to call the Free method for the DragObject when dragging is over. If you use TDragDockObject, your application is responsible for freeing the drag object.

If the OnStartDock event handler sets the DragObject parameter to nil (Delphi) or NULL (C++), a TDragDockObject object is automatically created.

Note: This information applies to Win32 applications only.

See Also

OnEndDock (see page 5859)

TDragDockObjectEx (see page 6018)

DragKind (see page 5819)

OnDragOver (see page 5857)

OnDockDrop (see page 6214)

90.1.3.3.20 TMaskEdit.OnStartDrag Event

Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.

Pascal

```
property OnStartDrag: TStartDragEvent;
```

C++

```
__property TStartDragEvent OnStartDrag;
```

Description

Use the OnStartDrag event handler to implement special processing when the user starts to drag the control or an object it contains. OnStartDrag only occurs if DragKind is dkDrag.

Sender is the control that is about to be dragged, or that contains the object about to be dragged.

The OnStartDrag event handler can create a TDragControlObjectEx instance for the DragObject parameter to specify the drag cursor, or, optionally, a drag image list. If you create a TDragControlObjectEx instance, there is no need to call the Free method for the DragObject when dragging is over. If you create, instead, a TDragControlObject instance, your application is responsible for freeing the drag object instance.

If the OnStartDrag event handler sets the DragObject parameter to nil (Delphi) or NULL (C++), a TDragControlObject object is automatically created and dragging begins on the control itself.

Note: On some controls, such as TRichEdit, the underlying Windows control handles internal drag operations. For these controls, there are no OnStartDrag or OnEndDrag events for drag operations within the control.

90.2 Types

The following table lists types in this documentation.

Types

Name	Description
TMaskedState (see page 15895)	TMaskedState is a set of flags that describe the current state of a masked edit control.

90.2.1 Mask.TMaskedState Type

TMaskedState is a set of flags that describe the current state of a masked edit control.

Pascal

```
TMaskedState = set of (msMasked, msReEnter, msDBSetText);
```

C++

```
(msMasked, msReEnter, msDBSetText) TMaskedState;
```

File

Mask

Description

The following table indicates the meaning of the various TMaskedState flags:

Value	Meaning
msMasked	A mask has been assigned. MaskState includes msMasked when IsMasked is true.
msReEnter	An invalid character has been rejected and the next edit should be a valid replacement character.
msDBSetText	The text comes from a database field and should not be validated.

91 Masks Namespace

This is namespace Masks.

Topics

Name	Description
Classes (see page 15898)	The following table lists classes in this documentation.
Functions (see page 15902)	The following table lists functions in this documentation.

Classes

	Name	Description
	EMaskException (see page 15898)	EMaskException is the exception class for errors that occur when comparing a file name to a mask.
	TMask (see page 15898)	TMask allows the comparison of strings containing wildcards to a file mask.

Functions

	Name	Description
	MatchesMask (see page 15902)	Indicates whether a file name conforms to the format specified by a filter string.

91.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	EMaskException (see page 15898)	EMaskException is the exception class for errors that occur when comparing a file name to a mask.
	TMask (see page 15898)	TMask allows the comparison of strings containing wildcards to a file mask.

91.1.1 EMaskException Class

EMaskException is the exception class for errors that occur when comparing a file name to a mask.

Class Hierarchy

System::TObject → SysUtils.Exception → Masks.EMaskException

Pascal

```
EMaskException = class(Exception);
```

C++

```
class EMaskException : public Exception;
```

File

Masks

Description

EMaskException is raised when the TMask (see page 15898) object or the global MatchesMask (see page 15902) function encounters an improperly formed mask string.

See Also

TMask (see page 15898)

MatchesMask (see page 15902)

91.1.2 TMask Class

TMask allows the comparison of strings containing wildcards to a file mask.

Class Hierarchy

Masks.TMask

Pascal

```
TMask = class;
```

C++

```
class TMask;
```

File

Masks

Description

Use TMask to determine if a string matches the format described by a mask. The mask contains literal characters, wildcards that can match any character, and sets that match a single character that is included in the set.

Note: Do not confuse TMask with the EditMask of a field or masked edit object. While both are used for comparing strings to a symbolic description of valid values, the special mask symbols and matching rules are completely different.

See Also

TCustomMaskEdit (see page 15798)

TField (see page 7115)

91.1.2.1 TMask Members

The following tables list the members exposed by TMask.

Public Methods

	Name	Description
	Create (see page 15899)	Creates an instance of TMask (see page 15898) for a given mask.
	Destroy (see page 15900)	Destroys an instance of TMask (see page 15898).
	Matches (see page 15900)	Indicates whether a specified string matches the mask.

91.1.2.2 TMask.Create Constructor

Creates an instance of TMask (see page 15898) for a given mask.

Pascal

```
constructor Create(const MaskValue: string);
```

C++

```
__fastcall TMask(const AnsiString MaskValue);
```

Description

Call Create to create a mask object for comparing strings to the mask given by the MaskValue parameter. A valid mask consists of literal characters, sets, and wildcards.

Each literal character must match a single character in the string. The comparison to literal characters is case-insensitive.

Each set begins with an opening bracket ([) and ends with a closing bracket (]). Between the brackets are the elements of the set. Each element is a literal character or a range. Ranges are specified by an initial value, a dash (-), and a final value. Do not use spaces or commas to separate the elements of the set. A set must match a single character in the string. The character matches the set if it is the same as one of the literal characters in the set, or if it is in one of the ranges in the set. A character is in a range if it matches the initial value, the final value, or falls between the two values. All comparisons are case-insensitive. If the first character after the opening bracket of a set is an exclamation point (!), then the set matches any character that is not in the set.

Wildcards are asterisks (*) or question marks (?). An asterisk matches any number of characters. A question mark matches a

single arbitrary character.

See Also

Matches (see page 15900)

91.1.2.3 TMask.Destroy Destructor

Destroys an instance of TMask (see page 15898).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TMask();
```

Description

Do not call Destroy directly in an application. Instead, call Free. Free checks that the TMask (see page 15898) reference is not nil, and only then calls Destroy.

Destroy frees the memory used to store a parsed image of the mask.

See Also

Free (see page 22300)

91.1.2.4 TMask Methods

The methods of the TMask class are listed here.

Public Methods

	Name	Description
	Matches (see page 15900)	Indicates whether a specified string matches the mask.

91.1.2.4.1 TMask.Matches Method

Indicates whether a specified string matches the mask.

Pascal

```
function Matches(const Filename: string): Boolean;
```

C++

```
__fastcall Boolean Matches(const AnsiString Filename);
```

Description

Call Matches to compare the Filename parameter to the mask that describes valid values. Matches returns true if the string matches the mask. Matches returns false if the string does not match the mask. Matches raises an exception if the mask is syntactically invalid.

The mask is set when the TMask (see page 15898) object is created.

Note: Filename parameter does not need to be a file name. TMask (see page 15898) can be used to check strings against any syntactically correct mask.

See Also

Create (see page 15899)

91.2 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	MatchesMask (see page 15902)	Indicates whether a file name conforms to the format specified by a filter string.

91.2.1 Masks.MatchesMask Function

Indicates whether a file name conforms to the format specified by a filter string.

Pascal

```
function MatchesMask(const Filename: string; const Mask: string): Boolean;
```

C++

```
Boolean MatchesMask(const AnsiString Filename, const AnsiString Mask);
```

File

Masks

Description

Call MatchesMask to check the Filename parameter using the Mask (see page 15797) parameter to describe valid values. A valid mask consists of literal characters, sets, and wildcards.

Each literal character must match a single character in the string. The comparison to literal characters is case-insensitive.

Each set begins with an opening bracket ([) and ends with a closing bracket (]). Between the brackets are the elements of the set. Each element is a literal character or a range. Ranges are specified by an initial value, a dash (-), and a final value. Do not use spaces or commas to separate the elements of the set. A set must match a single character in the string. The character matches the set if it is the same as one of the literal characters in the set, or if it is in one of the ranges in the set. A character is in a range if it matches the initial value, the final value, or falls between the two values. All comparisons are case-insensitive. If the first character after the opening bracket of a set is an exclamation point (!), then the set matches any character that is not in the set.

Wildcards are asterisks (*) or question marks (?). An asterisk matches any number of characters. A question mark matches a single arbitrary character.

MatchesMask returns true if the string matches the mask. MatchesMask returns false if the string does not match the mask. MatchesMask raises an exception if the mask is syntactically invalid.

Note: The Filename parameter does not need to be a file name. MatchesMask can be used to check strings against any syntactically correct mask.

	MaskGetMaskSave (see page 15909)	This is function MaskUtils.MaskGetMaskSave.
	MaskIntlLiteralToChar (see page 15909)	This is function MaskUtils.MaskIntlLiteralToChar.
	MaskOffsetToOffset (see page 15909)	This is function MaskUtils.MaskOffsetToOffset.
	MaskOffsetToWideOffset (see page 15910)	This is function MaskUtils.MaskOffsetToWideOffset.
	OffsetToMaskOffset (see page 15910)	This is function MaskUtils.OffsetToMaskOffset.
	PadInputLiterals (see page 15910)	This is function MaskUtils.PadInputLiterals.

92.1.1 MaskUtils.FormatMaskText Function

Returns a string formatted using an edit mask.

Pascal

```
function FormatMaskText(const EditMask: string; const Value: string): string;
```

C++

```
AnsiString FormatMaskText(const AnsiString EditMask, const AnsiString Value);
```

File

MaskUtils

Description

Call FormatMaskText to apply the mask specified by the EditMask parameter to the text string specified by the Value parameter. The edit mask string consists of three fields with semicolons separating them. The first part of the mask is the mask itself. The second part is the character that determines whether the literal characters of the mask are matched to characters in the Value parameter or are inserted into the Value string. The third part of the mask is the character used to represent missing characters in the mask.

These are the special characters used in the first field of the mask:

Character	Meaning in mask
!	If a ! character appears in the mask, optional characters are represented in the returned string as leading blanks. If a ! character is not present, optional characters are represented in the returned string as trailing blanks.
>	If a > character appears in the mask, all characters that follow are in uppercase until the end of the mask or until a < character is encountered.

<	If a < character appears in the mask, all characters that follow are in lowercase until the end of the mask or until a > character is encountered.
<>	If these two characters appear together in a mask, no case checking is done and the data is formatted with the case present in the Value parameter.
\	The character that follows a \ character is a literal character. Use this character to use any of the mask special characters as a literal.
L	The L character requires an alphabetic character only in this position. For the US, this is A-Z, a-z.
l	The l character permits only an alphabetic character in this position, but doesn't require it.
A	The A character requires an alphanumeric character only in this position. For the US, this is A-Z, a-z, 0-9.
a	The a character permits an alphanumeric character in this position, but doesn't require it.
C	The C character requires an arbitrary character in this position.
c	The c character permits an arbitrary character in this position, but doesn't require it.
0	The 0 character requires a numeric character only in this position.
9	The 9 character permits a numeric character in this position, but doesn't require it.
#	The # character permits a numeric character or a plus or minus sign in this position, but doesn't require it.
:	The : character is used to separate hours, minutes, and seconds in times. If the character that separates hours, minutes, and seconds is different in the regional settings of the Control Panel, that character is substituted in the returned string.
/	The / character is used to separate months, days, and years in dates. If the character that separates months, days, and years is different in the regional settings of the Control Panel, that character is substituted in the returned string.
;	The ; character is used to separate the three fields of the mask.
_	The _ character automatically inserts spaces into the returned string.

Any character that does not appear in the preceding table can appear in the first part of the mask as a literal character. Literal characters are inserted automatically if the second field of the mask is 0, or matched to characters in the Value parameter if the second field is any other value. The special mask characters can also appear as literal characters if preceded by a backslash character (\).

The second field of the mask is a single character that indicates whether literal characters from the mask are included in the Value parameter. For example, the mask for a telephone number with area code could be the following string:

(000)_000-0000;0;*

The 0 in the second field indicates that the Value parameter should consist of the 10 digits of the phone number, rather than the 14 characters that make up the final formatted string.

A 0 in the second field indicates that literals are inserted into the Value string, any other character indicates that they should be included. The character to indicate whether literals should be included can be changed by changing the MaskNoSave (see page 15915) constant that is declared in the MaskUtils (see page 15903) unit.

The third field of the mask is the character that appears in the returned string for blanks (characters that do not appear in Value). By default, this is the same as the character that stands for literal spaces. The two characters appear the same in the returned string.

Note: When working with multibyte character sets, each special mask character represents a single byte. To specify double-byte characters using the L, l, A, a, C, or c specifiers, the mask characters must be doubled as well. For example, LL would represent two single-byte alphabetic characters or a one double-byte character. Only single-byte literal characters are supported.

92.1.2 MaskUtils.IsLiteralChar Function

Pascal

```
function IsLiteralChar(const EditMask: string; Offset: Integer): Boolean;
```

C++

```
Boolean IsLiteralChar(const AnsiString EditMask, int Offset);
```

File

MaskUtils

Description

This is function MaskUtils.IsLiteralChar.

92.1.3 MaskUtils.MaskDoFormatText Function

Pascal

```
function MaskDoFormatText(const EditMask: string; const Value: string; Blank: Char): string;
```

C++

```
AnsiString MaskDoFormatText(const AnsiString EditMask, const AnsiString Value, Char Blank);
```

File

MaskUtils

Description

This is function MaskUtils.MaskDoFormatText.

92.1.4 MaskUtils.MaskGetCharType Function

Pascal

```
function MaskGetCharType(const EditMask: string; MaskOffset: Integer): TMaskCharType;
```

C++

```
TMaskCharType MaskGetCharType(const AnsiString EditMask, int MaskOffset);
```

File

MaskUtils

Description

This is function MaskUtils.MaskGetCharType.

92.1.5 MaskUtils.MaskGetCurrentDirectives Function

Pascal

```
function MaskGetCurrentDirectives(const EditMask: string; MaskOffset: Integer):
TMaskDirectives;
```

C++

```
TMaskDirectives MaskGetCurrentDirectives(const AnsiString EditMask, int MaskOffset);
```

File

MaskUtils

Description

This is function MaskUtils.MaskGetCurrentDirectives.

92.1.6 MaskUtils.MaskGetFldSeparator Function

Pascal

```
function MaskGetFldSeparator(const EditMask: string): Integer;
```

C++

```
int MaskGetFldSeparator(const AnsiString EditMask);
```

File

MaskUtils

Description

This is function MaskUtils.MaskGetFldSeparator.

92.1.7 MaskUtils.MaskGetMaskBlank Function

Pascal

```
function MaskGetMaskBlank(const EditMask: string): Char;
```

C++

```
Char MaskGetMaskBlank(const AnsiString EditMask);
```

File

MaskUtils

Description

This is function MaskUtils.MaskGetMaskBlank.

92.1.8 MaskUtils.MaskGetMaskSave Function

Pascal

```
function MaskGetMaskSave(const EditMask: string): Boolean;
```

C++

```
Boolean MaskGetMaskSave(const AnsiString EditMask);
```

File

MaskUtils

Description

This is function MaskUtils.MaskGetMaskSave.

92.1.9 MaskUtils.MaskIntlLiteralToChar Function

Pascal

```
function MaskIntlLiteralToChar(IChar: Char): Char;
```

C++

```
Char MaskIntlLiteralToChar(Char IChar);
```

File

MaskUtils

Description

This is function MaskUtils.MaskIntlLiteralToChar.

92.1.10 MaskUtils.MaskOffsetToOffset Function

Pascal

```
function MaskOffsetToOffset(const EditMask: String; MaskOffset: Integer): Integer;
```

C++

```
int MaskOffsetToOffset(const AnsiString EditMask, int MaskOffset);
```

File

MaskUtils

Description

This is function MaskUtils.MaskOffsetToOffset.

92.1.11 MaskUtils.MaskOffsetToWideOffset Function

Pascal

```
function MaskOffsetToWideOffset(const EditMask: String; MaskOffset: Integer): Integer;
```

C++

```
int MaskOffsetToWideOffset(const AnsiString EditMask, int MaskOffset);
```

File

MaskUtils

Description

This is function MaskUtils.MaskOffsetToWideOffset.

92.1.12 MaskUtils.OffsetToMaskOffset Function

Pascal

```
function OffsetToMaskOffset(const EditMask: string; Offset: Integer): Integer;
```

C++

```
int OffsetToMaskOffset(const AnsiString EditMask, int Offset);
```

File

MaskUtils

Description

This is function MaskUtils.OffsetToMaskOffset.

92.1.13 MaskUtils.PadInputLiterals Function

Pascal

```
function PadInputLiterals(const EditMask: String; const Value: string; Blank: Char): string;
```

C++

```
AnsiString PadInputLiterals(const AnsiString EditMask, const AnsiString Value, Char Blank);
```

File

MaskUtils

Description

This is function MaskUtils.PadInputLiterals.

92.2 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TMaskCharType (see page 15911)	This is record MaskUtils.TMaskCharType.

92.2.1 MaskUtils.TMaskCharType Enumeration

Pascal

```
TMaskCharType = (
  mcNone,
  mcLiteral,
  mcIntlLiteral,
  mcDirective,
  mcMask,
  mcMaskOpt,
  mcFieldSeparator,
  mcField
);
```

C++

```
enum TMaskCharType {
  mcNone,
  mcLiteral,
  mcIntlLiteral,
  mcDirective,
  mcMask,
  mcMaskOpt,
  mcFieldSeparator,
  mcField
};
```

File

MaskUtils

Description

This is record MaskUtils.TMaskCharType.

92.3 Types

The following table lists types in this documentation.

Types

Name	Description
TEditMask (see page 15912)	Represents the mask that validates and formats user input.
TMaskDirectives (see page 15913)	This is type MaskUtils.TMaskDirectives.
TMaskedText (see page 15914)	TMaskedText is the type for the text that is typed into a masked edit control.

92.3.1 MaskUtils.TEditMask Type

Represents the mask that validates and formats user input.

Pascal

```
TEditMask = type string;
```

C++

```
type string TEditMask;
```

File

MaskUtils

Description

TEditMask is a string that consists of three fields with semicolons separating them. The first part of the mask is the mask itself. The second part is the character that determines whether the literal characters of a mask are saved as part of the data. The third part of the mask is the character used to represent unentered characters in the mask.

These are the special characters used in the first field of the mask:

Character	Meaning in mask
!	If a ! character appears in the mask, optional characters are represented in the text as leading blanks. If a ! character is not present, optional characters are represented in the text as trailing blanks.
>	If a > character appears in the mask, all characters that follow are in uppercase until the end of the mask or until a < character is encountered.
<	If a < character appears in the mask, all characters that follow are in lowercase until the end of the mask or until a > character is encountered.
<>	If these two characters appear together in a mask, no case checking is done and the data is formatted with the case the user uses to enter the data.
\	The character that follows a \ character is a literal character. Use this character to use any of the mask special characters as a literal in the data.
L	The L character requires an alphabetic character only in this position. For the US, this is A-Z, a-z.
l	The l character permits only an alphabetic character in this position, but doesn't require it.
A	The A character requires an alphanumeric character only in this position. For the US, this is A-Z, a-z, 0-9.
a	The a character permits an alphanumeric character in this position, but doesn't require it.

C	The C character requires an arbitrary character in this position.
c	The c character permits an arbitrary character in this position, but doesn't require it.
0	The 0 character requires a numeric character only in this position.
9	The 9 character permits a numeric character in this position, but doesn't require it.
#	The # character permits a numeric character or a plus or minus sign in this position, but doesn't require it.
:	The : character is used to separate hours, minutes, and seconds in times. If the character that separates hours, minutes, and seconds is different in the regional settings of the Control Panel utility on your computer system, that character is used instead.
/	The / character is used to separate months, days, and years in dates. If the character that separates months, days, and years is different in the regional settings of the Control Panel utility on your computer system, that character is used instead.
;	The ; character is used to separate the three fields of the mask.
_	The _ character automatically inserts spaces into the text. When the user enters characters in the field, the cursor skips the _ character.

Any character that does not appear in the preceding table can appear in the first part of the mask as a literal character. Literal characters must be matched exactly in the edit control. They are inserted automatically, and the cursor skips over them during editing. The special mask characters can also appear as literal characters if preceded by a backslash character (\).

The second field of the mask is a single character that indicates whether literal characters from the mask should be included as part of the text for the edit control. For example, the mask for a telephone number with area code could be the following string:

(000)_000-0000;0;*

The 0 in the second field indicates that the Text property for the edit control would consist of the 10 digits that were entered, rather than the 14 characters that make up the telephone number as it appears in the edit control.

A 0 in the second field indicates that literals should not be included, any other character indicates that they should be included. The character that indicates whether literals should be included can be changed in the Edit Mask (see page 15797) property editor, or programmatically by changing the MaskNoSave (see page 15915) typed constant.

The third field of the mask is the character that appears in the edit control for blanks (characters that have not been entered). By default, this is the same as the character that stands for literal spaces. The two characters appear the same in an edit window. However, when a user edits the text in a masked edit control, the cursor selects each blank character in turn, and skips over the space character.

Note: When working with multibyte character sets, each special mask character represents a single byte. To specify multi-byte characters using the L, l, A, a, C, or c specifiers, the mask characters must be duplicated as well. For example, LL would represent two single-byte alphabetic characters or a one double-byte character. Only single-byte literal characters are supported.

92.3.2 MaskUtils.TMaskDirectives Type

Pascal

```
TMaskDirectives = set of (mdReverseDir, mdUpperCase, mdLowerCase, mdLiteralChar);
```

C++

```
(mdReverseDir, mdUpperCase, mdLowerCase, mdLiteralChar) TMaskDirectives;
```

File

MaskUtils

Description

This is type MaskUtils.TMaskDirectives.

92.3.3 MaskUtils.TMaskedText Type

TMaskedText is the type for the text that is typed into a masked edit control.

Pascal

```
TMaskedText = type string;
```

C++

```
type string TMaskedText;
```

File

MaskUtils

Description

TMaskedText is the value of a masked edit control's text before the mask is applied.

92.4 Variables

The following table lists variables in this documentation.

Variables

Name	Description
DefaultBlank (see page 15915)	This is variable MaskUtils.DefaultBlank.
MaskFieldSeparator (see page 15915)	This is variable MaskUtils.MaskFieldSeparator.
MaskNoSave (see page 15915)	This is variable MaskUtils.MaskNoSave.

92.4.1 MaskUtils.DefaultBlank Variable

Pascal

```
DefaultBlank: Char = '_';
```

C++

```
Char DefaultBlank = '_';
```

File

MaskUtils

Description

This is variable MaskUtils.DefaultBlank.

92.4.2 MaskUtils.MaskFieldSeparator Variable

Pascal

```
MaskFieldSeparator: Char = ';';
```

C++

```
Char MaskFieldSeparator = ';';
```

File

MaskUtils

Description

This is variable MaskUtils.MaskFieldSeparator.

92.4.3 MaskUtils.MaskNoSave Variable

Pascal

```
MaskNoSave: Char = '0';
```

C++

```
Char MaskNoSave = '0';
```

File

MaskUtils

Description

This is variable MaskUtils.MaskNoSave.

92.5 Constants

The following table lists constants in this documentation.

Constants

Name	Description
mDirLiteral (see page 15917)	This is constant MaskUtils.mDirLiteral.
mDirLowerCase (see page 15917)	This is constant MaskUtils.mDirLowerCase.
mDirReverse (see page 15918)	This is constant MaskUtils.mDirReverse.
mDirUpperCase (see page 15918)	This is constant MaskUtils.mDirUpperCase.
mMskAlpha (see page 15918)	This is constant MaskUtils.mMskAlpha.
mMskAlphaNum (see page 15919)	This is constant MaskUtils.mMskAlphaNum.
mMskAlphaNumOpt (see page 15919)	This is constant MaskUtils.mMskAlphaNumOpt.
mMskAlphaOpt (see page 15919)	This is constant MaskUtils.mMskAlphaOpt.
mMskAscii (see page 15920)	This is constant MaskUtils.mMskAscii.
mMskAsciiOpt (see page 15920)	This is constant MaskUtils.mMskAsciiOpt.
mMskDateSeparator (see page 15920)	This is constant MaskUtils.mMskDateSeparator.
mMskNumeric (see page 15921)	This is constant MaskUtils.mMskNumeric.
mMskNumericOpt (see page 15921)	This is constant MaskUtils.mMskNumericOpt.
mMskNumSymOpt (see page 15921)	This is constant MaskUtils.mMskNumSymOpt.
mMskTimeSeparator (see page 15922)	This is constant MaskUtils.mMskTimeSeparator.

92.5.1 MaskUtils.mDirLiteral Constant

Pascal

```
mDirLiteral = '\';
```

C++

```
mDirLiteral = '\';
```

File

MaskUtils

Description

This is constant MaskUtils.mDirLiteral.

92.5.2 MaskUtils.mDirLowerCase Constant

Pascal

```
mDirLowerCase = '<';
```

C++

```
mDirLowerCase = '<';
```

File

MaskUtils

Description

This is constant MaskUtils.mDirLowerCase.

92.5.3 MaskUtils.mDirReverse Constant

Pascal

```
mDirReverse = '!';
```

C++

```
mDirReverse = '!';
```

File

MaskUtils

Description

This is constant MaskUtils.mDirReverse.

92.5.4 MaskUtils.mDirUpperCase Constant

Pascal

```
mDirUpperCase = '>';
```

C++

```
mDirUpperCase = '>';
```

File

MaskUtils

Description

This is constant MaskUtils.mDirUpperCase.

92.5.5 MaskUtils.mMskAlpha Constant

Pascal

```
mMskAlpha = 'L';
```

C++

```
mMskAlpha = 'L';
```

File

MaskUtils

Description

This is constant MaskUtils.mMskAlpha.

92.5.6 MaskUtils.mMskAlphaNum Constant

Pascal

```
mMskAlphaNum = 'A';
```

C++

```
mMskAlphaNum = 'A';
```

File

MaskUtils

Description

This is constant MaskUtils.mMskAlphaNum.

92.5.7 MaskUtils.mMskAlphaNumOpt Constant

Pascal

```
mMskAlphaNumOpt = 'a';
```

C++

```
mMskAlphaNumOpt = 'a';
```

File

MaskUtils

Description

This is constant MaskUtils.mMskAlphaNumOpt.

92.5.8 MaskUtils.mMskAlphaOpt Constant

Pascal

```
mMskAlphaOpt = 'l';
```

C++

```
mMskAlphaOpt = 'l';
```

File

MaskUtils

Description

This is constant MaskUtils.mMskAlphaOpt.

92.5.9 MaskUtils.mMskAscii Constant

Pascal

```
mMskAscii = 'C';
```

C++

```
mMskAscii = 'C';
```

File

MaskUtils

Description

This is constant MaskUtils.mMskAscii.

92.5.10 MaskUtils.mMskAsciiOpt Constant

Pascal

```
mMskAsciiOpt = 'c';
```

C++

```
mMskAsciiOpt = 'c';
```

File

MaskUtils

Description

This is constant MaskUtils.mMskAsciiOpt.

92.5.11 MaskUtils.mMskDateSeparator Constant

Pascal

```
mMskDateSeparator = '/';
```

C++

```
mMskDateSeparator = '/';
```

File

MaskUtils

Description

This is constant MaskUtils.mMskDateSeparator.

92.5.12 MaskUtils.mMskNumeric Constant

Pascal

```
mMskNumeric = '0';
```

C++

```
mMskNumeric = '0';
```

File

MaskUtils

Description

This is constant MaskUtils.mMskNumeric.

92.5.13 MaskUtils.mMskNumericOpt Constant

Pascal

```
mMskNumericOpt = '9';
```

C++

```
mMskNumericOpt = '9';
```

File

MaskUtils

Description

This is constant MaskUtils.mMskNumericOpt.

92.5.14 MaskUtils.mMskNumSymOpt Constant

Pascal

```
mMskNumSymOpt = '#';
```

C++

```
mMskNumSymOpt = '#';
```

File

MaskUtils

Description

This is constant MaskUtils.mMskNumSymOpt.

92.5.15 MaskUtils.mMskTimeSeparator Constant

Pascal

```
mMskTimeSeparator = ':';
```

C++

```
mMskTimeSeparator = ':';
```

File

MaskUtils

Description

This is constant MaskUtils.mMskTimeSeparator.

93 Math Namespace

This is namespace Math.

Topics

Name	Description
Classes (see page 15927)	The following table lists classes in this documentation.
Functions (see page 15929)	The following table lists functions in this documentation.
Structs, Records, Enums (see page 15981)	The following table lists structs, records, enums in this documentation.
Types (see page 15985)	The following table lists types in this documentation.
Constants (see page 15988)	The following table lists constants in this documentation.

Classes

	Name	Description
	EInvalidArgument (see page 15927)	EInvalidArgument is the exception class for out-of-range parameters in specialized math and accounting functions.

Constants

Name	Description
Infinity (see page 15988)	Infinity represents positive infinity.
MaxComp (see page 15989)	MaxComp defines the maximum absolute value for a Comp variable.
MaxDouble (see page 15989)	MaxDouble defines the maximum absolute value for a Double variable.
MaxExtended (see page 15989)	MaxExtended defines the maximum absolute value for an Extended variable.
MaxSingle (see page 15990)	MaxSingle defines the maximum absolute value for a Single variable.
MinComp (see page 15990)	MinComp defines the smallest absolute value for a Comp variable.
MinDouble (see page 15991)	MinDouble defines the smallest absolute value for a Double variable.
MinExtended (see page 15991)	MinExtended defines the smallest absolute value for an Extended variable.
MinSingle (see page 15991)	MinSingle defines the smallest absolute value for a Single variable.
NaN (see page 15992)	NaN represents a value that cannot be represented as a valid number.
NegativeValue (see page 15992)	NegativeValue defines a negative number result from using Sign (see page 15973).
NegInfinity (see page 15993)	NegInfinity represents negative infinity.
PositiveValue (see page 15993)	PositiveValue defines a positive number result from using Sign (see page 15973).
ZeroValue (see page 15994)	ZeroValue defines a zero value number result from using Sign (see page 15973).

Functions

	Name	Description
	ArcCos (see page 15931)	Calculates the inverse cosine of a given number.
	ArcCos (see page 15931)	Calculates the inverse cosine of a given number.
	ArcCos (see page 15931)	Calculates the inverse cosine of a given number.
	ArcCosh (see page 15932)	Calculates the inverse hyperbolic cosine of a given number.
	ArcCot (see page 15932)	Calculates the inverse cotangent of a given number.
	ArcCotH (see page 15933)	Calculates the inverse hyperbolic cotangent of a given number.
	ArcCsc (see page 15933)	Calculates the inverse cosecant of a given number.
	ArcCscH (see page 15934)	Calculates the inverse hyperbolic cosecant of a given number.
	ArcSec (see page 15934)	Calculates the inverse secant of a given number.
	ArcSecH (see page 15934)	Calculates the inverse hyperbolic secant of a given number.
	ArcSin (see page 15935)	Calculates the inverse sine of a given number.
	ArcSin (see page 15935)	Calculates the inverse sine of a given number.
	ArcSin (see page 15935)	Calculates the inverse sine of a given number.
	ArcSinh (see page 15935)	Calculates the inverse hyperbolic sine of a given number.
	ArcTan2 (see page 15936)	Calculates the arctangent angle and quadrant of a given number.
	ArcTanh (see page 15936)	Calculates the inverse hyperbolic tangent of a given number.
	Ceil (see page 15937)	Rounds variables up toward positive infinity.
	ClearExceptions (see page 15937)	Clears exception bits in FPU status word.
	CompareValue (see page 15938)	Returns the relationship between two numeric values.
	CompareValue (see page 15938)	Returns the relationship between two numeric values.
	CompareValue (see page 15938)	Returns the relationship between two numeric values.
	CompareValue (see page 15938)	Returns the relationship between two numeric values.
	CompareValue (see page 15938)	Returns the relationship between two numeric values.
	Cosecant (see page 15938)	Returns the cosecant of an angle.
	Cosh (see page 15939)	Calculates the hyperbolic cosine of an angle.
	Cot (see page 15939)	Calculates the cotangent of an angle.
	Cotan (see page 15940)	Calculates the cotangent of an angle.
	CotH (see page 15940)	Calculates the hyperbolic cotangent of an angle.
	Csc (see page 15941)	Returns the cosecant of an angle.
	CscH (see page 15941)	Returns the hyperbolic cosecant of an angle.
	CycleToDeg (see page 15942)	Converts an angle measurement from cycles to degrees.
	CycleToGrad (see page 15942)	Converts an angle measurement from cycles to grads.
	CycleToRad (see page 15942)	Converts an angle measurement from cycles to radians.
	DegToCycle (see page 15943)	Returns the value of a degree measurement expressed in cycles.
	DegToGrad (see page 15943)	Returns the value of a degree measurement expressed in grads.
	DegToRad (see page 15944)	Returns the value of a degree measurement expressed in radians.
	DivMod (see page 15944)	Returns the result of an integer division, including the remainder.
	DoubleDecliningBalance (see page 15944)	Calculates the depreciation of an asset using the double-declining balance method.
	EnsureRange (see page 15945)	Returns the closest value to a specified value within a specified range.
	EnsureRange (see page 15945)	Returns the closest value to a specified value within a specified range.
	EnsureRange (see page 15945)	Returns the closest value to a specified value within a specified range.
	Floor (see page 15945)	Rounds variables toward negative infinity.
	Frexp (see page 15946)	Separates the Mantissa and Exponent of X
	FutureValue (see page 15946)	Calculates the future value of an investment.
	GetExceptionMask (see page 15947)	Returns the exception mask from the FPU control word.
	GetPrecisionMode (see page 15947)	Returns the FPU precision control mode.
	GetRoundMode (see page 15948)	Returns the FPU rounding mode.
	GradToCycle (see page 15949)	Converts grad measurements to cycles.
	GradToDeg (see page 15949)	Converts grad measurements to degrees.
	GradToRad (see page 15949)	Converts grad measurements to radians.
	Hypot (see page 15950)	Calculates the length of the hypotenuse.

	IfThen (see page 15950)	Conditionally returns one of two specified values.
	IfThen (see page 15950)	Conditionally returns one of two specified values.
	IfThen (see page 15950)	Conditionally returns one of two specified values.
	InRange (see page 15950)	Indicates whether a value falls within a specified range.
	InRange (see page 15950)	Indicates whether a value falls within a specified range.
	InRange (see page 15950)	Indicates whether a value falls within a specified range.
	InterestPayment (see page 15951)	Calculates the interest portion of a loan payment.
	InterestRate (see page 15952)	Returns the interest rate required to increase PresentValue (see page 15965) to FutureValue (see page 15946).
	InternalRateOfReturn (see page 15952)	Calculates the internal rate of return for an investment.
	IntPower (see page 15953)	Calculates the integral power of a base value.
	IsInfinite (see page 15953)	Indicates when a variable or expression represents an infinite value.
	IsNan (see page 15954)	Indicates when a variable or expression does not evaluate to a numeric value.
	IsNan (see page 15954)	Indicates when a variable or expression does not evaluate to a numeric value.
	IsNan (see page 15954)	Indicates when a variable or expression does not evaluate to a numeric value.
	IsZero (see page 15954)	Indicates when a floating-point variable or expression evaluates to zero, or very close to zero.
	IsZero (see page 15954)	Indicates when a floating-point variable or expression evaluates to zero, or very close to zero.
	IsZero (see page 15954)	Indicates when a floating-point variable or expression evaluates to zero, or very close to zero.
	Ldexp (see page 15955)	Calculates X times (2 to the power of P).
	LnXP1 (see page 15955)	Returns the natural log of (X+1)
	Log10 (see page 15955)	Calculates log base 10.
	Log2 (see page 15956)	Calculates log base 2.
	LogN (see page 15956)	Calculates the log of X for a specified base.
	Max (see page 15957)	Returns the greater of two numeric values (Delphi only).
	Max (see page 15957)	Returns the greater of two numeric values (Delphi only).
	Max (see page 15957)	Returns the greater of two numeric values (Delphi only).
	Max (see page 15957)	Returns the greater of two numeric values (Delphi only).
	Max (see page 15957)	Returns the greater of two numeric values (Delphi only).
	MaxIntValue (see page 15957)	Returns the largest signed value in an integer array.
	MaxValue (see page 15958)	Returns the largest signed value in an array.
	Mean (see page 15958)	Returns the average of all values in an array.
	MeanAndStdDev (see page 15959)	Calculates the mean and standard deviation of array elements.
	Min (see page 15959)	Returns the lesser of two numeric values (Delphi only).
	Min (see page 15959)	Returns the lesser of two numeric values (Delphi only).
	Min (see page 15959)	Returns the lesser of two numeric values (Delphi only).
	Min (see page 15959)	Returns the lesser of two numeric values (Delphi only).
	Min (see page 15959)	Returns the lesser of two numeric values (Delphi only).
	MinIntValue (see page 15960)	Returns the smallest signed value in an integer array.
	MinValue (see page 15960)	Returns smallest signed value in an array.
	MomentSkewKurtosis (see page 15961)	Calculates the mean, variance, skew, and kurtosis.
	NetPresentValue (see page 15961)	Calculates the current value from an array of estimated cash flow values.
	Norm (see page 15962)	Returns the Euclidean 'L-2' norm.
	NumberOfPeriods (see page 15962)	Returns the number of payment periods for an investment.
	Payment (see page 15963)	Calculates a fully amortized payment.
	PeriodPayment (see page 15963)	Returns the principal amount from a full payment.
	Poly (see page 15963)	Evaluates a uniform polynomial of one variable at the value X.
	PopnStdDev (see page 15964)	Calculates the population standard deviation.
	PopnVariance (see page 15964)	Calculates the population variance.
	Power (see page 15965)	Raises Base to any power.
	Power (see page 15965)	Raises Base to any power.
	Power (see page 15965)	Raises Base to any power.
	PresentValue (see page 15965)	Calculates the present value of an investment.
	RadToCycle (see page 15966)	Converts radians to cycles.

	RadToDeg (see page 15966)	Converts radians to degrees.
	RadToGrad (see page 15966)	Converts radians to grads.
	RandG (see page 15967)	Generates random numbers with Gaussian distribution.
	RandomFrom (see page 15967)	Returns a randomly selected element from an array.
	RandomFrom (see page 15967)	Returns a randomly selected element from an array.
	RandomFrom (see page 15967)	Returns a randomly selected element from an array.
	RandomRange (see page 15968)	Returns a random integer from a specified range.
	RoundTo (see page 15968)	Rounds a floating-point value to a specified digit or power of ten using "Banker's rounding".
	SameValue (see page 15969)	Indicates whether two floating-point values are (approximately) equal.
	SameValue (see page 15969)	Indicates whether two floating-point values are (approximately) equal.
	SameValue (see page 15969)	Indicates whether two floating-point values are (approximately) equal.
	Sec (see page 15970)	Calculates the secant of an angle.
	Secant (see page 15970)	Calculates the secant of an angle.
	SecH (see page 15971)	Calculates the hyperbolic secant of an angle.
	SetExceptionMask (see page 15971)	Sets the exception mask on the FPU control word.
	SetPrecisionMode (see page 15972)	Sets the FPU precision control mode.
	SetRoundMode (see page 15972)	Sets the FPU rounding mode.
	Sign (see page 15973)	Indicates whether a numeric value is positive, negative, or zero.
	Sign (see page 15973)	Indicates whether a numeric value is positive, negative, or zero.
	Sign (see page 15973)	Indicates whether a numeric value is positive, negative, or zero.
	SimpleRoundTo (see page 15973)	Rounds a floating-point value to a specified digit or power of ten using asymmetric arithmetic rounding.
	SinCos (see page 15974)	Returns sine and cosine of an angle.
	Sinh (see page 15974)	Returns the hyperbolic sine of an angle.
	SLNDepreciation (see page 15975)	Returns the straight-line depreciation allowance of an asset.
	StdDev (see page 15975)	Returns the sample standard deviation for elements in an array.
	Sum (see page 15976)	Returns the sum of the elements in an array.
	SumInt (see page 15976)	Returns the sum of the elements in an integer array.
	SumOfSquares (see page 15977)	Returns the sum of the squared values from a data array.
	SumsAndSquares (see page 15977)	Returns the sum of the values and the sum of the squared values in an array.
	SYDDepreciation (see page 15978)	Calculates depreciation for an asset.
	Tan (see page 15978)	Returns the tangent of X.
	Tanh (see page 15979)	Returns the hyperbolic tangent of X.
	TotalVariance (see page 15979)	Returns the statistical variance from an array of values.
	Variance (see page 15980)	Calculates statistical sample variance from an array of data.

Structs, Records, Enums

	Name	Description
	TFPUException (see page 15981)	TFPUException defines TFPUExceptionMask (see page 15985) values.
	TFPUPrecisionMode (see page 15982)	TFPUPrecisionMode defines how the FPU handles precision.
	TFPURoundingMode (see page 15983)	TFPURoundingMode defines how the FPU handles rounding issues.
	TPaymentTime (see page 15984)	TPaymentTime is an enumerated type used as a parameter in financial functions.

Types

Name	Description
TFPUExceptionMask (see page 15985)	TFPUExceptionMask defines a set of TFPUException (see page 15981) values.
TRoundToRange (see page 15986)	TRoundToRange defines the RoundTo (see page 15968) rounding limits.
TValueSign (see page 15986)	TValueSign defines the Sign (see page 15973) returned value.

93.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	EInvalidArgument (see page 15927)	EInvalidArgument is the exception class for out-of-range parameters in specialized math and accounting functions.

93.1.1 EInvalidArgument Class

EInvalidArgument is the exception class for out-of-range parameters in specialized math and accounting functions.

Class Hierarchy

System::TObject → SysUtils.Exception → SysUtils.EExternal → SysUtils.EMathError → Math.EInvalidArgument

Pascal

```
EInvalidArgument = class(EMathError);
```

C++

```
class EInvalidArgument : public EMathError;
```

File

Math

Description

EInvalidArgument is raised by some functions in the Math (see page 15923) unit (mostly financial functions) when one of the parameters is out of range or makes the calculation impossible.

Note: On Windows, because EInvalidArgument descends (indirectly) from EExternal, it saves the Windows exception record (if there is one) in its ExceptionRecord data structure.

See Also

EExternal (see page 22727)

DoubleDecliningBalance (see page 15944)

93.2 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	ArcCos (see page 15931)	Calculates the inverse cosine of a given number.
	ArcCos (see page 15931)	Calculates the inverse cosine of a given number.
	ArcCos (see page 15931)	Calculates the inverse cosine of a given number.
	ArcCosh (see page 15932)	Calculates the inverse hyperbolic cosine of a given number.
	ArcCot (see page 15932)	Calculates the inverse cotangent of a given number.
	ArcCotH (see page 15933)	Calculates the inverse hyperbolic cotangent of a given number.
	ArcCsc (see page 15933)	Calculates the inverse cosecant of a given number.
	ArcCscH (see page 15934)	Calculates the inverse hyperbolic cosecant of a given number.
	ArcSec (see page 15934)	Calculates the inverse secant of a given number.
	ArcSecH (see page 15934)	Calculates the inverse hyperbolic secant of a given number.
	ArcSin (see page 15935)	Calculates the inverse sine of a given number.
	ArcSin (see page 15935)	Calculates the inverse sine of a given number.
	ArcSin (see page 15935)	Calculates the inverse sine of a given number.
	ArcSinh (see page 15935)	Calculates the inverse hyperbolic sine of a given number.
	ArcTan2 (see page 15936)	Calculates the arctangent angle and quadrant of a given number.
	ArcTanh (see page 15936)	Calculates the inverse hyperbolic tangent of a given number.
	Ceil (see page 15937)	Rounds variables up toward positive infinity.
	ClearExceptions (see page 15937)	Clears exception bits in FPU status word.
	CompareValue (see page 15938)	Returns the relationship between two numeric values.
	CompareValue (see page 15938)	Returns the relationship between two numeric values.
	CompareValue (see page 15938)	Returns the relationship between two numeric values.
	CompareValue (see page 15938)	Returns the relationship between two numeric values.
	CompareValue (see page 15938)	Returns the relationship between two numeric values.
	Cosecant (see page 15938)	Returns the cosecant of an angle.
	Cosh (see page 15939)	Calculates the hyperbolic cosine of an angle.
	Cot (see page 15939)	Calculates the cotangent of an angle.
	Cotan (see page 15940)	Calculates the cotangent of an angle.
	CotH (see page 15940)	Calculates the hyperbolic cotangent of an angle.
	Csc (see page 15941)	Returns the cosecant of an angle.
	CscH (see page 15941)	Returns the hyperbolic cosecant of an angle.
	CycleToDeg (see page 15942)	Converts an angle measurement from cycles to degrees.
	CycleToGrad (see page 15942)	Converts an angle measurement from cycles to grads.
	CycleToRad (see page 15942)	Converts an angle measurement from cycles to radians.
	DegToCycle (see page 15943)	Returns the value of a degree measurement expressed in cycles.
	DegToGrad (see page 15943)	Returns the value of a degree measurement expressed in grads.
	DegToRad (see page 15944)	Returns the value of a degree measurement expressed in radians.
	DivMod (see page 15944)	Returns the result of an integer division, including the remainder.
	DoubleDecliningBalance (see page 15944)	Calculates the depreciation of an asset using the double-declining balance method.
	EnsureRange (see page 15945)	Returns the closest value to a specified value within a specified range.
	EnsureRange (see page 15945)	Returns the closest value to a specified value within a specified range.
	EnsureRange (see page 15945)	Returns the closest value to a specified value within a specified range.
	Floor (see page 15945)	Rounds variables toward negative infinity.
	Frexp (see page 15946)	Separates the Mantissa and Exponent of X
	FutureValue (see page 15946)	Calculates the future value of an investment.

	GetExceptionMask (see page 15947)	Returns the exception mask from the FPU control word.
	GetPrecisionMode (see page 15947)	Returns the FPU precision control mode.
	GetRoundMode (see page 15948)	Returns the FPU rounding mode.
	GradToCycle (see page 15949)	Converts grad measurements to cycles.
	GradToDeg (see page 15949)	Converts grad measurements to degrees.
	GradToRad (see page 15949)	Converts grad measurements to radians.
	Hypot (see page 15950)	Calculates the length of the hypotenuse.
	IfThen (see page 15950)	Conditionally returns one of two specified values.
	IfThen (see page 15950)	Conditionally returns one of two specified values.
	IfThen (see page 15950)	Conditionally returns one of two specified values.
	InRange (see page 15950)	Indicates whether a value falls within a specified range.
	InRange (see page 15950)	Indicates whether a value falls within a specified range.
	InRange (see page 15950)	Indicates whether a value falls within a specified range.
	InterestPayment (see page 15951)	Calculates the interest portion of a loan payment.
	InterestRate (see page 15952)	Returns the interest rate required to increase PresentValue (see page 15965) to FutureValue (see page 15946).
	InternalRateOfReturn (see page 15952)	Calculates the internal rate of return for an investment.
	IntPower (see page 15953)	Calculates the integral power of a base value.
	IsInfinite (see page 15953)	Indicates when a variable or expression represents an infinite value.
	IsNan (see page 15954)	Indicates when a variable or expression does not evaluate to a numeric value.
	IsNan (see page 15954)	Indicates when a variable or expression does not evaluate to a numeric value.
	IsNan (see page 15954)	Indicates when a variable or expression does not evaluate to a numeric value.
	IsZero (see page 15954)	Indicates when a floating-point variable or expression evaluates to zero, or very close to zero.
	IsZero (see page 15954)	Indicates when a floating-point variable or expression evaluates to zero, or very close to zero.
	IsZero (see page 15954)	Indicates when a floating-point variable or expression evaluates to zero, or very close to zero.
	Ldexp (see page 15955)	Calculates X times (2 to the power of P).
	LnXP1 (see page 15955)	Returns the natural log of (X+1)
	Log10 (see page 15955)	Calculates log base 10.
	Log2 (see page 15956)	Calculates log base 2.
	LogN (see page 15956)	Calculates the log of X for a specified base.
	Max (see page 15957)	Returns the greater of two numeric values (Delphi only).
	Max (see page 15957)	Returns the greater of two numeric values (Delphi only).
	Max (see page 15957)	Returns the greater of two numeric values (Delphi only).
	Max (see page 15957)	Returns the greater of two numeric values (Delphi only).
	Max (see page 15957)	Returns the greater of two numeric values (Delphi only).
	MaxIntValue (see page 15957)	Returns the largest signed value in an integer array.
	MaxValue (see page 15958)	Returns the largest signed value in an array.
	Mean (see page 15958)	Returns the average of all values in an array.
	MeanAndStdDev (see page 15959)	Calculates the mean and standard deviation of array elements.
	Min (see page 15959)	Returns the lesser of two numeric values (Delphi only).
	Min (see page 15959)	Returns the lesser of two numeric values (Delphi only).
	Min (see page 15959)	Returns the lesser of two numeric values (Delphi only).
	Min (see page 15959)	Returns the lesser of two numeric values (Delphi only).
	Min (see page 15959)	Returns the lesser of two numeric values (Delphi only).
	MinIntValue (see page 15960)	Returns the smallest signed value in an integer array.
	MinValue (see page 15960)	Returns smallest signed value in an array.
	MomentSkewKurtosis (see page 15961)	Calculates the mean, variance, skew, and kurtosis.
	NetPresentValue (see page 15961)	Calculates the current value from an array of estimated cash flow values.
	Norm (see page 15962)	Returns the Euclidean 'L-2' norm.
	NumberOfPeriods (see page 15962)	Returns the number of payment periods for an investment.
	Payment (see page 15963)	Calculates a fully amortized payment.
	PeriodPayment (see page 15963)	Returns the principal amount from a full payment.
	Poly (see page 15963)	Evaluates a uniform polynomial of one variable at the value X.

	PopnStdDev (see page 15964)	Calculates the population standard deviation.
	PopnVariance (see page 15964)	Calculates the population variance.
	Power (see page 15965)	Raises Base to any power.
	Power (see page 15965)	Raises Base to any power.
	Power (see page 15965)	Raises Base to any power.
	PresentValue (see page 15965)	Calculates the present value of an investment.
	RadToCycle (see page 15966)	Converts radians to cycles.
	RadToDeg (see page 15966)	Converts radians to degrees.
	RadToGrad (see page 15966)	Converts radians to grads.
	RandG (see page 15967)	Generates random numbers with Gaussian distribution.
	RandomFrom (see page 15967)	Returns a randomly selected element from an array.
	RandomFrom (see page 15967)	Returns a randomly selected element from an array.
	RandomFrom (see page 15967)	Returns a randomly selected element from an array.
	RandomRange (see page 15968)	Returns a random integer from a specified range.
	RoundTo (see page 15968)	Rounds a floating-point value to a specified digit or power of ten using "Banker's rounding".
	SameValue (see page 15969)	Indicates whether two floating-point values are (approximately) equal.
	SameValue (see page 15969)	Indicates whether two floating-point values are (approximately) equal.
	SameValue (see page 15969)	Indicates whether two floating-point values are (approximately) equal.
	Sec (see page 15970)	Calculates the secant of an angle.
	Secant (see page 15970)	Calculates the secant of an angle.
	SecH (see page 15971)	Calculates the hyperbolic secant of an angle.
	SetExceptionMask (see page 15971)	Sets the exception mask on the FPU control word.
	SetPrecisionMode (see page 15972)	Sets the FPU precision control mode.
	SetRoundMode (see page 15972)	Sets the FPU rounding mode.
	Sign (see page 15973)	Indicates whether a numeric value is positive, negative, or zero.
	Sign (see page 15973)	Indicates whether a numeric value is positive, negative, or zero.
	Sign (see page 15973)	Indicates whether a numeric value is positive, negative, or zero.
	SimpleRoundTo (see page 15973)	Rounds a floating-point value to a specified digit or power of ten using asymmetric arithmetic rounding.
	SinCos (see page 15974)	Returns sine and cosine of an angle.
	Sinh (see page 15974)	Returns the hyperbolic sine of an angle.
	SLNDepreciation (see page 15975)	Returns the straight-line depreciation allowance of an asset.
	StdDev (see page 15975)	Returns the sample standard deviation for elements in an array.
	Sum (see page 15976)	Returns the sum of the elements in an array.
	SumInt (see page 15976)	Returns the sum of the elements in an integer array.
	SumOfSquares (see page 15977)	Returns the sum of the squared values from a data array.
	SumsAndSquares (see page 15977)	Returns the sum of the values and the sum of the squared values in an array.
	SYDDepreciation (see page 15978)	Calculates depreciation for an asset.
	Tan (see page 15978)	Returns the tangent of X.
	Tanh (see page 15979)	Returns the hyperbolic tangent of X.
	TotalVariance (see page 15979)	Returns the statistical variance from an array of values.
	Variance (see page 15980)	Calculates statistical sample variance from an array of data.

93.2.1 Math.ArcCos Function

Calculates the inverse cosine of a given number.

Pascal

```
function ArcCos(const X: Extended): Extended; overload;
function ArcCos(const X: Double): Double; overload;
function ArcCos(const X: Single): Single; overload;
```

C++

```
Extended ArcCos(const Extended X);
Double ArcCos(const Double X);
Single ArcCos(const Single X);
```

File

Math

Description

ArcCos returns the inverse cosine of X.

X must be between -1 and 1.

The return value is in the range [0..Pi], in radians.

See Also

Cos

ArcCosh (see page 15932)

ArcSin (see page 15935)

93.2.2 Math.ArcCosh Function

Calculates the inverse hyperbolic cosine of a given number.

Pascal

```
function ArcCosh(const X: Extended): Extended;
```

C++

```
Extended ArcCosh(const Extended X);
```

File

Math

Description

ArcCosh returns the inverse hyperbolic cosine of X. The value of X must be greater than or equal to 1.

See Also

Cosh (see page 15939)

ArcCos (see page 15931)

93.2.3 Math.ArcCot Function

Calculates the inverse cotangent of a given number.

Pascal

```
function ArcCot(const X: Extended): Extended;
```

C++

```
Extended ArcCot(const Extended X);
```

File

Math

Description

ArcCot returns the inverse cotangent of X.

See Also

Cot (see page 15939)

ArcCoth

93.2.4 Math.ArcCotH Function

Calculates the inverse hyperbolic cotangent of a given number.

Pascal

```
function ArcCotH(const X: Extended): Extended;
```

C++

```
Extended ArcCotH(const Extended X);
```

File

Math

Description

ArcCot (see page 15932) returns the inverse hyperbolic cotangent of X.

See Also

Cot (see page 15939)

ArcCoth

93.2.5 Math.ArcCsc Function

Calculates the inverse cosecant of a given number.

Pascal

```
function ArcCsc(const X: Extended): Extended;
```

C++

```
Extended ArcCsc(const Extended X);
```

File

Math

Description

ArcCsc returns the inverse cosecant of X.

See Also

Csc (see page 15941)

ArcCsch

93.2.6 Math.ArcCscH Function

Calculates the inverse hyperbolic cosecant of a given number.

Pascal

```
function ArcCscH(const X: Extended): Extended;
```

C++

```
Extended ArcCscH(const Extended X);
```

File

Math

Description

ArcCsc (see page 15933) returns the inverse hyperbolic cosecant of X.

See Also

Csc (see page 15941)

Csch

93.2.7 Math.ArcSec Function

Calculates the inverse secant of a given number.

Pascal

```
function ArcSec(const X: Extended): Extended;
```

C++

```
Extended ArcSec(const Extended X);
```

File

Math

Description

ArcSec returns the inverse secant of X.

See Also

Sec (see page 15970)

ArcSech

93.2.8 Math.ArcSecH Function

Calculates the inverse hyperbolic secant of a given number.

Pascal

```
function ArcSecH(const X: Extended): Extended;
```

C++

```
Extended ArcSecH(const Extended X);
```

File

Math

Description

ArcSec (see page 15934) returns the inverse hyperbolic secant of X.

See Also

Sec (see page 15970)

Sech

93.2.9 Math.ArcSin Function

Calculates the inverse sine of a given number.

Pascal

```
function ArcSin(const X: Extended): Extended; overload;
function ArcSin(const X: Double): Double; overload;
function ArcSin(const X: Single): Single; overload;
```

C++

```
Extended ArcSin(const Extended X);
Double ArcSin(const Double X);
Single ArcSin(const Single X);
```

File

Math

Description

ArcSin returns the inverse sine of X. X must be between -1 and 1. The return value will be in the range [-Pi/2..Pi/2], in radians.

See Also

Sin

ArcSinh (see page 15935)

ArcCos (see page 15931)

93.2.10 Math.ArcSinh Function

Calculates the inverse hyperbolic sine of a given number.

Pascal

```
function ArcSinh(const X: Extended): Extended;
```

C++

```
Extended ArcSinh(const Extended X);
```

File

Math

Description

ArcSinh returns the inverse hyperbolic sine of X.

See Also

Sinh (see page 15974)

93.2.11 Math.ArcTan2 Function

Calculates the arctangent angle and quadrant of a given number.

Pascal

```
function ArcTan2(const Y: Extended; const X: Extended): Extended;
```

C++

```
Extended ArcTan2(const Extended Y, const Extended X);
```

File

Math

Description

ArcTan2 calculates ArcTan(Y/X), and returns an angle in the correct quadrant. The values of X and Y must be between –2^64 and 2^64. In addition, the value of X can't be 0. The return value will fall in the range from -Pi to Pi radians.

93.2.12 Math.ArcTanh Function

Calculates the inverse hyperbolic tangent of a given number.

Pascal

```
function ArcTanh(const X: Extended): Extended;
```

C++

```
Extended ArcTanh(const Extended X);
```

File

Math

Description

ArcTanh returns the inverse hyperbolic tangent of X. The value of X must be between -1 and 1 (inclusive).

See Also

Tanh (see page 15979)

93.2.13 Math.Ceil Function

Rounds variables up toward positive infinity.

Pascal

```
function Ceil(const X: Extended): Integer;
```

C++

```
int Ceil(const Extended X);
```

File

Math

Description

Call Ceil to obtain the lowest integer greater than or equal to X. The absolute value of X must be less than MaxInt. For example:

Ceil(-2.8) = -2

Ceil(2.8) = 3

Ceil(-1.0) = -1

See Also

Trunc (see page 22537)

Floor (see page 15945)

Ceil

93.2.14 Math.ClearExceptions Function

Clears exception bits in FPU status word.

Pascal

```
procedure ClearExceptions(RaisePending: Boolean = True);
```

C++

```
ClearExceptions(Boolean RaisePending = True);
```

File

Math

Description

ClearExceptions clears the exception bits in the FPU status word. If RaisePending is true, any pending floating point exceptions cause an error to be raised.

See Also

GetExceptionMask (see page 15947)

SetExceptionMask (see page 15971)

Set8087CW

93.2.15 Math.CompareValue Function

Returns the relationship between two numeric values.

Pascal

```
function CompareValue(const A: Extended; const B: Extended; Epsilon: Extended = 0):
TValueRelationship; overload;
function CompareValue(const A: Double; const B: Double; Epsilon: Double = 0):
TValueRelationship; overload;
function CompareValue(const A: Single; const B: Single; Epsilon: Single = 0):
TValueRelationship; overload;
function CompareValue(const A: Integer; const B: Integer): TValueRelationship; overload;
function CompareValue(const A: Int64; const B: Int64): TValueRelationship; overload;
```

C++

```
TValueRelationship CompareValue(const Extended A, const Extended B, Extended Epsilon = 0);
TValueRelationship CompareValue(const Double A, const Double B, Double Epsilon = 0);
TValueRelationship CompareValue(const Single A, const Single B, Single Epsilon = 0);
TValueRelationship CompareValue(const int A, const int B);
TValueRelationship CompareValue(const Int64 A, const Int64 B);
```

File

Math

Description

Call CompareValue to determine the relationship between two numeric values. When comparing floating-point values, CompareValue lets you specify a maximum difference to use when comparing values, so that they are considered the same if they are within that amount.

A and B are the values to compare.

Epsilon is the maximum amount by which A and B can differ and still be considered the same value.

CompareValue returns

LessThanValue if A is less than B (by more than Epsilon if A and B are floating-point numbers).

EqualsValue if A is equivalent to B (the same, or within Epsilon if A and B are floating-point numbers).

GreaterThanValue if A is larger than B (by more than Epsilon if A and B are floating-point numbers).

See Also

SameValue (see page 15969)

VarCompareValue

93.2.16 Math.Cosecant Function

Returns the cosecant of an angle.

Pascal

```
function Cosecant(const X: Extended): Extended;
```

C++

```
Extended Cosecant(const Extended X);
```

File

Math

Description

Use the Cosecant to calculate the cosecant of X, where X is an angle in radians. The cosecant is calculated as 1/ Sin(X).

See Also

ArcCsc (see page 15933)

CscH (see page 15941)

Secant (see page 15970)

Sin

93.2.17 Math.Cosh Function

Calculates the hyperbolic cosine of an angle.

Pascal

```
function Cosh(const X: Extended): Extended;
```

C++

```
Extended Cosh(const Extended X);
```

File

Math

Description

Use the Cosh to calculate the hyperbolic cosine of X.

See Also

Cos

ArcCosh (see page 15932)

Sinh (see page 15974)

93.2.18 Math.Cot Function

Calculates the cotangent of an angle.

Pascal

```
function Cot(const X: Extended): Extended;
```

C++

```
Extended Cot(const Extended X);
```

File

Math

Description

Call Cot to obtain the cotangent of X. The cotangent is calculated using the formula 1 / Tan (see page 15978)(X).

See Also

Tan (see page 15978)

Sin

Cos

ArcTan

93.2.19 Math.Cotan Function

Calculates the cotangent of an angle.

Pascal

```
function Cotan(const X: Extended): Extended;
```

C++

```
Extended Cotan(const Extended X);
```

File

Math

Description

Call Cotan to obtain the cotangent of X. The cotangent is calculated using the formula

1 / Tan (see page 15978)(X)

Note: Do not call Cotan with X = 0.

See Also

Tan (see page 15978)

Sin

Cos

ArcTan

93.2.20 Math.CotH Function

Calculates the hyperbolic cotangent of an angle.

Pascal

```
function CotH(const X: Extended): Extended;
```

C++

```
Extended CotH(const Extended X);
```

File

Math

Description

Call CotH to obtain the hyperbolic cotangent of X, where X is an angle in Radians.

See Also

Cot (see page 15939)

ArcCot (see page 15932)

93.2.21 Math.Csc Function

Returns the cosecant of an angle.

Pascal

```
function Csc(const X: Extended): Extended;
```

C++

```
Extended Csc(const Extended X);
```

File

Math

Description

Use the Csc to calculate the cosecant of X, where X is an angle in radians.

See Also

ArcCsc (see page 15933)

CscH (see page 15941)

Sec (see page 15970)

Sin

93.2.22 Math.CscH Function

Returns the hyperbolic cosecant of an angle.

Pascal

```
function CscH(const X: Extended): Extended;
```

C++

```
Extended CscH(const Extended X);
```

File

Math

Description

Use the CscH to calculate the hyperbolic cosecant of X, where X is an angle in radians.

See Also

ArcCscH (see page 15934)

Csc (see page 15941)

SecH (see page 15971)

93.2.23 Math.CycleToDeg Function

Converts an angle measurement from cycles to degrees.

Pascal

```
function CycleToDeg(const Cycles: Extended): Extended;
```

C++

```
Extended CycleToDeg(const Extended Cycles);
```

File

Math

Description

CycleToDeg converts angles measured in cycles into degrees, where

degrees = cycles * 360.

93.2.24 Math.CycleToGrad Function

Converts an angle measurement from cycles to grads.

Pascal

```
function CycleToGrad(const Cycles: Extended): Extended;
```

C++

```
Extended CycleToGrad(const Extended Cycles);
```

File

Math

Description

CycleToGrad converts angles measured in cycles into grads.

93.2.25 Math.CycleToRad Function

Converts an angle measurement from cycles to radians.

Pascal

```
function CycleToRad(const Cycles: Extended): Extended;
```

C++

```
Extended CycleToRad(const Extended Cycles);
```

File

Math

Description

CycleToRad converts angles measured in cycles into radians, where

radians = 2pi * cycles.

93.2.26 Math.DegToCycle Function

Returns the value of a degree measurement expressed in cycles.

Pascal

```
function DegToCycle(const Degrees: Extended): Extended;
```

C++

```
Extended DegToCycle(const Extended Degrees);
```

File

Math

Description

Use DegToCycle to convert angles expressed in degrees to the corresponding value in cycles.

93.2.27 Math.DegToGrad Function

Returns the value of a degree measurement expressed in grads.

Pascal

```
function DegToGrad(const Degrees: Extended): Extended;
```

C++

```
Extended DegToGrad(const Extended Degrees);
```

File

Math

Description

Use DegToGrad to convert angles expressed in degrees to the corresponding value in grads.

93.2.28 Math.DegToRad Function

Returns the value of a degree measurement expressed in radians.

Pascal

```
function DegToRad(const Degrees: Extended): Extended;
```

C++

```
Extended DegToRad(const Extended Degrees);
```

File

Math

Description

Use DegToRad to convert angles expressed in degrees to the corresponding value in radians, where

radians = degrees(pi/180).

93.2.29 Math.DivMod Function

Returns the result of an integer division, including the remainder.

Pascal

```
procedure DivMod(Dividend: Cardinal; Divisor: Word; var Result: Word; var Remainder: Word);
```

C++

```
DivMod(unsigned Dividend, Word Divisor, Word Result, Word Remainder);
```

File

Math

Description

Call DivMod to perform 16-bit integer division and fetch the remainder as well, all in one operation.

Dividend is the integer into which you are dividing.

Divisor is the value by which to divide Dividend.

Result returns the result of the integer division.

Remainder returns the remainder (the difference between Result * Divisor and Dividend).

93.2.30 Math.DoubleDecliningBalance Function

Calculates the depreciation of an asset using the double-declining balance method.

Pascal

```
function DoubleDecliningBalance(const Cost: Extended; const Salvage: Extended; Life: Integer;
Period: Integer): Extended;
```

C++

```
Extended DoubleDecliningBalance(const Extended Cost, const Extended Salvage, int Life, int
Period);
```

File

Math

Description

DoubleDecliningBalance determines accelerated depreciation values for an asset, given the initial cost, life expectancy, end value, and depreciation period.

93.2.31 Math.EnsureRange Function

Returns the closest value to a specified value within a specified range.

Pascal

```
function EnsureRange(const AValue: Integer; const AMin: Integer; const AMax: Integer):
Integer; overload;
function EnsureRange(const AValue: Int64; const AMin: Int64; const AMax: Int64): Int64;
overload;
function EnsureRange(const AValue: Double; const AMin: Double; const AMax: Double): Double;
overload;
```

C++

```
int EnsureRange(const int AValue, const int AMin, const int AMax);
Int64 EnsureRange(const Int64 AValue, const Int64 AMin, const Int64 AMax);
Double EnsureRange(const Double AValue, const Double AMin, const Double AMax);
```

File

Math

Description

EnsureRange returns a value that is guaranteed to be within a specified range.

AValue is the value you want as long as it is in range. If AValue is in range, EnsureRange returns AValue.

AMin is the minimum acceptable value. If AValue is less than AMin, EnsureRange returns AMin.

AMax is the maximum acceptable value. If AValue is greater than AMax, EnsureRange returns AMax.

See Also

VarEnsureRange

InRange (see page 15950)

93.2.32 Math.Floor Function

Rounds variables toward negative infinity.

Pascal

```
function Floor(const X: Extended): Integer;
```

C++

```
int Floor(const Extended X);
```

File

Math

Description

Call Floor to obtain the highest integer less than or equal to X. For example:

Floor(-2.8) = -3

Floor(2.8) = 2

Floor(-1.0) = -1

Note: The absolute value of X must be less than MaxInt.

See Also

Trunc (see page 22537)

Ceil (see page 15937)

93.2.33 Math.Frexp Function

Separates the Mantissa and Exponent of X

Pascal

```
procedure Frexp(const X: Extended; var Mantissa: Extended; var Exponent: Integer);
```

C++

```
Frexp(const Extended X, Extended Mantissa, int Exponent);
```

File

Math

Description

Frexp returns the mantissa of X as Mantissa and the exponent as Exponent.

93.2.34 Math.FutureValue Function

Calculates the future value of an investment.

Pascal

```
function FutureValue(const Rate: Extended; NPeriods: Integer; const Payment: Extended; const
PresentValue: Extended; PaymentTime: TPaymentTime): Extended;
```

C++

```
Extended FutureValue(const Extended Rate, int NPeriods, const Extended Payment, const Extended
PresentValue, TPaymentTime PaymentTime);
```

File

Math

Description

FutureValue returns the future value of an investment of PresentValue (see page 15965) where Payment (see page 15963) is invested for NPeriods at the rate of Rate per period. The PaymentTime parameter indicates whether the investment is an ordinary annuity or an annuity due (enter ptEndOfPeriod if payments are at the end of each period, ptStartOfPeriod if they are at the beginning).

93.2.35 Math.GetExceptionMask Function

Returns the exception mask from the FPU control word.

Pascal

```
function GetExceptionMask: TFPUExceptionMask;
```

C++

```
TFPUExceptionMask GetExceptionMask();
```

File

Math

Description

Call GetExceptionMask to ascertain the types of exceptions the FPU (floating-point unit) generates. Any element set in this mask prevents the FPU from raising the corresponding type of exception. Instead, the FPU returns its best attempt at a value – often NaN (see page 15992), Infinity (see page 15988), or NegInfinity (see page 15993). The value depends on the operation and the current rounding mode.

See Also

Set8087CW

SetExceptionMask (see page 15971)

NaN (see page 15992)

Infinity (see page 15988)

NegInfinity (see page 15993)

IsInfinite (see page 15953)

IsNaN

93.2.36 Math.GetPrecisionMode Function

Returns the FPU precision control mode.

Pascal

```
function GetPrecisionMode: TFPUPrecisionMode;
```

C++

```
TFPUPrecisionMode GetPrecisionMode();
```

File

Math

Description

Call GetPrecisionMode to ascertain the level of precision that the FPU (floating-point unit) uses for floating-point calculations. The precision control mode can be any of the following values:

Value	Meaning
pmSingle	single precision
pmReserved	not used
pmDouble	double precision
pmExtended	extended precision

See Also

Set8087CW

SetPrecisionMode (see page 15972)

93.2.37 Math.GetRoundMode Function

Returns the FPU rounding mode.

Pascal

```
function GetRoundMode: TFPURoundingMode;
```

C++

```
TFPURoundingMode GetRoundMode();
```

File

Math

Description

Call GetRoundingMode to ascertain how the FPU handles rounding issues. The rounding mode can be any of the following values:

Value	Meaning
rmNearest	Rounds to the closest value.
rmDown	Rounds toward negative infinity.
rmUp	Rounds toward positive infinity.
rmTruncate	Truncates the value, rounding positive numbers down and negative numbers up.

See Also

Set8087CW

SetRoundMode (see page 15972)

93.2.38 Math.GradToCycle Function

Converts grad measurements to cycles.

Pascal

```
function GradToCycle(const Grads: Extended): Extended;
```

C++

```
Extended GradToCycle(const Extended Grads);
```

File

Math

Description

GradToCycle converts angles measured in grads into cycles.

93.2.39 Math.GradToDeg Function

Converts grad measurements to degrees.

Pascal

```
function GradToDeg(const Grads: Extended): Extended;
```

C++

```
Extended GradToDeg(const Extended Grads);
```

File

Math

Description

GradToDeg converts angles measured in grads into degrees.

93.2.40 Math.GradToRad Function

Converts grad measurements to radians.

Pascal

```
function GradToRad(const Grads: Extended): Extended;
```

C++

```
Extended GradToRad(const Extended Grads);
```

File

Math

Description

GradToRad converts angles measured in grads into radians, where

radians = grads(pi/200).

93.2.41 Math.Hypot Function

Calculates the length of the hypotenuse.

Pascal

```
function Hypot(const X: Extended; const Y: Extended): Extended;
```

C++

```
Extended Hypot(const Extended X, const Extended Y);
```

File

Math

Description

Hypot returns the length of the hypotenuse of a right triangle. Specify the lengths of the sides adjacent to the right angle in X and Y. Hypot uses the formula

Sqrt(X**2 + Y**2)

93.2.42 Math.IfThen Function

Conditionally returns one of two specified values.

Pascal

```
function IfThen(AValue: Boolean; const ATrue: Integer; const AFalse: Integer = 0): Integer;
overload;
function IfThen(AValue: Boolean; const ATrue: Int64; const AFalse: Int64 = 0): Int64; overload;
function IfThen(AValue: Boolean; const ATrue: Double; const AFalse: Double = 0.0): Double;
overload;
```

C++

```
int IfThen(Boolean AValue, const int ATrue, const int AFalse = 0);
Int64 IfThen(Boolean AValue, const Int64 ATrue, const Int64 AFalse = 0);
Double IfThen(Boolean AValue, const Double ATrue, const Double AFalse = 0.0);
```

File

Math

Description

IfThen checks the expression passed as AValue and returns ATrue if it evaluates to true, or AFalse if it evaluates to false. In Delphi, if the AFalse parameter is omitted, IfThen returns 0 or an empty string when AValue evaluates to False.

93.2.43 Math.InRange Function

Indicates whether a value falls within a specified range.

Pascal

```
function InRange(const AValue: Integer; const AMin: Integer; const AMax: Integer): Boolean;
overload;
function InRange(const AValue: Int64; const AMin: Int64; const AMax: Int64): Boolean; overload;
function InRange(const AValue: Double; const AMin: Double; const AMax: Double): Boolean;
overload;
```

C++

```
Boolean InRange(const int AValue, const int AMin, const int AMax);
Boolean InRange(const Int64 AValue, const Int64 AMin, const Int64 AMax);
Boolean InRange(const Double AValue, const Double AMin, const Double AMax);
```

File

Math

Description

InRange returns true if AValue is greater than or equal to AMin and less than or Equal to AMax. It returns false if AValue is less than AMin or greater than AMax.

See Also

VarInRange

EnsureRange (see page 15945)

93.2.44 Math.InterestPayment Function

Calculates the interest portion of a loan payment.

Pascal

```
function InterestPayment(const Rate: Extended; Period: Integer; NPeriods: Integer; const
PresentValue: Extended; const FutureValue: Extended; PaymentTime: TPaymentTime): Extended;
```

C++

```
Extended InterestPayment(const Extended Rate, int Period, int NPeriods, const Extended
PresentValue, const Extended FutureValue, TPaymentTime PaymentTime);
```

File

Math

Description

Call InterestPayment to calculate the portion of a loan payment that reflects the interest.

Rate represents the fixed periodic interest rate.

Period identifies the payment period.

NPeriods is the number of periods of the loan.

PresentValue (see page 15965) represents the amount borrowed (the principal).

FutureValue (see page 15946) is the future value of the investment.

PaymentTime indicates whether the cash flows occur at the beginning or end of the period.

93.2.45 Math.InterestRate Function

Returns the interest rate required to increase PresentValue (see page 15965) to FutureValue (see page 15946).

Pascal

```
function InterestRate(NPeriods: Integer; const Payment: Extended; const PresentValue:
Extended; const FutureValue: Extended; PaymentTime: TPaymentTime): Extended;
```

C++

```
Extended InterestRate(int NPeriods, const Extended Payment, const Extended PresentValue, const
Extended FutureValue, TPaymentTime PaymentTime);
```

File

Math

Description

InterestRate calculates the interest rate required in order for an investment of PresentValue (see page 15965), with periodic payments of Payment (see page 15963), to be worth FutureValue (see page 15946) within NPeriods compounding periods. If NPeriods represents years, an annual interest rate results; if NPeriods represents months, a monthly interest rate results, and so on. The PaymentTime parameter indicates whether the cash flows occur at the beginning or end of the period.

93.2.46 Math.InternalRateOfReturn Function

Calculates the internal rate of return for an investment.

Pascal

```
function InternalRateOfReturn(const Guess: Extended; const CashFlows: array of Double):
Extended;
```

C++

```
Extended InternalRateOfReturn(const Extended Guess, const array of Double CashFlows);
```

File

Math

Description

InternalRateOfReturn determines the internal rate of return on an investment. It references an array that contains cash flow information and uses the supplied internal rate of return estimate to calculate results.

Before using this function, define an array containing expected cash flow amounts over a period of time. It is assumed that the amounts are received at regular intervals. Negative amounts are interpreted as cash outflows, and positive amounts as inflows. The first amount must be a negative number, to reflect the initial investment. The following amounts can all be the same for each time period, or they can be different (including a mixture of negatives, positives, or zeros).

Specify the estimated rate of return as the Guess parameter. Pass the array of expected cash flow amounts as the CashFlows parameter. In C++, the CashFlows_Size parameter gives the index of the last entry in CashFlows (one less than the number of entries).

93.2.47 Math.IntPower Function

Calculates the integral power of a base value.

Pascal

```
function IntPower(const Base: Extended; const Exponent: Integer): Extended;
```

C++

```
Extended IntPower(const Extended Base, const int Exponent);
```

File

Math

Description

IntPower raises Base to the power specified by Exponent.

See Also

Power (see page 15965)

93.2.48 Math.IsInfinite Function

Indicates when a variable or expression represents an infinite value.

Pascal

```
function IsInfinite(const AValue: Double): Boolean;
```

C++

```
Boolean IsInfinite(const Double AValue);
```

File

Math

Description

Use IsInfinite to test whether the value specified by AValue represents positive or negative infinity. Use the Sign (see page 15973) function to distinguish positive infinity from negative infinity.

See Also

GetExceptionMask (see page 15947)

NegInfinity (see page 15993)

IsNan (see page 15954)

Infinity (see page 15988)

IsZero (see page 15954)

Sign (see page 15973)

93.2.49 Math.IsNan Function

Indicates when a variable or expression does not evaluate to a numeric value.

Pascal

```
function IsNan(const AValue: Double): Boolean; overload;
function IsNan(const AValue: Single): Boolean; overload;
function IsNan(const AValue: Extended): Boolean; overload;
```

C++

```
Boolean IsNan(const Double AValue);
Boolean IsNan(const Single AValue);
Boolean IsNan(const Extended AValue);
```

File

Math

Description

Use IsNan to test whether the value specified by AValue represents NaN (see page 15992) (not a number). Note that NaN (see page 15992) is distinct from positive and negative infinity, which can be detected using the IsInfinite (see page 15953) function.

See Also

GetExceptionMask (see page 15947)

Nan

IsInfinite (see page 15953)

93.2.50 Math.IsZero Function

Indicates when a floating-point variable or expression evaluates to zero, or very close to zero.

Pascal

```
function IsZero(const A: Extended; Epsilon: Extended = 0): Boolean; overload;
function IsZero(const A: Double; Epsilon: Double = 0): Boolean; overload;
function IsZero(const A: Single; Epsilon: Single = 0): Boolean; overload;
```

C++

```
Boolean IsZero(const Extended A, Extended Epsilon = 0);
Boolean IsZero(const Double A, Double Epsilon = 0);
Boolean IsZero(const Single A, Single Epsilon = 0);
```

File

Math

Description

Use IsZero to test whether the value specified by AValue is zero, or differs from zero by at most Epsilon.

See Also

SameValue (see page 15969)

IsInfinite (see page 15953)

Sign (see page 15973)

93.2.51 Math.Ldexp Function

Calculates X times (2 to the power of P).

Pascal

```
function Ldexp(const X: Extended; const P: Integer): Extended;
```

C++

```
Extended Ldexp(const Extended X, const int P);
```

File

Math

Description

Ldexp returns X times (2 to the power of P).

93.2.52 Math.LnXP1 Function

Returns the natural log of (X+1)

Pascal

```
function LnXP1(const X: Extended): Extended;
```

C++

```
Extended LnXP1(const Extended X);
```

File

Math

Description

LnXP1 returns the natural logarithm of (X+1). Use LnXP1 when X is a value near 0.

93.2.53 Math.Log10 Function

Calculates log base 10.

Pascal

```
function Log10(const X: Extended): Extended;
```

C++

```
Extended Log10(const Extended X);
```

File

Math

Description

Log10 returns the log base 10 of X.

See Also

Log2 (see page 15956)

Ln

LogN (see page 15956)

93.2.54 Math.Log2 Function

Calculates log base 2.

Pascal

```
function Log2(const X: Extended): Extended;
```

C++

```
Extended Log2(const Extended X);
```

File

Math

Description

Log2 returns the log base 2 of X.

See Also

Log10 (see page 15955)

Ln

LogN (see page 15956)

93.2.55 Math.LogN Function

Calculates the log of X for a specified base.

Pascal

```
function LogN(const Base: Extended; const X: Extended): Extended;
```

C++

```
Extended LogN(const Extended Base, const Extended X);
```

File

Math

Description

LogN returns the log base Base of X.

See Also

Log2 (see page 15956)

Log10 (see page 15955)

Ln

93.2.56 Math.Max Function

Returns the greater of two numeric values (Delphi only).

Pascal

```
function Max(const A: Integer; const B: Integer): Integer; overload;
function Max(const A: Int64; const B: Int64): Int64; overload;
function Max(const A: Single; const B: Single): Single; overload;
function Max(const A: Double; const B: Double): Double; overload;
function Max(const A: Extended; const B: Extended): Extended; overload;
```

C++

```
int Max(const int A, const int B);
Int64 Max(const Int64 A, const Int64 B);
Single Max(const Single A, const Single B);
Double Max(const Double A, const Double B);
Extended Max(const Extended A, const Extended B);
```

File

Math

Description

In Delphi, call Max to compare two numeric values. Max returns the greater value of the two.

See Also

MaxValue (see page 15958)

Min (see page 15959)

MaxIntValue (see page 15957)

93.2.57 Math.MaxIntValue Function

Returns the largest signed value in an integer array.

Pascal

```
function MaxIntValue(const Data: array of Integer): Integer;
```

C++

```
int MaxIntValue(const array of Integer Data);
```

File

Math

Description

Call MaxIntValue to obtain the largest integer from the Data array. In C++, Data_Size is the index of the last element in the array (one less than the number of elements).

See Also

MaxValue (see page 15958)

MinIntValue (see page 15960)

93.2.58 Math.MaxValue Function

Returns the largest signed value in an array.

Pascal

```
function MaxValue(const Data: array of Double): Double;
```

C++

```
Double MaxValue(const array of Double Data);
```

File

Math

Description

MaxValue returns the largest signed value in the Data array. In C++, the Data_Size parameter gives the index of the last element of the array (one less than the number of elements).

See Also

MaxIntValue (see page 15957)

MinValue (see page 15960)

93.2.59 Math.Mean Function

Returns the average of all values in an array.

Pascal

```
function Mean(const Data: array of Double): Extended;
```

C++

```
Extended Mean(const array of Double Data);
```

File

Math

Description

Mean calculates the arithmetic average of all the values in the Data array parameter. In C++, the Data_Size parameter gives the index of the last element of the array (one less than the number of elements).

See Also

MeanAndStdDev (see page 15959)

93.2.60 Math.MeanAndStdDev Function

Calculates the mean and standard deviation of array elements.

Pascal

```
procedure MeanAndStdDev(const Data: array of Double; var Mean: Extended; var StdDev: Extended);
```

C++

```
MeanAndStdDev(const array of Double Data, Extended Mean, Extended StdDev);
```

File

Math

Description

MeanAndStdDev calculates Mean (see page 15958) and standard deviation in one pass. Using this is twice as fast as calculating them separately. Precision may be lost when the Mean (see page 15958) is very large (> 10e7) or the variance is very small.

Data specifies the data to be summarized. In C++, Data_Size is the index of the last element in the Data array (one less than the number of elements). The mean is returned as Mean (see page 15958) and the standard deviation is returned as StdDev (see page 15975).

Note: If the sample size is 1 (that is, if Data contains only one entry), StdDev (see page 15975) returns the value of Data[0] and not zero.

See Also

Mean (see page 15958)

StdDev (see page 15975)

93.2.61 Math.Min Function

Returns the lesser of two numeric values (Delphi only).

Pascal

```
function Min(const A: Integer; const B: Integer): Integer; overload;
function Min(const A: Int64; const B: Int64): Int64; overload;
function Min(const A: Single; const B: Single): Single; overload;
function Min(const A: Double; const B: Double): Double; overload;
function Min(const A: Extended; const B: Extended): Extended; overload;
```

C++

```
int Min(const int A, const int B);
Int64 Min(const Int64 A, const Int64 B);
Single Min(const Single A, const Single B);
Double Min(const Double A, const Double B);
Extended Min(const Extended A, const Extended B);
```

File

Math

Description

Call Min to compare two numeric values in Delphi. Min returns the smaller value of the two.

See Also

MinValue (see page 15960)

Max (see page 15957)

MinIntValue (see page 15960)

93.2.62 Math.MinIntValue Function

Returns the smallest signed value in an integer array.

Pascal

```
function MinIntValue(const Data: array of Integer): Integer;
```

C++

```
int MinIntValue(const array of Integer Data);
```

File

Math

Description

Call MinIntValue to obtain the smallest integer in the Data array. In C++, the Data_Size parameter specifies the index of the last element in the array (one less than the total number of elements).

See Also

MaxIntValue (see page 15957)

MinValue (see page 15960)

93.2.63 Math.MinValue Function

Returns smallest signed value in an array.

Pascal

```
function MinValue(const Data: array of Double): Double;
```

C++

```
Double MinValue(const array of Double Data);
```

File

Math

Description

MinValue returns the smallest signed value in the Data array. The Data_Size parameter specifies the index of the last element in the array (one less than the total number of elements).

See Also

MaxValue (see page 15958)

MinIntValue (see page 15960)

93.2.64 Math.MomentSkewKurtosis Function

Calculates the mean, variance, skew, and kurtosis.

Pascal

```
procedure MomentSkewKurtosis(const Data: array of Double; var M1: Extended; var M2: Extended;
var M3: Extended; var M4: Extended; var Skew: Extended; var Kurtosis: Extended);
```

C++

```
MomentSkewKurtosis(const array of Double Data, Extended M1, Extended M2, Extended M3, Extended
M4, Extended Skew, Extended Kurtosis);
```

File

Math

Description

MomentSkewKurtosis calculates the core factors of statistical analysis: the first four moments plus the coefficients of skew and kurtosis.

Data specifies the data to be analyzed. In C++, Data_Size is the index of the last element in the Data array (one less than the number of elements). M1, M2, M3 and M4 return the first four moments (M1 is the mean, M2 is the variance, and so on). Skew reflects symmetry of distribution. Kurtosis reflects flatness of distribution.

93.2.65 Math.NetPresentValue Function

Calculates the current value from an array of estimated cash flow values.

Pascal

```
function NetPresentValue(const Rate: Extended; const CashFlows: array of Double; PaymentTime:
TPaymentTime): Extended;
```

C++

```
Extended NetPresentValue(const Extended Rate, const array of Double CashFlows, TPaymentTime
PaymentTime);
```

File

Math

Description

NetPresentValue calculates the current value of an array of estimated cash flow values, discounted at the given interest rate of Rate.

CashFlows is the array of estimated cash flow values. In C++, CashFlows_Size is the index of the last element in that array (one less than the number of elements).

PaymentTime indicates whether the cash flows occur at the beginning or end of the period.

NetPresentValue helps determine how much an investment is currently worth, based on expected earnings, although its accuracy depends on the accuracy of the cash flows in the array.

93.2.66 Math.Norm Function

Returns the Euclidean 'L-2' norm.

Pascal

```
function Norm(const Data: array of Double): Extended;
```

C++

```
Extended Norm(const array of Double Data);
```

File

Math

Description

Norm returns the Euclidean 'L-2' norm for the values in the Data array. The 'L-2' norm is the square root of the sum of squares.

Note: In C++, Data is an array of values, and Data_Size is the index of the last value in the array (one less than the number of values).

See Also

SumOfSquares (see page 15977)

93.2.67 Math.NumberOfPeriods Function

Returns the number of payment periods for an investment.

Pascal

```
function NumberOfPeriods(const Rate: Extended; Payment: Extended; const PresentValue:
Extended; const FutureValue: Extended; PaymentTime: TPaymentTime): Extended;
```

C++

```
Extended NumberOfPeriods(const Extended Rate, Extended Payment, const Extended PresentValue,
const Extended FutureValue, TPaymentTime PaymentTime);
```

File

Math

Description

NumberOfPeriods computes the number of payment periods required for an investment of PresentValue (see page 15965) to reach a value of FutureValue (see page 15946), while making regular payments of Payment (see page 15963) and accruing interest at the rate of Rate per compounding period. PaymentTime indicates whether the cash flows occur at the beginning or end of the period.

93.2.68 Math.Payment Function

Calculates a fully amortized payment.

Pascal

```
function Payment(Rate: Extended; NPeriods: Integer; const PresentValue: Extended; const
FutureValue: Extended; PaymentTime: TPaymentTime): Extended;
```

C++

```
Extended Payment(Extended Rate, int NPeriods, const Extended PresentValue, const Extended
FutureValue, TPaymentTime PaymentTime);
```

File

Math

Description

Payment calculates the fully amortized payment of borrowing PresentValue (see page 15965) at Rate percent per period over NPeriods. It assumes that interest is paid at the end of each period.

FutureValue (see page 15946) is the value that the investment will reach at some point. PaymentTime indicates whether the cash flows occur at the beginning or end of the period.

93.2.69 Math.PeriodPayment Function

Returns the principal amount from a full payment.

Pascal

```
function PeriodPayment(const Rate: Extended; Period: Integer; NPeriods: Integer; const
PresentValue: Extended; const FutureValue: Extended; PaymentTime: TPaymentTime): Extended;
```

C++

```
Extended PeriodPayment(const Extended Rate, int Period, int NPeriods, const Extended
PresentValue, const Extended FutureValue, TPaymentTime PaymentTime);
```

File

Math

Description

PeriodPayment gives the part of the payment that is principal. The InterestPayment (see page 15951) function gives the part of the payment that is interest.

The Rate parameter is the interest rate. Period is the number of periods into the loan for which the principal is desired, and NPeriods is the number of periods of the loan. FutureValue (see page 15946) is the value the investment will reach at some point. PaymentTime indicates whether the cash flows occur at the beginning or end of the period.

93.2.70 Math.Poly Function

Evaluates a uniform polynomial of one variable at the value X.

Pascal

```
function Poly(const X: Extended; const Coefficients: array of Double): Extended;
```

C++

```
Extended Poly(const Extended X, const array of Double Coefficients);
```

File

Math

Description

Call Poly to evaluate the polynomial represented by the Coefficients parameter at the point where the variable equals the value of the X parameter. The coefficients are ordered in increasing powers of X, as shown in the following Delphi-like example:

Coefficients[0] + Coefficients[1]*X + ... + Coefficients[N]*(X**N)

Note: In C++, the Coefficients_Size parameter is N, the highest power to which X is raised.

93.2.71 Math.PopnStdDev Function

Calculates the population standard deviation.

Pascal

```
function PopnStdDev(const Data: array of Double): Extended;
```

C++

```
Extended PopnStdDev(const array of Double Data);
```

File

Math

Description

PopnStdDev calculates the population standard deviation (the square root of the population variance) of all values in the Data array parameter. In C++, the Data_Size parameter indicates the index of the last element in Data (one less than the number of data points).

This function is used in some business and financial calculations.

See Also

StdDev (see page 15975)

PopnVariance (see page 15964)

93.2.72 Math.PopnVariance Function

Calculates the population variance.

Pascal

```
function PopnVariance(const Data: array of Double): Extended;
```

C++

```
Extended PopnVariance(const array of Double Data);
```

File

Math

Description

PopnVariance calculates the population variance of all values in the Data array parameter, using the n method (biased): TotalVariance (see page 15979) / n. In C++,. the Data_Size parameter is the index of the last value in the Data array (one less than the number of data items).

See Also

Variance (see page 15980)

TotalVariance (see page 15979)

PopnStdDev (see page 15964)

93.2.73 Math.Power Function

Raises Base to any power.

Pascal

```
function Power(const Base: Extended; const Exponent: Extended): Extended; overload;
function Power(const Base: Double; const Exponent: Double): Double; overload;
function Power(const Base: Single; const Exponent: Single): Single; overload;
```

C++

```
Extended Power(const Extended Base, const Extended Exponent);
Double Power(const Double Base, const Double Exponent);
Single Power(const Single Base, const Single Exponent);
```

File

Math

Description

Power raises Base to any power. For fractional exponents or exponents greater than MaxInt, Base must be greater than 0.

See Also

IntPower (see page 15953)

Sqrt

93.2.74 Math.PresentValue Function

Calculates the present value of an investment.

Pascal

```
function PresentValue(const Rate: Extended; NPeriods: Integer; const Payment: Extended; const
FutureValue: Extended; PaymentTime: TPaymentTime): Extended;
```

C++

```
Extended PresentValue(const Extended Rate, int NPeriods, const Extended Payment, const
Extended FutureValue, TPaymentTime PaymentTime);
```

File

Math

Description

PresentValue calculates the present value of an investment where Payment (see page 15963) is received for NPeriods and is discounted at the rate of Rate per period. FutureValue (see page 15946) is the value the investment may reach at some point. PaymentTime indicates whether the cash flows occur at the beginning or end of the period.

93.2.75 Math.RadToCycle Function

Converts radians to cycles.

Pascal

```
function RadToCycle(const Radians: Extended): Extended;
```

C++

```
Extended RadToCycle(const Extended Radians);
```

File

Math

Description

Use RadToCycle to convert angles measured in radians into cycles, where

cycles = radians/(2pi).

93.2.76 Math.RadToDeg Function

Converts radians to degrees.

Pascal

```
function RadToDeg(const Radians: Extended): Extended;
```

C++

```
Extended RadToDeg(const Extended Radians);
```

File

Math

Description

Use RadToDeg to convert angles measured in radians to degrees, where

degrees = radians(180/pi).

93.2.77 Math.RadToGrad Function

Converts radians to grads.

Pascal

```
function RadToGrad(const Radians: Extended): Extended;
```

C++

```
Extended RadToGrad(const Extended Radians);
```

File

Math

Description

Use RadToGrad to convert angles measured in radians to grads, where

grads = radians(200/pi).

93.2.78 Math.RandG Function

Generates random numbers with Gaussian distribution.

Pascal

```
function RandG(Mean: Extended; StdDev: Extended): Extended;
```

C++

```
Extended RandG(Extended Mean, Extended StdDev);
```

File

Math

Description

RandG produces random numbers with Gaussian distribution about the Mean (see page 15958). This is useful for simulating data with sampling errors and expected deviations from the Mean (see page 15958).

93.2.79 Math.RandomFrom Function

Returns a randomly selected element from an array.

Pascal

```
function RandomFrom(const AValues: array of Integer): Integer; overload;
function RandomFrom(const AValues: array of Int64): Int64; overload;
function RandomFrom(const AValues: array of Double): Double; overload;
```

C++

```
int RandomFrom(const array of Integer AValues);
Int64 RandomFrom(const array of Int64 AValues);
Double RandomFrom(const array of Double AValues);
```

File

Math

Description

RandomFrom returns a randomly selected element from the array passed as the AValues argument. In C++, AValues_Size is

the index of the last array element (one less than the number of elements.)

To initialize the random number generator, add a single call Randomize or assign a value to the RandSeed variable before making any calls to RandomFrom.

See Also

Randomize

RandSeed

93.2.80 Math.RandomRange Function

Returns a random integer from a specified range.

Pascal

```
function RandomRange(const AFrom: Integer; const ATo: Integer): Integer;
```

C++

```
int RandomRange(const int AFrom, const int ATo);
```

File

Math

Description

RandomRange returns a random integer from the range that extends between AFrom and ATo (non-inclusive). RandomRange can handle negative ranges (where AFrom is greater than ATo).

To initialize the random number generator, add a single call Randomize or assign a value to the RandSeed variable before making any calls to RandomRange.

See Also

Randomize

RandSeed

RandomFrom (see page 15967)

Random

93.2.81 Math.RoundTo Function

Rounds a floating-point value to a specified digit or power of ten using "Banker's rounding".

Pascal

```
function RoundTo(const AValue: Double; const ADigit: TRoundToRange): Double;
```

C++

```
Double RoundTo(const Double AValue, const TRoundToRange ADigit);
```

File

Math

Description

Call RoundTo to round AValue to a specified power of ten.

AValue is the value to round.

ADigit indicates the power of ten to which you want AValue rounded. It can be any value from –37 to 37 (inclusive).

RoundTo uses "Banker's Rounding" to determine how to round values that are exactly midway between the two values that have the desired number of significant digits. This method rounds to an even number in the case that AValue is not nearer to either value.

The following examples illustrate the use of RoundTo:

Expression	Value
RoundTo(1234567, 3)	1234000
RoundTo(1.234, -2)	1.23
RoundTo(1.235, -2)	1.24
RoundTo(1.245, -2)	1.24

Note: The behavior of RoundTo can be affected by the Set8087CW procedure or SetRoundMode (see page 15972) function.

See Also

Round

SetRoundMode (see page 15972)

Set8087CW

SimpleRoundTo (see page 15973)

93.2.82 Math.SameValue Function

Indicates whether two floating-point values are (approximately) equal.

Pascal

```
function SameValue(const A: Extended; const B: Extended; Epsilon: Extended = 0): Boolean;
overload;
function SameValue(const A: Double; const B: Double; Epsilon: Double = 0): Boolean; overload;
function SameValue(const A: Single; const B: Single; Epsilon: Single = 0): Boolean; overload;
```

C++

```
Boolean SameValue(const Extended A, const Extended B, Extended Epsilon = 0);
Boolean SameValue(const Double A, const Double B, Double Epsilon = 0);
Boolean SameValue(const Single A, const Single B, Single Epsilon = 0);
```

File

Math

Description

Call SameValue to determine when two floating-point values are equal, or approximately equal.

A and B are the values to compare.

Epsilon is the maximum amount by which A and B can differ and still be considered the same value.

See Also

CompareValue (see page 15938)

IsZero (see page 15954)

93.2.83 Math.Sec Function

Calculates the secant of an angle.

Pascal

```
function Sec(const X: Extended): Extended;
```

C++

```
Extended Sec(const Extended X);
```

File

Math

Description

Call Sec to obtain the secant of X, where X is an angle in radians. The secant is calculated using the formula 1 / Cos(X).

Note: Sec is identical to the Secant (see page 15970) function.

See Also

ArcSec (see page 15934)

Secant (see page 15970)

SecH (see page 15971)

Cos

93.2.84 Math.Secant Function

Calculates the secant of an angle.

Pascal

```
function Secant(const X: Extended): Extended;
```

C++

```
Extended Secant(const Extended X);
```

File

Math

Description

Call Secant to obtain the secant of X, where X is an angle in radians. The secant is calculated using the formula 1 / Cos(X).

See Also

Sec (see page 15970)

SecH (see page 15971)

Cos

93.2.85 Math.SecH Function

Calculates the hyperbolic secant of an angle.

Pascal

```
function SecH(const X: Extended): Extended;
```

C++

```
Extended SecH(const Extended X);
```

File

Math

Description

Call SecH to obtain the hyperbolic secant of X, where X is an angle in Radians.

See Also

Sec (see page 15970)

ArcSec (see page 15934)

93.2.86 Math.SetExceptionMask Function

Sets the exception mask on the FPU control word.

Pascal

```
function SetExceptionMask(const Mask: TFPUExceptionMask): TFPUExceptionMask;
```

C++

```
TFPUExceptionMask SetExceptionMask(const TFPUExceptionMask Mask);
```

File

Math

Description

Call SetExceptionMask to specify the types of exceptions the FPU (floating-point unit) generates. Any element set in this mask prevents the FPU from raising the corresponding type of exception. Instead, the FPU returns its best attempt at a value – often NaN (see page 15992), Infinity (see page 15988), or NegInfinity (see page 15993). The value depends on the operation and the current rounding mode.

SetExceptionMask returns the previous exception mask.

See Also

Set8087CW

GetExceptionMask (see page 15947)

NaN (see page 15992)

Infinity (see page 15988)

NegInfinity (see page 15993)

93.2.87 Math.SetPrecisionMode Function

Sets the FPU precision control mode.

Pascal

```
function SetPrecisionMode(const Precision: TFPUPrecisionMode): TFPUPrecisionMode;
```

C++

```
TFPUPrecisionMode SetPrecisionMode(const TFPUPrecisionMode Precision);
```

File

Math

Description

Call SetPrecisionMode to specify the level of precision that the FPU (floating-point unit) uses for floating-point calculations. The precision control mode can be any of the following values:

Value	Meaning
pmSingle	single precision
pmReserved	not used
pmDouble	double precision
pmExtended	extended precision

SetPrecisionMode returns the previous precision control mode.

See Also

Set8087CW

GetPrecisionMode (see page 15947)

93.2.88 Math.SetRoundMode Function

Sets the FPU rounding mode.

Pascal

```
function SetRoundMode(const RoundMode: TFPURoundingMode): TFPURoundingMode;
```

C++

```
TFPURoundingMode SetRoundMode(const TFPURoundingMode RoundMode);
```

File

Math

Description

Call SetRoundingMode to specify how the FPU handles rounding issues. The rounding mode can be any of the following values:

Value	Meaning
rmNearest	Rounds to the closest value.
rmDown	Rounds toward negative infinity.
rmUp	Rounds toward positive infinity.
rmTruncate	Truncates the value, rounding positive numbers down and negative numbers up.

See Also

Set8087CW

GetRoundMode (see page 15948)

93.2.89 Math.Sign Function

Indicates whether a numeric value is positive, negative, or zero.

Pascal

```
function Sign(const AValue: Integer): TValueSign; overload;
function Sign(const AValue: Int64): TValueSign; overload;
function Sign(const AValue: Double): TValueSign; overload;
```

C++

```
TValueSign Sign(const int AValue);
TValueSign Sign(const Int64 AValue);
TValueSign Sign(const Double AValue);
```

File

Math

Description

Use Sign to test the sign of a numeric value. Sign returns

0 if AValue is zero.

1 if AValue is greater than zero.

-1 if AValue is less than zero.

See Also

IsZero (see page 15954)

93.2.90 Math.SimpleRoundTo Function

Rounds a floating-point value to a specified digit or power of ten using asymmetric arithmetic rounding.

Pascal

```
function SimpleRoundTo(const AValue: Double; const ADigit: TRoundToRange = -2): Double;
```

C++

```
Double SimpleRoundTo(const Double AValue, const TRoundToRange ADigit = -2);
```

File

Math

Description

Call SimpleRoundTo to round AValue to a specified power of ten.

AValue is the value to round.

ADigit indicates the power of ten to which you want AValue rounded. It can be any value from –37 to 37 (inclusive).

SimpleRoundTo uses asymmetric arithmetic rounding to determine how to round values that are exactly midway between the two values that have the desired number of significant digits. This method always rounds to the larger value.

The following examples illustrate the use of SimpleRoundTo:

Expression	Value
SimpleRoundTo(1234567, 3)	1234000
SimpleRoundTo(1.234, -2)	1.23
SimpleRoundTo(1.235, -2)	1.24
SimpleRoundTo(-1.235, -2)	-1.23

See Also

Round

RoundTo (see page 15968)

93.2.91 Math.SinCos Function

Returns sine and cosine of an angle.

Pascal

```
procedure SinCos(const Theta: Extended; var Sin: Extended; var Cos: Extended);
```

C++

```
SinCos(const Extended Theta, Extended Sin, Extended Cos);
```

File

Math

Description

Call SinCos to obtain the sine and cosine of an angle expressed in radians. Theta specifies the angle. The sine and cosine are returned in the Sin and Cos parameters, respectively.

SinCos is twice as fast as calling Sin and Cos separately for the same angle.

93.2.92 Math.Sinh Function

Returns the hyperbolic sine of an angle.

Pascal

```
function Sinh(const X: Extended): Extended;
```

C++

```
Extended Sinh(const Extended X);
```

File

Math

Description

Sinh calculates the hyperbolic sine of X.

93.2.93 Math.SLNDepreciation Function

Returns the straight-line depreciation allowance of an asset.

Pascal

```
function SLNDepreciation(const Cost: Extended; const Salvage: Extended; Life: Integer):
Extended;
```

C++

```
Extended SLNDepreciation(const Extended Cost, const Extended Salvage, int Life);
```

File

Math

Description

SLNDepreciation calculates the straight-line depreciation allowance for an asset over one period of its life. The function divides the Cost minus the Salvage by the number of years of useful Life of the asset. Cost is the amount initially paid for the asset. Salvage is the value of the asset at the end of its useful life.

To compute accelerated depreciation (allowing higher depreciation values in the first years of the assets life), use the SYDDepreciation (see page 15978) function.

See Also

SYDDepreciation (see page 15978)

93.2.94 Math.StdDev Function

Returns the sample standard deviation for elements in an array.

Pascal

```
function StdDev(const Data: array of Double): Extended;
```

C++

```
Extended StdDev(const array of Double Data);
```

File

Math

Description

StdDev calculates the sample standard deviation (the square root of the sample variance) of all values in the Data array parameter. In C++, Data_Size indicates the index of the last element in the array (one less than the number of elements).

See Also

TotalVariance (see page 15979)

Variance (see page 15980)

93.2.95 Math.Sum Function

Returns the sum of the elements in an array.

Pascal

```
function Sum(const Data: array of Double): Extended;
```

C++

```
Extended Sum(const array of Double Data);
```

File

Math

Description

Sum returns the sum of all the values in the Data array parameter. In C++, the Data_Size parameter specifies the index of the last value in Data (one less than the number of values).

See Also

SumInt (see page 15976)

93.2.96 Math.SumInt Function

Returns the sum of the elements in an integer array.

Pascal

```
function SumInt(const Data: array of Integer): Integer;
```

C++

```
int SumInt(const array of Integer Data);
```

File

Math

Description

Sum (see page 15976) returns the sum of all the values in the Data array parameter. In C++, the Data_Size parameter specifies the index of the last value in Data (one less than the number of values).

See Also

Sum (see page 15976)

93.2.97 Math.SumOfSquares Function

Returns the sum of the squared values from a data array.

Pascal

```
function SumOfSquares(const Data: array of Double): Extended;
```

C++

```
Extended SumOfSquares(const array of Double Data);
```

File

Math

Description

SumOfSquares returns the sum of the squares of the Data values: Data[0]^2 + Data[1]^2 + Data[2]^2... In C++, the Data_Size parameter specifies the index of the last value in Data (one less than the number of values).

See Also

Sum (see page 15976)

SumsAndSquares (see page 15977)

93.2.98 Math.SumsAndSquares Function

Returns the sum of the values and the sum of the squared values in an array.

Pascal

```
procedure SumsAndSquares(const Data: array of Double; var Sum: Extended; var SumOfSquares:
Extended);
```

C++

```
SumsAndSquares(const array of Double Data, Extended Sum, Extended SumOfSquares);
```

File

Math

Description

SumsAndSquares returns the sum of the Data values in Sum (see page 15976) and the sum of the squares in SumOfSquares (see page 15977). The data to sum is specified in the Data array parameter. In C++, Data_Size indicates the index of the last value (one less than the number of values in Data).

This function is faster than calculating the sums separately.

See Also

Sum (see page 15976)

SumOfSquares (see page 15977)

TotalVariance (see page 15979)

93.2.99 Math.SYDDepreciation Function

Calculates depreciation for an asset.

Pascal

```
function SYDDepreciation(const Cost: Extended; const Salvage: Extended; Life: Integer; Period:
Integer): Extended;
```

C++

```
Extended SYDDepreciation(const Extended Cost, const Extended Salvage, int Life, int Period);
```

File

Math

Description

SYDDepreciation (for "sum-of-years-digits depreciation") calculates depreciation amounts for an asset using an accelerated depreciation method. This allows for higher depreciation in the earlier years of an asset's life.

Cost is the initial cost of the asset. Salvage is the value of the asset at the end of its life expectancy. Life is the length of the asset's life expectancy. Period is the period for which to calculate the depreciation.

See Also

SLNDepreciation (see page 15975)

93.2.100 Math.Tan Function

Returns the tangent of X.

Pascal

```
function Tan(const X: Extended): Extended;
```

C++

```
Extended Tan(const Extended X);
```

File

Math

Description

Tan returns the tangent of X. Tan(X) = Sin(X) / Cos(X).

See Also

Sin

Cos

ArcTan

93.2.101 Math.Tanh Function

Returns the hyperbolic tangent of X.

Pascal

```
function Tanh(const X: Extended): Extended;
```

C++

```
Extended Tanh(const Extended X);
```

File

Math

Description

Tanh calculates the hyperbolic tangent of X.

See Also

Cosh (see page 15939)

Sinh (see page 15974)

93.2.102 Math.TotalVariance Function

Returns the statistical variance from an array of values.

Pascal

```
function TotalVariance(const Data: array of Double): Extended;
```

C++

```
Extended TotalVariance(const array of Double Data);
```

File

Math

Description

TotalVariance returns the sum of the squares of the difference between each Data value and the mean of the data values.

Total Variance (see page 15980): SUM(i=1,N)[(X(i) - Mean (see page 15958))**2]

See Also

SumOfSquares (see page 15977)

Variance (see page 15980)

StdDev (see page 15975)

Mean (see page 15958)

93.2.103 Math.Variance Function

Calculates statistical sample variance from an array of data.

Pascal

```
function Variance(const Data: array of Double): Extended;
```

C++

```
Extended Variance(const array of Double Data);
```

File

Math

Description

Variance calculates the sample variance of all values in the Data array parameter, using the n-1 method (unbiased). In C++, Data_Size specifies the index of the last value in Data (on less than the number of data values).

See Also

TotalVariance (see page 15979)

StdDev (see page 15975)

Mean (see page 15958)

PopnVariance (see page 15964)

93.3 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TFPUException (see page 15981)	TFPUException defines TFPUExceptionMask (see page 15985) values.
	TFPUPrecisionMode (see page 15982)	TFPUPrecisionMode defines how the FPU handles precision.
	TFPURoundingMode (see page 15983)	TFPURoundingMode defines how the FPU handles rounding issues.
	TPaymentTime (see page 15984)	TPaymentTime is an enumerated type used as a parameter in financial functions.

93.3.1 Math.TFPUException Enumeration

TFPUException defines TFPUExceptionMask (see page 15985) values.

Pascal

```
TFPUException = (
  exInvalidOp,
  exDenormalized,
  exZeroDivide,
  exOverflow,
  exUnderflow,
  exPrecision
);
```

C++

```
enum TFPUException {
  exInvalidOp,
  exDenormalized,
  exZeroDivide,
  exOverflow,
  exUnderflow,
  exPrecision
};
```

File

Math

Description

The FPU (Floating Point Unit) handles floating point calculations. You can prevent exceptions from occuring by using SetExceptionMask (see page 15971) to mask some or all of them.

When an exception is masked, the FPU returns its best attempt at a value – often NaN (see page 15992), Infinity (see page 15988), or NegInfinity (see page 15993). The value depends on the operation and the current rounding mode (see GetRoundMode (see page 15948) and SetRoundMode (see page 15972)).

TFPUExceptionMask (see page 15985) can have none, one, some or all of the following TFPUException values set :

Value	Meaning
exInvalidOp	An invalid operation was attempted.
exDenormalized	A number was reduced in size smaller than can be stored as non-zero. It has been denormalized.

exZeroDivide	An attempt was made to divide by zero.
exOverflow	A number has exceeded the highest positive value supported.
exUnderflow	A number has exceeded the highest negative value supported.
exPrecision	A number has exceeded the number of digits of precision.

See Also

GetExceptionMask (see page 15947)

GetRoundMode (see page 15948)

SetExceptionMask (see page 15971)

SetRoundMode (see page 15972)

TFPUExceptionMask (see page 15985)

93.3.2 Math.TFPUPrecisionMode Enumeration

TFPUPrecisionMode defines how the FPU handles precision.

Pascal

```
TFPUPrecisionMode = (
  pmSingle,
  pmReserved,
  pmDouble,
  pmExtended
);
```

C++

```
enum TFPUPrecisionMode {
  pmSingle,
  pmReserved,
  pmDouble,
  pmExtended
};
```

File

Math

Description

The FPU (Floating Point Unit) handles floating point calculations. GetPrecisionMode (see page 15947) is used to read, and SetPrecisionMode (see page 15972) is used to set the precision control mode, with TFPUPrecisionMode defining this mode.

TFPUPrecisionMode can be one of the following values :

Value	Meaning
pmSingle	Single precision : 7 significant digits, exponent from -38 to +38.
pmReserved	Reserved for future use.
pmDouble	Double precision : 15 significant digits, exponent from -308 to +308.
pmExtended	Extended precision : 19 significant digits, exponent from -4932 to +4932.

See Also

GetPrecisionMode (see page 15947)

GetRoundMode (see page 15948)

SetPrecisionMode (see page 15972)

SetRoundMode (see page 15972)

93.3.3 Math.TFPURoundingMode Enumeration

TFPURoundingMode defines how the FPU handles rounding issues.

Pascal

```
TFPURoundingMode = (
  rmNearest,
  rmDown,
  rmUp,
  rmTruncate
);
```

C++

```
enum TFPURoundingMode {
  rmNearest,
  rmDown,
  rmUp,
  rmTruncate
};
```

File

Math

Description

The FPU (Floating Point Unit) handles floating point calculations. GetRoundMode (see page 15948) is used to read, and SetRoundMode (see page 15972) is used to set the rounding mode, with TFPURoundingMode defining this mode.

TFPURoundingMode can be one of the following values :

Value	Meaning
rmNearest	Rounds to the closest value.
rmDown	Rounds toward negative infinity.
rmUp	Rounds toward positive infinity.
rmTruncate	Truncates the value, rounding positive numbers down and negative numbers up.

See Also

GetPrecisionMode (see page 15947)

GetRoundMode (see page 15948)

SetPrecisionMode (see page 15972)

SetRoundMode (see page 15972)

93.3.4 Math.TPaymentTime Enumeration

TPaymentTime is an enumerated type used as a parameter in financial functions.

Pascal

```
TPaymentTime = (
  ptEndOfPeriod,
  ptStartOfPeriod
);
```

C++

```
enum TPaymentTime {
  ptEndOfPeriod,
  ptStartOfPeriod
};
```

File

Math

Description

TPaymentTime indicates when interest is calculated. The following table lists the possible values:

Value	Meaning
ptStartOfPeriod	Interest is calculated on the principle balance at the beginning of the payment period
ptEndOfPeriod	Interest is calculated at the end of the payment period

93.4 Types

The following table lists types in this documentation.

Types

Name	Description
TFPUExceptionMask (see page 15985)	TFPUExceptionMask defines a set of TFPUException (see page 15981) values.
TRoundToRange (see page 15986)	TRoundToRange defines the RoundTo (see page 15968) rounding limits.
TValueSign (see page 15986)	TValueSign defines the Sign (see page 15973) returned value.

93.4.1 Math.TFPUExceptionMask Type

TFPUExceptionMask defines a set of TFPUException (see page 15981) values.

Pascal

```
TFPUExceptionMask = set of TFPUException;
```

C++

```
TFPUException TFPUExceptionMask;
```

File

Math

Description

The FPU (Floating Point Unit) handles floating point calculations. You can prevent exceptions from occuring by using SetExceptionMask (see page 15971) to mask some or all of them.

When an exception is masked, the FPU returns its best attempt at a value – often NaN (see page 15992), Infinity (see page 15988), or NegInfinity (see page 15993). The value depends on the operation and the current rounding mode (see GetRoundMode (see page 15948) and SetRoundMode (see page 15972)).

TFPUExceptionMask can have none, one, some or all of the following TFPUException (see page 15981) values set :

Value	Meaning
exInvalidOp	An invalid operation was attempted.
exDenormalized	A number was reduced in size smaller than can be stored as non-zero. It has been denormalized.
exZeroDivide	An attempt was made to divide by zero.
exOverflow	A number has exceeded the highest positive value supported.
exUnderflow	A number has exceeded the highest negative value supported.
exPrecision	A number has exceeded the number of digits of precision.

See Also

GetExceptionMask (see page 15947)

GetRoundMode (see page 15948)

SetExceptionMask (see page 15971)

SetRoundMode (see page 15972)

TFPUException (see page 15981)

93.4.2 Math.TRoundToRange Type

TRoundToRange defines the RoundTo (see page 15968) rounding limits.

Pascal

```
TRoundToRange = -37..37;
```

C++

```
-37..37 TRoundToRange;
```

File

Math

Description

The RoundTo (see page 15968) routine rounds a floating-point value to a specified digit or power of ten using "Banker's rounding". A negative TRoundToRange value rounds to this number of decimal places. A positive value removes all decimal places, and zeroes this number of significant digits to the left of the decimal point. Banker's rounding always rounds down to an even value last digit when it has a choice.

See Also

RoundTo (see page 15968)

93.4.3 Math.TValueSign Type

TValueSign defines the Sign (see page 15973) returned value.

Pascal

```
TValueSign = -1..1;
```

C++

```
-1..1 TValueSign;
```

File

Math

Description

The Sign (see page 15973) routine determines whether a number is negative, zero or positive. It returns the result in a TValueSign value as follows :

Value	Associated constant	Meaning
-1	NegativeValue (see page 15992)	Negative number.
0	ZeroValue (see page 15994)	Zero.
+1	PositiveValue (see page 15993)	Positive number.

See Also

NegativeValue (see page 15992)

PositiveValue (see page 15993)

ZeroValue (see page 15994)

RoundTo (see page 15968)

93.5 Constants

The following table lists constants in this documentation.

Constants

Name	Description
Infinity (see page 15988)	Infinity represents positive infinity.
MaxComp (see page 15989)	MaxComp defines the maximum absolute value for a Comp variable.
MaxDouble (see page 15989)	MaxDouble defines the maximum absolute value for a Double variable.
MaxExtended (see page 15989)	MaxExtended defines the maximum absolute value for an Extended variable.
MaxSingle (see page 15990)	MaxSingle defines the maximum absolute value for a Single variable.
MinComp (see page 15990)	MinComp defines the smallest absolute value for a Comp variable.
MinDouble (see page 15991)	MinDouble defines the smallest absolute value for a Double variable.
MinExtended (see page 15991)	MinExtended defines the smallest absolute value for an Extended variable.
MinSingle (see page 15991)	MinSingle defines the smallest absolute value for a Single variable.
NaN (see page 15992)	NaN represents a value that cannot be represented as a valid number.
NegativeValue (see page 15992)	NegativeValue defines a negative number result from using Sign (see page 15973).
NegInfinity (see page 15993)	NegInfinity represents negative infinity.
PositiveValue (see page 15993)	PositiveValue defines a positive number result from using Sign (see page 15973).
ZeroValue (see page 15994)	ZeroValue defines a zero value number result from using Sign (see page 15973).

93.5.1 Math.Infinity Constant

Infinity represents positive infinity.

Pascal

```
Infinity = 1.0 / 0.0;
```

C++

```
Infinity = 1.0 / 0.0;
```

File

Math

Description

Infinity is literally defined as 1.0/0.0 : positive infinity.

Note: Only use Infinity in assignments : use IsInfinite (see page 15953).

See Also

IsInfinite (see page 15953)

NegInfinity (see page 15993)

93.5.2 Math.MaxComp Constant

MaxComp defines the maximum absolute value for a Comp variable.

Pascal

```
MaxComp = 9.223372036854775807e+18;
```

C++

```
MaxComp = 9.223372036854775807e+18;
```

File

Math

Description

MaxComp defines the maximum absolute value for a Comp variable.

See Also

MinComp (see page 15990)

93.5.3 Math.MaxDouble Constant

MaxDouble defines the maximum absolute value for a Double variable.

Pascal

```
MaxDouble = 1.7e+308;
```

C++

```
MaxDouble = 1.7e+308;
```

File

Math

Description

MaxDouble defines the maximum absolute value for a Double variable.

See Also

MinDouble (see page 15991)

93.5.4 Math.MaxExtended Constant

MaxExtended defines the maximum absolute value for an Extended variable.

Pascal

```
MaxExtended = 1.1e+4932;
```

C++

```
MaxExtended = 1.1e+4932;
```

File

Math

Description

MaxExtended defines the maximum absolute value for an Extended variable.

See Also

MinExtended (see page 15991)

93.5.5 Math.MaxSingle Constant

MaxSingle defines the maximum absolute value for a Single variable.

Pascal

```
MaxSingle = 3.4e+38;
```

C++

```
MaxSingle = 3.4e+38;
```

File

Math

Description

MaxSingle defines the maximum absolute value for a Single variable.

See Also

MinSingle (see page 15991)

93.5.6 Math.MinComp Constant

MinComp defines the smallest absolute value for a Comp variable.

Pascal

```
MinComp = -9.223372036854775807e+18;
```

C++

```
MinComp = -9.223372036854775807e+18;
```

File

Math

Description

MinComp defines the smallest absolute value for a Comp variable.

See Also

MaxComp (see page 15989)

93.5.7 Math.MinDouble Constant

MinDouble defines the smallest absolute value for a Double variable.

Pascal

```
MinDouble = 5.0e-324;
```

C++

```
MinDouble = 5.0e-324;
```

File

Math

Description

MinDouble defines the smallest absolute value for a Double variable.

See Also

MaxDouble (see page 15989)

93.5.8 Math.MinExtended Constant

MinExtended defines the smallest absolute value for an Extended variable.

Pascal

```
MinExtended = 3.4e-4932;
```

C++

```
MinExtended = 3.4e-4932;
```

File

Math

Description

MinExtended defines the smallest absolute value for an Extended variable.

See Also

MaxExtended (see page 15989)

93.5.9 Math.MinSingle Constant

MinSingle defines the smallest absolute value for a Single variable.

Pascal

```
MinSingle = 1.5e-45;
```

C++

```
MinSingle = 1.5e-45;
```

File

Math

Description

MinSingle defines the smallest absolute value for a Single variable.

See Also

MaxSingle (see page 15990)

93.5.10 Math.NaN Constant

NaN represents a value that cannot be represented as a valid number.

Pascal

```
NaN = 0.0 / 0.0;
```

C++

```
NaN = 0.0 / 0.0;
```

File

Math

Description

NaN is literally defined as 0.0/0.0 : an undefined value.

Note: Only use NaN in assignments : use IsNaN.

See Also

IsNaN

93.5.11 Math.NegativeValue Constant

NegativeValue defines a negative number result from using Sign (see page 15973).

Pascal

```
NegativeValue = Low(TValueSign);
```

C++

```
NegativeValue = Low(TValueSign);
```

File

Math

Description

Sign (see page 15973) determines the sign of a number, returning the result in a TValueSign (see page 15986) value. TValueSign (see page 15986) will be NegativeValue if the number is negative.

See Also

PositiveValue (see page 15993)

Sign (see page 15973)

TValueSign (see page 15986)

ZeroValue (see page 15994)

93.5.12 Math.NegInfinity Constant

NegInfinity represents negative infinity.

Pascal

```
NegInfinity = -1.0 / 0.0;
```

C++

```
NegInfinity = -1.0 / 0.0;
```

File

Math

Description

NegInfinity is literally defined as -1.0/0.0 : negative infinity.

Note: Only use NegInfinity in assignments : use IsInfinite (see page 15953).

See Also

Infinity (see page 15988)

IsInfinity

IsInfinite (see page 15953)

93.5.13 Math.PositiveValue Constant

PositiveValue defines a positive number result from using Sign (see page 15973).

Pascal

```
PositiveValue = High(TValueSign);
```

C++

```
PositiveValue = High(TValueSign);
```

File

Math

Description

Sign (see page 15973) determines the sign of a number, returning the result in a TValueSign (see page 15986) value. TValueSign (see page 15986) will be PositiveValue if the number is positive.

See Also

NegativeValue (see page 15992)

Sign (see page 15973)

TValueSign (see page 15986)

ZeroValue (see page 15994)

93.5.14 Math.ZeroValue Constant

ZeroValue defines a zero value number result from using Sign (see page 15973).

Pascal

```
ZeroValue = 0;
```

C++

```
ZeroValue = 0;
```

File

Math

Description

Sign (see page 15973) determines the sign of a number, returning the result in a TValueSign (see page 15986) value. TValueSign (see page 15986) will be ZeroValue if the number is zero.

See Also

NegativeValue (see page 15992)

PositiveValue (see page 15993)

Sign (see page 15973)

TValueSign (see page 15986)

94 MConnect Namespace

This is namespace MConnect.

Topics

Name	Description
Classes (see page 15996)	The following table lists classes in this documentation.
Functions (see page 16051)	The following table lists functions in this documentation.

Classes

	Name	Description
	TCOMConnection (see page 15996)	TCOMConnection is the base class for components that connect to application servers using DCOM or OLE.
	TCustomObjectBroker (see page 16002)	TCustomObjectBroker is the base class for components that locate available application servers for a DataSnap connection component.
	TDCOMConnection (see page 16008)	TDCOMConnection handles a client application's DCOM connection to the remote server in a in a multi-tiered application.
	TDispatchAppServer (see page 16015)	This is class MConnect.TDispatchAppServer.
	TDispatchConnection (see page 16017)	TDispatchConnection is the base class for objects that connect client applications to an IDispatch-based application server.
	TOLEnterpriseConnection (see page 16033)	TOLEnterpriseConnection is provided for backward compatibility with applications that connect to an application server using OLEnterprise.
	TSharedConnection (see page 16039)	TSharedConnection connects to a child remote data module that is accessible only through the properties of a main remote data module on the application server.

Functions

	Name	Description
	GetMIDASAppServerList (see page 16051)	This is function MConnect.GetMIDASAppServerList.

94.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TCOMConnection (see page 15996)	TCOMConnection is the base class for components that connect to application servers using DCOM or OLE.
	TCustomObjectBroker (see page 16002)	TCustomObjectBroker is the base class for components that locate available application servers for a DataSnap connection component.
	TDCOMConnection (see page 16008)	TDCOMConnection handles a client application's DCOM connection to the remote server in a in a multi-tiered application.
	TDispatchAppServer (see page 16015)	This is class MConnect.TDispatchAppServer.
	TDispatchConnection (see page 16017)	TDispatchConnection is the base class for objects that connect client applications to an IDispatch-based application server.
	TOLEnterpriseConnection (see page 16033)	TOLEnterpriseConnection is provided for backward compatibility with applications that connect to an application server using OLEnterprise.
	TSharedConnection (see page 16039)	TSharedConnection connects to a child remote data module that is accessible only through the properties of a main remote data module on the application server.

94.1.1 TCOMConnection Class

TCOMConnection is the base class for components that connect to application servers using DCOM or OLE.

Class Hierarchy

Pascal

```
TCOMConnection = class(TDispatchConnection);
```

C++

```
class TCOMConnection : public TDispatchConnection;
```

File

MConnect

Description

Do not create instances of TCOMConnection. Instead, use TCOMConnection as a base class when created a custom component that forms a COM-based connection to an application server.

TCOMConnection adds to the ability to work with COM objects to the generic connection capabilities inherited from TDispatchConnection (see page 16017). It has two descendants: TDCOMConnection (see page 16008), which creates and manages connections using DCOM, and TOLEnterpriseConnection (see page 16033), which is provided for backward compatibility and handles connections using OLEnterprise.

See Also

TClientDataSet (see page 8289)

TDCOMConnection (see page 16008)

TOLEnterpriseConnection (see page 16033)

TDataSetProvider (see page 18508)

IAppServer (see page 16450)

Writing Applications Using COM

94.1.1.1 TCOMConnection Members

The following tables list the members exposed by TCOMConnection.

Protected Events

	Name	Description
	OnGetUsername (see page 8533)	This is OnGetUsername, a member of class TCustomRemoteServer.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DoConnect (see page 16001)	Connects to an application server.
V	DoDisconnect (see page 6864)	Provides the interface for a method that terminates the connection.
V	DoDisconnect (see page 16023)	Drops a connection to an application server.
V	GetAppServer (see page 8530)	Returns the value of the AppServer (see page 8532) property.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetConnected (see page 6865)	Returns the value of the Connected (see page 6868) property.
V	GetConnected (see page 16023)	Returns the value of the Connected (see page 16026) property.
V	GetDataSet (see page 6865)	Returns a dataset, given its index in the DataSets (see page 6870) property array.
V	GetDataSetCount (see page 6865)	Returns the value of the DataSetCount (see page 6869) property.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetServerCLSID (see page 16024)	Returns the GUID for the application server.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.

	Loaded (see page 6866)	Initializes the connection component after all objects in the form or data module have been loaded.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	Notification (see page 16025)	Responds when other objects are created or destroyed.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	RegisterClient (see page 6866)	Registers an object that uses the connection component.
	SendConnectEvent (see page 6867)	Informs all registered clients that use the connection component when a connection is opened or closed.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetAppServer (see page 8531)	Sets the AppServer (see page 8532) property.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetConnected (see page 16001)	Sets the Connected (see page 16026) property.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	UnRegisterClient (see page 6868)	Removes a registered client so that it is no longer associated with the connection component.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	ObjectBroker (see page 16028)	Specifies an Object Broker that allows the connection component to choose from several application servers.
	StreamedConnected (see page 6874)	Indicates whether the Connected (see page 6868) property was true when the connection component was loaded from a stream.

Public Events

	Name	Description
	AfterConnect (see page 6874)	Occurs after a connection is established.
	AfterDisconnect (see page 6875)	Occurs after the connection closes.
	BeforeConnect (see page 6875)	Occurs immediately before establishing a connection.
	BeforeDisconnect (see page 6875)	Occurs immediately before the connection closes.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.

	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Close (see page 6863)	Closes the connection.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
V	Create (see page 6862)	Creates an instance of TCustomConnection (see page 6858).
V	Create (see page 8529)	Creates an instance of a remote server component.
V	Create (see page 16022)	Creates an instance of a dispatch connection component.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 6863)	Destroys the instance of a connection component.
V	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetProviderNames (see page 8530)	Executes a callback for all provider objects on the application server.
V	GetServer (see page 8530)	Returns the IAppServer interface of the application server.
V	GetServer (see page 16023)	Returns the IAppServer interface of the application server.
V	GetServerList (see page 8531)	Returns a list of application servers (remote data modules) to which the component can connect.
V	GetServerList (see page 16024)	Returns a list of remote data modules to which the component can connect.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.

V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	Open (see page 6866)	Opens the connection.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	AppServer (see page 8532)	Contains the interface for communicating with the application server.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Connected (see page 6868)	Determines whether a connection has been established to the remote source of data.
R	DataSetCount (see page 6869)	Indicates the number of datasets associated with the connection component.
R	DataSets (see page 6870)	Lists the datasets currently using this connection component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	LoginPrompt (see page 6872)	Specifies whether a login dialog appears immediately before opening a new connection.
	OnLogin (see page 6873)	Occurs when a communication channel opens to the server.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Events

	Name	Description
	AfterConnect (see page 16031)	Occurs after a connection is established.
	AfterDisconnect (see page 16031)	Occurs after the connection closes.
	BeforeConnect (see page 16032)	Occurs immediately before establishing a connection.
	BeforeDisconnect (see page 16032)	Occurs immediately before the connection closes.
	OnGetUsername (see page 16033)	This is OnGetUsername, a member of class TDispatchConnection.

Published Properties

	Name	Description
	Connected (see page 16026)	Indicates whether the TDispatchConnection (see page 16017) object is connected to an application server.
	LoginPrompt (see page 16027)	Specifies whether a login dialog appears immediately before opening a new connection.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	OnLogin (see page 16028)	Occurs when a communication channel opens to the server.
	ServerGUID (see page 16030)	Specifies the GUID of the application server with which to connect.
	ServerName (see page 16030)	Specifies the name of the application server with which to connect.
	Tag (see page 2808)	Stores an integer value as part of a component.

94.1.1.2 TCOMConnection Methods

The methods of the TCOMConnection class are listed here.

Protected Methods

	Name	Description
	DoConnect (see page 16001)	Connects to an application server.
	SetConnected (see page 16001)	Sets the Connected (see page 16026) property.

94.1.1.2.1 TCOMConnection.DoConnect Method

Connects to an application server.

Pascal

```
procedure DoConnect; override;
```

C++

```
virtual __fastcall DoConnect();
```

Description

DoConnect is called internally when the Connected (see page 16026) property is set to true. DoConnect creates a COM object for the application server (based on the ServerName (see page 16030) or ServerGUID (see page 16030) property), and sets the value of the AppServer property to this COM object.

Descendants of TCOMConnection (see page 15996) override DoConnect to change the way the client application forms a connection to an application server.

See Also

AfterConnect (see page 6874)

BeforeConnect (see page 6875)

Connected

AppServer (see page 8532)

ServerName (see page 16030)

ServerGUID (see page 16030)

94.1.1.2.2 TCOMConnection.SetConnected Method

Sets the Connected (see page 16026) property.

Pascal

```
procedure SetConnected(Value: Boolean); override;
```

C++

```
virtual __fastcall SetConnected(Boolean Value);
```

Description

SetConnected is the protected implementation of the Connected (see page 16026) property.

If Value is false, SetConnected generates a BeforeDisconnect (see page 16032) event, closes the connection, and generates an AfterDisconnect (see page 16031) event.

If Value is true, SetConnected performs the following actions:

1. It checks the value of the ServerGUID (see page 16030) or ServerName (see page 16030) property and raises an exception if these do not specify a valid application server.
2. If LoginPrompt (see page 16027) is true, and the connection is not already open, SetConnected generates an OnGetUsername (see page 16033) event, and uses that to initialize a login dialog. It displays the login dialog, and aborts the connection if the user cancels.
3. It generates a BeforeConnect (see page 16032) event.
4. It opens the connection.
5. It generates an AfterConnect (see page 16031) event.
6. If LoginPrompt (see page 16027) is true, and the connection opened successfully, SetConnected generates an OnLogin (see page 16028) event.

AfterConnect (see page 6874)

BeforeDisconnect (see page 6875)

AfterDisconnect (see page 6875)

LoginPrompt (see page 6872)

OnGetUserName (see page 8533)

OnLogin (see page 6873)

94.1.2 TCustomObjectBroker Class

TCustomObjectBroker is the base class for components that locate available application servers for a DataSnap connection component.

Class Hierarchy

Pascal

```
TCustomObjectBroker = class(TComponent);
```

C++

```
class TCustomObjectBroker : public TComponent;
```

File

MConnect

Description

TCustomObjectBroker defines the methods by which a connection component obtains information about available application servers. When a connection component uses an object broker, it does not save any properties that identify a particular server machine. Instead, when it needs to open a connection, it uses the methods of the object broker to get that identifying information. This process allows client applications to locate server systems dynamically at runtime. If there are redundant server systems, this allows client applications to continue functioning when a server goes down.

TCustomObjectBroker does not implement any of the methods that provide information to connection components. Instead, descendants such as TSimpleObjectBroker implement a mechanism for choosing servers and identifying them to connection components. Application developers can derive more elaborate object brokers that provide additional benefits such as intelligent load balancing.

See Also

TDispatchConnection (see page 16017)

TSimpleObjectBroker (see page 17877)

94.1.2.1 TCustomObjectBroker Members

The following tables list the members exposed by TCustomObjectBroker.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.

	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 2766)	Disposes of the component and its owned components.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.

A	GetComputerForGUID (see page 16006)	Returns a string that identifies a server machine for an interface identified by its GUID.
A	GetComputerForProgID (see page 16006)	Returns the machine name, URL, host name, or IP address of a server machine that supports an interface identified by its class name.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
A	GetPortForComputer (see page 16007)	Returns a port number for connecting to a specified remote server.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
A	SetConnectStatus (see page 16008)	Records whether a connection was established to a specified server.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

94.1.2.2 TCustomObjectBroker Methods

The methods of the TCustomObjectBroker class are listed here.

Public Methods

	Name	Description
	GetComputerForGUID (see page 16006)	Returns a string that identifies a server machine for an interface identified by its GUID.
	GetComputerForProgID (see page 16006)	Returns the machine name, URL, host name, or IP address of a server machine that supports an interface identified by its class name.
	GetPortForComputer (see page 16007)	Returns a port number for connecting to a specified remote server.
	SetConnectStatus (see page 16008)	Records whether a connection was established to a specified server.

94.1.2.2.1 TCustomObjectBroker.GetComputerForGUID Method

Returns a string that identifies a server machine for an interface identified by its GUID.

Pascal

```
function GetComputerForGUID(GUID: TGUID): string; virtual; abstract;
```

C++

```
virtual __fastcall AnsiString GetComputerForGUID(TGUID GUID) = 0;
```

Description

Call GetComputerForGUID to obtain a string that identifies a server machine on which a given interface is registered. The GUID parameter specifies the global unique identifier of the desired interface.

TCustomObjectBroker (see page 16002) declares GetComputerForGUID as an abstract (pure virtual) method. It is implemented in descendant objects that return a string designed to work with a particular connection component.

Connection components call this method, passing in the value of their ServerGUID property. They use the return value to set the ComputerName, URL, Host, or Address property, as appropriate.

See Also

GetComputerForProgID (see page 16006)

ServerGUID (see page 16030)

computername (see page 16014)

Address (see page 18935)

Host (see page 18936)

URL (see page 19878)

94.1.2.2.2 TCustomObjectBroker.GetComputerForProgID Method

Returns the machine name, URL, host name, or IP address of a server machine that supports an interface identified by its class name.

Pascal

```
function GetComputerForProgID(const ProgID): string; virtual; abstract;
```

C++

```
virtual __fastcall AnsiString GetComputerForProgID(const  ProgID) = 0;
```

Description

Call GetComputerForProgID to obtain the name or address of a server machine on which a given interface is registered. The ProgID parameter specifies the name of the desired interface. If the server was created using one of the remote data module wizards, this is the value that was entered as the class name for the wizard.

TCustomObjectBroker (see page 16002) declares GetComputerForProgID as an abstract (pure virtual) method. It is implemented in descendant objects that return a string designed to work with a particular connection component.

Connection components can call this method, passing in the value of their ServerName property. They can use the return value to set the ComputerName, URL, Host, or Address property, as appropriate.

See Also

GetComputerForGUID (see page 16006)

ServerName (see page 16030)

computername (see page 16014)

Address (see page 18935)

Host (see page 18936)

URL (see page 19878)

94.1.2.2.3 TCustomObjectBroker.GetPortForComputer Method

Returns a port number for connecting to a specified remote server.

Pascal

```
function GetPortForComputer(const ComputerName: string): Integer; virtual; abstract;
```

C++

```
virtual __fastcall int GetPortForComputer(const AnsiString ComputerName) = 0;
```

Description

Socket connection components call GetPortForComputer to get a value for their Port property. The ComputerName parameter specifies a Host name or IP address that was returned by GetComputerForGUID (see page 16006) or GetComputerForProgID (see page 16006).

None of the connection components that work on Linux explicitly use a Port number. GetPortForComputer is included in TCustomObjectBroker (see page 16002) to allow for the possibility of connection components that use an explicit Port number. The ComputerName parameter is a Host name or IP address that is returned by the GetComputerForGUID (see page 16006) or GetComputerForProgID (see page 16006) method.

TCustomObjectBroker (see page 16002) declares GetPortForComputer as an abstract (pure virtual) method. It is implemented in descendant objects that return a string designed to work with a particular connection component.

Note: This interface assumes that a single socket dispatcher on each server system handles all client requests, even when they are destined for different application servers on the same host.

See Also

GetComputerForProgID (see page 16006)

GetComputerForGUID (see page 16006)

Port (see page 18938)

94.1.2.2.4 TCustomObjectBroker.SetConnectStatus Method

Records whether a connection was established to a specified server.

Pascal

```
procedure SetConnectStatus(ComputerName: string; Success: Boolean); virtual; abstract;
```

C++

```
virtual __fastcall SetConnectStatus(AnsiString ComputerName, Boolean Success) = 0;
```

Description

After calling GetComputerForGUID (see page 16006) or GetComputerForProgID (see page 16006), connection components use the returned value to open a connection to the identified server. They then call SetConnectStatus to tell the broker whether the connection was successfully opened.

TCustomObjectBroker (see page 16002) declares SetConnectStatus as an abstract (pure virtual) method. Descendants override this method to keep track of when server machines are down or to monitor the number of connections created for each server.

See Also

GetComputerForGUID (see page 16006)

GetComputerForProgID (see page 16006)

94.1.3 TDCOMConnection Class

TDCOMConnection handles a client application's DCOM connection to the remote server in a in a multi-tiered application.

Class Hierarchy

Pascal

```
TDCOMConnection = class(TCOMConnection);
```

C++

```
class TDCOMConnection : public TCOMConnection;
```

File

MConnect

Description

TDCOMConnection is used in the client portion of a multi-tiered database application to establish and maintain the connection between the client and a remote application server. The DCOM connection object can

Establish an initial connection to a remote application server.

Obtain an IAppServer for the application server.

Obtain a list of providers on the application server.

Drop the connection to the remote application server.

TDCOMConnection uses DCOM to establish the initial connection between the client application and a remote application server. In order to do so, the application server must be registered on the client machine.

Once the connection is established, the client registers any or all of its client datasets with TDCOMConnection, and these client datasets use the IAppServer interface from the DCOM connection component to communicate with providers on the application server, or to otherwise call the application server's data module interface.

To connect client applications to remote application servers using TCP/IP sockets, use TSocketConnection instead. To connect to remote application servers using HTTP, use the TWebConnection component. To connect to application servers using SOAP, use TSoapConnection.

See Also

TClientDataSet (see page 8289)

TSocketConnection (see page 18928)

TRemoteDataModule (see page 6585)

TDataSetProvider (see page 18508)

TWebConnection (see page 18968)

TSoapConnection (see page 19864)

Specifying a Connection Using DCOM

94.1.3.1 TDCOMConnection Members

The following tables list the members exposed by TDCOMConnection.

Protected Events

	Name	Description
	OnGetUsername (see page 8533)	This is OnGetUsername, a member of class TCustomRemoteServer.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DoConnect (see page 16013)	Connects to an application server.
V	DoDisconnect (see page 6864)	Provides the interface for a method that terminates the connection.
V	DoDisconnect (see page 16023)	Drops a connection to an application server.
V	GetAppServer (see page 8530)	Returns the value of the AppServer (see page 8532) property.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.

	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetConnected (see page 6865)	Returns the value of the Connected (see page 6868) property.
	GetConnected (see page 16023)	Returns the value of the Connected (see page 16026) property.
	GetDataSet (see page 6865)	Returns a dataset, given its index in the DataSets (see page 6870) property array.
	GetDataSetCount (see page 6865)	Returns the value of the DataSetCount (see page 6869) property.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetServerCLSID (see page 16024)	Returns the GUID for the application server.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Loaded (see page 6866)	Initializes the connection component after all objects in the form or data module have been loaded.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	Notification (see page 16025)	Responds when other objects are created or destroyed.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	RegisterClient (see page 6866)	Registers an object that uses the connection component.
	SendConnectEvent (see page 6867)	Informs all registered clients that use the connection component when a connection is opened or closed.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetAppServer (see page 8531)	Sets the AppServer (see page 8532) property.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetConnected (see page 6867)	Changes the value of the Connected (see page 6868) property.
	SetConnected (see page 16001)	Sets the Connected (see page 16026) property.
	SetConnected (see page 16025)	Sets the Connected (see page 16026) property.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	UnRegisterClient (see page 6868)	Removes a registered client so that it is no longer associated with the connection component.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	StreamedConnected (see page 6874)	Indicates whether the Connected (see page 6868) property was true when the connection component was loaded from a stream.

Public Events

	Name	Description
	AfterConnect (see page 6874)	Occurs after a connection is established.
	AfterDisconnect (see page 6875)	Occurs after the connection closes.
	BeforeConnect (see page 6875)	Occurs immediately before establishing a connection.
	BeforeDisconnect (see page 6875)	Occurs immediately before the connection closes.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Close (see page 6863)	Closes the connection.
V	Create (see page 16013)	Creates and initializes a DCOM connection component.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 6863)	Destroys the instance of a connection component.
V	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetProviderNames (see page 8530)	Executes a callback for all provider objects on the application server.
V	GetServer (see page 8530)	Returns the IAppServer interface of the application server.
V	GetServer (see page 16023)	Returns the IAppServer interface of the application server.

V	GetServerList (see page 8531)	Returns a list of application servers (remote data modules) to which the component can connect.
V	GetServerList (see page 16024)	Returns a list of remote data modules to which the component can connect.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	Open (see page 6866)	Opens the connection.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	AppServer (see page 8532)	Contains the interface for communicating with the application server.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Connected (see page 6868)	Determines whether a connection has been established to the remote source of data.
R	DataSetCount (see page 6869)	Indicates the number of datasets associated with the connection component.
R	DataSets (see page 6870)	Lists the datasets currently using this connection component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	LoginPrompt (see page 6872)	Specifies whether a login dialog appears immediately before opening a new connection.
	OnLogin (see page 6873)	Occurs when a communication channel opens to the server.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Events

	Name	Description
	AfterConnect (see page 16031)	Occurs after a connection is established.
	AfterDisconnect (see page 16031)	Occurs after the connection closes.
	BeforeConnect (see page 16032)	Occurs immediately before establishing a connection.
	BeforeDisconnect (see page 16032)	Occurs immediately before the connection closes.
	OnGetUsername (see page 16033)	This is OnGetUsername, a member of class TDispatchConnection.

Published Properties

	Name	Description
	ComputerName (see page 16014)	This is ComputerName, a member of class TDCOMConnection.
	Connected (see page 16026)	Indicates whether the TDispatchConnection (see page 16017) object is connected to an application server.
	LoginPrompt (see page 16027)	Specifies whether a login dialog appears immediately before opening a new connection.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	ObjectBroker (see page 16014)	Specifies an Object Broker that allows the connection component to choose from several application servers.
	OnLogin (see page 16028)	Occurs when a communication channel opens to the server.
	ServerGUID (see page 16030)	Specifies the GUID of the application server with which to connect.
	ServerName (see page 16030)	Specifies the name of the application server with which to connect.
	Tag (see page 2808)	Stores an integer value as part of a component.

94.1.3.2 TDCOMConnection.Create Constructor

Creates and initializes a DCOM connection component.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TDCOMConnection(TComponent * AOwner);
```

Description

Call Create to instantiate TDCOMConnection (see page 16008) at runtime. DCOM connection components placed in forms or data modules at design time are created automatically.

The AOwner parameter specifies the component (usually the form or data module) that is responsible for freeing the DCOM connection component.

94.1.3.3 TDCOMConnection Methods

The methods of the TDCOMConnection class are listed here.

Protected Methods

	Name	Description
	DoConnect (see page 16013)	Connects to an application server.

94.1.3.3.1 TDCOMConnection.DoConnect Method

Connects to an application server.

Pascal

```
procedure DoConnect; override;
```

C++

```
virtual __fastcall DoConnect();
```

Description

DoConnect is called when the Connected (see page 16026) property is set to true. DoConnect establishes a dual interface with the remote data module on the application server. This interface is used to locate providers on the application server.

To locate the server system, DoConnect uses the ComputerName (see page 16014) property. If the ObjectBroker (see page 16014) property is set, DoConnect gets this value from the object broker. Otherwise, the application must assign this property a value directly.

See Also

AfterConnect (see page 6874)

BeforeConnect (see page 6875)

Connected

AppServer (see page 8532)

computername (see page 16014)

94.1.3.4 TDCOMConnection Properties

The properties of the TDCOMConnection class are listed here.

Published Properties

	Name	Description
	ComputerName (see page 16014)	This is ComputerName, a member of class TDCOMConnection.
	ObjectBroker (see page 16014)	Specifies an Object Broker that allows the connection component to choose from several application servers.

94.1.3.4.1 TDCOMConnection.ComputerName Property

Pascal

```
property ComputerName: string;
```

C++

```
__property AnsiString ComputerName;
```

Description

This is ComputerName, a member of class TDCOMConnection.

94.1.3.4.2 TDCOMConnection.ObjectBroker Property

Specifies an Object Broker that allows the connection component to choose from several application servers.

Pascal

```
property ObjectBroker: TCustomObjectBroker;
```

C++

```
__property TCustomObjectBroker ObjectBroker;
```

Description

Set ObjectBroker to use a broker that maintains a list of servers that support the application specified by ServerName or ServerGUID. When the connection component needs to open a connection, it requests information to identify a server machine from the Object Broker.

Descendants of TDispatchConnection define properties that specify how to locate server machines. These properties are not saved with the connection component if the ObjectBroker property is set. Instead, the Object Broker provides this information

dynamically at runtime from its list of available servers.

Applications can use TSimpleObjectBroker for an object broker, or derive their own object brokers from TCustomObjectBroker.

94.1.4 TDispatchAppServer Class

Class Hierarchy

Pascal

```
TDispatchAppServer = class(TInterfacedObject, IAppServer, ISupportErrorInfo);
```

C++

```
class TDispatchAppServer : public TInterfacedObject, public IAppServer, public
ISupportErrorInfo;
```

File

MConnect

Description

This is class MConnect.TDispatchAppServer.

94.1.4.1 TDispatchAppServer Members

The following tables list the members exposed by TDispatchAppServer.

Protected Data Members

	Name	Description
	FRefCount (see page 22278)	This is FRefCount, a member of class TInterfacedObject.

Protected Methods

	Name	Description
	_AddRef (see page 22278)	Implements the IInterface (see page 22396) System::TInterfacedObject::_AddRef method.
	_Release (see page 22279)	Implements the IInterface (see page 22396) System::TInterfacedObject::_Release method.
	QueryInterface (see page 22280)	Implements the IInterface (see page 22396) System::TInterfacedObject::QueryInterface method.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22279)	Responds after the last constructor executes.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	AS_ApplyUpdates (see page 16451)	Applies updates received from a client dataset using a specified provider.
	AS_DataRequest (see page 16452)	Generates an OnAS_DataRequest event on the specified provider component.
	AS_Execute (see page 16453)	AS_Executes the query or stored procedure bound to a specified provider.
	AS_GetParams (see page 16454)	Fetches current parameter values from the dataset bound to a specified provider.
	AS_GetProviderNames (see page 16454)	Returns a list of all the available providers on a remote data module.
	AS_GetRecords (see page 16455)	Returns a data packet that contains the specified data.
	AS_RowRequest (see page 16456)	Returns information from a specified record of the provider's dataset.
V	BeforeDestruction (see page 22279)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 16017)	This is Create, a member of class TDispatchAppServer.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetIDsOfNames (see page 22395)	This is GetIDsOfNames, a member of class IDispatch.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetTypeInfo (see page 22395)	This is GetTypeInfo, a member of class IDispatch.
	GetTypeInfoCount (see page 22395)	This is GetTypeInfoCount, a member of class IDispatch.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	Invoke (see page 22395)	This is Invoke, a member of class IDispatch.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22280)	Allocates memory for each instance of an interfaced object.

	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	SafeCallException (see page 16017)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
	RefCount (see page 22281)	Indicates the number of interface pointers currently dependent upon the object.

94.1.4.2 TDispatchAppServer.Create Constructor

Pascal

```
constructor Create(const AppServer: IAppServerDisp);
```

C++

```
__fastcall TDispatchAppServer(const IAppServerDisp AppServer);
```

Description

This is Create, a member of class TDispatchAppServer.

94.1.4.3 TDispatchAppServer Methods

The methods of the TDispatchAppServer class are listed here.

Public Methods

	Name	Description
	SafeCallException (see page 16017)	Handles exceptions in methods declared using the safecall calling convention.

94.1.4.3.1 TDispatchAppServer.SafeCallException Method

Handles exceptions in methods declared using the safecall calling convention.

Pascal

```
function SafeCallException(ExceptObject: TObject; ExceptAddr: Pointer): HResult; override;
```

C++

```
virtual __fastcall HRESULT SafeCallException(TObject * ExceptObject, void * ExceptAddr);
```

Description

System::TObject::SafeCallException handles exceptions in methods that use the safecall calling convention. Some classes that implement interfaces override this method to handle errors that might occur.

As implemented in System::TObject::TObject, System::TObject::SafeCallException simply returns E_UNEXPECTED. This is the appropriate response for classes that do no support interfaces

94.1.5 TDispatchConnection Class

TDispatchConnection is the base class for objects that connect client applications to an IDispatch-based application server.

Class Hierarchy

Pascal

```
TDispatchConnection = class(TCustomRemoteServer);
```

C++

```
class TDispatchConnection : public TCustomRemoteServer;
```

File

MConnect

Description

Do not create instances of TDispatchConnection. Instead, use TDispatchConnection as a base class when creating a custom component that forms a connection to a COM-based application server in a multi-tiered database application.

TDispatchConnection introduces the infrastructure for logging on to an application server, obtaining an IAppServer interface, calling the application server's interface, and managing a remote connection. Additionally, TCustomRemoteServer inherits the ability to work with one or more client datasets.

TDispatchConnection is not capable of connecting to an application server. This ability is added by descendants, which are specialized for different connection types. Once a connection is formed, however, TDispatchConnection makes the application server's IAppServer interface available to TClientDataSet components.

To enable a client application to connect to a COM-based application server, use a descendant of TDispatchConnection such as TSocketConnection, TWebConnection, or TDCOMConnection (see page 16008).

TSOAPConnection

94.1.5.1 TDispatchConnection Members

The following tables list the members exposed by TDispatchConnection.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	DoConnect (see page 6864)	Provides the interface for a method that opens a connection.
	DoDisconnect (see page 16023)	Drops a connection to an application server.
	GetAppServer (see page 8530)	Returns the value of the AppServer (see page 8532) property.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetConnected (see page 16023)	Returns the value of the Connected (see page 16026) property.
	GetDataSet (see page 6865)	Returns a dataset, given its index in the DataSets (see page 6870) property array.
	GetDataSetCount (see page 6865)	Returns the value of the DataSetCount (see page 6869) property.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetServerCLSID (see page 16024)	Returns the GUID for the application server.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Loaded (see page 6866)	Initializes the connection component after all objects in the form or data module have been loaded.
	Notification (see page 16025)	Responds when other objects are created or destroyed.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	RegisterClient (see page 6866)	Registers an object that uses the connection component.
	SendConnectEvent (see page 6867)	Informs all registered clients that use the connection component when a connection is opened or closed.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetAppServer (see page 8531)	Sets the AppServer (see page 8532) property.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetConnected (see page 16025)	Sets the Connected (see page 16026) property.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	UnRegisterClient (see page 6868)	Removes a registered client so that it is no longer associated with the connection component.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.

	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	ObjectBroker (see page 16028)	Specifies an Object Broker that allows the connection component to choose from several application servers.
	StreamedConnected (see page 6874)	Indicates whether the Connected (see page 6868) property was true when the connection component was loaded from a stream.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Close (see page 6863)	Closes the connection.
	Create (see page 16022)	Creates an instance of a dispatch connection component.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 2766)	Disposes of the component and its owned components.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 6863)	Destroys the instance of a connection component.
	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.

	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetProviderNames (see page 8530)	Executes a callback for all provider objects on the application server.
V	GetServer (see page 16023)	Returns the IAppServer interface of the application server.
V	GetServerList (see page 16024)	Returns a list of remote data modules to which the component can connect.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	Open (see page 6866)	Opens the connection.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	AppServer (see page 8532)	Contains the interface for communicating with the application server.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
R	DataSetCount (see page 6869)	Indicates the number of datasets associated with the connection component.
R	DataSets (see page 6870)	Lists the datasets currently using this connection component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Events

	Name	Description
	AfterConnect (see page 16031)	Occurs after a connection is established.
	AfterDisconnect (see page 16031)	Occurs after the connection closes.
	BeforeConnect (see page 16032)	Occurs immediately before establishing a connection.
	BeforeDisconnect (see page 16032)	Occurs immediately before the connection closes.

	OnGetUsername (see page 16033)	This is OnGetUsername, a member of class TDispatchConnection.

Published Properties

	Name	Description
	Connected (see page 16026)	Indicates whether the TDispatchConnection (see page 16017) object is connected to an application server.
	LoginPrompt (see page 16027)	Specifies whether a login dialog appears immediately before opening a new connection.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	OnLogin (see page 16028)	Occurs when a communication channel opens to the server.
	ServerGUID (see page 16030)	Specifies the GUID of the application server with which to connect.
	ServerName (see page 16030)	Specifies the name of the application server with which to connect.
	Tag (see page 2808)	Stores an integer value as part of a component.

94.1.5.2 TDispatchConnection.Create Constructor

Creates an instance of a dispatch connection component.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TDispatchConnection(TComponent * AOwner);
```

Description

Call Create to instantiate a dispatch connection component at runtime. Connection components placed in forms or data modules at design time are created automatically.

After calling the inherited constructor, Create initializes the LoginPrompt (see page 16027) property to false.

See Also

LoginPrompt (see page 6872)

Create (see page 8529)

94.1.5.3 TDispatchConnection Methods

The methods of the TDispatchConnection class are listed here.

Protected Methods

	Name	Description
	DoDisconnect (see page 16023)	Drops a connection to an application server.
	GetConnected (see page 16023)	Returns the value of the Connected (see page 16026) property.
	GetServerCLSID (see page 16024)	Returns the GUID for the application server.
	Notification (see page 16025)	Responds when other objects are created or destroyed.
	SetConnected (see page 16025)	Sets the Connected (see page 16026) property.

Public Methods

	Name	Description
	GetServer (see page 16023)	Returns the IAppServer interface of the application server.
	GetServerList (see page 16024)	Returns a list of remote data modules to which the component can connect.

94.1.5.3.1 TDispatchConnection.DoDisconnect Method

Drops a connection to an application server.

Pascal

```
procedure DoDisconnect; override;
```

C++

```
virtual __fastcall DoDisconnect();
```

Description

DoDisconnect is called internally when the Connected (see page 16026) property is set to false. It drops the connection and changes the AppServer property to a NULL Variant.

See Also

AfterDisconnect (see page 6875)

BeforeDisconnect (see page 6875)

Connected (see page 16026)

AppServer (see page 8532)

94.1.5.3.2 TDispatchConnection.GetConnected Method

Returns the value of the Connected (see page 16026) property.

Pascal

```
function GetConnected: Boolean; override;
```

C++

```
virtual __fastcall Boolean GetConnected();
```

Description

GetConnected is the protected implementation of the Connected (see page 16026) property. It uses the AppServer property (set by the DoConnect method of a TDispatchConnection (see page 16017) descendant) to determine whether a connection is established.

If a connection is established, GetConnected returns true. Otherwise, GetConnected returns false.

See Also

Connected (see page 16026)

DoConnect (see page 16001)

94.1.5.3.3 TDispatchConnection.GetServer Method

Returns the IAppServer interface of the application server.

Pascal

```
function GetServer: IAppServer; override;
```

C++

```
virtual __fastcall IAppServer GetServer();
```

Description

Client datasets call GetServer to set the value of their AppServer property. This allows them to access providers on the remote application server.

GetServer ensures that there is a connection and then returns an IAppServer interface that can be used to communicate with providers on the application server. To use other methods of the application server's interface, use the AppServer property instead.

See Also

Connected (see page 16026)

AppServer (see page 8532)

AppServer (see page 8462)

94.1.5.3.4 TDispatchConnection.GetServerCLSID Method

Returns the GUID for the application server.

Pascal

```
function GetServerCLSID: TGUID;
```

C++

```
__fastcall TGUID GetServerCLSID();
```

Description

GetServerCLSID is used internally to obtain the GUID for the application server.

In most cases, GetServerCLSID returns the value of the ServerGUID (see page 16030) property. However, if the application server was specified using the ServerName (see page 16030) property, and the application server was not registered when the ServerName (see page 16030) property was set, ServerGUID (see page 16030) will not represent the application server's GUID. GetServerCLSID can return a GUID that only becomes available when a connection is opened.

If neither the ServerName (see page 16030) nor the ServerGUID (see page 16030) property is set, GetServerCLSID raises an exception.

See Also

ServerGUID (see page 16030)

ServerName (see page 16030)

94.1.5.3.5 TDispatchConnection.GetServerList Method

Returns a list of remote data modules to which the component can connect.

Pascal

```
function GetServerList: OleVariant; override;
```

C++

```
virtual __fastcall OleVariant GetServerList();
```

Description

Connection components use GetServerList internally to fill the drop down list in the Object Inspector for the ServerName (see page 16030) property. GetServerList returns a variant array that lists all application servers that are on the local machine, registered in the system registry, or on the remote machine identified by the connection component.

See Also

ServerName (see page 16030)

94.1.5.3.6 TDispatchConnection.Notification Method

Responds when other objects are created or destroyed.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

Notification is called automatically so objects can make internal adjustments when components are created or destroyed. TDispatchConnection (see page 16017) overrides the inherited method to set the ObjectBroker (see page 16028) property to nil (Delphi) or NULL (C++) when it receives notification that that object is about to be destroyed.

See Also

ObjectBroker (see page 16028)

94.1.5.3.7 TDispatchConnection.SetConnected Method

Sets the Connected (see page 16026) property.

Pascal

```
procedure SetConnected(Value: Boolean); override;
```

C++

```
virtual __fastcall SetConnected(Boolean Value);
```

Description

SetConnected is the protected implementation of the Connected (see page 16026) property. It establishes a connection to the Application server if Value is true, and disconnects from the application server if Value is false.

If Value is false, SetConnected generates a BeforeDisconnect (see page 16032) event, closes the connection, and generates an AfterDisconnect (see page 16031) event.

If Value is true, SetConnected performs the following actions:

1. If LoginPrompt (see page 16027) is true, and the connection is not already open, SetConnected generates an OnGetUsername (see page 16033) event, and uses that to initialize a login dialog. It displays the login dialog, and aborts the connection if the user cancels.
2. It generates a BeforeConnect (see page 16032) event.
3. It opens the connection.
4. It generates an AfterConnect (see page 16031) event.
5. If LoginPrompt (see page 16027) is true, and the connection opened successfully, SetConnected generates an OnLogin (see page 16028) event.

See Also

Connected (see page 16026)

BeforeConnect (see page 6875)

AfterConnect (see page 6874)

BeforeDisconnect (see page 6875)

AfterDisconnect (see page 6875)

LoginPrompt (see page 6872)

OnGetUserName (see page 8533)

OnLogin (see page 6873)

94.1.5.4 TDispatchConnection Properties

The properties of the TDispatchConnection class are listed here.

Protected Properties

	Name	Description
	ObjectBroker (see page 16028)	Specifies an Object Broker that allows the connection component to choose from several application servers.

Published Properties

	Name	Description
	Connected (see page 16026)	Indicates whether the TDispatchConnection (see page 16017) object is connected to an application server.
	LoginPrompt (see page 16027)	Specifies whether a login dialog appears immediately before opening a new connection.
	OnLogin (see page 16028)	Occurs when a communication channel opens to the server.
	ServerGUID (see page 16030)	Specifies the GUID of the application server with which to connect.
	ServerName (see page 16030)	Specifies the name of the application server with which to connect.

94.1.5.4.1 TDispatchConnection.Connected Property

Indicates whether the TDispatchConnection (see page 16017) object is connected to an application server.

Pascal

```
property Connected: Boolean;
```

C++

```
__property Boolean Connected;
```

Description

Set Connected to true to establish a connection to the application server. Set Connected to false to terminate the connection.

When changing the value of Connected, TDispatchConnection (see page 16017) generates a BeforeConnect (see page 16032) and an AfterConnect (see page 16031) event, or a BeforeDisconnect (see page 16032) and an AfterDisconnect (see page 16031) event. In addition, when setting Connected to true, TDispatchConnection (see page 16017) may display a login dialog, depending on the value of LoginPrompt (see page 16027).

The Connected property uses the protected DoConnect and DoDisconnect (see page 16023) methods to connect to or disconnect from an application server. Descendants of TDispatchConnection (see page 16017) override DoConnect and DoDisconnect (see page 16023) to change the way the connection is formed or terminated.

See Also

DoDisconnect (see page 16023)

LoginPrompt (see page 6872)

AfterConnect (see page 6874)

AfterDisconnect (see page 6875)

BeforeConnect (see page 6875)

BeforeDisconnect (see page 6875)

DoConnect (see page 16001)

94.1.5.4.2 TDispatchConnection.LoginPrompt Property

Specifies whether a login dialog appears immediately before opening a new connection.

Pascal

```
property LoginPrompt: Boolean;
```

C++

```
__property Boolean LoginPrompt;
```

Description

Set LoginPrompt to true to provide login support when establishing a connection. LoginPrompt controls two things: the occurrence of the OnLogin event, and the appearance of a default login dialog that prompts users for a name and password when you include DBLogDlg.hpp in your unit (C++) or add DBLogDlg to your uses clause (Delphi). When the OnLogin event occurs and when the default login dialog appears depend on the type of connection component:

For TDatabase, TIBDatabase, and TSQLConnection, the dialog appears after the BeforeConnect event and before the AfterConnect event, unless you supply an OnLogin event handler. If there is an OnLogin event handler, that event occurs in place of the login dialog, and there is no need to include DBLogDlg.hpp in your unit (C++) or add DBLogDlg to your uses clause (Delphi). If correct values for the user name and password are not supplied in the dialog or by the OnLogin event handler, the connection fails. The OnLogin event does not fire unless LoginPrompt is set to true.

For TADOConnection components, the dialog appears after the OnWillConnect event and before the BeforeConnect event. If there is an OnLogin event handler, that event occurs after the login dialog. If you do not include DBLogDlg.hpp in your unit (C++) or add DBLogDlg to your uses clause (Delphi), the OnLogin event occurs but there is no default login dialog. If correct values for the user name and password are not supplied in the dialog or by the OnLogin event handler, the connection fails. The OnLogin event does not fire unless LoginPrompt is set to true.

For DataSnap SOAP connection components, the dialog appears after the OnGetUsername event and before the BeforeConnect, AfterConnect, and OnLogin events. If the user cancels from the login dialog, no attempt is made to open a connection.

When LoginPrompt is false, the application must supply user name and password values programmatically:

For TDatabase, the user name and password can be supplied as USER NAME and PASSWORD parameters in the Params property.

For TADOConnection, the user name and password can be supplied as the ConnectionString property.

For TSQLConnection, the user name, password, and database can be supplied as UserName, Password, and Database parameters in the Params property, or provided as connection parameters associated with the connection name.

For DataSnap SOAP connection components, there is no built-in use for the user name and password supplied by the login dialog. (The UserName and Password properties of TWebConnection are unrelated).

Warning: Storing hard-coded user name and password entries as property values or in code for an OnLogin event handler can compromise server security.

See Also

OnLogin (see page 6873)

BeforeConnect (see page 6875)

AfterConnect (see page 6874)

OnGetUserName (see page 8533)

OnLogin (see page 9994)

Controlling Server Login

94.1.5.4.3 TDispatchConnection.ObjectBroker Property

Specifies an Object Broker that allows the connection component to choose from several application servers.

Pascal

```
property ObjectBroker: TCustomObjectBroker;
```

C++

```
__property TCustomObjectBroker ObjectBroker;
```

Description

Set ObjectBroker to use a broker that maintains a list of servers that support the application specified by ServerName (see page 16030) or ServerGUID (see page 16030). When the connection component needs to open a connection, it requests information to identify a server machine from the Object Broker.

Descendants of TDispatchConnection (see page 16017) define properties that specify how to locate server machines. These properties are not saved with the connection component if the ObjectBroker property is set. Instead, the Object Broker provides this information dynamically at runtime from its list of available servers.

Applications can use TSimpleObjectBroker for an object broker, or derive their own object brokers from TCustomObjectBroker (see page 16002).

See Also

DoConnect (see page 6864)

ServerName (see page 16030)

ServerGUID (see page 16030)

TSimpleObjectBroker (see page 17877)

Brokering Connections

Specifying a Connection Using HTTP

Specifying a Connection Using DCOM

Specifying a Connection Using Sockets

Using TSimpleObjectBroker

94.1.5.4.4 TDispatchConnection.OnLogin Property

Occurs when a communication channel opens to the server.

Pascal

```
property OnLogin: TLoginEvent;
```

C++

```
__property TLoginEvent OnLogin;
```

Description

OnLogin occurs when connections are opened if the LoginPrompt property is true.

For DataSnap SOAP connection components, the following sequence of events occurs when opening a connection to an application server:

1. An OnGetUsername event occurs, where the application can supply an initial user name for the login dialog.
2. The login dialog appears, where the user can supply a user name and password.
3. A BeforeConnect event occurs, the connection is opened, and an AfterConnect event occurs.
4. The OnLogin event occurs, where you can write code to log in to the application server using the username and password that were provided in the remote login dialog.

   Note: Do not use the OnLogin event if the connection component provides a different scheme for logging in. For example, TWebConnection uses the Username and Password properties instead.

   For ADO connection components, the following sequence of events occurs when opening a connection to an application server:

1. A BeforeConnect event occurs.

2. An OnWillConnect event occurs, where the application can supply an initial user name and password for the login dialog, as well as the connection options and status.

3. The login dialog appears, where the user can supply a user name and password.

4. The OnLogin event occurs, where you can write code to respond to the user-supplied values. (For example, you could convert an application-specific user name and password to database user name and password).

5. The connection is opened, and an AfterConnect event occurs.

Note: Some

C connection components that do not connect to an application server in a multitiered database application replace the OnLogin event defined in TCustomConnection with a different event that occurs before a connection is established.

See Also

Connected (see page 6868)

Open (see page 6866)

OnGetUserName (see page 8533)

BeforeConnect (see page 6875)

AfterConnect (see page 6874)

LoginPrompt (see page 6872)

OnWillConnect (see page 1039)

94.1.5.4.5 TDispatchConnection.ServerGUID Property

Specifies the GUID of the application server with which to connect.

Pascal

```
property ServerGUID: string;
```

C++

```
__property AnsiString ServerGUID;
```

Description

Use ServerGUID to specify the application server to which the client application should connect by its GUID (global unique identifier). If the value specifies a valid GUID for a registered application server, setting ServerGUID changes the value of ServerName (see page 16030) to the class name of the corresponding COM object.

Using ServerGUID rather than ServerName (see page 16030) to identify the application server is more robust because it does not require the application server to be registered on the client system.

Note: Either ServerName (see page 16030) or ServerGUID must be provided so that the dispatch connection can create and communicate with the appropriate server COM object. This is true even for connections that are not formed using DCOM, because the remote data module on the application server is always implemented as a COM object.

See Also

ServerName (see page 16030)

Connecting to the Application Server

Connecting to the Application Server using DataSnap Components

94.1.5.4.6 TDispatchConnection.ServerName Property

Specifies the name of the application server with which to connect.

Pascal

```
property ServerName: string;
```

C++

```
__property AnsiString ServerName;
```

Description

Use ServerName to specify the name of the application server to which the client application should connect. At design time, the Object Inspector provides a drop-down list of all available servers if one of the following conditions is met:

For DCOM and OLEnterprise connections, the servers must be registered in the system Registry (see page 18633).

For Socket connections, ScktSrvr.exe must be running on the server machine.

For Web connections, the connection component must have an URL for locating httpsrvr.dll.

If ServerName specifies a valid name for a registered application server, setting ServerName sets the ServerGUID (see page 16030) property to the GUID that corresponds to the named application server.

Note: Either ServerName or ServerGUID (see page 16030) must be provided so that the dispatch connection can create and communicate with the appropriate server COM object. This is true even for connections that are not formed using DCOM, because the remote data module on the application server is always implemented as a COM object. Using ServerGUID (see page 16030) rather than ServerName to identify the application server is more robust because it does not require the application server to be registered on the client system when using a COM-based connection.

See Also

ServerGUID (see page 16030)

Connecting to the Application Server

94.1.5.5 TDispatchConnection Events

The events of the TDispatchConnection class are listed here.

Published Events

	Name	Description
	AfterConnect (see page 16031)	Occurs after a connection is established.
	AfterDisconnect (see page 16031)	Occurs after the connection closes.
	BeforeConnect (see page 16032)	Occurs immediately before establishing a connection.
	BeforeDisconnect (see page 16032)	Occurs immediately before the connection closes.
	OnGetUsername (see page 16033)	This is OnGetUsername, a member of class TDispatchConnection.

94.1.5.5.1 TDispatchConnection.AfterConnect Event

Occurs after a connection is established.

Pascal

```
property AfterConnect: TNotifyEvent;
```

C++

```
__property TNotifyEvent AfterConnect;
```

Description

Write an AfterConnect event handler to take application-specific actions immediately after the connection component opens a connection to the remote source of database information.

See Also

BeforeConnect (see page 6875)

Connected (see page 6868)

Connecting to a Database Server

94.1.5.5.2 TDispatchConnection.AfterDisconnect Event

Occurs after the connection closes.

Pascal

```
property AfterDisconnect: TNotifyEvent;
```

C++

```
__property TNotifyEvent AfterDisconnect;
```

Description

Write an AfterDisconnect event handler to take application-specific actions after the connection component drops a connection.

See Also

BeforeDisconnect (see page 6875)

Connected (see page 6868)

Disconnecting from a Database Server

94.1.5.5.3 TDispatchConnection.BeforeConnect Event

Occurs immediately before establishing a connection.

Pascal

```
property BeforeConnect: TNotifyEvent;
```

C++

```
__property TNotifyEvent BeforeConnect;
```

Description

Write a BeforeConnect event handler to take application-specific actions before the connection component opens a connection to the remote source of database information.

See Also

AfterConnect (see page 6874)

Connected (see page 6868)

Connecting to a Database Server

94.1.5.5.4 TDispatchConnection.BeforeDisconnect Event

Occurs immediately before the connection closes.

Pascal

```
property BeforeDisconnect: TNotifyEvent;
```

C++

```
__property TNotifyEvent BeforeDisconnect;
```

Description

Write a BeforeDisconnect event handler to take application-specific actions before dropping a connection.

Delphi Examples:

```
{
This BeforeDisconnect event handler makes sure that the
client dataset has applied all its pending updates before
terminating the connection to the server.
}
procedure TForm1.RemoteServer1BeforeDisconnect(Sender: TObject);
begin
  if (ClientDataSet1.ChangeCount > 0) then
    ClientDataSet1.ApplyUpdates(-1);
end;
```

See Also

AfterDisconnect (see page 6875)

Connected (see page 6868)

Disconnecting from a Database Server

94.1.5.5.5 TDispatchConnection.OnGetUsername Event

Pascal

```
property OnGetUsername: TGetUsernameEvent;
```

C++

```
__property TGetUsernameEvent OnGetUsername;
```

Description

This is OnGetUsername, a member of class TDispatchConnection.

94.1.6 TOLEnterpriseConnection Class

TOLEnterpriseConnection is provided for backward compatibility with applications that connect to an application server using OLEnterprise.

Class Hierarchy

Pascal

```
TOLEnterpriseConnection = class(TCOMConnection);
```

C++

```
class TOLEnterpriseConnection : public TCOMConnection;
```

File

MConnect

Description

TOLEnterpriseConnection is used in the client portion of a multi-tiered database application to establish and maintain the connection between the client and a remote application server using OLEnterprise. This component is provided for backward compatibility.

TOLEnterpriseConnection establishes the initial connection between the client application and a remote application server using OLEnterprise. Once the connection is established, the client registers any or all of its client datasets with the remote server, and these client datasets use the IAppServer interface from the OLEnterprise connection component to communicate with providers on the application server, or to otherwise call the application server's data module interface.

To connect to remote application servers using DCOM, use the TDCOMConnection (see page 16008) component instead. To connect client applications to remote application servers using TCP/IP sockets, use TSocketConnection. To connect client applications to remote application servers using HTTP, use TWebConnection. To connect to remote application servers using SOAP, use TSOAPConnection.

See Also

TClientDataSet (see page 8289)

TRemoteDataModule (see page 6585)

IAppServer (see page 16450)

TWebConnection (see page 18968)

94.1.6.1 TOLEnterpriseConnection Members

The following tables list the members exposed by TOLEnterpriseConnection.

Protected Events

	Name	Description
	OnGetUsername (see page 8533)	This is OnGetUsername, a member of class TCustomRemoteServer.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DoConnect (see page 16038)	Establishes a connection to the application server.
V	DoDisconnect (see page 6864)	Provides the interface for a method that terminates the connection.
V	DoDisconnect (see page 16023)	Drops a connection to an application server.
V	GetAppServer (see page 8530)	Returns the value of the AppServer (see page 8532) property.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetConnected (see page 6865)	Returns the value of the Connected (see page 6868) property.
V	GetConnected (see page 16023)	Returns the value of the Connected (see page 16026) property.
V	GetDataSet (see page 6865)	Returns a dataset, given its index in the DataSets (see page 6870) property array.
V	GetDataSetCount (see page 6865)	Returns the value of the DataSetCount (see page 6869) property.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetServerCLSID (see page 16024)	Returns the GUID for the application server.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Loaded (see page 6866)	Initializes the connection component after all objects in the form or data module have been loaded.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	Notification (see page 16025)	Responds when other objects are created or destroyed.

	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	RegisterClient (see page 6866)	Registers an object that uses the connection component.
	SendConnectEvent (see page 6867)	Informs all registered clients that use the connection component when a connection is opened or closed.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
V	SetAppServer (see page 8531)	Sets the AppServer (see page 8532) property.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
V	SetConnected (see page 6867)	Changes the value of the Connected (see page 6868) property.
V	SetConnected (see page 16001)	Sets the Connected (see page 16026) property.
V	SetConnected (see page 16025)	Sets the Connected (see page 16026) property.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	UnRegisterClient (see page 6868)	Removes a registered client so that it is no longer associated with the connection component.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	ObjectBroker (see page 16028)	Specifies an Object Broker that allows the connection component to choose from several application servers.
	StreamedConnected (see page 6874)	Indicates whether the Connected (see page 6868) property was true when the connection component was loaded from a stream.

Public Events

	Name	Description
	AfterConnect (see page 6874)	Occurs after a connection is established.
	AfterDisconnect (see page 6875)	Occurs after the connection closes.
	BeforeConnect (see page 6875)	Occurs immediately before establishing a connection.
	BeforeDisconnect (see page 6875)	Occurs immediately before the connection closes.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).

	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Close (see page 6863)	Closes the connection.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
V	Create (see page 6862)	Creates an instance of TCustomConnection (see page 6858).
V	Create (see page 8529)	Creates an instance of a remote server component.
V	Create (see page 16022)	Creates an instance of a dispatch connection component.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 6863)	Destroys the instance of a connection component.
V	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetProviderNames (see page 8530)	Executes a callback for all provider objects on the application server.
V	GetServer (see page 8530)	Returns the IAppServer interface of the application server.
V	GetServer (see page 16023)	Returns the IAppServer interface of the application server.
V	GetServerList (see page 8531)	Returns a list of application servers (remote data modules) to which the component can connect.
V	GetServerList (see page 16024)	Returns a list of remote data modules to which the component can connect.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	Open (see page 6866)	Opens the connection.

	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	AppServer (see page 8532)	Contains the interface for communicating with the application server.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Connected (see page 6868)	Determines whether a connection has been established to the remote source of data.
R	DataSetCount (see page 6869)	Indicates the number of datasets associated with the connection component.
R	DataSets (see page 6870)	Lists the datasets currently using this connection component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	LoginPrompt (see page 6872)	Specifies whether a login dialog appears immediately before opening a new connection.
	OnLogin (see page 6873)	Occurs when a communication channel opens to the server.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Events

	Name	Description
	AfterConnect (see page 16031)	Occurs after a connection is established.
	AfterDisconnect (see page 16031)	Occurs after the connection closes.
	BeforeConnect (see page 16032)	Occurs immediately before establishing a connection.
	BeforeDisconnect (see page 16032)	Occurs immediately before the connection closes.
	OnGetUsername (see page 16033)	This is OnGetUsername, a member of class TDispatchConnection.

Published Properties

	Name	Description
	BrokerName (see page 16038)	Specifies the name of the Business Object Broker that locates the application server.
	ComputerName (see page 16039)	Specifies the name of the machine on which the application server is located.
	Connected (see page 16026)	Indicates whether the TDispatchConnection (see page 16017) object is connected to an application server.
	LoginPrompt (see page 16027)	Specifies whether a login dialog appears immediately before opening a new connection.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	OnLogin (see page 16028)	Occurs when a communication channel opens to the server.
	ServerGUID (see page 16030)	Specifies the GUID of the application server with which to connect.
	ServerName (see page 16030)	Specifies the name of the application server with which to connect.
	Tag (see page 2808)	Stores an integer value as part of a component.

94.1.6.2 TOLEnterpriseConnection Methods

The methods of the TOLEnterpriseConnection class are listed here.

Protected Methods

	Name	Description
	DoConnect (see page 16038)	Establishes a connection to the application server.

94.1.6.2.1 TOLEnterpriseConnection.DoConnect Method

Establishes a connection to the application server.

Pascal

```
procedure DoConnect; override;
```

C++

```
virtual __fastcall DoConnect();
```

Description

DoConnect is called when the Connected (see page 16026) property is set to true. DoConnect obtains the interface of the remote data module on the application server using OLEnterprise runtime. This interface can then be used to obtain interfaces for the providers on the application server or to make interface calls to the remote data module.

See Also

AfterConnect (see page 6874)

BeforeConnect (see page 6875)

Connected

AppServer (see page 8532)

94.1.6.3 TOLEnterpriseConnection Properties

The properties of the TOLEnterpriseConnection class are listed here.

Published Properties

	Name	Description
	BrokerName (see page 16038)	Specifies the name of the Business Object Broker that locates the application server.
	ComputerName (see page 16039)	Specifies the name of the machine on which the application server is located.

94.1.6.3.1 TOLEnterpriseConnection.BrokerName Property

Specifies the name of the Business Object Broker that locates the application server.

Pascal

```
property BrokerName: string;
```

C++

```
__property AnsiString BrokerName;
```

Description

Use BrokerName to specify the OLEnterprise Business Object Broker with which the application server is registered. The Business Object Broker locates an available application server with the name specified by the ServerName (see page 16030) property.

If you are not using the Business Object Broker, use the ComputerName (see page 16039) property instead. You must specify a value for either BrokerName or ComputerName (see page 16039):

Note: Setting the value of BrokerName changes the ComputerName (see page 16039) property to blank, and vice versa.

See Also

ServerName (see page 16030)

ComputerName (see page 16039)

94.1.6.3.2 TOLEnterpriseConnection.ComputerName Property

Specifies the name of the machine on which the application server is located.

Pascal

```
property ComputerName: string;
```

C++

```
__property AnsiString ComputerName;
```

Description

Use ComputerName to specify the machine where the application server resides if you are not using the Business Object Broker. If you are not using the Business Object Broker and ComputerName is blank (the default), TOLEnterpriseConnection (see page 16033) assumes the application server can be found on the user's machine or that the computer name can be derived from the system registry based on the DCOM configuration. If ComputerName is not blank, it overrides any system registry entries.

If you are using the Business Object Broker, use the BrokerName (see page 16038) property instead. BrokerName (see page 16038) and ComputerName are mutually exclusive: Setting the value of ComputerName changes the BrokerName (see page 16038) property to blank, and vice versa.

See Also

ServerName (see page 16030)

BrokerName (see page 16038)

94.1.7 TSharedConnection Class

TSharedConnection connects to a child remote data module that is accessible only through the properties of a main remote data module on the application server.

Class Hierarchy

Pascal

```
TSharedConnection = class(TCustomRemoteServer);
```

C++

```
class TSharedConnection : public TCustomRemoteServer;
```

File

MConnect

Description

TSharedConnection manages a connection to a "child" remote data module that is managed by a single main remote data module on an application server. The client application does not connect directly to the "child" remote data module. Rather, it uses a single connection to the main remote data module on the server machine, and that main remote data module dispatches calls to the IAppServer interface of other "child" data modules. This allows the client application to use a single connection rather than one connection for each remote data module on the application server.

On the server-side, the interface for the child remote data module is surfaced as a property of the main remote data module's interface. The TSharedConnection component uses this property name to indicate which child remote data module is the actual target of its connection.

TSharedConnection uses a TDispatchConnection (see page 16017) descendant (TDCOMConnection (see page 16008), TWebConnection, or TSocketConnection) to form the connection to the main remote data module on the application server. When you use TSharedConnection to open a connection, it causes the associated dispatch connection to connect to the main remote data module if it has not already done so. When you close the connection maintained by TSharedConnection, however, it severs only the connection to the child remote data module, leaving the connection to the main remote data module open in case other components on the client application are still using it.

Connecting to an Application Server That Uses Multiple Data Modules

94.1.7.1 TSharedConnection Members

The following tables list the members exposed by TSharedConnection.

Protected Events

	Name	Description
	OnGetUsername (see page 8533)	This is OnGetUsername, a member of class TCustomRemoteServer.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.

	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	ConnectEvent (see page 16045)	This is ConnectEvent, a member of class TSharedConnection.
	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	DoConnect (see page 16045)	Provides the interface for a method that opens a connection.
	DoDisconnect (see page 16045)	Provides the interface for a method that terminates the connection.
	GetAppServer (see page 8530)	Returns the value of the AppServer (see page 8532) property.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetConnected (see page 16046)	Returns the value of the Connected property.
	GetDataSet (see page 6865)	Returns a dataset, given its index in the DataSets (see page 6870) property array.
	GetDataSetCount (see page 6865)	Returns the value of the DataSetCount (see page 6869) property.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Loaded (see page 6866)	Initializes the connection component after all objects in the form or data module have been loaded.
	Notification (see page 16046)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	RegisterClient (see page 6866)	Registers an object that uses the connection component.
	SendConnectEvent (see page 6867)	Informs all registered clients that use the connection component when a connection is opened or closed.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetAppServer (see page 8531)	Sets the AppServer (see page 8532) property.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetConnected (see page 6867)	Changes the value of the Connected (see page 6868) property.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	UnRegisterClient (see page 6868)	Removes a registered client so that it is no longer associated with the connection component.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.

	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	StreamedConnected (see page 6874)	Indicates whether the Connected (see page 6868) property was true when the connection component was loaded from a stream.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Close (see page 6863)	Closes the connection.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 16044)	Destroys the TSharedConnection (see page 16039) instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetProviderNames (see page 8530)	Executes a callback for all provider objects on the application server.
	GetServer (see page 16046)	Returns the IAppServer interface of the child remote data module.
	GetServerList (see page 8531)	Returns a list of application servers (remote data modules) to which the component can connect.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.

	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	Open (see page 6866)	Opens the connection.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	AppServer (see page 8532)	Contains the interface for communicating with the application server.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Connected (see page 6868)	Determines whether a connection has been established to the remote source of data.
R	DataSetCount (see page 6869)	Indicates the number of datasets associated with the connection component.
R	DataSets (see page 6870)	Lists the datasets currently using this connection component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	LoginPrompt (see page 6872)	Specifies whether a login dialog appears immediately before opening a new connection.
	OnLogin (see page 6873)	Occurs when a communication channel opens to the server.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Events

	Name	Description
	AfterConnect (see page 16048)	Occurs after a connection is established.
	AfterDisconnect (see page 16049)	Occurs after the connection closes.
	BeforeConnect (see page 16049)	Occurs immediately before establishing a connection.
	BeforeDisconnect (see page 16049)	Occurs immediately before the connection closes.

Published Methods

	Name	Description
V	Create (see page 16044)	Creates an instance of a remote server component.

Published Properties

	Name	Description
	ChildName (see page 16047)	Identifies the child remote data module on the application server with which you want to communicate.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	ParentConnection (see page 16048)	Specifies the connection component that establishes a connection to the main remote data module on the application server.
	Tag (see page 2808)	Stores an integer value as part of a component.

94.1.7.2 TSharedConnection.Create Constructor

Creates an instance of a remote server component.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TSharedConnection(TComponent * AOwner);
```

Description

Create instantiates an instance of a remote server component and initializes its properties.

AOwner is the component that is responsible for freeing the TCustomRemoteServer instance. It becomes the value of the Owner property.

See Also

Create (see page 6862)

Owner (see page 2807)

94.1.7.3 TSharedConnection.Destroy Destructor

Destroys the TSharedConnection (see page 16039) instance.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TSharedConnection();
```

Description

Do not call Destroy directly in an application. Instead, call Free, which verifies that the reference to the shared connection component is not nil before calling Destroy

See Also

Free (see page 22300)

94.1.7.4 TSharedConnection Methods

The methods of the TSharedConnection class are listed here.

Protected Methods

	Name	Description
	ConnectEvent (see page 16045)	This is ConnectEvent, a member of class TSharedConnection.
V	DoConnect (see page 16045)	Provides the interface for a method that opens a connection.
V	DoDisconnect (see page 16045)	Provides the interface for a method that terminates the connection.
V	GetConnected (see page 16046)	Returns the value of the Connected property.
V	Notification (see page 16046)	Forwards notification messages to all owned components.

Public Methods

	Name	Description
V	GetServer (see page 16046)	Returns the IAppServer interface of the child remote data module.

94.1.7.4.1 TSharedConnection.ConnectEvent Method

Pascal

```
procedure ConnectEvent(Sender: TObject; Connecting: Boolean);
```

C++

```
__fastcall ConnectEvent(TObject * Sender, Boolean Connecting);
```

Description

This is ConnectEvent, a member of class TSharedConnection.

94.1.7.4.2 TSharedConnection.DoConnect Method

Provides the interface for a method that opens a connection.

Pascal

```
procedure DoConnect; override;
```

C++

```
virtual __fastcall DoConnect();
```

Description

The Connected property uses DoConnect to establish a connection. Descendant classes override the DoConnect method to establish their connection as appropriate. As implemented in TCustomConnection, DoConnect does nothing.

See Also

Connected (see page 6868)

DoDisconnect (see page 6864)

94.1.7.4.3 TSharedConnection.DoDisconnect Method

Provides the interface for a method that terminates the connection.

Pascal

```
procedure DoDisconnect; override;
```

C++

```
virtual __fastcall DoDisconnect();
```

Description

The Connected property uses DoDisconnect to close a connection. Descendant classes override the DoDisconnect method to drop a connection. As implemented in TCustomConnection, DoDisconnect does nothing.

See Also

Connected (see page 6868)

DoConnect (see page 6864)

94.1.7.4.4 TSharedConnection.GetConnected Method

Returns the value of the Connected property.

Pascal

```
function GetConnected: Boolean; override;
```

C++

```
virtual __fastcall Boolean GetConnected();
```

Description

GetConnected is the protected read implementation of the Connected property. Descendant classes override this method to return true if a connection is open and false otherwise. As defined in TCustomConnection, GetConnected always returns false.

See Also

Connected (see page 6868)

SetConnected (see page 6867)

94.1.7.4.5 TSharedConnection.GetServer Method

Returns the IAppServer interface of the child remote data module.

Pascal

```
function GetServer: IAppServer; override;
```

C++

```
virtual __fastcall IAppServer GetServer();
```

Description

Call GetServer to obtain the interface of the remote data module on the application server. GetServer returns the IAppServer interface of the same remote data module as the one whose interface is the value of the AppServer property. Client applications can communicate directly with the child remote data module through this interface.

See Also

AppServer (see page 8532)

94.1.7.4.6 TSharedConnection.Notification Method

Forwards notification messages to all owned components.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

Do not call the Notification method in an application. Notification is called automatically when the component specified by AComponent is about to be inserted or removed, as specified by Operation. By default, components pass along the notification to their owned components, if any.

A component can, if needed, act on the notification that a component is being inserted or removed. For example, if a component has object fields or properties that contain references to other components, it can check the notifications of component removals and invalidate those references as needed.

Note: Notification is not called for components that are freed implicitly (because their Owner is freed).

See Also

FreeNotification (see page 2775)

InsertComponent (see page 2780)

RemoveComponent (see page 2785)

Owner (see page 2807)

94.1.7.5 TSharedConnection Properties

The properties of the TSharedConnection class are listed here.

Published Properties

	Name	Description
	ChildName (see page 16047)	Identifies the child remote data module on the application server with which you want to communicate.
	ParentConnection (see page 16048)	Specifies the connection component that establishes a connection to the main remote data module on the application server.

94.1.7.5.1 TSharedConnection.ChildName Property

Identifies the child remote data module on the application server with which you want to communicate.

Pascal

```
property ChildName: String;
```

C++

```
__property AnsiString ChildName;
```

Description

Set ChildName to the name of the property on the application server's main remote data module that exposes the interface for the desired child remote data module. TSharedConnection (see page 16039) uses this property to obtain the interface for the child remote data module, which it sets as the value of the AppServer property.

See Also

AppServer (see page 8532)

ParentConnection (see page 16048)

94.1.7.5.2 TSharedConnection.ParentConnection Property

Specifies the connection component that establishes a connection to the main remote data module on the application server.

Pascal

```
property ParentConnection: TDispatchConnection;
```

C++

```
__property TDispatchConnection ParentConnection;
```

Description

Set ParentConnection to a connection component that connects to the main remote data module on the application server. TSharedConnection (see page 16039) uses this component's connection for communicating to the child remote data module.

The main remote data module with which ParentConnection communicates must expose the interface for the child remote data module as a property on its IAppServer interface.

See Also

AppServer (see page 8532)

ChildName (see page 16047)

AppServer (see page 8532)

94.1.7.6 TSharedConnection Events

The events of the TSharedConnection class are listed here.

Published Events

	Name	Description
	AfterConnect (see page 16048)	Occurs after a connection is established.
	AfterDisconnect (see page 16049)	Occurs after the connection closes.
	BeforeConnect (see page 16049)	Occurs immediately before establishing a connection.
	BeforeDisconnect (see page 16049)	Occurs immediately before the connection closes.

94.1.7.6.1 TSharedConnection.AfterConnect Event

Occurs after a connection is established.

Pascal

```
property AfterConnect: TNotifyEvent;
```

C++

```
__property TNotifyEvent AfterConnect;
```

Description

Write an AfterConnect event handler to take application-specific actions immediately after the connection component opens a connection to the remote source of database information.

See Also

BeforeConnect (see page 6875)

Connected (see page 6868)

Connecting to a Database Server

94.1.7.6.2 TSharedConnection.AfterDisconnect Event

Occurs after the connection closes.

Pascal

```
property AfterDisconnect: TNotifyEvent;
```

C++

```
__property TNotifyEvent AfterDisconnect;
```

Description

Write an AfterDisconnect event handler to take application-specific actions after the connection component drops a connection.

See Also

BeforeDisconnect (see page 6875)

Connected (see page 6868)

Disconnecting from a Database Server

94.1.7.6.3 TSharedConnection.BeforeConnect Event

Occurs immediately before establishing a connection.

Pascal

```
property BeforeConnect: TNotifyEvent;
```

C++

```
__property TNotifyEvent BeforeConnect;
```

Description

Write a BeforeConnect event handler to take application-specific actions before the connection component opens a connection to the remote source of database information.

See Also

AfterConnect (see page 6874)

Connected (see page 6868)

Connecting to a Database Server

94.1.7.6.4 TSharedConnection.BeforeDisconnect Event

Occurs immediately before the connection closes.

Pascal

```
property BeforeDisconnect: TNotifyEvent;
```

C++

```
__property TNotifyEvent BeforeDisconnect;
```

Description

Write a BeforeDisconnect event handler to take application-specific actions before dropping a connection.

Delphi Examples:

```
{
This BeforeDisconnect event handler makes sure that the
client dataset has applied all its pending updates before
terminating the connection to the server.
}
procedure TForm1.RemoteServer1BeforeDisconnect(Sender: TObject);
begin
  if (ClientDataSet1.ChangeCount > 0) then
    ClientDataSet1.ApplyUpdates(-1);
end;
```

See Also

AfterDisconnect (see page 6875)

Connected (see page 6868)

Disconnecting from a Database Server

94.2 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	GetMIDASAppServerList (see page 16051)	This is function MConnect.GetMIDASAppServerList.

94.2.1 MConnect.GetMIDASAppServerList Function

Pascal

```
procedure GetMIDASAppServerList(List: TStringList; const RegCheck: string);
```

C++

```
GetMIDASAppServerList(TStringList List, const AnsiString RegCheck);
```

File

MConnect

Description

This is function MConnect.GetMIDASAppServerList.

95 Menus Namespace

This is namespace Menus.

Topics

Name	Description
Classes (see page 16055)	The following table lists classes in this documentation.
Functions (see page 16186)	The following table lists functions in this documentation.
Structs, Records, Enums (see page 16198)	The following table lists structs, records, enums in this documentation.
Types (see page 16203)	The following table lists types in this documentation.
Variables (see page 16207)	The following table lists variables in this documentation.
Constants (see page 16209)	The following table lists constants in this documentation.

Classes

	Name	Description
	EMenuError (see page 16055)	EMenuError is the exception class for errors involving menu items.
	TMainMenu (see page 16056)	TMainMenu encapsulates a menu bar and its accompanying drop-down menus for a form.
	TMenu (see page 16067)	TMenu is the base type for menu components such as TMainMenu (see page 16056) and TPopupMenu (see page 16169).
	TMenuActionLink (see page 16090)	TMenuActionLink links menu item clients to the corresponding menu action.
	TMenuItem (see page 16102)	TMenuItem describes the properties of an item in a menu.
	TMenuItemEnumerator (see page 16160)	This is class Menus.TMenuItemEnumerator.
	TMenuItemStack (see page 16162)	This is class Menus.TMenuItemStack.
	TPopupList (see page 16164)	TPopupList manages the window that handles popup menu messages.
	TPopupMenu (see page 16169)	TPopupMenu encapsulates the properties, methods, and events of a pop-up menu.

Constants

Name	Description
cDialogSuffix (see page 16209)	This is constant Menus.cDialogSuffix.
cHotkeyPrefix (see page 16209)	This is constant Menus.cHotkeyPrefix.
cLineCaption (see page 16209)	This is constant Menus.cLineCaption.

Functions

	Name	Description
	AnsiSameCaption (see page 16186)	Indicates whether two strings are the same based on the current locale, ignoring case information and accelerator characters.

	DrawMenuItem (see page 16187)	This is function Menus.DrawMenuItem.
	GetHotkey (see page 16187)	Returns the last character in a string marked with an ampersand (&).
	IsAltGRPressed (see page 16187)	This is function Menus.IsAltGRPressed.
	NewItem (see page 16188)	Creates and initializes a menu item.
	NewLine (see page 16189)	Creates a menu item for a separator.
	NewMenu (see page 16190)	Creates and initializes a main menu.
	NewPopupMenu (see page 16191)	Creates and initializes a popup menu.
	NewSubMenu (see page 16192)	Creates and initializes a menu item that represents a submenu.
	ShortCut (see page 16193)	Creates a menu shortcut for a specified key combination.
	ShortCutFromMessage (see page 16194)	This is function Menus.ShortCutFromMessage.
	ShortCutToKey (see page 16194)	Returns the key code and shift state of a menu shortcut.
	ShortCutToText (see page 16195)	Converts a menu shortcut into a string that describes the shortcut.
	StripHotkey (see page 16196)	This is function Menus.StripHotkey.
	TextToShortCut (see page 16196)	Creates a menu shortcut from a text string.

Structs, Records, Enums

	Name	Description
	TFindItemKind (see page 16198)	TFindItemKind indicates the criterion to use when locating menu items.
	TMenuAnimations (see page 16199)	TMenuAnimation (see page 16204) and TMenuAnimations indicate how a popup menu appears on screen.
	TMenuBreak (see page 16199)	TMenuBreak indicates the criterion to use when locating menu items.
	TMenuItemAutoFlag (see page 16200)	TMenuItemAutoFlag and TMenuAutoFlag (see page 16205) Indicate when menu items are automatically maintained.
	TPopupAlignment (see page 16201)	TPopupAlignment represents the position of a popup menu relative to the mouse.
	TTrackButton (see page 16201)	TTrackButton specifies which mouse button activates a tool button menu.

Types

Name	Description
PMenuItem (see page 16203)	This is type Menus.PMenuItem.
TAdvancedMenuDrawItemEvent (see page 16203)	TAdvancedMenuDrawItemEvent is the type for event handlers that render menu items in owner-drawn menus.
TMenuActionLinkClass (see page 16204)	This is type Menus.TMenuActionLinkClass.
TMenuAnimation (see page 16204)	TMenuAnimation and TMenuAnimations (see page 16199) indicate how a popup menu appears on screen.
TMenuAutoFlag (see page 16205)	TMenuItemAutoFlag (see page 16200) and TMenuAutoFlag Indicate when menu items are automatically maintained.
TMenuChangeEvent (see page 16205)	This is type Menus.TMenuChangeEvent.
TMenuDrawItemEvent (see page 16206)	TMenuDrawItemEvent is the type for event handlers that render menu items in owner-drawn menus.
TMenuMeasureItemEvent (see page 16206)	TMenuMeasureItemEvent is the type for event handlers that render menu items in owner-Measuren menus.

Variables

Name	Description
PopupList (see page 16207)	This is variable Menus.PopupList.
ShortCutItems (see page 16207)	This is variable Menus.ShortCutItems.
ValidMenuHotkeys (see page 16207)	This is variable Menus.ValidMenuHotkeys.

95.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	EMenuError (see page 16055)	EMenuError is the exception class for errors involving menu items.
	TMainMenu (see page 16056)	TMainMenu encapsulates a menu bar and its accompanying drop-down menus for a form.
	TMenu (see page 16067)	TMenu is the base type for menu components such as TMainMenu (see page 16056) and TPopupMenu (see page 16169).
	TMenuActionLink (see page 16090)	TMenuActionLink links menu item clients to the corresponding menu action.
	TMenuItem (see page 16102)	TMenuItem describes the properties of an item in a menu.
	TMenuItemEnumerator (see page 16160)	This is class Menus.TMenuItemEnumerator.
	TMenuItemStack (see page 16162)	This is class Menus.TMenuItemStack.
	TPopupList (see page 16164)	TPopupList manages the window that handles popup menu messages.
	TPopupMenu (see page 16169)	TPopupMenu encapsulates the properties, methods, and events of a pop-up menu.

95.1.1 EMenuError Class

EMenuError is the exception class for errors involving menu items.

Class Hierarchy

Pascal

```
EMenuError = class(Exception);
```

C++

```
class EMenuError : public Exception;
```

File

Menus

Description

EMenuError is raised if an error occurs while an application is working with menu items. For example, an EMenuError exception occurs if

An application tries to delete an item from an empty menu

A menu item attempts to insert itself into it's own list of items

An application attempts to reference a menu that does not exist

An application specifies an invalid GroupIndex for a menu item

See Also

TMenuItem (see page 16102)

TMenu (see page 16067)

95.1.2 TMainMenu Class

TMainMenu encapsulates a menu bar and its accompanying drop-down menus for a form.

Class Hierarchy

Pascal

```
TMainMenu = class(TMenu);
```

C++

```
class TMainMenu : public TMenu;
```

File

Menus

Description

Use TMainMenu to provide the main menu for a form. To begin designing a menu, add a main menu to a form, and double-click the component.

TMainMenu introduces properties and methods for merging the drop-down menus of the main menu with the main menu of another form.

TMainMenu introduces properties and methods for assisting in the menu negotiation process of an OLE container.

Tip: To create a menu that users can configure at runtime, use the TActionMainMenuBar component with an action manager instead.

TMenuItem (see page 16102)

TPopupMenu (see page 16169)

TActionMainMenuBar (see page 585)

TActionManager (see page 432)

95.1.2.1 TMainMenu Members

The following tables list the members exposed by TMainMenu.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.

	AdjustBiDiBehavior (see page 16073)	Applies the BiDiMode (see page 16083) property to the menu when the Windows control is created.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	DoBiDiModeChanged (see page 16074)	Updates the menu when the BiDiMode (see page 16083) property changes.
V	DoChange (see page 16075)	Generates an OnChange (see page 16090) event.
	DoGetMenuString (see page 16075)	Returns the caption for an item in the menu.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetChildren (see page 16076)	Executes a callback for child menu items.
V	GetHandle (see page 16060)	Returns the value of the Handle property.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsOwnerDraw (see page 16077)	Indicates whether menu items can contain more than simple captions.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Loaded (see page 16078)	Calls the DoChange (see page 16075) method when the menu is first loaded into memory.
V	MenuChanged (see page 16061)	Responds when the menu changes.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	Notification (see page 16079)	Responds when components are added or deleted.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
V	SetChildOrder (see page 16081)	Ensures that the menu item indexes reflect the order in which they are loaded and saved.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateItems (see page 16081)	Causes all menu items to update themselves.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.

	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 16072)	Creates an instance of TMenu (see page 16067).
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	CreateMenuItem (see page 16073)	This is CreateMenuItem, a member of class TMenu.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 2766)	Disposes of the component and its owned components.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 16072)	Destroys the menu component.
	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DispatchCommand (see page 16074)	Calls the Click method of the menu item with the specified value as its Command property.
	DispatchPopup (see page 16074)	Dispatches a pop-up menu command.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FindItem (see page 16076)	Locates and returns a menu item.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetHelpContext (see page 16077)	Returns the help context ID associated with a menu item.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetOle2AcceleratorTable (see page 16060)	Returns the main menu's accelerator table.
	GetParentComponent (see page 2778)	Returns the containing Component.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.

	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	IsRightToLeft (see page 16077)	Indicates whether menu items read from right to left.
	IsShortCut (see page 16078)	Dispatches a key message if it represents a shortcut key for an item in the menu.
	Merge (see page 16061)	Combines the main menu of one form with the main menu of another in non-MDI applications.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	ParentBiDiModeChanged (see page 16079)	This is the overview for the ParentBiDiModeChanged method overload.
	PopulateOle2Menu (see page 16062)	Populates an OLE menu with items from the main menu.
	ProcessMenuChar (see page 16080)	Responds to keyboard input for the menu.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetOle2MenuHandle (see page 16062)	Associates the handle for an OLE menu with the main menu.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	Unmerge (see page 16063)	Reverses the merging of two menus in a non-MDI application.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	Handle (see page 16083)	Provides access to the Windows menu handle for the menu.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	WindowHandle (see page 16089)	Provides access to the handle of the window that uses the menu.

Published Events

	Name	Description
	OnChange (see page 16067)	Occurs when the menu changes.

Published Properties

	Name	Description
	AutoHotkeys (see page 16063)	Determines whether the accelerator keys for menu items can be reset automatically.
	AutoLineReduction (see page 16064)	Determines whether redundant separator bars are automatically removed from the menu.

	AutoMerge (see page 16065)	Determines if the main menus of secondary forms merge with the main menu of the main form in non-MDI applications at runtime.
	BiDiMode (see page 16065)	Determines the layout of the menu in Middle East locales.
	Images (see page 16065)	Lists the images that can appear beside individual menu items.
R	Items (see page 16084)	Describes the elements of the menu.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	OwnerDraw (see page 16066)	Specifies whether the menu items are drawn by the application.
	ParentBiDiMode (see page 16066)	Indicates whether the BiDiMode property is inherited from the control that uses the menu.
	Tag (see page 2808)	Stores an integer value as part of a component.

95.1.2.2 TMainMenu Methods

The methods of the TMainMenu class are listed here.

Protected Methods

	Name	Description
V	GetHandle (see page 16060)	Returns the value of the Handle property.
V	MenuChanged (see page 16061)	Responds when the menu changes.

Public Methods

	Name	Description
	GetOle2AcceleratorTable (see page 16060)	Returns the main menu's accelerator table.
	Merge (see page 16061)	Combines the main menu of one form with the main menu of another in non-MDI applications.
	PopulateOle2Menu (see page 16062)	Populates an OLE menu with items from the main menu.
	SetOle2MenuHandle (see page 16062)	Associates the handle for an OLE menu with the main menu.
	Unmerge (see page 16063)	Reverses the merging of two menus in a non-MDI application.

95.1.2.2.1 TMainMenu.GetHandle Method

Returns the value of the Handle property.

Pascal

```
function GetHandle: HMENU; override;
```

C++

```
virtual __fastcall HMENU GetHandle();
```

Description

GetHandle is the protected implementation of the Handle property. Override this method to change the implementation of the handle property. For example, TMainMenu overrides GetHandle to adjust for menus added by embedded OLE objects.

See Also

Handle (see page 16083)

95.1.2.2.2 TMainMenu.GetOle2AcceleratorTable Method

Returns the main menu's accelerator table.

Pascal

```
procedure GetOle2AcceleratorTable(var AccelTable: HAccel; var AccelCount: Integer; const
Groups: array of Integer);
```

C++

```
__fastcall GetOle2AcceleratorTable(HAccel AccelTable, int AccelCount, const array of Integer
Groups);
```

Description

Call GetOle2AcceleratorTable to obtain a handle to an accelerator table for all menu items with a GroupIndex value that appears in the Groups parameter. The AccelTable parameter is set to the accelerator table handle, and the AccelCount is set to the number of entries in the table. GetOle2AcceleratorTable is used by OLE containers when merging menus.

See Also

GroupIndex (see page 16146)

ShortCut (see page 16152)

95.1.2.2.3 TMainMenu.MenuChanged Method

Responds when the menu changes.

Pascal

```
procedure MenuChanged(Sender: TObject; Source: TMenuItem; Rebuild: Boolean); override;
```

C++

```
virtual __fastcall MenuChanged(TObject * Sender, TMenuItem Source, Boolean Rebuild);
```

Description

MenuChanged is called automatically when changes occur that affect the structure of the menu. The Sender parameter indicates the object that originates the change. It's value can be nil (Delphi) or NULL (C++). Source indicates which menu item is affected. Rebuild indicates whether the menu must be rebuilt to reflect the change (for example when items are added or deleted).

MenuChanged calls the DoChange method, which generates an OnChange event.

Note: Changes that affect individual items rather than the menu as a whole trigger the UpdateItems method instead of MenuChanged. For example, when the Images property changes, UpdateItems is called rather than MenuChanged.

See Also

Items (see page 16084)

UpdateItems (see page 16081)

DoChange (see page 16075)

95.1.2.2.4 TMainMenu.Merge Method

Combines the main menu of one form with the main menu of another in non-MDI applications.

Pascal

```
procedure Merge(Menu: TMainMenu);
```

C++

```
__fastcall Merge(TMainMenu Menu);
```

Description

Call Merge to merge another main menu with this one. Specify the menu you want merged with this menu as the Menu parameter.

For example, to use the main menu of the first form in an application as the main menu for the application, call Merge to merge

the main menu of any additional forms in the application with the main menu of the first form.

Depending on the value of the GroupIndex property of menu items on the main menu, the merged menu items can replace menu items on the menu bar, or insert menu items into the menu bar. See GroupIndex for information on how to do these things.

To merge and unmerge main menus automatically when other forms are displayed, change the value of the AutoMerge (see page 16065) property to true on all forms whose menus should be merged in.

See Also

AutoMerge (see page 16065)

GroupIndex (see page 16146)

Unmerge (see page 16063)

95.1.2.2.5 TMainMenu.PopulateOle2Menu Method

Populates an OLE menu with items from the main menu.

Pascal

```
procedure PopulateOle2Menu(SharedMenu: HMenu; const Groups: array of Integer; var Widths:
array of Longint);
```

C++

```
__fastcall PopulateOle2Menu(HMenu SharedMenu, const array of Integer Groups, array of Longint
Widths);
```

Description

Call PopulateOle2Menu to merge the menu items with GroupIndex values specified by the Groups parameter into the menu that uses the SharedMenu handle. PopulateOle2Menu appends all menu items in the specified groups to the menu, and increments the corresponding entries in the Widths array for every menu item appended. PopulateOle2Menu is used by OLE containers when merging menus.

Note: PopulateOle2Menu populates the menu specified by the SharedMenu parameter but does not set this as the OLE menu associated with the menu.

See Also

GetOle2AcceleratorTable (see page 16060)

SetOle2MenuHandle (see page 16062)

GroupIndex (see page 16146)

95.1.2.2.6 TMainMenu.SetOle2MenuHandle Method

Associates the handle for an OLE menu with the main menu.

Pascal

```
procedure SetOle2MenuHandle(Handle: HMENU);
```

C++

```
__fastcall SetOle2MenuHandle(HMENU Handle);
```

Description

Call SetOle2MenuHandle to temporarily replace the menu of a form with the menu represented by the Handle (see page 16083) parameter. To restore the original menu, call SetOle2MenuHandle with the Handle (see page 16083) parameter set to 0. SetOle2MenuHandle allows an OLE container to use menu items provided by an OLE server.

See Also

GetOle2AcceleratorTable (see page 16060)

PopulateOle2Menu (see page 16062)

95.1.2.2.7 TMainMenu.Unmerge Method

Reverses the merging of two menus in a non-MDI application.

Pascal

```
procedure Unmerge(Menu: TMainMenu);
```

C++

```
__fastcall Unmerge(TMainMenu Menu);
```

Description

Call Unmerge to remove items from another main menu that were added using the Merge (see page 16061) method. The Menu parameter is the merged menu whose items should be removed from the main menu.

See Also

AutoMerge (see page 16065)

Merge (see page 16061)

95.1.2.3 TMainMenu Properties

The properties of the TMainMenu class are listed here.

Published Properties

	Name	Description
	AutoHotkeys (see page 16063)	Determines whether the accelerator keys for menu items can be reset automatically.
	AutoLineReduction (see page 16064)	Determines whether redundant separator bars are automatically removed from the menu.
	AutoMerge (see page 16065)	Determines if the main menus of secondary forms merge with the main menu of the main form in non-MDI applications at runtime.
	BiDiMode (see page 16065)	Determines the layout of the menu in Middle East locales.
	Images (see page 16065)	Lists the images that can appear beside individual menu items.
	OwnerDraw (see page 16066)	Specifies whether the menu items are drawn by the application.
	ParentBiDiMode (see page 16066)	Indicates whether the BiDiMode property is inherited from the control that uses the menu.

95.1.2.3.1 TMainMenu.AutoHotkeys Property

Determines whether the accelerator keys for menu items can be reset automatically.

Pascal

```
property AutoHotkeys: TMenuAutoFlag;
```

C++

```
__property TMenuAutoFlag AutoHotkeys;
```

Description

Set AutoHotkeys to indicate whether the menu should automatically ensure that accelerator keys for its items are reset if

necessary so that every menu item has an accelerator key and no two items have the same accelerator key. This ensures that menu items added dynamically at runtime can have accelerator keys that do not introduce conflicts. TMenu tries to preserve all existing accelerator key mappings when adjusting the accelerator keys, but may be forced to change some in order to ensure that every item has a unique accelerator.

Before the menu is displayed, the menu checks and adjusts the accelerator key mappings if AutoHotkeys is maAutomatic. When AutoHotkeys is maManual, the menu does not alter the top-level menu items, but may adjust the accelerator keys for submenus, depending on the AutoHotkeys property of the menu item that is the parent of the submenu.

When AutoHotkeys is maManual, an application can still adjust the menu items by calling the Items property's RethinkHotkeys method. AutoHotkeys merely controls whether this adjustment occurs automatically.

Note: The AutoHotkeys property of a menu is linked to the AutoHotkeys property of the TMenuItems object that implements its Items property. Setting one sets the other.

See Also

AutoHotkeys (see page 16134)

Items (see page 16084)

RethinkHotkeys (see page 16128)

95.1.2.3.2 TMainMenu.AutoLineReduction Property
